The immediate tactical issue is simple but important. It is whether the West German terms for free elections should be simply repeated *ex cathedra* from Bonn, or whether they should be discussed round the table with Eastern Germany. The mere fact of bringing Bonn representatives to a conference would certainly represent a measure of success for Moscow. It would be hard for West Germans to reject the Soviet proposal that the conference should quickly work towards conclusion of a peace treaty, to be followed by the withdrawal of American troops. But at the time of writing it looks as if the conditions for electors laid down by the Bundestag have checked the Grotewohl initiative.

* * *

Unity on Bonn's Terms

The West German representatives should, and could, stand by the terms for free elections that they laid down when the Atlantic powers were much weaker than they are today. These conditions meant in effect the dismantling of the Soviet system in the Russian zone, some considerable time before elections were held, so as to restore free political activity in some measure. Beyond this, if a conference were to take place, the Federal Germans would have to demand that the all-German government should be free both in principle and in fact even to join the Schuman Plan and Nato if it wished. It must not be bound to a false neutrality. For their part the United States—and indeed the British and French—would have to make it perfectly clear that in the foreseeable future there would be no withdrawal of their forces, which is the chief aim of Soviet policy in Germany. This would be essential, for without such a declaration elections, however free in theory, would in fact be held under the shadow of Russian might.

In the unlikely event of Moscow's allowing all such terms to be accepted by Grotewohl, the "Austrian solution" frequently advocated in these pages would have been achieved for Germany. However difficult to work out, and however much its success would depend on Soviet relations with the Western Allies, it would provide the way of re-uniting their country which, by one means or another, the western powers must eventually offer the Germans. They must offer it because it is evident that the Germans are not likely to prefer any alternatives which the west can provide; and because history teaches that the division of a country is a dangerous threat to peace.

Pie in the Sky?

Anxiety about the King's health has overshadowed the preparations that the parties are steadily making for next month's trial at the polls. Yet the campaign is in any event developing slowly and cautiously. The two opposing armies are reconnoitring their ground very carefully before committing themselves to battle. The Conservative leaders at Mr Churchill's home at Hyde Park Gate, and the Labour leaders at Transport House, have in these days been grappling with essentially the same problem: how much can they afford, in the present straitened condition of the nation, to promise to the electors? Must they indeed promise much at all, except to offer their brand of administration as superior to that of their opponents?

For the Tories this is a peculiarly difficult choice. Power lies so close to their grasp that the temptation to clinch the issue by holding forth hopes of more bountiful times to come—times in which new houses will rise at the rate of 300,000 a year, in which the real benefits of the welfare state will be maintained at a lower cost by wise administration, in which both prices and taxes will be lowered and food supplies increased—is very great. But against this view certain responsible voices, including, it is reported, that of Mr Eden, have been raised among the Conservatives to urge that it would be both wrong and foolish for them to burden themselves with a series of promises which might be very difficult, if not impossible, to carry out. These advisers would have Mr Churchill appeal to the country primarily with the promise of "clearing up the mess," of providing careful economy and sound administration—in short, to ask for the "doctor's mandate."

There are three streams of opinion inside the Conservative party which Mr Churchill has to reckon with in his final decision on the party's policy. On the one hand there is the bulk of solid Conservative opinion which stands primarily for an election cry of "Sound Government." Side by side with it are today's Tory Reformers, Mr Butler's young men from the Central Office, who have drawn their ideas from the reformist side of Liberalism as well as from the Shaftesbury tradition of Tory benevolence. They want a promise that the welfare state and the social services will be maintained. And then there are those Tories whose views stem from the Manchester school of realistic economics, men like Mr Eccles, who are prepared to commit themselves frankly to the view that a six per cent cut in government expenditure is necessary for economic salvation, even though

it would inevitably involve cuts in the social services. Since the Tory Reformers and Mr Eccles tend to cancel each other out, the odds are that the Conservative policy, when it appears, will be in essence an appeal for a new government rather than a detailed promise of the policies it will execute.

* * *

Laying the Party Lines

In one vital aspect of policy, the Conservatives have to consider not merely propaganda, but counter-propaganda. They have to be ready to combat the idea, whether it be shouted or merely muttered by their opponents, that a Churchill government might be worse fitted than an Attlee government to maintain the peace. One Labour Minister, Mr Robens, has already expressed the view that the Tories, though equally anxious to avoid a war, may well blunder into one, and Mr Bevan was quick to stress the same line in an article in a Sunday paper. A hint of it was even to be seen in Mr Attlee's cautious speech to the Scottish Labour party, when he asked "What do the Tories mean when they talk of 'a strong foreign policy'?" Before the election is far advanced this issue of the preservation of peace, the central issue of foreign policy, may be thrusting itself more and more to the centre of the stage.

Nothing can undo the fantastic blunder of the Bevanites in bringing out their internecine pamphlet "Going Our Way" within forty-eight hours of the election announcement; but now that a truce has been hastily patched up between Mr Bevan and the unions, the Labour Executive can go on to formulate its election appeal. This will undoubtedly be based on Labour's past record and future administration. The cry will be one of "Attlee rather than Churchill" instead of "Socialism rather than Capitalism." There are, it is true, one or two goods with which to deck the shop-window—the state fruit and vegetable markets, further laws against monopolies, dividend limitation—but experience of office has made Labour clearly aware of the confines, financial and military, within which such a policy must operate.

The Liberals face an even greater dilemma, that of forging a policy for a third party at a time when the essential purpose of the election is to choose between the other two contenders for power. They are seeking a programme that will face the realities of the economic situation and which will put the high cost of living in its proper place as an unpleasant symptom. But their temptation will be to fall back on their record in the last Parliament as the defenders of individual liberty and their advocacy of co-ownership and of regional devolution.

The other party in the field will be the Communists, who are running 24 candidates. The fact that 20 of these are standing in Labour constituencies, where they may split the Left vote just enough to let a Tory in, and only four in Tory strongholds, shows how much there is in the Communists' protestations that they are on Labour's side. The reverse is, of course, the truth. They hope that a Tory victory will give them a chance to win over to Communism a section of the Labour vote, and particularly a section of the trade union vote.

* * *

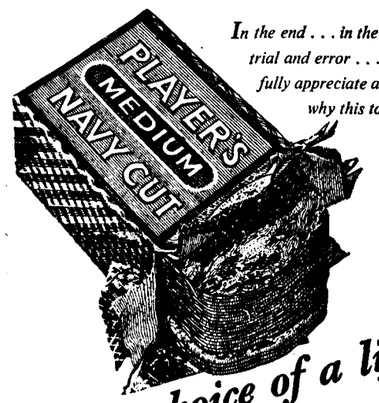
Right Industrial Policy?

The disadvantage of fighting an election campaign on one's opponent's record rather than one's own policy is that it encourages a like tactic from the adversary. Present discontents are an asset to the Tories; but the Tory record is still almost as great an asset to Labour. This is particularly annoying to those younger Conservatives who, bearing no responsibility for the Baldwin-Chamberlain era, want their party judged on its present merits.

The pamphlet "A New Approach,"* published recently by a group of young Conservative MPs, is designed (with obvious sincerity) to demonstrate those merits to trade unionists. One of the chief co-authors is himself an active trade unionist, the other has had—as clerk, unemployed man, general labourer—an effective worm's eye view of industrial relations. They appeal to the trade union movement to recognise its own interest in higher productivity and its own peril from the monolithic state; to appreciate the Conservative Industrial Charter as the best means of achieving security, incentive and status; to realise, in the words of Sir David Maxwell Fyfe's foreword, that "the association of 50 years ago which tied the Trade Union movement to Socialistic theories has long outlived any usefulness which it may have had."

The appeal is in itself both sound and shrewd. Delivered and heard in an atmosphere untroubled by historical echoes, it could have a considerable effect on that influential minority of trade unionists who actively consider and shape union policy, and, through them, on the passive majority. It will, however, take more than an enlightened pamphlet or so to convince organised labour (or indeed anyone else) that the Tory leopard has changed its spots. "Conservatism since 1939 has renewed itself," say the authors. It is no longer, they imply, the party of the Blackleg's Charter or of supine acquiescence in mass unemployment. "Alone among the political parties, the Conservative party has re-thought its philosophy in the light of modern developments." The claim is large, and hard to justify on the evidence of Hansard or the Conservative press. The time may come when it is visibly justified. Indeed, a victorious Conservative party which did not in considerable measure justify it would rapidly qualify for the fate of American Republicanism. But how generally, within the Conservative party, is this necessity realised?

* * *



Treaty Revision for Italy

Wednesday's declaration by Britain, America and France that they favour a modification of the Italian peace treaty is welcome. Both sides are to be congratulated on bringing it about, the Big Three for taking the plunge and Signor De Gasperi, the Italian Prime Minister, for his negotiations with them while they did so. It was high time this move was made, in view of the west's new relations with Japan and its current attitude to Germany. Mr Churchill long ago told the Italians that they must work their passage home, and for some time the obligation has lain on the democratic powers to recognise that they have done so.

Signor De Gasperi has had a diplomatic success that he very much needed. Once again a serious Cabinet crisis is brewing in Rome and this start on the revision comes at a peculiarly useful moment in Italy's internal political struggles. Indeed, if Signor De Gasperi had failed to secure the declaration, he would probably have faced a party revolt on his return from America. As it is, his influence among the Christian Democrats has lately waned more quickly than many observers had expected during the summer and he again has a difficult period ahead of him, sooner in fact than had been foreseen.

The present declaration of principle must not, however, be taken as making any formal change as yet in the status of the Italian peace treaty. The treaty has not been abrogated or rescinded, and its terms cannot be altered without the agreement of at least a majority of its signatories. However, a chain of events has now been set in motion. The Italians

Business Car Hire LOWERS your costs

Many famous British companies are using our special Business Car Hire Service—*to their profit.*
They have discovered, as you will, that this individually planned service often reduces travelling costs to a considerable degree. For meeting clients at airports or docks, for making sales calls or for entertaining—in fact, for all your journeys a fine new chauffeur-driven car is always at your service . . . bringing your company added prestige and efficiency. Only the large resources of Daimler Hire Ltd. can offer such facilities—and *guarantee* absolute reliability.

CARS INCLUDE *latest model* 1951 *Daimler limousines, Humber Pullman limousines, Humber Super Snipe saloons.* DRIVE YOURSELF SERVICE *provides Humber Super Snipe, Standard Vanguard, Humber Hawk, and Hillman Minx saloons.*

BERMUDA

A Coral Island Holiday after your New York trip

Bermuda is favoured above most corners of the world. Its gentle climate, its beaches of warm pink sand and its flowering trees, the charm of its old buildings and the comfort of its modern hotels make Bermuda a very special place indeed. You can play golf or tennis, swim or sail, go game-fishing or riding, enjoy carriage drives and dancing under the stars. And you can relax—for Bermuda is above all a restful place, where work-a-day cares float away on the warm water of the Gulf Stream.

One of the regular routes from London to Bermuda is via New York, from which, in any case, Bermuda is readily reached. Why not take advantage of this, and enjoy a break there on your way home from a business trip to America. The currency is sterling. No limit on the amount you may use there.

Write for free illustrated booklet and information about fares and hotel charges, to P.R. Officer, Bermuda Government Information Office, Regent House, 89 Kingsway, London, W.C.2 (Tel. Holborn 0487), or any Travel Agent.

For those carefree weekend hours, when livers are shed with workaday liveries, and raiment expresses the ego . . . '*Chetwynd*' revives the youth of the older tweeds, restrains the exuberance of the new.

have been asked to be more specific about the clauses in the treaty to which they object, and Signor De Gasperi has indicated that they will reply within a fortnight. The future position will then obviously be a matter for further negotiation, and it would be wrong for anyone in Italy to count too many chickens before they are hatched. The rate of progress ought still to depend to some extent on the development of events in Italy, and—although Mr Morrison disclaimed in Ottawa any British intention of driving a bargain—on the progress Italy itself makes in negotiating with Jugoslavia a settlement over Trieste.

* * *

M. Pleven in Trouble

M. Pleven has at last managed to put an end to the special session of the National Assembly which had lasted six weeks of the holiday season instead of the intended ten days. Right up to the last minute the Socialists, Communists and Gaullists, who have between them an absolute majority, resisted the adjournment. But M. Herriot, declaring that no positive proposal could be made, quietly put up the shutters and said he would reopen when he judged the moment opportune.

The "little session" has been disastrous and it is hard to see how M. Pleven's coalition can recover from it. The final passage last Friday of the MRP Bill admitting the principle of state aid to non-state (Catholic) schools provoked a Socialist declaration of non-co-operation until the law was repealed. M. Pleven's survival demands at least abstention by the Socialists, but they have no scruples about making parliamentary democracy unworkable. That they would have no mercy became clear when, mainly to embarrass the MRP, they introduced a Bill for a sliding wage scale. This was carried, against all the government's financial plans, by means of Communist and Gaullist support; although it provided for a sliding scale, the reverse of the Gaullist wage policy under the system of *Association Capital-Travail*, the RPF leapt at the chance of bringing the government down. It was only the refusal of the Upper House to return the bill to the Assembly for several weeks that saved the government from extinction.

During the recess there will be the cantonal elections and the British general election, both with their bearing on French socialist policy. Much more important, however, will be the final elaboration of France's civil and military budget for 1952. The civil budget will be submitted to parliament before the end of the year; the military one depends on the outcome of further Nato conferences (which themselves must wait upon the *mise au point* of the plan for a European army). M. René Mayer has made no bones about what is to come. He came back from Washington with the promise of a million tons of very expensive and rather poor coal (to be paid for commercially); of an increasing dollar inflow into France from the placing of US armament orders and from US military "occupation"; and with a vague hope that Nato would set up an economic standing group that would dam the tide of Europe's inflation wherever it most threatens to swamp national economy. In November M. Pleven's coalition will be given its last chance to prove its worth. The only alternative to it seems to be a Gaullist led coalition of RPF, Conservatives and Radicals, whose policy is more easily imagined than ascertained.

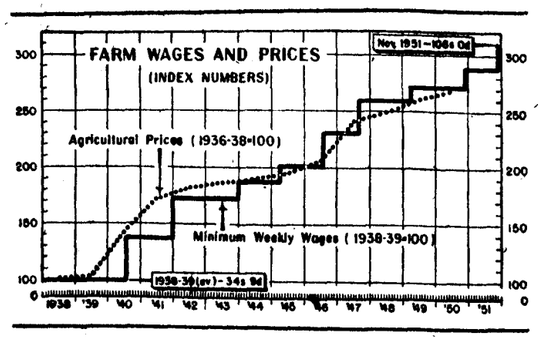
* * *

More Help for Indo-China

Next week General de Lattre de Tassigny, the

above all, with the Americans understanding more clearly that the campaigns in Korea and Indo-China are but two fronts of the same war. The General is a persuasive spokesman, and Indo-China is now to receive a priority second only to Korea. It will probably receive the bulk of $1,000 million from the Americans between now and next July. It is well understood that one reason why the United States will and should increase its support is that whatever France spends on Indo-China is taken away from the defence effort in western Europe. This is particularly true now that the total cost of the Vietnamese war is increasing, as more and better equipment is used and bigger forces are recruited on the spot. Backed by the general mobilisation order signed in July, the intention is to bring the Vietnamese army up to a strength of 120,000 men as soon as possible.

"Once Tongking is lost," General de Lattre had told the National Press Club, "there is really no barrier before Suez." This is putting the matter in an exaggeratedly simple form, but it is true that a victory in Vietnam—say, as complete as that in the Greek civil war—could have an effect out of all proportion to its cost.



General de Lattre left behind him a fairly stable military situation, and he will be back before the better weather next month re-opens the campaigning season. He cannot, however, be quite so happy about the political front, the state of which depends to an alarming extent on his own power to instil confidence. Nevertheless, several factors should now assist him. The threat of a Chinese invasion against a largely isolated French army has greatly diminished; the chances of more than clandestine Chinese support for the Vietminh have been reduced by the UN victories in Korea, and Mr Tran Van Huu, the Vietnamese Prime Minister, has had extensive evidence at San Francisco, in Washington and now this week in London, of the sympathy as well as the growing strength of the West.

* * *

Agriculture at the Crossroads

This is a critical period for British agriculture. Production, which last year reached a peak of more than 40 per cent above the prewar level, threatens to decline instead of continuing its upward trend. The June 4th returns showed a reduced wheat acreage and a smaller cattle population. Farmers are not growing enough feedingstuffs to produce the extra meat for which the nation hopes. Part, but not all, of the disappointment can be attributed to a year of bad weather, now culminating in a poor harvest.

Farmers complain that rising costs are inhibiting their efforts. The latest example is the award by the Agricultural Wages Board of an extra 8s. a week to farm workers and a

to invoke the procedure of a special price review. The Government, under agreements which it foolishly made with the farmers' leaders, has no choice initially but to meet the whole bill for increased costs, although it could in theory reverse its decision at the next regular price review. That bill amounts in a full year to £16½ million for the wages award (if confirmed) and £20 million for other costs. It certainly means higher prices for consumers in the coming winter.

Under present world conditions, a high output from British agriculture is more necessary than ever. But it is high time that farmers absorbed a larger slice of their rising costs through improved efficiency and better utilisation of labour. The accompanying diagram shows that wages have risen no faster than prices during a period in which rising production and increased mechanisation have offered an ample margin for profit. Farmers should be told to digest their gains before asking for more.

* * *

Bomb Happy

New recruits for civil defence have dwindled to the merest trickle. The rate of recruitment rose to about 12,000 a month at the beginning of the Korean war, and in the second quarter of this year was still as high as 5,000 a month. But in July it was less than 3,000 and in August less than 2,000. This decline is partly due to holidays, partly to the end of the Home Office's recruiting campaign, and partly no doubt to the reassuring effects of the possibility of a truce in Korea. The total strength of the Civil Defence Corps is now 152,368—a long way still from the very modest target of 470,000. The strength of the Auxiliary Fire Service is 10,607, towards a target of 60,000.

The average number of civil defence workers per thousand of the population is 3.5, but curiously enough it is lowest in London and the North-East, the very areas where a large civil defence force might be needed. In the country, perhaps, a course can be a social gathering of people who know each other; in the big towns it is merely tedious, and there is a general impression that less can be done to mitigate the effects of an atom explosion than can in fact be done. The Social Survey found last year that one-fifth of the population thought that they would not be safe within 50 miles of an atomic explosion, and there is no reason to think that they are much better informed now.

In October the Home Office is to start a new recruiting campaign, probably with some co-operation from the BBC and the cinemas. But, unpalatable as it is, the fact must be faced that unless the propaganda appeal can quickly be made much more effective the Civil Defence Corps will not reach adequate strength except by making attendance at a course compulsory.

* * *

Harlow Makes Progress

The industrial estate of the new town at Harlow was officially opened this week, and the town's development has reached a new stage. Seven factories are ready and seven more are being built. These visible signs of progress are small by comparison with hopes, but they are large by comparison with fears. A year ago there was much reason for concern about the industrial prospects of Harlow. Essex has an unsatisfactory railway system; the only main road through the town is small; there appeared to be more than the usual proportion of idealism in the town's lay-out; a new towns. It was no wonder that prospecting industrialists were deterred.

Many things have worked to improve this situation. Not least important have been the outward and visible signs of houses where the workers could live—and houses, moreover, that show a liveliness of conception and an originality of execution which are of themselves an earnest of courage and confidence.

NEW TOWN HOUSING PROGRAMME, 1951

Leading Towns in Home Counties	Number of Houses Authorised to be Started in 1951	Number Expected to be Completed in 1951	Total Completed by May 31, 1951
Basildon	560	150	...
Crawley	1,000	520	213
Harlow	900	630	284
Hatfield	515	120	1
Hemel Hempstead..	950	610	354
Stevenage	440	200	49

To attract industries is still, however, the key problem of the new towns, and though for Harlow the signs are better than they were, they are still far from reassuring. Most of the completed houses are occupied by building workers, and the corporation's policy is to go on housing builders until the permanent complement for the town is reached. Meanwhile, not only is the new community badly out of balance, but those industries that are being attracted are too much weighted on the side of light engineering. The town will certainly not be firmly established until a much higher proportion of its residents is employed in a larger number and a wider range of local industries.

* * *

Proposals for Palestine

For thirty years the words "Palestine" and "conciliation" have presented a contradiction in terms. The Palestine Conciliation Commission set up by the United Nations in 1948 therefore started life with a handicap. It could overcome its unfortunate name only by intelligent timing of any proposals it had to make. It chose a wrong moment when it selected this month for an effort to replace the Israel-Arab armistice agreements by some more permanent arrangement. Why choose a time when the Arabs and Egypt had just struck a new note of dudgeon with the United Nations over its vote condemning Egypt's blockade of Israel at the Suez Canal? No dispassionate person can quarrel with the actual content of its proposals, which are sheer commonsense. They suggest agreement on war damages, repatriation of some of the Arab refugees and payment of compensation to the rest through the medium of a United Nations trustee, and other adjustments. But, over Palestine, commonsense without timing is vain.

The core of the Commission's problem is that only two of the countries concerned—Israel and Jordan—vitally need the changes that a peace would bring. Peace would also, no doubt, afford Lebanon a few economic advantages. But to Syria, Egypt and Iraq it is, economically speaking, immaterial whether there is a settlement or not. Indeed, in all these countries the maintenance of an uncompromising semi-belligerent attitude presents something of a gain when viewed from the narrow angle of the home politician. The chances of securing the consent of the Arab front to an all-round settlement are therefore negligible.

The Israelis, living as they do sealed off from all contact with the state of mind in adjacent states, do not realise how

Conciliation Commission should remember that the armistices were only reached piecemeal, and that no one can hope to extend them, except inch by inch. The only way of breaking the deadlock is to make some small beginning which an Arab prime minister, when presenting it to his Parliament, can point to as a gain—on balance—for his side.

* * *

Paying for Israel

Israel's prolonged cabinet crisis—which has now lasted since the elections on July 30th—is not its leaders' worst preoccupation. Food shortage, due partly to last month's drought but mainly to lack of foreign exchange, has become the main topic of conversation and controversy. Several public statements by ministers (those in the last cabinet still hold office) reveal how tense is the struggle for such currencies as are available. The Foreign Minister, Mr Shertok, has left to attend a fresh dollar-gathering rally in Washington.

One cause of trouble is of course the rising world price of materials but another, and an even greater, is the tremendous current rate of immigration ; this was fast approaching the 150,000 mark at the end of the first six months of 1951. The newcomers are, for a varying period but at least until they learn Hebrew, consumers only, and it is calculated that every 150,000 of them add £I 10 million to the import bill. Statistics for the first months of the year show a rise in exports, but in a measure totally insufficient to offset the rising bill.

Last year, a payments deficit—visible and invisible—amounting to £I 90 million was offset by the means described in *The Economist* of May 12th. Can this year's deficit —a worse one—be righted from the same sources ? The 1951 campaign of the United Jewish Appeal in America—the source of gift dollars—has so far collected $55 million and hopes for another $35 million ; about two-thirds of its collection goes to Israel. Israel's own bonds drive in the States has in four months collected $70 million towards its three-year target of $500 million. The United States government's recently made grant-in-aid affords another $50 million. This year's release from Israel's sterling balances—already fully drawn upon—is £9,000,000. It appears, therefore, that Israel, despite the immigration rate, can, in 1951, just manage to round the corner. But for 1952 the prospect is black, for by then the bonds drive will have lost its first impetus, and the sterling balances will be exhausted. Only if the Finance Ministry has an inexhaustible supply of fresh stunts up its sleeve can unchecked immigration be allowed to continue.

* * *

Talking About Talking in Korea

Last week the Communists opened a fresh chapter in the story of the Korean campaign by announcing their readiness to renew the armistice talks—the course of which, to date, is described on page 749. General Ridgway had told them plainly, when they broke off the talks a month ago, that he was always ready to start again, provided the setting of any new meeting was such as to offer a reasonable chance of success; and he had since repeated that offer. However, the Russians and Chinese, in gaining publicity for their own "offer to renew," have no doubt secured the propaganda advantage they sought. Now the problem is to get the negotiations started on a realistic basis. For not only is the basic question still unsettled on which the talks foundered before the San Francisco conference—whether the Communists can bring themselves to accept any terms except the impossible ones of a cease-fire on the thirty-eighth parallel—but there now seems to be a dangerous tendency for the Communists to set too much store by the terms on which the main negotiations themselves shall take place. In replying to last week's offer General Ridgway very wisely laid down conditions which might prevent further accusation by either side that the neutral zone had been violated, and he suggested—but did not insist—that an alternative to the ill-omened and Chinese-dominated Kaesong should be chosen as a site. The Communist liaison officers, however, walked out of the meeting on Tuesday rather than discuss these terms.

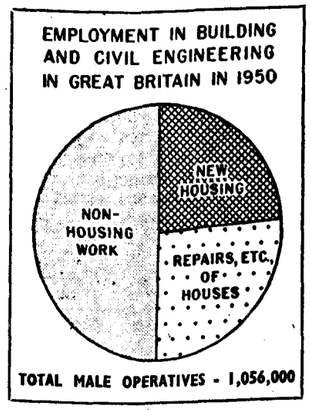
Though such behaviour obviously risks landing both sides in another winter campaign, the UN negotiators will almost certainly have to put up with some measure of Communist prevarication if peace is to be won. It appears to be due in part to the well-known inability of Communist delegates to negotiate except at the highest level, since they cannot depart from their briefs after reaching the conference table. It is also due to the Communist determination to make the best propaganda capital they can even out of military defeat—they appear to be quite friendly at the current liaison meetings and the Chinese at least seem genuinely anxious to reach a settlement.

On the other hand, a balance must be struck. If the Communists want peace, they cannot also expect to get it entirely by their own methods. Only if General Ridgway were granted outright his basic demand of a defensible armistice line partly north of the parallel, could he afford to enter further negotiations which might again make him appear to be the suppliant and the Communists the victors. And since such a crucial Communist concession is most unlikely, except after further hard bargaining in a genuine resumption of the full armistice negotiations, General Ridgway has no alternative but to hold out for adequate safeguards to the conditions in which the talks themselves take place.

* * *

Exercise Counterthrust

The seven-nation, seven-day manœuvres staged in the British zone of Germany last week provided some evidence that the Atlantic nations are tackling their defence problem in a realistic manner. The defending forces resisted the temptation to fritter away their armoured units in attempts to halt every enemy thrust, preferring to mass their armour at key points from which it could disrupt the attackers' drive by getting at its flanks. The limitations of armour were also carefully brought out ; use of the *autobahn* was forbidden, the ground chosen for the exercise gave little opportunity to take tanks across country, and infantry screens were widely used to protect tanks from bazooka fire when approaching woodland. The attacking forces used infiltration tactics based on experience in Korea, and on both sides it was assumed that ground troops were permanently in danger of air attack. No amount of realism, however, could disguise the difference between fighting on a forty-mile front, to which Exercise Counterthrust was confined, and fighting on the 500-mile front which in fact confronts the Atlantic armies in Germany.



While the participating units were predominantly British, the 100,000 men engaged included French, American, Belgian, Dutch, Danish and Norwegian troops—a large number of German civilians were also employed as transport drivers —and this juxtaposition vividly revealed the discrepancies between the equipment of the different armies. During the exercise Field Marshal Slim spoke candidly about the critically weak state in which the Atlantic forces still find themselves ; and General Juin, in a remarkably frank statement, said that he had deliberately delayed assuming command of the Nato land armies until now because he had no wish to command a mere staff. Exercise Counterthrust, however, seems to have impressed General Juin more favourably, although he thought it over-optimistic to assume that a strong attacking force could be brought to a halt so quickly. On all accounts both British and other troops appear to have acquitted themselves well in a gruelling test,

although Nato has still a long way to go before it can consider its German "front" secure. Those who argue for and against the rearmament effort during the election campaign should not overlook the fact that the cream of the British Army is committed to two vulnerable fronts—Germany and Korea—and needs all the support in equipment, reserves and aircraft that it can get.

* * *

Liberal Housing Policy

The Liberal party has published an "interim" report on its housing policy. Many of the suggestions are unexceptionable and familiar. Two points can, however, be extracted which are of special interest. The first is the explicit recognition of the competition between housing and rearmament. This awkward fact has been skated over by both the main political parties. In the 1951 Economic Survey it was stated that it was not intended to reduce the housing programme as a whole, "but there may be some interference with local housing programmes." Mr Marples in his housing pamphlet published by the Conservative Central Office adroitly set the question of rearmament on one side. The Liberal party rightly thinks that rearmament may seriously affect house-building, and it is concerned to reduce the cost per house so as to maintain the number of houses and flats built, in spite of other demands on resources. The nation will have to face the same problem.

The second and more controversial proposal is concerned with the balance to be maintained between new house-building and repair and maintenance. The Liberal party is anxious to make good the deterioration in prewar houses due to inadequate maintenance and repairs. It therefore advocates a 25 per cent increase in controlled rents, to be devoted to repairs. As the diagram shows, the manpower devoted to the building of new houses is already slightly less than that devoted to repairs, maintenance and conversion. As the resources allocated to housing ought not to be increased, larger expenditure on repairs would involve a reduction in the volume of new building. The Liberal party's housing committee considers that this possibility must be faced. It would take some political courage to plead on an election platform for a policy involving a reduction in new building. It remains to be seen whether the Liberal candidates will actually do so, whatever the party's pamphlets may say.

British Council on the Defensive

In two successive years the British Council has been instructed by the Treasury to cut its expenditure on work in foreign countries by something over £300,000. As expenditure under this heading in 1949-50 was £1,740,000, it is not surprising that the tone of its latest annual report, for the year 1950-51, is defensive. It is designed to fasten the shutters against further cold draughts. But defensiveness is not an endearing quality, and this report will do little to widen the Council's circle of friends in this country. The cuts have been most bitterly resented, and some good work has, no doubt, been sacrificed ; but it is difficult not to feel that there was also much cotton-wool padding to soften the impact.

The Council's activities have unfortunately been restricted by other agents besides the Treasury. In 1950 the actions of the Communist governments forced it to withdraw from Hungary, Czechoslovakia and Bulgaria. The only remaining links behind the iron curtain are now in Poland and China, and in China at least their survival seems very doubtful. The value of the Council's work must therefore now be judged entirely by its effects on Britain's allies and on Arab and other countries in the half-free world.

Those effects are necessarily too intangible for confident judgments to be passed. It does appear, however, that at least one ground for criticism is in process of being put right. In the past too many vague and woolly lecturers seem to have been sent abroad to lecture on vague and woolly subjects related to the British way of life. The demand for this type of lecturer has declined and in its place there is an increased demand from specialist groups for lecturers on subjects related to medicine, agriculture, education and the social sciences. Spaniards want to know about British methods of anaesthesia and Pakistanis about agricultural research. This kind of contact has more valuable and permanent results than those typified by the Australian lady who told Sir Alan Herbert: "We are glad to see you. You may not be much good, but you are a bit of England."

* * *

Correction

In a Note of the Week on page 669 of *The Economist* last week the British action in stopping sugar bound for Persia was reported as saving the United Kingdom $750,000. This figure should have been $20,000,000.

Assurance of Prosperity

All who are intimately acquainted with the speculative business which has been transacted this year, and who are aware of the means which are too often resorted to, in order to postpone the consequences of losses incurred in that way, are not without their apprehensions that further cause for uneasiness will be experienced during the next five months ; but be that as it may, so far as the general commercial prospects of the country are concerned, it would be difficult to conceive a more favourable combination of circumstances than present themselves at this moment. We have just explained the grounds on which we have come to the conclusion that money (capital) must remain abundant and cheap; in addition to that important element, notwithstanding the defect in the potato crop, it is not too much to say that we have just concluded a harvest which, taken altogether, has perhaps never before been equalled for quantity and quality. On the Continent the result, especially as regards the rye crop, to them a most important one, is not nearly so favourable. But *nowhere* is the harvest really bad. Then comes the next important element of our trade—the cotton crop: that, too, there is now no doubt, will prove the largest of any on record ; and in addition to this, the supply of all the other raw materials of importance promises to be large. With such a concurrence of elements of success, we cannot but look forward with the greatest confidence to a continued full employment of the people, and to an abundant and cheap supply of all the chief necessaries of life, both in food and clothing ; and as long as such is the case, we cannot feel any apprehension for the prosperity of trade, whatever momentary clouds of discredit may pass over it as the consequence of individual instances of speculation.

Letters to the Editor

Germany and the West

Sir,—A newspaper here recently reprinted an article of yours, the basic thought of which seemed to be: "Can one trust the Germans?" I have seldom heard so foolish a question. How much more justified are we Germans in asking: "Can we trust the English?" No, we cannot. Too much speaks against you. We have seen through your game a long time and know exactly what it is all about—particularly those of us who experienced the first world war and realised its causes. You and the Americans can only speak of your luck in finding so many traitors among the German people who smoothed the way for you and saw to it that we lost the war. You and the others cannot claim to have won the war.

Your policy during the last years was very unwise. Why had England to inflate into collective guilt what was done in Germany only by a small, bad clique? How foolish and shortsighted this was! Are you really so blind that you do not see what immense danger, to you in particular, threatens from the East? In one or two years Russia will probably be ready. Would it not have been much wiser for England and America to ally themselves firmly with Germany, and to try to achieve by means of fair treaties what you are trying today to secure by intrigues? Do you believe you can ever eliminate Germany completely as a Great Power? It is only side by side with Germany that you can exist at all. Consider history, and you will find that Germany never disappointed its treaty partners, but was always betrayed. It would therefore be right and decent to aim at an alliance, to set up 100 German divisions, which could be supervised as long as your completely unjustified mistrust continues. The prerequisite would be to guarantee Germany's pre-1914 boundaries, to win a commercial partner in Germany and not to try to exterminate the German people and make them economically helpless by emigration. You and the others have no need to steal German patents in the guise of war booty; in free economic relations you can partake of the advantages that the Germans will aways have to offer.

What is the use of a treaty with Japan to you? Conclude a better with Germany. You thought you could let Germany sink to nothingness, but we, the Germans, are in any case bound to win, while you will lose more and finally everything. What you want to destroy within Germany is growing *abroad* under German spiritual leadership to a far more mighty danger. Do not imagine that it would be an advantage for you if the Russians destroyed the Ruhr, your bogey of German economic competition. The Russians would only regard it as a first step to forcing you too to your knees.

Only a powerful Germany, firmly allied to you and the Americans, can keep away the misfortune that the Russians will bring you. But for that you need more frankness, more philanthropy, more humanity. You can rely on us; and one can only beg a beneficent providence to give you and your people the intelligence and insight to see it in time.—Yours faithfully,

PETER LAMBERTUS

Bielefeld

The Age of Inflation

Sir,—Mr Recknell inquires how my pensions proposals could be worked. Not being an actuary I cannot say. Let him however inquire of: Association Professionnelle des Banques, 18 rue Lafayette, Paris IX; and Commission Paritaire, 33 Avenue Hoche, Paris; where such schemes are in successful operation. There is, I suspect, a working foreign precedent for every single proposal made.

Mr Hepburn objects that a money premium increasing with the cost of living becomes a heavier burden on the payer. This is an excellent example of Euclidean thinking in a non-Euclidean world. For in fact most money incomes rise with the cost of living. An alternative suggestion is to make the premium a constant proportion of current income. To take out ever more policies of the present kind is not at all the same thing: it is merely to set aside still more good money in order to receive bad. Nor can it be seriously suggested that with-profits policies are an important mitigation of the halving of the value of money.

Mr Maynard appears to be quite right. I also erred in saying that first war pensions were based on 1922 prices. They appear to have been settled in 1918 or 1919, and therefore not to have lost purchasing power—yet.

If this debate really stimulates a successful attempt to stabilise money its initiator will be only too pleased to emerge a false but useful prophet. But in saying that my prophecy must be rejected you have not posed the essential political conditions. Inflation must be taken as far out of party strife as foreign policy. No conceivable change of party in power will "put value back into the pound," in Mr Menzies's phrase of 1949. Only a coalition, or an all-powerful extra-parliamentary commission, could achieve the extreme ferocity and icy impartiality required. But is this, let us not say possible, but going to happen? Do you think it is going to happen? If you don't what right have you to deny the prospective losers their protection?

You have, I think, much exaggerated the inflationary effect of these proposals. Well aware that unless people are cheated by inflation it will continue, I made proposals not to stop cheating but to cheat everybody. As to belief in the stability of money, do you know anyone, except politicians on public platforms, who holds this belief? About 4,000,000 people's wages are already on a sliding scale. To relieve replacement of income-tax, or to reform insurance, would upset nobody's confidence, except in the value of accounting textbooks. To link "fixed" interest with the cost of living would increase saving. But I need not enumerate. The gain in justice and rationality would surely outweigh the dubious loss through further inflation.

Rising prices can, as you say, destroy democracy. But only if these proposals are not carried out.—Yours faithfully,

YOUR CORRESPONDENT

Food *versus* Homes?

Sir,—According to Dr Stamp's letter in *The Economist* of September 1st, a loss of 80 per cent of its agricultural output is involved in using farm land for open density housing. This has not been the experience of First Garden City Ltd., a pioneer in open development.

The 4,630 acres estate owned by this company in Hertfordshire comprised in 1903 a dozen farms on which arable cultivation was practised with average commercial results. Today 1,700 acres constitute the town area of Letchworth surrounded by 2,930 acres of green belt. The build-up portions of the town area carry 4.5 houses to the gross acre having their own gardens which, in Dr Stamp's phrase, respond to hand cultivation. Gardens, supplemented by allotments, produce very large amounts of fresh vegetables, poultry and fruits. At Letchworth long before 1939 the existence of the market provided by the new town had led to the farms in the green belt being largely turned over from arable to animal husbandry and thus being much more intensively cultivated. War and postwar needs have intensified this trend. The food output of the estate taken as a whole, so far from diminishing, has increased in terms of nutritional value—perhaps doubled. But Letchworth incidentally houses a population of 21,500 souls—and before long will house 30,000—under conditions regarded by them as incomparably preferable to those of urban or suburban life, or—for the great majority—of life in purely agricultural districts.

This is no argument against Dr Stamp's call for economy in land-spending nor in favour of siting new development on the edges of towns already too large to have a worthwhile identity of their own. It does go to show, however, that more open development of future housing points the way to a pattern of life more civilised and humane than the life of strap-hangers and flat-dwellers. Our overgrown towns with their sprawling suburbs are a legacy from the railway age—in the age of electricity and of motor transport much of industry can be dispersed to economic advantage, and population with it. New life can be poured into historic country towns and compact new towns, sited with an eye to true economy in land use, can compete with these in offering our people homes where they can work a bit of land of their own and raise fresh food for their families. Here is a way to grow both more food and happier men: for Englishmen by nature are sons of the soil.—Yours faithfully,

ERIC MACFADYEN, *Chairman*,
First Garden City Ltd.

Books and Publications

Apologia pro Vita Sua

A King's Story: The Memoirs of HRH the Duke of Windsor, KG.

Cassell. 440 pages. 25s.

This book, many may say, should never have been written. It is, according to such opinion, undesirable and undignified for any member of the Royal Family, let alone one who was that family's head and the nation's sovereign, to discourse in print on his private affairs; it is particularly undesirable to rake over events which, having once roused dangerous passions, mercifully led to what is universally recognised as the happiest outcome for the country and the Commonwealth.

A different book might have justified that view. Written in self-pity, resentment or rancour, such an autobiography might have been not merely regrettable but thoroughly mischievous. It is, on the contrary, a most dignified, objective and historically valuable work whose readers will, it is safe to say, look on the Throne with an enhanced and deepened respect; and if it does recall past indignations, that is a small price for historical justice. To the student of society its interest lies less in the final drama, fascinating as that is, than in the earlier description of the upbringing of a Royal heir and the attempted analysis of his peculiar relationship to ordinary human society. The Duke's story contains an element common to all his generation with its Victorian background, its consciousness of dizzily accelerating change, its conflict of standards, and its disorientation by war. The stresses undergone by the "lost generation," however, have special significance when they affect a young man whose lifetime duty is to embody that very sense of continuity, security and established authority which he and his contemporaries so inevitably lack; and when, through the same circumstances which have made that duty psychologically harder, the time-honoured precedents shaping its performance have largely become unreliable.

"A King's Story" is little concerned with the purely constitutional aspects of this change; the social aspects are given full value. As the embodiment of continuity, security, a paternal unifying principle, it has become more than ever the Monarch's duty to show himself to his people, to spread even more widely, by personal contact, the reassuring sense of what they symbolise. The greater the lack of these things, the greater the importance of this function and the calls which it makes on all members of the Royal Family. The conflict between this view and the older, less exacting, social conception of kingship as the formal and ceremonial apex of the social hierarchy comes out plainly in the account of those tireless postwar journeyings through the Commonwealth and Empire. But there is more to the social role of royalty than the embodiment of those cohesive and continuous elements. Not merely the King's public acts, but his entire private life, must be symbolical and representative; a life which the great mass of his subjects can, through him, vicariously live with self-approval. His recreations, his family relationships, whatever of his opinions and valuations are recognisably implicit in his activities, must build up an identity embodying, as it were, the national super-ego. It is just possible for an exceptionally devoted, well-balanced, self-disciplined and self-abrogating individual to live up to the super-ego's specifications without hypocritical concealment, provided that he himself accepts them. But the acceptance, as well as the devotion, must be genuine.

As Prince of Wales and as King, the Duke of Windsor neither wholly accepted these specifications nor felt it his duty to conform to them in his brief leisure hours. In particular, he was unwilling to substitute the public conscience for his own when deciding (as, at some stage, he must have decided, though the memoir is silent) to continue a friendship with a married woman for whom he was beginning to feel a dangerous attraction. From the moment when that attraction became a vital factor in his life everything, including all his own most creditable qualities, worked ineluctably towards crisis. The closing chapters of the book have an almost classical dramatic tension, inevitability unfolding from inevitability. Could there have been a different issue had the first lead to public opinion come from other men than Stanley Baldwin and Geoffrey Dawson? Hardly; though the world might have been spared a national display of self-righteous censoriousness as stomach-turning as any in British social history. The lead was given; the response followed; and no counter-stroke was in good conscience possible. "By making a stand for myself, I should have left the scars of a civil war . . . not less a war when it is fought in words and not in blood." The choice was narrowed: a surrender felt to be as ignoble as it was intolerable, or abdication; and for the sake of the Crown as much as for his own, the King renounced his heritage and accepted exile.

The story is told with restraint and with patent sincerity; there emerges from it a personality both sympathetic and dignified. The Baldwinian myth of the King's irresponsibility and selfishness, accepted so readily by the very public which had sentimentalised over Prince Charming, should by this book be demolished once for all.

Whose Plan?

Principles of Private and Public Planning. By Wilhelm Keilhau.

Allen and Unwin. 272 pages. 16s.

In this most stimulating, closely-reasoned but possibly over-ambitious book, Dr Keilhau sets out to rescue the concept of economic planning from the exclusive possession of the state planners and to re-establish it in its proper and universal application to economic activity in general. Orthodox economic theory, concerning itself above all with the establishment of static compatibilities, has depicted to the lay eye a process of automatic, impersonally determined mutual adjustment between economic qualities—supply, demand, price—to which the processes of human decision are merely subordinate and secondary.

Dr Keilhau's correction of this picture, while involving some fairly minute and illuminating dissection of the processes by which economic adjustments develop from the first sense of an unfilled want to the final action directed to filling it, is essentially of an almost comic simplicity. "Geography is about maps, biography is about chaps"—and the core of Dr Keilhau's argument is that economics is also "about chaps"—and not about abstract quantities or statistics or impersonal pressures, which merely register the results of the way chaps behave. Whoever takes an economic decision makes a more or less long-term, more or less rationally-motivated plan to benefit somebody. The somebody may be himself, or the shareholders of the firm which he directs, or the members of the non-commercial group (club, church, mutual benefit society) whose affairs he is conducting, or the inhabitants of the area, whether parish or sovereign state, to which his decision refers. Planning is universal and everywhere involves essentially the same elements; the question to be answered is not "Plan or no plan?" but "Whose plan?"

The answer, in each case, must derive partly from a consideration of these necessary elements of the planning process; the recognition, personal or vicarious, of a want and its occurrence in time, the further recognition of the goods and services by which to fill it, of the methods by which they may be secured, the weighing of the sacrifices involved in securing them against the urgency of the want, the decision to act (or not to act), and the drawing up of the necessary schedule of practical activities—the plan proper. Evidently that answer will vary according to the nature of the want and the state of technique to be applied to its satisfaction. But it will also vary with political ideology.

The liberal ideology to which Dr Keilhau adheres must be justified on ethical grounds; and he accordingly devotes four vigorous though sketchy chapters to establishing the view that the supreme function of the state is to enlarge the "spheres of freedom" in which individuals exercise their specifically human right of choice. The implications of that view in relation to the planning process ramify out through considerations of the division of authority, the role of public enterprise, the importance of monetary stability, the concept of welfare, the significance of national budgets, and many more. They are far from indicating a *laisser-faire*, "night-watchman" state as ideal; they are equally far from indicating a totally centralised plan.

The frontier dividing the publicly planned from the privately planned field can be as rationally drawn—and revised—by liberals bent on maximising freedom as by authoritarians concerned only with technical and administrative efficiency. Dr Keilhau is confident that one day it will be so drawn. His book is a notable addition to the armoury of modern liberal thought.

A Political Process

Manstein: His Campaigns and His Trial. By R. T. Paget, KC, MP. With a Foreword by Lord Hankey. *Collins.* 239 pages. 15s.

This book is an account of the trial for war crimes of Field-Marshal Manstein, and the author is Mr Reginald Paget, KC, who acted as counsel for his defence. Mr Paget declares that in his opinion an advocate, having made his case in court, "has no business to criticise the judgment" in a proper judicial process, and if he had regarded the trial of Manstein as a "judicial" one, he would not have written about it; but as he considers it to have been "a political as opposed to a judicial process," he has put on record his criticism both of the constitution and the findings of the court.

> The trial, he claims,
>
> involved the application of a law which did not exist to facts which were not and could not be proved in accordance with any system of evidence by a court with no jurisdiction save physical power.

He is concerned with the particular case of Manstein, for whom he clearly conceived a strong personal attachment while conducting the case, but his legal argument strikes at the basis of the procedure used for all trials for war crimes under the Royal Warrant of June, 1945. He was the first and only counsel for the defence to challenge the legality of the Royal Warrant, which German lawyers in other cases had not dared to attack, and the speeches on both sides on this all-important question are given in full in an appendix to the book. The court, as might have been expected, found in favour of its own legality, but it is difficult to see how anyone with no vested interest in the Royal Warrant, and what has been done under it, can deny Mr Paget's contention that it contravened several articles of the Geneva Convention on the rights of prisoners of war, so that international law was violated by the very instrument which was supposed to affirm and enforce it.

The Allies in 1945—and in particular Britain, with the special responsibility for upholding the tradition of British justice—had in effect the choice between two alternatives: to deal with the Nazi chiefs and certain categories, such as the *Einsatz* units and SS concentration camp guards, by a simple decree of outlawry, or to proceed to the trial of individual war criminals by a strictly correct legal procedure. Unfortunately, the decision was to adopt neither of these courses, but to act by a legal procedure which was full of illegality. This made it possible to spread the net more widely than could have been done with a proper judicial process, but the moral and political result has been, and will be, disastrous. For the discredit which has come to be attached to the system in such borderline cases as that of Manstein (rendered the more conspicuous both by his outstanding military record and by the late date of the trial) has served to call in question the condemnation of others about the enormity of whose offences there can be, historically speaking, no doubt.

Empire with a Difference

The New Soviet Empire. By David J. Dallin. *Hollis and Carter.* 218 pages. 18s.

One hundred and fifty years ago the Napoleonic Empire was the chief problem of European politics. Today Stalin's "empire" equally dominates the international stage. One is almost tempted to say that it is the fate of revolutions to be tamed inside their own borders and then to be carried abroad, in some bastard form. Before the war Stalin was the apostle of "socialism in one country"; then the Red Army carried his brand of socialism up to the Elbe. The successful Chinese revolution still further extended Stalin's sphere of influence, so that now he finds himself at the head of a gigantic bloc with a population of some 800 million.

Mr Dallin's latest book is devoted to this new empire. He sees in Soviet Russia the only remaining "imperialist" power in the sense used by Lenin or Hobson. This paradox is more attractive than accurate, for Mr Dallin would certainly not pretend that Russia is seeking outlets for its surplus capital and goods. The Soviet Union exploits countries within its orbit by means of Soviet-dominated mixed companies and trade agreements, in which prices have nothing in common with the prevailing terms of trade. Internally, the old equalitarian ideal has long since been forsaken. A new privileged class, the Communist bureaucracy, has come to the fore and if it does not accumulate capital, it accumulates "joys" and lives in greater luxury than did the ruling class in Tsarist days. The only relatively good feature of the regime is its treatment of minorities, which are all equal before the prevailing lawlessness.

Mr Dallin uses in this book many reports by Soviet refugees. He knows Russia intimately and one has come to expect substantial fare from him. Yet, this time, it turns out to be a rather meatless Russian salad. In scarcely more than 200 pages he deals with subjects as diverse as the Jewish question, Russia's expansion, Soviet medicine, and trends within the Politbureau. Many topics are only glossed over. Thus, Mr Dallin dismisses in a few pages the major issue of the attitudes of the new Soviet generation grown up since the revolution. To Mao's China, which has opened new vistas and pitfalls to the Russian Government, he devotes even less space, though he includes China in the new empire. One feels as if the author had given the manuscript to his publishers before it was completed. The same feeling is created by a certain lack of balance. Mr Dallin draws comparisons with Tsarist Russia and Nazi Germany, yet the real analogy is with Napoleon's France. Napoleon and Stalin controlled empires, but empires with a difference, and what must be explained is not only their hideousness—this is done often enough—but also their attraction and driving force. To paint only the seamy side is neither good history nor good social analysis.

The New Marshall

Economics: An Introductory Analysis. By Paul A. Samuelson. Second Edition. *McGraw-Hill.* 762 pages. 36s.

Professor Samuelson's textbook requires no more introduction to English than to American teachers of economics. In three years it has deservedly gained a unique position in its field. Indeed, there would be little exaggeration in saying that it is becoming as dominant an influence on a generation of students as Marshall's "Principles" once was.

This second edition, the product of extensive revision, does more than consolidate the achievement. The main aim has been clarification; Mr Samuelson has succeeded in making the argument flow as smoothly at what were some sticky points as it always did at most points. But he has also put in some useful new material, of which the most notable is a discussion of wages and of the distribution of income in general. This is the fourth of the five main parts into which the new edition is divided. The book now achieves a high degree of success in linking the modern, "national income" approach to economic aggregates with the more familiar discussion of the components of the economy. The first part sets out basic concepts and the institutional framework. The second covers national income, employment and monetary theory. The third embraces what used to be called the theories of value and costs. The fifth—and to the British student the least satisfactory—examines international economics; it is perhaps significant of the American origin of the book that this occupies less than a tenth of it.

In general, however, the width and balance of Mr Samuelson's book is remarkable. Even so, the greatest of all its virtues is the energy and enthusiasm with which it is written and which can hardly fail to penetrate to the student. The trouble taken by the author is exemplified by the fact that most of the illustrative tables are brought up to 1950. Most impressive of all is the way in which the emphasis of interest has in this edition been shifted from the trade cycle to the problems of inflation. If Mr Samuelson maintains anything near this flexibility, he will continue to provide many economics students with their basic textbook for many years.

Figuring in French

Quelques Aspects Fondamentaux de L'Economie Mondiale. Institut National de la Statistique et des Etudes Economiques. *Presses Universitaires de France.* 340 pages. 1,000 francs.

L'Espace Economique Français. Institut National de la Statistique et des Etudes Economiques. *Presses Universitaires de France.* 144 pages. 1,000 francs.

The first of these two official studies from France sets out and discusses, in a world setting, facts about population, standards of living, food and raw materials, capital investment and international trade. Drawing on an immense amount of information from various sources, it traces general developments over past years and leads up to a series of present-day balance sheets (generally based on 1949 figures) between geographical regions. One of these, for instance, shows the ageing population in central and north-west Europe set against the much younger population of eastern countries, another the density of population related to agricultural area, a third the concentration of two-thirds of the world's energy in Western Europe and North America. After an analysis of the food situation, the not too gloomy conclusion is reached that the earth can supply a higher population, provided attention is focused on immediate and simple aids to food-growing in the highly populated countries of the Far East and Latin America.

Attempts to compare the standards of living in different countries seem surrounded with difficulties, especially when considered in terms of social security measures. It is impossible also not to feel somewhat dubious about international comparisons of capital investment. This is a particularly precarious piece of national accounting and a deeper probing into original sources would be necessary before any confident application of the figures could be made. But, throughout this book, there are many illuminating charts and interesting methods of presenting statistics; and all sources of the original data are given. It is a pity, however, that there are a number of discrepancies—usually small ones—between the figures in the text and those in the tables and some instances of hastiness in compilation or proof-reading.

The second of these publications shows how population, employment, production, taxes and various social factors in France are distributed between its 90 departments. This is done in some 300 maps of France in which each department is shaded according to the strength of the phenomenon concerned, seven gradations being allowed for each map. A few of the main statistics are included with the text which comments on the maps, most of which refer to one of the years 1946, 1947 or 1948. This study is said to be only a first attempt with many gaps yet to be filled, but it will be welcomed by all interested in the economic geography of France.

A KING'S STORY

The Memoirs of H.R.H. THE DUKE OF WINDSOR

K.G.

Born 1894 in the reign of Queen Victoria
Created Prince of Wales 1910
Proclaimed King of England January 20, 1936
Abdicated December 11, 1936

H.R.H. The Duke of Windsor tells the story of his private life from his birth in the last years of the reign of his great-grandmother Queen Victoria—living his childhood under the benign influence of his grandfather King Edward VII, learning the art of kingship from his father King George V, touring the British Empire as Prince of Wales, becoming King of England in the midst of political strife and economic depression and finally abdicating to avoid national dissension.

448 pp. Sh. Demy 8vo, 24 pp. of illustrations, 25/- net

CASSELL

newly trained workers into the armed services. But the complaints are a diminishing chorus. Most producers are tackling the problems which they alone are competent to deal with.

Foremost among these is the shortage of skilled manpower. Tool-makers, die-makers and machine tool operators, trained during the last war, moved into other fields during the postwar slump in the industry. In replacing them the crucial factor is time. Several years are required to train a machine tool worker, and all industries today are competing for a limited supply of trainable manpower. The labour turnover is also abnormally high because so many learners must be hired and because the patriotic incentive of a great war is lacking. Big defence plants are accused of "stockpiling labour." While hiring in advance of need is inevitable in a time of rapid and nation-wide plant expansion, the machine tool makers hope that Mr Wilson will issue a directive against the "pirating" of their workers.

Cincinnati has become a kind of exchange centre for ideas on how to break the manpower bottleneck. That solid, slow-growing city has always been an excellent source of skilled labour. Recent years have seen comparatively few strikes in its machine tool plants. In a precision industry, calling for a high degree of individual skill, there is more occupational pride than in mass-production fields. Most machine tool plants are small, and their labour-management relations are based upon mutual respect. Moreover, the industry has, even in normal times, an unusual *esprit de corps*. Problems of personnel training are being constantly explored by a national association, to which all the big companies subscribe. Helpful hints are exchanged over the telephone or at the luncheon table, for the normal spirit of competition weakens when every company has more orders on hand that it can fill, with backlogs ranging from six months to two years. Plant training programmes, for women as well as men, have been resumed on patterns created during World War II.

The industry has been through all this before, and not many years ago. Indeed, there is a growing disposition to resent the familiar reference to machine tools as the great defence bottleneck, to point out other obstacles—the critical copper shortage, for example—or to assert (what is true) that many domestic and foreign customers could not immediately use the tools on order even if they were delivered. There are still plenty of worries, the worst being the shortage of structural steel for plant expansion. Both in Washington and throughout the country, the supreme incentive of wartime need is lacking. Yet leading executives, with experience of making tools for two world wars, are confident that, given time—and there is no getting away from the fact that it takes time to produce machine tools—the industry will provide the tools that are needed, as it always has in the past.

American Notes

All-out on the Atom?

At his first press conference this week Mr Lovett, the new Secretary of Defence, brought firmly down to earth premature hopes of impregnable security at bargain prices inspired by Senator McMahon's speech on mass production of atomic weapons. The outlook for new and revolutionary developments is promising, he said, but for the present the United States must rely on proved and available models. Senator McMahon himself had made no promises of an immediate revolution in weapons which would make present defence spending unnecessary. What he argued was that an all-out effort, increasing the money spent on atomic development from just over $1 billion a year to $6 billion, would produce, by 1955 or 1956, an almost limitless flow of atomic weapons which would provide much greater deterrents to aggression at far less cost than conventional arms. He put the savings at $30-$40 billion a year out of future defence budgets of $60-$80 billion. This way it would be possible to escape the choice between financial bankruptcy and military disaster which Senator McMahon and many other Congressmen believe stares the United States in the face.

Much more Congressional enthusiasm greeted this argument than the other which accompanied it; that a new effort should be made to reach an enforceable international agreement to disarm. No Senator voted against the recent $59 billion appropriation for the services, but Senator Douglas's anguished whoop of frustration at the sanctity of military demands expressed an uneasiness shared silently by many. Senator McMahon, as chairman of the Joint Committee on Atomic Energy, speaks with an authority which few are qualified to challenge, thanks to the secrecy which surrounds atomic developments. His statement capped a fortnight in which the President and others, less well informed, had made broad references to fantastic new weapons and the Air Force, beating the other services to the draw, had unveiled its B-61 Matador, a pilotless bomber, and announced the formation of the first pilotless bomber squadron. It is small wonder that the Defence Department, which has nearly completed work on the military appropriations for the year beginning next July, is concerned lest the public should assume that a cheap and easy short-cut to security has been found.

Mr Lovett conceded, however, that there were grounds for optimism about new weapons. Among those revealed to the public is the President's request for another $484 million for the hydrogen bomb plant being built on the Savannah River in South Carolina; this is taken to mean that the Eniwetok tests showed conclusively that the super-bomb can be constructed. The second is the announcement that the use of atomic weapons against troop concentrations will soon be tested at Frenchman's Flat, in Nevada. The tests, it is said, will be of new light atomic bombs, not, as yet, of atomic artillery. One bomb, at least, will be exploded over troop positions to measure its effectiveness and determine how much time can elapse before troops can enter the area. If the tests are successful, production of a whole family of atomic bombs, designed for different purposes, will be put in hand. But cautious observers point out that the tactical atomic bomb is still in its infancy and doubt whether in the near future it will make conventional arms obsolete or, by itself, prove conclusive against an aggressor.

Farmers' Privilege

It is the farmers' privilege, particularly in an election year, to have the best of both worlds. Cotton farmers, who last spring were threatening to send the Price Administrator back to Toledo for daring to put a 46 cent ceiling on raw cotton, are being given every encouragement, now that the price has fallen to 35 cents a pound, to hold their crop off the market to force a price rise. Congressmen from cotton-growing states have issued a proclamation urging every grower to apply for a government loan on half his crop, and Mr Brannan, the Secretary of Agriculture, has been quietly seconding their efforts. If inflation is a bad thing, deflation, or disinflation, it appears, is even worse.

The present loan rate is 32 cents a pound, so that growers can hold out for a better price at little risk. If the price rises, they redeem their cotton; if it falls they keep the cash and let the cotton go—to the government. The Secretary of Agriculture has also succeeded in persuading the Export-Import Bank to enter into negotiations for dollar loans to foreign countries for cotton purchases. Since the Munitions Board indignantly turned down demands that cotton be stockpiled (pointing out that the stockpile is meant to include only critical materials not available inside the country in time of war), there has been Congressional agitation that a "military reserve" of cotton be accumulated.

If Mr Brannan's problem is to keep cotton off the market, the Price Administrator's is to find some means of bringing beef to the table at prices people can pay. Livestock prices, which are not controlled, have moved steadily up, and although the number of cattle is 4,000,000 greater than it was last year, slaughtering is down from 10 to 20 per cent. Even the Army has had to go away empty-handed, and look abroad for 10 million pounds of beef; packers, squeezed between rising livestock prices and the fixed prices they may charge, contend they cannot afford to bid when they are losing $20 a head. Some packers are closing down and protests from unemployed meat workers are beginning to be heard.

A very little relief was granted when the controllers allowed an additional penny a pound to the packers to make up for what they lost when the prices of hides, tallow, and other by-products fell. But this was swallowed up at once in the cattle markets, where firms not above falsifying their accounts offer more than they are permitted to, and thus deprive law-abiding packers of their supplies. The hurried enforcement drive now going on can hardly take the place of the slaughter quotas, which were designed to control this situation, but which Congress lifted in July. Their reimposition is not given a very good chance, despite the present chaos. Mr DiSalle has never lacked courage, but his hopes of a quieter life in Ohio politics, either as Senator or Governor, are not hard to understand.

* * *

Wild About Harry

Whether or not the eighteen plainclothes policemen, indicted in Brooklyn for conspiring to receive $1,000,000 a year in graft, are guilty is now unlikely ever to be known for certain. For the case against them depended on Mr Harry Gross, the bookmaker who had confessed to paying this sum in "ice" for the protection that made it possible for him to earn $100,000 a year by his illegal activities. And the case therefore collapsed completely when Mr Gross finally refused to repeat his evidence on the witness stand, in spite of two days of most unjudicial browbeating from a judge who threatened to let him rot in jail for a thousand years if he persisted in his silence. It may be that Mr Gross was inspired with gratitude to the men who are said to have found, when he went broke two years ago, that they could not live without his bribes and arranged for him to be set up in business again. It seems more likely, however, that when he eluded his guards, ostensibly to enjoy a day at the races shortly before the trial opened, his lips were sealed with hard cash; $75,000 has been mentioned. He himself maintained that the lives of his wife and children would have been endangered had he spoken.

Mr Gross has already been condemned to 1,800 days and $15,000 in fines on the sixty convictions for contempt of court which his silence brought upon him; his sentences on the gambling charges to which he has pleaded guilty could run to as much as 68 years in jail and fines of $40,000. But unless new and quite separate indictments can be obtained against them, the eighteen policemen will go free. By waiting until the trial had begun before he refused to testify, Mr Gross forced the dismissal of the case against them and the law of double jeopardy prevents a new trial on the same charges. Since they have not been found guilty, the Police Department might even be required to reinstate them. New York's cops are reported to be humming "I'm just wild about Harry" as they go their rounds.

The Brooklyn District Attorney was certainly not to blame for the failure to secure convictions in this case, but across the harbour in Staten Island another District Attorney, Mr Methfessel, is in trouble for his failure to prosecute another group of gamblers, the three Dalessio brothers. He excused himself to the State Crime Commission on the grounds of lack of evidence, but another witness testified that she had seen him playing roulette with the Dalessios. Mr Methfessel promptly had her arrested for perjury and Governor Dewey equally promptly had him suspended from duty for "gross abuse of power" for "personal or political purposes."

However, it is not the Republican Mr Dewey who will be the immediate beneficiary of these sordid demonstrations of how justice has been frustrated in Democratic New York City by the alliance between organised crime and public officials. It is Mr Rudolph Halley who, as counsel to the Senate Investigating Committee, first brought this alliance to the notice of the public and who is now running as an independent candidate for the Presidency of the City Council. His aim, like that of so many before him, is to beat Tammany, the Democratic organisation in the city, and to "kick the underworld out of politics." New Yorkers might be well advised to put the ball at his feet next November.

Power for Aluminium

Last weekend Mr Charles Wilson, the defence mobiliser, dramatically asked aluminium producers in the Pacific north-west to let him know within forty-eight hours how much time and money it would take to move their plants to other districts where more electricity was available. Mr Wilson seems to have taken fright at the news that drought had forced the huge hydro-electric installations on the Columbia

THE HANOVER BANK

River to reduce supplies of power to the plants that provide half the country's aluminium. Already three "potlines" have been closed down and, if it does not rain soon, not even a "brown-out" on the Pacific coast can save output of aluminium in the area from a severe reduction, perhaps of as much as 30 per cent. Both aluminium producers and local officials assert that Mr Wilson is exaggerating the danger and that in any case the right solution (as well as the one most advantageous to themselves) is to bring more electricity to the district by speeding the construction of additional dams.

Mr Wilson will probably have to accept this view, for it is difficult to see where the aluminium producers could now find electricity available in the quantities and at the low

PROPOSED EXPANSIONS IN CAPACITY

Source: Office of Defence Mobilisation.

prices they need. The Tennessee Valley Authority is already discouraging additions to aluminium facilities in its area. It is planning to double its power capacity—to 6,000,000 kilowatts—but by means of steam, not hydro-electric, generators, which will mean an increase in its charges. This is the largest individual project in plans that call for a rise of nearly 40 per cent in the country's electric capacity by 1953. Whether this will be achieved is another matter, for at present the programme is running behind schedule, because of shortages of materials both for building and equipping the new plants.

Over 1,500,000 kilowatts of this supply of power were intended for the use of new aluminium facilities. In July plans called for doubling aluminium capacity by the end of 1953 and now that the Air Force is thinking in terms of 125 groups instead of 95, it is expected that the aluminium industry will also be asked to raise its sights. It is already in the privileged position of being the one civilian industry that is able to obtain as much structural steel as it wants and the scarcity of power seems to be its only technical problem. The aluminium programme has been held up by a political problem as well; in the last war government financial assistance for expansion was used to break the Aluminium Company of America's monopoly of the industry and this time it was hoped to bring about a further proliferation by the same means. But the only small firm that has so far been both willing to go into aluminium production and acceptable to the mobilisation authorities was proposing to establish itself in the north-west; the shortage of power there has now led the government to reconsider this project. It seems that, if the services are not to go short of aircraft, the giants of the aluminium industry will have to be allowed to grow still bigger.

Senator Douglas Upheld

Thanks to the tradition of senatorial courtesy, which permits a Senator to block federal appointments in his State by declaring them to be "personally obnoxious," Senator Douglas has been upheld in his struggle with the President over the men to fill two vacancies on the bench in Illinois. The Senate Judiciary Committee has refused to report out favourably the President's two disputed choices. These two judgeships, which it is urgent should be filled, may go begging for some time; Mr Truman has declared that he is satisfied with his nominations and that the responsibility for the vacancies must rest on the Senate.

When the President refused to accept Senator Douglas's recommendations, polls were taken of the Chicago and Illinois Bar Associations and the President's candidates ran far behind those chosen by Senator Douglas. This may not necessarily have been what decided the Judiciary Committee, but it is the third time in a year that disapproval by the bar has preceded disapproval in the Senate. It will encourage the American Bar Association, which has recently adopted a resolution asking both parties to pledge their presidential and senatorial candidates, to consult the Association before appointing judges.

The present case offers a good example of the defects in the present method of filling judicial vacancies. The overriding of Senator Douglas was, in part, a result of the President's coolness toward a fellow Democrat, and a Fair Dealer, who not only favours General Eisenhower for the presidency, but is alleged to have political ambitions himself, if only for the vice-presidency. The ability to name judges is a matter of political prestige, and the Democratic organisation in Illinois is powerful. Mr Truman's choices have the enthusiastic support of the local politicians, while those of the Senator, however great their merit, were alleged to be "politically inactive." Moreover, it is said that Mr Truman had already promised one of the judgeships to Representative Sabath, of Illinois, whose nephew, in fact, was one of the two men selected by the President and pigeon-holed by the Senate. It is an interesting footnote that both Mr Truman and Senator Douglas agreed that all three great religions were entitled to be represented on the bench. By agreement, a Protestant has secured one place, and a Roman Catholic and a Jew were, in both cases, recommended for the others.

Shorter Notes

The Government has ordered the retrial of Mr William Remington, the former civil servant whose conviction for perjuring himself, by denying that he had been a Communist, was reversed by the Court of Appeals last month. The reversal was based on irregularities in the trial; the chief of these were that no exact definition of what constitutes membership in the Communist party was given and that the judge's charge to the jury had been inadequate.

*

The Congressional correspondents' committee has rejected the demand of the American Society of Newspaper Editors that representatives of the Soviet news agency be expelled from the press galleries in retaliation for the imprisonment of Mr William Oatis, the Associated Press correspondent in Prague. The committee "believes that the principle of a free press cannot be upheld by abridging it" and that it is not its function to enter the field of international diplomacy.

*

Both the American Constitution and the Declaration of Independence are now safe for ever from the gnawing tooth of time—and from the caterpillar that managed to break into the glass case earlier this year under the eyes of the librarians of Congress. Each sheet now rests between glass plates, filled with helium gas and permanently sealed with a new alloy; a special system of lighting has been devised, which will not fade parchment or ink.

THE WORLD OVERSEAS

Korea's Hundred Days of Hope

IT is now fourteen weeks since Mr Malik, the Soviet delegate at United Nations headquarters, proposed that the belligerents in Korea should start discussions for an armistice. It was noted at the time that his proposal was tacked on to the end of a speech that was devoted almost entirely to a vicious attack on the western democracies. But Mr Malik had at least broken the icy silence with which all United Nations efforts to get Communist leaders to discuss a ceasefire in Korea had so long been greeted.

On June 25th, two day after Mr Malik's statement, the Chinese Communists' official newspaper declared that "the Chinese people fully endorse his proposal"; but this endorsement, like the proposal itself, was embedded in a mass of anti-American vituperation, including claims that the allied forces in Korea had been decisively defeated. Undeterred by the unpromising tone of both the Soviet and the Chinese statements, the Governments of those members of the United Nations which had sent forces to South Korea's aid held immediate consultations on the situation, and agreed to make a new cease-fire offer. On June 29th General Ridgway, the UN Commander-in-Chief in Korea, broadcast to the Communist commanders a message beginning "I am informed that you may wish a meeting to discuss an armistice" and suggesting a meeting on a hospital ship.

Generals Peng and Kim Il Sung, the Chinese and North Korean commanders, replied on July 1st, agreeing to "talks concerning cessation of fighting and establishment of peace," but proposing that they should be held at Kaesong on or after July 10th, the delay was explained as due to transport difficulties. To this General Ridgway agreed, although he also offered to begin the talks earlier and thereby to avoid unnecessary losses. This offer was not accepted, and the negotiators did not in fact meet at Kaesong until July 10th.

Communist Demands

At the first meeting General Nam Il, the North Korean representative, immediately tabled proposals for the withdrawal of both armies to the 38th parallel and the subsequent withdrawal of all foreign forces from Korea in advance of a political settlement. The United Nations representatives made it clear during the next few days that neither of these conditions was acceptable. The first would in practice have meant the withdrawal of the UN forces from an area of 2,000 square miles and their relinquishment of a relatively strong position in exchange for a longer and almost indefensible line; the second would have meant the complete abandonment of South Korea to the pressure tactics of its Communist neighbours. At first the Communists insisted that there could be no cease-fire unless these terms were accepted. But on July 21st they obtained a four-day recess in order to study the rival proposals, and then agreed to defer the question of the complete withdrawal of troops to a later date.

This made it possible to begin discussions on the fixing of a demarcation line. But it brought no further progress, for the Communists still flatly refused to discuss any line other than the parallel. Fifteen meetings were devoted to this question, including the celebrated occasion when General Nam sat in complete silence for over two hours. Statements from the UN side that it was not thought essential to draw the line exactly along the existing battlefront, and that reasonable adjustments would be willingly considered, brought no corresponding softening of the Communist attitude. Eventually Admiral Joy proposed for the United Nations that each side should appoint a single delegate to meet privately and explore the situation, and the Communists agreed to this, although they found it necessary to appoint two delegates, one North Korean and one Chinese. These small closed meetings began on August 17th, but it is impossible to judge whether they might have produced any results, for six days later the Communists abruptly broke off all negotiations for an indefinite period.

The Neutral Zone

The reason given for this rupture was an alleged violation of the Kaesong neutral zone by UN aircraft. To bring this incident into perspective the whole history of the neutral zone must be reviewed. Kaesong lies near the west coast of Korea, in the only area south of the parallel still held by the Communists. When it was first proposed as a site for armistice talks the United Nations suggested that a neutral zone should be drawn round it, but the Communists rejected this proposal, and used their control of the area as a background for propaganda giving the impression that the UN delegates, entering Kaesong under white flags and guarded by Communist soldiers, were virtually suing for peace in the traditional manner of the defeated. General Ridgway accepted these humiliating conditions in order to get the talks started, but dug in his heels when on the second day of the meetings UN press correspondents bound for Kaesong were turned back by armed Communist soldiers. The talks were suspended for three days, and resumed after the Communists had accepted the idea of a neutral zone and promised to withdraw all troops except a few policing patrols to at least five miles from Kaesong. This promise was broken on August 4th, when a company of armed Chinese was marched past the conference building. General Ridgway again suspended the talks until adequate guarantees against further incidents were provided by the Communist commanders; and in giving these guarantees on August 10th, Generals Peng and Kim promised that, if there was any similar violation of the zone by UN forces, they would not "terminate the negotiations rashly and irresponsibly without going through the procedural steps of protest, investigation, consultation and settlement."

Twelve days later these promises had apparently been forgotten. On the night of August 22nd, UN liaison officers were abruptly summoned to Kaesong and informed that all meetings were henceforth suspended. They were told that three hours earlier a UN aircraft had dropped three bombs in the conference area; but the only sign of damage was a hole in the ground six inches deep and two feet across, and the officers' request to be allowed to return in daylight for a further inspection was refused. During the next few days the Communist commanders not only accused the UN forces of having tried to murder their delegates, but produced a new crop of alleged violations of the Kaesong zone, some of which, they said, had occurred much earlier but had not been reported owing to their desire not to interrupt the talks. The UN Command denied that any of its aircraft had been over Kaesong at the time of the alleged bombing, or that they had, as the Communists claimed, attacked vehicles in which Communist delegates were travelling to Kaesong; it had already denied a charge of responsibility for the death

of a Chinese platoon commander in the neutral zone on August 19th, but the denial did not prevent this officer being given a lavish funeral at which lurid accusations were made against the UN Command. The only charge which the UN admitted to be true was one of firing on a point in the neutral zone by an aircraft on September 10th.

The record of the hundred days since Mr Malik made his statement is, in sum, scarcely consistent with the Communist thesis that the UN Command has blocked the achievement of a cease-fire. The UN Command issued the first invitation to the talks, and then yielded to the Communist preference for Kaesong. It accepted Communist control of the conference zone as long as it was exercised with restraint. It sought a simple cease-fire based on the existing front, but indicated that it would consider reasonable adjustments to that line. It introduced the idea of holding small informal meetings in hopes of breaking the deadlock, and there may be significance in the fact that these meetings were apparently proceeding smoothly when the Communists broke off negotiations. It is again on the initiative of the UN Command that fresh contacts have now been made between liaison officers on either side.

Atlantic Council in Session

[FROM OUR CANADIAN CORRESPONDENT]

AT Ottawa Nato found itself facing for the first time—though not without warning—the conflict between the militarily desirable and the economically and financially possible. Finance ministers and defence ministers sat with their foreign ministers for the first time; and perhaps the most eloquent expression of the issues before the Council was the sight, on several occasions, of the twelve finance ministers having more sympathy with each other than with their Cabinet colleagues. The doctrine of Cabinet responsibility was not entirely inviolate; but it was of great value that, for example, the finance ministers should hear directly from foreign and defence ministers, instead of hearing about foreign problems only from their own colleagues of foreign affairs.

The crucial problem before the Council was expounded at an early sitting when Mr Gaitskell replied, extemporaneously, to Mr Acheson's speech on the report of Nato's Financial and Economic Board. Mr Acheson stressed speed and production as Nato's main tasks. He used the simile of two fast cars racing along a straight road and said the only way the second car could pass the first was to put on a real burst of speed. He instanced the immense increases in American production, and then said: "It is not a choice between military production and civilian consumption. We must, and can, increase both." Mr Gaitskell's reply, warmly praised and bitterly criticized, was the key speech of the meeting. He wished he could agree with Mr Acheson, but he couldn't. It might be true that the United States could have both more guns and more butter. But the scale of its effort had already tended to make it more difficult for its allies to increase their production. For Britain and continental Europe it was a choice between defence and civilian living standards.

The Europeans agreed with this. The Canadians, on the whole, thought he was right. But nobody was convinced that Europe was doing all it could. The statistical exercise by the Financial and Economic Board had been intended as a preliminary basis for working out a more equitable sharing of the burden. But it clearly did not provide a solution to the conflict between defence needs and economic capabilities. Only political authority can assess possibilities which Governments deny to exist. Something more than expert studies was necessary; but something less than supernational decision. Hence there developed the idea of resorting to the authority of personal prestige and position. The original French request was for General Eisenhower alone to undertake the burden-sharing study. This was soon turned down, and extended to the idea of a three-man body. The Americans were said to be thinking of Mr Harriman as their man. Mr Gaitskell insisted on political status and was anxious to be the British representative himself. The French were believed to be thinking of Jean Monnet.

This was the background to the American, British and French proposal for a three-man committee—promptly saterised by Mr van Zeeland as the "Three Wise Men." But the Council was in no mood to delegate a vital responsibility of this sort to representatives of the Big Three. Already there were rumblings of discontent about the Standing Group on the military side. Neither the smaller European powers, nor yet Canada, would accept a body on which the views of the American, British and French Governments would have full expression, while the interests of the other nine powers might be judged *in absentia*.

The resort to personal prestige was therefore modified to the extent of appointing a 12-man committee, of which three Wise Men might do the real work, but which would ensure that the other nine governments had an adequate voice in any recommendations that might be made to or about them. How much prestige and authority remains is a question for demonstration.

The paradox of the whole Nato concept appeared vividly as the Atlantic Council tried to find a course between national sovereignty in the economic and financial sphere and joint international planning in the military sphere. It recognised, belatedly but unanimously, that the gap between military requirements and economic capacity demands international planning and decision. But eleven of the powers also showed quick sensitiveness about any dictation from the twelfth, or indeed about any abrogation of their sovereignty. Eleven of the twelve powers felt, and many of them voiced, concern at the way Washington had announced its decision about admitting Turkey without consulting them. The Standing Military Group came in for criticism on similar grounds. "The generals," it was said, "speak only to admirals, and the Standing Group speaks only to God."

The American delegation was clearly much aware of this feeling, and went out of its way to avoid the appearance of pressure. But it was a curious background for the resounding speeches about Atlantic Community which were such a feature of the public pronouncements of all the chief ministers. The effect of all the speeches about Article II and the long-range objectives of economic integration seemed to be to commit the principal powers in an unforeseeable future to a pooling of sovereignty which none of them showed the slightest intention of accepting in the foreseeable future.

Towards a Wage Settlement in France?

[FROM OUR PARIS CORRESPONDENT]

THIS summer the French trade unions have been demanding three main concessions from the government: a higher minimum wage, abolition of minimum wage differentials between regions, and a sliding wage-scale which moves whenever there is a rise of 5 per cent in the cost of living. The government retains, within the restored system of collective bargaining, the one *dirigiste* function of fixing the minimum wage. In principle the minimum is agreed by a mixed commission of all parties concerned. In practice the commission can never agree on the composition of the family budget representing the workers' real needs. So the govern-

NICKEL

NICKEL is sometimes found in meteorites, alloyed with iron, but in the earth's crust it does not occur in the metallic state. More than four-fifths of the world's supply of this valuable element is mined in the Sudbury district of Ontario from deposits of "pentlandite"—a mineral containing sulphides of iron and nickel. A corrosion-resistant silver-white metal, nickel is well known in the form of nickel-plating, but it is far more important as a constituent of alloys. It is used for example in stainless steels and to add strength and toughness to alloy steels for motor cars, aircraft, armaments and machine tools. It is alloyed with copper and other metals to make condenser tubes and coins. Together with zinc and copper it forms nickel silver, the basis of plated tableware, and with chromium it is used extensively in gas turbine engines and to make heating elements for electric fires. Nickel and its salts are also used in alkaline storage batteries and in the manufacture of enamels. Besides producing large quantities of wrought alloys containing nickel, such as nickel silvers and cupronickels, I.C.I. uses a nickel silver alloy to make 'Lightning' slide fasteners, and nickel catalysts in the manufacture of cyclohexane, one of the intermediates from which nylon is produced.

ment consults its own officials and the *Institut National de la Statistique*.

The lately decreed new minimum of 20,000 francs (in Paris), an advance of 15 per cent on the previous legal minimum, has disappointed all the unions whose claims averaged about 23,000 francs. On regional differentiation, justified originally by variations in the cost of living throughout the country, the government has reduced the maximum discrepancy from 13.5 to 10 per cent. MM. Pleven and René Mayer, determined, like all the government, not to allow any automatically sliding scale, were temporarily steam-rollered in the National Assembly last week when a Socialist Bill to establish just such a thing was voted at its first reading by 410 to 203 by an unholy alliance of Socialists, Communists, Gaullists and a few of the MRP. The horror of the Bill lies not only in the automatic slide but also in a provision admitting the revision of the family budget upon which the cost of living is based without reference to the government or parliament.

Clamour for a Sliding Scale

The minimum wage is calculated on a 45-hour week, the average working week in France today. (The "statutory week" is 40 hours, above which all work, while remaining perfectly legal, must be paid as overtime.) The minimum wage is reckoned, however, not strictly by the week or by the month, but by the hour, on the supposition that the workman is really working the 45-hour week. On that account the legal minimum takes no account of underemployment—a fact which has prompted the CGT to propose its own minimum (23,600 francs) on the 40-hour legal week. So it is certain that the present legal minimum protects insufficiently a number of workers in sweated private industries, especially in the country and in small towns. To this category of *économiquement faibles* belong also all those whose pensions are inadequate to withstand any inflation whatsoever. As always, single people are the main sufferers.

Apart from the problem of the underpaid, the minimum wage is important in its relationship to the whole wage-scale. In theory, changes in the legal minimum do not affect the "wage-fan." Practically, they nearly always do. After the new minimum was fixed this month, the employers' association (CNPF) with unaccustomed zeal hastened to invite the industrial federations to negotiate a wage-scale rising from a higher base than the legal minimum. In many industries —e.g., textile, building, motor—new contracts have since been signed giving throughout the whole scale as much as a 17 per cent increase on the previous level. (The increase of 15 per cent in the legal minimum itself is clearly a flea-bite to the larger industries.) In Renault's, for instance, not a single employee is earning as little as the legal minimum.

Thus, in spite of the government's refusal to meet the unions' claims, the edge has been taken off the early autumn discontent by the action of a big sector of industry. These wage-increases of 15 to 17 per cent come, however, after a rise in the cost of living which has already absorbed about 10 per cent of them. Bread and coal are already up and the price of electricity is to be raised in November. So there is little cause for elation. The politicians are well aware that the real test will come towards the end of October, when it will have become evident whether or not the government is capable of stemming the inflation. If it is not, there will be a real popular clamour for the sliding scale (assuming that it has not previously become law as a result of the present Socialist-Communist-Gaullist manœuvre). In that event the French economy will set out inevitably on the down road. There is, however, no reason to presume that inflation must continue. The *opération bifteck* (which is fighting against a distribution chain of eight or nine middlemen, several of them tightly "ringed") cannot yet be pronounced a failure. It is therefore possible that a number of limited successes (such as in another field are attending the anti-road-hog campaign) may tide economic life over the turn of the year. With next year's taxes in the offing a happy Christmas is absolutely indispensable.

The trade unions themselves remain as disunited as the political parties. In reply to exhortations by the CGT for unity of action in wage-claims, the Christian union (CFTC) has indeed replied with agreement to discuss a common programme. But *Force-Ouvrière*, which seceded from the CGT after the last war, has refused all negotiations with the Communist-led body. French labour is handicapped time and again by the unions' weakness in wage-bargaining just as it is frustrated in parliament by the doctrinal disunity of the Socialist Party and the MRP. But fresh sources of strength are not visible.

Has Russia All the Raw Materials?

A. N. NESMEYANOV, Chairman since last year of the Soviet Academy of Sciences, claimed a few days ago that thanks to the discoveries of its geologists the Soviet Union has now all the raw materials it requires and "need seek nothing outside its frontiers." If one were to judge only by the existence of deposits of potential sources, there is much justification for such a claim. The Soviet Union, not unlike the United States in this respect, has within its vast territory almost all the principal raw materials necessary for economic self-sufficiency. Yet the problem which has always faced the Soviet leaders has been not so much the scarcity of materials as the shortage of machinery and qualified labour necessary for their exploitation.

It is true that during the three decades of the Soviet regime it has been proved that Russia possesses much richer natural resources than had ever been expected. Before the Revolution only one-tenth of the territory had been explored. By 1945 nearly three-quarters had been submitted to detailed geological surveys and the results were very satisfactory. According to Soviet data, published in the late 30s, the USSR with 1,654 billion tons of coal less than 2,000 yards below the surface has the richest coal deposits in Europe and the second richest in the world. The iron ore deposits, put at nearly 11 billion tons, of which 4.5 billion are suitable for exploitation in the near future, would account for roughly half of the world's reserves (both coal and iron figures include deposits of low quality). Oil reserves were put by various estimates at 3.5 to 5 billion tons. The USSR is one of the major producers of manganese, chromium, gold and asbestos and has vast deposits of many other minerals.

Yet, with all these resources, the Soviet Union in 1950 produced only 260 million tons of coal, 27 million tons of crude steel and 37 million tons of oil. These are very large quantities compared with 1913 or even the late 20s, but they are still far behind the American output and much below the ambitious projects of the Soviet planners. This discrepancy between resources and production confirms the thesis that the main Soviet worry is not the natural resources but the other factors of production.

There are, however, certain raw materials which must be scarce in the Soviet Union, since it has been trying to import them till quite recently. The most important are rubber, cotton and wool, tin, tungsten and molybdenum. In their attempts at reaching self-sufficiency Soviet leaders proceeded rapidly with the extension of cotton production in Uzbekistan, Tadjikistan and the Caucasus and efforts are being made to improve the production of artificial fibres. The production of synthetic rubber and the cultivation of rubber-bearing plants (*kok-sagyz*) are also strongly encouraged, though no data is available on the progress achieved in this sphere. Judging by the efforts made to speed up the output of uranium in Saxony and Czechoslovakia, uranium may also be scarce in the Soviet Union, though there are apparently many deposits, particularly in the Fergana Valley in Central Asia.

The Soviet policy of self-sufficiency was certainly prompted by the fear of encirclement and war. Like all such efforts at major national economic expansion the cost had to be borne by the home consumer. The achievements were tremendous and so were the costs. Then, after the last war, Stalin, the advocate of socialism in one country, in one closed Soviet economy, found himself at the head of a tremendous economic bloc extending from Shanghai to Berlin. Yet the Soviet psychosis of economic self-sufficiency seems to have persisted. The pride taken by M. Nesmeyanov in the availability of all raw materials "within the Soviet borders" seems to indicate that, even in the changed circumstance, the Soviet leaders continue to make a virtue of what was probably once a necessary vice.

Politics of Afrikanerdom

[FROM A CORRESPONDENT IN JOHANNESBURG]

THE regained unity of Afrikanerdom is to bear the neat hallmark, "the National Party." The title is a misnomer. Despite formal promises of equality to the English, Dr Malan's party is more than ever before the party of the Afrikaner *volk*. The English section of the white population find no spiritual home in it. That is why they are flocking to join the torch commando, whose real significance is that it represents the re-entry of the South African English into active, angry, if sometimes muddle-headed, politics. The United Party failed, after all, to unite, and so long as the present polarisation persists, the United Party is unlikely to stage a comeback. But national unity is not within Dr Malan's grasp either: only Afrikaner unity, which is quite a different thing. White South Africa is a house divided.

Both General Smuts and General Hertzog were great South Africans as well as great Afrikaners. Of the two, General Hertzog was more the Afrikaner, but even he had no time for the *Broederbond* with its creed of Afrikaners as top-dogs, while on the non-European front he was careful to extend the hand of friendship to the Cape Coloured people. The "National Party" has tossed these Hertzog principles overboard. The English are estranged: the non-Europeans, including the Cape Coloureds, are estranged. It seems a high price to pay for Afrikaner unity.

Dr Malan however does not think it too high, and neither apparently does Mr Havenga, whose compliance was certainly the most important factor in achieving this Afrikaner unity. Earlier hopes that Mr Havenga was entering the camp of the victors only in order to re-introduce Hertzog principles have faded. He accepts the virtual disfranchisement of the Cape Coloureds. Nobody now therefore believes that the protests he is pledged to make when the government in due course discards the Hertzog-Smuts formula of representation of Natives in the House of Assembly will have much effect. If the Nationalist upperhand represents a real political revolution, then Mr Havenga, one of the last of the Boer War heroes, is its tragic von Papen.

There is nothing outwardly tragic about Dr Malan. He has sacrificed no principles he once held. At 77 he retains great mental if not physical vigour. He has always believed in Afrikaner unity first and foremost. Bearing no ill-will against Englishmen, he simply thinks that in South Africa the Afrikaner is right and it is for the English to acknowledge this. If Englishmen want to live in South Africa they must adopt the Afrikaner way of life, just as if they lived in America they would have to adopt the American way of life. Besides, in the Afrikaner way lies the only real hope of saving "white civilisation": to reject firmly for all time any idea of political equality for non-Europeans. The English South Africans must have no truck with British liberalism, which is destructive of "white civilisation" in Africa. Sooner or later Afrikaner ideas must also prevail in the rest of Southern Africa, for the same reason. The future really lies with the past—with the Voortrekkers and their idea of "no equality between black and white in Church or State." English liberalism in the Cape was an unhappy and unfruitful interregnum.

The English Outnumbered

Within the Nationalist camp, the overriding aim is to preserve the regained Afrikaner unity. Nothing else is more important than this, for only when Afrikaners stand united can they lead South Africa along the right road. There must be no more splits and schisms among Afrikaners. Even without the English vote the Afrikaners can rule, as the 1948 election showed. The Afrikaners outnumber the English and are increasing their numbers faster. (Immigration would upset this and therefore must be restricted.)

This does not mean that there may not be personal rivalries. When Dr Malan goes, there may be more than one claimant for the leadership. Dr Malan is a Cape Nationalist. So is Dr Donges, by far the cleverest man in the present Cabinet. So is Mr Erasmus, whose role as a party organiser is still in Nationalist circles regarded as more significant than his being Minister of Defence. The leader of the Transvaal Nationalists is Mr Strydom. His chief followers in the Cabinet are Dr Verwoerd, the Minister of Native Affairs; Mr Swart, the Minister of Justice; and Mr

Letters to

Reclame-en Adviesbureau WYT, Pieter de Hoochweg 111, Rotterdam, W. Holland

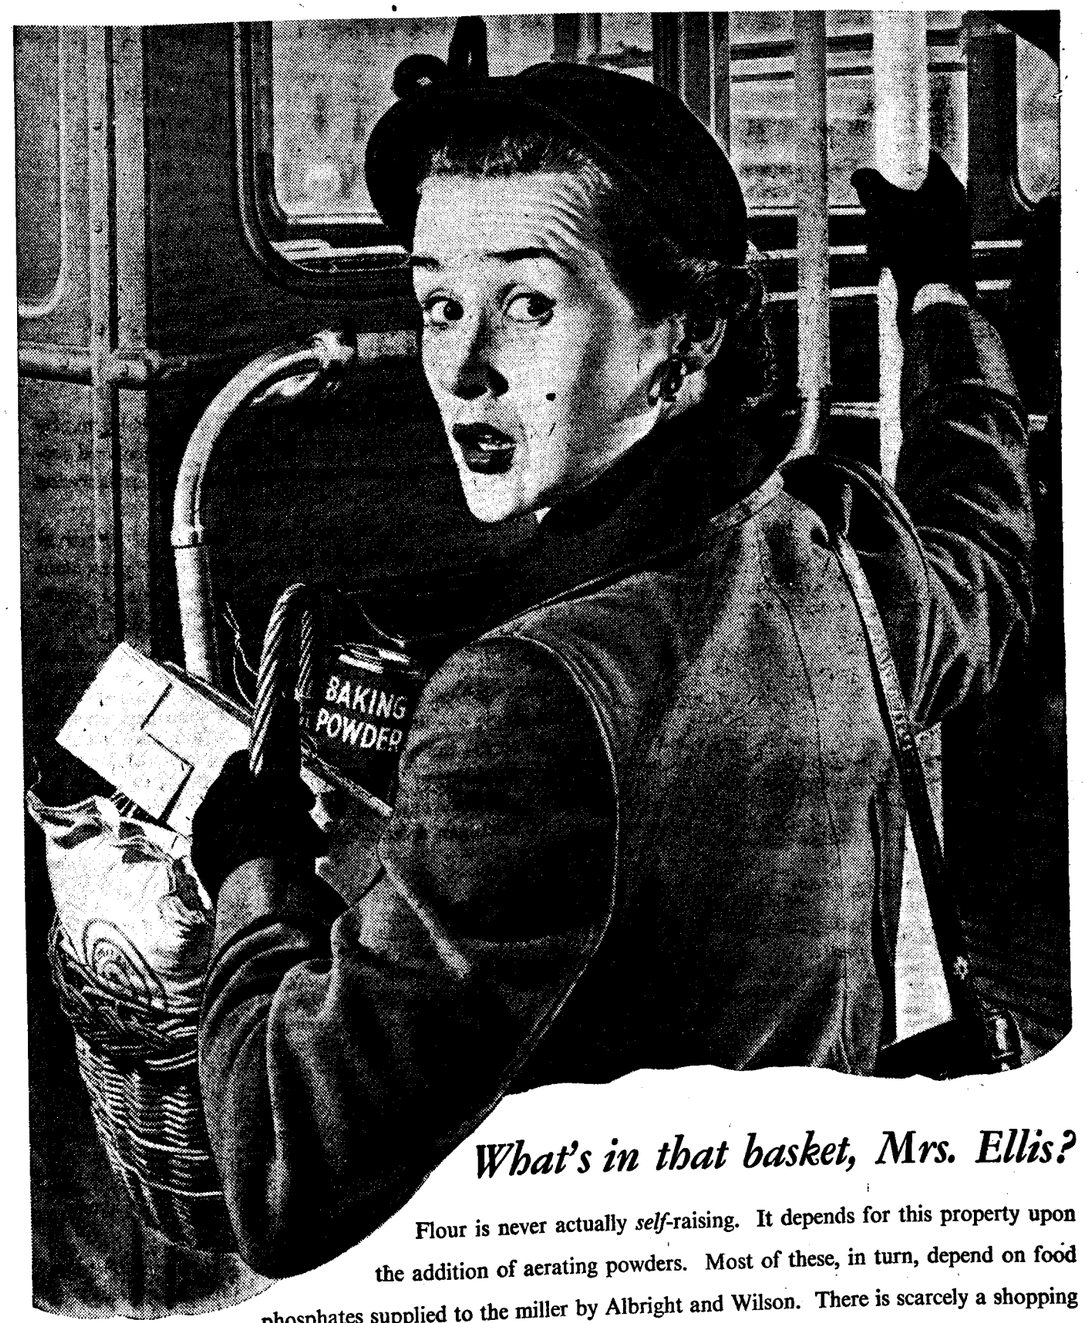
Eric Louw, the Minister of Economic Affairs. Mr Strydom and his supporters fear British influence and want a republic quickly. They also tend to distrust the concept, which is essentially Dr Malan's, of a republic still within the Commonwealth. On all fronts, the Transvaal Nationalists are more extreme than the Cape Nationalists: more anti-British, more anti-Native, more anti-capitalist. Though the Nationalist Party was born in the Cape and the Free State, the Transvaal Nationalists today feel themselves the stronger section and are confident that Mr Strydom will one day be Prime Minister, if not first president of the Republic. On Mr Strydom's burly shoulders has descended the mantle not of Hertzogism but of the more potent, longer-lived Krugerism.

Though these personal rivalries may one day become serious, there is no sign at present of them affecting Afrikaner political dominance. The lesson Dr Malan has continuously drummed into the heads of his Nationalists is that if they again fall into schism, they will again be driven into the political wilderness, and that this is the greatest evil that could occur. There is plenty of evidence that the lesson has been learned. Thus Dr Donges is both an ambitious man, and a much cleverer man than Mr Strydom; but if it appeared that Mr Strydom was in the stronger position, Dr Donges would probably not refuse to serve under Mr Strydom. He might rely on his cleverness to see that the policies Mr Strydom pursued did not differ materially from his own ideas. But this would not be difficult, since the differences between them are not really great. While it is true that the Nationalists have a "moderate" section and a more extreme section, there is no great dispute about fundamental objectives, including Native policy and a republic. The pace may be different but the goal is the same. To win over the English vote is not a primary consideration of "National Party" policy. The appeal is essentially to Afrikaners.

To come back to power the United Party must secure more Afrikaner supporters. It is finding it very difficult to do this: the Afrikaner unity achieved by Dr Malan is real. The other problem for the United Party is the success of the Nationalists' *apartheid* propaganda, among Afrikaners. Seeking the Afrikaner votes they must have, United Party speakers again and again are stolidly asked at meetings: "If you don't stand for *apartheid*, then won't your policy mean our daughters will be marrying Kaffirs?" The most emphatic negative carries no conviction whatever—perhaps because it is negative.

If present tendencies continue to operate, the floating vote may disappear in South Africa. By and large, it will be English ranged politically against Afrikaners, with the Afrikaners in the majority. The interesting question is how long the "National Party" of the *volk* will be prepared, in deference to the English minority, to postpone the declaration of the republic which, as Mr Strydom points out, it is already within their power to achieve.

Gold Coast—The Next Stage



AFTER six months in office, the people of the Gold Coast are now looking to Dr Nkrumah, the Leader of Government Business, to deliver the goods. The tumult and the shouting which accompanied the inauguration of the new constitution, and the exciting first general election, have died down; an impatient and inexperienced electorate now clamours for results. Menacing signs of a split in the Convention People's Party are discernible. As a result, all the stress in Gold Coast politics is now on an ambitious development plan.

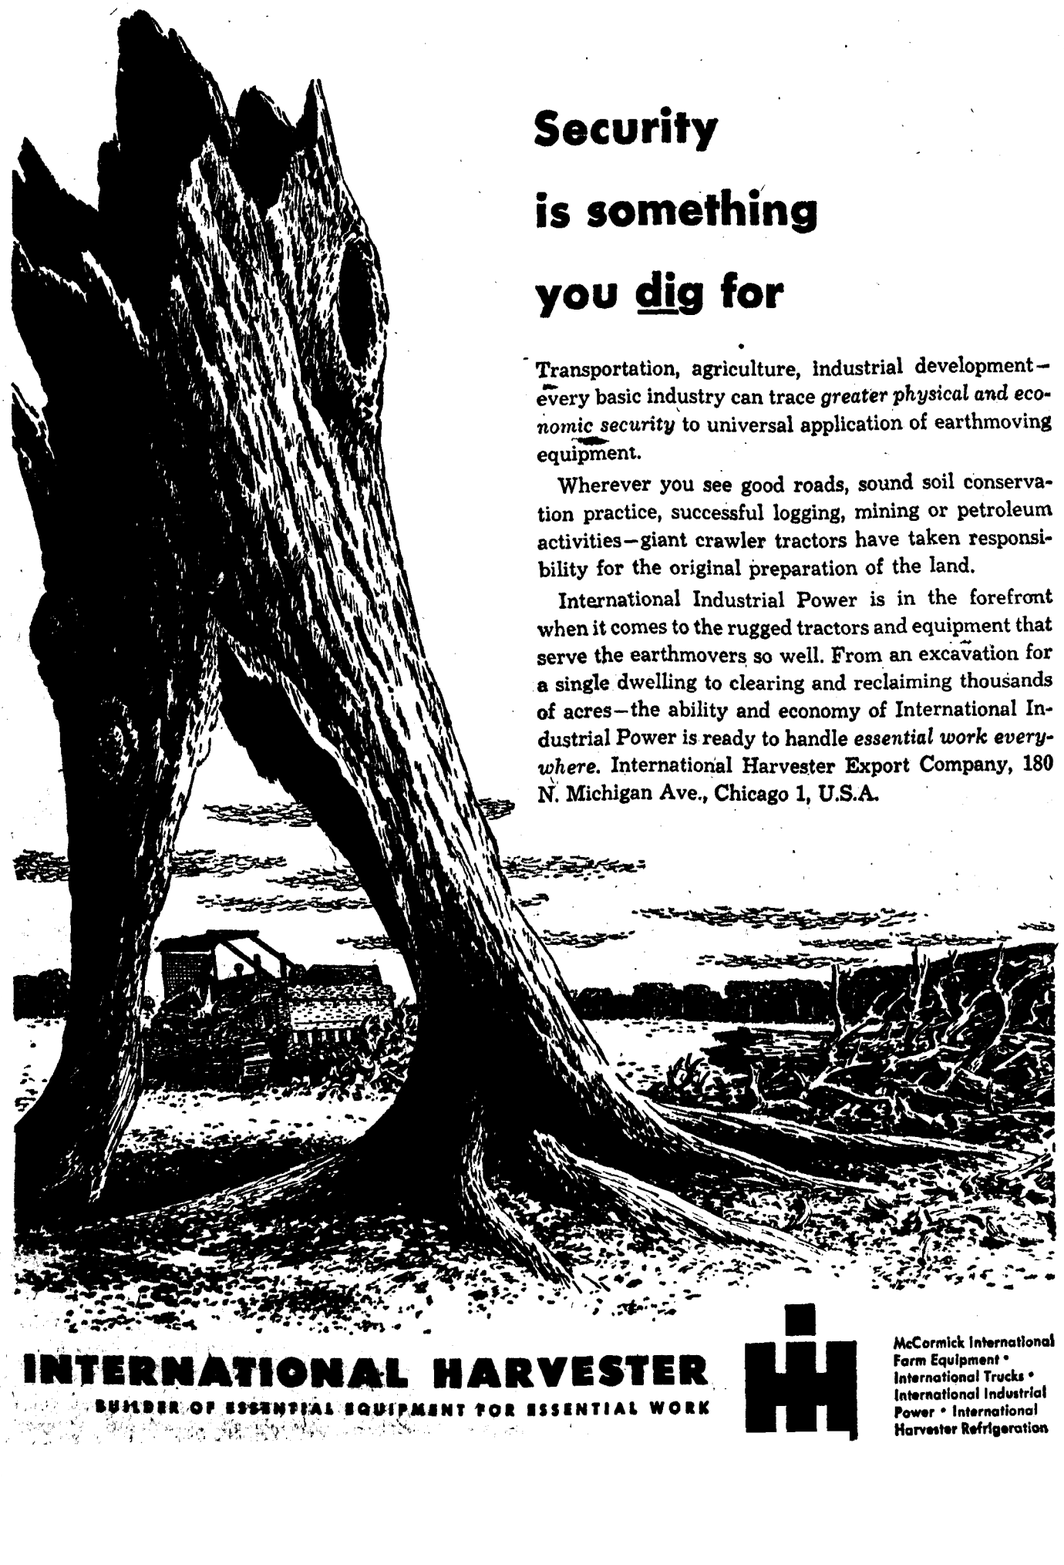
The total estimated cost of this plan is £74 million. The time-table is elastic; no date is given by which it is to be completed. As in the development plans which almost every Colony has now adopted (though on a smaller scale) expenditure is divided into certain broad categories—productive development, communications and public utilities, social services, administration. In the earlier days of the Colonial Development and Welfare Act, argument was about whether the bias of a plan should be on "development" or on "welfare." The Gold Coast puts the emphasis firmly on development, with the social services (except for education) as an also-ran. Particular attention is to be given to agriculture, industry and water, and especially interesting are the many proposals for industrial development. The Gold Coast proposes to establish a sack-making industry, a cement factory, textiles, shoe-making, brewing, canning, vegetable oils, and brick and tile manufacture. A special psychological significance attaches to this determined drive towards industrialisation—it meets the long-held suspicion of colonial peoples that they were being deliberately prevented from industrial advance because their manufactures might compete with the British export trade. With this resentment was coupled the belief that only through industry could real wealth be attained; agriculture was all very well, but in the colonial peoples' minds it was linked up with all the degradations of poverty. Industrialisation became, therefore, the symbol of a new era. Road and rail communications, which also play an important part in the plan, are seen as the key to government development projects, and also to the attraction of private enterprise.

Need to Attract Capital

The need for attracting outside capital has now become one of Dr Nkrumah's major difficulties—one that has never been seriously faced before by Africans. Under the old regime it was "the Government"—in other words, British officialdom—which was responsible for securing grants from Britain, or organising loans on the London money market, or—at the worst—for imposing unpopular taxes on the people themselves. It was also considered (and not by Africans alone) the responsibility of the British people to justify their imperial role by giving economic help to their dependencies. But foreign investment capital was something rather to be feared, particularly when it came in the guise of big private companies commanding the trade or the mineral resources of the country, and even outside technicians and managers provoked an uneasy antagonism. Today, if Nkrumah is to deliver the goods, he must have capital and technical help from outside—even if it be private capital. He has hopes of raising two-thirds of the £74 million required locally—from surplus balances, current revenue and export duties on cocoa; but the remainder must come from loans or investment. In the debates in the Legislative Assembly on the Development Plan, opposition spokesmen taunted the government with its inability to raise the necessary funds, and its failure to guarantee its credit and stability in "the eyes of the finance world." To this Nkrumah replied that "the government appreciates the need for co-operation and assistance from overseas as regards technicians, investment capital and the like."

The extent of the Gold Coast's foreign needs are much greater than the £28 million required for the Development Plan. Pride of place in all Gold Coast schemes is given to the Volta River Project for hydroelectric and irrigation development based on the exploitation and processing of aluminium. The publicly owned parts of this plan will cost another £65 million, and the only immediate possibility of making progress depends on a private company taking responsibility for the non-public part—the extraction of bauxite and the operation of the factory for processing aluminium. All the technical details are ready. The scheme has been found practicable from both the engineering and economic points of view, and the Gold Coast's bauxite reserves are estimated at 225 million tons. The main aluminium companies have pronounced the scheme sound, but none has yet committed itself to the undertaking. In all, the extent of foreign aid needed to carry through all

What's in that basket, Mrs. Ellis?



Flour is never actually *self*-raising. It depends for this property upon the addition of aerating powders. Most of these, in turn, depend on food phosphates supplied to the miller by Albright and Wilson. There is scarcely a shopping basket throughout the country which does not carry, anonymously, in at least one of its packages, some part of Albright and Wilson's output of essential phosphate products.

the development plans is reckoned, by Nkrumah himself, to be from £80 to £100 million.

In the meantime, however, less expensive schemes can be tackled. From next January all primary school fees are to be abolished, and the Assembly gave unanimous approval to the plan for a mass literacy campaign. A Mineral Resources Board is being created to examine the mining industry, with particular reference to the question of whether the country is deriving the maximum benefit from the exploitation of its mineral wealth. Heavy compensation is to be paid to farmers for cutting out diseased cocoa trees; and an Industrial Development Corporation is to be set up.

Rumours are now going the rounds that the only possible way for the government even to begin to meet all these obligations is by increasing taxation. The present income tax hardly touches the bulk of the African community—will it be extended in scope and increased in severity? And where, in the end, will the outside capital come from? ECA has granted about £500,000 for some minor road and rail development, but this is a drop in the ocean. There are no large funds available at the United Nations. Would the world's money markets have confidence in a loan?

The Gold Coast Ministry of Development which was created last June to take charge of the Volta scheme and its subsidiaries has now been closed, and Dr Nkrumah, who was Minister of Development, will become the chairman of a new Development Committee of the Cabinet to supervise the whole field of operations. A European civil servant has been appointed Secretary of Development. Everything is now ready for advance—except the money.

Sweden's Trade with Eastern Europe

[FROM OUR STOCKHOLM CORRESPONDENT]

THE extent and nature of Sweden's trade with Eastern Europe is of considerable interest and importance to the rest of Western Europe. Sweden is an important neutral; it has concluded, in 1946, an outwardly impressive five-year credit agreement with the Soviet Union; and in its large iron-ore deposits it possesses potential exports of great value. But in the first half of this year imports from the Soviet Union and its satellite states represented only about 7 per cent of total Swedish imports. This figure, it is true, is a little higher than the average computed by OEEC for the countries of Western Europe. But this is mainly due to the comparatively heavy imports from Poland, which were about six times as large as those from the Soviet Union. The latter accounted for less than 1 per cent of all Sweden's imports. Imports from Czechoslovakia and Eastern Germany were much smaller than those from Poland, but were still considerably larger than the Soviet imports. There was practically no trade at all with Rumania and very little with Hungary and Bulgaria.

As an outlet for Swedish exports Eastern Europe has also played only a small part. During the first half of this year it took little more than 6 per cent of total Swedish exports. Poland took about 3 per cent, but the Soviet Union only took about 1.5 per cent. When, in 1946, Sweden undertook to grant to the Soviet Union very large credits in order to facilitate purchases of Swedish products, it was stressed by those who advocated this policy that Sweden would gain much from closer contact with the Russian market. Those expectations, however, have not so far been fulfilled. If allowance is made for the incorporation of the Baltic states into the Soviet Union, imports from Russia do not form a larger share of total Swedish imports now than before the war—rather the reverse.

According to the provisions of the agreement credits could be obtained up to a limit of 1,000 million kroner. But the credits actually granted will probably not much exceed a total amount of 500 million kroner. This will not be regarded as unsatisfactory by the government. Sweden's financial strength was over-estimated in 1946, and in any case the political outlook has changed in a way which could not then be foreseen. It is quite certain that if the confirmation of the agreement by the *Riksdag* had been delayed only for a few months it would never have been given.

So far, in spite of the credit agreement, Russia has taken no more of Sweden's exports than it did before the war. The figures may rise to some extent during the later part of this year and during next year, when the last deliveries under the agreement take place. But the increase cannot amount to much. By the middle of this year the value of unfilled orders was approximately 230 million kroner.

Sales from Sweden to Eastern Europe do not include any war materials. But there is no very clear line of demarcation between military and civilian goods; and it cannot be denied that Sweden, like several other countries of Western Europe, supplies the Soviet Union and its satellites with some commodities of considerable importance. Engineering products, particularly electrical machinery, have been a main item in Sweden's exports to the Soviet Union. There have also been substantial deliveries of trawlers and fishing craft. Metal manufactures and machinery also form an important part of Sweden's exports to the satellite countries, especially Poland and, to some extent, Czechoslovakia. Pulp and paper have also been exported to Poland in fairly large quantities, though the share of Poland in the total Swedish trade in such commodities is a small one.

Iron Ore Exports

The importance of Sweden's exports of iron ore to Poland and Czechoslovakia is frequently exaggerated. During the first half of this year the three leading buyers of Swedish ore were Great Britain, Western Germany and the United States, each of them taking roughly 25 per cent or a little less of the total iron-ore exports. Belgium was the fourth largest customer, taking 15 per cent of the total. But total sales to Eastern Europe were only about 10 per cent of the whole, Poland alone taking approximately 7 per cent. Their imports of Swedish iron ore are no doubt of considerable importance to Poland and Czechoslovakia, and an interruption of these supplies would have very adverse consequences. On the other hand, Poland is a leading exporter of coal to Sweden and it would be rash to contend that the harm done to the Polish economy through a break in the exports of iron ore would be greater than the damage which a retaliatory ban on Polish coal exports might inflict on the Swedish economy.

Before the war there was very active competition between British and the Polish coal in the Scandinavian market, and in its commercial treaty with Great Britain in 1933 Sweden practically pledged itself to take at least 47 per cent of its total coal requirements from that country. Those days are unfortunately past. During the first six months of this year Britain contributed only 10 to 11 per cent of the total Swedish imports of coal and coke. The supplies from Poland, on the other hand, amounted to some 40 per cent of the whole. Western Germany with more than 30 per cent came next. Deliveries of coal and coke from these two countries are more essential than ever during the present international shortage of fuel. High-quality iron ore is also a scarce commodity today, and in order to secure a sufficient supply of fuel Sweden may have to reserve more of its iron ore and other raw materials for those countries which are able to contribute substantially to covering its indispensable needs of coal and coke. For Sweden to cut its trade with Poland so long as there is no alternative source of fuel of the same capacity is practically out of the question.

THE BUSINESS WORLD

New Basis for Markets?

THE Stock Exchange has not held for long the mood of exuberance that was its spontaneous response to Mr Attlee's election decision—and to its own assumption that a Conservative government will be returned. The barometer of the equity share markets, which was of course the most sensitive to these hopes, rose in two days last week by a shade more than it fell after the thunderclap of Mr Gaitskell's dividend project last July, but since then it has lost almost the whole of this unspectacular advance. The barometer of gilt-edged prices, which had only flickered upwards, had also been slipping back even before the worsening of the Persian situation provoked an abrupt movement. And the volume of business has slackened. To some extent this quick fading of market ebullience reflects questionings about the basic assumption—not because the City has really changed its view, but simply because it is wisely recalling how far former election forecasts have gone awry. More particularly it reflects a realisation that the advent of a Tory government, while it would blunt the sharper points of the barbs that have been driven into the flesh of investors as such, would not promise of itself any early lightening of those burdens of economic difficulties that they carry in common with the rest of the community. For both these reasons, what some commentators conceived to be the City's careless rapture has already given place to careful calculation. Investment advisers are now settling down to the sober job of appraising the implications of October 25th on several alternative assumptions. Most of these exercises are being founded on the hypothesis that there will be a Conservative government with at least a working majority, for this, obviously, is the hypothesis that implies the biggest change in the climate within which investment takes place.

Even on this hypothesis, however, the nature and extent of the change could vary within very wide limits, determined principally by the degree of toughness and orthodoxy with which the new government approached the problem of inflation. The nature of this approach is of most vital concern for every section of the Stock markets, but it is perhaps in the gilt-edged market that this would be most clearly and quickly apparent. The acid test of the economic wisdom and political courage of the new government will be the extent to which it founds its anti-inflationary measures upon use of the price-mechanism, in its manifold forms, instead of upon physical directives and rationing. But most of the major measures for shifting policy in that direction would have to wait upon the budget (or upon specific legislation that could scarcely be introduced before the budget in any case). The one direction from which an over-riding disinflationary pressure could be quickly brought into play is that of monetary policy. If, therefore, a new government acknowledged the obvious importance of giving early proof of its realism and determination, it is to monetary weapons that it ought to turn.

It is far from certain, however, whether even a courageous Tory government would in fact do so. There has been so much muddled thinking about monetary policy in the past twenty years, and so many vested interests have been built up in cheap money (notably those of the Treasury itself, and of housing finance) that many people who extoll the virtues of the market-place in almost every other instance resolutely deny them in this one instance. Others shrink from the use of the interest rate weapon for the opposite reason, holding it to be so potent and salutary in its effects that it would be dangerous, or at least imprudent, to allow it free play. But although the advice it would receive from banking circles would be confused and conflicting, a new Tory government would undoubtedly be more inclined towards monetary policy than any British government for the past twenty years. It would also be much more sensitive to criticism founded upon a continued expansion of the volume of credit—which certainly will continue to expand unless strong disinflationary measures are applied.

This means that even a government without any strong belief in the efficacy of dearer money as such might find itself impelled to impose restraints upon the quantity of money. And unless it went even further in the direction of physical controls and the euphemistically styled "selective" credit policies than three Labour Chancellors have ventured to do, its only means of quantitative restraint would be the orthodox techniques of central banking. In other words its first step would have to be a discontinuance of the practice—unprecedented before 1939—whereby central bank credit is in effect available on tap to the commercial banking system. If the initiative in central credit creation were thus restored to the monetary authorities and was then used to put a firm restraint on the whole volume of credit, rates for short money and floating debt would rise forthwith; whether Bank rate was also raised, and to what extent, would of course depend on the degree of pressure that the authorities deemed necessary in the light of subsequent experience. For reasons fully discussed in three articles in *The Economist* last May, this is the realistic way to reintroduce monetary discipline; it is much to be preferred to the method, generally assumed in City discussion, of trying to guess in advance what level of Bank rate would be stiff enough, and then of imposing such a rate forthwith.

*

The gilt-edged market, which in the past week has plainly shown its first apprehensions of moves in this general direction, has so far formulated only the most general views about the possible market repercussions. At present, virtually the only conclusion that most people are prepared to venture is that the short bonds would be more vulnerable than the medium-term and longer stocks—an opinion that has been clearly shown in a moderate narrowing of the very wide spread of the yield spectrum. This conclusion is based mainly on the argument that the short bond market is at most times largely shaped by specialist institutional investors, chiefly the discount houses; these carry bonds on borrowed money, the cost of which would be immediately responsive to a tightening of central credit supplies. It should be noted, however, that the margin between money costs and bond yields is not finely adjusted, so that, except at the very outset, short bonds might not be unduly sensitive to a general rise in money rates—unless the rise was very abrupt and was regarded as the forerunner of further rises. On the other hand, if the policy of restraining the quantity of credit were pursued impatiently, without giving the rise in rates time to check marginal demands for bank advances, there would be a possibility of gilt-edged sales by the banks as well as from industry—in which case the focal points of strain might be in the medium and longer term sections of the market.

Against these adverse implications for gilt-edged on a fairly short view, there would have to be set the important longer-run benefits for all fixed-interest stocks of a determined assault upon inflation. The inflationary influences are now so strong and inflation "psychology" is so widely diffused, however, that the chances of a sufficiently tough policy to show results in the medium term are not great—even if the Government had great political fortitude. But the quick resort to a firm monetary policy would be an earnest of good intentions.

*

In the ordinary share markets there has been an almost complete disappearance of the natural but never immodest burst of activity that the election announcement produced. The fact that leading industrial shares failed, even so, to regain their levels of mid-June—a few weeks before dividend limitation was introduced by White Paper—did not, of course, prevent the usual misleading headlines of the "Millions made from Stock Exchange boom" kind, nor left-wing moralising about sordid greed. It would, of course, have been a very odd Stock Exchange that did not rate the possibility of the end of a Labour government, and one that has never concealed in word or deed its dislike of the private investor and its distrust of the security markets, as being worth a 4 per cent rise in share values; and that 4 per cent has now almost disappeared. No fortunes have been made; there is no equity share boom; but there is the opportunity, which thoughtful investors are taking, of considering the change in the ordinary share outlook that would follow a change of government.

The immediate change would be the disappearance of dividend limitation, which will otherwise be a certainty in the new session. For relief from that mixture of spite and injustice, the equity shareholder would certainly be grateful. It would, in fact, be the first occasion since the war on which a major obstacle to a reasonable investment policy had been removed and a gross injustice towards the legitimate rewards of risk-bearing put right. There are other obstacles and injustices that will remain for a much longer time; the return of a Conservative government will not get rid overnight of penal profits tax that saps industry's capital resources, or remove the control of capital issues, or halve the doubled stamp duty. Nor, after the damaging way in which the Stock Exchange and other financial institutions have been represented to the popular mind in recent years, would a Tory government be likely to come out openly as champion of "the City." It is as likely to appeal to industry for "moderation and restraint" in dividend payments as Sir Stafford Cripps ever was, and as likely to get a faithful response. The prospect that a Conservative government would provide for the investor is not a tear-away jump in dividends so much as the chance for the soundest companies to make moderate and regular increases in dividends that reflect the increase in their true profits and productivity, without the shackles and anomalies of statutory dividend limitation.

*

Past attacks on the investor and on the Stock Exchange have reflected chagrin at the supposed "benefits" that inflation has bestowed on ordinary shares. A new evaluation of equity share prospects, if a change of government results from the election, would first need to assess the chances of a decisive change in monetary policy, which has already been discussed. That would be a contribution to eventual economic health of decisive importance, but it would end the automatic advance in equities that has been a feature of the market for more than a year, and at particular points in industry it might conceivably have its effect upon earnings. On the other hand, it would have little or no influence on near-term economic and industrial problems this winter. It would not shift the power peak, produce another ton of coal or steel, or recruit another locomotive crew. It would not restore the balance of payments, or stem the drain of dollars; it would only be the first start towards these ends. It would not immediately produce a strong flow of risk capital or promote a resurgent willingness to save. It would have little immediate consequence for the cost of living and wholesale prices.

But given courage and time, the working out of a policy of monetary remedies to remove inflation—instead of a system of controls that purports to keep the effects of inflation in check—would introduce a new element into equity share calculations that has been wholly unfamiliar in a dozen years of war and postwar inflation. The object of such a policy would be to remove a superabundance of demand that has guaranteed full employment, high money profits, easy sales in a sheltered home market, freedom from compulsion to embark upon commercial adventure, and the utmost rigidity in the use of labour and in the deployment of resources. It would be the object of monetary discipline to make room for changes in the manufacturing economy, to accommodate more of the demands for resources that could survive the test of market price and to exclude some of those demands that are at present imposed by means of controlled prices and allocation of physical resources and output. If the way were cleared towards a freer economy of this kind—and indeed it is a very big "if"—the ordinary share investor would be confronted with a task of assessing a variety of different factors affecting different industries, instead of basing himself on the comfortable assumption, as he has been able to do for many years, that a lucky dip in the industrial

share market is quite as promising as the shrewdest selection.

All this, no doubt, is a long way off, if indeed it comes at all. In the short run, the equity shareholder's hopes are centred in the removal of the dividend limitation threat and in the end of the discriminatory attacks of recent years. They cannot be encouraged by the economic prospects of the coming winter, which look dire on any political assumption. On these calculations, the more cautious attitude of the ordinary share market this week does not come amiss. This caution, it should be emphasised, is combined with the assumption that a Tory government is in prospect. If there were to be any development in the election campaign that seemed to favour a return of a Labour government, the market's reaction would be sharp indeed.

Winter Coal and Beyond

THIS winter's fuel outlook offers one shred of comfort to members of the new National Coal Board; the crisis may not rest primarily on coal output, but on the incapacity of the railways to move coal from the pits. The railways show strong signs of replacing coal as the nation's most crippling industrial infirmity. It is new for them to be hard put to move coal in summer: but already coal from the East Midlands for London is having to be shipped coastwise through Immingham, and if many miners around Doncaster had not taken the morning off a fortnight ago to see the St. Leger, some mines might have had to stop raising coal because it could not be carried away from the pithead. Coal stocks will probably fall short of the figure the industry hoped for this winter, and there will be insufficient large coal and coke. But if the present slightly encouraging output trend continues to provide 200,000 tons a week more than last year until December and a smaller increase of, say, 100,000 tons a week thereafter, then output, coupled with vigilant economy by consumers, should meet the winter need. Imports of coal on any considerable scale—as distinct from small special imports for the gas industry—are now out of the question; neither the coal nor the ships are to be had without disrupting supplies for the rest of Europe. Given the dollar cost of importing American coal and the margin of risk involved (perhaps 2 per cent of the country's yearly consumption), the Government may have been right in putting the onus of getting through the winter where it ordinarily belongs—on British miners and consumers.

The winter will be an anxious time for the new Board, even if output comes up to its expectations. It will have to show a completely new kind of determination and foresight if it is to get away from the preoccupation of day-to-day crisis and begin to make an attack upon the problems that will confront the industry for the next few years. These problems bulk large enough, in all conscience. Since April the mines have been losing manpower at the rate of 17,250 a year, and in recent weeks the decline has grown faster than ever: though recruitment is quite good by earlier standards, the wastage of men from the industry threatens to become calamitous. The next three fuel winters look particularly dangerous. On the present rising curve, inland consumption may catch total production by 1952-53; the "cushion of exports," already wafer-thin, will be wholly gone. In Europe, the British coal industry, already in poor odour, will be in total disgrace. And after 1955, when new techniques may begin to transform output, overseas markets for coal, and British goodwill in them, may be gone.

Long before that, the new Board will have to come to grips with an internal problem—the demand for reorganisation. Within the next four weeks, the Board may become answerable to a Government committed to decentralising it. The Lancaster-Reid-Young plan has become more or less official Conservative policy since its authors, the industry's three weightiest critics, produced it three months ago; its proposal for a policy-making central board working direct (that is, without divisional authorities) to fewer, larger coal areas must be reckoned with as the likely framework of any reorganisation imposed from above. Decentralisation has become something of a vogue word inside the NCB and outside it; now the industry is confronted with at least one confidently defined meaning that could conceivably be put into practice. The Conservative demand for more local independence in coal has indeed been echoed, with the considerable variations to be expected, in a Co-operative Party study. If Tory prejudice against coal nationalisation and Labour prejudice in favour of the particular structure set up five years ago were both out of the way, there would be a chance for reason to take a share in devising the most effective way of running the coal industry.

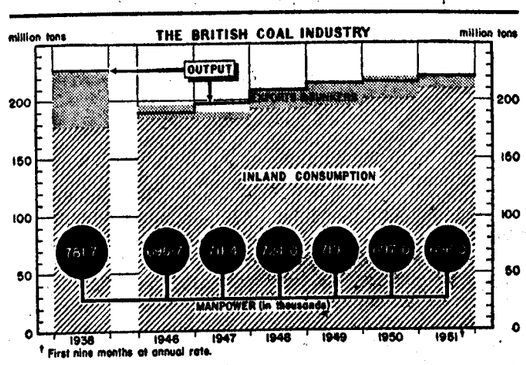
★

Some of the most painstaking study, and conceivably the most useful conclusions, made by any independent investigators since the National Coal Board was formed have just been published by the Acton Trust*. Its double monograph is sharply critical of the NCB, but equally unfavourable towards some remedies suggested by the Board's critics. It has attempted to get beyond a comparison of ideal patterns of organisation, and also to fasten upon the real effects of the present centralised structure. The conclusion reached is that real decentralisation is "not simply an aim which can be achieved by organisational changes, but is primarily a problem of the adjustment of human relationships." The study does not reject changes in structure, but neither is it attracted to some solutions that rely mainly upon formal pyramids of organisation. On the Lancaster-Reid-Young proposals, it comments:

> . . . they provide measures for splitting the industry into a number of units, each of which may itself remain highly centralised and each of which is large enough for such centralisation to be felt as oppressive by operational management. They achieve decentralisation at the uppermost level, but not at the lower levels. But it is at precisely the uppermost level where the degree of decentralisation is already greatest; the Divisions maintain a very considerable degree of independence from the Coal Board.

The conclusions also underline the distinction between the formal and the informal structure of an organisation. In the structure of the present Coal Board, efforts have been made to delegate more authority; but where, for example, a headquarters' representative may formally be only one of the members of a committee sitting round a table, informally his advice and views may dominate the decisions simply because he is associated with the other members' immediate superiors. A simplified formal structure by itself may not necessarily get rid of this feeling among operational managers dealing with higher officials or with specialists: and it is the operational manager who is the key man in the industry. Upon him—or upon him and the NUM lodge secretary—depend to a degree that can hardly be exaggerated the morale and the total effort of the individual pit.

* "The Extent of Centralisation," Parts I and II. The Acton Society Trust. 2s. each.



Today the British pit manager, as the Acton Trust points out, too often feels the most frustrated man in the industry. Historical forces have been undermining his position for a quarter of a century, since the time when he was often the uncrowned king of the village. Full employment and loss of mining manpower have sapped his power to give or withhold work; bitter memories of big strikes and tragic labour relations in the past explain why the men still regard him as a mine-owners' representative, not their leader; and the union has tended to usurp his local authority. Developments in mining technique have brought in the technical specialist to share and sometimes to dispute his authority on technical mining matters for which he nevertheless retains an onerous legal responsibility. These influences are at least partly independent of the form of ownership of coal mining, though difficulties encountered in a few of the largest colliery companies before nationalisation have been extended to the whole industry by organisation under one single ownership. It is not easy to determine how far the mine manager's difficulties have really been increased by remote control under the NCB; but undoubtedly he often thinks they have.

It does not dispose of the pit manager's frustration to conclude that he is often responsible himself for a considerable part of it. The coal industry between the wars attracted limited numbers of the best managers, and mining technique has proceeded faster than many of them could keep pace with. The industry's greatest weakness at the end of the war, as Sir Charles Reid recognised in his first report, was the lack of men of the right kind; it still is. The Coal Board has begun to tackle this problem for the future by providing scholarships for men both from inside and from outside the industry; but the raising of the general managerial standard in this way must take a considerable time. "All responsible persons in the industry," comments the Acton Trust report, "agree that the manager's status should be raised, not lowered—but they also agree that before this can be done a more highly trained type of manager must be brought into being."

★

There is some sign that the deeper human problems such as this are realised in the counsels of the Board. The new team is thinking out the lines of reorganisation and the chairman has known leanings towards decentralisation. Some simplification of the Board's own procedure and some extension of authority to sub-committees has already come about. But enthusiasm for decentralisation has to be tempered by the realisation that the quality of staff in the different areas is far from uniform; what the industry needs at this moment is not an ideal structure, but one that will make the best use of the men now available.

That being so, the Board and its critics will probably opt for evolution, not revolution. The human effects of a massive reorganisation upon overstrained and not always adequate personnel who had at the same time to keep up output have not yet altogether subsided since the NCB was set up in 1947. Another major reorganisation, too drastically administered, could set the industry back another three or four years. What improvements have come about in the present structure of the Board—and they are admittedly limited—have resulted largely from giving up rigid uniformity and in giving good mining men their chance. Any final formula of administration must be concerned with the human problems of decentralisation that the Acton Trust has touched upon. There may even be certain patterns of decentralisation that could to some extent be tested in advance; whether one form of organisation may require more top-grade mining engineers behind administrative desks than another, for example, is not to be determined once for all by drawing a new administration chart.

Nor can the most pressing production problems of the industry be solved by reorganisation, much as they can be affected by it. The NCB will enter upon wage negotiations this autumn through pressure of circumstance, with no better wage structure in mind. It might be able to achieve slight improvements in adjusting district differentials that bear no relation to local manpower needs or to local mining efficiency; but the Board has not given any sign of new ideas upon wage policy. Whatever may be the role of the centre in future organisation, the Board's grip upon forward planning and development, both in evaluing and in pressing forward projects, should be stronger than it now is. Some tightening of efficiency within headquarters might assist here. It cannot be said at the moment that the Board is getting good value for the huge volume of information that flows periodically into Hobart House, partly because the same information is often duplicated or supplied to departments that no longer need it, partly through inadequate statistical appreciation of the data within headquarters. In addition, there is a pressing need—with some signs of an answer—for the more rapid spread throughout the industry of some of the new techniques that have been proved in recent months. First and last there is manpower. Reorganisation can only be one means towards solving these problems and improving the morale of the industry. They demand, equally, direct attack.

Business Notes

The Dollar Gap

When the Chancellor of the Exchequer speaks to the bankers and merchants of the City of London at the Mansion House dinner given by the Lord Mayor next Wednesday, he will deal at some length with the deterioration that has occurred in the dollar balance of payments of the sterling area and will announce the figure of the dollar deficit incurred during the third quarter of this year. There has been a certain amount of intelligent leakage that should have prepared the world for a loss of close on $500 million in the gold and dollar reserve over this period. This will also be the measure of the actual deficit of the sterling area, since very few Marshall aid reimbursements remain to soften the impact of the dollar deficit on the actual gold and dollar reserve. A loss of this magnitude would reduce the reserve to about $3,400 million, a figure admittedly far higher than that at the time of sterling's devaluation, but hardly high enough to justify Mr Gaitskell's assurance that "it gives us the essential element of time to correct the situation"—especially when the intended timing is linked to a conference of sterling area finance ministers to be held early next year "to deal with the dollar problem as it affects the sterling area as a whole."

In the statement at a press conference this week at which Mr Gaitskell gave these doubtful reassurances, he also pointed out that the gold losses incurred during the third quarter of this year were to a large extent "the result of temporary factors." There have been some heavy non-recurring dollar payments that the Chancellor declined to specify, and considerable loss has also been incurred as a result of the cessation of Persian oil supplies. In addition, the circumstances that led to the earning of large dollar surpluses in 1950, namely, stockpiling and exceptionally high commodity prices, have now changed; Mr Gaitskell was forced to admit that "the underlying position [of dollar earnings and expenditure] is much less favourable." Apart from the measures to curtail imports that are to be taken in concert with the rest of the sterling area, the solution of the dollar problem is being tackled by the British Government by direct negotiations with the United States for "steady purchases" by that country of sterling area raw materials at "reasonable prices." These talks presumably relate to such commodities as tin, rubber and wool, which at present are not being handled by the International Materials Conference in Washington.

* * *

"Steps Must be Taken"

Mr Gaitskell was even less informative on the question of the balance of payments as a whole. As a result of the extra burden imposed by the rise in import prices—a burden, he said, that involved just as much of an extra load as the additional amount Britain is putting into defence this year—there is now a "large trading deficit as against the surplus earned last year." This was followed by the trite observation "we cannot afford to go on doing that for long" and by the promise that "we shall have to take further steps to restrict imports and expand exports"—but what steps were not specified. The balance of payments problem is clearly linked with that of defence and will be affected by the decisions that may ultimately be taken as the result of the Nato burden-sharing exercise. This is far from complete yet, though Mr Gaitskell pointed out that a valuable interim report from the Finance and Economic Board of Nato had been received at the Ottawa Conference and that for the time being "we are quite content to leave the matter there."

What mainly appeared to worry Mr Gaitskell was the demand made by the military advisers of Nato for a further increase in the scale of all defence programmes including the British. To this Mr Gaitskell countered "I cannot see how we in the United Kingdom can do more than we have promised and are carrying out unless there were to be a radical change in the economic policies of all the members of Nato involving something much more like a war economy both internally in each case and in their relations with each other." That, perhaps, is not an unreasonable attitude. But in the Government's dealings with Britain's external financial problem, discretion has clearly been the better part of valour. The mass represented by the balance of payments troubles is being left to the care of whatever administration the general election may throw up. There was no hint in Mr Gaitskell's statement of appropriate measures to deal with the situation. The drift continues.

* * *

The Fund and Gold

Little by little the picture of the debate on premium gold sales that has been proceeding at the International Monetary Fund is coming to light—though as yet only a small part of the scene is revealed. Mr Gaitskell, at his press conference this week, said that the problem of premium gold sales had not in fact appeared on the agenda of the governors' meeting, but that it was to be considered by the executive directors of the IMF after the end of the annual meeting. Mr Gaitskell also gave some indication of official British policy in this matter. The British Government, he said, supported the view of the IMF that gold producing countries should sell their gold exclusively to central banks and, therefore, at the respective parities of their currencies. But he implied that if there were any deviations from this rule they should be allowed on a non-discriminatory basis. He admitted that the British representatives at the IMF would be supporting a demand by Southern Rhodesia for equality of treatment with South Africa in the matter of premium gold sales. When news comes from Washington of the decisions taken in this matter by the executive board of the Fund, it will be very surprising if this principle of equality of treatment is not officially recognised. If it is, there is no doubt that all gold producers will be entitled to the facilities that South Africa now enjoys in selling gold at other than premium prices.

The alternative, that South Africa should relinquish a part of its present freedom of action, has not even been considered. That was made abundantly clear by a remarkable statement of Dr Holloway, the South African alternate governor on the IMF Board on his return to South Africa from the Washington meeting. In this Dr Holloway contended that the fund had no authority whatever to intervene in the arrangements made by gold producing countries in selling their gold at other than parity prices. Dr Holloway added

> The Fund now finds that it cannot suppress the trade in gold by the public without breaking the articles of agreement which brought it into being. This explains its evident embarrassment. It also explains why South Africa did not again raise the question at the IMF annual meeting.

This assertion that the fund cannot attempt to check premium sales of gold without breaking its own agreement calls for highly dialectical interpretation of an agreement all signatories of which bind themselves to serve the cause of exchange stability. There can be no real refutation of the view put forward by the International Monetary Fund when it made its first move to stop international transactions in gold at premium prices, that these operations were calculated to disturb the exchange relationships between members of the Fund and to call into question the official parities of their currencies.

Whatever one may think of Dr Holloway's legal interpretations of the Fund agreement, his statement is an unmistakable indication of the confidence South Africa now has in the strength of its position. South Africa may not stand an early chance of getting the higher dollar price of gold for which it has long campaigned, but it insists on remaining free to order its premium gold sales policy as it wishes. If the rule of non-discrimination is to apply, this means that all gold producing countries will in fact be given the same freedom. The International Monetary Fund, will in that case, be prepared to turn over to member nations the responsibility for regulating the premium gold market. That may well be the burden of the decision taken by the executive directors of the Fund which is due to be announced in the course of the next few days. If so, it will be another abdication of power and authority by the Fund. If this freedom is used without restraint, it may have a considerable effect on the free market price for gold. That effect would be not only sharp but sustained were it not for the cloud of inflationary suspicion by which all major world currencies are now overshadowed.

* * *

Retreat from Rating Revaluation?

It now seems clear that the brave attempt to revalue all rated property in time for the lists to be brought into force by April, 1953, has been abandoned. In a written answer just before Parliament rose, the Minister for Local Government and Planning announced that the difficulties in recruiting staff made it impossible for the Inland Revenue to complete the new revaluation lists in time and instructions have been given that they are to concentrate on properties other than houses—a decision that implies that commercial properties are to be reassessed immediately and that revaluation of houses is to be postponed indefinitely. Sixteen years have elapsed since the last general revaluation and the immediate consequence of falling back on piecemeal revaluation can only be that the commercial ratepayer will suffer a considerable increase in rates while 75 per cent of the country's total rateable value represented by houses will be unchanged. It remains to be seen whether the new valuation lists will be used in Schedule A income-tax assessments.

Thus the experiment of transferring responsibility for valuation from the local authorities to the central government has proved a lamentable failure. The intention of the Local Government Act of 1948 in making this transfer was to secure, as far as possible, a uniform standard for rating valuations throughout the country, on the basis of which an equitable distribution of government grants to the local authorities would be possible. All authorities with a rateable value per head of population below the national average were to receive an Exchequer equalisation grant equivalent to the rates payable on their deficiency of rateable value. To have left the local authorities to make their own valuations for the rating might indeed have been a temptation for some of them to adopt an unduly low standard and thus to attract an unfair amount of grant. But a fair distribution of the grant still depends, as it has always done, on a uniform standard of valuation throughout the country; this does not exist now and it will be indefinitely postponed by the decision to abandon the revaluation of houses. For four years since 1948 a pool of Exchequer equalisation grants and education grants of about £170 million has been shared among the authorities in proportions that are admittedly inequitable. Since these inequities are not, it seems, to be corrected by revaluation, immediate investigation of hard cases and remedies for injustices are surely required.

* * *

Gaffe at Gatt

The sixth session of contracting parties of the General Agreement on Tariffs and Trade continues at Geneva in closed sessions from which little information has emerged in the last few days. All accounts from Geneva, however, suggest that the proceedings are still reeling somewhat from the blow of Sir Hartley's Shawcross's extremely candid opening speech for Britain, a speech (briefly noted in these columns last week) that was tantamount to a provisional notice of withdrawal from Gatt.

So far, the United Kingdom government, like other governments, has not felt able to commit itself finally to the General Agreement, and we shall need to consider how far its present provisions, with the undoubted restrictions which they impose on us in such matters, for example, as preference between Commonwealth countries, and with their unsatisfactory bearing on the relations between the contracting parties and the International Monetary Fund, are counterbalanced by tangible advantages in the promotion of world trade.

Equally harsh was Sir Hartley's opposition to the proposal to give Gatt somewhat more permanent and continuous form by creating a standing committee of the contracting parties and providing great security of tenure for the secretariat:

> I am, and my Government is, a life-long supporter of the fullest possible degree of international co-operation. But that co-operation is not always promoted by the mere multiplication of formal pieces of international machinery, and we are not convinced that a standing committee would, in the present provisional stage of the General Agreement, be a useful thing. We feel that at this time, when there are already in existence a multiplicity of international bodies, some of which are perhaps less useful than the expenditure of experts' time and taxpayers' money on them might have entitled us to hope, new accretions of international machinery ought not to be established unless a clear case has been made out to show that they will in practice achieve useful results.

This negative attitude and these assaults on the basic principles of Gatt, have caused not a little consternation among the assembled delegates.

* * *

More Serious Cheese

Britain has also been in the dock on the more specific charge of the protection surreptitiously given to domestic goods by the operation of the Utility Goods Scheme. This matter had already been raised at the Torquay meeting and the promise was then given by the British delegates to look into it. But, far from being remedied, the situation has been aggravated by recent changes in utility specifications that have extended the area of discrimination against imported goods. Canada, the Netherlands and France have again protested at the Geneva meeting. They have been told by the British delegate that a committee has been appointed to overhaul the purchase tax and utility system and to consider among other problems that of the discrimination against imports that has been involved by the system. This committee, however, will not report until next year. Meanwhile, the protection complained of by the other contracting parties will continue.

The main explosion at Geneva, scarcely muffled by the doors of the closed sessions, has, however, been caused by some serious straying from the path of Gatt orthodoxy on the part of the United States—by imposing a complete ban on the import of butter and other edible fats and severe restrictive quotas on imports of cheese. This action was taken in accordance with the amendments introduced by Congress into the Defence Production Act of 1950. One of these amendments, based on a curious definition of "defence," stated that controls over fats and oils, butter, cheese and other dairy products are "necessary for the protection of the essential security interests and economy of the United States in the existing emergency." The United States Administration is trying to remove this Janus-like blot on its escutcheon as a signatory of Gatt, but the strength of the farm lobby in Congress may be too great for the efforts of the State Department. There have been strong protests against the United States' action on the part of the Netherlands, Canada and Denmark, with encouraging noises from the British dele-

gation, which must also be thinking of its exports of Stilton. The incident has come as a saddening but significant illustration of the difficulties that Gatt must encounter, even at the hands of its most outspoken friends and advocates.

* * *

Encouraging Exports

For the first time for many months the detailed trade figures can be called moderately encouraging—though only on the export side. It was already known that total exports in August, at £226 million, were £4,000,000 more than in July and £37 million more than in August, 1950. The details now available show that while the old stalwarts of the export drive, the vehicle and machinery groups, declined, the export of consumer goods increased. A trend cannot be deduced from statistics relating to one month, but this, emphatically, is the pattern of change that will be needed as rearmament progresses. Among the individual groups, the export of vehicles in August fell by nearly £3,000,000 to £38 million; the number of new cars exported declined from 28,872 to 26,318. Machinery exports fell by £1,000,000 to £31 million; iron and steel manufactures by £1,000,000 to £13 million while exports of non-ferrous metals, cutlery and hardware and electrical goods were either very slightly lower or almost unchanged. The textile group led the field among those showing increases. Cotton exports increased by £3,000,000 to £20 million, chiefly because of the much larger shipments of piece goods; exports to Australia, for example, reached 20 million square yards or more than double their monthly average for 1950. Exports of wool manufactures increased by nearly £500,000 to £16 million, again because more piece goods were sold abroad; increases were also recorded for silk and rayon manufactures and apparel. The export of chemicals was £1,500,000 larger at £14 million, while the sale of refined petroleum to overseas markets (valued at £3,500,000) was more than four times its monthly average for last year.

After allowing for these offsetting decreases and increases, the aggregate volume of exports last month was no larger than in July; the increase in value was mainly due to a 2 per cent rise in export prices. As import prices fell by 3 per cent (owing to cheaper raw materials), the terms of trade moved some 6 per cent in Britain's favour. This favourable trend in the cost of imports per unit of exports has now persisted for three months. If it is to continue, however, Dr Dalton and other politicians may have to curb their exuberant campaign to reduce prices of textiles in Britain. Some overseas buyers, expecting British prices to fall, have already begun to cancel their contracts for textiles—a repercussion that the doctor had apparently not foreseen.

* * *

Trends in Imports

Despite the decline in import prices in the past two months, Britain's import bill has soared to new heights. It reached £368½ million in August. The value of imports in the first eight months of this year was 49 per cent higher than the monthly average for 1950, although the volume of imports was only some 15 per cent higher. Britain is now paying for its improvidence of twelve months ago when it accumulated a large trade surplus by living on its stocks of food and raw materials. It has had to pay much higher prices this year to buy sufficient quantities not only to maintain productive capacity, but to replenish depleted trade stocks and to build up government reserves. Moreover, despite the high prices paid and the large trade deficit incurred, Britain is still not getting as much as it wants of some imported commodities. The accompanying table shows the physical volume of imports of the more important foodstuffs and raw materials during the first eight months of 1950 and 1951. Among the foodstuffs, larger supplies of grain, flour, cheese, sugar and tea have been received this year, but much smaller supplies of meat and eggs and slightly smaller quantities of butter, bacon and vegetable oils and oilseeds. Some of these decreases, however, have been due to non-recurring factors; shipments of meat and butter from Australia and New Zealand, for example, were held up in the early part of this year by shipping delays and the dock strike.

Raw materials present a more serious—though mixed—picture. It is true that there have been sizeable increases in imports of tin metal (presumably mainly for stockpiling), softwood, aluminium, nickel and crude petroleum, and that more rubber, copper, paper-making materials and refined petroleum have been bought. But, on the debit side, imports of tungsten, wool, zinc and lead have fallen by 25-33 per cent. Hides and skins, molybdenum and sulphur have declined by 10-15 per cent; and supplies of iron ore, raw cotton and manganese have been some 5 per cent smaller than last year. Not all of these materials are physically scarce; wool, for example, is now available in ample quantities at prices ruling in 1949, while cotton is now in more plentiful supply than last season. Tungsten, however, is still perhaps Britain's most severe shortage despite international allocation; less zinc is available because of the sharp increase in American consumption, and lead supplies have fallen because of the shipping delays on the Australian routes. Moreover, even a decline of 5 per cent in imports of iron ore and manganese can have serious consequences for the steel industry. Against this, the fact that supplies of sulphur and molybdenum have been only some 10 per cent less than a year ago is a tribute both to the work of the International Materials Conference in Washington and the co-operation on it of the United States, the chief supplier of both these materials. The raw material shortage has not yet been as crippling as some people feared nine months ago, but, despite the country's much larger import bill, British industry cannot yet look to the future free from qualms.

Agreement on German Scrap

The formula for west German exports of scrap finally accepted at Bonn last week does not specify exactly how much the British steel industry will receive for the next nine months; but it seems likely that imports will not much exceed 25,000 tons a month, about half the rate for the first six months of this year and a sixth of that imported throughout 1950. Under the sliding-scale agreement, which runs until June 30, 1952, the first 325,000 tons of scrap collected in Western Germany are to be retained by its home steel industry; the next 50,000 tons exported; the next 25,000

'What is their commercial standing?'

THE WESTMINSTER BANK can, in many cases, give you an immediate reply; or, if the required information is not already available in the extensive and up-to-date records of the Foreign Branch, it can very quickly be obtained. The provision of reliable confidential information as to the reputation of your prospective overseas customers is part of a comprehensive service which the Westminster Bank provides for those who trade abroad. This service is described in a booklet which can be obtained without charge at any branch. Ask for *The Foreign Business Service of the Westminster Bank.*

BANK OF NEW SOUTH WALES

ESTABLISHED 1817 HEAD OFFICE, SYDNEY, AUSTRALIA

LONDON OFFICES: 29 Threadneedle Street, E.C.2, and 47 Berkeley Square, W.1

(INCORPORATED IN NEW SOUTH WALES WITH LIMITED LIABILITY)

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are. Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to:—

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2.
West End (London) Branch: 28 Charles II Street, London, S.W.1.
Manchester Branch: 52 Mosley Street, Manchester, 2.
Liverpool Branch: 27 Derby House, Liverpool, 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank, under British management directed from London, are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

STRENGTH AND INTEGRITY

Friendly contact with each customer is synonymous with the banking house of Glyn, Mills & Co. No matter whether it is a private customer or a large concern, this bank still preserves the personal touch. It also provides a completely modern banking service, one that has earned a reputation for strength and integrity throughout the world.

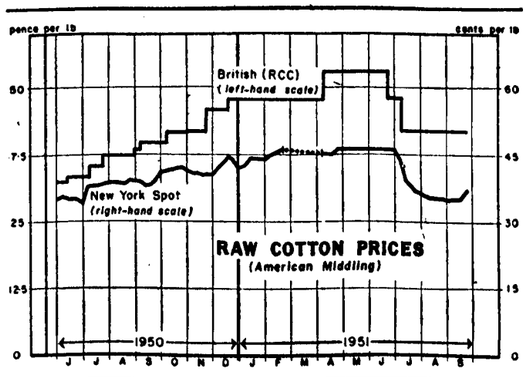
tons divided equally between home and exports; and any additional supplies divided in the proportion of two-thirds home, one-third exports. German scrap supplies totalled about 400,000 tons a month when its scrap drive was launched some months ago; but hardly any increase has been achieved since then. Hopes of an extra 100,000 tons have now dwindled to estimates that perhaps 30,000 tons a month extra might be achieved. The success of the drive is being jeopardised by scrap hoarding, partly to keep the metal in Germany and partly in hopes of a rise in the German internal price, which is considerably lower than that prevailing on the world market.



Monthly supplies of even 425,000 tons, therefore, would yield for export a total of only 62,500 tons. Of the total exports, Britain and the United States are to receive 60 per cent, which on these figures would thus yield 37,500 tons. There is no official formula for the final division between the two countries; but in the past Britain has generally received two-thirds of the combined exports. A fairly optimistic estimate, therefore, would suggest 25,000 tons monthly. Imports of scrap, therefore, cannot be expected to total much more than 550,000 tons for 1951 as a whole: and next year total imports will probably be well below 400,000 tons. This 1951 figure corresponds roughly with the revised estimates the British steel industry has already made: the year's total supplies of scrap, from home and abroad, are expected to be about 9,500,000 tons. Next year, moreover, the drawings upon stocks and diversion of scrap from blastfurnaces that have supplemented "home arisings" this year cannot be counted upon. The British scrap drive may bring in half a million tons more: though as yet the increase in collections from outside the industry in response to the new prices has not been as great as was hoped. A rough and ready estimate of steel scrap supplies for 1952, therefore, might be 9,000,000 tons or slightly less. This figure throws emphasis upon the critical importance of iron ore supplies, from home and from abroad, in the maintenance of steel output next year. It also suggests that American assistance to British steel supplies next year could effectively take the form of a reduction of American claims upon imported raw materials and need not be confined to the shipping to this country of extra supplies of American steel.

* * *

Dearer Cotton and Wool

So the signal for the housewife has been set at green; she can now enjoy a buying spree with the blessing of the Minister for Local Government and Planning and his assurance that "price rings for clothing and textiles are broken" and the profiteers "in full retreat." But Dr Dalton forgot to tell his audience last Tuesday the simple fact that prices of raw cotton have been rising for the past three weeks while the protracted fall in wool prices at last seems to have come to an end. The buyers' strike and its Ministerial ringleader have made no impression upon world markets. Eighteen years ago, a sharp fall in British demand for any of the major raw materials might have engendered a fall in its world price. Now it is the United States that is able to call the tune on the commodity markets, and Britain takes second place.

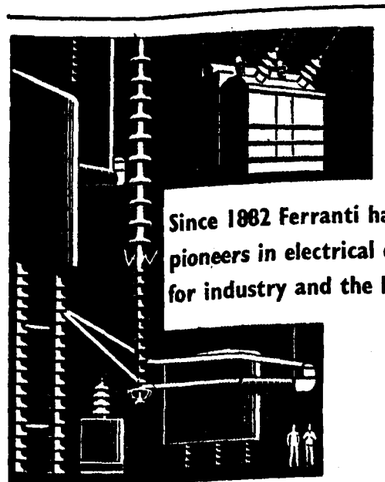
The firmer trend in cotton prices first became apparent in the futures market, but during the past three weeks the New York spot quotation has risen from 35 cents a lb. to 37¼ cents. This rise might seem surprising in view of the large American crop. But, as a note on page 710 of last week pointed out, total available supplies of cotton this season are not much larger than in 1950-51 and the carry-over stock on August 1st was extremely small. American cotton growers have apparently accepted the advice tendered to them to put their cotton "in loan," and quite a sizeable quantity is reported to have been transferred to the Commodity Credit Corporation. The Raw Cotton Commission has raised its selling price of American cotton for forward delivery three times in one week and the standard grade for January is now 36½d. a lb. compared with 35d. a fortnight ago. British prices are now some 7d. a lb. higher than corresponding American prices, and although the Commission justifies this anomaly by saying it is encouraging spinners to use substitute growths, textile importers of other countries are not satisfied. Prices in Alexandria also rose at

the beginning of the week; Karnak jumped by 6d. a lb. on Tuesday and on the following day the RCC raised its rates by 4d. a lb. only to reduce it by 1d. on Thursday when Alexandrian prices fell.

The firmer tone that reigned in the wool market at the end of last week has been fully maintained. Bradford has been buying more freely in the London sales, and so has the continent. In Australia prices have tended to rise, and are now more or less equivalent to the London rates; both Japan and the United States have been buying fairly large quantities in Melbourne. It is seldom wise to prophesy about the future course of the wool market, but in view of the low level of stocks in manufacturers' hands throughout the world, it does seem that the fall in wool prices, which has persisted for six months, has come to an end.

* * *

Aluminium Cans?



Among container manufacturers, the idea of using aluminium in food canning is not as novel or necessarily as attractive as it may appear to the administrator of America's Reconstruction Finance Corporation; and British experts, at least, did not take too seriously Mr Stuart Symington's dramatic disclosure last week of two "substitutes for tinplate." But the materials themselves, as distinct from their rhetorical convenience in attacks upon tin producers, are arousing some technical interest—admixed with commercial scepticism. The Reynolds Metal Company, of Virginia, which informed Mr Symington of its new products—an aluminium-plastic "laminate" and aluminium-coated steel sheet—did not, apparently, expect the publicity he gave them; it has not yet been able to obtain a final patent upon the aluminium-plastic process.

This material, which Reynolds expects to bring into production "almost immediately," is heavy aluminium foil coated by a continuous process with plastic—the vinyl group and polyethylene are among those suitable, according to the company. Further thicknesses may be added to this first layer if required. The initial output will go into food cans for the American Army until the aluminium shortage is overcome: eventually, Mr Louis Reynolds commented last week, cans could be produced in this way by the food or perishable processing plants, producing a container tailored to its contents and obviating shipping of empty cans. He asserted that the material would be competitive in price with regular tinplate and "in many cases actually cheaper."

"South African Sherry for me every time

So I've converted you, too, then?
You certainly have! Do you remember you told me to look specially for the fine South African sherries. Since then I've found some which are just exactly to my taste.
And don't you find them easy on the pocket, too? That means something these days!
Yes, how is it they can send us such remarkably good wines at such a reasonable price?
Well, there are two reasons: that amazing climate of theirs at the Cape, and then the Preferential Duty.
No wonder South African Sherry is becoming so popular, then.
It deserves to be. Do you know they've been making wine in South Africa for nearly 300 years. With all that experience behind them and the splendid organization they have now built up, they're able to produce the very highest quality. Their really fine wines are matured for many years before they're shipped to this country.
I suppose we can now say, then, that South Africa is one of the leading wine producing countries?
Well, wouldn't you say it was, from the taste of this sherry? **Let me fill your glass!"**

This last claim is difficult to accept without further elucidation. At present, both aluminium and most plastics are more expensive than tinplate, thickness for thickness; it is not easy to see how their combination by a mechanical process could give a material competitive in price, unless it were so reduced in thickness as to make the can impracticably weak. Moreover, tinplate cans are mass produced at the rate of 300 a minute: since no satisfactory method of soldering aluminium in a continuous process has yet been evolved, the making of laminated cans would seem to offer formidable production problems. Sheet aluminium has been used for fish canning in Norway, where hydro-electricity makes the metal cheaper than tinplate, since the first world war, and it has been tested for most foods; but even when lacquered it seems less widely applicable than tinplate, and in most countries the price comparison has put it out of court. Reynolds's second material, aluminium-coated steel sheet, is new only in process of production, aluminium foil being rolled on to both sides of the steel to form a sandwich. Various coating methods are known experimentally: at present, for example, the British Iron and Steel Research Association is conducting research into a hot-dip process similar to galvanising. Such tests as have been carried out with aluminium-coated steel have not suggested that it could easily replace tinplate, though it might find other useful applications.

More Stable Prices?

Nothing was done at the meeting of the North Atlantic Council about stabilising raw material prices; so much was clear from Mr Hugh Gaitskell's remarks before he left Ottawa. Mr Gaitskell said in London on Tuesday that it would be helpful to the sterling area if America bought steadily at "prices which seemed reasonable to both sides." He would not elaborate on the meaning of "reasonable," but it was clear that, so far as his mission to Washington and Ottawa was concerned with promoting an agreement on stabilising raw material prices, it did not produce any immediate result. The International Materials Conference is to continue its work in Washington of co-ordinating the buying policies of the western powers through joint consultation or by allocation schemes when necessary. In this way it is hoped to prevent any repetition of the fantastic rise in commodity prices that took place between September, 1950, and March, 1951. The impact of actual arms production has not yet been felt on either the demand for raw materials or on the level of earnings. But when it is felt (possibly some time next year), a renewed up-surge of prices is to be expected, unless common action is taken by the larger consuming countries. And it is then that the real value of the IMC will be put to the test.

During the past two or three weeks commodity prices have moved irregularly. Wheat has gone up and maize has gone down. Both sugar and cocoa are cheaper than they were at the beginning of the month, while coffee is, if anything, a little dearer. Cotton has risen by 2 cents to 37¼ cents a lb. during the past three weeks, while wool prices, which continued to fall during the first half of September, are showing a very slight recovery. Jute, which fell sharply after June, has risen slightly this month, though sisal has declined by £5 to £240 a ton. Both rubber and tin have shown little change on balance this month, though the daily fluctuations have been considerable. Prices of copper, lead, zinc and tungsten have all remained unchanged. Tung oil and tallow are a little cheaper on the month and shellac a little dearer. From these conflicting trends, it seems that the general fall in prices has petered out; the question remains whether prices are likely to keep fairly stable at this lower level or whether in a month or so they will begin to rise once more.

COMMODITY PRICES

	June 20, 1950	Mar. 27, 1951	June 5, 1951	Sept. 5, 1951	Sept. 12, 1951	Sept. 19, 1951	Sept. 26, 1951

Science Looks at Coal

Roughly 20 million tons of coal—the ten per cent that modern coal-cutting methods turn into dust—are wasted into the underground atmosphere of British pits every year: dust represents not only a danger to miners' health and safety but a margin that, "turned into good-sized coal," could banish home and export shortages from this country. Making that possibility practicable—devising cutters that waste less, methods of carrying all the coal to the surface whatever its size, and reconstituting tonnage that is now wasted into manufactured fuels—is perhaps the most important project of the National Coal Board's central research establishment at Stoke Orchard, Gloucestershire. Last week its director, Dr J. Bronowski, indicated that the work is making some progress. At the coalface, the trend is towards cutters using fewer men and loading all the coal cut; in underground transport and raising, towards the use of pipelines to pump coal, suspended in water, to the surface: and in manufacture, towards the production of satisfactory "briquettes" from the widest possible range of coals and slurries.

"Briquettes" and "ovoids" have an understandably mixed reputation among domestic fuel users. They range from "Phurnacite"—which apart from the best sized and cleaned anthracite is perhaps the best solid fuel obtainable—to the low grade ovoids, composed of "slurry and anthracite dust" (and much more besides) produced in large quantities during the late war. Demand for these has dropped since; the Coal Board acquired 20 briquetting plants from the former coalowners and ten ovoid plants from the Ministry of Fuel and Power, but not all of these are now operating. Last year's output of both manufactured types was about 1,100,000 tons.

Considerable success has been obtained in producing these carbonised briquettes, and other fuels such as "semi-coke," from a wide range of coals. There is a body of opinion in the industry, moreover, that looks towards manufactured fuel, possibly tailored for any specific purpose, as the proper product of the coal industry of the future. Sir Charles Ellis, the Board's member in charge of scientific affairs, has spoken of an industry using coal as a raw material. His "factories" would manufacture it into solid fuels of various branded types, into chemical by-products, into tar, and possibly into certain liquid fuels. Such liquid fuels would not necessarily be fuel oils made by hydrogenation or other processes; investigations are being made into semi-liquid substitutes for heavy fuel oils. Briquettes designed for specific uses—for example, in locomotives—have already been produced at Stoke Orchard. It should be noted that the various ventures are all medium- or long-term projects, and cannot be expected to give considerable results for perhaps a decade. But they illustrate one department, at least, in which the Coal Board is not too constantly worried to think.

Tramp Tonnage Stabilisation?

A year ago, when freight rates stood at about 75 per cent of the 1948 level, tramp shipowners were beginning to worry about the possibility of laying up vessels through lack of profitable employment. Although this fear proved to be baseless, work was continued on preparing a tonnage stabilisation scheme on a co-operative basis, whereby owners who laid up their vessels would be compensated out of levies on the earnings of ships in service. This plan has been carried a step further by the registration of the Tonnage Stabilisation Association, Ltd., a company limited by guarantee without share capital, to which 23 leading tramp shipowners are named as subscribers. The objects of the company are to compensate members on the mutual principle against losses incurred in the business of shipowning or in connection with the operation of merchant ships, and to carry into effect a tonnage stabilisation scheme. If in a weak market freights are reduced to an unremunerative level, the pressure of tonnage on the market can be relieved by laying up surplus vessels, instead of leaving them to fight for unremunerative freights. Compensation would be paid to laid-up vessels by a levy on the gross tonnage of vessels still employed.

To make this scheme workable, it is essential that all dry-cargo tramp shipowners, British and foreign, should co-operate. So far, the British tramp industry as a whole is not committed, though it is open for the deep-sea tramp section of the Chamber of Shipping to adopt it as and when circumstances warrant. Meanwhile the machinery has been set up and it is open to individual owners to subscribe. Membership will not be confined to British shipowners; the co-operation of foreign owners would be necessary to guarantee success. So long as freight rates remain at their present levels, there is no immediate need for the scheme. Individualism among tramp shipowners in the past has militated against a scheme which depends on co-operative action in an international industry, but the similar scheme for tankers (the International Tanker Pool), which operated before the war and of which the machinery is still in existence, shows that such co-operation can succeed.

Shorter Notes

The eighteen member countries of the Organisation for European Economic Co-operation have agreed to prohibit, as from October 1st, the use of copper and copper alloys of 40 per cent or more by weight in the manufacture of some two hundred different commodities ranging from window frames to cocktail shakers. The list of prohibited uses has been agreed by all member countries, who have also agreed not to export to each other any manufactures on the list containing more than 40 per cent copper. This joint action is intended to alleviate the world shortage of copper and to free supplies for defence purposes.

*

Since October, 1938, wage rates have risen by roughly 90 per cent; but average earnings have risen by 156 per cent. The Ministry of Labour's half-yearly inquiry into average earnings and hours of work (in some 60,000 industrial establishments) shows that average earnings in the last pay-week in April this year were £6 16s. 2d. for all workers: £8 0s. 2d. for men throughout industry; and £8 5s. for men in manufacturing industry. These averages exclude among other occupations agriculture, where men's average weekly earnings for the six months up to the end of March last were £5 15s. 6½d.; coal mining, in which men's average earnings in the week ended April 7th were £10 9s. 8d.; and dock labour, where in the three months April to June, 1951, average earnings were £9 15s. 11d. a week.

*

Certain estimates that are of value in clarifying the current controversy about the extent to which retail clothing prices may be expected to reflect fluctuations in wool prices are given in a note on "Cost Components of Wool Suits," published in the latest bulletin of the London and Cambridge Economic Service. From an analysis of controlled prices for utility suits and corresponding prices of yarn, wool tops and raw wool, A. P. Zentler and Joan Gherson estimate that at the end of 1950 wool represented only about 7-14 per cent of the retail price of men's and women's suits (without purchase tax). The periods of production the authors assumed are also of interest. They were: from wool to top and from top to yarn, 3 months for woollens and 6 months for worsteds: from yarn to cloth, 7 months for woollens and 11 months for worsteds; from cloth to suit, 6 months for woollens and 4-5 months for worsteds.

*

It is to be hoped that all former owners of coal mines in South Wales will be able to accept the agreement upon division of the district's £14,231,000 "global award" that their representatives approved last week: any advance in the snail's progress of coal compensation is welcome. Such voluntary agreements, by which coalowners hope to bypass the slow process of district valuation, have as yet been concluded only in four small districts—Kent, Cannock Chase, Leicester and Somerset; in the remaining 16 districts, which include the bulk of the industry and therefore of the compensation, little progress has been achieved. Agreement upon such schemes must be unanimous if the district valuer is to accept it as the basis of his own valuation. Companies that hold out for a fractionally larger share of the fixed total sum may be protecting the interests of their shareholders in theory; but in practice they are bargaining for a slightly larger compensation in money that may eventually buy less.

*

A new 2,050-foot shaft, and a mill to handle 10,000 tons of ore a day, have been completed by the International Nickel Company of Canada at its Creighton mine. The project, which cost $17 million, is part of the company's $100 million expansion plan to raise its output of ore from 5,700,000 tons in 1950 to 13 million tons in 1953. From the new Creighton installation the concentrate will be piped for 7½ miles to the company's production plant at Copper Cliff.

ECONOMICS—Postal Tuition

- Founded in 1887, U.C.C. provides tuition for the B.Sc. Econ. Degree of the University of London, open to all without residence or attendance at lectures. **The College is an Educational Trust, not conducted primarily as a profit-making concern,** and has a staff of highly qualified Tutors. Fees are moderate, and may be paid by instalments if desired.
- SELF-EDUCATION COURSES are available in Economics, Economic History, Statistics, Foreign Languages, etc.

Company Notes

Davy and United Engineering.—The carrying out of the immense plans of modernisation, re-equipment and expansion by the British steel industry since the war owes much to the ability of Davy and United to provide much of the heavy capital equipment. Davy and United quickly embarked on its own development policy and re-equipped its plant. This programme, which involved some extension of capacity, is now almost completed. Ample justification for the company's initiative is to be found in the expansion of profits in the last two financial years; earnings in each of these two years have been more than double any previous records. Last year Mr D. F. Campbell, the chairman, pointed out that the year's profits of £713,207 were somewhat exceptional as a number of long-term contracts were completed in this particular period. The fall in profits to £675,179 in the year ended March 31, 1951, should not therefore give rise to critical comment. The directors, in fact, consider the year's results "as eminently satisfactory and more representative of a normal year of full employment at our factories." A few shareholders may feel that the maintained ordinary dividend of 10 per cent, to which it was raised from 7½ per cent in 1950, barely reflects a due share in the company's prosperity. Mr Campbell forestalls such criticism by suggesting that penal taxation is making it impossible to plough back sufficient profits, once "the necessary reserves dictated by ordinary prudence" have been made, to meet the cost of maintaining the company's productive equipment "at a proper level of efficiency and abreast of progress."

The pace of plant replacement and improvement has to be maintained. It appears that this factor, coupled with the year's satisfactory results and the happy prospect of a full order book, was in the directors' mind in deciding to increase the company's equity capital. Stockholders are to be offered the right to take up the issue of 47,069 £1 shares at par in the proportion of one new share for every £20 stock held.

	Years to March 31, 1950	1951
Consolidated Earnings :—	£	£
Trading profit	713,207	675,179
Total income	722,959	691,446
Depreciation	50,229	53,624
Taxation	272,842	263,460
Group earnings for ordinary stock	*152,911*	*144,333*
Ordinary dividends	51,769	49,415
Ordinary dividends (per cent)	10	10
Replacement reserves	80,000	80,000
Added to general reserves and carry forward	101,142	94,918
Cons. Balance Sheet Analysis :—	£	£
Fixed assets, *less* depreciation	1,151,132	1,217,503
Net current assets	910,397	1,062,899
Stocks	769,874	895,437
Cash	212,564	40,558
Reserves	1,120,279	1,338,952
Ordinary capital	941,250	941,250

£1 ordinary stock at 42s. 0d. yields £4 15s. per cent

The balance sheet calls for little comment. The bank overdraft has been reduced from £65,944 to £57,757, the whole of the latter amount apparently being owed by the parent company, but cash balances have fallen sharply from £212,564 to £40,558. This stringency of liquid resources may be relieved in part by the rights issues.

Davy and United have already made a notable contribution to the installation of modern strip mills at Margam, Ebbw Vale and Shotton, but much new equipment is still needed in British works and elsewhere. Of the orders in hand about half are for export; one of the most important export contracts is for the installation of plant, designed for an ultimate annual capacity of 650,000 tons, in northern Norway. It is not surprising that the company's order book is of "great magnitude" and that demand "continues unabated."

William Doxford.—Many shareholders will find it difficult to agree with the decision of William Doxford's directors to lower the ordinary dividend from 20 to 17½ per cent. This rate, the directors state, is "the maximum permissible in view of the Government's declared intention to control dividends." This amounts to an acceptance of government by White Paper, even with a general election in a month's time. It is to be hoped that if the Conservatives are victorious at the polls the board will reconsider its decision. A dividend of 20 per cent has been paid since 1947; the company also made bonus issues to ordinary shareholders in 1949 and 1950, which have been taken into consideration in calculating the "maximum permissible" dividend.

	Years to June 30, 1950	1951
Earnings :—	£	£
Profit before tax	493,433	600,442
Taxation	217,000	305,000
Earnings for ordinary stock	*95,287*	*191,348*
Ordinary dividends	63,937	55,125
Ordinary dividends (per cent)	20	17½
Plant renewal reserves	84,335	18,219
Added to general reserves and carry forward	36,890	136,225

£1 ordinary stock at 86s. 6d. yields £4 1s. per cent.

The company's prosperity in recent years and the latest improvement in profits before tax from £493,433 to £600,442 only serve to make the dividend decision more disappointing. The chairman remarked a year ago that orders then outstanding ensured full employment for nearly three years ahead, chiefly owing to a large demand for tankers both for home and overseas shipowners. The preliminary profit statement calls for little further comment, except to note that the taxation provision of £305,000, against £217,000, takes more than half of net profits before tax.

For the third consecutive year the company is to make a bonus issue of £50,000 of new ordinary shares, this time in the ratio of one fully paid new share for every twelve. A regular scrip bonus has some attraction for equity shareholders, but it may not prevent them from questioning the decision to cut the ordinary dividend rate this time.

★

Electric and Musical Industries.—Until the votes have been counted on October 25th some uncertainty must still exist whether the Government's dividend control proposals are dead or not. Given these doubts, the directors of Electric and Musical Industries have shown wisdom in declaring an interim ordinary dividend of 8 per cent and in recommending a final dividend of 4 per cent at the annual general meeting in December, which "if circumstances permit" will be paid, and if not will be carried to a special dividend reserve. A dividend of 8 per cent has been paid since 1943, except in 1947 when the rate was reduced to 6 per cent. On the day before the announcement the 10s. ordinary shares changed hands around 21s.; after these recommendations were published the price jumped to the year's highest price of 23s. 10½d.

Group profits for the year ended June 30, 1951, are stated to be "substantially higher" than in the preceding year, but "owing to the complexity of the accounting involved" the exact figure of profits will not be available until the end of October. Evidently the results to be published next month will show a major improvement on those of 1949-50, which disclosed a fall in group profits from £1,040,418 to £916,238. At the current "middle" price of 22s. the yield, assuming the payment of a full dividend of 12 per cent, is £5 9s. per cent.

Statistical Summary

EXCHEQUER RETURNS

For the week ended September 22, 1951, total ordinary revenue was £53,839,000 against ordinary expenditure of £75,835,000 and issues to sinking funds £10,000. Thus, including sinking fund allocations of £9,080,000, the deficit accrued since April 1, 1951, is £30,976,000 compared with a surplus of £102,422,000 for the corresponding period of the previous year.

COMPANY MEETINGS

GEORGE COHEN SONS AND COMPANY

(Engineers and Iron, Metal and Machinery Merchants)

HIGHLY SUCCESSFUL YEAR'S TRADING

ORDERS ON HAND REACH RECORD LEVEL

TAXATION: ALARMING DRAIN ON BUSINESS LIFEBLOOD

MR. CYRIL M. COHEN ON FINANCING OF IMPRESSIVE EXPANSION

The twenty-seventh annual general meeting of George Cohen Sons and Company Limited, was held on September 26th at Grosvenor House, Park Lane, London, W., Mr. CYRIL M. COHEN (chairman and managing director) presiding.

The following is the statement by the chairman which had been circulated with the report and accounts:—

I submit herewith the directors' report and statement of accounts for the year ended March 31, 1951.

In addition to the usual explanatory chart we include, for your interest, other information relating to the Group's activities and earnings and we also show the movement of funds—to which I will refer later—since March 31, 1947, in which year the company was made a public one.

SATISFACTORY COMBINED PROFITS

It is gratifying to your Board to report a highly successful year's trading. The results reflect the greatest credit on the managements, staffs and workpeople of the "600" Group of Companies. In a year complicated by shortages of many materials and during a period in which we carried through important measures of reorganisation, they showed the most commendable initiative, skill and adaptability. The fact that they were assisted in some directions by favourable trade winds in no way detracts from their achievements and I am glad to record this tribute.

The table on page 8 of the report shows that the net profits applicable to the stockholders of the Parent Company amounted to £847,000, an increase of some £500,000 over the abnormally low profit made last year. It will be seen that £422,000, or roughly half, was earned by our manufacturing units and half by our merchanting and related engineering work.

Improved Merchanting Results. — The improvement was most marked in our merchanting organisations. Here we experienced a large increase in demand for capital goods and the radical alterations made in our structure resulted in more efficient and economical working.

Last year I attempted to correct a mistaken view regarding our trading in non-ferrous scrap metals, but since this error appears to persist in some quarters, I feel I should repeat that, as a point of policy, we avoid speculation. Although our metal departments showed improved out-turns, the sharp movements in prices had relatively little effect on aggregate results.

Margins in scrap iron and steel remained extremely lean, but in recent years we have invested large sums in the mechanisation of our scrap yards, and our output, once again, was greater. We were thus able to minimise, but not to eliminate, the effect of the heavier costs of recovery and processing. Since the close of the financial year, however, the predicted shortage of iron and steel scrap has made itself felt.

The necessity to speed every possible ton to the consuming works has, as is well known, become of paramount importance to the country's economy; and we are striving by every means in our power to support the scrap drive at home and to discover additional sources of supply throughout the world.

Higher Manufacturing Outputs. — In spite of the rising costs of materials and services and the mounting difficulties of obtaining raw materials and suitable manpower, our main manufacturing plants, K & L Steelfounders and Engineers, Limited, and T. C. Jones and Company, Limited, thanks to improved equipment and methods, again enlarged their outputs and were also able to show substantial improvements in net earnings. Actually, all our trading subsidiaries, without exception, yielded higher profits.

On page 8 of the report we make some calculations relating to earnings and true capital employed; and we also give a simplified profit and loss account with comparative figures for the previous year.

CONSOLIDATED BALANCE SHEET

The main financial changes disclosed by the balance sheet are summarised on the chart accompanying the report and it will be seen that the group overdraft, to which I made special reference last year, has now been reduced by £431,000 to £222,000.

You will observe that inventories were decreased by £351,000. Although, by dint of selective buying and vigilant control, we have managed to carry a much reduced stock, whilst yet supporting a substantial increase in turnover, part of this reduction, resulting as it did from the inadequacy of steel supplies, was unwelcome.

Debtors have risen by £642,000, largely due to the higher turnover and to some special transactions in the closing weeks of the year, but the figure also reflects a tendency on the part of some customers to take longer credit.

The negotiations, to which I referred last year, in connection with the compulsory transposition of the Parent Company's Canning Town depot to an adjacent site, have at long last been completed and the formal agreement, between the Company and the various Authorities concerned, has just been exchanged. It can, therefore, be expected that the compensation due to us will shortly be assessed and settled.

CAPITAL PRESERVATION

The combined effect of the fall in the value of the £ and the crushing burden of taxation is jeopardising the productive resources of this country. Frequent references to this have, of late, been made in the statements of company chairmen, and it cannot be emphasised too strongly or too often. It is no exaggeration to say that if these two evils persist, the inevitable result will be a rapid dissipation of the nation's capital.

In order to mitigate the effect of these dangerous influences on your Group's resources and to ensure, as far as practicable, that adequate funds are available to meet the rising costs of stock replenishment, plant replacement and improvements, your Board—in common with industrial managements generally—has striven to increase earnings and has limited distributions.

The Government should realise that the directors of large and old-established industrial concerns, being fully mindful of their heavy responsibilities, can be relied upon to pursue voluntarily a prudent financial policy; and, further, that omnibus legislation, since it is heedless of the special considerations that apply to particular cases, must often provoke injustice.

Financing of Impressive Expansion.—You will like to know in greater detail how your Group has fared so far and at the foot of page 9 we give a statement showing the movement of funds from April 1, 1947, to March 31, 1951.

In this period of four years, during which annual turnover has increased from £6,500,000 to approximately £12,000,000, and assets from £4,500,000 to £6,600,000, your Group has been able to preserve its capital intact. The impressive total of £1,224,000 has been expended on replacements of, and extensions and improvements to, its productive facilities. The proceeds of the additional £500,000 Preference Stock issued in 1948 were of material assistance but, this apart, the Group has provided the extra working capital to support the large expansion from its retained earnings.

How long we can remain successful in this respect it is, of course, difficult to predict. But as a measure of the problem it may be of interest to you to know that for every £100 which your Board considered it necessary to earn in 1947 so as to give a reasonable return on your investment and to provide for replacements and healthy growth, it is now considered necessary to earn over £140.

In passing, it is also interesting to note, from the summary given, that of trading profits earned during the four years amounting to £2,653,000, a net sum of only £401,000 was paid in dividends, whilst no less than £1,566,000 was taken by taxation—surely an alarming drain on the lifeblood of a business and liable to lead to chronic anæmia.

Accounting Treatment.—Recently some companies have taken account of the falling value of the £ by earmarking reserves for specific purposes and have, in certain cases, departed from traditional methods of valuation of assets.

If funds are adequate to cover all responsibilities—as they happily are, so far, in our case—the precise method of presentation of the accounts assumes secondary importance. But, in view of the two schools of thought that exist, you may be interested in our reasons for adhering to orthodox practice.

An extra provision for depreciation computed at current replacement costs over the anticipated life of the assets would almost certainly prove inappropriate for our requirements during the next few years. Additionally a "Stock Replacement Reserve" could only be calculated on information available at a particular time and would stand to be falsified by changes in the composition of stocks due to alterations in designs and methods, or other causes.

To take the further step and depart from the generally accepted bases of valuation of assets could, in some circumstances, react to the detriment of stockholders who, after all, are primarily interested in the earning power of those assets.

Therefore, whilst budgeting for our financial requirements in advance, we have not earmarked our reserves—preferring the advantage of retaining flexibility in their utilisation—nor have we revalued our fixed assets.

I might add that companies have recently suffered from decrees which were designed to placate interests that remain oblivious to the true nature of company reserves. It is quite conceivable that predatory fingers might be pointed at the notional reserves created by revaluations of assets as "large untapped sources of wealth" remaining untaxed.

APPROPRIATIONS

The balance of net profits, after taxation, applicable to the stockholders of the parent company, amounted to £331,983. After paying the dividend on the Preference Stock, £37,125, and the interim dividend on the ordinary stock, £26,400, there remained £268,458.

Final Ordinary Dividend.—The profits for the year under review, the present financial position of the Group, and the immediate outlook, amply justified a modest increase in the ordinary dividend, and your Board, on July 24th, therefore decided to recommend a final payment of 15 per cent., making 23 per cent for the year. The net cost of the extra payment, including the additional profits tax incurred is £13,230.

We have transferred £64,000 to general reserve, restoring the total to £700,000, and we have written off £21,948 relating to the new Pension Scheme. Subsidiary Companies have retained £134,957 and, if you approve the final dividend, the Parent Company's carry-forward will be increased by £303 to £65,707.

Pension Schemes.—During the year we widened the scope of our pension schemes to include certain categories of female and works staff who were not formerly eligible, and the amount of £21,948 charged in the accounts is an actuarial assessment of the net capital cost of pensions relating to back service of the entrants to the new scheme.

The trustees of this scheme will, as a matter of convenience, also administer on behalf of the group the funds set aside to provide the ex gratia pensions which are being paid. The capital cost of these pensions was computed at some £44,000 and we have paid this sum to the trustees, reducing the Employees Pension Fund, which had borne tax in previous years, by a net amount of £20,684.

OUTLOOK

Our manufacturing plants continue to extend the range and scope of their products and orders on hand have reached a record level. Their capacities are devoted to the execution of contracts of the greatest industrial importance. Shortages of essential materials during the past year were serious handicaps to production and were only alleviated by costly improvisation and unremitting ingenuity. Subject to their achieving the same measure of success in resolving such troubles, I have no doubt that these works will continue to flourish.

To date there has been no falling off in the heavy demand for machinery and our reconditioning shops are kept fully occupied. Supplies of the high-class equipment in which we deal are becoming more difficult to procure but we are re-doubling our efforts, both at home and abroad, to buy what is needed. In this connection, we have been able to secure for the Ministry of Supply a very large number of new Continental machine tools which are required for the Defence Programme. We have placed contracts for these with manufacturers of the highest repute, for whom we act as sole agents in this country. Deliveries began in March and will progressively increase for some while to come. Taking a view over all the prospects for the current year, I feel justified in closing on a note of optimism. My optimism is somewhat tempered, however, by the thought that existing difficulties may become more acute in the future and, furthermore, that, in these unstable times, new adverse influences, quite outside our control, might be introduced into the sphere of business.

The report and accounts were adopted.

BRITISH HOMOPHONE COMPANY, LIMITED

MR J. LESSER'S SPEECH

The annual general meeting of The British Homophone Company, Limited was held on September 26th in London.

Mr J. Lesser, chairman and managing director, after expressing regret at the death of the late chairman, Sir Herbert Morgan, said that the net profit for the year, before providing for taxation, was virtually unchanged from last year at £14,725 as compared with £15,122. The taxation charge was slightly higher by virtue of the profits tax on the higher dividend, with the result that the net profit after taxation was £4,818 as compared with £6,222. The balance sheet was almost unchanged and, therefore, the strong position was maintained.

During the year there had been a substantial increase in the turnover of Ebonestos Industries, Limited, with the result that the consolidated profit and loss account showed an improvement. The combined figure, before taxation, was £29,498 as compared with £11,499. The taxation charge was correspondingly higher, with the result that the profits, after all taxation, were £12,574 as compared with £2,599.

At the last annual general meeting Sir Herbert had pointed out the necessity of exercising caution in assessing the results for the year now under review. They were then facing problems such as recruiting and training new labour and difficulties in obtaining certain raw materials. The results shown had been achieved in spite of those difficulties, which, he must add, were still with them. Nevertheless, taking all things into consideration, the board assessed the trading of the companies, in so far as the foreseeable future was concerned, as progressing satisfactorily. Incoming orders were being well maintained, labour personnel had been steadily increased and production elasticity was to some extent compensating for the immediate lack of all raw materials required at a given time.

The report was adopted.

WATNEY COMBE REID AND COMPANY, LIMITED

EXPANSION IN EXPORTS

The ordinary general meeting of Watney Combe Reid and Company, Limited, was held on September 21st in London, Mr S. H. Combe, M.C. (the chairman) presiding.

The following is an extract from his circulated statement:

The last year's trading has been difficult in the extreme and we have suffered from ever rising costs. Comparing present day costs with those of 1938/39, barley has risen by over 300 per cent., hops by nearly 300 per cent., wages by 250 per cent., general overheads by over 200 per cent., bottling costs by nearly 300 per cent., building costs have risen between 2½ and 3 times compared with prewar. Beer duty per standard barrel was 104s. in 1939 and is now 321s. in 1951.

The year under review has seen an appreciable expansion in our export trade, and results in this direction are encouraging. At home the change in popular taste from draught to bottled beers continues with increasing momentum. Active steps have been, and are, being taken to increase our output at all our stores.

In March last we made an offer for the equity holding of Charles Hammerton and Company, Limited, and we have recently completed the purchase of the whole of the ordinary shares.

THE NEW TOWNS

We are beginning to see the fruits of the Licensing Act, 1949. Plans have been prepared and financial provision made for the building of State public houses in several new towns. Although naturally opposed in principle to State Management, the trade has made clear its willingness to co-operate with the Government in the State Management areas. We hope that our genuine desire to be of assistance will be reciprocated by those responsible, ensuring that a fair proportion of licensed premises in those areas is allowed to remain under private enterprise. This would be in accordance with the Government's policy of encouraging the competition of private and public enterprise.

The profit on trading at £1,434,852 compares with £1,452,329. The profit for this year, before providing for taxation, is £96,882 lower at £1,434,815, and having regard to all the circumstances I do not consider this unsatisfactory.

A final dividend of 10 per cent. and a bonus dividend of 2 per cent. making, with the interim dividend already distributed, 17 per cent. for the year is proposed.

In regard to the outlook for the future, I find it difficult to see any immediate prospect of an increase in beer consumption. In fact, with ever increasing demands on the spending power of the public, a continued decrease in consumption would appear more probable.

Addressing the meeting the chairman said:

Since the statement was issued there has been another serious rise in one of our chief raw materials—that is barley—amounting at the present time to an increase of over 60s. per quarter. This represents a rise of over 7s. per barrel in our production costs and in the case of export beer, which is, of course, of a much higher gravity, a rise of from 12s. to 14s. per barrel.

The report was adopted.

DAVY AND UNITED ENGINEERING COMPANY, LIMITED

EMINENTLY SATISFACTORY RESULTS

DEMAND UNABATED

MR D. F. CAMPBELL'S SPEECH

The seventy-eighth annual general meeting of Davy and United Engineering Company, Limited, will be held at the Royal Victoria Station Hotel, Sheffield, on October 12th.

The following is the statement to be made by the chairman, Mr D. F. Campbell:

The net profit for the year, after providing for depreciation and taxation, is £279,333. This compares with £327,911 last year. You will recall that in my statement last year I mentioned that an exceptional number of major contracts came into account as finally completed and, in consequence, that year's profits should be regarded as correspondingly exceptional. Your directors consider the results for the year under review as eminently satisfactory and more representative of a normal year of full employment at our factories.

The only item in the accounts calling for comment is the smaller appropriation this year (£30,000 against £70,000) to the Group Income Tax Initial Allowances Equalisation Reserve. This arises from the lower amount of capital expenditure in the year now under review. Furthermore, the figure of £70,000 related to capital expenditure over more than one year. Otherwise, the directors' report and accounts are straightforward and call for no special comment. I therefore turn to some of the wider aspects of the Company's affairs.

MODERNISATION POLICY JUSTIFIED

I have said on many previous occasions that the policy of your directors is to bring our designing organisation and our manufacturing plants up to the highest pitch of efficiency and to maintain them at that pitch. When the war ended we had considerable arrears of re-equipment to make good which, coupled with an obviously expanding demand for our products, justified a bold programme of modernisation, with some extension of capacity. That issue was squarely faced and our postwar development scheme is now almost completed.

From the results of the last two financial years your directors may fairly claim that their policy was justified. Not only have good profits been earned, but we still have an order book of great magnitude, and the demand for our products continues unabated. This is the direct result of building up a fine reputation for efficient manufacture and, above all, because our prestige as engineering designers stands high.

This satisfactory position is due to the devoted efforts of the senior members of the Company's staff and the whole-hearted collaboration and loyalty of all engineers, office staff and workpeople, who have each and all contributed to the Company's good reputation and success.

In the year under review we earned a surplus, before taxation, of £542,793. It represents profits earned in an inflated currency by the use of fixed assets, many of which were purchased before the period of postwar inflation. The true worth of the Company's assets is today greatly in excess of the issued capital and it is, therefore, entirely misleading to compare the year's profits with the latter.

HIGH DEGREE OF EFFICIENCY

Having now reached, as we think, a high degree of efficiency we have the task of maintaining and still further improving it. This involves constant expenditure on costly new machine tools and labour saving devices, as there is continuous change in the technique of cutting metals and machining, to say nothing of plant requirements arising from developments in design. The money for such expenditure can only come from new capital or from profits. Your Directors have estimated the probable annual cost over the immediately foreseeable period and it exceeds by a fair margin the nett profits likely to be available. Of our surplus last year of £542,793 roughly half is taken in tax.

The dividend of 10 per cent. (payable in depreciated currency) cannot be considered excessive for a risk-bearing equity of this kind. After making the necessary reserves dictated by ordinary prudence, the balance available for ploughing back is insufficient to meet the estimated annual cost of maintaining the Company's productive equipment at a proper level of efficiency and abreast of progress. In short, either taxation is too high, or our profits are too low, and stockholders will no doubt draw their own conclusions. In fact, this demonstrates how penal taxation is stripping industry of the funds necessary for the maintenance of efficiency.

INCREASE IN ISSUED CAPITAL

Your directors are determined, however, that at any reasonable cost this process of plant replacement and improvement must continue. In view of the satisfactory year's working and the future prospect of work to be done by your Company, your directors have therefore decided that this year they will offer to existing stockholders the right to take up a modest increase in the issued capital in the proportion of one new share for every £20 stock held. Letters of Right will be posted on October 12th.

In my statement last year, I referred to the possibility of further substantial orders for export. Of the total value of orders now in hand, about one half is for export to the U.S.A., Australia, South Africa, India, Pakistan, Burma, Egypt, Portugal, Sweden, Italy, Holland, Norway, Poland, Turkey and Brazil.

CONFIDENCE IN FUTURE

The future of this Company may be viewed with confidence so long as our present leading position in the design of heavy metal-working machinery is maintained and this is supported by efficient shops, with keen and skilled workpeople. Much new equipment is still required in British works, and the modern strip mill installations at Ebbw Vale, Shotton and Margam, to which your Company have made substantial contributions, serve to emphasise the absolute necessity of replacing old equipment which is so wasteful in human energy.

FACTS, FIGURES, AND OPINIONS

These are what you seek in the columns of THE ECONOMIST. The organisation that produces the paper can also serve the needs of business and other clients through:

THE BRITON FERRY STEEL COMPANY

OUTPUT A NEW RECORD

COLONEL J. M. BEVAN'S REVIEW

The sixty-third annual general meeting of The Briton Ferry Steel Company, Limited, was held on September 27th at Briton Ferry, Neath, Glamorgan, Col. J. M. Bevan, M.C., chairman and managing director, presiding.

The following are extracts from the chairman's circulated statement:

On February 15, 1951, the whole of the stock capital of the parent company was vested in The Iron and Steel Corporation of Great Britain by virtue of The Iron and Steel Act, 1949. In addition to the parent company, two of its subsidiaries—the wholly-owned London Works (Barlows), Limited, and the partly-owned Neath Steel Sheet and Galvanizing Company, Limited—were included in the Third Schedule to that Act. Our fully-owned subsidiary, The Briton Ferry Steel and Tinplate Agency, Limited, also became a publicly-owned company on that date. The above changes have necessitated minor amendments to the basis upon which the consolidated accounts are prepared.

During the financial year the directors paid the balance outstanding of the purchase price of the stock units of London Works (Barlows), Limited. As a result of the acquisition of this company during the year 1948, the profits of the group increased from £258,470 for the year to April 3, 1948, to an average of £433,963 for the succeeding three years. As the reference period for determining the compensation value of our ordinary and preference stock occurred in the year 1948 this increased level of profits was not reflected in the compensation value of £1,154,526, upon which figure these profits show a 38 per cent. return.

The group net profit this year of £391,918, although somewhat lower than last year, can be considered satisfactory.

PRODUCTION AND DEMAND

The steel industry of Great Britain reached a peak of production in 1950 in which our steel works played their part by establishing a new record output for the company.

Our re-rolling plant in Birmingham—London Works (Barlows), Limited—and The Neath Steel Sheet and Galvanizing Company Limited, worked to full production; the tinplate works of the group were only able to work to about 70 per cent. of capacity due to an extreme shortage of labour. Every effort has been made to recruit more labour into the tinplate industry, and we are at present employing a considerable number of Italians and other foreign labour, but, despite this, our output of tinplate continues to fall as our labour force diminishes.

In the early part of May this year, it became apparent that, due to a shortage of raw materials and the starting-up of the new steel plant in Port Talbot, certain of the older steel works in South Wales must perforce close down. It was with great regret, therefore, that it was found necessary after 60 years of steel-making for the older of our two steel works to cease operations, though by closing down at this time it gave our employees an opportunity of obtaining further employment at the new works or elsewhere.

FUTURE PROSPECTS

It is understood that the new continuous tinplate mill is likely to commence operations towards the end of the year, but that this will be in addition to the present output, which confirms the views I expressed last year that all the existing hand mills and the necessary labour operating today will be required for some years longer than was originally contemplated.

The report was adopted.

THE GOLDEN HOPE RUBBER ESTATE, LIMITED

The forty-fifth annual general meeting of The Golden Hope Rubber Estate, Limited, was held on September 24th in London.

Sir Eric Macfadyen, the chairman, presided, and the following is an abstract of his address: In the balance-sheet the property items have risen from £412,003 to £465,660, with an increase of £45,840 in issued capital and a new capital reserve of £33,068. These changes mainly follow from the sale of Reading and Tai Tak Estates (the latter having been acquired during the year by amalgamation) and the purchase of Pendamaran; £42,000 has been invested in a local company. The working profit, arrived at after payments for export duty and quit rent amounting to £55,000, is £435,731: reduced by tax provisions of £255,475 to an available balance of £180,256. Two interim dividends, of 10 per cent. each, have been paid, and the directors have placed to a deferred dividend reserve £53,856, the amount required for a final dividend of 25 per cent. which would have been recommended but for the issue of the White Paper on dividend control. £15,000 is transferred to general reserve, £45,122 to cultivation and replacement reserve and £25,000 to dividend equalisation reserve. The carry-forward is £28,315 against £25,836 brought in.

Dealing with the emergency the chairman said: There is now a working plan in action but it is a misreading of the situation to imagine that all is over bar the shouting.

The report was adopted.

BOULDER PERSEVERANCE

EFFECT OF AUSTRALIAN INFLATION

The twenty-seventh annual general meeting of Boulder Perseverance Limited, was held on September 26 in London.

Dr K. B. Edwards, B.Sc., Ph.D. (London), F.R.I.C., chairman and managing director, presided.

The following is an extract from the chairman's circulated statement:—

Notwithstanding interference from labour disputes which affected the early part of the year's operations, tonnage treated during the year was 114,810 long tons of an average value of 4.90 dwts., being 0.09 dwts. lower than for the previous 15 months. Development was again curtailed through lack of labour and the ore reserves have therefore decreased to 387,400 long tons at the same value of 4.8 dwts., a decrease of 62,900 tons from the figure at March 31, 1950. There was an increase in cost of A.8s. 9.94d. per ton. Re-treatment of tailings contributed only £1,715 to the profit, and dividends from Kalgoorlie Enterprise Mines £5,720. The total profit amounts to £52,189, and the net provision for taxation amounts to no less than £30,450, or 58.35 per cent. of the profits.

THE ENTERPRISE MINES

Kalgoorlie Enterprise Mines produced for treatment for the same period 46,044 long tons of an average grade of 6.67 dwts. Shortage of labour affects this mine more acutely that Perseverance Mine, largely owing to the necessity for cut-and-fill stoping. The conversion of the winding engine to a higher power has at last been completed, and it is hoped that the tonnage of ore hoisted and treated can be increased. Ore reserves stand at 224,800 long tons of 6.3 dwts., a reduction of 43,300.

Kalgurli Ore Treatment Company operated at an extremely high rate of efficiency, the extraction based on mint returns amounting to 94.62 per cent. of the computed theoretical gold entering the plant.

With a fixed price for our product and the inflationary movement still continuing in Australia, Great Britain and the United States, it is impossible to make any forecasts. The penal legislation with regard to taxation is shown clearly in the accounts, and neither in Australia nor in Great Britain is any consideration given to the real capital invested in the company's operations, but only the issued capital.

In view of the deliberately distorted statements commonly made as to the right of the workers to share in profits, this company out of a gross income of £340,267 pays out in Australia, wages, salaries and payments on behalf of employees £154,727 (45.47 per cent.), while stockholders receive net £12,084 (3.55 per cent.). The report was adopted.

NOTICES

MARKET RESEARCH

An exceptional opportunity exists in the Market Research Department of a manufacturer with world-wide interests for a young man with some experience in Market Research. This post offers opportunities for advancement within the department and experience in all phases of Market Research. Apply, with full details of age, education and business experience.—Box 762.

MANAGING DIRECTOR, age 41, Public School, Cambridge University (Honours Degree Engineering), available shortly. Successful record backed by thorough experience in all aspects of industrial and business administration.—Box 722.

ADVERTISER, early 30s, sound experience Home and Export marketing and advertising with front rank National Company, seeks appointment Sales Executive. Impeccable references; valuable contacts Grocery, Chemists and Catering Trades. Fluent 3 European languages.—Box 740.

ACTIVE City Merchant House seek personal assistant Managing Director. Principal requirements fluent French, German and knowledge finance, staff control import export procedure. Not afraid responsibility. Good salary and prospects.—Box 749.

ECONOMICS GRADUATE (29), experienced statistics, accounts, organisation and methods in industry, wants post with scope for development of management ability.—Box 754.

ASSISTANT MANAGER wanted for progressive post with growing firm of Import and Export Merchants and Manufacturers in West Riding of Yorkshire. Activities include wool, yarn and textiles, hosiery and knitted outerwear; extensive home and foreign interests. Ambitious, adaptable and vigorous gentleman, aged 25-40, should have basic knowledge of trade with organising ability in sales and general administration. German and French an advantage.—Write fullest details, in confidence, to Box No. 170, Bennett Williams (Advertising) Ltd., 15a, Westgate, Bradford, Yorkshire.

ORGANISING SALES MANAGER or Superior Salesman for Woollen Knitted Outerwear and Hosiery Manufacturers and Distributors wanted for West Riding of Yorkshire Office of International Firm. Progressive post with rapidly expanding concern for adaptable hard-working executive. Trade experience essential and languages an advantage.—Write fully, in confidence, to Box No. 171, Bennett Williams (Advertising) Ltd., 15a, Westgate, Bradford, Yorkshire.

SOLICITOR, experienced advocate and sound lawyer, very versatile, perfect German, fluent Italian, seeks business or professional opening at home or abroad.—Box 755.

ECONOMIST, Second Class Honours, 25, wide experience journalism and industry, used to working on own initiative, seeks responsible position requiring energy and imagination.—Box 756.

EXECUTIVE, M.A. (Cantab.), having managerial position City export house, seeks more responsible appointment with manufacturers, to promote export sales.—Box 761.

WARMTH, comfort and good food at a first-class hotel in Devonshire. Winter terms £5 5s. per week from October 1st for a stay of not less than one month. Write Major Morris, The Arundell Arms Hotel, Lifton, Devon. Telephone: Lifton 244.

Consult the World Air Travel Experts if you have to go abroad on business. We arrange trouble-free travel.

BUSINESS AND HOLIDAY TRAVEL LIMITED

Grand Buildings, Trafalgar Square, W.C.2. WHItehall 4114/5.

MARKET RESEARCH

A large textile manufacturing Company requires an Assistant for planning work. The duties will include the interpretation of statistics and other economic data, the preparation of sales forecasts and long term commercial development plans. Candidates should have a degree in economics and a genuine interest in analytical work. Preference will be given to candidates with good knowledge of the textile industry and experience of modern market research techniques. Applications from men or women should give full details of education, qualifications and experience and will be treated in confidence. Starting salary will be in the range of £450/£700.—Apply, Box No. K17, A.K. Advtg., 212a, Shaftesbury Avenue, W.C.2, quoting Ref. 1506/7.

PROPERTY FOR SALE

Factory, centrally situated in Edinburgh, one of the lowest rated cities in Great Britain; presently used as a printing works; 4 floors and basement having approx. total floor area 20,000 sq. feet; existing use—light industrial; assessed rent £235, derated to £58. No ground burdens, electric lift, two loading banks, all in modern condition, approximate entry December. Permission to view from and offers to Shepherd and Wedderburn, 16, Charlotte Square, Edinburgh.

THE JOHN LEWIS PARTNERSHIP will shortly require an Assistant in the Insurance Department. Capable of working with limited supervision. Applicants should be between 30 and 40 years of age and have a knowledge of the Drapery Tariff, Public Liability and Motor Insurance.—Applications must be in writing in the first instance, and give age, experience and salary required and sent to the Director of Personnel, 32, Cavendish Square, W.1, not later than October 13th. Acknowledgements will not be sent before that date.

A FIRST CLASS overseas Manager required by international organisation of world-wide repute marketing products to Grocers, Ironmongers, and Automobile trade. Applicants must be prepared to travel extensively abroad and have the ability to work with all nationalities at all levels. A knowledge of French and one Scandinavian language would be an asset. The position is one requiring versatility, with particular emphasis on the ability to plan and carry through Sales and Advertising campaigns. A practical outlook is also essential as the Company have several manufacturing plants in various parts of the world. Every help and training will be given to the successful applicant. A good commencing salary will be paid during training and the Company also operate a very useful profit-sharing and pensions scheme.—Please send full particulars of age, experience, and salaries earned, to Box 758.

FIRST-CLASS Buyer required by prominent company engaged in light engineering. This is an important post entailing group purchasing and will probably suit a thoroughly experienced second in command buyer with a large engineering company. Applicants should give full details of experience, positions held, age, present salary and an indication of salary required.—Box CRC 187, 29, Hertford Street, London, W.1.

"TURNOVER INCREASED last year by just over 50 per cent. You are very largely entitled to the credit for this," writes the head of a well known firm. WE can give the advertising service that BUILDS to the firm that needs it.—FORDHAM SADLER ADVERTISING LTD., 33, Torrington Place, W.C.1. Euston 8721-3.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 16, George Street, Mansion House, E.C.4.

B. Sc. (Econ.), 30, Statistics, Commercial Law, 10 years' engineering experience, seeks post.—Box 760.

FOR SALE.—*The Economist*, 28/5/49—24/6/50 and 22/7/50—7/7/51 inclusive.—Offers Box 747.

AGGREGATE ASSETS at 31st March, 1951. £117,750,908.

REFUGE ASSURANCE COMPANY LIMITED
CHIEF OFFICE OXFORD STREET MANCHESTER 1
THE REFUGE WILL SAFEGUARD THE FUTURE

GOLD COAST AGRICULTURAL DEVELOPMENT CORPORATION LIMITED
APPOINTMENT OF MANAGING DIRECTOR
The Corporation is established by Ordinance No. 27 o. 1948 by the Government of the Gold Coast.
Qualifications
Candidates must be under 50 years of age, and have had experience of large scale agricultural development. A recognised degree in agriculture and experience of the tropics will be an advantage. Candidates should preferably have had some managerial experience and be familiar with the organisation and management of limited liability companies.
Terms of Appointment
The salary for the post is £2,000 per annum gross. Terms of employment include free housing; leave on full pay at the end of each completed tour, at the rate of 7 days for each month of service in the Gold Coast; 1st class passages to and from the Gold Coast, once in each tour, for himself, his wife and his children up to the age of nine years while proceeding on and returning from leave, but in the case of his children the Corporation will not contribute a sum in excess of one adult return fare; and free medical attention while in the Colony.
The appointment will be on contract for two tours, but the period may be extended by agreement. The contract will be terminable by either of the contracting parties on six months' notice being given.
In addition, and subject to good behaviour, the person so appointed, will be eligible to receive a gratuity on the termination of his engagement at the rate of £37 10s. for each completed period of three months' service.
The normal tour of service will be 12-18 months. Applications should be sent to The Commissioner for the Gold Coast, Melbourne House, Aldwych, London, W.C.2.

DICTAPHONE Equipment, Time Master Model, wanted by actual users. Will arrange collection from anywhere.—Please write details and price to Secretary, Box 763.

Postal Tuition for **B.Sc.ECON.**
The London University B.Sc. Econ. Degree is a valuable qualification for statistical, research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894). Fees are reasonable and may be paid by instalments if desired.
Prospectus from the Director of Studies, Department P17 WOLSEY HALL, OXFORD

ALL three parties have now published their election manifestoes. The Liberals' is naturally an attempt to show how Liberal influence in the House of Commons would be useful, rather than to lay down a policy for government. Between the two major parties, the chief distinction is that the Labour manifesto does not admit the existence of an unsolved economic problem for Britain while the two Conservative documents recognise its existence but do not say what a Conservative government would do about it.

The difference, if in one sense slight, is still enough to make the Conservative statement the better. How much the better was inadvertently emphasised by the Chancellor of the Exchequer himself, when on Wednesday he announced that in the last three months the gold reserve of the sterling area has fallen by $600 million, undoing in a seventh of the time one quarter of the improvement achieved since the point of bankruptcy on September 18, 1949, when sterling had to be devalued. Once again the life-blood of the sterling area is running away and the whole basis of this island's livelihood is in question. The primary immediate issue before the British people is what shall be done to close the gap before the world's confidence in their economy and their currency is again broken.

The dollar gap and the general deficit in Britain's overseas payments are, indeed, the symptoms, not the disease. But they are the symptoms that make a cure urgently necessary. One party recognises at least that something needs to be done while the other suggests that the country can go on happily as it is. The difference is one of kind rather than a mere superiority in degree. One document is relevant and the other is not. The elector's choice is not, however, so simple as that. Political parties are to be judged by their actions more than by their words. And while the Tories may be no better than their words, Labour certainly cannot be so bad as it presents itself.

If the manifesto were to be taken at its face value, Labour's case would be hopeless indeed. It not only refuses to recognise the seriousness of the economic problem. In the little it says about economics it achieves a rare refinement of wrong-headedness. Its one reference to this country's difficulties attributes the reopening of the dollar gap to "world shortage of raw materials." That is nonsense. If there is one thing that shortages of materials, and consequent high prices, certainly do, it is to increase the dollar earnings of the sterling area. In fact two of the reasons why the dollar deficit is so large are precisely opposite to this: one is that the rest of the world's pressure for commodities has slackened and the other is that the sterling area has itself been buying the things of which, in order to save dollars, it deliberately went short last year when prices were lower. Labour has learned nothing about causes and as little about policies. It still boasts of "full" employment in the sense of there being not as many jobs as workers but *more* jobs than workers"; in other words, it claims, if it knows what its words mean, inflation to its credit. Again, it still

puts forward price control as a means of reducing prices, although all the experience of the past six years has shown that such suppression of the symptoms of inflation inevitably encourages the deficit in the balance of payments that Labour declares itself able to "conquer."

Two proposals in the Labour manifesto deserve at least support in principle: to abolish resale price maintenance and to set up provincial vegetable markets. But both are of slight practical importance. For the rest, Labour offers to go on as it is, with two qualifications. For the first time, it makes no specific proposals for more nationalisation. The vague declaration that "we shall take over concerns which fail the nation" is a mere nod before tradition. The two concerns that at this moment are patently "failing the nation" are the nationalised coal industry and the nationalised railways. How exactly would another Labour government "take them over"? Such is the dead end to which the doctrine of public ownership has come.

But if there is not to be more nationalisation, there must be some more important concession to the Left. There must be more class war. Labour would impose some undefined further levy on unearned income and a capital gains tax as well. Mr Gaitskell and others have explained that such further redistribution cannot make wage-earners significantly better off. It is in the Labour programme not because the party leaders seriously believe that it will contribute to a more just society; if they believed that they would have taken their ample opportunities to do it before. It is there because Labour must somehow convince itself that it is still a party of social change even if the only change it can think of is pointlessly to level down a few peaks without significantly raising the troughs. That is all that is left of the progressive tradition in Labour hands. There was never a clearer confession that a political party has played itself out.

By comparison with all this escapism, the sombre tone of the two manifestoes issued by the Conservative party is impressive. They avoid the definite promises of lower taxes and other benefits with which the last election hook was baited. This time

> the Conservative party . . . offers no bribes to the electors. We will do our best to serve them and to make things better all round, but we do not blind ourselves to the difficulties that have to be overcome, or the time that will be required to bring us back to our rightful position in the world, and to revive the vigour of our national life and impulse.

The dignity of Mr Churchill's prose is, as always, impressive. The Tories present themselves convincingly as men more willing and able to grapple with the difficulties of a country in crisis than the tired Labour administrators can possibly be. But they do not do more than that. They do not put the grappling-irons on show. The voter is not offered bribes, but he is asked to act on faith rather than conviction. And the basis for faith in the Tories remains slender.

Many of their proposals—to denationalise steel, to decentralise coal, and so on—are excellent in principle. They do not add up to a coherent general policy matching the size and urgency of the country's needs. Indeed, two of the points on which the manifestoes are most precise are of dubious relevance to such a policy. The proposal of an excess profits tax is not necessarily to be condemned because it is an obvious trick to dish the Socialists. In practice it would no doubt be part of a set of changes both in the assessment of profits and in the existing profits tax whose net effect would be—rightly—to reduce the present impost on company earnings. The fact remains that any EPT, however mild and however temporary in intention, falls more heavily on the expanding business than on the established, relatively stable business. It therefore discourages enterprise more directly than does a flat-rate profits tax, and runs counter to the promise of "due incentive and reward" on which the Conservatives base their claim that they could increase production. There is little in their declared policies that would on balance make much difference to existing incentives either for management or for workers. But if production cannot be quickly increased, the economy can be restored to health only if the present excessive demands on it are cut down. At this point Tory policy remains almost as unhelpful as Labour policy. The "target" of 300,000 houses a year is in itself inflationary. The mere removal of "waste and extravagance" in government expenditure, without reducing any of the benefits of the social services, could hardly be even an adequate offset to the housing policy. As far as its specific declarations go, the Tory party is no readier than Labour to impose the disinflationary remedies that the British trade deficit plainly requires. The differences between the two manifestoes spring less from contrasts in doctrine than from the perennial difference between the attitudes of the "ins" and the "outs." The Labour party will not admit problems because that would be to confess its own past failures. The Tory party can admit them but shrinks from advocating remedies because those inevitably offend some voters; and thereby it runs the grave risk that if it does get into office it will be almost as inhibited from taking large measures in time as Labour has been.

*

To condemn both parties for their unrealism is to run the risk of assuming, or at least of appearing to assume, an attitude of moral superiority that ignores the practical limitations on politicians seeking office and is therefore quite as unrealistic politically as their own attitudes are unrealistic from the economic point of view. And yet what alternative is open to the commentator? The issues before the British people are not obscure. If Mr Bevan is ignored, and one assumes with the leaders of the two parties that a rearmament programme of the present size has to be carried out, the primary task of the politician is now—as it has been at most points since the war—to scale the claims on the British economy down to the level that the economy can sustain. The task is, in other words, to prevent inflation. The practical problem is to decide what things among the present activities of the country shall be scaled down, and the decision depends on five main issues of principle.

1. To what extent, if at all, is it desirable in an inflationary age for a government to pursue policies deliberately designed to encourage consumption? The most notable of such measures are the food subsidies, rent control and the housing subsidies, and the utility schemes. Labour is firmly wedded to them all, and while the Tories do not like them they do not say that they will change them immediately.

2. What is now the proper balance between the proportion of the national income that consumers should be free to spend as they choose and the proportion that the state takes in taxes to spend as it thinks best? Labour would like to take more for the state and the Tories would like to take less, but both fear that a change in either direction would lose more votes than it would gain.

3. How equal should the distribution of incomes and property be? Labour would like to make it more equal than now but is afraid of the economic consequences; the Tories would like it to be if anything less equal but are afraid of the political consequences.

4. How extensively should the state intervene, by planning, controls and public ownership, in the economic activities of the community, and how can such intervention best be reconciled with the flexibility, inventiveness and efficiency which alone can support a high standard of living? On these questions no party has as yet formulated coherent ideas.

5. How should wages be settled in a fully employed economy, and how low a level of unemployment is compatible with effective financial control of the economy by the government planners at the centre? Of these things no party will dare to let itself think.

The visible, inescapable evidence that the present answers to all these questions are unsatisfactory is provided by the continual inability of the British economy to pay its way in the world. To the independent observer they are plainly the issues that somehow the British people have to settle. And neither party manifesto faces them. They are all issues that have been discussed extensively in these columns. It seems, however, appropriate that in the two further issues of *The Economist* that will appear before the election another attempt should be made to set out what we believe to be at least the lines on which the right answers may be found—the answers which it is the politicians' task to convert into political possibilities.

Middle East Munich

NOTHING that Mr Attlee or Mr Morrison has said or can now say will alter the fact that the evacuation of Abadan is a deeply humiliating episode and a grave defeat for British policy. What might weeks ago have been a deliberate act of strength, forcing Dr Mossadegh to recognise that Persians had neither the skill nor the resources to run the oil industry alone, became through delay and hesitation a last-moment rout. Of course it was right to withdraw the 300 employees of the Anglo-Iranian Oil Company before they were thrown out; they had been left too long in an intolerable situation. But what has been wrong and deserving of the sharpest criticism is the long series of errors in judgment and timing that have marked the handling of the oil dispute by the Foreign Office and the Cabinet. The strength of the nationalist movement in Persia was misjudged both by the oil company and the British Embassy in Teheran; terms that were in fact offered under pressure were not put forward at an earlier stage when they might have done some good; while the British Government used at intervals the language of diplomatic exasperation that meant nothing unless there was behind it the determination to use the forces that stood ready.

It became clear at a fairly early stage of the dispute that the use of force to protect British property in Persia or to keep British technicians at their posts would be most unwise. Immediately that conclusion was drawn, the next best policy, as has consistently been argued in these columns, was to withdraw all the British employees of the Anglo-Iranian Company, voluntarily and at once, in order to make it clear that there would be no acceptance of unsatisfactory compromises and that the responsibility for Persia's ruin lay on Dr Mossadegh's shoulders. This was not only the next best policy but also the next strongest policy, because it was logical and consistent and could be maintained. The responsibility for hovering and wavering into this week's humiliation—the double humiliation at Abadan and New York—is the Government's. But the Conservatives must bear a fair share of blame for their stupidity in continuing to insist on the symbolic retention of 300 unemployed Englishmen in an idle refinery and in branding their withdrawal as a "weak" policy—although anyone with a correspondent in Teheran could have told them that the continued presence of the technicians was regarded by the Persians as proof that Britain was bluffing. It was mistaken Tory pressure of this kind which extracted from the Prime Minister, in the last minutes of the debate on July 30th, the "pledge" that he is now said to have broken.

To say, as some Labour spokesmen are now saying, that the use of troops would have started war, is neither here nor there. There are situations in which a display of weakness is as likely to lead to war as a display of strength—and the Persian case is very probably one of them. The reason why troops could not be used was not that there would then be a risk of war, but because British foreign policy has to work within the limits set by Britain's obligations as a member of the United Nations and as an ally of the United States. It has seemed highly probable all along—and the past week's events have proved it—that Britain, if arraigned before the United Nations as an aggressor, would find a hostile majority, and that the United States, when faced with the choice between supporting the justice of the British case or trying to keep the Persians sweet because they are so near Russia, would wobble towards the latter.

*

The defeat, so far, is complete. But the story is not yet finished and there are two conclusions to be drawn from what has happened hitherto. The first is that, now that the Persians have been allowed to have the whole of their own way, not one syllable of the consequences they have brought down upon themselves should be remitted. The British stake in Persian oil may have gone for good and all. The more imperative is the need to show to others who may be thinking of treading the same road that it leads to ruin for themselves. Any oil sold by the Persians is stolen property, and it must be treated as such.

The second consequence is more important, and to draw it involves some plain speaking. What the British Government could or could not do in Persia was, in the last analysis, dictated by Washington. Mr Harriman's mediation, so far as it went, was helpful and understanding. But on the major issue the Americans still do not

seem to realise what they have done. The Middle East is an area of the most vital importance to the whole alliance of the free world, and it has been held for the free world hitherto by British prestige and power. The withdrawal from Abadan—a policy imposed on Britain by America, since it was America that vetoed the alternative—has caused great damage to British prestige and may have incalculable consequences for British power. The Americans do not seem to dispute that the Anglo-Iranian Oil Company has a sound claim, in law and in equity, to its concession. To admit the British to be in the right but to acquiesce in their having no remedy—indeed, to hold them back from matching arbitrary acts by arbitrary acts—is to do what Neville Chamberlain did to the Czechs. The occasion is less dramatic; but the parallel is a close one. This policy of appeasement has created a vacuum of power in the Middle East. Are the Americans ready to fill it? Otherwise, if their policy is appeasement and nothing more, it will have the usual consequence—the Middle East will pass to those who have more logic and more courage.

The Anglo-American alliance cannot continue on a basis of whole-hearted British liability in Europe and Korea and half-hearted American liability in the Middle East. An alliance is a relationship of trust and it involves a certain amount of loyalty on both sides. The Americans have now deliberately acquired the rights to Neville Chamberlain's umbrella. The only way in which they can salvage anything from the wreck—the wreck in the Middle East and the very heavy strain on their relations with their principal ally—is to open up the umbrella and spread the protection of their direct responsibility over the whole Middle East. If they will do that, the British will try not to obstruct them with more suspicion, jealousy and backbiting than they themselves have had to put up with in the days of their own responsibility.

More or Less Arms?

SHOULD the rearmament programme of the North Atlantic nations be increased or cut down? This is the great unresolved problem that the Three Wise Men —Mr Averell Harriman, M. Jean Monnet and Sir Edwin Plowden deputising for Mr Gaitskell—are shortly to meet in Paris to tackle. It was the central point of all the discussions last month in Washington and Ottawa and it is bound to figure in the British election campaign, however much Mr Bevan's dissent is muted. The pressure for more rearmament comes chiefly from General Eisenhower. He wants a greater effort in Europe to fulfil the existing programmes for the year from mid-1951 to mid-1952, and an increase in the programmes for 1952-53. If this is not done, he gives the warning that a satisfactory state of preparedness will not be reached by 1954 and that the period of intensive effort will therefore have to be indefinitely extended. But the representatives at Ottawa of continental Europe were full of woe about the industrial unrest and the threat of runaway inflation with which they are already faced. They can hardly say that this is the result of their own rearmament programmes, which have barely yet begun; the shoe pinches before more than a toe or two is in it. The difficulties are rather the reaction on Europe of American and British rearmament; but whatever the cause it has led to a plea that the present programmes cannot be carried out without an increase in American aid. The two arguments—General Eisenhower's and the Continental politicians'—do not make contact with each other. So the debate continues: more or less arms?

Unfortunately, this is not a question that can be answered with a simple Yes or No; the answer will be different for different countries, and for the same country at different times. Several contradictory things can all be true at once, to the confusion of the unfortunates who have to try to live up to the name that has been conferred upon them of Three Wise Men. As with other confused problems, the best thing that can be done is to separate it into its parts and give a separate answer to each one.

If all the arms that figure upon programmes extending to the year 1954 are ever all made and manned, then it is highly probable that the west will find itself grossly overarmed. In this sense, the strength of Soviet Russia has been over-estimated; and in this sense Mr Lewis Douglas and other shrewd and realistic observers are right when they say the programme should be cut down. The military, when handed a blank cheque and told to fill it in, always—and quite naturally—put down figures that are too large. They were encouraged to do so last winter by the almost universal conviction in America at that time that full war was imminent. In large measure, the present American programme is designed for fighting Russia, not for staying at peace by deterring a Russian aggression. Certainly, when one imagines what expenditure at the rate of $65 billion a year, continued for several years, will bring forth, when one hears talk of an Air Force of 140 groups, it is difficult to believe that it is not being overdone. If so, it should be cut back, for too large a programme creates too much dislocation of one sort while it continues and of another sort when it stops. Moreover, it is not safe for the world for either side to be overwhelmingly stronger than the other—even if it is our side and inspired by the most pacific of intentions. Good men are not exempt from temptation.

But all this is an argument about 1953 or 1954. At the moment, the side that is overwhelmingly stronger than the other is still the Communist, and the need of the moment is for as much armament as can be turned out. Mr Charles Wilson reports that the tooling up of American industry is now nearly finished and that within a year the phase of quantity production will be reached. A year is still a long time, and it would be folly in the highest degree to reduce by a single item the programme of production for 1952. The facilities now created in America are, next to the stockpile of atomic bombs, the world's best protection against war. The sooner they get rolling the better. The argument for cutting down is not one for scrapping these new plants or failing to use them. It is an argument for planning to shift them down into low gear earlier than is at present planned, and in any case before they suck in all the spare materials of the world and create a mountain of weapons so monstrous that it is either wastefully redundant or menacingly tempting.

In Britain, the picture is rather different. The ultimate programme laid down by the British Government is smaller, relatively to the national income, than the

American. It is not by any test too big, either by the test of what is needed or by the test of the resources available. Mr Gaitskell has made it clear that the £4,700 million programme is not to be reduced. Indeed, it cannot be; for it does not take any knowledge of official secrets to see that the country is still woefully weak even in its elementary defences. The programme is not to be cut; but if they are urged to increase it, there are several points that British Ministers can very properly put. The Americans are apt to judge the rearmament efforts of the different countries by what they have achieved; when they say that their partners are lagging behind, they are thinking of equality of achievement. But that is not the only measuring rod; to politicians who have to face electors it is not even the most significant. There is also the measure of how much hurt a country is doing to itself by its efforts, and by this test there can be no doubt at all that the British are not only doing as much as the Americans but far and away more. Perhaps if they managed their affairs more wisely they would do themselves less hurt than they do; the American observer and the native economist are right to make this reservation. But what counts in politics is actuality; and the actual fact is that Britain has suffered much more from rearmament than any of its allies. The programme can, of course, be increased if it has to be; it is still only quarter-war. But before still more hurt is done to the British economy, there is an unanswerable moral case for a little levelling-up of sacrifice. If Americans feel irritation at the constant British talk of "burden-sharing," they should realise that their own harping on "more effort" falls equally gracelessly on British ears.

For the moment, it is simply not practical politics to talk of increasing the British programme. The effort should be to achieve on time what is already planned.

On the Continent, the picture changes again. The programmes are, indeed, large enough on paper—possibly too large, since many of them were drawn up under the delusion that the volume of American aid to to received depended on the size of the programme. But achievement is another matter. It is broadly true to say that none of the Continental countries has made more than the feeblest attempts to adapt its economy to carry a greater net burden. For example, in the French military budget of 850 billion francs, 350 billion are allocated to *matériel*; in fact, orders actually placed with French industry are believed to be no more than 100 billion francs—compared with Mr Gaitskell's £1,300 million (or 1,300 billion francs) of orders placed out of a three-year programme of £2,000 million. Even so, France is probably ahead of the other continental allies, and France has the excuse (though it is overworked) of the war in Indo-China.

Different answers have thus to be given for different countries. But in each of them the answer is a function of time. In the peculiar exercise on which the western world is now engaged, that of building up armaments in the hope not of using them in war but of deterring the aggression of others, there are three distinct phases. There is first the phase of persuading the politicians and their masters to take the matter seriously; in this phase the motto should be "Think Big; the Sky's the Limit." Then, secondly, after a reasonable volume of resources has been effectively moved into the business of rearming, the slogan should be "Get It Done On Time." And thirdly, since the need is finite, there is the third stage when the voice of wisdom says "Don't Overdo It." The present position is that the Continental nations are still in the first phase and should be exhorted to double the number they first thought of. Britain is in the second phase. So, in October, 1951, is America; but phase three is already coming into sight.

* *

All this makes up a very complicated task for the Three Wise Men, who have to draw up what can be made to look like a coherent plan. If they really are wise, they will not go too much into detail. Their first task, surely, is to look over the whole programme, to match the military demands with the strength of the other side and with the resources of our own. In this stage of their task, perhaps the most pertinent enquiry they can make is why, if the object is simply to draw level with an adversary so much weaker in total potential, it is thought necessary to mobilise so large a proportion of the free world's total resources for such a long time. There has been a lot of comparing national incomes between the free nations; a few comparisons with the Communist states would be salutary.

Their second task, one may surmise, will be to disentangle the ultimate from the immediate and to ask whether it may not be true, at least in places, that the size of the programme for 1953 is impeding the execution of that of 1951. This may be true not only directly but also indirectly, as witness the harm done by the stampede last winter to build up reserves of materials against a shortage that was believed to be going to be as acute as in time of full war. The need of the moment is not ultimate scale but present speed; perhaps limiting the one would help to increase the other.

ALLIANCE
ASSURANCE COMPANY LTD.

The Alliance undertakes the duties of Executor and Trustee and of Trustee for Debenture Issues.

And thirdly there is still great need for seeing that the parts fit together, that progress in one sector does not positively impede progress elsewhere. The great lubricant, of course, is American aid, and here the argument comes to rest on the need to have a figure ready to present to Congress by the New Year. It would be foolish for those who have no access to the facts to try to guess what answer the Three Wise Men will give to this part of their exercise. It is fairly clear, however, that here also there is a danger in over-concentration on large total figures. The total amount of American aid matters greatly, of course; but what matters at least as much is that it should be flexible in form, so that it can be quickly applied, like a good lubricant, to the points where friction is in fact generating undue heat. Simple and rigid remedies are as out of place in this complex endeavour as simple and sweeping judgments of the progress being made in it.

Ready for Battle

(By a Correspondent)

[*This is the first of three articles in which correspondents will report their impressions of the course of the election campaign in the constituencies.*]

THE Parliament of 1950 is dead and the party managers have set the election stage, have provided their manifestoes and their popular literature. In the next three weeks it is for the candidates and their leaders to make what they can of the play. As yet, there is little to show. There are no posters on the hoardings or bills in the front windows; few meetings have been held and most of the press has carried only a column or two of election news daily.

This is not because the election catches the parties unprepared. It is astonishing how often one comes across prescient agents or members who booked halls or even printed election addresses weeks ago, confident that October 25th would be the day. Now in the offices of regional and constituency agents one finds arrangements being made steadily and without flurry. All are glad that the battle has come at last. For eighteen months they have been expecting it at short notice and they rejoice to be freed from uncertainty. One Conservative agent commented: "Thank God it came now! I couldn't have kept my volunteers at the right pitch of enthusiasm much longer." But at the moment there undoubtedly is enthusiasm. Organisers on both sides have been surprised by the way in which their party membership has increased since the last election.

Last year party organisation was at a new pitch of efficiency, but the machines are probably in even better shape now. Conservative headquarters tend to have the same glossy and faintly military atmosphere but, here and there, there are signs of pruning in what had threatened to become a bureaucracy; where there has been a change of agents it has usually been for the better. Labour offices are far dingier than those of their rivals and the quality of the organisations tends to be much more uneven; less than half the constituencies have a full-time agent and, unlike his opposite number, the Labour agent usually lacks a car and paid secretarial help. But there is a surprisingly high level of competence and, with the help of a very able group of regional organisers and the assistance which comes from trade unions in the course of an election, Labour enters the fray at little technical disadvantage compared with its more lavishly equipped opponents.

With the Liberals it is far otherwise. One can hardly say that the election caught them unprepared; they simply have not the money or the men to provide any comparable organisations in either the regions or the constituencies. Many candidates have withdrawn since the announcement of the election and in some seats that the Liberals still intend to fight they have yet to find both a candidate and an agent.

If one asks an experienced agent whether he hopes by the efforts of his organisation to win many converts between now and October 25th he will smile and say, "The national campaign may do that. All we can do is to keep our own people in good heart and see that all of them get to the poll." That is the end to which he has been busy in the last fortnight arranging meetings, preparing posters, and laying final plans for the canvass. Of perhaps decisive importance is the securing of postal votes for supporters who are ill or absent on business or who have moved house. At the last election the postal vote overwhelmingly favoured the Conservatives. It seems likely to do so again. Labour agents are working hard, and will secure many more postal votes than last time but, especially in country areas, the Conservatives are likely to increase their efficiency even more; at a moderate estimate, the postal vote may be worth an average of 500 votes per constituency to the Conservatives.

Agents' opinions about the way the Liberal vote will go vary widely. They will name some seats where the withdrawal of the Liberal candidate will definitely favour the Conservatives and others where it will definitely favour Labour. But over the country as a whole there is much doubt about the pattern. Both sides are strangely modest in their estimates and the usual conclusion is that on balance Liberals with no candidate of their own will roughly cancel each other's votes. But many agents add that if any voters are still floating uncertainly between the left and right, ready to be rescued by the most astute campaigner, they are the Liberals.

There are three reasons for the slow start of the campaign. First, the King's illness has helped to damp down open political activity and press publicity. Secondly, few agents believe in a long campaign: they are afraid of boring the voters and exhausting the enthusiasm of their workers. Thirdly, they are restrained more severely than ever before by finance. The cost of paper and printing has gone up enormously since last year but the legal limit on expenditure is unchanged. Something has to be cut down—the issue of a second leaflet, the envelopes round the election addresses, the double crown posters, or (although the saving is small) the length of the campaign.

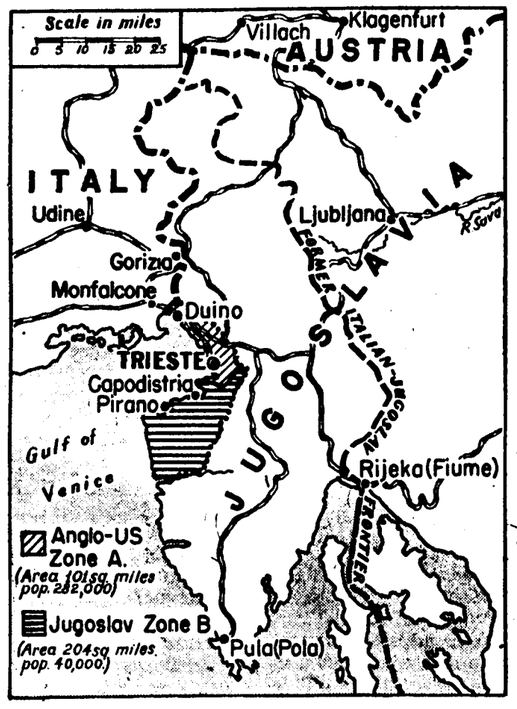
There is still some vagueness about what the parties want the issues to be. Agents from widely different parts of England agree that there are no local issues of any great importance; in Scotland and Wales it may be different. The Conservatives seem on the whole to feel that their strongest points will be "the proved administrative incompetence and lack of leadership of the Government," "high prices" and the opportunity they offer for "hard work to win a just reward." On the Labour side "the prewar Tory record," the creation of the social services, and above all the danger of war under the Tories are likely to be most emphasised. "Whose hand do you want on the trigger, Churchill's or Attlee's?" will be the loudest cry. Some ministers may stress that they do not believe that anyone wants war, and have privately pressed Mr Morrison to moderate the charge of war-mongering. But no Labour speaker will refrain from suggesting that only Labour can be trusted to avoid hot-headed use of the vast store of armaments now supposedly being built up. Among agents and the rank and file of the party there is great optimism about the force of this appeal. Few appear to have considered the possible effectiveness of the Tory counterattack, in terms both of the mishandling of the Persian situation and of the popularity of Mr Eden; whatever the relative public confidence in Mr Churchill and Mr Attlee, there is no doubt that Mr Eden commands more trust as the arbiter of peace and war than does Mr Morrison.

Both sides naturally profess cheerfulness about the outcome. Conservative agents, cured of over-optimism by last year's experience, are nevertheless quietly confident of winning a moderate number of Labour seats in each area and of losing almost none. On the other side, the revivalist enthusiasm of the Scarborough rally, with its fine façade of unanimity, has done something to shake off Labour's pessimism engendered by the events of the last year and the findings of the Gallup polls. Some Labour members admit to grave doubts about their personal prospects, but all seem to place inordinate hopes on Mr Attlee's tour. He is expected to "do a Truman." The contrast between Britain's present circumstances and those of the United States three years ago, as well as the profound difference in personality, is forgotten; by this magic touchstone all is supposed to be cured and the Labour Government returned with a secure majority.

The fervour of this unlikely faith is perhaps chiefly a symptom of Labour's unconfessed pessimism. It is true that the election may not yet be decided: certainly a gross blunder could still destroy the Tories' chances. Mr Attlee's travels may attract wide publicity, large crowds and some votes. But to one who listened to him opening the campaign in Colne Valley and speaking to his party at Scarborough, it seems inconceivable that either the man or his arguments can have anything of the impact of President Truman's whistle-stop tour.

Italy and Jugoslavia

THE time has come to mend the breach between Italy and Jugoslavia, and to calm the bitter and passionate dispute over the Free Territory of Trieste. Last week's announcement that America, Britain and France are ready to lift the "restrictions and discriminations" imposed on Italy by the peace treaty has created a better opportunity of working out a settlement than at any time since the war. By going some way to satisfy Italian pride and opinion, there is reason to hope that this change may enable Rome to yield a little on its claims to the whole of the Free Territory. Any attempt to concede these claims in full would be resisted by the Jugoslavs with force; yet, so long as they go unsatisfied, competing with equally extravagant Jugoslav claims, there remains a gap in the political and military defences of southern Europe that the western alliance cannot afford. It is fortunate that the prospect of less rigidity in Italy's attitude offers itself at a moment when, for the first time, there has been an even more important shift in Marshal Tito's attitude. It looks as if Belgrade is willing to compromise if Rome is.



During the next few weeks, while negotiations are proceeding between Italy and the western signatories of the peace treaty to implement last week's statement about revision, Jugoslavia, itself a signatory, will have to decide its own attitude. Clearly Marshal Tito does not want, and certainly cannot be expected to acquiesce in, either a complete abrogation of the clauses under which certain former Italian areas were ceded outright to Jugoslavia and the Free Territory of Trieste was established, or a purely one-sided revision involving only Italy's relations with the western powers. On the other hand, it would pay him to seize the opportunity of regulating his position with Italy, if he can afford to reduce some of his own claims in the Trieste question.

To solve this problem of Italo-Jugoslav relations does not lie within the direct competence of the three major western powers; they can only smooth the way. They cannot even complete Italy's release from any of the provisions of the peace treaty without the agreement of most, if not all, the other signatories which lie outside the Soviet bloc. Of the original twenty signatories, five are in the Soviet bloc and presumably will not agree to any change; twelve, including the Big Three, may agree to change; and there are three doubtful starters, Jugoslavia itself, Greece and Ethiopia. The Big Three stand, nevertheless, in a strong position to bring moderating influences to bear in both Rome and Belgrade and they have very great interest in doing so. Delicate as the question is, their intervention could in certain circumstances of deadlock be decisive, provided it were exercised with restraint and in secret. Both open diplomacy and inspired leakages should be avoided; for, during the last three years, it has been the inability of the Italians and Jugoslavs to withdraw from positions taken up publicly that has impeded normal relations.

Any hope of a settlement between the two countries depends largely on the political situation in Italy. During the summer it has become doubtful whether Signor De Gasperi can maintain himself in power until the next general election, which is now likely to take place next year and must in any case be held by 1953. The prime minister's spell over his own party has suddenly been broken, and a sense of disillusionment has crept into Italy's association with the Atlantic Pact. The question of Trieste is political dynamite, used against the govern-

ment both by the extreme Right with accusations of weakness, and by the Communists, who are doing everything in their power to stop a deal with Marshal Tito. If Signor De Gasperi were to agree to surrender Italy's claims without obtaining anything concrete and acceptable in return he would be thrown from power. In his place would probably appear an interim Christian Democrat administration led by Signor Piccione or Signor Gronchi, with a cautious and indeed almost neutralist foreign policy which would serve the interests of neither Italy nor the western alliance.

That is the position at the moment. On a longer view events have reached a point, as they did before the Italian general election of 1948, where the western powers are bound to consider their actions with a view to their effect on the Italian voter. Since 1943 the United States has provided Italy with $2,630 million worth of economic aid, of which $2,217 million has consisted of outright grants. While this has given immense and crucial support to the Italian economy, and many Italians recognise America's generosity as well as its motives, the aid has not been enough to put an overpopulated country on its feet. More economic help is needed as well as the moral support of the Atlantic allies.

So much for Italy. In Jugoslavia any effort at conciliation must run straight up against Marshal Tito's sensitiveness to Cominform propaganda. If he gives anything away in order to obtain a settlement in Trieste, he is open to the accusation from Moscow that he is now feeling the strings attached to economic aid. Against this, it cannot be too strongly emphasised that the Cominform's bitter hostility is the best reason why Marshal Tito must seek a settlement with Italy which will at once wipe the Trieste problem off the slate and give him security at his rear. Marshal Tito has formidable difficulties to contend with in his own country, but he should be strong enough to be able to act against popular sentiment over Trieste. There is encouraging evidence of his realistic understanding of what is at stake. In public there have been several Jugoslav offers of friendship with Italy. At Split on September 10th, Marshal Tito declared: "Here is our hand . . . we shall keep it outstretched." In Rome itself, on September 18th, Mr Kardelj, the Jugoslav Foreign Minister, spoke of the need for a "third solution" in Trieste even if it involved sacrifices, and last week, in the National Assembly, he admitted that the demand to incorporate the whole of Trieste is no longer practical politics.

What are the facts on the spot? At present, the Free Territory is split into Zone A occupied by up to 10,000 British and American troops, and Zone B, which has been illegally incorporated into Jugoslavia. In Zone A, which includes the city of Trieste, there is a Slovene minority of about one to five: in Zone B, with a very much smaller total population, there is an Italian minority of perhaps one to two. The basis of the Italian claim to the whole Free Territory is now the three-power declaration of March 20, 1948, in which Britain, America and France promised Rome their support at a time when Marshal Tito was still in the Cominform. Since then this categoric declaration has become more and more embarrassing in view of the new relationship to Jugoslavia. Jugoslavia's position at that time—before the break with the Cominform—was set out in the agreement Marshal Tito made with Signor Togliatti, the Italian Communist leader, on November 7, 1946, in which he agreed to Italian sovereignty over the city of Trieste itself but claimed Gorizia (which is not in the Free Territory at all). Since then Marshal Tito has reverted to much bolder though not very specific claims with a minimum demand for no concessions in Zone B.

The question now is how to use the new possibility of good will to resolve this very complex situation. The Big Three have long been urging the Italians and Jugoslavs to negotiate directly. At law, any change in Trieste imposed from outside would require Russian approval, since the Free Territory was set up in the Italian peace treaty. But as the Russians have consistently obstructed execution of the treaty they could hardly complain if the two most interested parties now took matters into their own hands and agreed to partition the territory. It is clearly in the interest of the western powers to promote such an agreement, for Trieste has become a King Charles's head to the Italians, preventing their wholehearted participation in the Atlantic Pact—and currently causing another bout of acute anglophobia through the fear that Britain will sacrifice Rome for the support of Belgrade. A division of the whole territory on ethnic lines, starting from the realistic basis that Zone A is to all intents and purposes Italian and Zone B Jugoslav, would now be the fairest way to a tenable solution. It might be desirable to modify this simple basis by giving the Italians some part of the hinterland of Zone B—though one reason why this is often opposed is that it would be extremely difficult in practice to draw the boundary—and by allocating perhaps two Slovene villages in Zone A to the Jugoslavs. This is the solution behind which the western powers should throw their weight, if Rome and Belgrade cannot readily agree on something else. It is in nobody's interest that the present friction and uncertainty should continue.

NOTES OF THE WEEK

Leaders and Parties

The Conservative campaign was opened in robust style but serious tone by Mr Churchill speaking at the Liverpool Stadium on Tuesday night. Mr Attlee had performed the same service for Labour at the beginning of the Scarborough conference on Monday. His speech was striking neither in matter nor in manner, but it served well enough the purpose that his party intended of it. The Scarborough conference has brought out more clearly Labour's wish to present the primary election issue as a choice between Mr Attlee and Mr Churchill, and both Mr Attlee's qualities and his defects serve at least to make the contrast sharp enough.

The Liberals inevitably stand aside from this contest in personalities; significantly, a meeting in London with several speakers opened their election campaign. It would hardly be fair to say that the Conservatives are afraid of the direct Attlee-Churchill challenge, but they certainly intend also to make the most of Mr Eden's popular appeal as the man to whom foreign affairs would be entrusted in a Conservative administration. Moreover, the Labour party has hardly avoided giving a forced impression about its emphasis on Mr Attlee. The Scarborough conference demonstrated, as nothing else had previously done, the immense gap torn in the Labour leadership by the loss in one year of both Ernest Bevin and Sir Stafford Cripps. Though every effort was made to build up Mr Attlee as the man to match the hour, though the pre-election atmosphere encouraged and aided unity, the sense of powerful and united leadership had gone. There was no Sir Stafford Cripps to pour a cold dose of realism on the delegates, no Bevin to lumber on to the platform, and by his very personality produce not merely the appearance but the reality of a united party. The fissionable material within the movement is, it is true, considerable in this year of rearmament. But it was also considerable during the foreign policy controversy of 1947, and even during the opening of the arms drive last year. The chief difference is that in those days the leadership to cope with such pressures existed. Now only the greater external pressure of the Tory challenge is holding back a considerable tussle for power within the Labour hierarchy.

* * *

The Scarborough Rally

The shortened annual conference of the Labour party this week became purely a pre-election rally, and as such was only a moderate success. Two and a half days was still too long, particularly when any spoken dissension might look like disloyalty and much of the debate from the floor was correspondingly hamstrung.

It was perhaps this knowledge that criticism from the Left could not be voiced that produced the remarkable increase in the votes cast for Mr Bevan and his friends in the election of the seven representatives of the constituency parties on the party executive. The constituency delegates have always tended to vote well to the left of centre as a counterbalance to the trade union bloc on the executive—Mr Bevan has headed the poll ever since 1946 (when he displaced Mr Shinwell, the wartime leader of the Left). No one, however, expected the elegant but hitherto politically unimportant Mrs Barbara Castle to rise to second place, or Mr Driberg to come third, ahead of Mr Griffiths and Mr Morrison, or Mr Mikardo to secure re-election. The voting is, of course, an imperfect guide to the feeling of the party's members. It is indirect—done by the delegates to the conference, not directly by the rank and file—and no electioneering by the candidates is permitted. This gives an advantage, at any rate among candidates who are not ministers, to writers, journalists and broadcasters—perhaps now most of all to television "stars"—whose names come regularly before the public.

But after all allowance for such considerations, the implications of this pro-Bevan vote are undoubtedly serious for the Labour party. It is not that they carry Mr Bevan nearer to party leadership—he still has only three supporters on an executive of 27 members, and an even smaller proportion of support within the Parliamentary party, which finally selects the leader. But the voting did demonstrate the unusually sharp split between the constituency parties and the unions. The unions duly endorsed, with increased majorities, the very members of the executive who were attacked with such bitterness in Mr Bevan's recent pamphlet on "Going Our Way." Some of the Right-wing union leaders are as a result already toying with the idea of restoring the method of voting which existed before 1938; all members of the executive were then elected by all the conference, instead of, as at present, twelve trade unionists being elected by the unions, and seven politicians being elected by the constituencies. But such a device would enable Mr. Bevan's supporters to pose as martyrs. It certainly would not restore the real unity of the party, and might further weaken even such appearance of unity as is likely to survive the election campaign.

* * *

Shades of Palmerston

Mr Morrison appears to have had second thoughts about the wisdom of making "Tory war-mongering" an issue in the election. He has said it would be neither true nor fair to use such terms of the average Conservative. Certainly the mud, if thrown, will not stick. For the leading Conservatives have, generally speaking, given the Labour Foreign Secretary fair and consistent support on all big issues of policy; and Mr Bevin owed much of his influence abroad to the fact that the British seemed to be speaking with one voice. It was only during the last illness of Mr Bevin and during the more inept stages of Mr Morrison's handling of affairs that the bipartisan habit was seriously interrupted in the House of Commons. In fact, as Mr Morrison well knows, Mr Churchill is no more likely than he is to forget that "the days of Palmerston are over." The difference between them is that Mr Morrison is obviously relieved that they are over whereas Mr Churchill is sorry. But that is another story.

Unfortunately Mr Morrison may have spoken too late. There are a number of Labour members who will prefer the simple charge of warmongering to the avuncular misgivings about Tory backbenchers that he expressed at Scarborough. And if those same backbenchers retort with the charge of appeasement, foreign policy will be, after all, spattered with mud. This would be on every count unfortunate. It would mean that whichever party wins, its Foreign Secretary would take office wearing a label that would mislead the outside world.

In fact it is important that the electorate as well as friends and enemies abroad should realise that a Conservative foreign policy would not differ substantially in aims and principles from a Labour policy. There would be differences in method and tone, and Mr Churchill might well seek fresh advisers. But the limits set to policy by membership of international institutions, by alliances, by treaties and—above all—by the state of the country's finances would be the same. This being so, the purpose of the Labour party in casting doubt on the sanity and restraint of Mr Churchill and Mr Eden can only be to distract attention from the basic problem

discussed in the first leading article of this issue. If this brand of peace campaign brings Labour back to office, it is the Labour Foreign Secretary who will feel in the House the effects of making foreign policy a party issue. But perhaps Mr Morrison has already made up his mind that someone else will be at the Foreign Office, and that he can return to the role of party tactician. Whatever the explanation for it, his tone has been deplorable.

* * *

Watered Liberalism

The efforts of the Liberals to convince the electorate that they have no connection with either of the firms next door met with an irritating setback this week. The Conservatives put into their official list of candidates the names of all the five Liberals whom they are not opposing. Even Mr Clement Davies—whom, as he has a safe seat, it would be folly to oppose—was subjected to this unwelcome blessing. But if the Tories did what they could to confuse the electorate, the Liberals do very little themselves to prove that they offer something distinct from the other parties. The Liberal manifesto is a collection of vague aspirations from which no politician could dissent. There must be a strong Commonwealth with a system of genuine co-operation; more production, lower prices as a result of greater efficiency, action against monopolies, more houses if (a touch of realism) the materials are available; a check on wasteful public administration, but no reduction of the social services or, unless food prices can be reduced, the food subsidies. There must be no change, either, in the system of guaranteed prices and markets for farmers. The only specifically Liberal sections are an expression of faith in the Council of Europe, a proposal to give self-government to Scotland and Wales, and a reference to the party's belief in co-partnership and profit sharing.

The manifesto claims that a strong body of Liberals is needed in the House to "strengthen the liberal forces in both parties," to act as a "brake on class bitterness," and to support legislation to help the producers of goods instead of hampering them. Certainly, the more liberal-minded men and women who are returned to Parliament the better. But is it necessarily best to segregate liberal-mindedness in a special group? Whether or not the other parties are wise to offer only comforting generalisations, the Liberals, having no chance of forming a government, certainly need not be so timid. Last year, although in theory they were contesting enough seats to form a government, their programme was commendable for its comparative bluntness. This year they had a better opportunity to show the country what a realistic programme for dealing with present problems would be like; it is a pity that they have missed it in order to take refuge in pious platitudes.

* * *

The Minimum in Korea

The deadlock over the truce negotiations in Korea has produced the danger that the United Nations cause may be seriously weakened by a nervous impatience in western countries in favour of winding up the war at too low a price. The Chinese Communists have cultivated in two and a half decades of incessant war, either against the Kuomintang or the Japanese, the valuable habit of perseverance, and if they think they can wear out the United Nations by holding out for a truce on their own terms, some recent comment in this country must have been very encouraging to them. The suggestion has been made that it is illogical for the United Nations to insist on retaining for the time being "a few miles of land" north of the 38th parallel, as in fact the parallel is the only possible line on which any lasting political settlement can be based. This suggestion shows a misunderstanding of the significance of the dispute over the line between the two Koreas.

It is not simply a question of choosing between the line on which the United Nations armies now stand and the 38th parallel. More important, in this context, than either of these is a third line, the line which General Ridgway has built up into a formidable defensive barrier, and which runs in places north of the parallel but coincides only at a few points with the present battle-line. Any withdrawal behind this third line would expose South Korea again to the threat of a sudden assault from the north in almost the same conditions as those of June, 1950. The parallel itself cannot be turned into a strong military position; neither the United Nations nor the Communists have ever succeeded in holding it. It is in no sense a tenable frontier. If the United Nations are to keep faith with South Korea, they cannot do less than provide it with a defensible frontier; if they are not to tie up an unnecessary proportion of their own troops in Korea for an indefinite period, they must find a line which can be held, at least against the first assault, by a reasonably small force. Both arguments make clear the vital importance of basing whatever dividing line may eventually be adopted on General Ridgway's prepared positions.

* * *

Dr Adenauer Sets the Course Straight

Dr Adenauer's government has made three declarations in the last few days which represent a brave attempt to steer German public opinion back to the right course, at a moment when it was wavering among cross-currents. The Chancellor has announced Germany's moral obligation to make restitution to the Jews; he has condemned the newly-formed League of German Soldiers for political activities, and he has granted a special fund for the relatives of men who were hanged after the 20th July plot. The Bonn Government's declarations should not be dismissed as obvious or belated. On the contrary, they have far more importance and require far more courage now than during the brief period after 1945 when almost every German was eager to claim that he had opposed the Nazis.

Among Germany's victims abroad the memory of past crimes is beginning to fade, and there is a widespread feeling that a fresh start should be made together in the interests of common defence. In Germany itself, however, the opposite process has taken place. The past has been revived in a new spirit of self-righteousness which is in turn alienating people who were willing to forgive and forget. Inside the Soldiers' League, the issue of "honour" and the 20th July is passionately contested. The temporary head of the League, General Friessner, has publicly expressed the widely-held view that the officers who revolted against their Supreme Commander were traitors.

The issue of war guilt and treason is more live than that of Hitler's persecution of the Jews, for few Germans would positively defend the massacres of the Third Reich. Most prefer to convince themselves they never took place. Restitution of Jewish property has been proceeding for some time past. Nevertheless, it remains an act of courage on the Bonn Government's part as well as a necessary prerequisite for relations with Israel, to make a solemn admission of Germany's crime and its determination to make whatever material restitution it can.

No one can say with certainty what effect such expressions of faith in a new Germany may have at this moment. It might well be powerful. Germans respond quickly to a lead, good or bad, and it was high time that the Chancellor raised his voice above that of General Friessner.

* * *

Check to Grotewohl

With Herr Grotewohl's offer of all-German elections in his pocket, Dr Adenauer has told the High Commissioner that the Washington proposals do not grant the sovereignty which he demands and the Western Germans have been led to expect. The talks on the abolition of the occupation statute in favour of contractual agreements have, therefore, reached a difficult hurdle at the outset, and optimistic forecasts of their quick conclusion are being revised.

It is understandable if the Federal Chancellor, with his vituperative critic, Dr Schumacher, at his heels, now desires to show that he is as firm a champion of German national claims when he is dealing with the western powers as he is when answering Moscow's spokesmen. Dr Adenauer secured a great triumph last week when the entire Bundestag, excluding the Communists, approved the fourteen conditions for free elections which he announced as a reply to Herr Grotewohl. Although the High Commission had taken no part in the decision, and forbore even to cheer from the gallery, this firm stand was in fact a victory for western interests as a whole. The Bundestag's conditions were well framed. They leave the Soviet German Government no chance of slipping through the loopholes of a federal state and of retaining a Communist system in the eastern part of the country, while the rest voted for democracy. The very first of the fourteen points laid down that "the electoral area shall form a single constituency and each party shall submit a list of candidates for the entire electoral area."

The overriding importance of the West German reply lies, however, less in its terms than in the fact that it was pronounced as an ultimatum. The Bundestag has not agreed to a conference at which their representatives might be trapped into supporting a Communist demand for the withdrawal of the occupation forces. Herr Grotewohl will now have to raise his price if Moscow wishes to continue the bidding.

A Plot That Paid

There seem to have been some genuine elements in the short-lived revolt which occurred in Argentina last week. The flight of a number of army officers to Uruguay suggests that the widespread belief that the whole affair was stage-managed by General Perón is not wholly accurate. But all the evidence indicates that the Argentine President knew exactly what the conspirators were planning, and that he welcomed the attempted coup as a timely chance to show his power and to rally the country behind him. The almost unruffled calm which prevailed in Buenos Aires, the swift counter-action taken at all the military stations affected, and the mobilising, within a few hours of the outbreak, of a mass rally in the capital from which the sounds of tempestuous loyalty to Perón were broadcast over all Argentine wireless transmitters, scarcely gave the impression that the authorities were taken unawares. And there can be no doubt as to the value of the incident to the Peronista regime; with the general elections only six weeks away it was provided with a new excuse for arresting opposition leaders while simultaneously exciting the masses of the people with emotional appeals to rally to the defence of the country—and the President.

The affair has naturally caused speculation about a possible revival of Señora Perón's claims to the vice-presidency, which were dropped at the end of August after they had threatened to split the Peronista movement. Señora Perón had, however, been ill for a week before the events of September 28th, and it has now been officially announced that she is suffering from anaemia severe enough to necessitate blood transfusions and absolute rest. While her illness may in itself win new popular sympathy for the Peróns, the removal of her powerful personality from public life must be a considerable setback to the propagandist strength of the regime. It is almost entirely her doing that, in next month's elections, Argentine women will for the first time both vote and stand for seats in the legislature. The regime, and particularly those within it who follow Señora Perón's demagogic but radical line, can undoubtedly count on gaining fresh strength from the newly enfranchised half of the population.

Conservative Agriculture

Politicians do not have to be too consistent, but even so it is surprising that the Conservative party should sponsor, at a time when it is striving to win the urban vote with talk of holding the cost of living, a document* about agriculture quite so blatantly restrictionist as that published this week. The Conservatives presumably hope that no consumer or taxpayer will read it; for it is written exclusively from a producer's point of view, and on a narrow interpretation of the producer's interest at that. The promises to stop "dumping" of cheap foreign food, which appear also in the Conservative election manifesto, strike an incongruous prewar note. The implication is that it is the British farmer, not the urban housewife, who is at present "depressed." The proposals for restoring producers' marketing boards are coupled with the extraordinary statement that the safeguards for consumers introduced in the 1949 Agricultural Marketing Act are unnecessary. Guaranteed prices would be retained, and would be further supplemented by "special selective subsidies" such as those for hill farming.

The Conservatives must know that the inevitable result of these policies would be higher prices in the shops, yet they insist on considering agricultural policy in isolation from the rest of the economy. It is an easy but inadequate answer to plead the paramount need for growing more food. British agriculture is mainly concerned with high-cost livestock products and is therefore a long way from the sort of subsistence farming which siege conditions or dire necessity would force upon it. The Conservatives wish to increase this emphasis on the more expensive farm products. They would therefore make costs more, not less, relevant in agricultural policy, and even in present conditions the prices paid to farmers are, for some products, well above what the consumer would pay in an open market. It is essential to relate production to the consumers' wants and pocket precisely because more food—of the right kinds—is so badly needed.

Festival Farewell

Londoners said goodbye to the South Bank exhibition in a strictly traditional way, with Gracie Fields, "Abide With Me," a religious service and the Guards. The Festival has earned general goodwill and has at least lived down the charge that it was a gross waste of money. Whether it was worth all the outlay remains an unanswerable question. It cannot be proved—as some have tried to prove it—an economic proposition in terms of extra foreign exchange or the development of overseas trade. About 450,000 foreign visitors are thought to have gone to the South Bank, but no one can say how many of these would not have come to Britain if there had been no Festival, and the total number of visitors is hardly more than can be accounted for by the normal growth of tourist traffic since the end of the war. Although it is of some advantage that British products should have been so brilliantly displayed, the Festival could not compete with the British Industries Fair as an industrial shop window.

But there have been other benefits. Artists and architects found for a short time a surprisingly enlightened patron, with plenty of money. Civic pride was stimulated all over the

* "Agriculture and Politics." By Philip Brembridge. Conservative Central Office. 1s. 6d.

country; and people enjoyed themselves, mostly in ways that are rarely provided in this country—in pageantry, eating and drinking out of doors, dancing on the Fairway, and looking at the lights: simple pleasures that in fact could have been enjoyed for very little outlay.

One permanent benefit ought be an attractive south bank. Government offices, inevitably, are to be built on the upstream half of the site, and the LCC is to complete the north block of County Hall. On the downstream site, next to the Festival Hall, there will one day be the National Theatre, and there is talk of leasing some land for building a luxury hotel. By the river the LCC intends to make gardens. None of these plans is yet complete, and in present circumstances there can be no timetable. But if there is ever again enough coal, the plans ought to include the floodlighting of the riverside each summer in the tourist season.

* * *

New Towns Defended

Sir Thomas Bennett, the chairman of Crawley Development Corporation, made last week an able defence of the work of the public agencies responsible for building new towns. He argued that since Government financial backing was today indispensable, and since the interests affected were numerous and diverse, it was a right choice to build the towns by public corporations of independent status which could be wound up when their work was done. More surprisingly, he professed complete satisfaction with the operation of Government centres in the new towns, in sharp contrast with the severe criticism expressed by Sir Ernest Gowers when he was chairman of the Harlow Corporation. The public must wonder which chairman is right—or whether their experiences have differed.

Sir Thomas's view was that slow progress in the new towns must be attributed to labour difficulties and the need for careful advance planning, and cannot be blamed on the Government. His comments are reassuring so far as they go, but they by no means exhaust the problem. It is not generally realised what an enormous part the building of new towns may be required to play in future development. New towns have been launched or advocated not only as the principal means of dispersal from large cities, but as aids to industrial development (as at Corby), as resettlement centres in the coalfields (as in Durham and South Wales), and even as agricultural centres. The problems of London remain particularly pressing. The LCC is still building houses in its outcounty estates at a faster rate than all the new towns combined, but within a few years this large force of building labour is supposed to be switched to the development of new towns and other centres at a distance from London.

Clearly there is here urgent need for the careful advance planning rightly insisted on by Sir Thomas Bennett, and for a review of new town machinery to see whether it could not handle more economically, preferably in closer conjunction with local authorities, the larger tasks that will be thrust upon it.

* * *

No Power for Papagos

Greece is again to be disappointed in its hopes of a strong and stable government. It is true that the elections on September 9th caused many casualties among the multiplicity of small parties; but no party secured enough seats to gain an absolute majority over all the rest. Field-Marshal Papagos's Greek Rally did best and will probably have 112 out of the 250 seats in the Chamber. But the King has turned down Papagos's request that he should be given a mandate to dissolve parliament and hold fresh elections on a simple majority basis; and Papagos has refused the King's request that he should join in a coalition with the two next largest parties—General Plastiras's Progressive Union (EPEK) and Mr Venizelos's Liberal party. The Field-Marshal will therefore find himself in the rôle—no doubt uncongenial—of opposition leader. His refusal to co-operate with the other parties may be unwise, but there seems to be no need to read into it any sinister implications. During the election campaign he repeatedly asked for an absolute majority which would allow him to govern "without compromises, without alliances and without political combinations and devices." He may well feel that he must stick to his guns if he does not wish to prejudice his chances of appealing more successfully to the electorate at a later date.

The King has therefore been forced to fall back on a coalition of the EPEK and the Liberals which will take office under General Plastiras when the new Chamber meets next week. The exact final distribution of the seats is not yet clear, but it seems only too probable that the new government will be gravely handicapped by its small majority. On the other hand, it is unlikely that the Greek Rally will prove a very disciplined opposition. The greatest danger to the new Cabinet probably lies in its own lack of cohesion. There is no real reason why the Liberals and the Progressives should not maintain a united front; but they have not found this easy in the past. Moreover, the question of the extent of political amnesty to be allowed to those implicated with the Communists in the civil war is still a live one; and it was precisely over this that the last EPEK-Liberal coalition came to grief in the summer of 1950.

Set Fair in Venezuela

Remote from the turmoil which has engulfed the oil industry in the eastern hemisphere, oil experts in the western hemisphere have just been attending a quiet but satisfactory gathering in Caracas. Two years ago the then Minister of Development in the Venezuelan Government conceived the idea of preparing, for public consumption, a technical and historical survey of the oil industry in his country. His successors in the present government decided that this September was an appropriate time at which to carry out Dr Engana's project. Accordingly, a National Petroleum Convention was held in Caracas from September 9th to 18th, attended by the representatives of ten foreign governments, including the United States and Britain, and members of the oil companies operating in Venezuela.

Venezuelan oil is mainly produced by three companies, Shell Caribbean, Creole (a subsidiary of Standard Oil) of New Jersey and Meneg (a subsidiary of Gulf Oil). At the present time an average of 1,700,000 barrels of crude oil are being produced daily, or about 620 million barrels a year. This is rather more than three times the quantity produced in 1939; and it represents an increase of 130 million barrels per annum since 1948, when the existing 50-50 agreement was concluded between the companies and the government. Venezuelans participate in all grades of the industry; not only do they provide nearly all the labour, but they are to be found in increasing numbers as technicians and managers. The most important factor of all in the present situation is that the proceeds from oil operations constitute at least 90 per cent of the country's revenue.

Both the companies and the country, therefore, have a major interest in an expanding future for the industry. The central feature of the recent convention was that both sides recognised the simple fact—which it is fashionable in international gatherings to deny—that there is a strong common interest between the private foreign investor and an underdeveloped country. The representatives of the industry, for their part, were given an opportunity to present themselves and their operations in their fair colours; no considered account of the development of the industry can fail to demonstrate the vast risks as well as the vast rewards, the perilously accumulated skills as well as the capital gains. The Venezuelans, for their part, had two important things to say: they welcomed foreign companies and capital in the development of their oil; at the same time, they were desperately anxious to broaden the base of their own economy, to reinvest their oil revenue in agriculture and secondary industries, and to encourage foreign capital in these fields as well. Venezuela offers, in other words, an expanding market—for capital, for goods and for technicians—with the opportunities for the one, and the money to pay for the others.

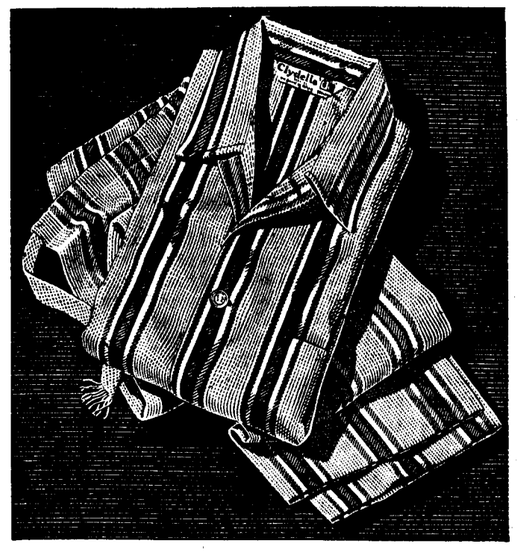
The Christian Churches in China

It is a long time now since it was Communist policy to make a frontal attack on the Christian religion. Although the Communist creed remains dogmatically atheist and any totalitarian ideology must strive through its educational system to eliminate all other world-concepts than its own, Communism in practice recognises that religious beliefs are strongly rooted among the masses and that it is well to walk warily in dealing with them. Thus in Eastern Europe the policy is to concentrate on destroying all links of the Catholic and Protestant churches with Western Europe and America and to encourage "reformed" religious bodies which denounce American imperialism, support the Communist "peace" campaign and otherwise make themselves politically useful. A similar policy has been followed by the Chinese Communists; but in China Christianity is a religion which has been introduced from the West, was only tolerated in the nineteenth century under the protection of treaties forcibly imposed on China, and has been up to now largely dependent on foreign missionaries for its propagation and on foreign money (mostly American) for its educational and philanthropic work.

Christianity in China has therefore always been under the reproach of being a "foreign" religion, and was formerly a target for reactionary anti-foreign outbursts, of which the worst was the "Boxer" rising of 1900. For a long time, however, before the Communists came to power such persecutions had ceased, and it is only now that active and violent interference with the work of the churches has been renewed. This time it is being carefully emphasised that the persecution is not being directed against Christians as such, but only against "imperialist" foreign agents and their Chinese accomplices; committees of Chinese Christians are formed to endorse (or at least the Communist radio, which no one can contradict, alleges that they endorse) the charges made against foreign missionaries.



The Communists, who usually have nothing but contempt for the ways of "feudal" China, have for the purpose of discrediting Catholicism (which has numerically the largest following of any Christian body in China) revived the popular prejudices against Catholic orphanages which were the cause of the Tientsin massacre of 1870. Catholic orphanages have always done a great work of charity in China, but they incurred suspicion among the masses by a practice of paying small premiums for mortally sick children to be brought to them so that they might be baptised *in articulo mortis*; the report was spread abroad that their aim was to obtain Chinese children in order to kill them and make magic potions from their hearts. Recently the Communist press has been full of accounts of the wholesale "deliberate" killing of Chinese children in Catholic orphanages, and a number of priests and nuns have been given prison sentences after mass "accusation meetings" in the Communist manner. The only difference between 1870 and 1951 is that the Communists do not publicly admit the nature of the popular belief which they have been exploiting, because to do so would imply the prevalence of faith in witchcraft among the Chinese proletariat, so these terrible crimes of the foreign "imperialists" are left without any motive except sheer malice. One wonders what Chinese intellectuals, such as Fei Hsiao-tung, who went over to the Communists as the party of progress and enlightenment, think now of the kind of propaganda which they have to endorse.

* * *

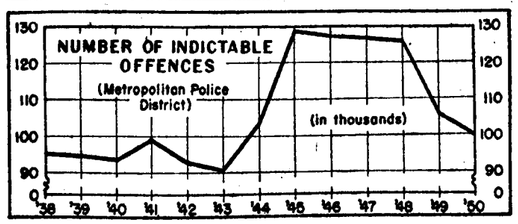
Crime and Prisons

The number of indictable offences known to the London police was reduced again last year. This is the most satisfactory section of the report (Cmd. 8359) of the Commissioner for the Metropolitan Police. The crime statistics for England and Wales as a whole, published in August, showed that the fall that took place in 1949 was not maintained in 1950. In London, however, the number of indictable offences has declined steadily since 1945—in spite of the increase in the population of the Metropolitan Police District and in spite of the fact that the regular force is still some 3,800 below establishment.

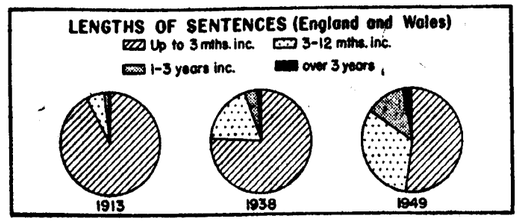
If this success in reducing the amount of postwar crime could be matched in the rest of the country, it would ease the burden on the Prison Commissioners, whose report for 1950 (Cmd. 8356) is again depressing. In May, 1951, the population of prisons and borstals passed 21,800, the highest figure recorded since 1909. Obviously a fall in the number of indictable offences would be the most satisfactory way

There's nothing to equal

'Clydella'



REGD.



IF IT SHRINKS WE REPLACE

WILLIAM HOLLINS & COMPANY LIMITED, NOTTINGHAM

F1/1

of reducing the prison population. As it is, much of the prison officials' effort is diverted from their main function of training persons convicted of crime. Of the total receptions of men into prisons and borstals in 1949, more than half had not been sentenced to prison for an indictable offence. They were there because they had been committed

on remand or for trial, or because they had failed to pay fines or to comply with orders for payment of money, or because they had been sentenced for non-indictable offences like begging.

Modern penal reformers think that offenders, particularly young offenders, should not be sent to prison if it can be avoided and that a prison sentence, when inevitable, should be long enough for the prisoner to have constructive training. The prison commissioners' report shows how far this theory is from practice. The accompanying diagram shows that short sentences are much fewer and long sentences more frequent than a generation ago or even in 1938. But in 1949 70 per cent of the convicted men were serving sentences of less than six months. It is even more disquieting to note that of the 1,216 youths aged 16-21 sentenced to prison, as many as 327 had no previous conviction. Further, many young people are still remanded to prison, and subsequently either acquitted or dealt with otherwise than by a prison or borstal sentence.

The Cost of Learning

If the needs of Cambridge, as expressed by the retiring Vice-Chancellor on Tuesday, are any guide to the financial needs of other universities, a large increase in the Exchequer grant for the coming quinquennium, 1952-57, will be necessary. In the year 1949-50, the last for which figures are available, Cambridge received some £950,000 from the Exchequer for running expenses. The Vice-Chancellor said that it would need an extra £200,000 a year simply to "maintain its activities at their present level." If Cambridge is typical, this 20 per cent increase over 1949-50 would involve an extra expenditure of £2,500,000 a year for all the universities.

It must be assumed that the Treasury is now scrutinising the demands from all the universities with a fiercely critical eye. All demands from civilian sources for larger grants are unwelcome, but obviously the universities are as subject to the difficulties of rising costs as are other institutions; the margin for economies is small, unless the Government deliberately wishes to reduce either standards or the number of students. Many people in the older universities would support a reduction in numbers, but they do not represent the universities as a whole. In the provincial universities the expansion over the past six years has been welcomed in spite of the problems it has brought. It would at least be premature to force the universities to reduce the number of their places until the situation can be more clearly seen. The Government has repeatedly pushed the policy of university expansion. Nothing has happened to make that objective less desirable. On the contrary, the recent decision by the Government not to support the project of a technological university makes it more than ever desirable to continue its support for the universities undiminished.

Reorganising Uganda's Cotton

After more than twenty years of inefficient management and discontent, as well as a whole series of commissions of inquiry, Uganda's valuable cotton industry is at last to be reorganised. There have been three main criticisms: there were far too many separate ginneries, many of them antiquated; there was no proper inspection or control, so that the product was of poor quality; and the ginneries were almost all in Indian hands, to the great resentment of the African growers. For a time there was talk of nationalising the industry, but this solution had little appeal for the Africans who suspected that nationalisation would not give them the entry into the industry that they desired. The Uganda government has now put forward new proposals.

Its first step will be to acquire and put out of action some dozens of uneconomic ginneries, so that the rest will handle a larger output. Next, strict specifications and standards, with power to enforce them by withholding licences, are to be imposed on ginneries. Most important, African co-operatives are to be assisted by government funds in purchasing ginneries, so that within ten years they should be processing some 100,000 bales of the total output of 350,000 bales. These ginneries will buy their cotton from African co-operative producing societies. Further, a Cotton Development Council will be established, representing all sections of the industry, to supervise the whole field of its operations. And finally, a training school will be set up immediately to train Africans as sub-managers, mechanics and accountants.

These proposals involve a comprehensive attack on the abuses of past years and they have a significance which extends beyond the problems of Uganda cotton alone. Uganda is one of many undeveloped countries that have rich crops which could bring them great wealth and which are urgently needed in world markets. Yet too often their production is badly organised and the producers are leaders of political agitation. Industrial reform is almost as badly needed as constitutional reform—and it has been far more neglected.

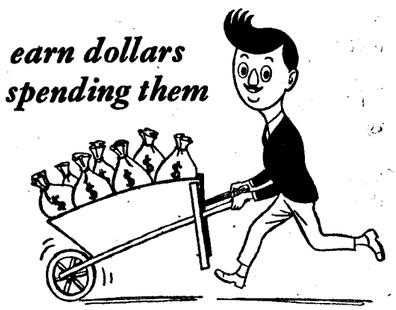
HARD FACTS

ANYONE who is approaching this election with the least hope of easier living in Britain, whichever party wins power on October 25, may as well realise at once that it is impossible. Any politician who leads the electorate to expect new benefits is not leading the people but misleading them.

Everyone should realise clearly the truth of the hard economic facts set out by Mr. Gaitskell There is no argument about them. The figures show clearly enough how, despite our greatly increased production, world trading conditions, plus rearmament, are draining Britain's reserves.

There is no argument between the parties either about the necessity for our defence burden. It is agreed by both to be the minimum for our safety and it is a programme of £4,700,000,000. That means ten per cent. of our manpower, 7s. in every £ of our taxes. Yet Eisenhower's military advisers are suggesting a still greater heave.

Mr. Gaitskell has made it plain to Washington that Britain cannot do more, "unless there were to be a radical change in the economic policies of all Atlantic Pact members." This needed saying, and he has underlined that we are handsomely doing our fair share.



But clearly world facts impose on the British nation, whoever governs it, the need, for this critical space, to put peace before comfort, to step up exports, to step up production and put benefits off till later. It demands planning without waste of time, and the Labour Government has a plan already in its final stages.

The truth is that this cannot honestly be an election of promises. *It is an election in which the public will decide who can best be trusted to keep a balance between defence and social services. Whoever wins must take hard decisions. That is not the same thing as abandoning our social progress and slashing the welfare of Britain's families.*

THE MAN WHO COVERS 26,000 FEET A MINUTE

AS CAPTAIN of one of T.C.A.'s Skyliners on the Europe-Canada run, Charles Skelding covers 26,000 feet of sky a minute, often wishes he could paint as fast. Off-duty, British-born Captain Skelding takes his pleasures quietly, likes pottering around his home with a paint brush and messing around in sailing boats. Captain Skelding, who is married, joined T.C.A. in 1938. An ex-President of the Canadian Air Lines Pilots Association, he has flown over a million miles, has now crossed the Atlantic over 200 times. As thoroughly dependable a fellow as you'll ever meet, Captain Skelding is typical of the men who look after you when you are travelling by T.C.A.'s giant "North Star" Skyliners. Carefully selected and intensively trained, these T.C.A. crews know every wrinkle of the Atlantic. Travelling with such men as these, you can be confident of a comfortable trip and regular "on time" arrivals — Paris, London or Prestwick today, Montreal tomorrow! Swift Skyliner services link you with every important Canadian and U.S. city.

WHEN IT'S A QUESTION OF TIME...

Is coming-in time going-home time ?

It is only natural that, if there are fast and slow clocks about the premises, workers will tend to arrive by the slowest and leave by the fastest. Industry loses many millions of productive minutes every year through this time leakage alone. There is a simple answer. Accurate time must be clearly shown and sounded throughout the premises. T.R. Time Control does this, and much more, to eliminate time waste in industry and implant a wholesome sense of time values in the minds of everyone concerned. Spend a profitable moment now to write for full particulars.

The Friends' Views on Peace

The pacifist position is, at first sight, so unlike the spirit in which the free world is challenging Soviet imperialism that it is not easy to imagine what practical contribution it can make to western policy. But a group of American Quakers has recently put forward interesting and controversial suggestions on the sort of foreign policy they think their government ought to pursue.* One point, in particular, that they make cannot be too often stressed. This is that western statesmen, however remote they may reckon the hope of a general settlement with the Russians, should never stop trying to get piecemeal settlements; they should "be persistent in seeking out and negotiating on those problems where some reasonable hope of success exists." It is only too true that the towering barricade of mutual distrust which has been built up between the Russians and the West can hardly at this stage be destroyed by one diplomatic assault; but it might be gradually undermined by more modest, although no less strenuous methods. And the United States has the power to do it. This is a very different approach from that of the Communist peace campaign, which is agitating for a five-power pact so comprehensive and vague that it can only increase the suspicion with which Russian intentions are now regarded.

While stressing quite rightly that a willingness to compromise on inessentials is necessary to achieve success in negotiation, the Quakers are forced by their beliefs to discard an even more essential ingredient for success; this is that the West should be able to negotiate from what Mr Acheson has called "situations of strength." Only those who are strong can begin the process of compromise without running the risk of giving away their whole position. Moreover, to argue that diplomacy should not be backed by armed strength betrays a failure to appreciate the point of view and experience of the Russian leaders. It is arguable that the United Nations, now that the hopes of Great Power unanimity on which it was based have proved illusory, would be wiser to concentrate on its mediatory and conciliatory functions and think less of its responsibility for enforcing collective security. But it is surely unrealistic not to admit that Uno also requires "situations of strength." How else is it to exercise authority in a world of which part is ruled by men contemptuous of the spirit that inspires the Society of Friends?

* * *

As Simple as ABC

Sir Ernest Gowers has followed up "Plain Words," his first attempt at improving official English, with an "ABC of Plain Words,"† which is intended to provide civil servants with a handy guide for writing good English. It is thus compiled alphabetically—hyphens follow hope and herewith, and got gobbledygook. This is the best layout for ready reference, but it has its drawbacks. As Sir Ernest Gowers says, it reduces everything to the same level of importance; and whether to write "a number *is*" or "a number are" is not nearly so important as the "woolly circumlocutions" caused by the addiction to abstract nouns.

Abstract nouns, padding, jargon, gobbledygook—these are the main target (yes, target) of his attack. It is aimed at civil servants. But journalists provide him with many of his examples, and any journalist who reads this book will feel self-conscious afterwards. Sir Ernest allows, unwillingly, *The Economist's* favourite child—disinflation. But he would not like us to recommend the disappreciation of sterling, and he frowns on too many bottlenecks, dilemmas and issues. Oddly enough, he does not mention problem, our enduring love, but that may be because civil servants recognise no such thing.

Some people will have none of all this. To them—and there are authorities on writing English among them—the attempt to substitute plain words for gobbledygook is misplaced. Official language, they say, needs a jargon of its own because, like legal language, it has to provide for every contingency. They would even defend, on the grounds that language is a living thing, which changes with the age and has its own fashions, some of the showy words and constructions deplored by Sir Ernest Gowers. Excessive simplicity, they would say, is as inappropriate in officialese as it was in Wordsworth's poetry. This criticism is partly justified. Language does reflect the age—as those who read the extracts of a hundred years ago can see for themselves. But Sir Ernest does not maintain that the short word is always preferable to the long and the simple construction to the grandiose. His attack is directed against obscurity, and obscurity, however justified in poetry and drama, ought not to be tolerated in officials—or journalists. An official who writes obscurely instead of plainly merely exasperates the person he is trying to help. He also makes himself ridiculous. The medical profession rocked with laughter on reading the regulation, quoted by Sir Ernest Gowers:

> Every woman by whom . . . a claim for maternity benefit is made shall furnish evidence that she has been, or that it is to be expected that she will be, confined by means of a certificate given in accordance with the rules. . . .

National Characters

"Human nature (we are told) is everywhere the same":—Human lips never uttered a more shallow and fatal fallacy. Human nature, in its manifold varieties of climate, *entourage*, and origin, exhibits discrepancies as marked, if not as wide, as animal nature. . . . One tribe is restless, insatiable, and warlike; another is timid, industrious, and pacific. Some, like the Tartars, are simple, pastoral and honest; others, like the Chinese, are crafty, encroaching and commercial. Some are lovers of gaiety and careless ease; others are never contented, and ever striving. Some are impelled to ceaseless toil and untiring acquisition by an *onwardness* of nature . . . which marks them out for conquest, for command, and for supremacy—but not for the happiness of repose—and the Anglo-Saxons are of this order of humanity. Others, finally, are impetuous and impulsive, but not indefatigable nor enduring—preferring the enjoyment of life to its improvement, and seeking that enjoyment not in perpetual struggle, but in the cheerful dance or the *dolce far niente* of a sunny home; and of such men is the Irish nation made. They can toil, they can save, they can adventure, they can endure hardships, they can encounter sacrifice and self-denial—few people better—but they do all this *for a time and for a purpose*—not for ever and for itself; they toil—but it is for the sake of future rest; they deny themselves present gratification—but it is for the sake of after and fuller enjoyment; they thrive and struggle, not like the Englishman or the New Englander for the sake of rising to a loftier elevation and reaching a wider field of exertion, but in order to command for the remainder of life the repose and the pleasure after which they have been always sighing. So it is. And in this fact we may see indicated . . . the means of renovating and redeeming Ireland. It is by inoculating it with a large admixture of Scotch and English blood that its children can be rescued from misery. . . . Ireland for the Irish; Ireland inhabited exclusively by Irish; Ireland accepting its destiny and receiving its impress and its character from the Irish—means the cabin for the pig, rags for the peasant, potatoes for the population.

Letters to the Editor

The Liberals' Choice

Sir,—Your "distasteful conclusion" about the Liberals' choice overlooks the fact that it is in the power of the Liberal vote to decide conclusively whether we shall get a "firm government" and also whether it shall be of the Left or the Right. We may well agree that the last Labour and the last Conservative governments were equally incompetent, but it is surely not a matter of indifference to Liberals what the complexion of the new government should be. Socialism and social progress are not identical, nor is a welfare state necessarily a healthy one. At present it is more urgent to increase the wealth of the nation, even if for the moment too much should get into some hands, than to see that everyone should get equal shares; and to liberate the economy is more urgent than to coerce it. A "property owning democracy" is nearer the Liberal ideal than one in which property—and therefore power—is mostly owned by the state.

Everywhere there are dangers of abuse, but if the Liberal leaders were to declare, as they reasonably might, that in spite of Tory shortcomings Liberals should, in the present emergency, vote for Conservatives when there is no Liberal candidate, millions of Liberals would do so who otherwise might not. In so doing they would probably ensure a firm government and, without any pact, it is highly probable and quite reasonable that some at least of their leaders might find themselves without Conservative opponents. This would maintain Liberal independence, for the decision would be taken without reference to other parties, and it would keep in the Liberal fold for better times millions who at present are bewildered or estranged because apparently the Liberal leaders cannot make up their minds what to do in circumstances which, if ever, require a bold as well as a wise decision. A party which in one constituency will vote one way and in the next another has given up all claim to be a political party at all.—Yours faithfully, W. N. LEAK

Winsford, Cheshire

★

Sir,—Your article rightly stresses the political purpose of the coming general election to produce a government with a working majority. The economic implication is, no doubt, that a strong government would nerve itself to pursue the sharp disinflationary measures necessary before plans for increasing production and exports can succeed.

The advice given to Liberals in order to further these aims is, however, based on two assumptions, neither of which can be shown to be true. The first of these is that the abdication of Liberal voters might increase the chances of a clear majority for one of the major parties; the second that, since 1950, the Liberal party can be written off in terms of political power. I see no evidence to support the first assumption. Surely the most one can say is that some Liberals would vote Conservative, some Labour, some not at all? If the Liberal vote were to tip the scales in favour of the Conservative in one constituency, might it not be cast to the advantage of Labour in another?

My argument against the assumption that the Liberal party is dead rests, admittedly, on pure conjecture. Much will be expected of a Conservative government, if one emerges. If such a government is much less than triumphantly successful in its economic policy (and no sane person would wish it to be unsuccessful) the "very large section of British opinion" represented by "the people who would like to support the Liberal party if they thought it had a chance" may decide that nothing is to be lost by giving it that chance. Suppose, moreover, that the Labour "split" were to develop in the comparative freedom of Opposition. All these imponderables are of the very stuff of politics, and the fact that it is possible to discuss them renders obituary notices served on the Liberal party a trifle premature!—Yours faithfully, L. A. JACKSON

Weybridge

★

Sir,—May I contribute one or two to the "legion of arguments," "wishful" or otherwise, which you anticipate in your article. I suggest that you are being much less than just to Liberal policy. In this very issue you pay tribute to the realism of the interim report on housing, and I recall similar praise for the party's attitude on other matters in the past. I cannot agree, either, with your statement that "The influence of the nine Liberals in the present narrowly divided Parliament has been negligible." The influence of nine among six hundred is bound to be limited but, within those limits, I submit that the record is one of which the party can be proud. Again I quote your own columns in support of this assertion, for you suggest that "their record in the last Parliament as the defenders of individual liberty" is such that the party will be tempted to rely on it as one of the main planks in its election platform.

But the influence of the Liberal party is far greater than that of its members in the House. The liberal tendencies to which you refer in the two major parties are surely induced by the need to woo liberal voters from the Liberal party. As it is, liberalism in both these parties grows on stony ground and is constantly menaced by the thorns of those "extremes on the Right and on the Left that are equally objectionable to any British Radical." I wonder how long liberalism so placed would survive the extinction of the Liberal party. Liberals will regard their vote as a long-term investment in the maintenance and development of their party and the defence of British liberty, for which they are willing to sacrifice the immediate advantage of helping in the choice between the two larger parties. If they also believe with you, sir, that "neither the devil he knows nor the devil he has almost forgotten is impressive," that will make things all the easier for them, both by reducing the present sacrifice and by enhancing the prospective yield of the investment.—Yours faithfully,

E. VICTOR MORGAN

Swansea

Germany and the West

Sir,—Being a German myself, at present studying in England, I was disgusted by Herr Lambertus's impudent letter published in your issue of September 29th.

It is ridiculous that a man like Herr Lambertus—full of self-importance and self-righteousness and exactly the type of German whose attitude horrifies and must horrify not only the outside world but Germans themselves—should advocate co-operation between the West and Germany. No letter could do more to prejudice a friendship between England and Germany, which so many people of good will, in both our countries, are doing their utmost to cement. I only hope that Englishmen and Americans will understand that most Germans don't think like Herr Lambertus. If the majority of the German people really shared his view, nothing, I think, would prove more convincingly that the Allies would be justified in having no confidence in Germany at all. But, fortunately, there are many Germans who realise that Germany has much to answer for and are willing to make amends for the past—as far as this is possible.—Yours faithfully,

Leeds S. H. FROWEIN

Age of Inflation

Sir,—I feel that the suggestion made by Mr Hepburn in his letter appearing in your issue of September 22nd, that a with-profit life policy provides, as far as life office contracts are concerned, a natural hedge against the effects of inflation cannot be permitted to pass without comment. In the first place the premium for a policy entitled to share in the profits of the life office is greater than that for a policy not so entitled, and the excess premium provides a substantial part of the bonuses added, the balance being derived from the profits of the life office. Secondly, Mr Hepburn's statement implies that the level of bonuses declared in times of inflation is so much higher than the normal level as to reflect the full effect of the rise in commodity prices; the records of life offices over the past forty years show that bonuses have not risen to such an extent as to compensate policy holders for the decrease in the purchasing power of the bonus itself let alone the sum assured. As for the future, is there any reason to suppose that the position will be different? The business of a life office is concerned not with goods, etc., but with money itself.

In general at the present time, a large proportion of life office funds is held in fixed interest securities. If the suggestion were made that these funds should be invested to secure the advantages of ownership of property, etc., the hedge thus provided would be dependent on that secured by the investments themselves, and, as shown by recent events, such protection as far as equities in the United Kingdom are concerned is far from complete. In any event it must be remembered that the financial strength of life offices and public confidence therein have been largely secured by an investment policy devoid of a large element of speculation.—Yours faithfully, A. C. RICHARDS

Horley, Surrey

Emaciated Technology

Sir,—While you are correct in saying that the policy outlined in the White Paper on Higher Technological Education "will not help technological progress," it is not true that the "hotchpotch of decisions will offend no one." The decision to establish a College of Technology instead of a technological university certainly does not find favour with my association.

The proposed (Royal) College of Technology will grant awards of Associateship and Membership at levels corresponding to first and second degree standards. But will the universities recognise Associateship of the College of Technology as a first degree for the purposes of post-graduate study? The Ministry of Education says no; the universities cannot be expected to commit themselves in advance to recognising degree-equivalents as actual degrees, although it is hoped they will do so eventually. Since, however, the universities have successfully "opposed the setting-up of any rival institution," that eventuality seems most remote. Yet only a technological university can give degrees that will serve as a satisfactory hallmark of professional standing.—Yours faithfully, PETER IBBOTSON

National Association of Labour Teachers

The Red Sox

Sir,—The consul who essayed to correct you on your knowledge of American baseball is not so omniscient himself. The Chicago White Sox have always been known by that name, except that in their earliest days, more than half a century ago, they were the White Stockings. The "Black Sox" nickname was the creation of Chicago sports writers who, in 1919, applied it to such members of the White Sox of that year as were involved in the scandal.—Yours faithfully, PAUL HUTCHINSON

The Christian Century, Chicago

Books and Publications

Lloyd George

Lloyd George. By Thomas Jones. *Oxford University Press.* 330 pages. 21s.

T.J.'s life of L.G.—the two pairs of initials have often been together before—has been awaited with lively expectation by those who knew the subject and know the author. Most of those expectations will be realised. Dr Jones has written an informative, penetrating and readable book—a truly remarkable achievement for a man in his 82nd year. Its outstanding character—and this also was to be expected—is its judiciousness; those who can remember the events he describes will often find their heads nodding in appreciation of Dr Jones's summings-up.

And yet it would be uncandid not to confess a certain dissatisfaction, of the kind that asks for more. After all, Dr Jones, of all men, should be able to write the final word on Lloyd George. He is of the same age and country and background; he worked intimately with him in his best years; and yet he can stand apart—was he not also a close friend of Stanley Baldwin, one of the very few who could bestride that chasm? He could have said so much more about Lloyd George than he has said in this book. For example, L.G. is 43 and in the Cabinet by page 33; and in the later years one often wants Dr Jones to expand and continue. This reticence is partly due to the limits set by the purpose for which the book was written—it is one of a series of "Makers of Modern Europe" published by the Harvard University Press. This has meant not only that the length of the book was determined, but also that the reader could not be assumed to have much or any knowledge of the background; valuable pages are therefore consumed in summaries of external events. For this Dr Jones is not to be blamed.

But he also seems to be deliberately holding back, as if half aware that his emotion and his reason are obstructing each other in trying to arrive at a judgment on L.G. As a result, Dr Jones will leave on his readers the rather odd impression that he thinks more highly of Lloyd George as a man than as a statesman. He defends him on the matters where his personal honour was in question (some of them he does not even mention), but his judgments on policies are often very severe. Yet surely the judgment of most people, as they look back, would be that (up to his semi-retirement in 1931) L.G. was very much more often right in his policies than wrong—indeed, some of the positions he took, at Versailles or in the 1929 election, now seem much more right than any of his contemporaries would allow him—while the distance of time hardly lends enchantment to his personal character.

But of all the public men of the twentieth century, Lloyd George is perhaps the one of whom it is least possible to express a single judgment. There were so many different Lloyd Georges—Baldwin said it would take ten men to write his *Life*. There was the Radical of 1906-14, who aroused among his countrymen emotions many times more passionate than have been seen since, passionate hatred on one side, but passionate love too among the great middle and lower middle classes, especially the dissenters. There was the war leader. Here the inevitable comparison is with Mr Churchill, and though Lloyd George was much less of a military leader, he had an infinitely more difficult political problem, and mastered it. He was perhaps the supreme executive of his age; there are still men in Whitehall who can tell of the electric urge that ran right through a great department of state when he walked in at the front door; and he had that sublime self-confidence of the great Minister who can listen to a roomful of experts talking on their own subject, can reject their advice, and be right. Then there was the Prime Minister of the peacetime coalition, when all the same great qualities seemed to go into reverse. And then finally there was the sudden and complete eclipse and the long years of frustration, the gall of which, in the later years, completely ate away his judgment.

Some people, of course, never had any use for him; but they were in the main the comfortable and the complacent and the narrow members of those governing classes to which he was proud never to belong. Millions of others, though they found it difficult to forgive some of the things he did, could also never forget what once he was. Their feelings may be summed up in some words quoted in Dr Jones's book:

> He is a man of iron determination, inflexible will, matchless courage and audacity and of peerless skill as a leader, but a man who will not allow even the demands of conscience and honour to stand in the way of his purposes, "who neither fears God nor respects man" . . . Who can withhold his meed of admiration from the old fallen commander and who can help feeling compassion at the ruin of such grandeur?

That is not Dr Jones on Lloyd George; it is Lloyd George on Parnell.

Assessment of Anthropology

Elements of Social Organisation. By Raymond Firth. *C. A. Watts.* 257 pages. 18s.

It is a sign of the times that catchwords purporting to be taken from the works of anthropologists are becoming for the Higher Journalism of the nineteen-fifties what psycho-analysis was to it in the twenties. Professor Firth's book is a welcome reassurance that all is not lost yet. The book is based on the Josiah Mason Lectures delivered by him at Birmingham University in 1947; and the Rationalist Press Association, which

founded the lectureship and has now published the book, deserves gratitude for sponsoring this important assessment of the present position of serious anthropological research.

Mr Firth's book is directed to the general reader ; but its sober style, exemplary clarity and abundance of factual information are deceptive. For there is a precise and by no means simple theoretical framework to it and the cumulative exposition of this theory is a notable achievement. The argument is satisfying not only because it fits the facts about Tikopia and Malaya but also because it makes sense to the historian or economist concerned with our own affairs.

The book begins with a closely argued chapter on the scope, data, methods of observation and main analytical categories of social anthropology. Mr Firth describes the unit of empirical study as a "field of social relations" which has a structural aspect, a functional aspect and an organisational aspect. He goes on to show how the social structure of a small homogeneous community of the kind normally studied by anthropologists can be analysed by reference to these categories and to the value standards accepted in it. But such simple societies are today undergoing rapid changes ; so Mr Firth turns to examine this process, drawing on data from all parts of the world. He gives special attention to the technological and economic changes going on in peasant societies and demonstrates with vivid examples how they affect all sides of social life. The high level of discussion is maintained in the next chapter, which deals with economic organisation. Mr Firth contends that the main body of economic doctrine holds for all types of human society, but that economic activity has social meaning only in the context of values and ends peculiar to a given society. Tackling the economist on his own ground and with his own weapons, Mr Firth shows that these values and ends are susceptible of systematic study and that primitive societies offer critical data for such study.

The theoretical argument is rounded off with a discussion of primitive art and of some general features of religious beliefs. This enables Mr Firth to show that the distinctive mental achievements of mankind can be related to the social ends and the standards of value found in a given society in the same way as can technological and economic activities. The sensitivity and wisdom of these chapters are the best proof that social anthropology, as expounded by Mr Firth, has a contribution to make to the formation of objective judgments about our own social problems.

Harrods

COMPLETE BOOK SERVICE

THE LIBRARY

Books and staff are the main factors in a Library Service.

Harrods buy large numbers of the popular books—often over 1,000 copies of a title—to ensure prompt availability.

Harrods are rightly proud of their staff who are carefully selected and trained to ensure pleasant and efficient service to readers. Each librarian has a limited number of subscribers to look after and is able to deal with each requirement on an individual basis.

★ Write for Library Prospectus

CHILDREN'S LIBRARY

There is an excellent separate library catering for children from six to sixteen.

SLOane 1234

In No Man's Land

Corporation, Trust, and Company. By C. A. Cooke. *Manchester University Press.* 206 pages. 15s.

The gap between economics and law is certainly one of the most serious gaps between two social sciences which should work closely together, and this study on the common ground of legal and economic history is therefore particularly welcome. The author has brought out the ways in which legal forms and economic purposes mutually influenced one another in the fields of corporate and joint stock enterprise from the development of the guild system to the Companies Acts of the mid-nineteenth century.

His central point is that the concepts of the corporation and of joint stock developed separately. Incorporation was originally bound up with the pursuit of some purpose identified as being in the public interest ; the growth of trading companies in the sixteenth and seventeenth centuries meant essentially that common interest in an enterprise and common ownership of funds had to be reconciled with the older conception ; but the reconciliation was slow. In the eighteenth century a body of law was growing up concerned with the rights and duties that arise from the joint ownership of funds, quite apart from the purpose for which the funds were intended, but it was from the equitable conception of the corporation —or the unincorporated group—as a trust holding property for the benefit of its members that the fruitful changes flowed. The original purposes of incorporation were paternalistic and monopolistic. Nevertheless, an age of competitive private enterprise honed to obtain from incorporation the benefits of limited liability and transferability of shares. The common law hampered this, and must have influenced the form of enterprise, but equity gradually modified the position, and in the early nineteenth century the common law position was itself changed. At first incorporation was hedged about by parliamentary enquiry, and the degree of limitation of liability was separately determined in each case, but the great series of Company Acts from 1844 to 1862 (at which point the treatment ends) laid down a standard procedure in the modern manner.

This is a useful book, in which a very large subject is treated in a moderate space, with sufficient detail, and with an appreciation of the interacting economic and social forces at work.

Co-operation Overseas

Agricultural Co-operation in the Commonwealth. By Margaret Digby. *Blackwell.* 172 pages. 15s.

Practical Co-operation in Asia and Africa. By W. K. H. Campbell. *Heffer.* 275 pages. 21s.

The spread of the co-operative movement from its home in Britain to the farthest corner of the Commonwealth is the theme of Miss Digby's book—treated here in a highly condensed, descriptive form. Agricultural co-operation, as Mr C. R. Fay points out in a Foreword, is concerned pre-eminently with the business side of agriculture, and this study compares its economic effort with that of the invention of the joint-stock company. This may be an exaggeration, but no one would deny the immense benefits which agricultural co-operation has brought. India, Pakistan, Ceylon and Malaya now have vigorous co-operative movements, and since the war the colonial territories have been opened to co-operation with some remarkable successes. These movements have been nurtured by registrars sent from Britain —often men of inspiration who have devoted their lives to the co-operative ideal. Today new problems for co-operators are arising through the interposition of the state as buyer, producer and distributor. The relation of the movement not to private but to public economy is the primary intellectual task now confronting co-operators. Miss Digby does no more than state this problem ; her narrative is wholly factual.

The author of "Practical Co-operation in Asia and Africa" is one of the best-known of the co-operative "missionaries" who has worked in, or paid advisory visits to, no less than 14 Commonwealth countries. His main task was as Registrar of Co-operatives in Ceylon, which now has one of the most effective movements ; he also advised the Chinese Government for five years. In this book his great wealth of experience is crystallised into straightforward advice on the law and administration of every type of co-operative—credit societies, co-operative banks, marketing societies, and his practical hints are shot through with the idealism which one expects from men of his stamp.

KEEP ABREAST OF LIFE

A sound knowledge of current affairs is essential to success and to full enjoyment of life. This is true not only of politics and economics, but also of the arts, of entertainment and sport.

Yet few have the time to read many newspapers and magazines covering all those things. Where can you get most, in the smallest compass, and for the least expense ?

Consider the regular features in *The Sunday Times.* Economics, world affairs, Parliament, personalities, music, drama, films, art, ballet, television and radio, bridge, gardening, country life, travel, women's interests, book reviews, etc., a comprehensive service of home and oversea news, editorial and contributed articles, and the finest sports page in Sunday journalism.

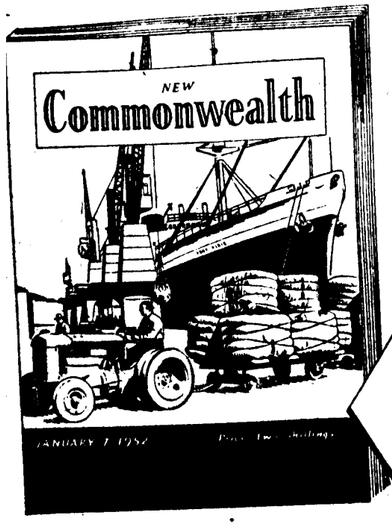
Consider, again, a few names among its regular contributors. Scrutator—a household word for sound, non-party judgment. Norman Crump—financial writer whose authority is recognised throughout the world. Dilys Powell—the country's leading film commentator. Desmond MacCarthy and Raymond Mortimer—a pair of literary critics without rival. George Schwartz—the most pungent writer on economics of his day. Peter Fleming—the famous author and traveller, in a frank and care-free column. Douglas Glass—famous portrait photographer. Henry Longhurst—whose wit and wisdom make his golf notes a joy to thousands of non-golfers.

If you want to keep abreast of life, you MUST read the

Sunday Times

The COMPLETE newspaper

Keeping pace with the Commonwealth



FROM NEXT JANUARY, "NEW COMMONWEALTH" will be published fortnightly instead of monthly. This significant decision has been made less than a year after *New Commonwealth* had expanded its field to cover the whole Commonwealth instead of the Colonial Empire alone. Such a change was found to be essential if *New Commonwealth* were to keep pace with the ever-quickening march of Commonwealth events.

The readers of *New Commonwealth* include the men who direct, administer and influence the affairs of the Commonwealth countries in every field. It is they who plan the future of commerce, industry and agriculture, and control the expenditure of thousands of millions of pounds. They must be kept constantly informed of the trend and significance of events, and it is to *New Commonwealth* (with its specialist home staff and corps of overseas Correspondents) that they look for this service.

As with readers, so with advertisers. They, too, must keep pace with Commonwealth developments. Commonwealth exports rose from £3,300 million in 1947 to £4,800 million in 1949. Last year's figures showed the value of Commonwealth exports as over £6,400 million and imports as more than £6,600 million. These figures emphasise the value of the fortnightly *New Commonwealth* as an advertising medium. The increased rate of publication will mean that advertisers will get more constant coverage. Their names will be brought twice as often to the notice of *New Commonwealth's* influential readers.

In no other advertising medium can a single campaign cover the great world market of the British Commonwealth with such efficiency and economy.

The *New Commonwealth* stands unique in its field. The necessity for fortnightly publication is the best evidence of its success.

NEW
Commonwealth

AMERICAN SURVEY

One Voice for America

Washington, D.C.

THE negotiations for a Japanese Peace Treaty, and the conference at San Francisco which was their climax, may well be remembered as the moment when the United States emerged as a great diplomatic power. It had been an economic power for a long time and had used its economic strength for political ends on many occasions—not always with superb tact but, generally, with good intentions and satisfactory results. But at San Francisco there was evident not only a greater certainty than in the past but also something new in American foreign policy, coherence. The delegates of other countries could see that Mr Acheson and Mr Dulles knew what they were doing, that what they were doing was what they wanted to do and that they had taken into account the possible effects of their actions. This spectacle, probably more than anything else, generated confidence in many delegates who had been wondering, before the conference began, how far and how fast they should follow the leader.

It is only four years since the United States began to have a foreign policy. Before 1947 it had no more than a set of unilateral and unrelated relations with foreign powers. Mr George Kennan notes in his new book that the Policy Planning Staff, of which he was the first director and which was one of General Marshall's early innovations when he became Secretary of State, was the first regular office of the Department of State to be charged in our time with looking at problems from the standpoint of the totality of American national interest, as distinct from a single portion of it. Traditionally, the State Department has been organised as a collection of separate kingdoms, not always on speaking terms with each other, with each kingdom conducting policy, if it can be called that, without reference to any of the others. Even now so many evidences of this tradition exist in matters of detail that one official in another Department often remarks that nothing like it has been seen since the Holy Roman Empire.

But gradually the various offices and divisions which recently operated so gaily on their own have been brought to realise that their operations must be organised to help, rather than hinder, the main lines of policy. And, since the Marshall Plan (the Truman Doctrine was really an *ad hoc* decision dressed up as a Doctrine), there has been a main line of policy. But State Department officials only originated the plan; they were not allowed by Congress—Congress, in this case being, to all intents and purposes, Senator Vandenberg—to run it. In retrospect the decision seems a wise one. The Economic Co-operation Administration was able to be single-minded in a way that would have been impossible for the State Department without many years of training.

ECA was, however, continually being frustrated by officials of the State Department who, without consulting anybody, took decisions with their eyes focused on the immediate problems of one geographical area—and one, probably, far from Europe—and who failed to take account of interlocking relationships. For example, while the main policy was to rebuild the economies of Western Europe, a busy little group was involved, in the name of anti-colonialism, in destroying the Dutch economy in Indonesia. And there are still some people in the State Department who believe it to be their duty daily to frustrate one of the old colonial powers.

* * *

As long as the main policy of the United States could be, and frequently was, modified by officials who took their own line, the country could not exercise the power which its inherent strength justified. It is probably no accident, therefore, that the kind of fears which are now being expressed all over Europe should become vocal at exactly the moment when American diplomacy has come to terms with itself and become certain and coherent in all important fields. The complaint is essentially that it has become altogether too coherent and takes too little time and makes too little effort to understand the incoherence and placate the fears of weaker countries.

Mr John Cowles, the publisher of the Minneapolis *Tribune* and *Star*, a Republican, but a Willkie Republican, last week released his observations on a trip round the world. He reported that

> Many highly intelligent Europeans and Asians, individuals who loathe Russian totalitarianism and believe completely in the democratic ideal, fear that through ineptness the United States is going to blunder into war with Russia or that we will become so provoked at Russia's exasperating conduct that we will ourselves precipitate war. It is difficult for Americans who have not recently talked with political and intellectual leaders in Europe and Asia to realise how widespread this view is. . . . Much of the world thinks that the United States has only one idea, that of confining Russian Communism by military might.

Mr Cowles concludes that the United States should put more emphasis on the "kind of a peaceful world that we envisage," but which will be possible only if Russia is not allowed to plunge the world into another war.

What he is asking, in effect, is that those who are administering the second stage of American postwar policy should give details of the third before they have had time to plan it. The first stage, the economic rebuilding of Europe, was interrupted by the Korean war and therefore gave way to the second stage, the military rebuilding, before either American plans or the European economy were ready to take the latter in their stride. As things have turned out Mr Cowles is right; American intentions have been misunderstood—and not without solid evidence for the misunderstanding. But it is reasonable to wonder what Congressmen would say if the new world were unveiled by the State

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Department before they had been consulted on either its shape or its cost.

What is needed is probably not so much promises for the future as clearer definition of present policy—and, despite recent improvements, a greater loyalty to it on the part of all officials, whether they are talking for publication or off the record. There would be less apprehension about what the United States intended a rearmed western world to do with its strength if such men as General O'Donnell stopped advocating using it to bomb all and sundry. But there are less extreme cases, which can be more damaging. When the President demands that there should be freedom of information on the other side of the Iron Curtain, he is demanding something which he must know that he cannot get without removing the present rulers of Russia—without, that is to say, going to war. Sonorous platitudes, designed to comfort powerful groups, are a part of the pattern of American domestic politics, but even sonorous platitudes can be dangerous at a time like the present.

Mr Kennan asserts that most of the present troubles of the United States come from its old habit of doing little beyond asserting moral and legal principles. Those who are making its policy are doing their best to recover from the position in which this habit landed them. They are continually impeded from both right and left. Nevertheless it becomes easier every year to recommend that the rest of the world watch what comes down the main stream of policy and neglect the shallows on both the right—or swashbuckling—side or the left—the "do-good"—one.

Minnesota's Primary

[FROM A CORRESPONDENT IN MINNEAPOLIS]

THREE local personalities and a coming event make politics more than usually interesting just now in Minnesota, the midwestern agricultural State that lies at the end of the Great Lakes just below the Canadian frontier. The personalities are Mr Harold Stassen, who was a strong contender for the Republican presidential nomination in 1948 and would like to be a candidate again next year; Mr Luther Youngdahl, Republican Governor of the State until he went to Washington at the end of September to take office as a Federal judge; and Mr Hubert Humphrey, junior United States Senator from Minnesota and a Democrat. The event is the State's first primary election, on March 18th, when the voters of Minnesota will have the opportunity, new to them, of expressing their views on possible presidential candidates from each party.

Mr Stassen has had the chief voice in important Republican decisions in Minnesota ever since his own election to the governorship in 1938, at the age of 31. Though now president of the University of Pennsylvania, he returns to his native State frequently and needs its endorsement in the primary to give him a good start towards winning the favour of the Republican party as a whole. President Trumans' nomination of Mr Youngdahl to be a Federal judge was a blow to Mr Stassen's pride and plans. Both represent the liberal side of the Republican party and Mr Stassen had picked Mr Youngdahl, then a member of the State Supreme Court, to run for Governor in 1946. Mr Youngdahl won easily and was re-elected in 1948 and 1950 by big majorities; he became one of the most popular figures in Minnesota's political history, although he was too headstrong to suit some of his party's leaders. Mr Stassen was counting on the Governor's help when he tries for the presidential nomination next year, but now the Federal judgeship has taken Mr Youngdahl out of party politics.

Although Mr Stassen was in Minnesota at the time, Mr Youngdahl did not consult him about the offer of the judgeship and Mr Stassen did not conceal his displeasure that such a powerful vote-getter was being removed from the scene. Indeed, the appointment seems to have been a master stroke by Senator Humphrey for, with Mr Youngdahl gone, it is generally conceded that the Democrats will have a better chance of capturing the State Government. Traditionally Minnesota is Republican, but it has voted for Democratic Presidents since Franklin Roosevelt first ran in 1932. It has one Republican and one Democratic Senator and five Republicans and four Democrats in the House of Representatives. The State Administration and State Legislature have been in Republican hands fairly constantly, although the Farmer-Labour party took control for a few terms in the nineteen-thirties.

Technically there is no Democratic party in Minnesota, but only a Democratic-Farmer-Labour party; the merger was engineered in 1944 when it became apparent that neither the Farmer-Labour nor the Democratic party could get far by themselves. Active in that coalition movement was Mr Hubert Humphrey, who in 1945 was elected Mayor of Minneapolis, Minnesota's largest city; he was re-elected in 1947 and chosen US Senator in 1948. He has plenty of political appeal of his own, especially in labour circles, and is full of energy and of ambition to turn the State Government over to his coalition party. It is even possible that he will try for the governorship himself in 1952, something he would never have attempted against Mr Youngdahl, for whose political sagacity and popularity he has a healthy respect.

Mr Stassen was also made uneasy by another aspect of the Youngdahl appointment. The new judge's successor as Governor is Mr Elmer Anderson, a young and unassuming wholesale magazine dealer, who has been Lieutenant-Governor continuously since 1938, with the exception of the term between 1942 and 1944, when he was sidetracked by the then Governor, Mr Stassen. Those were the years during which Mr Stassen went to war and the Lieutenant-Governor, Mr Thye, now the senior US Senator, took over. Mr Anderson has always said that he has no political aspirations beyond being Lieutenant-Governor, but now that he has at last tasted power he will probably be a candidate for the governorship next year. His extreme modesty and the slight put on him in 1942 aroused the sympathy of many voters and since then he has quietly and steadily, and without anyone's help, been successful in every biennial election. He is certainly not to be counted out of the governorship race in 1952, although more brilliant figures in both parties are looking hopefully at his position. And in view of past history it is unlikely that in the meantime Mr Anderson will use his influence as Governor on behalf of Mr Stassen's presidential candidacy.

*

Still it is a fairly safe bet that the Minnesota delegation, or at least a substantial portion of it, will back Mr Stassen at the Republican partys' convention next summer. Senator Taft and General Eisenhower both have strong support and the Minnesota Poll, a local opinion survey, indicates that General Eisenhower is the most popular of all amongst both Republican and Democratic voters in the State. But in the absence of any encouragement from him the organised backing will go to Mr Stassen or Mr Taft, or perhaps be divided between them.

The new Minnesota law provides that a candidate for the presidential nomination may enter his name in the State's primary election between January 15th and February 15th of a presidential election year, or may be entered by his supporters with or without his consent. A candidate may himself file only on one party ticket, but that limitation does not apply to his supporters and General Eisenhower's name could conceivably appear on both tickets in Minnesota. But he, or any candidate, may withdraw by February 25th, and it is possible that what the General does in connection with the Minnesota primary may provide the first firm evidence of his presidential intentions.

The probable winner on the Democratic side of the primary is President Truman. Although he has not stated his intentions, he raised no objection when told by Senator Humphrey that his name would be entered. Mr Humphrey has long been a leader in Americans for Democratic Action, a liberal organisation, and urged support for either General Eisenhower or Justice William Douglas of the US Supreme Court at the 1948 Democratic convention. Nevertheless, since then Mr Humphrey has gradually worked himself into Mr Truman's good graces, although secretly he would probably prefer a stronger candidate for the 1952 campaign.

A Democrat can count on most of the labour vote in Minnesota and in 1948 the farm vote was also given to Mr Truman, as it was, unexpectedly, in most States. Now there seems to be much more dissatisfaction with the Administration. Far Eastern policy and the conduct of the Korean war are widely criticised and in the new defence programme Minnesota has been neglected. Lying on the northern border, the State would probably be a target in an air attack coming from across the North Pole, but virtually all military air stations are being established in the south. The Mayor of Minneapolis recently reminded the President that he is not supposed to be defending the Mason-Dixon line. Any resurgence of isolationism in this State would operate to the disadvantage of the Democrats. So Democratic leaders are apprehensive and, like many others, are looking to the presidential primary on March 18th for an indication of how far their apprehensions are justified.

American Notes

Reprieve for Economic Aid

Economic aid for Europe, the stepchild of this year's foreign assistance programme, has fared better in conference than was expected before the Ottawa meetings underlined the need for it. In the Senate, where the most damaging cuts were made, the upward revision already has been accepted. Out of a total authorisation of nearly $7.5 billion, just under $1.5 billion is allocated to economic assistance; of this, Europe's share is just over $1 billion, $142 million more than the Senate originally approved. The division of aid funds between regions and economic and military assistance for the fiscal year ending next June is as follows:

	Economic Aid	Military Aid
	(Millions of Dollars)	
Europe	1,022	5,028
Asia and the Pacific, excl. Korea	238	535
Middle East and Africa	160	396
Korean Reconstruction	45	...
American Republics	21	38
Total	1,486	5,997

None of these figures is more than a ceiling; foreign aid must go round the Congressional course once more before the appropriations are fixed. And economic help for Europe still remains $600 million below what the Administration thought was needed. But by loosening some of the rigid boundaries between economic and military aid, the conferees have made this less serious. Though some Republicans objected that they had no right to do so, the conferees provided that the President may transfer as much as 10 per cent of the military funds to the economic programme, instead of 5 per cent; this may swell Europe's economic aid to $1.5 billion. In addition, military funds may be used, not only to finance munitions contracts abroad, but also to pay for the building of airfields and other facilities for the common defence in Europe. This may bring $500 million or more to the relief of Europe's dollar deficits and strained budgets.

This reprieve for economic aid is due almost entirely to the last minute intervention of General Eisenhower, who informed the conference committee, in the most forceful language, that economic aid was as important as military help and, from the point of view of increasing arms production in Europe, even more vital. This warning could not be lightly disregarded; it came not only from the Supreme Commander in Europe, but from a man who may soon be the first Republican President for twenty years.

In return for its concessions on the amount of aid, the Senate has had its way about the control and organisation of the programme, which the House had favoured placing in the hands of a new, single agency. The conferees are thus to be congratulated on preserving the best in both versions. A new Mutual Security Agency will replace the Economic Co-operation Administration within sixty days, taking over its responsibility for economic aid and 90 per cent of its staff. But the Defence Department will continue, as at present, to supervise military aid and the State Depart-

ment to direct technical assistance under Point Four, though the director of the new agency, who is to co-ordinate their efforts, will be responsible to the White House, not to the State Department, as the present co-ordinator has been. He is confidently expected to be Mr Harriman, though the President insists he has not made up his mind and Mr Eric Johnston is thought to have ambitions for the job.

* * *

Tax Relief—Senate Style

Fifteen liberal Democrats kept the Senate working overtime for nine days on the Tax Bill in an attempt to bring it closer to the Administration's wishes, but they did not loosen Senator George's grip on what he declares will be the last tax-increasing Bill to come out of the Senate Finance Committee while he is chairman. The Senate version provides for additional revenue of about $5.4 billion in a full fiscal year, but this is only half as much as the President wanted and $1.8 billion less than the House offered in the Bill it passed three months ago. Of more immediate importance, the Senate, by postponing the start of the various tax changes, would provide only $2.7 billion in the current fiscal year compared with the House's $5.4 billion.

Both Bills make changes, both up and down, in existing excise taxes and put a 10 per cent tax on a new group of mechanical household devices such as floor polishers, door chimes, and pants pressers. Both Bills also contain a new 10 per cent tax on betting, even though this will mean that the Federal Government is profiting from something it does not approve of. At the last moment the Senate required annual returns of net worth from all persons drawing more than $2,500 from any illegal enterprise, so that the police might know who were building up fortunes through activities, such as gambling, banned by state governments.

* * *

The Senate Bill is less severe than the House as regards increases in both personal and corporate income taxes, although it provides for levies on the expense allowances of the President and members of Congress—but not until after the next election. Both Bills permit the establishment of family partnerships, so that incomes can for tax purposes be spread among relatives instead of being credited all to one individual. The Senate made this provision retroactive to 1938, thus apparently benefiting people who are still fighting tax assessments on inflated wartime incomes. This is only one of many obscure clauses which have led those who claim to understand their implications to call the Senate Bill a "tax relief," instead of a "tax increase," Bill. Relief is also provided for new and fast-growing businesses, such as television, in a collection of twenty-two provisions which lift the weight of excess profits tax from their shoulders; in addition the Senate has refused to lower the ceiling above which earnings become liable to EPT.

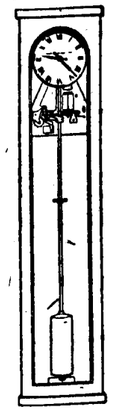
The oil industry will continue to enjoy its very generous depletion allowance and a number of other mineral producers are also granted new or increased depletion allowances. Coal owners are permitted to pay taxes on a capital gains basis, more favourable than income tax in the higher brackets. This relief for coal can perhaps be excused on the grounds that it is a depressed industry, but this hardly applies to farming. Yet the same concession has been extended by both Houses to livestock kept for breeding, and the Senate added turkeys, apparently because one member takes a special interest in these birds. Other examples of the Senate's leniency are its rejection of the House's withholding tax on dividends and its refusal to increase the capital gains tax; both of these differences are likely to give trouble to the conferees who are meeting this week.

Government in a Goldfish Bowl?

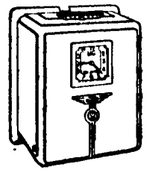
To the satisfaction of the Republicans, case after case of improper influence, of alliances between officials and gangsters, of bribes accepted and favours bought seems to be qualifying the Administration for the old tag of "corrupt and contented" originally applied to the city government of Philadelphia. These are not scandals on the scale of the Harding era, but the public is becoming disgusted with "Trumanism"—the blind eye deliberately turned to wrongdoing. The President burned his fingers over the Reconstruction Finance Corporation, and today he is as obstinately standing by the chairman of the Democratic National Committee. The Senate investigating sub-committee has received, as yet, no proof of the *St Louis Post-Dispatch's* charge that Mr Boyle received $8,000 from a printing firm for expediting an RFC loan in the days before the agency itself was reconstructed. But Mr Boyle admits to arranging a meeting between the firm's president and the then head of the RFC, and to accepting eight law cases, mostly concerning government agencies, while he was unpaid head of the Democratic Committee. Republicans contend that the alleged sale of his practice when he reluctantly accepted a salary from the Democrats was only a blind.

Mr Boyle is only the largest Republican exhibit. A new internal revenue scandal has blown up in the west, and a whole procession of government employees have admitted receiving gifts, loans, and commissions from companies dealing with the government. Few have had even as nice a sense of the proprieties as the RFC examiner who, admitting he had taken a ten-pound ham, said he would have drawn the line at twelve pounds.

To the irritation of the Republicans, however, the sharp edge of their case has been blunted by their own national chairman who, four days a week in that capacity, declared the RFC should be abolished, but on the other three ran Carthage Hydrocol, Incorporated, a firm with an $18.5 million RFC loan. While some Republicans were demanding Mr Gabrielson's resignation, Mr Truman gave the tables an additional turn by asking Congress to require all appointed and all elected officials (including Congressmen and prominent party figures) to make public all their sources of income, including gifts and loans. This, the President said blandly, would put an end to cruel insinuations that most public servants were venal, while it would discourage the few tempted to put private concerns before the national interest. Such a proposal, however justified it may seem in the light of present revelations, might be a source of keener discomfort to innocent than to guilty men; it certainly would not make government service any more attractive to the able. But Congressmen, who have no objection to officials being forced to live in a goldfish bowl, are not likely to take the plunge where they themselves are concerned. Many Congressmen augment their incomes by practicing law or in other ways. Mr Truman has scored a shrewd political stroke which will make it easier for Democratic orators to face their critics, but whether it will satisfy the public is more doubtful.



* * *



End of the Beginning

The main fact which emerges from the third quarterly report of Mr Wilson, the defence mobiliser—rather grandiloquently entitled "Three Keys to Strength: Production, Stability and Free World Unity"—is that after more than a year of hard work, tooling up for defence is nearly complete. The United States stands on the "threshold of volume production" for many articles of military equipment. Contracts worth $45 billion have been let (in addition to $7 billion committed, but not spent, at the outbreak of the Korean war), out of nearly $100 billion made available, including foreign military aid. Deliveries up to the present total $14 billion, more than $5 billion of which were received

The pipe world is almost universally a man's world—where in the smoke clouds there is no nonsense about sex equality, no question of who is the Lord of creation, and, if there is any conversation at all, no inhibitions. This is the world that Sobranie Pipe Tobaccos serve—with a long slow smoke which brakes the whirl of events, and a satisfying full flavour that makes connoisseurs of us all. The traditionalist will swear by his Mixture, the progressive will be just as persuasive about his Virginia No. 10 with its touch of cigar leaf as the added touch of genius. Both will be fundamentally at one in their devotion to Sobranie . . .

★ ★ ★ *Sobranie 'Virginia' are made by the makers of* Balkan Sobranie *who have been making perfect cigarettes since cigarette smoking first began in this country over seventy years ago.*

during the past quarter. This quarterly rate is four times the amount received a year ago; by this time next year it should have doubled. Re-tooling for combat vehicles is now one-third complete, and should be finished by the end of the year; in 1952 deliveries are expected to be seven times what they are today. A threefold increase in deliveries of electronic equipment also is expected by next summer. Aircraft production will quadruple, but not for two years; re-tooling for the complex new bombers has been delayed by the scarcity of skilled labour and of specialised machine tools.

That there has been some "slippage" in the schedules—the jargon for a failure to meet them—springs to the eye.

Source: Office of Defence Mobilisation

Three months ago the defence mobiliser confidently predicted that military deliveries would reach $4 billion a month by next June. Now that rate of production is not expected even to be approximated until the third and fourth quarters of the year. And annual spending for national security, which also was to reach a peak of $65 billion in June, will not attain it until three months or more later.

It is Mr Wilson's belief that, thanks to an increase by then in the gross national product to an annual rate of $330 billion (at 1951 dollars) and decreases in private investment, defence spending on this astronomical scale will not seriously decrease consumers' goods, though shoppers will have to take more in soft goods and less in metal-using articles such as automobiles, television sets, and houses. The present metal stringency is due, not only to direct defence demands, but also to those of the basic industries which are expected, in a three-year period, to expand to the tune of $50-$60 billion. Mr Wilson is more hopeful than his aides that further immediate cuts in supplies for consumers' durable goods can be avoided; and more optimistic, at a press conference, than his own report, which points out that continued drought in the north-west might, by turning off the electric power, cost the nation 100,000 tons of aluminium in the next six months and force further cuts in consumption.

* * *

Gunning for McCarthy

Last week was a black letter one in Senator McCarthy's calendar, for during it he was for the first time forced to take not one, but three, doses of his own medicine. The first was at the pre-trial hearings of Mr Drew Pearson's damage suit, for combined assault and libel, against Mr McCarthy and others. There the Senator was questioned, as he has so often himself questioned witnesses, in a way that he considered impertinent about income tax returns that seemed to him irrelevant. The day afterwards Senator McCarthy was again on the defensive, being examined by members of the Senate Foreign Relations Committee who are considering whether Dr Philip Jessup is a suitable delegate from the United States to the United Nations. Mr McCarthy had accused Dr Jessup of "having an affinity for Communist causes," but the committee members, whether Democrats or Republicans, insisted on pinning him down, a new experience for the Senator. They demanded definite answers, not rambling insinuations, and were unimpressed by "proofs" which only proved that, if Dr Jessup had ever been connected with the causes in question, they had not been Communist-front organisations at the time.

Next day another Senate sub-committee, a section of the Rules Committee, allowed Senator Benton to present his case for driving Mr McCarthy out of the Senate as he has, in his own opinion, driven Communists out of government. The case was presented in almost the flamboyant McCarthy style, but the ten specific charges against him, by a man he regards as a "mental midget," add up to far more than any he has ever made himself. Mr Benton accused Senator McCarthy of perjury, fraud, calculated deceit and gross irresponsibility in his attacks on the State Department, in his interference in last year's election campaign in Maryland and on other occasions. If upheld, the charges certainly amount to the "disorderly behaviour" for which the Senate is constitutionally entitled to punish its members. But even if the sub-committee decides to proceed with hearings on Senator Benton's accusations, it would be most surprising if Mr McCarthy were expelled.

Last week's events show definitely that the tide has turned against Senator McCarthy, but there is some danger that Senator Benton's direct challenge may reverse the trend. His own Democratic Party officials are unenthusiastic about his insistence on gunning for Mr McCarthy, for they fear that, if Mr Benton fails to hit the mark, the Administration may be accused of trying to silence its critics; and if Mr McCarthy is actually shot down, his home state of Wisconsin may make a martyr of him and re-elect him next year—as it probably will anyway. Finally, if the many Republicans who would like to drop Senator McCarthy quietly are asked to do so with a bang, party loyalty may overcome their scruples and rally them to his side.

Shorter Notes

Civil war rages in New York City every year between the Giants of Manhattan and the Dodgers of Brooklyn, both of baseball's National League, and last week the two teams tied for this year's championship. From Monday to Wednesday the decisive play-off kept the city glued to its television sets until the Giants won in a sensational finish, a fitting climax to the series of victories which had taken the team from far down the League to the top in two months. But this was only the beginning, for on Thursday the Giants went on to the field to fight the World Series against yet another New York team, the Yankees from the Bronx, who head the rival American League. There is therefore no cause for alarm, and no long-term significance, in the fact that business activity in New York has dropped almost to vanishing point this week, except in a few specialised fields such as peanut-vending.

*

When Congress realised last week that it could not meet its proposed adjournment date, October 1st, it was obliged, for the third time since the fiscal year began on July 1st, to provide temporary appropriations to finance the Federal Government for yet another month.

*

The State Department has come to the conclusion that most of the young Lebanese who come to the United States as students are looking not for further education but for a spouse. For a Lebanese to get a visa as an immigrant takes five years, but visas for students are available at once. Few of the Lebanese students have completed their courses and even fewer have returned home. Most of them have married American citizens, usually members of resident Lebanese families with whom they had already been in correspondence; this seems, in fact, to be a new version of the "picture bride" system, applied to both sexes.

*

The Pennsylvania Railroad is experimenting with automatic machines on its trains, from which can be obtained such delicacies as roast beef sandwiches, ice cream, pastry and hot coffee. If successful the machines will take the places of the attendants who have hawked food up and down the coaches, and perhaps of some of the dining cars as well.

THE WORLD OVERSEAS

The Crown Comes to Canada

(From Our Ottawa Correspondent)

THE history books show how closely the monarchy is linked with the course of the Commonwealth; but it does not need a future historian to estimate the importance of the tour of Canada on which Princess Elizabeth and the Duke of Edinburgh are to embark next week. It must be accident rather than design; but it has happened that the tour coincides with a particularly sharp mood of Canadian national consciousness; and Princess Elizabeth and the Duke provide a focus for it.

Their present tour has the incidental effect of correcting in the most vivid manner possible the exaggerafed sense which many British people seem to have of the "Americanisation" of Canada. It sometimes seems here as though the "Mother Country"—a phrase which most Canadians abominate—had watched her Canadian child grow up, and then been saddened to see that child flirting with a rich young man of whom she could not altogether approve. In so far as this may be a fair representation of some British attitudes towards Canada, it is based on a complete misunderstanding of the supposed flirtation. To carry through the rather odious family analogy—Canada has to live next door to the rich young man, who is determined and sometimes headstrong. It requires all Canada's tact and skill to maintain friendly, harmonious relations while avoiding any suggestion of impropriety. For any daughter in such a position the most irritating attitude her mother could possibly adopt would be to assume that the marriage—or the liaison—was already a foregone conclusion.

Spontaneous Public Interest

That the British should recognise Canada's distinctive character as a country that is British by history and American by geography is welcome and overdue. But the recognition that Canada is part of North America might have come from any schoolboy's atlas; and it should not conceal the equally important fact that Canada is still very different from the United States. The royal tour is a very vivid, and timely, illustration of this second fact. From afar it may seem as though the crowds which turn out to cheer Princess Elizabeth and the Duke of Edinburgh have little permanent significance. It may not be easy to distinguish the welcome given to the royal couple and that which might be evoked by any pageant or any celebrity from Hollywood. But Princess Elizabeth is not being greeted with the flippant and frothy excitement which a film star might arouse. Every Canadian magazine and newspaper, in French or in English, has been flooded these past weeks with the latest pictures of Princess Elizabeth and her family, and with articles about them. But the inevitable and natural "human-interest" stories are matched by serious discussions about the nature of the Commonwealth to which this country belongs and the role of the Crown in Canadian life. The national broadcasting system is using the occasion to broadcast a series of talks by eminent Canadians about the Commonwealth. The regular broadcast commentaries on current affairs, given by prominent journalists and others, have for some weeks devoted a surprising amount of time to the position and

of the Crown. There is a new emphasis on the Commonwealth link as a counter-balance to the United States.

This public mood—a mixture of emotional enthusiasm and rational discussion—has had no inspiration from above. The Canadian government has been co-ordinating arrangements for this visit through a back-room committee, whose doings have been publicised only in the form of bare and unexciting schedules. The impression left by the federal government offices here has been that they would be just as happy to soft-pedal the whole affair. The massive public interest and concern arose quite spontaneously. Certainly it would be wrong to overemphasise the part of royalty in the minds of most Canadians. It would be utterly misleading to suggest that there is any return to the mood of old-time "imperialism." But the royal tour has aroused and demonstrated deep feelings which do not often get such open expression. Its effect is to put a new stress on those things which differentiate Canada so sharply from the rest of North America.

A Sovereign in Residence?

It would be over-facile to say the stress is on the "British-ness," rather than the "American-ness" of Canada, and it would be only a partial truth. For one thing, the royal visit arouses as much enthusiasm amongst Canadians of French ancestry as anywhere else. Moreover, this is something even more significant than the maintenance of ties with people across the seas: the sense of relationship with them inevitably grows feebler as the years pass. The reality, about to be proved by Princess Elizabeth, is more remarkable. It is that the Crown, the British parliamentary system, the joint traditions of British and French law and culture, have become so much a part of the Canadian fabric that they evoke spontaneous recognition—not as something imported from across the seas, but as essential components of the community which is Canada. Canada is not so much showing itself to be British as the Crown is showing itself to be Canadian.

This being so, part of the serious discussion about the visit inevitably concerns the continuing relationship between the Crown and the many countries which owe it allegiance. Dr B. K. Sandwell, the veteran Canadian editor who is now in semi-retirement as "Editor - Emeritus" of *Saturday Night*, recently brought into the open considerations which many Canadians have had in their minds. He wrote: "A Kingdom implies a Palace, and a Kingdom of Canada implies a Palace in Canada, even if the same King has other palaces in other lands. I think it also requires that for a portion of each year, or perhaps of each two or three years, the monarch should be in residence in the Canada of which he is sovereign, and should himself, and not through a deputy, exercise his right 'to be consulted, to encourage and to warn' his advisers."

There may be many opinions about the practicability of this solution. But there should be little argument that the problem to which it is a suggested answer is already a

Exercise Counterthrust

[BY A CORRESPONDENT]

THE general idea behind the recent manœuvres of the British forces in Germany was that lying to the north of a peaceful and democratic state, called Blueland, was a hostile and aggressive state, called Redland, possessing military forces initially much superior in strength to those of its southern neighbour. After a short period of tension Redland launched an unprovoked attack on Blueland, which fought a delaying action to obtain time to mobilize its reserves and obtain help from its Allies. The ground forces actually engaged were, on the Blueland side, an army corps consisting of the 7th and 11th British Armoured Divisions, a Belgian brigade, a Netherlands brigade and a Norwegian brigade; and on the Redland side the 2nd British Infantry Division plus an American armoured brigade group together with one Danish and one French battalion.

From a general point of view the main interest of the exercise lay, first, in the light it threw on the standard of training and equipment of the British Forces in Germany, and second, in the light thrown on the problem of close co-operation in the field between units from different Nato countries. So far as the British forces were concerned there was a marked improvement on the situation prevailing a year ago. The strength of units was in many instances up to ninety per cent of war establishment as compared with little more than sixty per cent a year ago and the standard of elementary training very clearly reflected the benefits of the extra six months of national service. On the equipment side the two armoured divisions, one of which had been sent to reinforce the Rhine Army earlier this year, were fully equipped with Centurion tanks, a process which a year ago had only just started in the one armoured division then in BAOR. The "soft" vehicle situation was on the other hand still unsatisfactory. The majority of trucks were ones that had been in use at the end of the war and they showed the effects of six years of hard wear. The wireless equipment was old and this contributed to the unsatisfactory standard of wireless communications.

The standard of basic training was good, but for the rest wide variations were apparent. A striking contrast was to be seen between the superb standard of camouflage of the 7th Armoured Division, which has been in Germany in one form or another since the end of the war, and the much lower standard of the 11th Armoured Division which only joined Rhine Army in April of this year. Similarly there were great differences in the standard of field defences prepared by different infantry battalions.

Broadly it was the finer points that were wanting, and here there was a noticeable difference between those officers and NCOs with war experience and those without. Those without war experience were not on the whole sufficiently information conscious and failed to pass back information as to what was occurring in their own locality and to demand information of what was happening on their flanks. One artillery regiment, for example, did not appear to have kept a proper tactical map at any stage during the exercise, and when their forward observer became a casualty his replacement was gaily sent up along a main road which had been in enemy hands for twenty-four hours. Likewise there was a tendency to accept, without serious effort at overcoming it, the failure of wireless communication.

A further weakness amongst young officers was a lack of appreciation of the need for the closest co-operation between different arms. In one such instance an artillery regiment was supporting a screen of armoured cars which were holding a gap between two brigades, but no plan had been arranged between the gunner officer on the spot and the armoured car commander for artillery fire in the event of enemy attack. In this case, as in many others, wireless sets which were provided for the express purpose of establishing this kind of inter-arms communication were lying unused in the back of trucks. A particularly disturbing feature of many of these cases was that the officers concerned, on being spoken to, did not seem to grasp the importance of this close co-operation. The best way of bringing the lesson home would have been to award to those units which were the principal offenders the heavy casualties that their sins would inevitably have brought them in real battle. For understandable reasons, however, it was laid down that the "dead" would be resurrected after a period of six hours (otherwise those killed would have had no more opportunity of gaining experience in the manœuvres).

Exercise Counterthrust provided a good opportunity to study the problems involved in the use of a number of relatively small different national formations, none bigger than a brigade. The only really satisfactory and intimate co-operation was that between the British and the American armoured brigade. Here there were naturally no language difficulties, and the steps that were taken both during the war and afterwards to standardise military terminology and procedures in the two Armies seemed to have borne excellent fruit. So far as the other brigades were concerned, language difficulties were very substantial, and these were made worse by differences in organisation. As a result these brigades were used as independent formations holding outlying positions and not as a coherent force. In the circumstances this was almost certainly the right decision by the Blueland commander, but it suggested very forcibly that a European Army made up of a large number of small national units would be relatively wasteful and inefficient. On the whole, the equipment and training of these Nato units compared not unfavourably with that of the British troops involved in the exercise, though it would be an unsafe deduction to suppose that the same could be said of the general standard of equipment in the continental Armies concerned.

Forces for German Unity

[BY OUR SPECIAL CORRESPONDENT]

THE reaction of West German politicians to the latest Soviet-German proposal for talks on unity and a peace treaty will probably encourage Herr Grotewohl to try again. The fact that the Bundestag supported practically with one voice Dr Adenauer's declaration of terms for free elections could not conceal the increased divergence of opinions which the Soviet-German concessions roused. On this occasion, Dr Schumacher has been playing a particularly dangerous game. He has denounced the Schuman Plan, the European army and the Washington proposals for ending the occupation statute; and he has refused to collaborate in negotiations with the High Commission, though Dr Adenauer has insisted upon keeping him informed. Dr Schumacher has said he was prepared to take part in "actions, not capitulations," *vis-à-vis* the Western Powers, and indicated that Dr Adenauer could be suspected of being the Allies' tool if he rejected Herr Grotewohl's proposal out of hand. The opposition leader, though he did not propose simple acceptance of the East German offer, made it, in fact, very hard for Dr Adenauer to argue that Germany's best interests would be served by concluding pacts with the West before any other step was taken.

This divergence between two equally patriotic and anti-Communist Germans such as Dr Adenauer and Dr Schumacher can be explained in broad terms. Though it contains Protestant and Socialist concentrations, the Federal Republic is predominantly Catholic and opposed to Marxist socialism. It is federalistic rather than centralist. In Bavaria, dislike of Berlin and everything "Prussian" becomes outright separatism. Dr Adenauer, the Catholic Rhinelander, with a traditional inclination towards France and away from Prussia, is the outstanding representative of a state which would in external affairs work with the West and in domestic affairs follow a Christian-social policy of collaboration between labour and capital.

Schumacher Looks East

By contrast, the present Soviet zone is predominantly Protestant, and once contained Social-Democrat strongholds in Berlin and Saxony. It is hard to say how many former Social-Democrats retain their allegiance to their old party since the merger with the Communists in 1946; but Dr Schumacher is convinced that free elections would rally them to him. In the West, Dr Schumacher has failed to force general elections on the issue of rearmament and German sovereignty. But all-German elections on the terms laid down by the Bundestag last week would, he believes, bring him and his party to victory. The Social-Democrats, perhaps with their allies, the refugee party (BHE), would govern a centralised state with its capital once more in Protestant Berlin. Its internal policy would be to socialise the industries of Western Germany and bring them into line with the present "people's concerns" of the Soviet zone. Externally it would concentrate on securing the next and biggest step towards unity—the return of the Oder-Neisse territories.

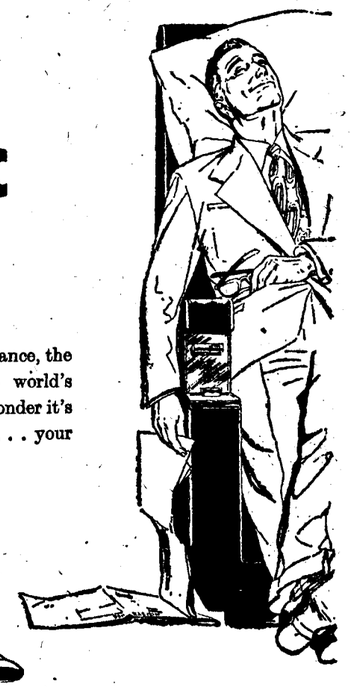
West German industrialists and businessmen, however much they want a reunion with the Soviet zone, have their enthusiasm damped by the prospect of Schumacher socialism. They also fear that they would lose the benefits of American rearmament orders, and would have to share any further US aid with an impoverished Eastern Germany. The Ruhr wants trade with the Soviet sphere, and dislikes the competitive industries which are being built up in the eastern zone—particularly the big new steelworks known as the *Huettenkombinat Ost*; but the steel industry would still less like to find, say, the *Gutehoffnungshuette* taken over by a socialist state and renamed *Huettenkombinat West*. On the other hand, there are many German industrialists who are refugees from Eastern Germany, and hope that reunion would bring them back lost factories and homes.

Nationalist Protestants

One of the leading forces working for unity is the Evangelical Church, which has its main strength in Eastern Germany. Its power and determination were demonstrated at the big all-German Protestant rally which was held in Berlin last summer. The Catholic Church is of course also concerned deeply for its flock in Soviet hands; but it is undeniable that its weight lies in the West, and that it has ties with Rome and Paris. The Evangelical Church in Germany is traditionally nationalist and obedient to a strong centralist state. Its Confessional wing, led by Pastor Niemoeller and his colleagues, is strongly opposed to rearmament; but the Church as a whole is not inclined to pacifism, even of Pastor Niemoeller's nationalist persuasion. It has, on the contrary, strong links with the old German army; owing to the domination of Prussia, the higher ranks of the officer corps were almost exclusively Protestant. Only the advent of the *Waffen SS* introduced generals who were not only anti-Catholic, but non-Christian by order.

It is clear that there are strong sections of the West German community whose particular interests lie in securing unity—with the Soviet zone first and the lost East German territories next. They will always be able to appeal to the patriotism of the people, and to the general fear of being branded as tools of the occupation powers. Now that the crucial moment is coming for the Federal Republic to join the Atlantic forces, it is evident that the idea of unity will appear much more strongly than before in the light of an attractive alternative.

A New "Purge" of Russian History



[BY A CORRESPONDENT]

IN the Soviet Union even death does not guarantee repose and stability to a public figure. Since it is considered, in Humpty Dumpty-like fashion, that historical events should mean what one wants them to mean, dead national heroes lead a perturbed existence travelling from the Pantheon to the dustbin and back again according to the political needs of the moment. The writing, or rather the rewriting, of history thus becomes an interesting indication of the political line currently followed by the Soviet rulers. A good illustration is provided by the posthumous fate of Tsarist generals such as Kutusov or Suvorov. Dismissed as Tsarist stooges or agents immediately after the revolution, they were brought back into official favour on the patriotic and nationalistic wave of the thirties. During the war, when it was necessary to increase the prestige of the Army, these Tsarist generals were restored as fully fledged national heroes. Then, fearing the danger of Bonapartism, Stalin gave another sharp turn to the wheel. Patriotic excesses and the glorification of the Army and its pre-revolutionary predecessors were severely criticised. But Kutusov and Suvorov did not leave the Soviet stage for long. In the present tense international situation the patriotic cult has once again become fashionable.

A symptom of this new and important trend is provided by a violent attack in a recent issue of the *Bolshevik*—the Party's theoretical organ—on the eminent Soviet historian Eugene Tarlé for "slandering the Russian Army and the memory of Kutusov." Not long ago Tarlé was still in the limelight as a contributor to *News*, the new Soviet English-language magazine. Now, the attack on him is so strongly worded that judging by prewar standards the author should be "withdrawn from circulation" as well as his book. This time, however, it appears that only the book will be with-

Happy paradox

Who would have thought that any cigar as satisfyingly full of character as La Tropical could yet be so mild? It's a grace peculiar to some of the very finest Jamaica leaf—this marriage of what one has learnt to regard as opposites. A marriage of great convenience to present-day smokers! Not many of us can smoke cigars with carefree regularity. And the man who cherishes cigars for occasional solace usually prefers them to be mild.

In cedar boxes of 10, 25 and 50. In cartons of 5. In all the usual sizes from 2/8 to 5/3 each . . . Petitas 1/6

Men Only?

EVENING ENGAGEMENTS take a variety of forms. Sometimes there is a rainbow of charming colours and a cascade of charming conversation: there are ladies present. At other times the sombre black and white of broadcloth and starched linen dominate the scene, and the talk is of mature and weighty matters: it is a 'stag' affair. Both sorts of occasion are equally important. Both, at the Connaught Rooms, are equally superbly done. In the Connaught Rooms, where no fewer than twenty of the most sumptuous Banqueting Halls are gathered together under one roof, London has an amenity without equal anywhere on earth.

drawn or rewritten, since at the same time as he was attacked in the *Bolshevik*, Tarlé's name was included among the signatories of some "important" peace petition.

The striking feature of the *Bolshevik's* article is that Tarlé is attacked for a book—"Napoleon's Invasion of Russia, 1812"—which he wrote in 1938. At that time, when war and invasion seemed likely, the Russians were being reminded of their "glorious national past," and the revolutionary tradition was being replaced by Tsarist legends. It was then that a Soviet film was made, in which the Tsarist general Suvorov was proudly shown trampling down flags belonging to the revolutionary armies of France. Tarlé's book was written in this mood. In 1943 it was republished with an introduction drawing a parallel between the two invasions and stressing the difference between Napoleon and Hitler (this differentiation between invaders may now be displeasing to Soviet leaders).

Chauvinism in Retreat

In 1945 the ultra-patriotic line in history was discarded. Stalin had become a generalissimo and pushed the marshals into the background. The *Istorichesky Journal* (Historical Journal) was accused of nationalistic excesses. It was closed down and replaced by *Voprosy Istorii* (Problems of History). One of the tasks of the latter was to fight against "the great power chauvinism which had developed in recent years and shown itself in attempts at justifying the rapacious, colonial policy of Tsardom, in the restoration of bourgeois concepts . . . in the idealisation of statesmen of the autocratic regime and the abandonment of class analysis of historical events." Tarlé did not escape attack; but he was criticised not for his writings on Napoleon but because in his history of the Crimean campaign he had shown an uncritical nationalism which went so far as to justify the diplomacy of Nicholas I.

Today Tarlé is being criticised once again but for quite different reasons. His book on the Napoleonic invasions which was acceptable at the height of the wartime nationalist wave does not apparently come up to the new standards of too great respect for the West. An unknown historian, a certain Kozukhov, brands his method as "unscientific" and reproaches Tarlé with giving more credit to French, English and German sources than to Kutusov's documents. "Tarlé," we are told "has distorted the image of one of our greatest men, has omitted his merits in the Battle of Borodino and minimised the heroic role of the Russian people, its Army and Kutusov." Since the mantle of the hero of the First Patriotic War falls on the shoulders of the generalissimo of the Second Patriotic War, it would seem that Kutusov must again be described as a hero without weakness or blemish, and who knows whether one day Tolstoy will not be blamed for his treatment of Kutusov in "War and Peace"?

In the meantime the new "historical purge" will no doubt follow its course. Tarlé's book will be followed on the censor's desk by works on the same period written under his influence. Already Professor M. V. Nechkina, a well-known author of text-books, has been blamed in the same article in the *Bolshevik* for stating that Moscow was burnt by the Russians, not by the French, and that the country was partly ruined by the Russians' own scorched earth policy.

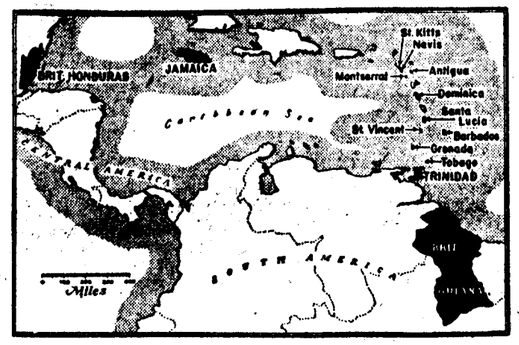
The Generals Reappear

The new line imposed on historians seems to have a twofold aim: on the one hand, to rekindle the Russian, or rather the Great Russian patriotic spirit; on the other, to quell any non-Russian, that is, centrifugal patriotic feelings. This second process was started some time ago by the withdrawal of a Stalin Prize granted to the Azerbaijan historian, G. Husseinov. The latter's "sin" was to have praised Shamyl, a Caucasian national leader who fought against Tsarist Russia. Shamyl, who until recently was still considered a hero in Soviet writings, has now been degraded to the role of "an English agent." After this the Academies of Sciences of Uzbekistan, Tadjikistan and other Soviet Central Asian republics all began to get busy rewriting the history of their countries. Russian writers too, for example, Professor A. M. Pankratova, have been criticised for their "wrong" interpretation of the history of these lands. In the books now being written, even the past of the countries in question must not be linked with the culture of, say, Persia or any other country now outside the Soviet orbit. National heroes who fought against Tsardom must be presented as foreign agents, while the civilising effect of Tsarist conquests must be stressed.

Thus, while the struggle with non-Russian nationalist movements goes on, the Great Russian nationalism is fostered. The two trends seem to be part of Stalin's policy of consolidation in the face of new external dangers. It is now a far cry from the anti-patriotic resolutions of 1945. The wartime Soviet marshals reappear in the limelight after years of oblivion. After Marshal Zhukov's sudden visit to Warsaw and Marshal Voroshilov's visit to Bucharest, Marshal Sokolovsky was sent to Sofia. In the wake of the Soviet marshals, the famous Tsarist generals once again step on to the stage.

Towards a West Indian Dominion?

EARLY next year—it has just been announced—a conference on West Indian federation is to be held in London. Four years have passed since the first conference on closer association in the West Indies was held at Montego Bay in Jamaica, and the vision of a Caribbean Federation, able to command Dominion status, took shape. But already at Montego Bay, political cross-currents disturbed the smooth surface of the discussions; individual territories and personalities had their own axes to grind, and it was by no means certain that all the clashing interests could be welded into harmony.



But the Montego Bay Conference did manage to approve the principle of federation and to agree on a number of immediate practical steps. It resolved that a Standing Closer Association Committee should be set up to prepare a plan for a federal organisation, and also that a number of special commissions, on such practical questions as a customs union and the unification of the public services, should immediately get to work.

The focus of the work was the Standing Closer Association Committee. It enjoyed a brief and successful life. It had a British chairman and secretary, but all seventeen members were West Indians, including many leading West Indian politicians. Two each, chosen by their own legislatures, came from the major colonies of Barbados, British Guiana, British Honduras, Jamaica, and Trinidad; one each from Antigua, St Kitts-Nevis, Montserrat, Dominica, Grenada, St Lucia and St Vincent. After eight weeks of discussion, spread out over a year, a unanimous report was signed proposing a federal constitution in which each of the West Indian territories could play its part.

The proposals were, in short, that "The British Caribbean Federation" should be established, with the seat of government in Trinidad. It should have a two-chamber legislature—a Senate, with two Senators nominated for each unit (except small Montserrat, which would have only one), and an elected House of Assembly of 50 members, elected on universal adult suffrage. There would be a Cabinet of 14—all except 3 to be members of the Legislature—including a Prime Minister, and the Cabinet would become the principal

instrument of policy. To this liberally based federal legislature certain special subjects would be assigned; in all other matters each constituent unit would retain complete control over its own affairs. These recommendations appeared early in 1950, together with the proposals for the unification of the public services, and were followed soon after by a plan for a customs union.

The next step was to take these proposals to each of the local legislatures—and it has been there, during the last eighteen months, that the reefs and shoals have uncovered themselves. Trinidad, the four small islands of the Windwards, and the three of the Leewards, all voted in favour of proceeding towards federation; but the major territories of Barbados, British Guiana, British Honduras and Jamaica would not commit themselves. Yet these four important colonies contain over two million of the total population of three million which would enter the federation. The reasons for their hesitancy are complex and various. There would be no difficulty in proving that, economically and administratively, each separate Caribbean unit is not viable; that development and trade are badly handicapped

by being split between so many governments; that the economic future of each separate territory is dubious; that some are overpopulated to an appalling extent and must find outlets for their population in others; that, indeed, already today the individual territories are forced to combine to sell their main crop (sugar) advantageously; and that in a dozen other ways the whole area is interdependent. But none of these rational arguments assuages local fears or overcomes parochial prejudices. For the very benefits which some islands would derive from federation may be at the immediate expense of others; by comparison with these immediate sacrifices future advantages seem nebulous.

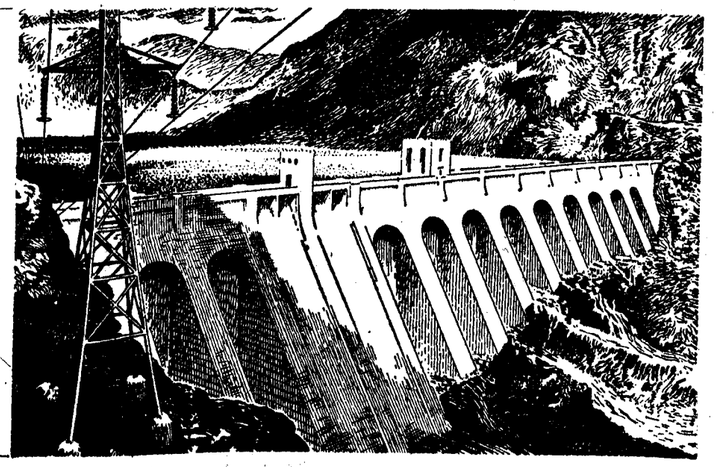
The conflict between the short-term and the long-term has a different bearing in the different territories. The bigger and more prosperous units (apart from Trinidad) have fears that they will be saddled with the economic burden of the smaller and poorer islands (who have all voted in favour of federation). Some of these weak links are today dependent on British help—will that onus in future fall on, say, Barbados and Jamaica? Trinidad, on the other hand, has strongly favoured federation as it is beginning to be industrialised and sees itself as the industrial supply centre of the whole area as well as the natural geographical trading and communications centre. Here, for Trinidad, is the obvious market for its new secondary industries.

Jamaica has looked at it differently. It has a population approaching one and a half million (half of the total) and feels more self-contained; also, it is divided from the other units (except British Honduras) by a thousand miles of sea, and feels no natural affinity with them. On the other hand, its large population and proximity to British Honduras, which is still largely undeveloped, frightens the Hondurans, who picture themselves flooded by the more aggressive Jamaicans, for whom they have no particular affection. British Guiana, with its temptingly unsettled and vast interior, has a similar dread of being swamped by Barbados's surplus population, as well as by Jamaicans, and this is particularly frightening as its own population is now increasing rapidly after an amazingly successful anti-malaria campaign. British Guiana also has other preoccupations. It is on the mainland of South America, and there has long been visionary—if unrealistic—talk of its "continental destiny." Why turn to the islands of the north when there are solid mainland neighbours next door? Not only that, but half its population are East Indian in origin, with an honoured and influential place in the community. Federate, and the East Indians become an insignificant minority in the overwhelming majority of African descent.

Whitehall Remains Neutral

Woven into these anxieties comes a clash of politics and personalities. Almost all the powerful political parties of the Caribbean are, in some way, "Labour," but there is a deep division between Labour leaders of the type of Alexander Bustamante in Jamaica and Uriah Butler in Trinidad on the one hand, and Grantley Adams of Barbados and Norman Manley of Jamaica, on the other. The first type—and they have their counterparts in some of the other territories—are dubbed "Fascist demagogues" by the second type, who adhere more strictly to the Socialist way of thought and action, and there is a very serious fear on the part of the latter that the federation as a whole will fall under the sway of the former—possibly with Bustamante as Prime Minister. It is not a fear to be lightly dismissed in this phase of West Indian political development.

The Colonial Office, faced with these conflicts, decided to hold its hand. There have already been flickers of resentment that federation was being "imposed" from London—and West Indians have gone far beyond the stage of stomaching Whitehall impositions. So London has remained neutral on the main issue, though pressing on with functional regional arrangements—a Standing Economic Committee, the unification of the currency, a trade commissioner service and so on—and working on constitutional reforms in the separate territories. For a time, the federation project has seemed altogether to hang fire, and gloom settled on all who were convinced that West Indian progress is impossible except within the broader framework.



Next Stage Towards Federation

New life is now given to the whole conception by the news of next year's London conference. The proposal, surprisingly, has come from Jamaica—formerly among the most lukewarm supporters of federation. Resolutions have been passed by both houses of the Jamaican Legislature accepting the principle of federation, and a joint committee of the two Houses will now consider the details of the Standing Closer Association Committee's report. After that they will be ready to join with the other colonies who are favourably inclined, for the next stages of the discussion. This should prod British Guiana, British Honduras and Barbados to a decision, or they will be left by the wayside.

That the conference is to be held in London is a particularly good move. As a pro-Federation politician in Trinidad put it some time ago: "When we West Indians meet anywhere in the Caribbean, we are conscious only of our differences. We think of ourselves first as Barbadians or Jamaicans or Guianese. But bring us among the cold and indifferent millions of London and we stand united as West Indians and brothers."

'ENGLISH ELECTRIC'

Every inch of rainfall at Loch Sloy now yields as much power as 400 tons of coal. Every year what was once a shallow mountain loch produces 130 million units of electricity, bringing better living to the people of Scotland. Loch Sloy is the most ambitious hydro-electric project yet completed in Great Britain. All the turbines and electrical equipment were supplied by 'ENGLISH ELECTRIC.'

bringing you

The ENGLISH ELECTRIC Company is the only firm in Britain supplying complete plant for hydro-electric installations. This equipment provides light, heat and power for homes and industries all over the world.

'ENGLISH ELECTRIC' puts the power of electricity at the service of millions.

ABROFILMS LTD.

GLASGOW—DOES IT AGAIN!

Already the largest user of 'ELECTRO-MATIC' road traffic signals in the British Isles, with 68 installations in service, the City of Glasgow has now placed orders for a further five. The success of 'ELECTRO-MATIC' signals in this city, with a population of nearly 1½ millions, is proof of the day-in, day-out reliability of this system of vehicle-actuated traffic control. Because 'Electro-matic' vehicle-actuated traffic signals provide positive control and are regulated by the traffic itself, there is a minimum of congestion and delay, even at the most complex road intersections. In use throughout the world, 'ELECTRO-MATIC' vehicle-actuated signals are the best control system for today's ever-increasing traffic — there is no traffic control problem they cannot solve. May we send you further information and literature?

THE BUSINESS WORLD

Deep in the Red

THE plunge into dollar difficulties proves to have been deeper and more violent than anyone might have foreseen a few months ago, and deeper even than was implied by the sombre picture, baldly portrayed by American correspondents, that the Chancellor was sketching in Washington in early September. That is the clear conclusion to be drawn from the weighty data released this week—the gold and dollar figures for the third quarter of this year, the statistical White Paper on the balance of payments during the first half of the year, and Mr Gaitskell's own appraisal in his speech at the annual bankers' dinner on Wednesday.

The net gold and dollar deficit of the sterling area in the three months to end-September was no less than $638 million—substantially more than the highest of the apparently inspired forecasts that had filtered out from Washington and had themselves come as a shock to observers on this side. This deficit is actually slightly bigger than that for the worst quarter of 1949, when the reserve was under special strain from the pre-devaluation

movements of capital; to find a larger deficit it is necessary to look back to that year of catastrophe and of post-war abnormalities, 1947, when the quarterly deficits ranged from $1,890 million to $704 million. No less striking than the absolute size of the latest deficit is the violence of the transformation that it reveals. Only nine months previously the dollar account was showing a record quarter's surplus of $398 million, and even as recently as the first quarter of this year there was a surplus of $360 million. The deterioration in these past three months has therefore been more than twice as great as that in the preceding three months, when there was still a surplus of $54 million.

Naturally, so large and sudden a deficit, like the large and sudden surpluses of a few months ago, is partly the result of special and probably non-recurring influences. These figures relate not only to current transactions, but also to all other operations in gold and dollars or their equivalent that impinge upon London's central reserve of the sterling area. They therefore include capital movements; and, just as the reserve was being fortified in the summer and autumn of 1950 by transactions inspired by the wave of rumours of impending appreciation of sterling, so in recent weeks has it been weakened (though much less markedly) by the opposite rumours—which had much wider currency on the Continent and in New York than in London. Such operations, however, can-

not explain more than a modest part of the quarter's deficit—though it seems possible that the sterling held on American and Canadian accounts in London, which rose on balance from the equivalent of $90 million at

mid-1950 to roughly $200 million at end-June last, has since relapsed to near its former level. Influences such as these are non-recurring in the sense that particular balances can be withdrawn only once; but unless and until official denials of any intent to devalue are reinforced by convincing action to bring the deficit within manageable proportions, Britain can expect a continuing dollar strain on capital account.

A little more reassurance can be found—though perhaps not as much as the Chancellor held out in his Mansion House speech—by scrutinising other influences that have been at work during the past quarter. This, as he pointed out, is traditionally a phase of strain on reserves, because dollar payments for cotton and tobacco are seasonally high while dollar receipts from sales of sterling area wool and cocoa are at a low ebb. In this past quarter, too, the seasonal swing has been enlarged on both the payments and receipts sides by special factors. Britain's dollar imports, as well as those of some sterling area countries overseas, have been unusually high; they have apparently included "some element" of purchases for strategic stockpiling as well as for the rebuilding of the sadly reduced level of commercial stocks of materials. In addition, there has been a heavy outlay by the sterling area as a whole in Western Europe—and net deficits incurred there have been costing Britain gold, through the working of the European Payments Union. By end-August, it will be recalled, Britain had repaid to EPU all the gold (amounting to $106 million) received from it on account of earlier surpluses. There will now be at least a pause in these losses, because Britain can tap the "gold-free" portion of its EPU overdraft rights. On the other side of the dollar account, receipts have been more than seasonally depressed by the suspension of United States purchases of tin. Tin, rubber and wool, it is worth recalling, normally provide one-third of the aggregate dollar earnings of the sterling area.

Finally, there has been one special factor that the authorities now describe as "semi-permanent"—the need to spend dollars to replace former supplies of "sterling" oil from Persia. The cost of this was formerly officially guessed at $350 million for the first full year, on the assumption that the Persian oil lost to Britain was purchasable elsewhere; this estimate has now been revised to $300 million, and it is pointed out that after the first year the dollar provision might be progressively reduced as additional refinery capacity comes into operation. Obviously, this element in the latest deficit is not, even on the best assumptions, so temporary that it can be left out of the reckoning in any programme of measures for dollar economy.

The special and seasonal and normal factors are all inextricably intertwined; but the Treasury experts are *hazarding* the guess that, if only "underlying" influences had been at work—notably, the heavy addition to import costs and the much slower rise in export receipts — the past quarter's deficit would have been "rather less" than half the $638 million actually recorded. There is little enough consolation to be obtained, however, from such hypothetical calculations: even if they implied (which of course they do not) that no other adverse influences would be at work in future, this "underlying" deficit would still be at the rate of some £400 million or more a year. And it deserves to be noted that, although undoubtedly there are adverse seasonal influences in the third quarter, only in one other postwar year has that quarter been worse than the second quarter and only twice has it been worse than the quarterly average for the year.

★

The official attitude is that this new dollar gap is not catastrophic; but there are at least three major reasons for taking it even more seriously than the problem of the gap in earlier postwar years. The first is that this violent swing from surplus to deficit has by ill-chance befallen precisely at the moment at which the postwar stream of special dollar aid has virtually ceased. In the year 1947, when the total dollar deficit was $4,131 million, no less than $3,273 million of the gap was filled by drafts on the United States and Canadian loans and a further $240 million by dollars from the IMF, so that the year's loss of reserves was limited to $618 million. Almost as much as that has now been lost in a period of three months,

since the only cushion against the deficit was the mere $40 million of residual receipts from Marshall aid. Unless and until the Nato "burden-sharing exercise" yields a slice of American relief for Britain, the position will soon be even worse than this—because, instead of being able to draw on loan or Marshall dollars, Britain will have to find dollars for loan repayments, at least to the extent of the capital portion of the annuity.

The second major reason for special concern is obvious, but needs emphasis. These dollar difficulties have arisen before Britain's own rearmament effort has had any significant effect upon the export trade; and they have also been felt at a time when raw material shortages have had much less effect upon industrial production than was feared earlier in the year. As Britain's arms effort grows, and especially if the Continental programmes get into their stride, measures to redress the dollar balance are likely to be much more difficult and painful than they would have been if attempted in recent months.

The third major consideration is that this new dollar gap, unlike any since 1947 when there was the bridge of liberal aid, is combined with the reappearance of yawning deficit on Britain's balance of payments as a whole. Britain's own dollar deficit is no longer being approximately offset, as it was in 1948 and 1949 (and much more than offset in 1950), by a massive surplus with the rest of the sterling area and with other countries. The changes in the geographical distribution of Britain's payments cannot be traced in detail beyond the first half of this year, the period embraced by the new White Paper; but there is no reason to suppose that the tendencies that it discloses have not been carried further in the past three months. During the half-year, Britain was in deficit with each of the geographical areas except the sterling area and the non-dollar portion of the Western Hemisphere; and the surplus with the former ran down from £83 million in the first half of 1950 and £135 million in the second half to only £46 million. At the same time, the dollar deficit rose from £56 million and £51 million in the 1950 half-years to £109 million, while 1950 surpluses of £53 million and £69 million with the OEEC group were transformed into a half-year's deficit of £26 million.

The aggregate deficit for the six months was £122 million, in contrast with surpluses of £42 million and £179 million last year. This half-year, moreover, included only a small part of the phase of maximum strain from the rise in import prices; at a rough estimate, the f.o.b. import bill for July and August was running at almost 20 per cent above the average rate for the first half of the year, and the aggregate deficit in these two months may have been equivalent to an annual rate approaching £700 million. During the remainder of the year the burden of import prices will be below the worst, but it will still be bigger than in the early months of the year. It seems certain that the deficit for the second half-year will be substantially larger than the first half-year's, and may be more than twice as large. Meanwhile, in the first half-year alone, Britain's liabilities on sterling balances have grown by no less than £425 million, to £4,168 million; and of this growth £368 million has accrued to the sterling area, whose balances stood at £3,098 million at June 30 last.

Such is the statistical shape of the problem. The unpalatable measures that will be required for an assault upon it will doubtless receive continuous study by civil servants, but it is plain that no significant decisions will be taken until after the election. Mr Gaitskell is obviously right in claiming that the dollar problem must be examined as an integral part of the balance of payments problem as a whole, and he is justified, too, in the contention that Britain cannot devise measures for either the dollar or the sterling part of the problem except in consultation with the sterling area. The problem is one of getting the sterling area as a whole into reasonable equilibrium with the rest of the world as well as with the dollar—and to these closely related objectives, as the Governor of the Bank of England emphasised on Wednesday, each member of the sterling group has a duty to contribute. In many instances, the manner of the contribution will have to be a belt-tightening process imposed not only by the method of reducing import quotas but also by a stiff dose of domestic disinflation to release supplies for export, to buttress the specific import cuts and to promote the maximum efficiency in production. It is not on Britain alone that the sacrifices should fall, but it is right that Britain should give a lead—especially in view of the rate at which it has been piling up borrowings from the rest of the sterling area.

The obstacle here, however, is political. After the experience of the past six months, there is no ground for supposing that a new Labour Government would pursue a policy of the degree of toughness required. To predict that a Tory Government might get closer to the target would be a political guess at odds with the fulfilment of some of the major proposals of the Tory manifesto. But, whatever the parties think and promise now, it is quite certain that one of them will be forced to come down out of the clouds of unrealism within a very few months. Mr Gaitskell affirms that the gold reserve, at $3,269 million, is big enough to give time for the formulation of wise correctives in concert with the representatives of the overseas sterling area who are expected to meet about the turn of the year. But, given the present and prospective rate of strain on reserves, the new Government will find itself imperatively required to take major and politically difficult decisions within a very few weeks of assuming office.

Cut off the Joint?

MEAT is a subject full of paradox and passion. Three weeks ago when the weekly meat ration was 2s. 2d., the British public, who had been loud in their complaints about the meagre ration of 8d. six months ago, failed to take up the whole of their bounty and sales are estimated to have reached only 90 per cent of the total ration. Now there is a growing argument whether in four months' time the meat ration may once again be down to the same meagre level, which after the recent rise in price of meat would cost 10½d. a week. The National Federation of Meat Traders Associations have voiced their concern about Britain's future supplies of meat and engaged in the usual exchanges with the Minister of Food. At their annual conference this week, the meat traders passed a unanimous resolution calling on the Ministry of Food to "procure and store sufficient quantities of meat of suitable quality to be made available to the public during the winter months." Before the resolution had time to reach Mr Webb, he had sent a lengthy telegram to the conference assuring the delegates that meat stocks were appreciably higher than they were last year and that although some difficulties would be experienced this winter, the ration at its lowest should be "appreciably higher than some of the recent guesses." The butchers and the Ministry have differed before, but rarely as widely as this. The butchers have as good an idea of the immediate flow of supplies as the Minister of Food, though presumably they would not claim to be so well acquainted with prospective arrivals. Yet in the past the meat traders' forecasts have sometimes been more accurate than the assurances of the Minister.

* 1934–38.

October which provide about 40 per cent. Home-killed meat is usually sold as soon as the animals are slaughtered, and not hung to improve its quality for fear of losing what is technically known as "bloom"—the luscious blood-red colour that gives the meat an attractive appearance but often leaves it tough. Thus the meat ration varies directly with home killings, and the basic supplies and reserves depend entirely on imported supplies.

Consumption of carcase meat declined in the first quarter of this year until in March it reached the lowest ration. Since then consumption has increased, thanks to a larger supply of home-produced meat and to the costly new agreement with Argentina, to reach a peak in September. In the first half of this year, consumption averaged no more than 90,000 tons a month compared with 156,000 tons a month in the first half of 1950. In the second half of this year consumption will undoubtedly be higher though it will be nowhere near the monthly average of 154,000 tons for the second half of last year.

The Government's new policy of encouraging the production of more meat has not had time to show positive signs of success, but up to June purchases for slaughter averaged 25,400 cattle and 20,200 calves a week compared with 24,600 cattle and 20,100 calves a week in the first half of 1950. For the whole of last year, purchases for slaughtering averaged 36,200 cattle and 25,600 calves a week, whereas the prewar weekly average was 38,000 cattle and only 15,900 calves. This year's figures should be higher than in 1950. Slaughterings of sheep and lambs this year were 7 per cent smaller than last year when the weekly average was 127,000—well below the prewar level of 180,000. But the numbers of cattle and sheep in Britain last June were slightly smaller than a year ago though cattle other than dairy cows increased. This summer British farmers appear to have culled their herds very heavily because meat was more profitable than milk. No official figures are yet available to show the extent of this movement, but it cannot provide a permanent increase in cattle supplies. That will have to

AUSTRALIA AND NEW ZEALAND BANK LIMITED

In which are merged The Bank of Australasia Limited and The Union Bank of Australia Limited

The new Bank formed by the merger of The Bank of Australasia Limited and The Union Bank of Australia Limited, is known as Australia and New Zealand Bank Limited. The following points indicate some of the improved banking facilities and services which will result from the merger.

RESOURCES · With a Capital of £Eng.17,000,000 and the combined assets of the merging banks amounting to £A.400,000,000, Australia and New Zealand Bank Limited will have powerful resources for the use of its customers.

LOCAL KNOWLEDGE · The knowledge and experience of local conditions in Australia and New Zealand, acquired by the merging banks in over a hundred years of banking, will be at the service of the customers of Australia and New Zealand Bank Limited.

BRANCHES AND AGENCIES With the combined Branches and Agencies of the merging banks numbering nearly 600 in Australia and over 150 in New Zealand and Fiji, as well as an international network of Agents and Correspondents, Australia and New Zealand Bank Limited will provide its customers with comprehensive and competitive banking facilities.

MONTACUTE HOUSE. (Property of the National Trust.)

The building of this famous old Somerset house was in progress in the last year of the sixteenth century and it was built for Sir Edward Phelips, at one time Speaker of the House of Commons and a leading figure in the indictment of Guy Fawkes.
The house itself is approached by garden structures in the same architectural vein as the facade, so that one regards the house as the logical climax of the architect's conception.

Martins Bank acts as Executor and Trustee and provides security, skill and continuity of management at moderate fees. The Trustee Department of the bank was formed over forty years ago, and a descriptive booklet may be obtained at any of the branches.

THE Church of England Building Society now invites investments up to the maximum holding of £5,000. The Society's fully-paid Shares, issued at £25 each, are not subject to Stock Market fluctuations; they are withdrawable on agreed notice being given.

Share interest at the rate of 2½% per annum is received by the investor half-yearly on 31st May and 30th November; the Income Tax on the interest is paid by the Society. Interest is calculated from the date of the investment up to the date of withdrawal.

The Society's substantial assets consist of First Mortgages secured upon carefully valued properties situated in selected districts in many parts of the country. This "spread-over" of mortgages enhances the already solid security enjoyed by our Investing Members.

Since its incorporation in 1882 this old-established Society has never failed to pay the agreed rates of interest at the agreed times, and in spite of wars and crises its stability has remained unshaken. As a medium for the non-speculative investor, who seeks, above all, security of capital, yet desires a reasonable, steady return, it is today an excellent proposition.

ASSETS EXCEED £6,500,000 • RESERVES £350,000
OPEN ACCOUNTS 18,000

A copy of the latest balance sheet, together with an explanatory booklet, may be obtained from the Secretary.

wait until beef rearing and feeding has been considerably extended.

Supplies of imported meat this year have been disappointing. Up to August only 314,000 tons of carcase meat and offal were received compared with 655,000 tons in the first eight months of 1950. No meat at all came in from Argentina until June, and supplies from Australia and New Zealand were greatly reduced first because of shipping difficulties and the dock strike and secondly because the high price of wool last season tempted the dominion farmers to keep their lambs until the spring shearing. Meat production in Australia and New Zealand has been increasing, though it fell in Australia last season, while in Argentina it has been declining. But domestic consumption in all three countries is much higher than it was before the war; total exports are smaller and exports to Britain are much smaller. In 1951-52, larger shipments of New Zealand and Australian lamb should be forthcoming, and possibly larger shipments of Australian beef, if the reports that the Ministry of Food has increased this season's contract price for lamb by 17 per cent and for beef by 23 per cent are true. But these imports will not arrive in quantity until February, even if there are no shipping delays. Argentina promised to send 200,000 tons of carcase meat in the twelve months ending May, 1952. So far about 45,000 tons have been shipped and nearly three months ago the Argentine Government banned all further export for the time being to conserve supplies for the domestic market, and there is still no news of any resumption of large-scale shipments. But it is unlikely that Britain can expect to receive, even on the most optimistic assumptions, more than 50,000 tons before the end of the year.

At the beginning of this year stocks of carcase meat in Britain amounted to 150,000 tons compared with 240,000 tons at the end of 1949. By the end of June stocks fell to about 135,000 tons and up to the end of September they may have increased to 200,000 tons against 180,000 tons a year ago. These estimates would seem to support Mr Webb's claims about stocks. But unless imports in the second half of this year amount to more than 300,000 tons, the ration will have to be cut again soon if a more drastic cut is to be avoided early next year.

The prospect seems about as bleak as the butchers suggest. Is there anything that the Minister of Food can now do, apart from imploring Argentina to resume large-scale exports once more? Mr Webb can hardly be expected to take meat off the ration and allow its price to fluctuate over the season, but the recent attitude of consumers towards a 2s. 2d. ration suggests that this step may not be nearly so fanciful as the Minister would no doubt think. Supplies and consumption are both well below pre-war levels. But if the public is not willing to buy more than 2s. 2d. of meat a week a head and if the average retail price of meat in this country has to go up from 1s. 8d. to 1s. 11d. or even 2s. a lb. because of the higher prices that Britain has apparently agreed to pay Australia and New Zealand, a balance between supply and demand might well be reached without the help of a costly and complicated rationing system.

There is certainly a need to spread home-killed supplies more evenly over the season, particularly as the consumer may in future have to depend more on home-fed meat than on imports. If there were a free market in meat, such a spread would be imperative if only to ensure an adequate return to British farmers, since large supplies at peak periods could only be cleared by reducing the price. At present there is insufficient chilling equipment and storage space to handle home supplies. If there is a serious intention to increase home-produced meat, increased storage space must be provided. If not, the consumer will be no better off than he was a hundred years ago when supplies of fresh or relatively fresh meat were only available in the summer months, and the cupboard was bare in winter.

Business Notes

Markets and Manifestoes

The perceptible improvement in all sections of the Stock Exchange in the middle of the week seems to have paid equally scant regard to the shock of the third-quarter gold losses and to a number of important investment implications that emerge from the manifestoes of the two major political parties. The Labour manifesto adds to dividend limitation the intention to "prevent" large capital gains and to "stop all excess profits." The Conservative manifesto, as expanded this week, emphasises the intention to impose firmer control over credit, and admits "changes in the rate of interest" among the variety of ways in which borrowing can be restricted. There is little or no spelling out of the "special contribution in the nature of an Excess Profits Tax" that the Conservative Party proposes "to ensure that the burden of rearmament is fairly and evenly spread for this emergency period" in the next three years. In framing the details of this plan, guidance will be sought from "past experience and by study of the American system." It can hardly be said that the American system itself provides much clear guidance, for its revision is now being fought out in Congress; but at any rate the Act of last January set a maximum of 62 per cent of net income that could be extracted by a combination of the regular rate of 47 per cent corporate profits tax, and the excess profits tax of 30 per cent of net income above the standard (85 per cent of the earnings of the best three years between 1946 and 1949). "Guidance" of this kind would seem to be necessary not merely in determining the rates, but also in providing for special cases.

The equity shareholder may indeed wonder whether a Conservative administration would be markedly more solicitous towards risk capital or more insistent on the need for its fair reward and encouragement than the Labour party. Evidently, there is no place in election manifestoes for emphasising the drastic prescriptions that alone would remove the "fortuitous rise in company profits" that rearmament is alleged to be causing. It may be something gained, however, that the Conservative document undertakes to "recast the existing system of taxation on industrial and commercial profits" and promises relief where profits are ploughed back and used for renewal of plant and equipment. These are essential to the proper maintenance of industrial capital, and hence are the minimum precondition of a new EPT of the form so vaguely outlined.

In sum, the Conservative proposals promise only a slightly less hard life for the equity investor. They contemplate at this stage, very tentatively, the use of the interest rate—and this may not be welcomed by institutional investors whose existing portfolios have already suffered from a sizeable fall in gilt-edged prices. Yet calculations of this kind, as the

week's events in the markets show, have been submerged at least temporarily in the City's hopes of a new government with new if not entirely agreeable policies to apply.

* * *

Mounting Defence Expenditure

After a slow start in the early months of the fiscal year, the growth of defence expenditure is now beginning to have substantial effects upon the national accounts. In the three months to end-September, Exchequer outgoings for supply services (including civil expenditure) totalled £831 million, compared with £635 million in the similar period last year, an increase of just over £195 million, or 31 per cent. The expansion during the first quarter of the year was only £98 million, or 16 per cent. Although the half-year's increase represents only one-third of the additional £867 million officially estimated for the full year, it is too soon to assume, as some people have done, that the year's provision will not be spent. The adjusted estimate for supply services for the year (including the full £160 million margin for defence supplementaries) is £3,580 million, so that £2,042 million remains unspent; but if the recent rate of increase were merely maintained, the second half-year's outgoings would come within roughly £100 million of this figure.

So far, the impact of rising outlays has been largely cushioned by an unexpected buoyancy of revenue. Ordinary revenue totalled £1,784 million during the half-year, showing a gain of £201 million, equivalent to fully two-thirds of the additional ordinary expenditure and nearly four-fifths of the budgeted increase in revenue for the full year (£258 million). The half-year's above-line deficit is therefore no more than £17 million, compared with a surplus of £14 million in the first quarter and one of £79 million in the first half of 1950-51. A large part of this heavy gain in revenue is quite clearly traceable to the rise in prices and the high level of consumption—especially of imported goods. Customs receipts, which were expected to rise by £25 million in the full year, have already gained twice that sum, while Excise, expected to fall by £4,000,000, gained £28 million. The other big influence, presumably also reflecting surpluses from rising prices, has been the increase of £35 million in receipts from trading services; for the full year, these were expected to fall by £25 million. All other revenue items except miscellaneous receipts have been running well up to estimate; income tax has provided in this season of lean collections £66 million of the year's estimated addition of £220 million.

Below-line expenditures, however, have been heavy. At approximately £276 million net, compared with £220 million in the first half of last year, they have already risen by more than twice the rise budgeted for the year. A large part of this deterioration has been attributable to an increase of £33 million in net new advances to local authorities; these were expected to decline by £13 million during the year. The "overall" deficit amounts to £293 million, compared with £142 million in the similar period of 1950-51. This worsening of the overall balance by £151 million compares with an officially estimated deterioration of £670 million for the year as a whole.

IMF Capitulates on Gold

The International Monetary Fund has at last acknowledged defeat in its attempts to control premium sales of gold by member countries. A resolution passed by the Board of Executive Directors at the end of last week reaffirmed the oft-repeated view of the Fund that gold should be held in official reserves and not go into private hoards. But it then went on to add that the circumstances of gold-producing and gold-consuming countries vary so widely as to make it impracticable to expect all members to take uniform measures to achieve the objectives of the (Fund's) premium gold statement of 1947. Accordingly while the Fund reaffirms its belief in the economic principles involved and urges the members to support them, the Fund leaves to its members the practical operating decisions involved in their implementation.

The statement of June, 1947, expressed the Fund's concern about international transactions in gold at premium prices on the grounds that, directly or indirectly, they involved exchange dealings at depreciated rates and thereby threatened to disturb exchange relationships among member countries. Such transactions encouraged evasion of measures designed to conserve monetary reserves and the IMF requested members to take steps to prevent them.

This request evoked varying degrees of compliance among member countries, but breaches were soon made and enlarged. One country after another began to operate domestic free markets in gold at prices higher than parity. It was argued that such markets acted as a disinflationary factor and served an essential purpose in certain countries by mopping up redundant purchasing power. As long as they remained domestic and insulated, the writ of the IMF was not contravened; but it was not long before the domestic markets in such countries as France, Belgium, Egypt, the Netherlands, were in effect linked and involved in international transactions in gold. The breach was greatly widened when consent was given to international sales at a premium of gold in the form of manufactured articles or against affidavits purporting to guarantee that the gold was required by the importer for genuine industrial purposes. A thriving international traffic in gold ashtrays, bangles and chains—all easily manufactured, and as easily remelted into bars—quickly grew. Many importing countries with flourishing free gold markets showed great readiness to issue affidavits that gold imports were intended for genuine industrial purposes. The producing countries, and South Africa in particular, began to use these facilities; had they found it politic to do so, they would have encountered no difficulty in accumulating enough affidavits to sell the bulk of their gold output on the premium market. In recent months South Africa has in fact been selling 40 per cent of its output in this way.

* * *

Official and Free Markets

Events in Korea greatly stimulated the hoarding demand for gold, and a noticeable decline occurred in the net amount of new gold entering official monetary reserves. The Executive Board of the IMF thereupon started an investigation, pointing out at the same time that the existing arrangements and practices of several countries, including specifically South Africa, "are no longer a satisfactory basis to implement the Fund's gold policy." The South Africans, specifically named in the charge sheet, argued by reference to the Fund's Articles of Agreement that although the IMF could control the prices at which inter-central banking or inter-governmental gold transactions took place, it had no authority whatever to control private international marketing of gold. When the report of the gold committee was submitted to the executive directors, it was clear that any attempt to bring the recalcitrants into line would probably provoke resignations.

The Fund's new managing director, Dr Ivar Rooth, explained this decision at a press conference this week and declared that gold should be held in official reserves and not in private hoards. He admitted, however, that attempts to control the premium price market could have only a limited effect unless they were reinforced by appropriate economic policies and that as these attempts at control lost their effectiveness it was useless to try to reinforce them by the mere imposition of supplementary controls. "The only

HOW WILL BRITAIN VOTE?

The Daily Express runs the best and biggest of all Public Opinion polls.

Its highly-trained specialised team of investigators question and cross-question thousands of prospective voters.

The voters come from every class in the community. They form a perfect cross-section of the nation.

And the answers they give produce, when analysed, precise information as to what the nation is thinking politically. And how it will vote.

There are some who criticise Public Opinion polls on the grounds that they damage democracy by producing in advance the secrets of the ballot box.

There are others who praise them because they make politicians pay attention to what the public is thinking.

Whether you praise or criticise the Daily Express Poll of Public Opinion, there is one thing you cannot afford to do. You cannot afford to miss its findings.

From now until polling day the Public Opinion poll will be published once a week. Watch for the next one and find out whether Socialist election oratory is reducing the Tory lead.

DAILY EXPRESS
POLL OF PUBLIC OPINION

Foresight on blue glass

LONG BEFORE THE PAPER was made on which today's news appears Albert Robbins* had all the information he needed. In charge of the giant grindstones which reduce logs to pulp at the only groundwood mill in the United Kingdom—one of the group of Bowaters' mills in Kent—part of Robbins' job is to ensure that the wood is ground to give exactly the right fibre for the manufacture of good paper. Every few minutes he scoops samples from the watery pulp flowing from the grinding machines and examines them on a blue glass under a strong light. Largely upon Robbins' skill and practised eye depends the satisfactory operation of the newsprint machines.

Drawn by A. R. THOMSON, R.A.

The hum of the grinders drowns the cries of the gulls wheeling over the mud flats of the Thames Estuary, and the siren blasts of distant ships. Thoughts of his hobbies—the allotment, his football team and the bowling green—do not distract his attention. As he chats Robbins' eyes and ears are alert. For each of the five great paper-making machines at Kemsley consumes some 10,000 spruce trees every week—the raw material of newsprint for the free press of the democratic world.

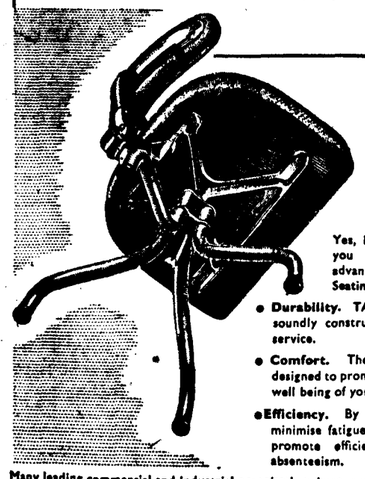
TELLING THE WORLD OF BRITISH ACHIEVEMENT

66 COUNTRIES in all parts of the world, including hard currency areas, are now receiving from Britain regular shipments of Hoover products — electric cleaners, washing machines, polishers and F.H.P. motors.



The volume of these exports is rapidly expanding all the time. In the first six months of 1951 the figure was 100% higher than for the same period in 1950, and that in turn was 68% higher than the figure for the first six months of 1949.

The export of Hoover products is not only valuable in earning foreign currency but is a magnificent advertisement for British enterprise as a whole. Every Hoover cleaner, washing machine, polisher and motor despatched overseas is a reminder to other countries that British initiative, invention and craftsmanship still remain unsurpassed.

HOOVER LIMITED

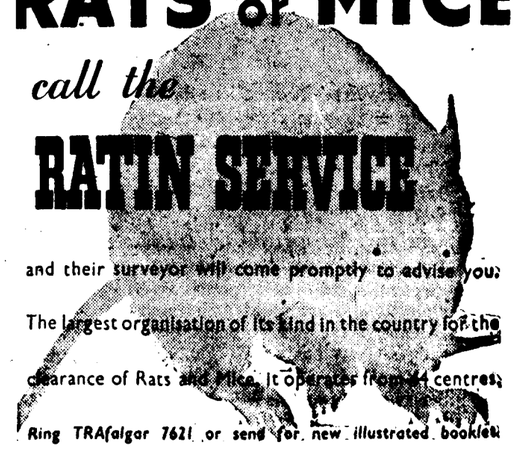
It will pay you to look into this!

Yes, it will literally pay you to examine the advantages of TAN-SAD Seating from these angles:



- **Durability.** TAN-SAD chairs are soundly constructed to give long service.
- **Comfort.** They are scientifically designed to promote the health and well being of your office Staff.
- **Efficiency.** By thus helping to minimise fatigue, TAN-SAD chairs promote efficiency and reduce absenteeism.

Many leading commercial and industrial organisations have proved by results that it pays to install TAN-SAD. May we help with your seating problems.

dependable way to get rid of premium gold markets and private hoarding of gold," said Dr Rooth, " is to create the economic conditions under which the private demand for gold will become negligible." This is tantamount to saying that in present conditions, and given the inflationary policies pursued by most countries in the world, the true price of gold differs considerably from the official price and that no controls will succeed in bringing these two together. Their reconciliation will be achieved either by such a diversion of newly mined and of existing monetary gold to the free market as will bring the free price down to around $35 per ounce or by an appropriate adjustment of the official price of gold.

Since there is no early possibility of a change in the official dollar price for gold, it is to be expected that a considerable increase in the flow of newly mined gold to the free markets will occur. This flow may even be supplemented, as it was during part of 1950, by some inroads into existing monetary reserves to feed the demand in the free market. All gold producing countries will now have freedom to decide their premium sales policy in the light of their own interpretation of their duties as members of the IMF. It may be assumed that South Africa will not be prepared to lower its premium sales below the figure of 40 per cent of output, and it is reasonable to guess that other producers will grant themselves at least the same dispensation.

*

This dispute on gold policy is not solely between the gold producers (represented by South Africa) on the one hand, and the IMF (reflecting United States policy) on the other hand. Other parties are as directly concerned, notably those governments and central banks that are once again feeling the pinch of a dollar shortage and whose gold and dollar income is likely to be adversely affected by the new freedom given to gold producers to sell their gold where they will. If, as a result of continuing monetary inflation and political uncertainty, hoarding demand maintains a reasonable premium in the free market price over the official price, considerable changes in the marketing of gold are to be expected. South Africa and the other gold producers are bent on getting the highest price they can for their gold. If they can do so by increasing their sales in the free market, they will unquestionably reconsider the contracts under which they sell gold to Britain at the official price. In the debate on gold policy which has been proceeding in the IMF the voice of the British representatives has constantly supported the Fund's policy. Its defeat must add to the United Kingdom's dollar difficulties.

* * *

The Deficit and the Banks

The impact of Britain's balance of payments crisis upon the domestic banking position is very apparent in the latest returns from the London clearing banks. In the five weeks to September 19th, net bank deposits rose by £28 million to £5,935 million. This increase compares with a decline of £58 million in August ; but much more significant is the fact that in each of these months the movement compared favourably with the corresponding change last year. In September, 1950, net deposits rose by £78 million, and in the preceding month they fell by less than £6,000,000. This slackening of the rate of credit expansion by comparison with last year has occurred, moreover, despite the continuance of strong demands for bank advances ; these rose last month by £25 million, whereas in September, 1950, they dropped by £1,000,000. The disparity between the behaviour of deposits and advances is explained by the fact that, although private demands for bank finance have been bigger than last year, governmental demands have been much smaller, despite the increase in the Treasury's need for finance to meet a growing deficit both " above " and " below " the line.

The Treasury's ability to reduce its new borrowing from the banking system at a time when its domestic requirements are rising is explained by the larger amount of new finance that is accruing to it from overseas. The relapse of the balance of payments into large deficit means that the Exchange Equalisation Account has been receiving sterling in exchange for its sales of dollars and gold (indeed, £200 million of the Account's holding of tap Treasury bills are to be cancelled this month), while the Treasury has been borrowing not only this EEA sterling but also the additional sums that have been piling up on externally-held sterling balances. Since the widening of the external deficit became particularly violent after the turn of the half-year, it is instructive to examine the banking trends of the past three months. Between end-June and mid-September, net bank deposits rose by only £15 million, or by fully £100 million less than in the similar period last year. Yet in this period bank advances were reduced on balance by only £5,000,000, in contrast with a reduction of £47 million in the third quarter of 1950. Allowing for a slight difference in the movement of bank investment portfolios during the two periods, these figures imply that net governmental borrowings from the banking system during the past quarter have totalled less than £20 million. In the corresponding quarter last year they were about £160 million—despite the fact that in that period the authorities secured substantial sums from the sale of gilt-edged securities.

* * *

Trade Agreement with Germany

Discussions for a new trade agreement between the United Kingdom and the Federal Republic of Germany were concluded in Bonn last Monday. These discussions were separate from but associated with the discussion on the special arrangements for the supply of steel scrap from Germany, the main outlines of which had been previously announced. That scrap agreement fixes German exports on a sliding scale based on actual collections of scrap in Germany. Assuming these scrap collections to run at the estimated rate of around 400,000 tons a month, it is probable that the British share in the exportable quota will lie between 20,000 and 30,000 tons a month. This is well below the figure of British imports of German scrap in recent years, but it is rather better than fears entertained in the early months of this year seemed to suggest.

Under the new trade agreement, the principal exports to Germany from the United Kingdom will be cotton, wool and linen yarns, textile machinery and miscellaneous chemicals. The United Kingdom will take from Germany steel and other metal manufactures, a number of foodstuffs and dyestuffs. Germany will also facilitate the supply to Britain of steel and other goods required in the rearmament programme. The new agreement will cover arrangements for Anglo-German trade up to the end of this year. It is based on assumptions governing the issue of import licences that are becoming decidedly out of date, given the considerable changes in the creditor-debitor status of both countries with the European Payments Union. It will be recalled that the issue of licences for imports into Germany was virtually suspended in April and May this year, owing to Germany's balance of payments difficulties. The issue of import licences is still subject to control in accordance with recommendations of the OEEC. This organisation has defined the lines on which Germany should proceed to licence imports on a non-discriminatory basis from all OEEC countries, including the United Kingdom, in respect of goods formerly admitted without restrictions, and it has in addition fixed limits within which Germany should negotiate quotas for imports of other goods in the period up to December, 1951. The new agreement provides for quotas relating to the latter imports.

A large proportion of United Kingdom imports from Germany and from other OEEC countries is now on open

licence. The new agreement relates to United Kingdom imports still subject to licensing control and it repeats for these goods the arrangement first made last December when German balance of payments difficulties became acute. In other words Anglo-German trade up to the end of this year will still tend to be conducted on the assumption that Germany is the chronic debtor and Britain the creditor. The subsequent readjustments in import licensing may be all the more violent by reason of this disregard of the fundamental change in the relative position of the two parties during the past three months.

* * *

Copper and Zinc Allocations

After arduous and difficult negotiations, agreement has at last been reached in Washington on the international allocation of copper and zinc for the fourth quarter of this year. The copper-lead-zinc committee of the International Materials Conference has announced that a total of 677,160 metric tons of copper and 469,260 metric tons of zinc will be shared among 36 countries during the last three months of this year. The United States is given the largest allocation of both metals—333,770 tons of copper and 228,460 tons of zinc—and Britain the second largest with 91,690 tons of copper and 60,250 tons of zinc. The allocation was made by meeting in full all defence requirements and then dividing the remainder of the output rateably among the claimants according to their last year's consumption. For Britain the allocation implies an annual rate of 366,000 tons of copper and over 240,000 tons of zinc, compared with the actual consumption of virgin copper last year of 332,000 tons and of virgin zinc of 237,000 tons.

Agreement on allocation was not lightly achieved. Chile resisted control of copper in order to defend its bargaining position with Argentina. A compromise was reached whereby 80 per cent of Chilean output was put into the IMC pool leaving the remaining 20 per cent to be disposed of as Chile wishes. Belgium was the problem country for zinc. It asked for much larger supplies than it used last year on the grounds that it intended to export refined zinc to other countries. The claim, however, was not accepted and in the end, Belgium was accorded the same treatment as other countries—full allocation to meet defence requirements and a share of the remainder to meet civilian requirements in part.

The new allocation scheme will at least ensure adequate supplies for the various rearmament programmes, but civilian use in many countries may have to be curtailed even more than at present. The recent agreement among member countries of the Organisation for European Economic Co-operation to prohibit the use of copper in the manufacture of specified goods will mean that the list of prohibited uses in Britain will have to be extended considerably. OEEC is now negotiating a common list of prohibited uses for zinc and nickel.

* * *

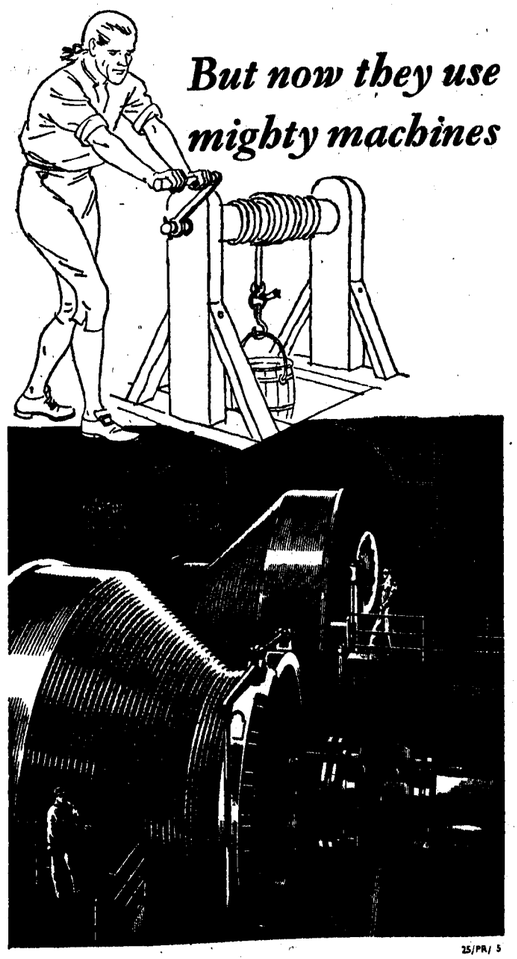
Wool Rises Again

Wool has this week displayed another of its fantastic price rises. On Monday prices at Melbourne rose by 20-25 per cent; on the following day at Perth the increase was only slight. But on Wednesday at Newcastle another 5-7½ per cent was added and on Thursday at Geelong another 10 per cent, so that merino 64's are now about 167d. a lb. compared with 123d. at the London sales last week and 114d. at the Sydney sales. This week London prices rose by 35 per cent in the opening bids and the general tone was very firm. In New Zealand prices for fleece wool have also increased; rises of up to 40 per cent have been reported for certain types.

The main factor in Australia has been heavy buying by the United States, Japan and Europe. Bradford reduced its purchases as prices rose. American military authorities are expected to place fairly large orders for worsted cloth shortly, and part of this week's demand for raw wool may have been in anticipation of these contracts. But American consumption of wool has not declined nearly so fast as consumption in Britain and Europe, and manufacturers have been reducing the stocks that they accumulated at high prices in the opening months of this year. If this week's renewed demand for wool was merely to replenish stocks, it would be unlikely to continue for long. Wool growers would feel happier if they saw wool consumption rising once more. There is no very firm indication that this is happening in this country, though the actual daily rate of wool consumption in August, after making allowance for holidays, was slightly higher than in July.

* * *

Manchester on Purchase Tax



The Manchester Chamber of Commerce has published its evidence to the committee now reviewing the effects of purchase tax on industries with utility schemes; this is the first public statement of the case that industry is expected to make against the tax. The Chamber speaks with considerable authority, as representing more than 5,250 companies of which about two-thirds are engaged in utility production, and its arguments in favour of ending the present system should prove difficult to refute, particularly now that purchase tax is levied on so small a proportion of their output.

The case against the present system is based on the effects that purchase tax at home has on sales abroad. While high quality textiles are deemed a taxable luxury on the home market they are "the most essential category from the point of view of exports," and the only type of textiles that can be sold in North American markets where efficient home industries are protected by tariffs from any competition in the medium and lower ranges. But these goods are becoming unsaleable at home, as percentage increases in purchase tax exaggerate every rise in manufacturers' prices. The evidence continues:

> The Chamber has definite evidence from many cotton textile manufacturers that they have taken out of production non-utility goods which might otherwise be earning valuable currency. This is inevitable as it is completely uneconomical for a manufacturer to try to develop new export lines unless he is assured of their sale in the home market as well as abroad. Only if he can combine home and export sales will he be able to produce a volume of goods sufficient to spread his overheads, thus to ensure efficient production and to reduce costs and therefore achieve a competitive price.

A point not mentioned is that manufacturers want to be certain that if the export market closes as rapidly as markets have closed in the past, then those goods can be cleared at home. The Chamber also questions the assumption contained in the Committee's terms of reference that utility schemes have brought special benefits to the consumer. The type of goods that have been sold in the utility ranges have always been and will continue to be produced to satisfy certain sections of the home market, whether or not the higher quality ranges are subject to tax.

The statement ends with an appeal for the abolition of purchase tax, on the grounds that benefits to the country's trade balance would more than outweigh the inevitable loss of revenue. It is hard to say how big this loss would be. The customs returns for the year ending March 31, 1950, show that the purchase tax yield on sales of non-utility clothing was £58.5 million. But since 1949-50, utility specifications have been altered considerably; following the recent changes it will be possible to sell all but the highest quality products within the ruling maximum prices. The revenue in 1951-52 from these same items will therefore be considerably smaller and could be expected to continue to shrink. The long-term effects of this system by which "the competitive ability of our industries . . . may well be permanently jeopardised" are barely touched on in the Chamber's evidence: it might well have elaborated them.

But now they use mighty machines

25/PR/5

In the 200 years that have followed Axel Cronstedt's discovery of nickel in 1751, mining technique has progressed beyond the wildest dreams of his day. Underground development in the nickel mines now exceeds a total of 283 miles, and reaches well over a mile below the surface. Active development of new areas goes on all the time. New shafts are sunk, new and powerful hoisting equipment constructed, every mechanical aid called in to bring more nickel out of its rock-bound storehouse in the depths of the earth.

GODFREY PHILLIPS LTD MANUFACTURERS AND GUARANTORS

THIS AUTOMATIC SECRETARY

Takes care of Your Detail and Cuts Your Work

NO OTHER means will do more to ease your work and free you from petty details and many minor matters.

For this "Desk Secretary" is a complete desk organiser. It keeps in orderly form and helps you to deal swiftly and systematically with all your papers and correspondence, and automatically reminds you of all commitments and matters to be attended to.

Comprises a brown leatherette-grained container with hinged lid and front giving easy access to its contents. Inside are three classified sections: first the complete alphabetical section, then sections for your daily follow-up, followed by sections for your monthly follow-up. Supplied in foolscap size 14 in. x 10 in. x 3 in. only.

This Almost Human Device

Shows you all letters or papers requiring attention each day; Insures correspondence answered on correct day; Looks after matters pending and brings them continually to your notice until finally dealt with; Prevents loss of all important papers; Keeps your desk clear of litter with all your papers systematically filed.

Supplies Limited - Order To-day

When the present small stocks are exhausted, it may not be possible to obtain replenishments. So make sure of securing your requirements whilst they are available, and POST THE COUPON NOW.

The Shoe Trade

Two exhibitions of shoes are running concurrently in London. At one of them some twenty-five manufacturers are exhibiting, all specialists in the top grade of mass-produced shoes for women. The second is the more robust Shoe and Leather Fair where the competitive emphasis is on price. About 400 companies directly engaged in shoe production or in the supply of machinery and materials are taking part in it. The atmosphere of the two shows differs but both provide similar evidence of the industry's difficulties. When world leather prices were rising alarmingly last winter, new utility price ceilings were negotiated with the Board of Trade. These allowed for a substantial increase in current margins and raised the retail prices of the highest grades of men's and women's shoes to between £5 and £6 a pair.

After these increases were announced in the summer, there was a rush to buy shoes, particularly men's shoes, at the old prices. Sales that would normally have been spread over the rest of the year or longer were compressed into a few summer weeks. Shoe sales are highly seasonal, and one result of these high summer sales will almost certainly be a comparatively slack period during the next three months, which ordinarily would be one of the selling peaks of the year.

Unfortunately for the trade, prices have in general risen by much less than the permitted margin. In the highly competitive home market, it is difficult and almost impossible to sell shoes at the top utility prices; certainly few shoes at either exhibition were being offered at the ceiling price for their range. This is becoming a common feature of trade in utility goods, especially now that the utility specifications are being so modified that the greater part of production in those industries with utility schemes can be made to conform with them. For the past eighteen months, 97 per cent of the shoes produced in this country have been sold free of purchase tax.

The rate at which orders were being taken in the first few days of the exhibitions suggests that the trade is not likely to recover for several months. Most manufacturers hope to keep up production (running at a steady 11 to 12 million pairs a month) as long as possible in order to put off the day when they lose labour to the rearmament industries. But in an industry dominated by small businesses, only the few big companies can afford to follow such a policy and now that the holidays are over rumours of short-time working in Leicester and Northampton are to be heard. At the same time, the industry may be facing one of those fundamental fashion changes that occur once in a generation. This is the popularity in the provinces of what the trade calls "bootees." Many women now wear these throughout the winter months, until they can be replaced by summer sandals. Their manufacture is comparatively specialised, while their popularity, and particularly their durability, is having a notable effect on the sale of women's ordinary shoes.

The general slackness is felt all the more acutely because the industry has only a small export market. Its sales abroad reached £8,611,843 in the first eight months of the year, £1,265,867 worth going to the United States. These figures could be higher, but few companies are prepared to undertake the type of sales campaigns essential to the development of exports. The bulk of the sales in America, for example, represent the efforts of one company showing at the smaller exhibition, a concern that has already made itself conspicuous on the home market by its vigorous advertising.

Research Race for Titanium

Since 1946, when the largest known deposits of ilmenite, an ore of titanium, were discovered at Allard Lake in Canada, American metal concerns have been investing heavily in its development. A raw material that yields fairly easily a pigment for which demand is established but still growing, and that may further be made to yield a new industrial metal of the first importance, might be described as a mining engineer's dream: and the huge Canadian ore body, estimated at 200 million tons, has justified the erection by Kennecott Copper and New Jersey Zinc of a smelter costing $30 million that should be in full operation by the end of this year. It will then produce annually 250,000 tons of titanium dioxide slag containing approximately 70 per cent of the dioxide, and 175,000 tons of pig iron. Titanium dioxide is a white pigment of extreme opacity used extensively in paint, paper, vitreous enamel, rubber, dental plastic, and glass colourings; and at present demand is swelled by the shortage of zinc for its rival pigment, zinc oxide. But development of the new orefield has inevitably heightened industrial interest in titanium as a metal; and with rearmament offering many potential applications for its special properties, great efforts in competitive research are being made to discover a simpler and cheap method of extracting the metal. In this research race, metal concerns, chemical firms such as Monsanto and Du Pont, and official research departments in the United States and Britain are pursuing a common object. Certain claims from America suggest this may be within reach.

Titanium, if it could be obtained reasonably cheaply, would need no special defence demands to justify its production. Its exceptional properties—low density, high strength, and exceptional resistance to corrosion—would then make it an obvious rival to the existing light alloys and even, as some metallurgists insist, to steel in certain applications. The metal is the seventh most abundant in nature and has been known for more than a century: but since it was first extracted in 1825, refining methods have remained exceptionally difficult and costly. Present methods, operated in two pilot plants in the United States and one in Canada, produced about 60 tons last year; this year the United States hopes to produce about 500 tons, and by the end of 1952 one American plant expects to turn out 3,600 tons a year. This will use the thermal-chemical process in which titanium chloride is reduced in molten magnesium in an inert gas at a temperature of 800-900 degrees Centrigrade. Abundant American supplies of helium make production of titanium metal in a "sponge" practicable by this method at a price of $5 a lb. The present small output of metal is used mainly in alloying. The heat resistant properties of titanium offer considerable possibilities of its use in jet engines.

In Britain, the established technique would require argon as an inert gas; this is considerably more expensive than is helium in America, and would result in higher production costs. In this country the companies producing titanium dioxide—British Titan, owned partly by ICI and Imperial Smelting, and National Titanium Pigments, controlled by Laporte Chemicals—have been mainly concerned with

developing the pigment. But the possibilities of the metal are well known, and the Department of Scientific and Industrial research, which is known to be studying reduction of the metal in hydrogen, is probably not alone in Britain in this field of research.

Materials from the Commonwealth

The Commonwealth supply meeting ended last week. Its achievements were probably greater than would appear from the face of the communiqué. The poser of price stabilisation was discussed but not pursued; countries were left to meditate in private about the best ways of fostering the almost unanimously accepted ideal of averting violent price fluctuations. According to the official communiqué the meeting concluded that "the range of prices (of both raw materials and manufactured goods) and purchasing arrangements should be such as would encourage long-term production without discouraging consumption." The Pakistan representative reserved the position of his delegation on this point. The British Government apparently succeeded in convincing Commonwealth countries that a continuous rise in the standard of living of peoples inside and outside the Commonwealth could be achieved only if the production of primary products increased commensurately. Plans to develop output of copper, zinc, tungsten, manganese and nickel in the Commonwealth were already well advanced. New and extended projects are to be introduced in the future. The limiting factor is the supply of capital equipment.

Britain, for its part, stated that, despite rearmament, it hoped to maintain a volume of exports of capital equipment and other essential goods to Commonwealth countries at the same level as in 1950. Exports of consumer goods, however, were expected to increase so as to provide a necessary incentive to production and to help to raise the standard of living throughout the Commonwealth. There was no reference to any practical steps to ensure that the dominions and the colonies got what they wanted when they wanted it. The communiqué merely concluded with a cryptic statement that "arrangements were agreed upon for the fuller exchange of information and for facilitating deliveries of British exports to Commonwealth countries."

No meeting on raw materials could ignore the existence of the International Materials conference, on which all Commonwealth countries are represented except Pakistan and Ceylon. The work of the new Washington organisation was discussed and most countries agreed that timely action in allocating scarce materials had done much to alleviate the shortages that had threatened the world nine months ago. The Commonwealth pledged itself to continue to give the IMC its full support. The real task now remains—to ensure that the practical outcome of these talks during the next five or ten years fulfils their promise.

Output According to Survey?

Industrial production, as measured by the official interim index, continues to fulfil the Economic Survey's forecast of a 4 per cent increase over last year's average: though that of the London and Cambridge Economic Service would suggest a slightly smaller increase. The official index puts output in July at 139 (1946=100), compared with 149 in June and 134 in July 1950. The London and Cambridge "B" index puts output in July at 130, compared with 143 in June and 128 in July, 1950. For August, the official index is expected to be 127-128, compared with 123 in August last year.

Most components of the official index for particular industries are published too late to indicate the pattern, as distinct from the total volume, of recent production. But building and contracting, according to the official index, is operating well below the 1950 level of activity. The London and Cambridge figure for "motors, cycles, and aircraft" in July was 187, compared with 183 in June, and 209 in July last year; this index excludes finished munitions. Textile production remains well above the industry's rate of output a year ago. These should be among the industries most concerned with defence production in the first year of rearmament; it cannot be said, therefore, that the indices yet show any considerable expansion in output for defence.

Prospects for the remainder of the year suggest that the Economic Survey's forecast about total production should be fulfilled, whatever the course of production for defence. The shortages of raw materials that became particularly threatening at the beginning of this year have in some cases been less serious than first appeared; in all cases they have been met fairly successfully by the resourcefulness of manufacturers. For the winter and for 1952, however, shortages of basic materials and interruptions of services present the main difficulties. By the end of the year rearmament may be making larger demands upon supplies of steel that can hardly be any larger; if the demands of apparently "essential" civilian industries remain irreducible, some of the remaining steel consumers may go very short. Coal production, including opencast, has so far this year increased by less than 3 per cent; with transport difficulties possibly affecting fuel deliveries and power supplies hampered by shedding and spreading, any general increases in industrial output will be hard won.

* * *

Speeding American Coal Exports

Partly because loading facilities at Hampton Roads, Virginia, are proving inadequate to handle all the coal being shipped through there to Europe, the American Department of Commerce is to introduce export licensing of coal exports from November 1st. Importing countries in Europe are to be allotted quotas of coal from this area—Hampton Roads is in a particularly convenient situation for shipments from coalfields producing the particular coals mainly required—and additional shipments are to be made through other ports such as Philadelphia, Baltimore and Charleston.

This move was to be expected. For some weeks congestion at Hampton Roads has been causing serious delays, with sometimes ten to twenty vessels waiting outside the port for loading and the scheduled arrival of coal has also been disorganised. The American Government has reason to be interested in the charges thus incurred and in the waste of shipping space involved, for through ECA it is largely financing the European coal import programme. It is also providing much of the shipping; since shipowners were recently hesitating to provide vessels at freight rates that ECA would approve, more vessels have been temporarily released from the American reserve fleet to carry coal to Europe. Port handling facilities, it is believed in Washington, now present the only real obstacle to shipping to Europe enough coal in time; there has never been any shortage of coal for export, and it is now believed that sufficient ships have been assembled to carry the 18 million tons that Europe hopes to import in the last half of this year.

Though there is some very restrained optimism about coal supplies in Europe from next spring onwards, few European observers would be prepared to argue that any considerable reduction is likely in 1952 in imports of coal from America, compared with this year's planned total of 25 million tons. For this winter, though coke supplies are expected to present the most serious shortage, most countries in Europe also expect to be short of coal, and they are picking up such additional quantities that they can find. As yet, however, hardly anyone apart from Britain has been induced to import from India.

* * *

Applied Research in Lancashire

A new company, Shirley Developments, Ltd., has been formed in Lancashire to "undertake the commercial development and exploitation of inventions, patents and processes in all fields, but particularly in textiles"—the inventions being those that arise as a result of work done at the Shirley Institute. The Institute has an established reputation in developing pure research to give eminently practical results, and has recently promoted several important developments in textile machinery, but the commercial exploitation of such work tends to lead it into fields outside the proper province of a research institution. These functions will now be taken over by Shirley Developments, although the precise relation between the two bodies, including the future of patents already held and licences granted by the Institute, has not yet been defined.

Since the Institute has facilities for pilot plant trials, the new company is likely to be a purely commercial body. Its chairman is Sir Raymond Streat, chairman of the Cotton Board; members of the Institute are on the board, and it is hoped that the principal sections of the textile industry will also be represented. Hopes have been expressed that the new company will result in technical advances perfected at the Institute being introduced more rapidly into the mills; but if these hopes are to be fulfilled, it must first find means of changing Lancashire's continued extreme caution concerning capital expenditure on new plant. The record of a similar body, the National Research Development Corporation, set up by the Government with the identical intention of bridging the gap between technical development and commercial application, has not, on its published results, been impressive, although it may have done good work behind the scenes. Shirley Development's close connections with the industry it is designed to serve may give it advantages that the NRDC, with its wider purview, cannot always secure.

Oil in 1955

Oilfields outside the Soviet orbit may be producing 30 to 40 per cent more oil by 1955 than they are today: but there may nevertheless be a gap between supply and total demand. This conclusion, based upon a report of a special committee of the National Petroleum Council in America, is reached by the Petroleum Press Service in its latest bulletin. Despite the present arrangements being made by America to assist oil consumers directly affected by the Persian dispute, the bulletin notes, the dependence of the United States upon foreign oil supplies has come to stay in the oil trade, and is certain to grow.

The American committee estimated that by 1955 American production might reach 7,800,000 to 8,800,000 barrels a day, and production from other oilfields in the free world some 6,000,000 to 7,100,000 barrels a day; these estimates compare with actual production in January this year of 6,500,000 and 4,500,000 barrels a day respectively. By 1955, then, the total "availability" of oil might be 13.8-16 million barrels a day. Of the increase in production outside the United States 70-80 per cent is expected to develop in the Middle and Far East: the expansion of "foreign" sources in general is anticipated to be proportionately much greater than in the United States itself.

The committee made no projections of demand, but the trend of recent years has shown no sign of any slackening in the growth of American domestic demand. This rose by nearly 11 per cent in 1950 to 6,800,000 barrels a day; it has been officially estimated as likely to reach 7,500,000 barrels a day this year. If the United States continues to enjoy high prosperity, the bulletin forecasts, its total needs by 1955 might well come fairly near 10 million barrels a day; even an annual average increase in consumption of only half the present rate would probably necessitate American oil imports on a higher rate than hitherto. During postwar years, the growth of demand in other free countries has been even faster, rising by some 13.3 per cent per year. This would suggest requirements of some 6,500,000 barrels a day by 1955, compared with the 1950 consumption of 3,600,000 barrels a day. Even if the higher levels of the American supply estimates are attained, on this analysis oil will not be abundant; if the lower ranges only are reached, it may mean oil shortages for all nations.

Shorter Notes

Wholesale textile stocks in August reached their highest level since the war. The value of stocks increased by 8 per cent during the month and was 22 per cent higher than in August, 1950. Sales were some 14 per cent above the July figure, which is usually low, but barely 3 per cent higher than a year earlier. Sales of furnishings fell by 26 per cent on the year and their stocks increased by 146 per cent. Sales of men's and boys' wear also declined—by 3 per cent compared with August, 1950, when prices were much lower—while stocks were 27 per cent higher. Sales of women's and children's wear fell by 1½ per cent and stocks increased by 21 per cent. Sales of other goods were higher in value than in August, 1951, and so were stocks except for gloves and sports and travel wear. These figures do not suggest any revival in public buying.

*

Retail trade figures for July show a continuance of the stagnation in trade that has been evident since March. Sales of clothing, of non-food merchandise and of household goods have declined consistently since that month and only food and perishables have shown any increase. Sales of household goods have fallen more sharply than the rest and the index of sales per week (1947 average=100) was 134 in July compared with 165 in March and 166 in February. The buyers' strike in this country is also evident in the United States and in certain European countries.

Company Notes

British Celanese.—The full accounts of British Celanese, coupled with the chairman's informative statement, entirely justify the comments in these columns on September 22nd about the gross unfairness of the dividend limitation proposals on this company and its ordinary stockholders. The chairman himself underlines the inequity of the cut in the ordinary dividend from 10 per cent. to 9 per cent. in observance of the White Paper proposals by showing that the ordinary stockholders (there are more than 10,000, of whom 9,000 hold 500 10s. units or less) will forgo £22,113 net compared with the previous year, whereas the increases in wages and salaries made during last year will cost £800,000 in a full year.

Moreover, the company's intentions about raising new ordinary capital have been thrown out of gear. Last June Treasury consent was given to a proposed issue of ordinary shares to raise £3½ million towards the finance of the projected spinning plant at Wrexham. Almost immediately, when the Government's proposals for limitation of dividends were made known, "it became problematical if that issue could be carried out on the basis originally intended." Authority is being sought for an increase in the authorised equity capital from 5,400,000 10s. units (of which 4,422,667 are in issue) to 12,000,000 units. The board, though plainly set back by the additional dilution of the equity that would have resulted from an issue to ordinary shareholders on post-White Paper terms, still hold that such a method of issue is the most desirable, "as and when market and other conditions permit," for financing the future capital programmes, including Wrexham and the company's participation in United Sulphuric Acid Corporation. The 10s. units, which stood at 36s. 6d. in mid-June, fell to 28s. 3d. on dividend limitation. Their subsequent recovery to 38s. ex dividend owes much to the prospect of a Conservative victory.

The weight of the new programmes is only partly measured by the commitments of just over £2,000,000 at June 30th. In addition, the raising of new capital must be viewed against the fact that net liquid assets of the group rose during the past year by some £3,000,000 to more than £12 million. In fact, "substantial new capital will be required during the next few years" to enable the group to proceed with the expansion of acetate rayon production; the board's faith in the qualities, application and cheapness of acetate rayon, in competition with other synthetic fibres, remains unshaken.

Last year produced record trading, both in volume and sales. It also produced a tally of difficulties—a precipitate embargo on exports of cotton linters from the United States, a rush to obtain what supplies were obtainable from other sources which forced prices up to eight times their level of early 1950, the partial substitution of wood pulp for linters in the making of cellulose with technical difficulties surmounted, and the final crisis in sulphuric acid only less serious in degree for British Celanese than it was for viscose producers. This series of production problems has been accompanied by great price increases which have been only moderately reflected in selling prices, because of increased efficiency and because the stocks that have been used have been taken into cost at less than current replacement values.

★

Great Universal Stores.—The earnings record of Great Universal Stores since the end of the war bears witness to the success of the group's expansionist policy. In the latest year trading profits have eclipsed all previous records, soaring from £5,896,913 to £8,161,150. The post-war expansion of the group has found its mark in the balance sheet. In particular, the burden of stocks and hire-purchase debtors on the group's finances has been considerable; a year ago, stocks were valued at some £13,000,000 and hire-purchase debtors at nearly £16,000,000, with bank loans and overdrafts of some £7,200,000. Rising prices and expanding turnover are likely to have swollen these figures even further this year but the evidence of the full accounts must be awaited for confirmation of this point. An ordinary dividend of 40 per cent. has been paid since 1947 and is again maintained this year. The company's issued ordinary capital has gradually increased in the same period, largely as a result of the acquisition of new businesses. The stable dividend policy accompanied by the steady expansion of profits has enabled the company to buttress its reserves; in the latest year this reinforcement is of the order of £1,800,000, even after taxation has absorbed nearly £4,500,000 against £3,000,000 in 1950.

	Years to March 31, 1950	1951
Consolidated Earnings :—	£	£
Trading profit	5,896,913	8,161,150
Total income	5,951,107	8,218,461
Depreciation	461,308	658,483
Taxation	3,019,367	4,489,415
Group earnings for ordinary stock	*1,260,265*	*2,082,700*
Ordinary dividends	295,769	284,631
Ordinary dividends (per cent)	40	40
General reserves	554,485	633,534
Other reserves	83,423	100,151
Added to carry forward	410,011	1,164,535

The group's expansion is far from being at an end. In Canada, where the company owns 86 retail stores, plans are in preparation for further development. The announcement by Mr. Isaac Wolfson that negotiations for the acquisition of a chain of retail stores in the United States are well advanced and that application is being made to the Treasury for the transfer of the necessary dollar capital recalls the events of two and a half years ago, when a similar application was accepted, but negotiations broke down at a later stage. One of the arguments then advanced for the investment was that it would provide another shop-window for British goods. In his announcement last week Mr. Wolfson emphasised that the newly proposed investment "would substantially increase the group's dollar-earning potential."

★

Glaxo Laboratories.—The preliminary statement for the year ended June 30, 1951, contains what is tantamount to a promise that, if there is a change of Government, shareholders will hear of something to their advantage. A "second interim" dividend of 7½ per cent. has been declared, bringing the year's total up, or rather down, to the "freeze" level of 15 per cent. At the same time, provision has been made for payment of a further and final dividend of 7½ per cent., payable December 12th, in the event of dividend limitation being buried with full Treasury honours. This payment will be well within the capacity of the company as profits before tax are up by £702,000 to a new high record of £3,101,000. After providing for all changes, including a greatly increased provision for taxation of £1,736,000, against £1,162,000, the net figure of £1,365,000, against £1,237,500, still constitutes a record.

The dividend proposals will require £31,356 or £62,712 net, as the case may be, against £54,750 and will leave a balance to be carried forward of £316,162 (£272,264) after allowing for the additional tax payable if a final dividend is forthcoming.

The 10s. ordinary units rose 3s. 9d. on publication of the figures, and at the present price of 83s. 9d. yield £2 13s. 9d. per cent. on the hoped-for 22½ per cent. dividend.

COMPANY MEETINGS

THE INTERNATIONAL TEA COMPANY'S STORES LIMITED

MR FRANK WILSON ON STAFF RELATIONS

The annual general meeting of this company was held on October 2nd in London.

Mr Frank Wilson, chairman and joint managing director, said that his statement on the past year's trading had already been circulated to stockholders, but he felt that he should make reference to the recent unfortunate strike which had occurred in a section of their business in South Wales and Monmouthshire, and the later threat of a general stoppage in their London warehouses and factories, which had very nearly become effective.

Some of the stockholders might misunderstand, or even doubt, his remarks in his circulated review on the question of staff relations. That was understandable, especially when certain sections of the press had extracted headings to paragraphs such as "Happy Staff Relations" and similar seemingly contradictory headlines in view of what had happened to them recently.

It was a very serious and worrying question, and to many stockholders it might appear that the directors did not understand or appreciate the mentality and feelings of their staff or the extent of their loyalty to the company. He had prepared his review some weeks before the issue of their accounts to the stockholders or to the press, and he wanted to stress that all he had said when he wrote his review was true then and remained true today. He was not prepared to withdraw or vary one word which he had written on that subject of staff relations.

BOARD'S ATTITUDE TO STRIKE

Summarising the events leading up to the strike, he said that approaches had been made to certain companies on the question of individual wages agreements between those companies and the trade union as far back as November, 1950. Their company, acting with other multiple traders through their trade association and also acting separately, had agreed that they would not negotiate on any such individual wages agreements. It had never been a question of wages; it was entirely a question of agreements. Having undertaken so to act, they had been unable to consider a later approach by the union, when it was to be confined to a group of retail branches in one small geographical area. They, with other members of the association, had taken the line that collective bargaining on retail wages already existed. They had informed the union that they were perfectly willing to, and they actually did, refer the matter to the Ministry of Labour for arbitration. If any one company had surrendered to the union's approach and acted on its own they would have sold the pass for the whole of the members of their association. A settlement had been reached at the request of the Ministry of Labour with the assistance of the trade association.

He repeated that with few exceptions the company's staff was loyal and appreciative of what the board and management did for them. It would be unfair and ungenerous to brand in any other terms the thousands of employees who had offered to help and see things through to the bitter end. They were proud of them. They hoped that the few who had supported such actions as those to which he had referred would see the right light before it was too late.

The report was unanimously adopted and the formal business duly transacted.

GENERAL ELECTRIC COMPANY, LIMITED

INCREASED SALES

The fifty-first annual general meeting of The General Electric Company, Limited, was held in London on September 27th.

Sir Harry Railing, the chairman, in the course of his speech said: We have achieved a further increase in our net profit. This result is due to an increase in sales of some 13 per cent. following a similar advance during the preceding year.

The majority of our establishments have contributed to this record in spite of the difficulties of obtaining additional labour and sufficient raw materials. These results have been made possible only by the additional capital retained since the war in the company's reserves which has been used to provide increased manufacturing facilities and stock finance.

After allowing £1,038,000 for depreciation, £106,000 more than last year, and other provisions, we show a profit of £5,650,000 before taxation. Taxation absorbs £3,640,000, and we are allowed to keep one-third of the profit we have earned. During the last four years taxation has withdrawn £11,000,000 from your company's capital, while the net dividends paid to the stockholders amount to £2,446,000. The directors have recommended the payment of a 10 per cent. dividend on ordinary stock as before and of a bonus of 12½ per cent. as against 7½ per cent. last year.

CAPITAL LEVY ON SAVINGS

Undistributed corporation profits have of late constituted Britain's prime method of saving. The heavy burden of taxation on undistributed profits constitutes a capital levy on savings, and since it taxes profits without allowing for the increased cost of replacement of stock and fixed assets, the capital assets available for maintaining efficient production are drastically curtailed. The dividend standstill now proposed, reduces the possibility of attracting outside savings for this purpose and for expansion and new ventures.

We pleaded and mean to go on pleading, for a reduction of taxation on profits retained in business. We further plead that whatever general taxes are necessary to meet the budget, it is suicidal to bring industrial dividends to a standstill without limiting other earnings.

THE OUTLOOK

I do not need to emphasise the seriousness of the world position in regard to raw materials. This is only partly caused by rearmament; the chief reason is that raw material production the world over has not kept pace with the increased world demand for goods. It is to be hoped that the countries which can alleviate this scarcity will concentrate their resources on this task. In so doing they will best help themselves and the world.

The building up of the great strength of our organisation has only been made possible by a courageous policy and the confidence that we can continue to reckon on an expanding world-wide market for our products. It is on this basis that we have to plan.

At home and abroad we are playing our full part in the rearmament programme, which has to receive first priority to assure our very existence, in the export drive to enable us to buy food and raw materials and maintain our economic life and in the help we give to industry all over the world by new electrical devices, new applications and the quality of our products. By all these actions and by farseeing research we are striving to ensure that your company will continue to lead and expand and help to uphold Great Britain's position and influence in the world.

The report was adopted.

THE PALESTINE ELECTRIC CORPORATION

VISCOUNT SAMUEL ON THE INCREASING DEMAND

The twenty-eighth ordinary general meeting of The Palestine Electric Corporation Limited, was held on September 28th in London, Sir Edward Baron presiding in the absence of the chairman, the Rt. Hon. Viscount Samuel, P.C., G.C.B., G.B.E.

The following is an extract from the chairman's circulated statement:

The year 1950 was marked by a continuance of the rapid expansion in the economic life of Israel which has been so striking a feature since the establishment of the State. All this activity has brought an unprecedented demand for electricity for industrial and domestic purposes and for irrigation. The consumption of electricity in 1950 was 40 per cent. higher than in 1949 and six times what it was in 1938.

PLANT EXPANSION

Your Corporation, anticipating a great increase in demand, took active steps immediately after the war to expand its plant and has since continued them without intermission, in spite of serious obstacles arising from the refusal of the British Treasury to sanction the issue of new capital; restrictions in currency transfers; difficulty in obtaining indispensable materials; and the constant rise in constructional and operating costs. All through 1950 supply kept pace with demand.

The gross revenue was I£4,833,000 in 1950. There was, however, an increase in operating expenditure in 1950, compared with the previous year, of 28.3 per cent. partly due to the increased output but in the main to the continuing steep rise in the cost of living in Israel. The directors again recommend the payment of a dividend of 5 per cent. free of tax on the ordinary and "A" ordinary stock and ordinary shares. The dividend will absorb I£152,583, leaving a balance of I£323,447 to be carried forward.

It was found necessary to place further orders for new plant in the United States, because of greater facilities for financing there and quicker delivery. The relevant orders in the U.S.A., amounting in the aggregate to some $10 million, are being financed as to $2,500,000 out of the facilities made available to the Israel Government by the Export-Import Bank of Washington.

The number of units sold was 315 million in 1949 and 443 million in 1950. It is estimated that the figure will be 600 million in 1951, and likely to reach 780 million in 1952, and 1,000 million in 1953. We have to envisage further extensions of plant accordingly.

CAPITAL INCREASE

Your directors therefore contemplate making further issues of capital, of such amounts and at such times as they may consider expedient. It is accordingly proposed to increase the authorised capital of the Corporation from £4,000,000 to £8,000,000 by the creation of 4,000,000 new shares of £1 Sterling each. Your directors intend to issue 250,000 ordinary shares of £1 Sterling each on the Israel Register, at par, to the trustees of the Corporation's staff pension funds, in accordance with the trustees' request.

During the first six months of the present year the operating results have been satisfactory.

The report was adopted.

At a subsequent extraordinary general meeting the proposed increase of capital was approved.

THE VALLAMBROSA RUBBER COMPANY LIMITED

The forty-seventh annual general meeting of members was held at Edinburgh on October 2nd, Mr T. J. Carlyle Gifford, chairman of the company, presiding.

Undernoted are the chairman's remarks:

Since the close of the accounts for the year 1950-51 the issued capital of the company has been increased to £135,900 by the capitalisation of £45,300 of the Reserve Fund and the issue of 453,000 shares being one share for each two shares previously held. The issued capital is thus brought somewhat more into line with the capital value of the estates, though still well below it.

The sharp rise which took place in 1950 in the price of rubber has naturally resulted in a great increase in the company's profits. The average price realised was just under 3s. per lb compared with a little over 1s. per lb. in the previous year. Much credit must be given to the management in the East for the fact that the f.o.b. cost of production rose no more than from 7.56d. per lb. to 8.29d. per lb. The previous year's figure included export duty of ½d. per lb. Export duty which for the past year was 2½d. per lb. is not included in the figure of 8.29d. per lb. as it is an expenditure which is not within the control of our staff in the East. For the current year there is certain to be a substantial increase in the cost of production but, to quote the remarks of the general manager, I am certain that the company can hold its own as a low cost producer with the majority of estates.

The trading profit for the year was £258,813 and we also received £8,736 in respect of war risks insurance. Taxation absorbed £161,300. We have thought it wise to place £10,300 to capital reserve fund so that the total amount expended on the estates out of capital may be practically covered by the issued capital and the capital reserve fund. £40,000 has been placed to the credit of provision for replacements. This is necessary against the cost of replanting the old estates with pedigree rubber, a task which is being undertaken as fast as local conditions, and particularly shortage of labour will permit. We have then been able to recommend a dividend for the year of 75 per cent. on the capital as it stands today, and to add a small sum to the carry forward.

Fortunately, this dividend was announced before the intimation of dividend restriction and is not itself struck at. For the current year the dividend will be limited to about 45 per cent. As this company was among the first to venture capital in the development of the then highly speculative industry of rubber planting in Malaya, and as for the seven years prior to 1950 only one small dividend, in 1948, could be paid on its stock it will be quite iniquitous if dividend limitation is applied to it now that it is again experiencing one of its periods of prosperity—one which may easily prove, as have others in the past, to be comparatively short-lived. To companies like this which took the risks fifty years ago is due the enormous contribution which rubber makes to the sterling balance of payments, and directly to the British Exchequer.

The financial results of the past year have been impressive, but I am much more impressed by the courage, steadfastness and loyalty of all who work for the company. The strain upon our European staff has been great. Fortunately, our coast estates are in what is as yet a quiet area but Kapar Bahru, where we have 1,600 acres, is in one of the worst districts in Selangor. Many attacks were made on the bungalow and the factory and the labourers and contractors were exposed to unpleasant threats from the Communists. Only the powerful influence of our European managers and their admirable relations with the labourers kept things going, and they gladly recognise the assistance they obtained from our loyal and courageous Asiatic staff. Apart from the Communist danger, our workers live in conditions not easily to be improved upon anywhere in Asia, and apart from the good wages paid which are at rates in the fixing of which the employer is only one party and is far from holding an autocratic position, the workers are in receipt of many benefits which cost the company many thousand dollars a year. Housing is of a high standard and fortunately much was done to improve and rebuild the lines in the earlier years after the war when building costs were lower than they are today. We can look with pride upon the relationship between the company and its employees on its coast estates which have been established and consolidated over the past fifty years and upon the steady growth of the same tradition on our much younger and in recent years more dangerous estate of Kapar Bahru.

I wish it were possible yet to take an optimistic view of the bandit activity, but as yet there is no lessening in Selangor. One can but admire the steadiness with which in such conditions work is carried on and acknowledge the company's debt to those who work for it in Malaya.

Were it not for this anxiety it would be possible to say that everything goes well with the company. The visiting agent, Mr Mackenzie, speaks highly of the condition of the estates and of the quality of their management. Steady progress is being made with replanting of old rubber, crop is well maintained, and the low cost of production is impressive.

The report and accounts were unanimously adopted.

BRITISH OVERSEAS STORES LIMITED

The thirtieth annual general meeting of British Overseas Stores Limited, was held on October 2, in London, Mr R. J. Blackadder, M.C., C.A. (the chairman) presiding.

The following is an extract from his circulated statement:—

From the formation of the company up to about 1937 difficult trading conditions and currency depreciation in some of those countries in which we are interested led to disappointing results. Thereafter up to the end of World War No. 2, despite the shortage of supplies, we earned reasonable profits.

During the last period we have seen the devaluation of the pound and the consequent rise in prices up to a point at which it seemed there must be a break in the market, but the outbreak of the Korean war, the fear of a third world war, and stockpiling, caused a further up-swing in prices.

After the lapse of six years, payment of dividends was resumed in 1938, when a dividend of 5 per cent. was paid, rising to 10 per cent. in 1947, at which rate it has been maintained.

At the moment all our subsidiary companies are doing well. We have acquired the entire share capital of Bickley & Bell, Limited. For many years it has been the policy of your board to establish a buying house in London under its own auspices. With the acquisition of Bickley & Bell, we are in a position to achieve this ambition.

While not making any forecast of the results of the current year, the encouraging reports from our overseas interests make me hopeful that the consolidated results this year will once more show an improvement.

The report was adopted.

INTERNATIONAL DIATOMITE

CONTINUED PROGRESS

The sixteenth annual general meeting of International Diatomite Company Limited was held on October 3, 1951, at Winchester House, E.C.2, the Chairman, Mr E. W. D. Tennant, O.B.E., presiding.

The Secretary (Mr Jesse Wood) read the notice convening the meeting, and the report of the auditors was read by Mr H. J. Binder.

The following is the Chairman's statement which was circulated with the accounts for the year ended June 30, 1951:—

In each of my statements circulated to shareholders with the annual accounts since 1947, I have referred to the steadily improving position of this company, and I have pleasure once again to be able to report continued progress.

Your operating subsidiary company, Moler Products Limited, has achieved improved results during the twelve months under review. In my statement last year I referred to a new production unit being brought into operation, and the works, including the new unit, have maintained full output which has proved 20 per cent. greater than that of the previous year.

Orders continue to come in freely, and with a good order book in hand, I am able to forecast another satisfactory year subject to the international situation. An encouraging start has already been made in the current year, and the directors have authorised the management to proceed with the construction of a further production unit.

Our Danish sub-subsidiary company, a/s Fur Moler Kompagni, has made a profit during the period; it has also supplied all the Danish Moler which Moler Products Limited required for its own consumption. The quarries are in good condition, and the company is in good heart.

I feel sure that the shareholders will join the directors in expressing their sincere appreciation of the satisfactory results to your managing director, Mr Robert Wood, and to all the officials and employees of the company.

The report and accounts were unanimously adopted, and a final dividend of 14½ per cent., making 24½ per cent. for the year, was approved.

The retiring director, Mr R. W. Young, F.C.A., was re-elected.

Messrs Binder, Hamlyn & Company continue in office as auditors.

UNIVERSITY COLLEGE OF HULL
DEPARTMENT OF ECONOMICS

Applications are invited for a Research Assistant in the salary range £250-£350, to work on problems of applied economics forming part of the research programme of the Department of Economics. Appointment for one year in the first instance, eligible for renewal for a second year.—Particulars from the Registrar, to whom applications (four copies) should be sent not later than October 20, 1951.

YOUNG man (37) present earning £1,700 p.a. running large department export merchants with proved success record finds life in London unsatisfying and wishes to live in smaller town, preferably South England. Will accept any offer run small factory or business, provided situated in or near small town.—Box 770.

DEPARTMENT OF SCIENTIFIC AND INDUSTRIAL RESEARCH
PRINCIPAL SCIENTIFIC OFFICER

The Civil Service Commissioners invite applications for a post as Principal Scientific Officer (Sociologist) in the User Requirements Division of the Building Research Station. The officer appointed will, for the present, be stationed in South Kensington, but it is expected that this Division will eventually be transferred to the headquarters of the Building Research Station at Garston, near Watford, Herts.

The successful candidate will be required to undertake research into the relationship between design of buildings of all types and the requirements of their occupants. The work will include a consideration of the effect on design requirements of the provision of communal services and to some extent the planning of neighbourhoods. Studies of the needs of special groups of people will form an important part of the research. Field surveys and experiments are envisaged.

Candidates must have been born on or before August 1, 1920. They must possess a First- or Second-Class Honours Degree or high qualifications in one of the Social Sciences; and must have had considerable experience in the use of social survey methods or operational research techniques.

Inclusive salary scale (London) £1,000 x £40—£1,200 x £50—£1,375 (men), £880 x £40—£1,200 (women). Exceptionally a starting salary above the minimum may be granted, according to qualifications and experience.

The post is superannuable under the Federated Superannuation System for Universities.

Further particulars and application forms from the Civil Service Commission, Scientific Branch, Trinidad House, Old Burlington Street, London, W.1, quoting No. S4084/51. Completed application forms must be returned by November 8, 1951.

PROPERTY FOR SALE

Factory, centrally situated in Edinburgh, one of the lowest rated cities in Great Britain; presently used as a printing works; 4 floors and basement having approx. total floor area 20,000 sq. feet; existing use—light industrial; assessed rent £235, derated to £58. No ground burdens, electric lift, two loading banks, all in modern condition, approximate entry December. Permission to view from and offers to Shepherd and Wedderburn, 16, Charlotte Square, Edinburgh.

A Stand for Suez

THE British and American answers to the Egyptian challenge have come more promptly and firmly than many expected. If it was events at Abadan that emboldened Nahas Pasha to abrogate the 1936 treaty with this country, they may also have determined Mr Acheson to insist on "proper respect for international obligations." If Nahas has at last made the Americans see that appeasement is not enough in the Middle East, he will have done Britain a very good turn indeed. A firm position has been taken up and there must now be plans to defend it. There is probably a long struggle of skill and will ahead, and every move must be carefully and consistently planned—if possible with allies, if not, by the British alone.

For the moment what matters most is that the old prime minister's motives should be correctly assessed. He acted as he did on Monday because he knew he would receive on Wednesday—from the American, British, French and Turkish Ambassadors—an offer of partnership with, but not in, the North Atlantic Treaty Organisation. They were to propose an international command for the Middle East—not, be it noted, a new treaty organisation—in which Egypt would be an equal with Great Powers. It was to be suggested that only those British troops would stay in the Canal Zone whose presence would be deemed necessary by this command. The substitute for the 1936 treaty on which Mr Morrison has rightly insisted would have been found; Cairo could get peace with honour. But this spelt trouble for the Prime Minister, his Wafd party, and its rich, powerful and unscrupulous secretary-general, Fouad Sevag el Din. They know that there is deep social and economic discontent in the people and that their party's fortunes are on the ebb. A discreet substitution of international protection for the British presence would deprive them of their main appeal to the crowd. Cairo must first have its triumph and London its snub. It was last Monday or never.

The nationalist fires will be stoked up during the few weeks that are left before the Egyptian Parliament passes the decrees of abrogation. If they are not to disorganise the Anglo-American front four things are necessary. First, British opinion should be given a clear lead by politicians of both parties, and Mr Morrison and the Conservatives should be in close consultation. Second, since the Egyptian politicians have committed themselves to getting all foreign troops out of the country, the Americans and the French should realise that the proposals for an international force in the Canal Zone are dead before they are presented. Third, it should be repeatedly said that British pledges about the Sudan make it unthinkable that the results of honest and enlightened administration should be handed over to the corrupt régime tolerated by King Farouk. Fourthly, the Commander in the Zone should know exactly what support he can expect from London in the face of "incidents" designed to discredit the British. These things can be done if the Government puts and faces squarely one question: Is the defence of the bridge between Russia and Africa, the seaway from Europe to the Commonwealth, to be guaranteed by treaty or not?

The Real Issues—I

THE immediate task of the government elected on October 25th is plain. It will be to prevent inflation and to remove the deficit in overseas payments which is, in the present state of world trade, largely a symptom of inflation at home. The parties will not say how they propose to perform this task. They will not say because both are, for different reasons, afraid to face the five main issues that an effective policy against inflation must settle. Those five issues were set out in the *Economist* last week. In summary form they are:

1. *Subsidies:* Whether the government should subsidise personal spending on food, housing and clothes.

2. *State spending and taxation:* The proper distribution of the national income between money the consumer spends for himself and money the state takes in taxes to spend for him.

3. *Equality* v. *Incentive:* The proper distribution of whatever personal income is left over from state activity, and of private property, between individuals and classes.

4. *Controls:* The extent and method of state intervention in economic affairs.

5. *Employment:* The negotiation of wages and the meaning of full employment.

The present article is concerned with the first two questions. The other three will be discussed in a second article.

Inflation is an excess of demand over supply, and the only possible short-term cure for inflation is to reduce some of the components of demand. Of these, consumption is by far the largest, and the only one where cuts can be made large enough to have any effect. This is not to say that there should be no economies in capital expenditures; but after twelve years of capital cuts and controls, it is unlikely that there are many unessential items in the capital programme. Broadly speaking, a policy to prevent inflation is a policy to cut consumption. The politicians get as far as this when they talk of the need for all-round sacrifices, though they still shy away from it when it is phrased more bluntly as the need for a reduction in the standard of consumption.

If this is the paramount need, it is surely lunacy for the state to go on deliberately encouraging consumption. This it does by its various forms of subsidy. There are two main categories of subsidy. First there are the food subsidies, which enable people to get their basic foods for £410 million a year less than cost price. Secondly, there are the rent subsidies. New houses are being built and let to their favoured occupants at about half, or even less than half, of their economic cost. The operation of the Rent Restriction Acts ensures that the occupants of prewar houses are provided with a subsidy at the expense of their landlords, who react, so far as they are able, by failing to keep them in repair. The net effect is that rent, rates and water charges, which absorbed 11.3 per cent of all personal expenditure in 1938, now absorb only 6.7 per cent.

If the real cost of food and housing were less, relatively to wages, than before the war, one could only rejoice at the demonstration that the British public could meet its needs at the cost of less effort. But, as everybody knows, this is not so; when the cost of the taxation needed to support the subsidies is reckoned in food and houses are relatively dearer than they used to be, not cheaper. What purpose is served by pretending that they are cheaper? It does not, in general, lead to more food and house room being consumed, since supplies of these things are limited. Subsidies make people try to consume more of these things without succeeding in doing so; they create artificial shortages. They do indeed stimulate consumption, but of the frills and luxuries of life, on to which the spare purchasing power spills over.

The subsidies do not fulfil their object of increasing the welfare of the people. They create much actual misery. Because basic foods and rents are artificially cheap many people use house-room wastefully. Parents whose children have left home stay on in relatively large rent-controlled houses, with some rooms unused, when if they had to pay an economic rent they would take in a lodger or prefer to move to a smaller house. On the other side, many younger families would be happier if they could pay a higher rent for the house thus freed and give up the visits to the cinema and the pub forced on them by the present necessity of sharing a house with another family. The prolonged housing shortage is proving to be for young married couples almost as desperate a social cancer as prolonged unemployment was for the previous generation. The subsidies do not result in a single additional house being built—indeed, the Rent Restriction Acts definitely reduce the supply of houses—while the artificial lowness of rents results in an uneconomic utilisation of existing houses.

The whole matter can be summed up by saying that if the subsidy policy were abandoned and the cost of it remitted in taxation, food could be unrationed and the housing problem would be discovered to be well on the way to complete solution.

*

Why, then, do the parties not advocate this policy? Partly because the British nation is so far gone in the economics of wonderland that it is genuinely difficult to make people see sense; but that is merely a reflection of the fact that the latter-day parties seem to be incapable of any sustained economic argument, as their fathers were in the days of the protectionist controversy. Perhaps the reason lies in the belief that the subsidies are a means of transferring income from the rich to the poor, and that their removal would therefore be a piece of social injustice. But that is an illusion. The mass of the people pay in taxes for their own subsidies—or at least the abandonment of the subsidies could be coupled with a remission of the "poor man's taxes" to the same amount. Fifteen million people nowadays pay income tax, and the main indirect taxes—the duties on tobacco and alcoholic drinks and the purchase tax—yield a total of £1,275 million. To cancel the subsidies and hand their cost back to the people in reduced taxes would not be to rob the poor for the benefit of the rich, it would simply be to let the working people of the country spend that much more of their incomes as they wished instead of as "the gentleman in Whitehall" thinks best. It would not raise the real cost of living by a single point or make wage-earners as a whole worse off or justify any claims for wage increases. It is true that there is still a small minority of people—mostly old-age pensioners and very large families—who are so poor as to spend very little indeed on tobacco or alcohol or goods subject to purchase tax. But the way to help the most needy is to do it directly by national assistance payments and bigger family allowances, not by subsidising everyone's food.

Another reason for hesitating to remove the subsidies is the belief that it would be inflationary to do so. Would it not send up prices? This is the old misunderstanding about the nature of inflation. Inflation consists in an excess of demand over supply; so far from its being synonymous with rising prices, rising prices are often the only possible way of choking off the extra demand and restoring equilibrium. The purpose of removing the subsidies and handing the money back to the people would be to get rid of the distortions that now bedevil the economy and breed inflation.

*

Moreover, the abandonment of the subsidies would make a large cut in taxation possible, which would be a powerful indirect blow against inflation. This is the second of the five great economic issues. One of the economic propositions that would command most nearly universal assent is that there is a point beyond which a nation cannot tax itself without making inflation inevitable. Just where this point is cannot be determined by *a priori* methods, and many people would put it higher than the 25 per cent of the British national product that was taken in government revenue in 1938. But it is certainly lower than the present 42 per cent. Such a high level of taxation is not only morally debilitating, it is also inevitably inflationary, even though there is a Budget surplus, with government expenditure smaller than the revenue from taxes. It discourages hard work and risk-taking, and therefore reduces the supply of goods available—reduces the supply a little immediately and inhibits its increase in the longer run. And, on the other side of the inflationary equation, it increases demand because the money the government spends comes in considerable measure from money that private people would save, not spend, if taxation were lower.

Yet, important as these effects are, it is unrealistic to maintain that the main services provided by central and local government—defence, education, the health service—should be greatly reduced in order that people may spend more as private individuals. Worthwhile savings are possible, both in these main services and in various minor services and in administration generally. But they are of the order of two or three per cent of the national income, not of five or ten per cent. If, therefore, the burden of state activity is to be reduced, and even if it is to be prevented from increasing as the defence programme expands, cuts must be made in the government's transfer expenditure—in the money that it takes in taxes not in order itself to provide services for the community as a whole but in order to hand the money on to other people. The wasteful and undesirable part of this transfer is not the money the state pays out to needy groups like pensioners and large families but the money it gives to everyone equally through subsidies.

Some day the subsidies will have to come off and the public will have to pay for their food and houses at cost. Some day the burden of taxation will have to be drastically reduced if Britain's economic health is not to be ruined. Stated so vaguely, these propositions would probably be agreed to by nearly everybody. But if anybody suggests that some day should be now, he will be told that it is not practical politics. The Conservative manifesto did indeed recognise the existence of the problem, but postponed it to happier days.

The politicians must remain the judges of what is practical politics. But the economist has a right to tell them that any party programme that does not promise to tackle these related problems drastically and at once is not practical economics and makes no contact with the realities of the desperately serious economic position in which the British people find themselves. So far from being an inappropriate time for beginning to talk economic realities, this is, above all, the time when it is crucially urgent. The danger of rapid inflation has never been so great. The balance of payments has never more urgently needed reinforcement. As for the Budget, the menacing shadow of rearmament expenditure makes it more important than ever to liberate some area of taxable capacity. The politicians are ensuring their own failure and ultimate defeat if they try to get into office by shirking these issues.

(To be continued)

Atomic Diplomacy

STALIN was giving nothing away last weekend when he furnished *Pravda* with answers to questions about atomic bombs, doubtless set by himself. For the Americans had already detected a recent explosion in the Soviet Union—the first since the summer of 1949—and had promptly told the world. He perhaps felt it necessary to tell his own people that their government had not been left standing in the race for supremacy in scientific weapons, and his purpose seemed rather to reassure them than to impress foreigners. Through almost sealed lips he spoke of further tests of "atom bombs of different calibres." More frankly he referred to a plan of defence against attack by "the Anglo-American aggressive bloc" which would be met by the Soviet Union "fully prepared." He threw in, too, a suggestion—a guarded hint to the Americans—that "advocates of the atomic bomb" might agree to its prohibition if they were convinced they had no monopoly of atomic weapons. This, at least, will help to save the face of those who have declared that the Russians use atomic energy merely for moving mountains and diverting rivers. The statement, in short, was neither momentous nor revealing.

Indeed, there is a rather old-fashioned ring to Stalin's words; and his advisers must realise this unless their reading has fallen behind the *New York Times*, to say nothing of the New York periodicals. For recent comment in the United States has made three things clear. First, that this second Russian explosion will be used to support American arguments for a sharp increase in the

proportion of atomic to conventional weapons ; second, that the press is allowed to surmise that the American stockpile of "big bombs" is now running into four figures (with a probable lead over the Russians of at least five to one) ; thirdly, that lack of the "tactical" atomic weapon is taking the attention of thoughtful officers and laymen away from the sky to the battlefront, away from the transcontinental strategic bomber to the atomic shell that guns would use against ground troops and to the little atom bomb that would be used by tactical aircraft against both troops and communications. This is no Wellsian fantasy of ebullient military commentators ; it is a sober picture of coming strategic and tactical changes, the thought of which is already influencing General Eisenhower's planning of the European army and its American support. We may soon be hearing, as we heard in the middle 'thirties, that the arts of defence are about to outdate and outwit the arts of offence; and that the free peoples of the west can call on new weapons to redress the balance of the old.

For the time being the layman will be wise to treat these assurances with caution. The problem of ensuring that Europe is not overrun by masses of Communist soldiery will have to be met for some time to come by "conventional" weapons, even though General Mark Clark has recently said that "new and unconventional weapons will be flowing to the troops before long." The period of greatest risk lies immediately ahead, when the most that can be hoped for is a trickle. And the allies of America need to know more about their role in the use of such weapons, about their cost, and about their military effects before they pin their faith—as the Germans did in the winter of 1944—to wonder weapons that arrive too late.

*

It is clear, none the less, that something of critical importance is happening. If peace is preserved—as it can be by a combination of strength in arms and skill in diplomacy—statesmen may confront in two or three years' time a completely new situation. For five years now the balance of military strength between the Communist world and the free world has been kept even by poising the threat of the atomic bomber against the threat of the Communist land armies. It has always been clear that, in time, the Russians would become able to drop atom bombs on the cities of the west, and that, by that time, the west must also be ready to neutraiise the Russian advantage on the ground by building up armies, not indeed as large as Russia's, but large enough to put up a successful defence. In short, as the west's offensive superiority in the air declines, its defensive inferiority on land is to be made good. The significance of the most recent atomic developments is that they promise greatly to increase the power of the ground defence: a defending army will be able to saturate the ground in front of it with radioactivity. This will make the west's task in neutralising Russia's present advantage much easier, and the balance of military advantage can be given a favourable tilt. To this there is, however, a most important proviso. The new weapons favour the side that has the tactical defensive, and in each of the two world wars the free nations have failed in the defensive ; forced back by the first onslaught of the aggressors, they have had to spend many years fighting their way back. If this were to be the pattern of a third war, then the new weapons would be an enormous disadvantage. They can be used to good account only if there is, from the start, a defensive force large enough to use them. So far from removing the need for rearmament and remobilisation, they make it more than ever necessary ; for they make it more than ever certain that it will be too late to arm and mobilise after the war begins, as was done with success in 1914 and in 1939, and as the western world is therefore tempted to rely on doing once again.

But if the new atomic developments make rearmament more necessary than ever, they also hold out the hope that rearmament may succeed in its task of preventing war more quickly than was originally foreseen. The moment when the initiative will be safely in western hands may be closer than anybody has hitherto supposed, and it is not too soon to begin preparing policy and public opinion for it. Without special preparations, several dangerous things might happen. There might be a sinister and subtle atomic dialogue between Washington and Moscow, with London and Paris putting in no more than a word here and there. Washington might, at a dangerous juncture, not know what it wanted to say and might well fail to understand what Moscow was trying to say. Those who have for five years watched sharply for every sign of Stalin's moving forward might easily fail to detect the signs of his moving slightly backward. And the western statesmen who do not want to negotiate until they are stronger could easily forget that eastern statesmen might wish to negotiate before they get weaker. It is at the point, where the Americans get confident and the Russians frightened, that the opportunity for skilful diplomacy and piecemeal peacemaking will appear. And that point, too, may be much closer than is realised.

*

As Mr Acheson plans his first cautious steps along the path of atomic diplomacy his chief thought must be to take his allies along with him ; for the condition of using American atomic power is that allied bases are available. He must see to it that his allies do not take fright and scatter ; and it is the prime aim of Russian policy to make them do just that. In other words, the path to be taken should be thoroughly discussed and surveyed in advance by the Secretary of State with his colleagues. They agreed at Ottawa to do something of the kind, but there are two good reasons for scepticism about this agreement. The ministers of Nato can speak with one voice only if they have begun to think ahead and with one mind on matters of the highest importance ; but they cannot think with one mind until their advisers are working together on what the Americans call policy planning—an activity that exists only precariously in the British Foreign Office. As things now are, the allies consult at the executive and not at the formative stage, in or just before the emergency, not well in advance. There is a great need for joint study of future possibilities by men free of daily desk work ; for again and again London, Paris and Washington have been caught napping by an event that could have been foreseen, if not in detail at least in broad outline, and as one of several possibilities.

The present disjointed methods are not good enough for the period ahead. If they negotiate from strength, the allies should begin considering now what they will have to offer and demand, how they will assess together their information from behind the iron curtain, how they will respond if Moscow puts out a feeler, who is to talk if there is to be talking in secret. Such consultation is necessary not only for efficiency but also for morale. Unless there is evidence of such common thought and action, it will be impossible to persuade many men and women on this side of the Atlantic that a strong American policy is their policy, and that power will be used on their behalf with wisdom and restraint.

Americans remember that Mr Attlee flew suddenly last December to Washington to discuss with President Truman the use of the bomb in Korea ; but they may forget that Mr Morgan Phillips, Secretary of the Labour party, was prompted to claim in August that the Labour Prime Minister had averted a third world war. This is a reminder, if any is needed, that there is in every allied country a powerful group that talks distrustfully of American power, not because it wants to play the Russian game or break the American alliance, but because it believes that such talk pays in votes. So long as that talk persists, the Russians will go on believing that their obstinacy can divide the Western alliance and that concessions to it are unnecesary—in other words, there will be no basis for negotiation and understanding. And, as Mr Baruch has again pointed out, without that understanding there can be no hope at all of international agreement on the control of atomic energy. Atomic diplomacy will go on.

Electoral Arithmetic

WITH two weeks of the election campaign still to run, it would be foolish to assume that the political barometer is already set steady. Even the numbers of candidates are uncertain until the nomination lists are closed next Monday. But election forecasting has become such an established pastime that its fascinations are likely to be already occupying the spare time of a great many people. This article sets out some of the electoral facts which may serve as a useful yardstick for predictions and indicates what results may be expected under certain reasonable assumptions.

One method of forecasting is to interpret the results of surveys of the nation's polling intentions according to a simple theory. An article in this journal last year drew attention to an almost forgotten empirical formula, put forward over forty years ago, stating that in contests mainly between two parties, the ratio between the seats won by the parties is the cube of the ratio between the votes cast for them. This cube law—for so it is dignified—has since received much attention. It fits very closely the election results of 1931, 1935 and 1945, but not those of 1950. The divergence last year can be explained by a bias—the Labour votes "wasted" in piling up huge majorities in areas like Durham—in the present electoral system, and rough corrections for the bias can be devised. But the reliability of the formula depends upon the pattern of voting remaining faithful to certain statistical provisions and, while it is quite conceivable that it will do so, there can be no certainty about it. The simplicity of the "law" is itself suspicious. Why exactly the power of 3 ; why not of 2.8 or 3.2 ? At the last election, the "cube law" was the simplest means of translating an assumed or predicted distribution of the total vote into seats, because the many alterations in the boundaries of constituencies made any more detailed method difficult. But this is not so in the present election ; the constituencies are unchanged and there are figures of actual voting in each of them less than two years ago which provide the obvious basis for any attempt at estimation. The "cube law" requires an estimate of the shift in the popular vote ; and if such an estimate can be made, it is much more accurate to apply it constituency by constituency. This is the method adopted here.

The broad results of the 1950 general election are recalled in Table I. Although the two major parties between them received nearly 90 per cent of the vote, more than one-third of the candidates came from Liberal and other parties. But, of these, only the Liberals made a sizeable indent into the poll. Labour won 76 seats on a minority vote and in all except eight of these seats the intervention of a Liberal was the sole or main cause. In a further 75 Labour seats, the winning votes formed between 50 and 55 per cent of total votes in the constituency. It is from these two groups that Conservatives will hope to make most of their gains.

The results of the study are presented in Table II, which deserves a few words of interpretation. The figures of each constituency in 1950 have been examined, and it has been found that, if 1 per cent of the total poll were transferred from Labour to Conservative, 17 Labour seats would be lost. If 2 per cent of the total were turned over, 35 seats would shift their party allegiance, and so forth. In addition to these direct shifts between the two major parties, there is the possibility of the Conservatives gaining some of the votes cast last year for the 475 Liberal candidates. What matters here is, of course, the net gain. Of last year's Liberal voters, 40 per cent may this year abstain (or vote Liberal, if they can), 40 per cent vote Conservative and 20 per cent vote Labour. Or the figures may be 30, 45 and 25 per cent ; or 10, 55 and 35 per cent. In each of these three instances, what affects the result of the poll is that the Conservatives, relatively to Labour, make a net gain of 20 per cent of the Liberal vote. The effect of such shifts is shown in the table. Thus if there is a 1 per cent direct shift from Labour to Conservative and in addition the Conservatives make a net gain of 10 per cent of the Liberal vote, the result is a gain of 25 seats.

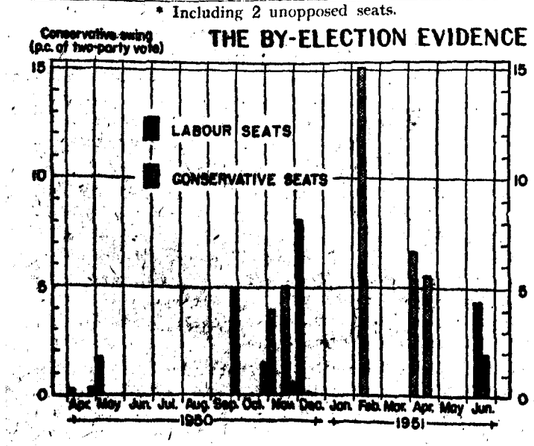
*

It should be emphasised that this table is purely "neutral." It makes no predictions ; it simply shows the result of certain arithmetical calculations. If the only contingencies considered are various degrees of Conservative gain, that is only because, on this occasion, nobody is predicting that Labour will improve its position ; but a similar table could easily be constructed to cover that possibility if it were thought to be relevent. The estimates are based on the assumption that any shift in public opinion is reflected equally in all constituencies. Though there are always the exceptional results that swim against the tide, past experience has shown that the great majority of results are strikingly uniform.

The real difficulty is not in compiling this table but in using it. What assumptions is it reasonable to make

about the direct swing from Labour to Conservative and about the transfer of the ex-Liberal vote ? One possible source of guidance lies in comparing the results of the 16 by-elections with the voting at the general election in the same constituencies. The accompanying chart shows that, if account is taken only of the changes in the relative proportions of votes cast for the two main parties (the two by-elections where there was no Labour candidate are ignored), there was a swing in each case away from Labour. The figures as they stand, however, can be very misleading. The swing averaged 2.8 per cent in the constituencies held by Labour and 6.3 per cent in those held by Conservatives, a reminder that in by-elections opposition supporters tend to be the more enthusiastic. The biggest swing, for instance, was in West Bristol, a safe Conservative seat where the poll dropped from 82 per cent at the general election to 54 per cent at the by-election ; it is evident that very many Labour supporters did not bother to vote a second time. Only two constituencies, West Dunbartonshire and Brighouse and Spenborough, were marginal Labour seats ; both these by-elections occurred within three months of the general election and can hardly be taken as evidence of opinion today.

The other evidence about changes in political feeling is provided by the public opinion polls. Two newspapers, the *Daily Express* and the *News Chronicle*, publish the results of such surveys. The latter, which is the one carried out by the British Institute of Public Opinion, has been the more frequent and has earned some considerable degree of confidence. It is true that Dr Gallup (whose methods the BIPO follows) signally failed to predict Mr Truman's re-election in the United States in November, 1948. But in this country the Gallup Polls have been very accurate ; and there are a number of technical reasons (of which the fluctuating size of the total poll in the United States is the chief) why more accuracy should be expected here than in America. At the time of writing the Institute's latest figures give the Conservatives 49.5 per cent of the poll, Labour 43 per cent, the Liberals 7 per cent and others 0.5 per cent. These proportions are reached after allocating the doubtful replies according to such evidence as can be obtained. Compared with the results of the last general election (see Table I), the Conservative proportion is up by 6 per cent and the Labour proportion is down by 3 per cent. It makes some difference to the result how much of these changes is due to a direct shift of votes between the two large parties and how much to the re-distribution of the Liberal vote. Moreover, when the survey was taken, replies from intending Liberal voters must have been somewhat confused in certain constituencies by doubt whether or not there would be a Liberal candidate to vote for. There may therefore still be some more Liberal votes to reallocate. If the Conservatives' net gain of Liberal votes were put at 20 per cent (for which there is some evidence), then it would appear that the "direct swing" from Labour to Conservative would be between 3 and 4 per cent. From the table the result can be read off—Conservative gains of 64 or 85 seats. A more realistic assumption would be that the Conservatives will make a net gain of 10 per cent of the 1950 Liberal vote where there will again be a Liberal candidate, and of 30 per cent where there will not. On this surmise, and on the basis of the incomplete information about Liberal candidates available at the time of writing, a 3 per cent direct swing would transfer 67 Labour seats to the Conservatives and a 4 per cent swing 93 seats. Since the recent



I—1950 General Election Results

	Number of Candidates	Votes Cast		Seats Gained
		Thousands	% of Poll	
Labour	617	13,266	46·1	315
Conservative	620	12,493	43·4	297*
Liberal	475	2,621	9·1	9
Others	156	390	1·4	4
	1,868	28,770	100·0	625

* Including 2 unopposed seats.

II—Seats Gained by Conservatives with Varying Shifts in Voting

% of Total Poll Gained by Conservatives from Labour	Conservative Net Gain of Liberal Vote			
	0%	10%	20%	30%
Nil	...	5	12	17
Up to 1	17	25	33	39
„ 2	35	42	50	57
„ 3	50	59	64	71
„ 4	70	78	85	97
„ 5	91	100	108	113
„ 6	112	116	119	124
„ 7	125	129	132	137
„ 8	136	140	145	150
„ 9	145	152	155	163
„ 10	163	169	175	179

Parliament contained 18 more Labour members than Conservative members, the result would be to give the Conservatives a majority of between 116 and 168 seats over Labour assuming that Liberal representation is unchanged.

These calculations are intended to show how it is possible to derive a forecast from the results of the last election and the current public opinion polls. The precariousness of any forecast is too obvious to need elaboration, but there comes a stage when the forecaster feels that he has got as much confidence in his results as he can hope for. These estimates have been made before that stage has been reached. Guesses about the allocation of the Liberal vote can be refined when the nominations are complete. At the same time, consideration can be given to the vote for "others" ; small though it was in total in 1950, in a few constituencies it was significant. Above all, by the time this article is read, a further public opinion poll will be available to work on. In so far as these things provide new material, the estimates will be amended in the next issue of *The Economist*.

Grapes from Thistles

(By a Correspondent)

IT begins to look as if Mr Attlee has set a new pattern for British elections—the early announcement, the fortnight of silent preparation, the recall and dissolution of Parliament and then the three weeks' intensive campaign. In this respect at least 1951 repeats the rhythm of 1950. Indeed the stage of intensive campaigning has been postponed even later this time than last. The application of an expenses maximum still fixed on 1948 price levels obliges the well-to-do constituency to concentrate its efforts within a shorter period ; the poorer constituency, only half recovered from the cost of the 1950 campaign, has to exercise care to avoid bankruptcy itself. It is tempting to speculate what the long-range effect of cheaper and cheaper elections in a context of rising costs will be. It is surely bound to mean greater emphasis on national campaigning and central office direction, because they alone have access to the two great channels which are outside the operation of the expenses law—broadcasting and the national press. The candidate who is seeking to make a distinctively constituency appeal has less and less scope.

Nevertheless, this week may fairly be said to have seen the start of the fight. The signs are unmistakable. The BBC is censoring comedians, the *Daily Herald* has started front page editorials, the quiet hum of adoption meetings is swelling into the roar of rallies and whispering campaigns.

Already certain clear departures from the practice of 1950 have manifested themselves. It was inevitable that the process of the Second Heave (or, from Labour's point of view, the Last Hand-Hold) would result in a sharpening of acrimony on both sides. The expectation that the second election would be dirtier than the first has not been falsified, but it is a relief to find that one of the results of the eighteen months' delay is the introduction of at any rate some fresh issues into the stale diet of platitudes that was fed to the electorate last time. Of course the disposition to be always fighting the previous war is ineradicable in politicians and the press. The *Daily Graphic's* two-page spread on "Germany Today" ("Unrationed, they live with Zest") probably deserves the prize for unimaginative evocation of a theme that had fallen flat before February, 1950, was a week old. But other old friends are here as well. If the Jarrow Marchers have not yet begun their pictorial tramp across the hoardings and election addresses, their statistical counterparts, the unemployment figures for the years of Tory misrule, are poised for action in the appendices to Labour's Campaign Handbook. None the less, it is now pretty clear that this will not be a Full Employment election ; it looks very much more like being a War Mongering one instead, and if this theme is more distasteful than the other, it is at least capable of more interesting variations.

From the first it was obviously Labour's intention to present itself as the party that kept the country out of war. Perhaps, from the moment of the Bevanite split, no other appeal could have rallied the party. But Dr Mossadegh and Nahas Pasha have climbed on this bandwagon in such enthusiastic haste as almost to wreck the original conception. First of all we were presented with the proposition, "of course the Tories do not want war, but. . . ." Then came Abadan and Mr Morrison advanced his prize question, "Would you have gone to war ?"

To this the Conservative counterpoint has been, "Rearmament is no longer an issue ; it is a fact. Vote for the party that believes in it and can use it to preserve peace." The events in Persia and Egypt have opened the way for the obvious rider, that pusillanimity increases the risk of war. But this is only the beginning of the ingenious embroidery. Mr Bevan is now demonstrating that it is the trauma left on Stalin's psyche by Mr Churchill's actions in 1918 which has made the USSR a menace in 1951. The *Daily Mirror* has had front-page doubts about whether Mr Churchill might not prove insufficiently aggressive—when faced with the warmongering zealots of the Pentagon. Mr Churchill has made the obvious rejoinder that much of our Middle Eastern troubles could have been avoided by better liaison with the United States. And so it goes on. There was nothing in 1950 comparable to this developing argument—an argument which owes little or nothing to the platitudes of the election manifestoes and derives its propulsion from the dynamic of events themselves. No doubt its origins in the "warmonger" scare are highly discreditable, but this may be a case where grapes are being gathered from thistles. It is after all a real argument, in the way in which broadside exchanges of recriminations about the Government's record or Tory misrule are not. Furthermore, it is related to the pressing problems of the hour in a way that enables the electorate to see the behaviour of its rival captains under the strain of real, not imaginary, conflicts. It is the first election since 1931 to be fought, so to speak, with live ammunition. Of course there are casualties, and perhaps the conduct for the next fortnight of our foreign relations

is itself one of them. But from an election point of view the gain is clear; we are transported out of the dull and cosy dugouts of trench warfare on to the draughty plains that offer some scope for generalship.

"At least so it seems, as one reads the newspapers. But signs are not wanting to suggest that perhaps the political stage managers, who planned it all months ago, may have the last word yet. Down at the constituency level, in the questions after meetings, canvassing on the doorstep, sloganeering from loud speakers and posters, one seems to hear the underlying persistence of the "Who gets what, when and how" politics of the social welfare state. Mr Churchill's "Talks with Stalin" suggestion in 1950 was a concrete proposition, likely to result in specific action if the Conservatives had won. Yet there is abundant evidence that it stirred hardly any voters; they thought and worried about houses, jobs, wages and prices. Since then, if the issues of peace and war have come nearer home, so too have the problems of domestic economy. And it is interesting to notice how the brave words of the manifestoes—of all parties—about the impossibility of easy times become the first victims of the process of simplification that will continue more and more ruthlessly every day from now to October 25th. The dear old folks and the chubby kiddies of the election posters are not going to have their future clouded over by any qualifications or cautionary parentheses; they are getting their pensions and their orange juice now.

The one exception to the total warfare of the parties has so far been the Liberals. Last time they were the victims of heavy cudgelling from either side. This time, from the Conservatives at least, they are receiving more delicate treatment. There has been no repetition of the tart exchanges between Mr Churchill and Mr Davies over the nomenclature of Tory fellow-travellers. Lord Woolton's wooing, if not more ardent, has at any rate less of the cave-man about it. Liberals all over the country are being given the flattering attention reserved for men who demonstrably possess a casting vote. It begins to look as if the 1950 strategy of fighting on a broad front may not have been so mistaken after all. Having proved their nuisance value by the conclusive argument of figures the Liberals have secured some constituency rights of way which they might otherwise have lost. By a further electoral irony, they are achieving this under the aegis of a programme which is markedly inferior in political content and economic relevance to the "No Easy Way" of 1950. All the same, it is only the most optimistic Liberals who do not expect to lose many votes to the Conservatives.

NOTES OF THE WEEK

Lessons of Abadan

The British appeal to the Security Council against Persia is now seen to have been a serious mistake. The Russians, Jugoslavs and—so it seems—the Indians would have nothing to do with a resolution that would scold the Persians or give the British international authority for economic or other sanctions. And the Americans are so worried by the vision of Persia falling bit by bit to the Russians that they are in a hurry—too much of a hurry—to propose bases of negotiation which make oilmen's hair stand on end. The most likely outcome of the deliberations in New York is that American good offices will be used to get negotiations restarted either in the corridors of Uno, the private suite of Dr Mossadegh's hospital, or Teheran itself. There will be generally more anxiety to get the oil flowing than to show Uno's determination and ability to assert either its own authority or that of the International Court.

It remains to be seen whether Dr Mossadegh will grow or diminish in stature under the television camera. He can be counted on to tell the tale of peasant woe and capitalist greed that always goes down well with mass audiences. But the question that Americans might ask themselves is this: "Would I take a job as a technician or business executive under a government run by this man?" That question is constantly lost sight of in public discussion of the Persian problem; whereas the British Government has constantly to bear in mind that it cannot commit the employees of the Anglo-Iranian Oil Company to work for a new company—whatever its form and whatever the nationality of its manager—unless they want to. And they will not want to unless the new arrangements are carefully defined and guarantees of good treatment given. When there are other jobs going in more orderly countries the motto for oil technicians is "once bitten twice shy." If this is remembered, the British action in ignoring the now famous undated, unsigned Persian *bout de papier* published by the Manchester Guardian appears in a fresh light.

Few have yet faced the fact that great commercial concerns—which means the men in them—will not put their services and livelihood at the mercy of regimes which will not observe written agreements and reasonable standards of behaviour. Nationalism is scaring away capital and the men who can use it most skilfully; and, in the name of internationalism, nothing is being done to stop it. The political slogans of the nineteenth century challenge the institutions of the twentieth; and the lesson of Persia is that wherever there may be a Mossadegh, Point Four plans must wait.

* * *

Baghdad Watches New York

While it formulates any new proposals, Washington would be well advised to recall the sad history of Overseas Consultants Inc. In January, 1951, before the Majlis had finally rejected the oil company's offer of a supplemental agreement, the Persian government sacked this Anglo-American team of technical advisers, whom it had engaged to draw up a plan for the development of the Persian economy. It sacked them mainly because it "could not find the money" to implement their plans. Three months later, the Majlis took steps which could only mean the loss to the Persian exchequer of 55-60 per cent of its revenue. The moral is that the motive power behind the Nationalisation Law was not a genuine, if misguided, attempt to secure the national assets for the country's social benefit, but a politically expedient xenophobia. There is a long way to go before anyone is likely to see a new division of profits between Teheran and the company seriously used by the politicians to improve the standard of living of the Persian masses.

The converse is equally true: that a Teheran government with an enlightened social policy would recognise that it has everything to gain by working out satisfactory arrangements with a foreign oil company. There is an excellent illustration of this point in Iraq; and Dr Mossadegh, if he were a wiser and healthier man, might stop to compare the barren consequences of his own actions with the fruits of Nuri Pasha's statesmanship. Under the new draft agreement between Baghdad and the Iraq Petroleum Company, Iraq's revenue from oil (50 per cent of the company's profits before the deduction of foreign tax) will rise to nearly £60 million by 1955. In the meantime, the Iraqi Parliament has ordained that all oil royalties shall be channelled direct into the economy through the new Development Board. This body, which includes a British secretary-general in the person of Sir Eddington Miller, has not only drawn up a five-year plan to spend £65 million but has already invited tenders and received a loan from the International Bank for the main irrigation project in the Wadi Tharthar.

The draft agreement with Iraq has so far survived the impact of the retreat from Abadan, and it is at present still being given the finishing touches in Baghdad. But reports from Washington suggest that one new approach to Dr Mossadegh might include the offer of a 75 per cent share of the profits on Persian oil. If expropriation by Persia is to be rewarded by terms more favourable than those which prevail in any other oil-producing country in the world, the forces of moderation in Iraq—and, for that matter, in Saudi Arabia and Kuwait—may yet succumb to the forces of unreason. The appetite for oil profits grows with eating.

* * *

Egypt's Claim to the Sudan

Nahas Pasha has not merely proposed the ending of the Anglo-Egyptian condominium in the Sudan; he has also outlined the terms that Egypt would like to impose on the Sudanese. These would give the Egyptian Crown control over the armed forces, foreign relations and currency of the Sudan, the right to appoint and dismiss Sudanese ministers, and the right to veto laws passed by the Sudanese Parliament. In other words, Egypt is not merely proposing that the two halves of the Nile Valley should be nominally united under a single crown; on the contrary, it seeks to make itself master of a Sudan which would enjoy only a restricted autonomy in its internal administration.

It goes without saying that Egypt's claims conflict with Britain's promises that the Sudanese should, on achieving political maturity, choose for themselves either independence or some form of voluntary association with Egypt. But it is important to examine the basis of these claims. They rest primarily on the conquest of the Sudan in 1821 by Mohammed Ali, the Ottoman viceroy of Egypt. The sixty years of subjection which followed brought the Sudan nothing but brutal oppression and a highly organised slave trade run by Egyptian merchants and officials. The Mahdist revolt of 1882 was basically an outburst of resentment against this exploitation, and it was not until 1898 that the Sudan was reconquered by Lord Kitchener's British and Egyptian army. The Anglo-Egyptian Convention of 1899, which created the condominium, made no reference to Ottoman or Egyptian sovereignty, confining itself to administrative arrangements and to the provision that both the British and the Egyptian flags should be flown in the territory. The Treaty of 1936 merely confirmed these arrangements.

Egypt's claim that the Sudan has always been Egyptian territory thus rests on the flimsy foundations of conquest by the Ottoman empire, sixty years of exploitation from Cairo at a time when Egypt itself was a Turkish dependency, reconquest by Anglo-Egyptian forces on British initiative, and the fact that the 1899 Convention did not specifically terminate Ottoman sovereignty. On historical grounds of this kind Portugal could make out a better claim to Brazil, India to Burma, or Turkey to Egypt itself. And if Egypt itself abrogates the Convention of 1899, it will have destroyed the only shreds of a legal case it possesses.

There are two main political parties in Khartoum today. The Umma Party, which demands complete independence for the Sudan, is not, as the Egyptians suggest "the tool of Whitehall," but a powerful political movement led by educated men and supported both by successful traders and cultivators and by many of the pagan tribes in the south who have reason to fear Egyptian domination. The Ashigga Party, which favours Nahas Pasha's proposals for "the unity of the Nile Valley," has long received both money and inspiration from Cairo. Its chief supporters are the effendis who have failed to obtain well paid posts in the administration, which is rapidly being Sudanised. The Ashigga members hope for important posts if the unity of the Nile Valley is achieved. They well know that no Egyptians will wish to live and work in the Sudan.

* * *

Voting on the Middle East

The election campaign began in earnest this week with the formality of adoption meetings in most constituencies and with the regular flow of election broadcasts. The matter for debate has been given definite, though not necessarily final, shape. In the speeches of the party leaders, commanding a national audience, foreign policy has taken pride of place.

Superficially, that is what Mr Morrison intended when he started the line of propaganda that the Tories are, at least inadvertently, warmongers. But it is very doubtful whether Labour in fact has any reason for satisfaction with the campaign. Mr Churchill answered the general charge effectively in his broadcast on Monday. Foreign policy has not achieved prominence because the floating voter shows any particular susceptibility to the charge against the Tories, but because events in the Middle East have forced it on public attention. Undoubtedly the impression is growing that the Government has been guilty of lack of foresight, uncertainty of decision and even simple inattention to business in its dealings with both Persia and Egypt. The remarkable argument used by the *Daily Herald*—that the Tories are to blame because their charges of Government weakness made Egypt think it could take its chance to denounce the treaty—is in its defensiveness and feebleness the clearest possible confession that on this point Labour has lost the initiative; the issue that it injected into the campaign with at least a desperate variety of hopefulness has proved to be a boomerang.

The debate is almost wholly artificial. This election is certainly not going to settle the issues of peace and war, and it is unlikely that many electors will regard themselves as making any decision at all about foreign affairs when they cast their votes on October 25th. Yet the intrusion of the irrelevant issue perhaps has its compensations. Both the major parties remain determined not to discuss the realities of their domestic policies. The voter is in effect asked to judge on character, on which group of men he would prefer to have in office. And the old generalities about nationalisation and national housekeeping have certainly become flat and unprofitable as guides to character. Persia and Egypt are at least something to argue about—and therefore to tell the voter more about the candidates and to distinguish between the basic attitudes of the parties. What they show unfortunately tends to be, outside the principal party leaders, the latent pacifism of Labour and the latent imperialism of the Tories. Neither is reassuring for the floating voter. But at the moment it is undoubtedly Labour that is getting the worst of the argument.

* * *

Holding the Home Forts

While it was inevitable that this week the election speakers should embroider their themes of the Tory drift to war and the Labour drift to disaster, it is still surprising that domestic issues have been pushed so much into the background. Mr Oliver Lyttelton was perhaps exaggerating very little when he said, at Aldershot last week, that many people would understand the dollar crisis only when they saw their

children crying round the breakfast table. One might still have expected more to be heard about the fuel situation, the railways' shortcomings, and the economic problem generally. Housing, even more surprisingly, has figured in few important speeches ; and little has been heard also of the old staple of controversy, bulk buying, and of the level of food supplies. Nor, on the more positive side, has any Conservative speaker developed effectively the emphasis on higher production that Mr David Eccles sought to establish. The cost of living appears as the one substantial domestic issue, and about it both sides are necessarily cautious. On every sector their mutual concern seems to be simply to hold such intellectual forts as they have established. The Tory case remains essentially and simply—and powerfully—that "It is time for a change," while Labour relies primarily on the contrast between present full employment and the thirties.

It is significant that the most interesting recent speech on domestic policy was Mr Churchill's at Woodford on Tuesday, when his main concern was to retreat from the implication that the Conservatives would completely overhaul trade union law, an implication which had been read into the earlier undertaking to do nothing about the unions without a round table conference. He said that the Conservatives had no intention of initiating any legislation on this subject, though he left the question of "contracting out" somewhat vague. This was a matter, he suggested, which might be left to "common sense and the British way of settling things"—which could mean almost anything. Even on the closed shop issue, which was brought sharply into prominence by the Durham dispute, Mr Churchill made no promise of legislative action. "Common sense and public opinion" were once again invoked. This may be astute electioneering, but it certainly does not help to solve the problems the Tories will have to face if they do get into office.

Meanwhile their best ally on the home front, Mr Aneurin Bevan, continues to exhibit his own strange blend of irresponsibility and ambition. He told a Manchester audience that he wants a Labour majority, big enough not, it appears, to solve the country's problems, but to make it possible for the Labour party "to afford the luxury of a quarrel." Such frankness is perhaps the oddest thing of all in what is surely the most diverse of election campaigns.

* * *

When Is a Vote Not a Vote?

If the Liberal party's campaign has so far done little to advance its standard it has at least produced some surprises. Sir Andrew McFadyean, a former president of the Liberal party, has suggested how Liberals can vote for their party even though there is no Liberal candidate in their constituency. They can abstain; and where the percentage of non-voters is higher than the average, one can then assume that Liberal opinion is strong. By counting the non-voters Sir Andrew may be able to calculate that there has been a Liberal landslide, but his suggestion is indeed a counsel of despair. He himself thought that as many as half the Liberals might seek this solution; a Gallup poll last January suggested that two-fifths might do so.

It is not the solution favoured by the other Liberal leaders. The intention is that where no Liberal candidate is standing the local Liberal party should present to the other candidates a questionnaire, the purpose of which is to reveal how liberal they are. The questionnaire character-test is familiar to all readers of the popular press and the glossy weeklies; and the questions asked by the Liberals will be just about as reliable in the results they indicate. Most of them are astonishingly far removed from the pressing problems of to-day. In the light of those problems, would a responsible Liberal allow his vote to be determined by whether the candidate would support electoral reform, or free trade, or co-partnership, or home rule for Wales and Scotland—whether or not these things are in principle desirable? And would a responsible candidate answer such questions out of the context of the circumstances prevailing at the time? The answers are to be discussed at local meetings and published in local papers, but they may well merely confuse the Liberal voter. What is to happen to his faith in the unique contribution of his party if he finds that both Conservative and Labour candidates have scored 100 out of 100 for Liberalism?

Many Liberals seem to have been disconcerted by Mr. Churchill's decision to speak for Lady Violet Bonham-Carter at Colne Valley. This is a natural enough arrangement between two old friends, though it will not necessarily win votes for Lady Violet; it will undoubtedly widen still further the rift between the right and left wings of the Liberal party. Mr Dingle Foot's election broadcast made some new points in Liberal policy. He commended the social services and urged no cuts in public expenditure other than those that could be accounted for by the "waste" in which the Opposition puts such faith; but, like Lord Beaverbrook, he was in favour of slashing the revenue by reducing or abolishing purchase tax on everything except luxuries. He said that the Liberals (he spoke as if they could form a Government) would postpone all new capital projects which do not contribute to greater production. No housing? No schools?

More Moves in the Contest for Germany

The speeches made last Wednesday by the East German leaders, in the presence of Russian representatives, left no doubt that the purpose of their present campaign for German unity is to block not merely German rearmament but the whole concept of an "Atlantic defence community"—to use the term coined by the western Foreign Ministers in Washington. Herr Grotewohl made it plain that he wanted the Western German representatives to discuss two issues simultaneously; they were asked to talk about all-German elections, together with methods of speeding up a peace treaty and the withdrawal of troops. Moreover, on this occasion he demanded outright that the Adenauer Government should break off its current negotiations with the Allied High Commission. He did not make any startling new concessions about the conditions for free elections, though he indicated that they might be held under international supervision. It is evident that the most important immediate aim for the Soviet German leaders is to bring the Western representatives at all costs to the round table to discuss a peace treaty on lines that would suit Moscow. What they discuss in the way of election conditions is comparatively immaterial, so long as the talks continue endlessly and render it difficult or impossible for negotiations with the Western Powers to proceed.

It was left to the Christian-Democrat Foreign Minister of the eastern republic, Herr Dertinger, to add threats to Herr Grotewohl's arguments and concessions. The Soviet Union's recent Note to France, he mentioned, had declared that German rearmament would not be tolerated. A reference to Stalin's atom bombs reinforced Herr Dertinger's point.

The German contest is now less between rival politicians than rival propagandists. On the Communist side a well-oiled machine is at work free from jarring interference. Dr Adenauer has to contend with Dr Schumacher's championship of all those Germans who are disappointed with the western alternatives to Herr Grotewohl's offers. In these difficult circumstances, he was justified in playing the strongest card that he holds. In his speech last week-end in Berlin the Chancellor pointed out that Herr Grotewohl

Bred in the bone

Smiths fine English 15 Jewel Watches compare in reliability and quality with the best the world can offer because they are made in the tradition of British Craftsmanship handed down by men like George Graham, who perfected the cylinder escapement. The bi-centenary of his death is this year being celebrated by The Royal Society of Arts. All good Jewellers sell Smiths Watches.

With chrome and stainless steel cases from £7.19.6 to £9.2.6. 9 carat gold cases from £23.6.0. All prices include P.T.

excluded the lost territories when he preached German unity. He said:

> For us, those lands belong to Germany. . . . The policy of the Federal Government is to use all its strength to achieve unity in peace and freedom with Berlin, the Soviet Zone *and* with Eastern Germany.

From making this speech, Dr Adenauer went straight to the High Commission's conference on abolition of the occupation statute ; and the Allied and German experts have now settled down to draft the terms of the agreement which are to replace it.

* * *

No Elections in Trieste

That the proposed elections in Trieste have been further postponed until next year is a hopeful sign. It means that there is some chance of the Italians and Jugoslavs making an early start on negotiations for a general settlement, and that the western powers are doing what they can to assist matters. Reports from Trieste suggest that one of the chief obstacles likely to be raised by an election in the near future would be that the local parties in favour of the present arrangements would probably gain ground. This would weaken the Italian Government's hand, quite unnecessarily and wrongly at a crucial moment, since their gain would be based on a false assumption. The Anglo-American occupation has certainly done great good, and it is as understandable as it is gratifying that more Triestines should wish for a continuation. In voting for it, however, they would be leaving out of account the wider picture in the background and the fact that the situation is unstable and a source of weakness to the whole community of southern Europe. Of course, if agreement between Italy and Jugoslavia is not achieved, the elections must be held as soon as the breakdown is complete.

In a leading article last week it was stated that Mr Kardelj, the Jugoslav Foreign Minister, made his favourable remarks about a "third solution" in Rome ; he in fact made these remarks, but a visit by him to the Italian capital is still something to be arranged—and very helpful it would be. Again, where it was suggested that the Italians might have some part of the hinterland of Zone B (the Jugoslav zone of Trieste), this should have read "some part of the coastline." It is the hinterland of Istria which is Slovene, while the fringe is Italian. In this connection, it is to be hoped that terms discussed with Marshal Tito by Mr Averell Harriman on his way home from Persia in August may have paved the way towards a solution, whereby, on the strength of American aid, Marshal Tito could in fact agree to let the Italians have most of the shoreline of the Gulf of Trieste.

* * *

Tito's Candid Friends

Last Sunday Marshal Tito complained of the type of radio and other propaganda that was being directed at Jugoslavia from the West. He alleged that it was "poisoning our people" and that it criticised "in an impossible way" measures taken by the state. This is not the first time there have been similar complaints. As far as the BBC is concerned, it seems that Marshal Tito's charges are a distortion of the spirit and content of its occasional commentaries on Jugoslav internal affairs. These are designed to help the present tendencies of the regime, not to frustrate them. If they cause irritation, it may be because of the tone rather than the content ; London can easily sound patronising in Eastern Europe.

The Jugoslav leaders are excessively sensitive to criticism, especially when it comes from the western countries that are helping them. But they cannot expect to have everything their own way. Before next June comes the American, British and French governments have undertaken to pump into the country aid worth £50 million, to say nothing of what is yet to come from the International Bank. Neither to this nor to any previous aid have written conditions been attached ; but neither international nor national economic advisers from outside can be expected to remain silent if they see good money in danger of going down the drain. The planners of Belgrade probably realise that they have a lot to learn from foreign advice and experience, but do not like to be reminded of it.

There is an even more important answer to Marshal Tito's touchiness. He has sought to join, and has been welcomed in, new company ; and the standards of the free nations are not those of the Cominform. They attach the highest importance to individual liberty under the law. They are impressed by the promise of liberalisation in the Jugoslav economy, but remember that the Communist party is still there to hold the reins. They appreciate the genuine, if limited progress that the Jugoslav citizen has made towards free speech but they ask whether his children can be educated in the religion of their parents. Above all, they ask whether it is right or necessary that some of the Marshal's political opponents should continue to languish in gaol. If points like these were not made to Marshal Tito by Mr Aneurin Bevan and Sir Hartley Shawcross on their holiday visits, he can be sure that they were not faithfully reflecting that public opinion in this country which believes in candour among friends.

* * *

Politics of Church Schools

There is nothing like an election—except a new education Bill—for stirring up controversy about church schools. At present both the principal parties are wooing votes by promises to improve the financial arrangements for church schools, and the Archbishop of Canterbury has astutely taken the opportunity to send them a statement of the churches' case for a revision of various sections of the 1944 Education Act. The Archbishop's statement and one published by the Ministry of Education appeared on the same day and covered much the same ground. They are the fruit of many months of joint discussions. The Minister concedes much of what the Archbishop asks ; whether he would have gone so far without an election may perhaps be doubted. The Conservatives, not to be outbid, issued a statement of their own promising that if returned to power they would negotiate sympathetically with the church authorities.

Since 1944 the terms of the settlement for the church schools have deteriorated in two ways. Costs have risen steeply, so that voluntary schools have much greater difficulty in covering their commitments by their endowments, particularly where new building work is involved. Secondly, some local education authorities have exercised their powers over voluntary schools so bureaucratically or with such a weight of indifference that the spirit of the settlement has not been fulfilled. By their very constitution and machinery, local authorities must inevitably incline towards their own schools and it requires a high order of intellectual integrity to keep the balance fair. That local authorities should do so is important not only to the churches but to all who value independence and variety in education. The church schools are valuable quite as much for their individuality as for their religious bias, and as uniformity increases within the state system it is the more important to keep independence, even in this very limited form, alive. If the price of variety is an increase in financial assistance, the price is well worth paying.

Subversion at Salford

When the Salford dock strike ended last June the port had been paralysed for six weeks and £150,000 of wages had been lost. The Minister of Labour then thought it important to establish what had induced the men to strike

against their union's advice, against their own interests and for a trivial cause. His department, in a report that reads like the plot of a spy film,* answers that question by implying that the strike was deliberately planned by Communists.

After the London dock strike of 1950 the leaders of the Port Workers' Defence Committee visited Manchester and an unofficial port workers' committee was later set up there under the chairmanship of Mr George Norman, a Communist. The expected opportunity presented itself when two men, in defiance of an agreement signed by their union leaders, refused to work overtime and were suspended for three days. Mr Norman then called a meeting, at which it was resolved that if the two men were not paid for the days in which they had been suspended, all overtime and night work should be banned. Having refused to work overtime, the men were not allowed to work by day, and so the strike became general. It was fed with any other grievances, however irrelevant, that the unofficial leaders could find—such as the agitation for the Dockers' Charter and the abolition of Order 1305. Finally it was broken by hardship; and an attempt by the local Communist party to show that the struggle was all part of the fight against rearmament merely hastened the men's return to work. As the report says, it is significant that after the strike was over, the discredited leaders still had enough funds to publish a pamphlet in defence of their case.

The report shows how easy it is for a few extremists to confuse and mislead a moderate majority and to keep a hold on them partly by picketing, but still more by a moral sanction: men fear to oppose those who seem to be acting in their common interest. But if they yield easily to bad leadership, they would be susceptible to good leadership—if it were equally vigorous and seemed as much in touch with their interests. The union leaders behaved correctly; but of what use were their moderate voices at occasional meetings compared with the harangues of Mr Norman twice a week? Of what use was the bureaucratic prose of the Manchester Dock Labour Board compared with "Well, Brothers. Are we going to allow dockers to be *victimised*? Stand by your resolutions"? In the difficult task of reconciling their new responsibilities with their position as representatives of a sectional interest, the unions still have much to learn about the techniques of leadership and persuasion.

* * *

Fishing in Legal Waters

The cases of the two contestants, the United Kingdom and Norway, in the Norwegian fishing dispute have now been laid before the International Court at The Hague. In outline, the dispute could almost be called a geometrical one: should the limits of Norwegian territorial waters in Northern Norway be defined, as the United Kingdom claims that they should be, by a series of curves corresponding to the actual coastline, or should the seaward limit consist as the Norwegian Government argues, of a series of straight lines connecting some forty-eight fixed points along the coast? The coastline is so irregular that the lines drawn by the Norwegians enclose a much larger area of open sea than those drawn when the British argument is followed.

The United Kingdom's argument—it is pressed because of the number of British fishing vessels arrested by the Norwegian authorities—is, shortly, this: The accepted international basis on which the seaward limit of territorial waters is drawn is that the outer line shall in general conform to the low-water mark along the shore, with accepted rules governing those instances where bays, inlets and islands break the uniformity of that line. It is common ground that the Norwegian Government did, in 1935, by royal decree seek to establish the line it now defends; but, according to Sir Frank Soskice's argument, in order to establish that the decree is effective in international law, the Norwegian Government must show that these waters were dealt with in that way before the end of the eighteenth-century and that Norway's claims have never been abandoned since. The Norwegian Government claims that there is no generally accepted principle of the kind alleged by the British Government. It further says that it supported its claims by decrees made in 1869 and 1889 applying the same method of definition to other stretches of its cost. Its third argument is that the need to reinforce these earlier practices by a decree in 1935 only arose because, for some 300 years at least before the present century, foreign fishing vessels had not in fact attempted to fish in these particular waters. A final argument, moral rather than legal, is that the protection given by this wide band of territorial water along these coasts is needed since at least 70 per cent of the inhabitants of Finnmark, on the coast, depend on sea fishing for their livelihood and that unless they have this protection the waters off their coasts will be over-fished by all and sundry.

The importance of the case is not confined to fishing rights. Now that installations for winning oil from below the seabed can be set up well away from the actual coastline, public authorities and private companies all over the world are increasingly interested in how territorial waters should be defined and what the rights of everyone in, and under, them are. The subject has been widely debated by international lawyers, but as yet there has been little opportunity for the International Court to give much guidance on the principles which should be applied. As a result, the decision of the Court in this present case will have a very wide interest and application. It is also likely to be a decision to which, for once, each of the contestant governments will give full effect.

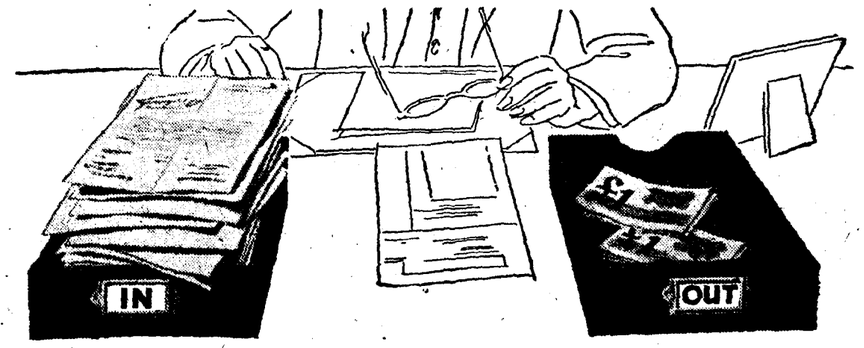
Assassination in Malaya

The ambush last Sunday of Sir Henry Gurney, High Commissioner for the Federation of Malaya, was one of those tragedies which can deeply affect the events that come after them. When the Communist terrorists lay in wait on the road to Fraser's Hill, they were out to kill a man whose life they had long sworn to take. This was not only because he was the King's representative and head of the administration in Malaya, but because he had performed his job supremely well and in three critical years had left his mark on the country. Sir Henry's great attribute was that, while he completely lived the role of a pro-consul in a time and at a place when it was necessary to do so, he threw his whole personal influence behind the policy of political evolution. In spite of the emergency, this has brought within the present year a measure of "cabinet" responsibility at the centre and has started the use of the electoral principle in local government.



Sir Henry Gurney's death has rightly and inevitably shocked people of every race in the Federation more than anything else could have done. Out of it should come a new resolve to bring the emergency to that early end which the efforts of Sir Henry and his colleagues had just begun to make possible.

Protecting Buckinghamshire

Buckinghamshire may be regarded, considering its proximity to London, as a well-favoured county. Its northern half is almost wholly agricultural and it has no large towns except for the expanding industrial centres of Slough and High Wycombe. It possesses in the Thames valley and the Chiltern hills two relatively unspoilt areas of consider-

Money is made of paper, too...

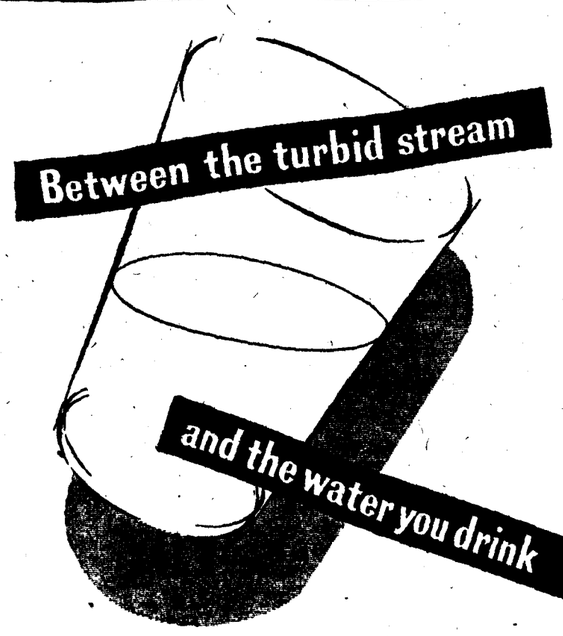
OVERLOADED in-trays cost money. Whatever the job — payroll, sales and costing, stores records — to be behind time is to be behind the times. A business needs vital figures regularly and *fast* if the rising cost of staff and office space is to be justified.

Burroughs are in business to step-up office output. By desk analysis they can show how to get figures as a continuous by-product of a normal accounting routine — without waste or peaks. Then, they can install the business machine that keeps the system in top gear.

The Burroughs organization is known all over the world. Experience of the changing needs of business, on the widest scale possible, helps them to solve the most localized problem *faster*. And to provide an on-call maintenance service that keeps their machines on the job all the time.

You can count on

Burroughs



Adding · Calculating · Accounting · Statistical Machines

It costs you nothing...

Many economies can be made in office departments — but problems cannot be solved until they are clearly defined. The Burroughs publication "Ways to Save Time in an Office" contains useful advice for office management. This booklet is obtainable, free of charge, from Burroughs Adding Machine Ltd., Avon House, 356-366 Oxford Street, London, W.1.

We've solved some problems in our time!

WANTED—*an unspillable aircraft battery*. That was 1916. On the western front, British artillery observation pilots, harried by enemy fighters, were learning new evasive manœuvres in a very hard school. With them, right way up or upside down, went the batteries used for W/T communication with the gunners below. Every so often, inverted batteries lost their acid and put the wireless transmitters out of action.

¶ Chloride Batteries solved that problem quickly—and finally. A battery with each of its necessary gas vents constructed in the form of compartments within compartments, so as to make an acid trap, was soon in action: the first truly non-spillable battery, and the forerunner of every such battery made since.

¶ For more than half a century, each year has brought its quota of problems to this company. In industry, transport and communications here and abroad, we can point to tens of thousands of our Chloride, Exide and Exide-Ironclad Batteries each giving satisfactory service in the special job for which we were asked to design and produce it. Those are answers which time has proved to be right.

¶ Our battery research and development organisation is the largest and best equipped in the country—if not in the world. It is at industry's service always—ready at any time to tackle another problem.

able rural beauty. The authors of the county development plan, recently published, are rightly anxious to protect these natural advantages. They propose that almost a third of the county shall be subject to close planning control, which would exclude any but small-scale building, either as a metropolitan green belt or as "land of great landscape value." The county council has been very active in making the preservation orders, and a third of the woodland area is already protected. It should also join with the Forestry Commission in making sure that the Chiltern beechwoods, which will otherwise decay, are properly regenerated.

The county council's attitude towards London is, however, excessively selfish. The Greater London plan, as amended, proposes that Buckinghamshire should eventually receive 149,000 of London's surplus population—a quite modest number, in relation both to the scale of the London problem and to the demands made on the other home counties. The development plan now proposes to cut this figure by more than half and to limit migration of all sorts into the county to a smaller rate than the spontaneous influx of the nineteen thirties. This decision is supposedly based, among other reasons, on a calculation of the building labour available locally after the rehousing requirements of the existing residents have been fully satisfied. This is a most ingenuous approach, since it must be known that building labour, from the LCC estates and elsewhere, will be progressively freed for work in areas intended for expansion. The county's attitude is probably shortsighted. Worse could easily befall it than the modest sacrifice asked of it in the Greater London plan.

The Problem of Bread

Few people outside the baking industry can have realised how complicated is the question whether night-baking should be abolished or not. The many problems raised are carefully and judiciously discussed in the report (Cmd. 8378) of the latest committee on night baking. First of all there are the problems that abolition would cause within the industry itself; the week-end problem; the holiday resort problem; the problem of the roundsmen and clerical workers; the morning roll problem; the "flour confectionery" problem; the problem of the decline in craftsmanship; the earnings problem; the problem of costs; the problem of the Jewish community. Then there are the consumer's problems: whether to have bread delivered later in the day or to buy bread baked the day before; whether to buy fewer cakes and accept stale rolls. There are even national problems. Would the abolition of night baking increase the cost of bread, increase the baking labour force, increase the daytime consumption of fuel? Even the problem of the morning roll spills over into the national context, for both the Caterers' Association and one of the bakers' organisations asserted that unless industrial workers got their morning rolls new, there might be a fall in productivity.

The committee discounts many of these problems. Others it considers have enough substance for it to turn down abolition of night baking in favour of limitation by alternating shifts—a system that in one form has been in force in Scotland since the war. Two problems would, however, still be unsolved. At present, workers are paid an additional 10 per cent for night work. In evidence, the bakers' unions said that smaller earnings would be willingly accepted as the price of abolition. The committee is not so sure. Nor will anyone be, and a demand for higher wages can be expected if limitation, which is bound to make some reduction in earnings, is enforced.

The other unsolved problem is the decline in craftsmanship and its effect on cakes. For the night shift to be fully interchangeable with the day shift, all workers must be able to make cakes, which are baked by day in cooling ovens. At present many bakers could not become cakemakers because increased mechanisation has turned them into factory hands. This problem only affects England and Wales, where hitherto there has been no apprenticeship scheme. Now that Scotland's example of apprenticeship is to be followed for English and Welsh bakers, even the problem of craftsmanship is on the way to being solved. In the meantime, the committee suggests that, before limitation of night work is enforced, two years' grace should be given for employees to learn how to make cakes.

Socialist Chic

The benefits of Labour rule have not been confined to Britain. In her election broadcast Miss Margaret Herbison claimed that it has shown those dowdy Parisians how to be smart. "The ordinary French women," she said, "had to buy low quality clothes with no cut and no line. Then suddenly they discovered British utility dresses and they are selling like mad—and in Paris." Let Paris tremble for its reputation. How will it compete with the inconspicuous good taste of *la Maison Attlee*, with the strong Persian influence evident in *les dessins Morrison*, or with the bold cleavage and leftward bias featured by that arch-designer Bevan?

The basis of Miss Herbison's remarks is that at least one of our leading clothing manufacturers has indeed succeeded in selling some ready-made clothes in this stronghold of the "clever little dressmaker." It will be an unexpected honour for them to have been given a place in Labour's election propaganda. But one must hope, for the sake of the Anglo-French alliance, that the broadcast was not heard in Paris.

Universal Protection?

It is scarcely worth while to add, after what Mr Disraeli said at Aylesbury, that at Slough he repeated his declaration against Protection. "I think," he said, "that there is one point on which we must all agree, and that is, that protection to a particular class, irrespective of all other classes, is quite out of the question." But protection to all classes is equivalent to protection to none. To make it equal, in the sense of securing similar pecuniary advantages to different interests, while society is continually expanding irregularly—now manufactures taking a stride, anon commerce going ahead, and again agriculture overtaking them, while soils are of different productive powers and arts are continually improved—would probably surpass the versatile power of Mr Disraeli. Equal protection for every class of producers to be established by law, seems to us about the most difficult problem human ingenuity ever attempted to solve. Compared to it to pick Bramah's lock, though as yet only one man has been found to do it, is the merest trifle that ever engaged attention. Protection for a single class—in other words, a law to enrich one class at the expense of other classes—is too barefaced a violation of all that men talk of as sacred to be any longer advocated; but protection for all classes—each class taking something from every other, and having something taken in turn—has in it some of the plausibility of fairness. Particular dishonesty disappears in a general plunder. But this scheme of general protection, however delightful to those whose power and wealth might be confirmed by it, is happily for future generations more thoroughly impracticable than even generally dishonest.

Letters to the Editor

Germany and the West

Sir,—I deeply regret that you published the letter signed Peter Lambertus. I can understand his feelings, but his way of expressing his ideas will, I fear, only create resentment on your side. What we want is mutual understanding and not mutual reproaches.

An historian 50 years hence will conclude that this century was dominated by the struggle of Europe—an overcrowded but highly civilised peninsula of the big Asiatic continent—against the primitive forces of Asia proper. Europe could only be overwhelmed by Asia as long as there was no unity among its different nations.

Does anyone in England realise that both world wars had their origin in the struggle of Germans against the advancing forces of the young Slav nations backed by Russia? The cause of the first world war was the defence of Austria against Russia. The second war was, in the first place, the struggle of Germany against the same forces. It was a mistake of the western powers to accept Poland as a part of Western Europe and a welcome rival to Germany. There was only a very small upper-class in Poland representing Western ideas; the masses were always part of the Eastern world.

Bolshevik Russia boasts that it represents Communism against western capitalism. In reality it is the manifestation of the Asiatic conception of power, a new form of the Czarism of Ivan the Terrible. After two world wars this Asiatic power has established its western frontier far beyond that line which for 700 years has been the boundary of western civilisation.

It is true that the Germans' lack of political sense has been the principal cause of this development and that it culminated in a negation of all true western ideas under the maniac leaders of the Hitler regime. But one must not overlook that France and England share this responsibility: by making alliances with Russia before the first war and even more by their attitude between the two wars, when far-sighted politicians should have realised the imminent danger of the new Russian power. If these fundamental facts are understood by all European nations the basis will exist for forgetting the hatred and ill-feeling of the last twenty years. Only then will the real co-operation be possible that is necessary for organising the defence of European civilisation against Asiatic barbarism in the form of Stalin's empire.

The present situation is very complicated for the Germans. The *Bundesrepublik* is no national conception. Dr. Adenauer's fight for equality of rights for this Western German Republic makes no sense for the average German. We want a united Germany. As long as we cannot get it, we are merely an occupied territory.—Yours faithfully,

Hamburg MERCATOR

Agin the Government

Sir,—The election has set me thinking about one of the basic assumptions of the whole process, and I have come to the conclusion that it is false. We all talk, and you, Sir, write, as if the British electorate on October 25th was going to vote for one or the other party. Technically, within the mechanics of the election, that is correct. But when you start ruminating about the motives that lead the elector, individually and in the mass, to cast his vote, I think you must, if you are honest, come to the conclusion that nearly all votes are cast, not for the man who receives them, but against his opponents. What did the British people mean to say in July, 1945—that they liked the Labour Party and wanted it to do the things it said it was going to do? Heavens, no; they wanted to turn the Tories out even at the price of the Labour programme. When the Tories win on the 25th, will that mean that the country has positive confidence in them? Of course not; it will mean that they are so tired of Attlee and Co. that they will even stand Churchill and Co.

This explains, incidentally, the otherwise puzzling fact (of which Australia has given the most recent example) that the same electors will put a party in office in an election and vote against its proposals in a referendum (it happens regularly in Switzerland). The electorate is not being fickle, but consistent. The Australians didn't vote for Mr Menzies because they liked his ideas, but because they didn't want to have Dr Evatt back in office.

I think the perfect electoral system would reflect this profound truth. Every voter should have a number of votes one less than the number of candidates in his constituency. He could scatter his votes or concentrate them on one man. But every vote would count against the candidate for whom it was cast, and the man with the least votes would win. That would be much more realistic, and it would have the advantage of deflating the politicians.—Yours faithfully,

PRO BONO PUBLICO

Laying the Party Lines

Sir,—In your issue of September 29th you state that the Communist Party's general election policy shows that it wishes for a Tory victory. I cannot conceive of any process of reasoning which would lead to this conclusion, and therefore can only assume that your allegation is based not on reason but on prejudice.

In 1950 the Communist Party put one hundred candidates in the field. On the day after the 1951 general election date was announced we published the names of twenty-five candidates who would stand this year. Later, an extended Executive Committee meeting of the Party decided to make a further reduction in the number of our candidates, so that now only 10 will be standing.

This drastic reduction has been carried out precisely because we believe that a Tory victory will be a disaster. It is a contribution to the development of a united fight against the Tories and for a genuine peace policy.

You claim that the fact that the majority of the constituencies we are contesting are held by Labour shows that we are not "on Labour's side." However, if we contested entirely in constituencies held by Tories it would have been argued that we did this to prevent Labour winning those seats from the Tories.

We have no doubt that the only course we could adopt which would recommend itself to you would be to abandon the fight for Communist Party representatives altogether. This we do not propose to do, and in spite of the obstacle of a completely undemocratic electoral system weighted heavily against minority parties, we shall fight for the return of Communist MPs to Parliament. At the same time, our members in more than 600 other constituencies will give practical proof of our determination to prevent a Tory victory by the work they do for the Labour candidates, and by the spirit of confidence and enthusiasm they bring to the election campaign in contrast to the pessimism and defeatism of the leadership of the Labour party.—Yours faithfully,

HARRY POLLITT,
General Secretary

The Welfare World

Sir,—Your correspondent, in his "Agenda for the Age of Inflation," makes the interesting statement that "we have passed from the Welfare State to the Welfare World. We do not equalise incomes within, but also between, nations. . . ."

There are great dangers in the application of the economic policy and fiscal apparatus of the welfare state to the welfare world. It will be disastrous in more ways than one if the peoples of the United States and Western Europe are encouraged by false analogies to develop a guilty conscience about their standard of living, which is the product of centuries of endeavour and enterprise. It is not "unearned." The poverty of the East, the Middle East and great parts of Africa, however appalling to the modern social conscience of the West, has existed throughout the history of western industrial civilisation. Its extremity is great only because of the striking contrast of western achievement.

In the East, as in the West, there has always been an inevitable approximation for the vast masses of mankind between contribution and reward, whatever their standard of life. The higher reward of the Western European is the result of the immensely greater productivity of his economic system and technical apparatus. This may give him a surplus of wealth, should he desire to restrict his standard of life, but it certainly does not give the impoverished areas of the world an *automatic* claim either upon this wealth or upon any subsequent increases in productivity made possible by effort and ingenuity. The admission of such a claim would permit no increase in the standard of life of the Americas and Western Europe for centuries.

If, however, the Christian ethic is to dominate the international economic policy of the West, both as a reflection of individual conscience and as an answer to the pure materialism of Communism, it is obvious that financial and technical aid must be given to those impoverished countries which seem most likely to profit therefrom. But it would be ludicrous to provide a flow of resources to backward countries which is greater than their economic and administrative systems can absorb and control.

It is easy for Communists and irresponsible governments to fan the flames of a futile and irrational international egalitarianism on the part of those who cannot be expected to understand the processes of wealth creation. The disintegration of the barriers of ignorance and prejudice behind which these forces are organised should be the prime aim of the West and the conditional responsibility of all supplicant governments and authorities. The emotions aroused by poverty must be harnessed to the eradication of poverty and not to the destructive limitation of the standard of life of those who have in large measure effectively harnessed science and nature in the service of mankind.—Yours faithfully,

I. S. LLOYD

Johannesburg

The Trial of the Polish Generals

Sir,—At the foot of his article "The Trial of the Polish Generals" your correspondent states that the Polish regime in 1945-46 pressed on Polish servicemen to return to Poland. This statement presents only half the story. An equally hard pressure to go back to Communist Poland was exercised by the British authorities.

In September, 1946, I was serving in a Polish cruiser. While in Plymouth we received specific orders from the British Admiralty. All hands were mustered and our British Naval Liaison Officer and his staff handed us leaflets signed by Ernest Bevin, then Foreign Secretary. Written in bad Polish the leaflet began. . . . "The British Government has often stated that in respect of the Polish Armed Forces at present under British command, its policy lies in the return to Poland of the maximum number of those Forces. . . ."

Further, the British Advisory Staff handling the Polish Resettlement Corps, by their orders, publications and posters, kept reminding us as late as in 1948 that the best solution would be to go back and—apparently—to supply the satellite forces with specialists trained in the West. Apart from the official pressure, equally strong propaganda was carried "privately" by the BAS. Friendly and personal talks in the mess were quite common, private letters from those who went back were given to us to read and similar means used to induce us to take advantage of an "amnesty" resulting from negotiations of the two governments concerned.—Yours faithfully,

KONSTANTY REYNERT

Books and Publications

A Traveller's Self Portrait

Beyond Euphrates. Autobiography 1928-33. By Freya Stark. *John Murray.* 341 pages. 25s.

The English owe some very good books to their passion for travel in the Levant and Arabia. Years ago, a book by Miss Stark won a place among these. By the title of her new book, she seems to wish it, too, to rank as a work of travel. But its real merit lies not in its traveller's tales, but in the art with which it presents the cross currents, excitements and doubts that mark the outset and determine the shape of any career.

This is the second volume of her autobiography. The first, which covered her childhood, was naturally preoccupied with the shadows cast by adults. It contained some brilliant portraits, but they were of other people. Now the narrative dwindles to the strand of one life. Some people may prefer the family album. But others will prize a chance to share the thoughts of another human being, and a highly diverting one. For these, the second volume is considerably the better of the two. It is stamped throughout with Miss Stark's special brand of discernment—a mixture spiced with humour and a pinch of malice. Taken as a whole, it is her best book so far.

Quite half its excellence lies in its method of presentation. Each chapter begins by summarising, from the pinnacle of afterthought, the events of a year or so. But the bulk of each consists of letters written at the time, and therefore capable of recapturing the impressions and thoughts that most people can only by chance recall. "I don't know why having tea at the Embassy should make me feel shy, but it does." "I looked quite right, and I do notice what a difference it makes." For those who prefer more enduring judgments, there is also plenty of meat.

> A mistake to assume that other nations are the same [as the British] don't you think? I am sure that the Italians prefer good operas to good laws, and these people [the Arabs] who suffer dreadfully from an inferiority complex, would much rather do without police and roads and bridges, and not have constantly to admit themselves inferior by being brought up against us.

Her analysis of the troubles that inhibit the British in the Middle East is distributed over a series of letters written from Baghdad in 1930, but equally apt today.

Many men, and all women who reach Miss Stark's present eminence, the eminence of best sellers, prize medals, and lectures to the Royal Geographical Society, share an experience which proves the unimaginativeness of the human race. The people who greet them, always admiring, often envious, seem to suppose that they sprang into

being fully armed either by inborn talent or good fortune, or some other lucky stroke. This book is proof of the ridiculousness of this fallacy. It is full of illnesses and cold trips in cheap buses, "Editor regrets . . ." slips, infuriating delays, hard work and the tedium of learning languages in foreign households. Nothing short of mixed experiences goes to make the person Miss Stark has become. Her book's prime lesson is that most of the excitements of life are wrought by enterprise, and that the man or woman who is ready to take no risks need expect no fun.

A Mediator's Testament

To Jerusalem. By Count Folke Bernadotte. Translated by Joan Bulman. *Hodder and Stoughton.* 280 pages. 20s.

The epic of United Nations action in Korea has eclipsed memories of its earlier failures. Count Bernadotte's posthumous book on Palestine restores them with a jolt. For four months in 1948 he was the Assembly's servant, charged by it with inducing Jew and Arab to accept a compromise of a kind that they had refused to entertain for fifteen years. His day-to-day record of the attempt is that of a man too decent to be daunted by the job but sufficiently a realist to awaken, slowly, to the United Nations shortcomings as a master. His book is, by implication, a tremendous indictment of the nations' capacity for taking refuge in votes which they have not the will to carry out.

As a contribution to history it is not important. It tells the old tale of abortive meetings with Jew or Arab—never with both—and of implacable reiteration of irreconcilable views. But as a study in human nature, it is much more interesting than its first hundred pages of naïve comment and discovery would lead us to suppose. Count Bernadotte was rich, royal, tolerant and neutral, blest with leisure and idealism and faith in human nature. He was also generously ready to spend these assets in the service of mankind. He scarcely hesitated when the summons to Palestine came: "There ought to be some chance of bringing about a better situation." He achieves a truce, and, for two months, his optimism flourishes. But as the real pattern of disagreement and obduracy, subterfuge and violence repeats itself again and again, even his spirit faints. He sees that the United Nations is a mockery unless it forges tools with an edge to them.

> They seemed to imagine, at Lake Success, that once the resolution had been adopted, all would be well.
>
> I had asked time and again that the 40 armed police who were needed should be sent . . . they had not yet come . . . and now the pumping station was blown up . . . the consequences were incalculable.
>
> I was now convinced . . . that the UN Assembly must come to a decision . . . or else the question would be solved by force.

By September, the month in which he was murdered, he was working for that decision with far more clear sight and drive than in the salad days of his idealism. The interest of the book lies not in its tale of a vain mission, but in its portrait of a man growing in stature to meet unsuspected problems. His last thoughts are a monument to the need for an international police force as a factor in peace.

False Idols

Hollywood: The Dream Factory. By Hortense Powdermaker. *Secker and Warburg.* 342 pages. 18s.

Readers of this book will experience the horrid fascination of examining unpleasant forms of life beneath a stone. Dr Powdermaker depicts an utterly corrupt society in which, in varying ways, almost everyone is prostituting himself or herself. She points to the absurdities that result from the obsession with box office returns; the search for success formulas; the reliance on crude opinion polls to find the sort of plot people like; and above all, the Code—the censorship that the industry applies to itself. This is designed at all costs to avert a censorship imposed by the separate states, and is therefore the lowest common multiple of American moral standards. Its operation has produced some curious results, such as the inclusion of scenes simply for the censor to cut out, so that others essential to the plot may be retained.

Dr Powdermaker has scarcely a good word to say for those who work in Hollywood. The big executives are tyrants, producers for the most part mediocrities with a dangerous power to interfere anywhere. Writers are either frustrated or without artistic integrity; stars are exhibitionists who accept slave conditions for the sake of the money and usually end by believing the publicity about themselves. Everyone detests everyone else and no group is so cordially despised as the stars; but extravagant displays of affection are the rule and everyone is manœuvring to be seen in the right company. Success is looked upon as a "break," not as the reward of talent.

Dr Powdermaker's account is so uniformly derogatory that one may wonder whether, as much of her material is based on hearsay, it is coloured by the prevailing hostility. But it is offered very seriously—too seriously—as an anthropological study. A faith in the reader's sense of humour would have allowed the points to be made briefly and tellingly; as it is they are laboured and often repeated. The style is readable, but the form loose and sprawling. The sketches of individuals suggest a penetrating knowledge of character; if only the author could give us real names instead of tiresome pseudonyms such as Miss Manifest Destiny and Mr Big Shot, what delightful gossip they would be. But in this atmosphere the anthropological observations seem out of place and of no great validity. All her readers, however, will share Dr Powdermaker's anxiety about the values of a community that possesses such power to influence the world's ideas.

Politics and Finance

The Growth of a Central Bank. The Development of the Commonwealth Bank of Australia, 1924-1945. By L. F. Giblin. *Melbourne University Press.* 363 pages. 30s.

For an eminent Empire central bank, the Commonwealth Bank of Australia had a most unrespectable parentage. It was born in 1911 when a Labour Government decided to set up a competitor with the "money power" of the ordinary banks and to grant it freedom from taxation. Once the new bank was formed, however, the first Governor very wisely directed its feet toward development into a central bank instead of into a competing commercial bank, and in 1924 it received some legislative encouragement to travel farther down this road. From 1924 to 1931 its main object in life seems to have been to qualify as a central bank in the eyes of the Bank of England. It is not surprising, therefore, that when the Australian Government made excessive anti-deflationary demands upon it in 1931, it excessively resisted them. It is also not surprising that it thereby became a butt of criticism from the Labour party and the subject of a long inquiry in the middle thirties. When war broke out, Australia was on the verge of introducing new banking legislation. During the war the Commonwealth Bank secured the powerful anti-inflationary weapon of being able to order the commercial banks to sterilise large amounts of their deposits in "special accounts." This power has been continued into the postwar period,

A survey and analysis of developments in domestic economic conditions and in international economic relations during 1949 and 1950.

Review of Economic Conditions in the Middle East
84 pp. 7s. 6d. (7s. 10d. including postage)
A full section of this Review is devoted to a discussion of the petroleum industry of the Middle East.

Review of Economic Conditions in Africa
128 pp. 9s. (9s. 4d. including postage)
This is the first study of the African economy to be prepared by the United Nations Secretariat.

Yearbook on Human Rights for 1949
421 pp. Clothbound. 37s. 6d. (38s. 5d. including postage)
Contains extracts from laws and constitutional provisions relating to human rights enacted during 1949 as well as a detailed review of the work of the United Nations in the field of human rights during 1949.

Economic Survey of Asia and the Far East, 1950
541 pp. 27s. 6d. (28s. 2d. including postage)
This Survey presents a comprehensive review of economic changes and developments in the area during the past year.

Annual Report of the Secretary-General on the Work of the Organization
207 pp. 15s. (15s. 7d. including postage)
In his annual report to the General Assembly, the Secretary-General reviews the work of the United Nations from 1 July, 1950 to 30 June, 1951.

Directory of Building Research and Development Organizations in Europe
113 pp. 5s. (5s. 3d. including postage)
The Directory lists 379 national and international organizations in Europe concerned with building research and development.

Yearbook of International Trade Statistics, 1950
174 pp. 12s. 6d. (12s. 11d. including postage)
This Yearbook contains figures from 42 countries showing trade by commodity and trade by countries of origin and destination for both the pre-war and post-war periods.

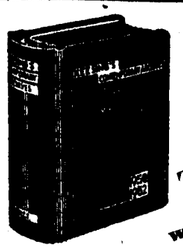
P.O. Box 569, London, S.E.1
or through any bookseller

"BACKGROUND TO THE NEWS"

To provide adequate background information so necessary to a full understanding of present-day questions and affairs, the NEWS CHRONICLE has planned the issue of a series of pamphlets and maps under the above title. Each pamphlet will contain about 12,000 words and be fully illustrated with photographs and diagrams.



First Three Titles:

1. **PARLIAMENT**
   By GEOFFREY COX, publication date October 15.
2. **THE CITY**
   By PAUL BAREAU, publication date November 7.
3. **THE PRESS**
   By MICHAEL CURTIS, with a foreword by LORD LAYTON, publication date December 1.

The price of individual publications will be 1/- per copy, unless otherwise advertised. Subscription rate for a fixed period of 12 months is 10/-.

A comprehensive folder giving full details of this new service, which begins on October 15, will be sent on application to the address below:

"BACKGROUND TO THE NEWS"
Publications Department,
NEWS CHRONICLE
12-22, Bouverie Street, London, E.C.4

"NOT FOR ALL THE OIL IN PERSIA would I be without your service"

This is only one sample from our large "fan mail." It has just come in and happens to be from a subscriber in the Transvaal, but you don't have to go overseas to meet KEESING'S admirers. They are to be found among thinking men and women everywhere, and obviously include many readers of THE ECONOMIST.

For the benefit of those who have never seen KEESING'S, here are some important characteristics:

KEESING'S is a "living" Reference Book on News covering Politics, Economics, Social Questions throughout the world.

KEESING'S, based on 20 years' experience in authentic recording of world events, is completely objective, scrupulously accurate, permanently up to date (through the addition of a fresh supplement every week, ready for filing in the patent binder).

KEESING'S most unique feature is its cumulative Index, renewed 26 times a year to give immediate access to every entry in the diary.

There are many other aspects of KEESING'S which will interest you. Just use the coupon below to obtain the free literature.

HIS CAMPAIGNS AND HIS TRIAL

R. T. Paget, K.C.

An important book:—

1. for the question it poses not only of the right but of the practicability of the victor attempting to judge the vanquished, of his selecting the evidence, then acting as both prosecutor and judge;
2. for the light it throws on the strength and weaknesses of the Russian war machine as encountered by Germany's ablest general,
3. and on the part that Hitler played in his own defeat.

Illustrated with maps and frontispiece, 15s.

THE FALCON PRESS

when Australian banking has again become a shuttlecock between opposing political parties.

The late Professor L. F. Giblin, who is the author of this book, was a principal economic adviser to successive Australian governments and a former director of the Commonwealth Bank. In his later years he had the reputation of being a lovable eccentric. The honest liberal must admit that some passages in his book suggest that he was the wrong sort of adviser—for example, he does not seem to recognise that a disinflationary monetary policy and pegged low interest rates cannot ride together. But his lively history, which avoids whitewash without carping, is much more entertaining and instructive than the majority of histories dredged up from bank records.

Soviet National Income

Soviet National Income and Product in 1937. By A. Bergson. Reprint from Quarterly Journal of Economics. 66 pages.

The compilation of national income statistics is generally a difficult task. It is particularly so for the Soviet Union, where data are scarce and require very careful handling. Mr Bergson's painstaking and shrewd study is therefore particularly welcome. He attempts to adapt, as far as possible, the available Soviet data to the pattern used by the United States Department of Commerce in its study of American national income. Thus, he compiles separate tables for the income and outlays of Soviet households on the one hand, and of the government and other economic organisations on the other. He then calculates the size of the gross national product and how it is used, and draws up a table of the net national product in various economic sectors.

True, he concentrates on a single prewar year, 1937, a relatively prosperous year for which data are ample by Soviet standards. What is important, however, is the method, while many of the findings are broadly applicable to the postwar period. To quote but a few of the more interesting features: in 1937 agriculture still accounted for 29 per cent of the Soviet net national product (compared with less than 10 per cent in the United States); the Soviet budget revenue was just over one-third of the gross national product; gross investment accounted for one-fourth, and together with defence for over one-third of the gross national income, while the propensity to save was only about half what it is in America. This fantastic discrepancy between investment and "voluntary" saving (for which Russian figures are always inflated, since part of voluntary saving is also compulsory) does more to explain the Stalinist regime than scores of fashionable books about Russia.

There is, it is true, a considerable margin of doubt. In Mr Bergson's calculation the share of investment in the national income is somewhat higher than in comparable studies by Clark and Wyler. A question of method is involved. Both Clark and Wyler forsake the rouble and calculate Soviet national income in terms of foreign prices. Mr Bergson sticks to current roubles in the first part and devotes the second part to an adjustment of rouble values to "real" values, chiefly through the elimination of discrepancies caused by the turnover tax (the Soviet purchase tax). The choice between the adjusted rouble method and the foreign currency method will always be somewhat arbitrary, but since one is dealing with Russian prices much can be said in favour of a cautious use of the rouble.

This analysis must have required a great deal of work, not only because of difficulties in finding data but also because of the peculiarities of the Soviet economic structure. It is to be hoped that it will mark a beginning and will be followed by similar studies on Soviet national income in more recent years.

Battered but Unbowed

Hobbes and His Critics. A Study in Seventeenth Century Constitutionalism. By John Bowle. *Jonathan Cape.* 215 pages. 10s. 6d.

Mr Bowle's purpose is to fill the gap between Hobbes and Locke which exists in most people's education, and he does this by disinterring the attacks which were made on Hobbes by his contemporaries. There were two principal counts in the indictment against Hobbes. The first, and in those days the more important, was that Hobbes left God out of his account of the beginnings of society and that he fell into the Manichean pit and other heretical sloughs. The second was his contempt for the orthodox view of the Commonwealth as a thing superior to established rules and current sanctions. In this, as Mr Bowle rightly insists, Hobbes was running counter to the medieval traditions behind him as well as to the developing trends of the future. He was a revolutionary who denied the past but was not acclaimed by the future—at least in his own country, which has continued to regard law as something which limits power rather than something which is created by and for power.

Hobbes was also attacked on the grounds that his picture of primitive society was historically quite untrue. Far more damaging was the criticism of experienced men of the world, like Lord Clarendon and Archbishop Bramhall of Armagh, that Hobbes's system simply would not work and that his polity would in fact destroy itself.

In view of the heavy body of adverse criticism presented by Mr Bowle it may seem strange that Hobbes should still, after 300 years, be counted among the principal English political economists, but the fact is that, though neither his contemporaries nor his successors have liked the answers which he gave, they have never been able to get away from some of the awkward questions which he put. Mr Bowle's book, though a book for the specialist, is therefore something more than an excursion into a little frequented by-way. He succeeds in treating his subject lightly and clearly without raising any doubts in the reader's mind about the depths of his erudition.

AMERICAN SURVEY

Doubts about Washington

Washington, D.C.

AMERICANS working in Washington during the war often assured visitors, with a fond grin, that Washington was a madhouse, it being legitimate then to take pride in the chaos which had newly enveloped a once quiet and decorous capital. But that was in the days when the objective in Washington was clear and uncomplicated, when everyone understood that the big idea was to win a war. Nobody believed that the war was going to be lost because Washington was a madhouse; on the contrary, the confusion of Washington, which was well known to be an outward manifestation of energy and drive, was taken to be an assurance of victory.

A lot of things have changed since then. The objective is no longer clear and uncomplicated. Difficulties never dreamed of, relationships never contemplated, responsibilities never remotely considered before, are now part of life as it is lived in the capital from one day to another.

Among the new discoveries has been the value which a nation wracked by the worries of leadership must place upon its allies. The Americans who are closest to the daily anxieties of leadership do not need to be told that acceptance of the United States as leader, even within countries which owe their free lives to the initiative of the United States, cannot be taken for granted. They have read a good many documents lately that have underlined the doubts, reservations and uneasiness about American leadership which have arisen in allied nations, and they are aware that when Washington goes off the rails, or is suspected of doing so, it causes a dangerous state of alarm and despondency abroad.

Yet most of these officials, turning their gaze to the immediate foreground, are haunted by events in Washington for which madness sometimes does not seem to be too strong a word. Last week, in an article in the *Saturday Evening Post* on some of the reasons why British confidence in America has been on the wane, Mr Joseph Alsop wrote: "A year and a half of drunken spree, followed by six months of a bad case of the shakes, was the approximate pattern of American policy-making in 1949 and 1950." That, most officials in Washington would probably say, is overstating the case; it has not been as bad as that. But few of them would be likely to deny that there have been times when behaviour in Washington has been of a kind that could be expected to disillusion and repel the allies whose willing co-operation the United States needs and should be able to rely on. And some of them are conceding that this present moment is one of those times.

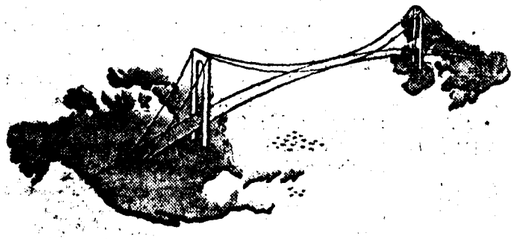
*

What are the allies of the United States to make of the effort to discredit, as a man with Communist sympathies, Dr Philip Jessup, Ambassador-at-Large, and to prevent his confirmation by the Senate as a member of the United States delegation to the United Nations? They see a sub-committee of the Senate Foreign Relations Committee listening to statements of Senator McCarthy of Wisconsin that Dr Jessup was once associated with six Communist-controlled organisations and once followed the Communist Party line. They see this public official, whose distinguished record as a skilled negotiator they well know, denouncing the so-called proofs which Senator McCarthy has brought as "barefaced falsehoods, distortions and misrepresentations"; and trying to vindicate himself by producing documentary evidence that he was a convinced and consistent isolationist before and during a good part of the war, having an affinity not with the Communists, but with Colonel McCormick of the *Chicago Tribune.* The harrying of the State Department has reached such a pitch that one of its high officials is driven to cite his record as an isolationist as a reason why he should continue to play an important role in the administration of American policy, which has turned its back on isolationism.

Furthermore, America's allies see Mr Harold Stassen, long described as one of the foremost liberal Republicans, joining Senator McCarthy before another sub-committee, one on internal security, in the effort to discredit Dr Jessup and Mr Dean Acheson, the Secretary of State under whom he has worked. Mr Stassen produces, after a curious delay, allegations that at a "round-table discussion" in the State Department in October, 1949, policies favouring the Chinese Communists over the Chinese Nationalists were advanced and had been "implemented" up to the time of the Korean war, and that, at a White House meeting in 1949, both Dr Jessup and Mr Acheson had wanted to deny arms to the Chinese Nationalists.

On the record itself the policies "implemented" by the State Department could hardly be called pro-Communist. Moreover, though the State Department conceded that such a meeting at the White House took place (but in February, rather than late 1949, as Mr Stassen suggested), it now appears from Senator Vandenberg's diaries that the proposal to cut off aid to China, which was rejected, came, not from Dr Jessup, who was not present, nor from the Secretary of State, but from the President's military advisers. But the allies of America must have been less interested in the rival versions of what happened at these meetings than in the continuing assumption, made on both sides, that everyone who was for General Chiang Kai-shek and the Nationalists was a prescient and enlightened statesman and that everyone who showed less than complete confidence in him was a tool of the Communists.

A retired general, a former intelligence officer on General MacArthur's staff, said that Dr Jessup once told him the United States was going to recognise Communist China. It was not enough for anyone to point out that no such event ever took place. Dr Jessup felt impelled to declare that the State Department "has never considered the recognition of



"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Communist China." The allies of America might have wondered what virtue there could be in the public assertion that an alternative which it was manifestly the duty of the State Department to examine with the greatest care, even though it was to be turned down, was never considered. But this point has not attracted attention in Washington.

The raking over of the Administration's policy on China at a time when it is not what has gone, but what is to come, that matters, and the repeated attempts to extract partisan advantage from these inquests, lost their novelty long ago. But the assumptions that lie behind them—from the assumption that the United States could ever have prevented the Communist conquest of China without sending troops no Americans in any party wanted to send, to the assumption that it is a just and intelligent thing to judge yesterday's thought and action by the different standards of today—may well seem to America's allies to grow more and not less dangerous as from week to week they go unchallenged and unregretted.

Washington is absorbed in the gains and losses of the partisan struggle, and almost nobody steps back long enough to marvel that it should be Republicans, who have opposed very nearly every one of the Administration policies which alone have kept Communism from engulfing the world, who are now accusing principal officials of this same Administration of being pro-Communist.

There is no disposition among officials who hear the reactions of America's allies to deny that what may look and sound like madness elsewhere has become political commonplace in Washington. Nor do these officials automatically claim that it is only the Congress and not their own branch of the government which provokes all the doubts abroad. At a press conference last week, anxious to turn aside hysterical attacks on an extension of the security regulations, President Truman declared that American newspapers and magazines have been giving away 95 per cent of the information which the United States Government should have kept secret. The effect on America's allies of the President's intimation that the nation which is undertaking to lead them in difficult and dangerous times has been functioning under a system which has handed over 9.5 of every 10 secrets to the potential enemy is not easy to estimate.

Bridging the dollar and sterling areas

Familiarity with business and trade conditions on both sides of the Atlantic makes the Chase National Bank an effective bridge between the dollar and sterling areas. Officers of our three London offices combine a keen understanding of British trade requirements with practical knowledge of market and credit situations in the United States.

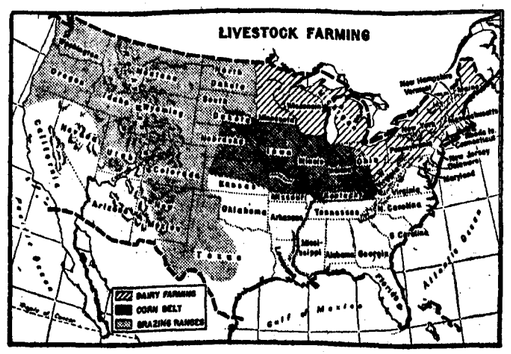
Meat Goes to Market

[FROM A CORRESPONDENT IN IOWA]



The great American meat industry has since the beginning of the century almost unfailingly provided from 130 to 160 pounds a year of meat (beef, pork, and mutton) for each member of the rapidly growing population, and 20 to 35 pounds of poultry as well. But today the industry is being pulled out of shape by the tug-of-war between the government price controllers, trying to hold down retail beef prices, which are already at record levels, and the livestock farmers and meat packers, determined to get their own way whatever the cost to the consumer.

Three months ago Congress took away the government's authority to fix quotas limiting the number of animals that slaughterers might kill. The Senate is now having second thoughts about this, as a result of the price controllers' insistence, supported by numerous examples of violations, that regulations cannot be enforced unless slaughterers can be penalised by the withdrawal of their quotas. The meat industry on its side argues that price controls invariably cause a scarcity of meat and this argument is supported by the present shortage of beef. There is little doubt that this has been deliberately engineered to some extent by the industry, but it is also certain that the complications and uncertainties arising out of the price control system, and out of Congressional interference with it, have distorted the normal pattern of an industry that is nowadays much more complex than it used to be, particularly when it comes to marketing the meat animals.

This is still done at the big public markets, with huge packing plants attached where the meat and its by-products are processed for sale, either fresh or tinned. But the motor lorry has destroyed the dependence of the livestock farmer upon railways, commission agents and the big meat packers. Though the "big four" remain by far the largest firms in the packing industry, they are no longer monsters isolated in railway centres such as Chicago and Kansas City. Today they have dozens of plants and hundreds of buyers scattered about the country; independent packing stations and local auction barns and dealers are also numerous. Altogether there are more than 3,000 plants slaughtering over 300,000 head of cattle each a year, and thousands of smaller ones. Moreover, many of the refrigerated locker plants in small towns slaughter and process meat animals for all comers. There is now in the aggregate more storage space in these locker plants and in home "deep freezes" than there is for meat in commercial cold storage houses, and more than half of this private refrigerated space is used for meat, much of it by farmers.

The beef cattle (Herefords, Aberdeen Angus or Shorthorns) and some sheep are raised on the dry ranges from western Nebraska and Texas to the Pacific, mostly on ranch-produced grass, hay, silage and sugar-beet tops, with bought maize or oil cake as a supplement. Raising beef cattle takes more acres to produce a given income than any other kind of livestock farming, but with good management, and a few years of decent prices and decent weather, cattlemen can have their Cadillacs and private aeroplanes. Some animals are sold directly from the ranges for slaughtering, but one-third, about two million head a year, go as calves or yearlings to farmers with greener pastures or home-grown concentrates for feed. Cattle fattening has been spreading lately to the west and south as the Pacific States gain population and the southern ones become richer. But the most important "feeding" areas are still in the Corn Belt amongst farmers who make this a speciality. From their "feed-lot" meat factories come the finished steers that produce America's most delectable food, well-marbled beefsteak.

The Corn Belt, from mid-Ohio well into Nebraska, is "corn-hog" country; beef and dairy farmers, and those who sell grain for cash, nearly all raise some hogs, and for many farmers they are the main enterprise, to be expanded or contracted according to whether more money is to be made out of maize by feeding it to hogs or by selling it direct. In this area half the land on a farm is devoted each year to growing grain, chiefly maize and oats, to feed livestock; hogs and cattle are also fed protein supplements such as soyabean, cottonseed or linseed oil cakes, all domestic products and all except the cottonseed grown locally.

In the triangle from Minnesota to New England and West Virginia dairy cows are the rule (Friesians, Jerseys, Guernseys or Ayrshires) with artificial insemination from top quality bulls spreading rapidly. There are more dairy farms scattered about the "milk sheds" around urban centres. All dairy cattle become beef eventually, or rather sausages, and calves of dairy cows bred to beef bulls make excellent eating. Farmers generally grow their own hay, and what maize and oats they can. Sheep harvest places along the fence rows and rougher pastures which the cattle miss, but even in the west sheep are a speciality and a declining one.

Poultry are raised everywhere in the United States as a sideline on most farms and in egg and bird factories near the big city markets. Baby chicks are generally bought from a commercial hatchery and only seven per cent are hatched by hens. Chicken, like pork, is less of a luxury than beef and output is steadily rising. Production of commercial broilers (birds up to 2½ pounds dressed) has increased almost sevenfold in the last ten years, mainly on specialised farms.

The Department of Agriculture and the experimental stations at the state agricultural colleges do a tremendous amount of research into livestock breeding and feeding, and the Department of Agriculture, through its market reporting and forecasting services, helped by the wireless and the telephone, enables farmers to know in advance when and where they are liable to get the best deal. Meat packers do their own research, spending $15 million a year, much of it in the hunt for new outlets for by-products. It was never quite true that the packers used everything about a hog except his squeal, and it requires a constant effort to keep it even approximately true. For example, synthetic detergents are taking the place of the soap which is made from animal fats, but thanks to research detergents can now themselves be made from inedible animal fats, as can a great variety of other chemical products. And the new drugs, cortisone and ACTH, started out as costly by-products of packing plants.

This great industry is based on natural and human resources which could not be marketed nearly so profitably in any other form. The grass and hay of the dry ranges of the western plains and mountains, and the stony upland pastures and cut-over forests of the eastern and Great Lakes States, can hardly be harvested at all except by livestock; in spite of the American fondness for corn bread and cornflakes only about one-tenth of the 3 to 3½ billion bushels of maize grown each year manages to get sold or given away for human consumption, either at home or abroad. The location of these natural resources still determines the main patterns of livestock farming and it is the location of underemployed human resources that has set the direction of one of today's chief developments in the industry, the southward movement. For in the south much of the time of farmers and farm labourers has been going to waste, as it would do elsewhere were it not for livestock farming, which is planned to dovetail into the seasonal needs of other crops, so that the year-round demand for labour is comparatively steady.

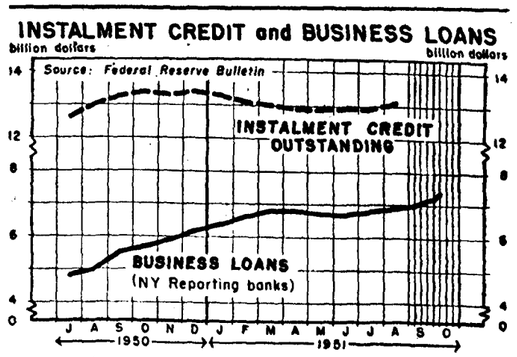
The Air Force Tips the Balance

It is understood that the Joint Chiefs of Staff have recommended, in the proposals which they have now submitted to the civilian authorities for next year's defence budget, that the Air Force's sights should be raised to about 140 groups of aircraft, to be achieved by 1954, instead of the 95 groups which are its present target and which will be reached before long. A substantial number of the new groups will be tactical, to give support to ground troops; the Army has been begging for this, but the Air Force refused to spare more than a few crumbs from the strategic bombers' table as long as it was limited to 95 groups. Naval aviation is also apparently to get rather richer fare next year.

These titbits have made it easier for the other two services to swallow a recommendation which tips the theory of balanced strength decisively in the Air Force's favour and which a few weeks ago seemed likely to revive 1949's inter-service brawl. What in fact seems to have happened is that, under pressure from Mr Lovett, the new Secretary of Defence, the Joint Chiefs have at last agreed, in practice as well as in principle, that the real meaning of the theory is not that the three services must balance each other, at least as far as appropriations are concerned, but that together, and with the help of America's allies, they must balance the military strength of all potential enemies.



It is now for the Bureau of the Budget and the President to decide whether the country can afford to satisfy the Joint Chiefs' requirements for next year. But whatever is decided Congress will almost certainly give the Air Force what it wants. It is true that the defence appropriations for the current fiscal year, finally agreed at just under $57 billion, contain only $1 billion, instead of the $5 billion proposed by the Senate, for emergency Air Force expansion, but this is only because plans for spending the extra money are not yet ready. Congress promised that more would be there for the asking whenever it was wanted. The big Air Force men seem to be on the point of winning their long fight in Congress, but the big atom men are already moving into their places, with demands for quintupling the present expenditure of $1 billion a year on atomic development. They argue that this would before long enable substantial savings to be made on armaments as a whole. This is an argument that has much popular appeal, especially now that the public has been told by the chairman of the Atomic Energy Commission that no moral opprobrium need be attached to the use of small atomic weapons against troops in the field.

* * *

Queue for Credit

The first real test of the brakes placed on the expansion of bank credit last spring seems to be approaching. In the week ending October 3rd business loans of New York City reporting banks, which account for about one-sixth of the national total, expanded by $117 million, the sharpest rise since February. They are now $547 million higher than they were at the end of June, though in the comparable months last year they rose by nearly twice as much. From all over the country comes the same story of the seasonal upswing in loans, as crops move to market, being added to heavy demands for defence credits. Many bankers feel that interest rates must move up again.

The precipitous rise in bank loans, set off by scare-buying after the invasion of Korea, began to level off in April when the Federal Reserve System ceased pegging government bond prices, bankers set up a voluntary screening system for loans, and the public began to realise that the shortages it feared were still far away. But now the FRB, which last spring won from a grudging Treasury relief from its obligation to hold government securities at a given price level, may have to beat a partial retreat. At the beginning of this month the FRB had to buy, in one week, $565 million of government securities to rescue a Treasury issue which the banks, in view of the demand for loans, could not take up. Among the purchases were the first long-term bonds it has bought since early July. The Treasury must not only find about $3 billion of new money before January 1st to cover the *deficit in the government* accounts, but also, during 1952, must reckon with refunding, which may reach a total of $42 billion. The issues which mature or are callable next year are, in the main, war bonds floated at 2 per cent, only a shade more than the Treasury is now paying for 11-month money. Washington also fears that, with the queue for credit lengthening, even essential borrowers may be turned away

empty-handed; for political purposes, at least, home-buyers cannot be dismissed as non-essential. Thus the FRB will be under heavy pressure, not, certainly, to go back to the bad old system of pegging government bond prices, but to increase the bond resources of the banks and help the Treasury by re-entering the bond market.

The Secretary of the Treasury hopes that increased saving, and an enthusiastic response to the savings bond drive now going on, the biggest since the war, will hold off the renewed inflationary assault which he fears is just around the corner and which will be strengthened if there is a deliberate easing of money. But how unwise it might be to count on continued consumer resistance is shown by the $155 million rise in instalment credit at the end of August, the largest since last September. The public has not been slow to take advantage of Congressional insistence that hire-purchase terms be made easier.

Truman's Top Secrets

His press conference once more proved a trap for the President when he tried to justify a very mild extension of the regulations relating to official secrets. This new order, issued last month, directs the heads of all federal agencies and departments, some sixty or more, to adopt for secret papers the security classifications used by the Departments of State and Defence: top secret, secret, confidential and restricted. (It is rumoured that beyond "top secret" lies a realm labelled "cosmic.") Handling of papers so stamped is prescribed; some must be kept in safes, others must not be discussed on the telephone. With the rearmament drive, civilians and civilian agencies have had to be given access to military plans; the Department of Defence, which sends its documents under armed guard and permits only "classified" caretakers to burn "classified trash," has been haunted by the thought that in less security-conscious agencies these same papers might be left lying unguarded. Editors and publishers, consulted at an early stage, had rejected

the idea, and the order, consequently, was carefully phrased to make it clear that it applied only to information of military value and that it would not be used to restrict the flow of legitimate news.

The thunder and lightning from the outraged press was not long in coming, but it was so palpably disproportionate to what was involved, and certain newspapers have so notorious a reputation for publishing whatever they can get hold of, that the storm might have blown itself out. Mr Truman, however, justifiably indignant at the outcry, made the mistake of offering examples of stories which should not have been printed, and the incredible blunder of choosing three cases in which the information had, in fact, been released by the Department of Defence, the Atomic Energy Commission, and the civilian defence authorities. In the last case, publication of certain maps had actually been requested, in order to induce volunteers for the civilian defence services to come forward. But the President insisted that the newspapers should have used their own judgment and refused to co-operate. It was on this occasion that he made the hair-raising statement that 95 per cent of all secret information in the hands of the government had been published—a declaration which might also be taken to show how widely the intelligence agencies would like to cast their net. The clarifying order which followed swiftly clarified away most of what the President had said on the spur of the moment; editors need not look gift horses from "responsible" officials in the mouth, though they must decide who is responsible.

The problem of safeguarding military secrets without permitting officials to abuse this power is an old one, and never satisfactorily solved. The new order falls far short of assuring perfect security; it does not touch Congressmen, one of whom it was who shouted the secret of the hydrogen bomb over the air, nor does it prevent newspapers from publishing anything they learn. On the other hand, the critics, if they would recognise that a problem exists, have a strong case for pointing out that no effective machinery is created for "declassifying" secret information; nor is there any real way of appealing from the decision of a civil servant who may be covering up inefficiency, or, more probably, be swayed by timidity.

Exploring the South

To Senator Karl Mundt, a Republican from South Dakota, the political country below the Mason-Dixon line seems well worth prospecting for the votes needed to give the Republicans victory in next year's presidential election. He has been making preliminary surveys for some time and has come to the conclusion that the South can best be exploited by an alliance between conservatives of both parties. Recently he announced that a "committee to explore political realignment" had been formed to prepare the ground for such a coalition; its membership and support were kept secret, but this was perhaps only suitable for a body that is going to wage political warfare. It also resembles democratic propaganda agencies in its purpose, "to stop the encroachment of the all-inclusive centralised super-state," which is said to be preparing the way for Communism in America.

Like all good propagandists, Senator Mundt is offering rewards to Democrats who come over to his side. He proposes that the Republican presidential candidate should be someone pleasing to the Southern Democrats and that, if the vice-presidential candidate is not a Southern Democrat, several of them should be promised posts in the Cabinet. More important, he would guarantee that Southern Democrats in Congress who join the alliance should keep their patronage rights and seniority, which means their committee chairmanships. And finally, Mr Mundt would draft a Republican platform that would be acceptable to the South; he would get round the question of civil rights for Negroes, which has hitherto been the irreconcilable difference between Republicans and Southern Democrats, by leaving it to individual state governments.

Senator Mundt's dream is a very old one, but its chances of fulfilment seem better than ever before. Conservatives of both parties have been working together in Congress for years and today they control both houses. In the last election a group of Southern Democrats openly revolted, under the name of States' Righters, and managed to carry four states. Next year, if President Truman stands again, the rebels are expected to be stronger and to include such famous champions as Senators Byrd of Virginia and Russell of Georgia, and Governor Byrnes of South Carolina, all of whom held aloof last time.

But so far these leaders have shown no open interest in Mr Mundt's approach, nor is there any evidence that it would find favour with his own party. There the machine politicians would be unlikely to make the very substantial concessions he suggests unless they could see no other chance of avoiding a Republican disaster. And to liberal Republicans his civil rights scheme seems a betrayal of the party's birthright and one that would ensure its defeat in the important industrial states of the North, which are more essential to victory than are the southern states. Finally, while Senator Mundt's slogan of "think alike, vote alike" may seem logical, it is in fact a contradiction of the American political tradition, when applied to party alignments.

Rainmaking Comes to Stay

It was Nature, not Dr Irving Krick of the Water Resources Development Corporation, that brought heavy rains to the parched Pacific north-west last week and eased the shortage of hydro-electric power that has been holding up aluminium output. But Dr Krick, whose rainmaking activities are still regarded with the utmost suspicion by the Weather Bureau, the federal agency most intimately concerned with them, got official recognition as a result of the drought from another federal agency, the Bonneville Power Administration, in the form of a $59,000 contract. The Water Resources Corporation has, however, been asked to postpone its activities until the effectiveness of Nature's intervention can be judged, to the satisfaction of farmers who want to get their wheat harvests in.

Neighbouring wheat farmers earlier this year employed the firm to supply the moisture their crops need at the beginning of the summer. Its success infuriated fruit growers whose cherries were ruined by the two inches of rain which Dr Krick's men made to the wheat farmers' order. His operators seed clouds with silver iodide crystals to make them drop their water, but rainfall can be prevented by excessive seeding. The cherry growers are reported to have started a rival organisation, Sunshine Unlimited, which will follow after Dr Krick's men and frustrate their operations by overseeding the clouds.

Nowadays any western farmer who has trouble with the elements can put the blame on Dr Krick; snowfalls engineered by him, to increase water supplies in the valleys, have blocked mountain roads and, although he claims he has never been responsible for a hail-storm, he is frequently threatened with damage suits for the crops spoiled and the chickens killed by them. Last summer he was even accused in Congress of having been responsible for the Kansas floods, a suggestion that is not as fantastic as it sounds, for his operations are on a scale almost large enough to justify it. In 1950 he was so successful in relieving the drought which threatened the south-west with a new dust bowl that this year the Water Resources Development Corporation, which employs 120 people, has had forty contracts to seed clouds over 330 million acres west of the Missouri river, an area ten times bigger than New York State. Rainfall in districts where clouds have been seeded seems to have been consistently heavier than in unseeded districts nearby. Dr Krick's firm is by no means the only one in the business and, controversial as it is, rainmaking seems to have come to stay.

Still Hope for the Seaway

On September 28th the President announced that, unless Congress assured an early start on the St. Lawrence Seaway and Power Project, he would support independent Canadian action as a "second best," though he had a strong preference for joint development by the two countries. He also reached an agreement with the Canadian Prime Minister that, if Canada went ahead on the seaway alone, the two countries would try to make arrangements for simultaneous joint development of a $400 million hydro-electric plant. In either event, this will presumably be built on Barnhart Island in the International Rapids section of the river, opposite Massena, New York, by agreement between the Province of Ontario on the one side and either the Federal Government or New York State Power Authority on the other, to share the cost and the resulting power.

If Canada were to construct the seaway alone it would lie on the Canadian side of the river, and so, presumably, Canada would control the freight rates on shipping—which is predominantly American. Whoever builds the seaway, the American public would therefore pay the major share of the expense in the form of toll charges and power costs. There is thus new pressure on Congress to approve a project which has been before it periodically for over ten years and which, when it came up again last February, was thought to have a better chance of passage than ever before. This was because the project has recently found new support among the steel interests, alarmed at the rapid depletion of iron ore in the Middle West and eager for direct access to the great deposits of Canadian ore in Labrador. Nevertheless, on July 28th the House Committee on Public Works pigeonholed the Seaway Bill by a vote of 15 to 12.

Now, however, there is fresh cause for optimism. On October 1st Representative Blatnik, a Democrat from Minnesota, introduced a new Bill authorising the construction both of the seaway and of the power project. It was hoped that this Bill would meet earlier objections by including provisions for complete advance information on costs (provisionally estimated at about $818 million), for determining toll rates, and for the submission of final plans for Canadian approval. But the objections are coming in just as usual, from the spokesmen of such ailing industries as coal mining and railways, who fear the competition of hydro-electric power and water transport.

Whether the seaway is built by Canada alone, or by the two countries, one other controversy remains: who is to develop the power project on Barnhart Island—the Federal Government, through a public authority, or New York State, distributing the power over private lines?

Shorter Notes

As expected, President Truman, on signing this year's foreign aid Bill, promptly appointed Mr Averell Harriman to be Mutual Security Director. This is a new post created in the new Act: Mr Harriman will be directly responsible to the President for co-ordinating not only economic and military assistance to foreign countries, but also technical assistance under Point Four. He will also be nominal head of the new Mutual Security Agency which is shortly to replace the Economic Co-operation Administration; like its predecessor, it will deal only with economic aid, and Mr Harriman is expected to appoint a deputy to handle its day-to-day operations.

*

With most unusual willingness Congress has given the Export-Import Bank an additional $1 billion, raising its total lending authority to $4.5 billion. A Senate report said this generosity was explained by the growing demand for loans to finance the production abroad of strategic metals and other essential supplies, but Congress was certainly encouraged by the fact that the bank was making loans to help countries, such as India, to buy American cotton.

*

South Dakota, swimming against the national tide, has cut taxation by $8,000,000 a year, abolishing taxes on liquor and cigarettes and reducing the sales and automobile taxes. The state has thus kept, to most people's surprise, a promise made when these taxes were imposed after the war to finance a special ex-servicemen's bonus by bonds which have now been paid off.

*

After every census the United States centre of population is calculated by an intricate process which, ignoring Columbus, regards the country as a flat platter balanced on a pin-point which moves with changes in the distribution of the population on the surface of the platter. The pivotal point has been moving steadily west since the first census in 1790, but for the last sixty years it has been in Indiana. Now it has left the "Hoosier" State for Illinois, forty-two miles further west in ten years, the biggest movement since 1890; even more significantly, it has begun to move south as well.

*

Maryland is at last being freed of its civil war debts. Before long the Federal Government proposes to pay interest, amounting to $171,000 which it owes to the city of Baltimore on money spent to build fortifications in order to protect Washington from the Confederate armies in 1863. And the Mayor of Frederick, Barbara Frietchie's town, has just paid the local banks the final instalment of a loan incurred a year later, when the town was obliged to pay another Confederate general $200,000 to save itself from being burnt.

B.Sc. ECON. & B.COM.
LONDON UNIVERSITY

- Men and women seeking a suitable qualification for executive appointments in commerce or industry, or higher government or municipal posts, should consider taking one of these London University Degrees, which are obtainable *without residence*. Study for either Degree covers a course of wide and interesting reading.
- U.C.C. prepares students by postal lessons for the required examinations. The College, founded 1887, is an Educational Trust, and has a staff of highly qualified specialist Tutors. Fees are moderate, and may be paid by instalments.

THE WORLD OVERSEAS

Iron Curtain Harvest

IN eastern Europe the harvest is completed and most of the farmers have turned to the task of fulfilling their autumn ploughing and sowing targets on time. By all accounts the harvest has been a bumper one, and no effort has been spared to gather it all safely in. The authorities in the satellite states have not been content with merely material rewards and penalties; they have used every propaganda device to catch the peasants' imagination and to spur them on to ever greater enthusiasm for the speedy collection of what, in a gesture of solidarity with the Soviet peace campaign, has been commonly called the "peace harvest." Loud-speaker vans have toured the harvest fields bringing musical greetings from nearby urban workers; the portraits of especially hard-working peasants have been prominently displayed; "cultural brigades" have entertained the peasants during their lunch hours; and, above all, they have been exhorted and encouraged in every possible way to emulate the example and achievements of their Soviet brothers.

From the evidence available it seems that the Communists have been justified in their boasts of a bumper harvest. A preliminary estimate gives the total crop of bread and coarse grains in all the satellite countries, including the Soviet zone of Germany, as over 39.5 million metric tons. This is slightly better than last year when the harvests were generally excellent. In Poland the total grain harvest is estimated at over 12.5 metric tons; in Czechoslovakia at nearly 5 million; in Hungary at over 6 million; in Bulgaria at nearly 3.5 million; in Rumania at over 7 million; and in the Soviet zone at nearly 5 million tons. But, however good the yields may have been, the crucial point for the east European governments now is the extent to which the peasants are fulfilling their compulsory delivery quotas. If the state granaries are not full to overflowing, jubilation over the bountiful harvest will be very much modified.

Resistance to Compulsory Deliveries

Here again it is impossible to form anything but the vaguest picture of what is going on; in any case the final position cannot be known until the final delivery dates have been reached. In the meantime it is difficult to strike a balance between the glowing accounts of peasants who have fulfilled and over-fulfilled their delivery targets and the disapproving reports about those who have either failed to meet their obligations or have handed in inferior grain. On the whole, it seems fair to say that the authorities are often experiencing considerable difficulty in getting the peasants to disgorge the requisite amounts of grain. Throughout the area, they seem to have had recourse to a greater display of force than last year in getting in the deliveries. In Poland and Bulgaria, especially the former, deliveries appear to be up to, and even ahead of, schedule. But in Hungary the situation seems to be less satisfactory; there are complaints of deliberate sabotage and of stupid peasants who do not understand the need for more grain; and rewards in the shape of vouchers for the purchase of consumer goods are being used to lure the farmers into producing their grain. And in Czechoslovakia the government has not tried to hide the fact that deliveries are lagging behind, although at the beginning of this month it was announced that specially good deliveries in some regions had made up for shortages in other areas. The authorities put the blame for these on the kulaks, who have not only hidden away their own grain, but have encouraged the smaller peasants to go slow.

In blaming the richer peasants for their difficulties in the countryside, the Czech Communists are probably not far wrong. Refusal to meet the State's demands on his grain is perhaps the most effective protest against collectivisation open to the farmer. Indeed, wherever the Communist authorities throughout eastern Europe have trouble in securing for themselves the first-fruits of the harvest, they must know that the fault lies largely in the hostility aroused by their own policy of pushing ahead with collectivisation. Wherever deliveries are behindhand, it is principally the private farmers who are to blame. One recent report, for instance, from a district in Czechoslovakia, said that whereas the co-operatives had delivered 102.2 per cent of their quotas the private farmers had only delivered 31 per cent.

No Halt to Collectivisation

Yet opposition to collectivisation is having no effect on the Communists' policy of multiplying collective farms by all means short of actual coercion. In Hungary there has been something of a major drive for collectivisation in recent months. In spite of the pause during the summer months, the Hungarian Minister of Agriculture was able to announce recently that the number of families in collectives (which a year ago amounted to 105,000) has now risen to 230,000. All the same the proportion of arable land belonging to the collective and state farms does not amount to much more than 20 per cent of the total; and it is typical of the extreme caution with which collectivisation is being tackled throughout eastern Europe, that the Hungarian Premier said last week that the government was now concentrating, not on setting up new collectives, but on consolidating existing ones.

Elsewhere, less publicity has been given to collectivisation and it is clear that progress has been slow and opposition great. Bulgaria has made most progress; Mr Chervenkov recently claimed that 50 per cent of the arable land was now cultivated by collectives. But this represents only an increase of about 6 per cent during 1951—a much slower rate of increase than during the previous year. In Czechoslovakia about 18 per cent of the arable land is in the collective and state farms; in Poland, not much more than 13.5 per cent; and in Rumania, little more than 8 per cent.

Confronted with this slow progress, the Communist authorities have been quick to turn the bountiful 1951 harvest to the best possible propaganda use. It has been turned into a gigantic advertisement for collectivisation and no opportunity has been lost to point out what much better results it produces than the old-fashioned methods ever did. In Rumania, for instance, a recent government decree has claimed that the average yield obtained by the collective farms has been 25 per cent greater than that registered by individual farms. Again, in Bulgaria, Mr Chervenkov has triumphantly announced that

> All peasants can now see in practice what the land can yield when it is worked by co-operatives and by machines according to modern scientific principles.

Such statements are, in fact, the purest propaganda. The ineradicable dislike of the peasants for collectivisation has always acted as a deadweight on the productivity of collectives. The Communist leaders must know this; nevertheless—ideological considerations apart—the urgent need for more manpower to carry out their ambitious industrial plans, forces them to push on with collectivisation.

Egypt and the Canal Zone

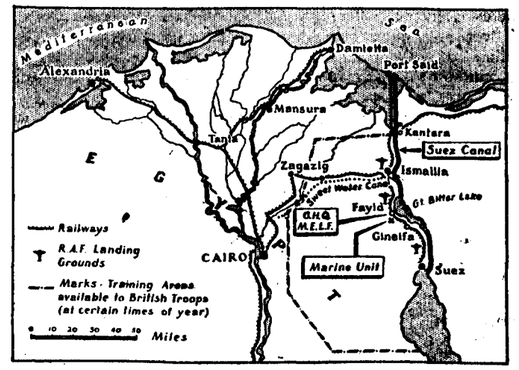
[BY A CORRESPONDENT]

FEW of the Egyptians who this week toured the cities of Cairo and Alexandria shouting "The British Army must go" have in fact seen a British soldier since the last British company left the Kasr el Nil Barracks, Cairo, at the end of March, 1947. After that date Alexandria, the whole of the Nile delta and Cairo have been visited only by small parties of British officers and other ranks on leave and wearing civilian clothes.

The Army and Royal Air Force installations and camps are entirely concentrated in a narrow zone which runs parallel with the Suez Canal and the Great Bitter Lake from Ismailia to Kabrit, a few miles to the north of Suez. Egyptians dislike living in the Canal Zone because it is so far away from Cairo and the delta towns.

The journey from Cairo to Fayid, on the Great Bitter Lake, where the general headquarters of Middle East land forces is situated, is accomplished in twenty minutes by air. By the straight Suez Desert road the seventy-odd miles can be covered swiftly by car, though in the summer months the more pleasant route is through Heliopolis and along the banks of the Sweet Water Canal through Tel el Kabir to Ismailia. On both these roads some thirty miles from the Suez Canal there is a road block and a wooden hut manned by four or five bored Egyptian policemen. When Anglo-Egyptian relations are cordial the barriers are removed and the policemen sleep in their huts or wave their hands and smile at cars as they pass. When relations are strained the barriers are lowered, each car leaving the Canal Zone must stop and all the British passengers must produce their passports duly stamped with a visa for Egypt before they are allowed to travel to Cairo. No military vehicles pass these control points without special authority, and all the British service personnel wear civilian clothes whether on leave or duty outside the Canal Zone.

Inside the Zone the British forces enjoy many facilities which were granted by the present Prime Minister, Nahas Pasha, when he and his colleagues signed the Treaty of Alliance in 1936. British soldiers or airmen can enter and leave the Canal Zone base without passport formalities. If they have an accident when driving or commit any crime or misdemeanour they are tried by a British court-martial, and, although it is not specifically mentioned in the Treaty the men serving in the Canal Zone use the Army Post Office and their mail is not subject to the delays of the Egyptian censor. The soldier receives his newspapers from London far more quickly than the civilian in Cairo and these, too, are uncensored, though the military authorities cut matter which might offend the Egyptian government or the royal family.



The Training Areas

The Egyptians agreed in the Treaty to allow large desert areas around the Canal to be used for military exercises and training. The Army and the RAF bases have excellent port facilities at Port Said and Suez and use the railways and roads in the immediate hinterland. No other area of the vast region now known as the Middle East has these advantages as well as an unlimited pool of semi-skilled manpower. Egyptian contractors have built bungalows and villas by the Great Bitter Lake which they furnish and let to British officers for high rents. Elsewhere the troops are housed in large camps and in Butlin-type dwellings for families of all ranks below that of colonel. The British authorities have never attempted to disguise the fact that the figure of 10,000 land troops and 400 pilots together with the necessary personnel for administrative and technical duties mentioned in the annex to the Treaty has been exceeded. Strangely enough the Egyptians do not appear to mind this. "If foreign troops are stationed on Egyptian soil it does not matter whether there are hundreds or thousands, it is the fact that there are troops at all we deplore," the Egyptian says.

It is typical of the violent nationalist fever that has spread over the Middle East that men who are earning good wages in the Zone from the British Army joined the recent demonstrations to demand the immediate evacuation of all British forces from Egypt, well knowing that if the British did leave they would be left unemployed. The tradesman who sells vegetables to the canteens or curios to individual soldiers knows he would be ruined if the army were evacuated; but he, too, is swayed by the majority; he believes the oft-repeated statements of politicians and journalists that the wealth of the country has been "stolen" by British imperialists and that when they leave Egypt everyone will be comfortable. Nor does the average Egyptian newspaper reader realise that many rich Pashas have used the "imperialist" bogy to divert the attention of the fellah from the prosperity of the Egyptian upper classes.

Away from the hysterical crowds of demonstrators, thoughtful Egyptians have been amazed at Persia's success in its quarrel with Britain. They, too, believe the government of Nahas Pasha is wise to abrogate the 1936 Treaty. This view is to some extent due to a fear in the minds of many intelligent Egyptians that as long as Whitehall administers the Sudan the Nile water may at some time be diverted there, with appalling effects on the economy of the lower Nile valley, which depends on irrigation. However, the most serious bitterness towards Britain has arisen from Whitehall's refusal to supply the Egyptians with arms and ammunition at a time when they believe that they were engaged in a life-and death struggle with the Jews. The Egyptian feels that Britain, if still a great power, should in some way have prevented the establishment of the state of Israel, whose economic and territorial expansion is feared. Owing to the omissions of the Arabic press even the intelligent Egyptian believes that Britain has done nothing to meet Egyptian demands and its "national aspirations"; and he is resentful of this. Only a handful of brave men will dare to voice their disapproval of the Wafdist bill to abrogate the Treaty.

MAP TO ILLUSTRATE THE TREATY OF ALLIANCE WITH EGYPT, 1936.

The demonstrations of this week may well be followed by outbursts of terrorism. Terrorist gangs are already well organised in the Canal Zone where, during the past few years, they have made almost nightly raids on British ordnance dumps. The stolen arms and ammunition could now be used against the British soldier as he moves about the zone. Roads may be mined and military equipment sabotaged, and the Egyptian police would be powerless to arrest the guerrillas even if they wished to do so. There

is little likelihood of deliberate attacks on British women and children. The terrorists would more probably devote themselves to harassing the smallest outposts and to seeking to destroy the material resources of the Canal zone. Their efforts are, in any case, likely to prevent a less serious problem than would the total withdrawal of Egyptian labour and supplies. To adjust itself to the latter possibility the garrison of the zone will have to reorganise much of its present way of life.

Japan's New Mainland Trade

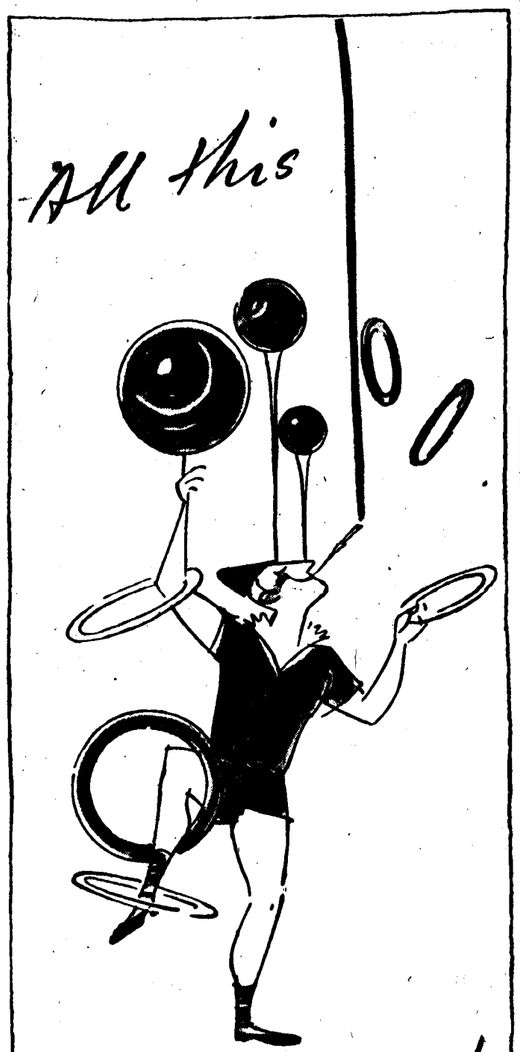
ON September 20th the Japanese Trade Ministry announced new and more liberal regulations under which trade with Communist China could be carried on. These relaxations had been made possible by the recent removal of American controls over Japanese textile exports to China. Their most important effect is that Japanese businessmen may now offer textiles in exchange for imports of Chinese coal, iron ore, salt, soya beans, tung oil and other basic commodities. This may prove a much more significant advance towards the revival of Sino-Japanese trade than at first appears, for the exchange of textiles against Chinese coal and iron ore has in the past been one of the great staples of Japan's foreign trade.

Before the war Japan imported 3,500,000 tons of coal a year from the mainland, and as recently as last year 65 per cent of all its coal imports came from Communist China. Japan's steel industry is particularly interested, because the coalfields of Japan itself produce little coal suitable for steel-making, and China is the only source of coking coal within a reasonable distance. The embargo on trade with China imposed after that country entered the Korean war forced the Japanese to buy coking coal for their steelworks in America and even more distant countries, at nearly double the Chinese price and with a serious aggravation of their shipping shortage.

There is little doubt that the Peking Government, which has been grappling with an acute shortage of cotton this summer, will welcome the new development. Japanese business men have, of course, expressed great enthusiasm, and are talking about a possible Chinese demand for 100 million yards of cotton goods a year, at least half of which they feel sure they can meet. It is reported in Tokyo that exporters have already requested permission to ship over 10 million yards of cloth to China. And in addition to the exchange of cotton textiles for coal, Japanese firms are negotiating the sale of rayon and other chemical textiles to China against payment in sterling.

Tokyo officials are still cautious about the extent to which Japan can recover its formerly vast trade with the mainland while it is limited to offering the Chinese textiles and consumer goods; but the Trade Ministry hopes to obtain 300,000 tons of coal and 100,000 tons of iron ore from China during the current financial year, and permission has already been granted for an import of 38,500 tons of coal. These figures are, of course, small in comparison with those of prewar years, when a quarter of all Japan's trade was done with China and Manchuria. They are small, too, in relation to Japan's immediate needs; it is estimated that in the second half of this financial year the country will be short of coal to the tune of 1,630,000 tons. The Sino-Japanese trade door is by no means wide open. But the new concessions, coupled with the recent exemption of Japan from the American ban on economic aid for countries which supply strategic goods to the Communist world, have enabled the Japanese to wedge a solid wooden sandal into the opening.

China Effervescent



PEKING has just been celebrating the second anniversary of the foundation of the Chinese People's Republic with military parades, loud boasting and a crescendo of abuse of the "imperialist" nations. The organisation of political propaganda in China by the present regime differs not merely in degree, but in kind, from anything which has been attempted in that country before. There is a systematic effort on a grand scale to speak directly to the vast uneducated masses and to instil into their minds without the possibility of dissent or criticism just the opinions, sentiments, and versions of news which the Government thinks it proper for them to have. Hatred and contempt for the West are being inculcated in a manner which makes all earlier "anti-foreignism" in China seem mere child's play. The character of the new publicity organisation may be appreciated from a study of the instructions recently issued in a joint resolution of the News Administration of the Central Government and the All-China Federation of Labour. It has been laid down that in factories, mines and enterprises with over 300 workers which do not already possess wireless sets, trade unions must have them installed at public expense; sets are also to be installed in workers' dormitories and "workers and their dependents should be organised to listen in during their leisure hours." This organised listening-in should be regarded as a main task of the unions and "should be regularly inspected and directed"; it should be used "in promoting production, organising studies of current affairs, carrying out political education and developing cultural and educational activities." Parallel with this approach a great political drive is being organised through the China Educational Workers' Union, said to be 490,000 strong, for intensifying the "Resist-America-Aid-Korea" campaign and collecting donations for the purchase of arms.

America's Weakness Stressed

The Chinese people has certainly never before been subjected to such pressure to convert it to active support of its government's policies, and it must find cause for strong emotions in the version of events unanimously presented to it through all permitted channels of publicity. The Chinese are taught that they are directly menaced by the Americans and by America's 47 puppet states which signed the San Francisco treaty, but that nevertheless, in alliance with the Soviet Union, they are more powerful than their adversaries. According to a widely broadcast editorial of the *Jenmin Jih Pao*, the American Government is

> in every respect similar to Japanese imperialism of six years ago. It is the deadly enemy of the Chinese people, of the peoples of Asia, and of the peoples of the world. However, one should not look only at the extremely evil countenance of US imperialism and fail to see why it is actually heading towards collapse. The plans of US imperialism to conquer Asia and enslave the Asian peoples are dangerous, but at the same time flimsy.

It is held that the American Government, "which represents only a handful of multi-millionaires such as Morgan, Rockefeller, Du Pont and Mellon," has failed to learn the lesson of the defeat of Japan by the Chinese and Russian peoples—America's Pacific campaign naturally gets no mention in this context—or to appreciate the "irresistible strength of the Asian peoples in fighting for independence." The self-restraint of the American and other United Nations Governments in keeping the war confined to Korea despite the Chinese intervention is inevitably misrepresented by Chinese Communist publicity as proof that the Americans and their puppets have been defeated in Korea. The Kaesong armistice negotiations have in this respect served the purposes of the myth most admirably. They were initiated on behalf of China at a time when the Communist forces had been so roughly handled that there was a possibility of a military collapse which could not have been concealed. The

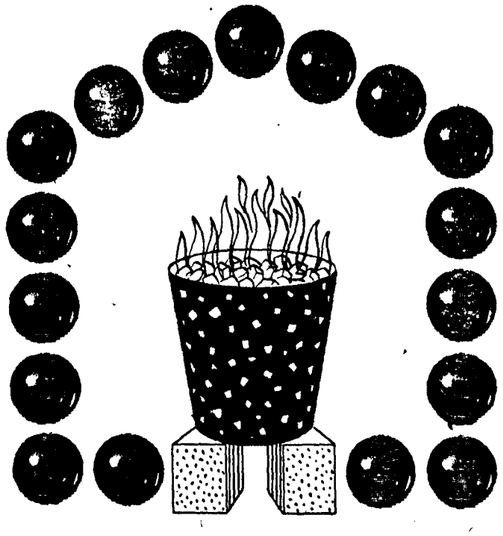
Welcome to the Inn



There is nothing which has yet been contrived by man by which so much happiness is produced as by a good tavern or inn.

DR. JOHNSON

beer is best

Issued by the Brewers' Society, 42 Portman Square, London, W.1

What goes on?

Usually, it goes like this: You pay for fuel to warm you and your house, and the warmth merely passes you by. It goes on through the room, on through the walls and on into the Great Beyond. Unless, indeed, you already have 'Fibreglass' in your walls and ceilings. 'FIBREGLASS'—THIN GLASS FILAMENTS SPUN FROM GLASS MARBLES — IS THE WORLD'S BEST INSULATION MATERIAL for heat, cold, sound or electricity. Installed under your roof, it keeps the temperature up, the fuel bill down and the future cosily secure (it lasts for ever).

FIBREGLASS TRADE MARK

FIBREGLASS LIMITED, RAVENHEAD, ST. HELENS, LANCS. ST. HELENS 4224

Kaesong talks averted this danger, while at the same time the fact that no armistice has resulted and that active hostilities have continued has enabled Peking to claim not only that the Americans "have been creating one provocative incident after another to torpedo the armistice talks," but also that they have launched a major offensive which has been repelled by the North Koreans and Chinese "volunteers." Peking radio quotes with satisfaction the Australian Communist Burchett, who is a war correspondent on the Communist side of the Korean front:

> the planes under Ridgway's command dare not tangle with Korean air force MIGs . . . the latest British aircraft have been pulled out of front-line duties and relegated to ground support because they are completely outmatched by MIGs and downed with ease. . . . Van Fleet, with the racial arrogance of his military caste, croaks that there are Caucasian specialists at the front ; he cannot bear to think that his crack troops have been hurled back from the "iron triangle" by Asians.

New Arrogance

The Chinese have now apparently completely recovered their nerve, which had been temporarily shaken by the military reverses in the spring. The Communist leadership indeed deserves the utmost admiration for the skill with which it has utilised armistice negotiations to paralyse the United Nations Command while avoiding an armistice. The extreme arrogance and boastfulness of tone which were characteristic of Chinese Communist utterances at the beginning of the year have now returned. Speaking of the alleged American use of Japanese manpower and resources for intervention in Korea, the *Kwangming Daily* declares:

> This is something which cannot be tolerated by the Asian peoples—including the Japanese people—and particularly the peoples of China and the USSR who are chiefly responsible for safeguarding peace in the Far East. This bloodthirsty and aggressive alliance, aimed at promoting war, undermining peace and endangering the interests of the Asian peoples, will surely be smashed by the invincible and matchless forces of the Asian peoples, first and foremost the forces of China and the USSR.

Just how, when and where these invincible and matchless forces are to be brought to bear is not explained, but the endless reiteration of such language, combined with the impression made by China's seemingly successful intervention in Korea and immunity from counter-attack, are preparing the Chinese mind for further adventures in which there will be no doubt of victory.

Stalin's Atom Story

LAST week Marshal Stalin informed readers of *Pravda* that "it is known that the Soviet Union has several times demanded the prohibition of the atomic weapon, but each time it has been refused by the Atlantic *bloc* of powers." The bland assertion that the USSR has always sought to save the world from atomic war, while the West has always blocked its efforts, is one of the mainstays of Communist propaganda. By constant repetition, such claims have been made to assume the appearance of fact in the minds of many people who have no time to study the record in detail. But the record itself tells a very different story.

At the very first meeting of the United Nations Atomic Energy Commission (AEC), on June 14, 1946, the United States, which at that time was alone in possessing atomic weapons and the secrets of their manufacture, offered to transfer the whole of its resources in this field to an international Atomic Development Authority, in which it claimed no privileged position. The American proposals, known as the "Baruch plan," were based on "renunciation of the bomb as a weapon," disposal of existing bombs, and a great co-operative effort to use atomic energy for peaceful purposes. "The peoples," said Mr Baruch, "want a programme not composed merely of pious thoughts, but of enforceable sanctions—an international law with teeth." His government therefore held that, if there was to be any real security against the atomic threat, "there must be no veto to protect those who violate their solemn agreements not to use atomic energy for destructive purposes." The Baruch plan was discussed at length, and endorsed, after amendment, by every member of the AEC except the Soviet Union and Poland. The only concrete counter-proposal tabled by Mr Gromyko called for the signing of a convention by which all nations would solemnly promise not to make or use atom bombs, and to destroy any bombs they had ; this convention was to make no mention of enforcement, or even of international inspection. Only the faithful Polish delegate supported this proposal, which to most AEC members seemed a classic example of "pious thoughts."

Mr Gromyko did, however, admit that some sort of control system should in due course be created. Accordingly the AEC set up a committee of scientists to examine the technical possibility of effective control. In September, 1946, these scientists (including Soviet and Polish specialists) unanimously reported that, as far as available information went, control was technically possible. They also agreed that "clandestine manufacture of atomic weapons would be extremely difficult to discover, because it could be carried out in relatively small, easily concealed installations." A second technical committee went into the control question even more carefully and reported that any really effective control system must include actual management of some stages of atomic energy development by an international authority. This committee also found that the international authority would need to have the power to make area and ground surveys ; but it recommended that powers of this kind should be carefully defined to prevent abuse. All members of the AEC, except the Soviet Union and Poland, approved these findings.

Insistence on Veto Power

On June 11, 1947, the USSR made its first proposals regarding inspection and control. In their first form these were vague on many points ; but, under questioning, Mr Gromyko revealed that the USSR still rejected any idea of international management, intended inspections to be only "periodical," forbade aerial surveys, and insisted that decisions even on minor sanctions could only be made by the Security Council—with its veto rule. In August, 1947, all members of the AEC, except the USSR and Poland, regretfully stated that the Soviet proposals were inadequate as a basis for effective control. The AEC, which had for over a year refrained from committing itself to a precise formula while it was still possible that the USSR might abandon its opposition, now formally adopted a report endorsing the need for effective international control on the lines of the Baruch plan. The USSR opposed the report and Poland abstained.

No progress was made during the next eight months, and in May, 1948, the AEC adopted (all members concurring except the USSR and the Ukraine) a motion suspending its meetings until the General Assembly should think fit to revive them. On November 4th the Assembly asked the AEC to resume meetings, and by 40 votes to six (the six being the Soviet *bloc*) endorsed the view of the majority in the AEC. The Assembly rejected, by the same large majority, a Soviet resolution repeating Mr Gromyko's proposals of June, 1946, and June, 1947. Undaunted, Mr Gromyko served up similar proposals to the AEC in February, 1949 ; they met the same fate. In July, 1949, the AEC again

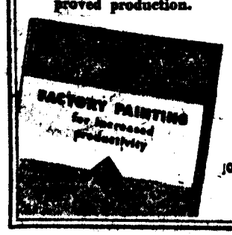
suspended its meetings, but in accordance with the Assembly's wishes private talks were then begun between Britain, Canada, China, France, the USA and the USSR. In January, 1950, Mr Malik ended these talks by walking out.

Meanwhile the Assembly had in November, 1949, rejected yet another Soviet proposal, on the now familiar lines, and had adopted instead by 53 votes to 5 the "Essentials of Peace" resolution, which called for the "joint exercise" of sovereignty in achieving atomic control. The same thing happened at the 1950 Assembly, which by the usual large majority rejected Mr Vyshinsky's proposals and voted 49 to 5 for the "Peace Through Deeds" resolution calling for atomic control on the basis already approved.

If the USSR has been consistent in blocking agreement on any effective control system which would impose a real ban on atomic weapons, its record has been less logical in other respects. In 1946 Mr Gromyko held that the importance of international inspection had been grossly exaggerated; but in 1948 he claimed that the USA was paying less attention to it than the USSR, which, he said, treated it as one of the most effective methods of control. Throughout the debates the USSR has championed the cause of unfettered national sovereignty, alleging that international control would enable the USA to interfere in the affairs of smaller countries; and the fact that every small country in the UN (except the Communist states) voted for joint exercise of sovereignty in 1949 has in no way altered the Soviet attitude. Most striking of all these contradictions was Marshal Stalin's admission last week, after years of assertion that the USSR was only using atomic energy for peaceful purposes, that it was producing several types of atomic bombs. Perhaps it is forgotten in Moscow that in 1948 Mr Gromyko defined atomic bombs as "weapons of aggression, designed to exterminate peaceful populations" and derided any suggestion that they could be weapons of defence.

The Plight of Italy's Heavy Industries

[BY A CORRESPONDENT]



REGGIO EMILIA, a market and industrial town of 120,000 inhabitants, lies at the centre of the Emilian plain, otherwise known as the "red belt" of Northern Italy. It contains the Reggiane Mechanical Industries works, which until last Monday had for over a year been forcibly occupied by those of its former employees who obeyed the orders of the Communist trade unions. The recent history of the Reggiane is an acute example of the ills that have afflicted Italian heavy industries in the postwar period.

The main business of the Reggiane was, in normal times, the building and repair of railway rolling-stock, though it also made a variety of industrial and agricultural machinery. During the war, however, the firm rapidly expanded and diversified its activities; by 1941 it was making fighter 'planes and employing 11,000 men. Then, in 1944, 70 per cent of the plant was destroyed by bombing; by the end of the war the labour force was down to 2,500. The firm entered the postwar period burdened with the cost of reconstruction, estimated at 1,800 million lire (about £1,000,000). But this was not all. Like other heavy industries of the same type, it was obliged by law not only to keep on or reinstate part of its inflated wartime labour force, but to take on—for "social" reasons—others whose claim to employment was their status as ex-servicemen, ex-partisans, and so forth.

As a result, the total labour force at the Reggiane shot up to 5,800. It remained at this figure for several years, since until 1948 it was legally impossible to dismiss anybody; and even after that date any attempt at dismissing redundant

What colour is more production?

That's what we said: if you find a factory producing more, more quickly and efficiently, what colour do you expect to see on the walls, the machinery, the controls?
This question matters a lot, and of course there's no single answer to it. But we do know an answer to eye-strain, greatest single factor causing fatigue and keeping production down. That answer is: careful colour planning. Dingy dark greys and browns, which cloak dirt instead of making it easy to shift, are not good enough—even positively harmful sometimes. Yet at no extra cost, when painting, factories can be made lighter, more cheerful, easier places to keep clean and to work in.
This improved atmosphere is always followed by improved production.

In 'Factory Painting for Increased Productivity' you'll find principles that can be applied with profit to any factory, simply and interestingly set out with practical illustrations in colour. We will send you your copy, free of any obligation, if you will write for it to

SODIUM

THE element sodium, a soft silvery and highly reactive metal, is never found free in nature but is widely distributed in the form of compounds. The best known of these is sodium chloride or common salt—the raw material from which sodium and many of its compounds are produced commercially. Salt occurs abundantly in sea water, but industrial supplies are obtained mainly from deposits of rock salt left in the earth's crust by the evaporation of prehistoric seas. Apart from the use of sodium in sodium vapour lamps, a familiar form of street lighting, the element itself is little known outside the chemical industry.

I.C.I. produces sodium for a number of industrial processes, and uses it in large quantities to make sodium cyanide—for gold extraction, casehardening and electroplating—and sodium peroxide for textile bleaching. Other sodium compounds produced by I.C.I. include salt, and the important heavy chemicals caustic soda and soda ash. Caustic soda is essential to the manufacture of soap, paper, textiles, explosives and dyestuffs. Soda ash is used in so many different industrial products and processes that it is almost as vital to a nation's industries as coal or iron.

workers inevitably ran into strong opposition from the trade unions—chief among them the Communist-dominated Chamber of Labour—whose first tenet, naturally enough in a country ridden with chronic unemployment, is the prescriptive right of a man once employed to be always employed. As there was never enough work to go round, the firm—and its case was anything but unique—was in fact paying, through an inflated wages bill, a disguised dole to several hundred, if not several thousand, of its employees. Of course it did not do the state this service for nothing. Formerly financed wholly by private capital, the Reggiane received, from 1945 to 1950, a total subsidy of 4,240 million lire (about £2,500,000), mostly in the shape of loans from the FIM (Mechanical Industries Fund), the government agency whose task it is to shore up such troubled concerns. Though the FIM also came to hold part of the issued capital, it does not seem to have taken part—as it has elsewhere—in the actual management of the firm.

It is an open question whether the Reggiane, any more than its fellow-patients in the FIM infirmary—Breda, Caproni, Isotta Fraschini, Ducati and the rest—could have overcome the handicaps of permanent over-expansion, leading to artificially high wage-costs and overheads, and of a system of hand-to-mouth government finance scarcely designed to encourage initiative. The charges levelled at the Reggiane management by the trade unions are very similar to those recently made against such sister industries as Breda and Savigliano by economists whose political motives are not suspect: excessive reliance on old markets (the Reggiane in fact went back to doing 75 per cent of their work for the State Railways) and lack of initiative in working out, and retooling for, new individual lines of production, and in seeking new markets. At all events the Reggiane's position worsened steadily as orders from the State Railways tapered off after the initial period of reconstruction, and new orders failed to come in: by the time the crisis came in 1950 the deficit had risen from 754 million lire in 1948 and 514.5 million lire in 1949 to a rate of 4 million lire (£2,350) per day.

Labour Takes Over

In May, 1950, the management, which in 1949 had managed to dismiss 800 employees by paying them a special bonus, attempted to dismiss 2,200 more. All three trade unions—Communist, Catholic and Social-Democratic—joined in fighting the move. Attempts at a compromise solution came to nothing; in October the dispute culminated in the occupation of the plant by the Chamber of Labour, this time alone. For a few months its members kept the plant running after a fashion; early this year the electricity was cut off, and since then about 3,000 men have merely checked in and out every day. Finally, in May of this year, the government decided to write off the Reggiane as a dead loss and place it in official receivership; eventually a new society was to be installed and the plant gradually brought back into operation on a very reduced scale. The Chamber of Labour, however, refused to evacuate the plant unless the dismissed workers were paid a special bonus over and above the normal one: the estimated cost to the Italian Treasury is about 1,000 million lire, which the government last Monday agreed to pay.

The Reggiane dispute became a national affair. The Italian Confederation of Labour (CGIL), besides launching a nation-wide campaign to "save the Reggiane," used its case to support the programme of higher capital investment and "productivist" policy which it—in common with the ECA mission and the left wing of the Christian Democratic party—has been urging on the government. For the Communists the matter was largely one of prestige. Reggio was the birthplace last winter of the Cucchi-Magnani breakaway movement: there even less than elsewhere could the party afford to let its campaign against retrenchment in industry appear a failure. So little, indeed, was this a local matter that *Unità* recently published a message of encouragement to the women of Reggio from the mother of a celebrated Soviet war heroine.

Though the new concession will be claimed by the Communists as a victory for their leadership, the government has in fact clearly decided that it cannot afford to leave Reggio and the surrounding province in a state of economic depression and political ferment. It is trying to salvage what it can of the Reggiane, as it has come to the rescue of other over-expanded and tottering industries. The great Breda works near Milan, for instance, after eating up 27,000 million lire (about £16 million) in FIM subsidies, is now being reorganised on a smaller scale by a government commissioner. The Marchetti aviation works in Lombardy, which went bankrupt early in September, and the Savigliano and Nebiolo works at Turin, which are in much the same position as the Reggiane was in last year, are other candidates for government help. It remains to be seen whether these industries, whose troubles have chiefly been due to war and its consequences, can be helped back on to their feet by the Nato rearmament programme.

No Change in Israel

ISRAEL'S long Cabinet crisis is at last over. Mr Ben Gurion's Socialist Mapai party has formed another coalition with the religious bloc. Over two months of negotiation have led to a solution which must astonish all who remember the bitterness of the Mapai's quarrels with the religious bloc last winter, as much as it must depress all who hoped that the elections on July 30th would lead to a more stable and strongly-based government for Israel.

The Socialist Mapai emerged from the elections with 45 out of the 120 seats—more than any of its rivals, but not nearly enough to be able to dispense with coalition partners. The two next largest groups are the General Zionists with 20 seats, and the very left-wing Mapam with 15. Alliance with the latter, which is pro-Russian except where Russia is anti-Zionist, would have jeopardised the dollar flow on which Israel depends. The former have a strong claim to be included in the new Cabinet since they increased their representation from 7 to 20 seats, but negotiations with them broke down over Mr Ben Gurion's refusal to allow the General Zionists to appoint a trade minister with authority over rationing and controls. Mr Ben Gurion was moved not so much by reluctance to put aside some of his socialist doctrines, as because he feared that the backbone of Mapai—the trade union vote—would be alienated if he struck a bargain with the big business opponents of recent strikes and wage-claims. Hence his efforts at one stage to include Mapam as well as the General Zionists in his team. Hence also his less ambitious but apparently equally abortive effort to wean the moderates from the extremists inside Mapam and thereby to split their party.

In the event Mr Ben Gurion has dismally failed to gain the object—of securing a more stable majority—for which he went to the polls. Indeed he will be worse off, since his majority in the *Knesset* has shrunk from 28 to 10. Moreover, in order to secure the adherence of the religious bloc, Mr Ben Gurion has had to agree to shelve for the time being the question of religious education in the immigrant camps, over which the coalition broke apart in the Spring. This concession to the religious zealots is bound to create friction within the Mapai, since many of its members have strong anti-religious views. Altogether, a long life seems unlikely for such a weak coalition, which fails to take account of the trend of public opinion as revealed at the polls. It is certainly the sort of government which a country in dire economic straits can ill afford.

THE BUSINESS WORLD

The British Motor Industry—I

Markets for Motors

THE re-shipment from Canada of several thousand British cars as "unsaleable" is not the happiest of portents for this year's Motor Show. This year, for the first time, the car export curve that rose so consistently between 1946 and 1950 has turned downward; in the eight months to the end of August, 240,811 cars and chassis valued at £74,735,808 were sent overseas, compared with 269,792 worth £78,376,002 in the same period of 1950. The decline can be attributed almost entirely to transitory, local, and even fortuitous circumstances. Reduced allocations of sheet steel and non-ferrous metals have cut car production this year by 8 per cent; exports have fallen by 11 per cent. Cars are being sent back from Canada as a result of drastic restrictions on hire-purchase. Exports to Australia and New Zealand, the British car industry's largest markets, were hampered in the early summer by the dock strikes. Exports of commercial vehicles rose by value and increased shipments of tractors and automotive spares have raised the total export earnings of the motor industries to a record rate of some £300 million a year, the biggest return for any British exporting effort. Britain is probably exporting more cars than any other country but even without this year's reminder that market conditions can change quickly, the progress of British car exports since the war would have brought in its train inevitable questions. To what extent has success been due to conditions that may not be permanent such as shortage of dollars? In an expanding and more competitive world could the British lead be maintained? What are the rewards of success, and how can it be promoted?

There are three main types of cars that compete—or under normal conditions might be expected to compete—in the world market. First, the great bulk of American sales are of standard six-seater cars, with an unladen weight of 29-32 cwt.; secondly, British models are mainly in the 20-24 cwt. range, with a proportion of cars of 15-16 cwt.; thirdly, sales by continental makers fall chiefly between 12-14 cwt. with a proportion between 20-24 cwt. The post-war pattern of the world car trade might be crudely summarised thus. About half the exports of British cars go to countries where the average purchaser has scarcely any opportunity to buy an American car and little to buy a Continental car. Where the customer has some freedom to choose, American cars are rather more popular—as in Canada and South America where conditions are more akin to those of the United States than to this country. British cars of medium size have so far been able to hold their own with purchasers in middle-income groups abroad, but the lower-priced and more economical small Continental cars such as the Renault, the Fiat, and the Volkswagen are beginning to threaten them. The risk is that the British car industry will have to fight for sales at one end of the scale against the large and cheap American car, and against the small Continental type at the other end. If the industry is to hold its leadership and increase its exports it will, under conditions of more competitive world trade, have to produce attractive vehicles at lower prices.

What characteristics would such a vehicle need? After the war there were some suggestions that British car production should be rationalised with the aim of producing cars closer to American standards. Such cars as the Chevrolet, Ford, and Plymouth, with a wheel-base of 110-115 inches, a weight of up to 30 cwt., an engine developing up to 100 h.p., and with room for six passengers, give the ordinary American family as much "transportation" as it can use. In the course of time, perhaps 90 per cent of American families will own such cars, probably equipped with automatic transmission and improved engine designs, and easier to drive. For many years American manufacturers have been studying the pros and cons of making smaller and cheaper cars that might attract buyers with lower incomes or those who seek a second car. Experience of the marketing of British cars in the United States since the war may tend to reinforce their previous conclusion—that such smaller cars could not be made at a price necessarily determined by the price of a second-hand car of standard size.

No American car producer is likely to build a car designed primarily for the overseas market; on the other hand, any apparent saturation of the American home market—if preoccupations with defence were out of the way—might lead to considerable promotion of standard car exports at sharply competitive prices. In those markets where dollars are available, such cars will always find a certain sale and there is no evidence at all that British manufacturers could produce and sell an American-sized car at a similar price in these neutral markets.

PASSENGER CARS
NUMBERS EXPORTED BY PRINCIPAL PRODUCING COUNTRIES, JANUARY TO MARCH, 1951

From:	Europe	Per cent	America	Per cent	Oceania	Per cent	Africa	Per cent	Asia	Per cent	Total Exports	Per cent	Exports as Proportion of Total Production Per cent
UK	19,390	58·0	19,233	33·9	31,989	89·9	16,181	61·9	6,029	59·3	88,821	44·3	72·5
USA	12,115	17·5	35,138	61·1	210	0·6	3,612	14·9	3,092	22·9	52,167	26·0	3·3
Germany ..	20,996	30·3	3,392	4·1	3	...	1,493	6·1	108	0·8	25,279	12·5	37·6
France	11,288	16·4	2,482	4·2	1,418	4·0	7,434	30·6	1,159	8·7	23,782	11·9	29·0
Italy	5,082	7·4	486	0·8	260	0·7	810	3·5	229	0·8	7,248	3·6	22·6
Canada ...	288	0·4	361	0·6	1,699	4·8	979	4·0	291	2·1	5,590	1·8	4·0

There will doubtless be buyers, small in numbers and high in incomes, for the full-size British car of high quality and price. The money value of this trade cannot be considerable, though vehicles of such excellence may enhance the prestige of the British motor industry as a whole. But major growth of the world car market may well rest in future upon an increase in the numbers of people just able to afford a car, at the lowest cost of ownership. If Britain and its non-American competitors can produce vehicles of which total costs of ownership and operation are substantially less than those of American cars, American export sales may be confined to a relatively small part of the total market.

*

The most acceptable size of car can only be determined by the trial of the market place. In postwar years, British makers have plumped almost unanimously for the vehicle of 19 cwt. and upwards in weight. The typical vehicle accommodates four people in real comfort, or six at a pinch, has an engine developing 45 or more brake horse power, and a top speed of 70 m.p.h. or more. Such are the Ford Consul and Zephyr, the Austin A.40, the Morris Oxford, the Standard Vanguard, the Vauxhall Velox and Wyvern, the Humber Hawk (a little above this specification) the Hillman Minx (a little below it), and the Jowett Javelin. A rather smaller class of car, pretty tightly filled with four adults, includes the Morris Minor, the Ford Anglia and Prefect, and the Triumph Mayflower. The small Fords are basically of prewar design: the Triumph Mayflower is based upon a "loosed out" version of the old Standard 8 h.p. engine but has a kerb weight of more than 17 cwt.; even the Morris Minor, which has earned high praise from connoisseurs, weighs over 15 cwt. No British car since the war has provided economy motoring for two persons as did the Austin Seven and the Standard Eight before the war, still less in the even more effective way of the small Renault (with a kerb weight of 12 cwt) and the Volkswagen (14 cwt) now. At next week's Motor Show, the Austin Company is expected to exhibit the new Austin Seven; it may come to represent the first British trial of this size of car in world markets.

It may be that the world car market of the future will be mainly divided between two types of vehicle—a 20 cwt. car and a 12½ cwt. car; it is not possible to predict their relative proportions. Broadly, Britain leads the world in the medium weights, and has yet to venture into the lightweight class. Germany with the Volkswagen, France with the small Renault and Italy with the tiny Fiat, have shown that, at that weight, a most serviceable automobile can be built at a cost of ownership very much lower than that of larger cars. If everything were done to reduce costs, the smaller car might well be the winner, at least among industrial workers and city dwellers. In Europe, for example, and conceivably in Britain, the cheaper car might succeed largely by attracting new owners; the broadening of the market might promote production economies, reductions in price and a second expansion of the market in a virtuous spiral. Elsewhere in the world, such small cars might find less ready acceptance—in the rural areas of the British Commonwealth, for example, where distances are long and comfort and road-holding are at a premium. But it is necessary to remember that potential car owners in the lower income groups would be able to satisfy their needs by the once normal means of the second-hand car market if the present pressure of demand for cars in Britain and Europe were to abate only moderately.

*

If Britain could continue to dominate the bulk car market of the future, either with its present range or with a long-sighted choice of new designs, there is no reason why this country's total automotive exports should not rise further from the present level of £300 million. Exports of commercial vehicles in the larger sizes are largely independent of the trend of car production and exports: but in the export of smaller commercial vehicles and tractors, the success of the car producers can have a considerable influence. The industry now faces the task of keeping the leadership in car exports that it has achieved since the war. This will not be easy; the return of Germany into the world market is only one of several signs of sharpening world competition. In meeting growing competition in the future—so far as it is possible to peer across current defence tasks towards a "normal" competitive period—some internal tightening of efficiency within the British motor industry may well be dictated by events. The success of the industry's export campaign during the postwar period of inflated demand has stilled to some extent suggestions of rationalisation and concentration of output that were made shortly after the war—and the industry has itself carried out a considerable programme of standardisation. These suggestions may have a revival in view of the production problems that now face the industry and the competing claims of defence.

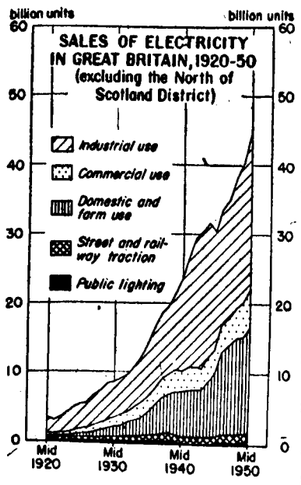
Economics of Electricity



A WEEK ago, in the advertising columns of the national press, the British Electricity Authority ventured a prediction: "If plans for new plant go through smoothly in the coming years, there should be an end of power cuts by 1956." BEA's annual report for 1950-51, published this week, is much less sanguine. If "nothing untoward" affects a forecast made early in 1950 of the quantity of new generating plant that can be installed in coming years, and if the growth in demand accords with expectations, load-shedding by power cuts should be comparatively infrequent by 1954-55 and very exceptional in the three following winters, though reductions in frequency and voltage would still occur. It adds:

> Unless, however, the annual programmes of new generating plant could be speedily increased, as planned, from the 1951 level of 1,000,000 kilowatts (sent out) to at least 1,800,000 in 1956, 1957 and 1958, it would be many years, on current expectations of the growth in demand, before full supplies could be given at all times.

Since this precondition at present conflicts with Government policy (which has set the limit of plant to be installed in any future year at 1,500,000 kW, not 1,800,000 kW), and since the report points out that rearmament is already hindering plant installation and must exceptionally increase industrial demand for power, it seems too early to talk of an end of power cuts. In power planning, moreover, much depends upon "expectations of the growth in demand" that can by definition be little more than guesswork.

By tradition as well as expectation, BEA sets its sights high. Once again, the report expresses its "serious concern" that the Government, in apportioning resources for capital investment, should continue to limit its annual generating quota to 1,500,000 kW. Even in present economic conditions, it argues, the completion of the plant programmes is in the best national interest; limitation would hinder increased mechanisation and use of power in industry, from which the most effective contribution to higher efficiency can flow. What the report does not emphasise is that the limit has not so far affected BEA's plant installation. This year, it still hopes to instal a million kilowatts of new generating plant, but its success depends upon the speed of manufacture and installation, not upon official control of investment. The Government's limit on capacity, upon BEA's most optimistic assumptions, would not begin to affect the commissioning of plant before 1954. Certainly, generation programmes have to be completed and orders placed some years in advance, but ordering has not yet been affected though it might be next year. Last year, indeed, the Authority overspent its investment "allocation" of £102 million by £19 million, which was only partly attributable to rises in wages and prices. For this year, the report sets out proposed investment totalling £133 million, but it records that halfway through the year it had no more to go on than Mr Gaitskell's vague remark that investment in electricity would be "substantially higher." The accompanying report of the Minister of Fuel and Power similarly records only that "it was decided that investment for electrical generating plant should be commensurate with a programme of commissioning of new plant which should reach 1,550,000 kW in 1955; some restriction of new distribution works was unavoidable" and that a programme had been agreed. This does not suggest the tightest of financial curbs upon the generating programe.

Ever-expanding demand exerts great strain upon BEA's physical and technical resources, as is illustrated by the report's account of a typical day's operations on the grid: but on the other side of the penny it makes for buoyant commercial results. During the year ending March 31, 1951, electricity sales reached 46,585 million units, 12 per cent more than in the previous year, a third more than in 1947-48 before nationalisation, and well over double the sales in 1938-39. This energy was sold to more than 13 million customers, at 1.181d. per unit against 1.2d. per unit in the previous year and 1.133d. in the last year before nationalisation. Sales of electricity thus brought in £229 million, or 97 per cent of the total turnover of BEA and the Area Electricity Boards: this reached £237 million, £22.5 million more than in the previous year. It was, however, more than offset by a rise in combined expenditure of £23.4 million to £230.7 million. On the year, therefore, BEA and the Area Boards made a combined surplus of £6.3 million (after paying £20.4 million in interest and setting aside £36.1 million for depreciation); this surplus compared with £7,200,000 in 1949-50 and £4,400,000 in 1948-49. Though the withdrawal of initial allowances next April was announced after the close of BEA's financial year, the Authority decided "forthwith" to make provisions towards offsetting the consequential increase in taxation charges that will arise in future years as the "interest-free loan" comes to be repaid. It has established a taxation reserve with a first contribution of £3,500,000 from the 1950-51 surplus. Last year, Lord Citrine declared that since "we can foresee no period in which we shall cease growing, we do not think the tax question will arise." This year, the report comments sombrely:

> The imminent withdrawal of initial allowances will terminate the virtual exemption from taxation which . . . the Authority were experiencing; and this change of fortune cannot fail to have an impact upon both bulk and retail prices of electricity.

Such a growth in volume of output might be expected to bring down generating costs: but in an industry manufacturing secondary power mainly from coal, fuel prices tend to determine station costs. In 1949-50 this influence brought costs down slightly; in 1950-51, it put them up a little (though the flat 4s. 2d. a ton increase in coal prices of February, 1951, would hardly be felt in the year under review). The high loading of the system at present, through shortage of generating plant, tends to have an adverse effect upon costs, instead of the advantages it would bring in an ideal system with plant of uniformly high efficiency; as the load rises, more units have to be generated by the older, less efficient stations that take more fuel.

Capital charges rose from £52.55 million in 1949-50 to £57.88 million in 1950-51, amounting to nearly 25 per cent of revenue. These charges reflect not only the growing depreciation provisions that must inevitably follow from the huge expansion programme, but also a slight increase in the average rate of interest that BEA pays. This increase followed from the substitution after May, 1950 of stock carrying 3½ per cent interest for temporary advances at lower rates; it is a reminder that the economics of the expansion programme would be vulnerable to any marked rise in interest rates. Some eighteen months ago Sir Henry Self, one of BEA's deputy chairmen, made some imaginative projections of the trend of electricity costs. The rise he then foresaw in charges for interest and depreciation is coming true. It may be that the increases in thermal efficiency he hoped for will accompany the new installations and offset the probable decrease in load factor as the shortage of plant decreases. But some of the other assumptions he had to make—such as unchanged prices for fuel are already unrealistic. The Authority is well aware of the trend of costs; Lord Citrine said frankly this week that tariffs are certain to rise.

*

In default of the national fuel policy that Mr Noel-Baker's latest committee is now beginning to study, no real comparison can be made between investment in the different fuel and power industries. But additional capacity should obviously be held to the minimum required to meet unavoidable peak demand. That means the utmost effort to level off peak demand, by economic or technical means. In former years the electricity supply industry has tended to set its face resolutely against anything that smacked of limiting demand; a tradition of competition for new sales and new consumers dominated its thinking. It is fair to say that during the last year BEA has begun, with some reluctance, to give the subject of load control really serious consideration for the first time.

Load-controlling devices may be of various kinds; all have the common purpose of reducing or limiting the peak loads on the systems, thus reducing in the long run the amount of new plant that has to be installed to meet that peak. But, as the report points out, considerable experience of load control would be necessary before its effect could be known sufficiently accurately to influence the plant programmes. In the meantime the devices would serve a secondary, but also useful purpose; they would substitute disconnection of specific "inessential" loads controlled by the limiters for the present indiscriminate load shedding, and might contribute to some easing of the load-spreading arrangements that now prove so costly to industry. Load-limiters or relays controlled from a central station, and thus operating only at time of peak load, have been suggested as the best line of approach to load control: and the BEA, according to the report, would prefer these types. It discusses the merits and demerits of central-controlled switches actuated by frequency (which could not be localised) or by voltage (which may be liable to accidental operation outside peak hours). The Authority is conducting extensive tests of centrally controlled limiting equipment in Merseyside and in South-West Scotland. In the meantime it has suggested to its Area Boards that they may go ahead with the ordering of certain types of load limiting equipment. Though the comparative costs have not been finally assessed, and probably many of the industry's engineers still retain their prejudice against any limitation of demand, there appears to have been a rather rapid, if qualified, conversion to the principle at headquarters.

In discussing load control the report makes its only detailed references to tariff systems. The connection is logical, if only because load limitation is the admission of failure in pricing policy. The account of commercial operations mentions a report upon "principles upon which uniform tariffs for domestic, commercial, farm and industrial supplies" should be based: but, unfortunately, there is no hint of what these principles should be. When it turns to tariff inducements to consumers to accept load control arrangements, it comes closer to a price system for electricity. Since peak load control would mainly affect capital charges, it considers the reduction of fixed assessment in a two-part tariff, or in the high-rate units of a variable block tariff, the best inducement to accept load limitation. The Authority still sets its face against time-of-day tariffs for larger domestic supplies, after a detailed investigation of the system of this kind now operated in Paris. This it considers "unlikely to be effective in securing reduction in peak loads." It may well be that "a tariff incentive reasonably related to the costs of supply is unlikely to be sufficient to offset the value to the consumer of the emergency use of electric space-heating in abnormally cold weather" as the report concludes in discussing one particularly objectionable use of electric power. But before dismissing the potential effects of economic pricing, would it not be as well to try it? The illogicality of

REVENUE FROM SALES OF ELECTRICITY, 1938-39 AND 1947-51, ANALYSED BY TYPES OF CONSUMER

Sell to CANADA!

There is still room on the Canadian market for millions of dollars' worth of the right British goods. Canada's first and oldest Bank will be glad to offer valuable information and advice on trading conditions and opportunities.

Enquiries welcomed.

BANK OF MONTREAL

47 Threadneedle Street, London, E.C.2

Head Office: MONTREAL

Over 570 branches throughout Canada

Assets Exceed $2,000,000,000

Incorporated in Canada in 1817 with Limited Liability

IT BEGAN WITH THE CRUSADES

We take some pride in our long history, but the business in which we are engaged is older than we are. Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to:—

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2.
West End (London) Branch: 28 Charles II Street, London, S.W.1.
Manchester Branch: 52 Mosley Street, Manchester, 2.
Liverpool Branch: 27 Derby House, Liverpool, 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank, under British management directed from London, are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

Trade with AUSTRALIA

A network of 600 branches and agencies provides a regular flow of trade information of vital importance to British business houses. For details of this service write to the Information Department of:—

EVERY CLASS OF BANKING BUSINESS THROUGHOUT THE WORLD

the present tariffs—or more accurately the lack of control that they allow over the industry's economic behaviour—is illustrated by the last year's trend of electricity prices. Last year Lord Citrine took credit for the fact that the average price to industry had been brought down, while the average price of supplies to domestic and small power consumers had gone up. This he rightly held to be a desirable trend. This year the exact opposite has happened—industrial prices, related to fuel, have risen while others fell. It would be unfair to assume any reversal of policy by Lord Citrine and the Authority. A more likely explanation, unfortunately, seems that the BEA still retains no real purposive knowledge or control of the effects of its multiplicity of tariff systems.

Business Notes

Winter Rail Planning

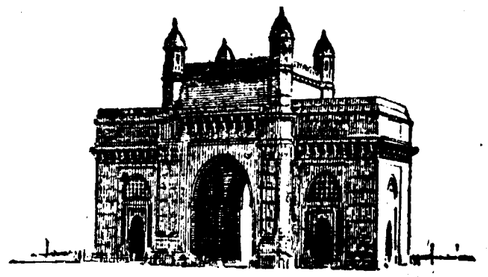
Details have been published this week of the steps that the Railway and Road Haulage Executives have taken, in association with the Federation of British Industries, the Association of Chambers of Commerce, and the National Farmers' Union, to prepare for the best handling of traffic in what is bound, even on the best assumptions about weather, to be a difficult winter. The forecasts of traffic have been made; the weak spots at certain key traffic junctions—in London, the Midlands, Manchester, South Wales and the West Riding—are known. The volume of freight traffic this winter is expected to be 5,000,000 tons heavier than last winter, and there are five per cent fewer staff to handle it—at particular centres where staff has been hard to retain and recruit, the losses are much greater than this average figure would suggest. Staff rather than shortage of physical equipment is at the root of the problem. There has been a disappointing response to the appeal to locomotive crews to increase their productive time; local shortages of labour cannot be remedied by increased wages at local points; and the call-up is still drawing men from railway working.

If these troubles can be remedied eventually, little can be done to put them right before the winter. The railways can only plan to handle the traffic that they expect to get with the staff that they now have, hoping at the same time that severe weather conditions, with fog and cold producing their inevitable crop of delays and sickness, will not strike the country. The emergency steps that are being taken are sensible—passenger train curtailment, diversion of freight traffic from congested routes, intensive week-end freight working (by which 450,000 tons of coal have been cleared in recent week-ends), the making up of block trains to avoid sorting of wagons at intermediate centres, cooperation with traders to get prompt loading and unloading of wagons particularly at week-ends, and provision for staff accommodation. The road haulage services will be used to relieve particular pressures on the railways.

Clearly, much will depend on effective local co-operation between the transport services and representatives of the traders. The railways are entitled in the circumstances to expect a determined effort on industry's part to keep traffic moving at week-ends; the spread of the five-day week in industry has increasingly forced transport itself into a five-day operating pattern that is a major impediment to the maintenance of a continuous flow of traffic. The ability of the 51 district committees, consisting of transport operators and users, to keep as many wagons on the move as possible during the worst of the winter is crucial to the success of the emergency exercise. Both sides will have their failures, but equally both have the highest responsibility to do their best.

* * *

Coal Stocks



It has been obvious for weeks that distributed coal stocks would not reach the "safety level" of 18 million tons by the beginning of the coal winter next month. Sir Hubert Houldsworth, at a fuel economy conference this week, put the highest level that could be hoped for in a fortnight's time at 17 million tons. There seems some likelihood, however, that this may prove sufficient, assuming that the high production of recent weeks may be counted on to give extra supplies at least until Christmas. In the last two months, the mines have produced 1,600,000 tons more coal than in the same period last year; of this about 650,000 tons came from higher production during the five-day week and 950,000 tons from Saturday working. But Sir Hubert emphasised that "we have just about squeezed the orange of Saturday working dry—we cannot expect much additional tonnage from this source in future."

His remarks on stocks were rather less encouraging. "Although we have managed to get through each winter," as he put it, "we were living on our fat." At the end of the coal winter, in April each year, stocks had fallen from 10½ million tons in 1949 to 9½ million tons this year. Assuming that stocks reach 17 million tons by November, and winter consumption runs as expected, stocks are likely to be 7,000,000 tons at the end of the coming coal winter. This figure may give an illusory impression of security. During any week, just over four million tons of those stocks must be counted as in transit; coal is counted into stocks the moment it leaves the pithead. A total of 7,000,000 tons, therefore, indicates that the country as a whole has merely a week's supply to hand; this will inevitably mean that many consumers have less. At the beginning of the coal summer consumers are naturally less concerned with stocks; yet with the present trends of coal production and consumption, there is a case for as much general stocking as possible during the year—particularly given the difficulties of winter coal transport. The margin between enough fuel and a crisis need not be more than four or five million tons of coal, representing little more than two per cent of the country's total inland consumption. If the saving of this amount were spread throughout the year, it is difficult to feel that it would occasion much hardship or loss in industrial output: but when it is concentrated into a few weeks in late January and February, it can cut supplies sharply enough to bring some works to a standstill.

Self-Defence by Belgium

Belgium has taken further measures in the last few days to protect itself from the consequences of persistent and substantial creditor status within Europe. As this issue goes to press, it is reported from Brussels that Belgium intends to refuse to accept at parity any EPU currencies, other than Swiss francs—an intention that, if put into effect, would destroy EPU. The latest indications are that Belgium accumulated a further appreciable surplus in the EPU compensations for September and has once again absorbed the whole of the additional credit facilities put at the disposal of EPU when Belgium's original quota had been exhausted. The first step taken to remedy the situation was to block 5 per cent of the proceeds of all Belgian exports to EPU countries. This was designed to divert Belgian exports to hard-currency areas, but the move is not expected to yield sufficiently rapid results and may, in any case, be circum-

The Gateway to India

Businessmen need go no further than London to find the key to the gate, for the National Bank of India can provide all commercial banking facilities needed for trade with the subcontinent of India. Moreover, the Bank's specialized knowledge of this area and of East Africa can be of great value to those interested in developing trade with these territories. Enquiries are welcome at Head Office and branches.

A comprehensive banking service is available at the Bank's branches in

LONDON OFFICES: 29 Threadneedle Street, E.C.2, and 47 Berkeley Square, W.1

(INCORPORATED IN NEW SOUTH WALES WITH LIMITED LIABILITY)

Lace and Licences

A large lace manufacturer had been notified by his Chilean Agent that an import licence had been obtained for a quantity of "lace for the embellishment of ladies' apparel". Aware that Chile prohibited the import of many luxury goods, the manufacturer asked us if such a contract would be in order.

On-the-spot information from our own Chilean branches enabled us to tell him that lace was one of several luxuries that might then be imported, but only against shipments of Chilean wine. From no other source would this vital information have been obtained so promptly.

THE ADVANTAGES OF BEING HERE AND THERE

As the only British Bank with branches throughout Latin America, we can offer you special services—either direct or through your own bank. These services are set out clearly and concisely in our leaflet "The advantages of being here and there". We shall be glad to send you a copy on application to:—

The Research Department

BANK OF LONDON & SOUTH AMERICA LIMITED

HEAD OFFICE: 6, 7 AND 8 TOKENHOUSE YARD, LONDON, E.C.2
BRADFORD: 19 SUNBRIDGE ROAD. MANCHESTER: 36 CHARLOTTE STREET

A housewife in Melbourne goes shopping . . .

. . . and an exporter here in Britain wants to know all about what she buys. He wants other information as well; for the success of his Australian export venture may depend on it. Many British exporters consult the Australia and New Zealand Bank which is in constant touch with all aspects of life in Australia and New Zealand. The Bank will be glad to answer any enquiries addressed to the Overseas Department at the Head Office.

AUSTRALIA AND NEW ZEALAND BANK LIMITED

In which are merged
The Bank of Australasia Limited and The Union Bank of Australia Limited

Head Office: 71 Cornhill, London, E.C.3.
Telephone: Avenue 1281
Branch Offices in London: 4 Threadneedle Street, E.C.2. 263 Strand, W.C.2, 6 Albemarle Street, Piccadilly, W.1.

vented. Given the existing dire shortages of many of the essential materials which Belgium has to sell—such as flax and steel—it may be possible for Belgian exporters to add the 5 per cent premium to the export price and thus shift the burden of the blocking to the shoulders of the buyers themselves.

In order to reinforce this general measure, it has been decided to reimpose strict export licensing in Belgium. The export licensing machinery has existed since the end of the war, but has fallen increasingly into disuse. Henceforth, however, applications are to be scrutinised strictly with a view to keeping Belgium's surplus with EPU countries within reasonable bounds. Among the instructions which have been issued to the Belgian licensing authorities are the verification of prices and credit terms. It has been discovered that by over-invoicing exports Belgian traders have to some degree lent themselves to a certain flight of capital into Belgium, the over-payments being held in that country on foreign account. The Belgian Foreign Exchange Control will also endeavour to scrutinise all in-payments so as to ensure that they are the counterpart of *bona fide* commercial transactions. Finally, Belgium has lifted all restrictions on investments of capital in European countries, other than Switzerland. The intention of these various measures is to reduce the surplus which Belgium is now running with its EPU colleagues. But, human nature being so perverse, the effect in the short run is likely to be the very reverse of that intended. Every sign that emphasises the strength of Belgium's position, every opportunity given to Belgian capital to seek employment abroad, forms another invitation for foreign capital to come into the country and seek the security of a manifestly strong currency.

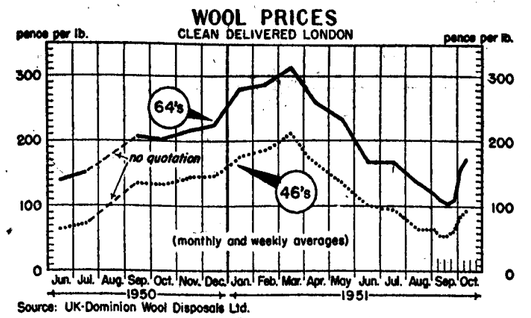
Gold Premium Sales

Canada has quickly brought its arrangements for sales of gold into line with the new rules proposed last week by the International Monetary Fund. Gold producers in Canada have in the past been compelled to sell their gold at the official price to the Canadian Government. Henceforth they will be allowed to sell the gold in the free market, but subject to three conditions. The first is that they receive US dollars in exchange. The second is that such gold must be sold in sheet of 22-carat or less—that is, in the form in which gold is normally exported for industrial purposes. The third and most important stipulation made by the Canadian authorities is that producers who sell gold at a premium in free markets will not be eligible for assistance under the Emergency Gold Mining Assistance Act. Each mine which receives a subsidy based on its production costs will have to elect in advance whether it will continue to take the subsidy or to sell its output in the free market.



The choice set before Canadian gold producers will in some cases call for very nice calculations. High cost producers will no doubt prefer to hold on to the subsidy though it may be questioned whether the Emergency Gold Mining Assistance Act will be re-enacted in anything like its present form when it expires in two and a half months' time. On the other hand, those producers who elect to sell in the free market must take a view of the future course of the premium on the free market price, a prospect which is by no means easy to discern since the IMF gold arrangements introduce new factors into the situation. It is assumed in Canada that the greater part of the country's gold will in fact be sold in the premium market and, since that output is running at the rate of 4½ million ounces a year, the possible effects of such a volume of sales on the free market price cannot be disregarded.

Australia is still considering what move to make in response to the IMF decision. The Treasurer, Sir Arthur Fadden, told the House of Representatives this week that Australia has in the past pressed strongly for a higher world price for gold and will continue to do so. He added that the interpretation of the new statement, by which the International Monetary Fund leaves to individual countries the framing of their gold sales policy, was a matter of some difficulty. Discussions with representatives of the Australian goldmining industry have been taking place and the new arrangements that will be decided upon as a result of these talks will be announced later. The free market price of gold has, as yet, shown little reaction to the promise of a considerable increase in supplies. This week the quotation is $39-39¼ with no great amount of business passing.

* * *

Feverish Wool Prices

Last week, wool prices experienced the sharpest jump in history—up to 60 per cent in five days, putting completely in the shade the 30 per cent jump on the opening day of last season. At the beginning of this week, prices seemed firmly established on an upward course and there was another 10-15 per cent rise on Monday. But Tuesday brought signs of faltering, and on Wednesday an actual fall of 12½ per cent was recorded, only to be followed by a further fall of 17½ per cent on Thursday. Normally the Australian wool market sets the pace for dealings in the other dominions, but this week the lead came from South Africa where on Monday prices were already some 10-15 per cent down and on Tuesday there was a further fall of 15-20 per cent. The resultant of this see-saw in wool prices is that merinos 64's are now quoted at 145d. a lb against 167d. last week and 103d. at their low point in September. They are slightly above the level of June, 1950, but still quite appreciably lower than at this time last year. Prices for lower count wools have moved in sympathy.

Source: UK-Dominion Wool Disposals Ltd.

Japan led the bidding during the buying spree, with Western Europe and the United States adding to the competition. Bradford bought little or no wool. The Japanese wool textile industry has been expanding rapidly; the number of spindles and looms in operation last June was 50 per cent higher than in January, 1950. Japanese wool consumption this season might easily reach 75 million lb (clean), compared with 51 million lb in 1950, and recent buying on Japanese account suggests that such a rise is being attempted. Perhaps the reason behind the recent jump in wool was no more than psychological. Last March, manufacturers felt that wool prices had gone too far, and they waited only for the least break to cease buying; in September prices may have seemed to be on the low side and it needed only one determined buyer to make the others come in for fear of being left behind. There is certainly no sign of any general recovery in retail sales of textiles. In both the United States and in Europe they are still lagging. In Britain sales reached the lowest point of the year in September, but there are reports of a sudden revival in the first week of October. Perhaps the British public only moves when Dr Dalton shows the green light.

Lower Cotton Cloth Prices

The first of the utility price cuts may give Dr Dalton another talking point but it is in fact very small beer. The Board of Trade has announced that the price of utility cotton cloth will be reduced by about 5 per cent and cotton mixture cloths by half that amount. But two price systems have been in force in the industry. One was based on the peak prices of raw cotton reached in the summer, and it affected most of the cheaper cloths like poplins, ginghams and household textiles, prices of which were raised in July to allow for increases in raw cotton prices. The second price system covered all the more elaborate and better quality cotton fabrics that were only recently brought into the utility range. Here the maximum prices are based on the much lower prices ruling for raw cotton at the beginning of the year. The new order reducing prices does not apply to this second class of fabrics at all; it simply serves to cancel out the price increase granted in July for the cheaper cloths.

These changes will have no immediate effect on retail clothing prices. When the prices of the cheaper cloths were raised in July, the Board of Trade started discussions with manufacturers about the price of clothing made from cloth sold at this higher price. It has just been announced that the prices of such clothing are going up between one and five per cent. There will be a time-lag of several weeks before these prices are again reduced to bring them into line with the new, lower cloth prices. Moreover, the Board of Trade, having brought a wide range of better quality, and much more expensive cloths, into the utility scheme, has had to raise clothing prices in general by a big margin. It has already been announced that the top price for a cotton dress will be four guineas next year, compared with 27s. this summer. The price of underwear is rising by anything between three and thirty per cent depending on the cloth used. It remains to be seen whether consumers will be prepared to pay these prices simply for higher quality. In recent months there have been a growing number of instances where the maximum utility prices have proved to be higher than the market would bear. Whatever the market reaction, the trend seems to be towards higher, rather than lower retail prices. Any downward adjustments that are made may be expected to have, like this present example, an extremely narrow scope.

* * *

Rise in Metals

The tin market has been enjoying another of its minor booms. After a modest fall at the end of last week the price jumped by £44 on Monday to £1,006 a ton, rose to £1,015 on the following day but declined to £1,005 a ton on Wednesday. But although prices have been actively rising, trading has been quiet. A major factor has been the deadlock in the negotiations between the United States and Bolivia. The 30-day contract fixed a price of 112 cents a lb. (£896 a ton) with provision for raising the price for all deliveries from June if a higher price were agreed under a long-term contract. An American mission has been assessing the cost of producing tin in Bolivia, but its conclusions have not been made known. Nor has the United States given any indication of what it considers to be a reasonable price. Bolivia has asked for 150 cents a lb. (£1,200 a ton) and this request has been turned down by the American negotiators as "fabulous." Bolivia admits that 150 cents a lb. is above its average cost of production but maintains that if output is to be stimulated the price must cover the costs of their highest-cost producers. It is possible only to guess the outcome of these negotiations, but £1,000 a ton for tin may not be as unreasonable as it seemed a few weeks ago.

The Tin Study Group at its recent meeting found that divergent views of producing and consuming countries about short-term and long-term international co-operation had remained unchanged. Various topics were discussed including restriction of consumption and prices. Indonesia and the Belgian Congo declared that they would invoke the GATT provisions against discrimination if the United States agreed to pay more than 112 cents a lb. for Bolivian tin. This is the price that the United States pays for Dutch and Belgian tin. The official communique, incidentally, included a denial of any existence of a producers' cartel.

Last week official American prices for zinc and lead were raised by 2 cents a lb.; zinc is now 19½ cents a lb. (£156 a ton) and lead 19 cents a lb. (£152 a ton). British prices are appreciably above these levels—zinc is £190 a ton and lead £175 a ton—so that it is unlikely that they will be raised in sympathy with the new American prices. Nor will British prices to Commonwealth producers be raised unless the increase in the official American prices is more than 2 cents a lb. American price stabilisation policy is having limited effects so far as non-ferrous metals are concerned. Copper rose by 3 cents to 27½ cents a lb. (£220 a ton) after the order came into force, and now prices for zinc and lead have been increased. Free market prices for all three metals are well above their official quotations. The American Government intended to make the official quotations the fixed ceiling prices for imported metals. But since Europe is paying at least 21½ cents a lb. for Mexican lead and 30 cents a lb. for foreign zinc, this leverage has not been successful as it was in the case of tin.

Sharing of Nickel and Cobalt

Two more commodities are now to be allocated by the International Materials Conference in Washington. This week the IMC announced that 31,153 metric tons of nickel and 2,050 tons of cobalt are to be shared among 32 countries in the fourth quarter of 1951. The United States obtains the largest allocation of both metals—19,690 tons of nickel and 1,212 tons of cobalt—while Britain comes second with 5,088 tons of nickel and 329 tons of cobalt. These quantities represent a sharp cut in supplies for Britain compared with 1950. Last year, total imports of nickel concentrates, unwrought metal and nickel alloys averaged 7,250 tons a quarter, while imports of cobalt averaged 450 tons. The allocations to individual countries represent the amount of metal to be processed or consumed by each country in the fourth quarter whether obtained from home production, imports or both. During the current three months, accordingly, British consumption of nickel will be at a rate 30 per cent lower than in 1950, while consumption of cobalt will be 27 per cent lower. Since rearmament will require increasing quantities of both these metals, supplies for civilian purposes are likely to be reduced more drastically than these figures suggest.

The procedure adopted by the IMC for these two metals was similar to that used in allocating copper and zinc. Defence requirements of the various countries were first met in full, and the remainder was shared out proportionately according to the average consumption, this time in the three years 1948-50. For cobalt a certain amount was earmarked for stockpiling—a surprising step in view of the present scarcity of the metal. The IMC estimated current production of cobalt at 2,075 tons a quarter compared with requirements of over 4,000 tons. The amount of nickel available for allocation for the fourth quarter was estimated at 31,500 tons and requirements of participating countries amounted to 56,800 tons. Since both metals are so scarce, there seems to be a good case for leaving stockpiling until production has been expanded.

The fourth quarter allocation for sulphur has not yet been announced. The United States fought hard to reduce its total export commitments for the previous quarter, but

The Uselessness of rubber

Rubber products are so much part of everyday life that one seldom stops to reflect that only a very small fraction of these consists of raw rubber. Raw rubber will stretch—but it won't snap back. It becomes hard and tough in cold weather but softens and becomes plastic at temperatures a little above normal. It 'perishes' when exposed to sun and air. It is the chemist who makes 'rubber', as we know it, a practical possibility. Resilience, toughness, tenacity, durability and life all come from compounding with chemicals.

The history of road speed records, for instance, is in large measure the history of the tyres that bore the chassis along; and each new record was evidence of an advance in rubber chemistry. The usefulness of rubber products has been increased over the years as rubber technology has progressed.

Monsanto have been co-operating closely with the rubber industry for over 20 years, and their products are used in every category of manufacture of both natural and synthetic rubber.

Rubber—so tantalisingly incomplete—is a challenge to man's ingenuity. Look around and you will see on every side how successfully the challenge has been met . . . by the chemist.

MONSANTO CHEMICALS FOR RUBBER INCLUDE:

UREKA and SANTOCURE
delayed-action accelerators for use with natural or synthetic rubber.

FLECTOL-H
antioxidant.

TACKOL
softener.

MONSANTO CHEMICALS – PLASTICS

finally gave way to the pressure of other countries. This time, it would seem, a compromise had to be found, and the total allocation has been cut by 10,000 tons to 240,000 tons. Britain's allocation may thus be reduced by 4,000 tons to 86,000 tons. This cut has no major significance, but it might be a dangerous precedent. Hitherto recipient countries have regarded the initial allocations as the minimum they can expect in any future quarter. It is now realised that they can also be the maximum. The United States case for demanding a cut was to emphasise the need to develop alternative sources of sulphur. But the switch to pyrites and anhydrites has already begun, and it is not likely to be accelerated merely by allocating 10,000 tons less of elemental sulphur in the fourth quarter of this year.

* * *

Higher Rayon Output

Rayon output this year has shown a striking ability in overcoming apparently insurmountable difficulties. At the beginning of the year, the industry's allocations of sulphuric acid were cut by 15 per cent. A cut of at least 10 per cent in yarn output seemed inevitable, and for the first quarter of the year the figures were rather lower than in the comparable period of 1950. But since March, output has been consistently above that of 1950; the total for the first eight months of the year has reached 252 million pounds—some 12 million pounds higher than last year.

To increase output in such circumstances of difficulty is a remarkable achievement. In part it has been brought about by buying sulphuric acid and sulphur wherever they could be found, at fancy prices. Compared with an average price of nearly £16 a ton for imported American sulphur, British buyers paid an average of nearly £87 a ton for the odd 544 tons imported from other countries in August. These occasional supplies have served to eke out the sulphur allocation but there is no guarantee that they can be repeated. To a large extent, recovery in output is due to real economies in the use of acid and carbon disulphide, which will be of permanent advantage.

Sales of rayon have been affected by the general setback in the textile trades. It is true that exports for the first eight months of the year reached 167 million square yards of rayon and mixture cloth compared with 137 million square yards in the same period last year; but this year's larger figure was artificially inflated by the wave of panic buying earlier in the year, and in recent months shipments have been falling. At home there are said to be big stocks of unsold summer clothes made from rayon. Home sales are not helped by a curious anomaly in the utility schedules. Utility rayon and cotton fabrics had at one time to be made to detailed specifications. This year, the schemes have, with one exception, been amended so that a utility cloth need only meet a maximum price and a minimum standard of quality. But cloth made from rayon staple (output of which is running at about 15 million pounds a month compared with 18 or 19 million pounds of continuous filament rayon) is not included in the list. It is still controlled by the "detailed constructions" and for this reason is not popular at home and it is not easily sold abroad. Makers of rayon staple cloth thus had a reasonable hope that the regulations governing utility goods might soon be brought into line with the more flexible arrangements that now apply to continuous filament yarn.

These hopes are fading. At the GATT meetings held in Geneva last month, French, Dutch and Canadian delegates commented sharply on the way in which the utility schemes discriminated against imported textiles and claimed that the wider scope of the utility schedules now that they include higher quality goods had increased this discrimination. Sir Hartley Shawcross had to admit that the changes had produced this effect, although he pointed out that the whole system of purchase tax and utility schemes was being reviewed by a committee that was "looking towards a thorough overhaul of its mechanism as well as the problem of discrimination." It seems unlikely that the Board of Trade would be prepared to provide these critics with more ammunition by making any further changes in the scope of the utility schemes until the committee makes its report next year.

Dearer Meat

New and higher prices for Australian meat were announced by the Ministry of Food last week-end. In order to avoid divulging the actual contract prices, the Ministry contented itself with the statement that prices for first quality lamb would be raised by 17½ per cent, first quality mutton by 15 per cent, other grades by 10 per cent, first grade beef by 3d. a lb, second grade beef by 2½d. a lb, and other grades by 1½d. a lb. Increases expressed in this way have little or no meaning. Mr McEwen, the Australian Minister of Commerce, however, was more forthcoming. He appeared to have gained all his points at the negotiations and described the new arrangements as giving a price incentive for quality production in Australia. He had no qualms in disclosing the contract prices. First grade beef (hind quarters) will now cost A15.31d. a lb compared with 11.56d. a lb last season—an increase of 32 per cent; the increase for the lower grades was less, making an average rise of approximately 23 per cent. First quality lamb (lightweight carcases) are to go up from A13.83d. to 16.25d. a lb, and first quality carcase mutton from A7.27d. to 8.36d. a lb. No revised prices for New Zealand meat have yet been announced and, although the long-term contract stipulates a maximum variation of 7½ per cent, it is inconceivable that New Zealand would be paid a lower price than Australia.

If the total cost of food subsidies is not to be increased these higher prices will have to be passed on to the British public. The Ministry of Food could reduce the subsidy on other foods and increase it on meat. But if no such expedient is followed, retail prices of meat in this country will have to go up by another 3d. a lb to an average of 1s. 11d. a lb. The Ministry of Food is also expected to pay some 10 per cent more for Danish butter, which in turn would mean 10 per cent more for New Zealand and Australian butter and higher prices for cheese, bacon and eggs. If the index of retail prices does not rise by more than five points in consequence of these higher purchase prices, it would be surprising.

The price of meat is certainly approaching the point when rationing by coupon might no longer be necessary. Would the British public be any worse off on that account? At the present time, the Ministry of Food's pricing system ensures that the profit it makes on buying imported meat is

Oil took to water when Noah used pitch to keep the Ark afloat. Oil is used as fuel by the fastest modern liners. Oil is a cargo that every country in the world can use. COFFEE: The earliest witness to the tonic effect of coffee was possibly an Arabian goatherd who noticed that whenever his flocks fed on a certain shrub the effect on their behaviour was immediate and remarkable. Greatly daring, he ate a handful of the berries and found the effect so exhilarating that he ran non-stop to his village to break the news of his discovery.

Although the popularity of coffee was well established by the middle of the nineteenth century, it was only at the beginning of the twentieth that Kenya Colony began to grow it. To-day Kenya specialises in the *arabica* variety which is the finest quality grown.

Full and up-to-date information from our branches in Kenya on the coffee industry and on general market conditions in the Colony is readily obtainable from our Intelligence Department.

used to offset part of the loss on home-produced meat. In the absence of equalised prices, prime English or Scotch beef might well rise by 6d. a lb or even more. But in compensation Australian and New Zealand mutton and lamb and Australian and Argentine beef might be 3d. or 4d. a lb cheaper than at present. The British public only enjoys "cheap meat" under rationing in those two periods of the year when home-fed meat provides the bulk of the weekly allocation. For the rest of the year it is paying more than it would under private importation.

* * *

Traffic Control for Comets

At a conference in London last week representatives from Commonwealth countries across which the Comet will operate regular passenger services from early next year discussed the necessary traffic arrangements. This is the first jet airliner, and indeed the first gas turbine airliner, to go into normal commercial operation, and its success will rest to a much larger extent than with a piston-engined aircraft upon the efficiency of ground services along its route. Most important of all is the way in which the Comet's take-off and landing is handled at the airports. The fuel consumption of a gas turbine, unlike that of a piston engine, does not fall with low speeds and it increases at low altitudes. To keep a machine like the Comet from climbing to its cruising altitude as rapidly as possible, or to delay its landing at a crowded airport for long periods, is to place an impossible burden on the operator in terms of the weight of fuel carried and the proportionate reduction in payload.

Five months of flight trials at London Airport have convinced the British authorities that the Comet can be fitted into the normal air control pattern, simply by reducing the wide margin of tolerance that affects existing facilities at most airports and weather stations. The fact that it is possible to delay the landing of piston-engined aircraft for an hour or more without calamitous consequences has led to a practice of "stacking" aircraft at various altitudes above the airport for an hour or more when bad weather makes landing difficult. Elimination of these traffic jams would benefit piston-engine operators: it is vital to those using jets. Experience at London Airport suggests that the one essential requirement is that radar contact should be made with the pilot while he is still 200 miles away and that this contact should be maintained until the plane has safely landed. The same requirement follows for successful take-off. In short, the traffic controller needs at all times to have information on the exact position of every aircraft within a 200-mile radius of his airport. In the London area there are sometimes as many as 70 machines on the radar screen; though some equipment has yet to be delivered, the London traffic controllers can already land aircraft in bad weather at intervals that never exceed five to seven minutes, and this figure is constantly improving.

Airports along the Comet's route have nothing like the traffic density of London, and the same equipment may not be an immediate necessity. But an airliner flying at twice the normal height needs weather forecasts for that altitude and this will entail considerable expenditure on improved meteorological facilities, the cost of which will most probably have to be met by the operators themselves. Weather forecasts for these high altitudes once again will lead to an immediate improvement in forecasting for the lower altitudes at which piston-engined aircraft are operating. As with traffic control, such an improvement is long overdue.

The success achieved in the past few years at London Airport with the Comet will no doubt be watched with interest from the United States. In many districts there traffic control in bad weather is open to improvement and this could become an important factor in the acceptance of gas turbine aircraft on the American airways. On the other hand, it may take the arrival of jet aircraft to spur the American authorities to approve the necessary expenditure on extra equipment.

* * *

Silver See-Saw

The markets for silver have been unusually agitated in past week. The first important movement was the reduction in the New York price towards the end of last week from 90.16 cents to 84.75 cents per ounce. This was immediately and automatically followed by a reduction in the London price for essential silver from 78½d. to 74d. per ounce. This week the New York price recovered to 88 cents and the London price duly followed to 77d. per fine ounce. These gyrations in the silver price are in part due to international transactions in silver based on cheap sterling. Some Dutch operators found it possible with the help of transferable sterling acquired at around $2.45 to the £ to buy exportable silver in London and offer it on the New York market. It was under the weight of this special selling order, supplementing a fair offering of Mexican and Cuban silver, that the New York price suddenly crumbled towards the end of last week. This could be regarded as a perfectly normal adjustment of the dollar price for silver to the sterling equivalent, calculated not at the official rate of $2.80 but at a figure nearer the current market price for transferable sterling of $2.45. This, however, proved a temporary factor in the market. The amount of exportable silver available in London is insufficient to influence the New York market, and given the existing regulations concerning the use of transferable sterling, the supplies of such sterling available to the operators in any particular country must be strictly limited. A fall in the price of silver would run against the basic trend of commodity prices, and the artificiality of last week's sharp collapse has been rapidly revealed.

Especial services for all kinds of information regarding import, export and trade regulations in force in Iran.

ADMINISTERS NATIONAL SAVINGS

Sterling Area Dollar Account

Among the items necessarily omitted from last week's study of the balance of payments White Paper was the important table showing the balance of dollar payments of the main components of the sterling area. The detailed information given in the White Paper is here summarised for the years 1949, 1950 and the first half of 1951:—

DOLLAR PAYMENTS OF THE STERLING AREA
(In Million $)

	1949	1950	1951 First Half
UNITED KINGDOM			
Current transactions	*—1109*	*— 300*	*— 305*
Capital transactions	+ 52	+ 477	+ 97
Total	*—1057*	+ 177	*— 208*
REST OF STERLING AREA			
Surplus or deficit with dollar area:—			
Dependent territories	+ 149	+ 376	+ 314
Other sterling area countries	*— 530*	+ 55	+ 101
Gold sales to UK	+ 234	+ 281	+ 115
Other items	+ 7	*— 8*	+ 2
Total	*— 140*	+ 704	+ 532
WHOLE STERLING AREA			
Dollar payments with non-dollar countries	*— 334*	*— 76*	+ 90
Net Gold and Dollar Surplus or Deficit	*—1531*	+ 805	+ 414

The figures show the traditional pattern—a deficit in direct United Kingdom-dollar area trade being more than made good by the dollar surplus of the rest of the sterling area. The improvement in the dollar deficit of the United Kingdom last year, after devaluation and import cuts, gave way to a serious deterioration in the first half of this year when the dollar deficit reached $305 million compared with $156 million in the corresponding period of last year. This deterioration was attributable wholly to higher dollar imports. Current dollar earnings of the United Kingdom in the six months were in fact higher—$687 million in the first half of 1951 as against $536 million in the corresponding months of 1950.

The dollar surplus of the rest of the sterling area and particularly of the dependent overseas territories in the first half of the year made the expected response to the rise in sterling area prices and to expanded purchases by the dollar countries of sterling area commodities. Unfortunately this agreeable picture changed markedly for the worse in the third quarter. The contribution of gold sales to the United Kingdom by the rest of the sterling area declined somewhat in the first half of this year, as a result of the growing diversion of newly mined gold to the free market. The gold and dollar account will probably lose further support from gold sales as a result of the new Monetary Fund dispensations on premium gold sales.

* * *

Sterling Capital Movements

The net surplus earned by the sterling area (excluding Britain) in its direct dollar trade was in part responsible for the increase in the sterling balances held in the United Kingdom by the rest of the sterling area. Another factor in the growth of the sterling balances from £2,730 million on December 31, 1950, to £3,098 million on June 30, 1951, was the surplus of $90 million secured in gold and dollar transactions between the whole sterling area and non-dollar countries. The main segment of these transactions is that represented by the payments cleared through the European Payments Union which provided the United Kingdom with an appreciable net receipt of gold in the first six months of this year. The major part, if not the whole, of this surplus was, however, earned by exports of sterling area produce to Europe and was therefore accompanied by a further growth of the balances held in London by other sterling area countries. The following table shows the main items in the capital transactions between the United Kingdom and the rest of the sterling area in 1949 and 1950 and the first half of 1951.

UK CAPITAL ACCOUNT WITH STERLING AREA
(In Million £)

	1949	1950	1951 First Half
Grants, etc.	*— 16*	...	...
Rest of sterling area deficit or surplus with dollar area	*— 89*	+ 154	+ 148
Purchase of gold from RSA	+ 68	+ 100	+ 41
Other inter-area transfers	+ 20	+ 208	+ 127
Other overseas investment by UK	+ 279	+ 134	+ 98
Changes in UK sterling liabilities	+ 11	*— 378*	*— 368*
Total of investment and financing	+ 273	+ 218	+ 46

The most striking fact revealed by this table is the extent of "other investments" by the United Kingdom in other sterling area countries over the first half of this year; the total amount of £98 million was at a rate appreciably higher than that maintained in the whole of 1950. The explanatory notes in the balance of payments White Paper dealing with this item point out that it includes a residual figure assumed to be of a capital nature and which has, therefore, been placed in this part of the account. It is impossible to link this figure of £98 million with what is known of the specific investments made in the first half of this year by the United Kingdom in sterling countries. It does, however, include a number of known commercial investments and it goes some way towards correcting the serious increase of £368 million in British liabilities to the sterling area in the first half of this year, following the increase of £378 million last year.

* * *

Profits and Dividends

Profits and dividends recorded by companies whose reports appear in the third quarter of the year are not in every way characteristic of the trends for industry as a whole. The latest figures, however, have particular relevance, first because of the Gaitskell "freeze" proposals, and secondly because of the freedom, not to say licence, of much comment on "high profits." The gross trading profit of 515 third quarter companies rose by fully one-quarter from £171.5 million to £218.6 million. This comparison reflects to the full the combination of rising prices, increased production and active trade that prevailed during the notional financial year to which these results can be attributed—roughly the twelve months ended last March. There have indeed been a few instances of sharp reversal—for example, from a small number of companies in wool and cotton textiles—but broadly speaking the latest figures continue a trend that has become familiar but may be in process of change. It is no accident that the stocks of these companies show a rise from £304.4 million to £343.6 million; evidently, an appreciable element in the latest increase in "profits" consists, as in earlier quarters, of inventory gains.

To those who argue that any increase in dividends is immoral and ought to be made criminal, there will be a talking point in the fact that even in a quarter of which only one month had elapsed when control of dividends by White Paper was introduced, net payments to ordinary shareholders rose by £2,600,000. This enormity sounds less serious when expressed in other ways—for example, the rise in dividends is equal to about one-twentieth of the rise in trading profits and to one-tenth of the rise in income tax and profits tax. The 2,580 companies whose reports have appeared in the past twelve months have increased their total income (again, making no distinction between real and "paper" increases) by nearly £250 million, of which the ordinary shareholder has participated to the extent of less than £20 million after tax—not, evidently, a fund from which any major increase in personal savings is to be expected. The figures in the first table deserve study both by those whose approach to company profits, provisions and dividends is concerned with the problem of maintaining and extending the amount and variety of Britain's productive capital, and by those whose attitude is governed by what passes for "psychology."

Attention is too commonly directed to percentage rates of dividend on issued capital, instead of the rate of return on the capital employed, for which issued shares merely represent a symbol of ownership. The second table brings up to date the usual calculations of the rate of earnings and dividends declared based on net worth. The third-quarter companies reported an increase in earnings from 13.3 per cent to 13.6 per cent based on net worth. This calculation makes allowance for profits tax at the full rate on a full distribution of earnings. The effective rate of dividend based on net worth, which represents the equity shareholder's real stake in industry, has risen from 5.5 per cent to 5.9 per cent.

Shorter Note

The draft scheme prepared by the British Transport Commission some months ago for passenger fares is now under consideration by the Transport Tribunal. The original scheme (which was outlined in *The Economist* of April 21st) contemplated increases in fares which would have the effect of producing an additional £17 million net revenue. On Wednesday, however, Sir Malcolm Trustram Eve, K.C., who is presenting the Commission's case, disclosed that amendments to the original scheme are to be submitted which if approved would produce £4,000,000 more from London and £250,000 more from outside London.

Company Notes

Thomas W. ward.—The complexity of T. W. Ward's interest in iron and steel, plant, cement, road materials and non-ferrous metals is matched by a complicated set of accounts, but no shareholder will cavil at the year's trading results. Group trading profits have risen from £1,635,611 to £2,017,232. Even more striking is the jump in the separate item "exceptional income" from £85,668 to £539,952. This results from the surplus of £506,567 on the vesting of subsidiaries' shares in the Iron and Steel Corporation; the sum has been transferred to the parent company's capital reserve. A taxation provision of £1,078,721, against £822,641, has cut deeply into profits, but the year's earnings have enabled the company substantially to reinforce its reserves. Apart from retentions by subsidiaries of nearly £200,000, against £234,000, the principal items are a contingencies provision of £200,000, against nil, and the transfer of £200,000 to general reserve as in the previous year. The directors, besides repeating the ordinary dividend of 15 per cent., have made provision for the payment of a further 5 per cent. on the equity capital, the distribution of which depends upon the result of the general election.

	Years to June 30, 1950	1951
Consolidated Earnings :—*	£	£
Trading profit	1,635,611	2,017,232
Total income	1,822,348	2,637,291
Depreciation	209,696	208,087
Taxation	822,641	1,078,721
Group earnings for ordinary stock	*471,076*	*426,548*
Ordinary dividends	90,750	88,000
Ordinary dividends (per cent)	15	15
Retained by subsidiaries (*a*)	184,149	169,006
Dividend reserve	...	(*b*) 42,000
Added to general reserve and carry forward	281,845	161,227
Cons. Balance Sheet Analysis :—		
Fixed assets, *less* depreciation	2,552,968	2,503,203
Net current assets	2,914,960	4,125,882
Stocks	2,587,888	2,614,595
Cash	429,158	1,105,542
Reserves	3,202,404	4,114,642
Ordinary capital	1,100,000	1,100,000

£1 ordinary stock at 76s. 10½d. yields £3 18s. per cent.
* Excludes profits of two subsidiaries now vested in Iron and Steel Corporation.
(*a*) General reserve and added to carry forward only. (*b*) Including participating rights of employee's shares.

The balance sheet is equally impressive. In particular, it shows a comfortable liquid position. Cash balances have risen from £429,158 to £1,105,542 and a further £250,000 appears as "cash on short term loan." In addition the vesting of the two subsidiary companies is reflected in the increase in investments from £16,219 to £163,326, the greater part consisting of British government securities. The year's results suggest that the company's works have been working to full capacity, and there seems little reason to believe that this happy position will be materially altered in the current financial year. Shareholders may also be wondering whether a Conservative victory might mean the return of Birchley Rolling Mills Ltd. and Wolverhampton Iron and Steel Ltd., now nationalised, to the group.

★

Qualcast.—Total turnover of the group increased by some 24 per cent. in the financial year ended June 30, 1951, and group trading profits advanced from £507,088 to £731,940. In view of these excellent results the directors had decided to recommend a final dividend of 27½ per cent., making a total of 40 per cent. for the year. The White Paper on dividend limitation, however, interfered with this intention and the directors have decided to recommend a final dividend of 18½ per cent. making, together with the interim dividend of 12½ per cent., the "standard" dividend of 31 per cent. A sum of £16,860 net, however, has been reserved so that a further dividend of 9 per cent. can be distributed as and when circumstances permit. Equity shareholders will also recognise the soundness of the chairman's remarks that as reserves now equal 287.6 per cent. on the issued ordinary capital "it is obvious that a further issue of bonus shares is due in order to bring the issued capital of the company more into line with the capital really employed."

	Years to June 30, 1950	1951
Consolidated Earnings :—	£	£
Trading profit	507,088	731,940
Depreciation	54,778	74,480
Taxation	207,766	327,189
Group earnings for ordinary stock	*166,519*	*225,143*

Ordinary dividends (per cent)	32½	31
Dividend reserve	...	16,860
Added to general reserve and carry forward	105,773	167,059
Cons. Balance Sheet Analysis :—		
Fixed assets, *less* depreciation	526,719	599,617
Net current assets	677,854	858,336
Stocks	486,203	479,055
Cash	137,800	280,566
Reserves	789,757	1,026,125
Ordinary capital	339,837	356,829

5s. ordinary stock at 41s. 3d. yields £3 15s. per cent.

A shortage of certain raw materials may largely account for the fall in the value of stocks from £486,203 to £479,055, a somewhat unusual occurrence in a year of rising prices and increased turnover. Shortages have not found their reflection in output, which so far this year is running ahead of schedule; moreover, the company is planning to step up production, for the chairman refers to a reorganisation of the Derby works, which should be completed next Spring and which will cost some £300,000.

★

Ferranti.—The extension of the manufacturing capacity of the Ferranti group of electrical and general engineers has contributed much to the remarkable trading results; output has risen by 30 per cent. and group trading profits have almost doubled from £718,969 to £1,427,467. The company's Canadian subsidiary has also substantially increased its turnover and profits, but a further loss has been made by the American subsidiary despite an increase in output. The flow of orders has been so great that at the end of the year the company had a record order book of £12½ million.

	Years to June 30, 1950	1951
Consolidated Earnings :—	£	£
Trading profit	718,969	1,427,467
Depreciation	134,714	169,140
Taxation	302,895	687,472
Ordinary dividends	16,500	15,750
Ordinary dividends (per cent)	6	6
Added to group general reserves and carry forward	211,071	488,270
Cons. Balance Sheet Analysis :—		
Fixed assets, *less* depreciation	1,449,935	1,678,387
Net current assets	917,110	1,208,900
Stocks	2,237,241	2,938,438
Cash	13,077	32,948
Reserves	892,063	1,394,451
Ordinary capital	500,000	500,000

Pressure on manufacturing capacity has been so intense that further works extensions, especially to the new factory at Hollinwood where power transformers are manufactured, are in progress. Modernisation and extension of plant and the beginning of the new development programme are reflected in the rise in the net book value of fixed assets in the latest financial year from £1,449,935 to £1,678,387 and this may be overshadowed in the current year, for outstanding capital commitments were estimated at June 30th last at £753,000. Additional investment in working capital and the fixed capital programme have imposed a considerable strain on liquid resources; cash balances total only £32,948, against £13,077, and the bank overdraft has been increased from £1,140,481 to £1,618,575. The fact that the ordinary shares of the company are held privately limits the investment interest in these excellent results.

Statistical Summary

EXCHEQUER RETURNS

For the 6 days ended October 6, 1951, total ordinary revenue was £69,073,000 against ordinary expenditure of £79,636,000 and issues to sinking funds £538,000. Thus, including sinking fund allocations of £9,618,000 the deficit accrued since April 1, 1951, is £37,393,000 compared with a surplus of £64,889,000 for the corresponding period of the previous year.

COMPANY MEETINGS

THE ALUMINIUM CASTINGS COMPANY

YEAR OF GREAT ACHIEVEMENT

MR R. K. CALDER ON THE IMPROVED LEVEL OF EARNINGS

The forty-fifth annual general meeting of The Aluminium Castings Company, Limited, was held on October 5th in Glasgow, Mr R. K. Calder, chairman and joint managing director, presiding.

The following is an extract from his circulated statement:—

The year just passed has been one of great difficulty but also one of great achievement in all spheres of the group's activities. Overall group turnover advanced by over 70 per cent. and total sales closely approached £2,000,000 with trading profits more than doubled. The group earnings before taxation advanced sharply from £25,717 to £100,532.

Profits have been curtailed by ever-rising production costs, far from fully recovered by increases in selling prices, but your directors consider that a policy of restraint is justified in the long run, and members have the satisfaction of knowing that the improved level of earnings now reported arises from reduced profit margins on a very substantially increased level of real output.

REVIEW OF SUBSIDIARIES' ACTIVITIES

There was brought into production last year a new design of washing machine marketed under the registered trade mark of "Swirlux." The new machine has been a marked success, and I think it can be claimed as a result of the independent test reports received that it is second to none in washing efficiency and capacity.

I am satisfied that the "Swirlux" range of machines are destined to enjoy a substantial demand when conditions again permit of all-out production.

I come now to the most important development of the year—the re-entry of Burnley Aircraft Products, Limited, to the aircraft industry—and I am very pleased to announce that the company is now actively engaged on the jet engine programme.

Aluminium Bronze Company, Limited, despite the very special difficulties to which I referred last year, in regard to price fluctuations of copper, their basic raw material, made very substantial progress, and tonnage output increased by 50 per cent. Orders in hand are at record levels.

Atkinson's Agricultural Appliances, Limited, have suffered particularly from increasing costs and erratic supply of material. During the year there was developed a new patented type of hydraulic manure spreader, which at the various summer agricultural shows created a very favourable impression, and a very satisfactory order-book is now building up on this new model. There was also developed last year a new type of road gritter and spreader for use by local authorities, and this also has had an excellent reception.

In December last the David Brown Tractor organisation, after a series of tests, adopted the Atkinson spreaders as standard equipment and a range of these models are now marketed under the name "David Brown Atkinson." This close association should prove to be of considerable benefit to our company.

The Verichrome plating companies—at Walsall and Larkhall respectively—and Makmoroom, Limited, all made satisfactory progress during the year.

Last in this brief survey of the subsidiary companies is Scottish Aluminium Ware, Limited, where I am particularly glad to report that a most marked recovery took place.

The parent company's foundry at Greenock has enjoyed a year of brisk activity and achieved record output, which has been further added to in the current year.

Coming now to the prospects for the current year, I am sure that members will be glad to learn that up to date both turnover and trading profits for the group are substantially increased—fully 50 per cent.—over the corresponding period of last year. To that extent, therefore, the current year starts off well.

The group is already heavily committed in the rearmament field. I am reasonably confident, therefore, that declines in our normal activities will be fairly well matched by the upsurge of defence orders output, provided always that adequate material is available even for high priority work.

The report was adopted.

THE JAVA INVESTMENT, LOAN AND AGENCY

The forty-first annual general meeting of The Java Investment, Loan and Agency, Limited, was held on October 8th in London, Mr T. E. Baring (the chairman) presiding.

The following is an extract from his circulated statement:—

The profit disclosed, after provision of United Kingdom taxation of £32,500, is £59,161. This profit, however, included net income from the subsidiaries for the previous year amounting to £14,904, and a truer comparison of results can be obtained from the revenue statement which shows gross revenue from the holding company and its subsidiaries for 1950 of £128,385, compared with £77,101 in the previous year. After expenses and provision for taxation in London and the East these figures are reduced to net amounts of £44,257 and £31,451 respectively.

DIVIDEND LIMITATION

It was our intention, subject to receipt from Indonesia of a remittance of the profits for 1950, to increase the normal dividend to a total for the year of 7½ per cent., and to pay a bonus of 2½ per cent. in respect of previous years' profits. Unfortunately, this remittance was not despatched until early August, by which time the unexpected and wholly unjust White Paper on dividend limitation had been published. To keep within the proposed limits the directors have been able to recommend a final dividend of 2½ per cent. only, bringing the total to 5 per cent. for the year. The balance of 5 per cent. (including the 2½ per cent. bonus) that would have been paid has, however, been placed to a dividend reserve and will be distributed as and when possible.

Dividend limitation will also, of course, affect our income from general investments, but with the increased dividends received during the first part of the year, particularly from rubber and sisal producing companies, it is anticipated that total revenue from this source will be no lower in the current year than in 1950. With rising costs and reduced selling prices for rubber we shall be satisfied if our dividends from the subsidiaries for 1951 are equal to half those received for the previous year.

INDONESIA

It is difficult to sum up the position in this country. Security conditions are somewhat better in that European planters are not in such danger of attack as previously, while damage to estates is now not common. Law and order, however, are by no means established and robbery, especially of crops on estates and of produce between estate and ship, reaches in some cases alarming proportions. In these respects thus far your estates have come off fairly well. Taxes, export duty and reduced receipts for produce due to currency manipulations add up to an almost intolerable burden on primary producers. On the top of all this, extravagant demands by labour unions and poor productivity, both of which result from ill-discipline, are causing ever-increasing costs of production. Serious inflation, of course, is at the root of much of the trouble. Our estates still show a margin between cost and selling price on both rubber and coffee, but that margin is decreasing. On the estates, field work is more or less limited to what is necessary to ensure crops coming in, while buildings and plant are, for the time being, no more than adequate to house staff and labour and to process crops. If, later, the general position warrants it, heavy expenditure will be required to put estates and buildings in really good order and up to requirements. A further great difficulty is to maintain trained staff on the estates—Europeans are rather loath to remain in Indonesia—while the supply of efficient Indonesians is entirely inadequate, anyway for estate management purposes. A good point is that there is an ample supply of estate labour. To sum up—unless at no distant date there is very real improvement in practically every direction, planting companies long established in Indonesia may have to consider whether they should cease to operate.

MALAYA

Our interests in Malaya, of which Beradin is the chief, are providing us with good returns, but the remarks I made last year about the anxieties which beset all who are interested in that country can be repeated today with even greater emphasis. The determined efforts which the Government is making to overcome and end the menace of banditry have in the first instance increased the number of incidents and murders. The bandits have been compelled to come out into the open and fight for the money and food they require for their sustenance and, as a result, more of them are being killed or captured. To that extent the situation has improved.

While selling prices of rubber have contributed towards better returns, I hesitate to suggest that these high prices have been all to the good. Costs of production have risen steeply, assisted by a harsh application of increased export duty, while the industry now faces a threat of frozen credits to be disgorged at some later date when lower prices and less prosperous conditions justify. Such a plan is meeting with the opposition it deserves. Estate owners are painfully aware that six years after the end of the war they still await payment of war compensation for the damage they suffered as a result of the Japanese invasion.

EAST AFRICA

Our East African interests progress satisfactorily. Sisal companies are earning good returns. The price of the commodity is, however, at such a fantastic figure that, while it suits us in the short view, I question whether it is to our advantage in the long. Binder twine has been the chief use of sisal fibre in past years and farmers are becoming reluctant to use it in the face of today's prices. It is to be hoped that sisal producers will engage in vigorous research, both commercial and agricultural, with the object of protecting the future of this industry.

Our tea interests in Kenya are progressing according to plan. In spite of a severe drought in 1950, the planting programme has proceeded satisfactorily. I would again remind you that this is a long-term investment from which we cannot expect quick returns.

The report was adopted.

POWELL DUFFRYN LIMITED

The annual accounts to March 31, 1951, were presented at the annual general meeting held on October 10th. The following is an extract of the statement of the chairman, Sir Herbert Merrett:—

When, after the vesting of our colliery assets, new ventures were embarked upon, it was known there would be a period when certain investments would yield no income. A policy of moderate dividend distribution and building up of the carry-forward of our profit and loss account was adopted. We are passing through this period now but, with the expectation of new and substantial income from 1953 onwards, the specially created carry-forward may remain intact. It is, however, available for payment of reasonable dividends if current earnings are insufficient.

Our exporting houses continue to trade in the movement of coal from one country to another. At unbelievable cost, this country has lost its hold on its export markets and British-owned coaling depots are largely dependent upon foreign coals to earn profits taxable in this country. It would be idle to pretend that this is a passing phase.

By virtue of their service to producer and consumer, Stephenson Clarke Limited (and their subsidiary and associated companies) have been able to maintain the volume of their trade at home.

The Stephenson Clarke fleet of ships is fully employed, new tonnage is being added year by year, and the area of its trading is being widened.

Satisfactory profits are expected from the group's direct interest in the oil marketing industry through our 50 per cent. partnership with Socony-Vacuum Oil Company Inc. of New York in the well-known British company, Vacuum Oil Company Limited. The construction of the refinery on the Coryton site has proceeded and amplifications have been made in the original layout, chiefly by the incorporation of a Catalytic Cracking Unit. As partners in this undertaking, we have not neglected the opportunity to invest further capital in what may prove to be the last word in refinery construction.

The clearing up stage of compensation for the mines and ancillaries, proceeds at snail's pace. If attempts to obtain voluntary agreement for the division of the area allocation are unsuccessful, settlement through the valuation board may be deferred for many years.

Production at the Hayes factory of Powell Duffryn Carbon Products Limited, is proceeding favourably and sales are satisfactory. It is expected that at no distant date the company will show progressive profits. A new company—British-American Carbon Corporation, has recently been formed in the U.S.A. jointly with the well-known American company, The Great Lakes Carbon Corporation. The new company is a 50-50 partnership.

When all our coal mines, coke oven plants, tar refineries and power stations were taken from us on January 1, 1947, we decided that the great knowledge and experience accumulated over the years should be remobilised and placed at the disposal of clients in this country and throughout the world.

Powell Duffryn Technical Services Limited was, therefore, formed as a consultant organisation to give impartial advice and service on all matters connected with the finding and mining of coal and its treatment, processing and efficient utilisation. These services have been welcomed by governments and private clients throughout the world. During the past four years we have included amongst these clients the Governments of Pakistan, Ceylon, Southern Rhodesia, Nigeria, British North Borneo and Sarawak, Nyasaland, the State Governments of Queensland and Victoria, and, in Europe, the Governments of Denmark, Greece, and Austria. In several of these cases we still have important work in hand.

The report and accounts were adopted.

ASPRO LIMITED

SATISFACTORY TRADING RESULTS

The sixteenth annual general meeting of Aspro Limited, was held on October 11th at 16, Berkeley Street, London, W.1, Mr Maurice A. Nicholas, the Chairman, presided.

The following are extracts from the chairman's circulated statement:

The profits for the year dealt with in the holding company's accounts amount to £209,726. After deducting £56,203 representing dividends on the preference stock and an interim dividend of 15 per cent. on the ordinary stock, your board proposes to allocate £100,000 to the general reserve and £5,000 to the staff contingencies reserve of Aspro Limited, and to recommend a final dividend of 20 per cent., less income tax, on the ordinary stock. This leaves £24,312 to carry forward in the holding company, as against £28,289 brought in. The total ordinary distribution for the year is 35 per cent., which is the same total rate as for the previous year to March 31, 1950, and for the nine-month period to March 31, 1949. The dividend restriction proposals contained in the recent Government White Paper, should they be passed into law in their present form, would permit this dividend rate to be maintained.

Taxation has now assumed such proportions that it constitutes the largest single demand on the earnings and finances of our business. Higher provisions must be made out of profits each year to meet the tax commitment; in fact, some 60 per cent. of profits is so absorbed. Increased profits nowadays yield comparatively little financial reward, and only by intensive work and development can the policy of maintaining our dividend level and allocating a prudent sum to reserve be carried out.

SOUND LIQUID FINANCIAL POSITION

In view of these difficulties, it is a special satisfaction to be able to draw stockholders' attention to the sound liquid financial position of the group. The group's current assets total £2,020,962; of this amount, the cash £852,163 and tax reserve certificates £200,000 alone nearly cover the entire current liabilities of £1,067,007, which latter amount includes full provision for taxation on all profits earned up to the date of the balance sheet.

UPWARD TREND OF EXPORT SALES

The penetration of "Aspro" in overseas territories continues. Particularly do I refer to our South African subsidiary company which contributes substantially to the group profits. Our general export sales show a steady and encouraging upward trend. We are constantly planning new development and within six months hope to commence manufacturing "Aspro" in India. It may be of interest to note that "Aspro" is now made in ten manufacturing units and is distributed in more than fifty countries. Over 10,000,000 "Aspro" tablets are sold every day in the year throughout the world. Whilst commenting upon overseas operations, it should be pointed out that we are not able to estimate the degree to which our present and future plans for development may be impeded by possible implications arising from Section 36 of the 1951 Finance Act.

The home market requires constant vigilance in order to maintain and, if possible, to increase sales. It is gratifying that part of the year's sales increase was undoubtedly caused by public appreciation of the great value of "Aspro" at the time of the influenza epidemic.

In conclusion, I wish to thank my colleagues for their continued co-operation and to express my appreciation for the work done by all members of the staff, at home and overseas, during the past year.

E. W. TARRY AND COMPANY, LIMITED

ANOTHER SUCCESSFUL YEAR'S TRADING

The annual general meeting of E. W. Tarry and Company, Limited, was held on October 9th in London.

Sir H. Fortescue Flannery, Bart. (the chairman), in the course of his speech said: It affords me great pleasure to report another year's successful trading, notwithstanding the abnormal trading conditions during the past financial year.

The trading profit for the past year amounts to £162,469, an increase of £13,094, and this result can, I believe, be considered good but is seriously affected by the heavy inroad of taxation amounting to £82,000. The net profit is £63,309, an increase of £4,004, and with the balance brought forward of £68,017 gives a total of £131,326. After appropriating £30,000 to the general reserve, the board recommend that a dividend of 15 per cent. be paid on the ordinary shares, the same rate as has been paid for the past few years.

Today, the economic life is overshadowed by political affairs, and while Europe continues unsettled and trade thereby hampered and restricted, the effect is bound to be felt, even in distant South Africa. Nevertheless, I am confident about the future of that country—there is still much pioneering and development to be undertaken and I am glad to say that the prospects for our company for the current year are encouraging. There is no falling off in the demand for our goods, and despite the continuance of the import control in the Union, the total sales for the first five months of the current year are very satisfactory.

The report was adopted.

NOTICES

APPLICATIONS are invited for the post of Temporary Assistant in connection with an investigation into the costs of Private Forestry in England and Wales.

Candidates should possess a degree in Forestry or Estate Management. Previous experience in investigational work is desirable. Conditions of employment may be obtained from The Secretary, Department of Forestry, South Parks Road, Oxford.

BETTER JOB SOUGHT by Press and Publicity man (aged 27), now assistant with national organisation. Experienced in trade journalism, magazine production, publicity methods. Cambridge economics graduate, former history scholar.—Write Box 769.

INCREASED sales are not the end of all good advertising: they are the beginning, and the story continues with expanding goodwill and bigger business in the future. For a chat with men who understand the true aims of advertising and how to achieve them, 'phone MUSeum 5050.

DIRECTOR (age 45), prosperous Shipping Company London as informed his salary £2000 Zenith, wishes change with more prospects, public school, hard worker.—Write Box "SP/123," c/o 95, Bishopsgate, E.C.2.

AMERICAN lawyer, University and Bar, twenties, English wife, seeks post, preferably but not essentially, involving law.—Box 767.

THE UNIVERSITY OF SHEFFIELD

Applications are invited for posts in the DEPARTMENT of ECONOMICS: (1) ASSISTANT LECTURER, (2) LECTURER or ASSISTANT LECTURER, to begin duties on January 1, 1952. An interest in Industrial Relations will be considered an advantage for post (2). Salary scales: Assistant Lecturer, £450 x £25—£500; Lecturer £550 x £50—£1,100, with Superannuation provision under F.S.S.U., and family allowance. Applications (3 copies for post 1, 5 copies for 2), with names of 3 referees and, if desired, copies of testimonials, should reach the undersigned (from whom further particulars may be obtained) by November 17, 1951.

A. W. CHAPMAN, Registrar.

UNIVERSITY OF CAPE TOWN
SOUTH AFRICA

Applications are invited for the post of SENIOR LECTURER IN ECONOMICS.

The Senior Lecturer must be well qualified in Economic Theory, and applicants should state what branch of Economic Theory constitutes their main field of interest and special qualification.

The salary scale is £800 x £40—£1,000 per annum plus a temporary cost of living allowance on the Public Service Scale (at present £258 per annum for a married man and £80 per annum for a single person).

The post is vacant from February, 1952.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

The closing date for the receipt of applications is November 15, 1951.

SUDAN GEZIRA BOARD

A Managing Director is required for the Sudan Gezira Board.

The Board is a statutory corporation constituted by the Sudan Government in 1950 to manage the Gezira Scheme, an irrigated undertaking covering about one million acres which produces cotton, grain and a fodder crop. The Government, Sudanese tenant-farmers, and the Board are partners in it. While the production of the cotton crop is the Board's primary responsibility, the Board is also responsible for encouraging the general farming activities of 25,000 tenants and fostering self-management of their own affairs.

Applicants must be of proved ability and have had experience in large-scale management. Sympathy with the aspirations of the Sudanese people is essential.

Salary £E3,000 to £E4,000 according to qualifications and experience, and a gratuity on completion. There is at present no Income Tax in the Sudan.

Free housing and leave passages for the Managing Director and family. Contract from 5-10 years.

Applications should be sent to: Sudan Agent in London, Wellington House, Buckingham Gate, London, S.W.1. Please mark the envelope "Managing Director—S.G.B. 4/2404."

CANADIAN PACIFIC RAILWAY COMPANY.—(Incorporated in Canada with Limited Liability)—ONTARIO AND QUEBEC RAILWAY COMPANY 5 PER CENT DEBENTURE STOCK, 6 PER CENT COMMON STOCK.—In preparation for the payment of the half-yearly interest payable on December 1st next, the Debenture Stock Transfer Books will be closed on November 1st and will be re-opened on December 3rd. The half-yearly interest on the Common Stock will be paid on December 1st to holders of record on November 1st.—R. F. TREMAYNE, Deputy Secretary, 8, Waterloo Place, Pall Mall, London, S.W.1. October 10, 1951.

SCIENCE GRADUATES are invited to apply for appointment as Lecturer in the Department of Education of the International Wool Secretariat. Lectures are given on every aspect of wool in schools, colleges and adult education institutions of all kinds. Previous lecturing or teaching experience is desirable. Some knowledge of wool would be an advantage, but training will be given after appointment. The work will entail considerable mid-week travel. Commencing salary: £484 (man), £440 (woman), plus superannuation benefits. Subsistence allowance and first-class travelling expenses are paid. Applications should be marked "Confidential" and addressed to the Secretary, International Wool Secretariat, Dorland House, 18-20, Regent Street, London, S.W.1, within two weeks of the appearance of this advertisement.

PARIS. YOUR OWN OFFICE, secretary, telephone, etc., when visiting France. Four vacancies in beautifully furnished, well equipped suite of offices off Champs Elysées. This service offered to ten companies only, of completely diverse interests.—Box 759.

EXECUTIVE, CHARTERED ACCOUNTANT and A.C.W.A. (43) wishes permanent post with progressive concern as joint managing director, comptroller, financial or commercial director. Experience includes commercial management, investigations and reorganisation; advisory work abroad for foreign government and American E.C.A. Mission.—Box 771.

MARKET Research Assistant required by leading plastics materials manufacturers. Graduate in Commerce or Economics preferred. Some experience in Market Research desirable. Write, giving full details including salary required, to Box 766.

MURRAY-WATSON
LIMITED
Advertising & Marketing
Home and Overseas
58 BROOK STREET, LONDON, W.1. GROSVENOR 3508-9
DUDLEY, WORCESTERSHIRE. DUDLEY 3162

BEDFORD COLLEGE FOR WOMEN
(UNIVERSITY OF LONDON), REGENT'S PARK, N.W.1

The Council of Bedford College invites applications for the post of part-time Assistant Lecturer in the Department of Sociology, Social Studies and Economics, vacant as from mid-November, 1951, open to men and women equally, salary scale £225 to £275 per annum. The Assistant Lecturer will be required to arrange visits of observation for Social Studies students, and to conduct tutorials on practical work. Candidates should be experienced social workers with University qualifications. Further particulars from the Secretary.

CANTERBURY UNIVERSITY COLLEGE, CHRISTCHURCH, NEW ZEALAND

Applications are invited for the position of LECTURER IN HISTORY OR IN POLITICAL SCIENCE.

The salary is at the rate of £800 per annum (N.Z. currency) rising to £950. (Annual increments will be at the rate of £50.)

Applicants should possess a good Honours Degree in History, Political Science, or an allied subject.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

The closing date for the receipt of applications is November 17, 1951.

HIS MAJESTY'S COLONIAL SERVICE

Applications are invited for the following post:—

A Statistical Officer (27297/1/51), Government Statisticians Department, Gold Coast, who will be responsible for the planning of statistical surveys and returns, and for statistical analysis.

The appointment will be on three years' probation for permanent and pensionable employment. Salary scale, including pensionable expatriation pay, is £680-£1,300 per annum with promotion bar at £860. War Service and experience will determine point of entry into scale. A temporary cost of living allowance is also payable. Rental of £60-£90 per annum is deducted where Government quarters are provided. Free passages provided for the officer, his wife and up to three young children on first appointment and on leave. Income tax is at local rates which are much lower than in the United Kingdom. Candidates must have 1st or 2nd Class Honours Degree in Statistics and at least five years' practical experience in some field of statistics.

Intending candidates should apply in writing to the Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, S.W.1, giving brief details of their age, qualifications and experience. They should mention this paper and quote the reference number (27297/1/51).

AN ADVERTISING ORGANISATION, such as our own, owes its success and reputation to contributing in turn to the success and reputation of its clients—with economy. If you are not entirely satisfied with your own advertising, we believe that our experience, facilities and director level co-operation could more efficiently progress your purpose. We shall be happy to be of service to you.—Townend-Smith Limited, Advertising, 40-41, Conduit Street, London, W.1. REGent 2600.

HIRE PURCHASE FINANCE. A well-known firm of Retailers, with branches throughout the U.K., are interested in obtaining further large scale facilities for discounting batches of hire purchase contracts, in units of from £1,000 to £50,000.

In addition to the basic security provided by the H.P. contracts themselves, a "blanket" guarantee is available to cover the small percentage of contracts which fall into arrears or become defaulting.

Both the contracts and the Company's financial accounts are available for the fullest investigation. The fixed return available on the unit investment is 11 per cent p.a.

This approach to the question of obtaining additional discounting facilities is being made in this somewhat unorthodox fashion owing to the effect of Treasury restrictions on the normal sources of H.P. finance.

Initial inquiries for particulars should be addressed to the Company's Accountants.—Box 765.

OXFORD man of 38, with first-rate qualifications and references, seeks opening as UNIVERSITY AND SCHOOLS LIAISON OFFICER in industrial firm which has started worrying about intake of suitable technical graduate staff. Excellent contacts with Universities, Technical Institutes and Schools, and a lively determination to follow them up are offered.—Box 772.

SALES and Advertising executive of leading branded food manufacturers interested in similar position with quality manufacturers where Directorship can result from exceptional ability. Excellent administrator, thorough knowledge of food trade, budgetary control, and modern promotion methods. Personal reasons for considering change.—Box 768.

Cairo's Quarrel

IT looks as if Nahas Pasha and his Minister of the Interior, Fouad Serag el Din, are now trying seriously to put a curb on the passions they called to their aid last week. Faced with Mr Morrison's statement that British troops would keep order in the Canal Zone if the Egyptians did not, they have in their own interest to avert the riot and bloodshed that at one moment seemed inevitable. Firmness in London and Washington have had their effects more quickly than might have been expected. Self-control and moderation in Cairo must prevail some time if there is to be a settlement of this dispute; and the sooner they are shown the better. Britain did not start this quarrel.

The situation may get worse, but it is difficult to believe that it will produce any surprises within Egypt itself. What may happen in other Arab countries is another matter. Cairo may now pause to think because it sees that Britain has both the power and the will to resist the threat of force, that the United States is not unmoved by the scrapping of a treaty, and that the planning of Middle East defence with France and Turkey will go on. Australia, New Zealand and South Africa have spoken, if not with one voice, in very similar tones. The Egyptian Prime Minister may now be realising that the time he chose for his action—just after the evacuation of Abadan, in the middle of a British election, and just before an international invitation backed by the American Government—was as unpropitious as it could be. Enough has now been said by Mr Morrison, by the Governor-General of the Sudan and by the commander of British troops in the Canal Zone to make it clear that the British are both determined and angry. A vital interest has to be defended and a pledge to the Sudan has to be honoured. Those are the thoughts uppermost in British public opinion. It remains for those who are less directly concerned to say what should be said—that nationalism is not always and everywhere right. Sometimes it can be the refuge of scoundrels.

Anger in this country over the behaviour of an ally—for it was a treaty of alliance that Nahas Pasha himself signed in 1936—will do good if it puts behind British policy a weight of opinion that was lacking when Mr Stokes went to Teheran. It will do harm only if it encourages the idea that there is some quick and masterful solution to the dispute or some bargain to be made on the side. At the moment nothing of the kind is in sight. The outlook would have been more hopeful if Britain's associates in the international defence plan had not presented it to a government that was basking in the heat of popular enthusiasm. As it is, there lies ahead a period of nerve war and strain, affecting in varying degrees, and to an extent that cannot yet be judged, American, British and French relations with the states of the Middle East and the Arab League. For there must be no illusions about two facts. The first is that such Egyptian opinion as is organised and articulate will stand solid behind the Wafd Government. There must be no hopes that Nahas will fall and give place to a more reasonable successor. The second is that Egyptians and other Arabs are still smart-

ing from the failures of the war with Israel. It may be difficult to limit the dispute and to segregate its consequences. In fact, the handling of the Egyptian challenge is a test case for the whole future of western relations with the Arab countries.

The broad issue, difficult and complicated though it is, has to be stated simply. It is that the transition of the Arab countries from dependent relationship with Britain to dependent relationship with international institutions cannot be made either by force or in a hurry. If international defence arrangements are to take the place of bilateral alliances, then they must be guaranteed by treaties. And until the Americans are ready to enter into treaty relations with Arab states and to accept clearly stated liabilities, Britain must be the leading party to such treaties. It is easy enough to suggest that the British leave Egypt, Iraq and Jordan by the front door, to the cheers of the crowd, and then return by the back door as members of an international command. But there is no sign that the guarantees and diplomatic ingenuity that such an operation would require are readily available.

Nor does any real hope of stability lie in imaginative economic schemes which, by making the desert blossom like the rose, will induce a mood of sweet reason and gratitude. There can be no serious progress with international schemes of economic aid and development in countries where the advisers and technicians of private enterprise may expect to be treated as they have been treated in Persia. If they are to work confidently and with effect they must feel that there is some rule of law, some guarantee of stability, on which they can lean. And this in turn implies that the authority of international bodies and contracts shall not be regularly flouted by those whom it is proposed to convert by kindness—in the case of the Middle East by governments that are pledged by their membership of the United Nations to observe a code of good behaviour. The Mossadeghs and the Nahas Pashas are challenging the international institutions of this century with the national slogans of the last.

*

If that is the broad, long-term issue there is the narrower, more immediate matter of the British position in the Canal Zone. Its moral and legal bases are generally acknowledged to be indisputable. What is less generally realised is its military strength. Although the Egyptian Parliament has declared illegal the presence of British forces, no attempt by Egyptian troops to force them out is likely. But something will have to be done to show that the Wafd Government, which cannot provide the people with either social reforms or enough to eat, can at least feed "national aspirations." A policy of strict non-co-operation with the British troops is to be expected, an attempt to make life and work impossible. But it is the Egyptians resident in the towns and camps of the Zone and the 30,000 Egyptian workers there who will suffer most. Should they be withdrawn they could be replaced by refugees from Palestine and by Maltese, Cypriots and Indians who served during the war and remained in Egypt. As for supplies, if fresh fruit and vegetables were stopped by the Egyptians, they could be brought in from elsewhere. Troops can work telegraph and telephone communications, prevent interference with railways and roads, and draw water from their own artesian wells. If the supply of water from the Sweet Water Canal is interfered with, the first victims would be the half-million inhabitants of Port Said. In short a state of siege in the Canal Zone can, if necessary, be sustained.

If, as seems likely, the dispute drags on, what is it reasonable to ask of Britain's allies as they decide their attitudes? It is, first and foremost, that they should recognise the need for the defence of the Canal and of the bridge between Asia and Africa to be guaranteed by effective force on the spot and by treaty. That is the sole purpose of British policy; there is no desire in London to stay on indefinitely in Egypt sustaining alone for the rest of the free world a weighty and costly burden. But unless a reliable and efficient alternative is found and accepted Britain will stay, and it asks for support in that resolve.

Clearly the voice that will matter most is that of the Americans; and, as our Washington Correspondent points out elsewhere in this issue, American minds may be changing but they are not made up. Of them, therefore, two things may be asked. First, that if Washington offers its good offices, as it did in Persia, it should realise that a mediator must accept some responsibility for carrying out the solution he advocates. That means that he must be clear before he begins to what end he is working. When it came to the point in Persia American policy tilted towards appeasement.

*

Secondly, the Pentagon, and the State Department, in their anxiety to set up some defence structure in the Middle East, should not forget the lesson of Germany. When the proposal for German rearmament was pressed forward last September the political preparation for it had been neglected, and the consequences of that failure are still being cleared up. There will be no valuable Arab military co-operation with Nato until more has been done to pacify the Middle East. This means that the United States and Britain must work much harder than they have done so far to bring about a settlement between Arabs and Jews and to honour the United Nation's obligation to the homeless refugees of the Palestine war. If Egyptian behaviour has shown lately a deep contempt for the code and authority of the United Nations, that body's failure to exert its authority for Arab-Jewish armistice arrangements is partly to blame. And if Anglo-American policy is to set its face firmly against what is illegal and outrageous in the Egyptian case, it should also recognise that the main motive behind the Arab League's support for Cairo will be its deep grievances against Israel, the merits of which have been persistently underrated in the United States.

The dispute over the Sudan—which must be kept apart from the dispute over troops in the Canal Zone—is best left to the British and the Egyptians. But in the wider question of the political and military organisation of the Middle East, American mediation will be welcome and useful, provided that there lies behind it a properly thought out policy. Britain's task is to hold the situation, to refuse to be bustled, while the Americans make up their minds.

The Next Government

IT is still far too soon to assume that the election will result in a change of government. The indications are to that effect, but nothing is certain in an election until the votes are counted. Nevertheless this article is written on the assumption that the Conservatives are about to come into office. By the time next week's issue of *The Economist* is on sale, Mr Churchill may be forming his government and the chief places may already be filled. But there are a number of points of some importance about the distribution of offices which, if they are to be made at all, ought to be made in advance. The only chance of doing so is to make them this week.

The Foreign Office

The first point relates to the Foreign Office. For nearly three years the country's foreign policy has suffered very grievously from the lack of a full-time Secretary of State. First Mr Bevin's illness reduced the volume of work that he could get through. When at last his successor was appointed, the Foreign Office got a new master who was even more distracted. There is no department where, at any time, a hard-working full-time ministerial head is more needed than at the Foreign Office. There is a mass of paper to be dealt with and personal interviews to be granted. What is more, policy is made up of a long series of daily decisions; the highest responsibility is never absent. If the Secretary of State is absent, or short of time, it is only the really urgent matters, the daily crises, that get dealt with. Other less urgent topics—a Persian oil dispute that is still in the simmering stage—have to be dealt with "at official level" (as the civil service says) and dealt with in a manner that does not require ministerial decision—that is, they are postponed and allowed to simmer. If problems are to be taken by the forelock, the Secretary of State must keep ahead of his papers.

This is true at any time, but there is an added reason at present. The Foreign Office is in a poor way. Ordinarily it is difficult for the outsider to form a judgment on the quality of the advice given by the Foreign Office until long years afterwards when the documents are published and the memoirs are written. But in the last year or two there have been opportunities of setting "the Foreign Office view" against the facts as they have been revealed by events, and the results are very disconcerting. In the Far East and the Middle East, the Foreign Office's judgment has been wrong. In Europe it has played an obstructive role. More even than usually, the Foreign Office needs a strong Secretary of State, able to give its affairs his full attention and commanding the fullest political authority.

The general assumption is that, in a Conservative government, Mr Anthony Eden will take the Foreign Office. If he were able to give it his full attention, that would be an excellent appointment. But Mr Eden is going to be a very busy man. Mr Churchill is in his 77th year and has never been greatly interested in administrative matters outside grand strategy and defence. Mr Eden, as the undisputed heir-apparent, will have to perform, or at the least assist at the performance of, a good many of the Prime Ministerial functions. The Deputy Prime Minister should not also be Foreign Secretary. Moreover, if there is to be a Conservative House of Commons, he is the obvious leader, with no adequate substitute in sight.

In view of this, it will be the path of greater wisdom for Mr Eden to let someone else go to the Foreign Office—though he might well be the chairman of a Cabinet Committee on external affairs, as suggested in the next section of this article. By far the best alternative at the Foreign Office, if his health will permit it (and unfortunately it is a large if), would be Lord Salisbury, who not only has great wisdom and force of character but has also for many years been an intimate colleague of Mr Eden. It is true he is in the House of Lords, but it is not many years since Lord Halifax was Foreign Secretary, and Mr Eden will be available to speak in the Commons. If, unfortunately, Lord Salisbury's health makes it impossible for him to be a full-time Foreign Secretary, Mr Harold Macmillan may be the next in line.

The wish may perhaps be added that the new Foreign Secretary, whoever he may be, should try to stay at home as much as possible. There are occasions when he must attend conferences in person, but they should be kept to a minimum. Policy is made in London, and cannot be made in his absence. There should be a good Minister of State, or even conceivably two, whose main job it will be to represent Britain abroad.

Large or Small Departments

A tendency has been noticeable in Tory pronouncements of recent months to advocate the amalgamation of this, that or the other pair of departments on the score of "economy." Civil Aviation, Materials, Food and even Supply are picked out as the intended victims of shotgun weddings. This would be a mistake. There is no economy worth talking about when two departments are amalgamated, so long as all their functions continue. The only economy is in the salaries of the Minister and of the Permanent Secretary, and the only result is to create an unbreakable bottleneck in the amalgamated and bloated department. The ideal size for a department is the size that throws up no more business than can flow smoothly across the desks of the Minister and the Permanent Secretary. Judged by that test, many departments are still too large. More splitting, rather than amalgamation, would make for greater efficiency. The Board of Trade, in particular, is still far too big.

A large number of relatively small departments creates, of course, a problem of co-ordination. But the experience of the last decade has pointed the way to the solution. This is not by super-Ministries *à la* Haldane, which have failed whenever they have been tried, but by the device of the standing Cabinet Committee, or sub-Cabinet, presided over either by the departmental Minister of the most important department in the group or by the holder of a sinecure office—but in either case by a politician of the first rank. The Cabinet itself should properly consist of the chairmen of these Cabinet Committees.

A Ministry of Production?

A particular example of this principle—or rather of its infraction—can be found in the proposal, which

is rumoured to have found favour in high quarters, to revive the wartime Ministry of Production. The wartime Ministry of Production, as a supervisory and co-ordinating body, was not a success ; it committed the mistake of piling one administrative organism on top of another. Later on in the war, it is true, functions were sorted out between the Ministry of Production and the other Supply Departments and it did much useful work —but not in supervising their activities, as was the original intention.

It is not clear what would be the purpose of a revived Ministry of Production. According to some accounts, it is to absorb the Ministry of Supply and the Ministry of Materials, both of which would cease to have independent existences. This would simply create a department so bloated as to defy efficient management. If, on the other hand, the proposal is to leave these two departments in existence and put a new one on top of them, then it would fail for the same reasons that have brought failure to other such experiments in the past.

There is a strong case for a Minister of Production, a politician of the first rank charged with expediting the rearmament programme and serving as Chairman of a Cabinet Committee for the purpose. But it would be a mistake to give him a Ministry or anything more than a small advisory staff.

Economic Policy

A very similar point can be made in relation to economic policy. A Prime Minister starting, with a clean slate, to form a new government might wish to appoint a Minister of Economic Affairs. There is a great deal to be said for such a post since, even under a government hostile to planning, there is a great deal of work to be done at the centre to make sure that the various parts of economic policy fit together. The essential thing, however, is to decide whether the Minister of Economic Affairs is to be over or under the Chancellor of the Exchequer. He should be one or the other ; to make the two co-equal is to revive the days when Dr Dalton drove in one direction and Sir Stafford Cripps in another.

At present, economic affairs are subordinate to the Treasury. Mr Gaitskell, as Minister of Economic Affairs, was junior to the Chancellor of the Exchequer, and when he succeeded to the higher office, the lower was absorbed into it. The Central Planning Staff is now incorporated in the Treasury. There is something to be said for this arrangement if the Chancellor of the Exchequer has the personality to rise above the purely financial preoccupations of his department. During the middle years of the war, however, the reverse was true ; Sir John Anderson, as Lord President of the Council, was the supreme economic minister, and the Chancellor of the Exchequer was not in the War Cabinet. Such an arrangement was perhaps more natural in wartime than it could be in peace, when finance cannot be by any means so subordinate. The best solution would be to recognise the extent to which in recent years the Treasury has been broadening its functions and to revive as an office separate from that of Prime Minister, the title of First Lord of the Treasury and confer it upon the chairman of the Cabinet's Economic Policy Committee. The Chancellor of the Exchequer would then be left with the functions that, in some countries, are given to the Minister of the Budget, the accounting for revenue and expenditure and the management of the debt. One of the subsidiary advantages of this arrangement would be that the Inland Revenue would get some of the ministerial attention that it has not had in recent years.

The Real Issues—II

THE previous article attempted to establish three propositions on which the next British government should act:

(1) Further inflation must be prevented.

(2) The only practicable way of working the existing inflation out of the economic system is to raise the prices now kept artificially low by the food and housing subsidies and by rigid rent control.

(3) To remove the subsidies is also an essential part of any effort to keep the burden of taxation on the British people within the bounds of what is supportable without inflation during a prolonged defence programme.

There ought to be little to frighten the politicians in these propositions. It is, after all, as much as four years since the Labour Government recognised that the food subsidies were the least desirable and defensible part of the state's civilian expenditure. In the mood of relative realism into which he had at length been frightened, Dr Dalton in his autumn Budget of 1947 laid down the principle that the expenditure on subsidies could not be raised in order to protect the consumer against further increases in the cost of food. The principle has been respected ever since, although in many other directions government expenditure has greatly increased and food prices have risen to an extent that in 1947 would have made the politicians' hair stand on end. The real significance of the subsidies has been greatly reduced. They, like so many other things, have been corroded by inflation. The fact that a particular figure of money expenditure has been maintained means, from the economic point of view, nothing at all ; and politically it means very little. A real issue of principle was involved as long as the subsidy policy was designed to prevent any increase in the price paid by consumers for basic foods, however the cost to the Exchequer might rise. But since that object was in 1947 recognised to be impracticable, it has been nonsense—in terms of the logic of Labour practice as well as in terms of Conservative theory—to regard the £410 million for subsidies as sacrosanct. It has been maintained because a Labour Government with no clear policies has never dared to upset its own expedients. And if a future Conservative government is to feel as timidly bound by every expedient of its predecessors, then indeed it will not achieve what it promises the country.

The working class pays far more in indirect taxes—in the tobacco and beer duties and in purchase tax—than it receives in subsidies. The previous article showed that if indirect taxes were correspondingly reduced, the subsidies could be removed—with good effects—without making the working class as a whole any worse off. But in fact a reduction in indirect taxes must have a low priority among serious political aims. The crying need

of the British economy is to cancel some of the discouragement to enterprise and hard work caused by high direct taxation of incomes. The practical effect of cutting the government's expenditure, and particularly of removing the subsidies, must be either to save the country from increases in taxation that would otherwise become necessary during the rearmament period or, at best, to make a reduction in direct taxes possible. But if the subsidies were removed without reducing indirect taxation, the result would be to take an equal slice off everyone's standard of living and therefore to hurt the poorer relatively more than the richer. It is this that raises the third of the five main issues which, as was suggested in these columns a fortnight ago, a practical policy against inflation involves. How equal should the distribution of incomes and property be ?

No one, it must be said at once, proposes that the very poor should be made still poorer. If a much smaller sum—£100 million rather than £400 million—were paid out in family allowances and national assistance, the poorest fifth or so of the community, which includes many people far above the poverty line, would be better off without subsidies than they are now. But it is true that some wage earners would be worse hit by the removal of subsidies than by an increase of £300 million a year in taxation, which is likely to be the practical alternative facing the next Chancellor. Moreover, even if the real difference is small, the vague belief persists that economy in the state's welfare expenditure is necessarily an attack on the working class whereas taxation is somehow always aimed more at the rich than at the poor. A party that recognises the economic need to remove the subsidies must squarely face the question of how much equality the country wants.

*

The sober sections of the Labour movement recognise that redistribution of incomes cannot wisely be pushed farther at present. There is surely nothing very shocking in another party saying—what many Conservatives certainly in private believe—that equality has already gone a little too far. That is what all the talk about incentives means, if it means anything at all—and what everyone who is going to be influenced by arguments knows it to mean. Certainly a party that set out to make the very few richer at the expense of the rest would get very few votes. But that has nothing to do with the issue. If Labour loses this election, it will be because, while the working class as a whole has benefited from the policies which Labour has claimed for its own, the upper grades of the working class have lost ground relatively to the lower grades. It is those upper grades—the skilled men, the piece-workers, the foremen—just as much as the middle classes, on whom a broad increase in taxation would have to be levied or who would gain if the removal of subsidies made a lowering of direct taxation possible. And it is precisely those people to whom the Conservative party must appeal if it is to become and remain a popular party. This was the strategically important element in the new approach that Mr David Eccles suggested to Conservatives two months ago, and of which regrettably little has been heard in the election campaign.

A policy for a tough, expanding economy is a policy for benefiting everyone but for benefiting the skilled worker, whether he is paid a wage or a salary, more than the unskilled. That is nothing to be ashamed of ; it is not a policy directed against the unskilled worker. It can be criticised only in terms of envy, of the attitude of those who do not want to be better off themselves if it means that other people get farther ahead. There is little that is electorally rewarding in such an outlook—if it is forced into the open. If the Conservatives were willing fully and frankly to work out their conception of an expanding economy, rich in incentives, to develop Mr Churchill's conception of the ladder rather than the queue, they would not only bring out the real issues of the election. They would at last strike at the assumption that, while Labour is genuinely for the working classes, they only say they would do what Labour does and secretly nourish dark designs for enriching the very few. They would put the Labour party on to the defensive, and in what is as it stands a weak defensive position at that. Whatever the eventual outcome in terms of party strengths, at least they would thereby force the Labour party also to clarify its latter-day ideas and policies. That could not fail to be to the advantage of good government for Britain in the next decade.

How incomes should be distributed is the primary nettle that the political parties ought to grasp, and the first to grasp it is likely to gain large electoral rewards. The issue has many ramifications that cannot be discussed in one article. It leads on to two further main points. First, there is the question of government planning and controls. Neither party has a coherent picture of how extensively it wishes the state to intervene in the economic activities of the community. Labour in 1945 inherited, and improvised on, a variety of wartime expedients. For the past three years it has been engaged in recognising that the apparatus—together with its own vaguer conception of ever-progressing nationalisation—went farther than could be reconciled with the needs of flexibility, inventiveness and efficiency on which a high standard of living for Britain depends. But in this year's extremities the government has been able to think of nothing better than reversing direction back to more extensive controls and particularly to price controls. The Tories wish to have none of them, but are afraid to say much about it. Such controls have the same sort of loose popularity as the subsidies ; as a major item of policy they are economically unsound—as has often been argued in these columns—for broadly similar reasons ; and in precisely the same way they can honestly be rejected, in terms the ordinary voter can understand, by a party concerned to create an expanding economy with incentives for the workers as well as the managers. There is no question of rejecting all controls in all circumstances, still less of rejecting the broad concepts of economic planning. But it is essential—and politically profitable—to work out frankly a more liberal attitude than the Conservative party as a whole has yet dared or even wished to do.

*

Secondly—and last of the five issues that these two articles set out to discuss—is the familiar but politically buried problem of wages and full employment. By now many groups of workers recognise almost as well as the middle classes that a disastrous inflation cannot be avoided if in a state of full employment wages often go up and never come down. The expedient of the voluntary "freeze" was, from the trade unions' point of view, a brave attempt to find some temporary solution to this problem. It never worked well and now it has been abandoned too thoroughly for its revival in the same form

ever to be likely. Yet no one, on the Labour any more than the Conservative side, seriously pretends that the present state of affairs can go on indefinitely.

The issue is critical because an effective policy against further inflation must, as has been argued, allow an initial rise of prices without precipitating a further rise in wages that would immediately offset the effects of higher prices. There are two possible policies. The Government can formally control wages or labour can be made less of a sellers' market, so that the unions no longer have everything their own way and the pressure is not always towards higher wages for every worker in every industry. The Conservatives rightly prefer that free collective bargaining should continue. But do they really deceive anyone by the pretence that everything can continue just as it is? To make labour less of a sellers' market means taking disinflation far enough to remove the excess of jobs over workers and restore not unemployment but the possibility of dismissal for the inefficient worker and of bankruptcy for the inefficient firm. Again, the champions of an expanding economy and of the restoration of incentives have nothing to fear from public recognition of this point. Dodging it will not save them from the suspicion, by those who want to be suspicious, that they wish to go back to the bad old days. There is no question of anyone advocating unemployment as desirable; but it is essential, and it involves no abstruse argument, to warn the electorate that full employment cannot mean security for everyone in his present job. To pretend otherwise is to make talk about stopping inflation patently unreal and insincere. To recognise the problem would be to bring out the muddle-headedness of Labour's attitude and to stop providing it with the ready-made assumption that it has a clear white to set against the black reaction of hidden Tory designs.

It has not been the purpose of these articles, any more than it is the purpose of an election campaign, to provide definitive answers to the questions that will face the next government. It is the task of the politicians to recognise for the public what those issues are. After six years of Labour government it is inevitable that one should look to the Tory party for a greater willingness to face them. And certainly there is within the opposition a larger minority privately aware of them. But it would be foolish to pretend that the party as a whole is as yet much nearer than Labour to screwing up its courage to tackle them.

The Uniform Election

(By a Correspondent)

[This is the last of three articles in which correspondents have reported their impressions of the election campaign in the constituencies.]

NOMINATIONS closed on Monday; over most of the country the electoral battle had begun in earnest the week before with the formality of adoption meetings. Nationally the campaign may be dull, but the constituency organisations are fully immersed in the solid work of electioneering. Party membership has generally increased since last year and meetings are more crowded. But agents on both sides will admit that they are doing well if 10 per cent of their members are active workers. It is notable how heavily women outnumber men—sometimes by four to one. Although a few of the ablest agents are women, men are strongly preferred as canvassers and volunteer administrators. "Women have more zeal than judgment", "They spend too much time talking in the committee rooms" are frequent agents' complaints. One is struck by the immense periphery of inefficiency in an electoral organisation, however efficient a centre the agent's office may be. In the outer rooms a housewife comes to do half an hour's envelope addressing; by the time the job has been explained she has time to complete three or four envelopes before she must go. It takes twenty minutes to dispose of an old lady enquiring about a postal vote to which she is not entitled. Somebody is making tea and two people are discussing last night's meeting. It is surprising how much work is often done in the general chaos.

In some Conservative offices the elaborate charts seem to represent a smoothly-working organisation. Agents claim convincingly that by polling day they will have completed a 100 per cent canvass and will deliver virtually every Conservative vote. But equally able agents deny the possibility of more than an 80 per cent canvass and of getting adequate coverage on polling day with the present allowance of cars. In Labour offices there is much less obsession with organisation and sometimes better concentration on the job in hand. "A 100 per cent canvass? Nonsense," one agent said; "But we'll get out the people in our best areas. In the Tory districts our people are much more conscientious and get to the poll without our nagging them." But agents on both sides are more agreed than ever that canvassing is what matters and that meetings are generally a tiresome relic of a past age. "We have to have them to keep the candidate happy," said a Scottish agent. "There'd be nothing for him to do otherwise. But they only waste time. They take hours to arrange and then the audiences are mostly our own old ladies who'd much better be out canvassing."

But the meetings go on and the weary candidate often rushes round to three or four a night, with a few lunch-time appeals at the factory gates thrown in. In hasty visits to meetings in local schools the candidate speaks for half an hour and answers half a dozen questions before rushing on to the next village or ward. The audiences are mostly quiet and attentive. Good and bad speakers are listened to gently, applauded, and then heckled by a rather standardised routine which the candidate soon learns to deal with. Occasionally an odd note is struck. "Why did you call the clerk of the council a clam?" one candidate was asked. "So it was you that stole that letter," came the retort, and the meeting degenerated into a sordid squabble.

Several local party organisations have suffered from internal feuds and upheavals that have taken a heavy toll on membership and efficiency. Most such fueds have been patched up—to the public eye, at least, more successfully than the larger disagreement within the Labour party as a whole. The Conservatives of Newcastle North provide a solitary exception. Long-standing quarrels, based on personalities rather than policies, led to the formation this summer of a break-away association which, to the infinite indignation of the parent body, secured official approval from party headquarters and chose Major Lloyd George as its candidate. The old organisation selected a young man, Mr Colin Gray, and to attend his meetings is to step into a world apart from the general election. The crowds are immense and appear to consist entirely of Conservatives; most are for Mr Gray but there are some hecklers. "Liberal" is hurled at them as if it were an obscene insult. National issues are almost absent. It is all most vigorous and entertaining; and it is unique.

*

Even in Scotland and Wales local issues have shrunk in importance. The two major parties seem agreed that, at least in the industrial belt which embraces two-thirds of Scotland's constituencies, Scottish nationalism and the Covenant movement influence few voters. "I have had no questions at all on devolution," one candidate said. Some agents said they had had a few, "but only from men with beards or Irish accents." The campaign in Scotland has, however, features of its own. The housing problem is particularly acute and speeches pay more attention to it than is usual in England; but the solutions offered are no different. Some of the propaganda supplied by the central offices has to be translated into a Scottish idiom; to this need the Labour party seems, surprisingly, more alert than its rival. On both sides constituency organisation is rather more rudimentary than in England. And in the Highlands, while the party label is still the most important factor, the personality of the candidate probably counts for much more than it does anywhere else in the country.

Rural Wales in many respects resembles rural Scotland. South Wales, on the other hand, has its own problems. Nationalism is no more important than in Scotland but local pride seems to be more developed. In South Wales more than one organiser thought that full employment was a more important issue than high prices. Elsewhere few people would agree; generally speaking, the cost of living provides the centre of the battleground with "peace" close at hand. Surprisingly, many Conservatives are finding Persia an awkward question. Several Labour candidates still think that it provides the most effective part of their speeches. But on the cost of living, where many people would think that Labour has at least a better case than on Persia, it is definitely Labour that is on the defensive.

In the past week the emphasis of the campaign has shifted somewhat away from foreign affairs towards domestic issues, and particularly to government extravagance and comparative price levels. That is not entirely to the good. It is perhaps right that a country which normally goes to the polls only once in four or five years should make up its mind on familiar issues about which all the arguments have been worn threadbare. Yet a grand inquest on the Persian question, a vehement argument on the causes and cure of Egypt's folly, provided at least a new and developing theme. In an election where the contrast between the two principal programmes is so limited, it could serve healthily to distinguish between the basic attitudes of the parties. But the elector cares much more about the cost of living than about the Middle East, and the partial return to last year's arguments was inevitable. But thereby some of such vitality as the election seemed to have has gone.

Reparations from Japan

WHEN sovereign power is handed back to the Japanese early next year on the ratification of the peace treaty, their government, their industries and their overseas business houses will begin a new drive for foreign trade. From the Japanese point of view, the situation, harsh and unstable as it is, will present several promising features. Although there is a wave of inflation at home and Japan's foreign trade is at present far below prewar levels—last year exports were only a quarter of what they were before the war, and the country subsisted on American aid—the most favourable feature of all is still the lowness of Japanese production costs. Nothing that has happened under the Occupation and nothing to which the Japanese have put their name in the peace treaty has really altered this. To the rest of the world, and particularly the British textile industry, the alarming cheapness of Japanese production is still the supreme problem of competition to which no answer has yet been found. And several questions must now be asked very seriously in this country. Where will this lead in the next few years? Is it too late, at this eleventh hour, to do anything about it politically through the peace treaties? What can be done, and with what likelihood of success, in the realm of direct business competition?

Before the war Japan competed with Britain on the world's markets in three directions: shipping, the sale of textiles and the sale of mechanical goods. Today, there has been a revival of shipbuilding and vessels are being hired from foreign owners; but with a steel output under half the wartime peak, Japan will take a good many years yet to replace the many fine ships lost in the war. The export of engineering and electrical products, both capital and consumer, is now being resumed on an increasing scale; but, again, with an enormous unsatisfied world demand and with Japan limited by its own shortages of raw materials, there is still room for plenty of expansion. In textiles, however, the picture is very different, especially in regard to its possible effects on British trade. No one denies that the world now needs more textiles, but the manner in which the demand is met during the next five years may affect the health of the British—and so the world's—economy for several decades. Japan, moreover, is at present impelled to enter the same markets as the British more vigorously than before the war, because it has temporarily lost nearly all its former trade with China, Manchuria and Korea, because it therefore needs South East Asian rice in order to live at all, and because much of its silk industry, with its great dollar-earning capacity, has been destroyed for ever by the coming of nylon.

What, then, is the present position as between the British and Japanese textile industries? During the six

years since the end of the war, there has been no question of serious competition. There has been a sellers' market, Japanese output has been low and Lancashire's textile capacity has been recovering from its setback during the war. In Britain, unfortunately, this whole long period has now elapsed without any clear policy being drawn up to meet the future Japanese competition. Moreover, the British textile industry's views were not effectively represented by British influence in the drafting of the Japanese peace treaty.

*

There were several reasons for this failure and the measure of responsibility is difficult to determine. It may also be that nothing which Britain had said could have materially altered the terms of a treaty which was drafted in Washington, with the crying need to meet Asian shortages of consumer goods very much in mind. The industry now blames the Government for not presenting Britain's case more strongly. That is unfair. The Cotton Board ensured that Lancashire's views would be ignored by making first the ridiculous proposal that Japan should be legally restricted to a fraction of the cotton spindles its industry used before the war. On the other hand, Lancashire's difficulties were not sufficiently understood in Whitehall. The industry is so diverse and complex that, so long as its several parts—spinners, weavers, bleachers, dyers, printers and merchants—were each doing good business, there was great difficulty in getting sufficient discussion throughout the trade to determine just what the future difficulties would be when the Japanese really got going, and what it was possible to do about them. Secondly, the leaders of the textile industry were inhibited from making their fears felt too openly and forcefully, for risk of discouraging the entry of new labour into the trade at a moment when labour shortage was the most immediate problem of all.

The main difficulty of the Japanese manufacturers since the war has not been to sell all they produced but to obtain enough new spindles to rebuild the basic capacity of their industry to anything near its prewar level. They had little difficulty with raw cotton, since the Americans were giving it to them, and today, when aid is being cut and provided in dollars, there is still a powerful cotton growers' lobby in Congress which is in favour of helping Japan to expand its textile industry. Nor have the Japanese manufacturers had any serious difficulty with labour. Under the Occupation and with the formation of trade unions, they have had to pay more for shorter hours of work; but the pressure from unemployment is great in a nation that houses nearly 85 million people on islands which even fifteen years ago supported only 70 million.

Today the scene is changing. The sellers' market is coming to an end. With the peace treaty ratified, some of the reasons why the Japanese have felt constrained to behave well will be passing. And in the terms of the treaty itself, the reparations clauses open very disturbing possibilities. Broadly, under article 14a, countries receiving reparations are to provide Japan with raw materials to be processed and returned to them free of cost. This will not only affect the textile industry, but in theory any other industry with which Japan is equipped. There is nothing, however, in the present clauses—which have yet to be clinched in separate agreements—to prevent nations receiving reparations from buying raw cotton in large quantities on the world's markets, shipping it to Japan for processing, receiving it back at cost-of-raw-material price, and selling it both at home and in neighbouring territories at prices far below those ruling today.

*

It is, therefore, worth reconsidering, even at this late stage, what the consequences of the present proposals might be and what others might be put in their place—which could still be done in the course of negotiating the supplementary reparations agreements that are still to come. Under the present proposals embodied in article 14a of the treaty, many of the leaders of the British textile industry feel that serious and probably unnecessary damage will inevitably occur to British interests, with very adverse effects on employment in Lancashire and on the British balance of payments.

It was never intended that this process of reparation payment should occur on a large scale or that it should be abused by sale of the finished article to third parties. And there are certainly official voices which declare that the scheme is in fact unlikely to be extensive or to be abused. Nevertheless, there is clear danger of a major and immediate psychological effect on Asian—and perhaps African—market prices as a result of the prospect of widespread sales of textiles at figures little, if anything, above the cost of the raw material. Markets in South East Asia at least would become very uncertain. It is true enough that the Indonesians, for instance, would not have signed the Japanese treaty without a reparations clause. But neither they nor the Americans are wedded to the idea of reparations in their present form; indeed, Washington has not shown itself particularly keen on reparations at all.

In these circumstances, there is a lot to be said for considering other means of reparations payment. One that has been suggested is for money to be paid into a reparations pool. This could be based on the levels reached by certain Japanese exports, the sum being assessed on the difference, or even part of the difference, between Japanese costs of production and those in Europe or America. This reparations pool could provide funds for use in war areas occupied by Japan, to meet costs of rehabilitation or to buy Japanese capital goods for new development including, if desired, the development of local textile industries. As the sums being paid into the pool would be recovered from the proceeds of Japanese exports—part going to the pool via the Japanese government and part to the manufacturer—the money would be available in foreign currencies.

It is not too late to consider a scheme of this kind and it is a high British interest that it should be considered. A reparations pool, cumbrous though it might seem at first, would have the advantage of ensuring that the Japanese do not become the main gainers by their own reparations payments—as they will be, if their goods invade overseas markets at very low prices. It would ensure that price stability is maintained, that war-damaged countries gain a permanent benefit from reparations, and that some attempt is made to deal on liberal lines with the problem of competition between countries with such widely differing standards of living as Japan and the western world. What the pattern of Japanese trade is likely to be under the influence of American policy and how Britain may best be able to deal commercially with Japanese competition will be the subject of a further article.

NOTES OF THE WEEK

Approach to Moscow

The American attempt to get Stalin's help in bringing about "a realistic peace agreement" in Korea does not seem to have been skilfully handled. Mr Vyshinsky's reply suggests that the approach made on October 5th by Admiral Kirk, the American Ambassador, is generally regarded in Moscow as a propaganda move; if it had been taken as a serious diplomatic overture it would hardly have been rejected in such terms. The question of what the Russians will or will not take seriously needs careful thought in all the western capitals, if their diplomatic interchanges are not to degenerate into one sally of political warfare after another.

The truth probably is that Stalin judges the sincerity of an offer to negotiate by the stiffness of its demands. Everything that has been revealed about wartime talks with him shows his preference for big issues and big bargains. And to his mind the beginning of a big bargain is probably a big demand by the other side. If the stakes proposed are big enough, neither side—particularly Washington and Moscow—will want to reveal them to the world, lest it find itself committed to get more than it can reasonably hope for.

At that point secret diplomacy begins, as it did in 1939 with Hitler. It would perhaps be useful if Washington, London and Paris could discuss together "at the appropriate level" what exactly the technique of negotiating from strength with Moscow should be. So far it appears to be not so much rusty as rudimentary.

* * *

Liaquat Ali Khan

The assassination in front of fifteen thousand people at Rawalpindi on Tuesday of Mr Liaquat Ali Khan, the Prime Minister of Pakistan, opens up grave possibilities. He had been the keystone of the government arch which has so far held Pakistan out of the folly of a war with India over Kashmir. Now he has been removed from the scene at a moment when every ounce of his influence was needed more than ever to restrain the hotheads behind him. As with the murder of Ali Razmara, the Persian Prime Minister, seven months ago, there is now a real danger of a crisis which could affect the whole world. It is a measure of the unique position which Mr Liaquat Ali Khan had won, as the only Prime Minister to hold office in Pakistan during the four years of its existence, that the Governor-General, Khwaja Nazimuddin—a former premier of East Bengal—has found it necessary to step down from his position and take over the reins of government himself, constitutionally a most extraordinary manœuvre. Not even he, however, can be assured of assuming the prestige and authority which belonged to the murdered Prime Minister, who stood second only to Mohamed Ali Jinnah as a founder and maker of modern Pakistan.

The record of assassinations in recent years and particularly in recent months is becoming alarming—from Mahatma Gandhi to King Abdullah, from Count Bernadotte to Sir Henry Gurney. In every case they were men of peace, compromise and courageous moderation. They could be defeated only by assassination, by arming madness against sanity. The risk now is that the knife and the bullet may make moderation and friendship with the west impossible in the public life of Asia.

*

The man who killed Mr Liaquat Ali Khan was torn to pieces by the crowd as soon as he had fired, and there is some doubt about what interest stood behind him. Whether he was an Afghan or a member of the extreme Moslem Khaksars—or both—he appears to have acted partly for money. There is also no evidence as yet to suggest exactly who paid him the money. The people behind the assassination may have been purely Moslem extremists (they bitterly resented the Prime Minister's modern outlook) or, what is almost the same thing, fanatical nationalists striking a blow for Kashmir or the Communists. But whoever it was, the effect is the same. The way may have been opened for embroiling Pakistan in a holy war with India for the possession of Kashmir.

The death of Mr Liaquat Ali Khan alone is not as dangerous as the success of the abortive plot last May would have been, since the regime itself has not been overturned. It is by no means certain that the government in Karachi will be unable to stem the tide of fanaticism. The danger, nevertheless, is very great. Whether a clash with India can be avoided during the coming months—Dr Graham's report was to have been laid before the Security Council this very week—must depend more than ever on the attitude adopted in Delhi. Mr Nehru and millions in India have been profoundly shocked by what has happened. The Indian Prime Minister would never have countenanced an attack on Pakistan. But it is now up to him to help the government in Karachi in every way he can to see that forces within Pakistan itself do not provoke a conflict.

* * *

Mossadegh's Heyday

There are signs that Dr Mossadegh is worried about how to get the Persian oil flowing again. Otherwise his visit to Flushing Meadows has been so successful that his health is completely restored, save for the deaf ear and blind eye that he turns to any hints of compromise with this country. The British resolution before the Security Council has been whittled down to avuncular advice that negotiation should be resumed, and its members have not even had the staunchness to support the ruling of the International Court in this respect. Sir Gladwyn Jebb's position from the outset was made weak by Mr Morrison's bad timing and instructions; now it has been made so feeble that he might be well advised to make his next appearance before the Security Council and the television camera in a wheeled chair.

This is one of the most farcical performances that the United Nations has staged under Mr Trygve Lie's direction and with incidental music from Moscow. The Persian Prime Minister has been allowed to throw at the oil company cooked figures and filleted facts. Plaintiff and defendant have been treated not as equals, but with the fashionable bias against the great power. And, as a climax of helplessness, the Republic of Ecuador proposes that the Security Council should not decide on its own competence in the dispute but adopt a procedure that resembles nothing more than that inconclusive dance called the samba.

The confusion is capped by the fact that whatever emaciated resolution may finally emerge, the Russians will almost certainly veto it. Neither Dr Mossadegh nor the Persian people have any natural love for Stalin—they have just suspended trade talks with the Russians—but if anything could smooth Moscow's path to Teheran it would be Russian support for the Persian claim that the Security Council cannot interfere in the affairs of Abadan. Even if some innocuous solution were found to this problem, there remains a fog of mutual distrust obscuring the road to any

new negotiations. The Persians remain profoundly suspicious of any western management which would be strong and efficient enough to produce oil in sufficient quantities to finance the Persian exchequer and the costs of compensation; and those in the west who can provide the expertise do not trust the Persian regime. It will baffle what Mr Morrison calls the twentieth century mind to find a way out of this *impasse*. What is needed is a little eighteenth-century patience while the Persian Cabinet thinks of what will actually be done to get the oil flowing.

* * *

Out of the Fog

The approach of polling day has as yet made the election issues very little clearer. A few grey shapes, but no more than that, can be seen through the fog of irrelevant debate. Little has come of Labour's attempt to start a new issue, the Tory attitude towards the trade unions. Mr Churchill's rapid disengagement has left Labour with no ground to fight over. The retreat from the position previously suggested by Sir David Maxwell Fyfe can hardly mean that a Conservative government would feel committed to a policy of leaving everything as it is in industrial relations. The "Industrial Charter," under which the Tories hope to do something about restrictive practices, would presumably be considered to stand outside the declaration that they have no intention of initiating legislation affecting the unions—which must be taken to mean legislation affecting them directly as unions. But a law against the "closed shop" principle is now definitely ruled out, though a Conservative government would still have scope for administrative action to check this abuse in the nationalised industries and possibly in local government service.

While the cost of living and "peace" are the two relatively clear issues, the party policies are certainly nebulous, and the choice put to the voters therefore turns on narrow comparisons. Under which party might prices be rather lower than under the other, and under which party might peace be slightly more secure? The speeches are of little help on either point. Mr Morrison in his broadcast on Wednesday night weakened rather than strengthened Labour's case on foreign policy. He declared with unexceptionable wisdom that "our policy must be neither appeasement nor hysteria but calm resolve to use our strength to keep the peace." But he shrank from any demonstration either of why he thought the Tories hysterical or of how he would define the line between appeasement and reluctance to "use our strength." It is hardly surprising that the cost of living has become the more important of the two issues.

* * *

A Straight Contest

With both the third force and the extreme Left much depleted, the total number of candidates nominated for the general election is only 1,376, compared with 1,868 last year. Both Labour and Conservative candidates total 617; the Liberals have fallen below their forecast of 150 candidates and, with 109 actually in the field, are running at less than a quarter of their numerical strength in 1950. The Communists, with 10 candidates, have been reduced to a tenth. Last time the typical contest was between three candidates and in only a sixth of the constituencies were there straight fights. Now about four-fifths of the constituencies have only two candidates to choose from. There are as many as four candidates in only four constituencies, compared with about 90 of these contests in February, 1950. The predominant change is that candidates have dropped out, but here and there the pattern is varied by the addition of a candidate. Six Liberals are standing in constituencies where their party had no representative last time; two of the Communists are trying fresh ground and so are a few Independents. Woodford remains one of the four-candidate constituencies but the array against Mr Churchill has been changed by the introduction of an Independent and the departure of a Liberal, with a Communist remaining.

As usual the constituencies that Labour is not fighting are all in the Conservative strongholds of Northern Ireland, where four Conservatives are returned unopposed. Four Liberal and four Labour seats in the last Parliament are left unchallenged by the Conservatives. Two of these Liberal seats—Carmarthen and West Huddersfield—were not contested by the Conservatives last year, and to this small group they have added Cardigan and Montgomery (Mr Clement Davies's constituency); in both cases the Liberal won easily last time. The four constituencies that returned Labour members in 1950, but where there is no Conservative candidate this time, are more interesting. In two of these—Bolton West and Colne Valley—last year's combined Conservative and Liberal vote exceeded that of Labour, though in Colne Valley by only a narrow margin. Liberal hopes are, therefore, high in these constituencies. In Fulham West, where Labour in 1950 had a majority of 2,849 over a Conservative opponent, Conservative support is now being given to the Independent candidate, Mr W. J. Brown, against Dr Edith Summerskill and a Liberal candidate. In Dundee West, the remaining constituency where the Conservatives are standing down, the Liberals' hope seems to depend on Communist intervention depriving Mr Strachey of some of his votes; in 1950 he had a majority of 4,701 over his Conservative opponent and the second Liberal—appearing after one candidate had withdrawn—polled less than 1,000 votes. There are two further changes in the candidatures of the major parties. At Hexham, where the Speaker was in 1950 returned without a party label, both parties have put up candidates. This seat may be taken as a safe Conservative gain, while at Greenock Labour has little reason to worry about the Conservative opposition that was lacking last year.

Few of these minor variations in the candidatures will make any difference to the election result. And unless the Liberal votes divide far more decisively for one side or the other than the present evidence of the Gallup poll suggests, even the withdrawal of Liberals from 372 seats they contested last time will not matter as much as a very narrow swing between the two major parties.

* * *

The Latest Arithmetic

Now that all the cards are on the table, the methods of trying to forecast the election result discussed in *The Economist* last week can be applied more exactly. The first step is to re-examine the 1950 voting in the marginal Labour seats in the light of the new lists of candidates. Liberals are contesting comparatively few of these seats. At the last election there were 53 seats in which all three main parties were represented and which Labour won with a majority over the Conservative of less than 8 per cent of the total poll. Only 11 of these seats are now contested by a Liberal candidate. On the other side of the account, many Communists have dropped out; they polled on the average about 1 per cent of the total vote last time. Their votes have now been added to those for Labour before determining the swing between the two major parties required to make a seat change hands. The few seats where there are now no Conservative candidate have been excluded. In these ways, the calculations published last week have been revised. The new estimates, given in the table, differentiate, in their provision for different allocations of the Liberal vote, between the cases where there will again be a Liberal candidate and where there will not.

There are a few special cases outside the scope of this table. The disappearance of Communist candidates affects the safety of four seats held by Conservatives in the last

Parliament. In two Glasgow divisions—Govan and Scotstoun—the Conservatives may have to gain large proportions of the Liberal vote in order to retain their seats if the Communist vote is given to Labour. Bexley and Shipley are also threatened unless the Conservatives can acquire a small net advantage from the former Liberal vote. However, these possible Conservative losses may to some extent be offset by the loss of Labour seats to Liberals in the constituencies the Conservatives are not contesting and by the probable Conservative gain at Hexham. To adjust the estimates to take account of these cases would merely give an unwarranted impression of accuracy.

SEATS GAINED BY CONSERVATIVES WITH VARYING SHIFTS IN VOTING

% of Total Poll Gained by Conservatives directly from Labour.	Conservative Net Gain of Liberal Vote.				
Where Lib. Candidate	0%	0%	0%	10%	10%
Where No Lib. Cand.	0%	10%	20%	20%	30%
Nil	—	3	10	12	14
Up to 1	15	19	24	27	34
„ „ 2	33	40	45	46	52
„ „ 3	48	56	59	60	65
„ „ 4	67	73	76	77	86
„ „ 5	85	91	96	98	103

The latest estimates of the British Institute of Public Opinion give the Conservatives 50 per cent of the poll, Labour 47 per cent, the Liberals 2½ per cent and others ½ per cent. As compared with the voting in the election of February, 1950, when Labour finished up 2.7 per cent ahead of the Conservatives, these figures show a Conservative improvement of about 5½ per cent, which might be due to a direct swing of rather less than 3 per cent, with the ex-Liberal vote dividing equally, or alternatively to a smaller direct swing plus some net gain of ex-Liberal votes. In either case, as the table shows, the indicated result is a Conservative gain of around 45 seats and a majority in the neighbourhood of 75.

This forecast depends, of course, on the reliability of the public opinion polls. There is no doubt that, this year, the difficulties of assessing the intentions of the ex-Liberals are adding considerably to the precariousness of the estimates. As would-be Liberal voters have discovered that they have no Liberal candidates to vote for, the Liberal proportion has come down, in a fortnight, from 7 to 2½ per cent. The redistribution of such a large block of votes must be chancy; and there is still an unusually high proportion of "Don't Knows"—or "Won't Says." For these reasons, every exercise in electoral arithmetic should end with a large question mark.

* * *

Chiefs of Staff in Greece and Turkey

During the past few days the American, British and French Chiefs of Staff have been visiting Greece and Turkey. After talks with General Eisenhower in Paris, Field Marshal Sir William Slim, General Bradley and General Lechères left for Athens on Wednesday of last week and arrived in Ankara on Friday. The object of their visit was to assess the military strength of the two countries and to discuss with the Greeks and Turks the practical details of their military association with Nato. The aim of the trip was to inquire and explore rather than to make hard and fast decisions, and it is expected to pave the way for the dispatch to Washington of senior Greek and Turkish officers to work with the Standing Group of Nato. In the Turkish case this may be General Yusuf Egeli, who has been chief of operations on the General Staff.

The visit should do much to dispel doubts in the two countries that the Nato powers are in earnest when they ask them to join the organisation at once and unconditionally, even though slowness in ratifying the invitation extended to them at Ottawa still prevents them from formally taking their place in the treaty organisation. What remains to be determined, however, is to which subsidiary regional grouping each country should be assigned. It is reported from Paris that the logical development is felt to be to place Greece in Admiral Carney's southern European command and for Turkey to play its main role in the new separate Middle East command which is now being formed. The Turks have been assured that their troops will remain as far as possible under Turkish command and will not be sent to other areas without Ankara's full consent.

Since Greece and Turkey were invited into Nato, Egypt's abrogation of its treaty with Britain and rejection of the offer by America, Britain, France and Turkey to join a military alliance have introduced new elements of uncertainty into the situation. It would, however, be a great mistake to do anything that might give the opposition in Ankara an opportunity to play on the theme that Turkey is regarded by the rest of Nato as nothing more than an outpost of Europe and first and foremost a Middle East ally. The Turks have outgrown their close association with the Arab world. They think of their country as the hinge between European and Middle East defence; and they are above all anxious that it should not stand out on Soviet maps as an area not formally and directly covered by plans for the defence of Europe.

* * *

France and the Arabs

The French government has received verbal assurances of American and British support for the Moroccan protectorate. This solidarity in face of the Arab League puts an end to Franco-American friction over Morocco that began with the famous meeting of the Sultan and President Roosevelt after the Allied landings, and continued with squabbles about the coca-cola drive and other trading rights. A dispute between the United States and the government of the Protectorate is still before the Hague Court. But even more significant is the improvement in Anglo-French relations in regard to Arab countries, which have nearly always been bad and since the war worse than ever. The main point of disagreement has been French opposition to British sponsored Arab independent movements in the Lebanon, where there has been something of a French comeback, and in Syria; in Egypt where very large French commercial interests automatically suffer from a relaxation of the British grip; in Libya, where the proposed federal kingdom is viewed by Paris as a gimcrack nightmare subversive to order in Tunisia. Now all these difficulties should, if not disappear, at least fall into proportion beside the overriding common interest to make North Africa and the Middle East secure. Questions relating to these areas will be discussed by the British Foreign Secretary and M. Schuman at their meeting in Paris in November. It is to be hoped that more will come of these conversations than of previous efforts at understanding.

* * *

Uno's Split Personality

In his latest annual report the Secretary-General of the United Nations points out that, since the Communist aggression in Korea, there has been a remarkable change in the previously widespread feeling that Uno could provide no protection, and that the only hope lay in regional defence groupings. Mr Trygve Lie acknowledges the value of such groupings, but he notes that their limitations have already shown themselves. On the other hand, he points to the "Uniting for Peace" resolutions adopted by the last Assembly as proof that most member nations want to set up a workable UN security system. Enthusiasm for these resolutions may not have been as general as Mr Lie suggests;

but he is thinking along realistic lines when he argues that

> the greater the ability of the UN to foil attempts to solve conflicts by force, the more likely it will be that those conflicts can be settled by negotiation.

When applied to the United Nations, however, this argument leads into deeper waters. Unlike Nato, the world organisation aims not only at making aggressors think twice, but also at providing a common ground on which antagonists can meet to resolve their differences. The penalty of dividing forces and advancing in two directions is that fire is met from both flanks. On the one hand Uno is denounced by the Communist world peace movement as being no longer "an area of agreement" but the fool of "a dominant group"; on the other, there is a natural irritation in western countries—and not least in Britain—at the way in which UN procedures can obstruct the protection of vital interests, and particularly at the organisation's inability to restrain extremist actions which fall short of war. The Communist reaction is to build up the "World Peace Council" as an alternative international forum to Uno, which will echo only the Kremlin's opinions. The western reaction is also to write Uno down to a minor role, but not to dispense altogether with its services where these can be fitted into the general pattern of collective security and national policies. Neither attitude offers much hope for the future of Mr Trygve Lie's organisation. But western doubts might be modified if it could be shown that Mr Lie is right in maintaining that Uno's function as a forum need not frustate its function as a policeman. This is a practical, not a theoretical, point; it cannot be established by reference to the text of the Charter, but only by observing the conduct of the members of the organisation. At the General Assembly which opens in Paris on November 6th the member nations will have a fresh opportunity to justify Mr Lie's hopes by their conduct.

Electioneering TV

It has long been a slogan of party organisers that elections are won or lost on the doorstep, by intensive canvassing rather than by extensive speech making. But this time a very energetic bid has been made to win the election at the fireside; besides the thirteen sound broadcasts there have been for the first time television broadcasts. The series was pioneered by Lord Samuel, who on Monday read for fifteen minutes a script on the Liberal attitude. It was to all intents and purposes the televising of a sound broadcast, and was marred by a mistaken signal that robbed him of his closing lines. Yet Lord Samuel's sincerity and reasonableness were vividly expressed, and the broadcast was much more effective than most of the professional television critics, applying the standards of entertainment, have considered it.

On Tuesday Mr Eden was equipped with a graph to show the cost of living and with a candid friend, in the person of a professional television speaker, to put all the right questions. The following night Labour went one better—or one further—and arrived not only with graphs, but with two speakers, Sir Hartley Shawcross and Mr Christopher Mayhew. Mr Mayhew, who while out of Parliament became a regular television commentator, carefully guided Sir Hartley through his points. This, with its claim to prove that the Tory graph was a fake, was by far the most entertaining show. Yet one wonders whether the stage effects and the cross talk were as good electioneering as the periods when Mr Eden and Sir Hartley spoke straightforwardly into the camera.

As an electioneering medium television certainly remains very much in its infancy. The first three sound broadcasts at an election, in 1924, had similar teething trouble. Mr MacDonald spoke from the platform of a meeting in Glasgow, and the show suffered severely from "noises off." Mr Baldwin learned the lesson quickly, and made his broadcast from a studio, setting in this way the pattern that has since been followed. In television the best methods may take longer to learn. This week most viewers were probably left with the impression that Mr Eden is a very nice man, and so is Sir Hartley, and Lord Samuel is a wise man but one far removed from any hope of power. But that is all. As a technique for stimulating thought or rousing fervour the usual discussion programme "In the News" is far superior to these staged talks. But there the performers are mostly party rebels of one sort or another, people kept out of sight as much as possible at election times. There is a long way to go before the full power of television is effectively deployed as a means of winning or losing votes.

* * *

Reforming the Health Service

Three main proposals have been put forward by the council of the British Medical Association in its report on reforming the health service. The first concerns arbitration. In 1949 the association was aggrieved because the National Health Service (Amendment) Bill of that year did not give the medical profession the right to resort to compulsory arbitration if disputes could not be settled through the normal Whitley machinery. What the Act did do was to apply the procedure of the Industrial Courts Act to disputes concerning the pay of any employees in the health service. On the second reading the Government spokesman said that it was intended to set up an arbitration tribunal for the health service on the lines of the civil service tribunal. But the intended arbitration agreement has not been brought into existence; in the meantime the negotiations between the British Medical Association and the Ministry of Health on doctors' capitation fees have dragged on and only recently has arbitration been agreed to. There is therefore some justification for the doctors' case. But it is difficult to believe that the Whitley machinery can ever work satisfactorily if, as is now proposed, either party to the dispute can take a dispute to arbitration without the consent of the other.

The council's other proposals are of more general interest. Part of the concern over arbitration arises from the Minister of Health's power to make changes by regulation in the pay of the medical staff of hospitals without reference to the Whitley machinery. It is therefore proposed to limit the Minister's powers in this respect and also some of his other powers which give him unnecessary control and wide discretion.

Some of the proposals for reforming the hospital service will be controversial. There will be general agreement—at least outside Whitehall—with the by now well-known suggestion that hospitals should be financed by block grants. But the proposed reform of the regional boards, under which the members would be elected by the sectional interests concerned, is much more dubious. It is true that the present system of appointment by the Minister after consultation is undemocratic. But it is difficult to see that anything would be gained by substituting representatives elected on such a limited franchise. They would be bound to regard themselves as serving the interests of their own professions and organisations first rather than the interests of the community.

Three to Make a Quarrel

By chance, it has not taken long for the Industrial Disputes Order made last August to come before the Courts. In 1949, a joint committee representing municipal corporations and town clerks made recommendations for increases in the salary scale of town clerks. The South Shields Corporation declined to give effect to these recommendations and twelve months ago the Society of Town Clerks, on behalf of their South Shields member, reported to the Minister of Labour that a dispute had arisen under the old Order 1305 and called for an arbitration by the National Arbitration Tribunal. After six months' thought the Minister referred the dispute to that body but the arbitration had not been heard when Order 1305 perished and this year's Order (1376 of 1951) replaced it. The South Shields Corporation then applied to the High Court for an order prohibiting the new Industrial Disputes Tribunal from considering the matter, on the grounds that it was not a "trade dispute" under the definition contained in the new Order. The High Court, last week, found for the South Shields Corporation and made the order of prohibition.

The reasons for this decision emphasise one of the two important changes made by this year's Industrial Disputes Order. One change was the abandonment of the "illegality" of trade disputes and lock-outs. That point was not involved in the South Shields decision. The other was the alteration in the definition of a "trade dispute." Under Order 1305, a trade dispute was any dispute involving one or more workmen or employers. Under the new regulation it is a dispute involving one or more employers but more than one workman; the workmen must be plural, not singular. Further, the dispute on the workmen's side may only be referred to the arbitration of the new tribunal if it is reported to the Minister of Labour by a trade union. The South Shields case fulfilled the second condition; it was reported by the Society of Town Clerks. It did not fulfil the first condition; a town clerk employed by a municipal corporation can never be in the plural. The assistant solicitors employed in his department may create a "trade dispute" within the meaning of the new regulation. Their boss can not. If the aim of the trade unions, when the new order was under discussion, was to ensure that every trade dispute must come to arbitration through them, they have succeeded. They have also made certain, intentionally or not, that the individual specialist in any one employment must get some of his fellow workers to join with him if he is ever to be able to carry his dispute to arbitration. That may be of small practical importance, but as far as it goes it hardly makes for industrial peace.

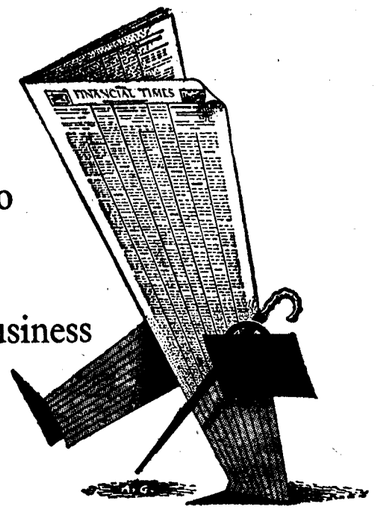
Poland Feels the Pinch

Poland's "economic upsurge" is a favourite theme of its leaders and commentators; but last week Mr Hilary Minc, Poland's chief economic planner, and the most able economist in the satellite countries, treated this subject from a more unusual angle. He pointed out that rapid industrial development must involve many difficulties and hardships. Moreover, he made it clear that it was the need to expand the armaments industry in face of "the acute manifestations of the aggressiveness of the imperialist camp" that made it imperative to press ahead more energetically than ever. This is the first time that a leader in any satellite country has spoken so plainly of rearmament, not "peaceful socialist construction," as the major factor in their industrial plans.



Mr Minc admitted that there were serious supply difficulties, including "an acute shortage" of meat, potatoes and other goods. He said they were due to the different rates at which industry and agriculture were growing. By the end of this year, industrial production would be 168 per cent above the 1938 level; but agricultural production, which in the Six-Year Plan is given as its aim a modest 6 per cent rise over the 1938 level, will not even achieve this owing to the decrease in the number of pigs and the poor potato harvest. The Government is now making strenuous efforts to stamp out "kulak blackmail" and bring the peasants to a proper sense of their duty to provide for the industrial workers.

The speech is further remarkable for its frank admission that the supply difficulties, whatever the Government may do or say, are bound to continue. The Polish Communists have always been particularly cautious about pushing ahead with collectivisation—the proved Communist method of consolidating revolution in the countryside and the orthodox method of increasing food supplies for the towns. Mr Minc says plainly that the conditions for more rapid collectivisation do not exist and that the Government cannot create them—in other words it does not know how to overcome the peasants' opposition. Even Mr Minc does not go so far as to suggest that the Government should try to regain the peasants' confidence by definitely calling off the collectivisation. He does not, in fact, follow his analysis of present difficulties with any new suggestions for remedying them; the Polish worker is merely given to understand that he must tighten his belt. As Mr Minc is believed to have recently been to Moscow, and as his speech has been given great publicity, it is not unreasonable to assume that his dose of realism and warnings of austerity are designed ultimately to reach a wider audience behind the iron curtain.

Suitors for Asian Exports

The countries of South East Asia are acquiring an embarrassing number of suitors for the favours of their export trade. Representatives of twenty-five governments, many of them fresh from the Commonwealth Conference on raw materials in London, gathered in Singapore last week at a trade promotion conference called by the UN Economic Commission for Asia and the Far East. They were to hear first the Russians and then the Japanese promise them unlimited manufactured goods in exchange for raw materials produced in the area. This was the first time the voice of independent Japan has been heard at an international conference, and it was inevitable that it should have embarked on a campaign for raw materials, promising, if it received

Men who mean Business read
THE FINANCIAL TIMES
every day

them, to provide the area with capital and consumer goods. It is evidence of Japan's determination to reconstitute itself the factory of the Far East. Such promises sound somewhat stranger on Russian lips; electrical generators and equipment, still being bought by Moscow from Britain, headed the list of Russian delicacies offered in exchange for tin, rubber, wool, jute, cotton and other materials. But Mr Migunov's statement was sinister as well as strange.

Since the Americans screwed down the controls on east-west trade, Moscow has shown several signs of real concern about its supplies of raw materials. Admittedly it has also put up a bold barrage of indifference in its various propaganda organs, but it was worried enough to add a conditional clause to its latest grain and timber agreements with Britain, to the effect that if it could get no rubber it would offer no grain and timber. It is, of course, equally true that the Soviet Union has no surplus of capital goods—in fact, it is much worse off in this respect than Britain—but it would be wrong to assume that it will therefore fail to find them, if South East Asia reacted seriously to its blandishments. In the Communist world somebody—for example Poles and Czechs—can always go without, if Moscow decides that it is necessary. Moreover, this bait is too vital a propaganda point for the Russians to be making frivolous promises. It is the first time that a Soviet delegate has specifically guaranteed the delivery of equipment to non-Cominform countries, and it must be regarded as Moscow's answer to the Colombo Plan.

The West has certainly shown itself acutely conscious of the need to meet the capital needs of the developing countries. At the Commonwealth Conference, Mr Stokes gave an assurance that the rate of Britain's exports to the Commonwealth will be maintained at its 1950 level. But Mr Migunov has now shown just how important it is that Mr Stokes's assurance should be fulfilled. Three days before the Singapore meeting, it was announced in Washington that the United States was considering the suspension of aid to Ceylon, because Ceylon had just shipped 5,500 tons of rubber to Communist China. The only effective way of ensuring that this kind of thing does not continue is not by cutting off aid, but by seeing to it that Ceylon can buy what it wants and needs with the money that it would earn by selling its products to the West.

Foreign Ministers for Bolivia

Bolivia has had eight revolutions and seven Presidents in the last ten years; it has had eighteen Ministers of Labour in four years, and eight Finance Ministers in eighteen months. Even among the smaller Latin American countries this is an unusually rapid turnover, and it is hardly surprising that the United Nations mission, which recently visited the country to see how technical aid could best be supplied, quickly concluded that "governmental and administrative instability" was the root cause of Bolivia's economic difficulties. What is surprising is that Bolivia and the UN have agreed to make a vigorous attempt to tackle the problem by methods for which there is no precedent.

Ten men with wide experience of administration in a number of different countries will, under the agreement signed at La Paz this month, be appointed to senior posts in Bolivia's civil service for periods of three to five years. They will not only have the right to make suggestions directly to the President and his ministers; they are also to be charged with carrying out sweeping reforms. They are to reorganise the Ministries of Finance, Labour and Agriculture, to organise a new Ministry of Mines and Economic Affairs, to stabilise the monetary system, to reform taxation, and to improve the quality of official personnel. They will also sit, with Bolivian Ministers, on a new council which will decide the broad lines of economic and administrative policy.

If this experiment succeeds, other countries which face problems similar to those of Bolivia will be encouraged to follow suit. Their natural antipathy to foreign interference in their domestic affairs may well be assuaged by the fact that these administrators will not be acting as UN officials but simply as employees of the Bolivian Government, and by their recruitment from several different countries. The last point is of particular importance in Latin America, where there is strong feeling against any kind of tutelage by the United States acting alone.

Planning in Lilliput

For many years a widening public has been fascinated by the model village of Bekonscot, near Beaconsfield, fascinated by the ingenuity and skill with which the waist-high buildings have been made. In return, visitors through their entrance fees have contributed some thousands of pounds to charity. But the innocent amusements of the thirties are the crimes of the fifties. By official standards, Bekonscot is unplanned. Its builders failed to ensure that their acre was zoned for miniature development, and they have now met the fate that befalls all who imagine that common sense can ever justify any exception to a Ministerial Order. The Bucks County Council, as planning authority for the area, has made an enforcement order; three Judges of the High Court have upheld it; and unless the Minister himself intervenes (and it is a far cry from Bucks to Durham) the county council, with the determination, if not the grace, of an elephant picking up a pin, will "liberate"—the verb is outdated, but it still seems appropriate—the portion of Bekonscot which has been built since September 30, 1929. Any Act of Parliament can be reduced to absurdity. The county council has ensured that the 1947 Planning Act is no exception.

* * *

Industrial Injuries

The Government actuary has issued his first interim report on the working of the Industrial Injuries Act (HMSO, 4d.). The industrial injuries scheme, which replaced workmen's compensation on July 5, 1948, is financed by contributions from employed persons and their employers and by an Exchequer supplement of one-fifth of the combined contributions. Its benefits are divided into three parts. Injury benefit of 45s. a week is payable for a limited period—not more than twenty-six weeks—during total incapacity for work as a result of an industrial injury or disease. At the end of this period, disablement benefit is paid, which, like war pensions, varies in amount according to the assessment of the degree of disablement. For 100 per cent disablement, the rate is 45s. a week, and for less than 20 per cent a gratuity instead of a weekly pension is usually given. Like war pensions, the disablement pension is paid irrespective of the amount of work the pensioner can do, and like war pensions it may be increased by an unemployability supplement and a constant attendance allowance; a special hardship allowance is also given if the disabled person cannot take up employment of a standard equivalent to the work he was doing before. Thirdly, death benefit is payable to widows and other dependants if an insured person dies as the result of an industrial accident or disease.

Since the actuary's report covers only the first twenty-one months of the scheme, by far the greater part of the expenditure in that period was on injury benefit. This amounted to £9,162,000 in the year 1949-50, and there is no reason for it to vary greatly from this amount in future. Older people

The Schweppshire Post — An Announcement

A TRIUMPH & AN OPPORTUNITY

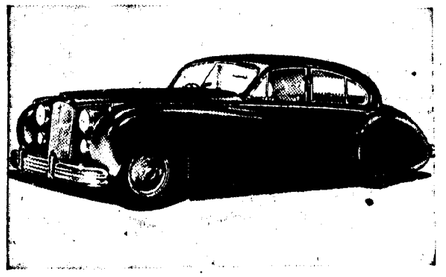
The more than international interest aroused by the Guide to Schweppshire demands a response. We hope, during 1952, to be able to reprint pages from our daily organ, THE SCHWEPPSHIRE POST, thus vividly pin-pointing, uniquely, SCHWEPPSHIRE'S LIFE TO-DAY. But opportunity shatters schedules. A General Election has given new meaning and fresh urgency. Here, then, is a preview of POST'S policy.

THE SCHWEPPSHIRE POST'S ELECTION MANIFESTO

It is addressed to YOU

This is a message. A message for *YOU*. For you, because YOU are one of 2,371 guaranteed SCHWEPPSHIRE POST readers, and though YOU diminished at first, now YOUR number is increasing daily. YOU will be bigger after October 25th. And why?

POST policy is *YOUR* policy. Politically, POST is for progress; yet realises that tradition plays its part. Internationally, POST is fearlessly for Peace, remembering war's honoured tradition. The country must remain alerted for defence, always recognising that the bogey of the atom bomb must not allow us to be ruled by scaremongers. We stand for Britain first, always remembering that the English-speaking peoples play their part, with the coloured peoples as their inseparable adjunct. For agriculture, the farmers must be absolutely free, and we must guide them to this freedom with the full co-operation of the Advisory Committees. POST is if possible even more for Youth; with maturity standing shoulder to shoulder with Age. POST is for our heritage of health, is for our national heritage, this realm, this diadem, this moat.



POST is for YOU.

Stephen Potter

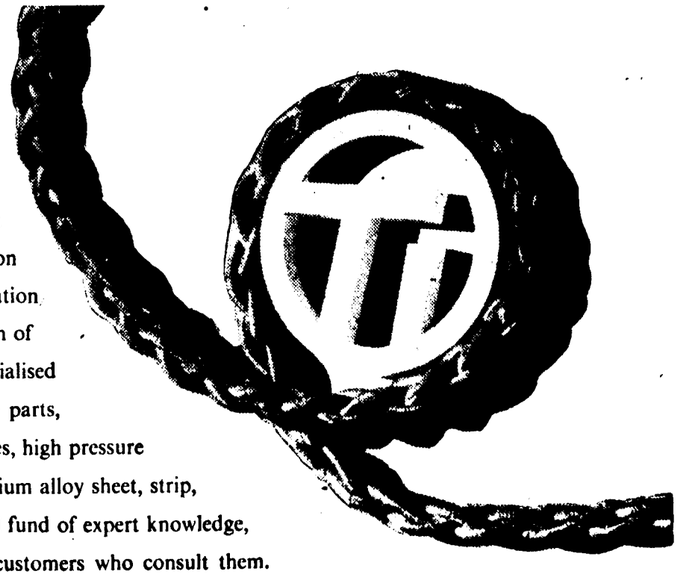
BERMUDA



A Coral Island Holiday after your New York trip

Bermuda is favoured above most corners of the world. Its gentle climate, its beaches of warm pink sand and its flowering trees, the charm of its old buildings and the comfort of its modern hotels make Bermuda a very special place indeed. You can play golf or tennis, swim or sail, go game-fishing or riding, enjoy carriage drives and dancing under the stars. And you can relax—for Bermuda is above all a restful place, where work-a-day cares float away on the warm water of the Gulf Stream.

One of the regular routes from London to Bermuda is via New York, from which, in any case, Bermuda is readily reached. Why not take advantage of this, and enjoy a break there on your way home from a business trip to America. The currency is sterling. No limit on the amount you may use there.

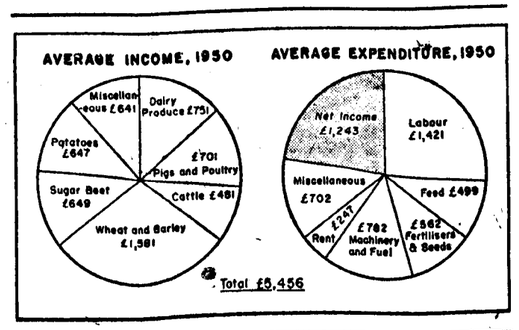
Write for free illustrated booklet and information about fares and hotel charges, to P.R. Officer, Bermuda Government Information Office, Regent House, 89 Kingsway, London, W.C.2 (Tel. Holborn 0487), or any Travel Agent.

CONSULTATION

Two forms of consultation are frequent at TI. No. 1 is full technical consultation with customers. No. 2 is expert consultation within TI itself, for TI is an organisation of 49 factories in Britain, each with its specialised job. TI companies make cycles, cycle parts, precision steel tubes, electrical appliances, high pressure cylinders, gland packings, paint, aluminium alloy sheet, strip, extrusions. . . . Each feeds the whole TI fund of expert knowledge, available to all TI companies and to customers who consult them.

TI's FORTY-NINE FACTORIES SERVE THE WORLD

TUBE INVESTMENTS LIMITED, THE ADELPHI, LONDON, W.C.2 (TRAFALGAR 5633)



tend to have fewer accidents at work than younger people, but this influence of an ageing population on expenditure is offset by the fact that injury generally keeps a man away from work for a longer time the older he is.

What is uncertain about the scheme is the cost of disablement benefit. In the year 1949-50, expenditure on this was only £2,766,000. But, as the actuary points out, it will mount from year to year until each year's crop of new awards is offset by the deaths of earlier beneficiaries. It is thus far too soon to say whether the £39 million credit balance at present in the industrial injuries fund will be too great or too small to meet the scheme's total liabilities.

* * *

Farming Prosperity Continued

A comparative survey of the economic returns of 320 farms in the eastern counties for the years 1949 and 1950* shows that, in this important farming region at any rate, there has so far been no decline in the high general level of agricultural prosperity. Costs in 1950 increased by 9½ per cent, largely because the subsidy on feedingstuffs was

removed, but receipts went up by 10 per cent, as a result both of higher prices and a larger turnover. Thus, despite its worse weather conditions, 1950 was a better year than its predecessor for farmers in this region. Average net farm income increased from £1,104 to £1,243, and the figure for the "profit surplus" (which is reached by deducting from net income the estimated value of the farmers' own labour and a 4 per cent return on his working capital) was £610 in 1949 and £730 in 1950.

These are satisfactory results for farmers as a whole, although they disguise wide differences within the sample. In both years some 10 per cent of the farms worked at a loss while another 10 per cent earned a net income of over £3,000. Such differences underline the difficulty of the government in honouring its guarantee to agriculture without presenting some farmers with enormous windfall profits, especially since rents (which are generally low) no longer perform their classic function of equalising natural advantages. Farmers on good soils tend to make high profits, whatever their level of efficiency.

Mechanisation is still proceeding rapidly. In the two years covered by the survey, the number of tractors increased by one-sixth and that of combine harvesters doubled. This fact is reflected in the rising annual cost of machinery repairs. It would seem that mechanisation is undertaken more in order to free the farmer from his dependence on casual labour than to bring down his costs, and that the latter objective is not being achieved. This is a disturbing reflection on farming efficiency.

Sweet and Lovely

So far the women politicians seem to be providing the comedy of the election campaign. Miss Pat Hornsby-Smith, the Conservative candidate for Chislehurst, took as the main theme of her election broadcast the poverty and hardship endured by the working classes today in contrast to the palmy prewar days when one could buy a suit for 50s. Everyone, admittedly, is talking nonsense about the cost of living. Miss Hornsby-Smith's remarks were not much more absurd than international comparisons of cost of living indices based neither on the same period nor on the same items of expenditure, or than comparisons of prices of subsidised foods with prices of the same foods abroad. But they were nonsense of a very challengeable kind. Ignoring Mr Gaitskell's advice to check her statement about "double wages and treble prices" by the Monthly Digest of Statistics, Miss Hornsby-Smith promised to contribute to the funds of the Labour Party if she were proved wrong. Fortunately for her she did not specify the size of the donation.

The palm, however, must go to Dr Edith Summerskill. She is touring her constituency of Fulham West in a caravan, to the signature tune of "Sweet and Lovely," because, as she is reported to have explained, "the Labour party's object is to introduce a little more sweetness into the lives of the workers." This announcement utterly confounds those critics who thought that Labour policy had reached a dead end, and details of Dr Edith's programme are now eagerly awaited.

Royal Tour

We certainly have no knowledge of any period within the present century, till now, when it would have been thought advisable for Royalty to visit Manchester and Liverpool. As late as 1842, there were considerable riots in the manufacturing districts, and there were only brief periods through the whole century when they were not the seats either of suffering or outrage. The people were either in want of employment and food, or, hurried on by blind passions and mischievous leaders, were exciting commotion or attacking their employers, whom they supposed to be the cause of their sufferings. Till 1851, it was scarcely reasonable to expect that the Sovereign should visit them, and till now they were studiously avoided. Liverpool, we believe, was never before honoured by the presence of its Sovereign, and since the time of James I Manchester has been equally deprived of Royal smiles. Both places have now been visited by the Queen, and at both Her Majesty was received with exuberant joy. The people crowded to see and welcome her; the magistrates and gentry were not more delighted with her presence than were the multitude, and her coming amongst them occasioned a general holiday. The people saw in her the representative of the national power and the national justice; the glories they inherit and the blessings they share were all symbolised in the Queen, and they surrounded her with devoted hearts and rejoicing voices. That Her Majesty could visit these districts at all, is almost a matter of wonder; that she should visit them and find the whole population orderly, joyous, and delighted, is, in contrast with the reputation given them by Tory politicians and advocates of Arcadian simplicity, as marvellous as any other marvel—the Great Exhibition itself—of this marvellous year. It can no longer be thought or said that the rural population have a monopoly of loyalty, and that Her Majesty may not as safely rely on the ardent attachment of her most skilful subjects, as on the blind devotion of the veriest clodhoppers whose ignorance is supposed to be the guarantee for their loyalty.

Letters to the Editor

Uno's Army of Experts

Sir,—In your issue of August 18th it is stated that "twenty-four countries, including Sweden, Brazil, Italy, Uruguay and Persia, have so far provided nothing at all" towards the United Nations expanded programme of technical assistance. As far as Brazil is concerned, the statement is not correct. By August, 1951, the whole of Brazil's contribution in technical services, scholarships and fellowships, valued at $460,000, had been made available to the UN Technical Assistance Administration. — Yours faithfully, L. DE A. NOGUEIRA PORTO

Comissao Nacional de Assistencia Tecnica, Rio de Janeiro

[The words quoted occurred in a summary of the latest report of the UN Technical Assistance Board, and it was made clear that they referred to the position on July 1, 1951.—EDITOR.]

Retreat From Rating Revaluation?

Sir,—I was interested to read your note in your issue of September 29th.

The matter of grants to the local authorities is one which must receive instant attention and I imagine if the case you make for England is good, that for Scotland is more so. You may not be aware that the national average valuation per head, for Scotland, for purposes of the grant, is arrived at by taking the English average and adding 25 per cent to it. This 25 per cent is supposed to compensate Scotland for higher local valuation which is in force in England. The fact is that Scottish valuations are under constant review for all parts of the country. Accordingly, the level of valuation is much more in accord with present-day circumstances than that prevailing in England.

This injustice to Scotland is one which is well worth pointing out and one which you can add to the growing list of injustices which local authorities have suffered in recent years.—Yours faithfully, WM. Y. DARLING

Edinburgh

Agin the Government

Sir,—"Pro Bono Publico's" suggestions call for legislation. Such legislation is unlikely to secure high priority in any government's programme. I suggest, therefore, as a slogan for electors to be going on with: "No Vote for any Sitting Member."—Yours faithfully, A. D.

Electoral Arithmetic

Sir,—In discussing the Cube Law you state that "rough corrections can be devised" for the bias against Labour in the electoral system. I hope you do not countenance the illogical method of adjustment now becoming popular, which makes a flat-rate deduction from the Socialists' poll. This ignores the fact that what makes them weak in attack also makes them strong in defence. Because they have an unduly large proportion of big majority seats, they have an unduly small proportion of small majority ones, and would be likely, other things being equal, to lose marginal seats at a slower rate than the Cube Law implies.

However, other things are not equal this time, because the disappearance of Liberal candidates in so many marginal constituencies favours the Conservatives. This may by accident make the adjusted Cube Law forecast more or less correct. But the chance that two unrelated errors have cancelled each other out will not prove the suitability of this forecasting technique to present British electoral conditions.—Yours faithfully,

CLARE CAMPBELL

London, S.W.1

[The possible corrections were described as "rough," and the "cube law" method of forecasting was dismissed in our article, for reasons such as Miss Campbell indicates.—EDITOR.]

As Simple as ABC

Sir,—Gowers is right. Disinflation is an abhorrent word. A balloon is inflated and deflated; so is the currency. "Disinflation" is sheer moral cowardice. Whether we disinflate or deflate, the consequences are identical. Dare to be a Humpty Dumpty. Show deflation who's master.—Yours faithfully,

GUY CHAPMAN

The University, Leeds

Books and Publications

The Keynesian Prescription

Economics of Employment. By Abba P. Lerner. *McGraw-Hill.* 386 pages. 34s.

The combination of the title, the author's name, the publisher's imprint and nearly 400 pages suggests another recondite sample of the massive American scholarship dedicated over the last few years to the New Economics. The suggestion is misleading. The scholarship is there in the background, but the exposition is strictly popular; with the exception of a few carefully signposted pages, "Economics of Employment" is aimed, with admirable accuracy, at the counterpart of the unscientific reader catered for by the scientific articles in *Life*. Its aim is to explain the need for, and the nature of, what Professor Lerner calls "Functional Finance"—the central control of the level of expenditure as a means of ensuring full employment without inflation; to analyse and rebut the common arguments against its effective exercise; to correct the view that it is applicable only as a remedy against depression; to put its international aspects in perspective; and to relate it to wider questions of political democracy.

All these aims are carried out with admirable skill. The old technical brain-twisters — propensity to consume, marginal efficiency of capital, necessary equivalence of saving and investment, and so forth—lose all their terrors in Professor Lerner's hands; and he goes through the legerdemain by which the compatible levels of employment and of national income are determined in a considerate slow-motion sequence revealing every step to the least receptive mind. For anyone who wants to know, without previously going to the trouble of taking a complete course of economic theory, not merely the broad outlines of the Keynesian technique but the details of the Keynesian prescription, this is the book.

It is, unfortunately, not only a masterpiece of exposition; it is also an awful warning. Mr Lerner brushes aside all possibility that a purely monetary approach to the trade cycle may be inadequate, that the "frictional" unemployment of men-between-jobs, which, he realistically recognises, may itself be subject to wide cyclical fluctuations destructive to the statistical criteria of "functional finance." He faces the enormous problem of accelerating wage demands with commendable honesty, but proposes for its solution an administrative and statistical device—a "national index of attractiveness" for different occupations, according to which wage advances should be regulated in inverse proportion—for which existing administrative and statistical techniques are about as adequate as those of the Tudors would have been to the national health service of today. His remedies for the disincentive effect of the heavy taxation needed to keep down spending when the national debt is increasing lead into a wilderness of partial state ownership and wholly private control, which provides no logical resting-place short of all-in socialism. At one point he is reduced to falling back on that deeply discredited piece of Socialist price-policy theory, "the Rule" by which marginal costs and marginal costs alone should determine prices, all overheads being ignored. And throughout a book otherwise distinguished for its intellectual honesty he equates all doubts concerning the all-sufficiency of "Functional Finance" to an unwillingness to allow it any place whatever in the armoury of economic policy.

This is altogether too thin. The complaint against Mr Lerner's technique is not that it is inherently a bad or irrelevant or politically unacceptable technique, but that he and other enthusiasts, from the United Nations' expert advisers down, claim far too much for it, and so encourage its inappropriate use to an extent likely progressively to defeat the very ends which they desire. The present plight of the British economy should serve as a warning, if not to Keynesians of a thinly disguised totalitarian persuasion, at least to liberals such as Mr Lerner claims to be.

A Bengali Adrift

The Autobiography of an Unknown Indian. By N. C. Chaudhuri. *Macmillan.* 516 pages. 21s.

"L'Inde c'est moi" says Mr Chaudhuri. He is quite wrong. No one could be less typical. He is a Bengali who, although he has lived for years in Delhi as a script-writer for the radio, talks only of Bengali life and Bengali thought. He is a Brahma, a reformed sect of Hinduism which is virtually confined to Bengal's more anglicised intelligentsia. He is a scholar whose favourite reading in his youth was the Encyclopædia Britannica; he was top of the list in his B.A. and he has a knowledge of French and the classics very rare in India; it is unfortunate that one of the results is that he cannot see three boatmen punting a boat on an East Bengal backwater without being reminded of a trireme, or a village mother bewailing the departure of a married daughter without mentioning Mme de Sévigné. Above all, the self-criticism so prevalent among Hindus takes with him an almost morbid form. He is unable to see anything good in India that has not come from outside, or anything, except putrefaction, in the orthodox Hinduism which still keeps the mass of his countrymen moral and content. He seems never to have been pro-British; indeed, he shared, for short periods, the sentiments of all the great nationalist movements from 1910 on; yet he sees in independence only corruption and the black market, a mere pause before another, and necessary, foreign domination.

His book closes to all intents and purposes in 1921 and the events of subsequent years are referred to only in parenthesis. This early close inevitably limits him to his childhood in Mymeusingh and his early manhood in Calcutta. About the rest of India there is virtually nothing. For Gandhi himself he has a most limited affection, for Chaudhuri is an intellectual snob; he has no faith in the people and little but patronage for the Mahatma's "servile morality" which he compares with that strain in Christianity which derives from what he considers its low-class origins.

Nevertheless, Mr Chaudhuri's is an important book, for nowhere else can one find so clearly portrayed the ideals and the decadence of that anglicised middle-class of Bengal which once led India, and is now so crushed. Mr Chaudhuri's parents represented this class at its best. His father was an up-country lawyer, practising in minor courts in a provincial town of 16,000 people. He once broke away and tried to run a bicycle shop in Calcutta but it failed. It seems unlikely that he can ever have earned more than £2 or £3 a week; yet he was a man deeply interested in philology, with a real feeling for English literature, and of the highest moral standards. He used no influence, he associated with no bribe-takers. His mother was a woman of even more rigid honesty. The whole society in which they lived was one where a knowledge of Thucydides and of Shakespeare was valued above either money or position; no sin was worse than the flaunting of wealth.

Today this society is dead; perhaps what killed it was the partition of Bengal in 1905, which turned so many of Bengal's best youth, including at one time Mr Chaudhuri's own brother, into terrorists fighting against the British whose culture they had loved so much. Mr Chaudhuri portrays admirably the sudden shift from humanism to the cult of the revolver. Bengal has ever since been adrift from its moorings; no one has explained how and why better than Mr Chaudhuri.

A Different Civilisation

Summing-up on Russia. By Stephen Graham. *Ernest Benn.* 224 pages. 18s.

Most of the books written on Soviet Russia have been by observers who have only known Russia since the revolution. Of those who were familiar with the old Russia before 1917—now very few in number—the majority have been antipathetic to the Communist regime, but there are some who in spite of a dislike of communism retain an enthusiasm for the Soviet world just because it is Russian. Their attitude is the opposite of that of western observers who approve of the socialist ideals of the revolution, but are repelled by the specifically Russian qualities of the new society. Mr Stephen Graham is one who refuses to interpret Russia in terms of western experience and values.

> It is difficult to bring home to German, Englishman or American that she is not to be measured alongside western civilisation, and that instead of going ahead or lagging behind, Russia is just different.

Hence his picture of Russia is a curious mixture of the admirable and the horrible, and there is a minimum of definitive judgment. He claims that there has been in Russia "a clean sweep of old-fashioned privilege associated with family, wealth and place in society," and makes it clear that he finds this condition attractive; on the other hand, he emphasises the fundamental disregard for human life in Russia, where "death has been reduced to be a trivial occurrence" and where "you are old at forty and look like a wizard at fifty."

It is another world, and the author conveys the impression that it is not so bad for Russians—at least for young Russians — however nightmarish its tyranny and inhumanity may be for people brought up in the tradition of western civilisation. His criticism of the Soviet system is made not so much from the point of view of western individualism and democracy as from that of the Christian religion, and not in its western, but in its Russian, form. He writes that he was "much moved and inspired" by Russian Christianity as he knew it before the revolution, and regarded it, "stemming in part from Dostoievsky," as "a revivifying influence which would increasingly affect the spiritual life of Christian people in England and America." He recognises that the restored Orthodox Church in Russia is a tool of the state, but from the fact that the Communists had to restore it infers that religion is still a powerful force, and points out that "the live part of the Christian community must seem dead because it is mute."

This muteness Mr Graham also finds in Soviet Russian literature, his chapter on which is perhaps the most interesting

in the book. He shows how everything now written in Russia must conform to the official picture of the happy Soviet life; "in some of the industrial centres," he says, "there is worse misery than Dostoievsky ever depicted, but it does not get a page in contemporary novels."

The Tool of Planning

An Introduction to National Income and Income Analysis. By Richard Ruggles. *McGraw-Hill.* 349 pages. $4.00. 34s.

National Income Behaviour. By Thomas C. Schelling. *McGraw-Hill.* 291 pages. 38s. 6d.

Since the war, national income accounting has become the vogue in economics, but few books have treated the subject in sufficient detail to enable the less advanced student of economics to appreciate its use as a tool in analysing current problems. The pioneer work in this field was done many years ago by British economists; more recent developments have come from the United States, where the subject has been closely studied both in the universities and by government economists.

Two books published in America complement each other in this field. It is unfortunate that they have appeared more than eighteen months apart, for their joint contribution to an understanding of this subject is not so apparent as it would otherwise have been. Both serve, from different points of view, as introductions to national income and national income analysis. Mr Ruggles's book appeared first. It is indeed an introduction, but, let it be said at once, the author is addressing students of economics and not laymen, though the general reader will undoubtedly find it of some value. The system of national accounts is built up from accounts of individual firms and government agencies, item by item, so that the whole structure is clearly visible. An interesting feature is the development of the theory of commodity flow which traces the movement of the main groups of commodities through the economic system; this analysis has an obvious value for guiding economic policy in periods when raw materials are scarce. The book also gives the sources from which American data on the various items can be compiled. The second part shows how the national accounts can be used as tools of economic analysis, and the examples are taken from American experience spanning the period 1929 to 1947.

Mr Schelling has set out to accomplish a different task; his book is an introduction to the algebraic form of national income analysis. It is claimed that the reader does not require any previous acquaintance with mathematics. Such a claim, however, is difficult to substantiate because it is not the logic of mathematics that many readers fail to grasp but the basic concept that relationships and trends can be denoted by symbols. The various algebraic contortions are indeed explained in the text, but only the stoutest of hearts will not be scared by a series of interrelated mathematical symbols proving the simple fact that national income consists of consumer expenditure and non-consumer expenditure. Nevertheless, mathematics is an extremely useful technique for economists, for it reveals implicit assumptions in arguments and enables the simultaneous operation of different interrelationships to be seen. Mr Schelling has shown very effectively how fairly simple mathematical techniques can be used to analyse business cycles and problems relating to fiscal policy.

It will take something easier than either of these books to bring home the lessons of national income to the general public, but they at least have the merit of bringing that stage one step nearer and of being simpler and more systematic than other books on this subject.

African Peoples

Seven Tribes of British Central Africa. Edited by Elizabeth Colson and Max Gluckman. *Oxford University Press.* 409 pages. 37s. 6d.

This is an indispensable book for anybody who is engaged in the government of African peoples. As it is concerned with some of the most important tribes of the two Rhodesias and Nyasaland, it happens to have special topical interest. If Mr Griffiths can be persuaded to read this book he may begin to understand why the native races of Central Africa are bound to object to federation. Nobody knows exactly how many tribes (that is traditionally more or less independent political units) there are in central Africa. Those of Northern Rhodesia alone probably run into three figures. The seven tribes described here are a chance selection brought together, it seems, simply because they have recently been studied by anthropologists. Their total population is not more than that of Northern Ireland. Yet underneath certain common patterns of administration due to British rule, they represent quite different kinds of political society and a considerable range of differences in social custom. What they have in common is a basic subsistence economy, now much overlaid by a money economy geared to labour migration and some cash crop farming, and a common subjection to British rule which the authors imply is often felt to be alien and irksome. A veneer of Mohammedanism in some tribes, and of Christianity in all its denominations in others, makes for further complications.

The tribes described are the Barotse, the Tonga, the Bemba, the Ngoni, the Nyakyusa of Tanganyika, the Yao of Nyasaland, and the Shona of Southern Rhodesia. Each of these is discussed by the anthropologist who studied it, and there is in each article a fairly full, though sometimes rather technical, account of the family system of the tribe, as well as of the village organisation, which seems to be bewilderingly variable, rules of land tenure, and the general effect of modern economic and political developments. Excellent bibliographies are included. The book is weakest on the economic side; and it has one serious lack. It needs a chapter summing up the main points of variation, resemblance and difference among these tribes, particularly in relation to modern changes. Nevertheless the light it throws on African tribal customs and conditions make it required reading for those who would solve the problems of central Africa.

Shorter Notices

Farming Machinery. By A. B. Lees. *Faber and Faber.* 220 pages. 21s.

Mr Lees understands farming as well as machines. He has farmed the hard way and can therefore appreciate the saving of cost and of human wear and tear brought about by the application of mechanical power to the farm. And his practical experience prevents his enthusiasm for machines from blinding him to their limitations. The result is a sensible book which not only describes a very wide range of machinery and equipment but also deals with some of the problems likely to arise when using them. The many illustrations are excellent. It is a book for farmers, but much of it, such as the chapter on capitalisation and sections on the application of power to the small farm, will interest others concerned with the economics of agriculture. Mr Lees always writes vividly; sometimes he is provocative. For example, most people would like to see a cut in food production costs, but few would accept Mr. Lees's suggestion that a cut of 20 per cent in the cost of living could "be quickly and easily achieved by bringing our agricultural production and distribution methods right up to date."

The Fourth Republic of France; Constitution and Political Parties. By O. R. Taylor. *Royal Institute of International Affairs.* 221 pages. 15s.

The task of the reviewer of this book would be easier if it were clearer what its purpose was, or for whom it was intended. It is one of those worthy but unfortunate publications that is neither interesting enough to attract the general reader nor detailed or novel enough to demand the attention of the specialist. It is difficult to see why it should qualify for so distinguished an imprint.

Mr Taylor divided his book into three parts. The first deals with the formation of the Constitution and with the contents of that document: This part is marred by the fact that Mr Taylor often fails to distinguish between what is new to the Fourth Republic, and what is in accordance with French constitutional tradition. He does not make it clear that the electoral law is not part of the Constitution. The second part deals with the structure and tendencies of the parties. There is some useful information here, especially on the oversees groups; but the section is too short, and the professions of the parties are taken too closely at their face value. The last section is a narrative of cabinet crises intended to demonstrate the fact that French political tradition and the party structure have been more compelling forces in dictating the course of events than have the reforms of the Constitution. The analysis of cabinets and parliamentary division lists is useful.

THE TEST

WILL some political leader please bring this election down to earth by talking otherwise than in vague generalities about the problem of chief importance: *How can both sides of industry be got to hasten the changes without which Britain will fail to earn her living?*

The facts are clear. To earn the bread and butter for our population we need still higher output per man. *There is a shortage of labour.* Particularly there is a shortage of *skilled* men in essential industries such as coal and transport.

There is a hang-over from the 1930's of arrangements by both sides of industry that restrict output. Organisation is not fully efficient. Manpower is being wasted.

Two things are necessary. *One is a wages policy recognising the value of the skilled essential worker over the rest.* The Government and the T.U.C. have wrestled with the problem of a wages policy, but the rank and file have proved slow to face the need.

The second necessity is to sweep away restrictive practices, in which much more progress would have been made had not the Labour Party's majority been so slender in 1950. *It is not a political debating point but a fact that the greatest obstacle, so far as the unions are concerned, is the workers' fear of a Conservative Government.*

But unless these two problems are solved—getting skilled workers where they are needed and ending the waste of men—*a falling standard of living cannot be arrested.*

Chatter about the cost of living means nothing unless the talkers face these problems of earning a living at all. The traditional Tory cure-all—a pool of unemployed—has had its advocates, but is repugnant to the country. Democracy can find a better way if it will; it does not want anyone to bury his head in the sand.

Will the parties say clearly what action is in their minds on these crucial questions? That is the test of statesmanship.

AMERICAN SURVEY

Egyptian Lesson

Washington, D.C.

THOUGH they may both be different aspects of the same problem, the strategic defence of the Middle East, the Persian and Egyptian crises have been treated very differently, not only by the State and Defence Departments, but also by the press and, as far as it is possible to judge, by the public. It is easy to find selfish reasons for the difference—that it was only the British who were being kicked about in Persia while the Suez Canal is of strategic value to the United States—but they would not provide a true explanation. The real reasons are to be found in the impact of the two situations on some of the most persistent American myths.

In Persia nothing was clear. In the first place, it was an oil company which was in trouble and, despite the scrupulous record of American oil companies in modern times, the original John D. Rockefeller is not yet forgotten. Therefore, regardless of any theoretical belief in the sanctity of international obligations, there was an instinctive inclination to take the side of a small country against a large company—especially when the small country was represented by such a challenging addition to the world's gallery of eccentrics as Dr Mossadegh.

Side by side with the John D. Rockefeller myth, however, there has grown up in the last two or three years the complimentary, or Aramco, myth. This is the story, and it has the advantage of being largely true and only slightly inflated by the American Arabian Oil Company's public relations officers, of an oil company which, by its tact and benevolence, and its sense of international responsibility, has won the heart of King Ibn Saud and is busily developing his country to the point where the desert shall rejoice and blossom as a rose.

Against this myth could be put the innumerable tales of travellers returning from Persia—of the Union Jack insolently flying over Abadan while Aramco only flew the Saudi-Arabian flag; of the Anglo-Iranian Oil Company charging the Persians more for the tiny quantity of their own petrol which they consumed themselves than they charge in the British Isles, a mistake American companies have never made; of the British government getting more in taxes than the Persian government did in royalties. If any of these stories were false nobody took any of the elementary steps to deny them and create a better impression against the day when the understanding of the American people would be needed.

It was against the background of a public opinion which had heard of such things and which enjoyed seeing a British government, committed to a policy of nationalisation, hoist on its own petard, but which was also aware of the importance of the Middle East and, particularly, of its oil, that the State Department had to operate. Nobody in the Department ever expected rational behaviour from the Persians, but they did expect it from the British government. It is hard to argue with the contention that London was just as irrational as Dr Mossadegh and his advisers. How could the United States support a government in a policy which it had not got—a government which was prepared neither to negotiate nor to use force?

The only policy which London seemed to have was to wait for the fall of Dr Mossadegh, an eventuality which, rightly as it appears, the American Government considered unlikely. The State Department thinks it did what it could. It removed Mr Grady because the British did not think he was helpful, but nobody removed Sir Francis Shepherd. It warned American companies not to try to step into Anglo-Iranian's shoes, though it had no authority to do so, but nothing was done to make Anglo-Iranian, as an organisation, more palatable to the Persians. The directors, who are believed to have a large share of responsibility for the debacle, are still running the company. Mr Harriman worked his hardest to bring the Persian Government to the point where negotiations could begin again, but when he thought he had succeeded, the British rejected the note of September 20th, against his advice and, not for the first time, in the view of Washington, gave the British public a misleading explanation.

Such is the sad story of Persia, as seen from Washington. For any number of reasons the American public was never more than half-hearted in its support of the British position. For these and many more reasons, chief among which was the British Government's own irresolution, the American Government, desperately as it wanted to find a solution, was never able to be more than half-hearted in its support of the British tactics.

* * *

There is no reason to expect the same kind of tragic misunderstanding over Egypt. The American Government will operate from the beginning against the background of a public opinion which has almost no sympathy for a country that for years has sedulously and successfully courted enmity. If there are two groups on whose support small countries starting out on an anti-British campaign can usually count, they are the Zionists and the anti-monarchists. Yet even at this moment the Egyptians cannot make any kind of public statement without managing to insult Israel; and King Farouk's matrimonial peculiarities and his well-advertised honeymoon at the gambling tables have created a distaste in the United States which has overflowed to engulf all the Egyptian ruling classes.

The State Department has, therefore, no domestic reasons for pulling its punches and it is in no mood to do so. Mr James Reston the other day in the *New York Times* quoted an official as saying:

> we are not opposed to changes in that part of the world but we are opposed to any more blackmail; we are opposed

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

to the defiance of legitimate international agreements; and we are opposed to the creation of military situations which will benefit nobody but the Russians.

And the Egyptian Ambassador's contention, at an ill-fated press conference which he had the temerity to call, that the Egyptian army would, after a year or two's training, be able to defend the Suez Canal is not believed to accord with the latest estimates of the Defence Department. Egypt would not be able to defend the canal, it is generally thought, against the Brooklyn Dodgers, a baseball team which has not covered itself with glory this year.

As much as anything else, it is the patent dishonesty of the introduction of the draft Bill for abrogation of the treaties which has annoyed Washington. The new proposals, of the imminence of which the Egyptian Government was advised two weeks ago, contained, as far as anybody in the American Government knew, all the safeguards of the Egyptian position for which the Ambassador had been asking during the last few months. The only reason for the precipitate action, therefore, must be a desire to embarrass the Western powers and play domestic politics. The Ambassador has, no doubt, been acting in good faith. Egypt is not the only Middle Eastern country which habitually betrays its Ambassador by using him as an innocent smoke-screen, behind whose obviously genuine protestations it can plot in comfort.

Mr Philip Toynbee explained to readers of the *New York Times Magazine* a couple of weeks ago that "the form of nationalism which is raging in Iran just now is very unlike the forms we have in the West . . . it has almost nothing to do with patriotism." Not very long ago few Americans would have understood what he meant. Lately, however, they have been getting some lessons. The lesson given by the Egyptians is not only the clearest they have been given but it is also the most magnificently mistimed. The United States has been very careful not to offend small powers; it has listened with a straight face to endless imagined grievances; it has soothed those whose "just aspirations" could not be fulfilled tomorrow morning; it has tried to sympathise with the most absurd excesses of adolescent nationalism. But its temper is becoming a little strained. It is more interested in internationalism than nationalism. The United States proposed and supported the United Nations as an organisation affording each nation a forum in which it could argue its case as an equal. It did not support it as a body to which countries could go screaming for help when they were in trouble, but whose decisions they would haughtily disregard as "an insult to national sovereignty" when they were unfavourable. Egypt may well find that it is the country which went too far.

Judicial Process

[FROM A SPECIAL CORRESPONDENT]

IT may have been only the tidy mind of a clerk drawing together judicial matters for the Senate's consideration which bracketed the fight between President Truman and Senator Douglas over two judicial appointments in Illinois with the request of the Judicial Confesence for the creation of nineteen new federal judgeships. But the net effect of this day's work was to emphasise Senatorial precedent and prerogative; it gave warning that in the appointment of the nineteen new federal judges the Senators would continue to defend their rights.

Technically the power to appoint federal judges belongs to the President, though he must secure the Senate's consent. In practice, this means that the Senator in whose district the appointee is to serve expects, if he is a member of the President's party, to offer suggestions to the President or to be asked to confer and agree before the choices are sent to the Senate. Why, in the case of the Illinois judgeships, Mr Truman chose to forget this custom is not clear. It may, of course, have had something to do with the rumour that Senator Douglas was a not impossible Democratic candidate for the Presidency. In any event, the Senate stood behind the Senator. With nineteen new judgeships coming up any one of them may have to reckon with Presidential forgetfulness, and need similar support.

The importance of these incidents goes beyond a momentary political skirmish to the question that periodically agitates both bar and bench; how can the best judicial abilities in the country be secured for the highest courts?

Both of the obvious alternatives, appointment and election, are in use. Election of certain local and state judges was introduced fairly recently in an attempt to free the judiciary from the control of political bosses. It has not had notable success. Few responsible people would suggest that the elective method be extended to the federal court system, which extends as a separate blanket over local and state courts and must in certain instances resolve disputes between the states. Yet distinguished appointments are made only by men who understand the country's need for them and value the power to make them. The President must be of that calibre, so must the Senators who vote to confirm or refuse to confirm his choices. Otherwise, murmurs arise that the best men are passed over, the recommendations of bar associations denied, and that the courts are becoming too subject to political pressure. The party in power also is accused of forgetting the high place which the judiciary must occupy in a democracy which expects it to act as a balance-wheel for the executive and the legislative branches of government.

*

Such murmurs have been endemic since President Roosevelt first struggled to persuade the Supreme Court that reforms of the New Deal were constitutional, and then threatened to render it more tolerant by adding six new judges of his own choosing. His plan was defeated, but it left his party saddled with the charge that to Democrats party loyalty is more important than justice, political usefulness more to be sought than judicial skill and experience. On balance, Mr Roosevelt's judicial appointments may have been no worse than those made by his Republican predecessors, but too many of his judges seemed to have been chosen for their political assets.

Mr Roosevelt's successor needed no such example to persuade him of the superior virtues of loyal party members in any post. Republicans go so far as to charge that the prestige of the Federal courts has been appreciably lowered by eighteen years of Democratic appointments. At least one recommendation now pending would suggest that the process is still going on.

Few Democrats are frank enough to retort that men whose programme of reform amounts, in fact, to revolution need the judges on their side; in any event, the political appointment of judges persists although the New Deal revolution is now history. Today, every Supreme Court justice who baulked Mr Roosevelt has died or retired. Between 1937, when he made his first appointment in the person of Mr Hugo Black (a Senator from Alabama whose judicial experience

All in the dark, Mr. Andrews?

When the fuses have blown, when the key-hole can't be found, when the lighter runs out of petrol we turn, almost without thinking, to the sure aid of the match. The match is one example among many hundreds in which chemicals by Albright & Wilson, usually anonymously, but so often importantly, serve the world at large. *Every match made in Britain and countless millions of others besides rely on Albright & Wilson's phosphorus products for the light they give.*

Chemicals for Industry ALBRIGHT & WILSON LTD

49, PARK LANE, LONDON, W.1.

(BW 151

then consisted of eighteen months as a police magistrate), and 1951 the court has come to be composed of five men who owe their posts to Mr Roosevelt and four who were appointed by Mr Truman. The oldest and most distinguished for legal abilities is Mr Justice Frankfurter, born in Vienna in 1882 and professor at the Harvard Law School for twenty-five years. The youngest is Mr Justice Clark, born in Texas in 1899. Only three of these justices had sat as judges in lesser courts before elevation to the Supreme Court, but three had served one or more terms as Senator, a fourth had sat for twelve years in the House of Representatives, one had been mayor of a major city.

These men do not, as did their predecessors, appear in photographs as grave archetypes of dignity and wisdom. They look as bewildered and contentious as the rest of the population. Remembering that they were picked by two presidents of the same political party in the short span of fourteen years, their failures to see matters from a single point of view are as surprising as they are frequent. Time and responsibility are welding them into a court, but it is still a court whose verdicts are characterised by an extraordinary number of individual opinions, concurring or disagreeing, written by men conscious that their judicial reputations are still in the making.

This diversity gives the court a contemporary liveliness, but deprives it of the aura that goes with the sure consciousness of superior authority. The decisions of the court have lost none of their binding force, the sessions of the court are opened with traditional care, the older counsel still appear before it in frock coat, striped trousers and pearl-pinned cravat. But even the young among the spectators miss the values which went with great reputations, grey beards and conscious dignity.

The autumn session, opened on October 1st without any of the fanfare that attends its British equivalent, faces problems very much on the public mind. One of the court's first decisions was to refuse to reconsider the case of the eleven Communist leaders, sentenced by Judge Harold Medina after a long series of contentious hearings. This means that the constitutionality of the Smith Act, which makes membership in the Communist Party a crime, is now settled. Several other Communist cases are on the docket, including that of Miss Judith Coplon, tried in two district courts with varying results. The court has been asked to decide whether Negroes can be segregated from white children in certain southern schools, whether transport companies have the right to force their riders to listen to the radio, whether Captain Dollar gets his steamship line back from the government, and Secretary of Commerce Sawyer goes to jail for not returning it sooner. Every year about a thousand appealed cases seek the court's attention. Of these it agrees to take up a much smaller number, for the Supreme Court considers only cases which involve important points of law.

Below the Supreme Court the federal system fans out to eleven circuit courts of appeal, each under a Supreme Court justice (the name dates from the time when the justices rode circuits on horseback), eighty-four district trial courts which are the foundation of the system, and a brace of special courts for special purposes. The federal courts have a high degree of individual autonomy, but in recent years they have been drawn closer and given standards for comparison by two new devices, the Judicial Conference, which is the governing body for the administration of the federal courts (except for the Supreme Court), and the Administrative Office, which is the operating agent for the Conference. It is in their annual reports that one finds such astonishing bits of information as the fact that the cost of federal justice to the taxpayer in 1951 was only $25 million, less that one-fourteenth of 1 per cent of the federal budget.

American Notes

Taft's Hat in the Ring

Senator Taft, who has been openly fingering his hat since his great victory in Ohio in 1950, has caused little surprise by tossing it into the ring for the Republican Presidential nomination. It has been there before, notably in 1940 and 1948. Mr Taft has announced his acceptance of an invitation to run in the Wisconsin primaries, an invitation of some significance since it has been extended by former

"A Sensational Announcement, Folks! — "

Herblock in the *Washington Post*

supporters of Mr Harold Stassen. In the primaries voters of each party indicate their preferred candidate, though the delegates to the convention are not bound by the results.

Senator Taft has taken the plunge early, but he is a highly cautious and professional politician; he has apparently satisfied himself that the disadvantages of making himself a target for all other ambitious contenders are outweighed by the advantages of being able to make hay while his chief rival, General Eisenhower, keeps his nose to the European grindstone. The interesting question is what effect this early announcement will have upon the Republican politicians already deeply involved in forwarding General Eisenhower's candidacy, and on the General himself. The procession of Republican visitors who have been beating a path to the General's door have come away with much hope, but little tangible satisfaction. It may be that the General has not made up his mind. But nothing is more likely to help him to do so than the news that Senator Taft is already in the

field. Whatever Senator Taft says, his supporters make no secret of their belief that in him they have a candidate who will oppose Administration policy lock, stock and barrel. Even with a Congress in which the predominantly internationalist Democrats outnumber the Republicans, General Eisenhower's prestige and potential political influence have been needed again and again to save important aspects of foreign legislation.

It may be that General Eisenhower still hopes for a nomination by acclamation, without having to lift a finger to get it. Very few of the experienced politicians arrayed under his banner believe that this is practical politics, even in his case. They will think so even less now that Senator Taft's campaign for convention delegates has begun in earnest. Prolonged uncertainty, too, is hard on a coalition which already is showing some signs of strain. Senator Duff of Pennsylvania, Governor Warren of California, and Governor Dewey of New York represent States which, if they act together, can probably determine the candidate. But Senator Duff is not altogether pleased by Governor Dewey's assumption of the leadership of the grand alliance; it would be strange if Governor Warren did not have presidential ambitions of his own. Other politicians who want to stop Senator Taft or simply to climb on the band-wagon are very vulnerable to hints that General Eisenhower may prove not to be a Republican, or that he may refuse to run. The slimy whispering campaign which has already begun arouses fears, as it is meant to do, that the General may decide that politics is too dirty a game as played today.

Taxes Up in the Air

With Congress hustling to complete its chores by the end of the week, and pigeonholing almost everything except major money bills, it was never expected that the Tax Bill so laboriously hammered out in conference would cause trouble. Yet in the House, an oddly assorted coalition of Republicans and Fair Deal Democrats has managed to reject the conference version by 207 to 167, on the score that it is unduly generous to income tax payers in the upper brackets, at the expense of those in the lower ones. The House had voted for a general 12.5 per cent increase over present tax liabilities; the Senate for an 11 per cent increase, with the qualification that those in the upper brackets might choose, instead, to pay 8 per cent on the net income remaining after present taxes. The conferees, in brisk last minute horse-trading, split the difference; tax liabilities would be increased by 11.75 per cent, but those who chose might instead pay 9 per cent on their net income after present taxes. It was this which the Representatives, perhaps on principle, perhaps because they are even more anxious to return in 1952 than to get away promptly in 1951, could not stomach.

Congressional experts put the yield of the new Tax Bill, before the House revolted, at $5.7 billion in a full year, approximately half Mr Truman's request. The President, it is felt, cannot afford to veto it, however great his disappointment, or however much he dislikes some of the millionaire's reliefs of the Senate. In the present fiscal year, the revenue would be increased by only $2.8 billion, because the new individual income and excise rates cannot go into effect until November 1st, a third of the way through the financial twelve months. If the government can spend the full $68 billion this year which the Treasury has estimated it will, this year's deficit will amount to $7 billion on Treasury assumptions as to revenue, and $5 billion on the usually more accurate Congressional estimates.

The rejection of the Bill by the House means that even these estimates may be too optimistic. Whatever concession the Senate makes on income tax, the new excise rates cannot go into effect on November 1st unless the President signs the Bill by October 21st. Excise, or sales, taxes, are expected, in a full year, to bring in another $1.2 billion compared with $2.3 billion from individual income taxes and $2.1 billion from corporation taxes. This is a cause of bitter reproach from the self-styled tax reformers who note that of the $15.8 billion in new taxes raised since the beginning of the Korean war, nearly 92 per cent has taken the form of income taxes, either on individuals or corporations, rather than a "broader-based" levy.

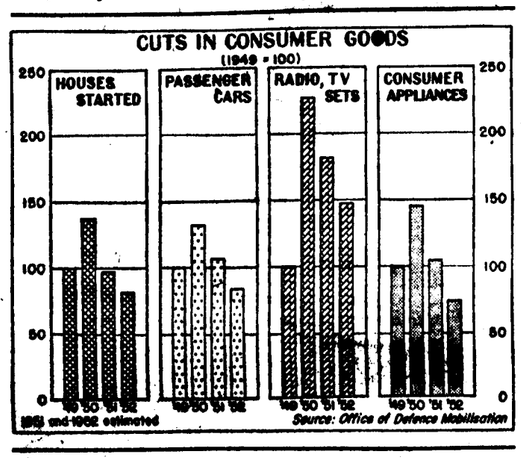
Metal-users in the Woods

Further cuts in steel, aluminium and copper for consumers' goods in the first quarter of next year have quickly followed the announcement of Mr Wilson, the defence mobiliser, that the period of greatest metal stringency has arrived. The use of steel is to be cut by 11.5 per cent compared with the current quarter; only 50-60 per cent of the steel used in 1950, and 50 per cent of the copper and aluminium will find its way into consumers' durable goods. Less essential businesses are lucky to escape with their lives; they have had a reprieve from the "death sentence" which was considerdd at one time, but producers of venetian blinds, ash-trays, garden tools and such things will receive only 15 per cent of the copper and aluminium they used in 1950. Some may succumb on this meagre diet, but the aim of the planners is to find something for everyone, in the hope that they will be able to hang on until the third quarter, when supplies of steel and aluminium, if not of copper, are expected to be easier.

The controlled materials plan, which was to introduce perfect order into the rationing of these scarce materials, appears to have under-estimated the demand; producers' books are still crowded, and deliveries uncertain. The release of 55,000 tons of copper from the stockpile, to make up the loss suffered in the summer strike, is to be followed by the diversion of all aluminium supplies for the stock-

... requires a well-planned and executed sales program. As one of America's oldest commercial banks, Irving Trust Company knows this great market thoroughly and, if you wish, will work with you in locating competent organizations in the United States to help develop or expand your sales there.



IRVING TRUST COMPANY

ONE WALL STREET • NEW YORK 15, N. Y.

MEMBER FEDERAL DEPOSIT INSURANCE CORPORATION

pile to industry. This is high-cost aluminium, but the government will sell it at the ceiling price and absorb the loss.

The planning of a "double-duty" economy is no doubt more difficult than that of an all-out war economy. One of the aims of the mobilisers must be to avoid driving firms out of business; in most cases their manpower and plant is not, at present, needed for the arms programme. Too deep a cut in supplies would only increase the pools of unemployment which exist in twenty-two cities. There are now 88,000 unemployed in Detroit, because, although car output is being cut, war contracts are not being carried out in the regular automobile plants. This is a good reason for not cutting steel for the next quarter below that needed to make 950,000 cars; the production authorities hope that, by drawing on

inventories and seeking substitutes for scarce metals, the number can be raised to a million. On a yearly basis, this is more than were produced in any prewar year except 1929, though substantially less than the £6,500,000 expected this year.

As the chart shows, production of most consumers' durable goods next year is to fall, for the first time, below the by no means austerity level of 1949. Housing, which this year outwitted the planners, is to be brought down to 850,000 new homes started. In general, however, consumers will not feel the pinch, if they ever do, for six months or so, thanks to the inventories piled up during the spring and summer. By then, Mr Wilson believes that metal-users should be out of the woods. If strikes can be avoided, the massive expansion of the steel and aluminium industries will be showing results, and their demands for scarce metals for their building programmes will be falling off.

* * *

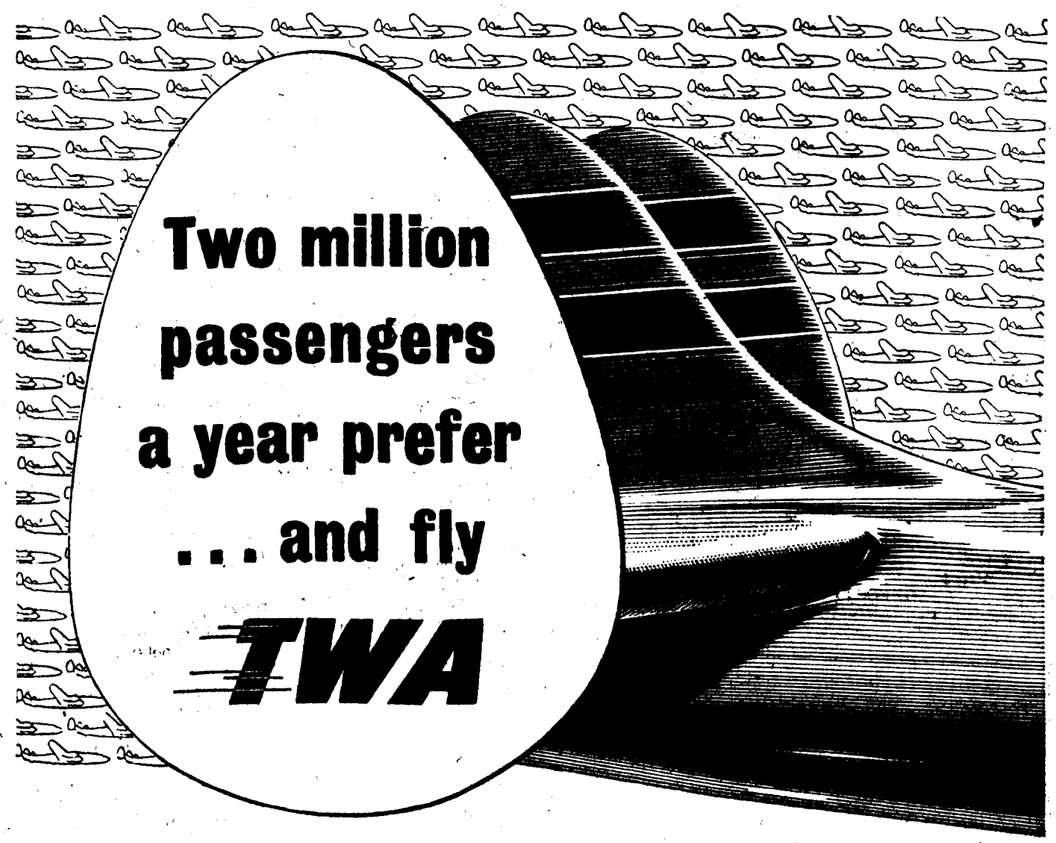
Boyle Bows Out

Mr William Boyle, chairman of the Democratic National Committee, has had the good sense to resign his office. Nothing illegal may have been turned up in the Senate inquiry into charges that the party chairman was instrumental in obtaining a loan from the Reconstruction Finance Corporation for a company whose legal adviser he had been, but his resignation will save the Democrats embarrassment. Senator Fulbright believes that Mr Boyle's exit is a "recognition of a change in the attitude toward public morals." This may be true, although Mr Truman's reluctance to accept Mr Boyle's resignation might have been greater but for the belief that some other chairman would provide more aggressive leadership in the coming campaign. Mr Gabrielson, Mr Boyle's opposite number in the Republican camp, who also had dealings with the RFC, meanwhile shows no awareness of the changing climate of opinion, though pointed reminders continue to flow in from members of his own party.

Mr Boyle is an old friend and colleague of the President, who worked with him in St. Louis days. Another old friend of Mr Truman's is in much hotter water, which may scald the Democrats severely. Mr James Finnegar, former Collector of Internal Revenue in St. Louis, has been indicted for bribery and for accepting payments for services involving controversies in which the government was a party while he was a government employee. Mr Finnegan is the target of Congressional, as well as judicial investigation. It has been brought out that his own tax payments are in arrears, and it is charged that he or his family received substantial sums from an insurance firm whose business lay with people who found themselves in tax troubles. Trails of corruption are now being followed into Internal Revenue offices all across the country; the Commissioner has been forced to institute an inquiry into the net worth of all the more highly paid employees of the Bureau.

Mr Finnegan's own account of how he came to accept the post of Collector, and how he carried out his duties, is enlightening. He spent only three or four hours a day at the tax office, because he made so much more money out of his legal practice. When he was appointed Mr Robert Hannegan, then Commissioner of Internal Revenue and later to become one of Mr Boyle's predecessors as Democratic National Chairman, assured him that he need not give up his other interests. Mr Truman has now come round to the view that this was undesirable, though he would not go so far as to take the tax collectorships out of politics—a step for which the present revelations seem to provide every possible argument. But this is not only an executive scandal; the naming of collectors of internal revenue is a Senatorial prerogative.

Shorter Notes



Both House and Senate, with virtually no argument, have now approved the sharing with friendly nations of information relating to the processing and production of fissionable materials. The approval of the Senate was given with only nine members present. This is the first amendment to the Atomic Energy Act of 1946, though an agreement was reached in 1948 between the United States, Canada, and the United Kingdom to exchange certain information not related to the military or industrial uses of atomic energy. The present step has the strong support of the Chiefs of Staff as promising tangible benefits for the American atomic energy programme. A complete ban remains on information relating to atomic weapons, although Sir James Chadwick pointed out in Philadelphia this week that nearly a year was lost in developing the first atomic bomb because of lack of co-operation between the United States and Great Britain.

*

In New York there is rationing of a commodity that to most people is always scarce—money. Small change is so short that the Federal Reserve Bank is restricting other banks to 50 per cent of the coins they drew last year. Inflation, which in this case means that more coins are chasing about the same number of goods, is the chief trouble, but the shortage has been accentuated by the copper strike and by cuts in the Mint's Congressional appropriation, which prevents the agency from making as much money as it might.

*

There are nearly 24 million tons of steel in the buildings and docks on the island of Manhattan and more than 4,000,000 more in public utilities and transport facilities, including motor cars. This works out at 2,000 tons an acre.

FIRST and foremost TWA's service offers air-travellers the greatest convenience in reaching their destinations with speed and comfort. If you are bound for any one of the many U.S. business centres or if you have to visit a number of them in double-quick time TWA can book you *and* fly you all the way. TWA is the only airline that can fly you from 20 world centres in Europe, Africa and Asia right through to any of the 60 important U.S. cities—*one ticket —one airline!* Flying with TWA is always a pleasure. The atmosphere is friendly and it is your comfort that matters. Your superb food is carefully prepared and well served. Your drinks, too. TWA's fast and luxurious 4-engined Constellations are favoured by seasoned air travellers for their above-the-weather flying, dependability, comfort and "on-time" arrivals. That is why some 2,000,000 passengers buy TWA tickets annually.

Exclusive all-sleeper service

TWA offers the only **all-sleeper** service to New York. The luxurious TWA "New York Ambassador" leaves London every Sunday and Paris every Monday. In addition to the all-sleeper flights TWA offers you a daily service from London to the U.S.A., including combination sleeper-lounge flights on Tuesdays and Thursdays.

AUSTRALIA and NEW ZEALAND via the USA

See and enjoy beautiful San Francisco, Hawaii, Fiji, on your way "down under." Fly by TWA–BCPA de luxe sleeper service.

THE WORLD OVERSEAS

Jugoslavia Today—I.

The Crisis in Economic Planning

(By a Special Correspondent)

SINCE 1949 Jugoslavia has received over $400 million worth of aid from the United States and Britain in loans and credits. This has been injected into the Jugoslav economy in the form of capital equipment, raw materials, consumer goods and even food. The effects of this aid can now be seen and enjoyed by the Jugoslav people. The standard of living has risen perceptibly in the past six months ; shops are full of consumer goods ; food prices have fallen ; factories which had closed down for lack of raw materials have been reopened, and there has been a rise in output in some of the mining and heavy industrial enterprises. Though this year's excellent harvest cannot be attributed to allied aid it has also helped to improve the situation. All these things are expected to be reflected in increased exports in the coming months. This does not mean that Jugoslavia's economic crisis is ended ; on the contrary, the situation is still extremely grave. But foreign observers do not doubt that with western aid the crisis can be solved. The question is how much will be required, for how long, and how is it to be used ?

The major problems facing Jugoslav planners today are an adverse balance of trade—this year's deficit is expected to be over $120 million—a heavy load of external indebtedness on top of recent allied loans and an internal economy which is so backward, both in its industry and agricultural objectives that it is difficult to get increased production without heavy new capital investment. It is now clear that the Five-Year Plan launched in 1947 with the aim of solving these difficulties has failed. Though some individual targets of this plan have been achieved (for example, in certain textile and building enterprises) the general aim of rapid development of heavy industry has not gone according to plan, and the whole system of economic administration has proved top heavy and inefficient.

The Jugoslavs give the following reasons for the failure of their plan. The break with the Cominform and the consequent economic blockade deprived them of credits, capital goods, raw materials and markets at the most critical stage of the plan and made necessary a difficult and lengthy reorientation of trade. The figures for Jugoslav imports and exports for 1948-1950 in the following table reflect these difficulties. Then the severe drought of 1950 forced Jugoslavia to discontinue its grain exports and even made it necessary to raise a special loan to import food for internal consumption. At the same time, the terms of foreign trade were moving steadily against Jugoslavia. Even more important was the deterioration world situation, the increasing Cominform threats against the nation and the ever present danger of war. Capital investment and manpower had to be deflected from productive industry into defence. Unwilling at first for ideological reasons, to ask for or accept weapons from the western powers the Jugoslavs have strained their whole economy in order to arm themselves against possible attack. Defence investments have averaged 15 per cent of the total national budget in the last three years and may in actual fact have been even higher.

JUGOSLAV IMPORTS AND EXPORTS
(In Million Dinars)

	1948		1949		1950	
	Exports	*Imports*	Exports	*Imports*	Exports	*Imports*
Total ...	15,112	*15,782*	9,613	*14,576*	7,929	*11,790*

Many Jugoslavs are now ready to admit frankly other reasons for the failure of the Five Year Plan. They say that there were serious mistakes both in the plan and in the way it was carried out. They admit that an internal investment of 28 per cent of national income was too high and tended to defeat its own purpose by lowering the standard of living so much that productivity dropped both in industry and agriculture. Ignorance and waste on a vast scale also played an important part in hindering development. Valuable machinery was ruined by careless use: it is calculated that one-third of all agricultural machinery is permanently out of use and a similar state of affairs exists in both transport and industry. Until the end of last year it was still usual to find most important economic enterprises—even vital mining and industrial concerns—in the hands of party bosses, whose political training did not qualify them to understand what was necessary for the satisfactory development of such things as steel, mining, and oil extraction and refining. One satisfactory aspect of the present situation is that this folly has at last been recognised and political careerists are being removed from positions that should be held by technical experts. Unfortunately there are more of the former than the latter. But the stubbornly held objections to foreign experts and foreign training for Jugoslav technicians have at last been raised, and this should also help to improve the organisation of industry.

No Change in Basic Theory

The Jugoslav leaders are confident that it is possible to solve all these difficulties in the long run because of their country's great potential mineral wealth and other natural resources. They believe that, given continued western aid until 1954 (in the form of long-term loans, from the World Bank as well as from Britain and the United States for capital investment, and short-term credit on current trade) they can achieve a balance of trade in three or four years and increase industrial production sufficiently to begin payment of their debts.

The planned investment for 1951 of 52,082 million dinars is divided as follows:—

	per cent
Industry (including mining and development of electric power)	48.1
Agriculture and Fishery	13.3
Forestry	2.9
Transport	20.9
Non-productive investments, building, etc.	14.8

This investment plan is still based on the fundamental idea behind the Five-Year Plan—the concentration of investment into heavy industry without parallel investment in agriculture. Many people have challenged the validity of this idea, but Mr Kidric and other Jugoslav planners are adamant. They maintain that alongside industrial development production in agriculture can be raised with only limited investment. In fact, if agriculture is really to provide between one-quarter and one-third of exports in the next three years, it is clear that the Jugoslav Government has to persuade the peasants not only to produce, but to produce more and to put what they produce on to the market. This is perhaps the most difficult problem facing the Jugoslav Government today.

(To be continued)

Three Wise Men of Nato

THE fruits of the recent Ottawa meeting of the North Atlantic Treaty Organisation are beginning to become visible, and a new approach to the problem of rearmament is taking shape. It looked at first sight as though all that had happened at Ottawa was the appointment of yet another committee to do what its predecessors had failed to do. Whether Ottawa should be counted a useful or a useless performance depended almost entirely on whether the new committee did in fact possess a power, a purpose and a sense of reality which was hitherto lacking in the organisation of Nato. The indications from Paris are that the committee is so equipped.

The first meeting of the "Twelve Apostles," on Wednesday last week, went much according to plan. Mr Averell Harriman, President Truman's special adviser on foreign affairs and future head of the new Mutual Security Agency which is to administer American foreign aid, was elected chairman. M. Monnet, France's chief industrial planner, and Mr Gaitskell (who will be represented by Sir Edwin Plowden) were appointed vice-chairmen. At the next meeting the crucial question arose of whether the other nine countries were prepared, for the sake of speed and efficiency, to delegate most of the work to a select group of three. According to their Ottawa form they would not have been so prepared ; in Paris, however, they agreed with alacrity to an arrangement which very nearly conforms to the French and American proposal which was rejected at Ottawa. The programmes of the smaller countries will be examined by the Big Three, together with the representative of the country whose programme is under review. When the programmes of each of their own countries are being examined, the Three Wise Men will be joined by Italy on one occasion, by a representative of the Benelux countries on another, and by a representative of the Scandinavian countries on a third. When it comes to conclusions and recommendations, all "Twelve Apostles" will return to the committee room. Thus it is assured that the slow and difficult detailed work will be done by a small and efficient group ; the conclusions, which must affect the sovereignty of all twelve nations, will —it is hoped—be reached by all twelve representatives. The Paris committee, of course, is only a temporary affair, but as a precedent this arrangement is of great importance.

There are other signs that a new approach is on the way. One of the first essentials of this technical age is the creation of a proper terminology ; *viability*, the key word to the Marshall Plan, is nowadays seldom heard. A new word, "infrastructure," distinguished the initiated from the uninitiated in Nato discussions, and no true believer in the North Atlantic community could possibly speak or write more than a few words without introducing this pass-word. But Nato has not stopped there. It has expressed its fundamental change of policy as "evolving in place of the over-riding medium-term defence hypothesis to which all economic planning was functionally subordinate, an antithesis of balancing *desiderata*, such as the politico-strategical necessity against the economico-social possibility, and further these two components against the need for a maximum of flexibility." What this really means is that whereas a national defence programme has been taken hitherto as something imposed from above which could not be altered, now the military requirements of Nato will be made to match the economic achievements of the individual countries, and this reconciliation will be the task of the new temporary committee of the "Twelve Apostles."

This new approach is in itself an achievement, for it implies a more equitable sharing of the rearmament burden. Countries will no longer be expected to turn their domestic economies upside down in order to attain an arms programme that would satisfy the more senior members of the North Atlantic community. The ultimate objective of the committee is clearly a co-ordinated arms programme, though the degree of co-ordination attained might well be less than one had originally hoped. At this stage there is no question of specialisation as between countries ; in any case the United States could produce all types of weapons much more quickly and more cheaply than any western European country, for munitions lend themselves to flow production methods. But the Paris committee is nevertheless aiming at a degree of co-ordination—co-ordination in the sense that no country will be expected to sacrifice its political or economic stability for the defence of the west. The economically stronger countries will have to make good any deficiency of the weaker countries.

The Business Man's Paradise

[FROM OUR CORRESPONDENT IN PAKISTAN]

PAKISTAN has often been called the planner's paradise, and to no part of the country does the description apply more aptly than to the eastern province. East Bengal, which until partition was supplied with almost all its needs from Calcutta and functioned mainly as a producer of jute for the Calcutta market, may be said to be a country with an undistinguished past but a highly promising future. In the

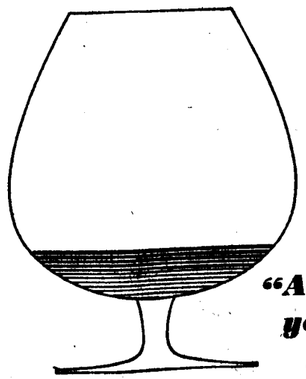
early days, it was anybody's guess what might happen when nearly fifty million souls on the Mongoloid fringe of India suddenly found themselves, somewhat to everyone's surprise, part of a new country, the other half of which was situated a thousand miles away facing the Persian Gulf. But India, by adopting from the start an unfriendly policy towards its old province and new neighbour, provided the catalyst which has united these two disparates. True, there have been constant bickerings between the Central Government and the East Pakistan Government, and constant complaints from the one side about the remote control of Karachi and from the other about the sluggishness and inefficiency of Dacca, but events have now knit the two together. The Province, voracious in its needs, is recognised as a valuable asset to Pakistan if only because its jute earns foreign exchange to the tune of about Rs. 800 million annually, and it is receiving the treatment of a most-favoured child from the Centre. Now that the era of planning is largely passed, it is a place where a great deal of public money is going to be spent in a very short time. In fact, the planner's paradise is becoming the businessman's dream.

Hitherto, it must be admitted, it has rather been the businessman's nightmare. Chittagong, the only port, became the commercial centre and, with its overcrowded streets and shack-like buildings of corrugated iron, bamboo and matting, has presented the appearance of a boom town

with all the attendant discomforts. The new foreign business offices, mostly opened from Calcutta to take over the East Bengal trade previously handled from that port, have had to be content with squalid and crowded accommodation, while the devoted and hardworking band of European managers and assistants have had to put up with residential accommodation far different from the air-conditioned comforts of Calcutta. The port was hopelessly inadequate to cope with the traffic, while the administration, generally speaking, fell very far short of the minimum requirements of efficiency. Experienced officials were few and far between and the job was in reality too big for all but a well-established and well-run administration. Effective supervision over such matters as export, import and exchange control, which were and are centrally administered, could not be maintained from Karachi, and consequently red tape in its worst forms caused trouble.

But in Chittagong, as in other centres, the face of East Bengal is rapidly changing, and those firms who have borne the burden and heat of the day should reap a reward which, even though taxation will prevent it from being a rich one, should at least be sufficient to compensate them for their trouble. In the industrial field the establishment of a jute manufacturing industry is the most important new development. All the jute mills of undivided India were situated in West Bengal, but the Pakistan Government has decided to establish a loomage of 15,000 within the next ten years. Three jute mills of 1,000 looms each are in process of completion, and six more mills of 500 looms each are definitely planned.

The work is being pushed ahead vigorously by the newly formed Pakistan Industrial Development Corporation, a statutory body which is participating to the extent of 49 per cent of the capital of each of these mills. Ancillary industries are likely to grow up, and it is evident that there will be a good market for suppliers of mills' stores and miscellaneous engineering equipment. The tanning industry in East Bengal is also attracting a good deal of indigenous capital, partly because attention was particularly drawn by the British industrial mission to the bright prospects of this industry. Another important enterprise is the setting up of a government-sponsored paper mill at Chandraghona, some twenty miles upstream from Chittagong. The paper mill is planned for an annual production of 30,000 tons—thereby meeting the country's entire requirements of printing and writing paper—and is to cost about Rs. 50 million. It should be ready by March, 1953.



For electric power, one of the essentials for development, the Province will rely chiefly on the multi-purpose Karnafulli scheme. A dam is to be constructed, probably about eighty miles upstream from Chittagong, across the Karnafulli river, and the installed generating capacity is to be four units of 10,000 kW. each. The scheme is estimated to cost Rs. 50 million. In the meantime, to meet the needs of Chittagong, where the demand for power has already outstripped supply, a diesel power station of 5,900 kW. capacity has been undertaken. The work has been somewhat delayed, but is expected to be completed by September, 1952.

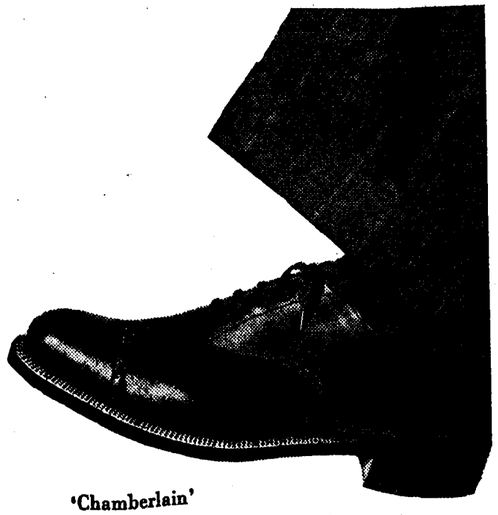
A Real Port at Chittagong

Chittagong port, which consisted at partition of little more than four rickety jetties, supported by very inadequate shed accommodation, has already been greatly expanded by the laying down of moorings and the construction of new sheds. The long-term plan provides for a thirteen-berth port with a total handling capacity of 3,000,000 tons per annum, excluding coal traffic, and a British firm of engineers is already at work constructing seven new steel screw pile jetties, each 500 feet long, with concrete decking. The total cost of the long-term development scheme is of the order of Rs. 130 million.

The East Pakistan Government has also prepared various agricultural schemes which have been approved as part of the six-year development programme of Pakistan. These include drainage projects and an important scheme for mechanised cultivation. The objective is to improve the production of foodgrains, edible oil seeds and jute, and the scheme involves the purchase of fifty tractors during the first year and one hundred tractors annually for the next four years. These tractors will be maintained at a central workshop, supported by four subsidiary and ten mobile workshops. Mention should also be made of a plan for power pump irrigation. The rainfall of East Bengal is not distributed according to the needs of agriculture throughout the year, and the yield of the spring crops is therefore low and uncertain. The present irrigated area is extremely small and it is intended to increase this by purchasing one hundred power pumps every year for a period of five years. These will be fixed on pontoon flats so that they can be carried from place to place. The scheme will cost about Rs. 8,500,000.

Behind all these schemes looms something even larger. With the assistance of United Nations experts, the Government are at work on preliminary plans for a huge multi-purpose project in the upper part of the Province, involving the construction of a dam over the Brahmaputra and the

"And with your coffee, sir. . . ?"



To the expert diner the answer is as clear as a well-polished glass. When a good meal ends, the special duties of Grand Marnier begin. In close alliance with a cup of black coffee, this famous liqueur induces an altogether old-fashioned sense of luxury and well-being. Made exclusively with Cognac brandy, matured for years in cellars hewn from the age-old rocks of the Charente, Grand Marnier is a tradition in itself. Uphold it—in your favourite glass.

reopening of the old course of the river through the Mymensingh district. Here, we get back to the realm of planning, and it is clear that, with their other commitments, neither the Central nor the Provincial Government could tackle a scheme of such magnitude unless assured of a World Bank loan for the purpose. Even if this does not mature, the development of the Province during the next ten years is likely to be sensational, and the scope for business enterprise almost unbounded, always provided that peace can be maintained between Pakistan and India.

Australia Budgets for a Surplus

[FROM OUR MELBOURNE CORRESPONDENT]

In the budget introduced into Parliament on September 26th, the Commonwealth Government has provided for a substantial surplus of £114.5 million from a total revenue of £1,041.5 million which in the view of Sir Arthur Fadden, the Treasurer, "will contribute in no small measure to the control of current inflationary pressure." This view, however, has been vehemently challenged by critics on both sides of the political fence on the grounds that money taken from the people by taxation and later spent by the Government according to its own ends contributes in no way to an easing of the current inflation.

In his Budget speech, Sir Arthur Fadden said it was proposed that the surplus of £114.5 million be paid into the National Debt Sinking Fund, which would be empowered to invest some part of it in loans raised for Commonwealth or State purposes. This statement in itself seems simple and logical enough, but it has wide implications when considered against the background of the crisis in government finance which has developed in Australia since May.

In June, Commonwealth and State Governments submitted to the Loan Council (an authority comprising Commonwealth and State Treasurers to regulate public borrowings) works programmes involving a total borrowing programme of just under £300 million. In view of the state of the Commonwealth loan market, which was sagging rapidly under pressure of heavy private and institutional selling, it was clear that nothing like this amount could be raised on the loan market on reasonable terms. Total borrowing programmes were therefore limited for the current year to £225 million, a reduction of 25 per cent on the programmes originally put forward, but an increase of 36 per cent on last year's actual borrowing programme. But even this reduced call for loan moneys is substantially in excess of the capacity of the loan market and, in the words of the Treasurer, "to the extent that loan raisings fall short of the approved programme, the Commonwealth will need to finance the balance from its own resources."

This is where the Budget surplus is likely to be applied, for the Commonwealth has resolutely put its face against any extensive use of central bank credit, on the proper ground that it would be a further aggravation of the current inflationary forces. This means that a substantial portion of the current year's public works are to be financed from current revenue. On this point, the *Sydney Morning Herald*, which is normally a strong supporter of the Menzies-Fadden government, joined issue. In its weekly financial review it said:

> Financing of public works through taxation must be condemned outright. Its adoption is an admission that public works cannot be financed on the present scale through the money market, which is the best arbiter of the relative amounts of resources to be used in the various capital employments in the economy. A still more serious objection is that taxation increases will have a serious retarding effect on production.

The crisis which has developed in government finances in Australia is a reflection of the inflationary forces which have been assailing the economy with such severity for the last two years. Chiefly because of the tremendous rise in farm incomes caused by wool prices more than doubling, the national income last year rose by £800 million to a new high peak of £3,101 million. "This deluge of additional spending power threatens to overwhelm us," said Sir Arthur Fadden in his budget speech.

Support has been falling away from Commonwealth loans because of the greatly enhanced attraction of equity shares which have been pushed to unreal levels by increasing profits, higher dividends and a spate of new and bonus share issues during 1950 when the government lifted control of capital issues. Since the beginning of the year, this control has been operating more severely than it did under the Labour Government's administration. In the space of four months, the bond rate of interest has risen from about 3½ per cent to more than 3¾ per cent, and there is every indication that money will become still dearer. When the last Commonwealth 3¾ per cent loan of £40 million closed last month it was £7,700,000 undersubscribed, the first loan failure since 1930.

All this raises the question as to how far the Government should go on curtailing essential development activity in pursuance of its avowed objective of checking inflation. This is now a highly explosive political issue in the country, taking pride of place even over Communism now that the referendum to ban Communists has been lost. A reduction in public works programmes means an immediate slowing down of electricity development schemes (and power is still desperately short in Australia), a delay in irrigation schemes at a time when primary production is showing little expansion, and a general postponing of countless works without which the country cannot reach full industrial stature. The Treasury says that it has been obvious for a long time that too many jobs have been undertaken for the labour and materials available and the absurd stage has been reached where major public projects are bidding against each other to attract key men and supplies. All this is very true, but it is a condition which must be expected in any economy which is expanding rapidly. And Australia has been subject to exceptional pressures since the war under the joint influence of public and private development coupled with an influx of immigrants on a scale previously unknown.

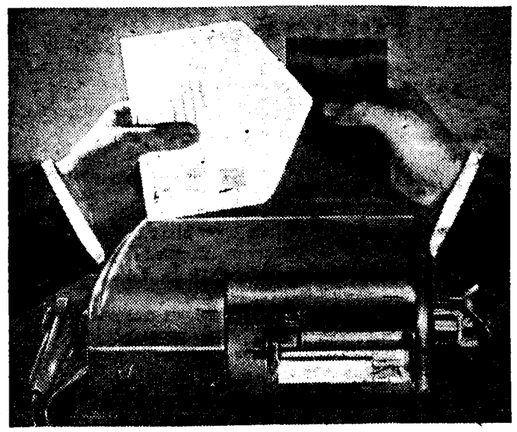
Need for Foreign Loans

The view is growing that Australia should not attempt development on the present scale without assistance from other countries in the way of loans for capital purposes. It seems patently clear that the rate of development will have to be reduced unless Australia embarks on some form of overseas borrowing plan. Australia's secondary industries are still unable to provide capital equipment necessary for major development projects and it could well be that a deterioration in the country's foreign exchange position in the current year could limit capital imports even from sterling sources. As Dr H. C. Coombs, governor of the Commonwealth Bank, pointed out in his latest report, if wool prices do not increase much above current levels, it is quite possible that with a continuing rise in the value of imports, Australia may face a balance of payments deficit on current account in 1951-52.

Professor Sir Douglas Copland, vice-chancellor of the Australian National University, is dogmatic in stating that on every ground a return to the traditional policy of foreign borrowing is still justified. He discounts suggestions that Australia's London balances should be used to finance an overseas loan because of the trend of trade and the fact that Britain itself is not in a position to increase its contribution of capital goods to Australia. What is required, he says, is a dollar loan that can be spent anywhere and for whatever purpose Australia thinks fit.

SIMON ENGINEERING GROUP

Aspects of enterprise



No. 13

A unique method of designing flour mills by using scale models has been developed by Henry Simon Ltd. The layout of the largest mill, which would take days or weeks on the drawing board, can be settled in hours; and mistakes are far fewer when the project can be seen "in the round". The number of schemes handled by a given staff in a given time is immensely increased. This is an unusual form of productivity, applied not to physical manufacture but to output of knowledge and experience in the shape of designs.

Factors of food production

Land, modern farm equipment and proper care and cultivation of the soil are major factors in production of food. Another factor of equal importance is the availability and use of replacement parts for farm machines.

Prime responsibility of farmers is to see that this equipment keeps working. The best way to maintain original engineering and new performance in food-producing equipment is through genuine replacement parts. For these parts—typified here by an oil filter element and a V-belt—are identical with the originals.

McCormick International Farm Tractors and Farm Equipment have so proved their ability that they are considered *basic tools* contributing to the *physical and economic security* of entire nations. They will continue in this role as top operating efficiency is retained by use of genuine replacement parts. International Harvester Export Co., 180 N. Michigan Ave., Chicago 1, U.S.A.

Russian Anxieties Over Livestock

THIS year's Russian harvest has been successful. Judging from Soviet reports the crops should be nearly 5 per cent higher than last year and may reach the record figure of 130 million tons. Thus there should be enough grain to supply the towns and put some aside for stocks and exports. With this worry temporarily off their minds the Soviet agricultural experts may now shift their attention to another problem which seems to be causing great anxiety, namely that of cattle rearing. The situation must be quite serious, since the official Soviet organs openly mention the possibility of a breakdown of the 3-Year Plan for Livestock Development which should end in December of this year.

Deficiency of livestock has been a chronic failing of Russian agriculture and the Soviet leaders have often sounded the alarm. Yet, this time the tone seems to be more anxious than usual. Thus the organ of the Ministry of Agriculture warns that "in many regions, provinces and republics there is real danger that the 3-Year Plan for socially-owned livestock rearing will not be fulfilled. Substantial losses due to the private appropriation of communal livestock, particularly of sheep, have been revealed." Thefts of communal cattle are not a new phenomenon, yet *Pravda*, in an article on the same subject, stresses that "now the basic agreements of collective farms are being bypassed through a shady and masked procedure. Valuable cattle belonging to the *Kolkhozy* are being exchanged for privately owned cattle of worse quality."

The Plan itself, the fulfilment of which is apparently threatened, applies only to livestock on state and collective farms. Were it to be fulfilled, the state and communal live-

3-YEAR LIVESTOCK PLAN
End of Year Targets (Million Units)

	1949	1950	1951	*1958*
Cattle	28·0	32·5	39·7	*58·1*
Pigs	13·4	17·0	23·6	*17·8*
Sheep and goats	71·7	83·7	101·5	*72·8*

stock at the end of this year should exceed the prewar level. But the Soviet authorities have given no information on the subject. The livestock figures for 1950 have not been broken down into state, collective, and privately owned and only total figures are available; but these fell far short of the original target laid down in 1946. They are quoted in the following table.

LIVESTOCK
(In Millions)

	1916	1922	1929	1933	1940	1945	1950
Horses	35·8	24·1	34·6	16·6	20·6	16·5	13·7
Horned cattle	60·6	45·6	67·2	38·4	71·0	47·0	57·2
Sheep and goats	121·2	91·1	147·0	50·2	108·8	96·4	99·0
Pigs	20·9	12·1	20·4	12·1	36·1	10·4	24·1

Even with more territory and a larger population there was less livestock in 1950 than in 1916. The figures themselves tell the whole drama of the Soviet countryside. Two world wars, a civil war and, last but not least, the mass slaughter of cattle and horses by the peasants during collectivisation, greatly depleted stock. The restoration of livestock looks like a task for Sisyphus; every time the losses are made up, some new calamity brings the Soviet leaders back to the starting point.

By 1929 the prewar level had been left behind. Then came the collectivisation. Not only did the peasants slaughter their cattle, but the new collective farms were not yet ready to take over the huge mass of livestock. The famine of 1932 made things even worse, and the recovery was painful. But slowly the situation improved and with the threat of the war the development of agriculture was speeded up still more by means of all sorts of rewards and premiums for livestock "Stakhanovites."

World War II caused terrible losses in livestock. By 1945 the cattle population was 25 per cent smaller than in 1940, and the number of sheep and goats had fallen by 40 per cent and the number of pigs by 70 per cent. According to Soviet statistics the Germans removed seven million horses, 17 million head of cattle, 27 million sheep and goats and 20 million pigs. The painful drought of 1946 rendered the task of recovery even more difficult. The Soviet planners soon realised that the livestock targets set in the 5-Year Plan were too stiff and unrealistic. A new and more modest 3-Year Plan (1949-1951) for State and collective farms was drawn up and this is the Plan which is now in danger of a breakdown.

All the prewar incentives—both the carrot and the stick—have been reintroduced. Yet the success of the Plan has apparently been limited. To solve the general rural problem the Soviet leaders decided to amalgamate collective farms into larger units. But this additional collectivisation seems to have had bad effects, at least temporarily, on livestock development. Judging from articles in the Soviet press, during the amalgamation many farmers took over cattle belonging to the *Kolkhozy* or improved their stock through "exchanges." The chairmen of the farms were apparently often in league with the culprits.

"Pneumonia Epidemics" of Sheep

Livestock development was also hindered in another way. When Nikita Khruschev—the Politburo member entrusted with additional collectivisation—started his campaign, he implied that the private holdings of farmers would be reduced or even taken over completely. There were also rumours that private ownership of cattle would no longer be allowed. The farmers apparently reacted in the same way as during collectivisation, only on a very much smaller scale, by slaughtering as much stock as they could, particularly in the sheep regions of the Kirghiz Republic and Kazakhstan. There, wholesale "pneumonia epidemics" of sheep were reported, which—the Soviet correspondents imply—were merely the results of "private enterprise."

Progress on state farms is mixed. On the one hand, it is reported that the average weight of slaughtered pigs has been raised from 96 kg. in 1940 to 110 kg.; that state farms have now nearly 9 million sheep (roughly 10 per cent of the total); that the average cow gives now 2,000 kgs. of milk per annum; that electricity is used for milking 15 per cent of the cows and shearing more than half of the sheep. On the other hand, we are told that the Ministry of State Farms has failed to fulfil its targets, that the proportion of cows to total horned cattle fell from 41 per cent in 1940 to only one-third, that too many cows are being slaughtered and that the state farms cannot fulfil their commitments for dairy products.

Not too much should be made of these Soviet alarms. It is reported that the food supplies for the main towns, such as Moscow or Leningrad, have been carried out in excess of the Plan. It is possible that the present fuss over livestock is chiefly due to the Soviet leaders' efforts to step up production in the last year of the 3-Year Plan in order to reach the targets. Yet, even if these were attained, it would only mean that for livestock taken as a whole the prewar level has roughly been restored. This is not very much for feeding the growing urban population, for stocks and for the requirements of the wool industry. Even if it is spared a new calamity the Soviet Union will need many years to raise its animal population up to the level required by its expanding economy.

THE BUSINESS WORLD

The British Motor Industry—II.

Motors and Materials

THE Motor Show, opened in London this week by the Minister of Supply, lacks none of the elegance that has become its accepted feature. This splendour is the more brave this year for the industry is facing its most difficult period since the war. Many of its most cherished hopes have died or dwindled in recent weeks. Markets are more difficult ; output is falling ; materials are short ; competition of defence needs is being felt. The Show does not bear any obvious marks of these changes. There are fewer innovations, perhaps, but the Austin Motor Company has reverted to prewar policy with a new baby car that will, it is hoped, go into production in the spring, while Vauxhall Motors has recently produced its long awaited new models, larger and apparently more lavish than their predecessors. There is no visible evidence of austerity in the superficial restyling of other companies' standard models. There is a new Daimler, a Bentley with a more powerful engine, and from the growing fraternity of sports car manufacturers, their usual versatility of design. On the surface, in fact, there is little to distinguish this year's show from any that have been held since the war. Home buyers, whose faithful support boosted last year's attendance figures to nearly half a million, gaze wistfully at the exhibits, not greatly excited by the possibility that they will in fact get 100,000 cars this year, compared with the reduced allocation of 80,000 cars originally laid down.

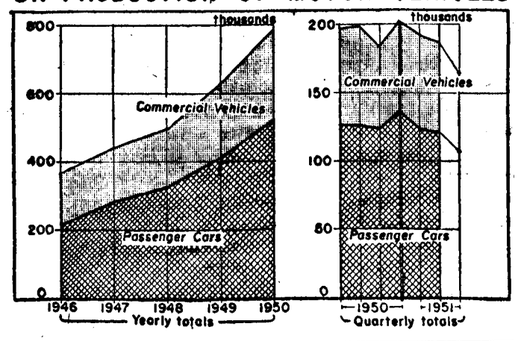
Recent production figures, however, already provide evidence of the industry's falling activity, and it is generally agreed that the real pinch has yet to come. Since the end of the war, production has been geared to a steadily rising supply of materials ; output rose from 367,582 cars and commercial vehicles just after the war, to 785,217 in 1950. Last year, it seemed reasonable enough to expect output to expand further, perhaps to a million vehicles a year in 1952 ; now it is clear that last year's production reached a peak that the industry is not likely to regain for some appreciable time. Early this year, the abrupt cessation of imports of sheet steel from the United States led to a cut of 20 per cent in the allocation of sheet to the motor industry and actual deliveries have probably fallen by about 15 per cent. Output has not been reduced in the same proportion ; manufacturers have been able to change over to the production of chassis and "knocked down" cars to economise in sheet. By the end of August, production had fallen by about 8 per cent compared with 1950. In that year, 522,515 passenger cars were produced and 262,702 commercial vehicles. Output was rising throughout 1950, and by the last quarter production of cars was running at an annual rate of 564,000. The annual rate of output is now about 475,000 cars a year and it is still falling. Commercial vehicle production, on the other hand, has shown little change.

So far this year, the volume of output has been determined by deliveries of sheet steel. About half a ton is used in a passenger car body and the same amount for cab bodies of commercial vehicles. The industry is now entering a phase where output will be limited by the supplies of basic materials, including pig iron and general purpose steel, that are available. Not only is steel output falling, but large tonnages of sheet and alloy steels are being diverted to armament production. High grade iron ore is scarce, and largely earmarked for steel production ; the result is an acute shortage of suitable ores for grey iron and malleable iron castings. The motor industry depends on such iron products for certain essential chassis components for which there is no possible alternative material. Suitable ore is now so scarce that one leading company which supplies the motor industry with about 80 per cent of its malleable castings, has for some months barely escaped going over to a four-day week. Falling steel output and rising steel consumption has created the symptoms of a serious shortage of strip steel in the motor industry. From another direction still, motor output is threatened by the shortage of alloying materials. The average British car weighs about a ton, of which half consists of sheet steel for the body, and much of the rest—some estimates suggest about 40 per cent—consists of components made of alloy steel. Estimates made by the steel industry indicate that about two-fifths of the alloy steel consumed in this country is used by the motor industry. Altogether, the vehicle, cycle and aircraft group of industries took more than one-tenth of all the steel consumed in this country last year—1,196,000 tons out of a total of 10,725,000 tons. The motor industry must have accounted for the greater part of this steel. Such a large user is bound to be peculiarly vulnerable to any change in the rate of steel deliveries.

*

These shortages are only beginning to materialise but, superimposed on the existing limitations on sheet steel, they are already having their effect on car output. The Vauxhall Motor Company recently cut its output by 50 vehicles a day and dismissed nearly 400 workers. At the Austin Motor Company's new assembly plant, only two of the four assembly lines are working ; whether a third line is opened for the production of the baby car in the spring seems to depend on finding extra materials, the chances of which at this stage are not very promising.

In such uncertain conditions, estimates of prospective production are hazardous in the extreme. The indications are that the cuts in sheet steel allocations this year will reduce total vehicle production to about 720,000 units compared with 785,000 in 1950. Passenger car production may be between 460,000 and 480,000 units compared with 522,000 in 1950. Further shortages might reduce output next year to perhaps 650,000 units ; roughly 420,000 cars and 230,000 commercial vehicles. By the end of 1952 production might be about 25 per cent lower than at the end of 1950. This is not a cheerful prospect, but it is subject to one important qualification: even a relatively small increase in supplies of critical materials could lead to a dramatic improvement on these estimates.



These calculations take into account any defence orders on which the industry might be engaged. Military orders will go largely to the makers of heavy commercial vehicles, one important exception being the "jeep" to be built by Austin Motors. Leylands and the Rootes subsidiary, Commer Ltd., have both announced military contracts ; Ford and the Vauxhall subsidiary, Bedford, are obvious choices. Military vehicles are included in the published statistics for commercial vehicle production. For this reason, commercial vehicle output in future months is not likely to fall as much as output of passenger cars. The total number of military vehicles required under the defence programme is not large in relation to the industry's capacity, but their four-wheel drive and greater stressing require more scarce materials (alloy steels in particular) than an equivalent number of civilian vehicles. These materials, moreover, will have to be found out of the total tonnage available for the motor industry as a whole. Sheet steel is the only material now allocated to the industry by the Ministry of Supply, but the introduction of general steel allocations is expected shortly. The Ministry has so far made one allocation of materials for the motor industry as a whole, and out of that total companies with defence contracts have received a special allocation. Production of defence orders cannot really be said to have got into its stride. When it does, this system of allocation is bound to lead to a sharper cut in civilian production than the estimates might suggest. It might appear to threaten the output of companies such as Standard and Nuffield that are not concerned with military vehicles more severely than that of companies such as Rootes and Austin that have been allotted military orders. But the difference can only be one of degree, for neither of these companies can produce military vehicles on car assembly lines.

*

Some members of the motor industry might dispute these prognostications because they do not accept a material shortage as inevitable. Many are becoming highly critical of the lack, as they see it, of a sustained effort to find additional iron ore and steel scrap, and particularly of the steps so far taken to increase domestic scrap supplies. If the reason for impending shortages is no longer lack of plant but lack of such raw materials as iron ore and scrap, why, they ask, are not greater efforts made to get more of these materials and semi-finished iron and steel from abroad ? Most companies have at some time obtained import licences for small quantities of continental steel and they would be more than willing to pay high prices for such imports to keep their production lines fully employed. It is an open question whether much sheet and alloy steel could be obtained in this way, and the facile assumption that a change of government might lead to a resumption of considerable imports from the United States is even more doubtful. Shortages of materials have affected car production in the United States even more severely than they have in Britain, and materials for export probably do not exist.

It is impossible to withhold sympathy from the industry. It has spent about £60 million since the war on re-equipment, only to have new plants partly idle on completion. Defence production offers little scope for alternative employment except for the commercial vehicle producers. In fact, more materials will be going to produce fewer vehicles ; civilian production, and particularly passenger car production, will therefore be cut more severely than the size of the defence orders might suggest. As a final blow, there remains the possibility that in an attempt to keep up the level of export deliveries next year, the original allocation to the home market of

UK PRODUCTION OF MOTOR VEHICLES

80,000 cars may again be cut drastically. Left to its own resources, the industry might have been able to get some extra materials from its suppliers, by virtue of being so large a customer. But the Ministry of Supply has declared war on the "grey" market in steel in the engineering industries and has notified the motor industry that allocations must be adhered to more closely than in the past when the industry consistently produced more vehicles than was possible on the basis of the tonnage allocated. There has been talk of imposing inspection in the plants, but the reaction of the industry to this suggestion has probably been sharp enough to kill.

If extra materials are not forthcoming and the industry does in fact face a drop of 25 per cent or more in production, the effect on its unit costs is bound to be serious. Production costs in the industry respond sharply to the scale of output, and when overheads have to be spread over a decreasing number of units, the rise in unit costs is bound to be severe. This fact will set aside any projects for major changes in models that the leading producers might otherwise have in mind. But it might promote changes of another kind. It is doubtful whether any company in the British motor industry has pushed the output of any single model so high as to get the full advantage and economies of a production run of the length common in the United States. This does not necessarily mean, as some critics have suggested, that there are too many producers in the industry, but it is reasonable to ask whether there are not too many models. If the shortage of materials leads to greater concentration of production on fewer models in order to reap every possible economy of scale, it may have some lasting benefit for the industry when it moves into happier times.

No Glut of Cotton

COTTON prices in the last few weeks have shown every sign of firmness, and simple optimism that a large American crop would provide ample supplies at cheaper prices has given place to real doubt. Cotton has been a difficult market ever since the cotton acreage was drastically reduced in the United States last year. The New York spot for American middling remained at 46.06 cents a lb. throughout the first half of this year; not until the beginning of July when it was clear that the American crop was going to be one of the largest on record did the price begin to fall. By the middle of August the price was already down to 35.70 cents a lb and by the first week of September it had dropped as low as 35.05 cents. These falls were not reflected in the prices charged by the Raw Cotton Commission to Lancashire spinners, but later in September, when the futures market displayed unmistakable firmness, the Commission was prompt in raising its selling prices. By the end of the month the spot price had recovered to 38.35 cents a lb., and it has eased only slightly to 37.85 cents since. Two factors have explained this recovery. First, American growers have placed large quantities of cotton "on loan" with the U.S. Commodity Credit Corporation. Secondly, it is now realised that larger crops in the United States and elsewhere do not necessarily mean ample supplies of cotton for the world market.

No sensible person would dogmatise about the future course of prices. But there are now enough hard facts to make plausible guesses about the prospective trends of supplies and consumption, including the quantities of cotton that Lancashire may expect to get in the current season. World production of cotton during 1951-52 is provisionally estimated at 36 million bales—a notable increase on last season's figure of 27,600,000 bales for which the sharp expansion in the American cotton crop has to be thanked. Two years ago the U.S. Department of Agriculture feared a surplus of cotton and restricted the planted area in the United States in 1950-51 to 21,695,000 acres. Its exhortations were so successful that in fact only 18,600,000 acres were sown. Unfavourable weather then reduced the yield below average, and output dropped by nearly 40 per cent to a mere 9,900,000 bales. The Korean war brought a sharp reversal of this policy; cotton growers were urged to plant 28,500,000 acres and exceeded this figure by a million acres; the third official estimate puts this year's total crop at 16,931,000 bales.

Estimates of the current Brazilian crop, the next largest source of American type cotton, are still uncertain. Last year, Brazilian cotton output increased by 16 per cent to 1,600,000 bales, the largest crop since the war. This season's figure is put provisionally at 1,350,000 bales. In South Brazil the crop is good, but in North Brazil an exceptionally severe drought earlier this year may cut output by 40 per cent. The Mexican crop is estimated at 1,200,000 bales compared with 1,120,000 bales in 1950-51, and the Indian crop at 3,000,000 bales against 2,700,000 bales. Official and unofficial reports indicate a bumper Egyptian crop of 2,072,000 bales compared with 1,761,000 bales last season. Leaf worm has caused less damage thanks to control measures introduced by the Egyptian Ministry of Agriculture. Production in the Sudan has increased sharply in recent years, and in 1950-51 an exceptionally high yield produced a record of 430,000 bales; this may not be repeated, but no significant decline in Sudan cotton is expected. Total production outside the United States may increase from 17,700,000 bales in 1950-51 to 19 million bales.

In sum, a substantial addition to the world cotton crop of the order of 30 per cent compared with 1950-51 and of over 20 per cent compared with 1938-39 is in prospect. Yet although the crop will be one of the largest ever recorded, cotton supplies will be only 6 per cent larger than last season. The reason is to be found in the sharp fall in carry-over stocks last season. Until last spring American exports were restricted, but as soon as there was the prospect of a large crop, the United States drew on its stocks to meet importers' requirements. On August 1st, end-of-season stocks in the United States had fallen as low as 2,200,000 bales against 6,850,000 bales a year earlier and 11,500,000 bales just before the war. The fall in stocks held by other countries was less drastic, from 9,750,000 to 8,600,000 bales; even so the current season begins with no more than 10,800,000 bales in stock, representing a fall of 35 per cent in twelve months.

During 1950-51 world consumption of cotton rose from 29,600,000 bales to 33 million bales. It is too early to estimate consumption for 1951-52, but there are certain pointers. The lull in textile sales that began last spring has persisted, but in the United States, at any rate, stocks of finished goods have been reduced and activity is again beginning to increase. American consumption of cotton is expected to equal last season's high figure, since military requirements are likely to make good any decline in civilian consumption. The rapid recovery of the Japanese cotton industry was one of the most striking features of last season and its expansion has continued. Consumption of the Japanese cotton mills last season amounted to 1,570,000 bales compared with 1,032,000 bales in 1949-50; the number of spindles installed was to be increased to 4,800,000 million by the end of 1951, but this total was already reached last month. In the coming year, Japanese mills might well use 2,000,000 bales—little less than Lancashire used last season. The recovery of Germany's cotton industry has been less spectacular, but a 25 per cent increase in last year's consumption to 1,050,000 bales suggests that the prewar figure of 1,150,000 bales might be reached in 1951-52, in which case Germany would be little behind France. All told, world consumption of cotton in 1951-52 might be maintained at about last season's rate of 33 million bales. In that event, carry-over stocks next July would amount to 13,800,000 bales; this would represent an increase of one-third, but it would still be a relatively small total, part of which would presumably be regarded as a strategic reserve.

*

How much cotton can Lancashire expect to get this year compared with last? The answer depends on available supplies and on the import requirements of the other big consumers. Exports from the United States are no longer restricted; the limiting factor to-day is dollars. Theoretically, exports of American cotton could be pushed as high as 5,700,000 bales this season, though such a rate of exports would keep end-of-season stocks to a mere 3,000,000 bales. The United States Government will probably wish to keep larger stocks and might therefore reinstate the control of exports if the season's total threatens to exceed 5,000,000 bales. Exports from Brazil are likely to be considerably reduced this season, perhaps to 550,000 bales compared with 682,000 bales in 1950-51. On the other hand, Egypt should provide larger supplies, if politics do not interfere. If the other exporting countries at least maintain their shipments, world exports of cotton may reach 12,750,000 bales compared with 11,834,000 bales in 1950-51 and 12,340,000 bales in 1949-50.

In all the main importing countries except Japan and India, stocks declined last year, and there will be strong pressure to build them up. Further, there is increasing competition for non-dollar cotton. For example, it is expected that Japan will import 1,300,000 bales from the United States and would take 1,500,000 bales if dollars are provided; this would still leave 700,000 bales to be imported from countries other than the United States. Germany, too, has become less dependent on American cotton, though last season the United States still supplied half of its total imports. British imports in 1950-51 totalled 1,971,000 bales compared with 1,888,000 bales in 1949-50. Egypt was the main source, supplying 21 per cent of the total, followed by the United States (15 per cent), Brazil (12 per cent), Sudan (11 per cent), Peru (7 per cent), India and Pakistan (7 per cent), and Mexico (6 per cent). Purchases from less important sources of supply such as Syria, Turkey, Argentina, Paraguay, El Salvador and Persia were significantly larger than in any previous season and accounted for 9 per cent of the total. Consumption last season rose from 2,092,000 bales to 2,135,000 bales and stocks fell by 170,000 bales to 1,228,000 bales.

If this level of consumption is to be maintained, British imports during 1951-52 will have to reach at least 2,250,000 bales and Lancashire manufacturers might feel safer if they approached 2,500,000 bales. Britain should certainly be able to buy 250,000 bales more from the United States if it is prepared to meet an additional dollar expenditure of nearly $50 million, but it may not be easy to buy an extra 250,000 bales from non-dollar sources, on top of the large quantities bought from these countries last season. If the Treasury proves reluctant to sanction an additional expenditure of $50 million on raw cotton, Lancashire will face a lean time in a period of relative plenty.

This analysis of trends in raw cotton supplies and consumption suggests little ground for the view that this year's large output of cotton will lead to lower prices. Unless some form of dollar aid is provided for purchasers of American cotton, the world may again see a marked discrepancy between dollar and non-dollar prices for the same commodity. In a dollar-hungry world, cotton prices in those exporting countries that are willing to accept currencies other than dollars may well rise sharply. For this country, in particular, cotton textiles will have to play a more important part in the export drive than they have done in recent years. This year, the average monthly value of exports of cotton textiles has shown a welcome rise of 30 per cent on 1950. But to maintain this performance and improve upon it, Lancashire will need adequate supplies of raw material to match its total consumption and of the right types and grades to suit its requirements.

THE AGE OF INFLATION

The three articles by a correspondent, and a fourth article expressing the editorial views of *The Economist*, have been reprinted as a pamphlet, price 8*d*. (including postage).

Business Notes

The Francs—Weak and Strong

The story of exchange control moves in France and Belgium during the past week has shown three facets of a single episode—the weakness of the French franc, the tendency for French capital to move surreptitiously into Belgium and the defensive measures taken by Belgium against that unwanted influx of "hot" money. The renewed loss of confidence in the French franc cannot be linked to any specific or dramatic symptom of deterioration in the French financial situation. Wages and prices have been creeping up, the problem of the public finances pursues its course of chronic intractability, and the evidence of all travellers in France this year has suggested that prices have more than caught up with the current exchange rate of the currency. On such straws of evidence, the conviction is again growing in France that the franc is due for another of its periodic devaluations. That sentiment has been reflected in a sudden increase in forward purchases of foreign currencies by many French concerns that may have need of foreign currencies in the future. A substantial part of this semi-commercial, semi-speculative, forward offering of French francs was for the purchase of Belgian francs.

In order to stop this movement of funds, the speculative and capital character of which was becoming manifest, the Bank of France last week-end suspended forward sales of foreign currencies and the Foreign Exchange Office issued an order prohibiting the purchase of foreign exchange by importers for the payment of goods before these have actually been shipped to France. Last week the Bank of France raised its official rate from 2½ to 3 per cent and new restrictions were imposed on the total credit made available to the commercial banks. The French Finance Minister, M. Rene Mayer, when asked last week whether the franc was about to be devalued, did not go through the hallowed formality of a vehement denial; instead, he told his questioners that "the Finance Minister cannot defend the currency by himself alone. If Frenchmen really want to defend their currency, it will be saved." The authorities can claim to be making some contribution to that joint effort.

* * *

Free Market in Belgium

The obverse of the problem of the French franc is that of the Belgian franc. Dealings in that currency are still subject to considerable difficulties, although some of the fog created by last week's successive announcements of new controls is beginning to disperse. In particular, it is now clear that the report circulated as last week's issue of *The Economist* went to press—that the Belgian authorities would refuse to buy at official rates all EPU currencies other than Swiss francs—applied only to exchange arising from transactions that had not been certified as commercially justifiable. Although the measures taken by the Belgian authorities to prevent an unwanted inflow of foreign capital, and to temper the chronic creditor position of the country within Europe, are the obverse of the French measures, they were designed not only in defence against the French franc, but against all EPU currencies—notably sterling, since Belgium's surplus with the United Kingdom is now the main component of its aggregate surplus with EPU. The process of reconsidering all export licences from Belgium and the refusal by the National Bank to buy any EPU currencies (other than the Swiss franc) arising from Belgian exports except against export licences has, for the time being, plunged the Belgian foreign exchange market into confusion. Traders who want to sell sterling or French francs without the delay involved in the revalidation of export licences have been selling at free market rates to others who need these currencies. The pound sterling has been quoted down to 135 in these free and officially tolerated operations; the parity rate is 140.

In London, the Bank of England has refrained from selling Belgian francs for spot delivery, since the new regulations in Belgium make it uncertain whether delivery of the francs could be effected; all transfers of Belgian francs from the accounts of central banks of EPU countries to those of non-residents are subject to authorisation by the Belgian exchange control. The Bank of England, nevertheless, has continued to sell Belgian francs forward on the basis of the official rate to *bona fide* British importers who can show that they have commitments to honour. It may take some time to clear up the uncertainty created by the latest exchange and trade control measures in Belgium. An echo of these measures has been heard in Geneva, where the contracting parties of the General Agreement on Trade and Tariffs are still in session. The United States and Canadian delegates have taken the strongest exception to that part of the Belgian attempts to remove the creditor position with EPU that has involved new discriminatory controls against dollar imports and attempts to switch the purchases to EPU countries of origin. The International Monetary Fund in Washington is also understood to have awakened to the implications of Belgium's actions in not only tolerating, but actively encouraging, a market in which the currencies of member countries are already being dealt in at extremely disorderly cross-rates. The last has not been heard of this episode; its repercussions carry far beyond the confines of EPU.

Forty per cent Free Gold

One by one the gold producing countries are coming into line with the new IMF dispensations on gold sales at a premium. From Southern Rhodesia news has come that there have been "strong representations by the United Kingdom Government" that a strict limit should be placed on the rate at which that country's gold will be allowed to flow to the premium market. These pleadings have been heeded. The Government of Southern Rhodesia has announced that sales must be limited to 17,000 ounces a month, or about 40 per cent of current production. The same proportion is to apply to the premium gold sales of the mines operating in Fiji. Reports from Melbourne add that in order to qualify for such sales the Fiji gold will have to be processed, or exported against affidavits purporting to show that it will be needed for industrial purposes. These are also expected to be the conditions on which West African gold will be allowed to go to the premium market. The pattern is thus becoming clear; the premium sales will be limited to about 40 per cent of current output, the sales must be made in processed or semi-processed form or against affidavits and, finally, the premium sales must be made against payment in United States dollars.

It is a pattern that gives rise to interesting questions. Why 40 per cent? Can there have been—or, indeed, could there be—any honest attempt to prove that the industrial demand for gold in the world in fact equals 40 per cent of the current output? The choice of this arbitrary figure unmasks the attempts to veil these arrangements under the cover of a *bona fide* industrial use. The 40 per cent has clearly been chosen because it is the proportion of premium sales to gold production that has in fact been maintained by South Africa in recent months. Now that the quasi-monopoly enjoyed by South Africa in this market is to be more widely shared, the premium may shrink. Already the free gold price this week has dipped below $39 per ounce. The margin of profitability offered by the premium market is becoming decidedly narrow—as the latest South African gold mining quarterly statements are beginning to indicate.

If these premium sales must be made against US dollars, another important consideration has to be weighed. The tacit assumption made in these arrangements is that the United States Treasury will be prepared to convert into gold at $35 per ounce any dollars offered to it by foreign central banks. But if an appreciable amount of these dollars comprises proceeds of gold sales at a premium, the United States, which has all along set its face against facilities for such sales, may refuse to take part in a game that basically rests on the readiness of the United States to buy and sell gold at stated prices. This raises horrifying possibilities to which the gold-producing countries have probably failed to give any serious thought.

* * *

The Growing Deficit

The provisional trade figures for September provide cold comfort despite the fall in the cost of imports—only the second to be recorded this year. Imports were valued at £337½ million, some £31 million lower than the record figure for August but still £13 million higher than the average for the first nine months of this year. The September figures usually show a seasonal decline both in imports and exports. The high level of commodity prices, coupled with the larger volume of imports, masked all seasonal fluctuations in the earlier months, and except in February, a short month, the cost of imports rose continuously from £298 million in January to £368½ million in August. The volume of imports this year has been some 14 per cent larger than in the corresponding period in 1950, but their value has increased by 53 per cent.

Exports in September fell by £19 million to £207 million. Again this was largely a seasonal movement, and despite this fall the average for the third quarter (£218¼ million) was 6 per cent above the average for the first half of the year, while the annual rate of exports for the nine months (£2,528 million) was 16 per cent higher than that for 1950. Nevertheless the adverse trade balance in September, taking imports inclusive of insurance and freight, still amounted to the large figure of £120 million. For the nine months this deficit totalled £927½ million compared with £291 million in the corresponding period of 1950. The visible deficit suggests that recent guesses of the total deficit on foreign payments account for this year ranging up to £400 million, may err on the side of optimism.

* * *

Fall in Dollar Exports

The disheartening feature of the September trade figures is the sharp decline in British exports to dollar markets. Shipments to the United States fell by 26 per cent to £9.6 million while exports to Canada fell by 40 per cent to £8.5 million and were 46 per cent below the peak reached last July. Sales of cars in Canada have been hit by the restriction of consumer credit; all makes have been affected, British, American and Canadian. But British cars seem to have suffered most and several thousand shipped there some time ago have been brought back to this country. Motor cars were not the only exports to be hit; wool textiles, another important dollar earner, were also much smaller in September and this fall accounted for much of the month's setback in shipments to the United States.

In September a year ago, exports to North America fell as a whole, and exports to Canada were more sharply affected than those to the United States. In October, however, a recovery ensued and dollar exports in the fourth quarter were the highest for the year. It is questionable if this experience will be repeated in 1951. Sales of textiles in North America are going slowly; there is some indication of a possible recovery in the near future, but British exports will not benefit unless the recovery is substantial. The fall in motor car sales can in no way be attributed to seasonal influences. It follows directly from the disinflationary policy now being pursued by the Canadian Government and will be reversed only if that policy is changed or if inflationary pressure again gets the upper hand. The prospect, then, is for only a modest recovery in dollar exports during the remainder of the year, with sales in the fourth quarter probably no higher than those for the first quarter of 1951, and well below those for the last three months of 1950. Until last month, British exports to North America had been running consistently above the 1950 level.

BRITISH EXPORTS TO NORTH AMERICA

* * *

Investment in Transport

The planned control of investment, as it has been practised in this country in recent years, can be legitimately criticised on many grounds. To the extent that it is effective, it bears all the marks of political compromise, arbitrary decision, and competitive auction among rival claimants. Over a wide field of individual decisions, control can hardly be said to work at all in the detailed way that the annual exercise in balancing investment resources against demands for new capital might be taken to suggest. It is significant that the nationalised industries—which at first sight would seem to be particularly favoured claimants in the investment pool—become more and more critical of the treatment they are accorded. The British Electricity Authority might not be able to speed up its generating programme even if it were nominally allotted a greater share of the physical resources that the statisticians and planners dedicate to the capital programme; but that fact does not prevent it from complaining loudly at the treatment it gets. There have been similar complaints from the Transport Commission, conceivably with better foundation, for transport certainly has not been treated as a favourite child. And this week, Mr A. B. B. Valentine, in his presidential address to the Institute of Transport, has argued the case that transport should be accorded a larger slice "not merely in the industry's interest but also in the national interest."

Mr Valentine showed that two-thirds of the present investment quota of British Railways has to be used for track and other works essential to safe running at existing speeds. He asserted that

> some of the most urgently needed capital expenditure on roads and railways could be shown to be more productive than much other capital investment now being allowed to take place in other industries.

He criticised the virtual suspension of all capital investment on roads and claimed that £10 million spent on road improvements would produce a bigger and quicker dividend in the

saving of man hours, equipment and resources than an equal expenditure by almost any of the major industrial users of capital today.

There is, no doubt, much in this case. But it is the weakness of controlled investment that cases are not weighed by relative economic merit so much as by absolute standards that vary according to the shift in economic circumstances year by year. The electricity industry cannot meet the full demand that it promotes by charging prices that are too low to enable it to replace its capital. It is therefore accorded, *pace* the BEA, an absolute priority for all the plant it is likely to be able to instal. The transport system creaks along, barely able to maintain itself and quite unable to improve its efficiency by the wise use of new capital ; but since the controllers can deal with only one crisis at a time, transport's claims must be deferred. But Mr Valentine, in emphasising these facts, also exposes wider issues. By what means can the total resources for new capital be increased ? Is the shortage that affects transport more than a reflection of a deficiency of capital resources as a whole ? And by what means other than new encouragement to save and the competitive mechanism of the market can they be expanded and economically apportioned ?

* * *

Steel Output Lower

If 16 million tons of steel are to be produced in Britain this year, the industry will have to produce roughly 4,280,000 tons in the final quarter, or 110,000 tons more than it produced in the last three months of 1950. This may not be beyond the powers of the industry ; but since output so far this year is 400,000 tons lower than in the same period of 1950, a final output of slightly less than 16 million tons must perhaps be considered more likely.

The falling trend of steel output this year has resulted entirely from shortages of steel-making materials. In September steel output was at an annual rate of 15,749,000 tons, well above that in the holiday month of August but more than a million tons a year lower than the rate achieved in September, 1950. Pig-iron output, however, was higher than during the first six months of this year and somewhat higher than in September, 1950. Higher pig-iron output, upon which steel output depends increasingly as supplies of imported scrap dwindle, in its turn makes additional demands upon coke. Supplies of coke have not dropped from the level that was previously adequate, but the blast furnaces could now use 5,000 to 10,000 tons more a week than they are receiving, partly in order to smelt an even greater proportion of low-grade home ores than they are now using. It may be noted, however, that supplies of imported ore have recently improved considerably ; stocks are not yet at the million-ton level that is hoped for, but they are still rising.

Unfortunately the reverse is true of scrap. Stocks at the end of August fell to 314,000 tons, the lowest level since the war. A decline in imports of scrap from Germany had been taken into account: but the pressure for a higher scrap price at home this summer, which eventually had to be conceded, caused for a time some withholding of the home scrap supplies upon which the industry depends. It cannot yet be said that the higher scrap price has had any marked effect in improving deliveries to the steelworks. Good results from the scrap drive early this summer seem to have come largely from a faster "turn-round" in scrap supplies within the industry itself, and among those industries that are normally large scrap suppliers. It does not seem yet to have called out the hidden resources of obsolete equipment upon which the organisers of the drive based considerable hopes. The campaign is continuing with vigour, and such marginal results as it may still achieve will be of great value. But their effect upon steel output in the remainder of this year and in 1952 is not likely to be very considerable.

Bleak Prospects for Rubber?

Lean times seem to be in prospect for rubber. Mr S. Symington, the head of the US Reconstruction Finance Corporation which controls, among other things, American production of synthetic rubber, stated last week that synthetic rubber had been developed to the point where it could replace natural rubber in almost every field. As much as 65 per cent of synthetic rubber can now be used in the manufacture of heavy-duty tyres compared with only 13 per cent "a year or so ago." He added that the United States is independent of natural rubber except for "small tonnages used in the production of surgeon's gloves and a progressively smaller amount needed for heavy duty truck tyres."

It is sometimes necessary to make allowances for Mr Symington's enthusiasms, but the recent progress of the synthetic rubber industry should not be underestimated merely on that account. It threatens to have a serious effect on the consumption and demand for natural rubber. Sir John Hay gave a different warning in his annual statement as chairman of the Kamuning (Perak) Rubber and Tin Company. Sir John pointed out that American purchases for the stockpile will not continue indefinitely and that when they stop a fall in price must be expected. In fact the United States announced some months ago that it should complete its stockpiling purchases for rubber early next year. Sir John's main point was that the price of rubber would fall at a time when production costs were rising ; "industrial efficiency," as he emphasised, "cannot continue to be maintained under conditions where security of person and property is lacking." Malaya has been involved in bandit warfare for three years and there is little sign of any improvement. High wages and shortage of labour are only two of the problems which confront estate managers. Many of the security measures designed to protect the labourers are irksome to them and encourage them to seek employment elsewhere. Production in Malaya is falling and in the first eight months of this year it has amounted to only 409,500 tons compared with 445,500 tons in the same period of 1950. World output, on the other hand, has increased from 1,167,500 tons to 1,267,500 tons.

More serious are the prospects of a decline in tapping care and skill and in the upkeep of replanted areas. The Malayan Government is now proposing to take over the control of replanting which would be put into the hands of a government-sponsored committee, financed by a levy on the volume of rubber produced. This will mean that the more efficient producers will finance the less efficient ones. Sir John adds that "according to this topsy-turvy, upside down economic theory, it seems that the way to encourage and accelerate replanting is to penalise those who have practised it and reward those who have not." The principle of "levelling-down" is now apparently to be applied to the rubber industry, at the expense of those growers who have been sufficiently far-sighted to see that most of their area has been replanted with high-yielding stock.

Wool Levels Out

Britain has decided to stockpile raw wool ; an announcement to this effect was made as this issue was going to press. The total quantity of 40 million lb. (clean), representing 9 per cent of Britain's current annual consumption, is to be spread over the whole season. Buying is to be done through the normal trade channels by private brokers. The United States has already acquired about three-quarters of its initial programme of 100 million lb. (clean). The British stockpile is clearly not envisaged as one on the same scale as the United States was considering nine months ago, but under present conditions it could have an appreciable effect on the market.

Before the announcement was made the wool market had

Finance for the Private Company

Rising costs of plant, stocks, and work in progress have combined with taxation to set new problems for the Private Company in raising additional capital or long-term funds. To assist sound enterprises in solving such problems within the limits of today's priorities is one of the functions of I.C.F.C.

I.C.F.C. operates on commercial principles and offers despatch, economy and flexibility in method.

Full particulars of the facilities offered may be obtained from

The General Manager, 7, Drapers' Gardens, London, E.C.2.
The Birmingham Manager, 214, Hagley Road, Birmingham, 16.

Gestetner

LIMITED

TOTTENHAM, LONDON, N.17.

The Company manufactures the world-famous "Gestetner" Duplicating Machine and accessories. It has branches throughout the United Kingdom and subsidiary companies or representatives in all parts of the British Commonwealth, in Central and South America, the Far East, and many countries in Europe. Extensive servicing facilities are available throughout the organisation.

Extracts from the Directors' Report are appended :—

"In the year under review both Home Market and Export Sales showed very substantial increases. The percentage of your Company's products exported [illegible] higher than ever before. The value and volume of shipments to hard currency countries were extremely gratifying and exceeded your Directors' expectations.
"The first year's trading in the United States of America has shown that your Company's products can more than hold their own in that country.
"Research has been expanded and remains in the forefront of our programme. It is interesting to recall that this year marks the 70th anniversary of the firm by the late David Gestetner, the inventor of the stencil duplicating process."

The permission of H.M. Treasury having been received, and the necessary resolutions of the Company having been passed, forms for subscription at par for 250,000 4½% Cumulative Preference Shares of £1 each have been sent to Ordinary, "A" Ordinary and Preference Stockholders of the Company.

"Get the Emidicta people to demonstrate their dictation machine in *your* offices. It'll open your eyes to a terrific saving in time and effort."

become notably steadier. Prices fell a further 10 per cent on Monday but the decline on Tuesday was only about 2½ per cent with merinos 64's quoted at around 123d. a lb. On Wednesday and Thursday another rise was started and merinos recovered to 138d. a lb. The interesting point is that the market turned this time at a price some 20 per cent above the trough of 103d. a lb. touched last month. That does not signify the advent of an era of stable prices; but equally it is difficult to discern from current trends of consumption another scramble for supplies, unless the United States suddenly decides to buy more wool for the stockpile. Because of the low level of stocks in consuming countries and the uncertainty about retail sales, increased buying by one of the major countries could conceivably start another sharp rise, and the experience of the past three weeks might become a regular feature this season until the bulk of the clip is offered.

The House Tells the House

In matters of public relations, the London Stock Exchange has since the war made some notable departures from its prewar tradition of silence—though it still appears both diffident and parsimonious by contrast with its sister in New York. Now the tempo of change is rising, accelerated by the recent crop of ignorant comments and criticisms from left-wing orators, by the odd reporting of market movements in certain newspapers, and, of course, by Dr Dalton's irresponsible "good fun." Hard on the heels of Mr John Braithwaite's pungent retort to the Doctor comes the Stock Exchange's most venturesome effort yet. It has circulated to all candidates in the general election a newly-prepared ten-page "child's guide" to the work of the Exchange. There is, of course, nothing novel in the information presented—most of it is recognisably drawn from a public address given by the chairman earlier this year, from his reply to Dr Dalton, and from the small book sponsored by the Stock Exchange some years ago. But there is most welcome novelty, and courage too, in the decision to disseminate home-truths about the Stock Exchange in this way. Very sensibly, since the occasion is political, the chairman prefaces the pamphlet with the explanation:

> The Stock Exchange is a national institution. It adheres to no party; it subscribes to no party funds; it does not engage in party politics. But an organisation so intimately concerned and bound up with the national economy must at all times play its part in the affairs of the nation.

He adds that the purpose of the pamphlet is "to correct certain misconceptions about the Stock Exchange which may exist in the public mind." Certainly, if all would-be members of that other House will thoughtfully read and remember these simple and objective answers to common questions about Stock Exchange matters, the new Parliament, whatever its predominant colour, ought to see the need for removing some of the grit these postwar years have thrown into the machinery of industrial finance.

Cheap Air Travel

The special winter excursion fares announced by Aer Lingus make this one of the first airlines, at least in Europe, to bring its day fares really close to rail fares for the same journey. A first-class monthly return rail ticket from London to Dublin costs £8 7s. 7d.; Aer Lingus is introducing a winter excursion ticket, valid for 17 days, costing £9 18s. Similar excursion fares are being introduced for the company's services outside Ireland. The railway fare does not include meals or cabin accommodation, and the journey takes about 10½ hours. The air fare includes light meals, and transport to and from the airport; the journey takes four hours. Like other airlines, Aer Lingus has increased its normal fares; but at the same time it has reduced these special winter fares in an attempt to attract passengers during the off-season winter months. When an airliner has to fly on a scheduled service, it is better to carry passengers than to fly half-empty. But Aer Lingus hopes that the lower excursion rates may do better than this, by attracting sufficient extra traffic to make up for the immediate loss in revenue per passenger.

This is something of an innovation in excursion fares because the tickets are valid for any flight. Airlines have been testing a number of different methods of fare reductions to attract more traffic, the most promising being the "tourist" fare for long journeys. The economics of tourist travel depend on carrying more passengers and less fuel and making more frequent re-fuelling stops than on a normal journey. There is less scope for tourist flights of this kind on short and medium length journeys and some lines, including British European Airways, have followed railway practice by offering cheap off-peak travel. If the inconvenience of early or late travel is discounted, these rates compare even more favourably with rail fares than those of Aer Lingus. The first class monthly return rail ticket from London to Paris costs £13 0s. 6d. Even after the recent increase, the BEA off-peak fare for the same journey is £12 compared with £15 6s. for the normal fare.

Less Meat Again

The meat ration is to be cut again from next Monday from 1s. 10d. to 1s. 7d. This decision marks a display of courage for election week, but it was tempered by an official announcement claiming that

> on the best assessment of the supply position that can be made at present, we are reasonably confident of maintaining the weekly ration throughout the winter and spring at not less than 1s. 5d. The ration will have to be progressively reduced to sustain this position.

Last year's experience, when the ration was kept high in the autumn to bluff the Argentine Government, only to be reduced to a miserable eightpennyworth (about 7 oz.) early this year, is not to be repeated; the cut this year is to be spread over a longer period.

A one-and-sevenpenny ration at current prices means a little under a pound of meat a week for each adult. It is not known whether the Ministry's forecast of a minimum of 1s. 5d. a week is calculated at current prices or at future prices when the newly increased prices for Australian and New Zealand meat are passed on to the consumer. The difference in the actual quantity of meat would be between 11 and 13 oz. a week for each person. If this level can be maintained it will certainly be an improvement on the 7 oz. a week distributed earlier this year. Last year meat consumption was the highest since the war, amounting to 75½ lb. per head of population compared with 91½ lb. before the war. In the first six months of this year, the annual rate of consumption per head of population was only 41½ lb. Admittedly the average for the whole year will be higher, but it is unlikely to be much more than 1 lb. a week or about ¾ lb. less than the prewar scale.

It is simply not true that exporting countries are not letting Britain buy more meat—a claim made by many government spokesmen during their election campaigns. Producing countries have been exporting less because Britain would not pay what to them was a reasonable price. And they are particularly annoyed with the Ministry of Food for selling their meat at a higher price to the British public in order to offset the large subsidy paid to British meat producers. The announcement of a new fifteen-year agreement with Australia shows that Britain is intent on developing meat production in the dominions. But there is little cause for optimism. In the first place it will take at least five years before supplies increase to any noticeable extent.

The fact that the new agreement guarantees minimum prices at the 1950-51 level for six years for beef and veal and for three years for mutton and lamb underlines this point. The Queensland project has now been going for some time and yet shipments from Australia have fallen. Britain's more immediate concern is to get shipments from Argentina resumed, and according to reports from Buenos Aires 2,000 tons of meat will be shipped immediately. But unless Argentine exports to this country reach a monthly figure of about 20,000 tons, the Ministry's forecast of the ration level in the winter and spring months may prove to have been only a pious hope.

* * *

Branded Garages?

More than three-quarters of the garages in this country, apart from the smallest "one-pump" filling stations, have now entered into "sponsored" sales and service agreements with one or other of the companies distributing motor fuels. Since last Easter, when *The Economist* drew attention to this development in the garage trade, it has been accelerated by unobtrusive but keen persuasion upon the part of the oil companies: in the past fortnight this has come into the open. What is emerging cannot fairly be described as a "tied garage" system, since garage ownership is not in question. Here the British trade will continue to differ from the American and some of the Continental garage industries, where filling stations are often owned by the oil suppliers. Most of the British agreements, moreover, are unwritten. But the various forms of "sponsorship" generally require exclusive sales of one or a specified range of branded petrols. In return, they offer assistance, mainly in kind, to bring the garage up to the standard of performance of the chain associated with (though not owned by) the oil company. Such assistance may take the form of structural alteration, the services of an architect, repainting in standard chain colours, aid in local advertising, overalls for forecourt operators, and—most important of all—training for garage staff.

The common motive of the oil companies' efforts is their need to rationalise distribution of oil products by increasing the size of the "drop" at each point of delivery, thus using their fleets of road tankers to the best advantage. There is little doubt that the British road system has too many garages for the motor traffic it carries, and that many of them are poorly sited, requiring too frequent separate halts by the road tanker to deliver small supplies of petrol. Though one-pump garages dwindled in number during the war, they still account for nearly a quarter of all the garages in the country. Many of them are run, as the Waleran Committee showed, as sidelines of small country establishments primarily concerned with a variety of quite different trades. By this and other measures now in hand, the oil industry is confident that it can cut distribution costs; if so, the movement is to be welcomed.

* * *

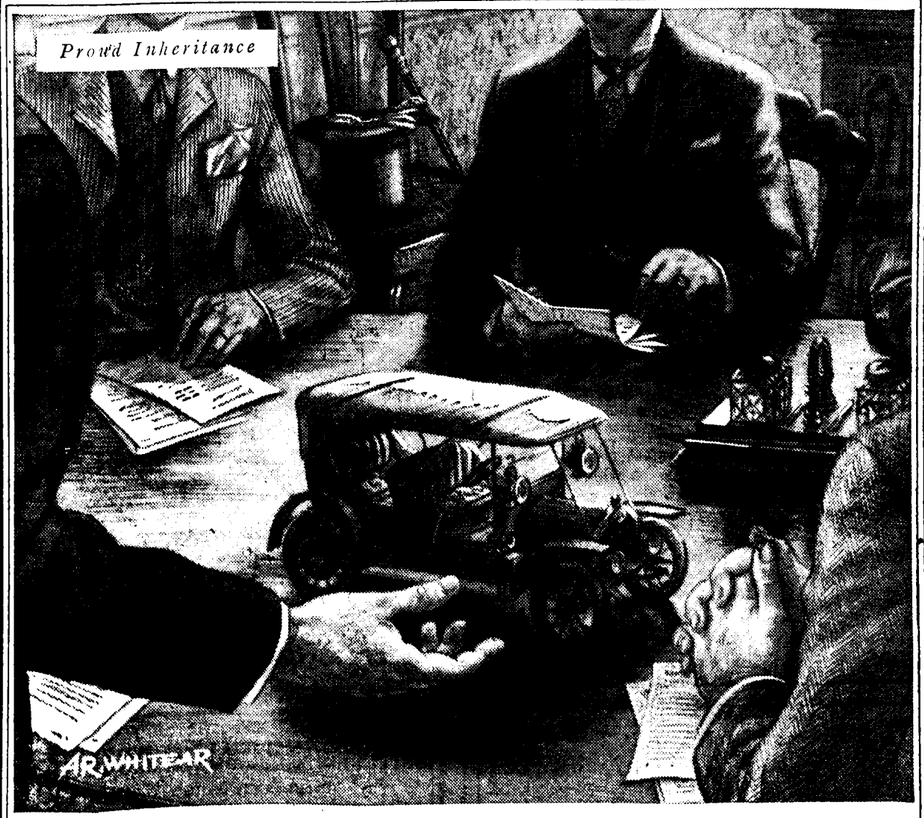
Squeezing the Pump?

So far the oil companies in Britain are not refusing to supply garages that have declined to become attached to one or other of the national chains. Nor have they gone to the length of employing special representatives to assist the nominated distributors with their book-keeping and accounting problems. The special assistance given to the "sponsored" garages towards the provision of improved service will certainly make the lot of an independent, poorly sited garage without such advantages even harder than a superfluity of competitors has done already.

How quickly such assisted competition may effect a worthwhile rationalisation by "shaking out" some of the smallest garages is difficult to judge. When petrol is offered merely as an additional convenience to promote and supplement other business, the commercial return that it earns directly may not be of decisive importance. Where a small garage is operated entirely by the owner's family, on the other hand, its economic staying power will often be remarkably high. It is worth noting that in selecting garages for "sponsorship" some at least of the companies are aiming at a geographically "national" service, covering remote areas and some of the one-pump sites as well as flourishing garages on busy roads.

When the six catalytic crackers included in the present British refinery programme are all in operation, the oil companies will have impressive technical arguments to reinforce their commercial eagerness to reintroduce branded petrols, for these units produce high-grade motor spirit without the refining losses involved in the thermal cracking units that alone existed here until this summer. When the decision comes to be made, competition in the British petrol market is likely to grow, and the new links with "branded" garages may be significant moves in this connection. The question is inevitably being asked in the garage trade whether these links are likely to become closer. Present assistance in kind obviously costs money; and as competition grows it may be that financial inducements such as preferential discounts or credit terms may come in to supplement it. But any further spread of the oil companies' influence, even if they intended it, would probably be counterbalanced by an important influence on the other side of the garage business—the arrangements with motor manufacturers for repair service, which are in any case rather longer-established.

* * *



Trends in Prices

Prices of basic materials in Britain have been falling for the past six months. The decline in September amounted to only one per cent and was the smallest for any month since the downward trend started in April, but it leaves prices 19 per cent below the peak of last March and only slightly above their level of last December. They are still some 40 per cent higher than in June, 1950. Of the textile materials, cotton, wool and sisal were cheaper, jute showed no change and silk and flax became dearer. Wool is the only material of which the price was below that of June, 1950, when the Korean war started. The Ministry of Supply's price of copper to home manufacturers declined during the month, the price of tin rose, and prices of the other metals were the same as in August. Hides and skins and rubber increased sharply.

"... quality has created the demand!
Gentlemen, we must expand ..."

The story of Crossley Motors has been a consistent one right from the earliest years: the very first cars were of the highest engineering quality, and indeed their output was restricted to enable these standards to be maintained. But so persistent grew the public demand that after a few years it became clear to their original sponsors that the only way to produce enough in quantity without sacrificing the mechanical quality was to form a separate company: and so, in 1910, Crossley Motors came into being.

Throughout the years the fame of Crossley cars increased, and their position in the automobile world was pre-eminent by the end of the nineteen-twenties. When it now became obvious that the industry as a whole had accepted mass-production methods, another bold decision was made—and in order to safeguard the ideals of the Company a change-over to the commercial vehicle market was affected. Today the magnificent buses and coaches that ride the roads bearing the Crossley name are a tribute to a company that has never made compromises where craftsmanship is concerned.

BLYVOORUITZICHT GOLD MINING COMPANY, LTD.

(Incorporated in the Union of South Africa)

AUTHORISED CAPITAL £3,300,000
ISSUED CAPITAL (£4,000,000 Shares of 2/6 each) £3,000,000

Extracted from the Annual Report for the Year ended 30th June, 1951.

Tonnage milled, 1,093,000.

		Per Ton milled.
Total Working Revenue	£10,007,728	£9 3 2
Total Working Expenditure	2,481,078	2 5 5
Working Profit	£7,526,649	£6 17 9
Total Profit for the year		£7,584,083
Balance unappropriated at 30th June, 1950		600,648
		£8,074,291
This amount has been dealt with as follows:—		
Taxation	£3,140,988	
Mineral Lease Consideration	789,304	
		3,930,352
Dividends declared during the year—No. 10 of 1s. 4d. per share and No. 11 of 1s. 4d. per share		4,143,939
Leaving a balance unappropriated of		3,289,000
		£943,899

The ore reserve was re-estimated as at 30th June, 1951, as follows:—

Reef.	Available			Shaft and Safety Pillars			Total		
	Tons	Value, Dwt.	Width, Inches.	Tons	Value, Dwt.	Width, Inches.	Tons	Value, Dwt.	Width, Inches.
Carbon Leader	5,817,000	13.0	46.2	1,132,000	12.9	48.6	6,949,000	12.9	46.1

Compared with the previous year the available reserve decreased by 443,000 tons, the value was 0.1 dwt. per ton lower and the stope width unchanged.

Satisfactory progress has been made on the work in connection with the sinking of Nos. A1, A2 and A3 Sub-incline Shafts, although the work was retarded by a shortage of steel.

The full Report and Accounts may be obtained from the London Secretaries, A. MOIR & CO., 4, London Wall Buildings, London, E.C.2.

An interesting comparison can be made between movements in British wholesale prices for basic materials and in world commodity prices as shown by Moody's index. In September, British prices were 40 per cent below their peak of last March but 40 per cent higher than in June, 1950. In September, the Moody's index was 15 per cent below its peak of last February and 15 per cent higher than in June, 1950. But the peak touched by British prices was 74 per cent above the level before the Korean war began, while the peak in the Moody's index was only 36 per cent higher. Thus, despite government trading, bulk purchase and all the other devices at the government's disposal, British prices of basic materials have been subject to more violent fluctuations.

Despite the fall in the cost of raw materials, the index of prices of those materials used in the mechanical engineering industry increased by 3 per cent in September, while prices of materials used in the electrical machinery industry increased by 1½ per cent. The rise in both index numbers (which include prices of intermediate products) has been almost continuous since April, 1950, two months before the invasion of Korea. The index of all wholesale prices in September rose by under 1 per cent; it, too, has been climbing continuously since July, 1949, with but one exception, last July, when it fell by a fraction of one per cent.

* * *

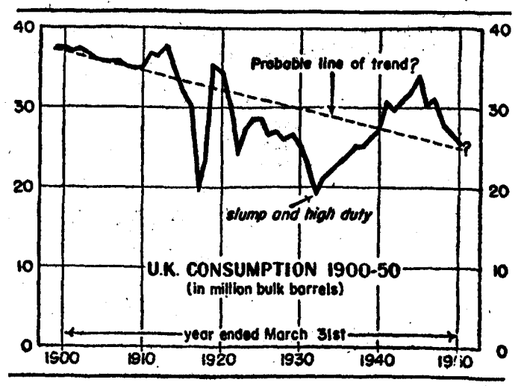
Petroleum Equipment

The manufacture of petroleum equipment is a fairly recent development of British engineering; it is not as yet a distinct industry, since only a handful of firms specialise entirely upon petroleum equipment, though something over 400 manufacturers produce certain items for the oil industry. Such equipment forms a comparatively modest proportion of the oil companies' purchases for use overseas—perhaps 25 to 40 per cent of the yearly £50 million, according to varying definitions; though it may constitute a somewhat larger proportion of the £25 million purchased annually for refineries and other operations inside Britain. Its producers have enjoyed during the dollar shortage a large degree of "protection" in supplying the British companies; and since the agreements last year that ended petrol rationing here, certain American-controlled companies have also had a special incentive to purchase as much equipment for sterling as possible.

The manufacture of petroleum equipment, and particularly of oilfield equipment, is a highly specialised branch of chemical engineering; in the United States it has grown up as a substantial ancillary of the oil industry. Few British manufacturers can yet afford to risk specialising in it; this inevitably means that they can seldom afford the elaborate consulting and after-sales service that the American industry gives and oil companies are accustomed to receive. Nevertheless, the dollar shortage and devaluation have both assisted manufacturers outside the United States; and both have influenced a number of American manufacturers to license manufacture to their designs in Britain in the last two years. In deliveries, the British makers cannot match American makers, and the onset of raw material shortages this year prompted the Ministry of Fuel and Power to enquire whether the existing system of scrutiny prior to dollar purchases by oil companies should be revised. The Council of British Manufacturers of Petroleum Equipment, which co-ordinates the producers, advised that these could handle existing and prospective orders, possibly with the aid of the "Preferential Treatment" certificate for steel supplies.

How secure the prospects may be for the manufacture of such equipment in Britain has often been questioned. At the Council's first annual general meeting at the beginning of this month Mr Howard Page, of Standard Oil, was cheering:

> The British manufacturers' opportunity is not dependent upon any arbitrary exchange rate, or on Government controls of currency or of imports. The potential volume outlet should, in most cases, be adequate for low cost manufacturing—that is, sufficiently low to be fully competitive with American suppliers in the overseas markets.



But he added that such manufacture is a very competitive business, not only in price but in quality and design: in both of these aspects the British manufacturers have a potentially rewarding but an arduous task before them.

Back to Normal in Beer?

In the first eight months of this year, output of beer amounted to 16,770,000 bulk barrels, compared with 17,020,000 bulk barrels in the period January to August, 1950. This represents a decline of only 1.5 per cent, compared with 3.5 per cent for the same months from 1949 to 1950 and 7.4 per cent from 1948 to 1949. It seems likely, therefore, that the Chancellor's pessimistic forecast in the Budget that revenue from the beer duty in 1951-52 might be 5 per cent lower than in 1950-51 may be falsified. Consumption, moreover, has not suffered considerably from the increase in the price of beer that mounting costs impelled most brewers to risk. Not all did, incidentally; some brewers in industrial areas did not raise prices.

But it is too early to conclude from the slackening rate of decline that demand may soon be stabilised. The downward trend apparent before the war, as shown by the chart, showed an average annual fall of about 1 per cent between 1900 and 1938, and this may persist. Output is generally back to 1938-39 levels. Most brewers are too cautious to venture an opinion whether it will stay there, but two who have made prophecies—Lord Courthope of Ind Coope last year, and Mr Combe of Watney, Combe, Reid last month—both spoke of further declines. After the effects of war conditions died

away, sales of beer might have been expected to settle near the immediate pre-war level. Beer prices have nearly trebled, a greater increase than for most staple consumer goods except tobacco, but there are nearly a million more men in civil employment, and there must have been an increase in the incomes of beer drinkers as a class. But social habits have continued to change, and new amenities are being consumed by the working classes; television, to mention only one, is not a rich man's toy. Further expansion of these rival demands may continue to be felt in the public house.

The outlook for the brewers, however, is not necessarily grim. It is true that costs—not least unit overhead costs—continue to rise; that while rearmament may stimulate demand in some areas, there is no slack of unemployed to whom it might give the chance to buy beer anew; that the chances of a cut in the duty are not high; and that disinflation might affect demand as well as costs. But there must be room for cost reduction in an industry so long sheltered by secure retail outlets. The expanding demand for bottled

beer, which now accounts for one-third of total output and might be replacing draught beer faster if bottling plant and supplies of bottle caps were adequate, is a hopeful sign. The potential market for light packaged beers among women and the salaried classes has probably not been fully plumbed. And even if draught beer sales continue to decline, the public house, in which change has been held up since 1939 by building restrictions, may yet offer possibilities of adaptation to changing social habits.

Safe Landing

A year ago a Viking aircraft owned by British European Airways crashed while attempting to land in fog at London airport and all but two of the 30 people on board were killed. The report of the Court of Investigation into the probable cause of the tragedy has recently been published. It concludes that

> this accident would have been avoided if the pilot had not brought his aircraft down as low as he did in spite of the information several times supplied to him that the meteorological visibility as measured on the ground was as low as 40 or 50 yards.

The aircraft was identified on the London Airport ground control approach system when it was 25 miles from the airport. This equipment is used to "talk down" the pilot in bad weather to a "break-off" point about 140 feet above the runway where, if it is safe to land at all, he can see the runway sufficiently clearly to make a visual landing. The pilot made a normal approach on GCA for the last eleven miles of the flight. From the break-off point he continued to make what appeared to be a normal landing, then said he was going to over-shoot the runway, but the aircraft crashed and caught fire.

The flying manual, the disciplinary code for pilots, lays down certain minimum weather conditions below which a pilot may not attempt to land—in this case, a cloud base of 200 feet and a visibility of 600 yards. But the regulations were worded in such a way that the conditions were not absolute. Visibility, for example, was understood to mean visibility from the cockpit, which can never be measured with precision, and not visibility on the ground, which can. If one condition was present and the other was not, the pilot could use his own discretion whether this combination met the spirit if not the letter of the flying manual's minimum conditions. Regulations of this kind date from the days when a pilot was obliged in the last resort to base his decisions on what he could see for himself. Ground control equipment like GCA has taken time to reach its present degree of accuracy and it has also taken time to train the crews to a peak of efficiency where the pilot can place complete reliance on what he is told from the ground. In the next few years it is likely that flying regulations will become stricter and more detailed. The Court's report says that "such an accident is unlikely to occur again if it is made an offence for a pilot to come down to so low a height when visibility reported from the ground is so seriously lower than the prescribed minimum." The BEA flying manual is being re-worded to remove any ambiguity about minimum weather conditions. Visibility will in future mean visibility on the ground and as soon as the ground controllers report that it is below the minimum the pilot will be bound to divert to another airport.

Shorter Notes

During August the "metals, engineering and vehicles" group of industries, which include those taking most of the burden of rearmament, gained 25,000 workers, increasing their manpower to 4,130,000: during the first seven months of the year their labour force had risen by only 19,000. Manufacturing manpower as a whole rose by 42,000, and the building and contracting industries added 7,000 workers to their total of 1,446,000. These increases formed part of the aggregate addition of 84,000 to the nation's labour force, which totalled 23,449,000 at the end of August: the seasonal increase resulted largely from the entry of children leaving school into industry. Unemployment, at 217,000 on September 17th, was very slightly higher than a month before, but still represented less than one per cent of the national labour force. The month's figures would thus indicate a slight quickening in the growth of manpower in industries that may be concerned with defence. But at the same time manpower in the coal industry continued to decline, and that in transport showed only a very slight increase; and unemployment in the distributive trades rose once again.

*

Very considerable deposits of coal in the Ruhuhu river area of South Tanganyika are indicated by the report of a geological investigation carried through in the last two years by a team from the Colonial Development Corporation. Diamond drilling has indicated a gross tonnage of more than 200 million tons, of which more than 40 million tons are considered extractable. The coal compares favourably with most South African and Rhodesian coals, and the quality in one part is better than any previously known in Tanganyika: seams vary from a few feet to over 20 feet in thickness. Two possible schemes of exploitation are being considered; both would require close collaboration with the Tanganyika Government. One is for a small colliery producing about 500,000 tons a year for East African consumption; the other is for a larger colliery producing perhaps 2,000,000 tons a year, of which three-quarters might be processed into petrol and fuel oils.

*

Industrial output in August, as shown in the London and Cambridge Economic Service index, showed the usual seasonal fall in August, when production is most affected by holidays. The "B" series showed an August figure of 125, compared with 131 in July and 120 in August, 1950. The "motors, cycles and aircraft" component of the index showed a drop of from 187 in July to 144 in August; this was largely seasonal, but compared with 152 in August last year. August's figures of industrial production as a whole would still be consistent with the official estimate of an increase of 4 per cent in industrial production this year.

*

Agreement has now been reached between the government of the Union of Burma and Burma Corporation providing for the formation of a new company, Burma Corporation (1951) Limited, in which the Burmese Government will subscribe half the issued share capital. The new company will take over the whole of the Corporation's undertaking in Burma and will issue fully paid shares in exchange to shareholders in the present company. The Burmese government will subscribe for an equivalent number of shares in instalments to provide the new company with additional working capital and with funds for the rehabilitation of the mines and plant. The agreement is subject to ratification by the Burmese government and by Burma Corporation shareholders.

*

The Treasury have had second thoughts in the question of United Molasses' capital. Last February when the company applied to CIC for permission to capitalise £3,909,000 from reserves in order to restore the 13s. 4d. cut off the £1 ordinary shares in 1934, it was given half of what was asked. Consent has now been given to a further capitalisation of £1,954,500 from reserves, which will restore the nominal value of the existing 11,727,000 ordinary stock units from 6s. 8d. each to 10s. each.

Aluminium Alloy Aircraft Hangars

for London Airport— **S·M·D** OF SLOUGH

Our illustration shows the method of erecting the main frames by winching.

The first all-aluminium aircraft hangars ever built have now been completed at London Airport. The design, prepared for the Ministry of Civil Aviation by our construction company, S.M.D. ENGINEERS of Slough (who also carried out the manufacture and erection) exploits to the full the advantages offered by the use of aluminium — prefabrication of main components, rapid site assembly, no painting.

If it's Aluminium — ask Almin!

THE ASSOCIATED LIGHT METAL INDUSTRIES GROUP

Parent Company

ALMIN LTD • FARNHAM ROYAL • BUCKS • TELEPHONE: FARNHAM COMMON 594

Company Notes

Fairey Aviation.—This company has concentrated on the development of a highly specialised aircraft, the Fairey Gannet, a coupled engine anti-submarine aircraft; a contract for building these aircraft was secured against strong competition last January. This fact alone does not necessarily imply a rapid increase in profits, much less in dividends. But it should certainly bring some recovery from the trading setback recorded for the financial year to March 31st when group trading profits fell from £381,719 to £321,123. The prospect suggests a steady, but not unduly high, level of earnings in the rearmament period. Not only have trading profits fallen, but profits brought in from earlier years are down from £404,074 to £248,981; there is, however, a big offset in the fall in development and research expenditure from £447,690 to £83,786.

The completion of one stage of development and research will probably mean a higher level of disposable profits, but it will also mean bigger claims by the tax-collector and a greater emphasis, no doubt, on the building up of reserves. These factors may have had their bearing on the directors' decision not to be "restricted by proposals for legislation which might never be enacted" and to maintain the ordinary dividend of 25 per cent instead of cutting it back to 22½ per cent as would have been necessary if the White Paper proposals were obeyed to the letter.

	Years to Mar. 31, 1950	1951
Consolidated Earnings :—	£	£
Trading profit	381,719	321,123
Prior years' profits	404,074	248,981
Total income	785,793	570,104
Development expenditure	447,690	83,786
Taxation	85,000	80,276
Ordinary dividends	141,316	134,892
Ordinary dividends (per cent)	25	25
Retained by subsidiaries	28,529	57,363
Development reserve	100,000	...
General reserve	...	150,000
Added to carry forward	*Dr 73,052*	12,399

10s. ordinary share at 36s. yields £6 10s. per cent.

The yield on the 10s. ordinary shares at the present price of 36s. of nearly £7 per cent appears to measure reasonably well the immediate risks inherent in an aircraft share of this calibre. Long-term forecasts for the aircraft industry are open to doubt for the fortunes of the companies largely depend upon defence contracts and upon forward-looking development. So far as this second factor is concerned Fairey Aviation have already acquired much research experience on the latest developments in delta-winged aircraft and rocket propulsion for aircraft.

★

Calico Printers.—The ordinary dividend of Calico Printers is to be maintained at 12½ per cent, although the "standard" dividend under the White Paper proposals is only 10½ per cent. Accompanying this announcement is a statement that "in view of the low average return received in the past by ordinary stockholders and in the absence of legislation limiting dividends, the directors consider they are fully justified in recommending a dividend, at the same rate as last year." To speak of a "low average return" is no exaggeration, since for a good number of years before 1947 no ordinary dividend was paid; in 1947 and 1948 ordinary shareholders received a dividend of 5 per cent, of 8 per cent in 1949 and of 12½ per cent in 1950. In view of the considerable advance in profits from £3,563,003 to £5,241,101 some shareholders may indeed feel that the mere maintenance of the ordinary dividend errs too much on the side of caution. Admittedly tax charges have mounted from £1,367,564 to £2,320,867 and the provision for depreciation and maintenance from £834,793 to £1,004,549, but the ordinary dividend is covered more than six times by the parent company's distributable earnings alone.

Uncertainty about prospects in the current year may have influenced the directors in deciding against a modest increase in ordinary distribution, which on the evidence of last year's prosperity was possible and not unjustified. The company has a considerable export trade and, therefore, its fortunes are particularly sensitive to raw material price changes and to the growth of Japanese competition, about which the chairman expressed anxiety in his statement last November. It will be some time before the textile mill, now under construction in Uganda and in which Calico Printers has a majority holding, will make any contribution to profits.

	Years to June 30, 1950	1951
Consolidated Earnings :—	£	£
Profit	3,563,003	5,241,101

Great Universal Stores.—The full accounts of Great Universal Stores amply confirm the suggestion made in a company note on October 6th that the advance of nearly 40 per cent in group trading profits from £5,896,913 to £8,161,150 has been accompanied by much heavier investment in current assets. The year's increase in aggregate sales by 29 per cent is due to some extent to higher prices. The rise in sales, higher prices and the consolidation of new acquisitions are responsible for the increase in stocks from £13,029,821 to £15,971,735 and in hire-purchase debtors from £15,914,989 to £20,651,570, which has taken place despite "restrictions upon borrowing or raising money for the purpose of financing hire purchase debtors to curb inflationary tendencies, to which extent the hire purchase turnover of the group is controlled." Such large-scale investment in current assets has imposed a considerable strain on liquid resources and although reserves have been reinforced by the appropriation of some £1,800,000 from profits, bank loans have risen from £7,230,976 to £8,687,403.

	Years to Mar. 31, 1950	1951
Consolidated Earnings :—	£	£
Trading profit	5,896,913	8,161,150
Total income	5,951,107	8,218,461

Reserves	7,780,983	10,980,358
Ordinary capital	1,319,979	1,335,513

5s. ordinary stock at 32s.xd. yields £6 5s. per cent.

The chairman, commenting on the year's results, remarks that public demand continues at a high level but there are some indications that purchasers are showing greater discrimination in the face of higher prices. Some goods, in fact, "have almost priced themselves above the capacity of the public to pay." Recently there have been signs of "a healthy recession" in prices which may have "the effect of restoring sales, where they have declined, to their normal levels." Turnover in the current year to date is in excess of last year and the company's expansionist policy of acquiring new retail outlets—there are already 815 in Britain—suggests that under present conditions a high level of profits should be maintained.

Statistical Summary

EXCHEQUER RETURNS

For the week ended October 13, 1951, total ordinary revenue was £51,048,000 against ordinary expenditure of £69,097,000 and issues to sinking funds £1,114,000. Thus, including sinking fund allocations of £10,732,000 the deficit accrued since April 1, 1951, is £56,556,000 compared with a surplus of £56,499,000 for the corresponding period of the previous year.

COMPANY MEETINGS

ODEON THEATRES AND SUBSIDIARY COMPANIES

STEADY AND HEARTENING PROGRESS

MR J. ARTHUR RANK'S STATEMENT

The fourteenth annual general meeting of Odeon Theatres, Limited, and the annual meetings of its subsidiary companies, British and Dominions Film Corporation, Limited; Gaumont - British Picture Corporation, Limited; Odeon Associated Theatres, Limited; and Odeon Properties, Limited, were held on October 12th at the Dorchester Hotel, London, W.1, Mr J. Arthur Rank, D.L., J.P., the chairman, presiding.

The following are extracts from his statement, which was circulated with the report and accounts: I am happy to inform you that the financial year covered by the audited accounts, namely that ended June 23, 1951, has been one of steady and, I think, heartening progress.

The net result of the year's operations in Odeon Theatres, Limited, is a profit of £277,980, which absorbs the debit balance of £91,818 brought forward from the previous year and, after deducting transfers to reserves of £30,325, leaves £155,837 to be carried forward. The consolidated balance sheet also shows a further marked improvement in the financial position.

I am glad to say that a further substantial reduction of £3,736,290 has been made in bank indebtedness during the year. As compared with the position at June 25, 1949, bank indebtedness has been reduced by approximately £7,000,000. I anticipate that a further reduction in bank indebtedness will be achieved during the current year.

Consolidated trading profits, less losses, subject to depreciation, interest, etc., amounted to £5,125,230 for the year, as compared with £3,293,426 for 1949-50. This satisfactory improvement is due to two main factors. First the profits of the exhibition and the manufacturing companies have increased; and, secondly, the amount to be provided for film production losses has been reduced.

As regards profits earned on exhibition in the theatres, the improvement is almost entirely due to economies and improved efficiency resulting from the policy to which I have already referred. The number of patrons attending the theatres during the year was approximately the same as in the previous year. As regards film production, it has been necessary to make further reductions in the stock values of certain films which were produced during the period of extensive production in 1949. Films released during the financial year under review also showed a loss, but on a greatly reduced scale, as compared with previous years.

The amounts provided for net film production losses, after taking into account distribution revenue, are £1,300,000 in respect of the Odeon and G.C.T. group, and £135,000 in respect of the Gaumont-British and Gainsborough group, as compared with £1,750,000 and £575,000 respectively in 1949-50. I am confident that such provisions for the next financial year will show a very substantial reduction. The net group profit subject to tax amounts to £2,769,949, as compared with £552,264 last year. Taxation requires no less than £1,709,846 (last year £1,215,010).

GAUMONT-BRITISH PICTURE CORPORATION

The trading and financial position of the Gaumont-British group shows a substantial improvement. The net profit, subject to taxation, amounts to £1,994,999 (after providing £542,522 for depreciation), as compared with a net profit of £813,362 a year ago. This marked improvement is due to a substantial reduction in the provision for film production losses and to increased profits earned by the theatres and the manufacturing subsidiary companies.

The group is faced with a heavy charge for taxation at £1,228,456 and after allowing for outside shareholders' interests the net profit applicable to the Corporation is £426,920. Special profits realised from the sale of properties, etc., £284,261 have been added to this net profit, bringing the total net surplus for the year up to £711,181.

In view of the substantial profits for the year and the satisfactory financial position, the directors recommend the payment of a dividend of 5 per cent. less tax on the ordinary shares absorbing with the preference dividends, etc., £209,040, leaving the carry forward at £1,538,614, as compared with £1,036,473 a year ago.

BRITISH AND DOMINIONS FILM CORPORATION

The trading profits at £389,114 show a decrease of £132,789 as compared with the previous period. The previous accounting period included 14 months results for one subsidiary and fifteen months for another. Apart from this factor, the decrease arises from the reduction in rentals received from the studios at Denham and Pinewood, as it has been necessary to continue the arrangements with J. Arthur Rank Productions Limited in view of the grave difficulties through which the production industry has been passing during the whole of the year under review. The net profit subject to taxation amounts to £311,970. The fixed dividend on the 5½ per cent. preference shares requires £110,000 less tax and taxation £189,901, leaving the balance of net profits carried forward at £587,063 as compared with £506,648 last year.

FILM PRODUCTION

I referred last year to the voluntary scheme which was instituted from September 11, 1950, whereby a contribution would be made to film production out of the box office receipts and which subsequently became known as the "Eady Plan." I said then that whilst this plan was a help, the sum involved was insufficient to render the making of films an economic proposition. I am afraid that the view which I expressed has proved correct.

The British Production Industry, whilst making some fine films during the year, has, nevertheless, been faced with many problems and whilst the losses incurred have been less, it has not, in my opinion, been possible to make a group of films at a profit. There have, however, been a number of events during the year which I hope will lead to more stable conditions and enable serious producers to produce in the future a group of films which will show a profit.

Last autumn the National Film Finance Corporation came to the conclusion that their then policy of financing Independent Producers was not likely to lead to continuity of production and the creation of a healthy British production industry for which purpose the Corporation had been formed. They therefore proposed in addition to financing Independent Producers to create three groups of producers, who, whilst retaining creative independence, would work together to ensure a properly planned and continuous production programme. We are co-operating with one of these groups, a company called British Film Makers Limited being formed to operate this scheme. We believe that this scheme will assist in stabilising production and have wholeheartedly supported its development.

I am of the opinion that the extension of the Eady Plan for a period of three years from August 5, 1951, will do much to assist in solving the immediate production problems and placing the industry on a satisfactory basis. It is, however, essential that although a levy is available to assist producers in recovering the cost of a negative, speculative production should not be allowed to become general. To produce films of merit production must be in the hands of experienced producers and directors.

There is, however, one point which I must emphasise. If the Eady Plan were withdrawn at the end of three years without the substitution of some similar scheme agreed upon by the whole industry then the problems which have up to recently beset the industry would immediately recur, although they might not show immediately, and the good work which I hope will by then have been done would be undone very quickly.

I have over the years expressed my faith in the British film production industry. I can only reiterate that in my view a stable British production industry is essential in the national interests and is necessary to the film industry of the country. Under these new conditions I shall do all I can to assist in endeavouring to achieve the aim for which I have been working since 1940, namely, to see a healthy programme of quality entertainment films being made by our group, but always with the proviso that we shall carefully ensure that it is limited to the creative talent which is available to us.

ENTERTAINMENT TAX

During the last year the industry has had to spend once again a great deal of time in wrestling with this unreasonable burden and the unfair discrimination in the rate of tax it has to bear as compared with other forms of entertainment. In the 554 theatres operated by this group, the public paid £27,918,192 by way of admission prices, and of this total no less than £10,527,761 was drained off as Entertainment Tax, representing 7s. 6½d. of every pound taken at the box office, or 37.71 per cent. of the total takings. If we had been taxed on the same basis as the live theatre we should have paid £2,660,460, a reduction of £7,867,301 or 75 per cent. These figures clearly bring out the unreasonable burden carried by this industry, which provides a large portion of the country's wage earners and their families with healthy entertainment.

The Chancellor of the Exchequer in his original budget proposals made provision for a further substantial increase in Entertainment Tax, the bulk of which increase was to pass to the Treasury, a very small sum to exhibitors and a larger sum to producers. I am glad to be able to report that as an outcome of negotiations the industry has received some relief but unfortunately the basic problem of discrimination as against other forms of entertainment has not been dealt with. I hope the industry will continue actively its efforts to secure the removal of this discrimination and some relief of this burden which I am convinced in the long run will harm the whole industry and in addition lead to reduced revenue for the Exchequer.

EXHIBITION

The motion picture theatre is in many ways a local and communal institution and its success is dependent upon the standing of its manager and his staff in the local community. Our personnel who are loyal, keen and enthusiastic men, have taken a leading part in the social and economic problems of the communities in which they operate.

DIRECTORATE

I must refer particularly to Mr John Davis, the principal executive of the group. In June, 1949, he set out to overcome the very great difficulties which then confronted the group. His confidence and enthusiasm have never faltered and his brilliant administration and leadership have been of the highest order. It was with particular pleasure that I was able to announce, earlier in the year, his appointment as deputy chairman of Odeon Theatres Limited, thus demonstrating the confidence the board have in him and their appreciation of his work during the last two difficult years.

PERSONNEL

I and your managing director are firmly of the opinion that an organisation is as good as its personnel. Ever since I entered this industry it has been my aim to build up a team of men who were hard workers with integrity and loyalty. This policy has been actively developed by your managing director who has in conformity with this policy brought into our group a number of young men who have been trained for this purpose. I am happy to say that we never have had at any time a more efficient and loyal team at all levels who are working together in the closest co-operation and harmony. Their hard work and enthusiasm are reflected in the improved trading results for the last year. I wish to thank them for all they have done.

THE DIVIDEND POSITION

You will have seen that it has been possible for Gaumont-British Picture Corporation to recommence the payment of an ordinary dividend.

The position of Odeon Theatres Limited has materially improved and we have given careful consideration to the position of the dividend on the 6 per cent. preference shares. The approximate results of the current financial year to date are available and having regard to these, to the prospects for the remainder of the year and the present financial position of the company, the board felt justified in paying one year's preference dividend less tax on the 2,750,000 6 per cent. pereference shares of Odeon Theatres Limited, thus bringing the payment of the cumulative dividend up to July 1, 1950. Your directors would not have made the payment on account of the arrears of preference dividend unless they felt there was a reasonable prospect of being able to clear the arrears in due course and resume the payment of regular dividends.

With the close of the financial year in June, 1951, we reached an important stage in the rebuilding of the group's financial position which suffered so severely in 1948-49. There is still much to be done, but provided the cinema industry is given reasonable conditions in which to operate and attendances are maintained at their present level I am confident that steady progress will be made.

At the meetings of Odeon Theatres Limited and subsidiary companies the report and accounts were adopted.

RANSOME AND MARLES BEARING COMPANY, LIMITED

INCREASED PLANT CAPACITY

The thirty-fifth annual general meeting of Ransome and Marles Bearing Company, Limited, was held on October 12th at Newark, Notts, Mr F. W. Baker (chairman of the company) presiding.

The following is an extract from the chairman's circulated statement for the year to June 30, 1951:

Production and sales have broken all previous records. The capacity of the plant has steadily increased and higher figures can be established provided materials, adequate labour and power are available.

Some difficulties have been experienced in keeping up the flow of raw materials and supplies, but for the most part these have been overcome. Whilst all possible steps have been taken to ensure the future position, any reduction in supplies must affect our production.

The balance of orders on hand is the greatest in the company's history and we are compelled to quote very protracted delivery dates for new business. It was in anticipation of such a situation that the project for the new factory at Annfield Plain was initiated some twelve months ago.

BALANCE SHEET ITEMS

The highly liquid position shown by the balance sheet is partly due to the recent capital issue. The reasons for making this were fully set out at the time and work on the new factory is well in hand. Most of the plant is ordered and considerable payments have been made on account. It is hoped that production will commence towards the end of 1952. This is dependent on completion of the buildings and deliveries of machine tools and equipment according to schedule.

The reserves on capital and revenue account are each in excess of the nominal capital and have been provided by the shareholders, either from share premiums or profits retained in the business. The capital reserves are, of course, restricted to application for capital purposes but the general reserve and profit and loss balance are derived from taxed profits and are therefore available for any purpose, thus making it unnecessary to create specially earmarked reserves.

Opinions have been taken as to the application of the White Paper on control of dividends to our case and we are satisfied that it is in order to make the same final distribution of 17½ per cent. on the increased capital.

THE OUTLOOK

Under existing world conditions it is impossible to say very much as to the future. Costs of raw materials and other supplies continue to increase and, despite improved technique to reduce production costs, some of this increase must inevitably be passed on. The very heavy demand for bearings for ordinary civilian use, not only from this country, but from all parts of the world, has been increased by the armament programme. This programme will naturally postpone many normal industrial developments, so that a large market would seem to be assured for many years to come. The production from the new works is therefore required at the earliest possible date.

The report and accounts were unanimously adopted and the dividends as recommended were approved. The retiring director, Mr E. W. Senior, was re-elected.

ANGLO-DUTCH PLANTATIONS OF JAVA

MR W. H. DAUKES ON REHABILITATION PROGRESS

The forty-first annual general meeting of this company was held on October 16th in London, Mr W. H. Daukes (chairman and managing director) presiding.

The following is an extract from his circulated statement:

Between the two wars great progress was made in the development of the properties.

The company was deprived of its properties until August, 1947, firstly, through occupation by the Japanese, and afterwards owing to the civil strife between the Dutch and Indonesians. When we returned to the estates, the picture presented was an extremely tragic one.

The great expansion of the company's interests was achieved despite the company having to pay a "company profits tax" far in excess of anything which was being levied in other countries growing tropical produce. I regard security of the person and of possessions to be an inherent part of a Government's undertaking in return for the taxes paid, and, consider that, in the event of a Government proving unable to implement this undertaking, compensation for loss incurred should be a definite obligation. We have had no compensation for any of our losses nor do we see any prospect of receiving any, and at the present moment as you are well aware, taxation in Java, if one takes into account the Government favoured rate of exchange, the heavy export duty and company tax, is an oppressive burden which hinders both expansion and reconstruction.

REHABILITATION PROBLEMS

I come now to the progress made from the moment of our return to the properties in August, 1947, up to the present time.

One of our greatest problems has been finance. In contrast to the immense programme of rehabilitation which lay before us, the financial means we had at our disposal were extremely meagre. Although our cash reserves were very small, fortunately the company's credit was first-rate.

When we returned to the properties in 1947 the directors had a very difficult decision to make: on the one hand, to spend as little money as possible, extract the maximum revenue, and distribute the profit made—this meant sacrificing the ultimate capital value for the sake of immediate returns—on the other hand, to rebuild the capital value of the properties so far as possible, although this of necessity, would mean a postponement in making any distribution to stockholders. The board decided on the latter course.

By the end of last year, six tea factories had been rebuilt or repaired and, in some cases, extended, while most of the tea gardens had been renovated and brought back into first-class condition; nine rubber factories had been, for the most part, rebuilt and nearly all the gardens are now restored to good condition.

The statement having dealt with the labour position and with individual cultures, continues:

You will, naturally, wish to hear something regarding the prospects for the current year. Difficult as it is to forecast either crops, sell[illegible]ces, or cost prices, under present conditions. Figures received for the first half-year give promise of satisfactory results for the whole year, but with still some months to go, more than this I dare not say.

Our next task, with the bulk of the rehabilitation work behind us, must be to strengthen our financial position, and as soon as possible to see our banking accounts in credit.

The report was adopted.

JAMES HOWDEN AND COMPANY, LIMITED

(Boiler, Auxiliary and General Engineers)

INCREASING DEMAND FOR PRODUCTS

IMPROVED PRODUCTIVE CAPACITY

MR CRAWFORD W. HUME ON THE DIVIDEND FREEZE

The forty-fifth annual general meeting of James Howden and Company, Limited, was held on October 12th at 195, Scotland Street, Glasgow, Mr Crawford W. Hume, M.I.N.A. (the chairman), presiding.

The secretary (Mr James S. Niven) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which has been circulated with the report and accounts:

The accounts for the year ended April 30, 1951, are in the usual form and do not, of course, show the change in the capital structure which was approved at the extraordinary general meeting on August 13, 1951. To meet the increasing demands for the company's products considerable additions have been made over the last few years to the factories and new and improved plant and machines have been brought into use. At the same time much attention has been given to methods of increasing the volume and quality of production. These accounts show that the policy of the board has been justified and is successful.

THE YEAR'S RESULTS

The profit, after taxation, amounts to £257,458 as compared with £148,787 for the previous year and is a reflection of the increased output. Provision has again been made for profits tax for the year ended April 30th last and a reserve for income tax on the profits for the same year due in 1952-53. These two together amount to £322,019.

£161,585 has been transferred to the general reserve account bringing this to £511,585 as shown in the accounts for the year ended April 30, 1951. Since then, however, as a result of the extraordinary general meeting already referred to, £111,585 has been capitalised together with the capital reserves of £161,415, so that today the general reserve stands at £400,000 and the capital reserves item disappears from the balance sheet, with a corresponding increase of £273,000 in the issued capital.

An appropriation of £30,000 has been made for the extension of the pension schemes for employees. While this has been set aside from taxed profits it is expected that as a result of negotiations now taking place with the Inland Revenue Authorities tax relief will be allowed in due course.

This year the directors feel that they would have been justified in recommending a total dividend on the increased capital of at least 20 per cent. and it is a great disappointment that under the Chancellor's proposed legislation this would not be allowed.

DIVIDENDS AND WAGES

Three years ago when the Government appealed for restraint in dividends they also asked for a corresponding restraint in wages, knowing well that the effect of wages on inflation was then 4½ times that of dividends and interest. Published figures show that during these three years wages have increased by 26 per cent., but dividends and interest have remained practically stationary, the increase being less than 0.4 per cent. The increase in wages is actually well over 300 times the increase in dividends and interest and the inflationary pressure has obviously not been affected by the income from these sources. On the other hand, if the increased cost of living justifies increased wages, it also justifies increased income to shareholders, many of whom are entirely dependent on the dividends from their savings which they have invested in industry. It is for reasons of this kind that the Chancellor's proposals have met with so much criticism and it may be that no Act of Parliament will be passed giving effect to them.

Over the past three years the company accepted the Chancellor's suggestion with regard to freezing of dividends, although larger dividends could have been paid. It is unfortunate that companies such as ours who accepted the recommendations are now to be penalised, if the proposals become law, by having a lower dividend standard than others who increased their dividends.

BOARD'S DECISION

In the present circumstances, however, the directors feel that they must act in accordance with these proposals and recommend a final dividend of 10 per cent., which keeps the distribution the same as in the previous year and which, less income-tax at 9s. 6d. amounts to £28,665. At the same time they have also recommended that £21,138 be transferred to a dividend reserve. This sum represents the net amount of a further 5 per cent. dividend plus the estimated amount required to meet the net tax on distributed profits and will be used as circumstances may allow. After making these and the other appropriations shown in the directors' report, the balance carried forward will amount to £48,259, as compared with £46,522 in the previous year.

It is satisfactory to note that the consolidated balance sheet this year shows a reduction of £171,512 in sundry creditors and accrued charges and an increase in the cash in hand and tax reserve certificates of £170,940.

The usual care has been taken throughout the year to ensure that the buildings and plant are being kept up to the high standard which is necessary for efficient production. The research buildings are now in full use and are proving to be of great value to the company. An ample provision has been made for depreciation of the fixed assets in the accounts for the year.

DEMAND AND SUPPLY PROBLEM

The greatly increased output is accompanied by a correspondingly increased rate of orders and the company thus continues to have on hand orders representing several years' work. Here, however, a note of warning is necessary. So far the company has not experienced any great difficulty in obtaining the supplies of steel necessary for its increasing output, but with the growing shortage of steel it is difficult to see as far ahead as one would like, and if the supply continues to be as restricted as it has been in recent months it will necessarily have an adverse effect on future output. A very considerable part of the company's production is for power stations and the fact that the country must have power to enable it to produce armaments (or indeed almost anything else) ought to ensure an adequate allocation of steel.

It is satisfactory to note that while the demand for the company's products for land power stations continues unabated, not only at home but abroad, and is likely to do so for a long time, the marine business has recently touched new high levels and the export orders are also more than encouraging. In this connection, close personal touch has been maintained in overseas markets with buyers of our products and the relationships so formed have led to good results.

The company has again enjoyed the loyal support of the administrative and executive staff and all employees, and I should like to express on your behalf to every employee our warm appreciation.

The report and accounts were unanimously adopted and the final dividend of 10 per cent. and the transfer of the sum to dividend reserve were approved.

The retiring directors, Mr Norman Burke and Mr Archibald Macfarlane, were re-elected, and the remuneration of the auditors, Messrs Wm. Hart, Jnr., and Wilson, C.A., having been duly fixed, the proceedings terminated.

THE KAMUNING (PERAK) RUBBER AND TIN COMPANY

EFFECT OF LAWLESSNESS ON INDUSTRIAL EFFICIENCY

SIR JOHN HAY'S STATEMENT

The forty-second annual general meeting of the Kamuning (Perak) Rubber and Tin Company, Limited, will be held on November 13th, at 52-54, Gracechurch Street, London, E.C.

The following is an extract from the statement by the chairman, Sir John Hay: The opening sentence of my last statement to you was in the following terms:

"It is melancholy to reflect that this is the third successive year in which I have had to begin my annual statement to you with a reference to the disturbed conditions in the area in which our property is situated, involving all who serve us in personal danger, as well as the risk of destruction to property."

Another year has elapsed. Violence, destruction, extortion, intimidation and lawlessness, euphemistically termed "a State of Emergency," still continue. So inured has the country become to this state of affairs that murder is now officially categorised as an "incident." As a company we must count ourselves exceptionally fortunate that during the period under review we suffered directly nothing more serious than the loss of three lorries. But the consequences of a continuance of a state of lawlessness such as has existed in Malaya for over three years are not to be measured by the recorded extent of material damage done, nor by the number of what in official jargon are termed "incidents." Industrial efficiency cannot continue to be maintained under conditions where security of person and property is lackihg. In the discharge of their duties estate managers and their staffs have not only to encounter personal danger: they have to accept considerable responsibility for the administration of orders designed by Government to deal with the "Emergency." Concentration of labour, the control of foodstuffs and the enforcement of a curfew are well-conceived measures, but their purpose is not always understood by the labourer whom it is designed to protect. Moreover, these measures interfere in many respects with his former habits and customs; they involve a curtailment of liberty and are not accepted without demur. At a time when labour is in such short supply that the worker can pick and choose his job, when wages are so high that he is relieved of the necessity of continuous work, the hard-pressed managers and their staffs have to exercise immense tact and patience if they are to retain the good will of the worker and win his co-operation in the carrying out of such Government orders.

Continuing dangers and mounting difficulties involve a strain on the diminishing ranks of the planter which in some cases has reached the limits of endurance. Hope, too long deferred, and multiplying frustrations are increasingly taking their toll.

Our present abnormal prosperity, regarded by some, not without reason, as both precarious and temporary, should not be allowed to mask the true condition of the rubber plantation industry in Malaya. In the circumstances briefly recorded here a growing loss of efficiency, most marked, of course, in areas subject to the greatest disturbance, is inevitable. The immediate results are expressed in declining outputs, rapidly mounting costs and, in the worst areas, a partial cessation of productive operations. In the long term a decline in tapping care and skill and a deterioration in upkeep, particularly of replanted areas, must, if not quickly arrested, result in serious and irreparable loss.

ILL-DEVISED OFFICIAL SCHEMES

Not the least disturbing feature of the situation is the apparent lack of a realisation of the facts in official quarters. The present time is singularly ill-chosen for the advancement of schemes already outmoded and discredited and based on no intelligible economic theory. We are officially bidden to extend and accelerate replanting, at a time when the bare upkeep of existing replanted areas is very difficult owing to an inadequacy of labour and supervision. It is proposed that the control of replanting is to be taken out of the hands of private enterprise and transferred to a Government-sponsored committee financed by an enforced levy on the volume of rubber produced. On this basis the producer who has been most progressive in replanting and consequently has a high output will pay more, while the unprogressive will pay less. According to this topsy-turvy, upside down economic theory it seems that the way to encourage and accelerate replanting is to penalise those who have practised it and reward those who have not.

Rubber owned by smallholders, which is a considerable proportion of the Malayan total, has all along been the special responsibility of Government. For over 20 years replanting has been the main feature of the policy of progressive elements in private enterprise, yet over that long period it is doubtful whether smallholders, operating under Government ægis, have planted up more than 1 per cent. or 2 per cent. of their total area with high-yielding stock. In this company over 70 per cent. has been so planted, and no less than 31 per cent. in the difficult postwar years. In the face of these contrasting achievements it is hard to understand what justification there can be for the claim that replanting can be better regulated by a committee presided over by a Government official who has acquired a short nodding acquaintance with a rubber tree. In economic matters one is entitled to look to official quarters for sound leadership and enlightenment; instead we receive misguidance and confusion. An industry which has achieved so much in a trying postwar period and has made such an outstanding contribution to the balance of payments, is surely deserving of more serious and responsible treatment. Government's first duty is the establishment and maintenance of law and order. It is to the performance of that urgent and overriding task that official energies should be directed. Until the present lawless condition has been brought under control and the rapid decline in confidence arrested, plans for big-scale replanting are irresponsible irrelevancies.

POSTSCRIPT

The foregoing was written before the announcement of the murder of the High Commissioner for Malaya, Sir Henry Gurney —a tragedy which gives a deeply distressing emphasis to the opening paragraphs of this statement.

OLYMPIC PORTLAND CEMENT COMPANY, LIMITED

RECORD TRADING PROFIT

The fortieth annual ordinary general meeting of this company was held on October 16th in London.

The Hon. Gerald H. G. Williamson, the chairman, in the course of his speech, said: The profit on trading for the year ended March 31, 1951, before charging depreciation and depletion, has increased from £117,709 to £172,757, which is an all-time record for the company. Production of clinker and cement, as well as shipments of cement, exceeded all previous records with the exception of those of 1939, when the Coulee Dam was under construction. Cement shipments amounted to 784,365 barrels, compared with 647,060 barrels in 1949-50.

In spite of increased costs in both labour and materials, manufacturing costs per barrel were again reduced, the decreases being 7½ cents on standard cement and 5 cents on High Early cement. The net selling price of cement was, however, lower than a year ago and the increase in profits is mainly due to the big improvement in deliveries.

The higher profits realised attract additional taxation, and after providing for income tax at the increased standard rate of 9s. 6d. in the £, and for profits tax proportionately higher at 50 per cent. in respect of distributed profits, a total of £73,714 has been charged to profit and loss account, against £44,357 a year ago.

It is interesting to note that approximately 57 per cent. of our assessable profits is absorbed by taxation, 30 per cent. is ploughed back into the business by way of reserves or carry-forward, and 13 per cent. only is paid in dividends.

The report was adopted.

D. & W. MURRAY

MR C. J. JONES ON A SUCCESSFUL YEAR'S TRADING

The fifty-fourth annual general meeting of D. & W. Murray, Limited, was held on October 15th in London, Mr C. J. Jones (the chairman) presiding.

In the course of his speech the chairman said: At the last annual general meeting I referred to the prosperous conditions, arising mainly from higher prices for primary products. You will realise from the accounts that this satisfactory state continued throughout the year, a profit of £245,811 being disclosed, after providing for all taxation. I feel sure you will consider that the accounts may be regarded as indicative of a successful year's trading.

On numerous occasions during the past year, the attention of the public has been directed to the spectacular rise in wool prices, which followed the opening sales last year, reaching its peak in March. Since then the trend has been downward, and, at the opening sales this season, prices were down approximately 20 per cent. on last season's closing rate, but recent sales show a marked upward tendency, and although much below their all-time peak of last March prices have risen 45 per cent. to 50 per cent. above levels at the close of the September sales at Sydney.

The 1951-52 wool clip is expected to be 3,625,000 bales—about 64,000 more than the previous season, but there is a possibility that this may not be realised owing to lighter yield in some districts.

Present indications point to less favourable trading than experienced last year, although sales to date show an increase.

The report was adopted and the total distribution of 17½ per cent. was approved.

TAP AND DIE CORPORATION LIMITED

PROFIT ESTIMATE EXCEEDED

The first annual general meeting of The Tap and Die Corporation Limited, was held on October 18th in London.

Mr D. G. N. Lloyd-Lowles, the chairman, in the course of his speech said: The profits for the year under review amounted to £307,807, compared with the figure of £235,542 mentioned in the particulars advertised in June, 1950. The net profit, subject to tax, is £295,125, but this "subject" is a very large one absorbing, as it does, nearly £173,000.

In July the Chancellor of the Exchequer announced his party's intention to bring in statutory dividend limitation and it appeared that the Corporation might be precluded from paying more than 7 per cent. (as a new company) on its issued capital of £312,500.

It is by no means certain when, if ever, the White Paper will reach the Statute Book, nor in what form. Your board decided to pay the full dividend forecast, even though, should we be restricted in our future payments to you, it may entail some temporary adjustment in the rate of dividend paid.

The business is suffering, in common with most other industries, from shortages of raw material and it is only by dint of unceasing pressure on our suppliers and by the exploitation of every known source that we have been able to increase production. Owing, however, to the great importance of our products to industry, both in peace and in war, we ought not to meet with any serious hold-up in production on that account. The past year has been one of progress. The current year shows still further expansion of turnover.

The report was adopted.

REFUGE ASSURANCE COMPANY LIMITED
CHIEF OFFICE
OXFORD STREET MANCHESTER 1
THE REFUGE WILL SAFEGUARD THE FUTURE

EXECUTIVE, CHARTERED ACCOUNTANT and A.C.W.A. (43) wishes permanent post with progressive concern as joint managing director, comptroller, financial or commercial director. Experience includes commercial management, investigations and reorganisation; advisory work abroad for foreign government and American E.C.A. Mission.—Box 771.

CENTRAL OFFICE OF INFORMATION require an Industrial Correspondent in London Press Service of Overseas Press Services Division. Duties consist of gathering and editing material for daily programme of industrial and economic news items and news features for publication overseas. Essential qualifications are wide experience of journalism, sound knowledge of economic and industrial affairs and ability to develop industrial contacts and to interpret and explain trends and developments in the economic situation of United Kingdom. Post is graded Temporary Senior Information Officer. Salary, £900-£1,075 (men); and £775-£910 (women). Written applications giving date of birth and education, full details of qualifications and experience of posts held (including dates) should be addressed to Appointments Officer, Ministry of Labour and National Service, 1-6, Tavistock Square, W.C.1, quoting reference numbers J.T.84, within ten days of appearance of this advertisement. In no circumstances should original testimonials be forwarded. Only candidates selected for interview will be advised.

HIS MAJESTY'S COLONIAL SERVICE, UGANDA

Senior Assistant Registrar of Co-operative Societies required for accountancy duties in the Co-operative Department of the Government of Uganda. The post is permanent and pensionable subject to satisfactory completion of initial probationary period of two years. Salary scale £1,182 x £45—£1,320. Point of entry into scale would be determined in the light of candidate's qualifications and experience. In addition, a temporary allowance of 15 per cent of salary is payable at present; subject to a maximum of £150 per annum.

Candidates must have a University degree, preferably honours in Economics and should be between 35 and 40 years of age.

Free passages for officer and family. Generous home leave on full salary. Quarters at moderate rental are provided. Income tax at local rate which is much lower than in United Kingdom. Further particulars and application forms obtainable by writing to the Director of Recruitment (Colonial Service), Sanctuary Buildings, Great Smith Street, London, S.W.1 (quoting reference 27365/3/51).

LARGE company requires high level commercial manager take charge of administration of an expanding group of companies engaged in manufacture and distribution of products derived from animal by-products. The man required must be about 35 and be at present holding responsible post in an undertaking transforming one or more animal by-products into finished manufactures (such as gelatine, leather, woollen products, soap), and should have had experience in two or more animal by-products industries, with training in works and costing and sufficient experience administrative matters enable him guide manufacturing and commercial policy. The salary will be in the region of £2,000 to £3,000 per annum according to qualifications, with a non-contributory pension scheme. Only applicants whose experience corresponds will be considered, and they are requested to write in confidence, giving full details, to Box 776.

SPECIALISED POSTAL TUITION for UNIVERSITY, CIVIL SERVICE & PROFESSIONAL EXAMINATIONS

A Metropolitan College Modern Postal Course is the most efficient, the most economical, and the most convenient means of preparation for the General Certificate of Education examinations: B.Sc. Econ., LL.B.; and other external London University Degrees. Civil Service, Local Government and Commercial Examinations, &c.

Also expert postal tuition for Prelim. Exams. and for the professional exams. in Accountancy, Secretarship, Law, Sales Management, &c. and many intensely practical (non-exam.) courses in commercial subjects.

More than 50,000 POST-WAR EXAM. SUCCESSES.

Guarantee of Coaching until Successful. Text-book reading library. Moderate fees, payable by instalments.

ROYAL BANK OF CANADA

DIVIDEND NO. 257

NOTICE IS HEREBY GIVEN that a DIVIDEND of 2½ per cent, being at the rate of 10 per cent per annum, upon the paid-up Capital Stock of the Bank, has been declared for the three months ending November 30, 1951, and will be PAYABLE at the Bank and its branches on and after December 1, 1951, to Shareholders of record October 31, 1951.

By Order of the Board,
T. H. ATKINSON, General Manager.

October 18, 1951.

AMENDED

SENIOR SCIENTIFIC OFFICERS; SCIENTIFIC OFFICERS: The Civil Service Commissioners invite applications for permanent appointments to be filled by competitive interview during 1951. Interviews began in January and will continue throughout the year, but a closing date for the receipt of applications earlier than December, 1951, may eventually be announced. Successful candidates may be appointed immediately. The posts are in various Government Departments and cover a wide range of scientific research and development in most of the major fields of fundamental and applied science. Candidates must have obtained a university degree with first- or second-class honours in a scientific subject (including engineering) or in mathematics, or an equivalent qualification, or possess high professional attainments. Candidates for Senior Scientific Officer posts must in addition have had at least three years' post-graduate or other approved experience. Candidates for Scientific Officer posts taking their degrees in 1951 may be admitted to compete before the result of their degree examination is known.

Age Limits: For Senior Scientific Officers, at least 26 and under 31 on August 1, 1951; for Scientific Officers, at least 21 and under 28 (or under 31 for permanent members of the Experimental Officer class) on August 1, 1951. London salary scales: Senior Scientific Officers: (men) £750-£950; (women) £625-£850; Scientific Officers: (men) £400-£650; (women) £400-£525. Somewhat lower rates in provinces.

Further particulars from Civil Service Commission, Scientific Branch, Trinidad House, Old Burlington Street, London, W.1, quoting No. 3399.

ADVANCEMENT causes a vacancy for a General Sales Manager in FIBREGLASS LTD. We manufacture glass fibre products for use in the insulation field and in plastics. The products sell mainly for technical purposes and many new applications are under development.

The General Sales Manager will be responsible for leading the sales effort of the company, and a high standard of education, such as a University Degree or similar qualification, is desirable. A man between the ages of 35 and 45 is preferred.

The post covers heavy responsibilities and the work is hard. The applicant must show thorough and successful experience in general sales organisation. Residence near the headquarters of the company at St. Helens, Lancashire, will be essential. The post carries a substantial initial salary and is progressive.

The vacancy has been notified to our own staff, and a rigorous selection will be made. Those with inadequate qualifications are asked not to apply.

Address applications, with an outline of career, to M.D., c/o Fibreglass Limited, St. Helens, Lancashire.

LONDON office of large international steel concern require young man 25-30 to be trained as Technical Commercial Executive. Applicants must have had a good education and training in mechanical and constructional engineering up to B.Sc. standard. Knowledge of French and German of considerable advantage. The appointment holds wide opportunities for capable energetic person with initiative. —Applications in writing giving full particulars, to Box 775.

AUTUMN LEAVES—but nobody leaves J.V.R. 3 Star Brandy. It's much too good and saves you money too. 37s 6d. per bottle, 19s. 3d. per half-bottle.

FRANCE FOR PERFECT WINTER HOLIDAYS

Enjoy perfection in winter sports, sunshine and cuisine at famous French resorts. TRAVEL BY RAIL FOR COMFORT, ECONOMY AND PUNCTUALITY. Reduced tourist or road-rail tickets issued in advance. Couchette Sleeping accommodation (1st and 2nd class). Through registration from London (Victoria) of baggage, skis, etc.

Information and bookings from Travel Agents or
FRENCH RAILWAYS LTD., 179 Piccadilly, London, W.1

The Verdict

THESE words will be read when the result of the British general election of 1951 is known. They have to be committed to print when the poll has been declared in only a minority of constituencies. But the early results have made it virtually certain that Labour has been defeated and probable that the Conservative government will have an adequate working majority in the House of Commons. And thereby it will have, what Labour in the past seventeen months has lacked, the first qualification for success. It is free, without too much thought for electoral consequences, to do what is necessary for the solvency and security of the nation in the next four years.

The election has thus fulfilled its primary function of making firm government possible; but it remains to be seen whether it has done any more. The campaign has shown how acutely the stalemate has demoralised both parties. Whether the change will be a change for the better will now depend on how far the new Conservative ministers will be able to shake themselves loose from the false attitudes of two years of continuous electioneering and confront their tasks as a government and not as a candidacy. It should not be imputed to them for blame that they did not campaign on a precise policy worked out in detail. With the strain of the international situation so great and with renewed financial trouble in the offing, they were justified in asking in effect for a doctor's mandate. The test is whether they can produce the policy now that they are in power. It cannot consist simply of undoing some of the things that the Socialists have done. Nor can the pretence be kept up that more than half the country's troubles are the simple consequence of bad administration that can be corrected with no hurt to anyone. Now they must act, and know how to act.

Britain is immediately faced with two inter-connected crises, the crisis of solvency and the crisis of respect. Something has been heard during the election of the latter, but very little of the former. It cannot be escaped any longer; the country will have to be told that it faces a foreign exchange crisis fully as severe as any that has gone before. The remedial measures will have to be sharp; they will have to be prompt; and if they are to have a chance of being effective, they will have to be novel. The new government will have to address itself to this task at the same time that it sets about the reconstruction of British foreign policy from the humiliating mess that it has got into.

Neither of these enormous tasks can be tackled by men who start at the slightest frown of displeasure from the electorate. We must therefore pray that the new ministers will conceive it their job to be successful rather than to be popular. British political history provides many instances where courage has been rewarded, not in heaven but in the earthly coin of political advantage. Certainly it should be quite clear in the present state of the country that if ministers stand still they will be lost, and the country with them. Courage and self-confidence are not only their duty but their best political gambit. The only means of escape from much more austerity for the people is a full measure of audacity in their rulers.

Rhine or Elbe?

IN a remarkable and sinister way the politicians of Germany are once again shaping their people's destiny. It is they, not the western allies, who are arguing about how and when free Western Germany should be united with Soviet Eastern Germany. The future of western integration—indeed, of the whole North Atlantic defence strategy—depends, not on Paris or Washington, but on the struggle in Bonn between Dr Adenauer the Chancellor and Dr Schumacher the opposition leader. And the duel of will and wits across the Elbe between the Catholic Adenauer and the Communist Grotewohl may decide the future balance of political power between the Rhine and the Vistula. For if the 50 million West Germans are not clasped into partnership with free Europe before they achieve unity with the 17 million East Germans, there will be no European army, no Schuman Plan, no Council of Europe worth speaking of. There will be instead an independent Germany—a third force—at the heart of the Continent, its internal politics dominated by the Communist effort to suffocate Social Democracy and its foreign policy by the game of playing the Russians off against the Americans. Six years after victory over Hitler this is a prospect to bewilder the mind and make the heart ache.

Yet the prospect is far from certain; the Russians are still further from winning Germany for their Communist empire than they may believe. Dr Adenauer might yet win the struggle if the issues are clearly seen in London, Paris and Washington—and by the Germans themselves. At the moment the situation is critical because German opinion is bewildered and in a mood for reckless decisions. Everyone concerned wants to achieve German unity for different reasons and by different methods. The Russians want it because they calculate that unification would wreck the whole plan of allied rearmament and German contribution to Europe's defence. The East Germans want it because they believe they can in time master a united people with their monolithic party, their indoctrinated youth and the power of Moscow behind them. West Germans of all parties want it because all are patriots and because unity means to many—especially to nine million refugees from the East—a step towards the return of the lands beyond the Oder-Neisse frontier. A year ago they were in no hurry; indeed, they were afraid of unity. Now that American and British strength in Germany and the pace of western rearmament have alarmed the Russians into offering easier terms for unity, they have become confident and impatient. Bit by bit, the terms offered by the Communist Grotewohl have come closer to those laid down by Bonn itself.

It now seems that free elections throughout Germany could be held. If they were, Dr Schumacher and his Social Democrats would expect to win with the help of the Protestant and working-class vote of the East. By an irony of history, the Social Democrats are now the leaders of German nationalism, the isolationists of Europe. To strengthen themselves against Dr Adenauer's European policy they have ranged themselves unhesitatingly with the ex-servicemen, with the extremists of the Right, with the passionate discontent of the refugees from the east. Against the European army they insist on a national German army—or no army at all; they treat the Schuman Plan as a device for French domination; when Dr Adenauer speaks for a united Western Europe they denounce him as a tool of the Anglo-American victors. Against such a campaign the Christian-Democrat party and the men of Right and Centre who support Dr Adenauer are losing ground fast. They cannot oppose unity; but they want a united Germany to be free—free from the Russian shadow looming across the Polish border. They want to see it associated with, and protected by, Western Europe and America. In short they want integration first, and German unity afterwards.

What are the Americans, British and French to say in a situation that has grown up so much faster than they believed possible? They, too, cannot oppose unity, for by doing so they would make Dr Adenauer's precarious position even weaker. They have themselves insisted that they wanted free all-German elections as a way of ending the division of the country. Moreover, they have promised Germany a freer and more dignified staus in Europe which the Germans persist—quite wrongly—in believing will give them the right to do anything they like. In face of these facts the western attitude is divided and uncertain.

If everyone wants the unity of Germany, the crucial question is clearly when and how it is to be attained. Dr Schumacher's Socialists say that the Adenauer policy of integration with the West will delay unification and so increase the risks of war. They say: unity first, and—perhaps—integration with the West afterwards, but on German terms. Dr Adenauer says integration with the West first and unity afterwards—on European terms. There is a world of difference between these two attitudes. If the Americans, British and French are to check Russian designs and rescue their German policy from the collapse that threatens, it is on this question of timing that they must concentrate. If they are serious about integrating Germany with Western Europe, they must press on with the institutions that are to offer a real and useful membership. If they intend to delay unification they have to make Schumacher think again.

One way of doing this is to expose the bold and clever game that the Russians are playing. Their strategic aim is clear. It is to sabotage the whole western policy of organising political and military defence by making the Germans believe that to join in this policy will cost them their unity, the recovery of their territories and the hope of peace. The first threat has already been made. The second is, for obvious reasons, still held in reserve because for the moment Moscow can denounce the French grip on the Saar but dare not question the Russo-Polish annexations in the East. The Russian tactics are less obvious and have already deceived the majority of Germans. The plan is to get West German representatives round a table with Communist Germans to discuss terms on which free elections could be held. Once they had met it would be made clear to the assembled Germans that Moscow was ready to offer a peace treaty and the withdrawal of Russian troops—provided that American, British and French troops would leave the country, too. There is no reason for any doubt on this score. Week in and week out for years past Russian propaganda has offered the Germans "unity, peace and the withdrawal of foreign troops." For Moscow the simple and obvious way of expelling Americans and British from the marches of the Communist empire without a war is to support German nationalism; it is the method that is being tried against the British in the Middle East and Asia. Once the troops of the Atlantic Pact powers had left Germany, the Russians would reckon that economic inducements, the skill and discipline of the Communist party, and the presence of their army in Poland only forty miles from Berlin would bring a united but disarmed nation slowly but surely into the Communist sphere. The balance of power in Europe would then have swung back to where it was in 1946, when America demobilised.

To understand the Russian method and intention is to realise that the invitation to a conference of West and East Germans is nothing less than a snare for Schumacher. Dr Adenauer has seen the danger. No German could refuse the offer of a peace treaty with the Russians, still less oppose the withdrawal of foreign troops. The task before the western powers is, therefore, twofold: to work out their own terms for unity, freedom and security and, while they argue and hesitate over them, to help Dr Adenauer as he plays desperately and skilfully for time.

Perhaps the most effective assistance they can give at the moment is to make it clear to the Germans what the consequences would be to them if they decided, with Dr Schumacher, for nationalism. There is a tendency among the Germans to assume that they can have the benefits of association with the western powers regardless of what they do themselves. It is true that the Allies have only themselves to blame if this impression has been given. They have taken so little pains to conceal the strength and urgency of their desire to do a deal with Western Germany that they have seemed to be soliciting as a favour what is really a bargain highly favourable to Germany, and it has not been made clear that the one side of the bargain depends on the other. The Germans have heard a great deal about the advantages to them of co-operation with the West, but very little about the disadvantages to them of a refusal.

This should now be corrected. It is for the Germans themselves to decide whether they will negotiate with Grotewohl and on what terms; the time has passed when the occupying powers can impose that decision. But there still are two very important points on which the decision still rests wholly in the hands of the Americans, the British and the French. One of these is when their troops of occupation shall be withdrawn; and it needs to be made very clear that they will in no circumstances whatever be withdrawn so long as the present international tension continues. If the Russians offer to withdraw their troops, well and good; they have less than a hundred miles to go. The troops of Nato will stay. And if Germans ask why, the answer is that the peace of Europe depends on Americans and Russians facing each other at its heart, on opposite sides of the Elbe. To leave a vacuum between the Elbe and Rhine is to invite another miscalculation by the Kremlin.

The second decision that the western occupying powers will keep in their own hands is whether their occupying troops are to regard Western Germany as the territory of a friendly ally or of a potentially hostile and expendable people, as land to be defended or as no-man's land. If Germans will not co-operate in the defence of Western Europe, then their land can be regarded in war as nothing more than a forward position to cover the defence and mobilisation of the nations of the North Atlantic Treaty. And if they refuse to associate themselves with the institutions of an integrated Europe, they need expect none of the economic and political benefits of membership. Germans will call this brutal reasoning; but it is nothing more than a statement of the facts. It is the European Dr Adenauer, not the nationalist Dr Schumacher, who is the realist.

We repeat what was said in these columns six weeks ago. If there is any common sense left in Western Germany, a bargain can still be struck. And the Allies, since they are seeking something of value to themselves, must be prepared to pay a price. They must be willing to take risks in withdrawing the restraints on German sovereignty in advance of the German *quid pro quo*—but only if they have good reason to believe that the *quid pro quo* will be forthcoming. Whatever the German decision—and it depends largely on Dr Schumacher—the allied troops will not leave. If the German decision is for partnership with the West, those troops will defend Germany as part of Europe; if it is for isolation they will be compelled to regard it as nothing more than a *glacis*.

A Free Man

After two or three false rumours the Madrid was signalled at Southampton about two o'clock on Thursday, and a crowd of people of all classes rushed down to the pier and the docks to greet Kossuth. Wearing his insignia of office, the Mayor went instantly on board, and found the long-expected hero, his wife and children safe and well. Taking the hands of the gentlemen introduced to him by the Mayor in both his own, Kossuth exclaimed, "Ah, *now* I feel I am free. I am free when I touch your soil." . . . As the vessel entered the dock, the crowds at the pier heads cheered loudly, and M. Kossuth, with uncovered head, bowed in acknowledgment. There were, perhaps, 800 or 1,000 persons stationed at these points; but opposite the mooring-ground of the Madrid, some 2,000 or 3,000 persons were collected, foremost amongst whom were the refugees. . . The enthusiasm on shore as the Madrid came alongside, and the exiles beheld Kossuth, was tremendous, and in their anxiety they nearly pushed each other into the water. At length he landed, and preceded by a band of music, the American and English ensigns waving in front, mingled with the Hungarian colours, was driven in the Mayor's carriage to his house. The bells rang, the crowd cheered, Kossuth bareheaded stood bowing at the back of the carriage. On reaching the house of the Mayor, Kossuth appeared at the balcony, and spoke as follows:—"I beg you will excuse my bad English. Seven weeks back I was a prisoner in Kiutayah, in Asia Minor. Now I am a free man. (Cheers.) I am a free man because glorious England chose it. (Cheers.) That England chose it, which the genius of mankind selected for the resting monument of its greatness, and the spirit of freedom for his happy home. May England be ever great, glorious, and free!—(Cheers)—but let me hope, by the blessing of Almighty God, and by your own steady perseverance, and by your own generous aid, that England, though she may ever remain the most glorious spot on earth, will not remain for ever the only one where freedom dwells." . . . The cheering lasted several minutes. "Three groans" were given for the Austrian tyrant; and afterwards the Mayor, giving a sketch of its history, presented to Kossuth a flag worked by some Hungarians in New York.

Lords and Universities

AN article in last week's issue of *The Economist* discussed some of the questions that would arise in the distribution of offices among the members of a Conservative government. It was necessarily based on the hypothesis that there would be such a government when the general election was over, though it was made clear that the hypothesis was not being treated as a safe assumption. The present article is, in a sense, a continuation of the first, in that it discusses two more constitutional points that will arise if there is a change of government, and it is subject to the same qualification. If, by the time these words are in print, it is clear that there is no change of government, then the article is pointless. But if there is to be a change, then these constitutional matters may perhaps gain by being discussed in the calm limbo of a preliminary hypothesis.

The Conservatives are pledged to restore the university vote. Their manifesto says—

> We shall restore the University constituencies, which have been disfranchised contrary to the agreement reached by all three Parties during the war.

The wording is important. It is the constituencies, not merely the university graduates' second vote, which are to be restored. And the reason for doing so is a desire to adhere to the tradition of recent years that changes in the franchise are made only with the consent of all major parties. If this doctrine is adhered to, it follows that everything connected with the university vote and constituencies must be put back to exactly the state that existed before the Representation of the People Act, 1948, since any change would be in breach of the doctrine.

Nevertheless, it will be a great pity if the door is considered to be closed against the discussion of possible variations in the university vote, and if a Conservative government were to put forward proposals for amendment, within the framework of a decision to restore some sort of university vote, it is not inconceivable that the other parties would agree to them. This is the justification for the discussion that follows.

The university vote, as it existed before the Act of 1948, suffered from two defects, even in the eyes of some of those who most firmly defend the principle of a separate vote for graduates. In the first place, it gives the university graduate a second vote, additional to his residential vote ; many people think this is undemocratic. In effect, it more than doubles his electoral weight, since the university vote is a more valuable vote than an ordinary one ; at the election of 1945 the total of votes cast divided by the number of members elected gave a quotient of less than 10,000, while in the other constituencies the figure was 40,000. It is at least worth considering whether the university vote should not be alternative to the residential one, those graduates who choose to be placed on the university register losing their residential vote. The disadvantage of this would be that it would make the university constituencies even smaller than they are ; it is therefore closely connected with the suggestion made in the next paragraph. An alternative way of meeting the same point would be to deprive the university members of their right to vote in divisions in the House of Commons. Members entitled to sit but not to vote are known in the legislatures of other countries and there is nothing impossible about the suggestion for application in this country ; but it is a little difficult to imagine the House taking kindly to the idea.

The second objection to university representation as it was is that the constituencies were too small. They were too small in the sense of electors on the register or votes cast—the seven constituencies, with 12 seats, had a total register in 1945 of 217,755 and 115,847 votes were cast. As a result, several of them tended to be almost pocket boroughs. It is true that, in recent years, this was becoming much less true. The Act of 1918 extended the franchise, in effect, to all persons graduating thereafter, and the gradual swelling of the registers in the following years was undermining the power of the resident caucuses and beginning to return independents of real eminence and distinction. Sir Alan Herbert and Sir Arthur Salter broke the caucus at Oxford, and if at Cambridge the caucus was never defeated, it was because in 1945 it wisely chose to contest only one of the two seats. Some of the others had hardly reached the stage of emancipation. Furthermore, the constituencies were too small for the system of proportional representation to work properly, since only two of them had three members and two more had two members each. Proportional representation is the ideal system for a special, additional academic franchise. The objections to it as a system for electing a whole parliament became arguments in its favour when applied to the university constituencies, where the desire surely is to secure representation for independents, special views and minorities rather than additional members for the major parties.

The suggestion may therefore be made that, if university members are to be restored to the House of Commons, they should represent not seven separate constituencies but one nation-wide university constituency returning twelve members by the system of the single transferable vote, so that any candidate who could secure the votes of one-twelfth of the university graduates of the country could make his voice heard in Parliament. As a very tentative additional suggestion, it might be thought reasonable to add to the register any person holding, as a result of examination, a recognised qualification from one of the chartered professional institutions—though the difficulties of definition would obviously be great, even if the principle were accepted.

*

The Conservative manifesto also proposes to call "an all-party conference to consider proposals for the reform of the House of Lords." One might answer "but will they come when you do call for them ?" Labour's attitude towards the House of Lords is likely to be more root-and-branch in opposition than it was in office and there is likely to be a retreat from the proposals which so nearly secured agreement in 1948. It will be remembered that the Parliament Act of 1911 gave the Lords the power to delay a Bill passed by the Commons for two years dating from the time that it first received its second reading in the Commons. The Labour Government's Parliament Bill of 1947 proposed to change this period of delay to one year. In a three-party conference, the Labour party were willing to extend the period to nine months from the *third* reading in the Commons, and the Conservatives to shorten it to twelve months, also dating from the third reading. But on this difference of three months (which has more importance than might appear) the conference broke down and the government pushed their Bill through ; it is now the Parliament Act of 1949. The Labour party having, after the breakdown of the conference, stood upon their original proposals, it would not be unfair of the Conservatives to repeal the Act of 1949 and revert to the two-year delay under the original Act.

More significant than the three-month divergence over the delaying power was that the conference agreed both on the other powers of the House of Lords (namely, that they should neither be extended nor reduced) and, in principle, on its composition. The agreed proposal was that a certain number of persons should be nominated by the Crown to be members of the House of Lords ; that they should include some hereditary peers, but that possession of a hereditary title should not by itself confer a right to a seat ; that the other persons nominated should be created life peers ; and that all hereditary peers not nominated to the House of Lords should be enabled to vote for, and stand for election to, the House of Commons.

Any fresh proposals for the reform of the House of Lords must at least start from this basis of agreement. Many people, however, will think that they did not go far enough in departing from the hereditary principle. The ideal for the House of Lords is that it should be a sort of moving average of the whole people, faithfully mirroring public opinion, but after a certain delay. The delay can be secured by nominating a House for life and leaving it to the Crown—that is, the government of the day—to fill up vacancies. But the faithful mirror cannot be secured so long as every member of the House of Lords is required to take a title, even if only for life. There are many excellent potential members of the second chamber, especially in the Labour party, who would be debarred by this provision.

Is it not possible to make a complete separation between the peerage and the House of Lords ? It should be no more difficult for Mr Smith to be a Lord of Parliament than to be a Lord of the Treasury or a Lord of the Admiralty. The peerage would then be left as a purely honorific body, whose members would be neither more nor less eligible to be nominated to one House or elected to the other than commoners. On the first occasion after such a reform of the House of Lords, the Crown should be moved to appoint, for life, nominees of the various parties in proportion to the popular vote accorded to them at, say, the last two general elections in combination. Thereafter, ordinary vacancies would be filled up, as they occurred, on the recommendation of the government of the day. It might be considered advisable, in addition to the royal princes, the bishops and the law lords to have a small number of members nominated for the life of one Parliament only, in order to enable the government of the day to find seats for Ministers.

If such a reform of the House of Lords were carried through, it might, finally, open the way to a solution of the problem of university representation to which the Labour party itself might possibly agree—namely that the university members should sit in the House of Lords.

Lancashire faces Japan

PRESENT evidence points to serious trouble for the Lancashire textile industry in two or three years' time. By then, if the current trends of Japanese recovery from the war continue without any counterpoise, competition from Japan will be so severe that Britain's export trade in textiles must decline, with all the crippling consequences to the nation's economy that that would entail. It is true that Lancashire's doom has been predicted often enough in the past five years, and that even so, at least until two or three months ago, there was no real sign of a break in the flow of postwar trade. But today there is a new factor in the situation—the signature of the Japanese peace treaty. Coming at this stage in the reconstruction of the Japanese textile industry and in the gradual balancing of world demand with world production, the regaining of independence by the Japanese is likely to bring about a crucial phase of competition within from two to three years from now.

In an article last week the immediate problem of reparations was dealt with, and two questions were posed for the future—what in fact may be some of the developments in Japanese trade and what might be done to meet the competition which they represent. The answers to these questions are certainly not as immediate a problem as that of reparations, but they will become more and more urgent during the next few months. In tackling them, moreover, two powerful facts will have to be borne very carefully in mind. First, there is an even greater difference between Japanese and British production costs today than there was before the war ; the difference is probably over three times as great, and British costs are certainly much more rigid than Japanese. Secondly, on the other hand, no workable answer to Japanese competition can be found on purely restrictive lines—the world does not owe Lancashire a living.

There are several reasons why Japanese textile competition has not yet been severe and in them may be found the seeds of the trouble which is brewing for the future. Apart from the sellers' market—which in any case must be adjudged a temporary factor—the main reason has been a co-operative attitude on the part of the Japanese themselves. It is true that there was alarm in Lancashire when the Japanese succeeded in June, 1950, in getting the American occupation authorities to remove the limit on capacity, which had been set at four million spindles, but from a national point of view their action was perfectly understandable, particularly in view of their possession before the war of nearly three times that number of spindles. In general, co-operation has so far been a matter of Japanese government policy in order to curry favour with the victors and to work Japanese passage towards a peace treaty and independence. This attitude cannot, however, be expected to continue for long after the peace treaty is ratified or once Japan has become an accepted member of the international community. The Japanese will then have much to gain and little to lose from an all-out trade drive.

Japanese manufacturers have so far acted in line with their government's policy, partly because the Japanese are a disciplined people and partly because it suited the

manufacturers to do so. They were, and are, making very substantial profits by selling at prices which are based more on Lancashire's production costs than on their own. Home and export demand has readily consumed the relatively limited output available; in the second quarter of this year Japan spun only 184.9 million pounds of cotton compared with a quarterly average of 269.8 million in 1939 and produced, in the first quarter, only 461.9 million square yards of cotton piece goods compared with a quarterly average of 1,198.5 million in 1937 (the last year for which comparable figures are available). With Japanese production still low but profits high, there is an enormous incentive to invest in the industry. It is only a matter of time—about three years at the present rate—before Japanese textile capacity is sufficient to enable Japan not only to catch up on home demand—for a larger population than before the war—but to break export records as well and actually to ship abroad more than Britain does.

Two other reasons for the lack of competition so far have lain in the structure of the British and Japanese textile industries, and in the retailing of Japanese exports by the same merchants who handle Lancashire's. Thus Britain bought 177 million square yards of Japanese grey cloth for further processing in 1949, 91 million last year and 57.5 million in the first eight months of this year. This is because it does not pay to produce low-earning cloths here and because, while the output of British weavers has fallen to only a little more than half the 1937 level, the printing and dying industries have maintained their prewar capacity, so that they are now just beginning to top their 1937 output figures. However, as the Japanese also develop their own finishing industries, they will have less grey cloth to feed to this part of the trade in Britain, except at prices which will prevent the finished British product competing with direct shipments of finished goods from Japan. On the merchanting side equally, the sands will be running out as Japanese export houses and consuls once again take over more of Japan's own overseas representation.

*

All this adds up to a formidable flood of competition. Obviously, to meet it, the British textile industry can afford neither to stand still itself nor to fail to press for any measure of help that it can obtain from the government in terms of Britain's foreign commercial policy. In both respects, nevertheless, there are considerable difficulties. It is certainly no longer easy to keep ahead of the Japanese in the technical aspects of either production or marketing. And the government is always bound to consider the many objections to any policy designed solely to safeguard Lancashire's, and so Britain's, standard of living at the expense of the underdeveloped territories which need cheap Japanese goods. For, whether successful or not, such a policy would be bound to clash with America on the issue of fighting Communism, would be inconsistent with Britain's own efforts to raise living standards in south-east Asia and Africa, and would invite retaliation against other British exports.

In these circumstances, any proposed measures to deal with the situation must be qualified in scope and moderate in execution. This does not, however, make it unreasonable to assess the means whereby Britain could and should in principle seek to maintain a world market for the products of the great textile industry which has been built up in Lancashire over several generations. Indeed, the first line of attack on the problem is already being pursued. Whatever the Japanese government may decide to do and whatever the long-term dangers, it is a British as well as a Japanese interest in the short-term that Japanese manufacturers should be persuaded to continue to sell at world market prices as established by the turnover in European and American goods. They are certainly in no position at the moment to supply even the markets of south-east Asia with a flood of cheap textiles; it would in fact be unfortunate if they were, in so far as this would enable them to buy up all the rice exports of the area. By reducing the already modest available supplies, this might produce a shortage of food in south-east Asia which would play into Communist hands and more than offset the favourable effects of better supplies of other goods. It is easy to exaggerate this kind of argument in either direction, but its existence at all implies that even in these days Japan's sudden entry into a particular market could do as much harm as good.

Again, in dealing with Commonwealth, colonial and possibly other governments, Britain might well be justified in making a bilateral approach. As some measure of defence against the eventual invasion of Japanese goods, the argument might be used that, if Britain buys the products of countries such as Australia at prices which are based on labour's "western" standards of living, there is a case for asking them to sign a long-term contract to buy from Britain. Where Lancashire's case falls down, of course, is in the relative inability to supply some lines not only at the prices but in the quantities required. As Sir Raymond Streat emphasised to the Cotton Board last week, Lancashire's problem in meeting competition is partly "to raise our production high enough to make sense of a progressive export and home trade policy."

It would be idle to build much hope on such things as the clauses in the peace treaty whereby Japan surrenders its rights under the Congo Basin treaties; by regaining most-favoured-nation treatment through GATT and as a result of individual trade agreements, it is only a matter of time before Japan makes good this kind of discrimination. In the last resort, Britain's main defence against the Japanese textile competition which is certainly coming is to concentrate as much as possible on the finer products where the skill of Lancashire labour puts it at the least disadvantage to Japan. It can also improve its own competitive capacity by superior marketing methods and by scientific progress. None of this will be easy. Much has been done in the past to offset differences in price by building up goodwill in British trade names—so much so that the Japanese have attempted to copy particular brands. If, however, this is to continue, there is a case for keeping to the system of resale price maintenance on the home market. Again, this will run counter to current trends towards liberalisation, and, if an exception is to be made for certain kinds of textiles, Lancashire will have to be moderate and realistic as well as insistent in its demands.

Lastly, Britain can and must maintain part of its position by the sheer merit of scientific progress. Lancashire is still ahead of Japan but by no means as far ahead as it used to be. Moreover, the Japanese have turned to copying from the most modern American processes and the quality of some of their products already beats the British. If competition from Japan is to be met, the need is for a sensible partnership between London and Manchester.

NOTES OF THE WEEK

Deadlock in Egypt

Politically the situation in Egypt shows no improvement; militarily it is better than might have been expected. Though excitement is still high in Cairo, the government has made genuine and successful efforts to keep order; and in the Canal Zone the picture of relations between Egyptians and British is far from uniform. Between the two armies relations remain friendly and the area can hardly be described as being in a state of siege. Indeed, at the time of writing, reports reaching London show that the Egyptian police have co-operated well with the military authorities. If there is trouble to come, it will be from intimidation tactics by the "Commandos" of the Moslem Brotherhood and from the new liberation militia that is said to be forming in the Cairo area.

Where there is friendliness and order the British should take pains to cultivate it, for the temperature of feeling is still lower outside than in the Egyptian capital. There is every reason to believe that what has been said by the Americans and done by the British has given Nahas Pasha and his advisers second thoughts; though how and when they will be translated into action remains to be seen. At the moment there is deadlock and the basis for negotiation still does not exist. Even if it did, election week is not a time when British policy can be expected to function effectively.

It cannot be emphasised often enough that the British aim is to reach an agreed policy for the defence of the Middle East, not to stage a trial of strength with Arab nationalism. The military purpose is to stay in the Canal Zone until an agreed—if necessary an international—solution is found. Interference in Egypt's civil affairs beyond what is necessary for strictly defensive purposes would merely make it more difficult to convince Cairo and other Arab capitals that British aims are thus limited. It would also be most unwise to encourage any talk of passing tankers through to Haifa in the name of the Security Council or the international company. The Arabs of Iraq and Saudi Arabia would be at once enraged by the thought of their oil going to Israel and would be convinced that Anglo-American policy was using the dispute to advance the cause of Israel. And that would be the end of any hopes of a defence agreement. If Mr Eden is in the Foreign Office next week, it is precisely this possibility that will worry Cairo, in view of what has been said in the past by the Conservatives in the House of Commons.

* * *

Moscow and Washington

Full texts of the exchanges between Mr Vyshinsky and the American Ambassador to Moscow earlier this month confirm the impression briefly stated in these columns last week. The Soviet Foreign Minister, while offering no hope of assistance in stopping the fighting in Korea, said that his country

> agrees to examine with the participation of the Government of the United States all important and unsettled questions and to discuss measures for the improvement of international relations including relations between the Soviet Union and the United States.

On what basis this would be possible is made clear in earlier parts of Mr Vyshinsky's statement. On Germany, on control of atomic weapons, on Japan, on "a five power pact of peace" he lays down the full demands of the Communist peace campaign. But it is most unlikely that he expects any American—or for that matter European—government to accept them. Why then does he put the price so high? Surely because he expects the Americans and their partners, if they wish to negotiate seriously and in secret, to set a high price too. It must seem inconceivable to Moscow that there could be any serious negotiation with the West unless it demanded impressive changes in the present favourable position of the Soviet Union. Being in the position of "haves" the Russians expect their rivals to talk like "have-nots." When they refuse to do so the Russians become suspicious. They read that the West will negotiate from strength, and they see that the strength is growing. They naturally assume that when the West feels strong enough to negotiate it will make demands. They want to know what they are.

Mr Vyshinsky scored a legitimate point when he complained of Mr Truman's statement that agreements with the Soviet Union are not worth the paper they are written on. The accusation is true enough in some cases but untrue in others; but to make it at a time when there is talk of negotiation is silly. Much time and patience will be needed before Moscow and Washington find common ground and a manner of talking that each understands clearly.

* * *

Prospects at Panmunjom

The fact that cease-fire talks in Korea are being resumed after an interval of over two months is in itself to be welcomed; so is the fact that the Communists have at last agreed that the meetings shall take place at Panmunjom, which is to be policed by both parties, instead of at Kaesong, where the Communists exploited their control of the area both for propaganda purposes and for the staging of "incidents" most of which the United Nations could not verify. But the move to a more satisfactory site has not been accompanied by any corresponding improvement in the mood of the Chinese and North Koreans. Two of their generals have, indeed, been removed from their truce team, but there is no evidence as yet that this indicates a shift of policy. On the contrary, Mao Tse-tung's speech on Tuesday was a trenchant restatement of the Peking Government's unconciliatory attitude to the Korean question.

This was the first public statement that the Chinese Communist leader had made about the Korean war since he threw his armies into it a year ago; and it was the more significant for being made to the national committee of the Chinese People's Political Consultative Conference, the nearest thing to a Supreme Soviet in Communist China, which meets but rarely and has the primary function of creating popular support for the policies announced by the regime. On this occasion Mao made it clear that the main task of the meeting was to mobilise the Chinese people to continue, and indeed to "strengthen," the struggle in Korea, in particular by increasing production and practising "rigid economy in support of the Chinese volunteers."

The meeting duly obliged by passing a resolution on these lines, in which special emphasis was placed on the collecting of more funds for the purchase of aircraft, tanks and guns. Meanwhile there is no sign of any ebb in the flow of hate-propaganda against America and its allies in the Korean war which the Chinese and North Korean press and radio are emitting daily; and the United Nations negotiators must have found little comfort in Mr Vyshinsky's recent statement to the US Ambassador in Moscow that the USSR could do little to influence the course of the truce talks, since it was no party to them. It is now reported that the new negotiation area in Korea is to be encircled by brightly coloured balloons; they are to be interpreted merely as warnings to aircraft, and not as any indication that the talks are being resumed in a spirit of optimism.

The Coy Election

If the 1950 election was, as Mr Churchill said "demure," this week's election must surely be characterised as coy. Both sides were essentially on the defensive ; they were unwilling to score points against their opponents lest they should thereby be trapped into implying something positive about their own policies. Even on the point that was pressed most vigorously, the supposedly more responsible of the Labour leaders contrived to insinuate that the Tories are warmongers while denying that they were saying so. Some other Labour propagandists were less inhibited in what will surely be remembered as one of the most dishonest and damaging acts of mud-slinging ever performed by the government party in a British election. Such propaganda, whether effective or not, certainly made no contact with realities. Yet it did more than anything else to give life to the campaign. It may not have won Labour many votes, but it stirred up Labour's supporters to greater efforts to match the better-oiled machine of its rivals. There could be no sadder commentary on the state of feeling, and the lack of ideas, inside the Labour party.

As a struggle between party machines, the election was more intense than ever. The only innovation in methods was the use of television ; since that notable battle of graphs and charm left both sides with the illusion of victory, it will undoubtedly encourage wider experiments in political television which may radically affect the conduct of future elections. But this time it hardly disturbed the traditional rituals of a campaign carried out more efficiently than ever by the major party machines. On the organisational side, the most notable development was the greatly increased attention to the postal vote ; the lead given in this direction in 1950 by a considerable number of Conservative agents has been widely followed on both sides. As a result the postal vote more than doubled and it seems probable that the Conservatives secured an even greater majority among these electors than they did in 1950.

*

The only other major change in the local conduct of the campaign stemmed from the pressure of greatly increased costs on a budget fixed by law. Fewer leaflets were distributed and the number of posters was cut ; the visible evidence that an election was in progress was very small. But the appearance was deceptive. In fact the parties were fighting with more vigour than before. The proportion of the electorate canvassed seems generally to have been considerably larger than it was last year, thanks to the better weather and the increased number of volunteer workers. Meetings were as numerous as ever and better attended. In general they were very quiet. Heckling appears to be in most parts of the country a dying art. Most audiences had little patience with interruptions, and there was certainly no decline in the public interest and earnestness shown last year.

Many candidates seem to have tried honourably, though generally unsuccessfully, to respond to the mood of their hearers by saying something serious about the balance of payments and even occasionally about its relation to inflation. But they soon slipped off into more well-worn political themes. The question "Can the Tories be trusted with guns ? " was answered with dignity and effect by Mr Churchill and Mr Eden, but at the local level in the constituencies it was more often met by the counter-question, "Can the Labour party be trusted with Bevan ? " The Conservatives hit hardest and evoked most response on the cost-of-living issue, but even there the real argument was slight. Essentially, the campaign can perhaps best be said to have consisted of five sets of rival assertions: on the one hand "the good old days," or on the other hand "the good new days" ; "the sinister Bevanites" or "the warmongering Tories" ; "the extravagance of bureaucracy" or "the benefits of the welfare state" ; "the high cost of living here" or "the high cost of living abroad" ; "the betrayal of Abadan" or "the preservation of British lives." It remains to be seen what contribution all this has made to future policy.

* * *

Educating the Masters

The election campaign ran true to form to the end. Its most marked characteristic was the way in which both the contenders for power pitched their appeals in a key well below the mental level of the electorate. They did not so much talk down to their audiences, as talk below them. The classic examples of this process were provided by parts of the broadcasts of Mr Morrison and Dr Charles Hill. But in some form the process extended to most levels of the election campaign. This, more than any other fact, explains the apparent quietness of the election. Two years of electioneering had made people familiar enough with the old arguments. They were quiet because they simply did not get from the politicians what they had come to want—some clear thinking and real guidance for the days ahead. The people of this country are certainly not well aware of what is wrong with their affairs today ; but they are well aware that something is wrong. During the past four weeks they gathered in the chilly school halls or round their wireless sets in the hope of hearing someone propound an answer. But now it is all said and done the answers have been woefully lacking. Again and again the earnest seeker after truth has been put off with abuse of the other side or a discussion of problems long since past.

It seems that the politicians and the party organisers, caught up in their own party battles and tied to their own traditional methods, are largely unaware of the wide process of education in public affairs which has been so active in this country during the past twelve years, and which now calls for a new and more intelligent approach to the electorate. This process has been effected partly by the BBC, whose educational and current affairs talks have exercised a steadily increasing influence. (To take only one example, the morning news commentaries for schools have a considerable adult eavesdropping audience.) Army education helped, and for all its shortcomings part of the press has done much to get the facts to the public despite the shortage of newsprint. If the politicians wanted a sign close at hand they had it in the increased circulation of Hansard, now five times its prewar size, as well as of other papers and journals. Above all, the facts themselves have provided a constant spur to public attention.

This education has not given the country the right answers to the questions, but it has certainly put the questions into the public mind. The politicians' lamentable failure to help it towards the answers will long be remembered as the hallmark of this election. The Tories failed because they feared that they might check the swing of the pendulum in their direction, that by saying too much they might lose power or tie their hands once they got it. Labour failed because it simply has not thought out its policies for the future. The electorate may well say of the politicians, as Robert Lowe in 1870 said of the electorate, "we must educate our masters."

* * *

The Final Arithmetic

The public opinion polls have attracted more attention than ever during this election campaign. The steady reduction in the lead they have predicted for the Conservatives has stimulated a horse-racing interest. Many people will want to know just how true the estimates were in the end. Of the two best-known polls, that published by the *Daily Express* showed this week a dramatic reduction in the Conservative lead, from 7½ per cent to 4 per cent of the poll. The last estimate made by the British Institute of Public Opinion, and published by the *News Chronicle*, gave the Conservatives 49½ per cent of the poll, Labour 47 per cent, the Liberals 3 per cent, and others ½ per cent. Since the previous week the gap had narrowed once more, but by only a further ½ per cent. Compared with the 1950 election results, this estimate implied that there would be a direct swing of about 2½ per cent from Labour to the Conservatives or, alternatively, a somewhat smaller direct swing plus some net gain of ex-Liberal votes in those constituencies where there was no Liberal candidate this year. The poll forecast for the Liberals was raised from 2½ per cent last week to 3 per cent ; this implied that Liberal support would be approximately unchanged in those constituencies where there was again a candidate.

Methods of trying to forecast the election results have been discussed in *The Economist* in the past two weeks. By those methods, the final poll published in the *News Chronicle* indicated a Conservative majority over Labour of about 70 seats. The calculation depended, of course, mainly on the reliability of the public opinion poll, but also on the degree of uniformity of behaviour in the different constituencies. But for those who enjoy post-mortems it should be recorded.

* * *

Security Council Scuttle

A helpless lethargy has descended on the protagonists in the Anglo-Persian dispute. Dr Mossadegh has neither won nor lost his contention that the Security Council had no business to interfere. London and Washington have successfully scuttled away from the threat of a Russian veto. The refinery is still idle and nobody but the Americans is showing any active desire to get it going again—and even they are reduced to doing little more than running to and fro between the disputants (they hardly qualify to be called interested parties any more) with cries of distress and anxiety. The only signs of activity come from the Russians, who have persuaded Teheran to resume trade and financial talks, signed an agreement to supply 6,000 tons of sugar (cut off by the British) and have given a promise to supply a further 26,000 tons under their existing barter agreement with the Persians.

If nothing has happened to change the outlook in Abadan, something grave has happened to the United Nations. This was the first and vital trial of the authority of the International Court ; and it was the first major dispute that had been brought to the Security Council since Mr Acheson's plan to remove the stifling effect of the veto. But, far from drawing courage from the Acheson plan, the Council not only failed to rise to the occasion ; it failed to rise at all. It just sat in its seat, wished it was anywhere but where it was, and scolded the British for having put it in that predicament.

*

No one can deny that Mr Morrison's timing was a gross and clumsy blunder ; he was asking the Council to prevent what was already a *fait accompli*. Yet the British deserve some credit for going to the Security Council because they, with fifty-three other nations, at San Francisco, had agreed that that was the right way to settle disputes which could not be settled through diplomatic negotiation. They and the world must conclude from the performance in New York that the Security Council is not more but less able to resolve international differences than national diplomats working through traditional channels.

What went wrong ? This time it is no good pretending that the Security Council is potentially a fine instrument, rendered useless only by the existence of the veto. It was not the veto, or even the threat of the veto, that produced the mental paralysis in the council room. It would have been just the same if there had been no power to veto ; for what people really feared was the psychological effect of an adverse Russian vote. If the members of the Council had believed in the rule of international law and the authority of the International Court, they would have been bound to feel that the value of upholding these institutions outweighed any local effects in Persia. But they did not believe this ; and the most disturbing thing of all is that the countries whose faith was weakest and who led this second "scuttle" were the young countries and the small countries who would have gained most from a firm stand.

* * *

Loyalties in the Sudan

The dust stirred up in the Sudan by Nahas Pasha's denunciation of the Anglo-Egyptian condominium shows little sign of settling. In the past week an already complex situation has been further complicated by the Sudanese themselves. Three sets of proposals for the country's future are now in the field. Nahas Pasha demands for Egypt a dominant voice in Sudanese affairs ; Britain, while maintaining that the Sudanese themselves must soon choose between full independence and association with Egypt, suggests that until they are ready to do so their political progress should be watched over by an international commission ; and now the Sudan Constitutional Commission, a body created by the Governor-General to represent the views of all Sudanese parties, has proposed that a United Nations commission should actually assume sovereignty over the country for about two years, during which time the Sudanese would work out their own constitution.

The superficial similarity between the British proposals and those of the Constitutional Commission is not enough to make it easy to find a compromise between them. The membership of the proposed international commission is a crucial problem. In the British view the members should include Britain, Egypt and the United States ; but the Umma (Independence) Party, which is the most powerful force in the Constitutional Commission, has already declared that it would prefer the Sudan to be supervised by such "neutral" states as Sweden and India. Moreover, the problem is not merely one of reconciling the views of Britain and of the Constitutional Commission. Unfortunately the Ashigga Party, and other groups which favour union with Egypt, have boycotted this Commission, so that its proposals do not represent the opinions of all Sudanese.

There are, however, signs that Nahas Pasha's intransigence is losing him allies in the Sudan. Between the Ashigga Party and the other pro-Egyptian groups differences have emerged as to the extent to which Egypt should be allowed to interfere in Sudanese affairs. The most striking of these developments was last week's declaration of support for the Governor-General by Sir Ali El Mirghani, one of Umma's most bitter opponents, whose influence dominates the Gabha El Watania, an important party hitherto sympathetic to Egypt. If the Egyptian Government does not modify its demands, it may find, when the dust clears, that the extremist Ashigga Party is the only friend left to it in the Sudan.

* * * *

France Confused

It is more than the French franc that is now in danger. The seriousness of the economic situation in France can hardly be exaggerated and it has reached a point where it threatens to hold up the development of the western partnership. The prospect that during the next few weeks the French will once again be in the throes of a government crisis, the causes of which are described by our Paris Correspondent on page 985, is particularly alarming. These are crucial months in the cold war, in the Middle East and above all in the particular arena of Germany ; and the time has come when the western peoples, including the French

themselves, simply cannot afford any longer to see their interests sacrificed to the frustrations of government in Paris.

Beneath the rising price indices and the collapsing political alliances in Paris lies the fundamental proposition that France, in its present mood and in its state of incomplete recovery from the war, is finding itself unable to face the burden of rearmament. That burden is so far slight compared with the load already pressing on the British economy; but it would be unrealistic simply to dismiss the thought that, if Western Europe can be thrown into its present confusion by the very first steps towards rearmament, the Russians could yet win a major victory in the cold war merely by keeping up the threat of force and without firing a shot.

*

The French Assembly meets again on November 6th, only four months since a new parliament met after the general elections. But already people are talking of either fresh elections—which, even if constitutionally feasible, would mean again running the gauntlet of the Communists' vote in the country—or of seeing General de Gaulle come to power with the parliamentary backing of M. Paul Reynaud's conservative group and of half the Radicals. The general himself is said to be confident of getting in by the spring at the latest. So long as no one feels sufficiently interested to see that the Third Force—and an able Finance Minister like M. René Mayer—gets a chance to succeed, the now apparently inevitable swing to the right can offer neither political nor economic satisfaction to the main bulk of the people of France. By his speech at Marseilles last week, M. Pleven has again shown that he could give his countrymen a positive lead if they would only trust and support him long enough and thoroughly enough to make results possible. Unless he, or someone like him, can soon change the tone of its political life, France will become in every respect a difficult partner and an unpredictable ally.

* * *

The Irish Gap

The report of the Central Bank of Ireland, published this week, helps to clarify the controversy about the balance of payments that has broken on the Irish public in recent weeks. The Irish trade balance has always been adverse but it has been compensated by large earnings on invisible account, from tourist expenditure, investments abroad (chiefly in the United Kingdom) and remittances from emigrants. In recent years, however, the balance has become more erratic. The deficit in the balance of payments was £30 million in 1947, £20 million in 1948, and £10 million in 1949. This progressive improvement has not been maintained. In 1950 there was a visible import surplus of £87 million, reduced by invisible earnings to a payments deficit of £30 million. This year the gap has opened still wider. Trade returns for the first nine months of the year show an import surplus of about £97 million, and there is no reason to expect invisible earnings for the twelve months to exceed £55 million to £60 million.

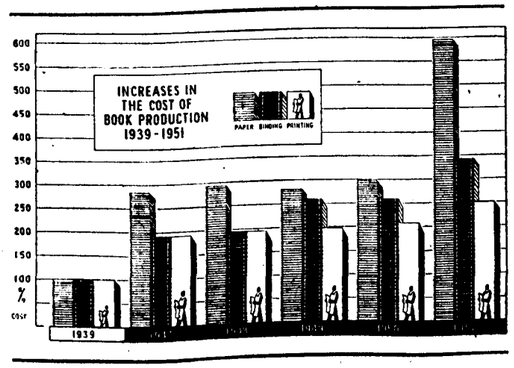
Soon after Mr de Valera's return to office in June, his Minister for Finance, Mr MacEntee, foretold a payments deficit of some £60 million for the present year. In recent weeks his colleague, Mr Lemass, has returned to the subject with speeches that have attracted much attention and caused some alarm. The estimated deficit has been raised to £70 million; and a warning has been given that at the present rate of running down its foreign assets Ireland will cease to be a creditor country within two or three years. The issue has become more controversial since Mr Lemass has accused Mr Costello's late government of spending sterling assets, as well as Ireland's loan under ERP, improvidently. The bank report, however, shows the underlying strength of the Irish position in sterling. Last July the net assets of the commercial banks amounted to £108 million. The bulk of the import deficit of the current year had been incurred by that time, while earnings from the tourist trade and the seasonal rise of exports in the autumn had not yet accrued. In recent months imports have fallen and there is some evidence of overstocking. Moreover, the net assets of the Central Bank and of the Post Office Savings Bank are £110 million, and there are also sterling investments held by private individuals in Ireland.

It is true that a continuing deficit on the scale of the early months of 1951 would soon make a breach in these last lines of defence. But at present there is still ample room for manœuvre and some reports that have appeared abroad seem excessively alarmist. The fundamental permanent difficulty lies less in Ireland's sterling position than in the dollar debt incurred under ERP, which to some extent swells the banks' sterling assets. The Central Bank's report deals primarily with the twelve months that ended on March 31st last, but its observations remain true. "The present economic picture is one of high consumption, high investment (with insufficient early output of the character most needed) and low savings." Mr Costello's policy of domestic investment was concerned with the restoration of soil fertility, an investment which was badly overdue and which should pay rich dividends when Anglo-Irish trade relations are put on a more sensible basis than recent British policy has allowed. The investment programme also paid special attention to things such as housing and rural electrification which did not contribute to immediate productivity and which increased the level of consumption. The task of Mr de Valera's government must be to discourage some forms of consumption that it is altogether beyond the country's capacity to afford. That will not be an easy task, particularly since the government's majority is slender. In the meantime the result of the British general election, which is expected to influence the future policies and fortunes of the sterling area, has been anxiously awaited in Dublin.

* * *

Books or Slates

Some time soon the Minister of Education will have to decide whether standards in the schools are to go on being lowered day by day under the pressure of rearmament and inflation or whether they are to be maintained by attempting less. The latest evidence of this pressure is a leaflet sent out this week by the Publishers' Association to all local education authorities, giving information about the rise in the price of books. The diagram reproduced from the association's figures, illustrates the leap in prices of paper, binding and printing between 1950 and 1951. The effect on the price of books is obvious unless their size and quality are drastically reduced.



THE AGE OF INFLATION

The three articles by a correspondent, and a fourth article expressing the editorial views of *The Economist*, have been reprinted as a pamphlet, price 8*d*. (including postage).

Special prices for bulk orders: 1 dozen, 7/-; 6 dozen, £1.19.0; 12 dozen, £3.6.0.

THE PUBLISHER,
THE ECONOMIST, 22 RYDER STREET, LONDON, S.W.1.

The publishers have a vested interest in encouraging a generous expenditure on school books, but there is also a real danger that the local education authorities' allowances for books and stationery will not keep pace with the rise in prices, and that in the coming year schools will be unable to buy enough of the primary tools of learning. The Publishers' Association has selected this moment to make its appeal because most education authorities are at present preparing their estimates for the coming financial year, and many of them are considering whether they should grant supplementary allowances for the current year to cover the increases which have already taken place.

Fortunately the aggregate item of "books, stationery and materials" comprises only some 3 per cent of the expenditure per pupil in primary schools and some 5 per cent in secondary schools; but the dilemma with which local education authorities are faced is real. If it could be thought that the pressure would last only two or three years—until rearmament gets beyond its peak—then a temporary lowering of standards could be tolerated. But if, as seems more probable, economies will last for a longer time and each year some former gains will be lost, then it would be better to sacrifice one full-sized victim at the start and keep the rest intact.

* * *

The Left and the Bright

The comprehensive school is being attacked from the Left as well as the Right. While the Conservatives were bound to make some political use of the controversy, they have committed themselves for election purposes only to the guarded statement that they "dispute the value of the over-large comprehensive school." But the current *Political Quarterly*, in whose editorial board the left-wing intelligentsia are heavily represented, devotes its leading article to an outspoken attack on the Labour party's recent pamphlet expounding "A Policy for Secondary Education."

The pamphlet wholeheartedly endorsed the comprehensive school on social and egalitarian grounds. It is attacked as a "shallow and superficial document" intent on the single object of obliterating the prestige and status of the grammar schools. The *Political Quarterly* declares unqualified support for the idea of an aristocracy of brains, of an educational elite based entirely on ability. It rightly stresses the real equality of opportunity that the 1944 Education Act has already given. In terms of practical educational policy, its attitude involves strong support for the grammar school tradition, coupled with rapid improvements in the secondary modern and technical schools—and, at this stage, carefully devised experiments with different types of comprehensive schools. These views will not be liked in the Labour party, but anything is to be welcomed that brings some light of reason to bear on the fog of prejudices covering this subject.

British Guiana and Self-Government

As each Colony in turn advances towards self-government, the complexity of the problems of transferring power becomes increasingly evident. The latest essay on this subject is the Report of the British Guiana Constitution Commission.* British Guiana has a small population of 400,000 and a vast undeveloped territory of doubtful potentialities. Whatever the merits of the old Crown Colony form of government, economic progress was halting and the people were becoming daily more restive. In constitutional reform Guiana has lagged behind other Caribbean territories mainly because of the division of the population between two races—Indian and African—not altogether on the best of terms. The Commission sent out from Britain to break the deadlock refused to hold back because of racial difficulties. They have therefore recommended the grant of universal adult suffrage; the existing limitation of a literacy test had disqualified many illiterate Indians and bred in them a sharp sense of resentment. They also propose the introduction of a ministerial system, with full executive responsibility for Ministers chosen from the elected members of the legislature. These elected Ministers are to be a majority in the "Cabinet." That they should be so is laid down as a key principle, for anything less gives the façade of responsibility without its reality; nothing could be more dangerous in the colonies today.

Serious difficulty arose over the composition of the legislature. If there is to be a wholly elected single house, all checks and balances are removed, and an inexperienced electorate is given unbridled sway. On the other hand the past system of holding the balance through a group of members nominated by the Governor has become the bugbear of Guianese politics, the people feeling that its will is thwarted by autocratic powers from above. The Commission, unanimous up to this point, here divided. The Chairman, Sir John Waddington, has proposed the continuation of the nominated system, but in reduced strength; the other two members—Professor V. Harlow and Dr Rita Hinden—recommend an all-elected Lower House, the check residing in an Upper House with powers not unlike those of the House of Lords. The stimulating argument as between these two opposing courses will have a relevance in all future colonial constitution-making. The Secretary of State for the Colonies has accepted the bicameral recommendation. British Guiana will thus have an adventurous new constitution, bringing yet another Colony to the very threshold of self-government.

The Hindu Code Bill

The shelving of the Hindu Code Bill, which was described by its chief promoter, the Indian Law Minister, Dr Ambedkar, as "the greatest social reform measure ever undertaken by the legislature of this country," has brought about Dr Ambedkar's resignation and a sharp public attack by him on both the domestic and foreign policies of the Congress Government. Dr Ambedkar is the leader of the Scheduled Castes Federation and his main political aim has been to win effective political and social rights for the depressed classes of Hindu society from which he has himself sprung. He played a great part in framing the constitution of the Indian Republic and hoped by his Bill to modify the whole structure of Hindu law relating to caste, family property, inheritance and the status of women. Mr Nehru at the outset gave him full support. He said that he would stand or fall by the Bill and that traditional Indian society, if it were not reformed to keep up with the times, would be swept away by revolution, as had happened to the old social order in China. It seemed that Dr Ambedkar could count also on a majority in the present Indian Parliament

* HMSO. 3s. 6d.

for the measure, and that it would go through, despite the hostile agitation of conservative religious leaders among the people at large.

Now, however, the Congress leadership has dropped the Bill like a hot brick. The reason is apparently to be sought in electoral calculations, for within three months India is to have its first general election on a basis of universal franchise. The Congress Party, led by Mr Nehru, will be opposed not only by the Socialists and a breakaway group from Congress on the left, but also by the Mahasabha, representing Hindu communalism, on the right. On general political issues Congress, as the party of Gandhi and Nehru, can be fairly sure of winning the great masses of peasant voters ; but the social reform legislation which seems so reasonable and progressive to the educated, middle-class politicians who make laws in New Delhi strikes at social customs of immemorial antiquity which still have strong roots in the villages, and the passing of Dr Ambedkar's Bill might well have swung millions of votes to the Mahasabha. Paradoxically, the extension of the franchise in India under present conditions is adverse to social reform.

Opposition to the Bill, however, has come not only from religious conservatives, but also from thorough-going secularists who object to any legislation which does not apply generally to all citizens. The Hindu Code Bill was applicable to Hindus—who have hitherto had their own system of law—but not to Moslems, Christians or Parsis. Mr Nehru wants India to be a secular state without discrimination between religions ; but in trying to make law specially for the Hindu community he has inevitably re-emphasised the distinctness of that community within the state, and brought religious issues into Indian politics in a way which he certainly would have wished to avoid.

Accuracy in Elections

The Representation of the People Act, 1949, provided a mechanism for keeping out of an election campaign what it describes as the "false statement of fact in relation to the personal character or conduct of the candidate." The speed with which it can work was shown last week. The Conservative candidate in one of the Nottingham constituencies was Mr Sheppard, managing director of a firm of clothing manufacturers which recently cut down production, because, as it explained, orders had fallen. At a public meeting on October 11th, the Labour candidate in an adjoining constituency, Mr Tom O'Brien, suggested (Mr Sheppard alleged) that Mr Sheppard's firm had been "playing at politics," that it had cut down production and laid off some employees to prove the folly of Dr Dalton's much publicised advice to housewives not to buy. Mr Sheppard's account was that the decision was taken, and explained to his workpeople, in August, and that it antedated by a month both the announcement of the election and Dr Dalton's original advice to his South Wales audience. Accordingly, Mr Sheppard last week took action under that section of the 1949 Act which authorises the High Court to grant an injunction to restrain any repetition of a "false statement of fact." The Court granted an interim injunction on Thursday and Mr O'Brien withdrew his suggestion even before he was served with a copy of the interim injunction. Thus, within eight days the whole business was over, settled amicably in court by the candidates and their counsel.

There is, it should be noted, another aspect of the section of the 1949 Act dealing with "false statements." The aggrieved candidate is allowed to seek individual relief, the injunction to restrain any repetition of the statement ; an earlier sub-section deals with the public aspect. It provides that a person making a false statement of fact about the character or conduct of a candidate, provided he makes it "for the purpose of affecting the return of any candidate at the election," is guilty of an illegal practice ; such a practice is punishable on summary conviction by a fine not exceeding £100 ; and if a successful candidate is reported by an election court as personally guilty of an illegal practice his election is void and he may not sit for that constituency for seven years. The legal armoury, at least, is formidable.

National Trust in Difficulties

The stately homes of England, after rocking the finances of their former owners, are now doing the same for the National Trust. Its latest annual report shows that the Trust's deficit for the year 1950 reached the formidable sum of £56,000, compared with £31,000 in 1949. Expenditure has risen with inflated repair and maintenance costs, while income from investments—largely in trustee securities and amounting in 1950 to less than £2,000,000—has not risen correspondingly ; and free legacies produced the disappointingly small sum of £27,000 in 1950, compared with £86,000 in 1949. The annual deficits since the war have been met by drawing on the Jubilee Appeal Fund, launched in 1946 when the Trust was 50 years old. What makes the future particularly critical is that this fund, which once stood at £90,000, will be exhausted this year.

There is no question, however, of the Trust's becoming dependent on a regular annual grant from the Exchequer. Other ways of solving the problem can be found. It is hoped that more can be obtained from annual subscriptions, which in 1950 brought in £18,050 ; but membership rises slowly and now numbers only 25,000. If necessary another special appeal can be made. And, on the other side of the account, expenditure will be less heavy now that the arrears of repair work left over from the war years are nearing completion.

The National Trust's finances might greatly benefit from the legislation, planned for last session but never introduced, to preserve historic houses. The Labour Government, while rejecting the recommendations of the Gowers report for income tax relief, proposed that the Ministry of Works should make grants or loans towards approved expenditure on historic houses. This assistance was intended chiefly for private owners, but the Trust had hoped to be eligible for it too ; it would not only help to solve present financial problems but would also make it no longer necessary to refuse all property offered without an endowment for maintenance. The Conservative party's attitude to these questions has never been defined, but it should certainly be sympathetic, and possibly less inhibited by fear of benefiting the rich. It is to be hoped that the government will see the need to take action quickly, for each year sees the decay of more great houses. If this generation continues to pay such a price for its social revolution, it will not, to quote the National Trust's report, "avoid the lasting censure of posterity."

Letters to the Editor

Apologia pro Vita Sua

Sir,—Your very just review of the Duke of Windsor's memoirs ended with a sentence which is a little unfortunate:

> The Baldwinian myth of the King's irresponsibility and selfishness, accepted so readily by the very public which had sentimentalised over Prince Charming, should by this book be demolished once for all.

Whether the qualities imputed to the King are a myth or not, the imputation is certainly not Baldwinian, if that means that it was propagated by Stanley Baldwin. Baldwin never in public called the King irresponsible or selfish, and I have yet to learn that he did so in private. It was not in his nature. He passed no moral strictures; on the contrary, he spoke in terms of sympathy and high respect of the King's bearing during the crisis.

That crisis, as Baldwin expounded it, arose from the King's determination to make a certain marriage. The marriage, in the opinion of Baldwin and indeed of the King's Prime Ministers throughout the Empire, was incompatible with the Throne. I suggest that the overwhelming judgment of history has confirmed this view. If it is correct, then there was only one possible resolution of the crisis. The whole of Baldwin's argument at the time reduces itself to the demonstration that abdication arose out of the inescapable facts, and had nothing to do with the King's personal qualities.

Nor, I think, did the public accept the decision so lightheartedly as is suggested. I had occasion during that week to read many hundreds of letters, which I believe to have been representative; and I can testify that public opinion accepted the abdication most reluctantly, under the compulsion of the facts, and with the utmost sympathy with King Edward. If there is any myth, it has been created subsequently, by controversialists who may claim to defend the Prime Minister's policy, but whose moral judgments would have been repudiated by Baldwin. Any dignity in the proceedings at the time of the Abdication was due to him, to other British and Commonwealth statesmen, to the Duke's family who behaved with extraordinary generosity, to his staff who were loyal, and finally to the public who accepted the fact, with patience and fortitude, that he wished to leave them.—Yours faithfully, DERMOT MORRAH
London

Germany and the West

Sir,—The article in your issue of September 8th described the actual situation objectively, on the one hand elucidating how the Germans are greatly overplaying their hand, but on the other hand frankly admitting that the follies of allied policy bear a large share of the responsibility for the present state of affairs. Now three German reactions have been published in your journal. After the outrageous letter of Herr Peter Lambertus and the gratifying reaction to this nonsense by Herr S. H. Frowein, "Mercator" provides a typical example of the Germans as described in your article and who fully answer to the characteristic: "wholly unable to see themselves as others see them."

One can hardly believe one's eyes, reading in Mercator's letter that both world wars had their origin in the struggle of Germans against the advancing forces from the East. This remark, which tries to eliminate the aggressive character of the wars of Wilhelm II and Hitler, will not have a reassuring effect on the free world and is not calculated to give Germany's neighbours a very comfortable feeling. The Germans invaded France three times during the last century, Belgium twice, and Holland once. There is much for which we blame the Russians, but does Mercator really believe that anyone in the occupied countries of Western Europe ever welcomed the German armies as a *nolens volens* occupation, prompted only by a holy struggle against advancing forces from the East?

Maybe it is the Germans' lack of political sense that is at the root of these errors. But then there is much to be cured; and the allied powers should be very careful indeed before paying a German price for the incorporation of Western Germany in the North Atlantic community. When Mercator says that Dr Adenauer's fight for equality of rights makes no sense to the average German, one can only hope that the future will produce more Adenauers than average Germans . . . or, rather, that other German readers of your journal will make clear that Mercator and the average German are not identical.—Yours faithfully,
E.B.F.R.G. WITTERT VAN HOOGLAND
Velp, Holland.

A Stand for Suez

Sir,—Your leading article remarks that "British pledges about the Sudan make it unthinkable that the results of honest and enlightened administration should be handed over to the corrupt regime tolerated by King Farouk."

May I observe that it is very regrettable that a similar policy has never been advocated in your columns when our honest and enlightened administration was to be handed over to the inexperienced and confusing regime of President Sukarno.—Yours faithfully,
The Hague E. HENNY

[Our correspondent has missed the point that the British purpose is to hand over the administration of the Sudan to the Sudanese.—EDITOR.]

Tax Evasion

Sir,—You refer, rightly, to the "discouragement to enterprise and hard work caused by the high taxation of incomes." But you say nothing about the people who evade taxation and thus throw their burden on others. Messrs Rowntree and Lavers ("English Life and Leisure," page 209) mention the earnings of certain women, which "seldom fall below £20 a day," and "they pay no income tax." Street bookmakers' runners, making about £7 a week, also commonly evade taxation.

Much more important than illegal evasion is the case of employees who "live in" and draw a large part of their remuneration in the shape of board, lodging, and perhaps perquisites. Why should they not be assessed on this part of their remuneration which is not paid in money? It would not matter if their board and lodging were reckoned at a figure below its probable value, for the whole extra assessment would be a gain to the Exchequer, and to other hard-pressed taxpayers.—Yours faithfully,
Cambridge J. E. ALLEN

Expenses and Inflation

Sir,—May I suggest that an important step in combating inflation would be to abolish tax-free expenses, particularly those for entertainment? It would first be necessary to prohibit paying any part of an emolument, salary or wage as a tax-free expense. (There should be no exceptions for Cabinet Ministers or Members of Parliament.) Secondly, all entertainment and certain other expenses should be excluded from what the Board of Inland Revenue consider legitimate expenses for income tax purposes. Those firms which have genuine entertainment and other expenses could claim a rebate from the Inland Revenue. But the onus of proving that they are genuine would be on the individual firms.

The growth of this subterfuge of tax-free expenses is a symptom of high taxation. It is not a symptom of inflation. It is itself part of the inflationary pressure, just as high taxation is, and it has a peculiar and particular incidence. It inflates the demand for restaurant meals, for hotel accommodation, for motor cars and for a number of other goods including, perhaps, mink coats. The fact that doubling the purchase tax on motor cars in the last budget only succeeded in increasing the price of second-hand cars is but one illustration of the effect of tax-free expenses. More important is their effect on the possibility of abolishing food rationing. The higher prices Britain has recently agreed to pay for its meat and butter (and presumably higher prices for cheese, bacon and eggs will follow) might raise retail food prices to a level where effective demand would be no higher (or at least not very much higher) than existing ration scales. In these circumstances food rationing could be abolished if the demand from catering establishments could be curtailed; and this can only be done by making certain business expenses come out of profits and salaries and not out of Government revenue.—Yours faithfully, MATTHEW

Books and Publications

A French Toynbee

The Sum of History. By René Grousset. Translated by A. and H. Temple Patterson. *Tower Bridge Publications.* 254 pages. 21s.

It is today a commonplace that events since 1914 have shattered the easy optimism about the permanence of Western civilisation and the automatism of human progress. The belief in progress, which is itself of no great antiquity, has been challenged by new theories of cyclical development in a plurality of civilisations, each with its own special qualities and each growing, flourishing and decaying like an animal organism. Spengler was the prophet of the new disbelief in continuous historical progress. Then came Professor Toynbee with a view of history also based on the theory of a plurality of separate civilisations with histories corresponding to a definite life-cycle, though somewhat more flexible and less grim than the philosophy of Spengler. Now we have in an English translation the work of a French writer who has been described as "the French Toynbee"; he is M. Grousset, a specialist in Oriental history, a Catholic and a member of the Academy. His book appeared in its original edition in 1946 under the title of *Bilan de l'Histoire.*

M. Grousset's book lacks the systematic and schematic character of the Spengler-Toynbee type of analysis—it is indeed a collection of essays rather than a single work—and he is much less addicted to basic pluralism in the conception of human civilisation; he sees a continuity of development from the Egypt of the Pyramids to contemporary Europe, where Spengler and Toynbee assert a series of separate civilisations linked only by "pseudomorphosis" or "affiliation." On the other hand, Grousset comes near to the Spengler-Toynbee outlook in his emphasis on the recurrence of catastrophe in history. Writing on the morrow of the Nazi eruption over Europe, including his own country, he refers to the "beast which has broken loose from its chains" and "destroyed, over vast areas, a civilisation which had believed itself immortal." Human progress, he declares, "has but served to make our periodical relapse into barbarism immeasurably more deadly." As a Catholic, however, he is neither surprised nor overcome with despair at the latest revivals of original sin. Indeed, for him the significance of human history lies ultimately beyond it, and in his last chapter, taking up Pascal's theme of the "silent universe," he contemplates the limits of possible human achievement.

As an Oriental scholar, M. Grousset is deeply interested in "the contribution of eastern Asia to the humanism of tomorrow." He declares that "mankind's spiritual peaks are few, and if half of them are grouped around our Mediterranean world, the rest are to be sought in the Far East and in India." This wide range of cultural sympathies gives a large horizon to a view of history which otherwise might be unduly Gallocentric, but there is no pretence of being the detached philosopher, without loyalties of his own and above the battle. M. Grousset affirms his own attachment to liberalism, as the modern outcome of the Hellenic-Christian tradition of Western Europe, and of Hitler's invasions he remarks that "the least we can say is that they belonged to the age of Alaric and Genseric." Of the contemporary "cold war" against Russian Communism he has curiously little to say, and his account of recent Russian history is strangely lacking in the critical comment which might be expected from a writer of M. Grousset's principles. But it has to be remembered that the book was written immediately after the liberation of France, at a time when hopes of postwar inter-Allied cooperation still ran high and any adverse criticism of Russia in France savoured of Vichy.

The American Inquisition

The Loyalty of Free Men. By Alan Barth. *Gollancz.* 253 pages. 16s.

This is the first book to deal comprehensively with the cult of loyalty which has arisen in the United States and its threat to the ideals of personal liberty. Mr Barth believes that the present Communist danger in the United States is a problem in counter-intelligence; in no other sense is it a real threat. By far the greater danger lies in the steps taken to fight off this bogy. These include not only the practice of character assassination in Congress, which Senator McCarthy has made such a fine art, but the well-intentioned inquisitions to which government employees are subject, the web of security regulations in which American scientists are entangled, and the growing demand that teachers and professors subscribe to special loyalty oaths.

Mr Barth is an unrepentant believer in personal liberty, and his view, with which it is hard to quarrel, is that whatever is gained in unmasking a few disloyal characters is lost many times over in other ways. The best men are discouraged from entering government service, scientific research, and the teaching profession; timidity prevents others from doing their best. Overt acts of spying and sabotage can and must be dealt with under the law. What Mr Barth is defending is the freedom of belief, whether it be right or wrong-headed, as a necessity for survival.

This is a highly readable and convincingly argued book; Mr Barth's views are sound and he is armed with the facts about the Hiss and Coplon cases, the dispute at the University of California, the use and abuse of the Federal Bureau of Investigation. Some of the most interesting passages are transcripts from the new inquisition, whether it is conducted by Congressional committee or government loyalty board. It will be read with profit even by those who feel that Mr Barth relies too much on the black and white in his paint-box.

The government's loyalty programme is so susceptible of abuse by fanatics, cranks, and the spiteful that he would reform it by abolishing it—something which even Professor Chaffee, in his introduction, admires for its breath-taking simplicity, but cannot quite accept. There is certainly no chance Congress would. The villains in Mr Barth's drama are the "Americanists," the McCarthys and McCarrans whose technique is so close to that of the Communists, and who, the author believes, are using the Communist scare quite cynically to stamp out all unorthodoxy. What British readers may not realise is that many intelligent, kindly, and progressive Americans are honestly in doubt as to many of the issues Mr Barth raises. Even if Americans do not always agree with him, his book should give them strength to resist the new tyranny.

Re-siting of Industry

Industry and Planning in Stepney. By D. L. Munby. *Oxford University Press.* 466 pages. 30s.

In 1939, Stepney contained 200,000 people in an area of 1,766 acres (much of it taken up by docks and industry), which represented a density of population and a degree of overcrowding without equal in England. The majority of its dwellings were terrace houses over 80 years old—the remainder were chiefly barrack-like flats. Today, thanks to the blitz, a third of the dwellings have been destroyed, but half the population has gone and conditions are slightly better. The London County Council's plan envisages a further reduction of the population to 75,000. Even so, in view of the space requirements for schools and for open space (non-existent before the war), this means net residential densities of 136 people per acre, with 60 per cent of the population rehoused in flats—contrary to their known wishes. In Mr Munby's view, Stepney "will be an area of sub-standard conditions even when re-planned by the LCC."

The key to Stepney's planning problems, as to those of the East End generally, is the dense concentration of industry in the borough. Before the war there was a net daily influx of perhaps 40,000 workers, and the figure is much greater today, since industrial dispersal has lagged far behind the outward movement of population. Thus even the LCC proposals for the borough compel a choice between accepting ever longer and costlier journeys to work or moving out a large proportion of local industry. It was to investigate the possibilities of the second alternative (the only socially satisfactory one) that Mr Munby has undertaken this fairly detailed survey of local industrial conditions. His pioneer work shows up the extent to which the LCC, and no doubt other local authorities as well, are making vital planning decisions on the basis of no more than a nodding acquaintance with basic economic conditions.

Mr Munby's findings are far from discouraging. The industry of Stepney is highly variegated, and only a small proportion is necessarily tied to the docks or a central location. Many firms could move, without loss of efficiency, to an outer suburb or (less commonly) to a new town, and an appreciable proportion are prepared to do so—given a lead and suitable assistance. This policy, however, needs careful advance planning and steps to enlist the co-operation and interest of local industrialists. The first, and not the last, requirement for replanning London is an effective and workable plan for industry; and it is certainly a sobering reflection that not even the sort of preliminary survey which Mr Munby has privately undertaken is available for other boroughs. It is these sort of deficiencies which show how jejeune the British attempt at social engineering must be still accounted.

Teaching Beginners

Earning and Spending. By E. E. Reynolds. *Cambridge University Press.* 103 pages. 4s. 6d.

Income Analysis. By Richard V. Clemence. *Addison-Wesley Press.* 182 pages. $2.50.

These two little books are both, at their respective standards, of considerable interest to the teacher of economics or of "social studies" generally. "Earning and Spending" might be described as a pre-primer of economics. Completely eschewing theory, it deals historically and descriptively with such matters as population (birth-rates and death-rates, age distribution, local distribution); occupations (skilled and unskilled; production, distribution, or service); trade unions, wages councils, time-rates and piece-rates, PAYE, and social insurance; the organisation of industry and the flotation of companies; forms of Government intervention; money; and international trade. Some of its generalisations and question-begging simplifications may well make a technically qualified reader blench; and the prospect of Mr Reynolds's innocent students discussing, as he suggests, the pros and cons of the nationalisation of the Bank of England, or the merits of the milk marketing scheme, or the advisability of a sliding-scale cost-of-living clause in wage agreements, without a single theoretical clue to help them, has its appalling side. Still, a wise teacher could do much to supplement its deficiencies; and it undoubtedly fills a gap.

"Income Analysis" is for the embryo specialist. Its author describes it as "a contribution to teaching method rather than to economic science," and it is amusingly easy to detect, in the lavish italics and frequent capitals, his attempt to reproduce in print the emphasis and cadence which he had found effective in the lecture-hall. It is a very neat job indeed, introducing the beginner, methodically and painlessly, to the main concepts of macroeconomics, relating these to available national income statistics, and thence passing on to the elements of trade cycle theory. Alas, it is American, and the British teacher using it would have a painful translation job; even those who boggle at that job, however, will not regret consulting it for their own benefit. For the benefit of teachers and other qualified readers using "Income Analysis" as a refresher, an excellent high-level bibliography is included.

The Steam-Roller

Russia's Soviet Economy. By Harry Schwartz. *Jonathan Cape.* 592 pages, 36s.

When faced with the figures on Soviet economic development provided in this volume, one is struck by the fact that real expansion took place only slightly more than a decade before the outbreak of the war and a few years after its end. The Soviet regime has been in existence for roughly one third of a century, yet during that time its economy has experienced three shattering blows: the civil war following close on the first world war, the peasant resistance to collectivisation, and, finally, the German invasion. Seen in this perspective, the achievements in basic industries assume their proper significance.

Under the constant fear of capitalist encirclement and war, the Soviet leaders decided to put the main stress on the development of heavy industry. They introduced new forms of government and economic organisation, and, in Stalin's hands, the state became a ruthless machine tolerating no obstacles and crushing all opposition. Yet, when considering the speed of Soviet economic development, which required an annual investment of about one-third of the national income, one wonders whether such a pace could have been maintained without ruthlessness and whether the limits on the freedom of the Russian people were not really the result of the decision to industralise at such a pace.

Mr Schwartz's book deals with this great and novel experiment. It may be regretted that, probably for lack of space, his chapters on the historical and the ideological background are rather sketchy. He could have shown in great detail how a system designed primarily for an advanced industrialised country had to be adapted to the needs of semi-feudal Russia. But his task was far from easy; facts on the Soviet economy are scarce and difficult to assess. In general, Mr Schwartz has succeeded in collecting and presenting intelligently a great wealth of material, both Soviet and foreign, on Soviet industrial and agricultural development, on transport and trade, the planning system and finance. It will be left to the reader to decide whether the author was too sceptical or too credulous in evaluating the Soviet sources. But the material is there and, by providing it, Mr Schwartz has helped his readers to strike a balance between the achievements and the drawbacks, the pros and cons of the biggest political and economic experiment of the twentieth century, so often distorted by the propagandist controversies of the cold war.

Rumanian Case-Study

Rumania: Political Problems of an Agrarian State. By Henry L. Roberts. *Yale University Press. (London: Geoffrey Cumberlege, Oxford University Press.)* 414 pages. $6.00.

Mr. Roberts clearly had two aims in writing this book. One was to study the general problems, economic, social and political, of a backward agrarian state when it is subjected to the influences of Western capitalism. The other was to interpret the history of Rumania in the last half-century in the light of its unsolved agrarian problems.

These two aims are closely related but not identical. Up to a point, Rumania can be used as an example of the backward agrarian state; it suffers from the typical ills of primitive and inefficient agricultural methods and low productivity. Rumania has, however, special characteristics of its own. Its peculiar method of government while under Turkish domination left it with an unbalanced social structure and a particu-

THE
NEW ISSUE MARKET
AND THE
FINANCE OF INDUSTRY
R. F. HENDERSON
The impact of still higher prices and the 1951 rearmament budget have accentuated the problem of risk capital for industrial development, in view of the effect of high taxation and inadequate depreciation allowances on company saving. This survey of the new issue market and other sources of industrial finance such as the I.C.F.C. should, in the words of Sir Henry Clay's Foreword, be studied not only by academic students but by those who are practically concerned.

"His arguments are carefully developed on a sound basis."—*The Banker.*

larly unfortunate tradition of inefficiency and corruption in public life. Its enormous increase in area and population after the 1914-18 war set the Rumanian state special problems and diverted energies away from economic and social reforms. Most important of all, Rumania's geographical position has made the assertion of national independence against Russia the supreme purpose of all political groups, except the Communists. In these respects, Rumania is not typical, and to use Rumania as a yardstick would be both to overestimate the warping effect of western capitalistic influences and to underestimate the drawing-power of Soviet communism.

Mr Roberts is well aware of this danger, though he has sometimes a tendency to generalise on the basis of the Rumanian example. Nevertheless, his careful analysis of Rumanian problems is of much wider than purely Rumanian interest and his political analysis is depressing but also fair. Thus if Rumania is now entering the phase of collectivisation, this does not mean that it is an inevitable phase in the growth of a backward agrarian state; it is merely a by-product of power politics.

Cures for Indian Agriculture

Indian Agriculture and Its Problems. By A. N. Agrawal. *The Students' Bookshops Limited.* 184 pages. 4s. 6d.

The object of this sensible and readable little book is to explain in small compass the major problems confronting Indian agriculture and its reorganisation. The approach is realistic, and both the nature of India's food and agricultural problems and the choice between possible methods of reform are presented in good perspective. Emphasis is laid on the necessity for enlarging the units of cultivation and of securing the wholehearted co-operation of the cultivators before modern methods of cultivation can be introduced. It is suggested that the best long-term method of reform would be to introduce a system whereby ownership will be respected, but dissociated from actual land-use, whilst cultivation of the village land will be undertaken collectively. "Thus the income from land will consist of two parts: work income and ownership dividend." Joint management would make scientific cultivation (including some degree of mechanisation) possible, whilst rights of ownership and inheritance would not be ignored. Mr Agrawal faces the psychological aspects of the problem squarely, and realises that the necessary preliminary educational and propaganda work will take time.

He also gives a clear explanation of the failure of the government's "Grow More Food" campaign, which has resulted in a larger area under cultivation but a decline in the total output of foodstuffs, and criticises the Colombo Plan on the grounds that it is financially unrealistic and neglects practical problems, particularly those of priorities. It is interesting that the recently issued report of the Indian Planning Commission, entitled "The First Five Year Plan," admits and attempts to remedy these defects, whilst it also comes to much the same conclusion as Mr Agrawal about agricultural reorganisation; that the best long-term method of reorganisation will be to manage the land of a village as one farm, whilst paying an ownership dividend. In an otherwise excellent little book it is a pity that Mr Agrawal appears to give his blessing too readily to "deficit financing."

Austrian Diplomacy

Austria-Hungary and Great Britain, 1908-1914. By A. F. Pribram. Translated by I. F. D. Morrow. *Oxford University Press.* 328 pages. 25s.

The distinguished Austrian scholar, Dr Pribram, was born in London in 1859, and came back to die here in 1941. This book is the last token of his abiding interest in our history. It is a penetrating study of Anglo-Austrian diplomatic relations in the years immediately before 1914, and we owe its appearance to his friend and pupil Mr Ian Morrow.

In it he is chiefly concerned to examine the handling of three crises, which followed one another in quick succession; the Bosnian affair, the Balkan Wars and the outbreak of the First World War itself. For his material Pribram relied mainly on the mass of British and Austrian documents published between the two wars, but he had also lived close to the events he describes, and he knew many of those charged with the management of affairs in both countries. Sometimes his judgment of men seems to falter, but in the main his handling of these complicated problems is remarkably shrewd and dispassionate.

Pribram does not pretend that the dealings of Britain and Austria in these years were of first importance to either power, or that they were a main theme in the diplomatic history of pre-1914 Europe. Britain's principal concern was with Germany, while the Austrians were busied with Serbia and the looming menace of Russia over the Slav world. Yet these secondary relationships throw a curiously revealing light upon the whole diplomatic scene. Pribram holds that the British made an unnecessary fuss about the formal annexation by Austria of Bosnia-Herzegovina, but he admits that Grey was determined to prevent the crisis from exploding in a European war. During the Balkan troubles, 1909-1913, he also thinks that the British exerted themselves with considerable success to damp down the dangerous rivalry of Austria and Russia, but his most significant comments are reserved for the outbreak of the general war in 1914. Pribram is convinced that the Austrians were determined to fight Serbia whatever the consequences, and he recognises that the British tried hard to stave off the calamity. But he argues that Grey could and would have done more had he not unfortunately been convinced that a great struggle was unavoidable. Grey might well have been painfully surprised to learn that in the last resort the peace of Europe depended upon his own unflagging exertions.

Shorter Notices

Motorists and the Law. By K. McFarlane. *Stevens.* 116 pages and Index. 5s.

Rent Restrictions. By E. Dangerfield. *Stevens.* 130 pages and Index. 8s. 6d.

These are two further volumes in the "This is the Law" series by these publishers and both of them tackle subjects of wide public importance. That on motorists is as comprehensive as its title suggests. It begins with a short account of the law of contract (buying and insuring the car and the problems that may arise when it is parked or garaged) and continues with the various statutory requirements that govern, or should govern, the condition and maintenance of the car as well as its management on the road. It concludes with a short account of the procedure in magistrates' courts.

The law governing motor vehicles can be said to be detailed rather than complicated. The Rent Restriction Acts, and their attendant judicial decisions, are both. They are a monument to the ingenuity of lawyers and the moral cowardice of politicians. Miss Dangerfield does not fully solve the problem of arrangement. Probably no one could. Her chapters are long and an understanding of all they have to explain would have been helped if each had been given a short summary of the points dealt with in it and by a more detailed index. But a feature which is of the greatest value is her abundant use of imaginary instances to illustrate the more formal language of the main text. By now so much of the law of rent restriction is case law that no other method of explanation is anything like as good. Both these books can be recommended to the lay public—with one proviso; that is, if any book on rent restriction can do anything more for the layman than reinforce his belief that only a judge can say what the law is and that many of the points treated as settled are settled simply because there is no appeal from the House of Lords.

Issue, Control and Regulation of Capital. By F. P. Randall. *Heffer.* 117 pages. 12s. 6d.

This book, we are told at the outset, "is presented in six separate yet inter-related sections in which is contained subject matter of importance underlying (1) Company Finance, (2) The Power to Borrow and Increase Capital and Methods of Raising Capital, (3) Financial Control, (4) Treasury Approval and CIC Requirements, (5) Requirements of the Council of the Stock Exchange and (6) The Prospectus, which is considered in relation to Statutory and Stock Exchange requirements, responsibilities and liabilities in connection therewith, its preparation and publication, and the significance of important sections of the Companies Act, 1948." This gives a summary of the scope of the work; unfortunately it also gives some idea of the almost unreadable style in which the book is written. This is a pity, for Mr Randall ploughs a useful field, and he is clearly a man who knows his statutes down to their very last Capital Letter.

ELECTRICITY

Why is there a Plant Shortage?

DEMAND FOR ELECTRICITY is still increasing more rapidly than supply. There is still a severe shortage of generating plant.

The post-war plant shortage was inevitable. In 1941 the Government ordered that no new power stations should be built except for war emergency needs. They knew then that this would mean a plant shortage at the end of the war and exonerated the supply authorities from all blame. New power station construction started in 1945. But a gap of four years had to be made up.

If the gap was to be bridged by 1952, then, from 1945 onwards, it would have been necessary to have *doubled* the pre-war annual record rate of construction (765,000 kilowatts, in 1938). This was impossible. A modern power station takes four or five years to complete. Materials and manpower were short. Factories had to be converted back to peacetime needs. Exports had to have priority. The early post-war years were full of difficulties for the heavy electrical plant manufacturers.

The following figures show what was in fact achieved.

CALENDAR YEAR	NEW PLANT ACTUALLY INSTALLED kW (s.o.)
1946	307,000
1947	340,000
1948	566,000
1949	703,000
1950	965,000
	NEW PLANT PLANNED
1951 & 2 (Two years)	2,150,000—2,650,000

And now the new Rearmament Programme has increased demand still further. The gap will be closed. Industry is capable of attaining the higher rate of plant construction now required. If plans for new plant go through smoothly in the coming years, there should be an end of power cuts by 1956.

BRITISH ELECTRICITY

AMERICAN SURVEY

Diplomacy Under Difficulties

Washington, D.C.

IN the course of a statement made before leaving Moscow for the United States, Admiral Kirk, the American Ambassador, said to Mr Vyshinsky, the Soviet Foreign Minister:

> The Soviet Government must surely recognise that, as a simple statement of fact, the breakdown of armistice talks in Korea would add greatly to the explosive character of the situation and might stimulate a course of events which would be undesirable from the point of view of both our governments.

According to a credible account of this meeting within the Kremlin, now current in Washington, Mr Vyshinsky here stopped the translator and asked: "Is that a threat?" Admiral Kirk pointed out that he had already described it as merely a simple statement of fact.

Ten days later Mr Vyshinsky said in his reply:

> . . . Mr Kirk . . . made rather strange allusions to some sort of possible "unpleasantness" between the USSR and the United States of America in case of unfavourable results of these discussions. . . . Is it permissible first of all to ask exactly what "undesirable consequences" or "unpleasantnesses" the American Government has in mind? If it is a question of the possibility of a further worsening of Soviet-American relations then it is only barely possible to imagine that these relations can worsen even more after President Truman stated to the whole world that agreements with the Soviet Union are not worth the paper on which they are written.

Mr Vyshinsky was here recalling the President's speech at the Library of Congress in Washington on September 17th in which, after observing that the Soviet society was "a jungle through which the naked power of the government prowls like a beast of prey, making all men afraid," Mr Truman said, "A Bolshevik agreement is not worth the paper it is written on." Less than twenty-four hours after the details of the Kirk-Vyshinsky encounter had been revealed by the Moscow radio, the President said in reply to a question at his press conference that he stood upon his assessment of the value of an agreement with Russia.

All this is an unusually compact example of the sort of thing from America that makes statesmen and diplomats wince and nourishes the doubts which "neutralists" in the free world feel about American leadership and, sometimes, about American motives. There is something to be said in Mr Truman's defence. Of all the agreements the Kremlin has broken, including those under which it promised freedom to the satellite countries in Europe, none has more directly affected the United States than the Sino-Soviet agreement of 1945.

If the Russians had honoured the undertakings they gave to the Chinese Nationalists in that year a whole train of events which have badly hurt the United States might have been avoided, and the dreary inquest on American policy in the Far East which is now dividing the country and weakening the Truman Administration might never have begun. So Mr Truman must feel, with what may well be an understandable bitterness. A further truth is that though his blunt or spur-of-the-moment observations often tend to obscure the fact, there has never been any real cause to doubt that the President is utterly and genuinely intent upon the procurement of peace.

The proposition that the allies of America have no just cause to worry over American motives is one that can be advanced with conviction. But it is another thing to argue that there is no cause for worry over American methods, and a high proportion of those Americans in Washington who are able, by reason of experience or training, to take an objective view of what is now going on do not nowadays make the attempt.

*

In the United States today it is not only safe, but politically rewarding to confuse public opinion and obstruct the policy the government is pursuing abroad, provided only that this is done in the name of anti-Communism. And the phenomena which cause alarm and despondency among America's allies often turn out on examination to grow out of the confusion and obstruction which can be created under the prevailing rules.

Opinion is now sufficiently confused, for instance, to enable two Senators to announce, without any subsequent outcry, that they had voted against the appointment of a skilled diplomat, Dr Philip Jessup, as one of the United States delegates to the United Nations, not because they doubted his integrity and loyalty, but because, due to attacks made upon his integrity and loyalty, he no longer had the confidence of the country. "He is a controversial figure," one of the Senators said, in explaining his vote. "His confirmation, I fear, would divide the country at a time when above all else we need unity."

The view that the way to restore confidence in a man who had been unjustly attacked might be to support his confirmation does not appear to have exerted any wide appeal. Neither the Senator nor any substantial part of his audience seemed to be concerned with the question whether, in providing evidence that men of integrity could be barred from office simply because they had been unjustly attacked, they might be enunciating the doctrine that accusations without proof will henceforth be given as much weight as accusations with proof. If this is to be the case, national unity will be possible only so long as those who have never committed themselves on any issue (and thus cannot be controversial figures) are nominated for high office. Opinion has been sufficiently confused to make this sort of intellectual and moral cowardice pass for statesmanship.

How far is American policy being obstructed because American policy-makers fear to do or say anything which may attract the attention of those who see that it is no

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

longer necessary to prove, but only to make accusations? It is hard to say. Has American policy on the Anglo-Persian oil dispute been affected by an instinctive partiality in the State Department for attitudes calculated to cause the least political trouble at home? Was this what tipped the balance, produced the instructions which the American delegation followed in the Security Council, and made inevitable last week's decision to avoid the awkward consequences of upholding the rule of law? There are those who think it was.

And are the confusions of opinion and distortions of policy which American methods are now producing going, at the best, to set back and at the worst to remove any immediate prospect of a fresh examination in east-west relations? The question is one that can be asked with a full realisation that if American energy and initiative had not led the way to the present enhancement of western strength—and it did so while working under the rules which American methods impose—the opportunity for such an examination would have been most unlikely to occur at all.

As it is, there is no assurance that the access of strength on the western side has yet been great enough to produce on the Soviet side a state of mind that might make any fresh examination a profitable exercise. It is a tenuous argument that Mr Vyshinsky's query as to what the Americans mean by an undesirable course of events may indicate a new Russian anxiety to avoid such a course of events; and the thesis that there was an undercurrent of disquiet in Mr Stalin's statement on the explosion of the second Russian atomic bomb is one which, as the Americans sometimes say, you can take or leave alone.

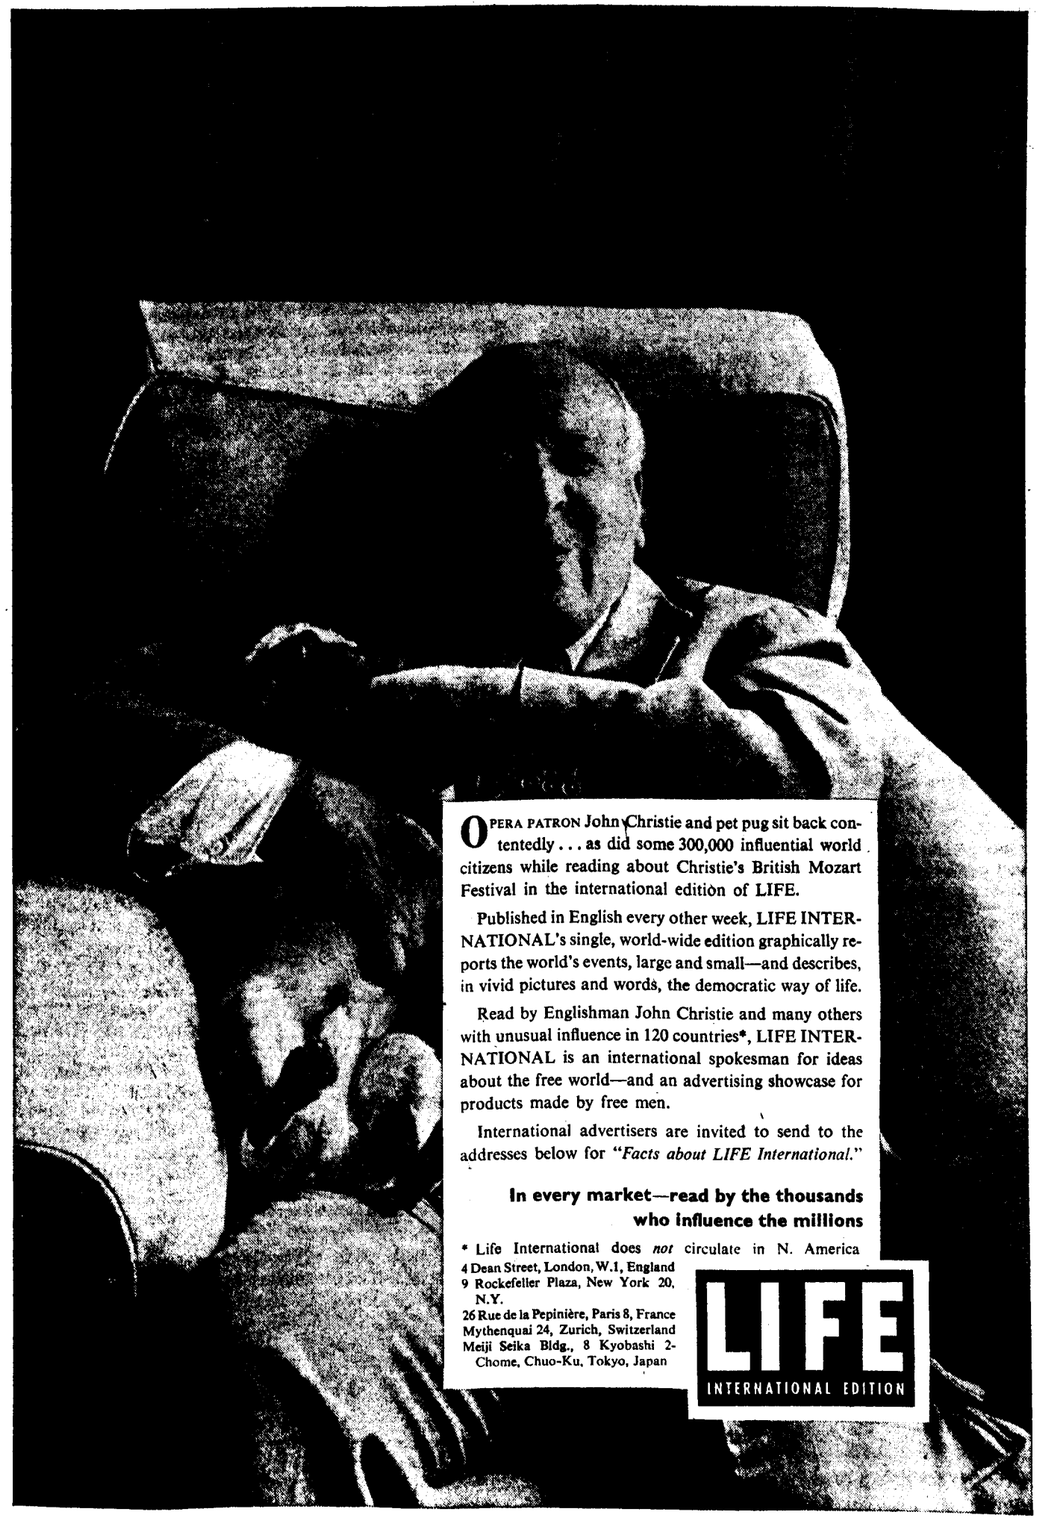
The Kremlin must now be watching the United States with more than normal concentration and attempting with more than normal application to determine the significance of what it sees. Whether the Russians have yet learned enough about American methods to interpret the phenomena accurately is one of the questions of the hour. For example, there will doubtless have been flown to Moscow by now copies of the current issue of *Collier's* magazine, which is wholly devoted to a projection of "Russia's Defeat and Occupation, 1952-1960," replete with "artists' conceptions" of what Moscow will look like as atom bombs burst above it and imaginary eye-witness accounts by prominent writers of events before and after the victory of the United Nations forces. What construction are the analysts in the Kremlin going to place on this manifestation of American (journalistic) methods?

It is impossible to tell. It is possible only to say that if they know their business the analysts in the Kremlin will note at once that the editors of the magazine have been sufficiently well aware of the temper of the nation to call this excursion "Preview of the War We Do Not Want," and to see that this title, an insurance-policy against public displeasure, is repeated at the top of each successive article.

Cities Can be Good

[FROM A CORRESPONDENT IN OHIO]

LORD BRYCE remarked that the conspicuous failure of the United States was the government of its cities—a statement still generally true. But a conspicuous exception is the government known nationally as "The Cincinnati Experiment." The honest, efficient, non-partisan administration of Ohio's second city is no longer an experiment, having been established some twenty-five years ago. Yet it is still the pilot city for engineers of municipal reform. Interest in this phenomenon of a large American city which has never—well, hardly ever—had a political scandal in the past quarter-century is heightened by the fact that the municipal election on November 6th will reflect many cross-currents of state and even national politics. The current campaign reveals the difficulties, familiar to municipal reformers in America, of maintaining a local reform coalition when its members are divided along partisan lines in state and national politics.



The practical reformers who wrote Cincinnati's new City Charter in 1924 represented a coalition of independent Republicans and "regular" Democrats. Until then, for more than fifty years the city had been a notorious example of the boss-ridden American community, sometimes under Democratic rule, more often under Republican control. Several attempts at reform had been made, but their successes had been, as is so often the case in the United States, rare and lamentably brief. By 1924, however, a crisis had arrived. Weary of waste, poor service and dictation from a political boss who did not even trouble to reside in the city, the voters rebelled against paying more taxes, and essential services were threatened. Out of this crisis rose the Charter Committee, a fusion of Republicans disgusted by their party's local performance and Democrats whose political motives had been purified by long confinement to the role of opposition. Taking advantage of the home rule clause in Ohio's constitution, this committee drafted a plan calling for a small city council, of nine members, to determine all policies and appoint a non-party city manager to administer them through a civil service staff. Voting was to be non-partisan, too, through the Hoare system of proportional representation. The new Charter was approved by the voters, and the first City Council under it was elected in November, 1925. It took office the following January.

*

Here was something of a revolution in Cincinnati, which is still the largest consistently Republican community in the United States. Significantly, in 1924 its voters gave Calvin Coolidge the biggest local majority of any presidential candidate up to that time. For eight years thereafter large majorities were piled up for Republican candidates for county, state and national offices, though local Republicans were regularly losing municipal elections. This seemed to prove that supporters of the Charter were right in believing that good local government is possible without either submitting to or injuring the national political organisations.

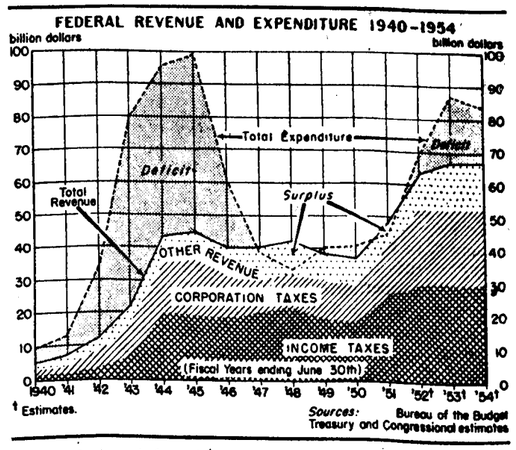
The success of the new system was immediate. Long-delayed improvements were built and new ones planned, while economies were made in the running of the city. Wisely, the new city fathers steered clear of the shoals of extravagance on which so many promising municipal reforms have been wrecked. The city remained solvent even in the depths of the great depression of the nineteen thirties. Cleveland, New York, Kansas City and other cities paid Cincinnati the tribute of imitation, though most of their reform administrations failed because they did not study their model carefully. But the Cincinnati experiment has lasted long enough to prove itself. When the Republicans held control of the council from 1941 to 1945, they did not even try to return to "the good old days."

The reasons for this success are a topic for chronic local dispute. The new order was favoured by two lucky accidents. Early Charter councils had more money to spend than their predecessors, owing to a change in the Ohio tax

laws which gave the cities a larger proportion of state revenues. They were fortunate, too, in that municipal elections came in odd years, and thus were spared the distracting pressures of state and national politics. More basic reasons for a record of accomplishment which has attracted national attention are the businesslike administration of all city services by the city managers (there have been only three so far); the active support of women in the community, who have brought an almost religious zeal to the Charter movement and helped check the appetite of Democrats for the fruits of patronage; and, most important of all, the reformers' realisation that all political action requires political organisation. The volunteer machines of the Charterites are organised on a year-round ward-and-precinct basis. An impartial historian would add that the city was ripe for the change when it came. The regular Republicans reformed along with the city. Indeed, with the passing years the Charterites have had to reach ever farther into the past for campaign ammunition. The cry, "Keep the rascals out!" has an obsolete ring for young voters and candidates—four of the nineteen candidates for the Council this year are under 36 years old—who were scarcely out of their cradles when the "rascals" were in.

The Charterites themselves attribute the success mainly to the proportional representation system of voting—a highly debatable point. In solidly Republican Cincinnati, it is true, the Republicans would win consistently if balloting were under party emblems. The non-partisan ballot favours an independent coalition of rebel Republicans and minority Democrats. At the same time, PR encourages voting by minority blocs, religious, racial, economic, suburban, and so forth. It has also produced, in three elections, a council of four Republicans and four Charterites, with the ninth man dictating the choice of a Mayor, who presides over the council and has certain appointive powers. PR has been consistently opposed by two of Cincinnati's three daily newspapers. Yet it has survived, though by small margins, three well-organised Republican attempts to repeal it. Cincinnati remains Republican in state and national politics, but prefers a non-partisan municipal government.

A legitimate criticism of PR is that under it one cannot vote on issues, but only for individuals. Publicity is so important as to give a big advantage to councillors seeking re-election. When one fails to run again he creates a serious problem for his colleagues. That problem has turned up in a rather complex form in this year's campaign. Mr Charles Taft, younger brother of Ohio's senior Senator, Mr Robert Taft, withdrew from the race for the council because he hopes for the Republican nomination for Governor next year. This has created a string of dilemmas for his four fellow-Charterites on the council—and for the local Republican organisation which he has fought for years. Mr Taft cannot count on the support of that organisation. He is in the embarrassing position of having to oppose it in the city elections in 1951, while being committed to its support in the state and national races in 1952.



The Republican candidates for the council are following their custom of linking the local race with their party's national opposition to the Truman Administration. To remove the Democrats from Washington, they argue, one must "start a fire at the grass-roots." The Charterites, on the other hand, profess exclusive interest in municipal welfare and condemn the Republican insistence upon "party regularity"—which Mr Charles Taft must endorse next year in state and national affairs.

It is very confusing, even to the subtle political understanding of an electorate reared on the intricate diet of PR. No doubt the withdrawal of Mr Charles Taft has weakened his group's chances in the race for the city council. But the voters remain serenely confident that their good government will endure, whatever the outcome on November 6th. Their example, they feel, has long since proved that American cities can be good, given the necessary will, intelligence and practical organisation.

American Notes

Congress Goes Home

Twenty-five million words had flowed into the *Congressional Record* when this most long-winded and investigation-minded session of Congress decided last week to shut up shop, but $13 billion in appropriations remained to be dispatched on the last day. Included in this sum was $7.3 billion in new money for foreign aid, a compromise about half-way between what the House, sticking close to the authorisation figures, thought should be spent, and what the Senate had arrived at by applying a blind 5 per cent cut. Economy, however, often goes before a spree even in the Senate, which, full of virtue, then succeeded in pressing an additional $100 million on Spain, though the Administration had not asked for it, and $450 million in unallocated

funds, designed for aid to Spain, Jugoslavia and Western Germany, was already included. The conferees accepted a $200 million cut in military assistance for Western Europe, but otherwise the House figures stand. For the main areas the division of funds is as follows:—

	Economic Aid	Military Aid
	(Millions of Dollars)*	
Europe	1,022	4,819
Asia and the Pacific	237	535
Middle East and Africa	160	396
American Republics	21	38

The last day's work, which involved acceptance of a $4 billion appropriation for military bases as well as the foreign aid compromise, brought total appropriations for this session to approximately $85 billion, though not all this will be spent this year.

As Representative Byrnes of Wisconsin pointed out in urging the House to reverse itself and pass the tax Bill, the place for economy is in appropriations, not in tax measures. Congress had, for example, raised the salaries of government servants to the tune of $650 million a year; now it must pay the piper. He failed to convince his Republican colleagues, but most Democrats, suitably chastened by the

unexpected success of their revolt last week, then voted to accept the new tax Bill which, in effect, was still the old one, though it had been softened slightly for taxpayers in the lowest brackets and stiffened slightly in its EPT and capital gains provisions. It has now been signed by the President, so that the new income tax rates and excise levies can go into effect on November 1st. The new corporate rates are retrospective to April 1, 1951. All three of these tax increases automatically lapse on April 1, 1954, unless Congress extends them.

In signing the tax Bill, Mr Truman expressed his dissatisfaction with it. It fails—probably by about $5 billion this year—to put the government on a pay-as-you-go basis, and he regretted that, instead of closing loopholes in the present tax laws, it opens new means for wealthy taxpayers to escape carrying their proper share of the load, such as excessively liberal capital gains provisions, unnecessarily generous depletion allowances, and family partnerships which permit splitting of income for tax purposes. But if Mr Truman means to ask for more taxes next January, he must be prepared for a stony reception. No Congressman likes to raise taxes in an election year, and Republican opposition to "excessive spending" kept the majority even for this year's tax increase to a niggardly 25 in the House.

* * *

Road to Rome

Mr Truman's decision to make General Mark Clark, the "liberator of Rome," the first American Ambassador to the Vatican is to be allowed to simmer until January, when Congress returns to Washington. It will certainly be kept near the boil, not only by the indignant Protestants, who regard the step as a threat to the separation of church and state, but also by Texans outraged by the choice of a man whom they hold responsible for the massacre of the Texan National Guard Division on the Rapido River in 1944.

Mr Roosevelt took the first step to revive diplomatic relations with the Vatican, which had lapsed in 1868, when he sent Mr Myron Taylor, like General Clark a Protestant, to Rome as his personal representative in 1940. This caused a storm of protest, but the despatch of a personal envoy did not require confirmation by the Senate and the arrangement was continued until Mr Taylor's resignation last year. The appointment of an Ambassador, however, can be made only with the consent of the Senate, and Senator Connally, the chairman of the Foreign Relations Committee, who is up for re-election in 1952, and is unwilling to do anything to prejudice his chances, will do his best to persuade his colleagues to turn down the appointment.

Normally, the President, if he wished, could make a recess appointment, but this is not possible in the case of General Clark, who is unwilling to resign from the Army. Congress must first exempt him from a law passed in 1870 which forbids army officers to hold civilian posts. At this point the Armed Services committee, on which the Protestant South is strongly represented, will have its say. Mr Truman was no doubt aware, when he hastily made his announcement at the tail-end of the Congressional session, that the inevitable delay would give Senators a chance to sound out public opinion on a highly controversial issue.

According to the White House, the dispatch of an Ambassador to the Vatican would help to co-ordinate the efforts of the free world to combat Communism. The anti-Communist blanket, which can be stretched to cover most things, is not likely, however, to muffle Protestant protest. The National Council of Churches of Christ, representing 29 denominations with over 30 million members, dissents sharply and even Mr Truman's own pastor issued a blast from the pulpit. An additional advantage, often mentioned, of reviving diplomatic relations with the Papacy is that it gives access to the best listening post in the world; it might also, it is thought, diminish anti-American feeling in Catholic countries. A number of Protestants suspect, however, that it was the hope of influencing the Roman Catholic vote in critical states such as New York next year which decided Mr Truman. Senator McCarthy's chances of delivering the Catholic vote to the Republicans might be much diminished. If these were the President's calculations, they would have been served better by a more adroit choice of an Ambassador.

* * *

The Senate Shirks Its Job

The President has given Dr Philip Jessup a recess appointment to the post of delegate to next month's United Nations Assembly, undeterred by a 3-2 vote against him in the subcommittee considering his nomination and the knowledge that, had the matter been brought to a vote before Congress adjourned, the Senate almost certainly would have turned him down. Dr Jessup's "impressive record," which includes five previous posts with Uno, weighed more heavily with the President than the unproven and partisan charges of Senator McCarthy and Mr Harold Stassen. Technically, confirmation will be in order when Congress reassembles in January, but by then the Assembly should have completed its work. Dr Jessup's appointment as Ambassador-at-Large, in which he was confirmed without objection in 1949, is not involved.

To send Dr Jessup abroad under a shadow, even though it is only that of Senator McCarthy, is manifestly unfair, both to the man himself and to the work of the American delegation. But many Senators were determined not to be forced into a decision between seeming to support Senator McCarthy, by disapproving Dr Jessup, or seeming to approve the Administration's policy in the Far East by confirming him. In fact, the allegations which weighed most heavily with the subcommittee were not Senator McCarthy's—his charges that Dr Jessup had "an affinity for Communist causes" made little impression—but Mr Harold Stassen's more sober, if equally untenable, line that Dr Jessup's errors of judgment were responsible for the collapse of General Chiang Kai-shek. In the view of Senator Smith of New Jersey, whose usually thoughtful vote was the crucial one, Dr Jessup was a "symbol of a disastrous China policy."

The State Department must accept a large part of the responsibility for the result. It not only allowed Dr Jessup's appointment to be fought out on the irrelevant, much-scarred Chinese battlefield, but it also refused to admit any possibility of past error, to the disillusionment of its friends. Recognition of Communist China was never even "considered"—a statement which Dr Jessup had to qualify almost at once. It had been "examined"—with a mind closed against change—but not "considered," which would have involved an open mind. An assumption of infallibility which requires such hair-splitting may be an understandable reaction to the McCarthys and Stassens, but it does not make for confidence in the candour or courage of the State Department. Mr Acheson recently complained that the number of candidates for the foreign service had fallen off by half, mainly because of an unwillingness to undergo personal attacks in Congress. It is not an inviting prospect when a man of Dr Jessup's eminence is tarred apparently in the hope that some of the pitch will stick to his friend and sponsor, General Eisenhower. But the State Department will also have to be more adroit and courageous in defending its men and its record. This may be easier now that Senator Taft, as a formal candidate for the Presidency, has decided it would be wise to dissociate himself a little from Senator McCarthy.

* * *

Ethics for Officials

The need for a stricter code of conduct for public officials became painfully clear during last spring's investigation of the Reconstruction Finance Corporation, the giant

government lending agency. A sub-committee under the chairmanship of Senator Douglas of Illinois was charged with considering the whole problem and, in particular, Senator Fulbright's proposal for a permanent Commission on Ethics. It placed its findings last week before a public even more perturbed by new revelations of corruption and improper behaviour in the collection of federal taxes. So cynical were Americans becoming about the feathering of private nests by public servants that President Truman, without waiting for the report and, indeed, without giving the committee credit for the idea, asked an unenthusiastic Congress to adopt one of its main recommendations: that Congressmen and all federal officials with salaries of over $10,000 a year should make annual statements of their income from other sources.

The report is the work of a group of Senators, drawn from both parties, who are noted for their liberal outlook and reforming zeal. They allot the lion's share of the responsibility for the "degeneration of moral standards in government" to the executive, but the share of Congress is not overlooked, and the report recognises that low standards in the conduct of public affairs are a symptom of low standards in the country generally. Influence "pedlars" and other operators in the twilight zone between legal and illegal behaviour can exist only as long as businessmen and others are willing to patronise them. As a former Secretary of the Interior, Mr Harold Ickes, has noted "No public officer ever bribed himself." The committee was particularly concerned to discourage the idea, which seems to be so prevalent, that anything is proper which is not specifically forbidden by law.

The report endorses the creation of a citizens' committee on ethics in government, but it also makes a number of specific recommendations for tightening the law and lays down a code of behaviour which might seem elementary if recent abuses had not shown how often it is disregarded. For example, it would make it a cause for immediate dismissal for an official to use his position or confidential information in his possession for private profit, or to accept valuable gifts from those with whom he did government business. Former federal officials would not be allowed, for two years following their resignation, to appear before the agencies in which they had worked, and they would never be permitted to take part in cases which they had handled for the government.

Sports on the Spot

Last week Congressmen were able to take their eyes from their television screens and return to more serious business. The World Series was at an end, and the Congressional inquiry into monopoly practices in major league baseball and the "bondage" of professional players—postponed since the World Series began last summer—was reopened. The great American game is disturbed by dissensions from within and without, and Mr Peewee Russell, Mr Lou Boudreau and other leading players have been appearing before a House sub-committee in Washington to give their views. Among the controversial issues are the reserve clause and the "farm system," by which the major leagues have been able to keep good players down in the minor leagues; and the "blanket exemption" for baseball from the anti-trust laws which is proposed in three bills now before Congress.

But baseball is not the only sport to be disturbed by monopoly charges. The government's Anti-Trust Division has opened an inquiry in New York into an alleged ring in prize fighting, a business which yields about $14 million a year, apart from radio and television rights. Many stars of the ring, including Mr Sugar Ray Robinson, Mr Jack Dempsey and Mr Gene Tunney are due to appear as witnesses before the federal grand jury conducting the investigation. Already Governor Dewey, disturbed by exposures of the influence of racketeers on the sport, had ordered a sweeping investigation into the policies of the State Athletic Commission, which is likely to affect the stranglehold of the International Boxing Club on the promotion of fights in the city. The IBC was formed in New York two years ago, and quickly absorbed the previous prize fight monopoly, Mr Mike Jacobs's Twentieth Century Sporting Club. It now holds exclusive contracts with nearly every champion in the game, in addition to the control of all boxing in Madison Square Garden, the city baseball parks, and sports arenas throughout the country. The IBC was responsible for keeping the Robinson-Turpin fight off home television screens in New York, and for restricting television shows of the fight to theatres at least ninety miles away.

The government has also brought its first actual anti-trust action in professional sport, against the National Football League in Philadelphia, and its twelve member clubs. The league is charged with restricting the broadcasting and television of games by boycotting certain radio stations, and by cutting out television and radio broadcasts of the games in certain areas, to protect gate receipts. This may be the prelude to further actions by the government, for the Assistant Attorney-General said, "If we are successful here, and the shoe fits anywhere else, they will have to wear it."

New Footing for the Reserves

In September the Army announced that all men who had fought in the Korean war last winter would be relieved by men from the National Guard and Regular Army units; they will be home for Christmas. With casualties in Korea exceeding 1,500 a week, there has been strong feeling in the House of Representatives about the continued use in Korea of inactive reservists who served in the last war. The House recently tried to reduce the maximum service of inactive reserves from 17 to 12 months. This was defeated in the Senate on the score that this would mean withdrawing men before replacements were available—but only on the understanding that the calling up of inactive reservists with war service is virtually at an end.

For the army, rotation of men from overseas service is a major headache since, as one of its spokesmen has said, it is "in the unique position of attempting to mobilise, to release large groups of personnel, and to fight a war all at the same time"—with the continuing problem of keeping Reserve and National Guard units up to strength. The taking of individual replacements from National Guard units, which like to serve together, is unpopular, but no other sources of trained men are readily available. Under the new military service act, about 500,000 married men without children are no longer exempt, but owing to a rejection rate of nearly 50 per cent, and for other reasons, less than 200,000 will in fact be available for immediate call-up.

Dissatisfaction with the present reserve system is based both on its inefficiency and its injustices, and is shared by the Department of Defence. Many men from the inactive reserve have been called before members of the active reserve; most of them had never contemplated service abroad in a "limited emergency"; many were called whose dependents would have entitled them to exemption under conscription or whose skills would have found them specialists' jobs; many, when recalled, were found to be physically unfit.

Mrs Anna Rosenberg, Assistant Secretary of Defence for manpower, has said that it now takes from nine months to a year to get a reserve division ready for combat, while a new system drawn up by the Department of Defence will cut that time by a half. The House has now approved this plan, which will divide reserves of all the services into three categories: ready, standby, and retired. Conscripts would pass into the ready reserves after their military service as, eventually, would those boys of 18 and 19 who undergo Universal Military Training, if Congress approves the UMT plan which is now being drawn up. At present the President has authority to recall all classes of reserves, subject only to Congressional limitation on the total size of the forces. After 1953 under the House Bill the President could call the ready reserve to active duty, on his own authority, but Congress will specify the size of the ready reserves. The standby and retired reserves could be recalled only by Congress or in time of war.

Shorter Notes

Leaders of the unofficial dock strike in New York which in the last ten days has piled up over $11 million of cargoes on the waterfront, some of them military, have offered to return to work provided the men are given another opportunity to vote on a new disputed contract. Dissatisfaction with this agreement, which provides for a ten cent an hour increase, all that is allowed under the wage stabilisation rules, is the immediate cause of the strike, but dissatisfaction with Mr Ryan, the life-time head of the longshoremen, is of long standing and has caused many dock revolts.

*

Congress has approved a resolution and Mr Truman has issued a proclamation ending the state of war with Germany. As the President noted, efforts to conclude a peace treaty with Germany continue to be frustrated by Soviet policy, but the proclamation means that Germans are no longer enemy aliens and may, among other things, sue in American courts.

*

The New York Court of Appeals has upheld the ban of the State Board of Regents on "The Miracle," the Italian prize-winning film. The vote was 5 to 2. The majority argued that the banning of the film as sacrilegious was justified and that freedom of the press was not involved because films are primarily a form of entertainment. The licence of "The Miracle" was revoked after Cardinal Spellman had urged all Roman Catholics to boycott it. The distributor plans to appeal the case to the Supreme Court.

*

One of the four Communist leaders who jumped bail after they had been convicted under the Smith Act of conspiring to teach the overthrow of the government by violence has been arrested in Mexico and deported to the United States to start serving a five-year prison sentence. He is Mr Gus Hall, national secretary of the American Communist Party. The United States has no formal extradition treaty with Mexico, but enjoys "good working arrangements" with the Mexican police.

*

The Army, Air Force, and Navy at home have, or will soon have, a new grievance—lack of beef. Last week the cupboard was almost bare, warehouses were empty, and the troops were threatened with a pork and poultry diet. Packers are unable, under the present price regulations, to buy beef for the Forces and sell it at a profit, and an attempt to buy 10 million pounds of beef abroad has been almost fruitless.

*

The first amendment to the Taft-Hartley labour relations Act has been accepted by Congress. It abolishes the requirement that before a union shop can be established, a special poll of the workers must be taken. Under a union shop, all employees must join the union within thirty days of being hired; few workers have been found to oppose this arrangement. The Bill also legalises 4,700 union shop clauses endangered by a Supreme Court decision in May.

FLIGHTS TO SOUTH AMERICA

Fly
QUICKLY AND SAFELY TO
Rio, Montevideo,
Asuncion, Buenos Aires

... AND OVER 60 OTHER SOUTH AMERICAN CITIES

To business people and private individuals planning a trip to South America—Panair do Brasil offers distinct flying advantages. It is the largest internal air network in the world. It covers all principal South American cities and more than 60 others, as well. The four-engined Bandeirante aircraft of P.A.B. have crossed the South Atlantic over 1,800 times—more often than any two other airlines combined! You travel in absolute safety and superlative comfort. Moreover, frequent flights and fast service ensure that you reach your destination in the quickest possible time. And bookings are reasonable. If you are planning a trip to South America, consult P.A.B. first. Full details of flights and fares will be gladly supplied by any travel agency—or by Panair do Brasil, London Office: 193/4 Piccadilly, W.1. Telephone: Regent 7292.

THE WORLD OVERSEAS

Oil and Bases in Iraq

(By a Correspondent)

FOR the last five years, whether in the limelight or temporarily in the shadows, Iraq's two major questions, one touching the national purse and both the national pride, have been treaty revision and the oil royalties. In neither are the Iraqis likely to see any *prima facie* identity of interests between themselves and the British—except very generally in the preservation of peace and harmony. Both provide fair game for violent "patriotism" and demagogy; and in both there is now, through events outside Iraq territory, a change of emphasis which could be menacing.

In the Anglo-Egyptian crisis Iraq, like a good Arab League member (though Iraq and Egypt were never cordial), announced its backing of Nahas; and now it is not possible for Baghdad, with its hot-headed public to consider, to sit still and brood over its own treaty, six years older and staler than the Anglo-Egyptian. Moreover, with Mossadegh on the war-path next door, the oil interests in Iraq—not less alien or less monopolistic than AIOC in Persia—must

expect to run into some trouble. The impression so far given to newspaper readers may be that Iraqi statesmen are behaving with more restraint and with less flagrant xenophobia than those of Cairo or Teheran. There has been no explosion, no ultimatum: Nuri'Said is known for as much of an Anglophile as a veteran Arab patriot and present party leader can afford to be: there is—and has been for thirty years—a fairly wide social, as well as official, field where Englishmen and Iraqis have got on well together. It is tempting, therefore, to hope that all may yet be well.

The 1930 Treaty was not made, as was the Anglo-Egyptian, under the stress of Mussolini's aggressions: and it has already lasted for twenty years, which indicates that it is a sensible and serviceable treaty. The trouble is that it was made in Mandatory days: it accords Great Britain unusual privileges, such as military bases, joint control of railways, and privileged status for the British Ambassador, and it aligns Iraq willy-nilly with Great Britain in its foreign relations regardless of what present-day Iraqis may prefer. To that extent it represents something less than the "complete independence" which Middle Eastern states take so seriously. To attack and "amend" this treaty was the invariable programme of Iraqi Oppositions in the period from 1930 to 1939—just as to flout it was the aim of Rashid' Ali and his generals in 1941.

Inevitably, therefore, there was a demand for treaty revision after the war; and after friendly discussions the Treaty of Portsmouth, blessed by Mr Bevin and the Iraqi Regent and Cabinet, was signed in January, 1948. But before the ink was dry it was rejected by a violent uprising of all the opposition elements, and the Baghdad mob which they mobilised. The Ministers responsible fled for their lives: the security forces were demoralised: and the restoration of an outwardly normal atmosphere in Iraq took some months under a caretaker government. This is a measure of the explosiveness of treaty revision in Iraq. It is true that the stage management of Salih Jabr's Government was poor: politicians outside the government clique were not consulted, the public temper was misjudged, the best Ministerial spokesmen were all absent when most wanted, and the Opposition staged a remarkably unified effort—with the Communists certainly playing a part. But it became clear that mass emotion on an alarming scale can be aroused by critics of a treaty that hurts the national *amour-propre*—above all, when the question of British air bases is emphasised.

Everybody knows the British objectives: stability and security, the goodwill of both the public and the government. communications that work and are available at need, a fair field for oil-production on agreed lines, and—hitherto—actual military bases. The trouble is in the last item. The 1930 treaty greatly restricted the RAF and its role: the 1948 draft further gilded the pill of "foreign troops on our soil" by hopes and palliatives. But the RAF is still there and still resented, and to secure its continued use of Iraq bases may or may not be possible. The Iraqis are certain to demand complete evacuation, as Egypt has; no party or politician can stop short of that and survive. At the best, some arrangement for joint forces (perhaps under Iraqi command), or some provision for the RAF's re-entry in case of war or imminent threat of war, might be accepted and produce agreement: at the worst, British insistence on remaining in occupation of Habbaniya and Shaiba airfields may lead straight to a head-on collision, with incalculable results—which would certainly include measures against the oil company.

Nor is it certain what line Iraq—as well as the other Arab States—will feel bound to take if the Anglo-Egyptian dispute actually turns into war; nor, more generally, whether Britain can reach any acceptable agreement with Iraq unless and until the outcome of Egypt's treaty repudiation is clear. In any case the position is hopeless unless it is realised that genuine goodwill is by far the most valuable of Britain's objectives, since without it nothing can work; that the feelings of the Iraq public, however regrettable or incomprehensible, must be taken into account; and that no statesman, whether Nuri or another, can steer through his Parliament a treaty opposed by mass emotion and therefore extremely dangerous to himself.

The oil question is partly financial: the Iraqis want a great deal more money per ton of oil, and they believe that the company's profits justify this. But because it may well be no longer a question of royalties only, but of the whole status of the oil industry, the question is also political or psychological. The Iraqis dislike the management of their greatest (or only) industry by foreigners with no Iraqi shareholding or control, and almost no Iraqis in senior jobs—and all on the basis of an indulgent concession last amended twenty years ago. On the financial side, the Iraq Petroleum Company and its associates has in fact travelled a long way, though possibly without much adroitness of timing. In 1950 it agreed to raise royalties from 4s. (gold) to 6s. per ton; in 1951 it has agreed in principle to conform to the fifty-fifty basis suddenly announced last year by the "Aramco" concessionaires in Saudi Arabia. A great deal of work has been done in fitting this formula to the complicated needs of the I.P.C.'s multinational shareholding groups, all with their own domestic fiscal problems; a fairly detailed basis of agreement with the Government has been initialled and is now, it is believed, about to be completed.

Meanwhile the course of events in Persia has had its repercussions in Baghdad. There is no Mossadegh there, but a number of journalists and deputies are clamouring for nationalisation, whatever it may mean. They declare roundly that no more mere royalties, no half-and-half shares, will do. The attitude of Nuri and his party, who today are in a majority, has so far been against nationalisation, while asserting (with perfect truth) that the oil in Iraqi earth is nationalised already. The best hope is that, with the Company formulating its offer in terms intelligible to the ordinary deputy, and with Nuri specifically identifying himself with this offer, it might be possible to secure its parliamentary ratification early in the new session, and so give the industry a few years of relative security. The prospect of very large revenues in and after 1952; the obvious fact that the I.P.C.'s pipelines run across other people's countries; the better relations between Company and Government than seem to have existed in Persia; the present disposition of the Prime Minister and his advisers—all these factors encourage such hopes. On the other hand, politics in Iraq and the Middle East usually run away with economics (witness the fate of the I.P.C.'s southern pipeline today); the extremist and the xenophobe have great emotional appeal; the Company is accused of being sadly backward in appointing high-level Iraqis to its staff, and meagre in its publicity. Many a deputy may in the end prefer to abstain rather than "support the foreign Company."

Draconian Remedies for France?

[FROM OUR PARIS CORRESPONDENT]

THE President of the French Republic spent last week-end in the Pyrenean region inaugurating monuments to the three Marshals of France: Joffre, Foch and Gallieni. M. Vincent Auriol then went to Chasseneuil in the Charente, where a ceremony was held commemorating the Resistance. At Chasseneuil the President spoke in passionate terms of the partisan attitudes and selfish practices which were ruining France. "Why should I conceal," he said, "my apprehension at the spectacle of egoisms unleashed, of the greed of individuals and sections, of an impatience to build quick fortunes on the ruins of our country and on the miseries of our people?" Referring to the necessity of five more years' reconstruction and industrial investment the President exclaimed:

> Oh, I know well enough that life is hard, above all for the workers. But it is often among humble people that one finds the greatest dignity and the keenest conscience. I say this to all those speculators who drive prices up in order to make exorbitant profits and then complain of the severity of the taxes of which they defraud the state. I say to them: by your greed, by your irresponsibility, you are ruining your country and at the same time digging your own graves.

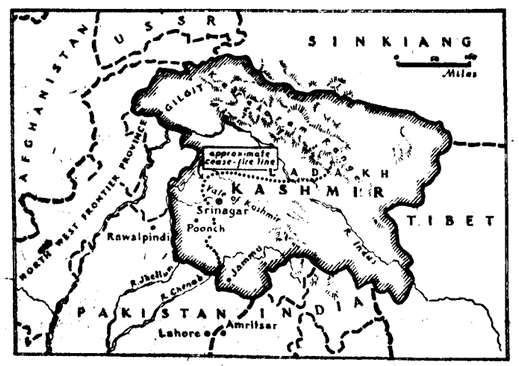
This solemn rebuke from the head of state bears witness to the gravity of France's economic predicament and to the disastrous consequences of any repetition of the profiteering of 1946-1948. As always, however, the problem is to get agreement on legislative action.

In another week-end speech, the Prime Minister, M. René Pleven, tried to extract a coherent policy from the parliamentary tangle left behind at the recess. When the National Assembly returns on November 6th it will have to decide upon the question of the sliding wage-scale (the Socialists' Bill, which has received its first reading in the Assembly, is at present before the *Conseil de la République*). Last Sunday, M. Pleven reiterated his opposition to the sliding scale, which would, he said, deprive the government and parliament of essential financial powers. The Prime Minister promised economies in the railways and in the social security system (two budgetary parasites of several years' standing); he also announced an anti-cartel bill and a trade policy to increase competition—but both, alas, are old chestnuts. M. Pleven described a further devaluation of the franc as an absurdity because, while imports of raw materials would become dearer, no compensation would be gained in the terms of trade since, in any case, the foreign demand for manufactures at present exceeded the supply. Finally the Prime Minister stated that the budget was financed too much by indirect taxes and that fraud, especially in the evasion of the sales-tax, must at all costs be suppressed.

The Budget Deficit

M. René Mayer's broadcast speech a fortnight ago left no doubt as to the inflationary danger. The measures already taken—the rise in the discount rate, the prohibition of forward dealings in foreign exchange and the restriction of bank credit, may halt speculation and impel traders to liquidate at least some of their stocks. But the problem of the budget deficit remains. M. Pleven has denied the figure of 1,000 billion francs (on a budget of 2,600 billion); but more than half that amount is generally assumed to be missing. The government has naturally been forced to reject civil servants' demands for a wage increase, and for the first time in French history the university teachers who form one of the national *élites*, have used the strike weapon against the government. The government's immediate reaction to empty coffers has been to extract more of the few taxes that it can certainly lay its hands on: the price of petrol has been raised from 53.60 francs to 64 francs a litre and stamps on letters are to rise from 3½d. to 4½d. Will M. Pleven be able to continue his resistance to wage demands when the Assembly meets? Will he, indeed, be able to govern at all? Nothing is less certain.

M. Jacques Fauvet of *Le Monde*, who is the greatest living master of French parliamentary nuances, indicates three possible majorities in the Assembly, all of them uncertain. The basic fact is that the Socialists will not join a government until the recently enacted law granting state aid to non-state (Catholic) schools is repealed. Few tears would be shed over their absence by their colleagues of the Independents, Radicals and MRP, who, when they are themselves agreed, can muster a simple majority if the Socialists do no worse than abstain. Unfortunately the latter are apt to vote with the permanent double opposition of Communists and Gaullists—this was the unholy alliance that voted for the sliding scale before the recess. The collapse of the coalition that emerged from the general election last June which was brought about by the schools dispute seems indeed irreparable.



In Indian Kashmir

[FROM OUR SPECIAL CORRESPONDENT]

ALTHOUGH Dr Graham presented his report to the Security Council last week, the Council adjourned without discussing it and there will be perhaps six weeks delay before they do. Coming after the death of Mr Liaquat Ali Khan, however, this postponement by no means shelves the Kashmir issue. A new period has opened in relations between India and Pakistan and no one knows yet what it may bring. At the same time, if passions run deep outside, a visit to Kashmir itself is always an anticlimax. The Kashmiris themselves feel so much less strongly about the Kashmir problem than their neighbours do.

In the part of the country occupied by India, the people —both government and opposition—would have liked to be left alone to cultivate their garden. Having to choose between India and Pakistan is a *pis aller* forced on them by world circumstances. They have to lean on someone, as they put it, and being pre-eminently reasonable they like to calculate delicately who has more to offer. The balance is a very nice one, and nobody in Kashmir gets excited enough to call his opponents traitors.

To appreciate the situation one must go back twenty years to 1931 when, under Sheikh Abdullah's leadership, the

people of Kashmir first began to revolt against their Maharaja. Between 1931 and 1947 it cost them, they say, some 500 lives, and made of Sheikh Abdullah a unique national hero. His party began as the Muslim Conference, for the Maharaja's rule was uncompromisingly Hindu ; but from the beginning some Hindus, like the present Director-General of Rural Development, were with the Conference. It decided, therefore, in 1939, to change its name to the National Conference, and then occurred the split which lies behind much of what is happening today. Chaudhury Ghulam Abbas led a section of the more strongly Muslim members out of the party and started a break-away movement under the old name. Today he is the leader of Azad Kashmir and many of those who left the National Conference with him are in Azad too.

The Muslim Conference grew with the growth of Muslim feeling in India, but it never formally became part of the Muslim League and when Mr Jinnah came to Kashmir in 1946 he found little support ; in one town he was actually stoned. The Muslim Conference, however, attracted the richer and more conservative Muslims, men who were frightened by such radical proposals as land-reform and the emancipation of women. Most notable of its supporters was the Maulvi, Yusuf Shah, once the Maulvi of Srinagar's biggest mosque ; he is now in Azad, but is still a name of power with Srinagar's middle class.

Many of the Muslim Conference's followers are still in the Valley and they, together with the classes which have been hard hit by the war and the bad economic conditions of recent years, are pro-Pakistan. This opposition does not, however, as both Pakistanis and Indians believe, support Pakistan because of Islam. Kashmir today is already a Muslim state. Not only are the majority of the people Muslim, but no member of the government would dream of attacking any Islamic tenet, and Sheikh Abdullah himself not only goes to mosque, but makes his main political speeches from the pulpit. What makes the opposition favour Pakistan is that they think it has more to give. They claim that food is cheaper and unlimited there, that their communications are down the Rawalpindi road or the Jhelum river into Pakistan. Above all, they hanker for Pakistan's rock salt, and attribute to Indian lake salt every ill from tuberculosis to bony cattle. Pakistan is not so much the representative of Islam as the only effective opposition, the only real alternative for those discontented with the omissions and commissions of the government. Equally, it may fairly be claimed that many of those who support Sheikh Abdullah do not worry their heads much about India. They are more interested in "New Kashmir," the manifesto of the National Conference, and its implementation. The original programme was a mixture of all the idealisms of the optimistic thirties, from the equality of women to equal opportunity for children, from work as a right to work as an honour. But there is nothing communist in it beyond the red of the cover and the stylised sickle and hammer of the flag.

What Reforms Have Done

Sheikh Abdullah, indeed, claims that his reforms are the best possible insurance against Communism. Education is being reorganised to make the children learn through doing and not through parrot repetition, and in the new Kashmir University examination standards are being stiffened. In the Valley alone some 350,000 acres of landlord land are being given out to perhaps 150,000 tenants, though the landlord is not completely expropriated: he is left his house, his orchards and 23 acres. *Jagirdari* has been abolished, and £1,600,000 of technically outstanding debt is being reduced to about £200,000. Land foreclosed as long as ninety years ago is being restored to the peasant wherever its proceeds can be assumed to have equalled the debt. The co-operative movement has been built up to a membership of 105,000—from 21,000—and an annual turnover of £1,250,000. It carries on the whole trade in salt, cloth and kerosene at distribution charges varying between 5 and 9 per cent. A hundred miles of village road and thirty miles of *bund* are being built per year, largely by villagers themselves. And lastly, rations have been increased by 25 per cent since 1947, until they are half as big again as India's—though the Kashmiris, of course, still complain of starvation.

These reforms and Sheikh Abdullah's own personal popularity are the arguments which are most used to justify the present regime. But it is also sometimes contended that the Kashmiris owe a duty to the Muslims of India and that Kashmir has obtained more autonomy from India than Pakistan would have granted. The Maharaja's government acceded to India only for foreign affairs and defence (in which it is not very interested), and communications (which means only a few telegraph lines) ; everything else, from fundamental rights to income tax, the Kashmiri administration keeps in its own hands. It is also contended that the Kashmiris hate Punjabis and that Pakistani rule would mean Punjabi rule. Half the administration is still Hindu, though the number of Muslims has increased, and it would certainly be difficult for Pakistan to replace them with anybody but Punjabis. Finally, there is an economic argument that, wherever the roads may have gone to, the markets for fruit and handicrafts are in India, and the tourists come from India.

The majority of the people are thus neither pro-Pakistan nor pro-India ; they are only for a change or for Sheikh Abdullah, and between these alternatives, their views swing with the economic situation. Those who remember American lavishness and trekking British officers ; those who have lost their land or have had their trade taken away by the new government emporia and government co-operatives ; those, too, who simply feel hungry, are all for a change. Those who have been given land or relieved of a debt, or who had a difficulty fixed by the Deputy Prime Minister, are for the status quo. The government popularity was probably at its nadir last year, after a series of bad harvests and ruined tourist seasons ; this year there has been a bumper crop, and there have been 10,000 tourists, the land reforms have got going and traffic is flowing smoothly over the Banihal. So the government's popularity is rising, the opposition has lost some of its flame, and even the frustration of suspense is mitigated by some feeling that time is being gained in which to act and to judge so that the ultimate decision may have some chance of being taken on its merits.

How a plebiscite would go is, of course, impossible to say, but if 1952 is a good year Sheikh Abdullah's chances might be bright indeed. Meanwhile, perhaps there is something to be said for his view that it is time the mediators came and mediated between him and Chaudhury Ghulam Abbas. They would be so much less passionate.

Liaquat's Achievement

[FROM OUR CORRESPONDENT IN PAKISTAN]

THIS article is being written in Rawalpindi while the workmen are still dismantling the ill-fated dais in the "Company Bagh" on which Liaquat fell mortally wounded. The fog of rumour has not yet cleared, and people are still trying to adjust their thoughts to the idea of a Pakistan without Liaquat. For he had that dangerous thing, power, in a measure that would have gone to most people's heads. Yet his equable temperament did not lend itself to bombast or overweening ambition ; practical-minded, imperturbable in success or adversity, he followed the ways of reason and moderation even when it cost him popularity. He kept his head out of the clouds, just as he kept his feet out of the mire.

In the field of foreign affairs Liaquat's policy met with a good deal of criticism, mostly inspired by impatience. "At least," a Pakistani was heard to remark on the morrow of the tragedy, "we shall now get an independent foreign policy"—the implication being that Liaquat had tied Pakistan to the leading strings of Britain and America. The speaker, like many others, believed that Pakistan should follow the middle course of neutrality—*medio tutissimus ibis* —joining other like-minded countries in aspiring to hold a balance between the Russian bloc and the western powers. Advocates of this policy do not appear to have sufficiently considered its logical consequences. They should ask themselves whether India has done itself, or its international standing, any good by its policy in respect of Korea and the Japanese peace treaty ; but perhaps they do not realise that they are urging Pakistan to follow India's example.

Let us assume that Liaquat's foreign policy during the past few years has been designed primarily towards the winning of Kashmir for Pakistan. Let us also adopt an entirely cynical line of argument, because that is the type of reasoning required to convince most Pakistanis in their present mood. It will be agreed that the Pakistanis cannot hope to win Kashmir by themselves, and Liaquat, accepting this, saw clearly that only the United Nations Organisation—with all its procrastination and weakness—could do the trick for them. Logically, therefore, his proper course (quite apart from the moral aspects of the matter) was to follow a policy of co-operation with the UN and with those countries which commanded most votes there ; that is to say, Britain and America. And by his steady co-operation, by the contrast between his consistent willingness to submit all Pakistan's differences with India to arbitration and India's manifold inconsistencies, Liaquat brought world opinion slowly but surely to the side of Pakistan in this dispute. This was a magnificent achievement, which one false move could easily have cast away.

Jugoslavia Today—II

Tito's Battle with the Peasants

[BY A CORRESPONDENT RECENTLY IN BELGRADE]

IF Jugoslavia is to surmount the present economic crisis it must solve the problem of agricultural production. This is at present well below what is needed. Livestock last year showed a decline in numbers and the proportion of land sown is still below the prewar figure. Before the war agriculture provided 56 per cent of Jugoslav exports and supported 75 per cent of the population—a third of whom were virtually unemployed and certainly undernourished. Today agriculture supports 68 per cent of the population and provides less than 33 per cent of Jugoslav exports. Contrary to the popular belief, the consumption of food per head in Jugoslavia has increased since prewar days, particularly in meat, sugar and wheat products. This partly explains why there is less food for export ; a more serious reason is that the peasants are no longer producing as much as they could.

This go-slow policy by the peasants is not only a reaction to Tito's government. It has been perfected during the past twelve years of unstable conditions. War, revolution, Communism have not produced conditions likely to persuade peasants to plan ahead for greater production—the risks were too great. Moreover, in Jugoslavia, as in all east European countries, the memory of the nineteen thirties, when food prices reached rock bottom, is still as sharp and bitter as the memory of unemployment in any mining area in Great Britain today. The peasants have reached a stage in which they can produce as much as is necessary for their own comfort ; if they are to go beyond this they will need some powerful incentive and a feeling of confidence that the government will share the risk. So far they have not received these from Tito's government.

Government policy since the war has aimed at encouraging the small and middle peasants and discouraging the richer peasants or kulaks. Since holdings were limited to 35 hectares in all (25 hectares of arable land) kulak could mean anyone with 15 hectares or with a particularly prosperous holding.

Co-operatives Not a Success

All private peasants have been subject to compulsory purchases by the government (OTKUP) at very low prices. They also had to pay heavy income tax. The assessment of both these has been arbitrary and designed to cripple the richer peasant. At the same time a government campaign, backed by moral and economic pressure, has been carried on to try to persuade the small and middle peasants to join their land into co-operative farms. It was to be a form of collectivisation without nationalisation of land. In theory, the co-operatives being larger units should have been more productive. In practice the machines, fertilisers, new stock, feed, even the administration necessary to make a success of co-operatives, could not be provided. Peasants who joined have been made to work in brigades as labourers and their profits were not what they had expected.

They, too, have therefore not had the incentive or the means for greater production.

One reason for the present situation is that the Jugoslav government has not been prepared to invest sufficient money in agriculture. Agriculture was the Cinderella of the Five Year Plan. Whilst industry was to have 100,000 million dinars investment over the five years, agriculture was scheduled for only 19,000 million. Though more than this figure has actually been invested in agriculture it is still much less than was needed.

INVESTMENT IN AGRICULTURE
(In Millions of Dinars)

Year	Total	State Farms	Improvement Schemes	Co-operatives	Village Centres
1947	1,712	1,416	241	23	38
1948	5,742	3,752	198	400	1,392
1949	8,204	3,218	1,664	1,524	1,798
1950	6,695	1,712	603	3,067	1,313
TOTAL	22,353	10,098	2,706	5,014	4,541

The greater part of the above investment has been internal investment much of which was spent on buildings which could be put up with local unskilled labour and home produced materials. Very little investment was in imported machinery, fertilisers, stock, etc., since, because of the development programme for industry, foreign currency could not be spared for the needs of agriculture.

The Jugoslav government has recognised the need for a new approach to agricultural problems and some changes in policy have already been tried out. The unpopular OTKUP is to be abolished for everything except cereals, fat and wool. Assessment for OTKUP and income tax is to be improved so that peasants will know their obligations to the state and can produce beyond that for their own benefit without fear of extra impositions. Food rationing is to be gradually abolished. Originally it was to end on November 1st, but this has now been postponed. It was expected that the abolition of rationing would be followed by a rush to buy food in which prices would rise and the peasants would make large profits. During October an interim scheme has been tried out in which rationing is by points which could be used for any commodity. It has been found that the demand for fats was so great that stocks were threatened. It seems likely therefore that derationing will not start until the government is sure that it holds sufficient stocks to prevent private peasants holding the whole nation to ransom.

There is also the important problem of providing sufficient consumer goods of good quality on which peasants can spend their profits—otherwise there is no incentive to sell or produce. Government officials seem confident that they have such stocks for immediate needs but they must also convince the peasants that they will be available in the future.

Peasants Try to Leave Co-operatives

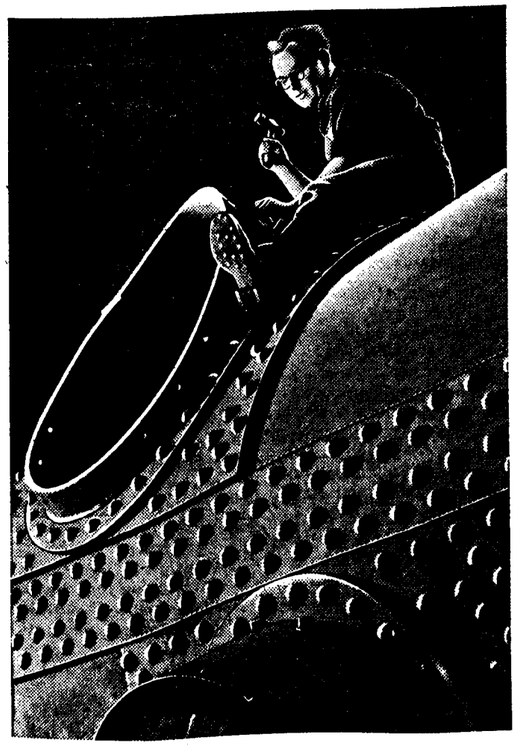
One of the promises originally made to peasants who joined co-operatives was that they could leave after three years if they were not satisfied and take away land equivalent to their original contributions. Although the three years is now up for many peasants, it seems highly improbable that they will be allowed to leave except in the very few cases where undue pressure can be proved. Already charges of sabotage have been made against lawyers who were prepared to take up the cases of peasants trying to leave co-operatives.

It is now clear why Tito's government cannot abandon its policy of encouraging co-operative farms; 75 per cent of Jugoslav agriculture is in the hands of private peasants who can exact high prices for their produce and force the government's hand simply by refusing to sell or to produce. The 25 per cent of agriculture which is made up of co-operative and state farms is still barely enough to act as a brake on peasant monopoly. The government's policy at present is not to increase the number of co-operatives but to make existing ones more productive. Food shops for the sale of co-operative products are being opened up all over the country. Co-operatives that supply food to these shops are being given coupons entitling them to reductions and to priorities in the purchase of industrial goods. They are also being encouraged to export surplus food and use the currency thus obtained to buy goods abroad for themselves.

Modifications in the way co-operatives may be run are also being considered. An experiment in Istria in which the brigade system was abolished and peasants were allowed to work co-operative land in family groups has received much praise. It is also significant that encouragement is now being given to General Co-operative Guilds. These organise planned production and co-operative buying and selling but they leave the peasant free to till his own soil and work for his own profit.

Thus considerable modifications are being introduced into the previous rigid policy for agriculture. But as long as nearly half the annual investment programme is scheduled for industry agriculture cannot be greatly developed. This is one of the anomalies of Jugoslav planning. World prices for food are high and likely to remain high; and many outside observers think that Jugoslav prosperity could be more rapidly achieved if investment could be adjusted in favour of developing the country's undeniably rich agricultural resources.

One important aspect of the whole problem of agricultural production is that by its very nature, it takes time, and therefore policy must be long-term. If peasants are to plan ahead to increase numbers of stock and extend their crops they need confidence that the government will share their risks and that its policy will be stable—not reasonable this year and harsh next. They need some assurance of a peaceful future. This Tito is powerless to give; but it is still in his power to restore the peasants' confidence which has been shaken by their experiences of the past few years.



(To be concluded)

Formosa—Outpost or Base?

WITH the signing of the Japanese peace treaty and the formal termination of Japanese sovereignty in Formosa, there can no longer be any juridical uncertainty about the status of Formosa; for although it has not been formally transferred to China—there being as yet no Japanese-Chinese peace treaty—there is no other nation but China to which its ownership can revert. The Nationalists have always agreed with the Communists that Formosa has been Chinese territory ever since 1945, as against the view that it was only Chinese-occupied territory before the San Francisco treaty; this was indeed the only subject on which Peking and Taipeh took a common stand.

The preservation of Formosa as a Nationalist stronghold since the Communist victory on the mainland of China now means that in international law, as well as Chinese opinion, a portion of Chinese territory rather larger than Holland remains under the rule of the Nationalist government. And as long as this is so, it is not a government-in-exile, even though the area of its control is very small in comparison with the vast size of the domain of Chinese Communism. This fact is of considerable importance, for in a civil war a beaten party which retains some foothold in the national territory has a much better chance of revival than one which is driven out entirely and only survives among refugees in foreign countries. Exiles are not only deprived in time of peace of the opportunities for action which they retain as

On the job for 158 years

There is a purposeful ring in the air of a Newton Chambers engineering shop. For here men work with a vigour, a sureness of touch, and a sense of pride which betoken a skilled team. In this same place have worked the fathers' and grandfathers of present-day craftsmen, and here, most likely, will work their sons and grandsons. And everything that leaves these workshops carries with it this spirit—this background. *At Newton Chambers every present-day development rests on the sure foundation of 158 years of hard-won experience.*

long as they have a base in their own country, but they are inevitably demoralised by the mere fact of being in exile and under alien sovereignties. In China the existence of a large island a hundred miles from the mainland gave Chiang Kai-shek a relatively secure place of refuge, as long as he retained naval superiority over the Communists, and preparations for retiring there were taken in hand long before the campaign on the mainland was at an end. To-day Formosa is more of a thorn in the side of the Chinese Communist regime than appeared possible at the time of the fall of Canton two years ago.

In the early months of 1950 Nationalist morale in Formosa was very low, not only because of the long run of previous defeats, but also because of the withdrawal of American support and the obvious trend of Washington's policy towards disentanglement from Chinese affairs, if not immediate recognition of the Communist regime. Chiang Kai-shek might well have felt as down and out as the whole world considered him to be. But just as in 1940 and 1941, in spite of an apparently hopeless military situation, he rejected all Japanese peace feelers because he believed that the Japanese were bound to overreach themselves and get involved in a war with the United States, so in 1950 he was sure that the Chinese Communists would overreach themselves and help him to survive by doing something that the Americans could not tolerate. His expectation was correct, for the aggression in Korea, first politically and then militarily supported by Peking, has brought him not only the naval protection which may or may not have been indispensable to his tenure of Formosa in the summer of 1950, but also the material and moral support which has enabled him to reorganise and re-equip his forces in the island as a serious military factor.

Activities of American Mission

In recent months American aid to the Nationalists in Formosa, both military and civil, has been more prompt, more suitably directed and, being in such a confined area, far better concentrated than American aid used to be when the Kuomintang held most of China. A strong American military mission, led by a general who formerly served in the Marine Corps, has been intensively training the Nationalist army, giving special attention to amphibious operations and landing tactics. An observer who recently travelled extensively in the island has reported that the morale of the troops appears to be high. It is believed that the Nationalists could now put up a very good fight against a Communist invasion from the mainland, even if American naval protection were to be removed. The whole of the coast facing the mainland has been covered with a system of beach defences planned with American technical advice, and invasion today would be a far more difficult problem for the Communists than it would have been two years ago.

The defence of Formosa, however, is no longer the foremost issue in the minds of the Nationalist leaders; more and more they talk in terms of returning to the mainland and being themselves the attackers in the near future. The training of the troops in landing operations appears to indicate that the American military advisers sympathise with these intentions; it has indeed been stated by the American mission, in response to the curiosity of journalists, that the object of the training is merely to enable the defenders of Formosa to counter-attack an invading army from the sea if it should succeed in landing, but this explanation is not taken very seriously by people on the spot. The current mood of the Nationalists is one of hope for an early opportunity to take the offensive. Their morale, indeed, ultimately depends on this idea, for they have never regarded Formosa as anything but a temporary refuge, nor have they ever had the aim of making it a separate state. They claim without any abatement to be the legal government of all China, and as long as the United States and a number of other nations continue to recognise this claim, they feel that they have strong moral support for their position.

There are three hypothetical situations which might give the Nationalists in Formosa a chance to re-emerge from their insular fortress. The first is a revolt within Communist China, which would open the way to new combinations in Chinese politics. There has so far been no sign of such an outbreak since the inauguration of the Peoples' Republic: indeed, the Communists have been more successful in coping with "war-lordism" than any Chinese government since the fall of the old monarchy, and the key positions in the army are held by party members of long standing. It still remains possible, however, that if the regime gets into difficulties, rebellion may flare up in some part of China with assistance by air from Formosa. Perhaps the most that can be said of this prospect is that it is somewhat less improbable than the Titoist evolution of Mao Tse-tung, which *is the favourite* speculation of British diplomats.

The second possible opportunity for the Nationalists would be provided by an unrestricted Sino-American war, whether arising from a local conflict in the Far East or by the extension of a war starting elsewhere; in such an event the Americans would certainly make every effort to overturn the Chinese Communist regime and restore the Nationalists, at any rate as part of a coalition of anti-Communist elements in China. The third possibility—and the one which the Nationalists themselves apparently regard as the most likely to be realised in the near future—is an intensification of Chinese Communist support for the Vietminh, with consequent French and American support for Nationalist operations against the Kwangtung coast and Hainan. Taipeh is at any rate confident that, while Mao and Liu hold power in Peking, there cannot be any real restoration of peace in the Far East, and that as long as a near-war situation continues, Nationalist Formosa will remain indispensable to the United States.

Liberation of Europe's Trade

UNDER the militant title *Code de la Libération*, the Organisation for European Economic Co-operation has published an anthology of its efforts to liberalise trade between the countries of Western Europe. It contains the final text, as adopted by the Organisation in July this year, of the principles to which all eighteen nations, with remarkably few reservations in practice, have now subscribed. It is a record of solid achievement since August, 1949, when the Council of the OEEC first took the bull by the horns and declared "as complete a liberalisation as possible" by 1951 to be a major objective of its operations.

Both in theory and historically, two distinct but connected themes have run through the working out of this objective. The first was the comparatively simple one of freeing as much as possible of each country's private trade with other members in the area from import and currency restrictions: in fact, to make some inroad against the barriers to trade which were the result of postwar shortages and financial crises. The second was to end discrimination in trade at least between the countries of Western Europe.

By January, 1950, the member countries had decided in principle that they could liberalise 60 per cent of their imports on private account, based on actual imports in 1948, and they were in practice already importing freely up to 50 per cent of such trade. The jump from 50 per cent to 60 per cent did not in fact take place until October, 1950, when the EPU came into operation. At that date, also, it was agreed for the first time to liberalise without discrimination, which meant, in effect, that when any country abolished restrictions on any particular import, it had to do so equally for all member countries. This was a major step forward, and it was possible only because of the new flexibility guaranteed by the EPU in intra-European payments, which meant that countries could balance their bilateral deficits with their bilateral surpluses, and need only worry about their net trading position with the area as a whole. For the first time, people could no longer argue that what they could import from Holland they could not afford to import from Belgium.

So long, however, as countries were free to choose which commodities they would liberalise, liberalisation was still only flirting with the fundamental problems. Countries tended to free only those imports which did not compete with their domestic industries; and there was no incentive to lift restrictions on goods which had been imported only in small quantities, or not at all, in the base year 1948. These issues came to a head in February, 1951, when the OEEC Council met to consider whether it could raise the quota from 60 to 75 per cent. Hitherto, it had insisted that trade should be freed equally in the three main groups of commodities; thus countries had agreed to free 60 per cent of their private imports of agricultural produce, of raw materials and of manufactured goods. When it came to 75 per cent, most countries felt that they could not apply the increase to all three groups without endangering their domestic producers; the most they could accept was a 75 per cent liberalisation in their private trade with Western Europe as a whole. Feeling that this was in a sense a retrograde step, the Secretariat prepared a list of commodities which it considered could be freely imported by all member countries, without serious damage to their internal economies, but which were important to the exporting countries. In April this year, this common list was finally adopted.

Progress Towards a European Market

This was a bold and new departure. For it was, among other things, the first real step towards the American objective—the creation of a European market for European products. Only when everybody allowed free imports of the same commodities could there begin to be genuine competition between the producers of those commodities. Tariff barriers, on which the Americans had been concentrating their attack, remained; but this theoretical freedom of movement was at least an advance.

The code of liberalisation thus provides that all countries will freely import goods on the common list; further, they will freely import 60 per cent of their private trade in agricultural products, raw materials, and manufactured goods respectively; finally, they will freely import 75 per cent of their total trade on private account with member countries of the OEEC. Any member who wants to evade these provisions must satisfy the Council either that its payments position in the EPU is so bad that it cannot afford to fulfil them—as with Western Germany at the beginning of this year—or that its internal economy is threatened by serious instability as a result of this degree of exposure to foreign competition. At the present moment, the main exemptions are Austria, Denmark, Germany, Greece, Iceland and Norway, who have not yet been able either to achieve the 75 per cent stage or to adhere to the common list.

This list, by which the real progress of liberalisation must be judged, is short and distinctly miscellaneous. It runs from fishhooks to fichu, and hazelnuts to hair with major omissions in between. A number of its items are goods which countries would in any event be only too pleased to buy, such as animal feedingstuffs and hardwood. But it does contain at least two major items where competition is hot and supply comparatively easy; these are textiles of every kind and degree of processing, as well as textile machinery; and fresh vegetables. The most glaring omissions—mainly in the field of agricultural products (butter, bacon, eggs)—can hardly be laid as failures at the door of the Organisation. They are the goods which Britain, the major consumer, imports not on private but on government account. This is the main and fundamental qualification which must be made to the British claim that they have liberalised over 90 per cent of their private trade with Western Europe.

Now as the code is published, liberalisation has again reached a crucial stage. All the comparatively easy things have been done. The remainder cannot be dealt with without a real change of heart by European governments. The two problems which loom longest are government buying and tariffs. Until the British reduce their government trading activities, no one will accept at its face value their claim that they have liberalised more than 90 per cent of their private trade; for the government still controls those imports in which Europe is mainly interested. Similarly, there can be no European market in any real sense until not only quantitative but tariff restrictions have gone by the board; in other words, until national economic policies become "European" in spirit as well as in the letter of this or any other code. France, it will be remembered, greeted liberalisation with one hand and doubled its tariffs with the other; a GATT working party has now agreed that there can be no further increases in the tariffs on liberalised goods, but it has not yet touched the problem of reducing the tariffs which already exist.

These are some of the problems; and they will not be easy to solve, particularly as they have to be faced at a time when even the achievements of the past are beginning to be threatened. As France and Britain move into a position where they become net debtors to the EPU, they must begin to wonder whether they should really pay gold for the sake of preserving the freedom of British traders to import cut glass from Belgium. The code has been published not a minute too late.

Taxation of Profits—I

Profits Tax in Principle

We shall set our face against the fortuitous rise in company profits because of the abnormal process of rearmament. We shall accordingly impose a form of Excess Profits Tax to operate only during this exceptional period. At the same time a revision of the existing system of taxation on commercial and industrial profits is required. Relief will be given in cases where profits are ploughed back and used for the renewal of plant and equipment.

Conservative Party Manifesto.

We shall limit dividends by law, increase taxation on the small minority who own great fortunes and large unearned incomes, and take measures to prevent large capital gains.

Labour Party Manifesto.

IT is difficult to measure from these vague promises and threats what either of the two parties precisely intends about the taxation of profits. One of the first tasks of the new government must be to re-shape fiscal policy not in the free and easy terms of manifestos but in the more disciplined words of budgets and finance acts. The Conservative manifesto included no explicit promise of revision of the Profits Tax, but " revision of the existing system of taxation on commercial and industrial profits " ought to imply sufficiently radical changes in the Profits Tax to justify the introduction of a temporary Excess Profits Tax. A Labour Chancellor's course would be preordained—the enactment of dividend limitation and some kind of capital gains tax. All this promises rich confusion in the future ; at present it is better to begin a review of the taxation of profits on the firmest foundation of fact. The first task is to examine the history and the principles, if they can be so described, of the Profits Tax. Next, there are important points of practice that need to be illustrated. And thirdly, some sketch of the ways in which Profits Tax needs to be revised must be attempted.

Like many burdens, the Profits Tax—formerly styled National Defence Contribution—has grown from humble beginnings ; it started in 1937 as a charge of a mere 5 per cent and has multiplied tenfold until the maximum rate is now 50 per cent. In the first full year, 1938/39, Profits Tax yielded £22 million compared with £336 million from Income Tax ; during the war years it was overshadowed by Excess Profits Tax but in 1948/49 it produced £199 million (Income Tax £1,367 million) in 1949/50 £261 million (Income Tax £1,438 million) in 1950/51 £258 million (Income Tax £1,404 million) whilst the full year's yield on the basis of the higher rates introduced in the last budget will be about £425 million. It has also emphasised new conceptions in British tax practice. Formerly, the Income Tax was regarded as a tax on the incomes of individuals. In a reservation to the Report of the Royal Commission on Income Tax in 1920, a group of signatories wrote:

> The Income Tax is not a corporation tax. It is a tax upon the incomes or profits of individuals, and though for convenience it is assessed in the first instance upon corporations in which they hold interests, the amount of it is always adjusted to the income not of the corporation, but of the individual shareholders. It is true that, when a company receives profits which it does not distribute, the profits are taxed at the standard rate. But it is universally recognised that the reason for this is, not that the company as such is liable to Income Tax, but that it is impracticable to tax the separate parts of a company's undistributed profit at the rates to which the separate shareholders, to whom those parts ultimately belong, are respectively liable. The mere fact, therefore, that a number of individuals have formed themselves into a separate legal entity does not constitute the receipts of this legal entity a taxable profit under any part of the British Income Tax law.

Today that would seem an extreme statement, for a company is now regarded as paying income tax, not as an agent for its shareholders, but as a taxpayer in its own liability. The change in outlook is significant, and unfortunate, for it cuts across the principle of taxation according to the size of individual incomes and personal circumstances. Now that sharper legal distinctions have been drawn between companies and their owners, corporations have become more vulnerable to taxation since they lack those personal attributes that enable individuals to claim that their incomes, from whatever source they may be derived, should be charged to tax on a similar basis to the incomes of other individuals. Indeed, this change in conception stems from the Excess Profits Duty of the first war. From EPD, two ideas gained ground: first, that it was proper to tax profits irrespective of their cause or character, and secondly, that profits, as distinct from incomes, must be the subject of charge.

Thus, the Excess Profits Duty introduced the practice of charging tax on profits by two stages, first because they were profits, and secondly because they formed a part of the wider category of income. The Duty was charged not on the whole of the profits but only on the excess above a certain standard, and in its method and purpose it set the pattern for the Excess Profits Tax of World War II. Both were designed as temporary charges, and were unsuitable as long-term impositions since they were based on a standard period that became more inequitable as it became more remote. But the Excess Profits Duty had set a new fashion and it was not long before profits came to be regarded as *sui generis*, having a taxable capacity distinct from that which attaches to

personal incomes. In 1920, a new Corporation Profits Tax was introduced which Mr Baldwin described as:

> a tax on the industry of the country which might be left when the Excess Profits Duty was removed, and which would help to provide that increased revenue which we know will be required for a great many years.

This taxed the profits of bodies corporate at the rate of 5 per cent of all profits, before payment of loan interest. Public utility companies were exempted (as they were from the National Defence Contribution at the outset) because, as the Chancellor of the day said, "They cannot adjust themselves to a new business expense thrown upon them, and that is what this tax is. It is not a deduction from the dividends of the individual shareholder, but an additional business expense put upon the business." Corporation Profits Tax was regarded as an item of cost which could be passed on to the consumer.

The Corporation Profits Tax was followed by provisions in the 1922 Finance Act designed to charge to surtax profits of private companies that were unreasonably withheld from distribution. There is a connection between the two matters that deserves consideration. Surtax is not a tax in its own right but an additional income tax designed to maintain the principle of graduation in the higher levels of income. But undistributed profits of companies do not reach the pockets of individuals and so do not enter into the computation of total income for surtax purposes. In the absence of detailed knowledge of the incomes of the individual shareholders to whom the undistributed profits ultimately belong, Income Tax is charged at the standard rate. The 1920 Royal Commision pointed out that this practice opened the way to avoidance of surtax through the formation of "one-man" companies distributing only a minimum of their "profits" to the proprietors, and the provisions of the 1922 Act were enacted to close this gap. But if the principle is strictly pursued that profits belong, not to the company but to its shareholders, some "loss" of surtax results from profits withheld from distribution by public companies. This "loss" may provide some justification for a separate tax on corporate profits over and above the Income Tax; but if so, it is a justification that has been greatly weakened by the growth of the concept that companies should be treated as separate entities for taxation purposes.

The Corporation Profits Tax had a short life. It was repealed in 1924, and until 1937 the Income Tax reigned alone as the only charge on profits as on other forms of income. The passing of CPT was not regretted; as Dr Dalton wrote in his "Public Finance":

> A special tax upon business profits, such as the postwar British Corporation Profits Tax, now repealed, was a bad tax ... for it discriminated against a particular class of property-owners, as compared with all other classes, including debenture holders and the holders of gilt-edged securities. It was, therefore, in effect, a tax on risk bearing and tended to divert the flow of capital from risky to comparatively safe investments. But, in view of the need that risks should be taken and the reluctance of many investors to take them, this was a harmful diversion.

In 1937, Mr Neville Chamberlain introduced the National Defence Contribution in the form of a tax on a sliding scale on profits that exceeded the "standard profit" based on profits of previous years or on the capital employed. In thus seeking to tax "excess" profits in time of peace Mr Chamberlain aroused strong opposition and his original proposals were withdrawn and were replaced by others that, under a different name and with greatly different rates and methods, still operate today. The tax was closely similar in form to the Corporation Profits Tax except that it was charged upon the profits of individuals as well as upon those of corporations. It was charged at 5 per cent of profits in excess of £2,000, with certain abatements, and was initially imposed on the profits that arose "within the five years beginning on April 1, 1937." In an early commentary prepared for the Incorporated Society of Accountants the authors wrote:

> It seems desirable to point out that N.D.C. in its present form is in fact a revulsion from the more elaborate impost originally proposed. On closer study, however, it is found that its simplicity is relative rather than absolute, while in practical application anomalies are likely to be the rule rather than the exception, being tolerable only because of the low rate of the duty.

This was a sound judgment; the Profits Tax of today would no doubt be very different if it had been originally conceived as a tax of up to 50 per cent instead of only 5 per cent.

In the first budget of 1939 there appeared a rare creature—a tax upon a certain kind of profits in the form of the Armaments Profits Duty. It was to be charged for a period of three years on profits derived from business under armament contracts at the rate of 60 per cent on excess profits over certain standards. It is open to doubt whether Armaments Profits Duty would have been workable, or, if workable, equitable, for large-scale Government spending has a way of generating profits in the most unexpected quarters. But the question was never put to the test, for in the Autumn Budget of 1939 the Excess Profits Tax was enacted and the Armaments Profits Duty repealed. The Excess Profits Tax followed very closely the pattern of the Excess Profits Duty of the first war. It lasted for 7¼ years: from April 1, 1939, to March 31, 1940, at 60 per cent, then until the end of December, 1945, at 100 per cent (effectively 80 per cent when the postwar refund was taken into account), and finally for the year 1946 at 60 per cent. During these years the National Defence Contribution remained chargeable, but only as an alternative in those cases where NDC exceeded the liability for Excess Profits Tax. It was a poor, ugly duckling bringing in about £30 million while EPT was yielding £400 million or more. No one paid any attention to it, few cases were fought, and no amendments introduced.

With the end of the war no time was lost in repealing the Excess Profits Tax; the Treasury has a long memory and it did not forget the enormous repayments of Excess Profits Duty in the slump of 1920, repayments so gre

that EPD came to be described as "the most complicated arrangement ever devised for borrowing money for five years without paying interest." Like the Corporation Profits Tax twenty five years earlier, the National Defence Contribution was called upon to make up for some of the loss in revenue. It was adapted to serve other purposes as well, and its name had already been changed to Profits Tax in preparation for the more important role it was to fill. The changes in the 1947 Finance Act were far-reaching. Profits Tax has been charged since the beginning of 1947 on all profits arising from trades carried on by corporations; individuals are outside its scope. Profits are computed, with certain modifications, on income tax principles. No tax is charged on profits up to £2,000 and there is an abatement up to £12,000. From January 1, 1947, until September 30, 1949, the rate was 25 per cent with relief of 15 per cent where "distributions" fell short of the profits charged; from October 1, 1949, until December 31, 1950, the rate was 30 per cent with 20 per cent non-distribution relief and since January 1, 1951, the rate has been 50 per cent with non-distribution relief at 40 per cent. Thus baldly stated, the bare bones of the tax appear simple enough. But this impression is entirely misleading with the adaptations that have proved necessary to safeguard the Revenue and to support the high rates at which it is levied, the Profits Tax is as complicated, fickle and anomalous a tax as has ever been charged in this country.

Utility Patchwork

THE character of the utility schemes has vastly changed since they came into being nearly ten years ago. In one industry after another, piecemeal revision of the utility regulations has attempted to meet the exigencies first of a sellers' and then of a buyers' market. The changes have been made principally to widen the scope of the schemes so that more expensive and better quality goods can be sold on the home market without purchase tax. But it has been difficult to detect any coherent policy in these changes. They have acknowledged the fact that prices have risen, but they still produce a wholly artificial division of output into taxed and untaxed goods, which discriminates against products above the common run of utility standards. A joint Treasury—Board of Trade committee is now studying the effects of purchase tax on industries with utility schemes, and is expected to present its report before the end of the year. It might be timely to ask at this stage whether the utility schemes now serve a useful purpose.

Utility schemes were first and foremost a means of providing the home market in times of wartime shortage with a supply of cheap goods of at least a minimum standard of quality. They were introduced for textiles, shoes and furniture, trades in which rationing kept effective demand within bounds. The schemes had two main objects—price control and quality control. The Board of Trade set the standard for utility goods by prescribing in some detail the way in which each product had to be made. Utility clothing and household textiles could be made only from utility cloth, for which certain requirements were laid down. Cotton, rayon, and linen cloths had to be made to one of a number of cloth constructions. It proved quite impossible to list similar constructions for wool cloth from the bewildering combinations of virgin wool, re-used wool, cotton and rayon with which Bradford confronted the Board of Trade. According to the Board's statement, "Because of the nature of wool it has never been practicable to have precise specifications for wool cloth." So a compromise solution was found by which wool cloth, for the purposes of the utility scheme, meant any cloth that contained 15 per cent or more of wool. Utility shoes had to meet fairly detailed descriptions, and for utility furniture meticulous control was imposed over the size of each item of furniture, the type and thickness of wood to be used for each section and in some cases the number of screws. Given these methods of control over quality, price control was a relatively—but only relatively—straightforward matter of fixing manufacturers' prices for each category of goods and negotiating distributors' and retailers' margins on the basis of these prices.

These methods were tolerable in wartime and in the immediate postwar phase. But other extraneous considerations began to affect the working of the schemes. The departments became adept in securing a time lag between a rise in manufacturing costs and an increase in controlled prices; the result was that production schedules were sometimes thrown into confusion and the only benefit to the consumer was a low notional price for goods that he could not get. There were several utility "famines," for which the textile industries were promptly blamed by the Ministers who were primarily responsible. Such a policy of holding down prices in the face of rising costs had a different effect in industries where the control on utility qualities was of necessity more loose. In these industries, manufacturers contrived to reduce quality to sell within the Board of Trade's price limits, and again the consumer suffered. In the wool textile industry, the only stipulation about quality was that "wool cloth" should contain at least 15 per cent wool. If a rise in costs prevented a manufacturer from being able to produce a given cloth at the price laid down for a particular grade, he had only to "upgrade" it, describe it as cloth of better quality, and automatically charge the higher price permitted for cloth of that number. In the clothing industry, utility garments had to be made of utility cloth and sold at or below a certain price. The expedients of using a lower quality cloth, or less cloth, or making fewer concessions to fashions have helped to maintain a reasonable volume of utility production in the face of rising costs and fixed selling prices.

The official attitude towards rising costs is still causing difficulty. The prices of utility wool cloth and of clothing made from it are still based on the price of raw wool in October, 1950; they make no allowance for the extreme variations in wool that have since occurred. Only in the past few weeks, when wool prices began to fall below the level of October last year, was it possible to discover any official disposition to renew price negotiations with the wool industry. Prices for all the better quality cotton cloths and clothing made from them are likewise fixed on raw cotton prices of early in the year and again they make no allowance for the later rises.

A new factor has now to be taken into account—the return of a buyers' market at home and abroad. It may

be politically desirable for the Board of Trade to keep utility prices as low as possible, but broader economic considerations dictate that the consumer industries should be given every assistance to expand their exports. At phases of acute shortage, some export markets did buy utility goods. But by their nature, and even more by the policy of squeezing manufacturers between minimum standards and maximum prices, the utility schemes encouraged the production of dull and unimaginative goods of no appeal to markets abroad. A successful export drive today depends largely on the reduction of costs by long production runs that are best obtained when the same product is made for home and export. Few manufacturers of consumer goods are willing to take the risk of producing for export an article that cannot be sold at home if, as sometimes happens, the export order is cancelled, or the market suddenly closed. The difficulty has been that non-utility goods are hard, and sometimes impossible, to sell at home with their top hamper of purchase tax, and utility goods virtually impossible to sell abroad. For these reasons, the Board of Trade has latterly been attempting to modify the utility schemes so that a larger proportion of the output of an industry comes within their scope. Maximum price limits for utility articles have been raised, and strict control on quality relaxed. The top retail prices permitted for utility shoes have for the past eighteen months been so high that 98 per cent of the shoe industry's output can be sold within the price limits and often far below them. The increase in exports of shoes since this policy was adopted is something of a tribute to its success. This year, the same policy was extended to textiles. The detailed descriptions of utility cotton and continuous filament rayon cloths that were formerly in force were abandoned in favour of loose definitions (although not so loose as those for wool cloth) and the top selling prices—and the prices of clothing made from that cloth—were raised at the same time by substantial margins. (There are exceptions ; household textiles, lining cloth, most gaberdine, corduroy, fustian and overall cloth are still bound by the old descriptions.) This change means that all but the very highest quality of cotton and rayon cloth can be made and sold as utility, without attracting purchase tax. The same relaxations were about to be extended to cloth made from rayon staple when protests from abroad about "discrimination" against imported cloth led to the scheme being put into cold storage.

*

As the schemes stand now, virtually the whole of the shoes, and more than 90 per cent of the furniture made in this country is sold as utility. Of the wool cloth going to the clothing industry, 90 per cent is utility. Early in the year, only 56 per cent of the cotton and linen and 62 per cent of the rayon cloth deliveries were utility, but since these schemes were changed to bring in a greater variety of cloth, utility production will probably account for 70 to 75 per cent or more of the cotton and rayon sold on the home market. At the same time, all the administrative paraphernalia of schedules, price ceilings, cloth numbers, etc., have been retained, so that the paper work has increased as the scope of each scheme expanded. This revision of the character of the utility schemes is admirable within its limits ; but it may not satisfy those consumers who hold that the purpose of utility schemes is to keep selling prices down. Top utility prices have been increased by 30 per cent or more to bring in the higher costs of better quality articles, and no doubt there will be some tendency to concentrate on production of these at the expense of the cheap end of the utility scale. But the widening of the utility footwear scheme has already demonstrated the power of consumer resistance to keep retail prices below the Board of Trade's top figures.

So long as the utility schemes were concerned with maintaining an adequate supply of cheap goods that represented "value for money," they had no seriously disruptive effect on the production of better quality goods selling at higher prices. But now that the schemes have been extended to cover the bulk of the output of these industries, questions arise whether they are necessary and whether they do not set too rigid standards. If the aim of producers is to bring more and more of their output within the top utility prices, when they can be sold without tax, the higher grades of utility products will soon set the standard of quality for each industry. No margin will remain for the design and experiment that are essential to the vitality of consumer industries. The top utility standards are in general still below the quality required for exports. Thus, even as improved, the schemes exclude precisely those goods that can make the greatest contribution to the country's exports. The Federation of British Industries has compiled an impressive dossier of cases of the harm done to exports by excluding high quality goods from the home market ; and it is on these high quality products that the British exporting effort depends. Only the highest quality textiles, shoes and clothing can be sold in the dollar markets where tariffs and lively home industries make it increasingly difficult to sell imported goods of medium qualities. According to evidence given to the purchase tax committee by the Manchester Chamber of Commerce, there is "definite evidence from many cotton textile manufacturers that they have taken out of production non-utility goods that might otherwise be earning valuable currency."

*

A policy that will encourage such production and be at the same time politically acceptable, will not be simple. The logical course would be to remove present artificial distinctions by freeing from purchase tax the small balance of textile, footwear and furniture output that still carries tax. The loss to the Exchequer would not necessarily be large. In the year 1949-50, tax revenue from sales of furniture, shoes and textiles came to nearly £100 million. This figure has since been considerably reduced by consumer resistance to goods carrying tax, and by the extension of the range of goods now sold tax free. Yet few people seem prepared to suggest that the utility schemes should be dropped. "Utility" has never completely lost its war-time association with low prices and guaranteed quality even though, as this article has attempted to show, the top utility prices have so lost touch with reality that they are higher than the actual retail prices, while quality control has largely become a polite fiction.

Is there a case, then, for compressing the utility schemes back to their original dimensions ? Such a step would imply a return to detailed descriptions of every item of the kind only recently thrown overboard in the interests of "flexibility." Their return would be unpopular both with industry and with the Board of Trade. Moreover, during the war production of these goods was stimulated by allocations of materials and licences and their consumption could be regulated by rationing. Could a compressed utility scheme work without these controls, and would they be palatable in peacetime ? Experience with such articles as utility towels, where price and quality are still closely controlled, suggests that cheap basic goods might simply not be made.

The committee will obviously be tempted to steer a middle course. If the Board of Trade argues for flexibility the Treasury can be expected to argue for revenue, and a flat rate of tax for all utility goods may be proposed. The danger is that the barrier between utility and non-utility will simply be re-erected in a different position. In that case, there will still be discrimination against all manufacturers of goods above the utility level. This is one instance in which compromise is likely to hurt all parties and benefit none. The time has come to leave these matters to be determined by the estimates of manufacturers and retailers about public demand, and to the decisions of shoppers to lay out their money over the widest field of choice. There is little or no virtue in the utility schemes, save for the fact that utility articles do not attract purchase tax. And the distortions of trade to which they give rise are a serious threat to a recovery of the high quality exports in which British consumer goods industries have taken special pride.

Business Notes

Dollar Link for Australia ?

Though Mr Gaitskell has recently denied that there is any "restiveness" within the sterling area, there is no doubt that the stresses within it are mounting fast. It will face its biggest stress yet if a project mooted this week by Sir Douglas Copland, vice-Chancellor of the Australian National University, makes any impression upon the Commonwealth Government. Sir Douglas, whose views on other matters of economic policy have been influential in Canberra, has declared that since dollar convertibility for sterling is not in sight, Australia's interests would be best served by developing a "more direct financial and economic relationship with the United States"—by which he apparently means that the Commonwealth should try to achieve the kind of relationship, to the United States and to Britain, that Canada has achieved. He suggests that Australia should accept direct and autonomous responsibility for its dollar accounts, and should make the Australian pound convertible into dollars as soon as possible.

The immediate promptings behind this project—or, at least, the considerations that may give it an appeal to the Commonwealth Government—are Australia's need, first, for a freer flow of capital goods than it thinks it can get from Britain during the rearmament phase and, secondly, for an inflow of financial capital to enable the Dominion to carry the heavy weight of investment outlay necessitated by the large immigration programme, as well as by rearmament. But the reference to the lack of sterling convertibility points clearly to other considerations as well ; and although Sir Douglas does not appear to have emphasised it, he evidently has it well in mind that at present Australia is lending heavily to Britain—because a large part of the greatly increased proceeds of Australia's wool exports has been left in London in the form of accumulating sterling balances. Australia's postwar policy of resisting the temptation to try to run down the sterling balances has been the surest test of its status as one of the most loyal supporters of the sterling area principle.

Now there is the possibility that this attitude may change, as it is changing elsewhere in the sterling area. Although Australia has this large surplus with Britain, it has in fact spent a large part of the fruits of wool inflation on additional imports ; and there is evident reluctance to assent to the import restraint that will be urged upon sterling area members at the forthcoming conference in London. Sir Douglas believes that Australia will not secure as substantial dollar loans as it might command unless Australian trade is orientated towards the dollar area—again on the model of Canada. There is a cold logic in this view, but it would imply a grave weakening of the principle of the sterling area dollar pool, and would certainly mean that the Commonwealth would eventually cease to regard its London balances as its first-line external reserve. To resist tendencies of this kind, Britain will have to make sacrifices to release capital goods for export. If this is done, it is reasonable to hope that wiser counsels in Australia will recall that the terms of trade will not always be so extravagantly in Australia's favour as they have lately been, and that in leaner times British finance has been, and will be again, a powerful support for the Commonwealth.

* * *

Britain Overdraws at EPU

There is nothing unexpected in the fact that the United Kingdom in September ran another substantial deficit with the other members of the European Payments Union. The net deficit, admittedly, amounted to 204,806,000 units (i.e., US dollars), equivalent to £73,145,000, the largest monthly deficit so far registered by the United Kingdom. But the increase compared with August's £67 million deficit was not larger than had been feared ; the really significant feature of the month's experience is that it completed the exhaustion of the surpluses accumulated by the United Kingdom with EPU over the first nine months of the operation of that system. For the first time, therefore, the British account has been overdrawn. At the end of August there remained £22,451,786 of the previously accumulated surpluses. After the September compensation, this had been converted into a debit balance of £50,693,214. This overdrawing with EPU will call for some innovations in British Exchequer accounting. The £50,693,214 in question will be taken into the Exchequer as a borrowing under the National Loans Act, 1939. It will appear in the published Government accounts, including the weekly Exchequer return, as "Money raised by the creation of debt—Other Debt, etc., Internal." The United Kingdom quota with EPU amounts to $1,060 million, of which up to 20 per cent, or $212 million, can be taken as overdraft without gold payment. At the rate at which the deficit was running in September, it appears likely that gold payments to EPU will have to be made by the United Kingdom for the present month, though at the lowest rate of 20 per cent of the current deficit.

The other outstanding debtor in the September EPU settlement was France, which incurred a deficit of $50,400,000. This meant that France had to pay back to the Union the balance of $17,100,000 of gold previously acquired from it. The remaining $33,300,000 was offset against the French credit balance with EPU, reducing it to $87,800,000. The surpluses earned in EPU in September were concentrated on Belgium, the Netherlands, Germany, Sweden, Italy and Switzerland—in that order. Gold moved to all these creditors other than Sweden, and the month's settlement cost the EPU a net gold loss of $70 million. This gold loss may gather momentum, since the principal debtors

—Britain and France—have the largest quotas, are still in slight cumulative credit or debit and have a long way to go before they start paying gold to the Union on a substantial scale. On the other hand, the main creditors, Belgium, Italy and Switzerland, are taking gold at the rate of 50 per cent of their current surpluses, while Germany and the Netherlands are still receiving the benefit of substantial gold repayments now that they have converted their earlier deficits into surpluses.

* * *

Nine Months' Trade

The detailed trade figures for September have allayed some of the worst fears about trends in Britain's overseas trade. The total value of exports reached £208 million, which was 7 per cent below the average for the two previous months, and if allowance is made for the fact that September was a shorter working month, the decline compared with July and August was no more than a seasonal movement. The index of export prices rose one point to 125 (1950 = 100) but the volume of exports last month was 9 per cent smaller than the average for the two previous months of the quarter. Britain at last is enjoying—if that is the right word—the benefits of a rise in export prices. During the first nine months of the year, exports by value were 17 per cent higher than in 1950, whereas their volume increased by no more than 3 per cent.

Imports last month fell by £31 million to £337 million, chiefly because of smaller quantities of foodstuffs received—a seasonal feature. Despite the continued fall in commodity prices, the index of import prices remained unchanged at 138 (1950 = 100). The cost of imports up to September this year was 53 per cent higher than in the same period of 1950, but the volume of imports is provisionally estimated to be only 14-15 per cent higher; and most of this increase was due to larger imports of raw materials.

Receipts of grain and flour during the first nine months of this year amounted to 114 million cwt against 89 million cwt in the corresponding period of 1950. Supplies of feeding stuffs have also increased, from 592,000 tons to 882,000 tons. But meat imports were sharply down, from 21 million cwt to 16 million cwt; imports of butter and eggs have also been smaller this year, but imports of cheese have increased—particularly the "frivolous" varieties. Less cocoa, more tea and more coffee have been received; imports of sugar were the largest since the war.

Imports of iron ore were only 2 per cent smaller than last year and sulphur only 8 per cent smaller despite the fears earlier this year of a severe shortage. Much more bauxite, aluminium, nickel and chrome has been received and more tin, copper, manganese and antimony, but imports of lead and tungsten have declined, while imports of zinc were some 13 per cent smaller. In contrast, arrivals of softwood in the nine months were more than double those of last year; supplies of hardwood have also increased, but imports of hides and skins have declined. Imports of both raw cotton and raw wool were smaller than a year ago, whereas imports of hemp and jute were much larger. A larger supply of paper-making materials has also been received. Britain has certainly been buying raw materials, but unfortunately at high prices, and this fact is reflected in its growing deficit in visible trade.

British Imports of Food and Raw Materials

	Unit	Jan.-Sept. 1949	1950	1951		Unit	Jan.-Sept. 1949	1950	1951

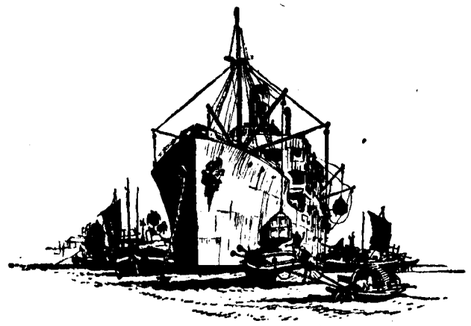
Molybdenum ore	'000 cwt.	41	47	48					

Fears for Exports



The anxiety felt about the export trade arises not so much from the figures for last month as from current reports that consumer resistance is being felt in a number of markets and for a variety of goods. Admittedly, North America is the only area for which the September figures have shown a sharp fall, but the American market is usually an efficient indicator. Shipments to the United States of all the main export groups were considerably smaller last month—chemicals (especially benzol), raw wool, iron and steel manufactures, non-ferrous metal manufactures, machinery, vehicles and woollen and worsted goods. In fact, the only exports to the United States that increased in September were whisky and pottery. Exports to Canada experienced an even sharper fall, and again the decline was spread over all the main groups, particularly pottery, woollen and worsted goods, and motor-cars. Only 154 cars were shipped to Canada last month, compared with a monthly average of 6,357 in 1950.

Exports of all the manufacturing groups declined during the month, with the single exception of oils and fats. The largest decline occurred in cotton and wool textiles and in chemicals. Exports of vehicles fell by £700,000 to £37½ million, though the actual number of cars shipped abroad increased. Machinery fell by £1 million to £29¼ million. Cotton manufactures at £18 million and wool textiles at £14 million were each £2 million smaller than in August, while chemicals declined by nearly £3 million to £11 million.

British Exports

	Unit	January-September 1949	1950	1951

Over the first nine months of the year, however, the export picture looks a little more heartening. Admittedly, both the quantity of coal and the quantity of raw wool exported was very much smaller than in the first nine months of 1950, and iron and steel manufactures were some 10 per cent down. On the other hand, a larger volume of machinery was shipped abroad, more cotton goods and wool tissues, but fewer motor-cars and commercial vehicles and less paper and cardboard. In value, all these groups except coal have shown notable increases on last year, and so, too, have pottery, cutlery, electrical equipment and chemicals. But, though the efforts that the export industries have made in the earlier part of the year will help this year's balance of payments, it is the declining trend in recent months that gives cause for anxiety.

Where can your goods go?

The world is wide—but economic conditions, currency restrictions and the like exercise a limiting effect . . . It is part of the service of the Westminster Bank to provide the accurate and up-to-date information on trade conditions which must form the background to any discussions of new markets and new business ventures. This facility is included in the wider service which the Bank offers to all importers and exporters and which is described in a booklet called *The Foreign Business Service of the Westminster Bank*. Your nearest branch will be glad to give you a copy.

WESTMINSTER BANK LIMITED

ASK THE MAN WHO KNOWS

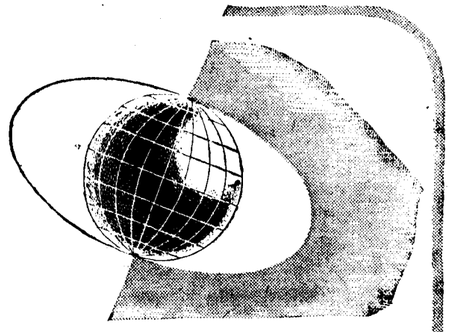
Business men and bankers who have visited Australia or New Zealand will tell you that the best medium for facilitating trade with those countries is the Bank of New South Wales — largest commercial bank there.

You are invited to use our specialist services through your own bank.

BANK OF NEW SOUTH WALES

ESTABLISHED 1817 HEAD OFFICE, SYDNEY, AUSTRALIA

LONDON OFFICES: 29 Threadneedle Street, E.C.2, and 47 Berkeley Square, W.1



(INCORPORATED IN NEW SOUTH WALES WITH LIMITED LIABILITY)

THE PERSONAL TOUCH IN BANKING

Nearly two centuries of financial experience and personal service to each customer have helped to build up the present tradition of Glyn, Mills & Co. The banking service which is provided is completely modern in all its aspects, yet has never become impersonal in its attitude towards the large concern or the private individual.

GLYN, MILLS & CO.
BANKERS
HEAD OFFICE: 67 LOMBARD STREET, LONDON, E.C.3

Associated Banks: Royal Bank of Scotland, Williams Deacon's Bank Ltd.

Plans for **DEVELOPMENT**

Business men who have plans for development in overseas and colonial territories which call for medium or long term finance should write for our new booklet. It explains what the Corporation can do for you and gives details of the countries in which we operate. Please write to the Manager at the address given below.

BARCLAYS OVERSEAS DEVELOPMENT CORPORATION LIMITED

54, Lombard Street, London, E.C.3

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are.

Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to The Chartered Bank of India, Australia and China which maintains an extensive system of branches, under British management directed from London, throughout Southern and South-Eastern Asia and the Far East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2
West End (London) Branch: 28 Charles II Street, London, S.W.1
Manchester Branch: 52 Mosley Street, Manchester, 2
Liverpool Branch: 27 Derby House, Liverpool, 2
New York Agency: 65 Broadway, New York, 6

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

SILVER

THE element silver sometimes occurs as a free metal, but is obtained mainly from the ores of lead, copper, zinc and gold. A lustrous and beautiful metal, silver has been used for ornament and exchange since the earliest days of history. At Ur of the Chaldees trinkets of silver have been found in royal tombs built more than 5,000 years ago; and the Old Testament relates how Abraham weighed out silver to buy a burial place for his wife Sarah. Silver has been mined in Peru since the time of the Incas but the main sources today are Mexico, the U.S.A. and Canada. Silver is well known in coinage and in such forms as Sterling Silver, and electroplated nickel-silver (E.P.N.S.) but it also has important industrial uses. The best electrical conductor known, it is used extensively to make electrical contacts, and plant for the manufacture of certain chemicals is sometimes lined with silver because of its resistance to corrosion. The important light-sensitive compounds — silver bromide and silver chloride — are the basis of all photography.

I.C.I. makes the sodium cyanide used in one method of silver extraction. I.C.I. also uses silver gauze and granulated silver as catalysts in the production of formaldehyde — one of the basic raw materials of the plastics industry.

ICI

India's Sterling Balances

On the principle that any concession made to Pakistan by Britain must automatically be given to India, there can have been no surprise at the news that the larger part of India's sterling balances have recently been liberated and transferred from the No. 2 to the "free" No. 1 account. According to the revelation made by the Indian Finance Minister, Sir Chintaman Deshmukh, India's sterling balances on June 30 last stood at £643 million, out of which £90 million was the free balance on No. 1 account. A further £210 million was the amount to be freed over a period of six years under the terms of the agreement signed last July but held meanwhile in No. 2 account. The balance of some £340 million was the "permanent core" of India's immobilised sterling. Yet £310 million of this core has now been transferred to the No. 1 account. The transfer is, however, intended more for the appearance than the reality. As in the case of the recent agreement with Pakistan, the amount so liberated will not be drawn on except in an emergency. It is intended to serve as currency reserve. But, as the Finance Minister rightly claimed, "if conditions remain as they are, there will be nothing left of the sterling balances problem at the end of six years."

Reports from New Delhi also suggest that the sterling area's latest gold and dollar deficit is beginning to cause some anxiety there. In the past financial year India earned a net dollar surplus equivalent to Rs. 370 million. It is doubtful, however, whether a surplus still obtains, given the present need to buy oil products from the dollar area following the shutdown of the Abadan refinery. In addition, India is beginning to turn to dollar sources for meeting requirements of capital goods that Britain finds it less easy to provide in consequence of the diversion of steel and engineering resources to rearmament. But although the Indian dollar account is thus deteriorating, it seems clear that India will be approaching the coming Commonwealth discussions of the sterling area's dollar problem with the intention of resisting any cuts in dollar imports that would have serious effects on India's development plans.

* * *

Freight Rates Rise Again

There are many indications that tramp freight rates this winter will rise further, despite the release of more and more ships from the United States reserve fleet. The Chamber of Shipping freight index for September, based on fixtures in sterling made during the month, showed that sterling freight rates had recovered more than half the loss of 30 points in August. This index is subject to sudden fluctuations owing to the uneven booking of charters, and it is apparent that the figure for May (203.8) was abnormally high and that for August (149.3) abnormally low. The average for the first nine months of 1951 is 172, slightly above the September figure of 166.5. Rates have been maintained at a fairly steady general level throughout the year, the significant feature being that the average this year so far has been about double that of last year. Operating and other costs have risen considerably, and ships' earnings are being curtailed by delays in port, but there is no doubt that tramp shipowners are now enjoying a profitable period, in contrast to the last rather lean year.

Since September the freight market has been consistently firm, and improved rates have been paid in many directions. Iron ore from North Africa to the United Kingdom, for example, has been fixed recently at 61s. per ton, an advance of 7s. over September fixtures, while the rate for Black Sea grain has advanced from 92s. 6d. to 107s. 6d. There has been sustained activity in the North American market, with high rates being paid for lumber from the North Pacific and wheat from the St. Lawrence. With the end of the season approaching, fixtures from the St. Lawrence to the UK/Continent have been made recently at 26s. 3d. per quarter, which compares with 18s. 9d. during the quieter season this summer, and only 8s. per quarter in the doldrums of 1950.

There have been numerous fixtures for American coal to Italy and Western Europe, but these have been made in dollars for American vessels, at rates controlled by the US National Shipping Authority and are unattractive to sterling operators. Many American vessels have also been employed in carrying grain to India, and two of them have been fixed to bring coal from Calcutta to Britain at the equivalent of about 98s. per ton. Owners of sterling vessels had recently been asking about 130s. a ton for these freights, but this week the National Coal Board booked a British steamer at 122s. 6d. a ton. Meanwhile, a few vessels have been chartered to take Welsh coal to the Plate at 120s., a rate that indicates the poor prospects of outward cargoes from that area. The demand for bulk carriers is undoubtedly strengthening, and inquiries are circulating for vessels on time charter for varying periods. There is a strong demand for American ore imports from India, West Africa and the Philippines, and a new feature is the movement of grain from Prince Rupert to Japan. Orders have also been registered to carry refined sugar from London to Karachi and even Japan.

* * *

Power Jets and American Royalties

The prolonged negotiations between Power Jets and the American Government about payment of royalties for Power Jets patents have at last reached a conclusion. The American Government is paying a lump sum of £1,400,000 ($4,000,000) for the military use of the patents over a period of 10 years. At first sight this appears to be a small figure for certain basic rights in a new branch of technology, but there are a number of factors to be taken into account. Power Jets' claim for royalties rested less on a watertight legal case than upon a moral obligation on the part of the American Government, and recognised by that government, to make some payment in return for the Whittle engine and other drawings that were sent to the United States during the war without being fully covered by patents. The American government undertook to indemnify its contractors against patent infringement and paid Power Jets £200,000 at the end of the war as a token of good faith. This sum has been included in the final settlement.

The original claim was for a payment of $10,000,000, and the real reason why the final settlement was for less than half this figure lies in the agreements made by a number of British engine builders in the United States. Rolls-Royce has for many years been receiving royalty payments from the American company, Pratt and Whitney, in return for licences to build Rolls piston engines. Similar licensing arrangements were made for the company's jet engines. Royalty payments made by one American company to one British company did not prejudice Power Jets' position *vis à vis* the American government, but when Curtiss Wright bought (not licensed) the rights to several Armstrong Siddeley engines, including the Sapphire, and then made a roughly similar agreement with the Bristol Aeroplane Company to buy the rights of the Olympus jet engine, the American negotiators began to protest that the United States would be paying twice over. This may have been a reasonable argument under the circumstances, but had the Power Jets claim for $10 million been settled before and not after the British companies sold their engines to Curtiss, it would probably never have been heard.

The sum received by Power Jets is for patent rights only—there is no technical manufacturing knowledge attached to the 200-odd patents covered by the agreement—and it is said to be one of the highest payments on record for an agreement of this kind. But even when all these factors have been taken into account, they are dwarfed by the fact that on the original drawings now covered by these patents rests the whole of American jet engine development.

TDRs and Short Money Rates

The banks and the money market have been intrigued in the past month by the fact that the Treasury has been making another notable switch in its weekly borrowings on floating debt. In four successive weeks the authorities have omitted to renew borrowings on Treasury deposit receipts from the banks, with the result that outstanding indebtedness on TDRs has run down from £290 million at end-September to only £175 million by the end of this week—by far the lowest figure since the earliest days of the operation of this system of borrowing, in 1940. Over the same period, however, issues of Treasury bills through the weekly tenders have slightly exceeded maturities, so that the total of outstanding tender bills has risen by £40 million, to £3,270 million. The fact that, while repaying indebtedness to the banking system on balance, the Treasury has accelerated repayments of TDRs by increasing its recourse to bills has given rise in some quarters to suggestions that the authorities may now be embarking upon a policy of extinguishing the TDR issue altogether. The residual issue is now so tiny by comparison with the bill issue (and with the TDR peak issue of £2,225 million, in 1945) that such an objective could readily be achieved, if the authorities so desired, without difficulty and without causing any undue further expansion of the bill issue. Indeed, if the recent tactics of omitting to renew maturing TDRs are continued, the issue will run out in the early months of next year. Those who contend that the authorities are thus planning to extinguish the TDRs point to the fact that recent experience has contrasted with last year's; for in the summer and early autumn of 1950 the TDR issue was being re-expanded after the massive switch to bills that had been made in the twelve months beginning in mid-1949.

These speculations about official policy have, not unnaturally, been associated in some discussions with the possibility of restoring some degree of flexibility to the structure of short money rates. Certainly, if the peg were to be removed from money rates, the banks could reasonably argue that they ought to be left free to decide for themselves the extent and distribution of their holdings of floating debt—instead of being virtually obliged, to the extent of the TDR issues, to take up such amounts as the Treasury dictates. On the other hand, some of the less orthodox advocates of dearer money reverse this argument, and contend that in precisely those circumstances the Treasury would need the discipline that the TDR system affords—lest the banks and the discount market, in a regime of possibly fluctuating rates, should seek to curtail their purchases of bills. Discussions of this kind help to elucidate some of the technical problems of launching a tighter monetary policy; but these particular speculations probably spring from false premises. Whatever technique the authorities would adopt if the new Government elects for a change in monetary policy, it seems improbable that the recent tactics were intended to prepare for the possibility of such a change. Because of their borrowings of the sterling funds accruing from Britain's yawning external deficit, the authorities have had large sums available for repayment of indebtedness to the domestic banking system, and they have used these sums in the manner best suited to their purely technical needs. By increasing the bill issue at this season, instead of reborrowing on the longer-dated TDRs, they ensure a flow of floating debt maturities during the weeks of maximum revenue surplus next year.

Iron Ore Surveyed

Total reserves of iron ore throughout the world, according to an estimate quoted by the British Iron and Steel Federation in their current statistical bulletin, amount to 95,000 million tons containing 40,000 million tons of iron. "Possible further reserves" would add another 435,000 million tons. Unfortunately, such astronomical reserves bear no necessary relation to supplies here and now; not enough rich iron ore is being produced today to satisfy the total demand of the iron and steel industries.

This shortage has resulted largely from the nearing exhaustion of the rich iron ore deposits in the Lake Superior district of North America. Because 340 million tons of this area's richest and most easily worked ores were removed during the second world war, considerably shortening the life of this great orefield, the United States has encroached upon the markets in which European iron and steel industries ordinarily obtain their supplies. The depletion of Lake Superior reserves of rich ore, at the same time, has turned the United States steel industry's attention to the vast deposits of low-grade "taconite" there; and it has also encouraged a major investment of American capital to exploit iron ore elsewhere in the western hemisphere—Labrador, Venezuela, Brazil and Chile—and in Liberia, in West Africa. The American steel industry is thus actively engaged in securing new and adequate supplies of ore. But this process takes time and much money and, in the meantime, American steel producers have turned for marginal supplies to the markets on which Britain and some other European producers depend.

Europe's pattern of iron ore imports has itself altered. Because coke has been short since the war, Belgium has been buying larger quantities of rich Swedish ores than formerly. German steel output is already recovering fast: before the war Germany was by far the largest buyer of Swedish ores, and its imports must be expected to grow. The Federation makes no forecasts about the ore supplies upon which Britain will be able to count in the next few years:

> All in all, no great change is likely in the pattern of supplies to Europe when conditions become more normal again; but there is keen interest in any possible sources of supply that are within reasonable distance of the European steel plants.

Iron ore may well become easier to obtain in a few years, when the United States should be able to withdraw from Europe's ore markets. But it may be significant that Germany, potentially Europe's greatest steel producer, has recently displayed an interest in supplies from further afield, including India. In the Singhbhum-Orissa iron orefield there are probably half a dozen deposits comparable to the fabulous Cerro Bolivar in Venezuela. The significance of location and transport costs in the world's iron and steel industry may explain why, so far, the size and richness of these deposits have been little appreciated in the west.

Fluctuations in Wool

Wool prices this month have displayed a novel pattern. They reached a low point of 101d. a lb. for merino 64's in the third week of September and then recovered to reach a peak of 204d. at the end of the first week in October. There was then a fall, almost equally sharp, to another low point eight days later of 124d., followed by a rise to a secondary peak of 167d. last Monday. Since then wool prices have been dropping once more. There are two features that call for explanation. The first is the converging pattern with the peaks declining and the low points rising, suggesting that, theoretically, stability might be reached at around 156d. per lb. The second is the sharp daily fluctuation in price. The wool market is used to rising and falling by 20-30 per cent over a period, but rises and falls of 20 per cent in a day are a perplexing novelty.

World consumption of wool has been declining since the beginning of this year. In recent months, moreover, it has become clear that the output of wool textiles has also been declining. Retail sales of textiles in all countries have fallen sharply and their volume is much smaller than it was twelve months ago. In the United States, sales fell less

than activity in the wool textile industry, so that retail and wholesale stocks have been largely liquidated. In Britain and in other countries, where the industry caters for an export as well as a domestic market, it is probable that stocks have increased. This fact alone would at least imply a limit for wool prices above which wool buyers will not bid. On the other hand, stocks of wool held by manufacturers are still surprisingly small in physical terms—very much smaller than before the war—so that the smallest indication of a revival in trade, whether it comes from the retail end or the raw material end, starts a minor scramble. In wool, as in other commodities, merchants no longer accept the risk of carrying stocks. So long as the Joint

Organisation offered wool throughout the season there was little need for a merchant to keep stocks. But the Joint Organisation is no longer operating and the manufacturer has now to buy his supplies direct from the London or primary markets, so that demand tends to be more concentrated than hitherto.

Stockpiling could have a significant effect on wool prices, though it is doubtful whether it has had any effect yet. The British announcement was made only at the end of last week and the quantity—40 million lb.—is less than 10 per cent of Britain's current annual consumption and only about 12 per cent of the current rate of imports. In any case the purchase is to be handled by the British Wool Federation, so that the Government will not compete with the trade. A more important consideration is the expansion of the Japanese wool textile industry; its consumption this season is expected to rise by 50 per cent, from 51 to 75 million lb. (clean). But this quantity still represents barely three-quarters of Japan's 1938 consumption and only 3½ per cent of the world's total consumption of wool. On the other hand, German consumption, which is two-thirds of its prewar quantity, has declined slightly this year. The recent behaviour of the market would thus seem to be determined by psychological factors—by buyers' uncertainty of consumers' reaction to prices in the coming months and of governments' intentions about defence and inflation.

* * *

Non-Ferrous Scrap Supplies

In spite of the shortages that have been reported from the scrap metal markets since early this year, British industry during the first eight months of this year has been able to obtain considerably more secondary non-ferrous metals than it used in the same period last year. Consumption of secondary copper, for example, reached 148,292 tons compared with 126,273 tons in the period from January to August last year, and that of remelted zinc and residues 64,922 tons compared with 59,071 tons.

This increased consumption, which appears largely to have been supported by the depletion of industry's substantial stocks, does not, however, imply that the scrap metal available has been enough to satisfy all demands. The demand for scrap copper, brass and zinc has been and is still high (though there is no shortage of lead scrap at present). The trade and the Ministry of Supply, moreover, still feel that the stocks drawn upon so far must soon be almost exhausted, and expect consumption (which in August was down to roughly last year's rate for both secondary copper and zinc) to decline fairly sharply in the coming months. A considerable proportion of scrap is now being recovered direct from customers by the metal fabricators, who are making the return of process scrap a condition of further supplies: while this diverts business from the scrap merchants, it probably speeds up the return of scrap and benefits output. The merchants, on the other hand, are

convinced that in both industry and homes there are considerable reserves of scrap that might be collected by a more vigorous "drive": the Ministry is likely to give some assistance in publicity for more widespread and intensive collections.

One of the more gaping loopholes in the Ministry's scrap price control has now been corrected, with the imposition of controlled prices for secondary brass ingots; the price of secondary copper ingots is also likely to be controlled within a few weeks. This should end the profitable practice by which scrap metals could be bought at grey market prices and then processed into ingots of which the price was not controlled. There are still allegations in the industry that the price control is being evaded in various ways, and that scrap is being acquired for bargaining purposes. The Ministry is inquiring into various other modifications of price control that the trade has advocated, including an automatic formula by which scrap prices may be varied to follow the changes in price of virgin metals. But there is no indication that the "quantitative licensing" of scrap that some merchants desire, by which supplies might be more thoroughly regulated, is more than "under consideration," as it has been for months past. Such an elaborate control system might well require more information about the amounts passing through the "normal channels" of the scrap metal trade than the Ministry may now possess, even since its first returns of stocks. It would also require more justification than the present state of the market seems to offer.

* * *

Cotton Conference

The chairman of the Cotton Board, Sir Raymond Streat, spoke at the Cotton Board's annual conference at Harrogate last weekend of the competition that the cotton industry would soon face in its export markets. The gist of Sir Raymond's argument was that total output is at present too small to enable Lancashire to regain its position as the leading supplier of cotton goods in the world export markets. India's

exports in the first quarter of this year totalled 464 million yards and Japan's exports 256 million square yards; British exports amounted to only 212 million square yards. In the second quarter of the year British exports rose to 247 million square yards but Sir Raymond Streat calculated that this represented only 25 per cent of Lancashire's total production. Japanese exports in the same quarter rose to 342 million square yards. American exports were 197 million square yards in the first quarter of the year and 146 million yards in the second.

These comparisons assume a greater importance when the flow of export orders begins to fall off, as it has been falling this year. Manufacturers started the year with full order books, but the volume of new orders placed during the past few months has been noticeably small. There are reports that business has improved in recent weeks, but few are yet prepared to say that the slump in textile sales has ended. Sir Raymond's emphasis at Harrogate was on the "harsh and fierce pressure of competition" that the industry may have to face, both from low-wage countries like Japan and from high-efficiency countries like the United States, and this competition may be carried into the industry's home as well as its export markets. He may have gone out of his way to emphasise these dangers, on the ground that many years of easy sales have blunted the edge of the highly competitive selling technique that the industry had developed in the years before the war.

Sir Raymond commented once again on the comparatively slow rate of re-equipment in the industry and a later speaker, Dr Toy of the Shirley Institute, criticised another aspect of the same problem, the slow rate at which the results of research are applied. Both points have a bearing on the industry's competitive efficiency, but it suffers great handicaps from what Sir Raymond called the "tying up of veins and arteries" by the medley of purchase tax, price and quality controls that govern the sale of textiles on the home market. The effects of these controls on textile exports have become sadly familiar, as an earlier article shows.

* * *

Possibilities of Boron Steels

Conservation of scarce alloying metals, during a period when rearmament must make exceptional demands upon alloy steels, is at present the subject of intensive research in the world's steel industries. In America, and recently in Britain, this has led to a greater interest, in certain uses, of a non-metallic element until now comparatively rarely used in steel alloys—boron. The use of this element, which is more familiar in its widely occurring compound, borax, aroused little interest until the second world war, when it was used on a very limited scale. Probably no more than two million tons of boron steels have ever been used. But since the outbreak of war in Korea, American metallurgists have concentrated much study upon its property of improving steel "hardenability"—a technical criterion defined below—with smaller admixtures of standard alloy metals than are ordinarily used. These specialists have become sufficiently convinced of the value of boron in the "needling" of alloy steels to warrant the issue of alternative specifications for certain types of alloy steels. These new specifications allow for the inclusion of a very small amount of boron—in the region of four parts in a hundred thousand—as a result of which a sharp reduction in the necessary percentages of such alloying metals as nickel, chromium, and molybdenum can be made. Certain British consumers of standard alloy steels, including the motor industry, have a natural interest in these more economical steels, since the output of cars is threatened by shortages of standard alloy steels.

No national specifications have been issued in this country for steels to which boron has been added for this purpose. Some reserve is still expressed in British industry about the commercial production of such boron-treated steels to consistent standards. This quality of "hardenability" is the ability of steel to respond to heat treatment throughout the whole of the section: owing to the different rates of cooling between the interior and the outside of the metal, alloying materials are used to give more uniform properties throughout, thus improving the "depth of hardening." The practical use of boron for this purpose depends upon the distribution of a tiny percentage of boron evenly through the steel section; larger percentages of boron at any point may tend to undo the good work of the correct amount. Boron is already used in one standard alloy steel produced by the United Steel Company, though for a different purpose—to improve the mechanical qualities of a molybdenum alloy steel. But the industry is studying the use of boron and other methods of economising standard alloy metals: the potential scarcity of such metals throughout the period of the defence programme is adding urgency to this research.

Full Order Books in the Shipyards

Orders for merchant ships on the books of British shipbuilding firms now total 6,250,000 tons gross, estimated to be worth about £550 million. According to the Shipbuilding Conference, this is the highest figure ever recorded, and the rate at which orders have been coming in during the past year reflects the strong position of the freight markets. In the first nine months of 1951 orders were placed with United Kingdom builders for some 600 vessels, totalling 3,300,000 tons gross. More than half of the tonnage on order consists of oil tankers, and nearly one-third is for export. A feature of recent orders, however, has been a higher proportion of cargo liners and tramps. This will help to offset the bias towards tankers, which absorb larger quantities of steel and do not give as much employment to the "white trades."

Merchant tonnage under construction in Great Britain at the end of September reached the highest figure for 30 years, according to the shipbuilding returns compiled by Lloyd's Register of Shipping. The total amounted to 2,271,640 tons, an increase of 157,321 tons since the end of June, of which 1,255,754 tons (55.3 per cent) consisted of tankers. Tonnage launched and completed during the quarter dropped below previous levels, and the whole of the increase consists of new ships on which work has begun. In addition, plans have been approved or material ordered for another 1,989,706 tons gross, a total 149,000 tons higher than in June. It can be seen that while the rate of launching and completion this year so far is slightly behind last year's, the tonnage on which work has started has increased. This is probably due to the increased amount of prefabrication for which the bigger yards are now laid out, a process that should accelerate tonnage output. It is a process, however, that may alter the rhythm of output, which may be affected by a shortage of steel in the welding shops or by shortage of labour or delays on the assembly berths.

Merchant ships under construction abroad showed a decline of 24,033 tons during the quarter, the total now being 3,192,862 tons. The French, German and United States totals increased each by about 43,000 tons, but declines were recorded in Japan and Italy, where agitations for Government subsidies are now afoot.

Airline Earnings

The earnings of the two British airlines in the first five months of their 1951-52 financial year promise well for the future. Between April and September, British European Airways carried 28 per cent more traffic than in the same period last year and showed a net profit of £106,206. But for labour difficulties in the summer that led to the cancellation of 450 flights in the peak traffic season, the profit would have been nearer £255,000.

These results have been achieved in the face of considerable difficulties. BEA's costs have risen by about 12 per cent, from 35.2 pence per ton mile in August, 1950, to 39.3 pence this year. Wage increases alone have added £1,150,000 a year to the bill. A major disappointment was the failure of the Ambassador airliner to come into operation for the summer services. This aircraft should be far cheaper to operate than the older Vikings and Dakotas that form the bulk of the corporation's fleet, and BEA could well have done with the extra capacity to meet the summer traffic.

In July and August British Overseas Airways Corporation succeeded for the first time in showing a net profit, after deduction of interest, etc., of £132,000 for the two months. The corporation actually made an operating profit (excluding interest and other charges) of £402,000 in the first five months of its financial year. The improvement in the BOAC results has been rapid, for the corporation did not begin to show an operating profit until just over a year ago. Neither of the corporations is in a position to earn a net profit for a full 12 months' operation, but BEA is approaching very close to the time when it will be possible. In both cases much of the improvement is due to the steady expansion of traffic and both corporations are urging international agreement on the introduction of "tourist" travel in an attempt to expand traffic still further.

Shorter Notes

During 1950-51, cable and radiotelephone traffic over the Commonwealth communication circuits operated by the nationalised Cable and Wireless group showed a considerable increase, largely under the influence of "greater activity in commodity markets and the general rearmament programme." This is shown in the group's annual report for the year ending March 31st this year. It records that some 486 million words were carried over the group's present telegraph system, compared with approximately 448 million in the calendar year 1949 over those circuits (in 1949 Cable and Wireless were operating certain other circuits since transferred to Commonwealth Governments, which accounted for the carriage of an additional 183 million words). During 1950-51 the radio-telephone circuits operated by the group's overseas branches were employed for nearly three million "paid minutes," or roughly a third more than in the year 1949. The group made a consolidated net profit of £2,232,743 during the year; but no clear comparison is possible with the figure of £1,893,699 recorded for the previous accounting period of 15 months, particularly as much of Cable and Wireless's business is conducted in currencies other than sterling, and devaluation presumably contributed to the increase in profits.

★

In the first nine months of 1951 roughly 9,250,000 people received wage increases totalling £3,983,900 a week. These figures show a massive increase upon the same period of last year, when some 3,250,000 had increases totalling £603,000 a week: in September, 1951, alone, wage increases of £350,000 amounted to more than half those granted during the first three-quarters of 1950. The largest increases recorded were in the transport and communication industries, where 1,323,500 workers received increases totalling £600,500 a week; the distributive trades, where 1,256,000 workers received £456,000 a week; and building and contracting, where 1,107,000 workers received £568,800 a week. The total increases raised the index of weekly wage rates to 121 (June, 1947=100), while the interim index of retail prices, with roughly the same base date, stood at 128 on September 18th.

CONSOLIDATED MAIN REEF MINES & ESTATE, LIMITED

(Incorporated in the Union of South Africa.)

Extracted from the Annual Report for the Year ended 30th June, 1951.

CAPITAL £1,247,608 IN £1 SHARES, ALL ISSUED, FULLY PAID.

Tonnage Milled, 2,861,000

		Per ton milled
Total Working Revenue	£3,945,515	£1 14 11
Total Working Expenditure	3,177,931	1 8 1
Working Profit	£767,584	90 6 10
Net Profit for the year		£785,855
Balance unappropriated at 30th June, 1950		428,915
Transfer from Shareholders' Contingency Reserve		7,500
Amount previously appropriated for Capital Expenditure, now reversed		5,199
		£1,207,469
This amount has been dealt with as follows:—		
Taxation	£280,184	
Forfeited Dividends Account	7,494	
		287,678
		£919,791
Dividends declared during the year:		
No. 33 of 4s. per share and No. 34 of 3s. 6d. per share		467,851
Leaving a balance unappropriated of		£451,940

The estimated ore reserve as at 30th June, 1951, was as follows:—

Reef	Available			Sharp and Safety Pillars			Total		
	Tons.	Value, Dwt.	Width, Inches	Tons.	Value, Dwt.	Width, Inches	Tons.	Value, Dwt.	Width, Inches
Kimberley Reef	438,000	2.7	60.6	69,000	3.9	66.4	507,000	2.9	61.3
Bird Reef	1,479,000	2.7	59.4	279,000	2.8	68.5	1,758,000	2.7	60.7
South Reef	1,059,000	3.6	48.2	132,000	4.0	48.0	1,191,000	3.6	48.2
Main Reef Leader	1,141,000	4.1	48.7	818,000	4.5	49.2	1,959,000	4.2	48.9
Main Reef	977,000	3.6	55.1	93,000	3.3	61.8	1,070,000	3.6	55.7
Total	5,094,000	3.3	53.5	1,391,000	4.0	53.3	6,485,000	3.5	53.5

Compared with the previous year's estimate, the available reserve decreased by **948,000 tons**, the stope width being lower by **0.5** inch and the value unchanged. Of the decrease, some **276,000 tons** was due to rising costs and consequent increase in pay limit.

The full Report and Accounts may be obtained from the London Secretaries, A. MOIR & CO., No. 4, London Wall Buildings, London, E.C.2.

RALLI BROTHERS LIMITED

Capital Reconstruction

Shareholders in Ralli Brothers Limited will have received Notices to-day of an Extraordinary General Meeting and Separate Class Meetings to be held on the 27th November next for the purpose of approving a scheme for the reconstruction of the Company's capital, designed principally to simplify its present complicated structure. The First and Second Preference Shares at present not only carry the right to fixed preferential dividends and to priority in a winding up for capital and, in the case of the First Preference Shares, arrears of dividend; they also confer upon the existing holders additional rights of participation in the balance of profits and, in a winding up, in surplus assets after all capital has been repaid. The main part of the proposals now put forward is that these additional rights of participation should be extinguished and that in lieu thereof Preference Shareholders should receive allotments of fully paid Ordinary Shares. Provision is also made for an alteration in the voting rights attached not only to the First and Second Preference Shares but also to the "A" Shares.

To meet the requirements of these changes and to adjust the position fairly between the various classes of shareholders the capital is to be increased to £4,720,000 by creating a further 520,000 Ordinary Shares of £1 each, which will be allotted credited as fully paid (by capitalisation of £520,000 from Share Premium Account) as follows:—

To the First and Second Preference Shareholders

One new Ordinary Share for every five existing Preference Shares.

To the Ordinary Shareholders

One new Ordinary Share for every ten existing Ordinary Shares.

To the "A" Shareholders

One new Ordinary Share for every ten "A" Shares

The consent of the Treasury to the issue of the new Ordinary Shares has been obtained.

The Directors of the Company recommend the scheme as being fair to all classes of Shareholder. If the necessary Resolutions are passed, it is proposed to post renounceable fully paid Allotment Letters for the new Ordinary Shares as soon as possible after the meetings have been held.

The Shareholders of the Company will also be asked to approve certain other alterations in the Articles, including a provision increasing the limit of borrowings by the Directors without the sanction of the Company in General Meeting.

Company Notes

Rhodesian Copper Profits. — Further evidence that the Rhodesian copper industry is enjoying a period of prosperity without parallel in its history is to be found in the advance in Rhokana's profits before tax from £6,687,165 to £10,483,687 in the year ended June 30th last. In the same period, group profits of Rhodesian Anglo American, which owns 52.4 per cent. of Rhokana's equity capital as well as interests in Nchanga and Mufulira, jumped from £7,985,033 to £14,819,139. Even these excellent figures understate the real improvement that has taken place so far as the equity shareholder who is taxed at the standard rate is concerned, for the expansion in net profits is relatively much greater than the rise in earnings before tax. The most important factor here is the six months' freedom enjoyed by Rhokana and Rhoanglo, following their change in domicile to Northern Rhodesia at the beginning of the year. Not only is the liability for taxation proportionally much lower this year than in the previous year, but the companies have also been able to release considerable sums from taxation provisions made in earlier years. In Rhokana's accounts, £3,718,292, against £3,613,307, is provided for taxation and £1,365,221 is written back from a tax provision; similarly in Rhoanglo's accounts, £5,627,338, against £4,328,765, is provided for taxation and £1,554,398 is written back.

As we confidently anticipated, record profits are accompanied by a substantial increase in the amounts to be distributed to ordinary shareholders. Rhokana's ordinary dividend is raised from 120 to 200 per cent., and Rhoanglo's ordinary dividend from 32½ to 55 per cent. Again, however, the benefits accruing to equity shareholders are understated. The dividends are payable in part out of profits earned in the six months before January 1, 1951, the date on which control and management were removed to Rhodesia, so that half the dividends paid are regarded by the British taxation authorities as tax-free payments. If, therefore, allowance is made for the full rate of tax of 9s. 6d. in the £, the dividends are equivalent to gross distributions of just over 290 per cent. for Rhokana and nearly 80 per cent. for Rhoanglo, but this calculation ignores the fact that British taxation to be deducted from the remaining half of the dividends will be at a reduced rate (to be announced later) in order to allow for unilateral tax relief. This very favourable tax arrangement only applies to the financial year 1950-51. Future dividends will be paid to British shareholders at the declared rate, less British tax, at a rate reduced by a provisional allowance for double taxation relief. No account of the White Paper proposals to freeze dividends has been taken in fixing this year's distributions and dividends are "therefore subject to modification"; this oddity is explained by the fact that Rhokana is no longer resident here, but it is registered here. Shareholders will need little reminding that the Treasury's reply to an inquiry by Tanganyika Concessions confirmed the suspicion that British companies that have shifted their seat of control abroad would not on that account escape from dividend limitation.

The steady rise in the selling price of electrolytic copper and the recent report of bumper profits by Roan Antelope and Mufulira encouraged investors to anticipate record profits and dividends from Rhokana and Rhoanglo, and the immediate response in the market when the results were announced was very slight. The current price of Rhokana £1 ordinary stock units is £27, and Rhoanglo 10s. ordinary stock units stand at 73s.

★

Eastwoods. — Production of building materials has been outstripped by demand in recent years. The report by Eastwoods of record sales in the year to March 31st last shows that the company has met the demand for its products by expanding capacity. The reward for these efforts is to be found in the jump in group trading profits from £371,011 to £433,241. The White Paper proposals to control dividends prevented equity shareholders from benefiting immediately from this improvement in the company's fortunes; the ordinary dividend had to be cut back from 12 per cent to a "standard" rate of 10 per cent. The directors believed that a more equitable share in the company's prosperity was a dividend of 15 per cent; accordingly, a reserve has been created from which a further 5 per cent will be paid once it becomes clear that the dividend limitation proposals will not become law.

	Years to March 31, 1950	Years to March 31, 1951
Consolidated Earnings:—	£	£
Trading profit	371,011	433,241
Total income	382,823	442,320
Depreciation	134,209	141,987

Group earnings for ordinary stock	*91,179*	*115,547*
Ordinary dividends	66,000	52,500
Ordinary dividends (per cent)	12	10
Retained by subsidiaries	539	5,362
General reserve	...	21,454
Dividend reserve	...	35,000
Added to carry forward	24,640	1,231
Cons. Balance Sheet Analysis:—		
Fixed assets, *less* depreciation	1,650,000	1,785,705
Net current assets	976,416	934,655
Stocks	519,967	615,923
Cash	169,691	223,292
Reserves	1,193,989	1,261,002*
Ordinary capital	985,500	985,500

£1 ordinary stock at 48s. 9d.xd yields £4 2s. per cent on 10 per cent.

The expansion of capacity to meet demand has found its mark in the balance sheet. The net book value of fixed assets has risen by some £135,000 to £1,785,705, and outstanding capital commitments are estimated at £235,000. A good part of the capital programme in the latest financial year has been financed by the sale of securities, the book value of which has fallen from £291,435 to £9,511. At the same time, cash holdings have risen from £169,691 to £223,292. Hopes of a boom in building materials have recently been reflected in a sharp rise in the price of building material shares, in the course of which Eastwoods £1 ordinary stock units have risen to 48s. 9d.xd. At this price the yield on a dividend basis of 10 per cent is only £4 2s. per cent, but assuming the payment of the full dividend of 15 per cent, the yield is nearly £6 3s. per cent.

Statistical Summary

EXCHEQUER RETURNS

For the week ended October 20, 1951, total ordinary revenue was £60,878,000 against ordinary expenditure of £96,593,000 and issues to sinking funds £566,000. Thus, including sinking fund allocations of £11,298,000 the deficit accrued since April 1, 1951, is £92,837,000 compared with a surplus of £23,911,000 for the corresponding period of the previous year.

COMPANY MEETINGS

THOS. W. WARD LIMITED

RECORD GROUP TURNOVER

SCRAP AND STEEL PRODUCTION TARGETS

The forty-eighth ordinary general meeting of Thos. W. Ward Limited, was held on October 26th at Sheffield. Mr George Wood, C.B.E. (chairman of the company), who presided, said in the course of his speech:

The more than usually strenuous period covered by the financial year to June 30, 1951, has, I am glad to say, resulted in an output and profit which both constitute a record in the long history of the company. Our turnover, including that accruing from the activities of our subsidiary companies, has reached twenty-six million pounds—an increase over the previous financial year of nearly three million pounds. Of this total turnover the parent company has contributed seventeen million pounds—an increase of nearly three million pounds in relation to the corresponding turnover for 1949-50.

This is a truly splendid achievement to which everybody in the company—management, staff and workpeople—has contributed. We and they can feel rightly proud of the results produced by this co-ordination of effort, and on behalf of the shareholders and the board I tender to them our very warm congratulations and thanks.

It is appropriate at this point to mention that our turnover for the first three months of the current financial year shows an increase, insofar as the accounts of the parent company are concerned, of approximately 7½ per cent. over that for the same period last year.

Although the work of the year has been very strenuous and profits substantial, it is nevertheless difficult to contemplate affairs today without a sense of unreality, or to shake off a feeling that business at this time and age is based on exotic foundations. The critical contributory factors of penal taxation, the inflationary tendencies of the Defence Programme, the currency hazards attendant on unbalanced imports and exports, these and other factors all add to this illusion of fantasy. In these conditions and at this time it is indeed difficult to imagine what the position would be if the curtain of illusion were raised and business was set free to seek success by virtue of its capacity for efficiency and economical production.

On this concept of business the English speaking peoples of the world have contributed much to the betterment of mankind, and it is salutary at this moment in our history to enquire whether we as a country are taking every opportunity to prepare for the time when these words once more take on their true meaning. Efficiency in production means economy in production, but its attainment is only to be achieved by hard work and careful thought. To deny, therefore, the just reward for this work and thought, to withdraw all encouragement and hope of compensation, is a policy which can only result in an endless vista of diminishing returns—individually and nationally. Conversely, to encourage endeavour and to reward efficiency would put new heart into British industry. Unfortunately tendencies over the past few years have certainly not been in this direction.

In reverting to domestic matters I am pleased to say that all sections of our Company have done well and that practically every one has contributed to the very substantial increase in turnover. This increase has not been influenced by enhanced prices to the extent one might imagine—a point amply demonstrated by the fact that prices of scrap iron and steel (in which commodity we do a very large business) were, up to the end of the financial year under review, still at pre-war level.

REDUCTION IN SHIPBREAKING

One section of our business, viz., shipbreaking, is operating under conditions of slackness quite outside our control. The extraordinary demand for ocean transport and the resultant high returns from freightage encourage keeping in service every possible ship that can limp the seas. Obsolete vessels, totalling many thousands of tons of valuable material, which would under normal conditions have come forward for breaking, still have some value as cargo carriers. The result is that the shipbreaking industry is only working to about 50 per cent. capacity at a time when every ton of scrap iron and steel is needed to maintain the country's steel production.

The company has again played its part in the export drive with an increase in value substantially greater than that for the previous year—and this despite the hampering restrictions of licensing limitation, ocean transport delays, exchange inequalities and other dislocating factors.

Last year I drew attention to the contract we had entered into for the building of a road from Jeddah to Medina in Saudi Arabia. Owing to the effect of the Defence Programme on the availability of plant, equipment and even personnel and to unavoidable delays in transport, we have suffered more than normal teething troubles, but I am glad to say that supplies are now catching up.

Any loss sustained has been written off in the accounts, and we look forward to a successful outcome of the contract. This statement is written early for the Press, so that we do not know how matters will progress, but we have to bear in mind that our supply line is through the Suez Canal and that the position could be made difficult for us if the relationship with Egypt worsened. We did, however, at the inception of this contract take the precaution to ensure it to the utmost extent possible, including a policy covering war risks, with the Treasury Export Credits Guarantee Department.

BALANCE SHEET ITEMS

Comparison of the balance sheet with that of the previous year will show that investments at £1,362,160 compare with £1,546,249 last year, a decrease of £184,089. This decrease is caused by the taking over by the Government of certain of our companies under the Steel Act. Investment in Government securities total £149,580, against £2,500 last year, an increase of £147,080. Here again we see the effect of the Steel Act, likewise in the additional item of £250,000 cash on short-term loan.

The special item of £506,567 on the balance sheet identified as "surplus on vesting of subsidiary shares in iron and steel corporation" we look upon as part of the capital of the company. We have been fairly successful in the past in the expansion that has taken place in the company's business both departmentally and by the acquisition of subsidiary companies, due to the special opportunities that have come our way. We do not doubt that in due course we shall be able to use these additional capital resources equally advantageously to the benefit of the company.

Taxation is another matter to be kept continually in mind. It will be observed that the liability of the group under this heading at June 30, 1951, was £1,643,098. That sum is due for payment in cash by the end of 1952. This company must, therefore, have large and liquid resources at its disposal.

The profit and loss account of the parent company shows a profit after allowing for general charges, normal depreciation and taxation, of £570,922.

	£	£
		570,922
to which is added :—		
Surplus on vesting of subsidiaries' Shares in Iron & Steel Corporation	506,567	
Profit on realisation of fixed assets	24,790	
	531,357	
Less provision for :—		
Depreciation of investments	9,000	
Benevolent scheme	25,000	
Taxation Equalisation Reserve	25,000	
Contingencies	200,000	
	259,000	272,357
		843,279
Amount brought forward from last year		558,726
There is an available balance of		1,402,005
Dividends already paid on preference and Employees' shares, and Interim on ordinary		73,441
Leaving a disposable balance of		1,328,564

The directors recommend that this be dealt with in the following manner:—

	£
Final dividend of 10 per cent. on ordinary and participating rights on employees' shares	60,044
Provision for a Bonus of 5 per cent., less tax, on the ordinary shares including participating rights on employees' shares together with taxation thereon	42,000
To capital reserve	506,567
To general reserve	200,000

Carry forward £519,953 which compares with £558,726 brought in.

There is a new item in the balance sheet on this occasion, viz., a reserve for contingencies of £200,000. To those of our shareholders who are managing businesses today this item will not come as a surprise. It is a cushion and a measure of cautious accountancy we think necessary for your company. We are conducting a large business—it might even be called a business empire—all over the world under circumstances which, to say the least, are not normal. The ordinary methods of trade whereby reliance could be placed within very narrow limits upon the supplier delivering the goods at a definitely agreed price within a specified period of time without probability of interference by the Government through restrictions, licensing, etc., have gone by the board. Today there is little security of price or delivery and business carries a risk which is sometimes difficult to minimise. A company not prepared to take these risks cannot do business, and it is because of this that your board have decided on this cautionary measure.

The proposal to make a provision for a deferred payment bonus of 5 per cent., less tax, was taken after careful consideration. We could, of course, have recommended that it be paid forthwith but your company has many facets and does business through very many channels, and we definitely feel we are acting in the best interests of the shareholders in recommending this course.

THE GROUP POSITION

As you know the Wolverhampton Steel and Iron Company (1946) Limited, and the Birchley Rolling Mills Limited, were transferred to the Iron and Steel Corporation of Great Britain Limited in February and, therefore, have had to be taken out of our accounts for the year to June 30, 1951. The dividends received therefrom have had to be treated as from subsidiary companies not consolidated. This accounts for the fact that comparative 1950 figures shown on the present report do not agree with the accounts issued in 1950. They do, however, compare like with like and on this basis the subsidiary companies show a profit (after all charges, including taxation) this year of £348,056 as against £390,635 last year. This difference of £42,579 is more than accounted for by increased taxation and depreciation. Carry forward applicable to the parent company has increased from £245,696 to £341,496.

It is pleasing to be able to report that our subsidiary companies are doing well with full order books. The male staff pension scheme, which includes all subsidiary companies, and which was put into operation three years ago has been extremely well received. The invested funds now amount to £409,000. During the past year, an addition has been made in the form of a group life policy, which provides death benefits up to pensionable age.

WHAT OF THE FUTURE?

This report is written and presented to the press before the general election, and as companies are not politically minded I am absolved from making any forecast. I am confident, however, that in the interests of our business we have every right to demand and expect, whatever the result of the election may be, that the suicidal experiment of nationalisation shall be looked upon as a fundamental failure which should be wiped clear of the slate of practical politics.

Thos. W. Ward Limited, is a company with adequate resources, capable management and valuable experience. Couple these three assets with the fourth of unbounded enthusiasm and we have a combination which can play its part in whatever role the future may have in store, provided we are given a fair field for enterprise.

A PLEA FOR MORE SCRAP

I cannot conclude my report without making a direct appeal to all our shareholders to take a keen personal interest in the problem of scrap iron and steel collection. It is impossible to exaggerate the importance of this matter in relation to our national economy. The furnace capacity of this country can produce over sixteen million tons of steel ingots per annum provided a sufficiency of scrap is passed to the consuming steel works through the usual channels of the scrap merchant. Every ton of steel which can be produced is needed for the Defence Programme and for the manufacture of export goods. To fulfil our obligations in these essentials we must have scrap and still more scrap.

It is not an overstatement to say that there are many hundreds of thousands of tons of valuable scrap laying about all over the country in the form of derelict plant, obsolete equipment, waste material and the miscellany of items under the benches and at the back of storerooms in every kind of industry. If this weight of scrap material could be quickly recovered it would be of immense benefit to the country generally. What is needed is undoubtedly a new approach to the problem on the part of every individual throughout industry. There should be a constant feeling of urgency, an ever-present scrap consciousness, even to the extent of it being looked upon as an offence to neglect starting any scrap for which the individual is responsible on its way to the melting works. The scrap merchants of this country are able to undertake the dismantling of plant and equipment where this is necessary—in short, there need be no obstacle in the way of rapid disposal of even the most difficult derelict plant.

It can be said without the slightest fear of exaggeration that only by the most intensive, personal effort can the hidden scrap resources of industry be uncovered. We need this scrap—every ton of it—if the steel requirements of this country are to be met.

The report and accounts were adopted and the dividends recommended declared. The retiring directors were re-elected and Messrs Joshua Wortley and Sons reappointed auditors.

NOTES:

(a) Commitments for Capital Expenditure so far as they are not included in Current Liabilities in this Consolidated Balance Sheet, amounted to approximately £750,186.

(b) Post-war Refunds of Excess Profits Tax have been included to the extent that such refunds have been received from the Inland Revenue.

(c) No Apportionment has been made to the interests of minority shareholders of the Reserve for Income Tax due 1st January, 1953, or the Taxation Equalisation Reserve, as it is not considered correct in principle to do so.

(d) The Shares of Subsidiary Companies were vested in the Iron & Steel Corporation of Great Britain on February 14th, 1951.

ALLEN HARVEY & ROSS, LIMITED

LARGER NET PROFIT

BRIGADIER G. M. B. PORTMAN'S STATEMENT

The annual general meeting of Allen Harvey & Ross, Limited, will be held in London on November 14th.

The following is the statement of the chairman, Brigadier Guy M. B. Portman, which has been circulated with the report and accounts:

The company's balance sheet as at September 30, 1951, and the profit and loss account for 1951 are now submitted to you for your consideration and adoption. The year has been smooth and satisfactory with no lack of opportunity to trade profitably within the company's resources. The company has been able to set aside additional reserves against the possible effects of the uncertainties which now confront us and changes which we may be awaiting.

The surplus shown in the balance sheet under the heading capital and revenue reserves has increased by £58,000 compared with last year.

RESULT OF YEAR'S OPERATIONS

It will be seen from the profit and loss account that the net profit for the year amounted to £89,619, an increase of just over £1,600 compared with last year's figure. The net profit of £89,619 is after making provision for rebate, amortisation of premiums on investments, taxation and adding to reserve for contingencies, as last year.

The directors again recommend a transfer to general reserve of £25,000, bringing the total of that reserve to £125,000. Dividend appropriations amount to £31,675, the difference of £1,325 compared with last year's figure being due to the increased income tax deducted; £102,842 is carried forward to next year, against £69,898 brought in.

Of the investments held at the date of this balance sheet all except £450,000 have a maximum life of 2½ years and just over half the holding has a maximum life of 1½ years.

BILL PURCHASES

The company's purchase by tender during the year of British Government Treasury bills has risen from £322,000,000 to £342,000,000 and the turnover by sale to the clearing banks has reached £321,000,000 (last year £271,000,000). There has been an increase in purchases of commercial bills of 34 per cent., that is from £32,000,000 during the previous year to £43,000,000 during this year; sales of these to the "clearing banks" have reached £37,000,000.

In recent conditions where private traders have been moving larger stocks of commodities at higher prices, on transactions appropriately the subject of acceptance credits, there has undoubtedly been the creation of a greater volume of bills on London. However, since the raising by the banks last July of their buying rates for bank bills and their call loan rates against these as collateral, inevitably there has been a tendency, especially on the part of the exchange banks, to hold rather than to rediscount with the market their purchases of bills abroad.

Your directors desire, on your behalf, to express gratitude and appreciation of the thorough and enthusiastic team work of the company's staff. The company suffered a sad loss in October, 1950, by the death of Mr F. P. King, the manager and secretary, who had served the firm loyally and well for 35 years.

H. A. SAUNDERS LIMITED

IMPROVED RESULTS

The sixteenth annual meeting of H. A. Saunders, Limited, was held on October 15th in London.

Mr H. A. W. Saunders (chairman of the company), in the course of his speech, said: We have finished a further twelve months' trading, which ended March 31st last, and, as I said in my speech last year, I hoped that our figures would turn out as good as the previous year. The figures are better and our profits have increased from £106,774 to £143,179, which is an increase of £36,405.

On paper the figures look very good, but personally I am somewhat disturbed over the terrible phase of inflation that we are going through. Please do not get the impression that I am pessimistic, as my directors and myself feel very confident at being able to handle any situation that may be brought about.

Our dealings in secondhand cars, the sale of spare parts for the companies we represent, and the service side have been very satisfactory. We have taken a great interest in the sale of industrial and agricultural tractors. Particularly since April 1st last this section has made good profits, and we are also finding that the products of manufacturers of tractors who we represent are getting more established.

The figures for the six months ended September 30th last, which deal with the new year's business, are very satisfactory, and I see no reason why the remaining six months should not be the same, although we may have slightly more difficulty in dealing with secondhand cars.

The report and accounts were unanimously adopted and a dividend of 20 per cent. on the ordinary shares was approved.

NOTICES

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of SENIOR LECTURER OR LECTURER IN GOVERNMENT. Salary scales per annum: Senior Lecturer £1,150 to £1,500. Lecturer £500 to £1,000. Membership of F.S.S.U. and Children's Allowance Scheme. Initial salary according to qualifications and experience. Applications should be sent not later than January 31, 1952, to the Registrars, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

ROBSON, MORROW & CO. require the services of a Chartered or Incorporated accountant with industrial experience and who is interested in being trained in the development and installation of management control accounting. Four-figure commencing salary with annual increases. Send full particulars of age, education, qualifications, experience and present salary to Robson, Morrow & Co., 59, New Cavendish Street, London, W.1, marking envelope "Application."

CAMBRIDGE GRADUATE (26), 2nd class hons., two years' wide experience all branches sales organisation with medium-sized manufacturing firm of highest reputation, would like improve position; industry immaterial; no technical qualifications, but post involving work, responsibility, and prospects essential.—Box 774.

DIRECTOR (age 45), prosperous Shipping Company London as informed his salary £2000 Zenith, wishes change with more prospects, public school, hard worker.—Write Box "SP/123," c/o 95, Bishopsgate, E.C.2.

PERSONNEL OFFICER (33), in charge of Central Department of large British Company in India, seeks new post at home or abroad early in 1952. Ex-serviceman, M.A., completed one year course of I.P.M. London.—Box 773.

Permanent position with pension scheme in operation. Experience in office organisation, costing and mechanised accounting essential.—Write Box 780.

NOTHING succeeds like success, but you have to succeed first. How to make advertising successful can best be learned from those who have done it. Consult an agency with experience—Samson Clark & Co. Ltd., 57/61, Mortimer Street, London, W.1. MUSeum 5060.

THE Economists' Bookshop, 11-12, Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History, and Social Sciences, you may wish to sell (periodicals excluded).

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 16, George Street, Mansion House, E.C.4.

FOR SALE.—The Economist, 1950, offers Box 784.

UNIVERSITY OF LONDON

A lecture on "Science in the Study of Administration" will be delivered by Professor W. J. M. Mackenzie (Manchester) at 5 p.m. on November 5th at the London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2. Admission free, without ticket.—James Henderson, Academic Registrar.

MINISTRY OF EDUCATION

H.M. INSPECTORS

Applications are invited from men and women for posts as H.M. INSPECTOR. Candidates, who should preferably be under 50 on December 31, 1951, should normally possess good educational qualifications and experience in Adult Education. Applications will be specially welcomed from candidates who have qualifications in Economics, Philosophy and Psychology.

The posts, which are permanent and pensionable, carry a salary scale for the London area of:—

£1,000 x £40 — £1,200 x £50 — £1,525 (Man)
£900 x £30 — £990 x £40 — £1,190 x £50 — £1,355 (Woman).

(A number of posts of special responsibility carry a £100 pensionable allowance; and Inspectors are eligible for promotion to certain higher grades.) The salaries of Inspectors working outside the London area are slightly lower at all points. In special cases successful candidates may be appointed at a commencing salary above the minimum.

Further particulars, together with an application form, may be obtained on written request to The Secretary (Inspectors' Section), Ministry of Education, Curzon Street, London, W.1. The closing date for applications will be January 31, 1952.

ADVANCEMENT causes a vacancy for a General Sales Manager in FIBREGLASS LTD. We manufacture glass fibre products for use in the insulation field and in plastics. The products sell mainly for technical purposes and many new applications are under development.

The General Sales Manager will be responsible for leading the sales effort of the company, and a high standard of education, such as a University Degree or similar qualification, is desirable. A man between the ages of 35 and 45 is preferred.

The post covers heavy responsibilities and the work is hard. The applicant must show thorough and successful experience in general sales organisation. Residence near the headquarters of the company at St. Helens, Lancashire, will be essential. The post carries a substantial initial salary and is progressive.

The vacancy has been notified to our own staff, and a rigorous selection will be made. Those with inadequate qualifications are asked not to apply.

Address applications, with an outline of career, to M.D., c/o Fibreglass Limited, St. Helens, Lancashire.

ASSOCIATION representing a manufacturing industry with its own house in Mayfair has available exceptionally good office space, conference rooms and also secretarial services. Home offered to similar organisation desiring to share these facilities.—Box 779.

FAMILY concern of Builders' Merchants needs expansion capital investment from those interest in the new building prospects, write Timperley Roofing Company, Chertsey, Surrey.

Policy First

OVER the next five years the task of the Conservative Government is to make the British nation solvent and secure. If Mr Churchill and his colleagues are content with any lesser objective, the present Parliament is unlikely to last for five years and the next Parliament is likely to have a Labour majority. For the present the Conservatives have been put into office with few commitments on detailed policy; the electorate has narrowly preferred them to Labour for a job of rescue and repair. The narrowness of the preference makes the task extraordinarily difficult but provides no shadow of an excuse for dodging it.

The Government's majority is admittedly too small for comfort. It is smaller than most people expected; it proved in the end to be smaller even than the early returns last Friday morning had indicated. But it is sufficient for firm government. The political deadlock is broken. It had two causes. One was the smallness of Labour's majority, and the other was that ministers had run out of ideas and were too exhausted to act decisively. They had little effective power, but they did not know what to do with such power as they had. The Conservatives are relieved of both these handicaps. They should know what they want to do, and their majority is big enough for them to do it. Labour in 1950 had a majority of six and survived for eighteen months without defeat on a major issue. After the election of the Speaker, and when a Labour member has been returned for Barnsley, the Conservatives' majority over all other parties is sixteen. As long as they behave at all reasonably they can rely on Liberal support on major issues and their effective majority is twenty-eight. That is bad for Parliament in the long run; it makes essential a stricter party discipline than is healthy. But for five years the discipline is possible. Unless the Government is very unfortunate in by-elections there is no Parliamentary reason why it should ever be defeated on a matter of confidence.

The fate of the Conservative party is therefore in its own hands. But the time of decision is short. The deadlock, with all the limitations it imposes, can easily be restored. If for six months the Government does little new, if it waits to see how things are going and hopes it can get along without offending anyone much, then it may cling to office for another four years but it will be as tightly bound to a continuing policy of timidity as Labour has been. For a short time the severity of the difficulties with which Britain is beset, in both economic and foreign affairs, can fairly be attributed to the weaknesses of the last government. But in politics the principle *post hoc propter hoc* cannot be escaped. Disasters twelve months after the Tories are put into office will be attributed to the Tories. If they interpret the narrowness of their minority to mean that they dare make only minor changes from Labour policies they will soon be held equally responsible for those policies and for the austerities of British life in 1952. And if they prove to have nothing appreciably different from Labour policy, why should they ever be voted into office again? The electorate will prefer,

and will be right to prefer, that the common policy should be carried out by men with their hearts in the task rather than by men who have taken it over with much misgiving because they are afraid to do anything else.

It may have been good strategy for the Conservatives to say as little as possible about their policy while they were in opposition. But for their own sake they must have a distinctive policy now. That cannot, of course, be a reactionary policy; but equally it must not be a policy of "me too-ism," of paying Labour the compliment of assuming that it is still the progressive party and therefore continuing to do all that it has done. The hard fact about Labour policy is that it has left this country insecure and, after six years for recovery, facing its worst economic crisis since the war. The Conservatives have a certain capital of goodwill, particularly abroad, that may for a few months help to make the pound sterling a less vulnerable currency. But the capital is small. Britain has to be pulled from the edge of economic disaster. Unless the changes in policy are sharp and firm, life under the Tories in 1952 and 1953 will be far worse for everyone than it has been under Labour.

The nature of the policy the Conservatives ought to follow is discussed in detail in a later article. Here three simple points of fundamental importance have to be made. A realistic economic policy is bound to be immediately unpopular. It is bound to hurt. But it is not only good statesmanship for the country; it is also good politics for the Conservative party. It is as certain as anything can be that this government will have to live through hard times. Unpopular measures now will be forgiven it if by 1956 it has brought this country safely through the twin crises of respect and of solvency, if it has put British influence and British prosperity on a safer footing in a less troubled world. The unpopular measures for which the Conservatives will not be forgiven are those that another economic crisis will drive them to if nothing unpopular is done now. The safe rule for Tory Ministers is that if they act in apprehension of the election, in fear of losing votes soon, then they certainly will lose the election when it comes.

The second point is that administration must not be mistaken for policy. It is true that relatively little legislation is necessary or even desirable. It is true that there are many things the Conservatives can do by better administration that will be sheer gain for everyone. But their importance is secondary. Good government does not consist chiefly in circulating minutes for urgent action round the departments. The future of this country depends on radical changes in policy, not on minor administrative adjustments, however vigorous.

The third point is that, while the narrowness of the Conservatives' majority must in no way inhibit them from taking effective measures, it should limit the range of things for which they can regard themselves as having a mandate. It limits not the intensity but the scope of their policies. They cannot be and must not try to be non-controversial. They cannot stick to things that Labour will accept; they should try to concentrate the political battle on as narrow a front as is compatible with the fulfilment of their main purposes. The standard ought to be whether or not a measure is acceptable to independent opinion, and the practical test of such opinion at present will generally be the attitude of the Liberal party. A later article shows how the Conservatives owe their victory less to the votes won directly from Labour than to the fact that they got much the bigger share of former Liberal votes. The significance of that is two-fold. For the Liberals, it means that the 700,000 people who voted for their candidates are, on the whole, people who if they had had to choose would have preferred—for this Parliament—a Tory to a Labour government. It is the "mandate" of the six Liberals—quite apart from the fact that some owe their seats directly to Conservative votes—to support Mr Churchill's government provided only that it does no sharp violence to Liberal principles. On the other side, the lesson for the Conservatives is that their position in the country depends on Liberal goodwill and they had better not do violence to Liberal principles.

In opposition the Conservatives' most effective criticism has been of the pettiness, the small-mindedness and hidebound ideological conservatism of the Labour party in power. The magnitude of the task they have inherited is also the measure of their opportunity. If they demonstrate the vision that has been lacking in Labour they can revive their country and destroy for ever the identification of conservatism with the evils of the thirties.

The Cabinet

MR CHURCHILL'S Cabinet is excellent in structure and it contains several men who, in administrative experience and intellectual grasp, are in the front rank. But in terms of personalities, the Cabinet—and indeed, the Government as a whole, so far as it has yet been announced—must be deemed a disappointment. It is, essentially, not a Conservative but a Churchill Cabinet. The "broadening" of the administration to which Mr Churchill has often referred has proved to mean in practice the choice of men with no direct party connections from among the Prime Minister's personal friends. Some of these choices are excellent. Others certainly give no clear advantage in ability; and since Mr Churchill is 76 they introduce an unnecessary danger of discontinuity in several of the higher offices of state.

The Cabinet is also unbalanced in the relative emphasis put on the main functions of government. Mr Churchill's interests and experience made it almost inevitable that he should be his own Minister of Defence. But it is only if he strictly limits his liabilities in that office, confining himself to the broadest supervision of defence policy, that he can possibly have also time and energy sufficient for his primary task. It is the greatest pity that in addition his deputy has to take responsibility for the most burdensome of administrative offices. The reasons for having Mr Eden at the Foreign Office are strong, but the reasons for having a deputy Prime Minister free from departmental duties—and in daily contact with the currents of opinion in the House of Commons—are far stronger. Mr Crookshank will lead the Commons well, but he cannot exercise the initiative and authority Mr Eden would have done.

In the most important of junior offices the choice of Mr Selwyn Lloyd, as Minister of State, is excellent.

With him, and with Lord Salisbury in the Cabinet to assist Mr Eden, there is a wealth of talent for the conduct of foreign affairs. Important though that is, Mr Eden could well have been spared for the general co-ordination of domestic and foreign policy. The choice of Mr Butler as Chancellor of the Exchequer is the crucial one for the Cabinet's future. That Mr Butler has the subtle intelligence required at the Treasury is not in doubt. What is not known, and what he now has the opportunity to show, is whether he can also command the political courage and the decisiveness of action that are supremely needed at this moment. And in economic policy there is no Lord Salisbury to advise at Cabinet level. Sir Arthur Salter will be a powerful reinforcement, but it is essential to the usefulness of his office that he should regard himself as acting within the Treasury, as did Mr Gaitskell when he held the same post under Sir Stafford Cripps's Chancellorship. Within the Cabinet, Mr Thorneycroft may be a competent President of the Board of Trade, but he is not the most able of the younger Tories and certainly has not the stature to make an effective contribution to the broad work of economic policy-making. It is the more regrettable, and strange, that the Cabinet contains no one broadly responsible for raw materials and the production departments.

Mr Churchill's limited experiment in the use of such co-ordinating Ministers is constitutionally the most interesting feature of his government. Besides his own post of Minister of Defence, there is Lord Woolton concerned with food and agriculture, Lord Leathers generally responsible for the nationalised industries, and Lord Cherwell, who will deal with scientific matters and especially atomic energy. Lord Woolton's appointment is as good a way as any not only to secure the co-ordination between two related departments that has often been lacking in the past, but also to ensure that the Ministry of Food's concern for the consumer is, sometimes at least, rated above the Ministry of Agriculture's concern for the producer. To have a senior Minister (but why a new Secretary of State?) concerned with general government policy in relation to the nationalised industries is sound in conception, and Lord Leathers has the vigour and grasp to make a success of the post.

If he does, it must be hoped that Mr Churchill will consider further experiments with this grouping device. Its success depends largely on the ability of the subordinate Ministers to work effectively with the co-ordinator; they have in effect to be a committee collectively responsible not only to the Cabinet but also to the House of Commons. In this respect it is a pity that in all these first experiments the co-ordinating Cabinet Minister is a peer, who will not be able himself to expound general policy to the Commons. It is, indeed, a wider weakness of Mr Churchill's Cabinet that so many as six of its sixteen members sit in the House of Lords. Whatever its advantages in personalities and in freedom from the ties of Parliamentary duties in a closely divided House, that is bound to weaken the explanation and defence of Government policy at the point where it commands the widest public attention. In these circumstances the merits of Lord Ismay and Lord Cherwell as personal assistants to Mr Churchill hardly justify their appointment to offices of Cabinet rank.

The remaining appointments to the Cabinet have considerable advantages. In the early stages, at least, the difficulties of industrial relations under a Conservative Government are well met by having a Minister of Labour with no political past. Whether Sir Walter Monckton's skill as a negotiator will enable him to win the confidence of the trade union leaders only experience can show. It likewise remains to be seen how effectively Mr Lyttelton's qualities will be deployed in the unfamiliar territory of the colonies; at least his appointment shows a clear recognition of their importance and the difficulty of their problems. Mr Macmillan, although there might have been better use for his talents in some field of external relations, is a guarantor of good sense and imagination in housing and town planning policy, and there is no doubt of Sir David Maxwell Fyfe's competence as Home Secretary, of the appropriateness of Mr Stuart at the Scottish Office, or of Lord Simonds's legal stature as Lord Chancellor.

It is, however, difficult to convince oneself that the defects of the Cabinet are in any way remedied by Mr Churchill's selections for the subordinate posts. They consist for the most part of the old familiar faces. Of the leaven of younger men, few of Mr Churchill's choices are first-class and some are bad; others can only be called odd. He will certainly have to be alert to recognise misplacings as they show themselves, both in the Cabinet and in the lower offices. When the Conservative party has been so long in opposition and the difficulties it faces are so great, a little early butchering need cause no distress or weakening of public confidence. The main doubt must be about the Cabinet's ability quickly to frame clear, coherent policies, especially for removing inflation and closing the trade gap. But that depends less on personalities and offices than on a courageous and clear-sighted general will of the Conservative leaders.

The Programme

THE leading article in this issue beseeches the new government to act promptly and firmly and to put policy before mere administration. It is easy for outside commentators without responsibility to say such things ; but it is unfair unless they are also willing to state in what action and policy should consist. Accordingly an attempt is here made to set down what *The Economist* believes should be the main heads of the Conservative Government's policy during its term of office. Nearly every item has been fully discussed in these columns in recent years and the argument here can therefore be summary. But an effort has been made to play fair by being specific whenever the information at the disposal of the public permits it. And the assumption has been made that it is not for the onlooker to counsel discretion, to judge where the frontier of practical politics is reached or to try to guess how much courage politicians can be expected to show.

1. The Crisis of Solvency

FOREIGN exchange crises are becoming familiar in postwar Britain. Those of 1947 and 1949, severe though they were, were surmounted without doing violence to the way of life of any inhabitant of the British Isles. There is, therefore, a tendency to treat all such crises as stuff for the headlines and not to be taken with real seriousness. Yet the brutal fact remains that if the reserves fall to the danger point, either whole categories of imported food or raw materials will have to be cut out, regardless of the consequences, or else the pound sterling will have to be left to find its own level and the rationing of imports be achieved by soaring prices at home. These are not fairy tales ; they are sober possibilities. There is, of course, no public information of what has been happening to the gold and dollar reserves during October, but to judge from the evidence of foreign markets the drain has not been reduced and may well have been speeded up. At this rate, it is very doubtful whether the reserves would last a year.

Moreover, the old familiar remedies have lost their potency. Imports can always be cut, but hardly on a scale sufficient to staunch the flow ; and in any case, cutting imports is merely a way of exporting the crisis. It is doubtful whether exports can be further stimulated —indeed, in many lines they are becoming more difficult. A second devaluation within so short a time is unthinkable. Assistance from the United States will not for many months be legally possible except within the narrow limits of Congress's appropriation for mutual aid—and even if it were legally possible, the American mood is hardly favourable.

There is one policy that has never been effectively tried, and that is the policy of sharp disinflation at home. Sir Stafford Cripps came closest to applying it in 1948, and though his version was very dilute, it produced a striking improvement in the British balance of payments. Disinflation is the remedy that is urged on other countries when they get into currency trouble, and there have been some very impressive examples of its effectiveness—notably in Germany in the last twelve months.

Without prejudice to whatever can be done by pruning imports and by the other familiar methods, the chief prescription for the crisis of solvency must be disinflation. As with all other remedies, however, a cure must not be expected unless the dose is adequate. It will be of no use whatever for the Government to enter upon a policy of disinflation with the mental reservation that it will not be pursued up to the point at which anyone gets hurt. The object of such a policy is to reduce the stream of spending of all kinds within this country, which is bound to hurt somebody. Unless it goes as far as this, it will not be doing the job for which it is designed.

A really determined policy of disinflation would be applied in three stages. First, there should be a statement of the policy and of the determination to carry it through couched in terms sufficient to carry confidence at home and abroad and to check, or even to turn, the tide of capital movements that is now flowing so strongly against sterling. The most striking symbol of determination would be an increase in Bank rate—provided that it were large enough to be impressive. Bank rate at present is ineffective, and an increase would be symbolic without immediate practical effect except of a psychological kind. The more is the reason for making the gesture convincing ; the increase should be to 4 per cent.

The immediate psychological effect of this would be very great. But psychological effects wear off unless they are backed up by real policy. The second stage, applied over the winter months, should be a real attempt to restrict and reduce the supply of money. The approach might well be gradual. To begin with, the automatic creation of credit through the present unlimited willingness of the Bank of England to buy Treasury bills whenever the discount market is short should be brought to an end. Next somebody should be "forced into the Bank" *pour encourager les autres*, and forced to pay Bank rate for his accommodation. Then, if the policy has not achieved its purpose, the next step would be to start reducing the cash reserves of the banks—or, alternatively, to require them to increase their cash ratio. At every step of this programme, somebody would be hurt and there would be loud protests—indeed, one of the difficulties is that twenty years of cheap money have created so many vested interests in its continuance, including those of the Treasury itself and of the banks, on whom the Chancellor of the Exchequer would ordinarily rely for advice. But it is no good talking about a policy of disinflation unless there is willingness to carry it to the point where money is really hard to get. Nor will it do very much good to raise interest rates if credit remains quantitatively easy to obtain at these higher rates. It should go without saying that a policy of tighter and dearer money should be applied equally to the local authorities' borrowings from the government.

Tight money, acting on capital expenditure of all kinds, would not, however, go very far unless it were reinforced by an attack on other kinds of expenditure, in particular on expenditure by the government and by the consumer. The third stage is that of the Budget next April. Mr Butler should set himself the object of providing for an increase in defence expenditure and at the same time increasing the surplus, without increasing

the burden of taxation. This is a formidable programme, but either of the alternatives—either still more taxes or an abandonment of the surplus policy to which, to do them justice, the Labour Chancellors clung through thick and thin—is unthinkable. It follows that there should be a really determined assault on all non-defence expenditure—and a severe combing-out of defence expenditure, too. The government should appoint a strong economy committee, of which Sir John Anderson would be the ideal chairman, to see what reductions can be made in next year's estimates. It is unlikely, however, that enough can be done by mere economy in administration, without major changes in policy. The only large economy that is possible is in the subsidies. This will be the acid test of the new government's sincerity and determination in defending the pound. To reduce the subsidies would mean higher retail prices for food. But the alternative of letting the ultimate crisis arrive will mean either very much less food or very much higher prices, or quite possibly both together.

2. The Crisis of Respect

IF the sad events in the Middle East in recent months have proved anything, it is that British policy can act only when it acts in concert with the United States. It is no disgrace to say that British policy is no longer wholly autonomous, since that merely puts Britain in the position of every other country in the world save two. Or even if it is accounted a disgrace, it is still a fact. At the centre of the problems of foreign affairs, therefore, lies the question of Britain's relationship to the United States. Formally, the Labour Government achieved what no other British Government has ever been able to do—it entered into a formal treaty of alliance with the United States. Actually, Britain's relations with America have hardly been those of a partner so much as those of a client. It is the great service that Mr Churchill can render to his government and his country that he can reverse this. There are others who can do the other tasks to which he may feel tempted to turn his hand ; he alone can quickly restore Britain to the position of a full partner with the United States — a junior partner perhaps, but one with real influence in shaping the policies of the partnership. As soon as it can be arranged and prepared for, Mr Churchill should visit Washington and try (if it is possible in that distracted capital) to work out all the main heads of an agreed policy.

The most important item on the agenda of such a visit would, of course, be the strategy of seeking a settlement with Russia. Mr Churchill might be of real assistance to President Truman here, for the President by himself is so imprisoned by the attacks of his opposition that he can hardly contemplate any sort of bargaining with Stalin. Accompanied by Mr Churchill, he might be able to defy the charges of appeasement. But long before any bargain could be struck or any meeting with Stalin arranged, there would have to be the clearest analysis of just what the aims of policy should be when rearmament has removed the danger of aggression.

Second only to the general question of cold war strategy, there would be the question of Asia, at both ends of that crucial continent. In recent weeks, public and official opinion in America has seemed to be waking up to the necessity for a carefully thought out and agreed policy in the Middle East. At the same time, the problems of the Far East are unresolved. There is a certain complementarity between them ; and it should not be impossible to achieve an agreed policy that embraces both.

The third major item on the agenda of a Churchill-Truman meeting should be the very difficult matter of Anglo-American policy in Germany, which is not at present in a happy state. The occupying powers will have to decide very soon whether to accept the reunification of Germany on terms that the Western and Eastern Germans may agree upon or to take the responsibility of obstructing it. Either course is fraught with difficulties which were discussed in an article in these columns last week.

Washington is not the only capital in which confidence in British policy needs to be revived. A reconstruction of prestige is also required in Western Europe, where the Labour Government contrived to create more distrust than its actual intentions really justified. Here again Mr Churchill, as the virtual founder of the European Movement, starts at a great advantage, though he would be well advised to leave this side of his government's policy to his colleagues. It is a task admirably suited to Mr Eden, who should seek an opportunity to visit the main capitals of Europe, to ask what they require of Britain and to explain what Britain can give in return.

It is unlikely that, in real substance, the Conservative policy towards Western Europe will be very different from the Labour. The limits to full British participation in schemes of European unity are by now fairly well understood both here and on the Continent, and nobody supposes that Mr Churchill's government will seek membership in any federal union. But attitude can make an enormous difference, and if Mr Eden can make it clear that the British have the fullest sympathy with the movement towards European unity and will join in its various manifestations to the fullest extent that their other commitments permit, he will not find that he is pressed to go further. Britain can hardly be a pillar of Western European Union ; but it can hope to be a flying buttress, supporting from outside.

3. Repair Jobs

THE Labour Government was a very active legislator and the Conservatives have made it perfectly clear from the outset that when they returned to power they would revise many of the Socialist schemes. Some revisions, indeed, are urgently needed on the score of the public interest. But the new Government will be wise to exercise restraint over its followers' desires. It would, in any case, be a very dangerous precedent if every government were to undo most of its predecessors' work. Some day the Labour Party will again have a majority, and if industries are to be nationalised and denationalised in alternate Parliaments, the results will be disastrous.

The Government will therefore be wise to undertake only those repair jobs which are necessary for reasons other than the application of party doctrine. This does not mean that nothing must be done that the Labour Party would not like ; it is now Labour's job to oppose and consistency requires them to vote against any modification of their schemes, however small. But if the Tories make sure that their amending proposals meet two

requirements—that they are clearly necessary for the efficient functioning of industry, and that there is support for them outside the ranks of the Conservative party itself—then they will be right to proceed in the confidence that the next Labour Parliament will not reverse their actions once again.

Steel

The denationalisation of the iron and steel industry is, in one sense, an exception to the principle stated above. It is true that non-party public opinion strongly opposed the Steel Act and would support its repeal. But can it be said that denationalisation is necessary for the efficient running of the industry? The answer clearly depends on the form it takes. If there is an attempt to put everything back into the state it was in two years ago, then the net effect will be to substitute a very tight privately owned cartel for a very tight publicly owned cartel, which would hardly be an improvement. Whatever may be the objections on political grounds to the nationalisation of the industry and to Mr Hardie's methods, there can be little doubt that the regrouping and rationalisation of the industry on functional and technical lines that the Corporation is believed to have in mind would be to the national advantage. The way to denationalise steel is therefore not to try to sell it back in exactly the same parcels that were acquired (except where a whole plant was acquired from a single owner, as in the case of a technically integrated subsidiary) but first to do it up in different, and technically more balanced, parcels. This will take time and the Corporation should be given, say, three years to accomplish the job. It is also perhaps worth sounding the warning that the only form of selling the industry back to the public that will be worth while will be genuine sales to private shareholders venturing equity capital. If such capital is not forthcoming—and investors who are once bitten may perhaps be twice shy—it would be better to leave things as they are rather than to set up some sort of semi-public, semi-private corporation financed by fixed-interest capital. A privately owned steel industry will be preferable to the present arrangement only if it is in diverse ownership, flexible and competitive to a higher degree than has prevailed since 1932. The denationalising of steel will not be a simple operation but a very complicated one.

Coal

There can be no question of going back upon the public ownership of the mining industry. On the other hand, there is a considerable body of opinion outside the Conservative party in favour of revising the constitution of the National Coal Board to provide a large degree of decentralisation. The plan produced by Colonel Lancaster and blessed by the Conservative party certainly points in the right direction, but perhaps goes too far: it is right that executive management should be devolved upon a relatively large number of relatively small areas, but perhaps there are matters of policy that would still need to be settled in a few regions rather than at the centre. The Conservatives have wisely promised to consult the National Union of Mineworkers, to whom the British Association of Colliery Management should be added. If these two bodies and the board can, within a reasonable period of time, produce an agreed plan, this would obviously be the best solution, and the new Minister would be foolish to try to impose ideas of his own. Moreover, he should never forget that patterns of administration do not cut coal.

Electricity and Gas

There is no need to make any change in the present organisation of these industries. There are reports that the new government proposes to give municipalities the right to buy back their electricity and gas undertakings. This would be a very bad case of playing politics. For electricity, in this small and crowded island, a single ownership is obviously the right form of organisation and to have created it is one of Labour's most sensible achievements. The argument is less strong in the case of gas, but the form of nationalisation adopted is a reasonable one and it should be left alone.

Organisation is one thing, however, and policy is another. The ruinously anti-social price policy of the British Electricity Authority should be sharply altered.

Transport

This may well prove to be, among the nationalised industries, the new government's biggest headache. The one thing that is reasonably sure is that transport cannot be left as it is now, with the whole of the railways but only part of road haulage and even less of road passenger transport brought under the Transport Commission. Either the policy of monopoly must be pushed on to its logical conclusion or it must be retreated from.

The theoretical case for a complete monopoly of transport is watertight. Fifty years ago the railways did virtually all the inland transport of the country, and they could still do a very large proportion of it today if there were no alternative. On top of this complete and nearly large enough transport system, the last generation has superimposed a second large transport industry by road. As a consequence, the country is over-supplied with transport capital. To allow the two systems to compete each other to death is obviously wrong; to compel both of them, by "Square Deal" restrictions, to operate below capacity is equally wrong. The remedy—so runs the argument—is to pool all transport, sort out functions and cut down the capital employed. If transport is now running at a loss, the greater is the urgency to push on with the rationalisation.

To this theoretical case, however, there are two sets of practical objections. The first is that it would be asking too much of Tory flesh and blood to expect the new government positively to intensify the drive for nationalisation. This is the more true because, if the theory of monopoly is adhered to, it will be necessary to do something about the rapid rise in the number of "C" licences, which enable firms to carry their own goods.

The second objection is that the nationalised transport industry does not look as if it will ever, in fact, reap any of the economies that, in theory, monopoly makes possible. So far, virtually nothing effective has been done about co-ordination, and the obstacles in the way of anything being done are now seen to be very formidable indeed. Whereas in theory monopoly offers the possibility of really great improvements in the efficiency of transport, in practice it merely means the cumbrousness and rigidity of hyper-large organisation, the price without the reward.

As a practical matter, therefore, at least for the present, the path must lie backwards. It is unnecessary, and would probably be impossible, to return all the road haulage assets to their owners; it is very doubtful whether all the previous long-distance operators who have left the industry will come back quickly. But monopoly as a policy can be reversed at once. The 25-mile limit can be abolished and the Commission can be instructed to divest itself of its road holdings as opportunity offers.

But to do this will leave two large difficulties. First, what is to be done with the railways? Faced once again with the competition of a free-enterprise road transport industry, and burdened with the inflated costs of a period of full employment, it is very doubtful whether the railways can be made to pay. Even if they could, it is more than doubtful whether anyone would buy them. They must therefore remain in public ownership, and there seem to be only three courses of action open: to make road transport artificially expensive, so that the railways can compete; to prohibit certain varieties of traffic on the roads; or to pay a subsidy. The new government will have to choose which it wants. There is also a question whether the centralisation of control of the railways in the Railway Executive should not be reversed. There are some matters of policy (for example, wage rates) which have to be settled centrally, but for ordinary executive control even the four previous railway companies were too large.

The other objection is that to abandon the pooling of road and rail transport is to abandon, or at least to postpone, the hope of a far-reaching rationalisation of transport. If the Conservatives abandon the Socialists' solution (and the practical arguments for doing so are overwhelming), they ought to think out one of their own.

Raw Cotton

This also presents the Conservatives with a real problem. There is no doubt that the closing of the Liverpool cotton market and the substitution of the Raw Cotton Commission was one of the Labour Party's most foolish acts. It is true that the Commission has operated with efficiency—but it is also fair to say that it has done so only because it was able to rely on the free cotton markets in other countries.

But to revert to the *status quo ante* may no longer be very easy. The dealing skill may still exist in Liverpool, but the skilled clerical staffs might be difficult to find and the finance even more so. Moreover, with dollars getting scarcer again, a fully free market would be impossible, at least where American cotton is concerned. Here again, the immediate solution may lie along the line of abolishing the Commission's monopoly, without for the present abolishing the Commission itself.

Nationalised Industries Generally

Considerable sectors of industry will in any case remain under public ownership and it is essential that effective steps should be taken to establish their accountability to Parliament and the public. Consumers' councils have, generally speaking, proved to be even less effective than was expected. What is required is a permanent body of great authority, equipped with a full-time staff empowered to ask whatever questions they see fit. The parallel with the Public Accounts Committee is obvious, but perhaps not quite exact. A body consisting entirely of parliamentarians, dealing with a controversial matter such as public ownership, might generate more heat than light. On the other hand, parliamentary authority would be an advantage. The solution would be either a mixed body, or else two tiers, an expert committee reporting to a Select Committee of both Houses.

Health

There is no question of altering the main principles on which the health service is built; in particular, the decision to include every citizen, whatever his income, was right and should be upheld. But in retrospect it is clear that the health service was set up with reckless precipitancy; if they had known how much it was in fact to cost, it is almost certain that even Labour ministers would have hesitated. Two lines of reform can be suggested. First, though the principle of the free provision of general professional services should be retained, it should become the policy to make a charge for special appliances and also for at least a part of board and lodging in hospitals, the charge in each case to be remitted in cases of genuine inability to pay. A charge should also be made for household remedies, as distinct from drugs that are a part of medical treatment. Secondly, though it would be both impossible and undesirable to try to reverse the policy of public ownership of hospitals, the present close control from the centre should be reconsidered, and five-year block grants-in-aid substituted for annual estimates and appropriations on the civil service model.

Housing

The chief immediate need in housing policy (in advance, that is, of a complete recasting of housing finance) is for much greater flexibility in aims and methods. The near-monopoly of building by the local authorities has gone far too far, and the individual authorities should be given much more freedom to allocate their quota of houses to private enterprise if they see fit. Building of houses for sale should be permitted. Moreover, the present discrimination against the middle classes should be ended; they should get their fair share of the building resources of the country.

Some relief should be given immediately to the private landlord, in the form of authority to raise controlled rents by a flat percentage, possibly one-third, plus an allowance for repairs based upon the actual cost of doing them.

Town Planning

The provisions of the Act of 1947 relating to the levying of development charge and the payment of compensation for loss of development rights are another example of a scheme that is excellent in theory but has worked badly in practice. That the development charges have not frustrated more development than they have is due to the fact that the demand for certain sorts of buildings has been so great as to make the payment of almost any charge worthwhile. Even so, there have been a number of cases of frustration, and in normal times they would be very numerous. On the other side, it has become clear that the sum of £300 million allocated for compensation is most unfair and inadequate, and to work the scheme without grave injustice would require the paying out of a very large sum of public money. It seems

best to repeal this section of the Act completely, which would involve repaying development charges already levied. But the problem that these provisions were meant to deal with remains.

Education

The most immediate need is to repeal the absurd 16-year age-limit for the General Certificate of Education. The new Minister of Education will find the teachers' union opposed to this change, but he should have the strength of mind to overrule it.

Both parties promised during the election campaign to reconsider the position of the voluntary schools. But it is important to realise that religious independence, which is what the churches have chiefly in mind, is only one aspect—and in most people's minds not the most important aspect—of the general subject of variety and independence in education. Practices vary from district to district, but it is generally true that the local education authorities have used their powers under the Act of 1944 to impose far more uniformity and standardisation on the schools than is justified. This is not so much a matter of party politics as of the natural instincts of bureaucracy and therefore the harder for the Minister of Education, the supreme bureaucrat, to correct. He should, however, determine to make himself the champion of the head-master and the independent governing body against the Education Officer. He should also review the position of the Direct Grant Schools, to see whether anything can still be done to bridge the chasm that Miss Wilkinson's rules created between the schools that determined to become fully independent, at the cost of raising their fees and abandoning their scholarships, and those that accepted the closer association with the local authorities that the new rules insisted upon.

4. The Larger Prospect

The Conservatives have always said that they appreciate the paramount necessity of raising Britain's standard of economic efficiency until it is equal to the demands made upon it, and they have been insistent that the task cannot be accomplished without a return some part of the way towards a competitive free economy. The facts that their present period of power is beginning in crisis and that its length cannot be foreseen do not absolve them from making a start on the reconstruction of the British economy. If they wait until they have a large majority and no current pre-occupations, they will never make a start. Mr Churchill would be wise to appoint a special committee of his ministerial colleagues, who might be assisted by a few back-benchers and a small staff, to map out the lines of policy that should be followed over a period of three to five years.

Four lines of advance can be suggested.

The Price System

The first objective should be to return towards a money economy, in which prices of goods and services are free to move and to perform their function as a sensitive regulator of the distribution of resources. The case for such a return need not be argued here, since it can be assumed that all Conservatives, and very many other people besides, are at least theoretically convinced by it. A money-regulated economy has its obvious defects, but it has become clear that the only alternative to it is an economy regulated in detail by an ever-growing bureaucracy which, at the best, is rigid and distorted, and at the worst degenerates into a tyranny.

There should therefore be a systematic enquiry into which prices, now controlled, can be set free. Clearly, not all of them can. So long as import restrictions and rearmament expenditure continue, there will be some commodities of which the supply in this island must remain below the demand at any reasonable price, and for them allocation of supplies and control of prices must continue. But there are other commodities of which the free-market price would not be far off the controlled price and they should be set free.

It is not only, however, in the wholesale markets that some restoration of the price system is needed. Indeed, it could hardly go very far without an equivalent freeing of retail prices. Here the argument enters the highly charged political realm of the food subsidies and of rent restriction. It is easy to understand why politicians should be chary of touching these. But those who believe in the price system—or, put negatively, those who disbelieve in the bureaucratically controlled economy—will be stultifying their beliefs if they are content to leave this enormous lump of rigid artificiality permanently embedded in the economy. It follows that they should be forming plans now for its progressive removal so that, within measurable time, these two gigantic industries can be returned to the price system.

To any such programme there are two obvious objections. The first is that, in dismantling the food subsidies and the rent restrictions, the Conservatives would be dismantling the welfare state. They will have to be ready with their answer, which is that they believe in providing welfare for the people by seeing that everybody has enough money in his pocket to buy the food and the houseroom that he wants, not by deciding in Whitehall what is good for him and seeing that he gets it. Put properly, it is a very strong case and one that the man in the street, once he understands it, will accept.

The second objection is that setting prices free means setting them free to rise, which, it will be said, is incompatible with an attempt to check inflation. This will have to be met frontally. The objection arises from the old confusion between inflation and rising prices, which are by no means the same thing but are thought to be. If the price system is to be restored and the economy rescued from its present rigidity, prices cannot be held for ever in exactly the relationship to each other that they happen to have today—either some must fall or others must rise. If there is anything that the public would dislike more strongly than rising prices it would be an attempt to force prices down at the inevitable cost of reducing wages. Therefore the sorting out can only take place by letting some prices rise. It goes almost without saying that any liberation of prices would be very dangerous unless there had first been a real attempt to squeeze the inflation out of the system. But any attempt, in the name of anti-inflationary policy, to hold prices exactly where they are now would be a simple misunderstanding of terms. The right policy is to accept the fact that some prices (which includes some wages) must be allowed to rise above their present levels—but to see that the general rise then comes to an end.

Taxation

A money economy will not work without the provision of adequate monetary incentives. The restoration of monetary incentives is an enormous field, not all of which (e.g. the margin between skilled and unskilled wages) falls within the government's powers of decision. But a very large part of the whole subject consists of taxation and this is wholly within the government's control. The Conservatives should formulate a consistent plan for overhauling the whole taxation system of the country in order to increase the force of monetary incentives.

The chief danger to be avoided is giving the impression that the provision of incentives involves relieving the rich of taxation at the expense of the poor. This is, of course, a misconception of the problem, which is, *within each income group*, to reduce the taxation on skill, enterprise and effort and, as a necessary consequence, to increase it on the lack of these qualities. This is a subject that has often been reviewed in these columns—indeed, an article dealing with part of the problem appears on another page of this issue—and the arguments need not be repeated or even summarised here. Some examples of what is involved are the severe reduction and, if possible, abolition of profits tax and its replacement by a higher rate of income tax on unearned income, or reductions in the rates of surtax on earned incomes compensated (if compensation is needed, for the revenue might well gain within a year or two) by increases in the rates of estate duty. In the lower ranges of income, it is clear that indirect taxes have a smaller disincentive effect than income tax. It is hardly practical to suggest any further increase in indirect taxation, but any reductions in taxation that become possible, either through economies in expenditure or by the completion of the rearmament programme, should be concentrated on income tax.

Apart from the taxation of personal incomes, the Conservative government will also have to consider the taxation of the undistributed profits of business, in which task they will be assisted (or conceivably hindered) by the reports of Mr Millard Tucker's Committees and Sir Lionel Cohen's Royal Commission. There is a great deal to be said for the principle (adopted in Sweden by the Socialist party) of taxing profits that are genuinely retained in business enterprises considerably more lightly than those that are distributed—though any such change might increase the case for a capital gains tax. There is nothing to be said for the system into which this country has now drifted, by which the provision of capital by "ploughing back" bears a heavier rate of taxation, on the average, than its provision by the alternative route of paying profits out to investors and attracting them back by further issues of capital.

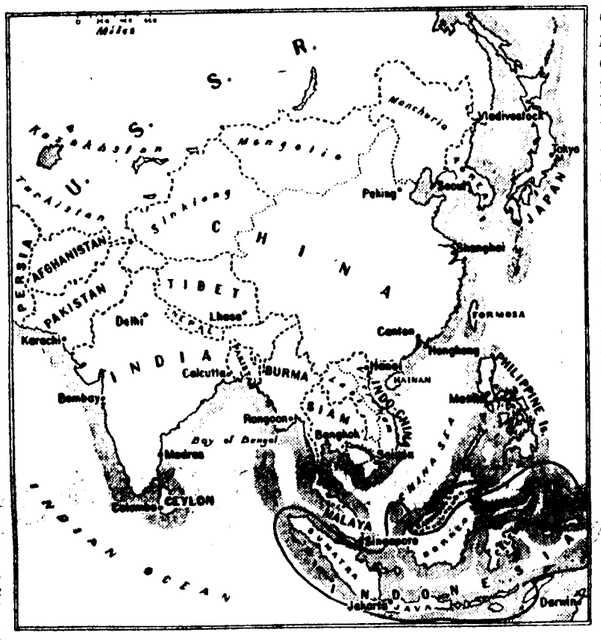
Monopoly

Any sincere and determined attempt to restore the conditions in which a free enterprise price economy can function effectively will have to tackle the questions of monopoly and restrictive practices, which have vastly grown in recent years, partly as a result of Conservative legislation in the thirties but mainly as a result of the war. The present Monopolies Commission is but the pale shadow of an excuse. Even if it were extended to cover the trade unions and the statutory corporations, it would still be very weak, since no principles have been laid down for its guidance, and the burden of proof rests, in substance, upon it and not upon the industries investigated. A more effective method of approach, often expounded in *The Economist*, would be to pass a declaratory Act, saying that certain defined practices (of which resale price maintenance would be only one) were *prima facie* contrary to the public interest, and that those industries which thought they had a good case, in the public interest, for adopting or continuing them should apply to the Monopolies Commission for absolution. But whether or not this method commends itself, the subject cannot be left alone.

The Role of the State

Finally, some hard thought will have to be given to the role of the state in the society and economy that the Conservatives envisage. This is not by any means an academic question; there is a sober possibility of the civil service breaking down within a few years under the load that it has borne for twelve years. Ministers should realise that, within the probable lifetime of the present government, they will lose by retirement the majority of their senior advisers, and it is a serious question whether they can be adequately replaced. Moreover, the Supplies and Services Act expires this autumn. The Government has no option this time but to renew it for another year, but it will have to define its attitude before the Act comes up again.

For these reasons, there will have to be a really serious and thorough review of the powers of the state. An authoritative committee should be set up to pass under examination every new power that has been conferred upon any government department since April 1, 1939, other than those that have been embodied in permanent and specific statutes (such, for example, as the Exchange Control Act). Sir John Anderson, after he has finished his economy inquiry, would again be an excellent chairman, but it is important that the committee should not consist of civil servants, since the main cause of the proliferation of vague powers is the desire of the civil servants to speed up administration by bypassing the usual forms of law-making.



As every power comes under review, the committee should ask four questions. Is the object for which the power was sought a necessary one? If so, can it be achieved by some means other than giving officials law-making powers? Are the powers sufficiently defined and restricted to their purpose? Are there adequate provisions against arbitrary exercise? Something has been said in an earlier section about controls which exist chiefly as a means of fixing prices. But there are many other survivals from the war which are equally suspect. The retention of identity cards is a case in point; either they should be abolished forthwith, or if they are to be retained it should be on the basis of a Bill that can be discussed in Parliament.

Under such an examination, many of the existing powers could be dispensed with entirely. The remainder could be arranged in two categories, those that are permanently necessary and those that are needed only for the duration of the rearmament emergency. The former should, as soon as possible, be embodied in permanent statutes, where their use and purpose can be adequately defined and safeguards can be provided for the rights of the citizen. The remainder can stay in an annual Act. No permanent power should be undefined, and no undefined power should be permanent.

Between Stalin and Mao

IN all the recent comment on Mr Churchill's prospects in foreign policy and Mr Morrison's failures there has been a marked tendency to think of Europe, America and the Soviet Union but to ignore the Far East. Has it been forgotten that Stalin has always looked east rather than west? Is it not realised that for all Communists this is above all the era of "liberation" for "colonial peoples"? If anything has become clear over the last twelve months it surely is that there exists a joint Sino-Soviet political strategy for Asia.

In Europe it is beginning to be possible to see what Mr Acheson has called a "situation of strength" emerging. In Asia, on the other hand, the situation remains definitely one of weakness and could worsen with great rapidity. Communist or Communist-led forces are waging "hot" war in five areas—Korea, Vietnam, the Philippines, Malaya and Burma; the majority of the Asian non-Communist countries are without cohesion or concerted policy in the face of the Communist challenge; and there are several acute conflicts which, although not directly connected with Communism, provide it with great opportunities for mischief—the tensions between India and Pakistan, between Afghanistan and Pakistan, between the Arab League and Israel, and between Britain and Persia. In short, Asia is now a more favourable field than Europe for the spreading of Communism by all mischief short of a major war. Such improvement as there has been on the front between the Baltic and the Bosphorus cannot be considered in isolation from the line of threatened or besieged positions all the way round the southern and eastern rim of Asia from the Mediterranean to Korea. This is not to say that any commitments in that area should be allowed to interfere with the priority of Europe's strategic needs or that the Communists are not being successfully held in several sectors. But it was Lenin's idea that Russia could overthrow the west if Asia were won to the Communist side, and there can be no doubt that the odds would be turned against the west if all the resources and manpower of the largest of the continents were at the disposal of the Kremlin. Communist strategy is different in Asia from what it is in Europe because the conditions are different. The west has to adopt counter-measures different from those suitable for Europe—that is to say, in so far as the west can help in a resistance which must be primarily a matter for the Asian peoples themselves.

There are three features of the situation in Asia which distinguish it from the European scene. There is the general economic backwardness of non-Soviet Asia—Japan being the notable exception—with a preponderance of pre-industrial and pre-capitalist conditions and vast masses of illiterate peasants living in deep poverty at very low levels of productivity. There is the fact that the countries of Asia—again with the exception of Japan—have been in the recent past in a colonial or semi-colonial relation to western nations; even where such subjection is now a thing of the past, they remain acutely anti-western and "anti-imperialist."

Lastly, there is the difference that, whereas in Europe the partners of the Soviet Union are small satellite states, in Asia the partnership is with China. One of them has a great preponderance of industrial and military strength, but the other has double the population and an overweening national pride based on an age-long tradition of regional supremacy.

If it were possible to consult the shade of Karl Marx in his Highgate resting-place, he would be shocked beyond measure at the idea that the peasant masses of Asia should be regarded as the perfect instrument for achieving a socialist revolution. But a generation ago Lenin revised traditional Marxism by breaking with its doctrinaire indifference towards peasants and nationalities and by making plans to use agrarian *jacqueries* and colonial nationalism as auxiliaries for the revolution of the proletariat. Alliance with agrarian revolt meant promoting the aspirations of landless peasants to acquire land in private ownership by division of landlords' estates. This, of course, could only have the effect of strengthening the petty-bourgeois element in society; likewise alliance with colonial nationalism means even supporting native capitalists in colonial countries as against the capitalism of the colonial powers. But the Communists have always held that such alliances involve no betrayal of their cause, provided that the Communist party becomes politically dominant; for it will be able in due course to collectivise the peasants and expropriate the bourgeoisie.

In this development of Marxist theory it is no longer necessary for a Communist-led revolution that the industrial proletariat should be a majority of the population, as the early Marxists expected it to become in highly industrialised societies. In China, between 1927 and 1948 Communist power was built up on entirely rural foundations, and it was this strange phenomenon of peasant Marxism that misled so many observers to entertain the delusion that Mao Tse-tung and his followers were not "real" Communists but merely radical agrarian reformers.

The fact that the Chinese Communists conquered the towns from the countryside and gained power through a prolonged process of guerrilla warfare and infiltration, in contrast to the Russian precedent of a single *coup d'état* in a capital city, has enabled the Chinese to claim that they have discovered and worked out a new technique of violent revolution, different from the Russian and better suited to conditions in Asia. This claim is the key to Communist activity in Asia. The existence of Communist-led armed forces carrying on guerrilla warfare in Vietnam, Burma, Malaya and the Philippines from lairs in jungles and mountains, without holding any important towns, presents obvious analogies with Chinese experience. Mao and his colleagues, having been successful in their struggle, commend themselves to the "national liberation movements" of other Asian countries, not only as providers of material and technical assistance, but also as the most knowing teachers and guides. Their example also makes a special appeal to other Asian peoples because China belongs wholly to Asia and was in the nineteenth century a victim of the western pressures which brought it into economic and political subjection. Russia, on the other hand, was definitely one of the European imperial powers under the Tsardom; and even now in its Soviet reincarnation is regarded in Asia as primarily a European state.

There have been some signs that the Russians have not entirely relished the Chinese Communist assumption of an independent leadership or the lofty style of talk affected by Mao Tse-tung and his colleagues. But it would be a great mistake to suppose that such undertones of jealousy prevent the closest co-operation in the assault on the free world. A comparative study of recent Soviet and Chinese radio propaganda suggests that a satisfactory working compromise has been reached in the matter of mutual commendation. The Chinese Communists pay suitable tributes of praise to Stalin and honour the Russians as the pioneers of world revolution and the country of advanced technology, while the Russians recognise the special qualifications of China for leading the revolution among backward colonial peoples. Corresponding to the theoretical division of labour there is a geographical division of spheres of influence whereby China has a free hand in South-East Asia—a region in which Russia has never hitherto had any direct interest. This is the region in which considerable Communist armed forces are already active, and where there are substantial communities of Chinese settlers, many of whom are inclined to help Chinese national expansion, even if they have no ideological sympathy for Communism. There can be little doubt that Chinese Communist assistance for revolts in South-East Asia would have been much more active than it has been so far if the Korean war had not diverted China's energies to another quarter. As it is, the Viet-minh forces have received large supplies of arms and military instructors from China. And a group of Burmese Communist rebels are known to be receiving military training at Paoshan.

The Russians are not without influence even in the Chinese sphere, for they participate in the permanent bureau of the Asian and Australasian division of the WFTU, which was set up in 1949 to co-ordinate "national liberation movements" from Persia eastwards and performs the functions of the old Comintern for this part of the world. In the Middle East the direction of Communist activities is directly in Russian hands. If China were to break down anti-Communist resistance in South-East Asia and if Russia were to gain control of Persia through an assisted internal transformation, the two wings of international Communist power would converge from west and east on the Indian sub-continent—the final goal of Communist strategy in Asia.

The lesson of this analysis is clear. The Peking-Moscow strategy for Asia is long-term, patient and simple—as was that of Mao Tse-tung against Chiang Kai-shek. Time will split the unity of the west; time will win men over in masses to the people's liberation armies in Malaya, Indo-China and Burma; time will enable the Russians to arm and train the masses of China; time will expel the Americans and British—without world war—and isolate India. If there is any doubt about the pattern, it can be dispelled by studying the way in which the Lao Dong party of orthodox Communism has taken over in Indo-China from the amorphous national front of Ho Chi-minh, preaching the need for a long struggle with the French and for a Viet-minh economy capable of sustaining the burden.

In all this, of course, there are weak points, and one in particular deserves the closest attention. Neither Peking nor Moscow is in a strong position to prevent the re-emergence of Japan as an Asian power. How, then, will they deal with the problem of Japan? That is the one question for which their strategy in Asia appears to have no answer. All the rest is disturbingly clear.

Patriotism and Purity

We are not insensible—God forbid that any man should be—to the added splendour which private excellence can shed around public virtues, nor to the clouding and detraction of that splendour which must ensue when patriotism and purity do not go hand in hand. But when we are discussing the justice of a cause, and the skill, courage, disinterestedness, and self-devotion with which a man has sustained that cause, then any reference to those personal infirmities of morals, "which chequer the volume of the brightest and best spent life," is irrelevant, invidious, and out of place.... We hold that, of all men, the patriot and the political reformer is entitled to have his private faults leniently judged. He, of all men ... has to walk through miry and thorny ways, to work with stained or damaged tools, to act in conjunctures in which a scrupulous morality finds it difficult to see its way. But as far as private character in concerned, allowance must be made for him which we are not called upon to make for others. Revolutions are not made with rosewater; nor are the men who engage in revolutions, even the most just and necessary, the men to whom virtue is most easy.... The true love of country and mankind often beats most warmly in the bosom of the man whose youth was stained by youthful frailties: his zeal may often be stimulated and elevated by the secret consciousness that he has much in the past to atone for;—and all that the world is entitled to ask about or to demand is, that the cause in which he has engaged shall be a righteous cause, that his devotion to it shall be single-minded and unselfish, and that he shall seek victory for it only by means as honourable and stainless as itself.

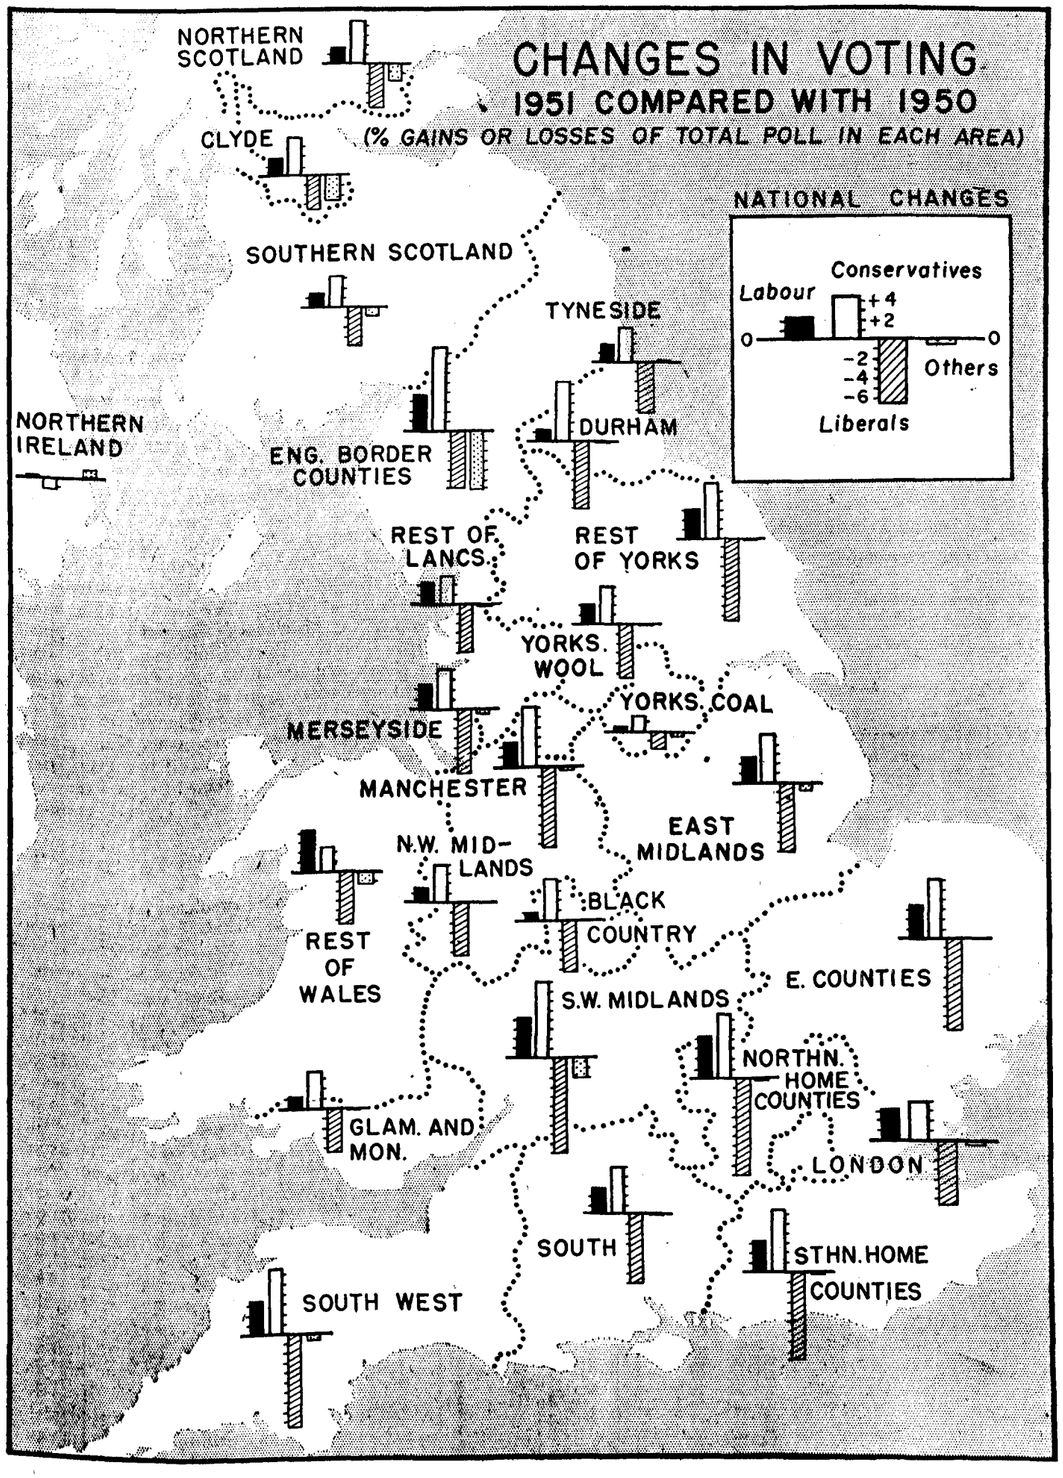
The Economist

November 1, 1851

The Results Analysed

IN the results of the election there is a note of defiance to the political statisticians. The narrow division in February, 1950, was confidently regarded as a somewhat freakish outcome of the British electoral system. In fact, despite the vicissitudes of the past eighteen months, it has happened again ; the swing of the pendulum was so small as to do little more than reverse the slender majority of the last Government.

On total number of votes Labour held the lead. Both the major parties got more support than in February, 1950, although the total poll dropped from 84.0 to 82.6 per cent of the electorate ; there was a large block of Liberal votes to redistribute between them. The Labour lead was reduced from 2.7 per cent of the total poll to 0.7 per cent. The Conservatives achieved a 2 per cent improvement compared with Labour. If the ex-Liberal votes had divided equally, this change would have been the result of a direct swing of 1 per cent from Labour to the Conservatives. In fact the direct swing between the two parties was even less because more ex-Liberals voted Conservative than voted Labour.



In the statistical tables on pages 1026 and 1027, the results of the two elections are compared and some calculations made about the voting in three different types of contest. In constituencies where there were straight fights between the two main parties in both elections, the Conservative improvement was 1 per cent, indicating a direct swing away from Labour of only 0.5 per cent or one voter in every two hundred. On the other hand, in those constituencies contested by Labour and Conservatives in both elections but by Liberals only in 1950, the Conservative improvement was as much as 3.6 per cent of the total poll. If only 1 per cent of this improvement was due to the direct swing from Labour to Conservatives, as in the straight contests, then the Conservatives must have gained the further 2.6 per cent from the uneven distribution of the ex-Liberal votes. Since these Liberal votes made up just over 10 per cent of the total poll in these particular constituencies in 1950, the Conservatives made a net gain of about a quarter of the ex-Liberal votes where there was no Liberal candidate. In the third type of contest, where there was a three-cornered fight both in 1950 and 1951, the Conservatives again did better than in the straight contests. And as the Liberal poll fell in these constituencies, it seems that there also the Conservatives made a net gain from ex-Liberal votes. Their total improvement here was 2.5 per cent of the poll of which, on the same basis as before, 1.5 per cent may have come from ex-Liberals. This implies a net gain of about one-tenth of the former Liberal votes.

This evidence is not altogether conclusive. The seats not contested by Liberals at either election include an abnormal proportion in the mining areas, where the direct swing from Labour to Conservative may have been smaller than in the country as a whole. This qualification does not, however, seriously affect such approximate generalisations as can reasonably be made. There is reason to believe that a number of the 1950 Liberal supporters abstained from voting this time where they had no Liberal candidate to support. For, while the average size of the poll throughout the country was rather less than in 1950, it dropped more in those constituencies than in the others. A rough estimate of the division of the ex-Liberal votes is that 15 per cent abstained, 55 per cent voted Conservative, and 30 per cent Labour. Where there was a Liberal candidate again, about 70 per cent remained faithful, about 20 per cent voted Conservative and 10 per cent Labour. The elimination of many Liberal candidates played a main part in determining the election result. Labour would probably have been defeated in any event, but without the support of former Liberals the Conservatives would not have won a definite majority. The "split vote" has not, however, entirely disappeared. A table on page 1027 shows that there were still 14 seats won by Labour and 25 seats by the Conservatives on a minority vote due almost entirely to Liberal intervention. Yet, on the most optimistic assumption about obtaining Liberal allegiance, neither party could hope to gain more than 6 seats from the other on this account.

These conclusions about the shifts in voting must be based on averages. There are always variations in individual constituencies. But the fact that not a single Conservative seat was lost to Labour shows how general was the small movement to the Right. Admittedly, of the 102 constituencies where there were straight fights at both elections, as many as 32 showed a very small swing towards Labour. But in only two, Belfast East and Belfast North, was the swing more than 1 per cent. The only striking Labour gains were made where there were ex-Independent Labour or ex-Communist votes to be won. The large Conservative gains were almost invariably made where the Liberal poll had been fairly heavy in 1950. Of the 21 seats gained by the Conservatives from Labour, 17 had lost their Liberal candidate since 1950.

★

The public opinion polls all predicted too easy a win for the Conservatives. The British Institute of Public Opinion, which provides the *News Chronicle* Gallup Poll, came nearest to the mark but, even so, its predictions overestimated the Conservatives' share of the poll and underestimated Labour's share by about 1½ per cent in each case. Translated into numbers of seats, the error is large. But the results of this election have confirmed that, in estimating the relation between votes and seats, changes in political feeling can rightly be assumed to be uniform throughout the country. According to the methods of electoral arithmetic described in recent issues of *The Economist*, a direct swing of 0.5 per cent from Labour to the Conservatives together with a 25 per cent net gain of the Liberal vote where there was no candidate, and 10 per cent where there was, would have predicted a turnover of 22 seats and a Conservative majority of 26 over Labour—very close to the actual result. The "cube law" also worked almost exactly after making the agreed correction to offset Labour's "wasted" votes in the constituencies where it enjoys very large majorities. Twenty-five Labour candidates had more than 75 per cent of the poll, while only four Conservatives—in addition to the four unopposed in Northern Ireland—had such an easy victory. The small bias against Labour that this implies seems likely to remain a feature of the British electoral system.

Votes and Seats of the Parties

In the tables below and in the map on page 1,025 (which compares the results of the 1950 and 1951 elections in graphic form), the country has been divided for the purposes of comparison into twenty-five regions, based on social and economic homogeneity, although widely different in size and population.

THE COMPOSITION OF THE REGIONS is indicated on the map. Some details of the boundaries are as follows: *Greater London* includes all boroughs adjacent to County of London. *Northern Home Counties* extends as far as Berks (excluding Abingdon and Newbury), S. Bedford and, in Essex, to Epping, Chelmsford and Southend. *Mid-Southern England* includes the rest of Berks and all Dorset except West Dorset. *South-West England* includes Bristol and S. Gloucester. *Eastern Counties* includes the rest of Bedford, Peterboro', Huntingdon and Isle of Ely. *Black Country* includes Birmingham Wolverhampton, Coventry and adjacent boros. also Cannock, Solihull, Sutton Coldfield and Nuneaton. *N.W. Midlands* includes Salop, rest of Stafford and Cheshire up to Chester, Runcorn, Knutsford and Macclesfield. *Manchester and District* includes Eccles, Middleton and Prestwich, Oldham, Stalybridge and Hyde, Cheadle, Altrincham and all boros. contained within these. *Merseyside* includes Crosby, Huyton, St. Helens, Widnes and all Wirral constituencies. *Rest of Lancashire* excludes Barrow and Morecambe and Lonsdale. *Yorks Woollen District* includes Sowerby, Keighley, Leeds, Wakefield, Colne Valley and boros. contained within these. *Yorks Coal and Steel District* includes everything in W. Riding south of Penistone, Hemsworth, Normanton, Barnsley and Don Valley. *Durham and Teesside* includes Middlesbrough and Cleveland. *Tyneside* includes all constituencies on the River Tyne as far as Consett on one bank and Newcastle on the other. *Glamorgan and Monmouth* includes Llanelly. *Clydeside* includes Glasgow, Greenock, Dumbarton and all Lanarkshire except Lanark. *Southern Scotland* includes everything else south of Stirling and Fife.

THE PARTIES HAVE BEEN DIVIDED as follows: *Conservative* includes Cons. and Lib., Cons. and Lib.-Nat., Unionist, Lib.-Nat. and National. *Labour* includes Labour and Co-op. but not Lab.-Ind. or ILP. Under *Others* are grouped all candidates who would not accept or would not be accorded the whip of any of the three main parties if returned to Westminster.

Four Conservative unopposed seats in Northern Ireland in 1951 and Barnsley, where the 1951 result is delayed, are excluded throughout. In addition, there were 12 University and 2 Labour unopposed seats in 1945 which are excluded from the figures for that year.

REGIONS	YEAR	LABOUR			CONSERVATIVES			LIBERALS			OTHERS			TOTAL POLL AS % OF ELECTORATE
		Votes	% of Poll	Seats	Votes	% of Poll	Seats	Votes	% of Poll	Seats	Votes	% of Poll	Seats

The Ex-Liberal Vote

The following table shows the voting in certain groups of constituencies in 1950 and 1951: (A) Where there was a straight contest between Labour and the Conservatives each time; (B) Where there was a three-party contest between Labour, Conservatives and Liberals in 1950 but a straight contest in 1951 without Liberals; and (C) Where there was a three-party contest each time between Labour, Conservatives and Liberals.

VOTING IN TWO- AND THREE-PARTY CONTESTS

	Number of Constituencies	Labour	Conservatives	Liberals	Total
		Votes (in thousands)			
(A) Two-Party Contests					
1950	102	2,557	2,002	...	4,558
1951	,,	2,550	2,034	...	4,584
(B) Three-Party Contests

Change	...	+ 1·13	+ 3·58	− 4·71	...

The Split Vote

The following table shows the numbers of Labour and Conservative members elected according to the proportion they obtained of the total poll in their constituencies.

Winning Votes as Percentage of Total Votes in Constituency	Number of Seats Won	
	By Labour	By Conservatives
Between 40 and 45 per cent.	2	5
,, 45 ,, 50 ,, ,,	12	20
,, 50 ,, 55 ,, ,,	82	89
,, 55 ,, 60 ,, ,,	67	86
,, 60 ,, 65 ,, ,,	59	60
,, 65 ,, 70 ,, ,,	30	37
,, 70 ,, 75 ,, ,,	17	16
,, 75 ,, 80 ,, ,,	16	3
,, 80 ,, 85 ,, ,,	8	1
,, 85 ,, 90 ,, ,,	1	...
TOTAL	294	317*

* Excluding the four unopposed seats.

It will be seen that 39 seats were won on a minority vote, 14 by Labour and 25 by the Conservatives. In all these seats the intervention of a Liberal was the sole or main cause. In the absence of Liberals, and on the extreme assumption that Conservatives made a net gain of 40 per cent of the Liberal vote, only 6 more seats would have been won. Equally, if Labour had obtained the same net transfer of up to 40 per cent of the Liberal votes the gain would have been only 6 seats.

Area and Constituency	Conservatives would have gained from Labour with *net* addition of following percentages of Liberal vote			Labour would have gained from Conservatives with *net* addition of following percentages of Liberal vote		
	20%	30%	40%	20%	30%	40%
Greater London:

Sowerby		*				
Rest of Wales:						
Conway					*	

The Size of the Poll

The first of these two tables shows the numbers of seats won by Labour and Conservatives arranged according to the size of the total poll in the contests and divided between safe and unsafe seats, the arbitrary distinction being made that a seat is considered safe if won with a majority over the next candidate of over 10 per cent of the poll. The figures show that the unsafe seats have a higher proportion of high polls.

Total Poll as % of Electorate	Number of Labour Seats Won			Number of Conservative Seats Won		
	Safe	Unsafe	Total	Safe	Unsafe	Total
55–60	—	—	—	1	—	1
60–65	—	1	1	—	—	—
65–70	1	—	1	8	—	8
70–75	8	2	10	11	—	11
75–80	29	4	33	65	3	68
80–85	95	34	129	118	38	156
85–90	68	51	119	19	51	70
90–95	—	1	1	—	2	2
TOTAL	201	93	294	235	92	317

The second table shows the size of the poll in the different types of contest, according to whether or not there was a Liberal candidate. Where there was a Liberal candidate in 1950 but not in 1951 the poll declined more than in either the two- or three-party contests.

	Number of Constituencies	Total Poll as % of Electorate		Change
		1950	1951	
Two-Party Contests	102	83·56	82·84	−0·72
Three-Party (1950): Two-Party (1951)	291	84·53	82·51	−2·02
Three-Party Contests	71	84·66	83·36	−1·30
All above contests	464	84·34	82·71	−1·63

NOTES OF THE WEEK

Better News from Korea

In the cease-fire talks that began again at Panmunjom last week the Communists have surprised everyone by offering to discuss an armistice line that differs by only two or three miles from the present fighting line. Although there had been little actual progress until this second offer came on Wednesday, the most notable change in the Communist attitude came earlier. Almost at the start the Communists, in reply to an offer by the United Nations of a buffer zone across Korea, proposed a cease-fire line running in many places ten miles north of the 38th parallel (this is the line shown on the accompanying map). This was rejected out of hand by General Ridgway's negotiators, since it bore no relation to the military situation: it offered only Communist evacuation of the worthless Ongjin and Wonan peninsulas in return for very substantial allied withdrawals on the main front. But its importance was that the Communists for the first time abandoned their claims to the parallel, on which the talks had foundered in August.

Many observers, including *The Economist*, interpreted cautiously last week the Communist jargon of Mao Tse-tung's important policy-making speech to the national committee of the People's Political Consultative Conference. It could, however, have been much more bellicose than it was and the

change of Communist tactics over the parallel suggests that Mao may have been preparing Chinese public opinion for a possible peace move, should the opportunity present itself for securing good enough terms at Panmunjom. If so, something useful may well be achieved within the next two or three weeks. What matters for the moment is that negotiations on a purely military line should be taking place at all.

There is thus a slight reason for cautious hope—nothing more. Peking would probably accept an armistice line only in the hope of eventually winning all Korea by other and slower means. Moreover, the armistice line is no more than the first item on the Panmunjom agenda. The second item to be thrashed out, before the UN forces can stop fighting, is the agreement for mutual inspection by the opposing sides to see that an armistice would not be used for building up forces for a fresh offensive. The third item is the exchange of prisoners, and the fourth is recommendations to governments for a permanent settlement. These are all formidable obstacles. Even if the last is reached, it is difficult to see a political settlement being quickly arranged. The situation in Korea after an armistice might become just like that in Austria. Whatever happens, the free world must expect to see UN forces remaining there for a long time to come.

The Arabs Hesitate

For the time being the Egyptians have had a setback. Living as they do sealed off from the rest of world opinion by deserts and by a rigorous press censorship, they know almost nothing about what people outside the Nile Valley are saying and thinking. They therefore took it for granted that all Arab League states would copy them in rejecting out of hand any consideration of the four power proposals for a Middle Eastern Defence Command. The four sponsors, the United States, Britain, France and Turkey, this week communicated their proposals, for information only, to all the other Near Eastern States affected, including Israel.

To Cairo's surprise some of the Arab states are giving the communication serious thought. The Lebanese cabinet sat all night. Saudi Arabia, dependent on revenue from American oil extraction, must think twice about a proposal which commits American arms to the defence of assets that the two countries share. Iraq, living closest to the Soviet Union and to the near-anarchy that threatens in Persia, must think seriously about defence problems.

Yet the recipients are in a quandary. If their statesmen could act free from pressure by public opinion, most would choose, as Turkey has, participation in an important military command on the proffered basis—which is that of equal partnership. The trouble is that this might entail sitting down to meat with Israel. If it did, they would hang back. If it did not, they would concur. But, except in Saudi Arabia, there is an uninformed, vociferous and easily-hired crowd to consider. Except for Saudi Arabia, therefore—and, just possibly, Iraq—no Arab country has a statesman with the moral courage to stand up to crowd tactics. If these are applied in earnest, and are followed by an Arab League meeting, all the states will probably in the end go along with Egypt.

The Arab predicament is acute, and their pause to think over the western communication is not only justified but laudable. The example of this week's demonstrations in Persia must reveal, to any Arab who thinks at all, that to surrender to crowd tactics is to push further open the door to Communism, which is already ajar. The Russians are telling the Arab States that they are eastern countries and that any defence arrangements they make "should be made in collaboration with Russia, the great Eastern State." This will incense some of them, but it may cow others. Now is one of the moments at which an Arab statesman might, by a statesmanlike explanation to his people of the real issues at stake, save his country from ultimate upheaval. But the moral courage that would be needed for such a course is not, among the Arab statesmen of today, a quality that leaps to the eye.

* * *

Qualms of the Persians

Dr Mossadegh still lingers in Washington. Day by day, he receives a visit from a bright face in the State Department. They talk, often for two hours. His visitor, on departure, tells inquirers that he thinks "some progress" has been made. Simultaneously, Persian spokesmen tell inquirers that the Prime Minister is still "considering various plans" and that nothing is sure. The real meaning of this run of inconclusive contacts is that Dr Mossadegh is in a quandary. Now that it is nearly time to go home the thought foremost in his mind is: what will his reception be in Persia? If he comes as the man who secured removal of the oil dispute from the Security Council's current agenda he will be wreathed in laurels; but he has already ordained that there

are to be "no triumphal arches." What if he is also greeted as the man who reached a new oil agreement with the odious foreigner?

To judge by the news from Teheran, the public reaction to this achievement would not be favourable. Teheran radio has said in so many words that the West is not dealing simply with Dr Mossadegh but has to reckon with a people that will not tolerate any foreign profit from its oil. Dr Kazemi, the vice-premier who was left to cope with affairs on the home front, is reporting uncontrolled demonstrations of people shouting "Long Live World Peace," "Down With Western Imperialism," and other slogans. He also reports in even more serious vein that his efforts to cut government expenditure by pruning civil service privileges and raising the tax on tobacco are highly unpopular.

The unhappy group of Persians who are staying on and on in Washington, at great expense, therefore face the fact that their treasury needs replenishing. Their better judgment tells them that they would make more money if they were to adopt one of the propositions now being made by the State Department visitors. (These are for foreign technical management of the industry with Persians directing the policy of installations inside Persia, and for employment of a foreign concern—perhaps a separate one—to fetch and market the oil.) Yet they know that they will get a dusty reception in Teheran if they agree to anything less than their original demands, which were for Persian technical management of a team of foreign technicians who would work for salary and expenses but not for profit. The Americans point out that no good foreign technician wants to work in such conditions, in the torrid climate of Abadan and perhaps under such an exacting master as Dr Mossadegh's henchman Dr Makki, would be. The prime minister's position, confronted with this set of self-made problems, is most unenviable.

* * *

Division at Once

The new House of Commons got off to an unhappy start on Wednesday. The election of the Speaker was challenged on a division for the first time since 1895. That was a highly regrettable break with a most important tradition. But it need not, fortunately, be interpreted as a serious challenge to the tradition. It does not mean that the impartiality of the chair is in question or that the Opposition is likely to challenge its authority in future debates. There is every reason to think that Mr W. S. Morrison will be a popular and successful Speaker. The Labour party forced a division not because it really has any objection to Mr Morrison but because it felt full of fight. Any issue would have done; the anxiety was simply to show the flag and divide the House at the first opportunity.

The main reason for this exuberance on the Labour side is that a good many members are pleasantly surprised to find themselves back at Westminster and to notice so few absent faces among their friends. There is particular cheerfulness that Labour still polled more votes than the Conservative party—a result that in the pessimistic mood of the last Parliament was certainly not expected. If some consciences are uneasy about the methods by which this result was obtained, and particularly about the warmongering scare, that only intensifies the Labour members' wish to justify their presence by opposing vigorously. But, unless circumstances are particularly unkind to the new government during its first few months, the Opposition's elation is unlikely to last. It was defeated soundly enough on Wednesday, and a succession of defeats may well make Labour's ardour to challenge the Government cool off, just as in the last Parliament the initial high spirits of the Conservatives faded after Mr Attlee had managed to stick in the saddle for a few months; they were revived only after such things as meat, groundnuts and coal had greatly embarrassed the Labour party. It is possible that in Parliamentary tactics the Conservatives will be handicapped by the smallness of their majority more seriously than Labour was. The party leadership may be less supple in manœuvre, and the following may respond less well to strict discipline. But although this may involve some additional embarrassment for Mr Churchill, there is no serious likelihood of its leading to defeat on an issue of confidence.

* * *

Party Moods

The mood of the Conservatives is certainly to stay in office as long as they can, and to have some confidence that it will be for several years. They are not only disappointed with the size of their majority but also angry and bitter about the slur of warmongering cast on them. In addition, the Conservative backbenchers are far from happy about Mr Churchill's government-making. They feel that it has been too slow, and particularly that the indecision as to whether Mr Eden or Mr Crookshank should lead the House of Commons was unfortunate. There is naturally much disappointment that so few of the younger men have been given important posts—and considerable feeling that all the fortunate ones are by no means those whose merits are most apparent.

By next week, however, these feelings will have sunk to second place. The one piece of Conservative legislation that will certainly be foreshadowed in the King's Speech is a Bill to undo the nationalisation of steel. The form of action on road transport is uncertain. It may immediately amount to no more than a stop to further transfers of road haulage firms to public ownership, with perhaps the restoration of more freedom to private operators. Immediate action on the university seats is not expected, though there is talk of an all-party conference on the House of Lords. Something will have to be done either to renew or to replace the emergency powers legislation that expires next month, but otherwise it is thought that for the next six months the Government will have little energy to spare outside economic and foreign affairs.

The Conservatives seem to believe that Labour is unlikely to settle down quickly to a deliberate policy of harrying the Government as much as possible. It will require some time to get its policies and strategy in opposition straight in its own mind. On the other hand, all sections of the Labour party are confident that the Bevanite conflict will become less serious. It is no longer a debate about what to do but about how to formulate a policy, and in that form is it less dramatic and less urgent—though not necessarily any easier to solve. And a period of intellectual fermentation is certainly not incompatible with a sharp storm turning more on differences of personality than of ideas.

* * *

Mr Morrison's Bogey

During the past week tributes have been paid to some of the retiring Labour Ministers. A special valediction is due to Mr Herbert Morrison. When the election campaign opened Mr Morrison had given ample confirmation of the fears expressed when he was appointed to the Foreign Office. Whatever his qualities as a party strategist, he had brought to his new task little better than a talent for provocative and partisan repartee; he was a bad Foreign Secretary. But by the time the campaign closed he had secured himself a place in history as about the worst Foreign Secretary of this century.

Mr Morrison may claim to be the chief architect of Labour's recovery from the disaster that threatened it when the campaign began. The evidence of most observers in the constituencies is that the "scare" that the Tories were warmongers played the main part in keeping the doubters

loyal to Labour. And it was Mr Morrison who played the chief part in the "warmongering" campaign. Some honest and intelligent members of the Labour party are now trying to exorcise their shame at the whole episode by pleading that it was the Tories who first exploited the Persian disaster as an election issue, and that the warmongering charges were merely an answer to Conservative propaganda about "a Munich at Abadan." The fact is, however, that Mr Morrison first introduced the theme as long ago as the end of July, when he told Durham miners that if the Tories had had their way "we should have been at war twice in the last ten days." Later, with a show of fairness, he made it more plausible by denying that the Tories wanted war; they were merely psychologically prone to it. The whole monstrous campaign was fathered and reared—with clever insinuations—by him.

In its implications for the fair conduct of elections in Britain the comparative success of the warmongering campaign was deplorable. In its implications for British foreign policy it was disastrous. If the people's desire for peace can be so unscrupulously exploited for the purpose of vote catching, it could mean that no Government whose foreign policy was not summed up in the word "scuttle"—or, at least, was made to look so to the world—could hope to get elected. Mr Eden has the unenviable task of showing that this tragic piece of political miseducation has not deeply influenced the outlook of the British people.

* * *

Wise Men's Buff

As Nato's three wise men grope towards their target, they are finding it increasingly elusive. And, as always, the harder the task becomes, the bigger the expert staff which is attracted to it. More and more people come into the circle to confuse the gropers, more and more papers to trip them up, and more and more figures to dazzle them. There is some danger that this private party by candle light will turn into a public gathering under neon lighting. Already there are two sub-committees: one on economic and financial matters, and one, under the American General McNarney, on military economy; and the walls of the conference room, which contains for most meetings the representatives of only three governments, are lined with tens and scores of experts.

The wise men's task was briefly this: in various parts of the Nato organisation on different pieces of paper there were available the soldiers' estimate of the military requirements, and the economists' estimates of material and financial resources. The wise men were first asked to look at these afresh—they called for new estimates and a new assessment of the gap—and, second, to recommend means of closing this gap. There were three main chances of doing so; the requirements might be screened and their costs reduced; Europe might revise its estimate of what it could afford; and America might have to try to find the means to supplement still further the European effort.

The gap is already proving extremely stubborn. For when the wise men come to look at the position of their own countries they find that the elasticity for which they had hoped is not there. M. Monnet can only explain to Mr Harriman that the best thing for France and Europe is that French industrial recovery shall go forward, with American dollars behind it. Sir Edwin Plowden can only say that Britain will do what it has set out to do, painful though it is, but under present circumstances not a penny more. Mr Harriman, who was expected at the end to pull some American rabbit out of the hat, is forced to confess that even the American economy is feeling the strain. It is in a sombre frame of mind, therefore, that the wise men have broken up for a few days to consult with their respective governments at home.

Mr Harriman as Trustee

If the news from Paris is of a hard grind and slow progress, what comes this week from Washington is more cheering. A new scheme of things is now emerging in the structure of the American agencies concerned with foreign aid; and a new figure in this scheme—Mr Averell Harriman—is rising phœnix-like from the fires of criticism which, during the last session of Congress, were threatening aid to Western Europe. A new Mutual Security Agency is to take responsibility—at present vested in an inter-departmental committee under Mr Cabot and in the separate Departments of State and Defence—for distributing military and economic aid; and Mr Harriman has been wisely chosen to head this Agency. He will also have a deputy to administer the Battle Bill which President Truman signed this week. This, it will be remembered, was the Administration's attempt to counter the Kem Amendment to the Foreign Aid Bill, which would have refused aid to countries trading anything "of strategic value" to the Russians and their satellites.

Thus the purse strings of aid may now be held by one American; and he, fortunately, is the man who is now chairman of the committee that is trying to establish Europe's capacity to rearm without too many tears. No one in the United States understands better than Mr Harriman the fact that the desirability of East-West trade must be judged by the balance of advantage it offers to the West. The Administrator is to be allowed great latitude in defining for the President which goods may and may not be sent under the curtain; all the indications are that he will use this latitude wisely. Already Mr Linder, at the State Department, has explained to the American public that there are some instances where the export from Western Europe of strategic commodities in return for strategic imports may be in the interests of the United States; he gave the example of Norwegian aluminium exchanged for Russian manganese. If this is to be the spirit in which the Battle Act is to be used, then perhaps sanity can be restored to the consideration of this question in Washington.

In fact, Mr Harriman is likely to be most concerned with Europe's economic stability. He is known to believe that the foreign aid already approved by Congress might serve its purpose better if it contained a higher proportion of dollars and a smaller proportion of finished arms. He is also known to be deeply concerned about Britain's dollar position. Europe, in fact, may be treated with an enlightened understanding by this new trustee of American largesse.

* * *

The Conservatives and Asia

The appointment of Lord Ismay as Secretary of State for Commonwealth Relations has already gone a long way towards taking some of the sting out of the rather critical attitude which was bound to be adopted in India and Pakistan towards the return of a Conservative Government led by Mr Churchill. Lord Ismay, who served under Lord Mountbatten, is well liked and well regarded in the sub-continent. As regards the older members of the Commonwealth, the new Secretary of State also has two other advantages. His own standing as a senior soldier will fit him to deal direct with defence questions; although the Commonwealth now faces several far-reaching problems in the economic field, it is the defence aspect which at the moment is the most urgent following Egypt's pressure on the British base in the Suez Canal zone.

What matters now is that steps should be taken to follow up the favourable reaction already obtained in the Asian Dominions. By word and if possible deed the new government needs to go on making its friendliness plain, both in India and Pakistan and towards countries like Burma and Indonesia that have obtained their independence since Mr Churchill was last in power. Asian leaders who are trying to fight the battles of the free world, or even just to avoid aligning their countries with China and Russia, will only be undermined if, under the skilful guidance of Communist-directed propaganda, their opponents at home can point to any genuine traces of incorrigible imperialism in the British attitude.

It is known that the new government hopes to make a fresh approach to the question of bringing about a settlement in Kashmir. The Conservatives have the advantage of coming to power at a moment when there has been a slight relaxation of tension under the shock of Mr Liaquat Ali Khan's assassination and when the Security Council is about to debate Dr Graham's report. No initiative is likely to succeed, however, unless something is done to close the gap which, for all the Labour party's past achievement, has been widening during the past few months between London and Delhi. This should be one of the Conservatives' first tasks in Asia. The effort would undoubtedly be assisted if Mr Nehru should see fit to review India's representation in London.

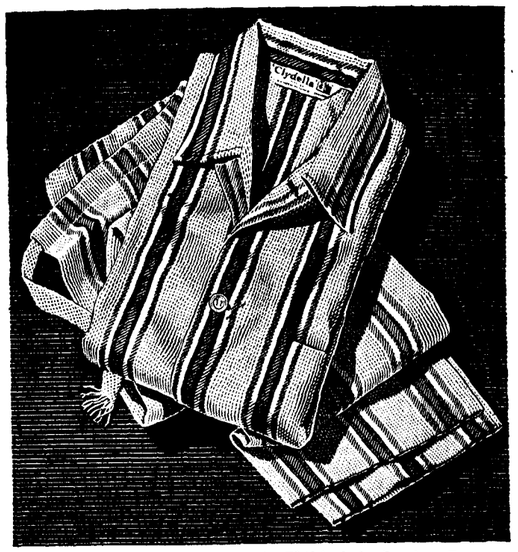
TUC Plays Fair

On Wednesday the General Council of the TUC gave formal notice of its intention to co-operate with the new Government. "It is our long-standing practice," said the Council, "to seek to work amicably with whatever Government is in power and through consultation jointly with Ministers and with the other side of industry to find practical and economic solutions to the social and economic problems facing this country. There need be no doubt, therefore, of the attitude of the TUC towards the new Government." If there is anything surprising in this, it is that the General Council should formally commit to paper the attitude proper to it. Trade union leaders usually mistrust Conservatives, but few of them would be moved by mistrust alone to undertake a general offensive against established authority. At the same time, the General Council paid its expected tribute to the Labour Government for achieving "quite remarkable improvements" in the standard of living; it also said that the results of the election "can hardly be called decisive" and that the period of Labour rule is only over "for the time being."



"For the time being" the TUC's co-operation presumably means that the trade unions will refrain from embarrassing the Tories more than they would, in any case, have embarrassed a Labour government. They will not press for higher wages out of spite. But they will not claim less, and the wages bill will continue to mount unless prices can be stabilised. The difficulty is to break the circle, for the unions have never admitted the need for some initial fall in the general standard of living, without which prices cannot be stabilised. Mr H. G. Brotherton, of the Confederation of Shipbuilding and Engineering Unions, warned the Government against disinflationary measures when he said this week that there were parts of the Tory programme about which the unions were "entitled to be apprehensive," and that if any attack were made on the standard of living they would see to it "that there is such a state of affairs invoked in this country that they will be bound to have second thoughts."

The new Chancellor plainly has a formidable task if he tries to persuade the unions to make their co-operation really courageous. But at least their mood is conciliatory. This is perhaps in part the fruit of the change in Conservative policy concerning the Trade Disputes Act of 1927. Having proclaimed their objections to its repeal in the Industrial Charter, they have recently decided that it would be politic to withdraw those objections. They no longer insist upon making illegal the automatic payment by trade unionists of a political levy to the funds of the Labour party, nor do they feel so strongly as they did about the political affiliations of the Civil Service unions. The unions had in fact already won their first victory over the Conservative party long before polling day—a victory of which they are certainly conscious and for which they may also show a certain gratitude in the next few months.

* * *

Seven Against a Union

The High Court this week gave judgment in the action brought by seven members of the Electrical Trades Union against their own union, and found for the plaintiffs. In substance, the men sought relief in two directions: first, to prevent their union from penalising them for not joining in an unofficial strike, and, secondly, to prevent the executive of the union from making *ex gratia* payments out of union funds to members who had taken part in the unofficial strike. The strike began last February (at which time it was also illegal) and in origin was an inter-union dispute. The London Electricity Board suspended a member of the ETU who refused to work alongside a member of the Transport and General Workers' Union, seventeen other ETU members stopped work in protest and the dispute spread. seven plaintiffs refused to join in and all of them were threatened with disciplinary action by their union officials—two of them were in fact fined—despite the fact that, as Mr Justice Wynn Parry said, the stoppage "was not and could not be authorised under the rules of the union." The decision about the payment of benefit to those ETU members who had stopped work rested on the interpretation to be put on the existing rules of the union when read in the light of the Trade Union Act of 1871. The court held that the rules did provide specifically for the situation when a strike became "authorised" and when strike benefit was to be paid. It also held that this stoppage did not fall within the definition of an "authorised" strike.

The decision does not lay down any fresh principle of trade union law, but it does re-establish the fact that minorities, in trade unions as elsewhere, have rights, that rules are meant to be followed, and that the courts exist to see that they are followed. The Conservatives have said that they do not intend to alter existing trade union legislation and, in this kind of case, there is no need for them even to attempt to do so. But the need for reform does exist. Is the TUC itself never likely to tackle the scandal of trade unions competing to establish their individual closed shops?

* * *

Conservatives and Colonies

Colonial policy, for the greater part of Labour's rule, was as bipartisan as foreign policy under Mr Bevin. This was not surprising. Both parties have the same objective for the colonies—self-government within the Commonwealth—and both parties have emphasised the need for economic development to accompany constitutional progress. Even development by public corporation was not a specifically Labour measure, for it was first mooted under a Conservative Secretary of State; and Mr Creech Jones, during his years of office, always insisted on the Labour Government's recognition of the need for the corporations' investment to be supplemented by private enterprise.

In later years, it is true, Conservatives became more critical of Labour's colonial policy, partly—on the economic side—because of the failure of the groundnut scheme, but also because of the pace of constitutional change. This was a natural reaction of a party in opposition. The new constitutions given to the colonies were criticised by many liberal people for giving too much responsibility to those with too little political experience. The point is that they were inevitable. It is very unlikely that a Conservative Government would have been able to slow up the pace of constitutional reform after 1945. Its attitude would have differed from that of Labour only in showing more reluctance at being forced at such a pace and less conviction that the speed was right as well as inevitable.

Unfortunately, the growing Conservative criticisms in the last year or two have coincided with the increased racial tension in Africa. Thus, the idea has grown up that the Conservatives, critics of Labour's policy, are sympathetic to the Europeans' fears of African domination. Since the election this idea has been voiced. In Northern Rhodesia, for instance, hopes have been expressed that the Conservatives will push on with Central African federation—to which the Africans are opposed. Yet it would be both wrong and dangerous if the Right were to be identified with the white and the Left with the black, and Mr Lyttelton's first concern should be to ensure that it has no foundation. One of his early tasks will be the constitutional issue in Tanganyika, where the Europeans are opposing the proposed equal representation of Europeans, Africans and Asiatics. Here he will have a good opportunity to show that a Conservative Government can hold a just balance between the races.

Cocoa and Self Government

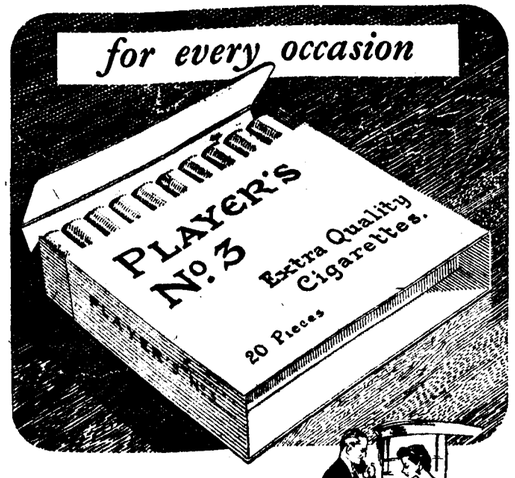
The Gold Coast is now in the midst of an ambitious eight-week operation—the Cocoa New Deal Campaign. This exercise commands interest not only because it is intended to clear the country of "swollen shoot" disease, which has been threatening the very existence of the cocoa industry. It represents also a new technique in political persuasion. And it has this remarkable feature: Kwame Nkrumah and his Convention People's Party, whose opposition to the cutting-out of diseased cocoa trees was a rallying cry in their election programme, have now, with power in their own hands, committed a complete *volte-face*. They are throwing the whole weight of their prestige into a campaign which, a short year ago, would have been anathema to them. This fact shows the growth in their self-confidence, and is a matter for congratulation.

It was already clear some years ago that only drastic measures could save the cocoa industry, and the only proven remedy was to cut out the infected trees. But this the farmers, with grim determination, refused to do, suspecting some "imperialist" trick. Compulsory cutting-out was imposed and a small compensation paid for each tree eliminated. Fierce opposition resulted, and three United Nations experts were invited to the Gold Coast to give an impartial opinion on whether this was indeed the best method. They could recommend nothing else. An insecticide was being experimented upon, with uncertain success. Even this disinterested judgment failed to convince, and when Nkrumah was elected into office, compulsory cutting-out was suspended. An African committee was appointed to investigate and its conclusions confirmed the earlier opinions. Appeals for voluntary action and the granting of higher compensation rates were partially successful in holding the disease in check, but the danger was not eliminated. Nkrumah was left with a peculiarly tough nettle to grasp.

The new campaign is the answer. It has begun with a five-day course of instruction in Accra for 40 delegates from all over the country. They have been trained in the use of microphones, cinema-vans and propaganda techniques. Members of the Legislative Assembly will accompany the vans in their own constituencies, and make personal appeals to farmers to adopt voluntary cutting-out. Pictures of Nkrumah will embellish the handbills to be distributed. The question now is—will the persuasiveness of elected leaders secure the adoption of unpopular measures where a Colonial Government notably failed? If it does, the new Gold Coast Ministry will have achieved its first really significant success.

* * *

Russians in Spitzbergen



The coldest sector of the cold-war front is unquestionably Spitzbergen, the island group which lies so far north of Norway that it is within ten degrees of the North Pole. Recent Soviet charges that the Norwegians are converting the islands into bases for aggression are not likely to raise noticeably the temperature in these arctic regions. Norway, as in 1949, has made a cool but firm reply to Mr Vyshinsky's accusations, and the matter can be expected to end there. Presumably the Soviet move was merely timed to make the most of Scandinavian fears that the extension of the Atlantic Pact to Greece and Turkey, and the focusing of western attention on the Middle East in general, were leaving the northernmost Nato partners out on a chilly limb. That it has not weakened Norway's resolution was shown on Wednesday; when the Storting approved the admission of Greece and Turkey to Nato by an overwhelming majority.

Spitzbergen could not be made into a Nato base without the knowledge of the large Soviet colony there. There are, in fact, more Russians there than Norwegians. Since 1931,

Post Prandial

IT IS OFTEN an anxious moment, between the dessert and the liqueurs, when the toastmaster takes up his position behind the high table and the busy noise of banqueting is stilled. What sort of speeches will there be tonight? Witty or windy? Delightful or dull? It all depends—partly on the speaker himself, partly on the way everyone is feeling. In pleasant surroundings, when the dinner has been expertly cooked and served, with wine of the choicest vintage handled with reverence and affection—then even the most dismal speaker develops redeeming features, and the witty and delightful one is at his brilliant best. Such is the way of speakers at the famous Connaught Rooms, where, with no fewer than twenty of the most sumptuous Banqueting Halls gathered together under one roof, London boasts an amenity without equal anywhere on earth.

THE GIRL WHO REALLY CARES

ARE YOU TRAVELLING to Canada for the first time? Then air stewardess Jean Bothwell will give you an excellent idea of the kind of people who look after you when you travel by T.C.A.'s luxurious "North Star" Skyliners.

Like all T.C.A. stewardesses, Miss Bothwell is a registered nurse and speaks French as well as English. Your comfort is her first concern from the moment you come aboard. She particularly likes passengers who are crossing for the first time, enjoys showing you around, sees you get delicious hot meals, books, magazines, an extra pillow, or a hot drink.

A quiet and helpful girl who takes great pride in her work, Miss Bothwell has looked after thousands of passengers. Travelling with such experienced and considerate people you can be certain of an exceedingly comfortable trip by T.C.A.—Paris, London or Prestwick today, Montreal tomorrow. Swift Skyliner services link you with every important Canadian and U.S. city.

when the Soviet Government bought a group of Dutch coal mines on the main island, there has been a self-contained and self-administered Russian community there, which now numbers about 3,500. The Norwegian governor pays them an occasional courtesy visit; but otherwise Norway leaves them entirely to their own devices, in accordance with the Paris Treaty of 1920, which, while confirming Norwegian sovereignty over the islands, guaranteed complete equality as regards economic exploitation to all signatory nations.

The USSR, which adhered to that treaty in 1935, has never had any cause for complaint about the treatment of its

nationals in Spitzbergen: they were readily readmitted after the war, and the Soviet mines are again producing coal, although not as yet in such large quantities as in the thirties, when their output rose to over 400,000 tons a year. The fact that the Russians find it necessary to seek coal in these inhospitable islands, where several Norwegian and Swedish companies found it uneconomic to operate before the war, suggests that they are unlikely to precipitate any serious crisis there which might endanger their own interests.

* * *

Mrs Mopp at Geneva

In this country the National Institute of Houseworkers has encountered considerable difficulties in its attempt to frame standard rates of pay and conditions of work for the diversely employed women for whom "houseworker" is the most convenient label. But its difficulties pale to insignificance beside those facing the expert committee of the International Labour Office attempting to draw up a code which would make sense in the still more diverse setting of all the ILO's member countries. "There was general agreement," says their report, "as to the desirability of providing for domestic workers protections of the kind now being provided for other workers"; at the same time it was recognised that the special character of the relationship between the domestic worker and employer "called for provisions covering domestic workers which allow for flexibility in arrangements . . . based upon mutual agreement."

There, indeed, is the crux. It is one thing to recommend that domestic workers should be brought within any national scheme of social insurance, or that contracts of life servitude or quasi-adoption should "not be considered as acceptable." It is quite another thing to lay down minimum rates of pay and thereby outlaw every arrangement of mutual convenience between the "employer" wanting only an occasionally lent hand and the "employee" wanting only a home and pocket money; or to define "adequate rest breaks during the day" that apply reasonably both to the heavy-duty charwoman and to the more supervisory kind of mother's help. The ILO experts, well aware of these difficulties, recur again and again to the need for "flexibility"; but can a sufficiently flexible international standard mean anything at all? Perhaps, on the narrowest interpretation of the word "standard" it can. There is use in a norm from which variations may be recognised, by both parties, as desirable. There is no use whatever, in this most various of all occupations, in a Procrustean insistence on conformity.

Domestic service provides, in fact, a limiting case for the whole problem of national or international regulation of labour contracts. Circumstances do not so obviously alter cases in other occupations; but they always alter them to some extent. Imponderables do not everywhere exert the same influence; but they always exert some. In no other occupation may it be so obviously to the employee's, as well as to the employer's, advantage that the wage paid should be flexible; but the problem of the part-time and sub-standard worker exists everywhere and will increase with the number of old age pensioners. As from other limiting cases, there may be a wider lesson to be learned from the ILO's recommendations and from the measures (if any) taken to put them into effect.

* * *

Failed B.A.

Even fee-paying students meet only a small proportion of the true cost of their university education, and failures in the final examinations must be deplored as a waste of public money quite apart from personal loss. For students financed by scholarships the public waste is considerable. Durham County Council has now published a report on the successes and failures of its major university scholarship holders. Of 245 first-year students about whom information was obtained, 45 failed in one or more subjects in their first-year examination and a further 25 had not done sufficiently well to remain in the honours school. Of 217 second-year students, 25 failed their examinations and another 5 were transferred from honours to pass courses. In the third year, 16 out of 93 failed their examinations. These are discouraging results.

It would be unfair to suggest that all those who failed did not improve later or did not benefit from being at a university. Successes in examinations are not the only fruits of university life. But most of these unsuccessful students can hardly have deserved the term "scholar" or the expenditure of public money. It is all too easy to conclude that scholarships are doled out too plentifully and that local education authorities should be more canny. But until methods of selection have improved, making the universities more confident that in accepting one set of applicants and rejecting another they are taking the good and leaving the bad, a simple policy of retrenchment would be unjustified. The Durham report underlines the necessity for better methods of selection and the advantage of distinguishing between "scholars" and those who merely need help from public funds. But until universities and schools have settled down more thoroughly after the postwar upheavals a reduction in the total number of awards would be at least premature.

Letters to the Editor

Japan and Lancashire

Sir,—The articles about Japan in your issues of October 20th and 27th will be generally welcomed in Lancashire, where there is a great wish that the rest of the country should be better informed about the many problems which arise in regard to the impact of Japanese competition upon our national economy.

There are some phrases which we might question: for example, you say that the Cotton Board ensured that Lancashire's views would be ignored by first making the ridiculous proposal that Japan should be legally restricted to a fraction of the cotton spindles its industry used before the war. The only formal expression of industrial opinion in which an enforced specific limitation of Japanese spindleage was mentioned emerged from a meeting of American and British cotton industry representatives in 1948. At that time there was spindleage limitation in force in Japan by order of the occupation authorities and public discussion was in progress as to whether this limitation should be modified. The Anglo-American meeting was therefore acting in accord with the conditions of the moment and the sentiments of the times in their reference to the question. It is a matter of interest that when their document was presented to the Lancashire public, I expressly indicated that we were quite ready to hear about alternative approaches to the basic problem. When an Anglo-American Cotton Industry Mission visited Japan in 1950 we said in public and in private that it was not our intention to table any views upon spindleage.

I do not think, therefore, that you were correct in saying that any ignoring of Lancashire's views was due to this particular approach. Indeed, I do not think it can be said that Lancashire's views have been ignored. Our standing conference on overseas trade policy has been meeting constantly throughout the postwar years and we cannot complain at all of the close interest which the Government has shown in our representations.

Not everybody has realised the extent to which throughout the postwar years we have been obliged to have regard to timing. We have known all along that we had a severe long-term problem on our hands. We took the view at an early date that a wise and durable solution would not be found in the provisions of any peace treaty and that whilst we could plan and prepare beforehand, as we did, it would only be after the making of peace that we could proceed with precision and practical effect. As part of our preparation we promoted the visit of the Anglo-American Mission to Japan to study the situation on the spot and to secure the advantage of personal contact with Japanese industrialists. In that action and at the present time, the purpose of our efforts is clear. We seek by contacts and discussions with the Japanese industry to evoke a situation in which the available volume of world trade may be enjoyed in proportions tolerable to the necessities of the internal economies of the nations principally concerned. This includes other nations besides Japan and ourselves. There is scope for several different forms of action to achieve the objective in view. The reactions we have had from Japan so far have not led me to conclude that this approach must necessarily be barren. If ultimately we should fail in these efforts for want of realistic Japanese collaboration such a failure would bring new considerations into the arena with which Government and industry would have to deal.

On the other side of the picture there is a growing realisation that as much depends on what we do at home as on what we can do in London or abroad. We realise that we can and must maintain part of our position, as you say, by the sheer merit of our own scientific, technical and commercial efficiency. Here again I am far from being discouraged, for there is an air of progress and a mood of courage in Lancashire.—Yours faithfully.

E. RAYMOND STREAT,
Chairman
The Cotton Board, Manchester

[The proposal to limit Japan's spindles "emerged" from an Anglo-American meeting in the sense that, as the *Manchester Guardian* commented at the time (and was not contradicted), "the Cotton Board got leaders of the United States cotton trade to join it" in the proposal: the British representatives pressed hard and the Americans were persuaded to let the idea be expressed in somewhat tentative language.

The occupation authorities' limitation on the number of Japanese spindles in use at that time represented an attempt to make the most effective possible use of the industry during the period when plant had to be rehabilitated and raw materials and fuel were scarce. As a temporary measure it was entirely different in spirit and intention from the Cotton Board's proposal, which American officials in Japan roundly attacked as soon as it was made. It is quite true that by 1950 the proposal had been buried as decently as could be.—EDITOR.]

Politics of Church Schools

Sir,—Your Note in your issue of October 13th omits what appears to me to be one of the most important aspects of the problem, and one which has been consistently overlooked. But for the devoted efforts of churchmen the nation (i.e. the taxpayer) would have had to pay a very great deal more for the education of the people. During the last hundred years or so the use has been had, virtually free of charge, of the premises of some 10,000 church schools.

The nation is, therefore, considerably indebted to the Churches and a wider recognition of the debt might well encourage more generous treatment of those now faced with vast charges for improvements and substitutions.—Yours faithfully,

The Beatty Touch

The Life and Letters of David Beatty, Admiral of the Fleet. By Rear Admiral W. S. C. Chalmers. *Hodder and Stoughton.* 488 pages. 25s.

When Admiral Chalmers undertook to write Beatty's life, he had plenty of material. Few famous men have had such full, adventurous, colourful lives; very few of these have written so constantly and frequently to their wives about their professional interests, and very few of these wives have preserved every letter. The book paints a very clear portrait of this great sailor—the portrait of a daring, fighting leader; for good measure, David Beatty looked the part as well. A keen enthusiast for his profession with the energy to play a full part in games, sports and social activities, he was the type of man most admired in the Royal Navy.

The biographer served with Beatty in his flagship, the *Lion*, and the hero-worship which started then shines through the whole book. This enthusiasm drives the narrative on when the tale tends to falter, but it leads the biographer into an unnecessary underlining and emphasis of the rightness of his hero's judgment and the correctness of his decisions. There is a quotation on the book-wrapper from a speech of Mr Attlee's in May, 1936, which starts "To many people the name of Beatty suggests a brilliant impetuous leader, rushing into battle regardless of consequences." Mr Attlee went on to explain that that was a mistaken notion; Admiral Chalmers combats the notion throughout the book.

The early part of the book is the best; the tale of Beatty's exploits on the Nile and later in China at the close of the last century is thrilling. The First World War saw Beatty climb to the pinnacle of his fame and the chapters on the Battles of the Heligoland Bight, the Dogger Bank, and Jutland, are the climax of the book. Few naval officers have made a closer study of the tactics and lessons of these battles than the

A MARKET for progressive people

There is no doubt at all that The Listener readership offers a first-class market for a wide range of goods and services. Here you have a market of educated men and women from trade, industry and commerce, from the professions and the arts, from public services and private life. They include some of the most influential people in almost every sphere of activity. Listener readers are, naturally, people of more than average discrimination and taste, and their confidence in the journal extends to the very sound advertisements it carries and the products they offer.

If you have a first-class product or service appealing to substantial people, you will do well to consider advertising in The Listener.

biographer, who has served on the directing staff of the Naval War College, and has been Director of the Naval Staff College. He gives a full, balanced and accurate account of these actions and the biography will undoubtedly be regarded as an authoritative text-book. But there is rather too much detail for the ordinary reader, too many irrelevant letters are quoted and the Jellicoe-Beatty controversy looms up in the narrative too early and too much. This criticism may be less than fair, however, to the biographer, who has written the book on request, and may not have had a free hand.

Admiral Chalmers finds few faults either in Beatty's conduct as a leader or in his outlook on policy, strategy and tactics. He points out that this view was shared by Kitchener in the Sudan and later by Churchill. Beatty was never found wanting in any of the qualities required for high naval command and, in the words of Mr Baldwin, "As a sailor he was undoubtedly a figure which appealed to the imagination of the British people." The highest compliment one can pay a fighting sailor is to say that he possesses "the Nelson touch." At the height of Beatty's fame in the Great War it was common to hear and read of "the Beatty touch," yet Beatty did not have the good fortune to achieve complete success, and his fame has not the lustre that great victories gave to Nelson's name. All in all, Admiral Chalmers's book is a just appraisal and for all his hero-worship his fale is well and fairly told.

African Challenge

Attitude to Africa. By W. Arthur Lewis, Michael Scott, Martin Wight, Colin Legum. *A Penguin Special.* 145 pages. 2s.

In this cogently written book the four authors set out clearly the immense task facing Britain in Africa. Their main theme is that the two forces loose on the African continent today—nationalism and racial antagonism—can lead to untold violence if Britain waits too long. In West Africa, the problem is comparatively simple. Here African nationalism is not complicated by racial antagonisms, and Britain is pursuing the right policy in transferring power to the nationalists when they can win free elections. Only in this way can their opposition mentality be sobered and their energies directed towards the responsible and consttructive tasks of government.

In East and Central Africa, European nationalism and racial antagonism complicate the issue. Unfortunately, although the authors present the existing dangers forcefully, and point out clearly the drawbacks of this and that solution, they are by no means so clear on just what their own political solution is. They say that inter-racial fears must be allayed and that the way to do this is to bridge the gulf that lies between black and white. This means a determined concentration on mass education—*alias* community development—for the African; and in subsequent chapters Mr Arthur Lewis outlines his policy for colonial agriculture (which is reprinted from the *Three Banks Review*), and Mr Michael Scott pinpoints the whole argument in the South African Protectorates —a test case of Britain's sincerity.

The difficulty is that community development is bound to take time, even if it can be carried out at the pace and at the cost Mr Lewis so convincingly insists upon. And what is to be done to reduce racial tensions in the meantime? The authors talk about a clear statement of policy drawn up by all three political parties in the United Kingdom on the recommendations of a Royal Commission. The British Government, however, appears to be trying a solution on quite different lines. It is trying to reduce friction by getting the races to agree to round-table conferences of their own representatives, at which they can work out their problems for themselves. Mr Wight and Mr Legum, with the concurrence of the other two authors, do not think that this policy has any prospect of success.

But it is equally arguable that there can be no solution by Royal Commission. Africans and Europeans alike are in no mood for it. To an outside body they would be only too likely to present their grievances and their fears in the most exaggerated form—which could only have the effect of intensifying mutual suspicions. The chances of moderation are much better if they are brought face to face and told to work out their own compromise.

Economic Peaks

Money, Trade and Economic Growth. *Macmillan.* 325 pages. 37s. 6d.

Few types of book confront the reviewer with a more exacting and indeed impossible task of appraisal than the essay-symposium "in honour of" an outstanding academic figure. The contributors are on their mettle; each writes at the height of a special expertise for an expert audience; and the only person capable of evaluating them all is probably the individual to whom they are a tribute—in this case Professor J. H. Williams of Harvard University.

These essays are a case in point. The seventeen contributors have selected the themes most frequent in his work: international economic organisation and world trade; the determination of national income and employment; and the theory of money and central banking. Their treatment varies from the statistical, descriptive, or institutional (as in Mr Henry C. Walach's paper on "Undeveloped Countries and the International Monetary Mechanism," Mr Robert Triffin's "Institutional Developments in the Intra-European Monetary System" or "Relative Income, Absolute Income, and Saving" by Professor James Tobin), through the more widely theoretical (as in Professor Paul A. Samuelson's "Principles and Rules in Modern Fiscal Policy" or Professor Howard S. Ellis's "Rediscovery of Money") to the mathematical (as in Professor William Fillner's "The Capital-Output Ratio in Dynamic Economics"). Perhaps four or five of the seventeen are within the scope of the intelligent lay reader with a suitable background; the opening essay, entitled "Towards a Theory of Inter-Governmental Trade," by Professor D. McCord Wright, is an outstanding example of common sense raised to its highest power, while Professor E. A. Goldenweiser's "Monetary Semantics" combines an enlightenment peculiarly welcome to economic journalists with some entertainment value. The rest can be recommended to the appropriate specialists, in much the same spirit as a reasonably competent Alpinist might call the attention of more gifted enthusiasts to a new range of Himalayan peaks.

AMERICAN SURVEY

Congressional Records

Washington, D.C.

THE first session of the Eighty-second Congress was born in muddle and died in confusion and, throughout its life of more than nine months, it always, as one correspondent of the *New York Times* said, "seemed full of activity, yet with the least sense of coherence or purpose of any Congress in recent memory." By the time it met at the beginning of January, it had already been presented with its first opportunity for incoherent activity by Mr Herbert Hoover. Out of the "Great Debate," which his incursion into geopolitics occasioned and which raged in the Senate for the first few weeks of the session, there emerged confirmation of two facts: that the President, as Commander-in-Chief, has the constitutional right to send the armed forces anywhere he thinks necessary and that the defence of Europe is more important to the United States than the defence of the Far East.

Hardly had the attempt of the right wing of the Republican Party to build a new isolationism been disposed of than Mr Truman dismissed General MacArthur and another long debate started. Out of it emerged confirmation of the same two facts. Like Mr Philip Jessup, these facts may need reconfirmation at regular intervals in the future—and, again like Mr Jessup, they may one day fail to get it.

Mr Jessup's recess appointment and the nomination of General Mark Clark as Ambassador to the Vatican provided the confusion in which Congress left Washington and in which it will, presumably, begin its second session, for which there is enough unfinished or half-finished business already without the President finding any more. And it is hardly to be expected that those who have discovered the publicity value of investigations, whether televised, broadcast or only reported, will be prepared to consider the time involved and forgo them entirely in an election year.

But, despite the Great Debate and the Great Dismissal, and the time wasted on them, the record of the Eighty-second Congress, on foreign affairs at least, is satisfactory judged by the yardstick of what it was asked to do by the Administration. The value of its achievements was often marred, however, by its method of achieving them, and sometimes put in jeopardy by riders, amendments or compromises which imperilled a whole policy for the interests of a section of the voters. The extension for two years of the Trade Agreements Act, even though the "peril point" provision was reinstated, was one of the achievements, but its value was almost destroyed by an amendment to the Defence Production Act, an entirely unrelated piece of legislation, which established an import quota on cheese. This "cheese amendment," which, under the circumstances, was a thoroughly dishonest measure, makes negotiations for tariff reductions nearly impossible while the failure to do anything about the Customs Simplification Bill weakens the value of agreements already reached.

This kind of behaviour—of which the Kem Amendment and the ill-temper shown in the debate on the Indian wheat Bill are other examples—makes it difficult to applaud the Eighty-second Congress. But at the same time it emphasises the quality of that minority—made up of men such as Senators McMahon, Lehman, Sparkman, Lodge, Morse, Fulbright and Saltonstall—which managed to secure passage of so many necessary measures. It would have been a brave man who would have prophesied in midsummer that the foreign aid Bill would get through with $7.3 billion of its original $8.5 billion intact and with little more than the unwanted addition of $100 million for Spain in the way of marring amendment. After the mistakes made by the Economic Co-operation Administration in presenting its case, it can, indeed, consider itself lucky to have got permission to transfer 10 per cent of the funds appropriated from one heading to the other. It is, thereby, able, with a little help from "offshore" purchases, to provide the economic aid for which it originally asked. It would no doubt like to have budgeted for more as things in Europe, and particularly in Britain, have developed.

Defence, which can no longer be separated from foreign affairs in American thinking, did as well as even the Chiefs of Staff could have hoped. Conscription was extended for four years and the age limit lowered and, if universal military training was not accepted as unreservedly as the President had hoped, the necessity for it was grudgingly admitted in the end. The report of the National Security Training Commission issued this week gives Congress a way of backing into the programme without too devastating an effect upon the voters before November. And, more important, the appropriations to support the expansion of the armed forces and their equipment were voted with little trouble. The spending of $57 billion on defence in peacetime is unheard of in the United States. Though Senator Taft regularly prophesies doom for the national economy if things go any farther (which, in the nature of rearmament programmes, they must) it will be exceeded next year with little more opposition.

*

But, while the Senate and House provided most of the money demanded, a total of $95 billion during the session, they were much more reluctant when they came to collecting it from the tax-payers. Voting for appropriations at this time is a patriotic gesture; voting for increased taxes is something else. Taxes are a domestic matter—very domestic when an election is in the offing, which it always is. Courage boggled at giving Mr Truman more than half the new taxes he wanted (even this brings tax revenues to a level far higher than that reached during the war) and politics suggested that it might be profitable to force him to ask for more at a date even nearer to the election. But taxes did no more than share the fate of all domestic matters—or even matters related to rearmament which impinged too directly on the domestic scene. The continuation of the controls imposed immediately after the outbreak of the Korean war, is an example of the latter.

But, when everything else is forgotten about this session, when its record for peacetime spending, for expanding the armed forces and for peacetime taxation have been made to look puny by the figures of future years, its addiction to investigation will be remembered. Senator Kefauver took a nicely varied troupe of Senators, a well-chosen interrogator and a splendid assortment of underworld characters before the television cameras and made history. But while he was breaking new ground in the matter of method his colleagues were being equally industrious without the help of extraordinary publicity. During the session 134 investigations were started and this, at least, is a record which may stand for many years.

Historians may find, in the techniques of investigation invented, perfected or revived during the session, this Congress's permanent claim to fame. Out of 134 investigations there were, naturally, a few which were serious in intention and successful, both in operation and result. Senator Lyndon Johnson's resurrection of the old Truman Committee to keep as close a watch on the present defence programme as was kept on expenditure during the war is doing important work and doing it soberly and well. The efforts of Senators Fulbright and Hoey to clean up the Reconstruction Finance Corporation were valuable and, as it turned out, only too necessary. And a subcommittee of the House Ways and Means Committee has performed the same service, with the same devastating results, for the Internal Revenue.

But the investigations which will stick in the national memory and which, if repeated too often in the future, may finally destroy the validity of the constitutional guarantees of freedom have been those into the minds of men. Membership in the Communist Party usually is susceptible of proof or disproof; an "unusual affinity for left-wing organisations" is not. But the little group of McCarthys and McCarrans who have given this Congress its peculiar flavour have gone further. They have undertaken to interpret ten year old motives and catalogue forgotten opinions. Their accusations generally are based on nothing more substantial than the dubious evidence of Mr Louis Budenz, an ex-Communist, but they announce their conclusions with a certainty that a trained psychoanalyst would envy. Their bewildered colleagues listen uneasily and wonder. "What is truth?" the Eighty-second Congress has asked many times, but it has never stayed for an answer.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Vox Populi

[FROM A SPECIAL CORRESPONDENT]

SPECULATION about the identity of the next President, never wholly absent from the American political scene, is rapidly increasing as election year approaches. Many who recall the debacle of the public opinion polls in 1948 must be surprised by the extent to which such surveys are now being quoted in the newspaper assessments of the possible candidates. It is plain that the likelihood of General Eisenhower's nomination is appreciably increased because Dr Gallup's cross-sections of the American electorate consistently prefer him to any other candidate. Senator Taft finds one of his main handicaps in the pollsters' findings that in a race against Mr Truman he would fare worse than any other Republican named. The rumours that Mr Truman might step down in favour of Chief Justice Vinson were substantially encouraged by the poll which suggested that the latter would beat any Republican except, of course, General Eisenhower. The parties each want to pick a winner at their conventions next summer; however much their faith may have been shaken by the tipsters' failure in 1948, they have found no better guides than those supplied by the polls.

The undiminished importance of public opinion surveys makes them merit serious study but, although there is a vast body of literature on polling technique and a number of books and articles have been written as propaganda for and against them, there exists no adequate description of the scope or structure of the industry and no dispassionate assessment of its place in democratic government.

Public opinion polls are, of course, only one branch of sample surveys. The techniques of the pollster are far more extensively used in market research than in the inquiries into popular opinions and attitudes on public and political questions with which this article is concerned. These inquiries may be divided into four rough categories according to their sponsors, which may be governmental, private, academic, or journalistic. The comparative scale of operations is not always easy to determine. One or two government studies, notably those into civilian morale in wartime and more recently into consumers' spending plans, are well known, but there have undoubtedly been a number of other surveys conducted by the government which have been shielded from publicity lest they attract unfavourable attention from economy-minded Congressmen. For different reasons most privately sponsored polls attract little publicity, but they undoubtedly have a considerable market. Although many universities offer courses on public opinion studies and a number, generously financed by the great research foundations, themselves carry out surveys, only two do so on a nationwide scale and their work, although non-profitmaking, is largely sponsored by the government or private organisations.

The field of newspaper sponsored—or what might be called political—polling is dominated by Dr Gallup. Today the only polls regularly published across the country are those conducted by Dr Gallup's American Institute of Public Opinion (AIPO). His releases are carried by about a hundred newspapers.

The explanation for this near-monopoly in the newspaper field lies in high costs and limited demand. A substantial amount of money has to be spent in putting a questionnaire to 3,000 or so people spread across the country and in tabulating their answers. The amount which a newspaper editor is prepared to pay for a column based upon the result is strictly limited and so is the number of editors interested in publishing such material. Dr Gallup was early in the field and is well established with most of the potential market. Furthermore, although even during its slump after 1948 the AIPO never lost money, it has never made profits on a scale that greatly tempted competitors. Dr Gallup's main income, like that of everyone else in the field, comes from privately sponsored work, mainly market research.

Mr Elmo Roper, whose surveys were for many years commissioned by *Fortune* magazine, has from time to time produced a syndicated column and he is now running a radio programme based upon poll findings, but despite his experience and skill—he entered the field in 1935 at about the same time as Dr Gallup—he has at present no newspaper outlet.

The polls have been much criticised, both for their techniques and their influence, but much of the attack, especially

since 1948, has been misdirected. Dr Gallup made his reputation in 1936 with a prediction of the Roosevelt victory which was 7.5 per cent in error; he almost destroyed his reputation in 1948 with a prediction of Governor Dewey's victory which was less than 5 per cent in error. Some of the mistakes made by pollsters in 1948 will not be repeated and another error of similar magnitude is unlikely. But in any case, because of incalculables such as turnout, last minute changes of mind, and the disposition of the "don't know" vote, elections are far from ideal proving grounds for opinion polls.

Their methods are reasonably well known. Too much criticism is usually devoted to the size and structure of the sample, which is seldom responsible for any major error. More attention is merited by the wording of questions—a trifling alteration in phrasing can sometimes transform the response—and by the problem of discovering how intensely opinions are held. The way in which the findings of the polls are reported has also not always been above reproach. Beyond a certain point simplification becomes falsification, and the pollsters have not always resisted the constant pressure from newspaper editors and readers to omit qualifications and technicalities. In privately commissioned polls there may also exist a temptation to obtain results which are pleasing to the sponsors. But it must be stressed that no serious charge of deliberate dishonesty has ever been made against any of the major polling organisations.

Polls are widely quoted—and even sponsored—by lobbyists and counter-lobbyists and there is no doubt that many Congressmen, supremely anxious about the way the wind is blowing, pay considerable attention to their findings. The problem inevitably arises of how so powerful an instrument can be safeguarded from abuse. It does not seem that Washington can do much about it. A Congressional inquiry after the 1944 election achieved little. It is hard to see how legal regulation of the polling industry could be effective without a fantastic degree of supervision. Certain technical standards and rules for publication could be laid down and the industry itself is discussing this. But such a step would have only limited influence.

The main check must be provided by competing polls. In elections the check is provided by the result itself. But on questions of opinion it can only come from rivals in the field. When seemingly contradictory findings emerge from different surveys there is a natural anxiety and the cause for the discrepancy, usually the wording of the question, is eagerly sought. But such a check is the exception rather than the rule, for usually there is only one inquiry along any given lines at one time. Perhaps the best hope of safeguarding the polls against abuse lies in the encouragement of subsidised non-profitmaking surveys.

The ultimate check must, of course, lie in an informed public aware of the technical limitations of polls and clear in its mind about the importance which, assuming their accuracy, a democracy should accord to poll findings. The disaster of 1948 was in almost every way a good thing for the future of polls. It not only taught the pollsters humility, but it also led to a fuller public realisation of the drawbacks and the possibilities of such work. The pollsters themselves too often seem to assume that what they find to be public opinion at a particular moment is what ought to guide policy makers. Occasionally the polls may show the public to be more realistic than had been thought and the timid politician may be encouraged to follow what he believes to be the right line, but in general polls must act as a deterrent to courageous political leadership.

American Notes

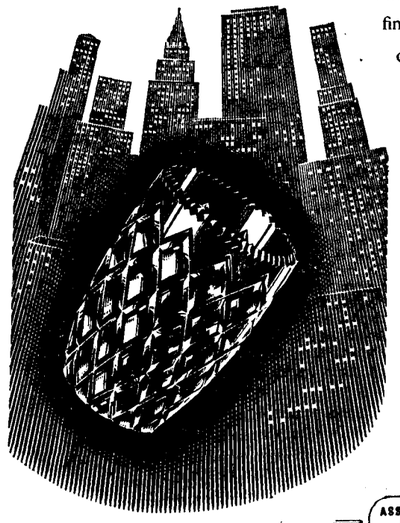
The British Election

The times when a British election was a closed book to most Americans, and one which there was no particular desire to open, seem to have vanished. Last week's vote in Britain not only captured the headlines and provided vast columns of print, but also was, in most cases, reported and commented upon with an understanding and fairness which is new—the consequence of growing awareness of the importance of the British alliance. The Republican machine, eager, as always, to grasp at any straw, tried to make party capital out of the defeat of socialism. But Republican rhapsodies were modified, in private, by a sober realisation that this was a victory for Mr Churchill, not for Senator Taft, even though their public utterances stung the Democrats to declare that "neither party in Britain advocated the back-to-McKinley programme for which the Republican leadership stands."

The only hope which it was politic to express before polling day was that whatever party won would enjoy a working majority capable of taking the unpleasant decisions needed to meet the coming financial crisis. But disappointment at the narrowness of the swing has not detracted from the almost universal pleasure that Mr Churchill is to return to the leadership from which he was, in the American view, so ungratefully hustled in 1945. Mr James Reston, in the *New York Times*, concludes that the first reaction

> tells more about Washington's state of mind than about Mr Churchill's capabilities. It is tired of big problems and little men. It is eager for change. And it is hunting for heroes, old ones if necessary.

In Washington, Mr Churchill's narrow majority may not be altogether a liability; Congress will want to avoid increasing his difficulties and thus opening a way for the Labour party, and more especially the Bevanites, to return to power. This does not mean that Mr Churchill need only ask for it to be given. The Administration may be alarmed at the growing gulf between Britain's world commitments and its ability to carry them out, but Congress is unlikely to forget that it has just voted $7.3 billion for foreign aid and will be presented with a new bill in January.



Mr Reston makes another interesting point: that Mr Churchill, as a Conservative, will enjoy a freedom to make new approaches to the Russians which American opinion would have found suspect in men of the left—or left of centre—such as Mr Attlee and Mr Truman. American officials, paralysed by the fear of provoking charges of Communist sympathies, may be encouraged to take a new look at the deadlock. The State Department almost certainly has its reservations about Mr Churchill's fondness for personal diplomacy, and even some anxiety about being entangled with a supposed symbol of the old colonial order, but American opinion has always had a weakness for direct negotiation. About the substitution of Mr Eden for Mr Morrison at the Foreign Office there are no reservations whatever.

Rebels on the Water-front

With more than 120 ships idle, and an estimated $350 million in cargoes held up, the New York dock strike has entered its third week. The strikers, members of dissident locals of the International Longshoremen's Association (American Federation of Labour) are rebelling against their president, Mr Joseph P. Ryan. All Mr Ryan's promises to get the men back to work have failed, though the military piers, where cargoes of war material for Korea have been held up since the strike began on October 15th, are again operating normally under an agreement reached between the port officers and the strikers. British exports are suffer-

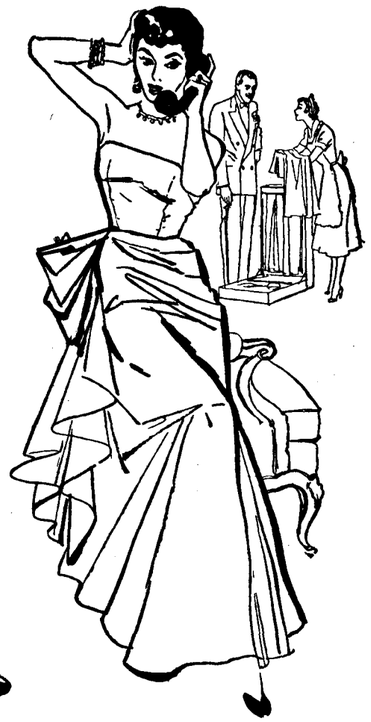
LEAD OXIDE

The men who cut glass in Stourbridge seem to have special instincts in their finger tips: as they turn a vase against the edge of a copper wheel, in a stream of water and fine abrasive, each facet is cut at exactly the angle which brings out the full brilliance of the glass.

AND

The brilliance itself is due to lead oxide, which can make glass look like a diamond. But the oxide must be free from impurities; even minute traces of iron, for example, would ruin the glass...

GLASS DOLLARS



Our job at Associated Lead is to provide the glass maker with oxides worthy of his skill. Our engineers have developed special plant—our chemists special analytical techniques for every step in manufacture. The result? Well, quite a lot of our lead sparkles on Broadway and Fifth Avenue.

†FROM LONDON VIA: *Air India · B.O.A.C. · El Al Israel Airlines · Pan American · Panair do Brasil · Qantas · South African Airways · TWA*

FIRST and foremost TWA's service offers air-travellers the greatest convenience in reaching their destinations with speed and comfort. If you are bound for any one of the many U.S. business centres or if you have to visit a number of them in double-quick time TWA can book you *and* fly you all the way. TWA is the only airline that can fly you from 20 world centres in Europe, Africa, and Asia right through to any of the 60 important U.S. cities—*one ticket—one airline!* Flying with TWA is always a pleasure, The atmosphere is friendly and it is your comfort that matters. Your superb food is carefully prepared and well served. Your drinks, too. TWA's fast and luxurious 4-engined Constellations are favoured by seasoned air travellers for their above-the-weather flying, dependability, comfort and "on time" arrivals. That is why some 2,000,000 passengers buy TWA tickets annually.

Exclusive all-sleeper service

TWA offers the only **all-sleeper service** to New York. The luxurious TWA "New York Ambassador" leaves London every Sunday and Paris every Monday. In addition to the all-sleeper flights TWA offers you a daily service from London to the U.S.A., including combination sleeper-lounge flights on Tuesdays and Thursdays.

AUSTRALIA and NEW ZEALAND via the USA

See and enjoy beautiful San Francisco, Hawaii, Fiji, on your way "down under." Fly by TWA-BCPA de luxe sleeper service.

ing from the general paralysis; consignments of Scotch meant to reach Americans before Thanksgiving, and before the new excise taxes went into effect on November 1st, have had to be returned to Britain.

On October 9th Mr Ryan negotiated a two-year contract with the New York Shipping Association providing for wage increases of ten cents an hour and certain other benefits—all the dockers were entitled to without a special exemption from the wage stabilisation regulations. Locals in Brooklyn, Manhattan and Staten Island struck in protest, under the leadership of Mr John Sampson, business agent of Mr Ryan's own local, who has been identified with every rebel movement in the union, and who is reputed to aspire to Mr Ryan's life presidency. Long-standing grievances of the rank and file against Mr Ryan have embittered the dispute. He claims that the disputed contract was accepted, 2 to 1, by members of the union, which covers longshoremen in east coast ports from Maine to Virginia, but the strikers insist that they knew none of the details of the contract, and that the vote was counted in an irregular manner. They also charge that Mr Ryan is in league with the employers, and that the union is dominated by racketeers. The New York City Crime Commission has lent weight to charges of evil conditions in the hiring of dock labour, and says that the leadership of the union is "honeycombed with mobsters." Among these they name Mr Harold Bowers, international organiser controlling longshoremen on the Cunard pier, who was a member of the gang of the convicted bank robber, Mr Micky Bowers. A leading figure in providing strike-breakers has been Mr Anthony Anastasia, brother of Mr Albert Anastasia, a key figure in Murder Incorporated. Mr Ryan himself has accused the Communists and Mr Harry Bridges, leader of the West Coast longshoremen, of instigating the strike.

The Federal Mediation Service made an unsuccessful attempt to secure a settlement, but was embarrassed by the fact that it had helped to arrange the original agreement. State mediators are now at work. The President, who has so far refused to invoke the emergency provisions of the Taft-Hartley Act as the employers would like, appealed to the strikers to return, but Mr Sampson rejected the appeal and asked instead for an "emergency impartial body" to review their grievances. Meanwhile the strike continues, and the tie-up of big copper and lead shipments threatens seriously to affect the defence programme, already disturbed by earlier strikes in the copper industry.

UMT on the Way

For the first time in its history America will have a system of universal military training (now to be called National Security Training), if Congress approves a plan submitted to it last Saturday. The National Security Training Commission, which has just issued its report, stresses the need for a UMT programme as providing "a method for achieving reasonable protection at a cost that can be borne over an extended period." The Commission was set up in June, under the Military Training and Draft Act, and contains five members, three civilians and two military, under the chairmanship of Mr James Wadsworth, former Senator and Representative from New York.

The report proposes a total of eight years' service for every young man, six months of which are to be spent in training in special camps, and the rest in a civilian organised reserve, such as the National Guard. Deferments, except for physical and mental reasons, will be hard to get. Both the Department of Defence and the Commission came out strongly against a plan sponsored by the American Legion to sweeten the dose by splitting the training into two three-month periods, probably to fall in the summers. They object that this would involve an excessively heavy burden on training personnel and facilities; would increase the cost of the programme (now estimated at over $4 billion for the first and $2 billion for subsequent years); and would probably decrease the effectiveness of the training.

Trainees are not to be members of the armed forces, and are not to be subject to combat duty, but are to have a special legal status between those of civilian and soldier. To reassure parents who are disturbed at the possible effects of camp life on their sons' morals, the Commission also stresses the need for strict supervision of the men's moral welfare: among other proposals are a limitation on the sale of alcoholic drinks to the weakest beer sold commercially (and even that would only be sold at an "inconvenient distance" from camps), and a clause to make illegal the establishment of a brothel near a camp. Prostitution is forbidden under state laws, but enforcement of them is often lax.

If Congress approves the plan, men may be called for training as soon as the President or Congress decides that actual service for men under nineteen is no longer necessary to keep the armed forces at their full authorised strength. There is some reason to believe, however, that the Commission has a doubt whether NST can be begun alongside Selective Service at all. The full programme will involve the training of 800,000 men a year, but the Commission urged a starting programme of 60,000. Congress must consider these proposals within forty-five legislative days, which will be towards the end of next February.

Bull in the Stabilisation Shop

Congress has gone home without reviving the slaughtering quotas which the Administration hoped would bring the cattlemen to terms and enable law-abiding packers to secure their normal supplies of beef. There have, consequently, been many rumours that price controls on meat would have to be abandoned. But Mr DiSalle, the Price Administrator, refuses to concede a defeat which would allow the price of beef to run wild and wreck the stabilisation scheme. He knows beef prices play an important part in the cost of living and in wage demands.

One proposed substitute for the quotas which, like them, would prevent certain dishonest packers from cornering the supply of live cattle would involve using the power of the Department of Agriculture to order packers to set aside a certain proportion of their production for the services, which are short of beef. The suggestion is that this should be fixed at anything in excess of their cattle purchases in a base period. This would make it unprofitable for the unscrupulous to offer over-ceiling prices for cattle, since the services cannot pay black-market prices. Unfortunately, the Department of Agriculture is not much more in sympathy with Mr DiSalle than are the cattlemen. Many of its officials are saying almost openly that if only price controls were removed beef would flow freely to the packers and butchers. On the other hand, Congress, which normally does not like the executive to repair its calculated omissions, may in January be readier to recognise that high meat prices are bad medicine in an election year.

Mr DiSalle is remarkably jaunty about another Congressional omission, the failure to revise the Capehart amendment to the Defence Production Act. This requires that, if a pre-Korean basis for price ceilings is to be used, instead of the present level, or that prevailing between January 25th and February 24th this year, the ceilings must allow for all increases in costs up to July 26th. The Administration has protested vigorously that this would let prices move only one way—upward. Now, however, that the controllers are embarked on the third stage of control, that of supplanting the general freeze and the interim regulations which followed it with dollar and cent ceilings "tailored" to individual industries and products, they have found unsuspected possibilities in the law.

Many goods are selling below their ceilings, which can thus be reduced in Senator Capehart's name; in some depressed industries, such as cotton textiles, the price officials have had to promise not to take full and unfair advantage of the law when they set permanent ceilings. There are other cases, which Senator Capehart never suspected, where the ceilings fixed under the general freeze are higher even than his amendment permits. Mr DiSalle can be trusted to bring them down.

Sweeping reductions are hardly to be expected; ceilings must be "equitable," they must not discourage production, and they must not cramp farm prices. But price control officials are reasonably hopeful that they can batten down the hatches for the big inflationary blow expected in the next few months. For this they must give the lion's share of the credit to the temporary recession and the consumer restraint which lies behind it.

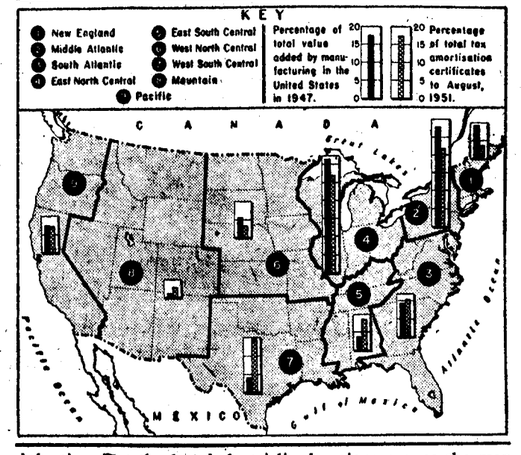
Shame of Cicero

Last July when a Negro ex-serviceman attempted to move into a flat in the white working-class town of Cicero, a suburb of Chicago noted for its connection with Al Capone, his furniture was burned by a mob, he and his wife were threatened with violence, and a number of people were injured when the National Guard was called in to stiffen the police, who had stood idly by. The Negro, Mr Clark, charges in addition that he was beaten by the police and ordered to leave town. At the height of the riot, the mayor and chief of police could not be found.

It was expected that the Cook County grand jury would indict these negligent officials as well as the leaders of the mob. Instead, an indictment was brought against the owner of the flats, her Negro rental agent, and a Negro lawyer, for conspiring to sell the pass to Negro tenants. Also indicted were a lawyer for the National Association for the Advancement of Colored People, who acted for Mr Clark and, almost as an afterthought, the chief of police. This may have been a calculated test of Negro rights, but its handling by the local authorities is none the less shameful. A special federal grand jury has now been convened, and Cook County has dismissed the indictments against everyone but the police chief. But under the weak federal civil rights laws, an indictment is notoriously easier to obtain than a conviction.



The Cicero riots are not an isolated case. There have been six similar outbreaks in Cook County since 1945 and other cities such as Detroit have not been free from violence. Arson and bombings are now so frequent that insurance companies are reluctant to write fire policies for Negroes in certain districts. White resistance to Negro infiltration has grown tremendously in the past decade, with the flood tide of Negroes moving out of the south to better-paying jobs in northern cities. From 1910 to 1940 1,750,000 Negroes were on the move; in the following seven years, the number was 2,700,000, as Negroes came north to do the dirty work done by Europeans before immigration was shut off. Negroes are crowded into costly and insanitary black ghettoes from which escape is difficult. In 1948 the Supreme Court ruled that restrictive racial covenants were not enforceable at law. But they continue to grow apace, and, as the Cicero case shows, when the mob decides to "enforce" them, local officials seldom have the political courage, if they have the inclination, to defend minority rights. The Cicero case has at least brought this fact out into the open, to the indignation of fair-minded Americans.

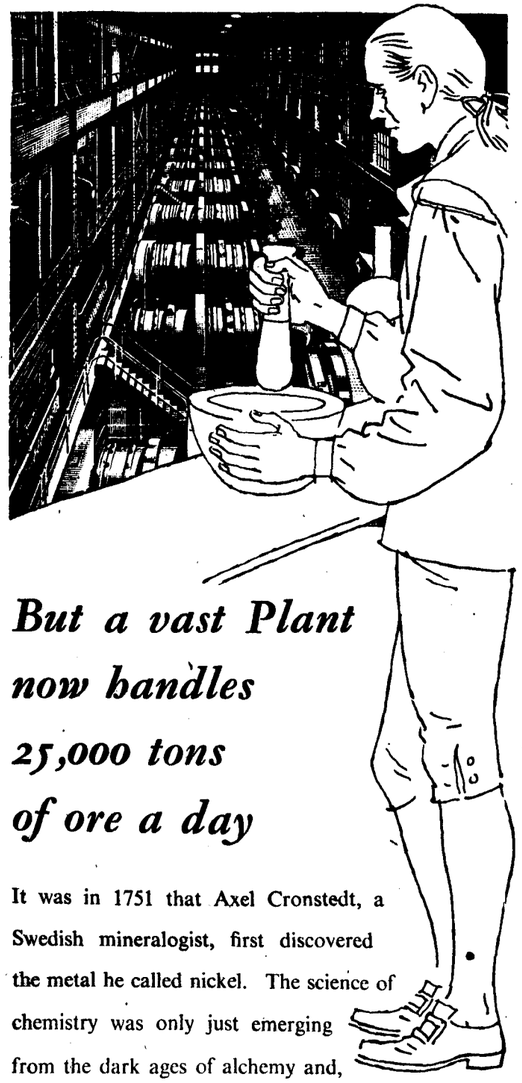
Industry Spreads Out

Although industry is still expected to break all records by spending $25 billion on new plant and equipment this year, an increase over last year's expansion of one-third in money and of one-quarter in physical growth, the latest survey shows that businessmen are beginning to draw in their horns a little. This is the result of shortages of building materials and components, not of second thoughts about capital spending; plans for the latter are in many cases becoming bigger and better every day, for nearly all businessmen expect the country's prosperity to continue.

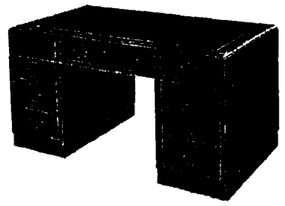


New facilities for the production of basic materials, for the eventual benefit of civilian consumers, have received over two-thirds of the certificates permitting rapid amortisation for tax purposes, by which the government is encouraging industrial expansion needed for the rearmament programme. So far about half of these certificates, by value, have been granted for new plants to be built in the manufacturing heart of the country, stretching from the Great Lakes to the

Atlantic. But the less industrialised regions are, as the map shows, getting rather more than their fair proportion of certificates when judged from the point of view of their share in the country's total manufacturing capacity. Even the Pacific coast, the industrial giant of the last defence programme, is today only holding its own; it is the south-west that is now shooting up, largely as the result of oil and chemical expansion in Texas. This movement away from the coasts and toward the growing markets of the south has been noticeable for some time, but the trend has been accentuated by the pressures of the present emergency, which are forcing manufacturers to put their new plants in the less industrialised areas where labour and other facilities are available.

This natural development is most desirable from the point of view of civil defence, for it is the coastal districts and those around the Great Lakes (on the direct Great Circle route from Siberia) which are most vulnerable to air attack. The absence of any government insistence on the necessity of decentralising industry has been criticised in Congress, but it was Congress which last summer defeated an attempt to make decentralisation a condition of government aid for industrial expansion. Representatives of the old manufacturing areas can always be counted upon to oppose legislation that would keep new jobs from coming to their constituents. Shortly afterwards President Truman himself burned his fingers on this politically hot potato, when he approved a policy for speeding up industrial dispersal.

The question cooled down quickly, however, once the President's statement was cleared of a semantic confusion between decentralisation, a regional affair, and dispersal, a local matter of placing new defence factories far enough apart for it to be unlikely that two will be destroyed by one atom bomb. Half the country's industrial output is said to come from the 35 chief target areas, and the need for dispersal has long been realised. It is now one of the considerations governing the granting of defence contracts and tax amortisation certificates.



But a vast Plant now handles 25,000 tons of ore a day

It was in 1751 that Axel Cronstedt, a Swedish mineralogist, first discovered the metal he called nickel. The science of chemistry was only just emerging from the dark ages of alchemy and, even on a tiny scale, his methods were laborious. Today, in the great mines and smelters of Ontario, the source of most of the world's nickel, modern knowledge and equipment have brought the process to a high pitch of efficiency. But still the search goes on for even better methods of production, to meet an ever-growing demand.

THE WORLD OVERSEAS

Mr Eden's First Assembly

A PERSIAN will preside over the first session of the sixth United Nations Assembly, which opens in Paris next Tuesday. He will, however, step down as soon as the president of the new Assembly is elected ; his role at the opening session is merely a consequence of the fact that Mr Nasrollah Entezam presided over the 1950 Assembly, which met before Persia achieved its present prominence in world affairs. Fortunately, the convention that the president must be chosen from a different part of the world each year makes it likely that this Assembly will elect a Latin American rather than another delegate from the Middle East ; fortunately, because questions involving the latter region are thickly strewn throughout the agenda.

Never before, in fact, has a UN Assembly met under such a cloud of Middle Eastern problems. Admittedly neither Persia's nor Egypt's dispute with Britain is on the agenda —although either might make its appearance before the Assembly grinds to its end some time in the New Year. Nor is the question of Palestine likely to achieve the prominence of previous years, even if the French, American and Turkish conciliators, who for months have been trying to bring Israeli and Arab views closer together, can produce a definite result during the Assembly. But the states members of the Arab League, who manifested only last week their displeasure with the world organisation by refusing to observe United Nations Day, will certainly air their grievances during the general debate. By the time that debate opens, fuel for their anger may well have been provided by the efforts of France, backed by Britain and others, to prevent the Assembly discussing the joint Arab motion regarding Morocco. A full-dress discussion on this matter—which is discussed by our Paris Correspondent on the next page—would be particularly embarrassing to France in view of its role as host country ; and it can only be avoided if the French argument—that the question is an internal one—is accepted by such "neutral" members as the Latin Americans. In this connection France's recent encouragement of the Latin Union, and M. Maurice Schuman's conferences in Rio de Janeiro, may be significant.

Even if the Moroccan issue can be sidestepped, there can be no escaping the abuse which, when Libya is discussed, will be hurled by Egypt and its friends at the western nations that freed that territory from Fascism and are now grooming it for independence. It is fortunate that the essential decisions regarding Libya were taken at last year's Assembly, when Middle Eastern passions were not running so high. The 1951 Assembly has little to do in the matter except receive reports ; and while this must provide an opening for propaganda by the Arab members, there is no means by which they can prevent last year's arrangements going through.

What Will Russian Tactics Be?

The mere fact that no reference to the USSR has as yet been made in this article indicates the extent to which this year's Assembly differs from its predecessors. It does not, however, imply that the Russians are likely to sit back throughout the proceedings, leaving it to the Arabs to blacken the face of the West. It can be assumed that, as the "hardy perennials" which appear at each Assembly come round again, the Russians will say their usual say, whether the subject is Greece, colonies, Indians in South Africa, human rights, or the admission of Italy to membership. They will, no doubt, again denounce the UN aid given to refugees, the technical assistance given to backward countries, the proposal to merge the Atomic Energy Commission and the Commission for Conventional Armaments, and the extension of Mr Trygve Lie's term of office as Secretary-General ; and they will be supported by the faithful Poles and Czechs. But will the USSR produce any startlingly new proposals?

The Soviet tactic of announcing a simple, propagandist motion after each Assembly has begun is already wearing rather thin. In 1948 Mr Vyshinsky called for a one-third cut in the Great Powers' armies ; in 1949, for a five-power peace pact ; in 1950, for the branding as a war criminal of the first nation to use an atom bomb. What new slogan can the Kremlin now find ? It is rather late to bring up the issue of the rearming of Germany and Japan ; the Communist-led world peace movement has already made much play with that theme, and it would not burst upon the Assembly with the same freshness as its predecessors. Perhaps this year's appeal will be for "talks on the highest level," a suitably vague slogan, calculated to have a certain impact on such westerners as have already forgotten the recent vain efforts of the four Foreign Ministers' Deputies, and on the many "neutrals" who never heard about them. Another possible Soviet move might be a new proposal on German unity ; it is already being suggested that the UN should supervise all-German elections, and a flattering twist might be given to this offer.

Aims in Korea

Unless Mr Vyshinsky's surprise packet takes a very novel shape, it is almost bound to meet the same fate as in previous years ; that is, it will be voted down by the overwhelming majority of member nations, after that same majority has approved a portmanteau resolution reaffirming its attitude on such general issues as resistance to aggression and the control of armaments. Then the Assembly will be able to get down to business. Apart from the Middle Eastern issues, the problem on which action is most urgently needed is Korea. A predominantly Asiatic commission, set up by last year's Assembly, has recommended that the United Nations' political objective must remain the establishment of a unified and democratic Korea, but there is still no sign of a clear statement of the UN's more immediate aims in that country. It will, however, be interesting to see how the Assembly answers the commission's request that the UN should now have more adequate political representation in Korea.

From the British point of view this Assembly has a special interest in that Mr Anthony Eden will be leading the British delegation for the first time. It can hardly be expected that the new Foreign Secretary, who has had only ten days to prepare for his journey to Paris, will take any electrifying initiatives in his opening speech. But the Assembly will enable the delegates of the fifty-nine other member nations to take the measure both of Mr Eden and of his Government, while he in turn will have a chance to talk informally not only with Mr Acheson and M. Schuman, but also with many ministers, such as those from Southern Asia, who are not normally available in Europe. Mr Eden, with his years of experience at Geneva, should be able to take full advantage of this unusual opportunity in spite of the many other pressures upon him.

France and the Moslem World

[FROM OUR PARIS CORRESPONDENT]

DURING the recent naval manœuvres in the Mediterranean General Eisenhower declared that "we" should take cognizance of "the legitimate aspirations" of the Moslem world in that area and, for that matter, all the way from Dakar to the Philippines or else, said the general, "I don't see how we can hold true to our doctrine that we do not want to dominate anyone." This statement has drawn groans from responsible officials in Paris—and not least from the Americans. They see, of course, what the Supreme Commander means, but they see also just what the Moslems of North Africa will like to think he meant in regard to immediate Allied policy. The Moroccan question is to come before the United Nations General Assembly before Christmas; the Tunisian question, after the mammoth tour of Habib Bourguiba, will surely be discussed in the corridors of the Palais de Chaillot; the establishment of the Kingdom of Libya and Cyrenaica, so rich in promise of multilateral discord, is in process and should be completed before the end of the year.

The situation further east is already well known. General Eisenhower's gesture of good will towards the Moslem peoples came at the outset of conversations between Britain, France and the United States on how to handle the complaint filed by the Arab League that France has both unnecessarily prolonged its protectorate in Morocco for its own ends and has also violated the UN Charter of Human Rights. While General Eisenhower's declaration may in a general way be said to puff into North Africa a welcome breath of fresh air, he has not made it any easier tactically for the responsible European powers on the spot to meet the contemporary Moslem challenge, still less to reconcile between themselves the divergencies of policy towards the Arabs which have for thirty years caused so much bad blood between Britain and France.

Morocco on The Move

In French North Africa each region has distinct problems which admit of practical solutions but which equally become insoluble if fanaticism supervenes. General Juin's tenure of office in Rabat coincided with the large industrial development of Morocco that followed the penury of the war years. On the plane of external and internal diplomacy, however, it was often marked by suspicion and downright bad manners. General Guillaume, who has succeeded General Juin with the latter's own blessing, has made an auspicious inaugural tour and has, it seems, established a more friendly relationship with the Sultan who was previously very close to the Independence party (Istiqlal). In his last months as Resident-General, General Juin pushed ahead with one constitutional reform—the formation of local assemblies. These in the French view, are the prerequisite of regional assemblies and of finally a Moroccan national assembly. In spite of the French refusal to declare a time-table of Moroccan independence, there is thus at least some momentum in the direction of realising the "legitimate aspirations" of which General Eisenhower spoke. The next few years will show whether a more liberal French policy can make headway against subversive propaganda and the unsettling presence of thousands of American airmen and their families around the Atlantic aerodromes.

The American trade penetration of Morocco is much exaggerated. It was conducted chiefly by ex-G.Is who came back in the export-import business and for a year or two made hay by selling American goods in an insatiable market and exchanging their large franc profits into dollars at Tangier. This triangular process, which was made possible only by American exemption from the French exchange control, caused a depreciation of the franc and consequently a French prohibition of imports for the purchase of which foreign currency had not been officially allotted. A rather insignificant Moroccan trading-lobby then succeeded in provoking an ideological response from Congress with the cry that American traders were being penalised by the protectorate when the United States still retained free trading rights within the Sherifian Empire under a treaty of 1836. This dispute, which is at present before The Hague Court, hardly constitutes a genuine intergovernmental quarrel.

It is therefore unlikely that differences of philosophy or interest will prevent the United States Government from formally supporting the right of France to pursue its policy as protecting power in Morocco as it thinks fit. As to the technique of handling the Arab League's complaint, the Americans, as a matter of principle, do not wish to exclude any subject from the Assembly's agenda. The French fear that, once their fingers are caught in the machinery of Uno, they may be put entirely through the mangle; so they intend to deny the competence of Uno at the outset and to state their refusal to take cognizance of its findings. The British, who support France on the substance of its case, also hold the view that the Assembly is incompetent to discuss the revision of treaties sanctioned by international agreement.

Tactics at Uno

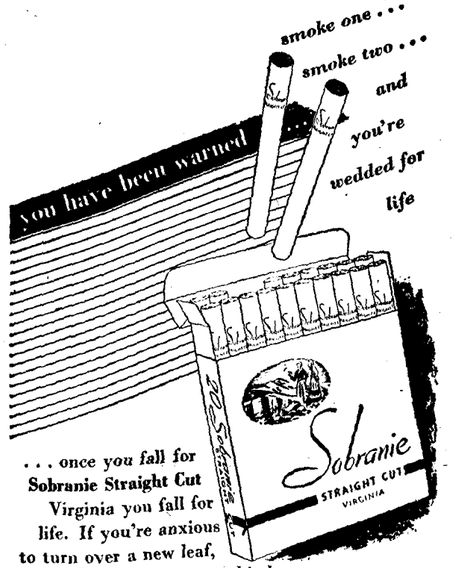
The British who—again rather more than the Americans—incline to the "open forum" view of the United Nations also reject a discussion on human rights, pointing out that the Moroccan case is on this count certainly no more suited to Uno than that of the exploitation of the Egyptian fellah by the Egyptian Government. In sum, diplomatically the French Moroccan case receives British support in return for French solidarity with the British over Egypt and the Sudan—while both powers are upheld by the United States partly in the interests of Allied security, partly on the principle of the non-violability of treaties.

On the latter point, however, there are obvious juridical differences between Morocco and Egypt: the Egyptians have unilaterally abrogated a recent "emancipating" treaty with a defined term. The Sherifian authority, on the other hand, has abrogated nothing. Last autumn the Sultan asked for and was refused a new treaty revising the relationship of the two parties, since when the protectorate has continued its juridically endless sway as defined in 1912. The resolution of the Arab League is made therefore, as it were, on behalf of a Sultan who has no international juridical personality.

But behind the legal niceties which, as always, are used by attackers and defenders only when convenient, there are the contemporary political *desiderata*. What appears to be desired by American expert opinion is that the Europeans should stay put in North Africa and, without sticking rigidly to the letter of past treaties defining rights and powers, should further economic, political and social development to the best of their ability. Such is the sense of General Eisenhower's declaration which springs, presumably, partly from a sense of his country's mission in the world at large and partly from the United States' military need for secure air-bases from Port Lyautey to Tripoli. No more than the Arab nationalists can the Americans rouse any great enthusiasm for the constitutional distinctions between Morocco, the French protectorate in international law; Algeria, the overseas department of France; Tunisia, the French protectorate *de droit interne*, Libya and Cyrenaica, the future federal kingdom "under licence" and Egypt—independent and suffering from a domestic feudalism that is far more predatory than any of the types of foreign rule in the other areas.

Like Morocco, Tunisia has its "progress-problem." But in this instance political evolution is further advanced. The conversations now going on in Paris between the French

TELLING THE WORLD
OF BRITISH ACHIEVEMENT



66 COUNTRIES in all parts of the world, including hard currency areas, are now receiving from Britain regular shipments of Hoover products — electric cleaners, washing machines, polishers and F.H.P. motors.

The volume of these exports is rapidly expanding all the time. In the first six months of 1951 the figure was 100% higher than for the same period in 1950, and that in turn was 68% higher than the figure for the first six months of 1949.

The export of Hoover products is not only valuable in earning foreign currency but is a magnificent advertisement for British enterprise as a whole. Every Hoover cleaner, washing machine, polisher and motor despatched overseas is a reminder to other countries that British initiative, invention and craftsmanship still remain unsurpassed.

government and M. Chenik, the Tunisian prime minister, deal not with abstract treaty changes but with the further practical association of Tunisians with the French in the control of their country's affairs. As when the Sultan was parleying in Paris last autumn French *colons*, fearful of threats to their own interests, have hastened after M. Chenik to present their own case to the government. But there is a major difference between Tunisia and Morocco. The local Arab intelligentsia—and it is always the intelligentsia who lead revolutions—are themselves more highly educated and have at their back a more skilled and more educated working class element than have their Moroccan counterparts. (Indeed they are in this respect ahead of all the other Arab states except Lebanon.) They are therefore more likely to be able to bring about improvement without recourse to the only weapon available to the ignorant, which is violence. It may yet be that evolution, not nationalism, will prevail in Tunisia. If so it will become a major factor of stability when in neighbouring Libya the United Nations seems to have laid the perfect conduit-pipe of Moslem fanaticism—from Egypt to French North Africa.

Unrest in Kazakhstan

REPORTS were published in the Western press last week of an alleged "peasant rebellion" in Kazakhstan, the second largest (it is ten times larger than the United Kingdom), but the most sparsely populated, of all the Soviet republics. The reports have almost certainly been much exaggerated. On the other hand there have been signs of unrest in the Kazakh SSR, and complaints about the "selfishness of Kazakh peasants" and the nationalism of the local intelligentsia have been voiced in the Moscow press.

The root of the present discontent seems to lie in the campaign for the recovery of livestock which is being carried out throughout the Soviet Union. The three-year plan for the development of livestock (discussed on page 933 of

The Economist two weeks ago) is supposed to be completed by the end of this year, and the Soviet leaders in their efforts to reach the targets set have tightened their control over the livestock belonging to the state and collective farms. The peasants have apparently taken advantage of the recent amalgamation of collective farms to grab as much as possible of the communal stock. The losses, it is reported, have been particularly noticeable in Kazakhstan which is the main centre of the Soviet sheep and goat population, and where, moreover, work numbers of Ukrainian peasants who were compulsorily transferred to this province because of their opposition to collectivisation. Hence it is not surprising that the campaign for the recovery of livestock has met with stiff opposition in this area. There may even have been some cases of sporadic resistance by the semi-nomadic Kazakh shepherds, who regret the good old days when nobody bothered about how many sheep and goats they possessed. The older ones tend to say nowadays that "Tsar Nikolai was a fool, but Stalin is a clever man: he knows exactly how many sheep and goats I still possess."

The Soviet leaders always fear an alliance between discontented peasants and a dissatisfied intelligentsia. Hence their campaign for the recovery of communal stock has been accompanied by severe blows at Kazakh nationalism. At a recent meeting of the Central Committee of the local Communist party both the first and the second secretary as well as the chairman of the Academy of Sciences, the rector of the University and the chairman of the Writers' Union were strongly criticised for tolerating, and themselves succumbing to, "nationalist deviations."

A similar attack on the nationalist intelligentsia as a potential ally of the discontented peasantry was carried out some time ago in the Ukraine. It is a sign of the development of Kazakhstan that it has created for the Soviet Government a "Ukrainian problem." With its great resources of coal in Karaganda and oil in the Emba region, with the richest Soviet deposits of non-ferrous metals and great possibilities for cotton growing and sheep rearing, the Kazakh Republic is too important to the Soviet Government for it to let the present situation get out of hand. Kazakhstan developed with great strides during the war and it still continues to do so; and the fact that the Soviet authorities now have to deal with a nationalist urban "intelligentsia" is a symptom of this comparatively rapid growth in the urban population. By leading their backward areas along the path of economic and social progress the Soviet Government is changing the nature of the opposition that it has to face in its non-Russian southern and eastern regions.

Perón at the Polls

[FROM A CORRESPONDENT]

ON November 11th, for the first time since the 1853 constitution (now revoked) was introduced, an Argentine president holding office will stand for re-election. Academically the term "holding office" may be incorrect. For Congress has granted President Perón's request for leave of absence from executive duties—a request made, according to Perón, in the interests of electoral freedom. Nevertheless, as this article is being written the President is still at Government House.

Other electoral innovations of Perón's own invention include the election of the president by the direct vote of the electorate; the replacement of the PR system (in force since 1912) which assures a one-third representation in the Chamber to the minority vote, by a system according to which constituencies return one member each by majority vote; and the appearance of organised labour represented by the officially controlled CGT or Labour Federation as an important force in the electoral campaign. A fourth innovation, the women's franchise, is generally attributed to Señora Perón's good offices; women voters in the Peronista ranks are organised in a separate party (*Partido Peronista Femenino*), and all parties have a fair sprinkling of women amongst their candidates. The polling will again be supervised by the army; this is a repetition of a practice initiated in the last presidential election—Perón's first. But as a result of the abortive September revolt, the elections will be held under martial law, unless this is revoked by a last-minute dispensation of the authorities.

Perón's opponents brand the abandonment of PR (slightly modified by a curious provision allotting ten seats to the minority vote) as one more step in a campaign directed towards *de facto* one-party rule within a pseudo-democratic framework. The charge is not unfounded; the new elec-

'ENGLISH ELECTRIC'

In at least one respect this busy English street scene is typical of many others thousands of miles away. Go to Sydney or Sao Paulo, Montreal or Montevideo, Colombo or Kyoto — you will find trolleybuses as popular as they are in Great Britain. You will also find that they are either completely built or equipped by 'ENGLISH ELECTRIC'.

bringing you

Every day, all over the world, people travel to and from their homes by 'ENGLISH ELECTRIC' trams, trains and trolleybuses. Housewives, school-children, factory workers, office workers, — all enjoy the benefits of cleaner, quieter, more comfortable travel.

Both inside and outside the home 'ENGLISH ELECTRIC' puts the power of electricity at the service of millions.

toral law was preceded a couple of years before by another law which effectively precludes any coalition of parties or any inter-party arrangement designed to avoid vote-splitting. Perón likes to point to his electoral practices as the first instances of electoral freedom in Argentina. But there are subtler means of hanging on to power than the crude election-rigging which kept the Democrats (Conservatives) in office for ten years before the 1943 military coup and has left them with a reputation for electoral mismanagement not yet lived down.

In the pre-election campaign, the balance has been heavily weighted on the side of the regime. It has had control of the popular Press, radio and television, and in fact free recourse to the public purse for the financing of its propaganda machine. Since the overplayed hand in the campaign's earlier stages and the virtual flop of the monster CGT rally last August, when Perón at a preview before making his official appearance on the platform is reported to have rated the CGT chief for what he called "*una ridiculeza*," events have once more dealt the Peronistas a strong trump suit: the September revolt.

The mystery surrounding the origins of this affair is now, if anything, deeper than ever. There are two official "explanations": the Minister for the Army, General Lucero, attributed it to the petty personal ambition of its leader and a small group of friends, while Perón, in a broadcast a week later, painted it as part of a much bigger conspiracy financed by foreign "imperialists" and aimed at the "subjugation" of Argentina. This story at least provided Perón with reinforcements for an old propaganda line and allowed the CGT to polish up a few rather tarnished slogans. It also provided a pretext for arresting a number of opposition leaders (later liberated as another gesture in the interest of electoral freedom), and for tightening up repressive measures: for instance, dissemination of rumours tending to "discredit the Government" was made a penal offence.

One Horse in the Race

With no popular Press, no radio facilities, no unlimited expenses fund, and forced to distribute electoral pamphlets more or less surreptitiously, the opposition has been condemned to virtual inarticulacy. Peronista slogans, on the other hand, scream from walls and hoardings, trams and buses. The two principal parties, Radicals and Democrats, have, it is true, been able to hold their meetings with little interference of an organised kind; but Socialist meetings have been interrupted by the police and party officials have been arrested. Dr Palacios the veteran Socialist leader, was one of those arrested and later released after the September revolt; a fortnight before polling day he withdrew his candidacy and advised his party to boycott the elections. On the whole there is little optimism amongst even the most sanguine of Perón's opponents. If any thoughtful Argentine is asked who will win at the polls he will probably reply: "*El caballo del comisario*"—in Argentina punters at country race meetings are proverbially advised to back the horse owned by authority as represented by the local *comisario*, or police chief.

Nevertheless, November 11th may yet reveal some electoral surprises. A potential source of change is the largely unpredictable women's vote, and of course housewives feel the sharp upward swing in living costs to a peculiar degree. There are also signs of dissatisfaction in the Peronista ranks in some constituencies because party candidates were thrown into the discard and others imposed on them by the CGT. And, of course, abandonment of PR is a two-edged weapon. There is, moreover, a curious but widespread belief in Argentina, now given an added fillip from the presidential demand for six months' leave, that Perón would gladly retire from the political scene, at least temporarily, at a time when the rapid deterioration in Argentina's economy makes the prospect of another term in office far from alluring.

Canada's Arms Dilemma

[FROM OUR OTTAWA CORRESPONDENT]

THE Canadian Government is coming under fire because it has not more to show for the very large arms expenditures ($1.6 billion in the current fiscal year) which Parliament voted last spring. Whether the production programme has been prosecuted as vigorously and as efficiently as it might have been is extremely difficult to say. But it is easy to see several highly frustrating factors which make Canada's defence production exceptionally difficult to plan.

The fundamental fact is that Canada must produce for other people besides itself if it is to produce at all economically. For example, the decision was taken more than a year ago that this country must have facilities to produce at least some of its own military vehicles. With some difficulty in the case of the Willys Jeep, manufacturing rights were obtained from American companies so that the three big Canadian automobile plants might each assemble one type. Canadian General Motors was assigned a 2½ ton 6 by 6 truck; the Chrysler Corporation of Canada a ¾ ton 4 by 4; and Ford of Canada the Jeep or ¼-ton truck. But the requirements of the Canadian armed forces, save in war, would not keep a production line rolling for more than a few weeks. The three automobile factories have therefore set up a sort of pilot assembly-line. It will allow them to get familiar with the American vehicles, and enable efforts to be made to develop an increasing Canadian content in them. But it is clearly not an economic operation. It is a measure of preparedness based on the presumption that, in the event of war, the full capacity of the Canadian automobile industry would be needed.

Aircraft production presents another case. The only way Canada could get modern fighters in the numbers needed was to build them here. The Canadair factory at Montreal is producing F86 (Sabre) jets at a rate sufficient for the RCAF. At full capacity it could produce them in three or four times the quantity. The limitation is that the engines have to come from the United States. If Canada could get twice as many American engines, it could produce enough fighters to supply the RAF, which would eagerly welcome them, as well as its own air force; and the per-unit cost would be correspondingly reduced.

Canada's second big aircraft project, the A. V. Roe (Canada) Company at Malton, outside Toronto, is the first to achieve near independence of either U.S. or British components. The big twin-engined jet fighter, known as the CF-100, was designed in Canada for Canadian conditions. The engine which is to go into it, the Orenda, was also designed and built by A. V. Roe (Canada) Ltd. Subsidiary factories have been started here to supply parts, down to the blades in the turbine; and British manufacturers of components, such as the Rotax Company, have been persuaded to open Canadian factories to serve A. V. Roe. The one major part which still has to come from Britain is the fuel system. Eventually Canada will have its first self-contained aircraft plant. The CT-100 will be the first genuinely all-Canadian aircraft both in its frame and its power-plant. But it is not yet in production. All that yet shows is the very high capital cost and four prototypes.

The one shining example of a really satisfactory and economic operation is the gun-plant at Sorel, Quebec, which is building the 3-inch 50 calibre naval gun for both the Canadian and American Navies. But it would never have worked out if Canada had not taken the initiative and started making the guns for its own use—on a strictly uneconomic basis.

The United States is virtually the only country that can afford to buy Canadian arms production and it is virtually the only country that does not want it. For all the talk about

North American integration and all the exhortations from American Ministers, the American procurement authorities are exasperatingly slow in placing orders here. Yet Canada is officially holding to the policy of using all-American standards until more widely standardized types are adopted. The production experts, now running a powerful Department of Defence Production under Mr C. D. Howe, insist that this is the only policy which makes industrial sense.

The argument on the other side is that, if war comes, it is Britain and western Europe which will be looking to Canada for arms, and that therefore Canadian industry should be set up as reserve capacity in support of British industry. This would mean tooling up to produce British types. It had to be this way last time because the United States did not come into the war for two years. But Canada learned by hard experience how difficult it is to adapt British designs to North American standards. This time the Americans are not only in from the beginning, but their weapons and their standards are widely spread throughout the whole Nato area. In wartime the United States, even more than Canada, would be the reserve arms supply for the whole alliance. Canada's relatively modest contribution might just as well come in the form of American types which will be in general use anyway. This, at any rate, is the general thinking here, but obviously it does not mean that the Canadian forces can switch overnight to American weapons.

For some time to come it looks as though the Canadian forces will have to be ready to use both British and American weapons. The principle of North American standardisation stands as a goal to aim at. But its application may require a good deal of flexibility, particularly so long as the United States maintains its general attitude of self-containment in arms production.

Moscow on the British Elections

Moscow's reaction to the results of the British election was exceptionally swift and sober. As soon as the outcome was known, a Tass report argued that Labour's defeat was due to the betrayal of its "peace promises." "The electors who voted for the Conservatives"—claimed Tass—"have apparently some hopes of the possibility of a change in British policy. However, the advent of the Conservatives to power will hardly bring about a change, for the Labour Government in fact carried out a Conservative policy."

The same line—stressing that the change of government is unlikely to lead to a change of policy—was picked up almost textually in a carefully worded first page leader in *Pravda*, which may well have been written in, and certainly was approved by, the Kremlin. It would seem that the Soviet leaders are taking great pains to show that the advent of Mr Churchill to power does not close the door to negotiations. Another pointer to Russia's desire to negotiate was the new attitude to the Conservative leader himself. Hitherto he has been the "warmonger," the "interventionist," the favourite victim of Soviet cartoonists, comedians and pamphleteers. During the electoral campaign itself Moscow still reminded its readers and listeners that Churchill thought of crushing the Soviets as early as 1917, and that it was he who was the precursor of the Atlantic alliance and the anti-Soviet front. Yet *Pravda's* article commenting on the results dropped the epithets and stated soberly that "the Conservatives led by Mr Winston Churchill have come to power."

True, there was a touch of ambiguity in *Pravda's* diplomatic leader. If, on the one hand, it insisted that the "so-called rivalry" between the Tories and Labour was—in the words of another Soviet commentator—"more of a duet than of a duel," on the other hand it stated that "the defeat of Labour . . . has a great deal of political significance." This contrasting note may be due to Russia's general apprehension about the right-wing swing that has been gathering momentum in Western Europe for some time. The departure of the British Labour Government may well in their eyes symbolise the end of a period. On the morrow of the war Communists were represented in many Western Governments and the latter were in most cases led by socialists. Now the Communists have no share in the government of Western Europe and the British Labour party is—with the exception of Scandinavia—the last workers' party in Western Europe to be switched from power into opposition.

This indecision may partly account for the three distinct phases in the Soviet propaganda on the British election. At first, the Soviet press and radio attacked both the Tory and the Labour leaders alike. Then, on the eve of the poll it concentrated its onslaught on the Conservatives, spoke of the dangers implicit in a Tory victory and urged its sympathisers to vote Labour. Finally, when the result was announced, it reverted to the theory of indifference and favoured the "*no change*" argument.

Moscow has taken this election seriously, since it indulged but little in absurdities and then not for long. There were few arguments "from Pickwick's Papers" or descriptions of rotten boroughs. The nearest thing was the accusation used by both *Pravda* and the *Red Star*—that

> the present voting system in England does not guarantee the most elementary democratic right to secret voting and clearly serves the purpose of controlling and influencing every voter.

(This claim was based on the fact that by comparing the counterfoil and the ballot paper one *could* find out for whom the vote was cast.) *Pravda's* London correspondent continued for some time in the lighter vein, describing the election as a family campaign with the Churchills helping each other and Mrs Attlee a "political chauffeuse—taking her knitting needles to the steering wheel . . . frantically driving the family car from town to town." Even in his polling day cable he told the story of a man who painted the portraits of Churchill and Attlee on the pavement and put a hat next to each. The amount of the collection in each hat thus served as a sort of electoral thermometer.

Yet, as soon as the result was known entertainment made way for serious political argument. This immediately tried to make it as obvious as possible that a change of government does not prejudice the possibility of talks. The Russians may now wait for the reaction to their feelers, but they may also give some more hints on their intentions on the 34th anniversary of the October Revolution, which is to be celebrated on November 7th.

THE BUSINESS WORLD

Taxation of Profits—II

Profits Tax in Practice

AN article in *The Economist* last week traced the history of the comparatively modern idea that profits are proper taxable game, and portrayed the development of the Profits Tax from its prewar antecedents of the National Defence Contribution. The next stage of the discussion is to justify the judgment on which last week's article ended, that the Profits Tax is as complicated, fickle, and anomalous a tax as has ever been charged in this country. The greatest difficulty arises in connection with the additional tax that is payable on distributions. To understand the matter it is necessary to work through the cumbersome machinery of the Act stage by stage. In the first place, Profits Tax is charged at the maximum rate, now 50 per cent, on all profits; secondly, non-distribution relief, now 40 per cent, is given on the amount by which the distributions fall short of the profits charged to tax.

If in a subsequent period the amount of the distribution exceeds the chargeable profit, the excess is made the subject of a "distribution charge" to the extent of the non-distribution relief already granted. Thus if in Period I the profit was £20,000 and the distribution £15,000, while in Period II the profit was £15,000 and the distribution £20,000, the liability for Period I would be £20,000 at 50 per cent less £5,000 at 40 per cent equivalent to £8,000, whilst in Period II the liability would be £15,000 at 50 per cent plus a distribution charge of £5,000 at 40 per cent, i.e., £9,500 in all. Thus, with the profits and distributions of the two periods combined each totalling £35,000, the total tax payable would be £17,500 or 50 per cent.

"Distributions" is a wide term to the tax authorities; it includes not only dividends paid out of current or past revenue profits but also capital dividends or distributions. It extends to assets distributed in kind except in connection with the reduction of share capital (and in this case the exception does not hold for share capital created by a bonus issue after April 6, 1949). In the case of director-controlled companies, the remuneration payable to the controlling directors in excess of modest limits, together with loans to members of the company, are treated as distributions for the purpose of profits tax. At first sight, these provisions might seem no more than is necessary to protect the revenue. In many cases, however, the rules governing distributions act harshly, for they rest on the unfounded assumption that any distribution must have been made primarily out of the latest fund of undistributed revenue profits. There are no provisions in the Income Tax or Profits Tax Acts that charge capital profits to tax, but if capital profits are distributed, irrespective of whether they were realised before or after the 1947 Act or whether they had been set aside to a separate fund without any ambiguity, they are quite arbitrarily deemed to be paid out of the undistributed revenue profits on which the latest, and highest, non-distribution relief has been granted, and Profits Tax at the rate applicable to distributed profits becomes payable thereon. The injustice may be illustrated by an example, in which the reserves and non-distribution relief of a company are assumed to be as follows:

	Additions to Revenue Reserves	Capital Profits	Total	Non-distribution Relief	
				Rate	Amount
	£	£	£	%	£
1946 or earlier	90,000	110,000	200,000	...	...
1947	10,000	...	10,000	15	1,500
1948	20,000	...	20,000	15	3,000
1949	40,000	...	40,000	15	4,500
				20	2,000
1950	30,000	...	30,000	20	6,000
1951	40,000	60,000	100,000	40	16,000
	230,000	170,000	400,000	...	33,000

Such a company will, by the end of 1951, have received non-distribution relief of £33,000, representing an average rate of 23½ per cent on £140,000 of additions to revenue reserves between 1947 and 1951. The original capital profits may date from, say, 1925, while the surplus of £60,000 in 1951 may arise, say, from an asset nationalised in 1948 of which the take-over price was not agreed and paid until 1951.

If the original capital profit of £110,000 had been distributed the additional Profits Tax payable would have varied with the date of payment as follows:—

Paid in	Profits Tax Payable
1946 or earlier	Nil
1947	1,500
1948	4,500
1949 January to September	9,000
1949 October to December	11,000
1950	17,000
1951	28,500

Where an old capital profit is suddenly distributed in this way while at the same time substantial revenue profits remain undistributed and thus gain relief, the law reasonably assumes that the label placed on the distribution has little meaning, and that the distribution should be deemed to come out of revenue profits and not from capital profits. Even in such a case, however, there are strong equitable grounds for contending that the distribution is made rateably out of the revenue profits that have been retained since 1946. If this were conceded, the additional profits tax payable would in the example given, amount to £25,902 and not to £28,500, which is the liability when the distribution is deemed to have been made out of the latest profits. It ill befits the Revenue authorities, in view of their attitude to stock-valuation, to insist on "last in first out" when, as here, it suits them to do so.

But if, subject to this reservation, some case can be made out for the existing treatment of the distribution of old capital profits, there can be no justification for treat-

ing the distribution of a post-1946 capital profit in the same way. If the company has paid normal dividends out of its revenue profits, it is not unreasonable that directors should wish, for normal business reasons quite unconnected with the saving of tax, to pass on to shareholders any capital surpluses resulting from sales or nationalisation of assets. But if the surplus of £60,000 received in 1951 had been distributed in that year, there would have been a liability for profits tax of £20,000—the 1951 non-distribution relief on £40,000 at 40 per cent (£16,000) together with the relief in 1950 to the extent of £20,000 at 20 per cent (£4,000). If the compensation had been received and distributed in 1948 the additional liability would have been only £4,500. That this point can be extremely important is shown by the experience of Guest, Keen & Nettlefolds Limited, which apparently had to find some £600,000 of additional Profits Tax in order to make a capital distribution of about £2,800,000 out of the compensation that the company received on the forced realisation of investments.

The treatment of capital distributions is particularly onerous where the object of the distribution is to provide funds for the payment of Estate Duty. A typical case would be a company that was worth £100,000 before the war and was wholly owned by an individual who had few other assets. In 1939, the death of that individual would have involved a liability for Estate Duty in the neighbourhood of £20,000, which might have been met without extreme difficulty by his executors and beneficiaries. But suppose that one of the assets of the business is a property worth £50,000 before the war but now worth £150,000; the assets of the company would thus total £200,000 and Estate Duty would now absorb £110,000. To meet this liability, the company might sell the freehold property and take a lease of it with the result that the rent payable would substantially reduce future profits. The capital profit of £100,000 would then be distributed and the executors would be placed in possession of funds with which to meet Estate Duty.

The "clawing back" of non-distribution relief previously given has radically altered this situation; it imposes what can only be described as a heavy fine on capital distributions. The amount of the penalty will depend upon the fund of non-distribution relief previously granted. In the earlier stages of the Profits Tax, when non-distribution relief was only at 15 per cent or 20 per cent and no substantial fund of relief had been built up, it was not necessarily onerous. As the years pass and more and more non-distribution relief is obtained at 40 per cent by the normal ploughing back of revenue profits, the additional Profits Tax payable in respect of a capital distribution will grow so that on a capital distribution of the £100,000 needed to pay the Estate Duty in the case instanced a total of £40,000 might be required to satisfy the distribution charge. Admittedly, Profits Tax is deducted in arriving at profits for Income Tax purposes so that the real burden of the Profits Tax liability is usually little more than one-half of its nominal amount. Even so, the payment of a net amount of £21,000 as a result of a capital distribution of £100,000 must seem heavy, especially to the executors who are making the distribution for the mere purpose of paying the proceeds over to the Estate Duty Office. And in extreme cases, the Profits Tax liability may exceed the total of the assessable profits for income tax so that full relief cannot be obtained.

There is another matter connected with non-distribution relief that is entirely inequitable. If the whole of the profits earned since January 1, 1947 had been distributed, it would seem reasonable to assume that no non-distribution relief would arise and hence, if any additional distribution was made out of profits earned before 1947, no additional Profits Tax would be payable. This is not the case. The profits of any period are divisible into three parts: one part goes to pay the Profits Tax, one goes in income tax and the third is available for the payment of a net dividend. If the largest possible dividend is paid, its net cost, together with Income Tax added back, will fall short of the total profits by the amount of the Profits Tax, and this difference will attract non-distribution relief. In consequence, if any profits of an earlier period are distributed there will be a distribution charge.

Once again, technical jargon fails to explain the working of the tax and resort must be had to an illustration. Suppose that a company has a balance of £40,000 on its profit and loss account from the undivided profits of 1936. From 1937 to 1950 no profits are made but in 1951 there is a profit, subject to tax, of £100,000 and the directors decide to pay the largest possible dividend out of the year's profits. By using algebra, they will find that the £100,000 will go as follows:—

	£	£
Profits tax:—		
£100,000 at 50 per cent ...	50,000	
Less Non-distribution relief:—		
£100,000 – £64,285		
£35,715 at 40 per cent ..	14,285	
		35,715
Income tax on £100,000:—		
£35,715 at 9s. 6d.	30,535	
Net dividend	33,750	
		64,285
		£100,000

Having dealt with the profits in this way, the directors may well assume that, on any logical basis, they have finished with Profits Tax. In the following year they earn no profits but decide to distribute the balance of £40,000 outstanding from 1936 as a tax-free dividend. By a queer whim of the taxing statutes, the payment is deemed to be a gross dividend of £76,180 from which tax at 9s. 6d. in the £ has been notionally deducted leaving £40,000 net; originally, in 1936, the profits would have been £53,330 less tax at 5s. (£13,330). They will then find that before they pay a dividend they must provide for a Profits Tax distribution charge of £14,285, this being the non-distribution relief in respect of 1951; the largest net dividend they can pay, ignoring certain Income Tax complications, will be £25,715 (equivalent to £48,981 gross) which is all that will remain of the £40,000. It can never have been the intention of the legislature to impose a charge of this description.

Although the fact still comes as a shock to countless business men when they are confronted with it, the fund of non-distribution relief is of great practical importance. It is liable to be clawed back when dividends are paid out of past profits, when capital profits are distributed, on liquidation, or in certain cases where capital created out of bonus issues is redeemed. It is often most material whether a distribution is made on the last day of one financial year, or on the first day of the next, when the fund would have been further increased by the whole of the non-distribution relief of that year. Unfortunately, general accountancy practice has not yet deemed it necessary to indicate on the balance sheet, by note or otherwise, the additional liability for Profits Tax that would arise if distributions were made from reserves. Revenue reserves are by definition available for distribution and it is wrong to expect shareholders (and indeed directors) to appreciate without specific indication in the accounts that any attempt to distribute the reserves would lead to substantial Profits Tax liabilities for which no provision has been made. Accountants would normally have regard to the quantum of non-distribution relief in assessing the value of shares in a company on behalf of a purchaser, and it is understood that the Estate Duty Office is prepared to allow a concessional deduction—in contrast with the ruling that future Income Tax is a contingent liability that cannot be taken into account. To be really "true and fair" the balance sheet should indicate how much non-distribution relief has been received.

Next week's article will deal with one or two further notable anomalies, will discuss the incidence of Profits Tax, and will then consider the broad problem of the future of the tax.

Nuclear Power

(By a Correspondent)

THE spate of public discussion about the possibilities of economic nuclear power shows no sign of diminishing—despite the fact, to which Sir John Cockcroft recently drew attention, that little factual material has been released upon which scientists outside the Atomic Energy Projects can base any real assessment. Even the more responsible comments seem at variance. Sir Claude Gibb for example, told the British Association Meeting in August that nuclear power at a fairly economic cost "is not far off." A month before, the 1950-51 report of the Advisory Council on Scientific Policy had seemed slightly less enthusiastic:

> The Committee's view is that there is a reasonable prospect that atomic power can be developed on a large scale and that the cost would not ultimately differ widely from that of power derived from coal. The Committee point out, however, that a number of technical problems still remain to be solved. . . . What appears to be clear on present knowledge is that the capital cost of an early type of atomic power station would be substantially greater than that of a coal station, but that its fuel costs might well be less. After full discussion of the problem, we conclude that the development of atomic power stations to the stage when they can contribute substantially to the power resources of the country is likely to take a generation at least.

The implication is clear: nuclear power is possible, but its development towards an economic basis remains a problem.

This view is strengthened by recent statements from the United States Atomic Energy Commission that orders have been placed for a nuclear-powered submarine for delivery in late 1953 and that development of a nuclear-powered military aeroplane is proceeding. The commission has stated elsewhere that the aircraft development may require a decade. In such military applications economic considerations are a secondary factor only. In this country, studies are proceeding on "power pile" designs, and the results of this work, together with estimates of cost of the programme, will be presented to the Government at an early date.

*

Many writers have suggested, and Sir John Cockcroft confirmed this year, that two main lines of approach to the technical problem of economic nuclear power are being pursued. The first concerns a pile that uses natural uranium as fuel. Natural uranium is composed of a mixture of two varieties of the metal that have almost identical physical and chemical properties, except that one, uranium 235, is a nuclear fuel and readily undergoes fission; whilst the other variety, uranium 238, is not a nuclear fuel itself but is transformed in a pile into a second nuclear fuel known as plutonium. In a natural uranium pile the uranium 235 fuel is destroyed progressively as the pile is operated, but since plutonium is formed this automatically delays the time when the pile ceases to operate from lack of fuel. It has never been stated just how long this process can proceed, but it is believed that with an optimum design of the pile the nuclear reaction ceases after most of the uranium 235 and about one per cent of the uranium 238 has been used up.

Recently, as reported in *The Economist* of September 1st, Mr Charles Thomas, of Monsanto Chemicals in the United States, proposed that his company should be allowed to build plutonium-producing piles in which the heat energy could be extracted at a useful temperature. By selling plutonium to the United States Atomic Energy Commission and using the electric power the company hopes to compete commercially with existing AEC plutonium installations. The commission has signed agreements for studies by four groups of firms, of which Monsanto Chemicals and its associate, the Union Electric

Company, form one group. The studies are expected to last twelve months and to deal with the engineering and economic aspects of such dual-purpose piles as Mr Thomas described and to " recommend industry's role in designing, building, and operating such piles." The companies are to bear all costs except those incurred by the AEC in acting as consultants. If the plutonium is not extracted from the fuel rods in a natural uranium pile, or ceases to have a high value, there is no clear indication that the nuclear power so obtained is likely to be sufficiently cheap to warrant its immediate large-scale development, at least in the United States: however, Sir John Cockcroft indicated last year that the possibility is sufficiently attractive for research and development to proceed very actively.

The atomic piles referred to so far employ a " moderating " material to decelerate the flow of neutrons formed in the fission of the nuclear fuels, so that the neutrons are moving slowly when they cause further nuclear fissions. If a considerable amount of plutonium is mixed with natural uranium to form a new type of fuel element, the nuclear reaction can proceed without slowing down the neutrons, and a very compact system results. The second line of development of nuclear power concerns such reactors. By careful design it is believed that as much or even more plutonium may be formed than is used up ; if this is so, all the uranium 238 in natural uranium can ultimately be burnt after conversion to plutonium, instead of only about one per cent in the natural uranium piles. Such systems have been referred to rather loosely as " breeder piles." The AEC has announced that an experimental breeder system is nearly complete at its Idaho test site, and there is little doubt that Britain will undertake similar developments. It is also possible that a " breeder " system might be built using thorium and a nuclear fuel produced from it in a pile and known as uranium 233. It is unlikely, however, that much is yet known about this system either here or in the United States ; its development will almost certainly follow upon the plutonium-uranium system.

Technological problems of nuclear power piles have been referred to, in general terms, in various expert statements, but it is not to be expected that any detailed statements will be made just yet about their solution. It is clear, however, that in seeking fuel elements and coolants that have suitable nuclear properties and will stand up to the intense radiations in a pile, the metallurgists and engineers have turned to metals such as beryllium and zirconium, which have had only a limited use in the past, and to liquid metal coolants that have had no general use in past engineering practice. The AEC has made this very clear in its statements, which indicate that a period of development of pile materials is in progress, as a result of which many new pile designs may become possible. The problems of chemical treatment of fuel elements and the safe disposal of radioactive wastes are also matters requiring much attention, but authoritative sources seem reasonably hopeful on both accounts. For breeder pile programmes inexpensive waste treatment processes become of great economic importance.

*

Numerous estimates have been published about the cost of nuclear power. No very reliable data exist, even within the informed circle—as is shown by the fact that even the AEC is only now inviting estimates that will necessitate twelve months' study by four groups of companies. But certain rough comparisons may be drawn from the energy content of various fuels and crude estimates of pile cost and lifetime. The capital cost of a new thermal power station is now about £50 a kilowatt installed. Comparable estimates for atomic power have ranged from £10 to £200: it now seems a reasonable long-term possibility that the substitution of an atomic pile for the coal-burning sections of such a plant would add perhaps £50 a kilowatt to its capital cost. An American press release in December, 1949, gave a price of $50 per lb for small quantities of metallic uranium. Assuming this price could be reduced on a larger scale, a rounded figure for the cost of processed uranium can be taken as £10 a lb, and if about one per cent of the energy in the natural uranium can be utilised, the cost of nuclear fuel in a natural uranium pile, for the same production of heat, might be about the same as that of coal (about three-tenths of a penny a unit in the British Electricity Authority's best stations). Suggestions that 100 per cent, or even 10 per cent, of the total energy could be utilised in a natural uranium pile do not seem well founded. Breeder piles use a concentrated fuel such as uranium 235, plutonium or uranium 233: estimates published in America in 1949 suggest that at present such materials might cost at least £20 million a ton, though advances in technology may reduce this considerably. Even at that figure, the nuclear fuel cost for a given output of energy would not be greater than that of a coal-fired station. It has often been stated that nuclear fuels are very cheap and that the main costs of nuclear power would arise from capital charges. In the case of natural uranium piles, this is by no means certain ; high-grade uranium ores are scarce and the cost of extracting the element from low-grade ores might prove expensive. Since it appears that breeder systems, for the same development of power, would require little more than a hundredth of the uranium ore needed in a natural uranium pile, this would argue strongly for the development of breeder piles ; as would the fact that it is only in such systems that thorium could be used. In such piles, the problem is to obtain a cheap processing cost for the nuclear fuel produced in the pile, in order to cover the cost of periodical removal of the radio-active fission products arising from the burning of the nuclear fuel.

A book on the subject published recently bore the somewhat ambitious title " Economic Aspects of Atomic Power."* As might have been expected, it contained little new information on atomic power ; such estimates as are given refer to very early US data. Much of the book is devoted to providing an assortment of data on the costs of industrial processes, their relation to power costs and the availability of power throughout the world. It is fairly obvious, for example, that the aluminium and graphite industries prosper in a locality possessing cheap hydro-electric power and that very cheap nuclear power, if attainable, might open up new localities for such industries. Since the authors of this book are well known, its lack of basic data raises a fundamental question: when can technological information on nuclear power be made generally available? Until it is available, only a selected few, inevitably isolated from general industrial activity, will be in a position to judge the possibilities.

With the passage of time, the " security " importance of information gradually diminishes—particularly when

'BARCLAY'S NEW CLERK, 1786'

After a watercolour now in the Institute of Bankers

History records that even in 1786 this " new clerk " appeared a little overdressed in his " embroidered waistcoat reaching nearly down to his knees." It is pleasant to be able to add, however, that he " remained in the house many years, and died at a very advanced age, much respected by his employers."

Much has changed since 1786, but it is still the aim of our staff to provide the same high standard of personal service which the old private bankers offered in the days of " Barclay's New Clerk."

BARCLAYS BANK LIMITED

CANADA

3rd greatest trading nation

Many British firms are already sharing in Canada's rapidly developing economy. For the fullest information concerning trading conditions, marketing opportunities, import-export regulations, etc., you are cordially invited to consult Canada's oldest Bank.

BANK OF MONTREAL

AUSTRALIA AND NEW ZEALAND BANK LIMITED

In which are merged The Bank of Australasia Limited and The Union Bank of Australia Limited

The new Bank formed by the merger of The Bank of Australasia Limited and The Union Bank of Australia Limited, is known as Australia and New Zealand Bank Limited. The following points indicate some of the improved banking facilities and services which will result from the merger.

RESOURCES · With a Capital of £Eng.17,000,000 and the combined assets of the merging banks amounting to £A.400,000,000, Australia and New Zealand Bank Limited will have powerful resources for the use of its customers.

LOCAL KNOWLEDGE · The knowledge and experience of local conditions in Australia and New Zealand, acquired by the merging banks in over a hundred years of banking, will be at the service of the customers of Australia and New Zealand Bank Limited.

BRANCHES AND AGENCIES With the combined Branches and Agencies of the merging banks numbering nearly 600 in Australia and over 150 in New Zealand and Fiji, as well as an international network of Agents and Correspondents, Australia and New Zealand Bank Limited will provide its customers with comprehensive and competitive banking facilities.

the same information may be made more widely available in America. Once the nuclear fuels become generally available and the main directions of the use of nuclear power become clear, the subsequent development of nuclear power will become mainly a matter of the allocation of resources and the devotion of time to a solution of the detailed technical problems. These may be solved rather better in some particular laboratory or firm than another one, but some solution is likely to be found within a reasonable time wherever the work is done. At this point, the question of industrial security will tend to replace military security, and the latter will no longer be a controlling factor in the release of the basic information. It will then be possible to publish all that is required to make conventional economic assessments of nuclear power; this may perhaps happen within a decade. What can be done now?

In the United States many large firms have been intimately associated with the atomic energy production and research facilities. Industry there possesses enough informed staff already, so that independent though secret assessments can be made and projects devised by industry for the development of nuclear power. This country after the war had little experience of production of nuclear fuels and there were no such facilities for it as were available in the United States; it is only recently, following the establishment of production facilities for nuclear fuels, that work on the power pile programme has been able to start. Industry has not taken such an active part in this country as in America, and there is only a very small body of informed opinion outside government circles. This has been largely due to the overloading of industry with export and rearmament work, so that no one firm feels able to make the effort required. For this reason it has been suggested that a separate corporation deriving its staff from industrial and government establishments might be formed in this country to help in nuclear power development. If, as this proposal assumes, many high-grade key staff might be borrowed for a limited period, it would then be possible to use their specialised knowledge in a way that is quite common in the United States. This is of even greater importance to Britain, since the key men are comparatively so scarce and thinly spread. Some such liaison between the government establishments and general industry seems imperative.

It is not easy to sum up a situation in which many of the facts are so elusive. For the layman there are two simple facts on which to fasten. The first is that nuclear power can be used now for the raising of steam at useful temperatures and pressures and, for example, for the generation of electricity. The second is that its development is therefore a matter of technical advance to reduce costs to a point where it can compete with other forms of energy. The argument that Britain is short of coal and therefore urgently requires another immediate source of energy is somewhat specious. If we have a great economic demand for more power, more coal will be dug, if the price is sufficiently high (there is plenty underground). In this case the ordinary household or industry will economise in its use. It may well be, however, that nuclear power will form a way of providing the heat for generating steam and electricity that would be more pleasant for the workman than the digging of coal; on these grounds, and within reason, immediate development might be held to be justified upon "social" grounds. On the other hand, it seems essential, bearing in mind the expanding requirements for energy, that some alternative source should eventually be found in the world. Those countries that have no indigenous fuel sources are in a difficult position in these days, and nuclear power may seem a possible early solution to them. However, only a highly industrialised nation is in a position to undertake the long and complex process of nuclear power development: it is for this reason if for no other that the United States and United Kingdom have a responsibility to proceed actively on the work. In the United Kingdom, the present indications are that much of the preparatory work has been satisfactorily accomplished, and that the stage has been reached for more active participation in design studies by private industry or the British Electricity Authority.

Business Notes

Markets Slide after Tory Victory

The City's response to the election results has defied all the forecasts—all, that is to say, except those of a select band of the shrewdest observers. Though the new Government had still to show its hand, the dismissal of the Labour Government signified of itself an end to nationalisation, to the project for statutory dividend limitation, and to spiteful drives against capital—three policies among many that have fallen with crushing severity upon the investing community. Yet every day since the results of the poll were known, Throgmorton Street has grown gloomier and gloomier, and prices have tumbled in almost every section of the markets. That staid barometer, the ordinary share index of the *Financial Times*, has fallen during the week from 138.3 on election day to 132.2; it is now (Thursday) actually below the level ruling just before Mr Gaitskell's notorious speech of end-July, and is fully eight points below the peak of mid-June. (Opposition papers, please copy.) This behaviour gives a telling retort to those ex-Ministers who five weeks ago were trying to make party capital out of the brief boomlet that greeted the announcement that Labour would go to the country; these spokesmen had rashly launched their gibes before that five-point rise was converted into a net gain of a mere 0.8—with the index back to 134.4 by October 2nd.

The reaction on that occasion was in fact a much more rational movement than the short-lived buoyancy; and the same is true of the speedy post-election loss of last month's gains. It might be said that both down-swings signify that investors are showing a more than customary realism—a recognition that the Tory policy for the economic crisis needs to be one of sweat and tears, and a hopeful forecast that a firm disinflation is in prospect. But in fact there is no such simple explanation. So far as can be discerned from a jumble of many conflicting views—in which opinions of what should be done are particularly entangled with those about what will be done—the City is fairly evenly divided between people who are gloomy because they fear that the government will not be tough enough and those whose gloom springs from apprehended toughness. It is only on the question of monetary policy that the sponsors of these two quite opposite diagnoses have tended to come together: expectations of an early move to raise interest rates have grown steadily stronger throughout the week, and have left a heavy mark on gilt-edged, shorts and longs alike.

"Technical" Shake-out

Investment behaviour founded on these quite general but conflicting views is far from being, however, the whole explanation of this week's experience in the markets. A major influence, which mainly accounts for the size of the movements, was the technical state of the market itself. In the later stages of the election campaign a considerable speculative position had been built up on the assumption of a Tory victory—by short-term buyers, strong and weak, professional and amateur alike. Many of these would have been sellers in any case before the Stock Exchange account ended on Tuesday; and, had their hopes been realised, their stock would have been readily taken up by a wave of post-election buying from the general public. But, for the more general reasons just noted, the wave of buying never came. Jobbers needed no gift of insight to detect the selling orders that were approaching and, in self-protection, they marked prices down.

Then, almost inevitably, the mood of nervousness took charge, and the pressure actually intensified after the opening of the new account. All the favourable market factors were seemingly quite forgotten—the relief at the demise of legal

control of dividends, the hopes of more rational depreciation allowances, and the pervading reassurance given by the advent of a government to which investors might look as, if not their natural friends, then at least not as their mortal enemies. Instead, all attention was suddenly concentrated upon the consequences of disinflation, upon the unknown terrors of the promised "form of excess profits tax"—and even upon the theory that the simultaneous weakness on Wall Street heralded the end of inflation and of easy (paper) profits. And over such reflections there brooded the uneasy feeling that, in view of the narrowness of the government's majority, the respite from drives against the investor might, after all, be shortlived.

* * *

Back to Bank Rate?

When the market is swayed by arguments so confused and contradictory as those of the past week, its behaviour obviously affords no useful guide to the future trend. The decisive consideration in the next few weeks and months will be the degree of toughness in the government's economic and financial policies—and the extent to which, if toughness is forthcoming, the investing community understands its implications. The City, at least, is becoming aware that a firm disinflation would mean that paper profits would be harder to win, but it has not yet appraised the vital consideration that, if the policy succeeded, the paper would be worth its face value—and the further prospect that, if the depreciation allowances are adequately amended, paper profits will become real profits.

These, however, are longer-term possibilities. In the immediate future the focus of attention is bound to be the government's attitude towards monetary policy, which has already come to be widely regarded as the testing-point for its intentions in economic policy as a whole. Although City opinion is still sharply divided on the question of the merits of a tighter money policy (and is even more confused in its guess-work about what the effects might be in detail), there is now a general expectation that some definite step will be taken—probably by Bank rate action next Thursday. Even the opponents of dearer money recognise that a move in this direction is almost the only measure of general disinflation that could be imposed forthwith. They recognise, too, that an increase in Bank rate, though far from being the only way of initiating a tighter money policy, would be a gesture that could impress opinion overseas. Reasoning on these lines has generated a pervasive rumour that the rate will be raised next Thursday to 4 per cent because a rise to merely 3 per cent would, it is argued, be insufficiently conclusive.

Somewhat curiously, this expectation was shared even by many of those who hold that the smallness of the government's majority will compel caution in economic policy, and especially in its approach to the problem of retrenchment. Yet a strong monetary policy would make little sense—and might, indeed, prove in practice to be untenable—unless it were flanked, as soon as possible, by equal strength in budgetary policy. The right way to get the surest results from quick monetary action would be to make it plain that parallel measures would follow as soon as they could be formulated. If this were done, then conceivably a lower rate than 4 per cent might suffice, at least for the time being, to impose a valuable restraint. On the other hand, unless there were a general conviction that economic policy as a whole would be strong, then even an increase in Bank rate to 4 per cent might quickly prove to have been only a hollow gesture—even if there were determination to make such a rate effective in the technical sense.

* * *

Forward Sterling Improves

The many free exchange rates that reflect world opinion about sterling have so far shown very little reaction to the result of the election. Transferable sterling, which was quoted in New York at $2.40-$2.41 on polling day, thereafter hardened to $2.40½-$2.42. Security sterling has made a slightly more impressive response, moving up from $2.23-$2.25 to $2.25-$2.28. The rate for Bank of England notes in Zurich (the best organised of the foreign markets for sterling notes) has improved from Frs. 10.00-10.15 a week ago to Frs. 10.22½-10.35, having in meanwhile touched Frs. 10.35-10.50. The three months forward rate for sterling in New York, which just before the election had dipped to $2.71, has since recovered to $2.76½. There has been a considerable volume of business in forward sterling in the New York market. The bulk of that business has been of a speculative character and has been transacted on Continental account. Any forward business for which genuine commercial justification can be proved is eligible for the official facilities provided by the Bank of England, which buys and sells forward dollars on the basis of a spread of ¼ cent per month over or below the official spot rates of $2.79⅞-$2.80⅛. The speculative character of much of the sterling business in New York is reflected in the fact that the spot rate has been consistently bid at $2.80⅛ this week, indicating a one-way market dominated by the covering of oversold positions.

Production — and the Forecast

Industrial output in Britain, as measured by the Central Statistical Office's index, stood at 127 (1946 = 100) in August this year, and seems likely to have reached 146-47 in September, compared with 123 in August and 143 in September last year. Since July, therefore, output has been falling—by a very slight margin—to fulfil the forecast in the 1951 Economic Survey that it would be 4 per cent higher this year than last.

The seasonal increase in production that normally reaches a peak in November could ordinarily be counted upon to redress the balance and achieve the forecast increase for the year as a whole: but that increase may itself be lessened this year by material shortages. These are already affecting many industries. In the holiday month of August the component index for manufacturing industries reached only 132, compared with 147 in July and 128 in August, 1950, while the level of building and contracting was lower than a year before, as it has been consistently since the beginning of the year. From recent comments by engineering companies, for example, it appears that the full effects of the shortages of non-ferrous metals and of steel have been felt really sharply only in the last two months: these effects have yet to appear in the index.

* * *

Rationing for Steel

One of the first industrial questions that the new economic ministers may be called upon to consider is the allocation of steel. This is due to come into force on December 3rd, and the fairly elaborate system chosen is presumably far advanced in preparation: but within the steel industry doubts are once again being expressed whether this system is the right one. After consultation with the industry, the last Government again chose the "M-form" system, under which steel supplies are allotted in the first instance to Government departments, responsible either for defence production or for civil industries. These departments then issue to steel consumers authorisations to buy steel for specified purposes or to permit their sub-contractors to buy steel (by quoting the symbol and number of the original "M-form"). Formerly, the only exceptions to this control of steel by "end-uses" were certain common-service products such as ball bearings, bolts and nuts, and electrodes; steel for these purposes was allotted in bulk to their producers.

When the necessity for re-imposition of steel allocation was accepted by the industry and the Government this year, the "M-form" scheme appears to have been decided upon because the industry and steel consumers were familiar with it, rather than because of any belief in its intrinsic efficiency. All parties remember its loopholes and the abuses to which it became subject, particularly between the end of the war and the abandonment of the system in April, 1950. There is some feeling within the industry that this cumbersome "end-use" allocation system, with its inevitable though limited "policing," is unnecessary this time, since the demands of rearmament cannot compare in size with those of defence production in wartime: and that some system of bulk allocation to industries, which could then share out the steel between individual consumers, would serve the purpose.

It is only with the close estimates of steel supplies and of defence demands possessed by the Government and certain representatives of the industry that an informed choice can be made between these two systems. If rearmament radically alters the pattern of demand, then control by end-use may be unavoidable. There is also the question whether all industries are sufficiently strongly organised at the centre to carry out such allocation effectively. The larger industries consuming steel might perhaps be served fairly effectively by either system: their supplies, in any case, are backed by close contact with suppliers. But whether steel could be equitably shared out among the many small engineering firms, for example, by some committee drawn from among them may be rather more doubtful. The final choice can be judged only when the margin by which supplies will generally have to be reduced is known. Here the total amount of steel available for 1952 will be crucial: a current "leak" in Washington suggests that a large proportion of the 800,000 tons of steel Mr Gaitskell asked for (partly in its ore and scrap equivalents) may be forthcoming next year to supplement the output of the British steel industry.

* * *

The Trend of Credit Creation

The banking figures for October tell with added emphasis the same story as that presented by the returns for some months past. Credit creation is continuing, but it is running at a very much slower rate than that of last year. In the four weeks to mid-October, net bank deposits rose by £46 million, whereas in the similar period of 1950 they rose by the near-record amount of £150 million. The margin between the two movements is thus more than twice what it was in the previous month, for the September make-up disclosed an increase of £28 million this year compared with £78 million last year. Over the past three months the net rise in deposits has been only £15 million, whereas last year it was no less than £222 million; in consequence, the two curves have now intersected, and aggregate net deposits, at £5,981 million, now actually stand £25 million below last year's figure. This contrast looks even more striking when it is observed that in this period net demands on the banks for advances have been much larger than in 1950. Last month advances rose by £20 million (to the new peak of £1,897 million), whereas in October, 1950, they dropped by £4,000,000.

These figures show that the dominant influence upon the credit trend is that the Government is borrowing much less from the banking system than it expected to have to do when the budgetary plans were framed, and very much less than it was borrowing in the similar period of 1950. This is not the favourable sign that it might appear to be at first glance. It is simply the monetary counterpart of the crisis on the balance of payments. The Government's ability to avoid heavy borrowing from the domestic banking system is explained by the fact that it is getting large sums from the sale of gold, from swinging from credit to debit at EPU, and from borrowing the fast-rising sterling balances of overseas monetary authorities. Last year precisely opposite influences were at work: the Government was then borrowing sterling from the banks in order to buy gold and lend to EPU. It is worth noting that the superficially favourable appearance of this year's credit trend makes an ominous parallel with 1947; then, too, the external crisis produced a marked deceleration in the rate of credit expansion.

* * *

Belgian Exchange Muddle

The confusion created by Belgium's precipitate action in reintroducing export licensing and refusing all sales of Belgian francs by the National Bank except against duly authorised export licences is gradually clearing. An average delay of about ten days appears to be normal in authorising a transfer from a non-resident or "B" Belgian franc account to the account of a resident in respect of a current transaction. There has, however, been very little resort to the tolerated free market in EPU currencies. Most Belgian traders to whom payments are due from other EPU countries have been prepared to wait until all formalities of export licensing and exchange control authorisation have been completed. It can be claimed for the new regulations, however, that for the time being they have effectively stopped the inflow into Belgium of speculative money through veiled commercial transactions.

One of the steps taken by the Belgian authorities was to subject the accounts of foreign banks in Belgium to a ceiling, the figure in each case being fixed somewhat arbitrarily and by reference to average balances maintained over a previous period. In many cases this ceiling has been found wholly inadequate for the normal working needs of the banks concerned. The Belgian authorities have laid it down that if the balance in any such account exceeds the ceiling the excess will be transferred automatically to the account of the Central Bank of the country in question. If, for example, a British commercial bank's account in Belgium exceeded the ceiling, the Belgian authorities are liable to transfer the excess to the account of the Bank of England with the National Bank of Belgium. There has in fact been a tendency to exceed the ceilings because of the delay in making payments from these accounts to resident accounts. In most cases, however, the Belgian authorities appear to have shown considerable elasticity in dealing with the situation and have allowed the ceilings to be exceeded without taking the threatened penal action. The Bank of England is again selling Belgian francs for immediate delivery, but all such sales are subject to the condition that the operations come within the ceiling of the buying bank ; they are also subject to any delay in delivery due to the control exercised in Belgium.

* * *

Allocation of Tungsten and Molybdenum

The tungsten and molybdenum committee of the International Materials Conference in Washington has had a rough passage ; after many weeks of difficult negotiations, it has at last announced the allocations of these two metals for the fourth quarter of this year. The fact that there are only two months of the quarter left is an indication of the number of hurdles that had to be negotiated. A provisional scheme was introduced for the third quarter ; it fixed a range of prices for tungsten and limited the purchases of importing countries, but it covered only ores and concentrates. The new scheme goes further ; it includes primary products and lays down specific quantities that producing countries must export.

Tungsten production is increasing ; supplies available to the free world in the last three months of this year are estimated at 3,245 metric tons, compared with 2,800 tons for the third quarter. Estimated requirements for the period, excluding stockpile purchases were, however, some 80 per cent larger than available supplies. As usual, defence needs have been met in full, and the remaining supply (to cover civilian and indirect defence needs) has been distributed proportionately to countries' requirements. The production of molybdenum in the fourth quarter is estimated at 4,720 tons, compared with 4,400 tons in the third quarter, total requirements were 70 per cent larger. The same procedure adopted for tungsten is used for molybdenum, and the allocations of the two metals are shown in the accompanying table. The United States, for example, will be allowed to use 1,550 tons of tungsten ores (900 tons will be imported and the remainder obtained from domestic production and stocks), but it will have to export 45 tons of primary products. Britain's allocation is 690 tons of tungsten ores (of which 680 tons are imported), with an export commitment of 35 tons of primary products. The main sources of supply of tungsten are Bolivia, Portugal, Spain, Australia, Brazil and South Korea, while the United States, Chile and Norway are supplying between them all the exports of molybdenum ores and concentrates.

Price has been a particularly difficult problem—at least for tungsten. In the third quarter exporters agreed to charge not more than $65 a short ton and importers agreed to pay not less than $55 a ton. This arrangement was a temporary one, but the committee recommended by a majority vote that it should be continued in the fourth quarter, and member countries are accepting that decision. A new method, however, will have to be devised for next year. The official American export price has been accepted for molybdenum, since the United States is providing nearly two-thirds of the total exports of this metal.

* * *

Prices Since the Election

The result of the election has had no discernible effect on the commodity markets, a fact that demonstrates once again that Britain is no longer the country that calls the tune

Commercial Bank of Australia
LIMITED
ESTABLISHED 1866
Assets Exceed Aust. £190,000,000

EVERY DESCRIPTION OF BANKING BUSINESS TRANSACTED
Trusteeships and Executorships Accepted

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are.

Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to The Chartered Bank of India, Australia and China which maintains an extensive system of branches, under British management directed from London, throughout Southern and South-Eastern Asia and the Far East.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA
(Incorporated by Royal Charter, 1853)
Head Office : 38 Bishopsgate, London, E.C.2
West End (London) Branch : 28 Charles II Street, London, S.W.1
Manchester Branch : 52 Mosley Street, Manchester, 2
Liverpool Branch : 27 Derby House, Liverpool, 2
New York Agency : 65 Broadway, New York, 6
Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

CLIVEDEN
(Property of the National Trust)

THIS famous Buckinghamshire home was built for the Duke of Buckingham, that brilliant dilettante, soldier, intriguer, duellist and diplomat who astounded and shocked not only the English Court bu the European Courts of the time of Charles I.

House and gardens are in keeping with the man for whom they were created, brilliant and exotic, with a mosaic chapel, a fountain in Sienna marble, statuary groups and a balustrade 140 feet long transported from the Borghese Palace in Italy.

Martins Bank has associations going back even farther, to Elizabethan times, and the principal London office of the Bank carries on a banking tradition under Sir Thomas Gresham's "Sign of the Grasshopper" which dates back to 1563.

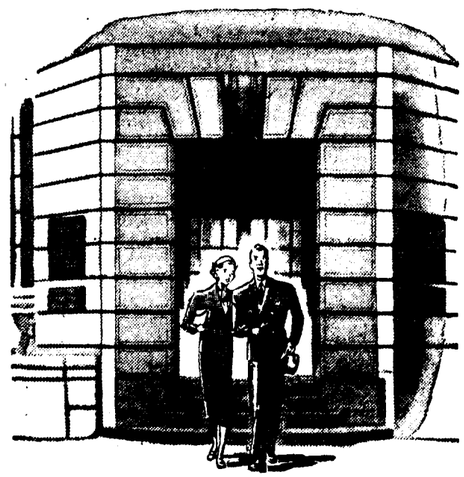
Capital Security

THE Church of England Building Society now invites investments up to the maximum holding of £5,000. The Society's fully-paid Shares, issued at £25 each, are not subject to Stock Market fluctuations; they are withdrawable on agreed notice being given.

Share interest at the rate of 2½% per annum is received by the investor half-yearly on 31st May and 30th November; the Income Tax on the interest is paid by the Society. Interest is calculated from the date of the investment up to the date of withdrawal.

The Society's substantial assets consist of First Mortgages secured upon carefully valued properties situated in selected districts in many parts of the country. This "spread-over" of mortgages enhances the already solid security enjoyed by our Investing Members.



Since its incorporation in 1882 this old-established Society has never failed to pay the agreed rates of interest at the agreed times, and in spite of wars and crises its stability has remained unshaken. As a medium for the non-speculative investor, who seeks, above all, security of capital, yet desires a reasonable, steady return, it is today an excellent proposition.

ASSETS EXCEED £6,500,000 • RESERVES £350,000
OPEN ACCOUNTS 18,000
A copy of the latest balance sheet, together with an explanatory booklet, may be obtained from the Secretary.

in commodities. In recent weeks prices have conformed to a fairly set pattern. The general decline that started last February has virtually petered out and prices have lately been reasonably stable. The day-to-day fluctuations in particular markets have been explicable by seasonal influences or by events peculiar to those commodities. And during the past ten days nothing has happened to disturb that pattern. Even wool prices, which oscillated sharply after the beginning of October, have become much more subdued and are now

Shellac (£ per ton)	237½	365½	356	362½	372½	372½	373½	362½
Tallow (cents per lb.)	4½	14½	11⅛	9⅛	9⅛	9 1/16	9⅛	9⅛

almost steady, at around 142d. a lb. for merino 64's. Cotton, on the other hand, has continued to rise and, though the rise this week has been the sharpest of the month, it is by no means startling. Jute is steady while sisal has fallen. Prices of grains, cocoa and sugar have also weakened.

Tin and rubber have both fallen during the week—though rubber only slightly, and it still shows a net rise on the month. The main non-ferrous metals (copper, lead and zinc) have been unchanged this week, and in their "free market" quotations, too, there has been no significant movement. Among the minor commodities, shellac has fallen and tung oil and tallow have shown no change. But all three are cheaper than at the beginning of October. The prices of all the commodities listed in the accompanying table are still above their prewar Korean level with the single exception of cocoa. Most of them are well above that level; wool is only slightly above it. The comparison with June, 1951, however, is more varied. Wheat, maize, coffee, cotton, jute, rubber, tin and shellac are higher than they were then, while cocoa, sugar, wool, tung oil and tallow are down.

This apparent indifference of commodity markets to the political happenings in Britain is not surprising. In the first place, Britain is no longer the largest consumer of any of these primary products, and in most cases it is no longer the largest importer. That role is being assumed by the United States. Secondly, Britain is facing an economic crisis that will not be cured merely by a change of government but only by radical changes of policy—and the new government has still to show its hand. Thirdly, many of the commodities are still purchased by Britain on government account and although the change of government is raising hopes of a restoration of greater freedom in commodity trading, those hopes cannot at the moment be translated into speculative operations.

* * *

"Frustrated" Cars from Canada

Of the 4,000 unsold British cars that are being shipped back from Canada by the Austin and Nuffield organisations, at least half will be put on the home market under conditions that call for some comment. The state of the cars will not be known until they arrive at the docks, but some brought back under similar circumstances a year or two ago were certainly not in mint condition. Besides overhaul and reconditioning, the cars will need conversion from left- to right-hand drive before they can be sold in this country. The Nuffield Organisation, it appears, intends to add at least the greater part of these costs to the usual domestic selling price, plus the freight and insurance charges incurred in bringing the cars back from Canada. Most of these cars are Morris Minors that normally sell at £333. The home buyer will therefore be asked to pay as much as £200 above this list price—with purchase tax in proportion—for cars that might more properly have been expected to sell at a discount. Indeed, the element of depreciation has been tacitly recognised by the British Motor Traders' Association, which although subjecting these cars to a covenant that bans their immediate re-sale, has decided that the restricted period should be shorter than the two years imposed on new cars. The Austin Motor Company has announced that, if it sells any of the reconditioned cars at home, they will be offered at the normal list price.

Many members of the motor industry have privately expressed doubts about the wisdom of Nuffield's departure from this practice. The company will have no difficulty in finding buyers for the 2,000 or so cars at the higher price, but its tactics do appear to be an unreasonable exploitation of the oddities that arise in a sellers' market that is subjected to partial control. Anyone who has long had a new car on order and who is now offered an older car at a substantially higher price is entitled to feel aggrieved.

* * *

"Automatic" Rise in Petrol Prices

This week's rise in the price of petroleum products by a halfpenny a gallon reflects an increase in tanker freight rates according to a formula that has become almost automatic. Any control of the price of an international commodity must obviously take market influences into account, and in petroleum the transport element in the price varies according to an index maintained by a committee of London tank shipbrokers. This index is based upon two-year time charter rates for an average tanker travelling between the Netherlands West Indies and the United Kingdom; the brokers issue "awards" every six months, at the beginning of April and October, and the Ministry of Fuel and Power adjusts the petroleum price 28 days after notification of a change in the price awarded. The transport element in the price of petrol therefore varies in accordance with the rates obtained by independent tanker operators; of the 28 million tons of tanker tonnage afloat in the world today, some 13 million tons belong to owners with no direct interest in oil.

* * *

Delays in Port

Perhaps the greatest contributory factor to the continued high level of shipping freights is the unsatisfactory rate of "turn-round" in ports all over the world. This considerably reduces the carrying capacity of the existing merchant fleets of the world, and its effects are widespread. Labour troubles are often responsible, particularly in Australia and New Zealand. Similar difficulties are now being experienced in the Port of London where the lightermen are indulging in go-slow tactics. Here the result has been a general slackening of operations in the port.

But there are more fundamental reasons for the congestion in the world's ports. In London the volume of exports passing through the port has doubled since before the war, and the port facilities themselves were heavily damaged during the war. Repairs have been carried out, but the normal programme of expansion and improvement has fallen into arrear, hampered by the restrictions on capital

expenditure. London is a port in which much of the cargo handled is discharged overside into lighters, and there is a serious shortage of these, causing the discharge on to dock quays of timber that would ordinarily be taken to wharves elsewhere on the river for inland distribution. Congestion on the quays and in the warehouses means that many lighters are held idle until unloaded. This congestion tends to pile up along the line until, in fact, the ocean-going cargo ships find themselves acting as floating warehouses instead of ocean carriers. The clearance of warehouses and the delivery of export cargoes to ships are similarly impeded by delays in road and rail transport; liners that must adhere to fixed schedules are sometimes compelled to sail with holds partly empty.

* * *

Research into Cargo Handling

Similar difficulties are common to many ports, not only in this country, and it is doubtful whether they can be resolved piecemeal. An attempt to approach them on an international and technical basis has been made in the proposal to form an International Cargo Handling Co-ordination Committee. With this in view a meeting of experts and observers from many maritime countries took place in London on Tuesday, to discuss provisional articles of association. The proposal has much to commend it, since for the first time an attempt has been made to embrace all the diverse factors of trade and transport that may affect, or be affected by, poor turnround in ports. Matters of study are not intended to be confined to the practical details of port operation, but will extend to other items that can influence the loading and unloading of ships. The problem of feeding the ports by complementary transport systems must be the subject of investigation, as well as the design of ships themselves and of cargo-handling equipment on ship and shore. Methods of handling materials and packing goods in factories ashore require study, so that the cargo may flow from origin to consumer without delay through some difficulty of handling unknown to the individual links in the chain.

At the preliminary meeting, delegates and observers, ranging from shipbuilders, packers and manufacturers to officials responsible for strategic planning, stressed the difficulties they had experienced in the past of obtaining suitable information when dealing with new problems. The first task of the committee, provided it receives adequate financial support, will therefore be to collate technical information in every branch for dissemination. Eventually it may be able to analyse the problems of particular ports and make recommendations for their solutions. It is also hoped to set up a research station in which model tests can be carried out on ideas for improving equipment on ship or shore. Special studies will be made of handling cargoes in tropical and primitive harbours, and of war transportation problems. The committee deserves support by governmental and inter-governmental bodies, but its success will depend not only upon the practical contributions of technical experts, but upon whether it avoids being overloaded by administrative discussion.

* * *

Sufficient Aluminium

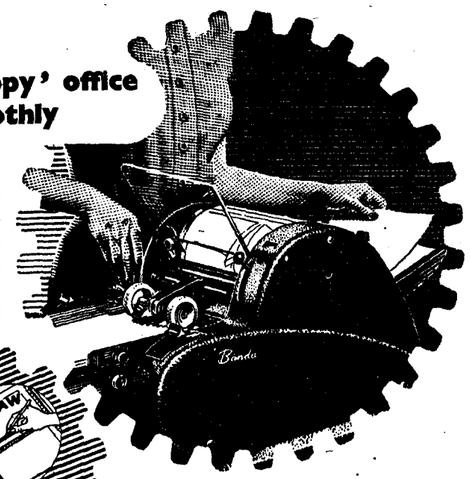
Because rainfall in north-eastern Quebec has been abnormally low for several months, Britain's total supplies of aluminium this year may be somewhat smaller than was expected. Upon that rainfall depends the output from the hydro-electric stations on the Saguenay river that supply power to the Aluminum Company of Canada's smelter at Arvida, which supplies almost all the aluminium that Britain imports. Arvida's current production is roughly 6,500 tons below its capacity of 37,500 tons a month, and may be further curtailed; the company expects operations to be affected for the remainder of this year and in the early part of 1952.

It had been hoped that Britain would be able to obtain 200,000 tons of aluminium from Canada during 1951, compared with its total imports of 141,240 tons last year. In the first nine months of 1951 some 131,000 tons have in fact been imported, 125,000 tons of it from Canada. But Alcan estimates that of a total output of 400,000 tons of aluminium for 1951 it will be able to export only some 182,000 tons to Britain. That might imply total imports into Britain of perhaps 190,000 tons this year, since imports from Norway and other countries were just under 6,000 tons in the first three-quarters of this year. Home production of virgin aluminium is still running at about 30,000 tons a year. Total supplies of the primary metal may, therefore, be roughly 220,000 tons this year. During the first half of this year the consumption of virgin aluminium, some 91,000 tons, was rather higher than supplies, necessitating the release of some 10,000 tons from Government stocks. But in the holiday months of July imports and home production totalled much more than consumption, though this grew; and over the year, despite the expansion of aircraft production, the Government will be able to build up its stocks beyond the 40,000 tons held in the last quarter of 1950. Consumption of secondary metal in the first half of this year was also augmented by releases from Government stocks; though scrap collections are no higher than last year, the total despatches of secondary metal, 65,920 tons, were not much lower than during the whole of 1950. Aluminium supplies as a whole, this year, should therefore meet the demands of rearmament and most civilian users, though the industry's fabricating capacity—some 320,000 to 330,000 tons—cannot be fully employed.

Imports, moreover, seem certain to increase in later years. The Ministry of Materials, while discussing with Alcan its present difficulties in delivering aluminium according to contract, seems confident of receiving 250,000 tons in 1952. Under contracts made this year the Government is to advance the Canadian company up to $120 million by the end of 1953, to assist expansion. In return it is to receive a million tons of aluminium during the four years from January 1, 1952, and to have a first call on 200,000 tons in each year until 1971; Alcan further guarantees to maintain a total smelting capacity of 400,000 tons a year, capable of being brought into production on nine months' notice. The company has also a number of small forward contracts with industrial customers in the United States. Its present expansion plans, which are to cost $300 million, call for a total smelting capacity of 545,000 tons by 1955, and it has entered into contracts with a corporation owned by the Norwegian Government for the smelting, in addition, of 7,500 tons a year until 1954 and 20,000 tons a year for the following 14 years.

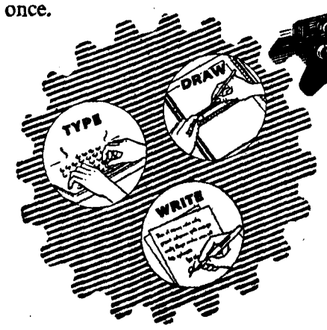
The Bank of Adelaide

invites all who have or would like to have relationships—business or personal—with Australia, to use its complete banking service throughout that country.



Head Office: Adelaide, South Australia.

LONDON OFFICE:



11, LEADENHALL STREET, E.C.3

(Incorporated in 1865 in South Australia with limited liability.)

A 'Banda-happy' office runs smoothly

it means—more copies, cleaner, quicker, from a single 'Master' sheet, typed, written or drawn—no stencils, no preparation—seven colours all at once.

There is a Banda model designed for every type of organisation, hand or electrically operated, for general duplicating, for charts and plans (up to 30") or for simplified production and invoicing routine.

Planning for Christmas?

Why not learn more about GAMAGES

Most Attractive Gift Scheme for your Staff and Friends

The Gift Voucher is printed in Blue on Azure cheque paper. Actual size 8 ins. x 4 ins.

A Gamage Gift Voucher is better than a cheque in various ways, and far more friendly. No fuss or bother for you or the recipients. Available for any amount, and accepted in lieu of cash for anything purchased in the Store.

The Supervisor of the Voucher Bureau in our Accounts Department will be happy to give you any further information.

THEATRE TICKET AGENCY	GAMAGES "OAK ROOM"	WINE & CIGAR LIST
Book now for Christmas Circuses, Pantomimes, etc. Office, First Floor.	Fully Licensed RESTAURANT Third Floor.	Including Gift Cases of Wines and Spirits. Free on request.

Ask for Christmas Toy and Gift List.

GAMAGES, HOLBORN, LONDON, E.C.1. *HOLborn 8484*

What is the cost?

of a Staff and Widow's Pension Scheme

Not always the original quotation!

It can depend on the Medical evidence submitted by each member. Some may not be eligible for the Widow's Benefit—or it may be heavily surcharged. Such a restriction will probably apply to those members with the longest periods of service, and it is for their Dependants that the Employer has the greatest obligation. If they should die before Pension Age a Supplementary Widow's Pension may have to be awarded.

The actual cost may therefore prove much greater than at first estimated, and can only be assessed by Independent Insurance Brokers, who have had many years' experience of the underwriting practice and the varying methods of selection of the Assurance Companies.

Employers who are contemplating the increase in Benefits of existing Pension arrangements are strongly counselled to investigate the possibility of acceptance of all the Lives before making final arrangements.

Food for Caterers

When rations are cut, the first plea generally heard is that supplies of rationed foods to restaurants and canteens should be cut instead. The official reply has always been that these supplies are too small to have any effect on the domestic ration. Last week the Ministry of Food published a detailed list of allocations of the main rationed foodstuffs to catering establishments and institutions during the first half of this year. Some of the figures are a little surprising. They reveal, it is true, that, as the Ministry has often pointed out, hotels and restaurants account for only 4-6 per cent of total civilian consumption, which excludes allocations to manufacturers and trade users. But the proportion for all catering establishments varies from 8 to 14 per cent. Supplies to institutions account for approximately 2 per cent.

The meat ration in the first half of this year reached its lowest level since the war, yet 14 per cent went to the caterers. Hotel and restaurants took 5 per cent, industrial canteens 3 per cent, and day schools and nursery canteens 6 per cent. This last proportion seems high, but it is one that can most easily be defended on social grounds. The allocation of margarine was also large—14 per cent, of which 6 per cent went to hotels and restaurants, 5 per cent to canteens and 2 per cent to schools. But during this period the domestic ration of margarine was not fully taken up. The tea allocation amounted to 11 per cent, of which 6 per cent went to hotels and restaurants and under 5 per cent to canteens; if economy is to be found anywhere, scope exists here. Yet a reduction in the number of cups of tea served in either a factory or a restaurant would instantly arouse a rage of protest from all sides; tea is one of the more profitable lines of catering. The allocations of the other foods—bacon, cheese, butter, cooking fat and sugar—look innocent enough and give little cause for criticism.

ALLOCATIONS TO CATERING ESTABLISHMENTS
(January to June, 1951)

	Meat	Bacon	Cheese	Butter	Margarine	Cooking Fats	Sugar	Tea
	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent
Hotels, restaurants	4·8	3·8	5·0	4·6	6·2	5·8	4·9	5·9
Industrial canteens	3·4	3·3	4·2	3·4	5·4	4·6	4·1	4·7
Social clubs	0·3	0·2	0·5	0·4	0·6	0·4	0·5	0·6
Schools, nurseries, etc.	5·6	0·9	0·6	0·3	2·0	1·2	0·9	...
Total catering	14·1	8·2	10·3	8·7	14·2	12·0	10·4	11·2
Institutions	2·4	1·9	1·3	1·4	1·7	1·5	1·4	1·8
Domestic cons.	83·5	89·9	88·4	89·9	84·1	86·5	88·2	87·0
Total civilian	100·0	100·0	100·0	100·0	100·0	100·0	100·0	100·0
Consumption	*Tons* 422,200	*Tons* 204,900	*Tons* 111,600	*Tons* 166,700	*Tons* 170,400	*Tons* 87,700	*Tons* 513,500	*Tons* 91,300

The Ministry's case would seem to be sustained. But that surely is not the end of the story. Supplies to caterers fluctuate with the domestic ration, and, so long as the ration is more or less adequate, such a policy is acceptable. But when the domestic ration has to be cut to meagre proportions—as with meat earlier this year—a case could be made out for a proportionately greater reduction in supplies to both restaurants and canteens.

Air Mail Rates and Airline Finances

The Post Office has agreed to increase the rate that it pays British Overseas Airways Corporation for the carriage of air mail from 11s. 1d. per ton-mile to 14s. 2d. This increase, although described by the corporation's chairman as "very acceptable," is smaller than that for which BOAC was asking. Both British airlines have frequently complained that they get a poor deal from the GPO because the rate for carrying British mail has always been lower than the international rate settled by the Universal Postal Union and the International Air Transport Association. The present international rate is 6 gold francs per tonne-kilometre for long distance operators and half this sum for short journeys. Each government, however, has the right to negotiate its own terms with its own operators. The increase granted by the Post Office to BOAC brings the long-distance rate up from 3.27 to 4.17 gold francs per tonne-kilometre. British European Airways obtained an increase in air mail rates last year and has been receiving 9s. 10½d. per ton-mile for mail carried out of the country; the internal air mail rate is lower. BEA is therefore getting the equivalent of 2.9 gold francs per tonne-kilometre, only 0.1 franc less than the international rate, but the difference has cost the corporation £60,000 in its past financial year. At BOAC it has been estimated that, had the corporation received the agreed international rate in the past, it would have earned an extra £3,000,000 a year.

The airlines have therefore some grounds for complaint about their treatment at the hands of the GPO, but, on the other hand, it has always been recognised that there is a big element of subsidy in the international rate. There is an even larger element in the rates that some countries, in particular the United States, pay their operators for the carriage of air mail. There even appears to be some degree of subsidy in the GPO rates although, according to the Treasury, this is not intentional. The Committee on Public Accounts has frequently discussed these air mail rates and last year it was said in evidence that the rate received for air mail was then three to eight times that paid on ordinary freight. On the London-New York route, BOAC was receiving, in terms of gold francs per tonne-kilometre, a passenger rate of 1.94 francs, a freight rate of 1.23 francs and a GPO rate for first-class mail of 3.96 francs (about 5.05 francs at the new rates). So big a difference seemed to the committee hard to justify on the purely commercial grounds of charging what the traffic would bear, the more so since the railways charge less for mail than they do for other kinds of freight. The airlines are understandably anxious to make a good financial showing. But as, unlike many other operators, they are already openly subsidised by Parliament, is there a sound reason for increasing this second, concealed, subsidy?

Firmer Cotton

The cotton market has become distinctly firmer in recent weeks and Egyptian prices have risen quite sharply during the past seven days. Karnak is now about 85d. a lb compared with 74d. a week ago; American middling is 1¼ cents dearer at 39.35 cents a lb. Futures have also risen, but hardly in sympathy; if anything they have dictated the trend in spot prices. The Raw Cotton Commission has kept pace with these moves and has increased its forward quotations six times in six successive working days. American middling for November delivery is 1d. dearer at 39d. a lb, whereas Karnak is 9d. dearer at 82½d. a lb. The Egyptian prices have not been raised to the full extent of the rise in Alexandria.

The reason for the firmness is not far to seek. As an article in *The Economist* of October 20th showed, there will be no glut of cotton this season, despite the welcome recovery in world production. Consumption is still running at a high level; last season it reached a record figure of 33 million bales, and though this season's figure may be

FACTS, FIGURES, AND OPINIONS

The Economist Intelligence Unit

22, RYDER STREET, ST. JAMES'S, LONDON, S.W.1.

BARCELONA TRACTION, LIGHT & POWER COMPANY, LIMITED

Following upon the publication of the Order of the Spanish Court made on 27th August, 1951, giving preliminary sanction to the sale by auction in Spain of the assets of Barcelona Traction, the Prior Lien Bondholders' Committee asked the Sindicos of the Spanish bankruptcy for an assurance that, in the event of such sale taking place, provision would be made for the payment to the Prior Lien Bondholders in sterling of the full amount of capital and arrears of interest due to them. The Committee has received a formal assurance from the Sindicos that they will take all steps possible in accordance with the relevant legal provisions not only so that the Prior Lien Bondholders but also so that the other Bondholders of Barcelona Traction shall likewise receive the moneys owing to them in the contractual currency. This assurance confirmed the legal advice which the Committee had received from the outset.

It is not, of course, possible to forecast when such a sale will take place. Meanwhile, and independently of the Sindicos' assurance, the Committee has been able to obtain from Helvetia Finance Company Limited an undertaking that, as soon as the necessary formalities have been completed, it will make a public offer to purchase in sterling all outstanding Prior Lien Bonds at a price equivalent to par plus all coupons matured since 1st December, 1936.

The Committee's duties have always been limited to the protection of the interests of the Prior Lien Bondholders by whom it was appointed. Its principal object has therefore been to procure payment in full in sterling of the principal and arrears of interest due to the Prior Lien Bondholders. At an early stage the Committee also considered that it was necessary for a full investigation of the Company's affairs to be carried out. The position now is that all Prior Lien Bondholders should shortly be able to obtain payment of their claims in full in the contractual currency and an investigation of the Company's affairs has been completed by experts appointed by the British, Canadian and Spanish Governments, in which connection an inter-Government Minute was signed and published in June, 1951.

Having been instrumental in arranging for Helvetia Finance Company Limited's offer to be made and having procured the formal assurance by the judicial administrators of the Spanish bankruptcy that in the event of a sale in Spain the Bondholders' claims will be paid in the currencies to which they are respectively entitled, the Committee considers that it has performed its function of protecting the interests of the Prior Lien Bondholders. The Committee's term of office would in any event finally have expired in April, 1952. It has accordingly with effect from the date of publication of the offer dissolved and terminated its appointment under the powers conferred by the Bondholders' Resolution of 8th April, 1948.

26th October, 1951.

smaller, the decline is likely to be modest. Further, the estimate of world output has been reduced. The American crop, though still very large, is not quite as large as at first expected, while the first official estimate of the Egyptian crop puts it at only 1,700,000 bales compared with the earlier forecast of 2,000,000 bales, and last season's crop of 1,760,000 bales. As Egyptian estimates are known to err on the side of caution, this first estimate may prove to be low: more Egyptian cotton is likely to be available this year than twelve months ago. The provisional estimate for world production, however, has been reduced from 36 million bales to 35 million bales.

These factors undoubtedly explain the present strength of the cotton market. They do not, however, explain the recent sharp rise in Egyptian prices. The Alexandrian market is notorious for its speculative character, aided by intrigue and government regulations that at different times control minimum prices, stocks and offerings. A shortage of dollars is usually a bull point for Egyptian cotton—particularly for the shorter staples, such as Ashmouni, which can replace American staples—but even that fact would not explain a rise of 11d. a lb for long-stapled Karnak. It would seem that the Alexandrian market is again showing the world how manipulation can yield profits.

Shorter Notes

At a meeting in London last week, representatives of the three sections of the film industry—the Cinema Exhibitors' Association, the Kinematograph Renters' Society, and the British Film Producers' Association—agreed to strengthen their existing liaison committee in the interests within the industry. This unity, they feel, will be needed in the forthcoming discussions with the new government upon Entertainments Duty: approaches to both major political parties by the CEA during the election campaign found neither prepared to commit itself to accept in advance that cinema taxation represented "unfair discrimination." Agreement among cinema exhibitors upon an alternative and preferable tax formula does not appear as yet to be complete. But the most serious difficulty with which the CEA has at present to cope is the recent withdrawal from its ranks of the Rank Organisation's Circuit Management Association—representing all the 550 cinemas in the Odeon and Gaumont-British circuits. Mr Rank has not as yet publicly explained his move, though in the trade it is believed to arise from disagreements concerning CEA policy over the "Eady" tax scheme and questions of entertainments duty. Nor is there any indication how long the withdrawal will last; without the backing of the Odeon group the CEA would be considerably hampered in negotiating for the trade.

★

The report of the productivity team from the shoe industry that visited the United States last autumn is the longest yet published. It described American techniques and layouts in considerable detail because the team is convinced that the key to the high productivity of the American industry lies in the attention given to planning the flow of work through the factory. Such effective "methods engineering" means that about 95 per cent of American shoe workers are on some form of incentive payment compared with only 50 per cent of the British workers. To help factory reorganisation, it was suggested that the British customer should be educated to accept a more standard product; here the team appeared to contradict its own findings. In one of the factories visited, the team was shown what a consumer would call eight entirely different shoes; they were in fact made from one basic design. Standard shoe design, in the American sense, does not limit consumer choice. There is no sound reason why the consumer of fashion goods should be expected to sacrifice variety in order to streamline production inside the factory.

Company Notes

Calico Printers.—Almost certainly the most prosperous section of the cotton industry since the war has been the printing and finishing trades. Trading profits of one of the biggest combines in this group, Calico Printers, have mounted steadily and in the year ended June 30th last jumped from £3,548,841 to £5,214,216; the latest advance in earnings, however, may be a reflection of rising prices rather than of physical turnover.

Despite bumper profits, the company has pursued a very cautious dividend policy, and in the latest year the ordinary dividend has been merely maintained at 12½ per cent. The growing threat of Japanese competition, the uncertain course of raw material prices in the future and the inflation of stock and plant replacement values have all influenced the directors in their decision to place the emphasis upon the reinforcement of reserves rather than upon distribution to equity shareholders. In the latest financial year, £700,000, against £600,000, has been transferred to the parent company's general reserves and £765,157, against £264,242, has been appropriated by the group to "reserves against stocks and debtors."

	Years to June 30, 1950	1951
Consolidated earnings :—	£	£
Trading profit	3,548,841	5,214,216
Total income	3,705,600	5,383,108
Depreciation, etc.	834,793	1,004,549
Taxation	1,367,564	2,320,867
Group earnings for ordinary stock	*865,062*	*978,856*
Ordinary dividends	138,238	151,955
Ordinary dividends (per cent)	12½	12½
Retained by subsidiaries	176,491	101,465
General reserve	600,000	700,000
Added to carry forward	*Dr. 49,667*	40,436
Cons. balance sheet analysis :—		
Fixed assets, *less* depreciation	6,786,985	6,860,671
Net current assets	7,333,096	9,613,881
Stocks	6,045,043	7,836,457
Cash	646,682	1,233,885
Reserves	7,341,968	9,784,314
Ordinary capital	2,010,736	2,010,736

£1 ordinary stock at 44s. 3d. yields £5 13s. per cent.

Rising prices may largely account for the increase in the book value of stocks from £6,045,043 to £7,836,457 and of debtors from £2,474,935 to £3,152,958. At the same time, the liquid resources of the group have been strengthened; cash balances have risen from £646,682 to £1,233,885, and tax reserve certificates from £9,000 to £507,500. The year's appropriations to reserves have played a part here, but it must also be noted that subsidiary companies have increased their indebtedness to the banks from £40,898 to £321,474 and that some £290,000 worth of investments, the book value of which has fallen to £2,802,670, has been sold. The full effect of Japanese competition may not be felt for two or three years to come, so that Calico Printers may enjoy the sellers' market a little while longer.

★

Fairey Aviation.—During the twelve months covered by the full accounts of Fairey Aviation to March 31st last the company's contribution to the rearmament programme was reflected in a phase of development and research leading to the beginning of actual production. It was pointed out in a note on October 20th that this would probably mean a higher level of disposable earnings in the immediate future, but it might also mean a greater emphasis on reinforcing reserves. The chairman's remarks upon expenditure on capital account help to strengthen this impression. In the latest financial year the net book value of fixed assets has shown only a small increase, from £744,474 to £769,172, but at the year-end the company was already committed to the expenditure of another £300,000, and since then a further £325,000 has been committed. Such sums have to be spent if the company is to fulfil its obligations under the rearmament programme.

Fortunately, the company enters into the production stage in quite a strong financial position; net current assets totalled some £2,800,000 on March 31st and cash holdings £1,300,000. The extent of the capital outlays already planned—apart from the others that may lie ahead—makes it likely, however, that the company will feel the need at least to maintain the proportion of current profits ploughed back to buttress reserves. In these circumstances, equity shareholders can hardly expect large increases in dividends.

	Years to March 31, 1950	1951
Consolidated earnings :—	£	£

10s. ordinary share at 84s. 3d.xd yields £7 6s. per cent

★

Electric and Musical Industries.—On the assumption that Mr Gaitskell's dividend limitation proposals are now dead, the directors of EMI have been quick to fulfil their earlier promise to add a further 4 per cent dividend to the interim ordinary dividend of 8 per cent when circumstances permitted. In a full preliminary profits statement it is announced that the additional 4 per cent, making a total distribution of 12 per cent for the year ended June 30th last, will be paid on December 20th. The remarkable expansion in earnings certainly justifies this increase. The statement a month ago that profits were "substantially" greater than in the previous year appears in the light of the profit figures, just released, to have been an understatement. Group net profits have almost doubled, rising from nearly £343,000 to £663,000. When, however, taxation is added back and deductions are made for tax rebates and prior years' profits, the advance appears more striking still; net trading profits before tax then appear to have jumped from £310,000 to £1,532,000. These results certainly suggest that the group's factories have been working to full capacity and that raw material and component shortages have been successfully overcome.

	Years to June, 30, 1950	1951
Consolidated earnings :—	£	£
Profit, before tax	310,301	1,532,000
Exceptional income	234,007	790,000
Taxation	201,499	959,000
Group earnings for ordinary stock	*97,377*	*561,874*
Ordinary dividends	127,726	182,881
Ordinary dividends (per cent)	8	12
General reserve(a)	175,000	b1,150,000
Added to group carry forward	28,652	18,993

10s. ordinary stock at 23s. yields £5 4s. per cent

(a) In subsidiary companies' accounts. (b) Including a surplus of £700,000 arising from E.P.T. adjustments, etc.

Within the last trading year the question of the group's liability for excess profits tax on overseas subsidiaries' earnings and of double taxation relief has been settled with the taxation authorities. As a result of this settlement, a surplus of £700,000 has arisen and has been transferred to the general reserves of subsidiary companies. A further sum of £450,000, against £175,000, has been appropriated to these reserves from profits. On the assumption—by no means a slight one—that these reserves are freely transferable within the group, the ordinary dividend is covered more than three times by distributable earnings.

COMPANY MEETINGS

BRITISH CELANESE LIMITED

RECORD YEAR'S TRADING

IMPROVED FINANCIAL POSITION

MR G. H. WHIGHAM'S STATEMENT

The thirty-second annual general meeting of British Celanese Limited, was held on October 25th at Winchester House, Old Broad Street, London, E.C., Mr G. H. Whigham (chairman of the company) presiding.

The following is the chairman's statement, which was circulated with the annual report and accounts for the year ended June 30, 1951:—

The net profit, before taxation, constitutes a new record and shows a substantial increase over the previous year.

It will be seen from the consolidated balance-sheet that the improvement in the financial position, which has been a feature of recent years, has continued during the year under review. The reserves are again higher, having increased from £3,161,837 to £5,330,646, £1,000,000 of such increase being in respect of the reserve towards increased cost of replacement of property and plant.

Net expenditure during the year on the item land, buildings, plant, machinery and equipment amounted to £1,230,413, and current assets less current liabilities (including future taxation) increased during the year by £1,461,944, and now amount to £8,274,369. The principal feature under the heading of current assets is the increase in the value of stocks, which exceeds the value shown for the previous year by £2,525,140. The volume of the stocks is not excessive for our requirements and the increase in value is due mainly to the higher cost of raw materials and higher wage rates. The increases referred to were provided out of the resources of the group as no new money was raised during the year.

Since the end of the last world war the expenditure of the group on plant expansion, modernisation and replacement has amounted to £5,763,535 and, after providing for the item future taxation, working capital has been increased by £5,135,333. I would remind you that, notwithstanding these substantial additions, only £1,812,500 has been raised since the war by the issue of new capital (in the form of first preference shares). In this connection, it should be noted that, broadly speaking, and viewing the company as a continuing undertaking the ordinary stockholders' interest comprises not only the nominal value of the issued ordinary stock but also the capital and revenue reserves and on this basis the ordinary dividend of 9 per cent. on the nominal capital represents a return of only 2.6 per cent., less tax.

The amount of Funding certificates outstanding at June 30, 1951, was £914,006. £556,671 has been set aside out of the year's profits for the further redemption of certificates in accordance with the conditions of issue. When such redemption is effected there will be approximately £385,000 outstanding.

During the year £177,216 of debentures were redeemed, including £70,000 of a subsidiary company.

The investments in associated companies represent the cost of the company's Common share holdings in Celanese Corporation of America and Canadian Celanese, Limited. Both companies continue to make very satisfactory progress, and the market value of these investments is very considerable, as will be seen from the balance-sheet.

TAXATION AND DIVIDENDS

Taxation equalisation account has been increased during the year by £285,592 and now stands at £1,054,231.

Under the 1951 Finance Act initial allowances on new expenditure on property and plant incurred after April 5, 1952, will be suspended. As a result of this suspension the company will not obtain taxation relief by way of initial allowances on any new expenditure on property and plant incurred after that date and will be called upon to pay taxation much earlier than was expected when the capital projects were originally planned. As an illustration, it is estimated that at the rate of capital expenditure contemplated over the next three years, including that for Wrexham, a sum exceeding £1,000,000 will now need to be provided from other sources instead of being available, as was originally expected, by way of taxation relief.

Much has already been written about the excessive burdens of taxation, and I will not attempt to develop that subject, but I must draw your attention to the very large sum the Government takes in direct taxation, which in the accounts under review amounts to £3,851,894 out of the profits of £7,291,578.

An interim dividend of 6 per cent. on the ordinary stock was paid on July 14th last. You will note from the report that the directors recommend a final dividend of 3 per cent., making a total of 9 per cent. for the year, as compared with 10 per cent. for the previous year. The total of 9 per cent. for the year represents the maximum amount payable, having regard to the implications of the White Paper on Control of Dividends (Cmd. 8318) issued in July last. During the year wages were increased, and recently there has been a further award. Salaries have also been increased. The cost of all these increases will be approximately £800,000 for a full year. As against this, the ordinary stockholders, who number over 10,000, will receive £22,113 (less tax) less in dividends as compared with the previous year. Of the total ordinary stockholders, over 9,000 are registered as holding 500 or less of the 10s. units. Your company complied with the wishes of the Government in making no increase in dividends during the period of voluntary restriction, and it was not until last year that, still observing the request for moderation and restraint, the dividend on the ordinary stock was conservatively increased from 8 per cent. to 10 per cent. Now the dividend is reduced to 9 per cent. This dividend can in no way be considered as being fair to the ordinary stockholders, who are subject to the increased living costs in the same way as the rest of the community.

TRADING

Again I am able to report a record year's trading both in volume and value.

Our chief problems during the year have been concerned with production rather than sales, because the demand pressure upon us has been as great as ever from all our markets and on all our products, with the single exception of those of our goods which carry the heavy burden of purchase tax.

Our manufacturing problems, however, have been serious and have only been overcome by a great deal of ingenuity and hard work. Our first difficulty arose in connection with the supply of cotton linters, our most important source of cellulose. The United States was our main supplier, and our contracts, with Government consent, were placed with American suppliers on conditions which both from the point of view of quantity and of price we regarded as satisfactory in view of the then prevailing conditions. Without warning the United States Government placed a complete embargo on the export of these linters. With the exception of a very small quantity specifically allocated for armament work, no further linters were released by the United States between September last year and July this year, when the quantity allocated to this company amounted to less than one month's requirements. This led us—as well as others, of course—to search for alternative sources of supply. Not only were these supplies physically short but the stress of new inquiries quickly forced prices to fantastic limits. For example, cotton linters were only obtainable at one time at eight times the price we paid at the beginning of 1950. Fortunately, the work we had been doing on improving standard wood pulp to an acetylisable cellulose stood us in good stead, and enabled us to substitute this form of cellulose to some degree, but the use of increased percentages of wood pulp and the assimilation of various qualities and types of wood pulp and linters presented us with many technical problems, and I am glad to say that, despite these difficulties, production has been increased and the quality maintained. Quickly following on the linters problem, there was a crisis in connection with sulphuric acid and the industry was advised by the Government at short notice of a substantial cut in supplies. Although our usage of this chemical is not substantial compared with the quantities required by the viscose industry, it is nevertheless vital to our main process in the manufacture of cellulose acetate. Here again it is owing to the efforts of our people and a great deal of help on the part of the Board of Trade that we managed to overcome the effects of the shortage.

In order to safeguard our future supplies of sulphuric acid, we have agreed to take an interest, commensurate with our usage, in the newly formed United Sulphuric Acid Corporation, Limited, but it will be about three years before supplies from this source are available.

There have been numerous other shortages throughout the year, and all these problems demand constant attention by our executives and require a great deal of time and energy.

In view of the urgent necessity for this country to increase its exports, I am happy to be able to report that your company's direct exports increased sharply in the last year. A substantial part of our turnover was represented by these direct exports and, o

course, much of the yarn and staple which we sell to manufacturers in this country is also exported by them in the form of fabric. The overseas trade was exceedingly profitable last year, and our exports made a substantial contribution to the trading results of the company.

PRICES AND RAW MATERIALS

The effect of raw material shortages upon world prices is, of course, obvious and, in addition to the great increases in the price of cotton linters referred to above, the price of wood pulp has much increased, and the price of industrial alcohol, which is also a principal raw material, more than doubled during the year under review. The cost of coal, transport and packing materials also increased. Fortunately, our output and our increased efficiency have enabled us to absorb a proportion of these increased costs and, although during the year under review it has been necessary to increase the prices of our yarns, it is significant that whereas for example the price of our 140 denier on bobbin increased by an average of 13d. per pound, during the same period similar counts of cotton yarn increased by 28d. and wool by 118d., although recently cotton and wool prices have fallen to some extent. During the year we have been consuming our stocks of raw materials bought at less than current replacement costs. The maintenance of our present selling prices will largely depend upon our ability to buy these raw materials at reasonable prices and on our being able to obtain them in sufficient quantities.

PLANT EXPANSION AND INCREASE IN SHARE CAPITAL

As indicated in my speech last year, it is the board's intention to undertake a considerable amount of plant modernisation each year and, pursuant to this policy, your board have approved during the year further substantial expenditure, the major part of which is in respect of the Spondon factory, where progress continues to be satisfactory.

In regard to the proposed spinning plant at Wrexham, the difficulties referred to last year having been substantially resolved, contracts have been placed for the construction of buildings for the first spinning unit.

During the year we have made good progress in plant installation in our new factories at Wigan, Jarrow and Blyth and, as a result, we have obtained a very much increased output. The majority of the labour had not had any previous experience in textile manufacture, but is progressively becoming more proficient, and we do not contemplate any difficulty in getting these factories into full production as soon as the balance of the machinery is installed, most of which is promised for delivery during this financial year.

Last June application was made to the Capital Issues Committee for permission to raise approximately £3,500,000 in connection with the Wrexham project by the issue of ordinary shares to be offered, in the first instance, to existing ordinary stockholders. The application was approved and Treasury consent was received. Had this been proceeded with the issue would have involved an increase in the authorised ordinary share capital. Shortly afterwards, on account of the Chancellor's statement foreshadowing legislation on the limitation of dividends, it became problematical if that issue could be carried out on the basis originally intended.

In view of the heavy capital expenditure already sanctioned and the future expenditure envisaged as being needed in addition to that for the Wrexham project, it is clear that substantial new capital will be required during the next few years. It is still the opinion of your board that the most desirable method of raising such capital is by the issue of ordinary shares as and when market and other conditions permit. Authority to increase the authorised ordinary share capital must therefore now be sought. Your approval is, accordingly, being asked to increase the authorised ordinary shares from 5,400,000 to 12,000,000 shares of 10s. each. It does not, of course, follow that more than a part of the unissued shares will be issued at any one time.

RESEARCH AND DEVELOPMENT

Elsewhere in this statement I have indicated the practical value of some of our past expenditure on research in connection with our principal raw materials. Ultimate profitability is one of the aims of industrial research and, in order to obtain the best and quickest results, we set up an economic picture before engaging our resources on any major project of research work. With this critical background and in the light of current achievements there is convincing justification for further increasing our expenditure on research in a controlled and orderly fashion. Such properly regulated research is the forging process for the competitive weapon of the future. It many times involves going back to first principles, challenging our procedures and preserving receptivity of mind to current scientific and technical progress. Our industry, where the market is an expanding one, demands that we should continue to improve our regular processes by simplification to attain the goal of productivity—more and better product per unit of human effort. We shall continue our investigations and install equipment for the better security of supply and the lowering of cost of our basic raw materials. In addition, we are, however, not neglecting the field of new fibres of the so-called purely synthetic type—although our view is that for some time to come their application will be somewhat limited to special uses. There is evidence that in the future they may perform a very useful function in the growing number of mixtures with the natural fibres and with already established man-made fibres.

Our yarn and fabric development departments continue their valuable work in extending the end uses of our products and establishing their acceptance in many new sections of the industry. The use of our products for defence purposes naturally involves more than usual attention at the present time. In addition, our technical service department gives highly effective service to all our customers. This service section was a pioneer organisation in the textile industry and, over the many years it has been operating, it has not only built up considerable goodwill with our customers but has also given them practical advice and assistance of great value.

FUTURE OUTLOOK

The future outlook is dominated by world politics. Important markets can be closed to us overnight or affected by suddenly imposed tariffs; vital raw materials can be denied to us by a stroke of the pen; and any attempts to make long-term forecasts are completely hazardous. It is, however, reassuring to know that the world is becoming more and more conscious of the man-made fibres and, in the rising demand, the great versatility of cellulose acetate assures us of a leading place in both continuous filament yarn and staple fibre.

Several new yarns have appeared during recent years and more will undoubtedly appear in the years to come; but up to date nothing in this line has occurred to shake the faith of your board in the inherent value of Celanese yarn and its versatility in application. No doubt each new yarn produced will fit into a niche in the general textile business to which its particular qualities are suited; but, in the case of cellulose acetate yarn, your board is still of the opinion that it is the best all-round textile fibre. It is, moreover, substantially lower in price than all the newer synthetics.

I referred last year to the production and export of rayon from Germany and Japan. In 1950, Germany's output of rayon was 25 per cent. greater than in 1949; during the same period Japan increased her rayon output by 100 per cent. and her exports of rayon piece goods were nearly six times as great by volume as in the previous year. However, her production and exports were overwhelmingly composed of viscose rayon. No doubt Japan's output and exports will continue to increase but, as I pointed out last year, it is worth while to bear in mind—although this is a short-term point of view—that the bulk of the existing capacity is chiefly designed to produce viscose and not acetate rayon.

PERSONNEL

It is the board's intention to set up a fund, to be administered by trustees appointed by the board, the primary object of which will be the payment of pensions to long-service works employees. The trustees will also have power to make grants of a benevolent nature to employees or to their dependents. It is the board's intention to make annual contributions to the fund so long as the company's finances permit.

The scheme has been submitted to Inland Revenue for approval, and its introduction is, of course, dependent upon such approval being granted.

The number of personnel employed by the company and its subsidiaries at our head offices in London and in factories, warehouses and offices throughout Great Britain is now over 16,000. The board is anxious that all its employees should be treated in accordance with the highest standards practised in British industry, and constant study is being given to this problem. The company also wishes to continue to attract staff of the best quality. There are excellent opportunities for suitable young men to progress to senior positions throughout the organisation, and it is only by the steady intake of able new entrants that our commercial and technical progress can be maintained.

I take this opportunity of thanking all our employees for the co-operation which has made possible the success the company has achieved.

The chairman said: Ladies and gentlemen, I regret that Dr Camille Dreyfus, who is in America, is unable to be present.

This year my statement was circulated in advance with the report and accounts in order that stockholders might have a better opportunity of considering it.

I propose, with your agreement, that the report and accounts and the statement be considered as read.

In my statement I referred to plant expansion and increase in share capital, and I would now like to add that we are negotiating for the raising of new finance by an issue of ordinary shares on the assumption that the resolution authorising the increase in capital, to be submitted later in the meeting, will be passed. I cannot give you details at the moment as the terms will not be settled, in any case, until after the election. If and when negotiations are completed you will receive a circular setting forth the terms of the offer to shareholders.

The report and accounts were approved and the resolution increasing the authorised capital was passed.

RONEO, LIMITED

FINANCIAL STABILITY FURTHER STRENGTHENED

LARGE INCREASE IN SALES

SIR GREVILLE S. MAGINNESS'S REVIEW

The forty-fourth annual general meeting of Roneo, Limited, was held on October 30th at the Holborn Restaurant, London, the chairman, Sir Greville S. Maginness, presiding.

The chairman, in moving the adoption of the report and accounts, said:—

Ladies and Gentlemen,—In submitting the accounts for the year ended June 30, 1951, I assume that you will agree to take them as read in view of the fact that they have been in your hands for the statutory period.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

Taxation amounting to £409,217 accounts for over two thirds of the profit, after providing £107,962 for depreciation and amounts written off, thus leaving a net profit of £197,200 for the year.

It is proposed to augment our reserves by appropriating £80,000 to plant replacement reserve, making this £280,000; adding £30,000 to general reserve, raising this to £280,000, and transferring £10,000 to investment reserve, bringing this figure to £20,000. Dividends on the 6 per cent. and 10 per cent. preference stocks, less tax, for the twelve months ended June 30, 1951, have been paid. On the ordinary stock an interim dividend of 5 per cent., less tax, has already been paid and it is now recommended that a final dividend of 12½ per cent., less tax, be distributed, making the total for the year 17½ per cent., less tax. I will have more to say about this later. After giving effect to these proposals and recommendations the amount to be carried forward to next year is £241,410 as against £213,487 brought in from the previous year.

CONSOLIDATED BALANCE SHEET

It will be seen that the financial stability of the company has been further strengthened inasmuch as the net liquid assets now amount to £1,573,172 showing an increase of £187,870 over the previous year and the revenue reserves including the carry forward on profit and loss account but excluding taxation now total £821,410 as against an issued capital of £661,378.

TRADING

Our sales increased by approximately 20 per cent. over last year, notwithstanding the difficulties of obtaining additional labour and sufficient raw materials. The further increase in our net profit disclosed in the directors' report is due partly to increased turnover and partly to a further improvement in the efficiency of our manufacturing operations and sales methods. I would remind you that to this end we have expended no less a sum than £500,000 during the last six years—an expenditure which we could not have afforded had we not ploughed back into the business sufficient reserves to meet the costs of such improvements.

Such reserves represent the vital life-blood of industry. The welfare of all those engaged in any business in whatever capacity depends upon an adequate retention of profits to provide for improved methods, replacement of plant, and expansion in productive capacity. The present system of taxing retained profits provided for these purposes restricts the healthy development of industry, for which the nation will have to pay a heavy price in the long run.

MACHINES AND SUPPLIES

The sales of both machines and supplies reached a record in volume and in value both at home and abroad. The Roneo "500" with its outstanding economy in running costs has now firmly established itself in the front rank of duplicating machines. The Policy model has more than justified our expectations, as is proved by the growing list of satisfied users.

STEEL OFFICE EQUIPMENT

The steel equipment section of our business continues to be hampered by the shortage of steel sheets, which was accentuated during the past year. The result has been that we are still unable to manufacture our normal range of well-established lines and only supply reduced quantities of others. We have, therefore, been obliged to concentrate still more upon those lines of high conversion value which has been our policy since material shortages manifested themselves. In this connection the systems side of our business has occupied an outstanding position. This company is the pioneer of controlled filing systems and manufactures the well-known Visible "80" Filing System which possesses three outstanding advantages—it is easy to understand, simple to operate, and is as fool-proof as any filing system can be. The demand for Visible "80" continues to grow and we have had to still further increase our manufacturing capacity in this line.

In the visible record section we have recently introduced an entirely new range of machine posting trays called "Flyweight" for use in conjunction with mechanically posted records. These are constructed throughout of light alloy and plastic. The outstanding features are extreme lightness—as their name implies—and speed of operation. They should make a strong appeal to banks, financial and other commercial houses.

EXPORTS

Our sales abroad increased by 21 per cent., compared with the previous year, and reached record figures to date, both in volume and in value. They were more than two and a half times what they were in 1947. These results whilst very gratifying are largely due to the abnormal state of affairs in the world generally, where demands still outstrip supplies. The real testing time has still to come, and I see no reason—on the longer-term prospect—to change the views which I have previously expressed as to the extent of the competition which this country will have to face in world markets. In the meantime, we have the satisfaction of knowing that our sales representation abroad has attained a higher standard of efficiency than ever before.

DIVIDEND POLICY

In my address last year I pointed out that the company had aligned itself with others in pursuing a policy of restraint whilst the wage freeze continued, and I added that if conditions should change your board would review the position in the light of all the circumstances ruling at the time.

The circumstances have changed. The wage freeze is ended. Your board feel fully justified therefore in recommending a modest increase of 2½ per cent. less tax for the year which, although this can now perhaps be regarded as academic, did in fact comply with the terms of the White Paper on the control of dividends.

NATIONAL SITUATION

In considering the results and future prospects of our own company we have to take account of the background of the general situation of this country—both nationally and internationally.

In addressing you in recent years I have endeavoured to draw attention to some of the salient facts of that situation as they have appeared to me at the time. Perhaps I may be permitted to do so again on the present occasion, although I am very conscious of the difficulties of such a review at this time when there are so many uncertain factors to be considered.

In particular, we are meeting this year at a time when a general election has just taken place and when a new Parliament is about to assemble. This is, of course, not the occasion for me to offer any comment on the purely political aspect of our national situation, but these circumstances nevertheless add to the difficulties of forming a clear idea of the outlook for this country. I will, however, attempt to assess the economic considerations which appear likely to influence our future.

REARMAMENT AND TAXATION

This time last year the Government had recently embarked upon the rearmament programme which, at that time, was estimated as being likely to raise our total defence expenditure to some £3,400 million over the succeeding three years. Since that time revisions of the programme and of the estimates for it have increased that figure to some £4,700 million, and it is quite clear that the problem of the burden of taxation on which I then commented has thereby become even more difficult. As I pointed out last year taxation in this country absorbs some 40 per cent. of our entire national income and that is a position which is unprecedented in the history of this country in peacetime or, for that matter, in any other modern state.

At the same time I referred to the virtual impossibility of the Chancellor of the Exchequer being able to raise additional taxation from taxpayers in the higher income brackets. I was very interested to see that the General Council of the Trades Union Congress drew the attention of the T.U.C. to this same fact when they stated in their annual report this year that if all personal incomes above £2,000 were taxed completely away—leaving the persons concerned with no income—this would yield only about £230 million extra. The Chancellor of the Exchequer in the last Parliament when addressing the Trades Union Congress last month stated the matter in a somewhat less extreme form when he drew attention to the fact that if all the excess net income over £2,000 a year were taken by the Treasury it would bring in only £53 million. The latter figure represents only about an eighth of our national expenditure on food subsidies.

When I spoke to you last year the position in regard to our overseas balance of payments had shown a substantial improvement and at the beginning of this year our gold

and dollar reserves had increased sufficiently for Marshall Aid to this country to be suspended. Since then, however, there has been a serious deterioration in the terms of trade from the standpoint of this country, due largely to a rise between July, 1950, and July, 1951, of some 75 per cent. in the prices of imported raw materials.

DOMESTIC PROBLEMS

The Treasury recently announced a fall in the gold and dollar reserves of the sterling area equivalent to more than £200 million—a sum which represents nearly one-sixth of these gold and dollar reserves. This is by no means the full story. The domestic outlook is itself far from encouraging. We are likely again to suffer a fuel crisis during the coming winter. Steps are being taken by industry to meet this position as far as practicable, and an attempt is being made by the Government to bring home the full seriousness of the situation to all consumers of fuel and power. Fresh difficulties, too, have arisen in regard to transport. Difficulty in obtaining many classes of skilled labour is almost universal, and as if this were not enough a new factor is emerging which we have not previously experienced. For the first time since the war it seems certain we shall be faced with a fall in steel production. This occurs at a time when increasing quantities of steel are required in connection with the Defence Programme.

While in recent years we have been faced by a succession of crises we are likely in the coming winter to meet many of these difficulties in an aggravated form simultaneously. It would be idle to expect that we can easily or quickly resolve these problems. There are, however, two things which can be done to assist our position. Firstly, in view of the over-riding importance of the Defence Programme there must be a rigorous limitation of all unnecessary Government expenditure in other directions. This is essential both with a view to avoiding a further increase in the existing heavy burden of taxation and wherever possible obtaining some alleviation of it, and also with a view to removing any unnecessary demands on national resources of manpower, materials and productive capacity. This is a matter which, of course, calls for Government action and all that we in industry can do is to draw attention to its fundamental importance. Secondly, it is clear that everything that we in industry can do to achieve higher production and reduce costs will assist towards the ultimate solution of our difficulties. Our task will not be easy especially in view of the situation in regard to fuel and raw materials. Co-operation and the maximum effort by all constitute the contribution which those engaged in industry can make. To secure the necessary co-operation it is essential that everyone should appreciate the facts of the situation. That appreciation will not be achieved by equivocal statements. Too often in the past government statements about the difficulties of these postwar years have been accompanied or immediately followed by other statements from these same sources which have attempted to gloss over the hard realities of the situation.

It is, of course, all too common to describe as "defeatists" those who have the courage to speak of our national problems with a sense of reality. It is only by stating these unpleasant facts frankly and recognising them that we can hope to meet them successfully.

TRIBUTE TO STAFF AND WORKPEOPLE

In conclusion I would like to express once more on behalf of the Board our sincere thanks to the staff and workpeople for their continued loyalty and devotion to the interests of the Company, and I feel sure that stockholders will wish to join the Board in this expression of appreciation.

The report and accounts were adopted.

WILLIAM DOXFORD AND SONS, LIMITED

DR E. P. ANDREAE ON DIVIDEND POLICY

The fifty-ninth annual general meeting of William Doxford and Sons, Limited, was held on October 26th in London.

Dr E. P. Andreae, the chairman, in the course of his speech, said: The results of another year of continuous full employment are recorded in the accounts and will, no doubt, be considered satisfactory. The trading account, after charging £47,545 in respect of special expenditure on research, shows a profit of £600,442 and the net profit is £267,442, an increase of £33,009. The sum available for appropriation is £382,848, of which £100,000 has been transferred to general reserve and £18,219 to capital reserve for plant extensions and renewals.

We are again recommending the capitalisation of £50,000 from undivided profits and, if that is approved, the issued ordinary capital will be 650,000 shares of £1 each, still a modest figure in relation to the capital actually employed in the business.

Notwithstanding the satisfactory results of the year, which provide ample justification for a higher dividend, your directors felt compelled, in view of the Government's declared intention to restrict dividends, to reduce the final dividend from 15 per cent. to 12½ per cent. which, with the interim dividend of 5 per cent. already paid, would be the maximum permissible for the year under review, if the proposed legislation reached the Statute Book.

Our decision was made before the announcement of a General Election, and was based on our conviction that it would be against the interests of shareholders were we to ignore the proposed legislation of any Government for the time being in power, quite apart from the fact that, in this case, had we done so, we ran the risk of a still further reduction in the rate of our dividend for the following year.

BOARD'S INTENTION

I am at a disadvantage in having to address you on the day following Polling Day, but before the final results of the Election are known. In any case, our dividend recommendation for the year under review must stand as already announced, but, in the circumstances, I think it would be only fair to shareholders to disclose the fact that, had it not been for the threat of enforced limitation, we had intended to recommend a final dividend on the ordinary shares of 20 per cent., which would have meant a total distribution of 25 per cent. for the year. This, in our opinion, would have been a proper recommendation, based on the merits of the case.

I am further prepared to say that, if, for any reason, the proposed legislation for restriction of dividends were to be abandoned, then, other circumstances permitting, we as your directors would be willing to give prompt and sympathetic consideration to a compensatory distribution, possibly in the form an an early interim dividend in respect of the current financial year. Such a distribution would, of course, apply equally to the new issue of 50,000 shares proposed for your sanction at this meeting.

The popularity of the Doxford Engine continues unabated, and at present engines totalling at least 1½ million horse power are under construction by or on order from ourselves and our numerous licensees throughout the world.

The report was adopted.

ALLIED INDUSTRIAL SERVICES, LIMITED

RECORD OUTPUT

The seventeenth annual ordinary general meeting of Allied Industrial Services, Limited, was held on October 26th at Bradford, Mr W. H. Rhodes, C.B.E. (chairman and managing director), presiding.

The following is an extract from his circulated review:

During the year under review the general volume of output from our combined factories was the highest yet achieved in any similar period. The coming into operation of the increased plant installed at the new extensions to our waste spinning mill some months earlier than was originally anticipated, has been one of various factors contributing to this increased output. Again the demand for the various products we service, as well as those we sell, has been at a consistently high level and, as a result, every department of the group has shown appreciable increases in volume of output.

The net profit of the parent company for the year amounts to £159,814 and after bringing in the balance from last year and deducting additional taxation payable £181,074 is available for allocation. It was our intention to recommend that the same rate as declared last year should be applied to the increased capital. In view of the White Paper on dividend limitation, however, we have decided to recommend that no change should be made in the gross amount distributed.

Concerning the present year, of which over three months have now gone, our output to date has exceeded that of the corresponding period of last year, and provided the demand for our products continues and that our essential supplies are obtainable throughout the winter months, it is expected that our output generally will be maintained during the present year.

The report was unanimously adopted.

FINNEYS SEEDS

The fifth annual general meeting of Finneys Seeds Limited was held on October 29th at 18, St. Swithin's Lane, London, E.C.4, Mr Ernest Cornwall (the chairman) presiding.

The following is an extract from the chairman's circulated statement:—

I have much pleasure in presenting the accounts for the year which ended on June 30, 1951. They present a picture recording once again a period of successful trading, which is all the more gratifying having regard to the anxieties due to the wet spring, which entailed great changes in the cropping programmes of many of our customers.

The accounts show that the profits have been fully maintained, in fact there is a remarkable similarity between our turnover and profits for the past two years.

Competition becomes keener each year, and while we shall always sell our seeds as reasonably as possible, combined with the best quality, our chief concern will be, as always, only to offer the finest stocks and strains procurable.

On the whole, the quality of seeds and grain harvested this year, despite weather difficulties, is much better than at one time anticipated.

Our forward order position is very good and the numbers received to date are in excess of those for the corresponding period last year. We have every hope that this position will continue to improve as we are appointing more agents and travellers.

We desire to place on record our gratitude to the officers and staff of the companies, who continue to render yeomen service.

The report and accounts were adopted.

TRINIDAD PETROLEUM DEVELOPMENT COMPANY

ACTIVE AND SUCCESSFUL YEAR

NEED FOR REVISION OF U.K. TAXATION POLICY

EXPLORATORY DRILLING AND ORE RESERVES

MR KENNETH MOORE'S REVIEW

The annual ordinary general meeting of the Trinidad Petroleum Development Company, Limited, was held on October 29th at the Abercorn Rooms, London, E.C.2, Mr Kenneth A. E. Moore, F.C.A., presiding.

The secretary (Mr J. Mytton), having read the notice convening the meeting and the report of the auditors, the chairman said:

Before we pass on to the broader aspects of the company's affairs it occurs to me that, although the accounts are set out with the utmost clarity, some remarks on various items may help in their interpretation.

First of all, the increase of about £243,000 in the balance from production account arises mainly from the fact that, under our contract with United British Oilfields of Trinidad, our production is sold, not at crude-oil prices (which have remained more or less stationary in recent years) but by reference to the Gulf Coast export prices for the principal products contained in the crude, arrived at by a process of analysis. These products, which comprise gasoline, gas-oil and fuel-oil, realised rather higher prices during the past year.

On the other side of the profit and loss account the only item calling for comment is the very large sum of £654,000 spent during the year on oil wells and development account.

This represents the costs of, and incidental to, the drilling of 22 wells of an average depth of just over a mile. Some of these wells were much deeper than this average and one went down over 2½ miles.

I propose, later in my address, to return to this subject and to the question of proved reserves.

PROFIT AND ALLOCATIONS

However, to get back to the accounts, you will see that, after charging drilling expenditure £654,000, depreciation of plant, etc., £249,000, and £23,000 for directors' and management remuneration the profit for the year, subject to taxation, was £740,000. Taxation takes an increasing toll (£430,000) and, by way of contrast, dividends, if confirmed, absorb about £185,000. This leaves £125,000, out of which £25,000 has been put to reserve for supplementary pensions, and £100,000 to general reserve—little enough having regard to the inflated cost of maintaining and replacing plant and of exploratory drilling. The foregoing appropriations leave the carry-forward practically unchanged at £198,380.

This brings me to the balance-sheet position:—

The capital employed now exceeds £2,900,000, as compared with an issued share capital of £1,700,000. The difference of some £1,200,000 is almost entirely accounted for by reserves of one kind and another built up out of profits over many years.

On the face of it, the financial position looks very strong, with current assets amounting to £1,538,000 against current liabilities of £721,000. But, of the current assets, over £700,000 is more or less permanently locked up in stores, stocks and debtors and, in fact, the cash assets of about £800,000 are no more than sufficient to cover with a modest margin the current liabilities of £721,000. And if you look a little further into the balance sheet you will see a note to the effect that contracts outstanding in respect of capital expenditure are estimated at £320,000 and future taxation (that is, the tax payable in the next fiscal year on this year's profits) amounts to over £400,000. Thus you will appreciate that we have to do our best by good housekeeping and by a comparatively conservative dividend policy to conserve and to add to our cash resources. The killer, of course, is profits tax, which at £180,000 is almost equal to the amount we are distributing by way of dividend.

PROFITS TAX

Profits tax is perhaps the most mischievous tax ever imposed. It is a subtle and cumulative poison in the system of private enterprise, in that it is payable wholly out of profits withheld from distribution and therefore militates against the building-up of a business by the time-honoured process of ploughing-in. It militates also against the raising of capital from outside, because it imposes a fine of 50 per cent. on any dividends paid. It is sapping the strength of British industry and is highly objectionable on that ground alone. When applied, as in our case, to the revenue derived from the extraction of irreplaceable mineral resources situated overseas it is indefensible both on economic and political grounds. I may mention that neither Canada nor America taxes profits as such earned in another country.

Quite clearly the present taxation policy of the United Kingdom is not only damaging to Trinidad's economy but is also putting British overseas enterprise at a great disadvantage compared with its transatlantic counterpart.

I trust that our new Government will speedily modify the profits tax and, at least in the case of overseas mining and oil companies, abolish it altogether. I hope, too, that they will look into the whole question of taxation policy on profits earned outside this country with a view to removing injustices, which are not only giving rise to criticism and ill-feeling in colonial and other overseas countries (as is made abundantly clear to all who visit them) but also having unfortunate effects at home.

CHAIRMAN'S VISIT TO TRINIDAD

To return to our domestic affairs, I again visited Trinidad early this year in company with our managing director, Commander Lavington.

The new and liberalised constitution introduced last year following elections based on universal suffrage, is working well. I had the opportunity of meeting some of the new ministers who are co-operating with our industry, and we with them, in the task of improving working, living and economic conditions in Trinidad by the efficient and enlightened conduct of its oil industry, a task in which our general manager, Mr Bennett, both in his duties with us and as a member of the Legislative Council, is making a valuable contribution

I also had the pleasure of meeting and conferring with the Governor, H.E. Major-General Sir Hubert Rance, whose wisdom and guidance Trinidad is singularly fortunate to have in this formative phase in its history.

On our oilfields there were abundant signs of continued progress in all aspects of our activities, thanks to a keen, competent and loyal staff and a good spirit amongst our many employees.

Our workpeople, I know, realise that their fortunes are linked with the continued success and progress of our operations, which alone have made possible the good wages, the improved housing, medical, educational, recreational and other amenities which they enjoy.

I venture to think that Trinidad has turned its back on any ideas of nationalising its oil industry, preferring the wise course of co-operation between government, community and industry, to the mutual advantage of all.

DRILLING OPERATIONS

On the subject of our drilling operations, you will remember that on a previous occasion I mentioned that they have, so far, been confined to about one-third of the total land area over which the company holds oil rights.

If you were to look at a marked map of the south-west part of Trinidad you would see that our holdings, which now amount in all to about 70,000 acres, are principally in the Palo Seco, Coora, Quarry, Los Bajos and Moruga districts, with a spur to the north-east in the Central Ranges.

In the first four named districts we have drilled altogether some seven hundred wells which have given us an intimate knowledge of the geological structure over some 6,000 acres in all scattered over a superficial area of about 25,000 acres. It is only in respect of the comparatively small area of 6,000 acres that our geologists feel justified in computing what are termed proved reserves, and you will be glad to know that, in their view, they would be sufficient to maintain the present rate of production for many years to come. The reserves in the remaining 64,000 acres are, as yet, a matter of conjecture, and will remain so until they have been thoroughly explored by the drill. That process is continually going on, and, by way of example, the wells completed during last year can be sub-divided as follows:—

	Cost
Sixteen exploitation wells (bread and butter wells drilled in proved areas)	£283,000
Three semi-exploratory wells, two of which gave good production and substantially increased the area of our known reserves	132,000
Three exploratory wells, two of which must be regarded as failures and one of which, Coora 188, as I shall tell you presently, is producing oil and raises hopes of important discoveries	239,000
	£654,000

Of the three exploratory wells, Moruga No. 1 ran into difficulties owing to the collapse of the formation between 6,000 and 8,000 feet, and ultimately had to be abandoned as a failure.

Marabella No. 1 at an early stage raised everyone's hopes by unexpectedly entering the Cretaceous formation at 3,500 feet, and thereafter extremely hard drilling was encountered. It was a great disappointment when, at 6,500 feet, it was found that we were, geologically speaking, back where we started, and that what had been drilled through with great difficulty was nothing but an immense overthrust. Subsequent tests gave small quantities of oil, but no commercial production. Further tests are still in progress.

HERRERA DISCOVERY

Coora No. 188, to which I referred last year, was eventually drilled down to 13,471 feet. A narrow belt of the Herrera sand—one of the objectives—was encountered just below 8,500 feet and the Cretaceous soon after 13,000 feet. This well was all but wrecked by the premature explosion of a perforating gun at 8,978 feet, but was ultimately recovered by very creditable salvage operations carried out by our engineers. Tests of the Cretaceous gave a small amount of oil and much salt water under great pressure but no commercial production. Subsequent tests of the Herrera have, however, yielded sustained production of oil averaging 100 barrels a day through an exceptionally small flow-hole at a pressure of over a ton per square inch. This is the first Herrera production we have achieved in our main fields and may be of great importance, though it would be dangerous to jump to premature conclusions.

Our geologists, however, think there is a good prospect that this Herrera sand extends over a considerable part of the company's holdings in the Coora Field and, possibly, in the Palo Seco Field also. There are reasonable grounds for hoping too that further to the north the sand may thicken and therefore prove more prolific.

In order to prove or disprove the extent and capacity of this Herrera discovery, two further exploratory wells have been put in hand but it will be some months before we know the answer. If the promise of Coora 188 is confirmed by these two wells proving good producers from the Herrera sand, it would be an event comparable in importance with the original discovery of the Coora Field, which has contributed so much to the company's prosperity in the last ten years.

As Coora 188 cost £170,000 to drill the present production from it would hardly make it a paying proposition but, from the geological point of view, it has, of course, provided invaluable information. I repeat, however, that it would be dangerous to jump to premature conclusions.

From what I have said you will appreciate that we have before us many years of intensive exploratory work, the outcome of which will be of vital importance not only to us but to the future prosperity of Trinidad.

We regard this work as an inescapable duty from all points of view and we intend, as a matter of policy (as I have no doubt would be your wish) to continue with our programme in spite of the great expense and commercial hazards involved.

DIRECTORATE AND STAFF

To turn to more personal matters, as you will have seen from the report, Sir Claud Hollis, owing to advancing years, is not seeking re-election. For many years he has contributed valuable advice in the conduct of the company's affairs, drawn from his long experience of Colonial administration. We regret his retirement, but are fortunate in having the opportunity of recruiting as his successor Sir John Huggins, who will bring with him just that facet of experience which in the past has been so useful to us.

It remains for me to take this opportunity of expressing on behalf of the board our most sincere thanks to all, at home and abroad, in the service of the company for their contribution to the continued progress of our undertaking. As shareholders you will, I am sure, wish to join with the board in sending a message of thanks and encouragement to our staff and workpeople in Trinidad, who, I can assure you from what I have seen personally, are doing a really first-class job.

The report and accounts were adopted.

FISHER AND LUDLOW LIMITED

SATISFACTORY RESULTS

MR ARTHUR KEATS'S REVIEW

The thirty-first Annual General Meeting of Fisher and Ludlow Limited was held on November 2, 1951, at the Queen's Hotel, Birmingham, Mr Arthur Keats, O.B.E. (chairman of the company), presiding.

The following is his statement which was circulated with the report and accounts for the year ended March 31, 1951.

Your Board of directors is pleased to be able once more to present accounts, which, although showing a slight contraction of earnings compared with the outstanding achievement of the previous year, are considered, in the light of circumstances which prevailed, to be very satisfactory.

In my statement last year I felt it my duty to point out the possibility of some reduction in trading profit due to rising costs and the introduction of new models with its attendant difficulties. This has been further aggravated during the year by shortages of materials of all kinds, and in particular sheet steel, which for the last three months of the year forced upon us short-time working in some sections of our plant.

Turning to the Accounts, which are fully informative and require little explanation, you will note that the net profit attributable to the group is £328,167 compared with £404,396 last year and this is after charging £245,432 for depreciation and £515,857 for taxation, the latter being particularly onerous as a result of the latest Budget increases.

As mentioned last year the balance of the Ordinary shares of Bendix Home Appliances Limited were acquired, involving the issue of 77,807 ordinary shares of your company. This transaction is responsible for the increase shown in Issued Capital and Share Premium Account. This acquisition is amply justified by the trading results being achieved and which, given reasonable conditions, should continue.

From the balance sheet it will be seen that the financial structure of the group has been strengthened still further in spite of the greatly increased need for working capital brought about by higher prices, steady expansion of trading and the ever-growing proportion of the company's income required to be paid out in the form of taxation.

DIVIDEND POLICY

Your company has for many years adopted a conservative policy with regard to dividends and has ploughed back into the business a considerable portion of its profits year by year, so that the Revenue Reserves and Surplus as shown in the Consolidated Balance Sheet together total £1,152,533. This policy has played no mean part in the healthy and continual development of your Company.

With the latest Government direction on the control of dividends it is possible that the maximum payable during the next three years will be at the rate of 22½ per cent., and this is recommended for the period under review. A further £10,000 is proposed to be allocated to the Staff Benevolent Fund.

We have continued with the policy of extending and modernising our plant and equipment, and capital expenditure amounting to £316,103 was incurred during the year. Commitments for a further £240,000 were outstanding at the date of the accounts. As a result of the withdrawal by the Chancellor of the Exchequer of the Initial Taxation Relief there must inevitably be a slowing down of this process, which, in the long run, can only have a detrimental effect upon British industry and reduce its competitive powers.

PROBLEM OF FULL PRODUCTION

Due to the shortage of materials the maintenance of full production is the chief problem of your Board. We have built up world-wide sales for certain of our products, and it is a source of great disappointment that the strenuous efforts made in this direction are offset by the inability to supply due to these conditions. You may be assured that this problem is receiving constant attention and, wherever possible, substitute materials are being introduced where these have been proved to be suitable and satisfactory for the purpose for which they are intended. This scarcity of materials has undoubtedly curtailed our export activities for the time being, but we are hopeful that some improvement in the position will not be long delayed. We also continue to experience interruptions to production on account of electricity cuts and load shedding.

Our Materials Handling and Factory Equipment Division continue to make satisfactory progress. There is undoubtedly great future scope in this sphere of our activities, dealing as it does with the supply of material handling equipment of all kinds, which is so essential to efficient production.

Your company has been privileged to receive as guests, many visitors from overseas, notably among which were the American team representing the Pressed Metal Industries of America, this visit being sponsored by the Anglo-American Council on Productivity, the Birmingham section of the Institute of Production Engineers who held a Material Handling Conference at our works, and the Institute of Mechanical Engineers.

Our order books remain satisfactory, and it may interest members to learn that your company is making a useful contribution to the Defence programme, both in development and production. During the present year production has been maintained at the maximum possible, taking into account the restrictions that have applied and which have been outside our control.

THE FUTURE

Whilst the year's trading has, in view of the various difficulties encountered, been satisfactory, I feel sure I could not be blamed for taking a not too optimistic view of the future. We have, as you are aware, already received warnings of the serious difficulties that are likely to be encountered with fuel and power, and there does not seem to be a possibility of an early improvement in the material situation. With such uncertainties it is difficult to hope for any better results, but you may be satisfied that your Board will use its utmost endeavours to obtain continuance of present achievements.

In conclusion, I wish to express your gratitude and that of your Board, to the Management, Staff and all employees of our organisation for their loyal endeavours and support throughout the year, which are reflected in the results before you.

The report was adopted.

TRONOH MINES, LIMITED

CONDITIONS IN MALAYA

The forty-ninth annual general meeting of Tronoh Mines, Limited, was held on November 1st at 73, Cheapside, London, E.C., Mr J. H. Rich, chairman of the company, presiding.

The following are extracts from the statement of the chairman which was circulated to the members:—

There is a shortage of mining labour in Malaya. Amongst the reasons might be mentioned the attraction of the profits made by those tapping on small rubber estates and the high wages offered to semi-skilled employees by building contractors.

Despite the official optimistic statements made from time to time, security conditions in Malaya do not appear to have undergone any appreciable change since our last meeting. The regrouping of mine labour is one of the additional measures for dealing with the bandit threat. Under this, all mine labour has to be removed and rehoused in selected areas which are encircled with barbed wire with police guards mounted and a nightly curfew imposed. The cost of this undertaking, which is heavy, falls on the mine.

AMERICAN ATTITUDE

Prominence has been given to attacks by American interests on the tin producers and in particular Malayan producers. Amongst other inaccuracies is the accusation that tin producers were "gouging" the U.S.A. regarding price. One result of these attacks was that the American Government refrained from buying in the open market and restricted the consumers' requirements by 20 per cent. of their consumption for the first half of 1950.

It is not a question of what the U.S.A. or anyone else considers a fair price, but it boils down to the simple question—is the tin required? If so, then the price must be such that the necessary tin will be forthcoming.

The U.S.A. appears to be obsessed with the idea that the sums she has spent on buying tin have inordinately swelled the profits of the producers. But something far more vital than mere profits to producers is involved. The U.S.A. does not appear to realise that Malaya is a bastion in S.E. Asia, putting up a fierce and costly struggle against Communism.

EFFECT OF GOVERNMENT'S POLICIES

It is not properly realised at home how the policies of the British Government, such as the recognition of the Communist Government in China, and the recent capitulation in Persia, have direct repercussions in Malaya. In view of the repeated assurances of Ministers that it was the government's intention that the representatives of our oil interests would remain in Abadan, our withdrawal in face of Persian pressure is bound to have far-reaching effects in Malaya. One of these effects is to raise doubts as to the degree of reliance that can be placed upon the then Prime Minister's statement in March, 1950, that there was no intention of a premature withdrawal from Malaya.

An unequivocal declaration is required from the British Government, making it abundantly clear that self-government will only be granted when the development and progress of the peoples of Malaya show without doubt that they are fitted for it and that when self-governing Malaya will still remain within the Commonwealth. Meanwhile first things must come first, and the great urgency is to resolve the emergency and the terrorist problem so that the necessary development can proceed in settled and peaceful conditions.

The report and accounts were adopted.

HAROLD WESLEY LIMITED

(Manufacturers of Paper Products)

INCREASED SALES AND PROFITS

The fifth annual ordinary general meeting of Harold Wesley Limited, was held on October 25th at the Wesley Social Hall, Wesley Avenue, Harlesden, N.W.10, Mr Percy Day-Winter (chairman and managing director) presiding.

The following is an extract from his circulated statement:

It was the directors' intention to recommend a final dividend of 16 per cent., making a total of 25 per cent., plus a bonus of 2 per cent., giving a full distribution of 27 per cent. for the year ended June 30, 1951, but on July 26th, the Chancellor of the Exchequer made his announcement proposing to introduce legislation to restrict dividends to the average of the two previous years, which, if passed, will "freeze" our dividend to 23¼ per cent. Your directors, therefore, recommend the payment of a final dividend of 14¼ per cent., making a total of 23¼ per cent., for the year and the appropriation of the difference of 3¾ per cent. to a special dividend reserve for payment to shareholders when circumstances permit.

Prudence dictates that a stock depreciation reserve should be created to provide against the possible fall of material prices, and your directors have therefore set aside the sum of £20,000 for this purpose.

The company's factories are in full production and adequate supplies of raw materials have been available to accomplish the satisfactory result shown and it is anticipated that progress will be maintained.

The report and accounts were adopted.

AMALGAMATED TOBACCO CORPORATION

The fifth ordinary general meeting of the Amalgamated Tobacco Corporation Limited, was held on November 1st in London, The Rt. Hon. Lord Llewellin, P.C., C.B.E., M.C., T.D. (the chairman), presiding.

The following is an extract from his circulated statement:—

I regret that this year for the first time I have to report a lower figure of profit as a result of the year's working. This decline in profits has resulted very largely from rising prices of every item coming into the costs of your company's products, while selling prices have remained virtually unchanged. Rising prices have, of course, affected all companies in the tobacco trade, but in our particular case we have had to operate under the injustice we are suffering over tobacco allocations.

The Board of Trade in exercising its control over tobacco is assisted by a Tobacco Advisory Committee, and in our view it is a great weakness of this Committee that it consists only of people connected with the six or seven large companies in the trade, and that no representative of what might be called the medium-sized or smaller companies in the trade is a member.

We consider that a "fair shares for all" scheme, which would give justice to all manufacturers, small as well as large, ought to be adopted. It would be a great relief to your directors if they could get a fair and just settlement of the tobacco situation. It would, I feel, be much easier for us to overcome the difficulties if we were not hampered by a Government control. It would even be easier if that government control paid more regard to the legitimate interests of the smaller companies such as ours.

The report was adopted.

NEEPSEND STEEL & TOOL CORPORATION

MR S. C. GOODWIN'S REVIEW

The thirty-first annual general meeting of this company was held on October 30th at Neepsend, Sheffield, Mr S. C. Goodwin, J.P., the chairman, presiding.

The following is an extract from his circulated statement:—

The trading profits before taxation, have amounted to £743,787, as against £539,554. The dividend and bonus declared on the ordinary stock represents a distribution of approximately 4 per cent., free of tax, on the capital employed in the Neepsend Group of companies.

In accordance with our policy of acquiring companies closely associated with our own spheres of activity, we purchased in the autumn of last year the entire share capital of William Smith & Company (Sheffield) Limited, manufacturers of high grade wires, and also Thomas Hancock & Sons (Saws) Limited, the former being one of the oldest established in the industry and with a very high reputation for its products, and the latter a long established factory specialising in certain types of saws. Both these firms, as also Hattersley & Ridge Limited, have contributed very satisfactorily to the consolidated profits of the parent company for the year under review.

While it is difficult to prophesy for the future in view of the rearmament programme and the high rates of taxation, coupled with increasing costs of production, the latter being specially serious for our important export trade, yet your board have every confidence in being able to maintain that prosperity we have enjoyed for so many years.

The report was adopted.

NOTICES

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of SENIOR LECTURER OR LECTURER IN GOVERNMENT. Salary scales per annum: Senior Lecturer £1,150 to £1,500, Lecturer £500 to £1,000. Membership of F.S.S.U. and Children's Allowance Scheme. Initial salary according to qualifications and experience. Applications should be sent not later than January 31, 1952, to the Registrars, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

THE Economists' Bookshop, 11-12, Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History, and Social Sciences, you may wish to sell (periodicals excluded).

ROBSON, MORROW & CO. require the services of a Chartered or Incorporated accountant with industrial experience and who is interested in being trained in the development and installation of management control accounting. Four-figure commencing salary with annual increases. Send full particulars of age, education, qualifications, experience and present salary to Robson, Morrow & Co., 59, New Cavendish Street, London, W.1, marking envelope "Application."

FOR SALE: 1 Neopost Franking Machine, 6 Values, Regularly Serviced. Apply, Secretary.—Box 778.

ASSOCIATION representing a manufacturing industry with its own house in Mayfair has available exceptionally good office space, conference rooms and also secretarial services. Home offered to similar organisation desiring to share these facilities.—Box 779.

New Trade Connections

Assistance in arranging desirable trade connections in Canada is readily available through the Royal Bank. Address inquiries to the Foreign Business Department at either of our London Offices.

London Offices—

6 Lothbury, E.C.2. — B. Strath, Mgr.
2-4 Cockspur Street, S.W.1. — R. B. Murray, Mgr.

THE ROYAL BANK OF CANADA

Head Office, Montreal
Offices in New York & Paris

Over 750 branches in Canada, the West Indies, Central & South America

Incorporated in Canada in 1869 with Limited Liability.

REFUGE

ASSURANCE COMPANY LIMITED
CHIEF OFFICE
OXFORD STREET MANCHESTER 1

THE REFUGE WILL SAFEGUARD THE FUTURE

STATISTICIANS IN THE CIVIL SERVICE

The Civil Service Commissioners invite applications for five posts Statistician (Main Grade).

Candidates must be at least 28 years of age on November 1, 1951. hey must have a University degree with first or second class onours, or equivalent, in statistics, or in mathematics or economics other appropriate main subject combined with statistics; or having btained their degree in mathematics, economics or other appro-riate subject, must have been employed whole-time thereafter for least twelve months continuously on statistical work. They will e expected to have had wide statistical experience. Selection will e by interview.

Salary scales £1,000—£1,375 (men); £880—£1,200 (women); but in ppropriate cases a higher starting salary may be authorised. rospects of promotion to £2,090.

Superannuation provision under F.S.S.U.

Particulars and application forms from Secretary, Civil Service ommission, Burlington Gardens, London, W.1, quoting No. 4093/51; ompleted application forms must reach him by December 6, 1951.

UNIVERSITY COLLEGE OF NORTH WALES, BANGOR

Applications are invited for the post of Professor of Economics. he appointment will date from October 1, 1952, and the initial alary will be £1,700 p.a., with superannuation and family allowances. Fifteen copies of the application should reach the undersigned. rom whom further particulars may be obtained, not later than ecember 31, 1951.

KENNETH LAWRENCE, Secretary and Registrar.

THE Royal Bank of Canada has declared a bonus of twenty cents per share for the year ending November 30, 1951—payable December 15, 1951, to shareholders of record at close of business on November 15, 1951.

FOR SALE: 3 Felt and Tarrant Hand Adding Machines. Apply, Secretary.—Box 777.

ECONOMIC DIGEST (monthly) will keep you informed of many important items you are liable to miss in the modern avalanche of articles, reports, lectures, memoranda. Free specimen copy with pleasure from Economic Research Council, 18, South Street, London, W.1.

DIRECTOR (age 45), prosperous Shipping Company London as informed his salary £2000 Zenith, wishes change with more prospects, public school, hard worker.—Write Box "SP/123." c/o 95, Bishopsgate, E.C.2.

SPECIALISED POSTAL TUITION for UNIVERSITY, CIVIL SERVICE & PROFESSIONAL EXAMINATIONS

A Metropolitan College Modern Postal Course is the most efficient, the most economical, and the most convenient means of preparation for the General Certificate of Education examinations, B.Sc. Econ. LL.B.; and other external London University Degrees. Civil Service, Local Government and Commercial Examinations, &c.

Also expert postal tuition for Prelim. Exams. and for the professional exams. in Accountancy, Secretaryship, Law, Sales Management, &c. and many intensely practical (non-exam.) courses in commercial subjects.

More than 80,000 POST-WAR EXAM. SUCCESSES.

Guarantee of Coaching until Successful. Text-book lending library. Moderate fees, payable by instalments.

Write today for prospectus, sent FREE on request, mentioning exam. or subjects in which interested to the Secretary,

STATISTICIANS IN THE CIVIL SERVICE

The Civil Service Commissioners announce a special competition for fifteen posts of Assistant Statistician.

Candidates must be at least 21 and under 28 years of age on November 1, 1951; extensions allowed for service on a regular or short-service engagement in H.M. Forces and up to two years for other Forces service. There will be a written examination in English, General Papers, Statistics, and either Economics or Mathematics on January 3, 4, and 5, 1952, followed by interview. No degree qualification is necessary, but the papers will be of First or Second Class Honours standard.

Salary scales: £400—£750 (men); £400—£650 (women). Prospects of promotion to £1,375 and to £2,000.

Superannuation provision under F.S.S.U.

Particulars and application forms from Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 96/51; completed application forms must reach him by November 30, 1951.

YOUNG English Graduate, 14 years' administrative experience central Africa and India (pay on leaving India £1,750 p.a.), willing undertake representation or administrative responsibility in the Rhodesias for suitable remuneration.—Box 781.

Consult the World Air Travel Experts if you have to go abroad on business. We arrange trouble-free travel.

Mere Beginning

THE Conservative Government's first programme is the least that could be expected in the desperate position in which it finds the country. The lightness of the proposed legislation is entirely welcome. In this situation it is right that the controversial measure to restore university representation in the next Parliament should be deferred until later in the life of the present Parliament. Greater precipitancy in the return of the steel industry to private ownership would have served no useful purpose. In transport, reorganisation is urgently necessary and the Conservatives ought to have had a fully considered scheme ready; but if it is not ready, immediate action is best confined to the single point of giving more freedom for road haulage operations by private enterprise. The renewal of the existing emergency powers legislation for another twelve months is a regrettable necessity; the breathing space could be well used for preparing a radical measure to deal with the jungle of controls and ministerial regulations next year. And with the promised measure "for strengthening and widening the activities of the Monopolies Commission" the Government is wisely choosing one of the principal fields in which vigorous legislation can be most fruitful and need not provoke unnecessary controversy on purely party lines.

But if the legislative programme is light and useful, the programme for economic action is light and inadequate. It differs in three respects from the policy that might have been expected of Mr Gaitskell if Labour had remained in office last month. Company dividends are to be restricted by an excess profits tax instead of by statutory limitation; in the import cuts there is less emphasis on direct dollar saving than has been customary; and the promise of economy in next year's government spending is a little more definite and convincing than Mr Gaitskell could easily have made it. For the rest, the measures are those that any Chancellor would probably now have found unavoidable. Even the attempt to restrict credit goes no farther, at this stage, than Mr Gaitskell might perhaps have gone after the election.

"The seriousness of the situation," the new Chancellor said on Wednesday, "justifies any departure from precedent." He meant that he would disclose the dollar deficit in the single month of October rather than wait for the usual quarterly statement. For the rest, the present programme follows the precedents set by Labour Chancellors in the previous postwar crises closely enough. It might claim to roll into one the summer import cuts and the autumn capital cuts of 1947. On the other hand, the essential budgetary attack on inflation is postponed till April, whereas Dr Dalton at least made a first move towards it in November, 1947.

The point of this comparison should not be misunderstood. It does not mean that Mr Churchill's Government is exposed to the same blame for doing too little too late as was Mr Attlee's Government four years ago. It is not the Tories' fault that the crisis of solvency has grown unchecked to the point Mr Butler had to describe. Plain though

the growth has been to independent observers, eleven days is little time in which to expect politicians to pass from the atmosphere of an election campaign, and from the more hardened attitudes of six years in opposition, to the realities of office. What is being done at once requires no mean measure of political courage. The Conservative Government will not be condemned for the inadequacy of its first programme. It will be condemned if it supposes that this programme is much more than a first gesture to demonstrate the seriousness of its intent. It will be condemned if Ministers deceive themselves that they are as yet much nearer to solving the permanent problems of the British economy than Dr Dalton was in October, 1947. It will be condemned if they imagine that they can now wait and hope that by April things will not be so bad after all.

*

Three-quarters of the immediate programme consists in the restriction of British expenditure overseas. To slow down the accumulation of stocks of strategic materials is a necessary act of prudence. There is also no choice but to abandon hopes of increasing the food rations and some will have to be reduced. The halving of the foreign exchange allowance for tourists is harder to defend because the saving is small and the damage to international good relations may be considerable. The major economy, however, will be in imports of foods and certain manufactured goods from Europe. That is a sad, if partial, retreat from the freeing of trade among Western European countries that had stood as one of the few recent achievements of international co-operation.

Mr Butler certainly did not put the wisdom of this measure beyond doubt. He estimated that the full effect of all the measures to economise foreign exchange would be to save £350 million a year (against a deficit that might otherwise be £500 million or £600 million in 1952). He did not try to indicate how quickly this effect might be apparent in the trade returns, after existing contracts have been honoured. Yet the restrictions, and particularly the restrictions on imports from Europe, can be justified only as emergency measures promptly effective in a desperate situation. In the longer run their effects are certainly mixed and the net advantage is highly questionable. Britain is not the only European country to be pinched by adverse terms of trade. Mr Butler himself took care elsewhere in his speech to emphasise that British problems are "at bottom, the problems of the defence of the free world." The example of a beggar-my-neighbour remedy for a common problem, so promptly set by a Conservative Government here, is unlikely to go uncopied, and in a general retreat from trade liberalisation British exports may well be reduced as much as British imports. There is a particular danger that more scope may in consequence be given to the reviving competition from Germany. And, in any event, the restriction of imports by administrative action will widen the gap between supply and demand in the home market and intensify the need for disinflationary policies to reduce demand.

For these reasons the fresh bout of trade restrictionism will be justified only if it is immediately effective in restoring confidence in sterling, in persuading foreign traders and bankers that under their new Government the British people are determined to cut their coat to the cloth, to live on what they earn. The issue of confidence is decisive. The dollar deficit last month was at the rate of $3,840 million a year. That is nearly as big as the deficit in 1947 and much bigger than the rate during the six crisis months that in 1949 led to devaluation. Speculation against sterling has again reached most alarming proportions. Unless the movement is quickly reversed the dollar reserves can fall to the point of bankruptcy in a matter of months. And it is certain that import restrictions in themselves will not restore the world's confidence in sterling. They are a medicine that has been tried and found ineffective before.

The crux is in the policy of disinflation, and immediately not so much in its practical effects at home as in the sense it creates both at home and abroad that the Government is in earnest about it. For this symbolic purpose the raising of the Bank rate by a mere ½ per cent is pitifully inadequate. As is argued in an article on page 1124, Mr Butler's gradualistic approach to the use of monetary policy may in the long run be as effective as any. It has to be hoped that the outside world will also give him the benefit of the doubt. But he should be fully aware that at the best it will do so for a strictly limited time. If he prefers to go cautiously in restricting credit, then there must be no doubt about the determination behind his other policies.

*

Faith in the Government's determination must in any event be based more on the supporting evidence than on the direct monetary policy that, as Mr Butler said, cannot by itself have decisive results. From this point of view the postponement of new building is unimportant. It is avowedly intended to increase, not to reduce, the amount of building work finished next year. It will help to check inflation only to the extent that it makes some building workers redundant by getting the work done more efficiently. And since the Government sticks to its intention of building more houses as soon as possible it can be taken for granted that few workers will, in fact, be declared redundant.

The conclusion is inescapable. The effectiveness of Government policy depends almost entirely on its remaining subdivision: it depends on the promised economies in the Government's own spending next year. And it is here that the programme is most disappointingly cautious. The careful internal review described by Mr Butler will no doubt secure some appreciable pruning of the estimates that would otherwise have been presented. It offers little hope of substantial net economies. The Chancellor rejected proposals for an external review by an independent committee with the argument that it would put Ministers on the defensive on behalf of their departments. If that is true it means that their enthusiasm for economy is, to say the least, lukewarm. In that spirit no internal review will achieve large results, whatever "co-operation" Mr Butler's colleagues have promised him. To cut out "all waste and unnecessary expenditure," to defer or slow down "less essential services"—"wherever possible"—will not transform the British budget. The marginal adjustments will be welcome, but they will not rescue this island from the familiar perils that have this week been "disclosed" with so fine a flourish. If the Conservatives agree that the primary remedy must be to cut Government spending

—and there is no alternative—then they cannot possibly expect to match their policy to the urgency of the situation without cutting welfare expenditure and getting better value for it.

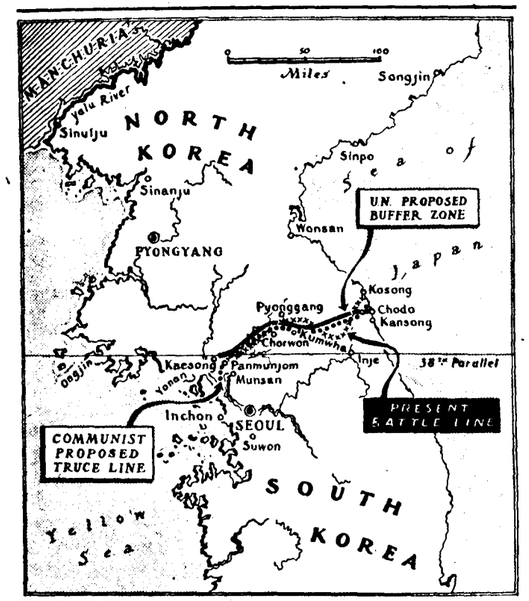
Until this is recognised the Government can offer little but the familiar prescription. It comes close to copying salvation by fleabites—the bites to be made next year. It is Labour's policy of minor expedients breeding major crises. There are, indeed, some improvements. There is a little more inclination to let the economic mechanism work—so long as it works without hurting anyone. There is a bow to economic sanity by charging local authorities the market rate for housing loans; and there is an immediate indication that sanity will not count because if need be the housing subsidies will be increased in order that the higher interest charges will not be reflected in the rents tenants have to pay. One is left wondering where the new policy is even supposed to lead. Is it, in brief, that everything necessary "to make and keep sterling strong" will be done, provided only that ninety-nine people out of a hundred barely notice it?

It is, fortunately, too soon to despair. The Government has had little time to take the measure of its problems. That measure surely cannot long remain hidden. What is at stake is, plainly, the survival of the British economy. It is not only the survival of the trade on which, as the Conservative party well understands, British prosperity and influence were built: On that trade depend also, in the absence of American subsidies, the full employment and the welfare state that the Conservative Government is rightly pledged to maintain. The cuts that will secure survival are cuts not in trade but in the excessive demands on the economy that are limiting and distorting its trade. It was never easy to be confident that a Conservative Government would have the resolution to make those cuts in time. But at least Mr Butler has given himself some breathing-space in which he may go on to more adequate remedies.

Truce without Illusions

THERE was never a moment in the Korean war when greater caution was needed than now in interpreting the news. This is because the news has begun to be good. At the armistice talks in Panmunjom much progress has lately been made in narrowing the field of disagreement about a cease-fire line; in fact, both sides have now made differing proposals about much the same thing—that the present front be taken as a basis for work by a sub-committee, while the main delegations discuss other items on the agenda. At General Van Fleet's headquarters there is also a feeling of greater military strength. The bitter summer and autumn campaigns are regarded as having secured a winter line which the enemy cannot break. Even the hard-pressed people of South Korea have plucked up fresh courage; they are trickling back to Seoul from the extremities of the peninsula and are fanning out again on their shell-torn farms.

On the other hand, all this could be reversed overnight. Neither the speeches and statements of the Communists nor their laboured handling of negotiations across the table at Panmunjom give any certainty that they want an armistice at all. During the Chinese civil war, truce talks were almost invariably used to gain time for regrouping, and in Korea there are reliable reports that the building up of the Communist armies continues apace; even if the United Nations front is strong enough to hold the enemy, something in the nature of an Ardennes offensive would surprise no one on the allied side. Russian aircraft are being used in constantly growing numbers, and the allies are no longer masters of all the North Korean air. In Peking the Chinese leaders continue to prepare their people by warning, instruction, abuse and exhortation, for a long war.



For the moment, however, the balance is on the side of progress in the armistice talks. Whatever their real reasons and whatever their long-term objectives, the Communists, having abandoned their former impossible claim to a truce line on the 38th parallel, have now proposed a line which differs by only a few miles from that put forward by the United Nations. At the same time, if the Communists are sincere in wanting an armistice, it may be that the task of ironing out these few miles may yet prove long and difficult. If they are not sincere, they could afford to yield fairly readily at this point and, having gained some propaganda advantage in appearing to show good will, could make their next real stand on one of the other items on the agenda.

On the United Nations side the armistice negotiations are virtually in the hands of the Americans. This is no more than fair and realistic in view of their preponderant share in the military effort. The other nations which have sent contingents to the Korean war may also rest on the assurance that General Ridgway and his negotiators, led by Major-General Henry I. Hodes, are being extremely cautious in their own interpretation of developments in the truce talks. There has been no let-up in American military preparedness and there is no intention that there shall be, until the last item on the armistice agenda has been agreed. The risk of slackening the effort is nevertheless a real one and it applies as much to America's allies as to the United States. It will grow with every step forward in the armistice talks themselves, a fact on which the Communists, if they are not sincere, may well be counting. The risk in fact is threefold, in respect of the military command on the spot, of American opinion at home, and of public opinion in the countries of Western Europe, where there is already a dangerous tendency to want to end the Korean war at almost any price that can be represented as reasonable, whatever its ultimate consequences.

It is difficult to see how the armistice negotiations can be anything but protracted, however willing the Communists may be to see them concluded successfully. The next item on the agenda is agreement defining the scope and precise functions of armistice commissions, appointed by each side to see that the other does not use the truce to prepare for a new offensive. Given the great aversion of the Russian and Chinese Communists to inspection in any form, it is likely to be difficult even in the most favourable circumstances to devise a satisfactory means of seeing that the Communist command sticks to its undertakings. If that hurdle can be cleared, the next item is the exchange of prisoners. Again, the Russians have a very bad record and both the Chinese and North

Koreans have so far shown complete disregard for the normal conventions of war, such as accepting inspection by the Red Cross and the ministrations of a neutral protecting power. There seems little reason to suppose that they will at all readily agree to the minimum acceptable conditions for the transfer of prisoners.

Lastly, there is the item on the agenda known as "recommendations to governments." It is here that the military armistice talks must merge into the wider political discussions that will have to take place if a truce is to be converted into peace. And it is here, accordingly, that perhaps the main obstacle to a cease-fire will be encountered. This item on the agenda refers mainly to the question of the withdrawal of foreign troops

from Korea. It thereby raises directly the problems which formed the object of the exchange of messages last January between the political committee of the UN General Assembly and the Chinese, at the time when General Wu Hsiu-chuan's mission was at Lake Success. In replying to the Assembly's statement of principles of January 13th, Mr Chou En-lai, the Chinese foreign minister, said on January 17th that the war in Korea could only be ended on the basis

> of the withdrawal from Korea of all foreign troops and of the solution of the internal affairs of Korea by the Korean people themselves; that the United States armed forces must be withdrawn from Taiwan (Formosa); and that the representatives of the People's Republic of China must obtain their legitimate status in the United Nations.

As other events intervened and as the military campaign had developed unfavourably for the Communists by the early summer, Mr Malik made his famous broadcast in June. He no longer insisted on the American abandonment of Formosa or on a Chinese Communist seat at Uno as conditions for a cease-fire in Korea. Both points had been vigorously rejected by the United Nations as in no way connected with the stopping of the fighting. In the exchange of messages leading up to the first cease-fire talks in July, however, it was plain that the Chinese continued to attach the greatest importance to the withdrawal of foreign troops, and it was only as a compromise that the question was deferred for discussion at the cease-fire talks themselves, being placed on the agenda in its present camouflaged form.

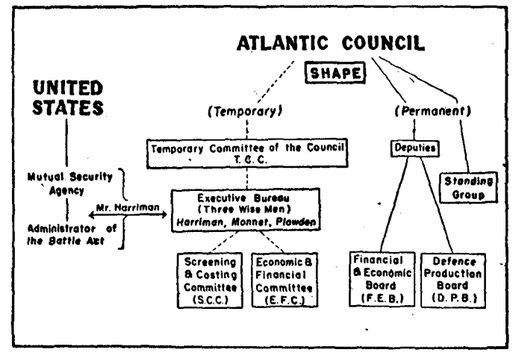
Today this problem of the withdrawal of foreign troops, during the twilight between the end of full-scale war and agreement on settled peace terms, must raise in an acute form the enigma of China's—and less directly Russia's—intentions. There can be no question of withdrawing United Nations troops from Korea until the South Koreans are in a position to defend their own interests. They can only do so if their army is bigger, better equipped and more highly trained than it was before the Communist aggression last year, and if there are clear international guarantees that another attack on them would bring the free world to their assistance. The alternative would be to reach a political settlement in which their position in a united Korea was assured—the final objective to which the United Nations is still committed. But either course implies a considerable interval between the moment of armistice and the withdrawal of UN troops. And, while it is not enough in a Communist country like North Korea to secure the withdrawal of the Chinese forces as a condition of UN withdrawal from the South, Chinese withdrawal must move in step with any reduction of UN strength.

★

As these wider questions impinge on the armistice talks at Panmunjom, it is clear that there is more and more opportunity for the Communists to prevent final agreement, while at the same time appearing to have made great concessions for peace and being able to place the blame for failure on the Americans. All depends on what they really want at the present stage, which is still a very long way short of the point at which there could be any practical discussions about the wider settlement in the Far East that the free world wants. Apart from the key questions of withdrawal of troops, abandonment of Formosa and a Chinese Government seat at Uno, Peking originally demanded that peace in Asia—as distinct from a military cease-fire in Korea—should be negotiated by seven nations, China, Russia, Britain, America, France, India and Egypt, meeting in China itself. These again are conditions which the free world could not accept, even if a settlement had been reached in Korea.

What is so far still lacking is any firm evidence of a Communist will for peace. Last February, Stalin declared to a correspondent of *Pravda*: "If Britain and the United States of America finally reject the peace proposals of the People's Government of China, the war in Korea can end only in the defeat of the interventionists." This has never been gainsaid, and as a pronouncement by the world's supreme Communist it must continue to be taken seriously. While, therefore, it is right to hope and work for the first step of all, an armistice in Korea, the wider background must never be forgotten. Fortunately, General Ridgway and his colleagues appear to be anxious—perhaps over-anxious—not to be fooled by the first impressions made by each new Communist proposal at Panmunjom. They know from the political experience of the last five years in Korea and from the military lessons of the last few months that they cannot afford to give way without obtaining specific gains in return. It is the duty of the outside world, particularly in distant Europe, to try to understand their problems and not to urge weakness when only strength can mark any real path to peace.

Europe's Arms Inquiry



THE layman is only slowly becoming aware of the fact that crucial decisions about the western rearmament for which he has to work, pay and serve are now being taken as much on an international as on a national basis. What, he asks, is happening in the North Atlantic Treaty Organisation? Who are these "three wise men" who travel so assiduously? Why has General Eisenhower been consulting with President Truman about Europe's capacity to rearm? Who is this General McNarney who has appeared in Paris with a fresh set of military experts?

To understand what has been happening since the Ottawa Conference one must go back to the time before that September meeting of the Atlantic Council. Three main bodies were then working on plans for the defence of Western Europe. In addition to General Eisenhower's headquarters near Paris there were the Financial and Economic Board, the Defence Production Board and the military Standing Group in Washington. All had planned themselves more or less to a full stop. The Standing Group had decided what forces were needed from member countries by a certain date if the Russians were to be deterred from attacking Europe. The Defence Production Board had listed the equipment that could and could not be produced in Europe without assuming any great degree of co-ordination, or the existence of an artificial stimulus such as "off-shore" purchases by the United States. It also had a fairly accurate idea of where in Europe surplus productive capacity existed, which would not be used without stimulus, of the extent to which this surplus capacity could meet the gaps in military requirements, and of the main factors preventing it from being used. In almost all countries except Britain the real difficulty lay in an unwillingness or inability to shoulder new financial burdens. The Financial and Economic Board had been analysing these burdens and their impact on economic stability. It found that the problems created by rearmament differed from country to country: in Britain the impact was mainly on the balance of payments, but in France on the cost of living. It added the reminder that, in most cases, current production plans were conditional on receiving economic aid from the United States. But the board was unable to say whether Europe's fears were justified, or what co-ordinated action could ease the burden.

At Ottawa it was clear that the three bodies working independently could get no further and that they had not got far enough. If plans were to become realities, new personalities, a fresh political impulse and a different angle of vision were required. The personalities must be strong and influential enough to be able to commit their countries to the real limit of their capacities. The political impulse must be found to stimulate international solutions and national sacrifices that were beyond the scope of mere officials. The new angle of vision was necessary to put in perspective and to relate for the first time the military needs and economic possibilities. There had to be drawn on the same graph the curve of desirable external strength and the curve of threatening internal instability; somebody had to find the optimum point where these two lines would cross.

Ottawa attempted to provide for this new task in the following manner. The Temporary Committee of the Council (TCC) was formed in Paris, with representatives from the twelve member countries of Nato. After one meeting, it appointed an Executive Bureau (the three wise men), consisting of Mr Harriman (United States) in the chair, M. Monnet (France) and Sir Edwin Plowden (Britain). They appointed two advisory groups to help them: an Economic and Financial Committee drawn largely from the permanent personnel of the FEB and a Screening and Costing Committee under the American General McNarney, who with his efficiency experts from the Pentagon is to use his scissors on the frills of the military programme.

By far the most important feature of this new temporary organisation is the position of Mr Harriman. A few weeks after his arrival in Paris, he was chosen by Mr Truman to administer the American foreign aid programmes, at the head of a new office in Washington called the Mutual Security Agency. In this office are concentrated the functions that have hitherto been

This diagram is only illustrative; it does not necessarily represent channels of responsibility.

scattered between the State Department, the Defence Department and the Joint Chiefs of Staff. It will also include the administrator of the Battle Act, which was designed to limit trade beyond the iron curtain carried on by recipients of American aid. Mr Harriman is thus at the centre of the efforts being made in Paris to co-ordinate European rearmament; he is at the same time at the centre of the organisation in Washington which will direct economic and military aid abroad.

If the first task of the "three wise men" is to find the present point of intersection between military strength and domestic stability, the second is to find ways and means of pushing this point as high up the graph as possible. To do this it was necessary to get the timetable straight, and Mr Harriman's visit to London last week-end suggests that important progress has been made. A not entirely unfounded rumour was circulating that General Eisenhower was dissatisfied with Europe's progress; and there have been many reports that he had sent a personal message to Ottawa pleading for a greater effort from Europe.

General Eisenhower is, in fact, not asking Europe, as it begins to stagger under the present strain,

to shoulder a much heavier load than that which it has already accepted. It is not the total size of the projected programme over the next three years that worries him but the fact that, in implementing this programme, countries are tending to forget the real objective of Nato. This is to deter the Russians not only in 1954, but—to the best of its ability—in 1952 as well. It is just as important—perhaps more—to have 20 divisions fully equipped in 1952, as 80 divisions in 1954. In short, the emphasis next year will be more on equipping the men already trained than on raising new divisions; and this may throw a heavier burden on American industry and a slightly lighter one on European manpower.

*

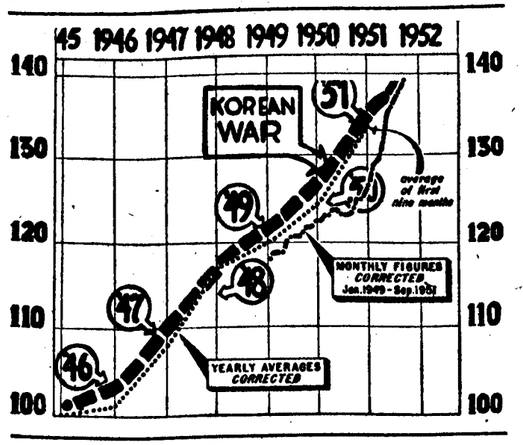
Next comes examination of the content of the programmes in relation to the timetable. The "wise men" began by asking governments for answers to a new questionnaire, designed by themselves, to reformulate as clearly as possible the information on which the financial and production boards had been working. The replies to these questionnaires are still coming in; but it is beginning to look as though the impression given at Ottawa was not very far from the hard reality. Rearmament is a serious threat to the internal stability of Europe.

To some extent the remedy lies in the hands of the separate governments, through the fiscal policies and physical controls which they may or may not feel able to adopt. The Paris committee has to try to screw up its political courage to the requisite point. Yet, even if all are as brave as they ought to be, the dangers will still be great. They can be lessened in two main ways. It may be possible to cut the cost and wastage involved in raising and equipping the armed forces, without impairing their fighting efficiency. Their arms may be too elaborate; their training may be too comprehensive; and their eating and dressing may be too lavish. These and similar questions are being examined by General McNarney and his group. In the wider sphere, the three wise men may have to consider whether the present world-wide distribution of troops is best calculated to keep the peace. Are the Americans protecting the Pacific too well and Europe too little? What should be the balance of strength as between the Far East, the Middle East and Europe? These are global questions and it is not clear who is to answer them; but those who are trying to lighten the burden in Europe can hardly avoid the necessity of doing so.

A second way of lightening the burden is co-ordinated action. A number of people have been talking for the past year about a co-ordinated arms programme, yet practically the only co-ordination that has emerged from it all has been the one-way flow of arms across the Atlantic. It is now clear that there will be no co-ordinated arms programme, in the sense that Europe and America can never be regarded as a single arms production unit and the Nato forces as a single arms market. But if this is impossible, there may yet be co-ordination of a supplementary kind. Where there is unused capacity in Europe that can fill gaps in the military programme at a reasonable cost, it may be possible to use it by some system of joint financing. Instead of selling Belgian and German steel for dollars across the Atlantic, it may be better to divert it to France and Britain, where rearmament programmes are being threatened by the lack of steel and by the lack of dollars to buy it from America.

Finally, the wise men cannot fail to look at the question of American aid. They must consider first how the aid already granted by Congress can be used to the best purpose. Who has first call on the economic aid? Should some of the military aid be used, as Congress finally agreed that it might, for placing contracts for arms in Europe where surplus capacity exists? Or is it quicker, more efficient and cheaper to concentrate it in supplying finished American weapons? They must consider, too, whether Congress granted the aid in the most useful form. It may prove to be healthier for Europe to receive more dollars to keep its civilian economies steady and fewer to defend its frontiers. Mr Harriman will have to decide whether he accepts this thesis and, if so, whether he can ask Congress to alter the existing appropriations accordingly. It is a further object of the Paris exercise to advise Congress on the amount of aid for which it may have to be asked in the next two or three years—and Congress expects detailed advice when it considers next year's appropriations in January, 1952.

Contest in Curves

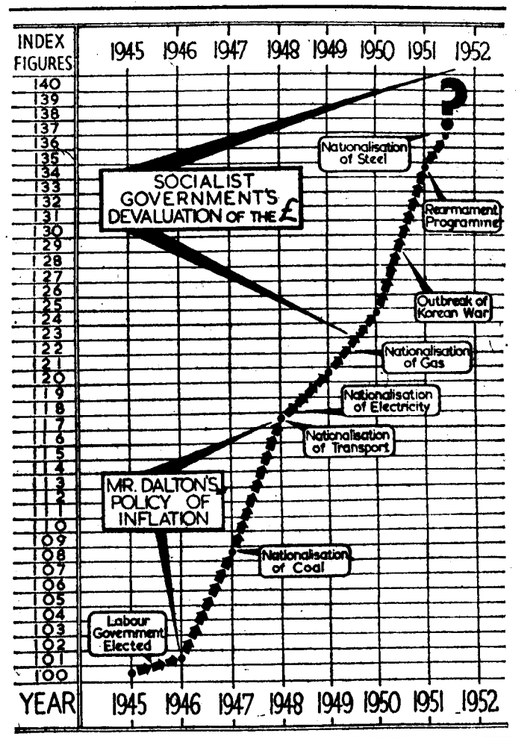


TELEVISION has let loose upon the unsuspecting public a new medium of misinformation—the graph. Even more than statistics, graphs can seem to prove almost anything. Their use or abuse stimulated one of the few lively exchanges in the recent election campaign. Mr Eden introduced into his television broadcast a graph (the first of the two reproduced on the next page) showing the rise in the cost of living since 1945. This was roundly denounced by Mr Christopher Mayhew as a "fake"; or rather, to be exact, Mr Mayhew first attacked a similar graph distributed in Conservative leaflets and publications, and also reproduced on the next page. Later he applied the same strictures to the one shown by Mr Eden.

The main point of Mr Mayhew's criticism was that the rise in the cost of living had been made to look much steeper than it has actually been by the device of lengthening the vertical axis and shortening the horizontal one; and he produced for his audience a "counter-fake" in which the units on the vertical axis were compressed while those on the horizontal axis were spread, so that the curve was almost flattened out. He also showed an "honest" graph, which, he claimed, fairly represented the rise that had taken place.

The controversy was continued in a vigorous exchange of letters published in the press. It did little to clarify the original point. Is the "honesty" of a graph dependent at all on its scale? Certainly there is no one scale that alone produces an honest result. Technically any graph is accurate which has the scales correctly marked and the points correctly plotted, and, if these two conditions were satisfied the Conservative graph and Mr Mayhew's counter-fake would be, mathematically speaking, equally accurate. To represent the rise in prices by an upward curve is, after all, merely symbolic, and no one gradient is right. There are, however, good graphs and bad graphs. A good graph strikingly represents the points brought out in the accompanying text; its function is to make truth leap to the eye. The scale obviously must depend partly on the dimensions of the paper and on the number of units which it is desired to show along the axes; in the accompanying charts, for example, the curves would have been even steeper if an extra year had been included and the length of the horizontal axis left unchanged. Moreover, a good graph should generally be drawn on such a scale that the curve adequately fills the space allotted and does not leave a desert of unoccupied graph squares.

*



By these tests the scales of the Conservative charts are fairly satisfactory. On the first test, the truth that leaps to the eye is that there has been a very steep rise in prices. Whether it is greater or less than the rise that has taken place in other countries is beside the point, which is that the rise since 1945 has probably been steeper than in any other six years of peace. If that were not so the Conservatives would have had nothing to gain by propaganda about the cost of living. But since it is so,

it is surely perfectly legitimate to represent what has happened by a sharply ascending curve. In the graph shown by Mr Eden in his broadcast the scale was to some extent determined by the dimensions of the television screen. It is true that the draughtsman made the curve steeper than it need have been by not using the whole of the horizontal axis, but some sharpening of emphasis is accepted practice in election broadcasts. And apart from this the curve adequately filled the picture. The same could not be said of Mr Mayhew's counter-fake, where the extension of the vertical axis left the lower three-quarters of the graph as a vacant space. Nor was the flat curve which thus resulted a telling symbol or a good illustration of what everyone has believed himself to be experiencing during the past six years. If they were plotted on Mr Mayhew's scale, prices during many peacetime periods of six years would be represented to the naked eye as perfectly straight lines.

But if the scales used did not justify Mr Mayhew's charges that the Conservative graphs were "fakes," the plotting of the curves put him on firmer ground. The graph used in Mr Eden's broadcast must be one of the worst pieces of plotting ever perpetrated. In the first reproduction, correct curves—in so far as they can be correct on an inaccurately drawn grid—are shown

beside the bricks so erratically dropped by the Conservative chartist. All the lines are drawn from the figures of the London and Cambridge Economic Service adjusted to the base of the average for 1945 equals 100. It would seem that the points shown on the axes marked 1945 to 1950 are averages for each year. That would be legitimate if it were consistent throughout the curve. But the chartist has not wished to deprive himself of the latest and highest figure, and has therefore switched

without warning to monthly figures. This is quite impermissible; the only way to include annual and monthly figures on the same chart would be to show two separate curves, such as are here superimposed on the original chart. But if monthly figures appear at all, the annual figures would more fairly have been attributed to the middle of each year, not to the beginning; for if the last point on the graph refers to the latest month, then the yearly axes refer by implication to the beginning of the year, which is an inappropriate position for an average referring to the year as a whole.

The other Conservative graph is made particularly misleading by its labels about the nationalisation of coal, gas and electricity. The connection between nationalisation and prices is remote, and the real criticism is not that the products of these industries have driven up the cost of living, but that in the present fuel shortage they have been kept too cheap.

This graph is rather more accurately plotted than the other, but it commits the same solecism of mixing annual and monthly figures. The effect is to iron out the fluctuations from the beginning of 1950 and to make the rise in prices during the past twelve months look less steep, compared with the rest of the curve, than it has in fact

been. The mistake has provided the basis for some misleading statements. Mr Eden made the point that the cost of living had been rising ever since 1946 "at an almost continuous rate." "You can see," he said, "that . . . the rate's exactly the same." The implication, more crudely put in Conservative literature, is that the main cause of the recent leap in prices is not Korea and rearmament but "Labour muddle, mismanagement and misrule." The fact is, as the curve of monthly figures shows, that prices were levelling off in the first half of 1950, and have risen precipitately since. It is quite true that the rise in prices in the second half of 1950 was not the consequence of the Korean war, since the steep rise in raw material prices did not immediately affect retail prices. It was rather the delayed consequence of devaluation, for which the Labour Government must be held responsible; it was in 1951 that the effects of devaluation and the American recovery of 1949 were reinforced by the commodity boom and rearmament.

But these are matters of interpretation. The inaccurate plotting of the Conservative charts remains. If any organisation but a political party made half the mistakes it would certainly owe its readers an apology and a correction. It is a solemn thought that the political education of the nation is to a great extent in the hands of the party propaganda departments; and while it is too much to expect that the material issuing from them should be objective, it should at least be scrutinised for its accuracy far more carefully than appears to be done at present.

NOTES OF THE WEEK

Disarmament and Rearmament

There is, at first sight, much that is grotesque in the spectacle of the western powers proposing disarmament at a time when so much of their energy and thought is devoted to rearmament. It is only too obvious that nations cannot disarm and rearm simultaneously. Moreover, the value of such grave and appealing words as "peace," "disarmament," and "inspection" falls steadily every time that they are used to stimulate futile hopes and vague speculations. Sincerity and integrity must be respected in these matters, if the free world is not to fall into the Communist habit of double talk and double think.

Yet President Truman and Mr Acheson were certainly right to take at the United Nations the initiative in putting forward new disarmament proposals that provide for full disclosure of military strength, control of atomic as well as conventional weapons, and international inspection. For four years the Russians maintained preponderant armed strength (Beria boasted of it on Tuesday) in a disarming world. They demonstrated how it is possible to have simultaneously a rearmament policy and a disarmament policy. What they did in a spirit of cynicism the western powers are attempting to do in a spirit of sincerity. Mr Vyshinsky will make a grave mistake if he treats the proposals without respect, for the free world does not want an armament race if it can be certain of peace without it. If there is an element of political warfare in the whole matter, that could hardly be avoided. The Americans could not be expected to sit down indefinitely under persistent charges that they are preparing a new war. To be more insistent, more specific and more spectacular than the peace campaign itself is legitimate diplomacy in the circumstances of the day.

There is also this to be said for the move. If the Russians are not frightened by the present strength of the west—16 divisions in Germany and an inadequate tactical air force can hardly keep Marshal Bulganin awake at night—they may well be worried by the rate at which that strength is increasing. Experience suggests that they seek negotiation at the point where concern is on the point of passing into real fear. That cannot be very far off; and the western offer may therefore prove well-timed. The Russians might, after some delay, see in it an opportunity to show their willingness to deal with the root cause of tension—the cause of which rearmament is only a symptom. And if it is asked what the root cause is, the reply is that the free world cannot accept the assumption that the Soviet Union and its allies are entitled to expand and exploit the political and military position that they gained as a result of the war. There will be no reality either in the UN or any other discussions until more particular matters are bargained about; and the western disarmament proposals rightly stipulate that there can be no disarmament while fighting goes on in Korea.

The Voice of Beria

At the time of going to press the complete text of the speech made last Tuesday in Moscow by Lavrenti Beria was not available for the full analysis that these annual declarations in celebration of the anniversary of the October Revolution deserve. At first sight, it looks like a defiant and warning utterance, to the effect that the Soviet Union, too, acts from strength. And part of that strength—perhaps the major part—in the Kremlin's eyes lies outside the Soviet Union in the subversive peace movement, in the "national liberation movements" of the Far East, Middle East and Africa, and in the economic crises to which rearmament is said to be leading the capitalist countries.

Of more immediate interest is the information given by Beria about the development of the Soviet economy. He claimed that the level of Soviet industrial production is now twice as high as in 1940. Since one of the purposes of his speech was to stress that the Soviet Union is not afraid of its opponents, Beria displayed statistics on the growth of Soviet heavy industry—and the figures look impressive.

According to this senior member of the Politburo, this year's crude steel output should exceed last year's by 4,000,000 tons; rolled steel production should be 3,000,000 tons above that of 1950, and pig iron production greater by 2,700,000 tons. Coal and oil extraction have risen by 25 million and 4,500,000 tons respectively. (As in Bulganin's speech last year, the current year's figures probably refer to annual production based on 10 months' output.) Thus the Soviet Union may now be producing annually about 285 million tons of coal, 42 million tons of oil, 22 million tons of pig iron and 31 million tons of steel—"more steel than Great Britain, France, Belgium and Sweden put together," Beria boasted.

Comparing this growth with the development during the Five-Year Plan, it appears that if the rate of increase is now slightly lower—which was to be expected—productivity is at least as high. This must involve a tremendous effort, probably at the expense of the consumers' goods industries. Beria's references to the light industries and to agriculture were notably reticent. It is likely that all resources are now being harnessed to keep up the pace of development in the basic industries, and to reach the long-term aims set up by Stalin earlier than was originally expected.

This may be one of the clues to the Soviet unwillingness to publish a new Five-Year Plan. True, Beria stated that the annual plan for 1951 will be exceeded, but he did not say what the targets were. Nor has a new Five-Year Plan been proclaimed, though 10 months have elapsed since the end of the former one. Such intervals, however, are not unusual in times of tension. In the present international situation the Soviet rulers will think twice before revealing their plan, and allowing an insight into the national economy.

* * *

Quiet Beginning

The keynote of Mr Churchill's first speech in the new Parliament was the same conciliation of the Opposition that marked his Cabinet building in such matters as the appointment of Sir Walter Monckton to the Ministry of Labour. The angry Mr Churchill who used to glower from his place on the Opposition front bench, or who delighted in taunting Labour backbenchers into uproar, was replaced on Wednesday by a benign, paternal figure determined to smile at gibes from Labour interrupters and, above all, to resist the temptation to blame the period of Labour administration for the nation's troubles. With equal determination, Mr Butler on Wednesday avoided the temptation to suggest that the economic crisis was something new which had been discovered only when the Conservatives got their "look at the books."

The legislative programme will provoke little immediate controversy. Legislation on the university seats is to be held over until a later date. No direct denationalisation of transport is promised, though "the extension of private road haulage activities is to be made possible." Repeal of the Steel Act is to be held over until after Christmas. Moreover, the Christmas recess itself is to be almost doubled in order to give Ministers a breathing space in which to sort out their policies.

Labour is greatly annoyed at this plan. It feels that Mr Churchill has changed the rules in the middle of the game, and called for a longer half-time just because he is now on the defensive. It would certainly be regrettable if shorter sessions, curbing as they would Parliament's duties of inspection and inquiry, became the general practice; and it is unfortunate that the price of the curtailment is to be paid primarily by private members, who have been deprived of their time for bills and motions before Christmas. But the government can hardly be blamed for taking the extra period for reflection and administration on this one occasion. In 1945 Labour had two months of the summer recess in which to prepare its programme, and the Conservatives are entitled to a similar break. The legitimate fear is that the long recess suggests a lack of advance thinking by Mr Churchill and his colleagues. In so far as they need the long Christmas recess to form a policy, and not just to apply a policy already formed, their action is an unhappy portent.

Apart from the issue of the Christmas recess, Mr Attlee was reluctant to engage in a major action at this stage of the session. He promised that Labour in opposition would be "vigilant but not factious," and contented himself with tilting gaily at the thinness of the King's Speech, at the absence of "any clear line of policy except negation," and at the number of peers in the Cabinet. The Labour party plainly has some hopes that the Government's life will be short; and Mr Attlee, in particular, concludes that the party should stick to an attitude of responsibility in opposition. In this he apparently has Mr Bevan's support. Having reached, by chance or design, a Parliamentary situation that suits him in every way, Mr Bevan is preparing to don the garments of sweet reason and moderation and to make a real bid for leadership of the Labour party. But the past is not so easily forgotten. At Wednesday's meeting the party executive dug up a hatchet they had buried for the duration of the election campaign. There was a heated discussion of the pamphlet "Going Our Way," so inopportunely published the day after the election announcement, and a resolution was passed deprecating its strictures on certain trade union leaders. For the future, however, it looks as though Mr Morrison will have a rival as the advocate of moderation.

* * *

Off the Record

One proposal made by Mr Churchill on Tuesday is greatly to be regretted. That is his decision to ask Parliament to debate defence in a secret session. The Prime Minister's motive was not, he explained, that he intended to divulge to the House of Commons secrets unknown to the general staffs of Europe and America. But he thought that members "should be equally well informed" and that "it is better that we should talk these matters over among ourselves in the first instance without what we say becoming a matter of headlines and discussion all over the world."

This is a complete and damaging distortion of Parliament's function. The House of Commons is the place where Government policy is explained, criticised and defended for the benefit of the public. It exists to lead the continuous popular debate on Government actions that is the essence of democracy. In order to fulfil that purpose the Parliamentary debate must be conducted on the same terms, with the same information, as those possible for the wider debate in the country. In war, under a coalition Government, circumstances are exceptional. Normal political debate is suspended. Parliament can legitimately turn to more technical issues of detailed military policy, issues that cannot be sensibly discussed without some secret information. But as long as the cold war does not rule out normal political controversy it does not create the special circumstances that may justify secret sessions in wartime (though even then their value is open to doubt).

A secret session has obvious attractions for any Government engaged on a heavy defence programme. It eliminates some unfair criticism based on inadequate knowledge of the facts. But is that a net gain even in the short run? The same criticisms will still be made by people outside Parliament, and if Ministers feel unable to answer them without giving away secrets it is hardly to be expected that the ordinary member will be more successful. Even in a secret session he cannot be fully informed on the most vital points of defence policy. A mere fringe of special knowledge is unlikely to make him better at explaining the necessity of particular defence measures to his constituents than he would be if he were convinced of their necessity without special knowledge. And, on the other side of the account, a secret session can only too easily breed new rumours and alarmist speculation.

If Mr Churchill wants Parliament to act as a Council of State on defence matters he would do far better to continue the practice of the last Government, which invited the principal Opposition leaders to private talks. More facts can then be disclosed, clear boundaries of secrecy can be set, the party leaders can be left to indicate to their followers what lines of criticism are mistaken, and outside those boundaries debate can be free for all. What is chiefly needed is not a secret session but one of those detailed accounts of the state of British defences, and of the strategic position, at which Mr Churchill excelled during the war. No one can strike better than he the right balance between the need for security and the need for public understanding, and he makes a grave mistake to limit his audience to the House of Commons rather than to the country whose discussions the House should inform.

The Risks in Egypt

There can be no doubt about the policy of the new British Government towards Egypt. The King's Speech at the opening of Parliament, the reinforcing of the Canal Zone, and the terms of a strong British Note delivered in Cairo, together make its intentions plain. Whether or not the Egyptians ultimately take part in the four power defence command, the British declare that their army is, by right and by Egypt's agreement, responsible for the defence of the Canal Zone until 1956, and will remain so. The fact that all Egyptian parties readily invited it to undertake this task when they felt a danger of war is not altered because they fail to sense or acknowledge that danger now. Meanwhile, arrangements for the four power command are going ahead. Cyprus, Crete and a port in Turkey are all being canvassed as possible sites for its staff headquarters.

The British position in Egypt has its weak as well as strong points. Of the latter the most important is that Britain has American support. This it will retain so long as the troops do not go too far in their tendency to assume more Egyptian civil functions than are strictly necessary to their own security within the limits of the treaty. Physically, also, the position is strong. An army cannot be elbowed out as the oil company employees were elbowed out of Abadan. A dearth of water is the main danger in the towns of the Canal Zone—Suez, Ismailia and Port Said—since all are dependent on the sweet water canal from the Nile for supplies in any quantity. The problem of drinking water can, however, be solved by tanker and distillation plant.

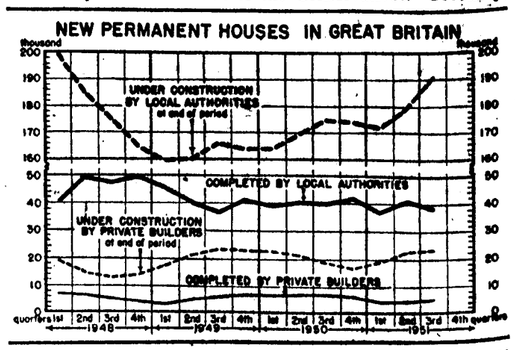
The weakness of the British position lies in the likelihood of serious disturbance inside Egypt. There is more than a possibility that the so-called "freedom battalions," which the Egyptian Government condones, will turn their weapons and guerrilla tactics not against the bristling British army but against the easier game of their Egyptian critics. If insurrection became suddenly nationwide, the task for the British would be clear; kings and pashas might even appeal for succour. But if, as is more probable, incident daily piles upon incident, the decision for or against measures to check incipient insurgence may prove difficult. The British may be tempted to take them, whereas the Americans are traditionally averse to such interference. Efforts must be made to avoid premature action on marginal cases. For such action might disastrously impair the new-found and valuable unity of American and British policies.

* * *

The Shah and Dr Mossadegh

Dr Mossadegh has overstayed his time in Washington. The Shah has now informed him that the worsening state of government finances at home and the temper of public opinion in Teheran, do not warrant further dalliance, and that he must come home. But, as well as outstaying his welcome, he seems to have overcalled his hand. American sympathies, which were with him when he arrived, have been alienated by his incapacity to do more than strike negative attitudes. His stream of American visitors has found him unable to come to any decision as to how to work the Persian oil industry so as to produce even a fraction of the oil, and indeed of the revenue, that were customary in Anglo-Iranian days. (It should not be forgotten that, in the financial year which ended last March, the Persian Treasury received from the British oil company £21 million in royalties and advances on royalties, and £17 million in taxation and in profit on the exchange rate which it imposed upon the company). The Americans have also found Dr Mossadegh all too ready to proclaim the empty state of the Iranian treasury, but too unready to admit the hard fact that Persia as a whole is not as yet bankrupt either in sources of taxation or in foreign exchange. Bad management, not penury, is the cause of its budget deficit.

Dr Mossadegh, in his unwisdom, dealt an even further blow to American belief in his sagacity. In explanation of the demonstrations which have been occurring in Teheran, he made his only recent public pronouncement. He laid the trouble at the door of "agents of the oil company." This parrot-cry disillusioned many surviving believers in his judgment and capacity.



How far he should now be helped to remain in power depends on two factors. One is his reception upon his return—a matter that is in doubt in a capital most of whose leaders of thought are confirmed weathercocks. The other is the degree of probability that if he falls, a Tudeh coup will ensue. American and British observers have lately been at variance on this important point. The Americans have argued that the danger is imminent, the British that the Persians are playing their ancient game of over-stressing the Russian danger to America, and the American danger to Russia. The two embassies in Teheran are within a stone's throw of each other. It would be disastrous if at this important moment they were unable to furnish a common appreciation of the local situation. This is needed, for it is a basic ingredient for the formulation of policy.

* * *

Housing—Labour's Account

The latest quarterly housing returns* bring the story of the postwar housing programme up to September, 1951, and are, therefore, the closing chapter of Labour's administration. At this date Mr Attlee's government had 961,000 new permanent houses to its credit, 157,000 temporary houses and 338,000 adapted or repaired houses, making a grand total of 1,456,000 new units of accommodation. Probably over 5,000,000 people have thus been rehoused during the six years.

The new government starts with certain advantages. As will be seen from the diagram, the number of houses under construction is rising. When these houses are completed the credit may seem to be due to the Conservatives. Secondly,

the vogue for cheaper houses has spread. Dr Dalton at length shouldered the unpopularity of seeming to lower standards and Mr Macmillan can take advantage of the change without the opprobrium of having initiated it. Thirdly, many local authorities will welcome the proposals to increase the scope of private enterprise. High costs of building have set them intractable problems. The burden of additional rate subsidies is heavy, and it is unpopular to raise rents. A number of local authorities will therefore be well pleased if their building programme is lightened.

In his statement on Wednesday Mr Butler expressly exempted housing from the three months' moratorium on new building of other kinds. All he said was that starting dates would be reviewed in order to ensure a smoother programme. The long-term scheme has not yet been worked out, but it is clear that no sudden changes of policy are planned in the immediate future.

BERMUDA

A Coral Island Holiday after your New York trip

Bermuda is favoured above most corners of the world. Its gentle climate, its beaches of warm pink sand and its flowering trees, the charm of its old buildings and the comfort of its modern hotels make Bermuda a very special place indeed. You can play golf or tennis, swim or sail, go game-fishing or riding, enjoy carriage drives and dancing under the stars. And you can relax—for Bermuda is above all a restful place, where work-a-day cares float away on the warm water of the Gulf Stream.

One of the regular routes from London to Bermuda is via New York, from which, in any case, Bermuda is readily reached. Why not take advantage of this, and enjoy a break there on your way home from a business trip to America. The currency is sterling. No limit on the amount you may use there.

Write for free illustrated booklet and information about fares and hotel charges, to P.R. Officer, Bermuda Government Information Office, Regent House, 89 Kingsway, London, W.C.2 (Tel. Holborn 0487), or any Travel Agent.

A PLEA

TO MANAGING DIRECTORS AND SENIOR EXECUTIVES

★

Their Own Drive Vital In Speeding Scrap Supplies

THE production and delivery of everything used or consumed both by British Industry and by the individual Briton depends on steel output. If that is not adequate our entire national economy must inescapably crash.

Today the crucial problem facing the steel industry is the shortage of Scrap. For lack of it many furnaces are shut down—producing nothing. It is imperative that every ton of usable Scrap that can be found should reach the furnaces at the earliest possible moment.

The Scrap Drive is doing grand work, but it must be accelerated. To that end, what is especially needed is that managing directors and other senior executives in industry should take a personal hand in the matter. Realising its unbounded importance, they should, in their own interests, cause the whole Scrap position in their works to be investigated and should satisfy themselves that deliveries to Scrap merchants (whose job it is to sort and process the Scrap) are not even one hundredweight short of the very maximum.

In particular, all old plant and installations which are no longer capable of playing a part in production should be scrapped.

This Advertisement is inserted by GEORGE COHEN SONS & COMPANY LIMITED, who will most willingly collaborate in every way possible.

Half a Million Vacancies

Sir Walter Monckton, the new Minister of Labour, has lost no time in assessing the problems he has to face. It was recorded in the King's Speech on Tuesday that the Government

> view with concern the serious shortage of labour, particularly of skilled labour, which has handicapped production in a number of essential industries. They will review, in consultation with representatives of those concerned, the possibilities of making available more labour for those industries and of ensuring the best use of the existing labour force.

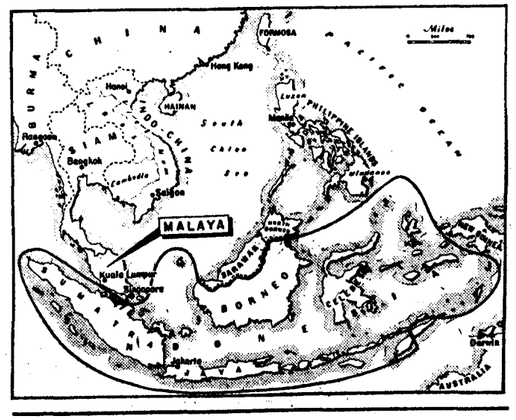
On Wednesday Sir Walter told the National Joint Advisory Council that on August 29th 446,000 jobs were known to be vacant. And he added that "something like 400,000 to 500,000 more workers will be needed in defence production in the manufacturing industries" when the rearmament programme "is in full stride." Most of them will be needed in the engineering industry, the vehicle building industry, the aircraft factories and the Royal Ordnance establishments.

These demands are formidable. They constitute, as Sir Walter told the British Employers' Confederation's conference at Leamington last week-end, the gravest problem that the Ministry of Labour has to face—almost as grave, indeed, as the problem that faced Mr Ernest Bevin when he joined Mr Churchill's Government in 1940. Sir Walter will not be able to solve it unless he can enlist, as Mr Bevin did, the active support of the trade unions on the one hand and of employers on the other. There is no quick and easy way of finding half a million men or women to fill half a million necessary jobs. Devices like a new Control of Engagements Order could work only if both sides believed them to be enforceable—as they certainly did not do when Mr George Isaacs was rather feebly attempting to operate such control in 1947 and 1948. A more comprehensive direction of labour is certainly out of the question in the present industrial and political atmosphere. It could not in any event be effective by itself. Whatever the administrative or other machinery, the extra half-million workers for essential industry can be found only by lessening the demand for labour by inessential industries producing for the home market. Sir Walter's problem, like so many others, can be solved only if Mr Butler's measures for disinflation are effective.

* * *

India and China

Two recent news items concerning relations between India and China show a certain significant discrepancy. The one that has received the greater publicity was the statement to the press made by Mr Panikkar, the Indian Ambassador to China, on his return from Peking. It was to the effect that the Chinese People's Government should not be regarded as a Communist regime and that its foreign policy does not differ from that of past rulers of China. The other item is the abrupt cancellation by a Chinese cultural mission visiting India of a proposed trip to Kashmir, as a protest against the Kashmir authorities' admission of some Kazakh refugees fleeing from the Chinese Communist conquerors of Tibet.



The question of the Kazakh refugees is not in itself of any great importance. They are anti-Communist tribesmen from Soviet Central Asia who more than a dozen years ago fled from Soviet planning to Chinese territory and, now that China also has gone Communist, are seeking a new home. But a major issue of principle is involved, for the right to grant asylum to political refugees is one which must be asserted by any government that claims to base itself on political liberty and respect for human rights. If a democracy once agrees to hand over refugees on the demand of a totalitarian state, its moral integrity is gravely impaired. Communist China, after having grandly ignored Indian protests at its policy of subduing Tibet, has now in the best Soviet style demanded that India shall not admit any refugee Kazakhs from Tibet. It has been reported that policy in Delhi has been to refuse admission to the Kazakhs, but the local Kashmir State authorities seem to have been more lenient—possibly because they expect in the near future an agitation for the union of Ladakh, the Tibetan-speaking region of Kashmir, with Chinese Tibet, and are not averse to having some reliable anti-Communists settled in that area. So the Chinese mission, which is supposed to be a purely cultural body, insolently cancels the arrangements made by its hosts in order to bring pressure on India.

The only course compatible with the dignity of a sovereign state in such circumstances would be to give the Chinese cultural delegates their tickets back to Peking by the next airliner. But the Indian Government seems resolved to put up with affronts from China which it would not accept from any other nation. It is this attitude of weakness and subservience which destroys any prospect of success in the policy of Indian-Chinese *entente* for which Mr Panikkar has worked so hard. It may be admitted that he has won for himself a position such as no other non-Communist diplomat enjoys in Peking; but so far, as the rest of the world sees it, it is not China that has been drawn away from Russia, but India that has been drawn away from the company of the free world. It is not China that concedes anything to India, but India that makes surrenders of interest and political principle to China. The Panikkar policy will pay no dividends until India is ready to negotiate from strength, both materially and morally, in dealing with China.

Morale in Malaya

The news from Malaya is not good. The improvement that had been hoped for by the end of the year does not now look like appearing. The murder of Sir Henry Gurney, the High Commissioner, has undoubtedly given a fillip to Communist morale; during the month since he died the security forces have suffered more casualties than in any similar period since the emergency began—while at the same time failing, in spite of a special effort, to kill or capture more than one man in ten of the guerrilla band which ambushed the High Commissioner.

It would be wrong to suggest that the government has suffered a serious reverse; the increased activity also led to the killing of 91 Communists during October, which is the highest figure for six months. But the situation, by merely remaining the same, is in fact getting worse. The lack of any real proof that the government has the measure of the guerrillas is beginning to undermine morale in both the European and Asian communities; the fact that rubber output is now falling may be a sign of this.

On paper, progress is still being made. Resettlement of the Chinese squatters, for instance, has now been virtually completed, the flow of information to the security forces continues, and the police and administrative services are recruiting a few more Chinese. But statistics do not give the whole truth. The government has failed to harness the wave of public sympathy created by Sir Henry Gurney's death. Moreover, many leaders of Malay, Chinese, Indian, European and other civilian opinion can still claim that they have not been properly consulted on the direction of the campaign against the guerrillas and the methods of waging it. An attempt was made to do this last month by expanding the Federal War Council, but that should have been done long before. Even now there is still a danger that the new move, while a step forward administratively, will not go nearly far enough in creating the new atmosphere of trust and confidence between the government and the people—particularly the Chinese—that is needed.

A heavy responsibility will rest not only on Mr Oliver Lyttelton, the new Colonial Secretary, when he visits Malaya later this month, but also on a new High Commissioner, whose appointment in this vital post is now overdue and cannot be delayed much longer without damaging Britain's power of leadership in Malaya. Mr Lyttelton should urge not only greater military pressure on the guerrillas but also an overhaul of the government's public relations policy and propaganda methods.

M. Pleven's New Plan

The fact that the French National Assembly began its new session on Tuesday, the same day that the United Nations Assembly opened on the other side of the Seine, is not the only connection between the two bodies. The presence in their capital of the diplomats of sixty nations, and the hope that during this international gathering France may be able to play an impressive role on the world stage, are factors which may induce French politicians to give a longer lease of life to M. Pleven's highly insecure government. The general mood among the deputies was not, however, sober enough to prevent them defeating the government on the first day of the new session. Fortunately, no question of confidence was involved. M. Pleven later secured a vote of 518 to 101, the Communists being alone in opposition, for his general programme of work.

The French Prime Minister is, indeed, compelled to lay before the Assembly a programme of work rather than a policy, for prolonged consultations during the six-week recess have failed to provide him with a united majority. The Gaullists and the Communists are as intransigent as ever, and the Socialists are only prepared to support the government on terms repellent to the right wing of M. Pleven's coalition. The Prime Minister deserves praise for not allowing this situation to reduce him to complete inaction. Instead, he has presented the deputies with a timetable and with the chapter-headings of a series of essential tasks; in the first nine weeks of the session he proposes to put forward a budget, a new wage-price sliding scale, and some modest constitutional reforms, and between January and April he wants the Assembly to take decisions on social security, the right to strike, fiscal reform and reorganisation of the State railways. This at least means tackling first things first, for the budget problem and the new inflationary trend are at the heart of France's present troubles.

According to M. Pierre Courant, Minister of the Budget, revenue for 1952 is unlikely to exceed 2,900 billion francs, while expenditure will total 3,275 billion even if the military estimates are kept down to 800 billion; but the Defence Ministry is asking for another 350 billion francs, which would mean a serious increase in the rate of inflation unless the Assembly could find a majority willing to vote new taxes or to cut down civil expenditure. No such majority is in sight. The whole future of France's defence programme is thus gravely endangered. French officials lay particular stress on France's dollar deficit and on the enormous cost of the campaign in Indo-China.

New Obstacles to German Reunion

Dr Adenauer and Dr Schumacher, partners for once, share the credit for asking the three western occupation powers to propose a UN commission to investigate existing conditions for elections in Western Germany and the Soviet zone. The request came from the *Bundestag*, as part of its reply to Herr Grotewohl's proposal for an all-German conference to discuss elections and a peace treaty. Dr Schumacher has rightly insisted that elections cannot be held unless the Russians are really prepared to permit them on terms satisfactory to the western powers as well as the Western Germans. The discussion at the United Nations should put Russian sincerity to the test. It will show whether the sole purpose of the Eastern German offer was to start interminable discussions about elections, and to trap the western political leaders into demanding a peace treaty and the withdrawal of occupation troops.

United Nations commissions are very unpopular with the Kremlin, and the indications are that it will not feel inclined to accept one in its zone of Germany. There have been suggestions from Soviet German quarters that any inquiries could well be held by Germans from all zones, under the supervision of the occupation powers. And, on legal grounds, Mr Vyshinsky can doubtless claim that the UN has no right to interfere in occupied territory which—since the Soviet Union has not ended the state of war with Germany—is still that of an ex-enemy. Whatever he says, however, a round is likely to go against Moscow in this particular bout. If a UN commission should be appointed, its work would entail delay in the reunion of the western and Soviet zones, which could be used for concluding the various agreements which will link Western Germany with the Atlantic community. It is no easy matter to create this partnership and time is essential if there is to be any hope of success.

Though many Germans fear the consequences of a shotgun wedding with their fellow-countrymen across the Elbe, the dread of being branded as unpatriotic keeps most of them silent. This is not true of the Bavarians, who are still strongly anti-Prussian, and federalist to the point of separatism. The Bavarian Premier, Dr Ehard, has protested against the Bonn Government's draft law, which lays down conditions for all-German elections and for the status of the national assembly which would be formed after they were held. He has, it is reported, insisted that the federalist principle be upheld, and the assembly confined to *drafting* a constitution; this is in opposition to the Social Democrats, who would like it to assume at once the legislative functions of a centralised government. This Bavarian obstinacy must be welcomed.

People on the Move

A first study of population movements based on new material has been issued by the General Register Office.* The information has been compiled from the national register which, unlike the census returns, lists gross movements into and out of each administrative area in England and Wales. A surprising picture emerges. It seems that, despite the abnormal housing shortage and the absence of unemployment, the English are a highly mobile people. During the period 1948-50 there have been 4,000,000 moves a year; roughly one person in ten moves to a different area each year. The turnover of population in almost every area is very much greater than the net gain or loss by migration shown in the census returns.

The familiar secular movements of population from declining to expanding areas are thus shown to disguise short-term movements of much greater volume. Even in declining areas the usual pattern is an annual exchange of at least 10 new for every 11 departed citizens, and in expanding areas the local turnover is generally greater. Moreover, the age and sex structures of the inward and outward movements seem, as a rule, to be roughly similar. The most mobile group consists, as might be expected, of childless people in the twenties.

The difficulty is to tell how much of this annual movement represents merely local changes of residence involving the crossing of administrative boundaries which may be highly artificial. This sort of movement is very frequent in the south-east of England and in the neighbourhood of big towns. It does seem, however, to judge by the rather scanty evidence taken from 27 selected localities, that a high proportion of the moves—in many cases more than a half—are made over distances of more than 40 miles. It is the medium and long-distance moves, which involve changing jobs as well as homes, that warrant a much closer scrutiny of the new figures that this report contains. The results, when available, should have important consequences for planning and housing. The extent to which migrants are undeterred by the lack of new houses, and simply find room in existing dwellings, will come as a shock to many local authorities. Equally their mobility suggests that new towns can usefully be built greater distances from the old than is now assumed. The population is much more flexible than its administrators.

* Internal Migration. By M. Newton and J. Jeffery. HMSO 1s. 6d.

Few, But Roses

These words conclude the latest annual report* of the Arts Council. Originally the motto over a nursery door, they are used to express the policy which the council may be driven to adopt if its budget remains constant and the costs of the enterprises it supports continue to rise. Hitherto with a Treasury grant of some £600,000 a year the council has attempted both to raise the standard of performance in the arts and to spread the appreciation of them. It asks now whether greater concentration has become necessary and whether it is wiser to consolidate standards already achieved, rather than to pursue a policy of wider dispersal—to raise rather than to spread.

The report ends on this rather gloomy note, which is the more surprising since the preceding sections, particularly those dealing with the 1951 Festival, are encouraging. Perhaps it is the contrast between what it has received (an extra "Festival" grant of £400,000 from the Treasury) and what it is about to receive which makes the council so gloomy. It is clear that its achievements for the Festival, direct and indirect, far exceeded expectations and that it was able by money and advice to stimulate much new activity. The eight-week music season in London was perhaps the greatest success of all; some 300 concerts were given and the Royal Festival Hall was filled to 85 per cent of capacity. Outside London there were 22 principal Arts Festivals. Poetry, plays, music, opera, ballet, painting and sculpture were all stimulated by Arts Council commissions and competitions.

Having helped to pump so much new life into the artistic activities of the country, and having discovered so much latent interest, the council is concerned about its inability to sustain it. Its difficulties affect not only the more modest groups

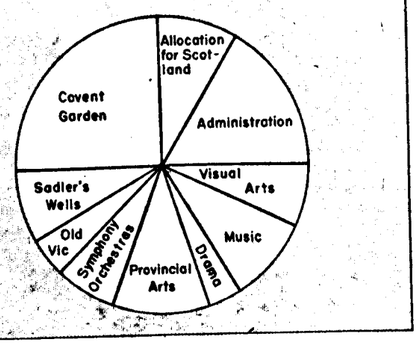
The Economist Diary



The Christmas present for the man who seems to have everything.	A memorandum book, an appointments register, and a complete reference book.	A diary lay-out specially designed to meet the needs of the busy man.
A week's appointments at an opening; a book that lies open flat on the desk.	Facts and figures covering the world always available when required.	All information easily found by means of handy thumb-indexes.
Bound throughout in red leather; title blocked in gold.	Price (U.K. only) **42/-** (including postage and purchase tax)	Prices to overseas addresses vary widely; a schedule will be sent on request.

ILLUSTRATED PAMPHLET AVAILABLE FROM

DIARY DEPT., THE ECONOMIST, 22 RYDER ST., LONDON, S.W.1

all over the country but also some of the major national undertakings centred in London. At present the council's grants-in-aid to the national opera and ballet companies are much less than those received by such companies abroad. No symphony orchestra can afford to improve its quality by reducing the number of performances. It is the sight of opportunities wasted and of ventures failing for lack of funds which accounts for the council's concluding note of pessimism. It would be a pity if this pessimism caused the council

DISTRIBUTION OF ARTS COUNCIL EXPENDITURE

to restrict its grants to established national enterprises; but if it cannot escape the dilemma it poses, it certainly has a good case for concentrating, for the time being, on raising standards of performance in the hope that spread will come later.

Earning and Saving

In the latest Bulletin from the Oxford Institute of Statistics Mr H. F. Lydall discusses a survey which has been made of personal incomes and savings in Oxford. The survey was only experimental. It relates to a small sample of a population which cannot be taken as typical of the country as a whole; and the results are far from conclusive. Yet it is of unusual interest because it has undertaken the kind of financial probing of which official investigations have fought shy.

The sample was drawn from the rating records of the Oxford area. The interviewers worked, therefore, from addresses and not names—which were never asked for. The aim was to interview each family in the private dwellings listed—or, more strictly, each "spending unit" so defined as to include married couples and children under 18 as one unit. Undergraduates were not included. The questions asked were about the amounts and sources of gross income in the preceding twelve months and about personal assets and liabilities then and a year previously. The survey was timed so that the period covered was approximately the 1950-51 financial year.

Replies were obtained from 416 families—too few for any reliance to be felt about the actual results, as the author himself readily admits. For the figures, especially of savings, varied quite considerably. One or two results may, however, be quoted to illustrate the information that surveys of this kind may yield. While the average income of all families interviewed was £469, professional practice yielded the highest average income—£563—from any one source. (It is explained that this figure is probably lower than it should be because part-time earnings of senior members of the University were included.) Net saving was found to increase with income; families with incomes under £200 a year had run down their assets by £36 in the twelve months, while those with incomes over £1,000 saved £82. But even among the lower income groups there was on the average some "contractual saving"—payments for life assurance, pensions or mortgages. Information of this nature, if collected on a larger scale, could add considerably to the present scanty knowledge about which people save and how they save. But no amount of improvement in carrying out the survey will ensure that people will lay bare all the ins and outs of their account books. This doubt will remain.

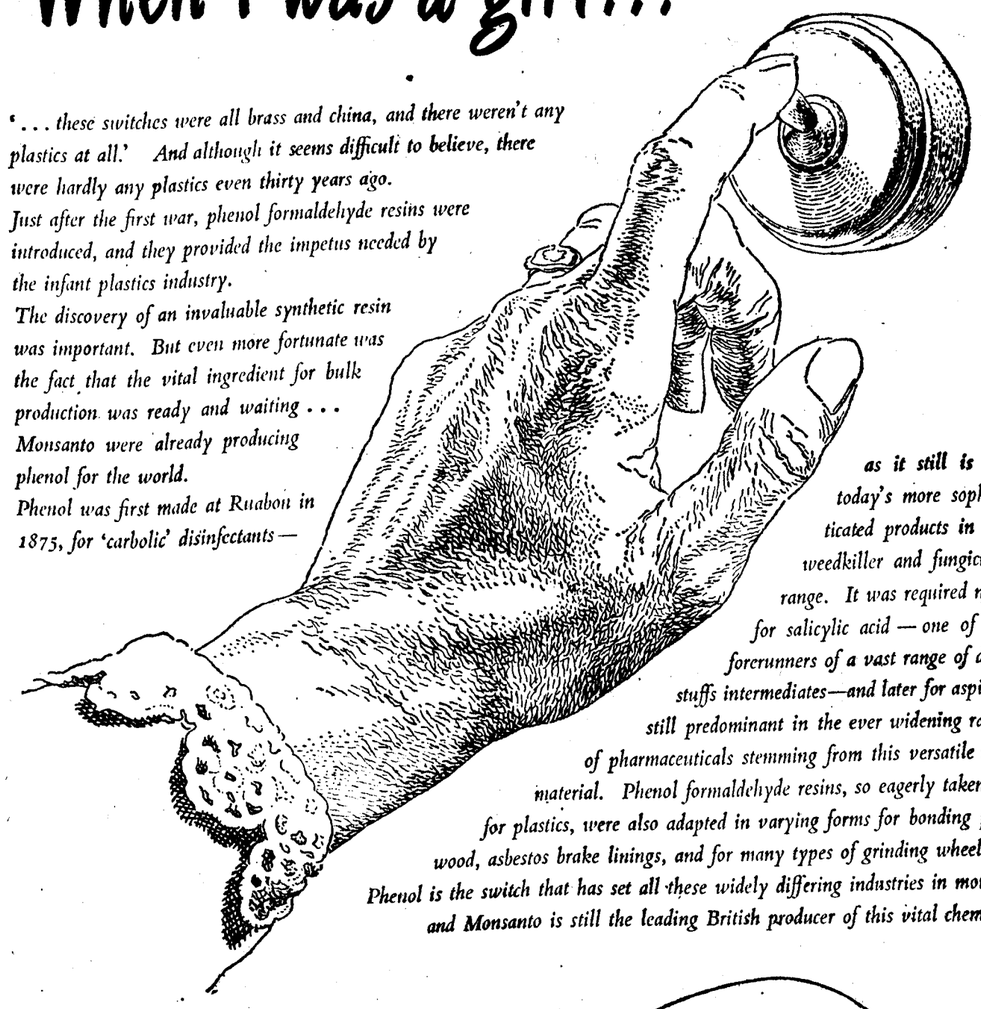
Correction.—It is regretted that, on page 1027 of last week's issue, some errors occurred in printing the table which showed the number of seats won by Labour and Conservatives arranged according to the size of the total poll in each contest. The table should have read:



Total Poll as % of Electorate	Number of Labour Seats Won			Number of Conservative Seats Won		
	Safe	Unsafe	Total	Safe	Unsafe	Total
55-60	—	—	—	1	—	1
60-65	—	1	1	—	—	—
65-70	1	—	1	8	—	8
70-75	8	2	10	11	—	11
75-80	29	4	33	65	3	68
80-85	95	34	129	118	38	156
85-90	68	51	119	19	51	70
90-95	—	1	1	1	2	3
TOTAL	201	93	294	223	94	317

Race Conflict in Africa

The arrivals from the Cape of Good Hope bring, we regret again to say, accounts that the war was still protracted . . . and has openly become, what it always in fact was, a war between blacks and whites, or a war between races—between the civilised intruder and the aboriginal savage—between those who desire to make use of the soil for all the purposes of agriculture and cattle feeding, and those who will retain it for ever in a rude state of nature, as hunting or pasture grounds, over which they might roam as their fathers roamed. We no more condemn their instincts and their pursuits than we condemn the more intelligent pursuits of the white men; but races so different cannot possibly live together, or in each other's vicinity in peace, and the war has now only assumed its proper character. We know of no example where such different races have lived together in peace on equal terms. . . . At the Cape of Good Hope, more than at any other place we are acquainted with, attempts have been made to keep the two races at peace, and they have been on the whole comparatively successful. All these exertions, as it now turns out, have been in vain, and the men we have taught and armed have, in the end, contrary to all expectations, deserted our ranks, and sided with their brethren against us. It is a confirmation of the old saying, that "blood is thicker than water,"—the bonds of nature are stronger than those of art. The great fact that has always pervaded the whole life of the colony and its whole policy—the conflict between black men and white men—is now avowed. . . . It is easy enough, after such a long-continued contest manifests itself, to find fault with this measure of the Governor, and that measure of the Colonial Office, and add to it the supposition that if some other little piece of policy had been adopted, the war would have been avoided . . . but it seems to us too much to expect that any Governor or any Government should always prevent the natural enmity between savage aborigines and civilised intruders from frequently showing itself in active and murderous hostility.

'When I was a girl'...

'. . . these switches were all brass and china, and there weren't any plastics at all.' And although it seems difficult to believe, there were hardly any plastics even thirty years ago. Just after the first war, phenol formaldehyde resins were introduced, and they provided the impetus needed by the infant plastics industry. The discovery of an invaluable synthetic resin was important. But even more fortunate was the fact that the vital ingredient for bulk production was ready and waiting . . . Monsanto were already producing phenol for the world. Phenol was first made at Ruabon in 1875, for 'carbolic' disinfectants—as it still is today's more sophisticated products in the weedkiller and fungicida range. It was required next for salicylic acid — one of the forerunners of a vast range of dyestuffs intermediates—and later for aspirin, still predominant in the ever widening range of pharmaceuticals stemming from this versatile raw material. Phenol formaldehyde resins, so eagerly taken up for plastics, were also adapted in varying forms for bonding plywood, asbestos brake linings, and for many types of grinding wheel. Phenol is the switch that has set all these widely differing industries in motion: and Monsanto is still the leading British producer of this vital chemical.

MONSANTO'S RANGE OF GENERAL CHEMICALS INCLUDES

MONSANTO CHEMICALS—PLASTICS

ADVERTISERS

what are you doing now about 1952?

HERE ARE THE FACTS ABOUT PICTURE POST

Think them over.

Think of the top circulation.
The figure is 1,225,858. This is ahead of any other general magazine in Britain.

Think of the top readership.
Over 8,000,000 every week. That is, one adult out of every four in Britain.

Think of the colour. For colour, Picture Post is unchallenged as the top advertising medium in Britain. A full-colour page in Picture Post is the most powerful advertising space in Britain.

Think of the company. More leading advertisers rely on Picture Post than on any other magazine in Britain. Look through, see who your fellow-advertisers will be.

If we can help you in any way in planning any of your 1952 campaigns please get in touch with me or my staff. F. A. Gray, Advertisement Manager, Picture Post, 43 Shoe Lane, London, E.C.4.

Think of the confidence. Large national advertisers put their entire appropriations in Picture Post *alone*. And every major campaign so far launched this year has appeared in Picture Post.

Think of the influence. The exciting and popular quality of Picture Post's new editorial policy has earned it a larger following than ever before.

Think of the service. Picture Post is Britain's ONLY National magazine to offer a complete merchandizing service. Every advertiser has the facilities of this service at his disposal.

Think of the flexibility. Picture Post offers spaces in every kind of size — from double page colour spreads to 1/16th pages. Picture Post guarantees you the continuity you need. Co-operates in every way possible.

Sum it up. It is certain no other magazine in Britain offers you such a combination of circulation, readership, colour, editorial influence, service and co-operation.

Take full advantage of this — in 1952.

Letters to the Editor

Does Democracy Work?

Sir,—In recent weeks I have found myself in acute disagreement with *The Economist* on one point. You have been maintaining:

> (1) That the electorate is much more intelligent and informed than the politicians believe.
> (2) Therefore, either of the parties could have told the people the brutal truth without being punished for its frankness.

I have been sceptical about this and submit that the election has justified me.

First of all (and regardless of the quality of the electorate), I cannot see how the Labour party could have blurted out the truth. When company directors reveal that for years they have been paying dividends out of reserves and not out of profits they do not get a crashing vote of confidence from shareholders. The Labour party is in exactly the same position.

The Conservatives might have told the truth—if the electorate had been adult. But is it? A month or two back the Tories had a 10 per cent lead. Since then two things have happened: (*a*) our world position has greatly gone down as a direct result of Mr Morrison's jaunty incompetence; (*b*) the campaign produced mud-slinging at its worst. The election now shows that (*a*) has made no impression at all while (*b*) has wiped out the Tory lead completely. A detailed study only makes the point more painfully obvious—Mrs Braddock worked the warmongering charge as hard as anyone and has had a remarkable increase in her majority; in Reading the intelligent and independent Mr Mackay is defeated, Mr Mikardo remains; etc., etc.

How I wish I were wrong, but I feel we must face the fact that democracy is a very imperfect instrument even in this country, and that you have for once been too optimistic.—Yours faithfully,

H. B. BARWISE

Oxford

Mr Morrison's Bogey

Sir,—Your "special valediction" to Mr Morrison deserves,-perhaps, a few footnotes.

(1) The theme of "Munich at Abadan," or "Let's stop being pushed around," was basic in the Conservative attack on the Labour Government. It was proclaimed with caution by Mr Churchill and Mr Eden, with less caution by Lord Salisbury, and with no caution at all by less distinguished Conservatives and by the gutter press. Clearly the Conservative party sought to win the election by an appeal to a vague emotional jingoism. It was only to be expected that the Labour party should counter the attack by an appeal to a vague emotional pacifism. Of the two emotions, the latter is a little the less disreputable.

(2) While there is room for criticism of Labour's handling of the Persian question on the score of uncertainty and dilatoriness, there is also room for criticism (*a*) of the "prestige diplomacy," applied to Eastern affairs, so popular in some Conservative circles, and (*b*) of particular demands for "action" in Persia, which would have involved the hostility of a majority of the United Nations, a breach on policy with the United States, and possible trouble with Russia.

(3) Memory suggests that there may be contestants for the position of "the worst Foreign Secretary of this century." The names of Sir John Simon and Sir Samuel Hoare occur.—Yours faithfully,

Meopham T. N. FOX

Utility Patchwork

Sir,—Having been closely associated with the origin and administration of the utility scheme from 1940 to 1948, I can testify that the article in your issue of October 27th describes the first objectives and later developments clearly and fairly.

Its conclusion that, apart from the purchase tax exemption, little or no virtue now remains in the scheme and that it is a great obstacle to high-class exports will be widely endorsed in the textile trades. In the present buyers' market for textiles the utility ceiling prices have become largely inoperative, and as to quality standards this argument never applied to the wool trade and has been weakened in cottons, rayons and furnishings by the flexible specifications recently introduced. (In any case cannot the cotton industry be trusted to maintain quality at home without Government control, since the half of its output that goes to export has to satisfy the exacting standards of world markets?) There remains the vast bureaucratic paper edifice of orders and schedules by the hundred and thousand, the endless anomalies and hard borderline cases, and above all the stifling of export enterprise in specialities and novelties.

The 66⅔ per cent purchase tax is no longer merely an obstacle, it is an obsession with retailers, who have suffered repeatedly by losing the tax on stocks of non-utility goods whenever the utility schedules are extended. Because of this, and of the flexible specifications, purchases of taxable textiles by the retailer have fallen tremendously in recent months, so that even the revenue argument, as your writer mentions, has largely disappeared. For instance in one typical firm payments of tax are now about 25 per cent of the level a year ago, and are still falling.

In the shortages of war and immediately afterwards the scheme was valuable. It was created by non-political civil servants with the co-operation of the trades concerned under a Conservative President of the Board of Trade. The late Government, however, without due regard to changing circumstances, elevated it into a fundamental article of faith. It is greatly to be hoped that the new Government will view the matter without preconceptions and with a strong bias to removing any control which hurts exports, unless it is quite unavoidable.—Yours faithfully,

R. W. BALDWIN

Manchester

Food for Caterers

Sir,—I was surprised to read the conclusion of one of your Business Notes last week. You suggest that when the domestic ration has to be cut to meagre proportions a case could be made for a proportionately greater reduction in supplies to restaurants and canteens.

It is already difficult for the hotel and catering industry to provide an essential public service for travellers, social benefits to the community on holiday, and a valuable contribution to the export drive. Why advocate starving its "factories" of raw materials? A cut in the supply of food to hotels and restaurants alone, excluding canteens, would add little to the plates of the rest of the population, and would force caterers further to outbid the housewife for supplies of poultry, unrationed meats and other "optional" foods.

A larger meat ration alone for hotels might not, I suggest, strain the national larder unduly, but could permit a lower price for the family on holiday (when they are deprived of their industrial and school canteen services), tempt the overseas visitor and his currency, and lower the price of poultry, etc., in the shops.—Yours faithfully,

JOHN G. BRIDGES

British Travel and Holidays Association, London, S.W.1

The BBC's Charter

Sir,—Among the many formidable problems which immediately face the Government, the new charter for the BBC, which is due at the end of this year, may seem a very small matter. But, apart from the intrinsic importance of broadcasting and television as a social technique, it is clear that the still unresolved problem of Scottish, Welsh and Northern Irish broadcasting might easily cause the Government great embarrassment and consume time and labour which ought to be devoted to other matters. The truth is that the Beveridge report, the White Paper and the two Parliamentary debates have merely thrust into prominence the two major problems of the organisation of British broadcasting, namely, the continuance or not of the monopoly and the problem of the correct balance between the centralising unity of London and regional autonomy, which, in effect, is the problem of the most efficient, economical and democratic form of organisation for British broadcasting.

What must be said, however, is that if a new charter for the BBC is granted

to come into effect on January 1, 1952, it will merely perpetuate the present system. There is simply no time for any government to do any more than that. Yet in view of all that has been said both inside and outside Parliament, it is unthinkable that the present system should be continued for fifteen years. Surely, therefore, the best thing is for the Government to renew the existing charter for twelve more months and in the meantime go carefully into the major questions which have all been left in dispute. I suggest further that the Government appoint one or two small expert committees to consider such matters as overseas broadcasting, television, and regional broadcasting with a view to determining what their relations should be with each other. This would be a great help to the Government, and Parliament would, of course, have full opportunities of debating and deciding on any proposals which the Government might make as a result of such further deliberation.—Yours faithfully,

JOHN COATMAN

The University, St. Andrews

Frustrated Cars

Sir,—You accuse the Nuffield organisation of "unreasonable exploitation" because, being forced to bring cars back from Canada, it offers them here for sale at more than the normal English price. Not for its own convenience the company has diverted nine-tenths (or whatever the fraction may be) of its output to export. Not by its own misjudgment it found a large number of these exported cars suddenly unsaleable in Canada, and had to bring them back to England. It offers them to willing buyers at a price that includes the cost of transport and conversion actually incurred. And for that you charge it with profiteering. It ought, apparently, to have accepted an enormous loss, caused entirely by the politicians, rather than sell the cars at a price the public in England is eager to pay. Are you not pitching commercial ethics ridiculously high?—Yours faithfully,

MORRIS OWNER

Books and Publications

Voice of Experience

Lessons of the British War Economy. Edited by D. N. Chester. Published by the *Cambridge University Press* for the National Institute of Economic and Social Research. 260 pages. 22s. 6d.

The idea behind this book is that the academic economists who worked in the government departments during the war should share among their colleagues the lessons of value for their own profession that they derived from their excursion into practical life. The National Institute of Economic and Social Research therefore commissioned Mr D. N. Chester to collect these thirteen essays, all but one of which are the work of holders of university posts. To introduce the volume the happy choice was made of Sir Richard Hopkins who, as Permanent Secretary of the Treasury, played so large and imaginative a part in fitting the "temporaries" into the civil service. The result is a book much more readable and enjoyable (and also, mercifully, much shorter) than most symposia. The merit of the different contributions naturally varies, but the average level is very high. Economists, civil servants and the great and varied number of ex-temporaries would all find much in this book to instruct or at least to stir memories.

It is apparent, however, that not all the contributors had quite the same idea—perhaps the different natures of their subjects imposed a certain variation. Some of them have written straightforward and almost chronological accounts of the development between 1939 and 1945 of the field of policy with which they are concerned. Professor G. C. Allen, for example, has written a lucid descriptive account of the policy of concentrating industry, which one would like to see expanded into a full volume with detailed examples—but for the purposes of the present book one wonders whether the concentration of industry is so remote from the economics of peacetime that there are really only three paragraphs of general conclusion to draw. Professor E. A. G. Robinson and Mr Hugh Weeks have written accounts of the machinery that was gradually evolved for the allocation of resources and for Anglo-American supply relationships. These potted war histories are of great interest and will be most valuable if ever the job has to be done again. But the same comment can be made, that the lessons of general application—of which there are several—might have been brought out more clearly.

Others of the contributors have not been so content to describe their subject but have gone on to analyse the problems it presented and to generalise about them—but still mainly within the rather blinkered context of their particular wartime job. Professor Devons, for example, contributes a most thoughtful and stimulating essay on "The Problem of Co-ordination in Aircraft Production" which is an admirable discussion of the precise range of territory delimited by its title. (In this case, the essay does not need expanding into a book; it is rather a summary of Professor Devons's admirable book already published.)

After these eliminations, few of the contributors have done (or, to be fair to them, one should perhaps say have been permitted by their subjects to do) what one supposes was in the National Institute's mind, to summarise how far their wartime experience has changed or extended their view of economics itself. Mr Chester himself has some thoughtful reflections on the place of the economist in the central machinery for economic policy, but this is a contribution to the science of administration rather than to economics. From this point of view, perhaps the best things in the book are an essay on rationing by Mr W. B. Reddaway, which could go almost as it stands into a textbook of the new economics, and Mr J. R. N. Stone's chapter on "The Use and Development of National Income and Expenditure Estimates," which ranges a long way past 1945 in explaining how the estimates of the national income—surely, from the economist's point of view, the most important product of the war years—can be used for purposes far wider than those that brought them into existence.

A review of this book in *The Economist* cannot close without quoting one passage from Mr Stone. He describes how, early in 1941, the idea began to circulate in Whitehall that something would have to be done to close the gap that had been developing between the inside and outside views of the financial position. . . . The last straw was an article in *The Economist* early in February, 1941, in which the current annual rate of the national income was put at £8,120 million and a level of £9,000 million was predicted for the financial year 1941-2. Preposterous, everyone said, ridiculously too high: the national income cannot be running at more than a little over £6,000 million at the present time. "I really think," wrote Hopkins to Keynes shortly afterwards, "that something must be done both about the national income and about the gap. Perhaps we could talk." . . . In a few days the Chancellor was considering a new form of Budget White Paper. . . . Having explained the strategic role played by *The Economist* in these proceedings, I must now try to make amends. . . . [*The Economist*'s] figures related to the "gross national income," . . . i.e., the national income plus depreciation allowances plus indirect taxes net of subsidies. . . . [From the subsequent official estimates] we obtain £7,990 million [for the financial year 1941-2]. Preposterous? At least £2,000 million too high? Well, well!

In acknowledging this very graceful *amende*, we can only add that *The Economist* at the time was wholly ignorant of the discussions that were proceeding in the Treasury.

Disaster in Malaya

Main Fleet to Singapore. By Russell Grenfell. *Faber.* 238 pages. 18s.

Captain Grenfell has set out to record the circumstances which led to the disaster in Malaya at the end of 1941, the defeat of the British land, sea, and air forces by the Japanese and the loss of Singapore. He wishes to show that it was the result of grave mistakes in strategy, of wrong thinking and neglect. From the purely naval point of view he aims at exposing the weakness and muddled planning of the Admiralty before the war, and the errors by the British Chiefs of Staff, which were magnified into grave blunders by Mr Churchill's domination of their councils—blunders which, he asserts, were responsible for the failure to send the main fleet to Singapore and for the loss of the weak squadron which was sent.

Captain Grenfell considers that December 10, 1941, the day on which the *Prince of Wales* and the *Repulse* were sunk, marks the end of an epoch—the end of British pre-eminence as a sea power.

The story of the loss of Singapore should be told, and its causes and consequences examined. One sympathises with the author in his complaint that although it is more than five years after the end of the war no official naval history has yet been produced. Captain Grenfell has, however, been able to obtain a great deal of information at first hand from most of the chief actors in the drama; senior officers concerned with the defence of Singapore in the months preceding the Japanese attack, and also a number of those in command during the fighting. He is, therefore, able to give an authoritative and interesting account of the situation as it appeared to the men on the spot.

With the main lesson of the book, few will disagree: that military weakness invites aggression. But there will be less acceptance of the author's championship of Japan and justification of Japanese aggression. And there will be much disagreement with his assessment of Mr Churchill as a man who, for some inexplicable reason, was ready during the war to succour any part of the world except Malaya. In his summing up at the end of the book, the author squarely charges the Treasury and the civil servants within the Admiralty, War Office and Air Ministry with being a powerful "sixth column" working continuously to assist Britain's potential enemies by trying to cut down the national defences. This conclusion will not startle those concerned as much as the author imagines, as it is the sort of thing service officers have been saying to their civil service colleagues across lunch-tables from time immemorial. The civil servants, for their part, make a number of damaging counter-charges against the fighting services. But the friendships survive.

The subject of the book is of absorbing interest, particularly to the Navy. When the author concentrates on naval narrative, the book runs much more smoothly. The action in which the *Prince of Wales* and *Repulse* were sunk is vividly described, and the development of the naval situation after the fall of Singapore is well told in the chapters on the naval moves in the Indian Ocean. One can only regret, therefore, that the author has such a bitter outlook, such a cynical view of all politicians and of the motives of governments, such a contempt for those who between the wars strove sincerely for peace, for agreement among the nations, and the reduction of armaments. It is the writing of a disappointed, disillusioned man, who sees little hope for the future.

The Sanctity of Dogma

Marx against the Peasant. By David Mitrany. *George Weidenfeld and Nicholson.* 348 pages. 25s.

Western students of economics have not shown in the past much interest in the peasant problems of Eastern Europe. Since the war and the establishment in this area of Soviet Russia as the dominant influence, concern with these problems has been heightened by their political implications. A thorough survey of the whole subject is needed. Dr Mitrany's book hardly meets this need, since he is concerned less with what has happened than with the role of Marxist dogma in the story.

Marxism has indeed been the villain of the piece. In its social-democratic form in the inter-war period it allowed the socialist parties to enter into coalitions with reactionary elements rather than with the peasant masses. In the postwar period, it induced them to combine with the communists up to the point when the latter were able to dispense with their support.

The first part of the book, which deals with the development of the Marxist theory concerning the role of the peasant and agrarian policy, is an expansion of an essay of the author's written in 1927 and contains little that is new. The second part, which deals with Soviet agrarian policy, is not very satisfactory. Indeed the notes at the end of the book, which show that Dr Mitrany is aware of the unreality of peasant control in the Kolkhoz, tend to contradict the impression left by the text. A closer attention to chronology would have helped to reveal the important fluctuations in Soviet policy in this field.

For non-specialists the most novel part of the book will be the third. Here Mr Mitrany gives an account of the peasant parties and movements of the interwar period. It is possible that he overestimates their representative nature; he ignores altogether criticisms by other writers who have suggested that, by and large, only the interests of the wealthier peasantry were fully upheld by the parties. The last part contains an account of what has been done in the Soviet satellites and in Jugoslavia since the war, although the story is not taken right up to the present. It is clear, however, that the Marxist dogma was not abandoned. The shareout of land in the immediate postwar period was as purely a tactical move as any of Lenin's. Governments determined to build up the "socialist heights" of the economy could never allow the countryside to be run by subsistence farmers. They would get neither the food nor the labour they required; and an irreconcilable focus of political discontent would remain. Collectivisation, however delayed or disguised, remains the goal. The Russian model shows that humanitarian considerations are not to count for anything against the sanctity of socialist dogma.

Enterprise in the Colonies

The Metropolitan Organisation of British Colonial Trade. By Kathleen Stahl. *Faber.* 313 pages. 25s.

This is an important addition to the very short list of books which deal with economic aspects of the British colonies. It covers the history and organisation of British firms operating in the West Indies, Malaya, Ceylon and East Africa. An obvious omission is the West African colonies, but some material, for Nigeria at least, has already appeared in volumes of the earlier Nuffield College series, edited by Miss Perham.

The present book is divided by territories and then again according to different general aspects which include the study of metropolitan associations of firms and the working of semi-official bodies such as the West India Committee. For each territory there is also a section on commerce, which is subdivided again by commodity groups. The treatment is descriptive throughout, and little attempt is made to compare the patterns of development in different territories or to assess the relative impact of similar institutions in the different areas.

Despite the lack of more analytical treatment, a great deal of valuable material has been collected. The commodity studies in particular are a useful contribution in a field where too little is still known. The chapters on commerce in Ceylon and Malaya contain descriptions of the work of managing agencies not to be found anywhere else and the historical background throws interesting light upon the extent of interlocking directorates and other institutional features.

As the title indicates, the scope of the book has been intentionally narrow and the economist will find that it leaves a number of questions unasked. For example, the impact upon the colonial economies themselves of the forms of commercial organisation described are not examined, and, with the exception

of Jamaican bananas, there is little general assessment of the place of foreign firms in the colonial production chain as a whole. Now that the nationalisation of foreign enterprises is popular and the export of produce is being usurped by the Colonial Marketing Boards, the functions of foreign enterprise in colonial territories are being subjected everywhere to review. While there is no explicit analysis of these problems, this study provides useful material on many points, including the part played by British enterprise in the opening up of colonial trade, and in the very rapid rate of its development over the last fifty years.

Scotland Under Survey

Third Statistical Account of Scotland: Ayrshire. By John Strawhorn and William Boyd. *Oliver and Boyd.* 886 pages. 20s.

When the first "Statistical Account of Scotland" was put in hand by Sir John Sinclair at the end of the eighteenth century, it contained few statistics, and no maps or illustrations. It was a parish-by-parish social survey: a 21-volume symposium by the ministers of the Church of Scotland, owing a great deal of its charm and interest to the diversity that it revealed. It was only by building up from parish data that a picture of the national economy could be presented.

This is no longer so. On the contrary, it is very hard nowadays to understand the problems of the parish, or even of the county or region, without some preliminary study of the same problems at the national level. The differences between parishes have dwindled or have lost any connection with parish boundaries, so that a mere aggregation of parish surveys would be highly repetitive and blot out a view of the national economy in a thick wood of parishes. Local surveys can still, however, provide illustrative detail of general trends; and a full-scale survey of a local community sufficiently homogeneous to be treated as a unit can bring out the problems peculiar to that community.

Ayrshire, which forms the subject of the first volume of the Third Statistical Account (there was a Second Account just over a hundred years ago), merits a full-scale survey for this reason. It is a fairly distinct geographical unit, with a tradition and life of its own; it is also, unlike most regions that form the subject of modern social surveys, a thriving and developing community. It has the best dairy herds in the world, an international airport, a magnificent coast, and as wide a range of industry as one could wish. For every industry that has died—and there have been many—two have arisen in its place. New pits are being sunk and a large number of new factories have been built since the war. Not all the county shares the expansion: there is a filtering of the population out of the rural south and east down towards the industrial north and west.

It is the main drawback of a descriptive survey that it cannot pursue the problems that it touches on. Dr Strawhorn, in an excellent study of the county, occupying the first third of the volume, cannot readily digress to tell us, for example, why the county's economy has shown such resilience, what the impact of the "incomer" on Ayrshire has been, and from what social groups is now supplied the leadership that came in the eighteenth century from the landed gentry, the lawyers and the clergymen. He succeeds, however, in conveying a vivid picture of the life and work of the community, complete with a neat set of diagrams and tables. Dr Boyd fills in the detail in a series of more chatty accounts of the parishes. But although these are delightful to dip into, they read somewhat like a mixture of Domesday Book and a local guide-book and are inevitably rather superficial.

It would seem too much to hope that all the remaining Scottish counties can be so skilfully and readily presented; and it might be preferable to group some of them together and omit, or greatly condense, the parish surveys. Meanwhile the Scottish Council of Social Service are to be congratulated on sponsoring a work worthy of the Festival of Britain—in honour of which the book is offered at a bargain price.

Gone with the Wind

Economic Resources and Policies of the South. By Calvin B. Hoover and B. U. Ratchford. *Macmillan.* 464 pages. $5.50.

For a long time most books about the American South tended to conform to one of two types, according to whether their authors came from above or below the Mason and Dixon Line. Either they represented the South as the source of all the shortcomings of America—and indeed by any conceivable statistical index it serves as an irresistible scapegoat; or they restated the myth of a southern agrarian Utopia destroyed by Yankee vandals in the Civil War.

In recent years the magnolia myth has given way increasingly to impartial studies of actual conditions in the region, and to the formulation of practical reform programmes. Mr Hoover and Mr Ratchford have performed a valuable service in producing an excellent summary, in concise and readable form, of the economic resources of the South and their development in the past twenty years. The subordinate status of the southern states in the nation is still frequently attributed almost exclusively to a number of permanent and vindictive discriminations, designed to ensure the domination of northern manufactures: differential freight rates; protective tariffs; absentee northern ownership of southern industry and public utilities; inadequate credit facilities. These disabilities have indeed been important in the past, but a study of the changed conditions shows that few of them are effective today. The southern states are still the poorest in the nation, but the change during the past twenty years has been remarkable, especially through the transformation of a purely agrarian economy, based on a single cash crop, towards a balance between industry and mixed farming. Cotton may still be king in the Mississippi Delta, but it has lost its pre-eminent position in the South at large.

The authors have not neglected the peculiar history of the South in their study, which is concerned with possible future policies as well as present conditions. But there is one strange omission: there is hardly a mention in the book of the race question, which pervades and colours every southern problem, economic, social or political. The conclusions about the economic prospects in the South are perhaps over-optimistic for this reason. But with the inevitable limitations imposed by space, this is an important contribution to an understanding of the changing character of the region.

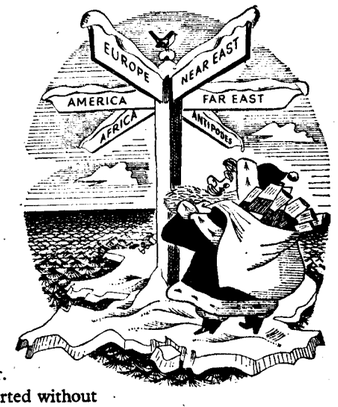
Principles of Social and Political Theory



By SIR ERNEST BARKER. *25s. net*

This volume contains an inquiry into the principles which lie behind the existence and action of National Society and the National State. It is divided into six books. In the first two books the inquiry turns on the distinction and the relations between Society and the State, first in their historical development (Book I) and then in their present form (Book II). The third book is an analysis and discussion of the idea of Justice, regarded as the purpose which creates and controls the State. The fourth book deals with the conception of Rights, and with the principles of Liberty, Equality, and Fraternity (or Co-operation) which govern the allocation of Rights: it is also concerned with the relation of these principles to the idea of Justice, with the connexion between Justice and Law, and with the enforcement of Law. The fifth book is an inquiry into the grounds and limits of political obligation; and it deals, in its course, with the problem of the general will, the problem of sovereignty, and the problem of resistance. The sixth and last book is concerned with the functions of government, with the causes and results of their extension, and with the general issue between collectivism and individualism.

The office clock needs watching

● CLOCKS are most expensive when they record overtime. Nowadays, the cost of office staff, in terms of space alone, must be justified by greater production per person, per day. But no organization can get this if it relies on obsolete figuring methods to provide all the facts it needs. Ideally, all procedures should be finalized within normal working hours; all accounts not only completed but proved; every desk cleared of today's work today.

Burroughs are in business to make this practicable. First, by expert advice on how to get an accounting routine working evenly, with no overloading and maximum output. Secondly, by installing the business machine exactly suited to the system that gives the best results.

The Burroughs organization is known all over the world. Experience of the changing needs of business, on the widest scale possible, helps them to solve the most localized problem *faster*. And to provide an on-call maintenance service that keeps their machines on the job all the time.

IT COSTS YOU NOTHING . . .

Many economies can be made in office departments—but problems cannot be solved until they are clearly defined. The Burroughs publication "Ways to Save Time in an Office" contains useful advice for office management. This booklet can be obtained, free of charge, from Burroughs Adding Machine Ltd., Avon House, Oxford Street, London, W.1.

AMERICAN SURVEY

Waiting for Ike

Washington, D.C.

WHEN General Eisenhower arrived from Paris last weekend for his "strictly military" talks with President Truman the domestic political situation was, as they say, fluid. It was the most fluid political situation in living memory. Analogies thrust themselves forward, and perhaps the most suitable is that of a couple of football teams who have just run out on to the field and are now punting a ball about in front of the respective goals or stamping and swinging their arms to keep warm.

The captain of the Democratic team, who is standing with his hands in his pockets, whistling cheerfully, is regarded by the other players with much anxiety, for he has not yet said whether or not he is going to play in the impending game. This is President Truman. At the Republicans' end of the field a figure is to be seen running about with immense vigour in all directions, intent on capturing the ball whenever possible and putting on exhibitions of fancy dribbling to show that he is the obvious choice for captain. This is Senator Taft, of Ohio.

But on neither team are the players giving their full attention to the events on the field. Their heads are repeatedly turned toward the players' entrance. The spectators in the stands are watching this gate with equal absorption. Players and spectators alike are awaiting the appearance of a mighty amateur who, though he has never before played in a professional game, is believed to be capable of leading any team to victory. The trouble is that nobody yet knows whether he is going to turn up or, if he does turn up, which side he is going to play on. And this is General Eisenhower.

From time to time players on the Republican team assure one another and the spectators that the gifted unknown is coming to captain their side. "I know he's a Republican and I'm sure he's going to play!" says Governor Dewey of New York, the left half-back. "He is vigorously anti-New Deal!" cries Mr Scott, of Pennsylvania, the inside right. "He will split the solid Democratic South and win," promises Senator Duff, of Pennsylvania, the left full-back. But Mr Taft, the outside right, only runs about harder and faster, and even as he shows off his tricky footwork he shouts: "I alone can lead the Republicans to victory!"

Just how tricky Senator Taft's political footwork is has been emerging with increasing clarity since he announced himself, in the middle of last month, to be a candidate for the Republican nomination. What is his programme? He is for "progress within the principles of liberty of the individual, of state and local self-government and of economic freedom." He is against any "Me Too" procedures, by which he means opposition acceptance of Administration policy at home or abroad; but on the other hand he is not in favour of taking an "extreme position." He considers that the present foreign policy of the United States is "the most tragic in United States history." He apparently does not consider this position to be an extreme one.

What is his view of Senator McCarthy? He approves the McCarthy campaign against alleged subversive influences in government, but "I don't know if I have to approve or disapprove of his methods." Of the nomination of General Mark Clark as United States Ambassador to the Vatican? It is "a novel proposal." Of what will be needed to win the Negro vote? He feels that "the Negroes will vote for what is best for the nation." In this manner, moving about the country in the role of nearly every man's friend, Senator Taft is reported to have lined up promises calculated to place him in a situation of considerable strength when the Republican convention opens next July.

★

None of this, however, can be greatly troubling President Truman, who some time ago, with every evidence of sincerity, made it clear that Senator Taft was his choice as the Republican candidate most likely to be defeated. The President may have more cause to worry about the recent signs that Senator Byrd of Virginia and Governor Byrnes of South Carolina are mapping out what could be a serious excursion by Southern Democrats, one which might take them at least temporarily out of the party unless they can ensure the nomination of a conservative candidate at the Democratic convention. Neither Mr Truman nor anyone who shares his convictions would meet with their approval.

The President has other worries. Mr William M. Boyle, bowed under the weight of criticism regarding his receipt of fees from a company which received government loans, has been replaced as chairman of the Democratic National Committee by Mr Frank McKinney, an Indianapolis banker with a vigorous approach to the "morality in government" issue and a comprehensive knowledge of the techniques of campaign fund-raising. But Mr Truman cannot have any illusions about the capital the Republicans intend to make out of the charges of outright or near dishonesty lately brought against officials of his Administration.

Mr Truman, meanwhile, is really being of no help whatever to those Republicans who are now wearing—or are prepared to wear—the new neckties reading "I Like Ike" which made their appearance the other day at a meeting in Kansas, the General's home state. Mr Truman keeps on saying, in effect, what a fine man and great soldier General Eisenhower is.

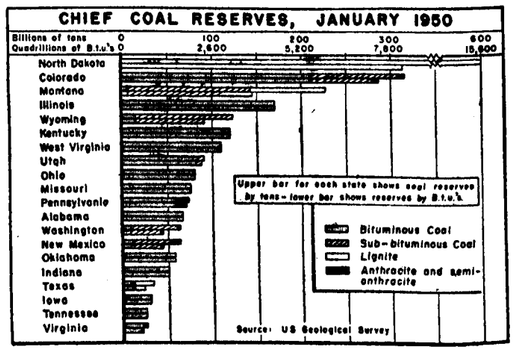
This praise by the President may well be more and not less distressing to the Eisenhower Republicans because it so plainly comes from the heart. For it deepens the thoughtful frowns of those in the Republican party who ask themselves whether the General, if he were nominated as a Republican, could possibly put up a hard or successful fight against a Democratic candidate (such as the President himself) who

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

made the Truman foreign policies the great issue of the campaign. How could General Eisenhower attack policies which he has himself diligently supported?

It is now the cry of the openly anti-Eisenhower factions within the Republican party that he is being backed by "Eastern internationalists." Another different cry is that it would produce grave consequences in Europe if General Eisenhower were to "turn tail" and leave his job there. With these and other arguments in the air, and with Senator Taft steadily acquiring support for which they are not yet even in a position to compete, the Eisenhower Republicans have been showing understandable signs of desperation. The demand for "a forthright statement from Ike" has begun to swell like an organ chord.

More objective observers have been inclined to consider the situation from General Eisenhower's own point of view. Would he be wise to say either yes or no at this juncture? Next January the Congress will have to begin consideration of a great new foreign arms Bill. The Administration's requests will be affected by the conclusions of the committee which is now examining the ability of the North Atlantic powers to share the burden of the accelerated military programme General Eisenhower is seeking. Congress and everyone else concerned may be readier to accept his objectives and speed their attainment if, while he remains the strongest potential contender for the Presidency, the General does not actually declare himself, a step which would summon up a host of political enemies at home. To declare himself out of the race, on the other hand, would reduce his present influence to a fraction of itself.

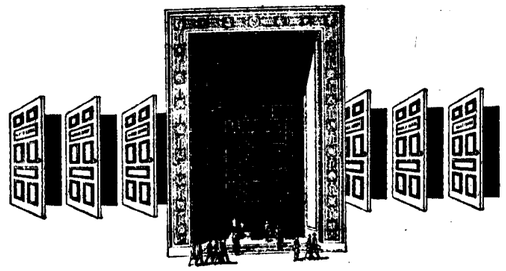


From the moment General Eisenhower arrived in the United States last Saturday to the moment when he left to return to Europe on Tuesday, the newspapers pursued and questioned him at every opportunity and analysed his words as though the secret of life itself were hidden in them. The General's performance in these circumstances was highly skilful. He made it clear that he had come to talk about the military balance sheet and was not to be lured away from the task of the hour. At the same time he contrived to leave behind the impression that Senator Duff and others might not be entirely wasting their time if they went on with the "Eisenhower for President" campaign. On the one hand General Eisenhower said that he had no political aspirations, did not talk politics with the President at their private lunch and had authorised nobody to engage in political activity on his behalf. On the other hand he added that he had talked to Senator Duff on the telephone, would not interfere with the actions of any of his friends and would speak out for himself "positively and definitely" if the time came to do so. He then flew back to Paris, leaving the political situation as fluid as ever.

The West's Fuel Aces

[FROM A CORRESPONDENT IN COLORADO]

IF, as seems probable, the production of liquid fuel and chemicals from coal and oilshale is undertaken on a large scale in the United States before long, it will not be because there is the immediate lack of petroleum that has in the past forced other countries to embark on similar projects, but because the United States wants to get a synthetic fuel industry established before it is really wanted. The need for it might arise suddenly if war broke out, but even without that domestic reserves of petroleum and natural gas are not expected to last for more than another generation. Such forecasts are always speculative, but it is certainly true that, on a thermal unit basis, petroleum and natural gas make up only just over 2 per cent of the country's known resources of fuel energy, while bituminous coal provides 55 per cent of them, sub-bituminous coal and lignite together another 32 per cent, and oilshale over 10 per cent.



Sooner or later therefore, the United States seems almost sure to have to fall back on coal and oilshale and it is a prospect very pleasing to the western half of the country. For three-quarters of these reserves are west of the Missouri River and so are two-thirds of the potential water-power; with these aces in its hand the west sees itself eventually rivalling the east in wealth, industry and population.

Meanwhile, however, there are many controversies—sectional, political and technical—to be settled before a synthetic fuel industry is actually started. Immediately after the last war, Congress authorised experiments with both coal and oilshale. Since then the Bureau of Mines, in the Department of the Interior, has been producing synthetic fuels and chemicals from coal on a relatively large scale by improved hydrogenation methods in Missouri, and has less advanced projects in coal gasification going on there, while in Colorado it is preparing to produce oil from shale by a new method. The Secretary of the Interior, Mr Oscar Chapman, confidently announced some time ago that, as the result of the work in Missouri, there would now be little risk either for the government or private industry in building a full size plant to produce synthetic fuels by hydrogenation.

In spite of this, however, no private firm has been prepared to undertake any risk at all in this connection, although one has offered to build a hydrogenation plant in southern Illinois, at a cost of $400 million, provided that the government guarantees it against loss and promises a market for all its output. This hardly seems a very attractive proposition from the government's point of view, but nevertheless Mr Chapman has asked the Defence Production Administration to guarantee to buy the output until 1962, at present prices or better, and has also asked for similar guarantees for a $55 million plant in Colorado, which would produce oil and chemicals from shale.

These requests are under consideration, but in the meantime Dr James Boyd, head of the Bureau of Mines, has resigned from the agency. He has gone to a much more profitable job with a private mining company, but it is suggested that one of the reasons for his departure is his belief that Mr Chapman has been pushing the synthetic fuel programme too fast and too far, and that he should at least have waited for reports on its feasibility and advisability which

THROUGH THE CHASE BANK...
NOT ONE DOOR, BUT MANY

Many American doors are open to expanding British export trade. In selecting the most desirable, the Chase National Bank, through its London offices, can prove extremely helpful. Our officers have full, up-to-the-minute information on market, credit and trade situations in all parts of the United States.

THE CHASE NATIONAL BANK
OF THE CITY OF NEW YORK
A United States Corporation with Limited Liability
LONDON—6 Lombard Street
51 Berkeley Square Bush House, Aldwych

Guaranty Trust Company of New York

This bank, through its New York and European Offices and correspondents throughout the world, provides complete banking facilities designed to meet the requirements of banking institutions, corporations, firms, governments, and individuals wherever located.

LONDON OFFICES

Main Office
32 LOMBARD STREET, E.C.3

Kingsway Office
BUSH HOUSE, W.C.2

Liverpool Correspondent, 31 Cotton Exchange Buildings

PARIS — Head Office 140 BROADWAY, NEW YORK — BRUSSELS

Incorporated with limited liability in the State of New York, U.S.A.

Manufacturers Trust Company

Manufacturers Trust Company, New York, offers its facilities to banks and bankers desiring a correspondent in the United States equipped to render a complete service in the field of international banking, including the handling of current accounts, time deposits, commercial letters of credit, collections, purchases or sales of foreign exchange, corporate and individual trusts, buying, selling and safe keeping of securities, and credit information.

Principal Office:
55 BROAD STREET, NEW YORK CITY
109 Banking Offices in Greater New York

European Representative Office:
1 CORNHILL, LONDON, E.C.3

Far Eastern Representative Office:
NAKA 7 BUILDING, 3-CHOME, MARUNOUCHI, TOKYO

Incorporated with Limited Liability in U.S.A.

Canadian Markets

British firms interested in Canada as a field for business and trade expansion, will find The Royal Bank of Canada a useful ally. With branches from coast to coast, we provide an informed banking service fully experienced in meeting the needs of foreign traders.

London Offices—
6 Lothbury, E.C.2. B. Strath, Mgr.
2-4 Cockspur St., S.W.1. R. B. Murray, Mgr.

THE ROYAL BANK OF CANADA
Head Office, Montreal
Offices in New York and Paris
Over 750 branches in Canada, the West Indies, Central and South America.

Incorporated in Canada in 1869 with Limited Liability.

were being prepared by various expert groups. One of these, from the National Petroleum Council, has just appeared. In condemning the coal hydrogenation process as uneconomic, it repeats the protests which the petroleum industry had made earlier against Mr Chapman's proposals. Then the industry claimed that it could build an ordinary refinery, with the same capacity as the suggested plant in southern Illinois, for about one-eighth of the money and added that it would be ready to build synthetic plants at its own cost whenever they became practicable. Now the council reports that in its opinion it would cost over 43 cents a gallon to produce petrol by hydrogenation, compared with the Bureau of Mines' estimate of under 11 cents and with about 13 cents for petrol from crude oil. The report is, however, rather more optimistic about the possibilities of producing petrol at a more competitive price by gasification or from oilshale.

*

But at the same time a hitherto unfancied process is coming up fast and may be in use before any of the so-called "high-heat" processes. Hydrogenation and gasification both use almost half of the original heat energy to produce the end product. The dark horse "cooks" the coal instead of breaking it entirely down and the process is conducted at a relatively low temperature. It also differs from hydrogenation in that private industry paid for much of the original research, done in a Bureau of Mines laboratory, and is prepared to stake many millions of dollars on its cheapness and reliability.

The Texas Electric Power Company of Dallas, which paid for the experiments, is building an immense power station, ultimately to have a capacity of 320,000 kilowatts, in Milam County, Texas, to supply electricity for a new aluminium plant which will make 85,000 tons of the metal a year. Milam County was chosen because it contains a vast bed of lignite, from which the electricity will be generated by the new process. It takes about ten kilowatt hours of electric power, or half a week's average supply for an American household, to make one pound of aluminium. Here, right in the preserve of the natural gas industry, lignite is outdistancing gas as a source of cheap power and, it is hoped, providing an answer for the shortage of hydro-electricity that is hampering aluminium expansion.

The cheapness is explained by the fact that the process separates the lignite into its two chief components, carbon, or char, which provides the fuel for the power generators, and coal tar, which can be made into all sorts of much-needed oil and chemical products. A ton of the Texas lignite produces about 14 gallons of tar; tar is now selling at from 8 to 10 cents a gallon, and the cost of the lignite is about $1 to $1.50 a ton. Thus the power plant will get its fuel almost free. There is, of course, nothing new about carbonisation. What is new about the present process is that it is better, cheaper and quicker, particularly when it comes to the removal of the water which makes up one-third of lignite by weight. Above all, the combined operation provides a useful way of disposing of the char that carbonisation inevitably produces in huge quantities.

Before long the western river basins will be needing more power than can be provided by harnessing even their great water resources. But the upper end of the Missouri basin, in North Dakota and Montana, is virtually one vast field of lignite and sub-bituminous coal, which are the grades upon which carbonisation works best; the Columbia basin also has rich reserves, in the State of Washington. The new process can apparently be applied very efficiently to oilshale as well, and to the low-grade coal in which the west abounds. The process has potential uses, other than for the production of electricity, which are also of great importance to the west. For example, it might be employed to make special fuels for the steel plants that now have to import some of their coking coal from other regions; to produce pure carbon for electric furnaces to refine the west's enormous store of phosphates; and to utilise its waste wood products.

American Notes

Atomic Plenty

The atom bomb came of age last week, for the fourth of the atomic explosions now taking place in Nevada was the twenty-first in the series that began in July, 1945. The atom has matured very satisfactorily, for the latest detonations were of bombs of different sizes and types, with ground troops participating for the first time; the Congressional observers were able to report that atomic bombs can now be used on the battlefield and followed up immediately by attacking forces without danger from radiation. It is believed also that the new bombs are not only tailored to fit the job they have to do, but also contain less plutonium in proportion to their explosive power than the old, and are therefore cheaper; in fact, measured in these terms, it seems that atomic weapons will eventually be more economical than conventional ones.

Atom bombs used in this way will not carry the moral reproach that Americans have always attached to their atomic attacks on Japanese cities in 1945, and the latest experiments show, in the words of the chairman of the Atomic Energy Commission, that the enemy can be met "with a fire power that should cancel out any numerical advantage he might enjoy." The Secretary for Air believes that a revolution in the country's basic military concepts will be required if full use is to be made of the great advances that are coming in atomic weapons. All of this will certainly reinforce Senator McMahon's demand for a much increased expenditure on atomic development, in the eventual interests of more security for less money; even so, it would take about three years to produce the new atomic weapons in the huge quantities needed to be effective.

Three years gives the Russians more than enough time to catch up with the United States, or at least to construct enough atom bombs to do serious damage. The point was underlined by the announcement, on the same day that the latest American experiments began, that a further atomic explosion had taken place in the Soviet Union. Yet Congress at its last session refused to provide money to give Americans the protection from enemy air attack that had already been approved. The President asked for $535 million for civil defence, but he got only the "tragically insufficient" sum of $75 million, which means that there will be no federal help for the construction of air-raid shelters and little for the stockpiling of emergency supplies.

* * *

Business in Distress

The hard facts that hit the stock exchange bulls in mid-October and made the bears stir in their sleep were the first batch of company reports for the third quarter of the year. Those which allowed in advance for the retrospective taxes which will have to be paid under the new Bill showed a sharp drop in profits compared with the same quarter of the previous year (when profits were swelled by post-Korean scare buying); those which ignored the new taxes for the present will obviously make an even poorer showing in the fourth quarter. But what really shook the stock market was the number of important companies that disclosed a decline in profits before making any allowance for taxes at all. The decline, which in many cases came as much from reduced volume of business as from increased costs, is likely to continue for some time, for few defence contractors are yet ready for large-scale output and makers of civilian durable goods cannot expect any increase in their supplies of materials before next autumn.

At the moment, however, it is not shortages of materials but lack of consumer demand that is restricting production of most civilian goods; some manufacturers of these are not even using their full allotments of controlled materials. Consumers have for months been obstinately saving an unusually high proportion of their steadily growing incomes (although they have not been buying government savings bonds). Retail trade improved in the last weeks in October, but that was mainly a spurt to beat the new excise taxes on household appliances and many other articles, which came into force on November 1st. Many retailers are doubtful whether they will be able to pass these on in full to consumers, especially since November 1st is also the date on which wage packets and salary cheques will begin to feel the effects of increased income taxes. Christmas is, of course, coming, but it will be followed by three months during which the tax collectors take their largest bite of the year out of incomes.

Depressing as all this is for businessmen, it does not mean that the country as a whole is facing an economic depression. All that has happened is that inflation has been unexpectedly delayed. The gross national product has levelled off, but at an annual rate of $328 billion in the third quarter it was still higher than ever before, and the index of industrial production is climbing again after its sudden fall in July. This is because defence production is at last getting under way, with deliveries rising fast, which explains in part why in September, for the first time in two years, there was a decline in the value of unfilled orders on manufacturers' books. This is also explained by the continued reluctance of wholesalers and retailers to order new stocks, but their inventories are gradually getting back into balance with their sales and sooner or later they, like consumers, must begin to buy again.

* * *

Dilemma for Bookmakers

Bookmakers all over the country are groaning over a provision of the new tax law which went into effect last week, under which they must pay a ten per cent federal tax on their gross earnings and must buy a $50 tax stamp each year to display on their premises. Ostensibly this is purely a revenue-raising measure, but Treasury estimates of the receipts seem to be based on the assumption that bookmakers will not comply with the law on any large scale. The expected revenue is put at $400 million a year. It will also cost a lot to collect this tax: 4,000 men will be needed, at a cost of $34 million. Professional gambling is illegal in every State except Nevada, but enforcement of the laws is notoriously lax—as an annual betting expenditure of over $20 billion shows.

The tax has already driven all bookmakers in Las Vegas, Nevada, out of business, but in the other States they seem to be less worried by the tax than by the registration provisions which go with it. Bookmakers are required to register with the Bureau of Internal Revenue their real and "trade" names, their home and business addresses, and the names of all winners, with the threat of a $5,000 fine and five years in prison for failure to comply. Many bookmakers have announced that they will close down, for by registering they will have to admit to being violators of local and State laws —and, in most cases, of federal income tax laws. Local law enforcement officers will find it harder now to plead ignorance as an excuse for inaction. As one gambler said, "You have to buy a licence to go into an illegitimate business." Some observers, however, have taken the bookmakers' notice of retirement with a grain of salt. They point out that operators of slot machines, which are illegal almost everywhere, already register and pay federal taxes, but suffer little local interference, just as bootleggers in "dry" States such as Mississippi buy federal liquor licences.

Income tax represents a bigger threat to the gamblers' security. Until now many bookmakers have represented their declared earnings as coming from other legitimate businesses, or have listed themselves as employees of taverns, whose owners have even co-operated to the extent of filing Social Security returns for them. Much of this evasion would be exposed.

The tax has also been attacked by many law-abiding citizens including Senator Kefauver, Democrat from Tennessee who headed the Senate Crime Investigating Committee, who believes that it represents a partial sanctioning of gambling by the government. The law might even be a violation of the Fifth Amendment, for a Washington lawyer has said, "When you acknowledge you're a bookmaker, that's self-incrimination, and that's against the Constitution." Few bookmakers seemed willing, however, to test the law in the courts.

Battering at the Wage Line

The New York dock strike has succeeded in becoming the longest in the port's history, but the strike which worries Washington even more is one which cannot take place for two months—that in steel. Mr Murray, the steelworkers' leader, makes no attempt to conceal his determination to batter a way through the wage stabilisation line, which would allow no more than a 4 or 5 cent an hour increase in steel wages. The contract termination notices have now been sent in to the 40 basic steel producers, giving the 60-day warning necessary under the Taft-Hartley Act if there is to be a strike on January 1st.

The government, however, cannot afford a shut-down in steel, which would bring defence production to a halt, however high Mr Murray's demands, or however strong a line the steel companies take. If a strike seems imminent, Mr Wilson, the defence mobiliser, certainly will demand a Taft-Hartley injunction (which the President would be reluctant to use in an election year) or the appointment of a special board similar to that used in the last steel strike in 1949.

One way of making wage stabilisation more elastic is the extension of productivity bonuses, such as the automobile workers have won from the General Motors Corporation. They receive an annual increase of 4 cents an hour, in addition to adjustments, calculated quarterly, to compensate them for increases in the cost of living. Another cost of living rise seems to be in the making; because of increases in clothing prices, the consumers' index reached a new peak in September. The Wage Stabilisation Board, whose chairman does not believe that wages should be tied rigidly to the cost of living, has had the productivity plan, as well as a whole range of "fringe" benefits—pensions and the like—under study for some months. So have the trade unions.

The automobile and steel industries take, however, very different views of productivity payments. General Motors has so much faith in incentives and good labour relations that it has agreed not to use the bonuses as a basis for demanding higher prices. Steel spokesmen, on the other hand, argue that their companies are already using incentive plans and that coming increases in productivity are due, not to increased efforts on the part of the workers, but to the vast expansion and modernisation programme now under way. They believe that, in view of past increases in costs, a rise in steel prices is already overdue, and they will fight any

attempt by the government to make them absorb a wage increase disguised as a reward for higher productivity. And higher prices for steel mean, inevitably, higher prices all round the economy.

* * *

Colour Television on the Shelf

Both the Columbia Broadcasting System and its rivals in the field of colour television have accepted with remarkable alacrity the request of Mr Wilson, the defence mobiliser, that production of TV colour sets should be shelved until the end of the metal shortage. Even the Federal Communications Commission, which threw the industry into an uproar by awarding the colour prize to CBS, may not be sorry to have time to weigh the new evidence and reconsider its decision. The industry is sceptical about Mr Wilson's reasons for requesting the standstill; with continued production of black and white sets the saving in materials is unlikely to be great, and as long as research into colour television goes on (and it serves military as well as civilian interests) not many engineers will be freed for defence work. The real argument seems to be that mass production of colour receivers might revive the ailing TV market and whet American appetites for scarce resources, both of metals and manpower.

Columbia might not have been quite so eager to comply if it had been able to exploit its victory before the FCC and later before the Supreme Court, which upheld the commission's power to approve the CBS system as the best available at present. The sale of CBS receivers, at over $700 each, has been slow, and because they are "incompatible," that is, cannot receive signals in black and white without a costly adapter, advertisers have been unenthusiastic. The only regular colour programmes—those of CBS from New York—have now been suspended, though colour television in theatres does not come under the ban. The standstill is even more welcome to the rivals of CBS, notably the Radio Corporation of America which has been fighting for time to prove that its compatible electronic system is, in the long run, far superior. The likelihood is that the present CBS system, which employs a mechanical spinning disc, may be shelved forever. By late 1952 or 1953, when colour TV is unfrozen, there are likely to be so many black and white sets in use that only a compatible system will be acceptable. By then research may have made conversion to the reception of colour simple and inexpensive.

* * *

The Postman's Round

The two new Bills which were signed by the President last week, increasing the postal rates on several classes of mail, and increasing the pay of postal workers, will not go far towards resolving the perennial crisis in the Post Office. Nor, probably, will they produce a rapid improvement in the bad delivery service which has caused many complaints: deliveries to residential areas were cut to one a day earlier in the year when Congress reduced the Post Office budget by $70 million as an economy measure. Delays in delivery are reported to be worst in the capital.

Although postal rates have been increased by $117 million, together with an additional $100 million from increased parcel rates which were granted by the Interstate Commerce Commission and which went into force at the beginning of last month, this will be offset by pay increases of $252 million for postal workers. The chronic Post Office deficit, running this year at more than $500 million, will not be staunched by these changes. The Senate proposed increases in rates which would have raised $400 million in revenue.

Two of the most controversial postal questions were dodged in the final Bill: first-class and airmail rates were left unchanged; and second-class mail rates, which include a subsidy for newspapers and magazines, were increased by thirty per cent, to be raised by three annual stages of ten per cent each. This was half the amount recommended by the Senate, and less than a third of that requested by the Administration.

Another Bill which would have reduced the Post Office deficit failed to reach a vote in the House before the end of the session. This measure, which would separate payments to airlines for carrying mail from sums paid to them in government subsidies, was proposed two years ago by the Hoover Commission. At present both charges, totalling about $130 million, are lumped together and paid by the Post Office, and it is not known precisely what proportion of this sum represents mail charges. Early this month the Civil Aeronautics Board announced that it had separated the two charges but, until legislation is passed, this will simply be a book-keeping change: the Post Office is still paying both bills.

Shorter Notes

Mr William Remington, a former employee of the Department of Commerce who was convicted of perjury in connection with allegations that he had been a member of the Communist party, has now taken his case to the Supreme Court. The Court of Appeals had upset his conviction, on the ground that the judge should have defined for the jury what acts constituted proof of membership in the Communist party. Instead of undertaking the new trial ordered by the Court, the government has obtained a new indictment against Mr Remington which charges him not with party membership but with perjury in denying certain specific accusations at his first trial. This gets round the technical difficulty of defining party membership, but in the view of the defending counsel puts Mr Remington in jeopardy twice for the same crime. The new trial has now been delayed, in spite of the government's protests, until the Supreme Court has had an opportunity to clear Mr Remington of the original charges. He has already been fighting this case for more than three years.

*

Both parties have been watching the Congressional election in Maine for an omen of success in next year's elections—and both affect to have found one. Although the Republican candidate always wins, the margin of his victory has tended to indicate which way the country will vote. This year the Republican margin was increased by ten per cent over last year and was only five per cent less than the record margin in 1944.

*

Music lovers are in the almost unique position of doing well out of the new Tax Bill. Both the Metropolitan Opera and symphony orchestras have at last won their fight for exemption from the 20 per cent entertainments tax. The Metropolitan had the greatest operating deficit in its history this year, but tax relief should reduce it to manageable proportions.

*

An aftermath of last summer's price war between the big New York department stores is the filing of an anti-trust suit against R. H. Macy and Company by the firm that makes "Mixmasters" and other household appliances. The price war was started when the Supreme Court ruled that retailers need not observe the so-called "fair trade" laws, which prevent price cutting on branded goods. Macy's promptly reduced the price of "Mixmasters" by nearly 50 per cent, and by so doing managed to obtain a virtual monopoly of trade in these articles, according to the manufacturers.

THE WORLD OVERSEAS

The Future of Pakistan

(From Our Karachi Correspondent)

ONE of the secrets of Liaquat Ali Khan's strength was that he—almost alone among the leading men of the country—was a Pakistani without a province. When he left India he severed his own provincial connection, such as it was, and in his new country was therefore unaffected by the sympathies and predilections to which his colleagues were prone. Now that he is gone, the danger is that the provincial jealousies which he managed to keep from rising to the surface will poison Pakistan's political life.

Admittedly, the change in leadership has been put through with incredible smoothness. There has been no unrest, and after the first few days of bewilderment and bereavement the people have pulled themselves together and carried on with their work as if nothing had happened. The recent crisis in Indo-Pakistan relations had, of course, strengthened the unity of the country and had produced a wave of patriotic fervour which has not yet lost its momentum. But many observers fear that that unity and that patriotism are going to be severely tested in the coming months.

Much depends on personalities. Khwaja Nazimuddin was no doubt the best choice as successor to Liaquat, but he was not altogether the obvious choice. Most people had, in fact, expected that Sardar Abdur Rab Nishtar, the Pathan Governor of the Punjab, would be nominated as Prime Minister; for he had distinguished himself in the administration of that difficult province, which was politically at a very low ebb when he took over. Moreover, there had already been rumours that he would be brought back to the central cabinet as deputy Prime Minister, to be groomed up as ultimate successor to Liaquat. He and his supporters must be presumed to be not altogether pleased at the turn events have taken. The Sardar has been appointed to the comparatively lowly post of Minister for Industries, but it is probable that he will be allotted the more important portfolio of Interior, Information and Broadcasting—generally known as the Home Ministry—when the Prime Minister's brother, Khwaja Shahabuddin, goes to Cairo as Pakistan's Ambassador to Egypt. The opportunity will then be taken to bring another Punjabi into the Cabinet.

Claims of the Punjab

That this is necessary is proved by a public statement made by Mr Mumtaz Daultana, the able, ambitious and still youthful Chief Minister of the Punjab, immediately after the new Cabinet had been constituted. He expressed his dissatisfaction at the fact that East Bengalis outnumbered Punjabis in the Cabinet—in this he was certainly voicing the general opinion of Punjabis, who are inclined to regard themselves as the master race of Pakistan—but stated that he had received an assurance that the Punjabi element would be strengthened. If this mollified the Punjab, it had the opposite effect in East Bengal; and Mr Nural Amin, the Chief Minister of that Province, which is, of course, numerically far stronger than any other and has always felt somewhat neglected by Karachi, put in a counter-claim for another Bengali Cabinet Minister. The Province of Sind, too, in the person of Mr Khuhro, a Chief Minister with a highly chequered record, gave vent to some grumbling about its inadequate representation.

At this crisis of the country's affairs merit should have been the sole consideration; it was depressing to watch provincialism raising its head in a fairly ugly form, when the wreaths had hardly faded on the grave of the great leader who had so long kept it successfully in check. In itself it is not an unnatural weakness in the body politic and should not threaten the stability of Pakistan unduly, but the danger is that it may be harnessed to personal ambitions and exploited by the less scrupulous and patriotic politicians for their own ends.

Possibly it is wishful thinking, but many observers believe that the chances of the re-establishment of amicable relations with India are brighter now than at any time in the past four years. It is not that Liaquat was an obstacle to this or that Khwaja Nazimuddin is expected to make concessions to Mr Nehru in the Kashmir dispute. The shock of Liaquat's assassination has, it is thought, produced a revulsion of feeling, and the removal of one of the protagonists may give the other the opportunity of adopting a more conciliatory attitude without loss of face. Pakistani propaganda on the subject of alleged harassment of Muslims in India has, mercifully, ceased; while from the Indian side less talk is now heard of the exodus of Hindus from East Bengal. Dr Graham's Report has reduced the differences regarding the Kashmir demilitarisation programme to a comparatively narrow field, and there is just a chance that a fair plebiscite, without recourse to arbitration regarding the intermediate obstacles, may now be possible.

Liaquat's Policy Continues

There is not likely to be any change in Pakistan's relations with the Commonwealth, and with the outside world in general. In this department, the effect of Liaquat's death will be felt perhaps less than in any other. The new Prime Minister has declared that his policy will be that of his predecessor, and there is no reason to doubt it. By temperament and training he will be personally inclined to lean on old friends rather than seek new alliances. Kashmir will, however, be the touchstone of Pakistan's foreign policy, and its co-operation with the Commonwealth—indeed, its very continuance as a member of that body—will depend on the degree of assistance and encouragement it gets from the Commonwealth countries over Kashmir. The general public has long been lukewarm about the Commonwealth connection and cynical about the United Nations, but it has been heartened by the Conservative victory. Although ideologically the man in the street is more inclined towards the Labour party and is suspicious of Churchillian "imperialism," he rejoices in the conviction that Mr Churchill will be ready to take a firmer line with India, if it proves necessary to do so to bring about a fair plebiscite in Kashmir; rightly or wrongly Pakistanis have always believed that the Labour Ministry had a sentimental attachment to the Indian Congress and would never give wholehearted support to any measures designed to bring pressure on India.

At this moment, however, the new Pakistan Government is faced with an awkward dilemma. The trouble in Egypt has aroused a great deal of popular excitement; the British are being accused of "naked aggression" and Khwaja Nazimuddin has been urged in some circles to declare that

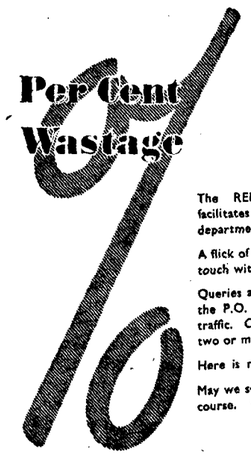
Pakistan is on the side of the Egyptians. This uprush of sentiment in favour of a fellow Islamic country cannot be ignored, but at the same time it is clear that the self-interest of Pakistan requires collaboration with the western powers. The new government is therefore faced with the task of steering a course between the demands of Islamic sentiment and the requirements of a realistic policy in international affairs. It should be helped in this by the fact, which has not gone unnoticed, that Islamic solidarity has never impelled the Egyptian Government to declare itself on Pakistan's side in the Kashmir dispute, while the attitude of the British, ever since the last Commonwealth Prime Ministers' Conference, has appeared helpful to Pakistan's case. The Government of Liaquat Ali Khan pursued, not very actively, a policy of closer economic and cultural relations with the Middle Eastern countries, but showed not the slightest enthusiasm for political alliances with such countries, still less for the concept of "Islamistan"—that is to say the complete integration of the Muslim countries of the Middle East and Pakistan advocated by Chaudhri Khaliquzzaman, the former President of the Muslim League. Khwaja Nazimuddin, who is a very devout Muslim, is likely to intensify the movement for closer economic and cultural relations, but is not likely to try any political adventures.

Spy Trial in Sweden

On September 12th of this year an engineer petty officer in the Swedish Navy named Ernst Andersson requested, and obtained, five days' leave from his duties in Stockholm in order to deal with an urgent family problem. But instead of going to Nässjö, in central Sweden, which he had given as his address while on leave, he devoted those five days to visiting Sweden's largest naval base, Karlskrona, on the south coast. On September 20th, having returned to Stockholm, he made his way to a lemonade-kiosk under the Tegelbacken viaduct and took from the racks a bicycle which had just been left there by a certain Nikolai Orlov of the Soviet Embassy. Andersson rode this bicycle to the Southern Hospital and left it there, after placing some papers in the tool-bag and concealing another piece of paper in the top of the pump; he then went home, by tram. Counter-espionage officers who had been watching his movements found these papers to contain, written in invisible ink, details of the dispositions and equipment of the warships based at Karlskrona. The next day Andersson was arrested, and the most sensational case of espionage in the history of modern Sweden was under way.

At Andersson's trial, which began on October 30th, the Commander-in-Chief of the Swedish Navy, Admiral Helge Strömbäck, stated that the damage done was to a considerable extent irreparable. The prosecution claimed that Andersson had obtained for his Soviet employers details of the dispositions, armament, and state of readiness of many Swedish warships, not only at Karlskrona but at other naval bases; information about possible landing points and coastal defences on both the east and the west coast of Sweden; details of the fortifications at Boden, the bastion of Sweden's defences against any overland invasion in the north; information about air force units and airfields around Lulea, the big base in the north of Sweden; and detailed information on the armament and equipment of British warships which visited Karlskrona this summer. If one spy could achieve so much, Swedes are asking themselves, how much information have the Russians been able to collect altogether from their agents in Sweden?

Undoubtedly Andersson was a fortunate choice. After reporting copiously on the Stockholm area early in 1950, he was first posted to Karlskrona, and then sailed on a fleet ice-breaker up the whole east coast. During this voyage he took numerous photographs with a camera bought with money supplied by Victor Anissimov of the Tass agency; some of these photographs were printed in a Swedish naval magazine, while the others were handed over to the Russians. On arrival in the north, Andersson was among a number of petty officers from the ice-breaker who were invited first to the Lulea air base and then to the Boden forts, where they were shown round by the hospitable garrison. His ship came south again in time for him to inspect the visiting British warships; and in spite of all these activities he found time to take a course in radar, which greatly increased the value of his reports.



Petty Officer Prophet

The fact that Andersson was given all these opportunities to collect information has caused much raising of eyebrows in Sweden. For it has been shown that he had been a Communist for over twenty years, and that his messmates were so well aware of his extremist views that they nicknamed him "The Prophet." According to one Swedish newspaper, his notoriety was such that a fellow petty officer, listening to the first wireless bulletin in which the case was mentioned, said without waiting to hear the name of the accused: "That must be Andersson; I've always suspected him."

The direct contacts that this spy maintained with Soviet officials have also given rise to comment. It seems hardly in the classic pattern of Soviet espionage for a man who had long been an active Party propagandist (Andersson helped to edit and distribute among naval men a Communist paper called *Torpedo*) to become not merely an active spy, but one who reported personally to members of the Soviet Embassy staff. Andersson made his first contact with the Russians in 1946, when a Swedish Communist introduced him to Vinogradov, a Russian secretary of legation. He and Vinogradov visited each others' homes for meals and drinks, and soon afterwards equally close relations were established between Andersson and Anissimov. Not until 1949 did the Russians begin to assign their agent to definite tasks; but from then on he reported regularly to Anissimov, sometimes by such devices as the cycle park and sometimes by actual meetings. In 1951 Orlov replaced Anissimov, who had left Sweden; Orlov himself has now returned to Russia.

At the trial Andersson admitted the prosecution's charges, and declared that he had been fully aware of the possible consequences of his actions, but had believed that he was doing the right thing for the world. He admitted receiving the relatively modest sum of 4,530 kroner from the Russians, but said he had probably spent more than that during his activities. He appeared calm and completely unshaken in his political beliefs; but he has, of course, been disowned and denounced as a *provocateur* by the Swedish Communists.

The agitation that the trial has aroused in Sweden is not entirely due to the scale of the damage already done, or even to the revelation of the ease with which Soviet espionage can operate in the country. The case has also to be seen against the background of the diplomatic offensive recently launched against Scandinavia by the Soviet *bloc*. Simultaneously with Mr Vyshinsky's peremptory Notes addressed to Norway, the Swedes have in the past few weeks received three equally bellicose Notes from Poland, which allege the existence of an "anti-Polish atmosphere" in Sweden; and they fear that they may be subjected to considerable pressure from Poland in the matter of the Polish coal which they urgently need if they are to get through the coming winter without embarrassment. Now the Andersson case has given them convincing proof that the most punctilious neutrality does not insure a country against the close attention of the Soviet intelligence services. Sweden has always taken care that its neutrality should be an armed one; but the question is now being asked whether the comprehensive information which the Russians seem to have obtained about the country's defences and possible invasion routes does not destroy the military basis of that neutrality.

How much time is wasted in your offices through lack of inter-departmental contact?

The RELIANCE Loudspeaking Telephone Service facilitates intercommunication between executives and departments.

A flick of a switch and your staff is at your elbow and in touch with each other.

Queries are settled without staff leaving their desks or the P.O. switchboard being overloaded with internal traffic. Complete conferences are possible by throwing two or more keys.

Here is real economy and real efficiency.

May we send you full particulars—without obligation of course. Write for leaflet T.E.7.

"THE CITY"

By PAUL BAREAU

prominent broadcaster and lecturer.

Published this week, price 1/-, 48 pages fully illustrated, "THE CITY" is the second booklet in the informative new series issued by the *News Chronicle* under the general title :—

"BACKGROUND TO THE NEWS"

Mr. Bareau's account of the manifold activities of the City is lucid, objective and remarkably thorough.

No. 1 of the series is PARLIAMENT by Geoffrey Cox.

BOTH BOOKS ON SALE AT NEWSAGENTS AND BOOKSHOPS

Annual subscription, 10/-. Further details from :

"BACKGROUND TO THE NEWS"

MAGNESIUM

MAGNESIUM, lightest of the common metals and silvery-white in colour, is the element usually associated with photographers' "flash powder", and incendiary bombs. It is produced by the electrolysis of magnesium chloride — a compound made either from sea-water, magnesium-containing brine or mineral deposits of magnesia — and by the thermal reduction of dolomite, a mineral which occurs abundantly in most industrial countries. By far the most important use of magnesium is in the manufacture of castings and wrought alloys for the aircraft and motor industries. It is also used to increase the strength of certain aluminium alloys. Compounds of the element, such as magnesium sulphate (Epsom salts) and magnesium oxide (magnesia), are well-known in medicine. Others are used in the production of rapid-hardening cements, in the rubber industry, in sugar refining and in paper-making. French chalk, meerschaum, asbestos and steatite are all compounds of magnesium.

In addition to making electrical insulators of steatite, I.C.I. uses magnesium in the manufacture of the aluminium alloys that are used so extensively in the construction of aircraft and in building and engineering.

Japan—Dazed and Strained

[BY A CORRESPONDENT RECENTLY IN JAPAN]

JAPAN'S economy was smashed and truncated by the war. It has subsequently been revived, in a partial and feverish manner, but it would be quite wrong to assume that the Japanese can yet see anything but a very difficult path in front of them. During the war 40 per cent of the urban area was razed by bombs or fire, and about 25 per cent of the national wealth, and 30 per cent of the industrial capacity were destroyed. Japan was shorn of the overseas empire to which its entire development had been shaped. Five million Japanese were repatriated—about 7 per cent of the country's population—and became a sudden addition to the natural rate of increase (now about 1,400,000 a year), which has brought the total number up to 83 million, or 20 per cent more than prewar. It is seldom realised how great a part of Japan's present equipment, and of the Japanese themselves, are entirely postwar phenomena.

The war damage was, of course, uneven. About 80 per cent of shipping was destroyed, 50 per cent of chemical fertiliser capacity, 30 per cent of thermal power, 25 per cent of cement, 22 per cent of electrolytic copper. Two-thirds of the prewar cotton mill capacity of 12 million spindles was first scrapped by the Japanese; then bombing caused a further loss of some 20 per cent in spinning equipment and 14 per cent in weaving. Such, in brief, was the industrial effect of the war.

The postwar rehabilitation and replacement have been no less uneven and uncertain. There were three periods. From 1946 to 1948 there was extreme political and industrial uncertainty, with purges followed by de-purges, trust-busting followed by the revival of trusts, and a fluctuating debate about reparations and peace terms. In 1949 and 1950, serious shifts in world markets and world politics were accompanied by the "Dodge Line" of deflationary stabilisation inside Japan. *Finally, since June, 1950, the* Korean War has had still more powerful, but divergent and distorting, effects on the Japanese economy.

Korean War Boom.

Some sense of direction has, however, returned. A consensus of agreement was reached on the "programme" for Japan's economic self-support by the end of 1952; there was not much of a programme about this, but it did represent close calculations of what would be required to balance Japan's international accounts by 1953. Hence it provides some positive estimate of the present direction and aims of the Japanese economy. Against this new yardstick of "self-support" by 1953, the recent progress looks very striking. Present capacity is much above prewar; indeed, it is ahead of schedule as regards the self-support programme.

But the appearance of self-sufficiency or solvency is due to a war boom of the crudest kind. The total figures conceal changes and movements which deeply affect future prospects. Through the first half of 1950 under the stabilisation programme prices were declining, inventories were increasing, and industrial plans were cautious. The Korean war brought a sharp increase in industrial production, caused sharp and uneven price rises, and halted the rise in the standard of living.

The UN forces' "direct procurement" in Japan was the main impetus behind this, though general conditions were favouring exports and checking imports. In the first nine months of the Korean war, direct procurement by the American military command made up one-third of Japan's total exports; it was valued at $250 million, of which two-thirds was in goods and one-third in services. Of the goods 25 per cent was machinery, 25 per cent metal and metal products, 20 per cent textiles, 12 per cent timber and paper, 5 per cent chemicals. The returns show at a glance how uneven were the effects of the Korean war:

INDUSTRIAL PRODUCTION INDEX
(1932-36=100)

	June, 1950	Dec. 1950	March 1951
All industries	94	117	127
Mining	112	120	129
Metals	131	158	164
Machinery	104	150	178
Ceramics	106	148	146
Timber	96	148	161
Textiles	40	49	51
Chemicals	123	151	165
Food, drink and tobacco	81	75	71
Printing	81	96	97

If the balance of payments was transformed, this was also largely due to procurement. Exports in the first half of 1950 were $323 million, imports $485 million, deficit $95 million; in the second half-year the figures were exports $498 million, imports $474 million, surplus $24 million (excluding procurement). If procurement is added, the export figure for the second half of 1950 is nearly doubled. But the situation deteriorated, from the Japanese point of view, in 1951; imports in the first half of the year were $512 million, against exports of only $287 million (procurement excluded). Dollar reserves, built up to almost $520 million at the end of 1950, fell below $450 million by March, 1951. The reasons for this are mainly the sharp rise in the cost of raw materials and freight, factors to which Japan is especially vulnerable.

Internally, the economy is "price-vulnerable," and contains serious inequalities and instabilities. Over the first year of the Korean war, the prices of items most in demand for export or for procurement rose much more than those of items mainly using indigenous raw materials and intended for the home market. In the former group, for example, the price of metals rose by nearly 200 per cent, of machinery by 125 per cent, of textiles by 50 per cent, and of fuel by 50 per cent. But in the latter group chemicals rose by only 6 per cent, food by a mere 2 per cent. Capital goods in general show a 90 per cent rise, consumer goods only 46 per cent. The internal terms of trade are especially adverse to agriculture, where receipts are more stable than costs; 60 per cent of family expenditure still goes on food. The structure of price controls, though still elaborate, has lost a great deal of its effectiveness over the last two years. The resultant inflationary pressure is now reinforced by the effects of the "usance" system, under which advances and long term credits were given by the State, last autumn and winter, to finance essential imports.

Consumption levels and real wages in Japan have remained broadly unchanged, on the average; but they may soon lag seriously behind prices. In this matter also, one must look behind the averages to see the significant and dangerous inequalities. For instance, not only are wages much higher in the larger Japanese firms than in the small ones, but the difference between them has recently been increasing.

WAGES (average for all factories=100)

Factories with:	1950 2nd qtr.	1950 3rd qtr.	1950 4th qtr.	1951 1st qtr.
Over 1,000 employees	115	116	122	129
500—999 "	107	109	112	118
200—499 "	101	100	100	97
100—199 "	101	93	90	86
50— 99 "	85	83	77	79
30— 49 "	77	73	69	66

All these index numbers give a grossly inflated idea of Japan's progress and solidity. The prewar base with which they draw comparisons is usually "the 1930-34 annual

average." This base period was originally taken as the "normal" pre-militarist scale to which Japan's economy might be readjusted in the peace settlement. But as an absolute measure of the present revival, it is as misleading as returns of European recovery would be if the base year taken were not 1938, but the depression period 1931-34. It looks very fine to see, for instance, that present industrial output is about 130 per cent of prewar, i.e., of the 1930-34 average. But further enquiry shows that the comparable figure for 1939, on the same base, was 163; and the wartime peak performance (1944) was as high as 215. This gives quite a different perspective. Similarly, while due praise should be given to the feat of balancing trade (in the second half of 1950) at over $800 million, the fact is that in terms of volume this represented only 40 per cent of the 1934-36 average exports. And now there are five mouths to feed where there were four before the war; ten hands to employ where there were eight.

Japan depends heavily on the Asian markets which took 60 per cent of Japanese trade in prewar times. Shipping and raw material costs may remain high, or even rise. The prospects or consequences of a resumption of Japanese trade with China, in particular, are uncertain. The recent restrictions made it necessary to seek more distant, expensive and uncertain sources of supply for iron, coal and salt; and they cut off one of Japan's most important and most natural markets. People in the Far East watch with some amazement the complacent propaganda in the West which depicts a restored and firmly refounded Japan, emerging from a wise and efficient occupation. The true picture is of the Japanese nation facing a grim struggle for existence, on the basis of somewhat artificial and distorted economic conditions, and of the Japanese people dazed and strained, after all their chequered experiences in the last ten years.

Israel and Middle East Defence

ISRAEL'S attitude to the proposed Middle East Command has undergone a *volte-face*. When the Four Powers originally communicated their proposition, which they did "for information only," first reactions were mistrustful and unfavourable. Umbrage was taken at the invitation to Egypt to become a founder member. The gesture was condemned as surpassing the legitimate bounds of opportunism, since Egypt had only a month previously been arraigned in the Security Council for its behaviour over traffic through the Canal, and had been voted guilty by a majority which included all four sponsors of the invitation.

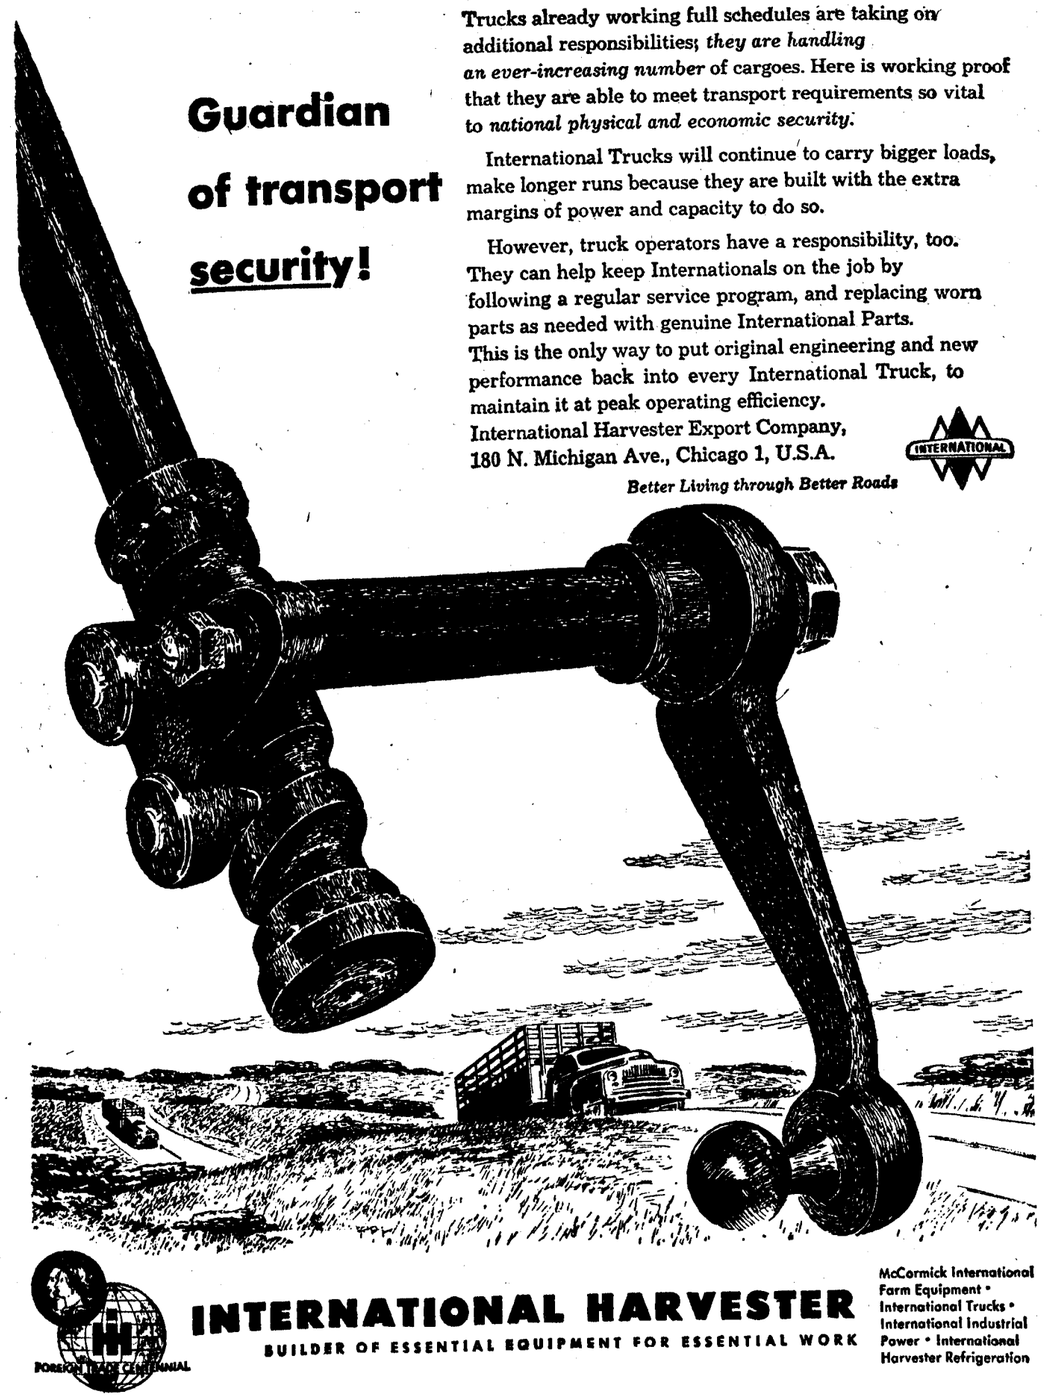
But such criticisms were not the fundamental cause of misgiving; they cloaked a very real fear that expediency would lead to undue appeasement of the Egyptians. The Israelis felt that Egypt might be subtle enough to temporise with the West, and might consent to parley with it at a price. The price that they feared was cessation of American economic aid to Israel. But the Egyptian Government, which is a prisoner of its own slogans and of its deteriorating home political situation, did nothing so astute. It turned the proposition down out of hand. Israel's Government is therefore prepared to see the project in a different light.

The Knesset (Parliament) debated it this week, and ended by giving it tacit approval through the medium of a vote of confidence in the Ben Gurion government by 60 votes to 36, with 24 abstentions. Many Israelis abandon with reluctance the pose of neutrality (which they call "non-identification"), upon which, since the birth of their nation, they have set so much store. In fact that pose has for two years been a fiction on account of the country's total dependence on gifts and loans from the United States. During the debate, Mr Sharett, Israel's foreign secretary, explicitly cut adrift from the neutralist policy:

> Israel's vital interests, however, demand that above all her relations be close with those countries whose Jewish communities are free to further the fulfilment of her historic mission and whose governments render practical assistance to enable her to stand up to the trials of today and to those which lie in wait for tomorrow.

He had previously stated that, though the Western Powers had not invited Israel to join the proposed command, their communication had put the "official seal" on Israel's inclusion in the region, and that Israel would do its utmost to strengthen itself economically and militarily in order to contribute its share to the defence of the Middle East.

Early Participation Unlikely



His declaration met with considerable opposition. It was of course violently attacked by the left-wing Socialists of Mapam, and by the Communists. But their warnings that the new policy would, in the event of war, cleave Israel in two produced from Mr Ben Gurion the retort that, in wartime support of the nation's enemies is treason.

The vote of confidence which followed the debate was the first full test of the new government's position, and must not be taken simply as a measure of the nation's attitude to the West. The opposition figure included, as well as Mapam and the Communists, the General Zionists and the Heruth party who are, after all, the principal protagonists of a link with the Western Powers. A motion of non-confidence in the government succeeded in mustering only 16 Mapam and Communist votes.

For more than one reason, therefore, public abandonment of neutrality does not presage an immediate request to participate in the command. Firstly, to incense Russia is not the object of the exercise, and many Israelis fear that overbold identification with the West would unnecessarily jeopardise the chances of rescuing the Jews remaining in Eastern Europe, notably in Hungary and Rumania. Secondly, public opinion at home has to be nursed along. Lastly, the Israel Government is well aware of the obstacles to a regional command that are created by its bad relations with the Arab states. It rates regional harmony as more important than its own admission to the new command. It is therefore well content to be non-committal.

Miners Behind the Curtain

IN BOTH Hungary and Czechoslovakia the Communist authorities have been having one of their periodic bursts of anxiety over the situation in the mines. They find themselves caught between the Soviet demands for still greater production for their heavy industries which cannot work without coal—and the unwillingness of the miners to work themselves to the bone for very little reward. In Hungary it is claimed that the coal production plan for the first half of the year was fulfilled by 96.6 per cent, but for the third quarter by only 90.2 per cent. A special meeting of miners' representatives and prominent Communist leaders recently met at Tatabanya to discuss measures to improve production. Mr Rakosi, who deemed it necessary to attend in person, pointed out that the conference was at least agreed that the target for coal was realistic and capable of fulfilment—if everybody worked hard enough. The coal production aimed at for this year is 16 million tons, as compared with 13 million tons in 1950. (It is not clear whether the figure of 27.5 million tons for 1954 is regarded as equally practical.) Mr Rakosi directed most of his oratory against the allegedly small number of "the undisciplined workers and incorrigible loafers" who are disrupting production. The miners' wage system is to be improved and steps are to be taken to increase

We've solved some problems in our time!

IN 1945 an oil company came to us with a problem. In measuring oil and gas pressures, they told us, recording instruments were lowered into the wells. The change in temperature during descent was resulting in false pressure readings. Could we supply a battery that would preheat the recording mechanism to a temperature of 160°F, and maintain it at that heat till it reached the well bottom? There was just one little difficulty—how to get a battery of 6 volts and one ampere hour capacity *inside a diameter of* 1¼ *inches* and a length not exceeding 3 feet.

¶ We designed and produced that battery—a contrivance of three cylindrical cells wired end to end within a framework of steel rods. It fitted exactly into its allotted place amongst the delicate recording instruments housed inside the 4 inch diameter steel cylinder. And it did the job.

¶ Hundreds of thousands of Chloride, Exide and Exide-Ironclad batteries giving good service today in every branch of industry, transport and communications owe their origin to just such a demand: 'Here is a job—make us a battery for it'. We have been solving that sort of problem for over 50 years.

¶ Our battery research and development organisation is the largest and best equipped in this country—if not in the world. It is at industry's service always—ready at any time to tackle another problem.

their supplies of meat and fats, but Mr Rakosi seemed to pin his greatest hopes to improved work by the party in the mines and to the creation of an "atmosphere of enlightenment and discipline."

In Czechoslovakia, the men in power seem to be even more disturbed. They have been concentrating their attention on the Ostrava-Karvinna coal basin, where 85 per cent of Czechoslovakia's hard coal is produced. Here the immediate cause of the trouble seems to be absenteeism, manpower shortages and the exceptionally high turnover of labour. About 5,000 regular workers have left the coalfield since 1947; and over 30,000 voluntary workers have stayed on the job for an average period of only four months. Other causes of the low production are said to be out-of-date norms and failure to mechanise and modernise the mines. The Central Committee of the party has been horrified by the "shameful state of affairs" revealed at Ostrava, and has decided to apply a number of remedies, which include a new system of wages and bonuses.

It is significant that the Committee's diatribes are directed not so much against the workers themselves as against the "extremely grave shortcomings and mistakes" of the industrial authorities and, above all, of the Communist party organisations. These latter appear to have failed dismally in their task of keeping the miners up to the mark. They have not educated them "in an uncompromising Bolshevik attitude towards symptoms of negligence and bad working morale." There have even been examples of party members themselves setting a bad example to their fellow workers, while at the other end of the scale groups of saboteurs have become "rampant." It would be a mistake to read too much into all this; but there is no doubt that the Communist authorities are seriously concerned. The success of the five-year plan depends, by their own admission, on the Ostrava coalfield fulfilling its targets.

The Drama of Gomulka

LAST week the Polish *Sejm*, on the request of the attorney-general, decided to waive the parliamentary immunity of the former General Secretary of the Polish Workers' Party (Communist) and vice-premier, Wladyslaw Gomulka, as well as of General M. Spychalski, former member of the Politbureau and vice-minister for war. Both are to face trial on the charge of activities prejudicial to the Polish state. The waiver of immunity may be a mere formality after the event; for it was known that General Spychalski, when he testified in the recent trial of the generals, had been brought from jail to the witness-box. Yet the official admission that the veteran party man, Gomulka, is finally to be put into the dock marks the much delayed epilogue of a drama which started as far back as 1948.

Europe was then definitely splitting into two opposite camps, and the Russians were taught a lesson by their experience with Tito. They decided to purge and close the ranks of the Communist parties in their sphere of influence, to eliminate the potential "Titos" or "Titoists," and to drop the appeal to nationalism which had been encouraged up to then in countries within the Soviet orbit. The Communist leaders who could be "dangerous" were purged. They were chosen as scapegoats responsible for the nationalist deviation, though their line of talk had hitherto enjoyed Moscow's approval. The security and police machinery which until then had been used against opponents of the new regimes was suddenly switched against its supporters. Budapest and Tirana, Bucharest and Sofia learnt that Moscow trials were articles for export.

Downfall by Instalments

Warsaw alone seemed immune. Not that Gomulka—who once used to be called Poland's "Little Stalin," and led the party, and therefore the country up to 1948—remained at the helm. The new line prevailed. The Poles, like the Hungarians or Czechs, stopped talking about their own way to socialism. Gomulka was in disgrace, but his downfall proceeded by instalments. At first he was only dismissed from the post of General Secretary; then he ceased to be vice-premier and minister; at the party congress in December, 1948, he was elected to the Central Committee of the party; nearly a year passed before he was dismissed from that position as well. Yet, formally, he has remained to this day a party member and vice-chairman of the State Control Commission.

Foreign observers began to wonder whether in Poland the drama might not end without the customary climax. Once thrown off the political stage, the "culprit" may well be forgotten and his inactivity regarded as the main punishment. The present rulers—his former collaborators and subordinates—it was argued, would try to shield him, partly to avoid trials and partly because they, too, had shared his "sins" at a time they were still virtues by Moscow's standards. Some of them are still in the Politbureau.

As it turns out the pattern was not to be broken. Molotov, during his recent visit in Warsaw, hinted that the Poles should exercise vigilance. And on the morrow of his departure there began the trials of the Polish generals accused of collaborating with British agents. Spychalski was implicated directly, and Gomulka indirectly, in the accusation. The question remained whether the trial was an act by itself or merely a curtain-raiser. The Polish Parliament has just given its answer. Moscow trials are contagious and a vaccine has not yet been found against the epidemic. Though the drama really took place three years ago, the final act could only be delayed. Molotov reminded the reluctant Poles that it must run its course to the bitter end.

Before you sleep to-night...

. . . imagine yourself a fisherman in a trawler nearing a strange port—numb from cold and with food and bed still to seek. Your one thought would be; *the Deep Sea Mission Hostel!* There, the fisherman can find a meal, bath, bed—all at a modest price: canteens, recreation rooms, first aid: and opportunities for worship. The Mission is not state-aided: it depends on the help of Christians everywhere. Won't *you*, before you sleep tonight, post a contribution or write for the free pamphlet "Welcome Stranger" to the Secretary, J. W. DONALD—

THE BUSINESS WORLD

Towards Monetary Orthodoxy

VERY wisely, the new Chancellor has lost no time in enlisting, for his attack upon inflation, the almost forgotten techniques of orthodox monetary policy. He has raised Bank rate—a rate kept unchanged and wholly ineffective for so long that it had come to be regarded by some people as a kind of museum exhibit from an obsolete system. Less wisely, as some may think, he has raised it by the very least amount that tradition allowed, by ½ per cent to 2½ per cent, whereas in the hey-day of Bank rate the convention was that it ought to rise by steps of not less than 1 per cent and fall by steps of not more than ½ per cent. To those who look back to the classical tradition rather than to the experience of the past twenty years, the movement may appear restrained, and even timid. Though the signal will be well understood by those at home and abroad whose ears are expertly trained, it will be scarcely heard at all by the domestic public at home. The authorities have therefore wholly rejected the argument that a drastic increase in Bank rate could, by its psychological gesture, have been made the means of demonstrating the determination that was to inspire the Government's economic policies as a whole. Instead, they have preferred a sober policy, what Mr Butler calls a "clear change of emphasis," that will exert its effect mainly by its repercussion upon the psychology of bankers through whom it has to be transmitted to the national economy.

It is the more important, then, that the aims and implications of the new monetary policy should be quickly and clearly comprehended throughout the banking world and that they should then be brought home to the general public as quickly as possible. The need for urgency here springs from the fact that, for the next few critical months, almost the whole of the Government's effort to resist inflation will depend upon these monetary measures. The immediate cuts in imports, as Mr Butler pointed out, will perforce increase the domestic inflation, because this reduction in goods available at home will not be automatically accompanied by any reduction in public spending power. The important counter-measures that may be hoped for through the budget, and the promised "review" of industrial investment, cannot even begin to relieve the pressure until the spring—if then. The responsibility that rests upon the monetary authorities and the commercial banks, now that their aid has at last been enlisted in this way, is correspondingly increased.

The skill and judgment with which the new measures have been devised give promise, however, that there will be a good response. The increase in Bank rate as such, though the most recognisable change for people outside the inner ring of the banking system, is in fact of less direct significance than other measures that may appear to be merely supplementary. The full range of measures is as follows:

1. The increase in Bank rate from 2 to 2½ per cent; but this new Bank rate, contrary to all former practice, is to apply only to seven-day loans against approved commercial bills and bonds. For seven-day loans against Treasury bills (which under the old system cost ½ per cent above Bank rate—for all types of approved collateral) the Bank will charge the market 2 per cent —and this is the rate that is in practice likely to be most used.

2. The abandonment of the ½ per cent market rate for Treasury bills, a rate kept rigidly pegged at this level ever since 1945 by means of the readiness of the Bank's agent, the "special buyer," to buy bills from the market at that rate to whatever extent was necessary to meet the market's need for cash.

3. The replacement of this rigid system by fluctuating market rates; the fulcrum of the fluctuations will depend upon the actual tactics of the "special buyer," but it is apparently intended to follow a policy that, for the time being, will cause the market's tender rate for Treasury bills to fluctuate around about ⅞ per cent—a very modest increase.

4. The restoration of the classic principle that, at anything less than Bank rate, the Bank will give relief only on its own initiative. The "special buyer" will not necessarily meet the whole of the market's requirements when it is short of cash, but may from time to time drive it to obtain the balance officially from the bank, when it will pay 2½ or 2 per cent according to the type of security tendered.

5. The offer next Tuesday of three 1¾ per cent funding loans to an aggregate amount of £1,000 million, in the form of serial funding stocks with maturity dates of November 14 in the years 1952, 1953 and 1954 respectively. The issue price for the one- and two-year stocks is 100½ and for the three-year it is par. Subscriptions will be received only in the form of British Treasury bills with an average remaining life of not more than 60 days, and for sums of not less than £5,000. The offer is equally available to holders of "tap" bills.

6. The bringing of the rates charged by the Public Works Loan Board to local authorities roughly into line with gilt edged yields; the rate for the longest loans is raised from 3 to 3¼ per cent.

This is a well-balanced and closely integrated programme of change, and one of its principal merits is that it carefully avoids giving the impression that these moves towards tighter money are necessarily final. To indicate its wider implications, it is first necessary to trace its technical effects, so far as they are yet predictable.

The first point that will strike the market is that, although the Bank rate has been raised, the rate that it will in practice pay if and when it borrows at the Bank will be less than it would have been had it been driven "into the Bank" on the old terms (because the convention was that loans from the Bank, as distinct from rediscounts, were charged at ½ per cent above Bank rate). Secondly, although Bank rate has not, in this technical sense, really been raised at all, the Treasury bill tender rate and the associated market rate are left a long way below it. If the tender rate in fact settles at around ⅞ per cent, and the banks' buying rate stays at the ¾ per cent at which it has been initially fixed, the increase will be smaller than anyone expected it would be if any change were to be made at all. The shock to the discount houses, through the depreciation of the capital value of their bill portfolios, will therefore be relatively small; moreover its effect will be much cushioned by the right to exchange bills, on the old basis of rates, for the new funding bonds. But although the rate changes are small, the change in the technique of the "special buyer" is more radical than the banking system had envisaged. It would never in fact have been practicable to drop the practice of "special" buying and selling altogether, for that would have meant that whenever a temporary dislocation caused a deficiency in the market's supply of funds (and such dislocations are very frequent), the whole of the deficit would have had to be filled by borrowings at Bank rate; all rates would then have been adjusted to that level, and Bank rate would thus have been unable to perform its function of being a "penal" rate. But many of those who realised this argued that the only alternative was to retain the practice of the past decade; and that would have meant that, although the level of rates might be raised, the authorities would still have been a perpetual source of cash supply to the market (and, through it, to the banking system) on terms that could never involve it in loss. By deciding that the special buyer may operate at varying rates and do so only on his own initiative and for amounts that may be less than the market needs, the authorities have shown real courage and independence. They have gone just as far as was practicable to demolish the pernicious automaticity of costless cash supply—a system that, for a decade and more, has been depriving them of all real control over the volume of money.

*

In principle, these technical changes are of fundamental importance. But they will not, of themselves alone, quickly or directly reduce the temperature of inflation. That can be reduced by monetary means only if they provoke a reduction in public spending; and the only point at which this may be directly caused by these changes in money market rates is by the restraint put upon borrowers by the discount of commercial bills (fine three months bank bills will now be discounted at 1½ per cent, compared with 1 per cent, since last July and 11/16 per cent before that). Borrowers through other banking channels will be directly restrained only to the extent that the new measures provoke an increase in bank charges for loans and overdrafts. It has been suggested that such an increase is likely; but, since the change in market rates is so small, it is probable that the only effect will be to strengthen the hands of the banks slightly in the effort they were already making in that direction. Certainly, there is no likelihood, as the outcome of this week's measures, of any such further increase in overdraft rates as would provide any salutary deterrent to borrowing. Bank allowances on deposit accounts, it should be noted, have been raised by only ¼ per cent, to ¾ per cent.

The efficacy of the measures so far taken will very largely depend, therefore, upon the extent to which they induce a new spirit of restraint and caution among lenders themselves—a restraint greater than that induced in the past by the method of official exhortation combined with control of capital issues and its associated directives (devices that are, of course, still to be used). The new measures will not of themselves directly and necessarily ensure this additional restraint. Although the cost of an additional supply of cash from the central bank has been raised, the procuring of such cash will not throw any burden on to the commercial banks; on the contrary, the banks are likely to secure a larger increase in their current earnings from their holdings of government debt than the additional cost of their deposits, though they may yet face further paper losses on their investment portfolios. If borrowers are still prepared to pay higher rates so that bank lendings continue to rise, the additional cash needed to support this credit creation will still be obtainable—by the customary means of calling in loans from the discount market or allowing Treasury bills to run off, thereby leading either the market or the Treasury to draw cash from the Bank of England. This method of providing for new lendings can be readily followed because the banking system has at present a more than ample supply of floating assets in these two forms—Treasury bills, or call loans secured by bills. Since the ratio of these items to deposits is so high—it stands at nearly 31 per cent, with an additional 8 per cent in cash—the banking sytem is not within sight of the point at which it would feel obliged to finance new advances by selling investments, which was the traditional practice when the orthodox system of control fully operated. Not until this point comes much nearer will the commercial banks feel that it might be really painful to make new advances—because they might then have to sell gilt-edged securities at a loss.

This aspect of the problem of excessive technical liquidity of the banking system lends special significance to the very sensible device of trying to reduce the supply of the most liquid securities by converting them into short bonds—though it seems probable that this plan was inspired mainly with the technical and more limited object of reducing the volume of tender Treasury bills (now £3,270 million) to a level that would be more readily manageable in the money market in the new conditions. It is too soon to speculate upon the chances of a big funding of the Treasury bills held by the banks, but any bank applications will bring the banking position rather nearer to the point at which official discipline of the whole credit position could be exercised directly without the violent and dramatic moves that would be necessary if the attempt were made forthwith.

*

Because this point of sensitivity has not been reached, the effectiveness of the new measures will turn upon the extent to which they indirectly induce restraint among bankers. The nature of these new measures—notably, the decision to make market rates flexible—carries some suggestion that the authorities are prepared to go further if necessary. It is greatly to be hoped that this is indeed their attitude. In any case, the banks would be wise to assume that this is so. If they do, they are likely to show a progressively increasing sense of caution, without waiting for it to be imposed upon them. In that

event, prospective borrowers will find that the scrutiny of credit-worthiness, of business prospects, of efficiency and of the scale of trading and indebtedness in relation to their own capital resources will be markedly more rigorous—notably, of course, for the weaker concerns and for those in marginal lines of business. If credit supplies are tightened in this fashion, a secondary process of restraint will quickly develop, because business men, knowing the attitude of the banks, will begin to re-examine the credit status of their own trade customers and the prospects of their markets. Moreover, the pressure from disappointed borrowers will then have direct repercussions, as distinct from psychological ones, upon the gilt-edged market and upon the yield structure as a whole. A minor action from the centre, multiplied many times as its repercussions spread through the whole economy, could provoke a quite salutary reduction in the whole scale of private expenditure. The authorities have thrown a stone into the central pool of the money market; it is up to the commercial banks to see that the influence does not stop there, but quickly spreads through the manifold channels of the banking system into the main circulation of business credit. Above all, it is up to the authorities, if the commercial banks act too sluggishly or if the disturbance proves in any case to be insufficient, to throw in more stones and larger ones.

Taxation of Profits—III

Profits Tax Anomalies

LAST week's article in this series examined some of the anomalies that the Profits Tax has created. It did not, alas, exhaust the list, and before the discussion turns to the future of taxation of profits—on which the Chancellor has promised a temporary excess profits tax—some points remain to be cleared up.

One consequence of the piece-meal development of the tax and of the great increase in the rate charged on distributions is to be found in the uncovenanted advantages that are conferred on certain classes of taxpayers where dividends are paid by a United Kingdom company to a foreign company resident abroad that controls the British company. The 1947 Act provided that such distributions to a foreign corporation should be left out of account in ascertaining the total distributions on which the higher rate of tax is payable. No such relief is given in respect of dividends paid to foreign individuals as distinct from corporations; the special privileges accorded to foreign corporations presumably marked a desire to encourage investment by such corporations in United Kingdom enterprises. This is not the place to argue for or against special treatment for certain classes of profits arising in this country, but it is proper to point out that such treatment is in strong contrast to the refusal of the Revenue to allow British companies operating abroad to claim such relief as would enable them to operate on a basis of equality with their foreign competitors.

The table opposite contrasts the position of two United Kingdom companies, one controlled here and the other entirely controlled by a foreign corporation; in each case the assumption is made that half the gross profits of £100,000 are distributed as dividend. It will be seen that whereas the advantage was of the modest order of £2,062 in 1947 it now amounts to £10,500.

Until 1947, Profits Tax was charged only upon trading profits. The Finance Act of that year brought in investment income, and thus widened the Profits Tax from an additional tax on all profits into an additional tax on corporate incomes. The change cannot be defended on any ground of principle; investment income has no greater taxable capacity when it is received by a company than when it accrues to an individual. Where such income is received from a source that itself is liable to Profits Tax (for example, a dividend from a United Kingdom company) relief is given by excluding the amount of the "franked investment income" from the total income on which the tax is charged. But the relief is imperfect in two respects. In the first place the franked investment income is brought into account in determining whether there shall be any abatement of profits. If profits amounting to £7,000 arise solely from trading profits, tax is chargeable on £6,000 only, since there is an abatement of one-fifth of the amount by which the profits fall short of £12,000. But if this company receives in addition franked investment income of £5,000, making the combined net revenue £12,000, it would not qualify for any abatement and would pay tax on an additional £1,000 simply because it had received investment income.

Secondly, any distributions made by such a company are deemed to come rateably out of franked and unfranked funds. A reasonable man might suppose that

where income has once been subject to the maximum rate of tax in the hands of one company it would be wholly exempt when passing through the hands of another, but this view is not accepted by the tax authorities. In opposing a clause designed to remedy this element of double taxation, the former Attorney-General said in the debate on the report stage of this year's Finance Bill:—

> This scheme which is adopted is one under which the distribution is considered as coming regularly from two

sources of income. We apportion each source of that income and consider it, therefore, as flowing in a rateable proportion from each source. That means that the company does get that measure of relief which is fair upon the compromise view, and neither the taxpayers nor the Revenue have it in their power to say "You are to consider this distribution as coming solely from one or the other."

This argument is in direct contradiction to the one that is used when a capital distribution is made, for a capital distribution is regarded as coming, not out of a mixed fund, but as far as possible out of undistributed revenue profits on which non-distribution relief has been given.

It is a sound fiscal principle that the tax payable should be certain and not arbitrary, and this principle applies with equal force to the rate of tax as to the amount of tax. In special cases there may be justification for the adoption of some formula which conceals the rate in the interest of equity, as in the taxation of gold mines in South Africa. But in general there will be agreement with a passage in the late Lord Stamp's evidence before the 1920 Royal Commission:

> The wanton and bigoted way in which persons obsessed with certain mathematical ideas urge the sacrifice of all practical points in their lust for algebra, would be a serious public danger if their influence became great.

The recondite character of the Profits Tax has certainly enhanced these dangers. The effective rate of profits tax varies with so many circumstances that its calculation is a matter of mystery and confusion to the business community. Even the maximum rate causes trouble; to arrive at the correct combined rate of profits tax and income tax of 13s. 3d. in the £ involves a high order of skill that Chancellors, resting on the knowledge of their experts, can afford to put in the simple shorthand of "twopence for me and a penny for you." It is, perhaps, still worth stating that the maximum rate of profits tax on £1 of chargeable profits is 7s. 2d. in the £, or if full relief is obtained from Income Tax, 3s. 9d. in the £. The minimum is 2s. gross, or 1s. 0½d. net. Between the maximum and the minimum all is uncertainty: the accountant tells the directors that if they will fix the dividend he will calculate the profits tax; the directors tell the accountant that if he will advise them of the liability for profits tax they will determine the dividend.

*

In a sellers' market, it is widely believed that industry and commerce can shift a considerable part of the incidence of a tax on profits on to the consumer—in other words, that the profits tax becomes a cost. This is an over-simplification: it may be assumed that most traders would charge the highest prices for their products irrespective of the taxes they have to pay. It is probably truer to say that high taxes lead to high prices partly because they lead to laxity of management and to extravagance and are repressive of enterprise. Moreover, at the present time, high taxes are levied upon "profits" that are calculated in such a way that they largely exceed true economic profits. For this reason industry, as a whole, seeks to earn a return that, after tax has been paid on it, will leave enough to maintain productive assets intact in spite of inflated price levels.

It is reasonable, therefore, to regard the incidence of the profits tax as resting with the corporation upon which it is levied. If it rested upon the capital employed by the corporation there might, if the need for the tax is accepted, be some equity in the distribution of the burden. But this is not the case. The capital employed is commonly provided from three sources: loan capital, preference share capital, and ordinary share capital. The interest paid upon the loan capital is not regarded as coming out of profits at all and is not chargeable to profits tax at either of the rates. The dividends paid on preference shares are paid in full without any deduction for profits tax; thus no part of the burden of profits tax is borne by the preference shareholders. But profits tax is, nevertheless, payable on the preference dividend and it must perforce come either out of the ordinary dividend or out of the residual fund which normally belongs to the ordinary shareholders. It has not become common practice to reduce the ordinary dividend (except where circumstances compel) to the extent of the profits tax payable on that part of the total profit which goes to the preference shareholders; in the majority of cases today the real incidence of the tax rests wholly on the undistributed profits which would otherwise be ploughed back to reserve and provide the means of financing productive improvements.

The following example shows the impact of the profits tax distributions on ordinary earnings and reserves in a case of high gearing, the preference share capital totalling £1,000,000 and the ordinary share capital of £100,000.

	Profits Tax at 10% only		Profits Tax at 10% + 40%	
		£		£
Profits		77,777		77,777
Less: Minimum Profits Tax 10%		7,777		7,777
		70,000		70,000
Less: Pref. Dividend 5%	50,000		50,000	
Distributed Profits Tax thereon 40%	...	50,000	20,000	70,000
Available for ordinary		20,000		nil
Less: Ordinary dividend—say 10%	10,000		nil	
Distributed Profits Tax thereon 40%	...	10,000	nil	nil
		10,000		nil
Less: Income Tax at 9s. 6d.		4,750		nil
Available for reserves		£5,250		nil

It is well understood that one effect of the profits tax is to distort the capital structure of industry by encouraging the raising of new requirements in the form of loan capital, rather than in the form of share capital, particularly preference share capital. Whether such financing will prove to be wise depends on the future course of the price level: if inflation continues companies may be glad that they raised their requirements in the form of notes or mortgages, provided always that they can renew them upon expiry and that their additional requirements can be similarly financed. But if price levels were to drop, the consequences could be extremely painful for industry would then be faced with the necessity of repaying depreciated pounds with appreciated pounds. But the issue goes far beyond expediency of this kind. It raises the very principles of the future of risk capital, which suffers a double injustice from the present form of profits tax. It is wrong that the form of company capitalisation should be dictated by arbitrary fiscal considerations.

What, then, is to be done about the Profits Tax? In fiscal commonsense it ought to go, but hard pressed Chancellors do not easily let go tried sources of substantial revenue. Would the end of the Profits Tax be a fair exchange for a new Excess Profits Tax? A final article in this series will examine these possibilities.

Business Notes

Cutting the Import Programme

The most disturbing aspect of the Chancellor's disclosures about Britain's balance of payments crisis is not that the deficit for the current year is estimated at between £500 and £600 million—that is bad enough—but that the departmental forecast for 1952 suggested another deficit of at least £500 million. Exports this year have remained buoyant, though, at £2,500 million for the twelve months, they will still be some 10 per cent below the objective set in the Economic Survey. Invisible exports, however, are becoming less productive and since the loss of the Abadan refinery the net surplus in this section of the accounts is likely to decline appreciably and to yield only £400 million. But the main calculation that has gone awry is the cost of imports. In the first nine months of this year, the import bill amounted to £2,919 million (c.i.f.) compared with £1,908 million in the first nine months of 1950—a rise of 53 per cent by value, while the volume is estimated to have increased by only 14 per cent. On this basis the bill for the whole year, excluding insurance and freight, threatens to be of the order of £3,500 million compared with the forecast of £3,300 million (of which £100 million was for stockpiling) in the Economic Survey and with the revised figure of £2,382 million in 1950. The "programme" estimate for imports in 1952 at end-September prices was £3,620 million. Drastic cuts in imports were clearly inevitable. The Chancellor's announcement on Wednesday that he is to slice off £350 million from external expenditure involves cutting imports by some £290 million; but even this surgery will still leave a wide prospective deficit.

* * *

Saving £350 Million

The first stroke of Mr Butler's axe has fallen on those imports entering Britain under open general licence in accordance with the OEEC scheme for liberalising European trade. No exact estimates of this trade have been published, but it is usually put at about £150 million. The Chancellor stated that open general licences for private imports from Europe and other non-sterling countries on a selected list of commodities were to be revoked and specific licences substituted. The new quotas will be based on the value of imports in the year July, 1950, to June, 1951, so that these goods will continue to be imported but in much smaller quantities than in recent months. These cuts are expected to reduce next year's import bill by £130 million by comparison with the "programme" estimate. Foods are primarily affected: tinned bacon, ham (imports of which have this year been running at an annual rate of £35 million), cocoa, chocolate, sugar mixtures, sugar fat mixtures, fruit juices, cooked meat, tinned meat, sausages, edible nuts (excluding peanuts), tinned vegetables, fruit (excluding bananas and oranges), and vegetables. One important group not affected is fancy cheese. These food items represent a saving of £100 million.

A few raw materials are also included in the cuts: essential oils, paper making materials, dressed leather, paper and board, plywood and veneers. The list of manufactures comprises a large number of items, the most important being wooden furniture, glassware, cutlery, carpets, footwear, apparel, toys, sports goods, brooms and brushes, manufactured drugs, paper and leather manufactures. Textiles are apparently not affected. Cuts in raw materials and manufactures are expected to total £30 million. The upshot of this revocation of open general licences is that in future only about 60 per cent of Britain's private trade with Europe will be liberalised as against more than 90 per cent before the cuts were made. Liberalisation therefore is not abandoned; it is merely pruned.

The second stroke has fallen on the Ministry of Food's purchases of both rationed and unrationed food. The saving on this count is expected to yield "rather more" than £60 million. The details have not yet been announced, but sugar, tea and coffee alone could yield £30 million if the stocks which have been built up during this year are allowed to run down. No doubt the Ministry will also reduce its purchases of tinned salmon, herrings and pilchards. In addition to these import cuts, the rate of government stockpiling is to be reduced, affording a saving, which might be guessed, of £100 million; while the halving of the tourist allowance (from £100 to £50) will save £15 million.

The economy bill thus adds up as follows: private food imports, £100 million; Ministry of Food imports, £60 million; private imports of raw materials and manufactures, £30 million; stockpiling £100 million; and tourist allowances, £15 million. The total comes to £305 million and the remaining £45 million is presumably to be saved on the use of foreign shipping and by general economies in government overseas expenditure. This remainder may also include some estimate of lower import prices during the coming year.

* * *

The Fuel Outlook

Once again, safety in fuel supplies this winter is put "at the mercy of the weather"; once again, Britain is to seek imports of American coal. Announcing this in the House of Commons on Thursday, Mr Geoffrey Lloyd, the new Minister of Fuel and Power, went out of his way to absolve the National Coal Board from responsibility for the level of distributed coal stocks, which at the end of the coal winter (October 27th) had reached only 16,807,000 tons, 1,350,000 tons higher than stocks at the beginning of the 1950-51 coal winter, but below even the reduced "target" of 17 million tons of which Mr Noel-Baker had so recently been confident. Mr Lloyd, whose own idea of "safe" stocks is 19 million tons, was understandably cautious about the prospects of obtaining much coal from America or elsewhere in time to affect the danger period of February and early March next year, since transport and loading facilities for American coal are already busy with supplies for the rest of Europe.

Though production recently has been more encouraging, partly through more widespread Saturday working, inland consumption has risen more than expected in the last fortnight. The main fear for any crisis in coal supplies this year may rest upon the weakness of the coal transport system, but Mr Lloyd looked forward to the effects of a production weakness nobody inside or outside the industry has yet learned how to check—the decline in manpower, which he estimated may cost the industry another 10,000 men in the next twelve months. Within the general fuel difficulty the main immediate danger threatens the domestic coal consumer; the Minister announced new measures to adjust domestic coal supplies. These limit total supplies for any one consumer to 24 cwt. between last May and next February—thus diverting coal from consumers with full coal-cellars to those who have not bought much since the end of last winter.

Special attention to domestic coal supplies is justified *At the beginning of the coal winter merchants' stocks* amounted to only 1,122,000 tons, compared with 2,020,000 tons at the same time last year; stocks of anthracite and boiler fuel, 83,000 tons, compared even worse with stocks of 181,000 tons at the beginning of the 1950-51 coal winter. The more careful part of the public bought 600,000 tons more this summer than last (in both off-seasons consumers were encouraged to buy early and fill up their cellars); and most of this increase seems to have been purchased in the

south, where supplies are most liable to be affected by coal transport difficulties. Stocks in home cellars are therefore substantially bigger: but the merchants estimate that this winter there are 200,000 more households to supply, requiring an extra 375,000 tons on the average consumption of last winter. Even last year, the coal supplied to consumers was some 15 per cent lower than the total budgeted for in the domestic ration of 50 cwt. in the north and 34 cwt. in the south of the country.

* * *

American Coal Again?

Whether a decision to import American coal now can bring in enough and in time to make a substantial contribution to British coal supplies this winter is a question only answerable in practice. Last year's decision to import was taken on November 20th; 8,000 tons of coal were brought in before the end of the year, and by the end of January shipments of 50-80,000 tons were arriving each week. By the end of February the National Coal Board had imported 488,000 tons. With relatively mild weather, and with the severe cuts that were decreed and for a time enforced upon coal consumers, any abrupt dislocation of industrial output was avoided. The cost of this importing operation—over and above the £5,000,000 that the NCB lost in re-selling this expensive coal at its own prices—was a shortage of shipping that raised freight rates sharply, and in particular an insufficiency of tonnage to bring in all the iron ore the British steel industry had purchased for this year. This year's coal imports thus contributed fairly directly to this year's fall in steel output.

The circumstances this winter are somewhat altered. Britain, in importing American coal, would come at the end of a long European queue; already $500 million worth of coal has been purchased or is being ordered. These other nations, bereft of British exports, did what the National Coal Board earlier this year vainly urged the Ministry of Fuel and Power to authorise: they went on importing American coal when they completed last winter's imports. Their chartering, and other large bulk movements of raw materials, have contributed to a continued shortage of shipping and a high level of freight rates; though the Transatlantic coal charters have partly been arranged for ships from the American reserve fleet at rather lower than prevailing rates. With a renewed grain shortage in India, shipping appears likely to become more scarce; few ships are to be had for operations during the next two months, despite the release of 100 more ships from the American reserve fleet. On the other hand, shipments of iron ore are now booked for some time in advance, and coal chartering should not affect the transport of the steel industry's raw materials.

The coal is to be had in America—almost in whatever quantities are needed. Whether it is to be transported, and loaded, is another matter. Some weeks ago the United States imposed export licensing for coal, on the grounds that ships were being delayed at its most convenient coal port for Europe, Hampton Roads, by overloading of the dock facilities and local inland transport. An arrangement was accepted by which nations purchasing coal from American suppliers had to agree to accept only part of it through the most convenient ports and the remainder through ports more remote from Europe—and in some cases from the American coalfields selling the coal. This is an arrangement which Britain would have to accept.

* * *

Second Thoughts on Steel Allocation?

Though a promised "new official statement" on the general allocation of steel supplies had not been made when *The Economist* went to press, it seems fairly certain that the scheme due to come into force on December 3rd is at the least being re-examined. The cumbrous M-form system, which involves specific authorisation for each permitted end-use of steel, was accepted by the late Government and the industry earlier this year only in default of anything more practicable and equally familiar. It now appears that renewed doubts of this scheme's necessity within the steel industry, some misgivings in the Ministry of Supply about its efficient operation, and the new Government's general distaste for more than essential controls have combined to dictate second thoughts about the whole question.

Prospects of steel supplies hardly offer any chance that allocation of some kind can be avoided. The present rate of steel output suggests a total for the year of little more than 15¼ million tons, and the Chancellor this week put Britain's needs in 1952 at "some 1½ million tons of finished steel more than we have been able to produce in 1951, to meet home and essential export needs." It seems doubtful whether the steel offered by the United States to supplement output here next year as yet justifies the estimates of half a million tons that have been published, unless negotiations still under way for finished steel considerably supplement the offers of ingots already made. Some of the ingots offered would be in exchange for an equivalent amount of structural steel, which will keep British finishing capacity busy but will not swell total steel supplies: and some that has been offered costs more than Britain may be prepared to pay. A proportion of the total mentioned, moreover, would be the "steel equivalent" of ore and scrap supplies that American steel producers might refrain from buying and allow Britain to purchase. Some easing of American competition for Swedish and North African ores would be welcome, though there may be some legal difficulty in inducing American private buyers to hold off. The relinquishment to Britain of steel scrap that under the recent agreement the United States might hope to buy from Germany would be equally friendly, but less productive. Germany is permitted under this agreement to retain for its own steel industry the first 325,000 tons of scrap collected, above which supplies are shared between home and exports on a sliding scale. In the first month after the agreement 344,000 tons of scrap were collected in Germany, compared with an expected rate of 400,000 tons; in the next, some 327,000 tons were bought in. The Ruhr industrialists make no secret of their determination to keep for use at home their dwindling special reserve of steel scrap from war damage. Though a larger share of the agreed joint exports to Britain and the United States would obviously assist steel production here in 1952 to some extent, imports of scrap next year cannot be expected to approach even the annual rate of 550,000 tons a year achieved so far this year.

In such circumstances, with rearmament demands growing and indications that the metal-using industries will also hope to continue to expand their exports, reconsideration of the proposed steel control cannot be expected to make that control slacker. A simpler scheme, that will ensure steel deliveries—not only authorisations—to defence and essential civil producers and distribute the remaining supplies equitably, is certainly desirable; nor are suggestions lacking. At one end of the scale, the steel producers favour bulk allocations to industries, to be shared by their central bodies among individual producers. At the other, spokesmen of engineering in the Midlands have advocated allocations upon a more realistic basis than tonnage consumed in 1946, preference for the more efficient manufacturers, and "a fairer crack of the whip" for small steel consumers. The existing systems of "DO" and "PT" authorisations are meanwhile not always being honoured in steel. Failing some considerable improvement in supplies, an acceptable system without the more objectionable features of the "M-form" may not be easy to devise.

Belgian "Free Market" Changes

As was perhaps to be expected, the Belgian authorities have quickly run into practical difficulties in their special measures to reduce Belgium's surplus with EPU countries. One of the steps recently taken in search of this objective was to remove the obligation upon Belgian exporters to EPU countries (other than Switzerland) to hand over the foreign exchange proceeds of their sales to the Belgian authorities, and to leave them free to sell this foreign exchange in a tolerated free market. Such "free" sales did in fact take place on a considerable scale, and were encouraged by the inordinate delay in the granting of authorisations of exchange operations at official rates against duly authenticated export licences. For a few days this created considerable confusion in the free market, and a substantial depreciation occurred in the rates at which the EPU currencies in question were negotiated. It was soon discovered, however, that there was an abundance of buyers of these currencies, through the demands of Belgian importers from the countries concerned; and after a short interval the rates quoted in this free market came to approximate closely to the official parities. The small discounts that remained were mainly attributable to the fact that any Belgian exporter selling his exchange in this free market avoided the painful arrangement under which 5 per cent of the proceeds of sales to EPU countries is blocked (if the exchange is sold to the authorities at the official rate).

The Belgian authorities thereupon discovered that, since a large part of the foreign currency requirements of Belgian importers were being satisfied in the free market, the toleration of this market was having virtually no effect upon the Belgian position with EPU. As a result, they decided this week to compel Belgian importers from EPU countries to secure their exchange through official channels, and to prohibit them from using the free market. The intention is to confine purchases of exchange on this market to those who require it for capital and other "non-current" purposes. The result has been a fall in the rates for EPU currencies quoted in the free market—and a cessation of dealings in "free" sterling for lack of buyers. The first indications of October operations of EPU suggest that Belgium was not quite able to restrict its EPU surplus to within the $35 million that, under the new arrangement, is the maximum that it may recover in gold for that month. The actual surplus was about $5,000,000 above that figure, so that this excess had to be covered by additional Belgian credits to EPU.

* * *

Cuts in Sugar Supplies?

It is clear from the Chancellor's statement on Wednesday that one of the imports most likely to be cut is sugar. Imports in the first nine months of this year amounted to 37 million cwt compared with 30 million cwt in the corresponding period of 1950, and most of this increase in supplies

International Banking Supplement

Three special articles, comprising *The Economist's* annual survey of trends in International Banking, appear on pages 1145 to 1154 of this issue, and an associated 15-page selection of International Banking Statistics is published in this week's issue of the *Records and Statistics* Supplement.

These articles discuss the strains within the Sterling Area, the latest EPU crisis, and recent banking developments in the United States.

has gone to build up the Ministry of Food's stocks. It is ironic that Britain should have to reduce its purchases of sugar at a time when world output is expected to reach a new record total. The first estimates of world production for 1951-52 prepared by Messrs. C. Czarnikow Ltd. puts the total at 35,611,000 tons against 35,120,000 tons in 1950-51 and 29,118,000 tons in 1937-38. But this increase is by no means uniform for all types of sugar and among the major producing countries. Beet production in Europe, for example, has fallen from 9,101,000 tons to 8,655,000 tons and world beet production from 13,278,000 tons to 12,475,000 tons, owing to a smaller American crop.

* Partly estimated. † Estimated. *Source :* Messrs. C. Czarnikow, Ltd.

Cane production, on the other hand, has shown quite a large increase, from 21,842,000 tons to 23,136,000 tons. Once again it has come mainly from Cuba, whose production this year is expected to top the 6,000,000-ton mark. In contrast, production in Commonwealth countries outside India and Pakistan is estimated to fall by 200,000 tons to 2,822,000 tons ; much smaller crops are reported from South Africa and Australia, while output in the West Indies, British Guiana, Mauritius and Fiji has increased.

For Britain, then, less sterling sugar will be available in 1952, but much more dollar sugar. The allocation of dollars for sugar is certain to be cut, though the actual reduction in supplies will depend more on the level of prices. The price of sugar in recent months has been falling. It reached a peak of 8.05 cents a lb in the middle of June ; this week it was quoted at 5.00 cents a lb, and the fall may well continue. At this rate, Britain might still buy the same quantity of dollar sugar as in 1950-51 and save about a quarter of the dollars expended.

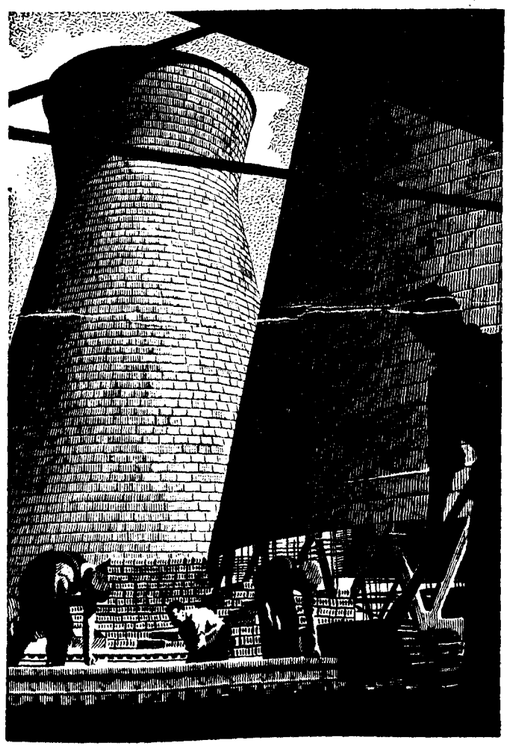
German Prewar Debts

Details were published this week of the official plan for distributing the proceeds of German prewar assets to residents in Britain who can establish claims in respect of German prewar debts. The details were given in an Order in Council and are based on the unanimous report of a committee appointed by the President of the Board of Trade under the chairmanship of Sir John Morison to advise on the distribution of German prewar assets taken over by the Custodian for Enemy Property. The report of the Morison Committee estimates that the total available for distribution among the creditors will be about £15 million. The total amount of claims that may be made against this sum is still not precisely known, but the Committee's Report states that "it is given to understand that the whole volume of debt that would be brought within the distribution scheme is not likely to be under £100 million and might be substantially in excess of this figure."

In order to rank for payment out of these German assets the claims must, according to the Order in Council, refer to debts owed to British persons on September 3, 1939. This condition, however, does not apply to the Reich debts, such as Dawes and Young bonds. According to the Order in Council, however, these bonds will rank for claim only if the owners held them on or before September 30, 1951. As active dealings have taken place in German bonds since that date, this would imply that present holders who have acquired the bonds since September 30th would have no valid claim under the scheme. This extraordinary and arbitrary provision has been the subject of a strong protest from members of the Stock Exchange, who have pointed out to the Board of Trade that this demarcation line would be quite unworkable and that if any attempt were made to apply it grave injustice would result. Pending clarification at this point all dealings in German bonds have been suspended.

* * *



Details of "Weighting"

The most interesting provision of the Order in Council is the allocation of priorities as between the different groups of creditors, namely, the various types of bondholders, the "standstill" creditors and the trade and commercial creditors. These priorities are based on the weighting given to the various classes of creditors by the unanimous finding of the Morison Committee. The weights are as follows:—

Nature of Obligation	Weighing Factor	Ranking £
£100 Bond of German External Loan 1924 (Dawes)	1·7	170
£100 Bond of German Government International 5½ per cent Loan 1930 (Young)	1·5	150
£100 Standstill and other short-term banking claims		
£100 Trade Debt as defined in paragraph 55		
£100 Konversionskasse 4 per cent Sterling Bond	1·4	140
£100 Potash Syndicate Bond	1·25	125
£100 City of Saarbrucken	0·7	70
£100 Austrian Government International Loan 1930	0·7	70
£100 Austrian Government Credit Anstalt Bond, 1936	0·3	30
£100 Berlin (City of) 6 per cent Sterling Loan of 1927	1·14	114
£100 Cologne (City of) 6 per cent Sterling Loan of 1928	1·04	104
£100 Dresden (City of) 5½ per cent Sterling Loan of 1927	1·25	125
£100 Munich (City of) 6 per cent Sterling Bonds	1·25	125
£100 Hamburg (State of) 6 per cent Sterling Bonds of 1926	0·86	86
£100 Hamburg Waterworks Company 6 per cent Sterling Loan	1·04	104
£100 Saxony (Free State of) 6 per cent 25 year Sterling Bonds of 1927	1·12	112
£100 Westphalia (Province of) 7 per cent Sterling Loan of 1926	1·25	125
£100 Prussian Electric Company 6 per cent 25-year Sterling Bond	1·10	110
Other loan indebtedness not specifically dealt with above	An amount calculated as the sum of the following amounts, so far as they were respectively due before the passing of the Act, viz. : (a) interest at the rate provided in the loan agreement, not at the reduced rate provided for transfer purposes by the Anglo-German Transfer Agreement of July, 1938 ; (b) an amount proportionate to the creditors' holding of Bonds in respect of Sinking Fund payments on that Bond issue ; (c) other capital repayments due in terms of the loan agreement. Subject to the limitation that no individual claim ranks for more than 125 per cent of the capital outstanding at 3rd September, 1939.	
£100 Claim not comprised under any of the heads mentioned above	1·0	100

These weights have been agreed by representatives of the various groups of creditors, and though they do not set a hard-and-fast precedent for the settlement of the prewar claims against Germany, they are a clear indication of the views of the creditors regarding their own priorities.

It should be realised that the plan announced this week refers only to the distribution among creditors of the proceeds of German prewar assets in this country. This distribution is a reparations matter and does not affect the legal position under which the creditors continue to hold a claim for full compensation against their respective debtors. No doubt the amount to be distributed will be duly allowed for in arriving at the final settlement; but the major part of the compensation for prewar creditors of Germany has still to come independently of the 10 to 12 per cent distribution to be made by the provisions of the Order in Council.

OIL AND THE WATERFALL

THE 22-million-gallon-a-day "waterfall" in each of these cooling towers at Anglo-Iranian's oil refinery in South Wales is part of an expansion project that has already raised the refinery's production to twelve times its pre-war rate. This in turn forms part of a greater expansion programme on a world-wide scale. Anglo-Iranian and its associated companies operate nine refineries in the United Kingdom, France, Germany, Italy and Australia. A tenth refinery has just gone into production in Belgium and another new refinery is under construction now in the United Kingdom.

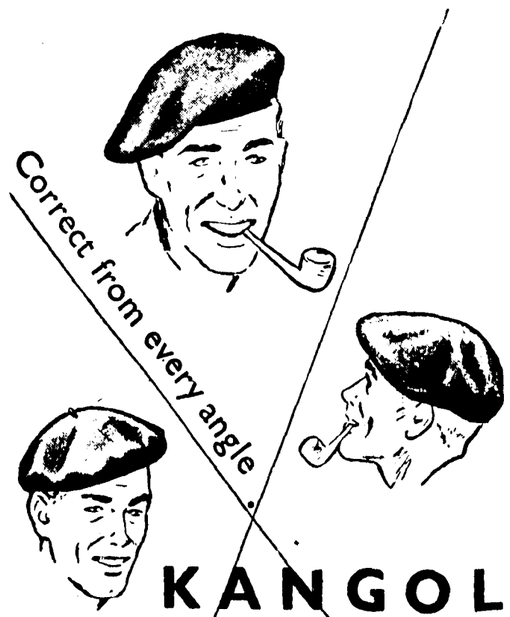
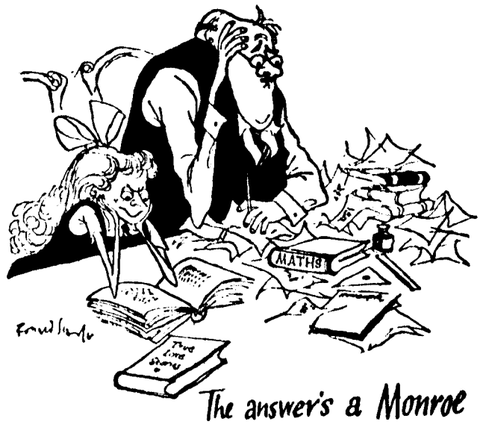
Plush dogs don't bark



To a baby a woolly toy may be indistinguishable from a living animal—but a dog-lover knows the difference! Baby's plaything won't beg for bones or run after sticks, however loudly you shout 'Fetch it, Rover'!

There are substitutes for wood, too, and to the ordinary person they may look just as good. But the expert knows the truth of the saying 'There's nothing like wood'. Wood is alive: wood has character: wood is something you *grow fond of.*

All very true, you may say, but can we *get* wood if we specify it? Well, there is a shortage of some traditional timbers—but on the other hand many new timbers are coming into the country. The Timber Development Association will be glad to put you into the picture on the supply situation. Why not drop them a line about *your* particular problem?



There's nothing like WOOD

Policy for Manpower?

A chief topic of discussion for Sir Walter Monckton's first meeting with the National Joint Advisory Council to the Ministry of Labour this week had been outlined in advance in the King's speech:

> My Government view with concern the serious shortage of labour, particularly of skilled labour, which has handicapped production in a number of essential industries. They will review, in consultation with representatives of those concerned, the possibilities of making available more labour for those industries and of ensuring the best use of the existing labour force.

The meeting, obviously, could do little more than consider the latest statistical outline of the shortage: Sir Walter, in a speech at the weekend, had already recognised this as "the gravest problem with which I have to deal." The present labour force, he said frankly, just could not meet all the demands made upon it; his immediate task was to decide how to share scarce labour between more and less essential industries. The production most often considered as threatened by labour shortage is rearmament; but equally important at present, and perhaps of longer duration, are the labour difficulties of two basic industries upon which the whole economy depends—coal and transport.

It is much too early to expect Sir Walter to define any new policy for manpower—particularly as his sphere is one within the general scope of economic policy, and the call for specific action by his Ministry will depend entirely upon the success of general measures to counter inflation. Last week he confined himself to the unexceptionable if unoriginal advocacy of training workers as a means of increasing industrial flexibility—he was speaking at a conference on training held by the British Employers' Confederation. As might have been expected, Sir Walter emphasised his confidence that he would receive full co-operation from both sides of industry—a point upon which Mr Arthur Deakin this week somewhat grudgingly repeated the Trades Union Congress's assurance.

* * *

Men for the Aircraft Factories

Labour shortage in the aircraft industry is a special case, even within defence production. Its leaders have been complaining of the inadequate rate of recruitment for some time: in London last week, Air Chief Marshal Sir Guy Garrod said that "our air rearmament programme will remain to a large extent on paper" unless "immediate action" was taken to get the industry more workers. He calculated that the industry needed about 150,000 workers within the next eighteen months. This is the figure accepted by most experts—though without improvements in production methods within the factories it might prove insufficient. Such a programme means increasing the labour force from its present level of 162,000 to 300,000 or more by the spring of 1953 when aircraft production will be fully under way. Since a proportion of women and unskilled workers can be employed this total would not appear to be beyond attainment, but the industry is proving peculiarly unattractive to labour and the rate of recruitment is actually falling. Between January and February the number of workers increased by 2,200; in July the increase was down to 900, although there was some improvement in August with a net gain of 1,900. Some companies are actually showing a net loss of workers each month, while others, particularly those near London, have no great difficulty in getting extra men as they are required. With sub-contracting of components and also of complete airframes and engines so widely spread throughout the industry, this unevenness could dislocate, as well as delay, production.

The foresight shown by the Ministry of Supply in the provision of machine tools on time has clearly not been matched in the gathering of workers to man the machines. But is the industry entirely fair in putting this responsibility, in the first case, upon the government? So far the shortage of raw materials used in the "inessential" engineering industries has not effected the automatic transfer of men from those industries upon which some authorities in Whitehall counted. But it may be asked what there is about the aircraft industry that makes workers prepared to work short time in other branches of engineering rather than enter aircraft factories. Lack of housing is one obvious explanation, particularly in areas without much local labour. Some houses have already been built specifically for aircraft workers in the Cheltenham district, and the same policy may be followed elsewhere. Fear about security of employment is probably also partly responsible. The aircraft industry has never been a steady employer; only last year it was dismissing workers in hundreds. The present rearmament programme is avowedly limited in duration and many men would prefer to tide over a slack period with their present employers rather than face unemployment in 1954. This fear might be exorcised if the industry could demonstrate conclusively that it has a potential export market for military and civil aircraft large enough to keep it working at a reasonable pressure when rearmament is over. The third and possibly most important reason for the industry's unpopularity as an employer may be the level of its wages. The aircraft industry adheres to wage rates laid down by the Engineering Employers' Federation that are at present the subject of negotiation. Openly or by subterfuges, many smaller engineering employers are paying more.

* * *

Good Year for Austin

The Austin Motor Company's profits in the year that ended on July 31st have proved to be even higher than its earnings in the previous twelve months, which were, in turn, double those of the year before. Group net profits before tax have risen from £4,509,771 to £7,014,755 in 1950-51. After allowing for tax deductions of £3,821,746 compared with £2,481,522 in the previous year, the company is passing a larger proportion of this profit to equity shareholders by increasing its ordinary dividend from 35 to 45 per cent. It is also rewarding the employees who contributed to its success: everyone who has been with the company since July 31, 1950, the beginning of its financial year, is to receive an extra week's wages. This higher dividend appears to be rather more comfortably covered than last year's lower figure; distributable earnings are of the order of £1,800,000 compared with £670,000 the year before. The appropriation to general reserve has been increased from £300,000 to £1,000,000, while replacement reserve receives another £1,000,000. At the rather depressed market price of 35s., the 5s. ordinary shares now give the comparatively high yield of £6 8s. per cent.

The company's expanding earnings in the past two years have been largely due to steadily rising production. Total production of cars and commercial vehicles in the motor industry was running at a rate of nearly 800,000 vehicles throughout much of the company's past financial year, compared with 600,000 or so the year before. Excluding tractors, Austin is the biggest vehicle producer in the country, and, it believes, still the world's largest exporter of vehicles. Since the beginning of 1951, however, shortages of materials have steadily reduced the output of the industry as a whole. Although the financial effects of this decline may have been partly offset by the general increase in British car prices early in the year, the fall is expected to continue throughout 1952. Austin is one of the companies with defence contracts—in this case for a newly-designed jeep—but these orders are small compared with the company's total capacity. Higher prices might still offset lower earnings due to a reduced volume of production next year, for although there are signs of increasing competition in export markets the industry,

and this company in particular, should have little difficulty in selling every vehicle that can be produced. There are grounds for believing that in recent years the British motor industry's anxiety to sell abroad has sometimes led it to under-price its products.

* * *

Pulp for Rayon

The decision of Courtaulds Limited and the Italian rayon producer Snia Viscosa to start a joint venture for producing wood pulp in South Africa will eventually relieve these companies of much of their present irksome dependence on Scandinavian pulp supplies. Almost no Canadian pulp has been available for European producers in recent years and as world rayon output expanded, the growing demand for wood pulp has put the Scandinavian producers in a strong position which they have fully exploited. In 1937, British producers were paying an average of £10 a ton for dissolving pulp. In September, 1949, the price was £48 a ton: twelve months later had risen by less than £4. By last September it was up to nearly £105 a ton and at present Swedish and Norwegian pulp is being quoted at £114 to £115 a ton. Had not the sulphur shortage intervened to check the rising curve of world rayon output, demand would by now have outrun available supplies of pulp. At the end of 1950 some rayon producers were finding it difficult to place contracts for all the pulp they needed, even at enhanced prices. Courtaulds, therefore, had every incentive to take the long view in searching for alternative supplies.

The South African venture is still in its early stages, a company jointly owned by Courtaulds, Snia and the South African government's Industrial Development Corporation having just been registered. The government's participation suggests that the pulp might eventually be spun locally; but in the first stages it will certainly be taken up by the two companies' factories in Britain and Italy.

This has been a year of expansion for Courtaulds. Some weeks ago the company announced its return to the United States as an active rayon producer; last week it announced its decision to start producing cellulose film in Canada, where it has been producing rayon for nearly 30 years. But at home, the industry's output in September did not show as big a seasonal recovery from the August figures as might have been expected. The total output of synthetic yarns, which includes about 800,000 pounds of nylon and a small quantity of other fibres like "terylene," was 31.7 million pounds, compared with 30.2 million in August and 34 million in July. This may, of course, simply be due to an extension of summer holidays into September. It is certainly not due to any fall in the demand for yarn. The producers' order books are still extremely long; though the present slackness in retail trade may help to reduce these to a comfortable length. Some weavers, however, are making up the yarn into linings and similar cloth for which there is a steady demand and which, unlike dress fabrics, can be kept in stock indefinitely without risk of fashion changes.

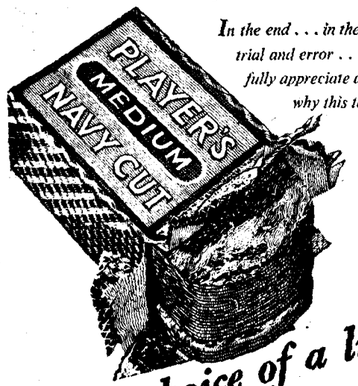
* * *

Depression in Textile Sales

There now seems small prospect of a revival in retail sales of textiles before the spring. When the public's six-month buying spree ended abruptly in March, retailers and wholesalers alike were caught with heavy stocks of high-priced goods. The existence of these stocks, and the marked reluctance of the public to buy them, has tied up the capital of the small retailer and made even the biggest stores extremely cautious in ordering autumn and winter goods. The wholesale textile index is a reliable indication of the way things are going. The latest figures are for September, the month when winter goods are being delivered: they show that sales were actually lower than in September 1950. The index itself (1947 = 100) rose from 110 in August to 151 in September but in the same months of 1950 it moved from 108 to 178. The fall in the volume of sales is even larger than these figures suggest, for prices have risen considerably in the intervening twelve months, in some cases by as much as 30 per cent. Stocks, on the other hand, are still much higher than twelve months ago. The September figure—again based on value—is 237 compared with 171 twelve months earlier. Retail clothing stocks, too, are about 14 per cent higher than they were this time last year.

Bad weather cut sales of summer clothes and the mild autumn threatens to have an equally disastrous effect on winter sales. But weather alone cannot be held wholly responsible for the continued depression. There are unmistakable signs that the new, higher textile prices are more than the public is able to pay. Simply to blame this on to events like the Dalton episode is to misread all the evidence of past months, which has pointed to growing price resistance, first affecting durable household goods like carpets and blankets but now extending to consumable items such as clothing. In consequence, clothing manufacturers have not only been receiving fewer winter orders, but they are getting cancellations of those orders even from their biggest customers. In the clothing and shoe industries generally there is a good deal of short time working and many cases of actual dismissals. One of the members of a deputation from clothing companies belonging to the National Union of Manufacturers, which is going to ask the committee reviewing purchase tax to replace it by a 7½ per cent flat sales tax on all garments, said last week that from lack of orders his wage bill today is half what it was six months ago. Should this continue, some workers may at last be diverted from consumer industries.

* * *



Earning Power of Shipping

One of the last acts of the late Government was to ask the Chamber of Shipping to carry out an inquiry into the foreign exchange earnings of the British shipping industry during 1952. The last time this was done was in respect of 1947: the results showed that British shipping during that year made a net contribution of £60.3 million to the United Kingdom balance of payments. This year it is unofficially estimated that the net earnings of foreign exchange being brought in by British ships are in the region of £150 million—excluding the net earnings of the tanker fleet. Since the industry has been given advance warning of the 1952 inquiry, it should be possible to strike a trial balance at the end of each month, which will give as early as possible a warning of the trend. One factor that is likely to militate against any increase in foreign exchange earnings is the declining tonnage available.

This is illustrated by the Ministry of Transport figures published in the *Monthly Digest of Statistics*. The following table gives figures for ships of 500 tons gross and over registered in the United Kingdom and Colonies:—

Date	Non-Tankers	Tankers
	(000 tons gross)	
September 1939	14,313	3,064
September 1950	13,545	3,873
September 1951	13,329	4,173

While the tanker fleet is now 1,109,000 tons gross larger than before the war, the dry-cargo fleet has declined by 984,000 tons. In view of the enormous expansion in the demand for oil since the war, it was inevitable that priority should have been given to the building of tankers, but there is cause for concern in the fact that the dry-cargo fleet is actually continuing to decline. In the last twelve months tankers have increased by 300,000 tons gross, but there are 219,000 tons fewer dry-cargo ships than there were in September, 1950. The non-tanker figures for both years, it

In the end . . . in the natural process of trial and error . . . you will find and fully appreciate all the good reasons why this tobacco is called . . .

Lend strength to Britain

The maximum holding of Defence Bonds has been increased from £2,500 to £3,500 (including all previous issues).

3% Defence Bonds

You can also Lend-Strength to Britain by investing in National Savings Certificates or by deposits in the Post Office and Trustee Savings Banks.

Issued by the National Savings Committee

must be mentioned, include cargo ships owned in Canada but transferred to U.K. registry, and this accounted for as much as 678,000 tons of the 1951 total. Meanwhile the tonnage under construction for British ownership is now approximately equally divided between tankers and non-tankers, but the rate of obsolescence is, for the time being, far higher for non-tankers. Statistics published by the *Shipping World* show that at the end of September there were more than 1,300,000 tons gross of ocean-going dry-cargo ships of 20 years of age or more. If the useful life of a tanker is assessed at only 15 years, the tanker tonnage due for replacement amounted to only 690,000 tons.

Training the American Worker

For more than two years productivity reports have been familiarising Britain with one outstanding industrial asset that the United States possesses in abundant supply—a resourceful and energetic average worker, flexible in skill and in his mental approach to production. One team sent by the Anglo-American Productivity Council has just reported upon the shaping of this unrivalled asset—the training for employment of the American worker.

Much that distinguishes the American worker from his British counterpart is inherent before either receives any specific training: "differences of approach, of environment and prosperity, of relationship between employer and employed." Against the background of an almost insatiable home market, the ambitious individual is not frustrated—"he readily accepts a way of life in which his prosperity is directly proportioned to his own efforts and ability." Upon that human material is brought to bear the American educational system—with a large proportion of young people in high schools until they reach 17 or 18, with vocational education following the actual practice of industry rather than that of the professional engineering school, and with most of the best pupils entering industry (most of Britain's best pupils enter the professions). Vocational, like general, education seems "broader and shallower than in Britain," with pupils being trained to be effective in a particular occupation rather than to be deeply knowledgeable; there was a division of opinion within the British team over which policy was the better, but the majority favoured the American.

Apprenticeship in America is distinguished by an almost complete disregard of the upper age of prospective apprentices; men can start up to the age of 35. Commending this system, the team suggest that its adoption might enable existing periods of apprenticeship in Britain to be shortened; so might the following of American practice in awarding credits for previous vocational training, thus enabling an apprentice to shorten his shop training. In the United States apprentices are often indentured to a local joint apprenticeship committee rather than to one employer; this enables transfer between employers, if necessary, to ensure the apprentice a fully balanced training. The report describes two American methods of training that epitomise the country's wholly empirical approach to manpower, as to machinery. Upon the formula that every professional man needs up to seven technicians working for him, technical institutes have been established to train men and women to exactly the degree required—instead of under-employing university graduates or asking too much of tradesmen. A second instance is the training system at Kelly Air Base, an Army air force store and maintenance depot in Texas. Here the overhaul and repair of hundreds of items is "de-skilled" onto production lines: the 11,500 civilian operatives at the base are each trained at every point along the overhaul line for one piece of equipment, then moved to other lines overhauling similar but differently-patterned equipment. This cross-training, which is carried on indefinitely, is supplemented by theoretical instruction. The result would appear to be a journeyman mechanic of great adaptability and wide experience, albeit not highly qualified in the theory of the work he can do effectively. Such a worker is perhaps the ideal of the American production system: the British team, were greatly impressed by this method of training, but comment that the conditions for such a system "are likely to occur in Britain only in times of national emergency."

Shorter Notes

Figures published by the Economic Commission for Europe show that this year's fall in retail sales is not confined to Britain. The index of textile sales (corresponding period of 1950 = 100) shows a marked fall in trade in all Western European countries between the first and second quarters of the year, where under normal conditions a rise would have been expected. The biggest fall was in Western Germany, where sales dropped 53 points, from 149 in the first quarter to 96 in the second. The fall in Belgium, the Netherlands and Austria was one of about 40 points, sales in the first two countries fell from around 120 to 80, in Austria from 154 to 115. The Norwegian, Swiss and British indices fell the least, by an average of 20 points, the British figures dropping from 115 to 96. Textile production has been cut back in those countries where the fall in sales has been the most marked.

*

The Railway Staff National Tribunal has awarded a wage increase of 8 per cent to 442,000 railway workers. This will cost British Railways an estimated £14,500,000 a year. Last July the railwaymen asked for a wage increase of 10 per cent, an increase of £18 million. The Railway Executive offered them a 5 per cent increase instead, which would have cost £9,500,000. The new award is to date from September 3rd; besides the flat pay increase, it contains provision for increases in weekend rates.

*

Some progress in the almost interminable final stage of coal compensation is reported from three of the larger colliery districts. In South Wales acceptances of the voluntary scheme of valuation, prepared by a committee from the former coalowners, now cover more than 96 per cent of the district's output, and arrangements can now proceed for an early distribution of the total sum—£14,231,000—awarded for the district. In Durham, more than 99 per cent of the former coalowners have agreed to the appointment of three assessors to value their collieries before the end of next April; also, and more important, they have agreed to accept these valuations without appeal. In Yorkshire a scheme for valuation of colliery assets by an independent panel—a somewhat similar scheme to that accepted in Durham—is now being discussed.

*

With steel output in 1952, even at a rate little higher than this year's, dependent upon home iron ore supplies of some 16 million tons, output from the Midlands ore workings is being built up. At Corby, Stewarts and Lloyds have just brought into operation their "W.1400," the largest walking dragline in the world, and indeed one of the most massive single pieces of machinery ever made. This 1,600 ton earth-moving machine, designed by Ransomes and Rapiers, can strip the overburden in the Corby opencast workings to a depth of 100 feet with a 282-ft jib; this will greatly lengthen the period during which the ironstone will be obtainable by this method. Nevertheless, the time is not far removed when Stewarts and Lloyds will have to go underground, which will increase the costs of this low-grade ore; already plans are being prepared for two mechanised mines in the area.

Company Notes

John I. Thornycroft.—In the shipbuilding and ship repairing industry, since contracts often extend over two or three accounting periods, year-to-year comparisons of profits are apt to be an unreliable guide to the underlying trend. If accounts credited in respect of delayed settlement of contracts largely completed before the beginning of the latest financial year are excluded, group trading profits of Thornycroft have fallen from £784,682 to £685,523. But if the special credits are bought into account, the trading balance has risen from £1,049,082 to the record figure of £1,160,523—which may be a more indicative movement. The company has celebrated its half centenary as a public company by declaring a final dividend of 10 per cent on the ordinary capital of £600,000, as doubled by the 100 per cent bonus issue, in addition to the interim dividend of 10 per cent on the original capital of £300,000. In effect, allowing for the bonus element, this represents an advance of 2½ per cent to 15 per cent.

Less pleasing to equity shareholders is the chairman's realistic and somewhat gloomy comment upon the future. Shortages of materials and labour, which the rearmament programme has made particularly acute, will, Sir John E. Thornycroft believes, have "a very serious effect in reducing turnover and increasing costs.". As the company has made considerable efforts to improve its overseas sales and service organisation, this is especially disappointing. Sir John is not the first chairman to comment adversely upon the restrictive practices of labour in the docks and shipyards, but he puts the case in a nutshell when he condemns the unwillingness "to depart from the conservative demarcation rules which were imposed by the unions in the years when there was considerable unemployment in the country." As for the company's interests in the construction of commercial vehicles, prospects appear to be rather brighter, for the company now appears to be concentrating upon the production of the heavier specialised vehicles.

All sections of the company are taking some part in the rearmament programme, but this participation will involve considerable outlays on improving and replacing buildings and plant. There were capital commitments of about £86,000 outstanding at the end of the financial year, and in addition the directors have authorised a three to four year programme of renewals and extensions that will cost £250,000 at present day prices. These outlays, apart from further investment in overseas subsidiaries, will make considerable inroads into the cash resources of the group, so that additional capital will be needed, "as under the present penal weight of taxation, it is quite impossible to plough back to reserve sufficient to meet these demands." The new issue when it is made is likely to be of ordinary shares.

	Years to July 31, 1950	1951

Reserves	2,105,479	2,203,279
Ordinary capital	300,000	600,000

£1 ordinary stock at 61s. 3d. yields £4 18s. per cent.
(a) Interim 10 per cent on capital of £300,000 and final of 10 per cent on capital of £600,000.

Ind Coope and Allsopp.—Attempts by the brewing industry to arrest the decline in beer consumption, now down to 1938-39 levels, have been mainly concentrated upon increasing the production of the more popular bottled beers, which now account for about one-third of total output; efforts are also being made to reduce working costs. Ind Coope was one of the first companies to adopt these two lines of attack; last year's increase in profits was attributed by the chairman to "growing demands for bottled beer, in particular Double Diamond, and to economies in production." A third factor of some importance to such a company as Ind Coope, which trades on a national rather than a regional basis, is to spread its interests as widely as is geographically possible; perhaps this was in mind when it acquired last year Parker Burslem and Lonsdale and Adshead breweries. The success of the company's efforts can be measured by the slightness of the decline in group trading profits, from £2,621,915 to £2,580,916, in a year when increasing costs of distribution, materials and wages may not have been offset entirely by the rise in the selling price of beer.

	Years to Aug. 21, 1950	1951
Consolidated Earnings :—	£	£
Trading profit	2,621,915	2,580,916
Total income	2,673,947	2,876,246
Depreciation	463,501	407,133
Taxation	764,742	941,667
Earnings for ordinary stock (a)	*566,533*	*522,220*
Ordinary dividends	497,879	479,927
Ordinary dividends (per cent)	30	30
Revenue reserves	119,695	337,803
Added to carry forward	991	730

5s. ordinary stock at 24s. 0d. yields £6 5s. per cent.
(a) Parent company only.

On the assumption that the year's reserve appropriations are freely available for distribution—and this might not be the case—the earnings cover on the maintained ordinary dividend of 30 per cent is only moderate. The group should be less vulnerable than some of the smaller regional breweries; but the bottled beer sector of the industry has its own difficulties to face—shortages of bottling plant and crown tops have, for example, still to be overcome.

★

Montague Burton.—In a year when the volume of trade was the highest in Montague Burton's history, group net profits before tax have jumped from £924,095 to £2,278,122 but distribution on equity capital has not been increased. For the year ended March 31st last the ordinary dividend has been maintained for the sixth consecutive year at 12 per cent. After providing £1,241,613 (against £373,869) for taxation, group net profits have almost doubled, rising from £550,226 to £1,036,509, so that equity shareholders must consider the company's dividend policy to be highly conservative.

The key to such conservatism in the matter of dividends may be a concern on the part of directors about the future. Of this—if indeed it exists—there is no sign in the preliminary profits statement, which fails even to detail the appropriations to reserves. Shareholders learn that group capital reserves have advanced by £666,523 to £3,420,271; but the increase mainly represents a surplus arising on changes in tenure of freehold and leasehold properties. Pending the chairman's speech and the full accounts, shareholders may surmise that the rise in turnover in the latest financial year may have been due in part to a scramble by consumers to buy goods before prices rise again; and they may reflect that the advance in profits might easily be reversed in an overstocked market subjected to disinflation. But they may still wonder whether such dangers necessitate a ploughing back of profits on this scale.

Statistical Summary

EXCHEQUER RETURNS

For the week ended November 3, 1951, total ordinary revenue was £95,100,000 against ordinary expenditure of £68,497,000 and issues to sinking funds £609,000. Thus, including sinking fund allocations of £12,057,000 the deficit accrued since April 1, 1951, is £56,094,000 compared with a surplus of £89,629,000 for the corresponding period of the previous year.

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are. Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds —a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to:—

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

INTERNATIONAL BANKING SURVEY

This survey, and the accompanying special 15-page selection of International Banking Statistics that appears in this week's issue of the RECORDS AND STATISTICS *Supplement, is complementary to the similar survey and statistical analysis of banking in the British Commonwealth published on June 2nd last. These half-yearly features together comprise the new form of* THE ECONOMIST BANKING SUPPLEMENT *which has been published for many years.*

Strains within the Sterling Area

IN many recent discussions about Britain's crisis of external payments, one illusion that has been sedulously fostered is that it is predominantly a dollar crisis, and must therefore be tackled mainly by measures designed to reduce dollar imports and expand dollar exports—unless yet another slice of dollar aid is forthcoming to help fill the gap. This dangerous line of reasoning had been encouraged partly by the emphasis put upon the dollar problem in official statements and partly by the form of the available statistics. The danger of concentrating upon the dollar aspect has now been specifically emphasised by the new Chancellor, though it remains to be seen whether the full implications of the wider approach will be allowed to determine his policy.

The truth is that Britain faces a sterling problem no less menacing than the dollar problem, and neither will ever be solved unless they are treated together as merely different aspects of a single crisis of external disequilibrium. The most dramatic demonstration of the extent of the sterling problem is the rate at which Britain has been running up debts in the form of externally-held sterling balances. During the first half of this year these balances rose by an unprecedented amount, by £425 million to £4,168 million. Of this increase, no less than £368 million accrued to members of the sterling area, whose aggregate balances rose to £3,098 million, or to over £600 million more than they held at the end of the war. The fact that Britain's partners in the sterling area have been prepared to put up these large additional sums (the gross lendings have, of course, been larger still, because some members of the area have been drawing down their balances) is sometimes also treated as an argument for putting the dollar problem first—on the assumption that whereas Britain's dollar imports might be cut off for lack of dollars, other imports will never be cut off through unwillingness of the overseas sterling area to accept sterling. But, in fact, the very opposite conclusion should be drawn from the accelerating rise in Britain's sterling debts—as anyone who has observed recent trends in the mood of sterling area members will readily understand.

In recent months, India, Pakistan and Ceylon—three countries that have been outstandingly successful in getting substantial releases of balances since the end of the war—have none the less shown marked restiveness at their inability to secure as ready a flow of capital goods from Britain as they deem necessary ; and, in the matter of releases, each is vigilant to ensure that its facilities are not less favourable than those secured by the other two. All three countries, now that they are net contributors of dollars to the central pool of the sterling area, have taken care to retain some dollars to provide independent —though still small—reserves of their own. Pakistan asserted its independence by insisting on retaining the dollar parity of its rupee when all other sterling area currencies were devalued in 1949 ; while India has for some time been deliberately building up direct financial relationships with "third" countries, thus reducing the proportion of its trade that is financed in the traditional way through London. The Indian Reserve Bank recently disclosed that between 1949-50 and 1950-51 the proportion of bills drawn or remittances received in hard-currency countries of destination rose from 20 per cent to over 40 per cent, while the use of sterling bills dropped from 62 to 40 per cent. The impetus behind such tendencies as these can hardly fail to grow as rearmament reduces Britain's capacity to supply the particular goods these countries demand ; and there is no doubt that they will lay great emphasis on this point when their representatives join other officials of the sterling area governments at the forthcoming meeting in London—a meeting designed to prepare the way for a full conference of Finance Ministers of the area.

Even more significant than the restiveness among the Asian members of the sterling area is the evidence that a similar attitude is beginning to arise in Australia, for that Dominion throughout the postwar years has been the biggest source of new credits, and took a long view of its sterling balances at the time when other members were importunate. Sir Douglas Copland, vice-Chancellor of the Australian National University, who has been an influential adviser of the Commonwealth Government, has lately argued that, since sterling convertibility into dollars is not in sight, Australia ought to take autonomous responsibility for its dollar accounts and should build them up with the object of making the Australian pound convertible into dollars as soon as possible. He seeks to develop closer direct relationships with the United States, in the hope of promoting therefrom a substantial flow of capital to Australia—capital that he believes Britain will be unable to provide. There is no reason yet to suppose that the Commonwealth Government feels as strongly on these issues as Sir Douglas does ; but if Britain hopes to secure promises of renewed economy in dollar expenditure, without at the same time giving firm pledges of a better flow of British goods to make such economies less

painful, it is likely to find that not even Australia will be acquiescent.

The reasons why these strains within the sterling area have been mounting so ominously can readily be discerned from analysis of the intricate pattern of financial relationships that subsist within it—and particularly between the United Kingdom on the one hand and the overseas members on the other. It is a revealing exercise, even though it cannot yet be carried beyond the middle of this year. The decisive fact that emerges is that Britain's relationship to the rest of the sterling area has changed radically since the end of 1949 and especially since the end of 1950. In all save the first of the years 1946 to 1949 inclusive, the overseas sterling area was running a large and growing current deficit with Britain, and in all four years it was also in deficit with the dollar area ; only in 1946 was this dollar deficit more than offset by sterling area sales of gold to Britain. In addition, there was on balance a small sterling area deficit with "third" countries. These relationships are clearly shown by the first four items whose postwar changes are traced in Table I. Through these four years, it will be seen, Britain was not only making "unrequited" exports to the rest of the sterling area to the extent of no less than £516 million (the aggregate of Britain's current surpluses with the RSA) but was also supporting a dollar drain on its behalf to the extent of £219 million, after crediting the RSA gold sales to Britain. In addition, it was having to carry an RSA net deficit of £29 million with "third" countries.

Until the end of 1949, therefore, the overseas sterling area was not only making very large net demands on British production directly but was dipping into the gold reserves. Since the beginning of last year, however, the relationship has been greatly changed. It is true that in 1950 the RSA again ran a big deficit with Britain ; but, at £218 million, this was appreciably below the peak of £273 million reached in 1949 and was, moreover, almost balanced by the surplus of £190 million that the RSA earned from "third" countries. More important still, the direct deficit with Britain was itself more than offset by the RSA's net contribution to the central gold and dollar reserves (which were fortified to the extent of £154 million by the RSA surplus with the dollar area and of £100 million by RSA sales of gold to Britain). In the first half of 1951, the latest period for which figures are available, the change became even more pronounced. On the one hand, the RSA deficit with Britain ran down to only £46 million (merely one-third of what it was in the first half of 1949). On the other hand, the RSA dollar surplus was almost as large in these six months (at £148 million) as it had been in the whole of the previous year, while the surplus with "third" countries (roughly equal to the RSA surplus with the OEEC group) mounted still further. Or, if the relationship is expressed the other way round, in this half-year Britain's surplus sufficed to finance less than one-quarter of the RSA contributions to the dollar pool, and little more than one-seventh of the counterclaims represented by those contributions plus the surplus with "third" countries.

It is generally reckoned that according to the normal principal of triangular and multi-angular payments relationships, Britain's export surplus with the overseas sterling area indirectly earns enough dollars for Britain to finance its own dollar deficit ; that it to say, the RSA has normally a dollar surplus and, instead of spending its dollars in the dollar area, spends them in Britain—by depositing them in the central pool against sterling credits that are then paid away for British goods. This traditional principle has not in fact operated since the war. Early in 1950, after the long phase of acute strain by the RSA on Britain, it seemed that it might be about to start working again ; but then the steep rise in commodity prices and the violent movement of the terms of trade in favour of primary producers swung the relationship abruptly to the other extreme, with Britain hopelessly failing to keep pace, by its own exports, with the fast-rising surpluses of the RSA with the rest of the world.

This, moreover, is only part of the story of Britain's unstable relationship with the RSA since the end of the war. The movement of RSA claims on London is determined only partially by the direct current factors that have been considered so far (the first four factors in Table I). There is normally a substantial flow of capital from Britain to the RSA, and since the war this movement has been very large indeed, thereby accentuating the disequilibrium. In addition, the net balance of Governmental transactions and analogous operations (such as RSA drafts on the IMF or Ireland's direct receipt of ERP) has added further to RSA claims. During the four years to end-1949, if the RSA deficits with Britain and with the dollar area, and its sales of gold to Britain, had been the only factors, the RSA sterling balances would have been reduced by no less than £735 million, with a further reduction of £29 million to finance the RSA net deficit with "third" countries—a total reduction of £764 million. In fact, the reduction was no more than £142 million, because, as Table I shows, there was in these four years a net flow of capital to the RSA that, with other miscellaneous transactions, provided it with credits aggregating £529 million. The omnibus "Governmental" group of factors provided it with a further £93

SOFT HATS AND HARD CASH

A Brazilian hat manufacturer wanted to buy from one of our clients a large quantity of rabbit fur. Before committing himself, our client wished to know how soon he could expect remittance of payment from Brazil.

Intelligence reports from our own Brazilian branches enabled us to tell him that Hatters' fur had been given preferential treatment in the granting of exchange and, at that time, remittance could be expected within 90 days. This news enabled our client to accept the contract with perfect peace of mind.

THE ADVANTAGES OF BEING HERE AND THERE

As the only British Bank with branches in Latin America, we can offer you special services—either direct or through your own bank. These services are set out clearly and concisely in our leaflet "The advantages of being here and there". We shall be glad to send you a copy on application to:—

million. Moreover, despite the violence of the change in relationship during the eighteen months from end-1949, the aggregate figures for the whole period of 5½ years is still a heavy net strain upon Britain: the RSA's net contribution to the central dollar pool (£224 million) and its net surplus with third countries (£282 million) together fell substantially short of the accumulated deficit with Britain (£780 million). The difference of £274 million may be regarded as the measure of Britain's "true" export of capital to the RSA; it will be seen at once that this "true" capital falls far short of the financial outflow of funds, aggregating, with miscellaneous transactions, no less than £757 million. In the latest eighteen months, moreover, although Britain has borrowed £490 million net from the RSA as a consequence of the several current factors, the outflow of British financial capital has continued—to the extent of £228 million. Hence, when Governmental transfers are added, the total increase in sterling area balances in these eighteen months has been £746 million.

Detailed consideration of the conclusions to be drawn from this extraordinary picture cannot be attempted in this article; indeed, a fair judgment cannot be reached on the basis of a phase so abnormal as the eighteen months to end-June last. But, whatever allowances are made for these abnormalities, it is clear that the sterling area mechanism will not withstand the stresses of this rearmament phase unless Britain makes herculean efforts to rebuild its surplus with the RSA. Since the other members of the system will certainly acknowledge that they have a part to play in the common effort, it may not be necessary for Britain to raise its surplus to the point at which the "current" accumulation of sterling balances (as distinct from the movement caused by capital transfers) is entirely checked. But unless this "current" growth is kept within bounds, the separatist tendencies and the RSA demands for release of dollars from the pool will grow steadily stronger. And the only way to ensure that this does not happen is for Britain to make a real effort to provide the particular goods that these countries need for their development programmes. But the overseas countries, in their turn, have a duty to keep a due restraint upon their own demands—by a firm resistance to inflation. This should require them not only to put a brake upon consumers' demands but also to ensure that their capital programmes really are confined to projects that can stand the test of essentiality during a phase of world rearmament.

The Latest EPU Crisis

LIKE the British balance of payments, the European Payments Union has been staggering from one crisis to another. The successive lurches of the EPU, however, quite unlike those of the British balance, have been in opposite directions, so that there is no immediate danger that the latest crisis, caused by the persistent creditor status of Belgium, will bring the system to the verge of collapse. The first serious threat to EPU, it will be recalled, was caused by the tendency for Germany to run into chronic deficit. This disequilibrium had to be met in part by stopgap measures, notably the extension to Germany of supplementary credits. It was also countered by the more fundamental measures taken, at the instigation of an OEEC mission, to toughen the German economy and restore equilibrium in the German balance of payments. These measures have proved extraordinarily successful. The German cumulative net deficit, which had risen beyond $450 million by the end of March, 1951, had by the end of September been reduced to $114 million, so that Germany recovered in the course of this improvement virtually the whole of the substantial amounts of gold previously paid over to the Union.

The German difficulties had in turn caused serious damage to the Netherlands balance of payments. The disappearance of these difficulties, and the consequent relaxation in German import restrictions, have appreciably reduced the Netherlands deficit, which at one time had also presented a serious threat to the stability of EPU. On the debtor side, in fact, EPU now has little to fear. The latest available figures, those to the end of September, showed that in no case except the very special one of Turkey, was the position of a debtor nearing its quota and, therefore, placing upon it the obligation of making relatively heavy gold payments to EPU.

In the earlier months of EPU the bulk of the aggregate creditor positions at EPU was represented by the credits of the United Kingdom and France, the two countries with the largest quotas and, therefore, the largest obligations to lend to EPU. For this reason, the amount of gold that was being withdrawn from the Union by creditors was small by comparison with the amount that was being paid into it by the substantial debtors. During this period, therefore, the cash position of EPU itself was never in any danger. The cash amount of $350 million with which EPU began operations on July 1, 1950 (this was the amount of the initial subscription made in dollars by the United States Government) had actually been raised to $447 million by the end of November, 1950; and the cash remained in excess of $350 million up to the end of March, 1951.

Thereafter, however, an important change became noticeable. The German balance of payments began to show surpluses and, in accordance with the cumulative principle on which payments of gold to EPU are made and drafts on EPU facilities are provided, Germany began to reacquire gold at a relatively rapid rate. At the same time, the credit balances of the United Kingdom and France turned to deficits; but, since these countries had been relatively small takers of gold, owing to the size of their quotas, this switch in its turn involved very little gold retransfer to EPU. Most important of all was the fact that a few countries, notably Belgium, became persistent and substantial creditors and, in fact, reached the point at which their quotas had been exhausted. At that point, in accordance with the strict letter of the EPU agreement, they could have taken the whole of their further surpluses in the form of gold—a procedure that would have created a serious threat to EPU's cash.

The most substantial creditor is Belgium. It was endowed at the outset with a quota of $360 million, including an "initial debit" position of $29 million. By the end of August, Belgium's credit position at EPU had

exceeded the quota by $12 million, while in September a further $68 million of creditor claims accumulated, bringing the total excess over the quota to $80 million. Special arrangements were then made with Belgium, which agreed that only 50 per cent of this excess was to be settled in gold, instead of the 100 per cent gold settlement for which the EPU scheme strictly provided ; the other half was to be carried forward as an additional credit by Belgium to EPU. At the end of September, however, it became evident that Belgium would continue to run a current surplus with other EPU countries ; but Belgium was unwilling to extend still further credits to the Union, on the grounds that such additional lending would foment inflation in Belgium at a time when its monetary authorities were striving to keep the domestic credit situation strictly under control. But a limit had to be set to the demands Belgium might make on EPU cash. Accordingly, it was decided that the Belgian surplus during the last quarter of the year should be settled wholly in gold up to an amount of $80 million, but that if it exceeded that figure it would have to be covered wholly by additional credits from Belgium. This, in effect, placed on Belgium the responsibility of keeping its further net surplus with other EPU countries in the last quarter of the year within $80 million. The exceptional and severe measures since taken by the Belgian authorities to reduce the Belgian current surplus with EPU countries and to prevent the speculative inflow of foreign money into Belgium need to be judged in the light of this special arrangement with EPU.

It is not only Belgium that stands on or beyond the threshold of its EPU quota. Another such creditor is Portugal, which by the end of September had exceeded its quota of $70 million by $1.3 million and which had drawn no less than $28.7 million of gold from the Union. Italy, too, has been a persistent creditor ; by the end of September it had an accumulated surplus of $142 million with the Union, compared with its quota of $205 million, and was accordingly taking gold at the rate of 50 per cent of its steadily growing surpluses.

As a result of these various demands, the point has now been reached at which the cash reserve of EPU must be causing serious concern. At the end of the first twelve months of operation of EPU, that reserve stood at $351,967,000, still fractionally above its initial level. Since then it has been seriously depleted. The settlements over the whole life of EPU, i.e. from July 1, 1950, to September 30, 1951, show that over this period EPU paid out $174 million more gold than it received. By September 30th, therefore, the gold in reserve was no more than $175.6 million. Of this $80 million was apparently earmarked against a probable loss of gold to Belgium during the last quarter of the year, leaving an effective balance of less than $100 million. This is far from sufficient to ensure that EPU can withstand the strains to which the system is subject.

In retrospect it is clear that the initial cash reserve of $350 million was too small in relation to the swings in balances and payments within Europe. Moreover, this reserve was mortgaged from the outset to the extent of $80 million—a " mortgage " that arose from the fact that the " initial debit " positions (i.e. obligations to provide credit beyond their quotas) with which members of EPU were handicapped at the beginning of operations were smaller by that amount than the " initial credit " positions (additional borrowing rights) with which other members were endowed. This difference was a contingent charge against the capital of EPU that has in fact been enforced since the positions have been utilised ; there has therefore been a corresponding loss of cash. The inadequacy of the cash reserve did not reveal itself in the early months of EPU because the position then was dominated by one large debtor, Germany, which in accordance with the sliding scale incorporated in the EPU agreement was, in the end, paying in gold up to 80 per cent of its current deficits.

The position has now been transformed. It is the United Kingdom and France, the largest quota holders, that are now running the principal deficits. Up to an amount equal to 40 per cent of their quotas they can finance these deficits without any gold payments at all—a proportion comprising the last 20 per cent of their remaining credit position and the first 20 per cent of their overdraft with EPU. This 40 per cent of the two quotas represents a total of no less than $632 million, which is the amount by which the United Kingdom and France can continue to run into deficit with EPU without paying any gold to the Union. Concurrently, however, the main creditors—Belgium, Italy, Switzerland and Portugal—will be taking 50 per cent of their current surpluses in gold from the Union 50, or, in the case of Belgium, perhaps more. Ultimately, the position will correct itself. The quotas and the provisions for gold payments and receipts are so arranged that, within the effectively closed circuit that constitutes EPU, gold payments and receipts must in the long run be equal ; it was for this reason that the original cash reserve of $350 million was expected to be adequate. These long run considerations, however, are no consolation when the immediate prospect suggests a dangerous depletion of the reserve.

The European Payments Union as devised in 1950 was not, in fact, intended to deal with such wide swings in balances of payments as occurred after hostilities began in Korea and with the major swings caused mainly by the violent fluctuations that ensued in raw material prices. Nor was it intended to deal, as it has had to do, with the whole finance of intra-European rearmament expenditure under the defence plans of the North Atlantic Treaty.

The widths of the swings in intra-European payments is due far more to pseudo-commercial but essentially speculative transactions than to genuine current operations. The fixed parities maintained under the Bretton Woods system have in these times of uncertainty provided a positive encouragement to speculation in currencies. The speculations can no longer take the form of outright sales or purchases of currencies, spot or forward, unbacked by any commercial justification. They are achieved mainly by postponements or anticipations of genuine commercial exchange operations. In some cases outright speculation has taken place by inventing " phony " import or export transactions on the basis of which the appropriate allocations of foreign currencies are obtained. These, however, are exceptional operations ; for the most part, the speculation in exchanges has taken the form of delayed or hurried settlement of current commercial transactions. The effect of this shift in the incidence of the current balance of payments on the reserve has been severe, as may be gauged from the extent to which sterling was oversold before devaluation, overbought in the early part of 1951 and again oversold in recent weeks. The French franc pro-

vides another example of overselling; this has been mainly responsible for the dramatic change in the French balance of current payments as reflected in the French EPU position in recent months. In view of the width and artificiality of these swings in balances of payments, it can be argued that both the extent of the quotas provided under the EPU mechanism and the cash reserve were inadequate.

Their inadequacy was further emphasised by the unforeseen impact of rearmament finance on EPU. As yet little or no provision has been made for handling the international payments arising from the common rearmament plans of the NATO countries. The problem is one of immense complexity. It derives not merely from direct expenditure on defence materials and such items of "infra-structure" as the building of aerodromes, camps and communications. The impact of rearmament has made itself felt over the whole range of private trade. The diversion of a material such as steel to rearmament in Britain has caused the demand for steel produced by the other members of NATO to rise abnormally, leading to artificial "grey market" prices. There has been no equality as yet in the diversion of industrial resources to rearmament in Europe. As a result, the uneven incidence of rearmament work has made itself felt over the whole range of international trade, both in consumer and capital goods.

To return to the example of steel, which has played an appreciable part in building up the creditor status of Belgium, there is no doubt that the scarcity of steel caused in Britain by concentration on rearmament has led not only to abnormal British imports of Belgian steel but has caused Australia, India and many other countries, which would normally be supplied with steel from Britain, to place orders at almost any price in Belgium. Similarly, the absence of any appreciable volume of rearmament work in Italy and the complete absence of such work in Germany have made it possible for the industries in these two countries to satisfy civilian demand that would otherwise have been filled by Britain or France. These currents set in motion by the inequality of the industrial rearmament efforts of the various members of NATO have been to some extent responsible for the swings in balances of payments and for the difficulties encountered by EPU. On this score, too, it can be argued that the EPU quotas were both inadequate and wrongly allocated—and, moreover, that the cash reserve put at the disposal of the Union by the United States was insufficient for its purpose. This is a problem that concerns not merely the mechanics of EPU but the problem of sharing the economic burden of the North Atlantic Treaty plans. Unless an early and successful attack is made on this last problem, EPU may in the course of the next few months have to face a crisis from which it will have little prospect of survival.

Attack on US Inflation

(By a Correspondent)

THE pattern of the year's developments in banking in the United States was set by the events of the last half of 1950 when, following the outbreak in Korea, the country experienced its worst bout of inflation in the postwar period.

The prospect that a full-scale conflict might be threatening affected the judgments of the Government, businessmen and consumers alike. The private sector of the economy was influenced partly by memories of scarcity and high prices during World War II, and partly by the very fact that the Government was insisting on the need for restraint in spending—thereby intensifying the fears of shortage and inflation. There was unprecedented consumer buying of soft goods, and of hard goods, such as cars, refrigerators, washing machines and furniture. At the same time stockpiling activities increased sharply. Both government and business turned to buy all available and prospective supplies of materials that were likely to become scarce. Business also embarked on a broad expansion programme that raised the rate of expenditures for new plants and equipment by more than half by the last quarter of the year, compared with the first quarter. The building boom began again as the public turned to houses as one means of guarding against further depreciation of the dollar. A flight from fixed-interest investments was accompanied by a rise in prices and activity on the stock markets, a decline in savings bond sales, and some liquidation of savings deposits and bond holdings.

These symptoms of inflationary psychology called for determined banking policies. It should be remembered that, except for the pressure of buying of scarce critical materials, the direct impact of government spending for defence was not begun to be felt by the turn of 1950. It was a private spending boom, stimulated by the use of credit.

But the defence emergency produced conditions that could not be treated exclusively by traditional methods. The situation was different from anything previously experienced. If the country had been fully at war, controls and rationing would have been the principal economic weapons, and credit problems would have largely resolved themselves. Instead, banking policies had to be adjusted in the light of the need to finance defence production speedily and effectively, without dislocating seriously the substantial civilian production to which the nation was still committed. Above all, banking policy had to recognise the fact that the use of credit was already enlarging effective demand. The policy-measures that were in fact adopted fell into three groups: voluntary credit restraint, selective credit controls, and quantitative control over credit.

The Defense Production Act of 1950 gave authority to the Federal Reserve to arrange a voluntary credit restraint programme, and after months of discussion and careful preparation, the programme began last March. Its aim was to ensure that essential credit needs were met and that speculative uses of credit were eliminated or at least discouraged. Under the chairmanship of Governor Oliver S. Powell, of the Federal Reserve Board,

a committee of commercial bankers, life insurance representatives and investment bankers was organised, and was later joined by savings and loan associations. The committee's task is to guide regional committees and individual financial institutions in considering requests for loans. Its purpose is to disseminate information and, if asked, to give advice through the regional committees, but not otherwise to influence the judgment of the lenders.

The voluntary credit restraint programme really attempts, on a more formal basis, to do what the American Bankers Association did in its anti-inflation programme in 1948—namely to use moral suasion, instead of government direction, to distribute credit in the national interest. An interesting aspect of the programme is that it recognises that bank lending and investing operations is not the sole source of potential credit inflation. It recognises the fact that the tremendous growth of liquid assets resulting from deficit financing during World War II expanded the resources of other financial institutions, such as life insurance companies. It gave them greatly enlarged lending power, which could have neutralised the effects of restraint exercised by the banks. Accordingly, these institutions were brought into the programme. There were some grumblings that the programme could not work. Certainly, its effects cannot easily be measured. Nevertheless, the facts are that credit expansion slowed down considerably in 1951, compared with the last half of 1950. In the first seventeen weeks after mid-year, business loans of reporting Federal Reserve member banks (holding about four-fifths of the nation's total) advanced seasonally only $1,300 million, or less than half the amount recorded in the same period of 1950 when credit demand had been running exceptionally high. An easing of prices and the modest inroads made into heavy inventories undoubtedly were factors tending to lessen demand for accommodation, but the warning signal given through the voluntary credit restraint programme undoubtedly played an important role.

Another achievement of the restraint programme has been the gathering of data from over 200 of the largest member banks about the purposes for which advances were being made. These data not only throw considerably more light on the divergent trends of components of the loan total, but also show the pressure that the defence effort is exerting on loan demand. Since the programme began in March, the detailed figures indicate a steady rise in accommodation for defence contracts and defence-supporting activities; the half-year through September showed about a billion dollar increase in the 200 banks for defence, but of a total of $1,300 million for both defence and non-defence purposes.

*

The second line of attack on the problem of inflation was the use of selective or qualitative credit controls. The Defense Production Act of 1950 authorised the reinstatement of Regulation W—consumer credit control, and initiation of Regulation X—real estate credit control. The Federal Reserve issued these regulations in the autumn of 1950. The confused state of the markets during the early months after their introduction made it difficult to appraise their effects; there had been scare buying by consumers before Regulation W placed limits on maturities and minimum down-payments on instalment contracts, and there was a huge backlog of internal projects started before terms on real estate credit were imposed under Regulation X. Nevertheless, whether by reason of the stricter credit terms or the saturation of markets in 1950, the instalment credit picture changed markedly in 1951. The total outstanding for the country as a whole showed a net decline of $300 million during the first nine months of the year; this contrasts with a rise of $2,500 million in the similar period of 1950.

The application of the selective controls over consumer and real estate credit encountered considerable opposition after enactment. The temporary shortages of durable goods during the summer and autumn of 1950 petered out as production rose in the early months of 1951. When the public discovered that it could secure goods, its attitude changed. Demand slackened off and inventories began to accumulate. This situation fostered opposition to the controls to such a degree that, when an extension of the defence production powers was enacted in July last, Congress gave a mandate to the Federal Reserve to relax the regulations, thereby making it easier to finance instalment and home purchases. This showed that the government was committed, at least for the time being, to the maintenance of a high civilian output of durable goods and houses, even if that required instalment and mortgage credit to support the markets. This was a retreat from the preceding policy. The role of banking policy—implemented through selective credit control—apparently was to take a back seat in favour of more direct production controls to regulate the output of consumer goods and ensure the shift of labour and materials to defence production.

*

The third line of the attack on inflation through monetary policy was quantitative restraint on the total volume of credit. It was exceedingly difficult to get this policy started, owing to its implications for the Federal debt.

The Federal Reserve fired its opening shot in the second half of 1950, when it allowed the short-term rate to rise and increased discount rates in August. The Federal Reserve sought to reduce the availability of credit, even though that action upset the Treasury's plans to finance its September maturities on a 1¼ per cent basis. As 1951 began, the Federal Reserve continued its pressure on the availability of credit by increasing reserve requirements of member banks.

The most significant move in this campaign, however, was made early in March. After several weeks of discussion, the Treasury and Federal Reserve announced an agreement under the which the long-term sector of the market for Treasury bonds was freed from rigid Federal Reserve price support. The Treasury offered, in exchange for the two longest-term issues of 2½ per cent non-bank eligible bonds, a new issue of non-marketable bonds with a longer term and bearing a higher interest rate. The new bonds were made convertible into 1½ per cent notes.

The purpose of this move was to encourage investors to hold their long-term obligations, rather than to convert them into other higher-yielding assets such as mortgages and corporate securities. By freeing the market from rigid support at pegged prices, the Federal Reserve introduced market uncertainty that made investors realise that they could no longer expect to convert securities into cash without some market risk. The process of supporting the market at pegged prices had made Federal Reserve credit accessible to all investors without regard to their responsibility for the use of credit. This situation was changed when, for the first time since World War II, prices of the long-term Treasuries were allowed to slip below par.

Here again, it is difficult to assess the immediate effects of this action intended to retard the general expansion of credit. The change in the long-term market undoubtedly reduced the willingness of lenders to sell bonds in order to extend credit to borrowers. Holdings of government bonds were no longer viewed as a reservoir that could be siphoned off to meet new credit demands, and changed conditions in the capital markets caused borrowers to revise their plans to obtain new money.

It would be difficult to exaggerate the importance of this move on certain institutional investors such as insurance companies, which had been feeding the demand for mortgage and other relatively high-rate credit by selling government securities. The investment executives of these institutions had become so accustomed to regard their government bonds as eligible for the guaranteed price that they have found it difficult to bring themselves to accept the capital loss involved in selling these bonds after the price control was removed. In one step, therefore, the abandonment of the price support policy blocked one of the main channels through which credit had been financing house-building and thus feeding what was perhaps the most important single inflationary factor in the United States economy.

The abandonment of the pegs marked the latest step in the shift from the fixed pattern of war financing. The first step had been taken as long ago as 1946, when the preferential discount of ½ per cent was abolished on borrowings from the Federal Reserve Banks against Treasury securities. In the intervening period, the bill rate has advanced from the wartime ⅜ per cent to around 1½ per cent in 1951, and the whole structure of interest rates has been gradually—but only gradually—coming into line.

*

Since last March inflationary pressures in the United States have abated considerably. Panic buying by the public has ceased and wholesalers and retailers have been faced instead with the problem of liquidating heavy inventories of consumer goods; industrial production has been running at record levels; savings have risen sharply; and higher personal taxation has been eating into disposable incomes. Most important of all, since March the United States Treasury has not needed to resort to the market for large scale borrowings. However, defence expenditures are mounting rapidly and have now reached an annual rate of $38 billion (or about the equivalent of the entire national income of the United Kingdom). By next autumn, according to present expectations, these expenditures will attain a peak annual rate of $65 billion. The impact of these growing outlays next year will provide the real test of the monetary policies improvised in 1950.

But the experience of 1951 has—or should have—taught America a lesson. It is that the problem of inflation through monetary excesses cannot be solved unless the root cause—deficit spending—is corrected.

COMPANY MEETINGS

THE ELY BREWERY COMPANY, LIMITED

TRADE AND PROFITS FULLY MAINTAINED

MR L. NIDDITCH ON SUCCESS OF BOARD'S POLICY

The fifty-fifth annual general meeting of The Ely Brewery Company, Limited, was held on October 30th at the New Inn Hotel, Pontypridd, Mr L. Nidditch, F.F.S.(Eng.), F.V.I. (the chairman), presiding.

The following is an extract from his circulated review:

Ladies and Gentlemen, It is again my pleasant duty to present to you the accounts of your company for the year ended June 30, 1951. It is needless to observe what a difficult year it has been in this trade, considering that barrelage sales have dropped in each year during the last three years in the whole country by over 4,000,000 barrels compared with the peak year of 1946. I am pleased to open this review with information that our trade and profits have been fully maintained in spite of all these difficulties and rising costs.

Since 1947, beer consumption in the whole country has decreased by 13 million barrels, or the equivalent of 7,500,000,000 half-pint bottles; while we have substantially increased our clientele numerically to compensate for individual reduced drinking, due to our improved quality, and a new loyalty created among all employees, and forward planning in 1948-49.

The balance of the profit account for the financial year is £10,000 higher than the previous year. We have continued to maintain and will repair and overhaul and renew plant, machinery and buildings and fixtures wherever possible within the limits of reasonable budgeting. The dividends from our investments at £9,000 are a little lower by £200 because we again realised some of them to maintain our liquidity.

I am pleased to explain that the debenture debt is down to £603,283, with a further redemption and cancellation during the year of £20,667; our debtors are up by £13,000; in spite of an increased turnover, our creditors are down by £22,000. Our freehold properties are up by £28,000, and our plant and motor vehicles increased by £13,000. We are again placing £40,000 to the general reserve, repeating last year's allocation.

DIVIDEND AND BONUS

Having already declared and paid an interim dividend on the ordinary capital of 3¾ per cent., your board now recommend a final dividend of 3¾ per cent., less tax, making in all 7½ per cent. for the year, and, also, a further tax-free distribution of 1¼ per cent. in cash out of realised capital gains account. In addition, as the earnings related to capital is most satisfactory, we also recommend a tax free accretion bonus in shares, to the extent of one ordinary unit for every 14 held, being 7¼ per cent., tax free.

Last August (1950) your board had to make up its mind upon the dividend policy, based on the action of the "market" of the Stock Exchange and our inability to issue new capital owing to unfair prices of all classes of capital.

If we had paid the finals, contemplated in June, 1949, for last year, this year and next year £60,000 is involved (including profits tax) and we dare not part with such a *cash* sum under prevailing conditions.

Our balance on trading in gross profit, including income from investments and unlicensed rents, at £301,000 is £26,500 up on the year; this is clearly no mean achievement in the period that we have just passed. Profits tax confiscates all our surplus and our legislators refuse to face real problems so involved.

Our trade was up in every department. To date in this new financial period we again show a slight rise in profits. We are about to open up and strongly pursue off-licence trade in about a dozen shops, especially separated from our ordinary trade in those houses. Our administrative expenses show again a substantial increase by £8,000, and that is essential for keeping the proper and necessary control and check in all directions, including property repairs while work is in progress, contrary to the customary practice before 1947.

Taxation takes £105,000 against £70,400 in the previous *pro rata* twelve months (£90,000 for the previous 15 months). Bonus and staff pensions and extra future allocations take a sum of £6,000. We also have very fully maintained our advertising expenditure.

The Exchequer has received during the year from our gross turnover around £800,000 in duty payments. With ordinary taxation, the amount to be found amounts to £900,000 against the net receipts by the shareholders of only £39,000 in dividend. This does not show capitalistic profiteering by any yardstick.

The debenture debt which in 1946 stood at £970,000 has been further reduced and is down to the very satisfactory figure of £603,000. We have continued the policy of endeavouring to extend shortened leases to periods of 99 years and buy the freeholds of others where possible, but that has now reached the stage where there will be very few and small movements in view of the grand attack we made during the last three years in those directions in endeavouring to consolidate the capital accounts and the security generally.

Our licensed houses have continued to receive every good attention in regard to sales approach ideas; our policy has shown that such decisions have brought their reward.

LIQUID CASH POSITION

Our liquid cash position, not overlooking the huge debts taken over by this board in 1947, and the large capital requirements essential to be found since that date is, I submit, quite satisfactory. Any shareholder can calculate from the results that we could easily last year have paid the equivalent of 10 per cent. in cash and this year either 10 per cent. or 11¼ per cent. (with share bonus issues additionally), but it would be most unwise for your board to distribute higher cash dividends than we have, and now propose to do, until your quotations are more realistic, the market adjusts its outlook, and remembers we have 2,500 shareholders, and the hindering of the issue of new capital is serious.

We have pursued a "strategic campaign" in regard to advertising to establish and protect the trade mark of Brewer's Own, which now stands for a beer of the highest quality and flavour to appeal to the national palate, prior to organising national marketing. We have provided for enlargement in planning as demand warrants and progresses.

In my review, in 1948, I mentioned that we proposed to create and open many new saloon bars, and in this direction we have now completed our programme.

The weight of responsibility involved in February, 1947, when I was elected to the chair, was so great as to obliterate thought of personal elation; with the houses in a deplorable condition, disrepair and penetrating dampness everywhere, through terrible neglect and approach, coal shortage, E.P.T. liability, shortage of cash by the unwise method of debenture conversion and refusal to consider or even discuss my advice, the almost negligible real administrative management and lack of an experienced supervisory inspectorate and the brewery plant in a very much wornout state mostly 20 to 40 years of age, complete vigil, self-exertion and absorption of the job on hand were imperative.

To achieve what has been achieved has proved the correctness of my interpretations and anticipations.

FINANCES REORGANISED

During 1947, we reorganised the finances of the company, so that no preference shareholder lost a penny of dividend arrears, nor any ordinary shareholder any of his capital. It would be right, therefore, to compare the balance sheets of a full year's working under my control, and that for the year ended March 31, 1946, under the direction of control from "the City." The year 1945-46 was an exceptional year for brewery profits, owing to low gravities then permissible.

After heavy expenditure in all directions, improving the fixed assets, the taxation due in 1948 was £140,000, against £116,000 for the year to 1946. The debenture interest was down as a result of my exertions from £70,000 to £33,000. In spite of improved trading and profits, the sundry debtors was down from £34,689 in 1946 to £30,216 in 1948.

The total assets of the balance sheet was up from £2,101,288 in 1946 to £2,483,698 in 1948, and the debenture debt down from £917,000 to £797,500. Also appearing was a new item of a capital gains account of over £100,000 and 100,000 shares in the separated successful Cardiff Malting concern, and £219,000 of quoted investments. We had also acquired the freeholds of several existing leaseholds and contracted to extend the length of other leaseholds of short-life duration.

EARNINGS ON THE EQUITY

Since January 1, 1947, when I had just entered the board room with a right to be heard and my views properly weighed up, the profits earned for the equity or ordinary capital to June 30th last, after all and every expense as a prior charge, has been £800,000 subject only to income and profits tax and pensions for employees. This sum could easily have been shown at £900,000 if the directors had chosen to enhance their prestige by applying such a sum of about £100,000 to the capital account instead of the revenue account and have been less prudent. During these four-and-a-half years the ordinary shareholders have only received a net sum in cash of £110,000 yet the turnover of the company during that period exceeded £6,000,000.

I think that I can look back on the last

four years or so with much pride and satisfaction in my handling of the complete reorganisation. It has not been easy and free of anxiety. I do, however, submit that I understand the outlook and approach of working men and human material at all levels of intelligence, and can assess and place square or round pegs in their rightful and most advantageous positions respectively, where their temperaments and flairs enable them to give of their best, to the advantage of the company; simultaneously to raise their own income and their standard of living and personal status.

It is not easy for me as financial director and chairman to satisfy shareholders, the Inland Revenue, employees, management and those individuals proved wrong by time, *simultaneously*, but with my colleagues, I submit we have made a good show in the last 4-5 years and brought happiness to hundreds of families and a better standard of living.

THE ADVANTAGES OF BONUS ISSUES

To those individuals unversed in the implications of the relationship between 'real,' 'paid up' or 'apparent' capital, and who have heard of my 'unorthodox' approaches, I can only refer them to results and achievements against great odds. In declaring a bonus issue in shares, I again visualise "market gossip" contending that we are 'loading up capital to the disadvantage of the equity,' when, in fact, it is a decision to give ordinary shareholders a better stake in the reserve of 'break-up values," and *minimise wide quotations*. In any case each ordinary shareholder will finally hold the *pro-rata number* of shares in the company, whether ordinary or preference, *related to his present holding to the total*, but participates in reserves to-day; also it avoids the shareholder of the next decade getting all the advantages of years of accumulated 'held-back profits.' Your board has accepted my advice as financial director that it is wiser to be a holder of 125 or 150 shares for a given dividend sum instead of 100. There is more safety of one's capital, and that must always be a first goal.

The amount required to pay the dividends on the bonus issue is *less than* 1 per cent. on the equity. Who can foretell in any business whether next year's earnings will be 1 per cent. or 2 per cent. more or less?

THE OUTLOOK

I am not unhopeful that the future trading results will be satisfactory, and we are maintaining a good level of activity, in every direction.

From the first day of my joining the directorate, I have held the view that the employees should not suffer for past mismanagement, especially since they have no voice in the directorate appointments.

When in 1947 we floated off the Cardiff Malting subsidiary, we decided to imagine we procured £10,000 less and start off a pension fund. As we do not wish to risk the loss of taxation allowances on that sum when we make the payments in due course, your board, on my advice, with a long-view approach, have decided to write that sum back to capital gains account, and in place, apply a similar sum from the revenue balance, which will ultimately have a double value with taxation allowance on sums as allowed to employees. That fund now equals £50,000 for possible payments.

BREWERY FINANCES

I would like to make some observations upon the relation of earnings to capital in the brewing industry generally and with particular reference to the figures of this company, now that the reorganisation, which I undertook in February, 1947, has been completed.

There are at least 200 breweries in the country (including but not counting subsidiaries), where there is an issue of consolidated accounts. Announcement by any company of a payment of 20 per cent. or 30 per cent. dividends means in fact little, unless structure of capital and accumulated undistributed profits are interpreted. Even 2½ per cent. compounded on £100 doubles itself in years. If a company had a paid-up capital of one million pounds in 1910-20, and has since ploughed back undistributed profits of another million, and acquired additional houses with those moneys in the meantime, it really has a trading capital of two millions, not reckoning the changes in the value of money and purchasing power.

The issued and paid-up quoted ordinary capital of all the brewery companies in Great Britain amounts to approximately £84,500,000. Their accumulated reserves are about £160,000,000. The preference capital is approximately £59,000,000, and debentures £80,500,000. Last year £15,500,000 net was earned (after taxation) on ordinary "employed capital."

Very few companies have had a revaluation of assets since 1936-39. Taking a reasonable and fair approach, I think that a revaluation of the tangible assets would indicate an increase of at least another 66 per cent. on the total employed book capital of £384 million related to dates of acquisition (or £1,000 property now worth £1,660). In other words, the "real" capital—at 1951 values—is £634 million. The gross earnings on *ordinary* at £33 million against this 1951 basis of £460 million (deducting debenture and preference capital) equals 7¼ per cent. approximately.

If we take the Ely profits of this year, or average of last five years, deducting all preference dividends and amortisation of leases, we have a profit figure earned on ordinary at £135,000. The real "employed ordinary capital" is £1,110,000, as shown in our balance sheet, which indicates earnings of 11 per cent. It must not be overlooked that we have not had a chance to accumulate 20 or 30 years of "ploughed-back" profits, and have suffered exceptional impositions in the last few years, more burdensome than those which had to be carried by any other brewery.

I submit, therefore, that Ely recovery is such that management and profit-earning ability can compare and is in line with the best and oldest managed companies which had good fortune on their side in the last few decades.

The report and accounts were adopted on a show of hands with three dissentients, and subsequently on a poll by 951,423 votes to 172,113, and the other formal business was duly transacted.

At a separate meeting of holders of ordinary stock resolutions were passed increasing the capital of the company to £1,373,000 by the creation of 220,000 additional ordinary shares of 5s., and authorising a bonus issue of one ordinary stock unit for every 14 units held.

At an extraordinary general meeting which followed, the chairman stated that it has been decided to delete the clause relating to compensation to directors from the proposed new articles of association, and to temporarily withdraw the clause relating to the export of beer from the new Memorandum of Association, and, subject to these amendments, the documents were approved.

The proceedings terminated with a cordial vote of thanks to the chairman.

FERRANTI LIMITED

FURTHER EXPANSION

The forty-sixth annual general meeting of Ferranti Limited, was held on October 31st in London, Sir Vincent de Ferranti, M.C., M.I.E.E., chairman and managing director, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to June 30, 1951:

We are pleased to present accounts which show further expansion in the company's activities and reflect the benefits that have been obtained from the extension of our manufacturing capacity to which I have referred on previous occasions.

The consolidated profit for the year, including dividends on investments, amounts to £1,227,601 as compared with £550,995 for the year ended June 30, 1950. After provision for tax on all profits earned to date, the net profit is £540,129, against £248,100 a year ago. The output of the group, which is employing over 9,000 people, is more than 30 per cent. above that of last year. All the departments have contributed to this increase.

RECORD ORDER BOOK

There has been a steady increase in orders received during the year, and we are left with a record order book of over £12,500,000. Further extensions of our manufacturing facilities are in hand to deal with this and with the continuing demand for our products, 32 per cent. of our output has been exported.

The Canadian company has substantially increased its turnover and its profits and the latter have been retained in its own funds. It has started the current year with a healthy order book. The trading of the American company has again resulted in an adverse balance; but it has increased its output and has substantial orders in hand.

The output of power transformers, some 27 per cent. higher than last year, was again a record, and continues to rise. To cope with the increase, further extensions to the new factory at Hollinwood, totalling 130,000 square feet in area, were put in hand; the first part of these should be in use by the end of 1951.

The total number of electricity meters produced was 43 per cent. higher than last year, in spite of difficulties with labour and raw material supplies. Shortage of skilled labour has been serious enough to restrict the output of our new foundry plant, though the order book is satisfactory. Sales of indicating instruments and allied equipment continue to rise, the figure for this year being 67 per cent. greater than that for last.

RADIO AND TELEVISION

Sales of radio and television sets have also been satisfactory and the value of the radio apparatus exported was almost double that for the previous year. Television production has been expanded to meet the increasing demand from the Midlands and North Western Regions, and the number of cathode ray tubes manufactured has been doubled. A lead has been given to the domestic appliance industry by the launching of our Safera electric fire.

Radar: Our distance-measuring equipment now enters the civil aviation field with beacons which are being installed at London, Rome and Cairo, and the airborne equipment is being fitted to the first few Comet aircraft. D.M.E. will provide navigational facilities for the aircraft on their proving trials on the route to the Middle East.

The report was adopted.

HARMONY GOLD MINING COMPANY

PROGRESS IN SHAFT SINKING PROGRAMME

PROPOSED INCREASE OF CAPITAL

MR G. V. R. RICHDALE ON THE NEED FOR FURTHER FINANCE

The first annual general meeting of shareholders of Harmony Gold Mining Company Limited was held in Johannesburg on November 2, 1951.

Mr G. V. R. Richdale, chairman, presided, and said: "First I will deal with the progress which has been made in the shaft sinking programme. The rate of sinking is, of course, largely dependent upon the prevalence and characteristics of the water-bearing fissures encountered in the shafts. During the eleven months from August, 1950, when sinking commenced, to June 30th, last, the average footage sunk each month was 118 in No. 3 Shaft and 160 in the ventilation shaft. Much of this shaft sinking took place in extremely difficult ground, and a large proportion of the total time was taken up in sealing the water fissures by cementation. Since June 30th, 781 feet have been sunk in No. 3 Shaft and 875 feet in the ventilation shaft, bringing the total depths at yesterday, November 1st, to 2,141 feet and 2,704 feet respectively. During this period the average footage sunk per month of 195 feet for No. 3 Shaft and 219 feet for the ventilation shaft shows an encouraging improvement on the figures I have just quoted for the earlier period. This is due to the fact that the time spent on cementation was appreciably reduced. Both shafts have passed out of the heavily fissured water-bearing Ventersdorp upper sediments which necessitated prolonged cementation operations, but we must expect that progress will meet with further delays from time to time. No. 3 Shaft is in lava and has approximately 2,679 feet to go to the Basal Reef horizon, while the ventilation shaft, which has passed through the lavas and is now sinking in the quartzites, is approximately 1,476 feet from the reef.

On the basis of the current rate of sinking, it is possible that the ventilation shaft may reach the Basal Reef horizon about June, 1952, and No. 3 Shaft early in 1953. This being the case, it may be possible to commence milling at an initial rate of 40,000 tons a month towards the end of 1954. There are, however, many unknown factors for which allowance must be made when calculating these dates and you must understand that I give them with considerable reserve, merely as a general indication of what may be hoped for if conditions are favourable.

WELFARE OF THE STAFF

Every effort is being made to provide a high standard of accommodation for our employees. On the mine property 60 houses for European personnel have been built and are occupied, while 18 of the first 30 houses in the Harmony suburb of the proposed township have been completed. Recreational facilities will be adequate and the whole property is being laid out in a most attractive manner. To this end, some 10,000 trees have been planted, four tennis courts have been constructed, while a swimming pool, a bowling green and a rugby field should be completed shortly. Plans for building a recreation hall are being prepared. The layout of Virginia township, which is to be administered by the Virginia Land and Estate Company Limited, of which your company is a shareholder, has likewise been planned with the greatest care.

The consulting engineer's report contains details of the exploratory drilling programme carried out on your company's property and in areas adjacent to it. Since that report was compiled, the results have been announced by New Consolidated Free State Exploration Company Limited of three further boreholes —LR5, LR6 and LR7—on the Farm La Riviera No. 289, immediately to the north of the Harmony lease area. They are indicated on the map which accompanied the report and I wish to comment briefly on their implications as far as the Harmony mine is concerned. Owing to lack of drilling on these neighbouring farms and the absence of the Basal Reef in Borehole RU1 in the extreme north-eastern corner of the Harmony property, it was originally difficult to make any close assessment of the potentialities of this portion of the lease area. Indeed, the results of Boreholes LR3, which intersected the Basal Reef with low values, and of RU1 led our technical advisers to assume that the north-eastern limit of the Basal Reef on Harmony probably occurred somewhere between these two holes. Boreholes LR5, 6 and 7, however, all of which gave good values, indicate that the limit of the Basal Reef may be farther to the east than was originally assumed. The rich ore now proved to exist to the north of our boundary further strengthens the confidence held by your board in the future success of the Harmony mine.

FINANCE

I now come to the question of financing the operations of your company, which was registered in August, 1950, with a nominal capital of £5,000. The authorised capital was increased in October, 1950, to £3,000,000, of which £2,000,000 in 8,000,000 shares of 5s. each has been issued, leaving 4,000,000 shares in reserve. The expenditure incurred by Union Free State Coal and Gold Mines Limited in opening up the Harmony property, together with interest thereon, was refunded to that company from the proceeds of this issue and operations were then financed by temporary loan facilities of up to £1,000,000, which were granted by two associated companies—Union Free State Coal and Gold Mines Limited and Central Mining Free State Areas Limited—at an interest rate of 5 per cent. This amount was the maximum which in terms of the articles of association your directors were empowered to borrow without the approval of the company in a general meeting.

A FURTHER ISSUE OF SHARES

An extraordinary general meeting was therefore held in June this year at which the borrowing powers were increased to £2,000,000. Additional loan facilities of £850,000 were then obtained from the Central Mining and Investment Corporation Limited and Union Free State Coal and Gold Mines Limited. The balance sheet shows that at June 30th, the loan accounts stood at £744,000 and accrued interest amounted to £8,843. A further amount of £438,000 has been borrowed since then, which brings the total borrowings to date to £1,182,000. The unexercised loan facilities therefore amount to £668,000, and it is estimated that this sum will be sufficient to meet expenditure until March next year when it will be necessary to obtain fresh funds to enable your company to repay these loans and to finance the continued development of the property. Your board has decided to raise these funds by means of a further issue of shares and, with this object, seeks your approval to increase the authorised capital by a nominal amount of £750,000 to £3,750,000 by the creation of 3,000,000 new shares of 5s. each. You will also be asked to authorise the directors to offer to shareholders of the company, at a price to be decided by the board nearer the date of issue, as many shares up to a maximum of 6,800,000 as may be necessary to raise approximately £5,000,000. You will no doubt be interested to know that the official consent of the U.K. Treasury to the proposed issue of shares in the United Kingdom was received a few days ago. After repayment of the loans this issue will leave your company with a little more than £3,000,000 fresh capital with which to continue work on the property.

The cost of opening up, developing and eventually bringing to production a large mine such as Harmony is very considerable, particularly at the present time when the general cost structure has reached an unprecedentedly high level.

NEW APPROACH TO PROBLEMS

The provision of adequate communications, power and water facilities, and housing for European and native employees in a relatively undeveloped area necessitates the expenditure of great sums far in excess of anything ever required for mining enterprises undertaken in the old days of the Rand. An entirely new approach must be made to problems that appear superficially to be familiar, and old and proved methods must be adapted to new techniques. Shareholders must remember, however, that if the sums required for this purpose seem alarming in their magnitude, the prospective rewards is nevertheless commensurate. There is good reason to hope that the Harmony mine will be one of the best in the Orange Free State goldfield and that the capital which must be raised to bring it to production will in due course pay well-deserved dividends to those who have had the courage to provide it. There are too many variable factors to be taken into account for me to be able to predict with any degree of accuracy what the total cost of bringing the mine to production will be. The £3,000,000 remaining, after repayment of loans, from the fresh capital to be raised early next year should be sufficient to provide for early development at the ventilation shaft to carry the sinking of No. 3 Shaft nearly to completion and to make substantial progress with the construction of a reduction plant of 40,000 tons initial monthly capacity. Shareholders must expect to be called upon during 1953 to consider a further proposal for the raising of a third and final tranche of capital required to carry the mine to production some time, it is hoped, before the end of 1954. When this call is made, shareholders should be in possession of reef development results at the ventilation shaft which promise to be of great significance in the closer assessment of mining possibilities. You should, moreover, find satisfaction in the knowledge that the Central Mining and Investment Corporation Limited, which, by virtue of its direct shareholding in your company and by its indirect interest through other companies of the Central Mining Rand Mines group, holds

oil resources and therefore of relations with the Arab States. The President's thesis suited Mr McDonald's emotional attitude to the sufferings of Jewry, and he worked directly with the President. Once, he even ran the risk of Israeli censorship in order to send a message by the safe hand of an American business man. He never sees that there were two sides to such a situation, and that he might have influenced policy the better by working through the State Department instead of against it. His method of diplomacy is seen at its zenith over the internationalisation of Jerusalem. He was instructed to deliver a stiff note about Israel's failure to observe the UN resolution on this subject. He did so, but delivered also a personal postscript. "We have been through too many things together," he records himself as saying to Messrs Ben Gurion and Sharett, "There is no need for me to offer any comment."

Mr McDonald invites censure. What is one to think of an ambassador who tattles out recent personal comments on policy uttered by fellow civil servants, and who reveals the proceedings of a secret conference not yet two years old? Mr McDonald is often observant but he is also naïve, and is seldom minded to draw from his observations any conclusions that run counter to his own prejudices and emotions. He portrays character well—and especially the character of his daughter, who was his hostess. Whether answering the doorbell, chasing a turkey for Thanksgiving, or fetching her knitting before going to the air raid shelter, she makes contact with earth whenever she appears.

Passionate Propaganda

Irish Nationalism and British Democracy. By E. Strauss. *Methuen.* 307 pages. 21s.

The author's purpose is to demonstrate that the relations between Ireland and England are a microcosm of colonial rule and exploitation, and the inevitable reaction of subject people towards nationalism. His book suffers from the inherent disability that its matter must be constrained to a formula rather than expanded into a discussion. Those who agree that the two great wars were fought for English world power; that Union was deliberately designed for the sacrifice of Ireland's interests; and that the material exploitation of the Irish masses by the English Whigs is comparable to peasant oppression in Tzarist Russia, will doubtless be stimulated by the brilliant venom of Mr Strauss's attack. The objectively minded will be driven to question and verify many sweeping generalisations, to the benefit of their own general knowledge.

Such readers will ask if the chronic breach between the radical Irish middle class and the revolutionary masses was always the inevitable result of Ireland's colonial position and never caused by the political chicanery of O'Connell or Parnell; if the machinations of Dublin Castle were not in part due to an indigenous lack of effective public opinion against jobbery; and if the Irish growers' desire to retain the English market was not partly responsible for the export of corn during the famine. Similarly, while admitting the influence of the Irish question on the policy of British prime ministers, they will deprecate the suggestion that it was paramount; and the claim that the example of Irish immigrants in the Chartist struggle was responsible for later socialist development in England will also be received cautiously.

Ireland suffered the dilemma of all debtor countries—that of repayment in a form that does not prejudice the mercantile interests of its creditors. The Union which appeared as a demonstration of tyranny was a political and strategic necessity to a British Government menaced by Napoleonic invasion. Neither the British Government nor the Irish landlords could be held responsible for the increase of population beyond the limit of economic safety; the subsequent emigration, which is here played up as a demonstration of hatred against English oppression and mismanagement, was also largely due to an act of God and to human cupidity—the potato famine and the Californian gold rush.

Mr. Strauss's passionate simplifications are a valuable counter-irritant to complacency, for external use only. It would be a pity if any enthusiast should swallow them whole.

Law and Politics

The Rational Strength of English Law. By F. H. Lawson. *Stevens.* 147 pages. 10s.

The Hamlyn Trust originates from the will of Miss Hamlyn, of Torquay, and, as now regulated, exists to further, by lectures or otherwise, the knowledge of comparative jurisprudence so that "the Common People . . . may realise the privileges which in law and custom they enjoy in comparison with other European People." The words are worth quoting because they describe so well what this book—the third in the series of lectures arranged by the trust—does.

Professor Lawson gave four lectures and a final summary. The first deals with the sources and general character of the law, the origins of the common law, its spreading over the Anglo-Saxon world and some of the separate characteristics of its progeny. The remaining three lectures deal with the three main heads of law, contract, property and tort. Each is a comparative study of the English law, not always to its advantage. Professor Lawson prefers the law of contract in Scotland to that of this country, for example. It is possible to regret that he has not had a little more to say, either in support or blame, of the agencies, such as the law reform committees, which are repairing piecemeal what are thought to be existing defects. But to leave comment there would be to convey nothing of the book's delight, nor of its value to anyone with a political sense. It has the quality of detachment which comes only from complete understanding. It has a wonderful sharpness of vision: "Sometimes, however, it seems better to leave the crucial question to a jury . . . because the balancing of interests . . . is felt to be too difficult to be performed by a judge who has to explain his reasons." It also contains these sentences: "English lawyers have never belonged to an intelligentsia. Somehow or other something of an aristocratic character has been communicated to the law itself. It is often brilliantly adventurous; it is often shabby and a little decrepit; it is usually canny, after the manner of those who are used to governing men; it is hardly ever concerned to be fashionable." That, perhaps, sums up its challenge to the political sense, for, today, this country is not a country of aristocrats. It is a country of administrators, accountants and civil servants. Will they lose more than they will strengthen of the structure they have received? Will the hundred and third Hamlyn lecturer still be able to say: "English law is therefore not only rational but strong"? For the Common People owe their freedoms more to the strength of the law than to the skills of the administrators.

A Nineteenth Century Destiny

A. J. Mundella, 1825-97. The Liberal Background to the Labour Movement. By W. H. G. Armytage. *Ernest Benn.* 386 pages. 30s.

A. J. Mundella was a Victorian worthy and a Liberal Cabinet Minister. The son of an Italian immigrant, he became a prosperous Midland manufacturer and developed at the same time advanced ideas about conciliation and mediation in industrial disputes. He was hard-working, high-minded and progressive; he seems to have lacked the narrower Victorian virtues, which appear so unattractive to a later age; but if he had a sense of humour, it was not (or so this biography suggests) allowed to intrude into his public life. Besides his pioneer work in industrial conciliation, Mundella was a fervent believer in the education of the masses and presided for a time over the department of the Privy Council which then had control of this subject. He was twice President of the Board of Trade and has a place in the history of the origins of the Ministries of Agriculture and of Labour. Within the Liberal Party he occupied a middle position and was a devoted follower of Gladstone. He was a Member of Parliament for Sheffield for nearly thirty years.

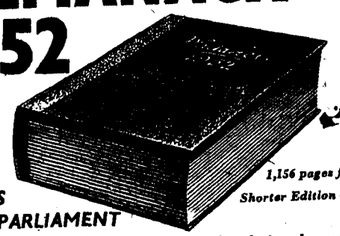
Mr Armytage's biography is therefore concerned with a man who had influence in his own day, though fame in a later age has been denied to him. Mr Armytage has been able to use much new material, including the long correspondence between Mundella and his friend and supporter, Robert Leader, editor of the *Sheffield Independent*. The result is a careful, interesting and useful addition to the political and social history of England in the second half of the nineteenth century, but Mundella's career and interests lay in the less glamorous quarters of public life and his biographer is therefore not provided with much scope for entertainment.

READY SHORTLY FOR 1952

BY APPOINTMENT SUPPLIERS OF DIRECTORIES TO H.M. THE KING

THE
POST OFFICE LONDON DIRECTORY
(153rd Annual Edition) (Price £5. 0. 0)

The most comprehensive, concise and up-to-date information on the Metropolis available.



COMPLETE in a Single Volume
an **ENTIRELY NEW** Sectional Street Plan, on a scale of **4" to a mile**, with a specially enlarged **CENTRAL LONDON** Section on a scale of **6" to a mile**, the whole fully indexed, accompanies each copy in a separate case.

Indispensable in modern business for:

(a) checking on enquiries
(b) planning deliveries
(c) revising records and mailing lists
(d) contacting those engaged in any business or profession
(e) tracing fresh sources of supply
(f) issuing tenders
(g) opening-up new sales channels
(h) devising well-directed postal and personal campaigns and publicity

BARNEYS may lead you to the true, deep, lasting friendship of the pipe—one of life's simplest, yet greatest, joys.

Gillingham Kent.

"I feel I must write you a few lines in appreciation of Barneys Tobacco. I have been trying to smoke a pipe for years, but after a few days have had to give in. Then I had the good fortune to strike Barneys. It is splendid, and the flavour is much better. I have already recommended it to two of my friends—both pipe smokers of long standing—who are as enthusiastic about it as I am."

The original letter can be inspected at, and further enquiries addressed to, Barneys Sales Bureau, 24, Holborn, London, E.C.1.

Smokers abroad can arrange for regular personal despatches, Ex-Bond and British Duty Free, in 2-lb. parcels, to many lands, but not as yet to all.

(325)

THIS AUTOMATIC SECRETARY
Takes care of Your Detail and Cuts Your Work

NO OTHER means will do more to ease your work and free you from petty details and many minor matters.

For this "Desk Secretary" is a complete desk organiser. It keeps in orderly form and helps you to deal swiftly and systematically with all your papers and correspondence, and automatically reminds you of all commitments and matters to be attended to.

Comprises a brown leatherette-grained container with hinged lid and front giving easy access to its contents. Inside are three classified sections: first the complete alphabetical section, then sections for your daily follow-up, followed by sections for your monthly follow-up. Supplied in foolscap size 14 in. x 10 in. x 3 in. only.

This Almost Human Device

Shows you all letters or papers requiring attention each day; Insures correspondence answered on correct day; Looks after matters pending and brings them continually to your notice until finally dealt with; Prevents loss of all important papers; Keeps your desk clear of litter with all your papers systematically filed.

Supplies Limited - Order To-day

When the present small stocks are exhausted, it may not be possible to obtain replenishments. So make sure of securing your requirements whilst they are available, and POST THE COUPON NOW.
