Ordinary dividends	313,510	340,230
Ordinary dividends (per cent.)	20	22½
Added to group revenue reserves and carry forward	351,414	307,144
Cons. Balance Sheet Analysis:—		
Fixed assets, *less* depreciation	2,483,056	2,385,449
Net current assets	10,828,024	11,552,177
Debtors	8,211,924	10,297,554
Cash	3,192,694	4,037,960
Reserves	9,809,193	10,338,234
Ordinary capital	2,850,094	2,850,094

£1 ordinary stock at 93s. 10½d. yields £4 16s. per cent on 22½ per cent. dividend.

The expansion of trade and higher prices, particularly in the oil section, have led to a substantial increase in current assets and liabilities; debtors, for example, have risen from £8,211,924 to £10,297,554. At the same time, the transfer of £506,040 to revenue reserves has contributed to the rise in cash from £3,192,694 to £4,037,960. A large part of this increase, however, will be needed to finance further capital developments; outstanding capital commitments are estimated at £909,817. The company's tug and barge building programme is nearly completed; and given an improvement in Persia and South Africa the company should continue to make steady progress. The raising of the ordinary dividend augured well for the future, but dividend control would peg the return on equity capital to 21½ per cent.

Statistical Summary

EXCHEQUER RETURNS

For the week ended July 28, 1951, total ordinary revenue was £84,078,000, against ordinary expenditure of £58,702,000 and issues to sinking funds nil. Thus, including sinking fund allocations of £3,918,000, the surplus accrued since April 1, 1951, is £55,862,000 compared with a surplus of £75,475,000 for the corresponding period of the previous year.

COMPANY MEETINGS

THE STANDARD BANK OF SOUTH AFRICA LIMITED

LARGER PROFIT

MR M. F. BERRY'S STATEMENT

The one hundred and thirty-eighth ordinary meeting (being the annual general meeting for the year 1951) of The Standard Bank of South Africa Limited was held on July 25th in London, Mr M. F. Berry, the chairman, presiding.

The following are extracts from his statement circulated with the report and accounts for the year to March 31, 1951: —

You will observe from the balance sheet that compared with last year the principal changes on the assets side are increases in the totals of "bills of exchange purchased" and "advances." These increases amount to £12 million and £18½ million respectively. The larger figure of bills of exchange being handled by the bank is a reflection of the increased movement of goods following the gradual relaxation of import control and the steadily rising price level which started with devaluation and has been further extended since the commencement of hostilities in Korea and rearmament in Europe and America.

Importers who foresaw the likelihood of shortages resulting from the diversion of manufacturing energy into rearmament in the countries from whom they have hitherto received their supplies of manufactured goods have accepted the opportunity to improve the position of their stocks.

INCREASE IN ADVANCES

The larger total of advances arises from the same causes, although in this case, where finance is required pending their realisation, the rising price of raw materials exported by the countries of Southern Africa has had an important effect.

Turning to the liabilities side of the balance sheet, the principal change of note is the increase in "current deposit and other accounts." This now amounts to £272 million—that is to say, £40 million more than last year. So far as the Union of South Africa is concerned, this movement is principally attributable to the exceptionally high prices which have been ruling for wool during the last season and the flow of capital funds from overseas: in the case of Southern Rhodesia it is a reflection of the expanding industries and the inflow of immigrants' capital.

DIVIDEND AND BONUS

Turning now to the profit and loss account you will note that after providing for taxation, and after making a transfer to the credit of reserve for contingencies, out of which reserve provision has been made for any diminution in the value of assets, the profit amounted to £809,224—that is to say, £48,532 greater than last year. Adding the balance of £178,524 brought forward, there is a total of £987,748 to be dealt with. Out of this sum an interim dividend of 7s. per share was paid on January 27, 1951.

From the balance remaining, £891,498, the appropriation to bank premises of £150,000 is repeated, leaving available for allocation £741,498. It is recommended that an amount of £400,000 should be allocated to the officers' pension fund and that a final dividend of 9s. per share, together with a bonus of 4s. per share, be paid, leaving a sum of £170,873 to be carried forward to next year's accounts. The dividend and bonus now recommended will amount to a total of £325,000 gross, and after deduction of income tax will appear in the accounts at £118,125 and £52,500, respectively.

The affairs of our wholly owned subsidiary, the Standard Bank Finance and Development Corporation, Limited have been conducted with satisfactory results during the year under review and a net profit of £9,436 has been realised.

FAVOURABLE CHANGE IN UNION'S ECONOMY

The most important feature of the economy of the Union of South Africa last year was the great change which took place in its balance of payments. From a deficit in the year 1949 a considerable surplus of receipts over payments was achieved. In large measure this favourable result was due to the high prices obtained for exports from the Union, notably wool and base metals.

DEVELOPMENT OF RESOURCES

The past year has seen considerable further capital development of the Union's resources. It should be appreciated that when conditions elsewhere are more settled and when perhaps the internal price level is lowered, this development will depend more than it does at present on high standards of efficiency and productivity. The effect of economic factors has been reflected in an increase in the quantity of money in circulation. Rising prices tended to subdue the demand for luxury goods, but the trading volume was well sustained by an expanding demand for essential goods backed by steadily rising levels of employment and earnings. Demand has also been stimulated by the expectation of shortages and of further price increases. Retail trade was not handicapped to any important extent by shortages of stock, but it is significant that local products represent a substantially increased proportion of the goods now available in the Union.

The expansion in manufacturing industries, particularly in engineering, electrical and textile goods, has been maintained but most sections of secondary industry are experiencing difficulty in securing sufficient supplies of raw materials.

MINING AND FARMING

Conditions in the gold mining industry did not remain as favourable throughout the year as they were immediately following devaluation. The industry continued to be handicapped by shortages of European and native labour which are likely to be intensified by the increasing demands of the Orange Free State goldfields, and, more recently, supplies of electrical power had to be curtailed. Costs have risen. The sales of diamonds last year exceeded the previous record and the strength of the markets was fully maintained, the demand for gem stones being particularly keen.

Favourable conditions existed for the farming industry and farmers' incomes, particularly those in the wool industry, showed a substantial rise. The sharp rise in wool values continued until the early months of this year and practically all that was offered in the auctions was sold. Towards the end of March, however, competition weakened as a result of the withdrawal of American buyers and uncertainty concerning their future buying policy. The check to the buoyancy of the wool market occurred, however, when most of the clip had been sold.

The report and accounts were adopted.

LONDON COUNTY FREEHOLD AND LEASEHOLD PROPERTIES

MR THOMAS J. CULLEN ON RENT CONTROL

The forty-first annual general meeting of the London County Freehold and Leasehold Properties Limited, was held on July 30th in London.

Mr Thomas J. Cullen (chairman and managing director), in the course of his speech, said:

It is heartening to see that notwithstanding the continuous increases in all outgoings, and with rents of controlled properties still pegged at the 1939 level, some slight improvement has been made in our net revenue balance.

Other countries, where there is a similar shortage of house accommodation by reason of the cessation of building during the war and war damage, have dealt with rent control in varying degrees, and have endeavoured to see that the permitted increase in rents does not lag too far behind the increased cost of repairs. Why have our Government been unable to deal with this important matter? It is in the national interest that every member of the community should be adequately housed by modern standards, and nothing militates against this more than rigid control of rents on an uneconomic basis.

The completion of practically all war damage rebuilding will bring a substantially increased gross income in the ensuing year. There will, of necessity, be some further increases in expenses, but, before the increase of 20 per cent. tax on distributed profits, we looked for quite a substantial increase in net income. Now I fear that this iniquitous tax will absorb almost the whole of the estimated increase.

The report was adopted.

A. C. COSSOR LIMITED

GREATLY INCREASED PROFIT

The thirteenth annual general meeting of A. C. Cossor Limited, was held on July 26th in London, the Rt. Hon. Lord Burghley, K.C.M.G., LL.D., the chairman, presiding.

The following are extracts from his circulated statement:

On this occasion I can lay before you the accounts to March 31, 1951, without apologies or reservations. Here you have the realisation of four years of hard work and careful planning, in the form of a trading profit which is, with the exception of the peak war year of 1945, the largest your company has ever made.

The company's net trading profit, after providing for all charges, amounted to £321,117, as compared with £114,659 last year.

For the group as a whole the net result is a profit of £164,657, as compared with last year's figure of £99,370. All of our subsidiary companies made profits for the year.

The radio and television division had a very satisfactory year.

The volume of our television sales approximately equalled that of our radio sales, and both were greatly in excess of those for the previous year.

The instrument department made steady progress.

Our marine radar business had a somewhat disappointing year. We have had at all times more orders on our books than we could fulfil, but we have been working on the introduction of a new model, and this has caused delays in our production programme.

As to prospects, we have a healthy order book, and we have made careful plans of the same kind as we have made in the past; with that we must rest content and see what the current year will bring forth.

The report was adopted.

THE BRITISH PLASTER BOARD, LIMITED

SUBSTANTIALLY INCREASED TURNOVER

WITHDRAWAL FROM VOLUNTARY PRICE AGREEMENT

UNFAIR MINISTRY REQUEST

LORD BELPER ON EFFORTS TO SECURE JUSTICE

The thirty-fourth annual general meeting of The British Plaster Board, Limited, was held on July 26th at 20, St. James's Square, London, S.W.1.

The Right Hon. Lord Belper, P.C., D.L., J.P., the chairman, presided.

The following is the chairman's statement which had been circulated with the report and accounts for the year ended March 31, 1951:—

Mr L. Biggs and Mr H. N. Butler have been invited to join the board of directors. Mr Biggs is a director and general manager of our subsidiary, The Gypsum Mines, Limited. Mr Butler is a partner in a leading firm of chartered accountants, and has been closely associated with our work for several years. You will be asked to confirm the election of these two gentlemen to our board. Their wide experience will be of great value to our group.

BALANCE SHEET

In my previous statement, I indicated that your board favoured a revaluation of the company's assets, and steps have been taken to accumulate information to guide us in assessing the up-to-date values involved. In the light of the widening acceptance by industry of this principle, your board propose to carry through such revaluation during the course of the current year.

In the meantime, you will observe that an appropriation has been made to a central obsolescence and replacement reserve as a first step in bringing the funds available for the eventual replacement of assets into line with the realities of the situation. In preparing the accounts for the coming year, detailed estimates will be made, as indicated, in order to arrive at the probable replacement costs so far as they can be judged at present, and the life of the assets will also be calculated as closely as possible. If circumstances permit it is then the intention of your board, in future, to write off from the profit and loss account a sum equal to the estimated income-tax wear and tear allowances, plus an additional sum to bring the total provisions up to the amount necessary to allow for replacement in due course. Meanwhile, the amount of £75,000, which has been transferred to the central obsolescence and replacement reserve, is not to be taken as indicative of the additional annual sum which will be required, but simply as a general provision.

You will note that the central obsolescence and replacement reserve account also includes an amount of £55,764. This is the result of the sale of certain assets—mainly the factory buildings at Wallasey which were no longer required—in terms of the post-war £, the assets having been bought mainly prewar. It will be obvious that this figure represents a depreciation in sterling and not a true profit on realisation.

The increase in the value of the shares noted under the heading "associated company" is due to the purchase of an additional holding in Gypsum Industries, Limited, of South Africa, following the agreement reached at the time of the amalgamation, to which I referred a year ago. You will be pleased to learn that the South African company is now making good profits and that the whole of the loans have been repaid, including the £40,000 which was still outstanding at the date of the balance sheet now under review.

TURNOVER

Turnover has been increased substantially during the year but there is ample surplus capacity in the mines, mills and factories to cope with further demands. The output from the plasterboard factories would have been larger had paper been available in sufficient quantity.

NEW DEVELOPMENTS

Recently, you will have read of the national shortage of sulphuric acid, due to the difficulties of sulphur supplies, and you will be interested to know that we are in negotiation for the supply of large quantities of anhydrite, of which we own big deposits, for the manufacture of this vital chemical.

Since the close of our financial year, negotiations have been successfully concluded with Messrs William Ross and Sons, Limited, Montrose Avenue, Hillington, Glasgow, for the purchase of their valve manufacturing business. Your directors feel that this business can be allied to your die stampings and steel drop forgings manufacture, for the benefit of both.

Our stampings factory is unfortunately short of raw material, and we are faced with a similar difficulty in the forgings concern.

PERSONNEL RELATIONS

Your company continues to enjoy amicable relationships with all the trade unions concerned and agreements have been readily negotiated during the year yielding improved standards for our work people.

In many ways the past year has been a difficult one for your company and its personnel, so that it gives me added pleasure on your behalf yet again to extend to all appreciation of their good work, continued effort and loyal service.

PRICES

You will doubtless have read in the press that three of the more important products of our group have been made the subject of Statutory Orders, namely, gypsum rock, gypsum building plasters and plasterboard. The Orders were made, according to the Ministry of Works press announcement, "owing to the withdrawal of the companies in the British Plaster Board Group from the previous agreement not to raise prices without the Minister's consent."

I take this opportunity to emphasise that the long-standing voluntary agreement with the Government on plasterboard prices had included the all-important practice of setting a price for the industry as a whole. Recently, the Ministry sought to change this practice and demanded that our group should sell plasterboard at prices below those permitted to the rest of the industry.

In the case of building plaster, the Ministry insisted that we accept a lower profit return than had previously been allowed by them as appropriate.

Your directors had maintained over a long period that the prices set were unreasonably low and failed to allow sufficient margin for the making of adequate reserves and the payment of reasonable dividends. It had been hoped that the successful completion of the very large extensions we had undertaken, and the economies resulting therefrom, would have created a situation in which our moderate objectives, by way of dividends and reserves, could be attained.

In the first half of the financial year under review we were in fact enabled to earn profits at a more satisfactory rate. In the second half of the year insufficient paper supplies to cope with increased demands for plasterboard and the large increases in cost of materials and services, outside our control, coupled with the failure to secure Ministry agreement to adequate selling prices, have not only wiped out the additional profits earned in the first half year, but, as you will note from the accounts, have resulted in an overall decrease for the year, in comparison with the previous period. Faced with this deteriorating situation, the request by the Ministry that we sell plasterboard at prices below those set for our competitors and reduce our return on plasters, could not be accepted voluntarily. We therefore gave requisite notice to the Ministry of withdrawal from the voluntary agreements covering plaster and plasterboard, but not that covering gypsum rock, with consequences of which you are aware.

Meanwhile, in the interest of the stockholders, as well as that of the whole of our personnel, it is vital that the justice of our particular case should be recognised without delay. We are taking all possible steps to secure this objective, and I propose to make a further statement on the subject on the occasion of the annual general meeting on July 26th.

DIVIDEND

A year ago I remarked, in effect, that even to maintain the value of the return being received by our stockholders an increase in the dividend was necessary, and I have already referred earlier in this statement to the group's postwar achievements which, in turn, merit an improvement in the rate. In any case, it must be recognised that the dividends which have been paid by this company in the past have been modest when considered in the light of the real capital invested.

In view, however, of the circumstances which I have just described, you will, I am sure, readily understand why the directors do not, on this occasion, feel justified in recommending any increase in the annual rate of dividend, which at one time seemed possible. It is, therefore, proposed to pay a final dividend of 9¼ per cent., which, with the interim of 7½ per cent., will maintain the distribution for the whole year at 16¾ per cent., the effective rate which has been in force for many years.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting the chairman said: In my statement dated July 3rd, which was issued with our published balance sheet and accounts, I engaged to make a further statement at today's meeting in connection with the restrictions on our prices imposed by the Government. I had, naturally, hoped that our difficulties over prices would by now have been resolved and, indeed, it appeared at one time that we would be left free to set reasonable prices for our own products. Contrary to inferences during the debate in the House of Commons on July 5th, it is common knowledge to those who have followed the history of this group, and would be immediately apparent to anyone taking the short time necessary to study our records, that our invariable policy has been to set low prices, and that this policy has, in the past, yielded considerable benefit to the consumer, to the company's personnel and to shareholders alike.

The Government has decided to reimpose statutory control of the prices of gypsum, building plasters and plasterboard; this has been done in spite of the rejection of one of the Orders by a majority of sixteen in the House of Commons and the rejection of the other two without a vote. Apart from restricting our potential earnings on the risk capital employed to unfairly low levels, this decision has brought into prominence the need for action on a national scale over two matters of importance to our British way of life, namely, a right of appeal against dictatorial decisions made under the Defence Regulations and the achievement of a higher standard of living.

Presumably, as members of a democratic society, we should put the highest value of all upon the liberty of the individual within a framework of law, which must surely be the same for all, recognising that no one man or group of men should have dictatorial rights overriding any rights of appeal. This conception of democracy appears to be denied, so far as industry is concerned and of which our group is an example, by the present actions of the Government.

It is also vitally important that the standard of living of the community shall be as high as possible. To attain a high standard of living, it is surely essential that the best efforts of every member of the community should be encouraged and that a government which sets itself the objective of an improvement in the standards of the community, should direct its main endeavours to the elimination of waste and the encouragement of efficiency. The Government's present actions are in direct opposition to the attainment of such laudable objectives.

I trust that everyone, who can be made aware of this situation, will use such influence as he has, to rectify the trend which is apparent in the three Statutory Orders imposed upon this group.

The report and accounts were adopted, and the other formal business having been duly transacted the proceedings terminated with a vote of thanks to the chairman, directors and staff.

COLTHROP BOARD AND PAPER MILLS LIMITED

RECORD OUTPUT AND PROFIT

MR FRANK W. J. SMITH'S STATEMENT

The thirty-third annual general meeting of Colthrop Board and Paper Mills Limited, was held on July 26th at the registered office of the company, Thatcham, Berks, Mr Frank W. J. Smith (chairman and managing director) presiding.

The following is the chairman's statement which was circulated with the annual report and accounts for the year ended May 31, 1951:

Before dealing with the results of the past year, I should like to take the opportunity of paying a tribute to the memory of the late Mr J. M. Henry, J.P., who passed away in August last. Mr Henry had been associated with me as a joint managing director since the incorporation of the company in the year 1918. The devoted services which he gave so freely in furthering the interests of the company will always be remembered. He was a man of sterling character, and the directors and all who are associated with the company deeply regret his passing.

As you will have seen from the directors' report on page 3, the profit for the year, subject to taxation, amounts to £492,800, which is a record in the history of the company. We are now reaping the benefit of the new plant installed since the end of the war and financed out of profits. The result is that the company has produced a greater tonnage of board and paper than in any previous year. Taxation takes a proportionately greater toll than ever at £287,342, or 58 per cent. of the profit, but after adding the amount brought forward from last year and deducting the preference dividend for the ten months to the date of redemption, March 31st, there remains a balance of £243,874.

DIVIDEND RAISED TO 25 PER CENT.

The directors propose to recommend the payment of a dividend of 25 per cent., against 15 per cent. for last year, to transfer £131,572 to general reserve, to transfer £30,000 to reserve for possible loss on wood pulp contracts and to carry forward £41,364.

On March 31st the company redeemed out of accumulated profits the whole of the outstanding 143,619 5 per cent. cumulative redeemable preference shares of £1 each at par, together with a premium of 2s. 6d. per share as provided by the articles of association, at a total cost of £161,572, which amount has been charged against the amount standing to the credit of the revenue reserves and undistributed profit. In compliance with the provisions of the Companies Act, 1948, the sum of £149,548 being the total nominal amount of the preference shares redeemed during the year has been credited to the capital redemption reserve, thereby increasing the same from £50,452 to £200,000. After making the necessary adjustments the general reserve will amount to the sum of £100,000.

The issued share capital of the company now consists entirely of ordinary shares, without prior charges of any description. There will no longer be the necessity, as formerly, to provide for the dividend on the preference shares nor the cost of the annual redemption of such shares.

STRONG CASH POSITION

During the year the company has bought and paid for the stock of wood pulp previously held for us by the Government, and has also financed the purchase of further stocks of wood pulp during a period of rapidly rising prices. In spite of this, the cash position, including tax reserve certificates which are equivalent to cash, is stronger at £283,133 than last year when it stood at £230,844, and the total current assets at the end of the year stand at £939,370 compared with current liabilities and provisions of £517,031.

I mentioned above that the directors propose to transfer £30,000 to a new account, "Reserve for possible loss on woodpulp contracts." We have to place contracts at present-day prices for future delivery of wood pulp, and in the possible event of a fall in prices this reserve will help to soften the effect. In addition to this, in order to minimise the consequence of a possible fall in the value of our present stock of raw materials, we have taken in the stock at approximately £110,000 less than present-day prices.

We have not considered it necessary this year to add to the reserve for replacements nor to the provision for doubtful debts, having regard to the large sum transferred to general reserve out of the year's profit.

THE OUTLOOK

As usual I shall not attempt to prophesy the course of business, but we have a good plant, which has been written down far below present-day values. Our financial position is sound, and we have the goodwill of our suppliers and customers. So far as we can reasonably foresee, therefore, we can confidently look forward to whatever the future may bring.

Finally, my thanks are due to my colleagues on the board, and to the staff and employees for all that they have done to provide such satisfactory results as are shown by these accounts.

CHAIRMAN'S ADDITIONAL REMARKS

The chairman, addressing the meeting, said: Before commencing the business of the meeting I wish to refer to the late Mr J. M. Henry, who had been associated with the Colthrop Mills for so long. He was joint managing director of this company with me from its inception, and our association was always most cordial and happy. He attended the annual general meeting a year ago, but unfortunately passed away two weeks later. We all miss him very much indeed.

You have doubtless perused the report and accounts, which you will have noticed are in a new form this year, and which I hope will show the figures more clearly than previously.

I have mentioned a number of the more important points in the statement printed on the back of the report, but it is impossible to cover everything, and so I propose to pass at once to the resolution, and then I shall be very pleased to answer any questions you may wish to ask. I now propose:

"That the report of the directors and the accounts of the company for the year ended May 31, 1951, be and they are hereby approved and adopted; that a dividend of 25 per cent., less income-tax, be paid to shareholders registered at the date of this meeting, that £131,572 be transferred to general reserve, that £30,000 be transferred to reserve for possible loss on wood pulp contracts, and that £41,364, the balance of the profit and loss account, be carried forward."

Mr J. R. Henry, O.B.E. (joint assistant managing director), seconded the resolution, and it was carried unanimously.

The retiring directors (Mr Angus Marshall and Mr C. Priestley Forster) were re-elected and the fee of the auditors (Messrs. Deloitte Plender Griffiths and Company) was duly fixed.

TRIBUTE TO DIRECTORS AND STAFF

Mr F. E. Armstrong, in proposing a cordial vote of thanks to the chairman, directors and staff of the company, congratulated all concerned on the figures of the past year, which constituted a record in the history of the company. The present Government, he said, urged all companies to adopt a policy of moderation and restraint; were it not for the policy of moderation and restraint which had been ruthlessly adopted by the chairman and directors over a long period of years the company would not have been in a position to pay off its Preference capital out of its cash resources and to increase its dividend to shareholders, which, incidentally, was less than one-fifteenth of the gross trading profits, while the collector of taxes took seven times the amount distributed as dividend.

Mr Eric Davenport, in seconding the motion, spoke of the high standing of the company in the trade and the admirable financial strength shown by the balance-sheet.

The motion was carried unanimously, and after a brief acknowledgment by the chairman the proceedings terminated.

TRUST HOUSES LIMITED

REDUCED PROFIT IN SPITE OF RECORD TURNOVER

The forty-eighth annual general meeting of Trust Houses Limited was held on July 27th in London.

Captain A. R. S. Nutting, O.B.E., M.C., the chairman, in the course of his speech, said: Our profit for the year shows a decrease as compared with last year; this in spite of the fact that our turnover was the greatest in the history of the company. Our turnover continues to increase, but unfortunately costs are also mounting and I see no immediate likelihood of any fall.

We have acquired during the year under review the White Swan Hotel at Halifax and the issued capital of the Palace Hotel, Paignton. In addition we have purchased the freehold of the "Lattrell Arms" at Dunster and the Temple Bar Restaurant—both of which were previously held on lease.

I should also like to mention the very considerable extensions that we have made (and are still making) at the Randolph Hotel in Oxford. These alterations have cost a lot of money, and we feel that when they are all complete we shall have a hotel worthy of that great and unique city. Substantial structural improvements have also been carried out at a number of other houses.

We have continually represented to the Government that the purchase tax is having a crippling effect on the hotel industry and that if they want the industry to put its houses into good order relief must be given. It is our constant aim to keep our houses bright and cheerful and we believe that the gratifying volume of our trade is largely due to this policy, but the cost is really alarming, reflecting as it does not only constantly increasing prices but also the burden of purchase tax which increases proportionately with them.

REFRESHER COURSES

I would like to say something regarding what I may refer to as our managers' refresher courses which were inaugurated this last winter and ran during a period of approximately six months. Each course lasted a fortnight and all branches of the hotel industry were covered by means of short lectures and practical demonstrations. Those who attended these courses showed great enthusiasm and, I hope, gained some useful knowledge and help in their arduous work, for running a hotel today is indeed an arduous task and calls for knowledge, tact, and a lot of hard work.

You will not expect me to prophesy and I have no intention of trying to do so; all I can say is that we shall continue in our endeavours, firstly, to keep our standards as high as we possibly can; secondly, to maintain a price which our customers can afford, and thirdly, to extend a welcome to all those who visit our houses.

Your directors have followed with close attention the Government proposals with regard to licensed houses in the new towns. I am glad to tell you that at Crawley, where state management is to be applied, the advisory committee has recommended to the Home Secretary that the company's house, the George Hotel, be excluded from state control and remain in our hands. I am hopeful that in other places we may have the opportunity of proving in the new hotels which will require to be erected that disinterested management as practised by this company is the most suitable method and most to the advantage of the public.

The report was adopted.

THE BRITISH SOUTH AFRICA COMPANY

SIR DOUGAL O. MALCOLM ON DIVIDEND POLICY

The annual meeting of The British South Africa Company was held on July 26th in London.

Sir Dougal O. Malcolm, K.C.M.G. (the president), in the course of his speech, said:

Our profit at £1,460,742 is almost exactly the same as for the year before, just under £2,000 more. Apart from the ever-increasing burden of taxation, which is up by nearly £350,000, so close to those of the year before that I hardly think that you will want me to go through them in detail.

For the year under review we have thought it prudent to repeat the same dividend as we paid last year—namely, 33⅓ per cent., less income tax (paid as a first and final dividend), and we add, as last year, another sum of about a quarter of a million pounds to our unappropriated profits carried forward, which now amount to the impressive figure of just under £2,100,000.

Our renewed prosperity is, of course, again due in the main to the success of the Northern Rhodesian mining industry; in particular, the copper mining industry. The copper mines, and we along with them, would be doing even better still were it not for the difficulties connected with the supply of fuel for the mines.

I am satisfied that every possible step is being taken with the willing co-operation of all concerned to improve the position. Our general outlook remains excellent and certain important matters, including very large matters of policy, arise from it.

INTERIM PAYMENTS

In the first place, we agree that the time has now come when we can fairly contemplate meeting a desire that has been in the past often expressed by our stockholders for interim dividends of the ordinary kind, to be followed by final dividends at the end of our financial year. We are in hopes of being able to take this step in respect of our year now current. The life of our Northern Rhodesian mineral rights comes to an end on October 1, 1986. This is a long way, but not an infinitely long way, off; and this consideration points, in our mind, to a conservative dividend policy while the sun of prosperity shines upon us brightly as it does at the present time.

We think that, while pursuing what I have called a conservative dividend policy, we should set ourselves to build up out of profits while we still have our mineral rights a great body of long-term investment mainly in Southern Africa. For that, we consider, good opportunities exist for profitable investment, opportunities of which with our close association with Rhodesia and with such important groups as Anglo-American and Consolidated Gold Fields, we are in an excellent position to avail ourselves. I do not believe that the possibilities of future copper-mining enterprise in Northern Rhodesia are by any means exhausted, or, indeed, fully known yet. Energetic steps towards their further exploration are being taken at the present time, of course, with every encouragement from us. Nor certainly are the possibilities of the West Witwatersrand, and of the new Orange Free State goldfields yet fully known. We have already very important investments in these enterprises, and we should lose no chance that we can prudently take of adding to these investments, which are quite independent of our royalty rights and may, we hope, at least in great measure, replace those rights when these disappear.

The report was adopted.

MILLARS' TIMBER AND TRADING COMPANY

EXPANSION IN ALL LINES

The annual general meeting of Millars' Timber and Trading Company, Limited, was held on July 24th in London, Colonel Clive E. Temperley, O.B.E., M.C., B.Sc., presiding.

The following is an extract from the directors' circulated statement:

The divisible profit for 1950 of the parent company amounted to £86,569 compared with £70,716 for 1949. Your directors recommend a dividend of 20 per cent. on the ordinary shares, against 15 per cent. last year.

Trading showed considerable expansion in all lines during 1950. The quantity of Jarrah and Karri authorised by the Australian Timber Control for export from Australia was again small despite the urgent and insistent demand from overseas markets, particularly for Jarrah railway sleepers. Whilst it is appreciated that Australia's domestic requirements for railway sleepers are urgent, it is unfortunate that, owing to exports being severely restricted, overseas markets may be lost to other less suitable timbers.

The profits earned by Millars' Machinery Company, Limited, were again satisfactory, and its products remain in great demand. The volume of orders received to date shows a further increase. The company's works at Bishop's Stortford are operating at full capacity. Your South African subsidiary was able to increase its purchases of timbers from overseas other than Jarrah and Karri. The merchanting side of Millars' business in timbers other than its own Jarrah and Karri continued to expand and in 1950 reached record figures.

It is anticipated that the profits for 1951 will be satisfactory.

The report was adopted.

JOHN I. THORNYCROFT

CAPITALISATION OF RESERVES

An extraordinary general meeting of John I. Thornycroft & Company, Limited, was held on July 31st, in London, to consider a resolution capitalising £300,000 of the general reserve fund, and approving its distribution as ordinary shares of £1 each to the ordinary shareholders at the rate of one fully paid ordinary share for each ordinary share of £1 each held.

Sir John E. Thornycroft, K.B.E., M.I.C.E. (Life Governing Director and Chairman), in the course of his speech, said: It was fifty years ago that your business was converted into a limited liability company, and I think I can claim that the products that have been produced have operated in practically all parts of the world, and that your company is looked upon with respect by a very great number of people interested in the engineering and shipping spheres.

For the last ten years a very considerable portion of the profits have been ploughed back into the business to consolidate the company's financial position, and in recent years this policy has complied with the Government's policy in respect of dividends.

The company has been using the £300,000 reserve, which it is proposed to capitalise by issuing the existing ordinary shareholders with 300,000 additional ordinary £1 shares. In fact, all the reserves, that the company has been able to plough back into the business, have been required to finance the company's operations and provide for future liabilities, and your board is of the opinion that it is only just to give the ordinary shareholders title to a portion of the company's reserves by issuing these 300,000 ordinary shares, which truly can be described as "plough shares."

The resolution was approved.

BRITISH GLUES & CHEMICALS LIMITED

SIR ROGER DUNCALFE'S REVIEW OF A RECORD YEAR

The directors' report and accounts for the year ended April 30, 1951, were issued to the stockholders on July 31st. The following are extracts from the review by the chairman, Sir Roger Duncalfe:—

In my forecast last year I said it would be unwise for stockholders to expect continuance of profits on the scale of that year. In the actual event this year's record profit exceeded by 50 per cent. the previous year's profit, which was itself a record. Various factors contributed to this result. Increased world demand, accentuated by the Korean crisis and rearmament, helped us. Our product stocks were reduced with consequent profit. With our postwar development programme virtually completed we were favourably placed to meet the increased world demand to which I have just referred. The substantial savings in works costs achieved by technical improvement were augmented by increased production and this served in some measure to counteract cost increases outside our control. New products found a ready sale. Our North American companies did well. Thus, international conditions, however unsatisfactory they may have been in other respects, moved in our favour.

Another factor lies behind the year's achievement. There is a virility, an urge, and a forward drive in our Group, the effects of which cannot be measured in any forecast. These qualities flow from the ever-growing strength of our personnel. Their careful selection and training by our managing director, Mr Harold J. Cotes, now ably assisted by our assistant managing director, Mr I. H. Chayen, is indeed yielding good results, and the contribution made by the younger men in all departments of our business grows year by year. I take pride in saying this and in expressing on your behalf gratitude to our managing director, who, for many years, has made it his unceasing care. I thank all our employees for a year of good work and of solid achievement.

CONSOLIDATED ACCOUNTS

The consolidated profit for the year, after providing for taxation, is £422,434 (£253,344). After adjustments the amount available for appropriation is £403,907.

Appropriations are: £50,000 to our pension schemes in respect of back service; £80,000 to replacement reserve (making it £160,000); £10,000 to reserve for tax deferred by initial allowances, making it £61,000; £125,000 to general reserve, with transfer of £100,000 from contingency reserve, making the general reserve £475,000; £33,865 to capital reserve and with the addition of excess profits tax postwar refund £16,135 this new reserve in the company's balance sheet is shown at £50,000. We propose to use it in making the £50,000 ordinary stock bonus issue referred to below.

Fixed assets stand in the balance sheet at £1,015,420, slightly less than a year ago, since depreciation was a little more than capital expenditure.

Current assets at over £2,000,000 (including over £1,000,000 in cash and tax reserve certificates) are approximately £640,000 greater than last year, and are more than double our liabilities.

Our revenue reserves and surplus including future taxation reserves now amount to £1,220,152, as compared with £897,299 a year ago.

DIVIDENDS AND BONUS ISSUE

The directors have decided to pay, on the ordinary stock, as increased by last year's £50,000 capital bonus, a second interim dividend of 25 per cent. making 30 per cent. in all (last year 25 per cent.).

It is proposed, subject to agreement at the annual general meeting, to issue again this year as a bonus to ordinary stockholders £50,000 ordinary stock (two 4s. units for every nine units held). This second bonus issue will not participate in the dividends already authorised by the directors.

PRODUCTION AND SALE

Turnover again showed a substantial increase, partly due to increased production, partly to some reduction of product stocks and partly to rising prices. Our improved technique and the greater production flowing from our new plant and the consequent economies, enabled us to absorb rising costs and thus to delay increases in prices for longer than might have been anticipated. Indeed, it was only in the early months of 1951 that heavy rises in our raw material costs forced a general revision of our product prices. Our new and improved products have proved an outstanding success, and the demand for them is such that we are finding some temporary difficulty in meeting it to the full. We have continued to give our most careful attention to research and development.

Our export business was a feature of the year—we sold to eighty countries and increased our exports both in tonnage and value. Visits were paid to twenty-nine countries. Our exports to North America were especially noteworthy, being nearly twice last year's considerable achievement.

Our business is a world business engaged in the production and sale of commodities essential both in peace and war. Our prosperity must largely be conditioned by world prosperity. The immediate outlook is prosperous but the future remains obscure. However, your company is financially sound, it is well manned, its works are in good shape, and its technique is modern.

OHLSSON'S CAPE BREWERIES

The sixty-second annual general meeting of Ohlsson's Cape Breweries, Limited, was held on July 26th in London.

Mr Geoffrey Dent (the chairman), in the course of his speech, said: The year under review has shown a further marked increase in the cost of living in the Union of South Africa, with a consequent reduction in the spending power of the public. Our trade in the Cape and Natal, in spite of this reduction, was on the whole well maintained. The effect in the Transvaal and in Rhodesia was much more marked. In both of these areas, moreover, we have had to face increased competition, resulting from the advent of two new brewery companies. A reduction in the selling price of beer has been a further adverse factor so far as profits in Rhodesia are concerned.

Costs of production have continued to rise steadily. The trading profits at £543,001 show a decrease of £87,110 due to the reduction in turnover. It is proposed to pay a final dividend of 17½ per cent., making 22½ per cent. for the year.

In August and September last year I visited South Africa and Rhodesia, and inspected all the company's breweries and depots and many of the licensed properties in which we have an interest. I was particularly pleased with the various rebuildings and improvements that have been carried out, and am confident that they will achieve their purpose in providing for more efficient working and for maintaining and expanding the business.

It is pleasing to note that sales for the current year have been fairly well maintained so far, especially in the Transvaal and Natal, but there are signs now of some lack of spending power in the Cape.

The report was adopted.

ST. MARTIN PRESERVING COMPANY, LIMITED

(Manufacturers of Chunky Marmalade, Preserves, etc.)

INCREASED TURNOVER

MR P. A. J. HAMMETT'S SPEECH

The twenty-third annual general meeting of the St. Martin Preserving Company, Limited, was held on July 27th at Maidenhead.

Mr P. A. J. Hammett, F.C.I.S., the chairman, who presided, in the course of his speech, said: Gentlemen,—Last year reference was made to the more competitive conditions to be expected. In face of the fulfilment of that anticipation, it is pleasing to be able to inform you that turnover exceeded that of the preceding year, and that despite increased costs and higher taxation it has been possible to add a further £5,000 to reserve and to increase the credit balance of your profit and loss account while maintaining the dividend and adhering to the policy of writing off capital expenditure to revenue. You will recall that the inception of this practice was in pursuance of the long-established policy of your directors to give primary attention to the strengthening of your company's financial structure, and while no business can claim to be impregnable in these days of unpredictable fiscal and economic legislation, yours is undoubtedly in an exceptionally strong position. Nevertheless, the fact has to be faced that the harsh and burdensome taxation upon companies now prevailing renders it increasingly difficult for industrial concerns to retain any substantial portion of their profits, and almost impossible if a reasonable return is made to those who made their activities possible. Therefore, it may well be that an adjustment of the policy so far pursued may be forced upon us.

GENERAL RESERVE £55,000

The amount of £25,000 standing to the credit of contingencies reserve has been transferred to general reserve. Therefore, with its own brought-forward credit of £25,000 and the appropriation now made from the profits, general reserve stands at £55,000.

Mr H. G. Henly, whose association with the company dates back to 1935, has expressed his desire to retire owing to the increasing demands his other business interests make upon him. It is with the greatest regret that his colleagues accept this position, appreciating, as they do, the invaluable services his wisdom and experience have enabled him to render.

While current conditions make it necessary to view the future with caution, the successful results of the past difficult year give grounds for optimism. Your company's speciality, Chunky Marmalade, becomes increasingly popular, and the sales of the past year created a fresh record. The larger demand now in evidence gives every indication that a new record will again be set up.

Your executive, office, factory and sales staffs and employees have contributed much to the results of the year. Suitable recognition has been made of outstanding achievements.

The report was adopted.

W. J. BUSH & COMPANY

CENTENARY YEAR

The fifty-fourth annual general meeting of W. J. Bush and Company, Limited, was held on July 31st, in London, Dr Percy C. C. Isherwood, O.B.E., F.R.I.C., chairman and joint managing director, presiding.

The following is the chairman's circulated statement:

I should like to record that the current year marks the one hundredth anniversary of the foundation of the business by the late William John Bush in 1851. As a result of increased turnover at home and overseas the accounts of the group now submitted show a profit of £398,648, as against £300,293 in the previous year, an advance of £98,355.

Although in making comparisons the present inflationary period has to be borne in mind the increase in fixed and current assets in the consolidated balance sheet does, I consider, provide an indication of the expansion in the company's business.

The ever-increasing incidence of taxation, the necessity of carrying adequate stocks at much enhanced prices together with the high cost of maintaining plant in a state of efficiency, all involve increasing demands on the company's liquid resources, which demands are accentuated by reason of our steadily expanding business both at home and overseas.

EFFECT OF REARMAMENT PROGRAMME

The diversion of a significant part of the national effort to the programme of rearmament necessitated by the disturbed international situation has already added to our difficulties in obtaining plant for maintenance and devlopment also in obtaining adequate supplies of essential raw materials. As the programme gets into its stride it is anticipated that this problem will become even greater. In spite of this it is gratifying to record that during the year under review we have been able substantially to increase our production and efficiency, with the satisfactory results referred to at the beginning of my statement.

In previous years I have referred to the importance of maintaining research both for development and for increasing the productive efficiency of existing manufactures. In this connection I am pleased to report that we have now completed the reorganisation and re-equipment of our research laboratories, which should increase our efficiency in this vital aspect of our business.

VISITS TO OVERSEAS COMPANIES AND BRANCHES

During the last few years it has been possible for your directors to visit our overseas companies and branches and discuss their problems on the spot. This personal contact is achieving valuable results.

As a result of enhanced costs for replacement of plant and buildings to which I have already drawn attention in this and previous statements, your directors consider it advisable to place a further sum of £50,000 to the reserve against this item, bringing it up to £300,000. It is also considered prudent to increase the reserve against stocks by £50,000, making the total £150,000. A further sum of £100,000 has been placed to general reserve, which now stands at £450,000.

Once again I wish to place on record my appreciation of the loyalty and hard work of my colleagues and the company's staff.

The report was adopted; the payment of a final dividend of 10 per cent. on the ordinary shares, making 15 per cent. for the year, and the payment of a centenary bonus of 1s. per share on the ordinary shares as recommended, was approved.

CITY OF SAN PAULO IMPROVEMENTS AND FREEHOLD LAND

FACTORS GOVERNING DIVIDEND

The thirty-ninth ordinary general meeting of this company was held on July 31st in London, Mr R. G. Mills, the chairman, presiding.

The following are extracts from his circulated statement for the year to February 28, 1951:

The board has felt for some time that there would be distinct advantages in registering a new company in Brazil. This was done on July 6, 1950, when the capital of 20,000 contos (£250,000 at Cr.$80 to the £) was subscribed almost entirely by this company.

The sterling-cruzeiro exchange rate for remittances remained unaltered, viz. 52.416 cruzeiros to the £, to which must be added the reimposed remittance tax of 5 per cent., increasing the effective rate to approximately Cr.$55 to the £. For eleven months of that period there was a complete embargo on remittances; consequently, it was impossible to remit any of the profits.

Since the date of the balance sheet we have received £108,090, of which £14,454 was the balance of the remittable quota in respect of the profits for the year ended February 28, 1949, and the remainder of £93,636 was the undisputed quota of the profits for the year ended February 28, 1950. We are endeavouring to alleviate the position by an arrangement made with the Exchange Controls in Rio de Janeiro and London whereby we should receive a further £30,000 of profits.

RECORD PROFIT IN BRAZIL

The profit for the year in San Paulo amounted to £155,856. In view of the administration in San Paulo having been taken over by the Brazilian company, no proper comparison with the previous year is possible. The net profits are £98,242 after providing for the first time for United Kingdom income-tax. The total charge for UK taxation, after deducting unilateral relief in respect of Brazilian taxation amounting to £42,913, is £43,879.

In the report you will see a statement amalgamating the sterling equivalent of the Brazilian company's profits, amounting to £261,286, making the total profit in Brazil before taxation and appropriations £462,984, compared with £267,345 for the previous year. The figure of £462,984 is by far the highest profit ever earned. These profits are still in cruzeiros and subject to the statutory limitation of remittances.

To those of you who were stockholders last year a reduction in the rate of dividend will come as no surprise. We have decided to recommend a final dividend of 2d. per unit (6¼ per cent.), free of tax, making a total dividend for the year of 3d. per unit (10 per cent.), free of tax. I cannot emphasise enough that under existing conditions this company's rate of dividend is not governed, as is normally the case, by the earning capacity but by the sterling available to pay such dividends and its UK taxation commitments.

The sterling equivalent, calculated at 3d. to the cruzeiro, of amounts receivable from purchasers of land spread over varying periods averaging 15 years, shows an increase of £1,600,000, and has reached the very considerable total of more than £5 million. The arrears at February 28, 1951, were very small. During the year under review the total sales made on the company's deferred payment terms amounted to Cr.$165,500,000 approximately compared with Cr.$75 million last year, which was itself a record and more than double those of the previous year.

The report was adopted and other resolutions were passed.

ASSOCIATED BRITISH PICTURE CORPORATION

IMPROVED RESULTS

The twenty-fourth annual general meeting of this company was held on August 2nd in London, Sir Philip Warter (the chairman), presiding.

The following is an extract from his circulated statement:

During the year the board decided to close the studios at Welwyn and concentrate film production at our modern Elstree studios. Economies arising from this rationalisation, together with our policy of strictly controlling production expenditure, have contributed to a considerable extent to the improved results which we are pleased to record for the year 1950-51.

The trading profits of the group show an increase of £298,651 from £2,205,624 to £2,504,275. The provision for taxation is increased by £189,429 at £1,217,464.

The net profit of the group amounted to £663,609, an increase of £119,987, and the net profit of the Corporation was £624,393, compared with £507,795 last year. Your board propose that the ordinary dividend should remain at 20 per cent.

During the year out of the group's box-office receipts of £18,901,114, £7,009,509 was paid to the revenue in the form of entertainments duty—representing 37.1 per cent. of the takings.

It is not generally appreciated that on what was the most popular price of seat—namely, 1s. 10d.—9d went to the Chancellor of the Exchequer. Too much is taken in entertainments duty and not enough is left to the industry.

The Chancellor of the Exchequer has now agreed to a conference between the Treasury officials and representatives of the industry to ascertain if there is an alternative method of tax collection which will give Exhibitors some elasticity in adjusting prices of admission without creating the anomalies which at present make this practically impossible.

A few days after the close of the financial year the Chancellor of the Exchequer proposed in his budget speech to increase entertainments duty by 1d. on all gross prices of admission from 6d. to 9d. inclusive, and 2d. per seat on other gross prices of admission from 10d. upwards.

The whole industry, represented by the four main organisations covering all forms of production, distribution and exhibition, submitted alternative proposals to the Treasury. Following protracted negotiations, the Chancellor agreed to a compromise plan, which provided for a 1d. tax remission on the 1s. gross price of admission whilst leaving all other prices under 1s. untouched. In addition to his new tax proposals, he has also agreed to seat price adjustments which should bring in additional income.

The Elstree studios have been fully employed throughout the financial year.

Nevertheless it has not been found possible to operate production profitably for the financial year under review, but the sum that it has been necessary to provide for the production deficit is less than in recent years. It is reasonable to anticipate that the "Eady Plan" which, insofar as production was concerned, had no effect during the financial year under review, will, taken together with the extension proposals in the budget, make a material contribution to our production results.

We believe that it will go a long way to foster a stable and successful British film production industry.

The trading for the current year to date can, under the circumstances, be considered satisfactory.

The report was adopted.

GROSVENOR HOUSE (PARK LANE) LIMITED

IMPORTANCE OF TOURIST INDUSTRY

The twenty-third annual general meeting of Grosvenor House (Park Lane) Limited, was held on July 27th in London, Mr Charles S. Taylor, M.A., D.L., M.P. (the chairman), presiding.

The following is an extract from his circulated statement:

Since the last annual general meeting the Rt. Hon. Lord Burghley, K.C.M.G., has been elected to the board.

The profit for the year amounted to £217,032. The directors recommend the payment of a dividend of 6 per cent., less income tax, on the ordinary stock. Although the profit earned was larger than last year, taxation is more than proportionately higher, owing to the increased rates of income tax and profits tax now payable. In addition, a proportion of the repairs and renewals charge, being unspent during the year, is disallowable for taxation purposes.

We are proud to say that the turnover on the past year's trading reached a record figure. This applies to the letting of hotel rooms and flats, and to catering—the three major departments of the company's activities—though the restaurant and grill room business continues to be affected by the reduced spending power so clearly discernible in this country.

TOURIST INDUSTRY'S DOLLAR CONTRIBUTION

The tourist industry contributes nearly twice as many dollars to Britain as any other single industry. It seems to us, therefore, remarkable that hotel-keepers should still be hampered and restricted in so many directions, seeing that hotels constitute one of the key points in the great tourist industry.

The need to employ properly trained staff and to achieve the maximum efficiency of the labour force has become intensified because of the high demand for labour compared with the short supply.

The newly-formed Hotel and Catering Institute will, we believe, develop a higher professional standard of hotel-keeping in this country, and therefore produce a higher standard of efficiency. It is our policy to co-operate with the institute with the object of furthering educational development and raising the standards of hotel and catering staffs.

We are continually being reminded that it is desirable from the national point of view that we should endeavour to attract the maximum number of clients from overseas. This especially applies to dollar countries, which are accustomed to a good standard of hotel-keeping, not only in their capital cities, but in many other of their cities and towns. I fear the time when, if present trends continue, it may be necessary for us to consider reducing the amount of service we now render, which, as is shown by the many spontaneous tributes that reach us, is so highly appreciated by our clients. If conditions make reductions in service inevitable the effect upon overseas travel to this country, in face of keen competition from neighbouring countries, must cause the authorities seriously to consider the position. I am sure that you will agree with me when I express the hope that action will be taken before it is too late. The long-term recommendations of the Catering Wages Commission have not yet been implemented, but I look forward to the final decisions. I believe that the industry as a whole could benefit from a revision of the present Catering Wages Board arrangements.

Notwithstanding the difficulties, I can claim that Grosvenor House is today, without doubt, one of the finest hotels in the world.

The report was adopted.

THE GREYHOUND RACING ASSOCIATION TRUST

MR F. S. GENTLE WANTS EQUITABLE TREATMENT

The twenty-third annual general meeting of The Greyhound Racing Association Trust Limited was held on July 31st at the White City Stadium, London.

Mr Francis S. Gentle (chairman and managing director), in the course of his speech, said: Totalisator turnover fell by 18 per cent., and attendances by 12 per cent., resulting in a drop of £241,000 in revenue, compared with the preceding year. By singling out totalisator betting on greyhound racecourses and imposing on it the 10 per cent. pool betting duty, the Government have driven a great volume of betting into untaxed sources—to the ultimate disadvantage of the Exchequer and at considerable loss to the greyhound racing industry. We do not seek any privileges in our competition with other forms of entertainment. All we want is equitable treatment—but we are not getting that so long as the present discriminatory, unjust and penal system of taxation on betting at greyhound tracks continues.

There is also discrimination in entertainments duty since theatres pay 15 per cent. but greyhound racing pays 45 per cent. The group's tracks produced a total of £2,006,000 in direct taxes last year.

The Royal Commission on Betting agree that betting as conducted in this country today is not a social menace.

The immediate outlook is unsettled, but we shall continue to fight against discrimination in all forms and I feel confident that equity and right-thinking will prevail—which must be to our benefit.

The report was adopted.

EX-LANDS NIGERIA, LIMITED

The thirty-ninth annual general meeting of The Ex-Lands Nigeria, Limited, was held on July 27th in London. Major-General W. W. Richards, C.B., C.B.E., M.C., chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year 1950:—

Production was down compared with the previous year—712 tons of tin concentrates assaying approximately 74 per cent., yielding 527 tons metal, against 725 tons concentrates yielding 537 tons metal. There was an increase in the aggregate mining costs of £10,500 compared with the previous year—£120,246 against £109,721. The cost per ton aggregated £169 compared with £151 per ton.

Tin realisation charges £75,124, which cover treatment, brokerage, freight and royalty, show a considerable increase compared with last year's figure of £43,173. The royalty payable to the Nigerian Government totalled £45,020, which is equal to £63 per ton, or 50 per cent. higher than last year.

The average price we received per ton of tin metal produced was £929.75, which yielded a revenue of £491,026—an increase of £186,266 over the previous year. The Board recommend a final dividend of 7.2 pence per unit of stock, less tax at 9s. 6d. in the £, making a total of 1s. per unit of stock for the year.

Prospecting work, costing £5,272, was carried out with the result that the ore reserves at December 31, 1950, of 4,658 tons showed an increase of 76 tons of tin compared with the 1949 figures, after allowing for the 712 tons produced during the year.

Current operations.—Production for the first five months was 263 tons.

The report was adopted.

NOTICES

"SHE is a woman, therefore to be won." Advertising to women is an art in itself—a mixture of insight, experience and exact knowledge of their tastes and buying habits. You draw on many years of experience of advertising to the feminine market when you consult Samson Clark & Co., Ltd., 57-61, Mortimer Street, London, W.1. MUSeum 5050.

LEADING STOCKBROKERS have a vacancy in active Investment Department. Applicants must be experienced, keen, and have really sound knowledge of accounts and economics. Excellent working conditions and good salary with prospects.—Write Box E.244, at 191, Gresham House, E.C.2.

SALES MANAGER wanted for U.K. Concessionaires of RIV anti-friction bearings with London headquarters. Qualifications: must be able to prove thorough knowledge of the industry, particularly on the technical side. Age limit 45. Good honours degree desirable. Successful applicant must be prepared to undergo a medical examination and will, after a period of probation, be eligible for inclusion in Group Pensions Scheme.—Apply, in own handwriting, to Personnel Manager, Box 713.

TELEVISION MANUFACTURERS in Surrey require an understudy to Works Manager. A well-educated man, with good personality, aged about 30-35, possessing University Degree in Electrical Engineering or equivalent and several years' production experience in an executive position, would suit. Commencing salary £800—£1,000 p.a., according to capabilities and experience. The position is an important one which offers good scope to the right man. All applications will be treated in confidence.—Box 715.

LAYTONS Wine Merchants, 2a Duke Street (Manchester Square), W.1, are also party caterers. Welbeck 8808, 1864.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 16, George Street, Mansion House, E.C.4.

ATTWOOD STATISTICS LIMITED invite applications from men holding a good British degree with statistics as a special subject. The post combines statistical and executive work, and is a sound opportunity for a person prepared to be trained in all aspects of Market Research. Experience of graphical presentation an advantage. —Write, giving full details of education, age and previous experience, to Attwood Statistics Limited, Chantrey House, Eccleston Street, London, S.W.1.

FACTORY, centrally situated in Edinburgh, one of the lowest rated cities in Great Britain, presently use as a printing works, approximately 21,000 square feet, existing use light industrial purposes, assessed rent £235, derated to £58. No ground burdens, electric lift, two loading banks, all in modern condition, approximate entry December. Permission to view from and offers to Shepherd and Wedderburn, 16, Charlotte Square, Edinburgh.

FINALS student Institute of Actuaries, 28, seeks post in statistical department stockbrokers; or in Commercial-Industrial Co., with management prospects. Public School, wide general education, plenty of initiative. Minimum £600 p.a.—Box 706.

EXPORT.—Representative of Australian wholesale firm wishes to take sole distributorships and agencies for manufacturers, as leaving for Australia soon.—Box 712.

FOR sale.—*The Economist*, April 6, 1946-June 30, 1951.—Offers to Box 710.

ROOM FOR BUSINESS GROWTH IN CANADA

To expansion-minded business men Canada presents new frontiers—a vast new field of enterprise. Its natural resources have not yet been fully developed—its markets are great, but still growing.

As the banking connection for numerous British concerns doing business in Canada, we are conversant with the trade situations that may be of interest to you.

We invite your enquiries.

THE CANADIAN BANK OF COMMERCE

2, LOMBARD STREET, LONDON, E.C.3.

HEAD OFFICE: TORONTO, CANADA

Over 550 Branches across Canada

TRADING OR ESTABLISHING in CANADA or the WEST INDIES?

If you are trading with or contemplating establishing a plant in Canada or in the West Indies, we can be of help to you.

Through 345 branches across Canada and 23 in the West Indies, we can provide information on business conditions, exchange regulations, exports and the establishing of branch plants.

Your enquiries will receive prompt and courteous attention.

THE BANK OF NOVA SCOTIA

108, Old Broad Street, London, E.C.2.

Established in Canada in 1832 with limited liability.

BANK OF SCOTLAND

Constituted by Act of Parliament 1695

AUTHORISED CAPITAL	£4,500,000
CAPITAL FULLY PAID	£2,400,000
RESERVE FUND & BALANCE carried forward ...	£3,191,979
DEPOSITS & CREDIT BALANCES as at 28th February, 1951	£90,134,108

Head Office: THE MOUND, EDINBURGH

Over 200 Branches and Sub-Branches throughout Scotland

London Offices:
CITY OFFICE, 30, BISHOPSGATE, E.C.
PICCADILLY CIRCUS BRANCH, 16/18 PICCADILLY, W.

AGGREGATE ASSETS at 31st March, 1950. £102,585,433.

Established nearly 90 years.

BANK of NEW ZEALAND

Incorporated with limited liability in New Zealand

Represented at over 200 points in New Zealand and in Melbourne, Victoria; Sydney, New South Wales; Suva, Fiji; Apia, Samoa.

London Office: 1, Queen Victoria St., E.C.4. O. M. Samuel, Manager.

Head Office: WELLINGTON, N.Z. R. D. Moore, General Manager.

REFUGE ASSURANCE COMPANY LIMITED

CHIEF OFFICE
OXFORD STREET MANCHESTER 1

THE REFUGE WILL SAFEGUARD THE FUTURE

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

(UNIVERSITY OF LONDON)

Applications are invited for appointment to Lectureships and Assistant Lectureships in Economics. Salary scales £600–£1,150 per annum and £450–£550 per annum, respectively, with superannuation benefits and family allowances. Starting salary according to qualifications and experience. The successful candidates will be required to take up their duties in October, 1951, or as early as possible thereafter. Candidates are invited to give in their application the names of three referees and an indication of any special interests in the field of Economics.

Applications should be received not later than August 15, 1951, by the Secretary, London School of Economics, Houghton Street, Aldwych, London, W.C.2, from whom further particulars may be obtained.

LONDON TRANSPORT EXECUTIVE invite applications for the post of Supplies Officer. Initially the occupant of the post will be responsible to the Chief Supplies Officer for all work in connection with the requisitioning, receipt, custody and issue of stores stocks with an annual turnover of about £5,000,000, embracing material for the maintenance of railway and road service rolling stock, electrical plant, signalling, and permanent way, as well as building materials and common stock items.

Candidates must have had a wide practical experience of storekeeping and of the forward planning of supplies in relation to engineering workshops, and they will be expected to be familiar with modern developments of stores lay-outs and storekeeping practice and accountancy. A knowledge of purchasing methods will also be required.

The salary for the post will depend on the experience and qualifications of the successful candidate and will be of the order of £1,750 per annum.

The successful candidate will be required to pass a medical examination and on completion of a satisfactory probationary period will be required to join a contributory superannuation fund. Applications, giving full particulars of age, experience, qualifications and present salary, should be sent within fourteen days of the appearance of this advertisement to the Chief Staff and Welfare Officer (F/V.09), London Transport Executive, 55 Broadway, Westminster, S.W.1.

THE UNIVERSITY OF MANCHESTER

Applications are invited for research posts in ECONOMICS, ECONOMIC STATISTICS, GOVERNMENT, SOCIAL ADMINISTRATION AND SOCIAL ANTHROPOLOGY. There are three grades: Grade I, £500 to £1,100 per annum; Grade II, £450 to £500 per annum; Grade III, £350 to £400 per annum. Applications should be sent not later than September 4, 1951, to the Registrars, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

FEDERATION OF BRITISH INDUSTRIES

Applications are requested for post of Assistant Secretary in the Federation's North-Western Regional office in Manchester. Duties include maintaining contact F.B.I. members in the area and secretarial work connected with F.B.I. North-Western Regional Council. Prospects of promotion. Preference given to applicants under years of age. Minimum salary £650 plus allowances; pensionable. Applications should be sent to the General Secretary, Federation of British Industries, 21 Tothill Street, London, S.W.1, to arrive not later than Monday, August 27th.

THE I.L.O. invites applications from men and women of U.K. nationality, aged not less than 28 and not more than 35 years on September 30, 1951, for a post of Assistant Member of Division in the Agricultural Division of the International Labour Office, Geneva, Switzerland.

Qualifications required :—

1. University degree (preferably including economics or agriculture) or the equivalent in experience.
2. Ability to draft clearly and concisely.
3. Good knowledge of French or Spanish.
4. Account will be taken of research experience in agricultural economics, if possible in agricultural labour problems.

Further particulars and application forms may be obtained on application, with stamped addressed foolscap envelope, from the International Labour Office, 38-39, Parliament Street, London, S.W.1.

Closing date for return of completed application forms is September 30, 1951.

WINE is so easy to enjoy; see if you have a natural palate; enter the Wine-Tasting Competition. First prize, a week among the vines. No charge whatever. Closing date for 1st Round is August 30th! Don't delay!—Apply The Friends of Wine, 1, Vintners Place, London, E.C.4.

Defence With Tears

BRITAIN'S trade deficit is not removing itself while the politicians are on holiday. The gap between imports and exports was bigger last month than in May and only moderately less than the fantastically large gap in June. In July alone the deficit on visible trade was as great as that for the whole second half of 1950. The country is left to go on living happily beyond its income, and the task it will eventually have to face grows more disturbing. Three times in six years Mr Attlee's Goverment has had to collect its courage and recognise that the only way to get out of economic difficulties was temporarily to reduce the standard of living of the British people. The first two occasions followed the crises of 1947 and 1949, and the third was this year's Budget. But this time the resolution to do something about it has faded even more quickly and more disastrously than before.

The situation in April was simple enough. The economic policies of 1950 could not provide in 1951 the extra armaments necessary for national security and the extra exports necessary for national solvency. Therefore Mr Gaitskell had to make room for these things by cutting other things. To put the point with formal correctness: the total of domestic civilian spending—Government and private, for consumption and for investment—had to be reduced in real terms. Bluntly, the practical meaning was that solvency and security must be provided out of the mouths and off the backs of the British people.

All the complexities of current economic discussion turn on this simple proposition. It was implicit in the Budget and occasional lip-service is still paid to it, though in the recent economic debate Mr Gaitskell himself would not go even so far. In a curiously contorted passage he argued that rearmament affected the consumer only to the small extent to which taxes had been increased; he denied that his policy had ever been to let higher prices restrict consumption. But if this was not the basis of the Budget, what was? According to the Economic Survey, there would this year be rather fewer goods for civilians to consume than there were last year. But money incomes would unquestionably be bigger—if only because of the rises in wages—and the Budget raised taxes very little. Plainly, therefore, consumption would be held in check only if prices rose and reduced the real value of money incomes. Without this assumption the Budget would have made no sense at all.

It is easy enough to see why, politically, the Chancellor has changed his tune. Mr Bevan and his friends have said that rearmament will hurt the British worker. The Government is commendably determined to stick to the rearmament programme, but it dare not seem to care less than Mr Bevan does for the living standards of its trade union constituents. And therefore it will no longer admit that consumption must suffer, that security has a real price. Its slogan has become "Defence and Bevan too." Mr Bevan says that because rearmament hurts, it cannot be necessary; by contrast, Ministers

nised last weeek in the submission to the Government by the Rubber Producers' Council of a draft scheme for financing smallholders' replanting as an alternative to the proposals for freezing earnings.

In the long run the eclipse of Communism in Malaya depends as much on maintaining a healthy economy as on defeating the guerrillas by military action and a progressive political policy there today. This eclipse is an interest of the whole free world and fully as much that of America as of Britain. At the moment neither is treating Malaya with adequate justice in the matter of economic policy. Malaya's inflation has been greatly accentuated by the shortage of consumer goods. The trade surplus has been piled up in sterling assets and not released either for spending in Britain or for transfer into dollars. The fault in Britain lies in the Treasury's departmental tendency to regard Malaya too much as a dependency, which can be ordered from Whitehall to deposit a very high proportion of its dollars against sterling balances in London and without sufficient regard to the effects in Malaya. In reality Malaya has a great deal of initiative in the matter, although it toes the line so far as it can. On the other hand, if Britain cannot supply the consumer and indeed capital goods which Malaya needs to meet inflation, the policy of surrendering dollars in conformity with sterling area requirements will be self-defeating if carried too far. It will prevent stability in the Malayan economy and play into the hands of the Communists.

*

For America, Malaya represents just that awkward little problem which is inherent in the assumption of world leadership and world responsibilities. And if the reason why Americans should take on these commitments is that they are necessary to the safety of the United States, then it follows that due importance should be attached to the needs of foreign policy against the requirements of industrial mobilisation at home. The price of rubber, which is crucial to the prosperity of Malaya, depends very gely on American demand. American purchases, since April last, have been very much reduced, US synthetic production has been stepped up to around 900,000 tons a year, and private industrialists in the United States are severely restricted by law in the amounts of natural rubber that they may use. The result is that, when present rubber stockpiling ends, an appreciable fall in the price of rubber is expected, and the prospects of future American demand are very uncertain. Nor has the position in tin been very much better. Disagreement earlier this year between London and Washington on the inclusion of tin in the metals to be discussed by the International Materials Conference, was followed by American action forcing down the price from over 180 cents to 103 cents per lb in a matter of weeks.

These tactics are unrealistic on the part of the United States, since they jeopardise the future not only of Malaya but of all South East Asia in the struggle against Communism. Washington is now spending a great deal on and to Indo-China and to the rest of South East Asia. But there is a jagged hole in its policy so long as no better arrangements can be made for buying Malaya's two vital commodities than a headlong rush at one moment and an almost complete standstill the next. In addition, if the United States wants countries to stop trading with the enemy, whatever the cost to their long-term interests in peacetime—and, on top of the loss of earnings through the price fall, Singapore is already losing entrepot trade to Indonesia—full consideration should be given in return to those who depend for a living on doing business with America. As was pointed out to Mr Dewey on his recent fact-finding visit to Malaya, these problems should stand higher than they do on the list of questions where greater Anglo-American co-operation is required.

Now that the long and bitter battle is swinging in favour of the British forces, Malaya is more worth helping than at any time in the past. It is too early yet to predict any decisive and final defeat of the Communist guerrillas, but recent news suggests that conditions should be distinctly better by the end of the year. Although the Briggs plan is behind schedule, more than half the Chinese squatters have now been resettled —280,000, leaving 160,000 still to be dealt with. More information on guerrilla movements is coming in and more guerrillas are being shot; their morale is going down, as the food denial campaign, begun in Johore in June, takes effect. On the political plane, the great questions of Malaya's ultimate status are still unsettled and it is well that they should be, at least until the country has had a period of calm and normality. But definite progress is being made towards self-government within the present constitutional framework, even if this progress is slow. All these events in Malaya are quite as important to the struggle against Communism in Asia as those in Indo-China. If either territory collapsed, the effect would equally be disastrous throughout South East Asia. It would be folly on the part of the leaders of the free world to do anything now, for either economic or political reasons, which would prejudice the great and gallant efforts made in Malaya during the past three years.

A New Epoch

A new epoch seems to have dawned on the world. Never before were all the elements of social happiness so abundant and apparently so assured. Men seem to have no other desire but, by trade, to serve one another. . . In increasing population, extending trade, advancing navigation, improving agriculture, and well-ordered finances, our country possesses more means of happiness and strength than perhaps were ever before vouchsafed to any nation. All these great improvements, contrary to one long-accredited theory, happily for us, and confirming our best hopes, accompany a rapid increase of the people; and totally contrary to another and very prevalent theory, all these improvements are connected with and grow from our town population. They do not spring from the wilds of Connemara, nor from the Arcadian vales of the South and West of England—not from the old population of our rural hamlets, but from the new population of our cities, from amidst the whirl of spindles and the hissing of engines. . . . We cannot, however, refer to our great present prosperity without reminding our readers that it requires as much care to preserve as to acquire; and in this world of change, preservation means continual improvement. To rest self-satisfied is to doom ourselves to decay. . . . That our prosperity may be as permanent and progressive as it is now striking and grand, we must deserve to be prosperous.

Eye-Witnesses of Aggression

HALF the battle in Korea was won when it was established within the first week who had begun it. If United Nations observers had not been present to report what they had seen all along the frontier of the two Koreas between June 9 and 23, 1950, the Communist insistence that Americans and South Koreans had begun the fighting would have been less effectively answered after June 25. What frustrated the aggressor then might well frustrate him again, and a world desperately in need of peace would do well to examine and adopt every technique which offers hope of making war less likely. In the last three years the stationing of trained observers, drawn from many nations, along threatened frontiers and in disputed territories has been developed as a wholly new technique of this kind.

Such observers are hardly needed where the threat to peace takes the form of a full-scale attack by a major power. A chain of United Nations observation posts along the Elbe would neither deter the Politburo from ordering the Red Army to march, nor would it be needed to show the world where the blame for a conflict in this area lay. But in the immediate future a major war is more likely to begin in a less direct way. It might result from the extension of a relatively small conflict at a point of friction between the Communist and the free worlds, or from the use of one of Russia's satellites to stage another aggression by proxy on the model of Korea. In either of these cases there is much to be gained from the presence at the danger point of a group of men capable of evaluating signs of military preparation, experienced in making objective reports, and drawn from so many different nations that their joint verdict could not be dismissed as a partisan view—except of course by the Communists and their friends, who will dismiss anything. It would be too much to hope that the presence of observers would actually prevent an aggression that had been deliberately decided upon—though on occasion it might do so. The real purpose that observers can serve is to prevent any division of opinion, based upon conflicting versions of the facts, in the free countries and therefore to encourage them to present a united front against the aggression. Thus they would indirectly have a deterrent effect.

The value of having observers on the spot can be seen from the record of the observers already stationed in five troubled areas in Europe and Asia. These men—most of them military officers with considerable experience of battle—have carried out their duties in remote and inhospitable areas with little public recognition. The scale of their work is indicated by the fact that at one time 594 of them were in the field at the same moment; and their experiences provide a number of important lessons for the future.

The United Nations observer system is a comparatively recent, and in some respects almost accidental, development. No mention of observers will be found in the UN Charter, and not until the third year of the organisation's life did the first of them take up their duties. By then the United Nations had already experimented with the technique of sending out temporary fact-finding commissions—a technique also used by the League of Nations, as in the case of Manchuria—and had discovered its limitations. The General Assembly of 1947 broke new ground by setting up a Special Committee on the Balkans, not to collect facts, but to observe

UN Personnel in Danger Areas

	Observation Work Began In	Personnel in Area in 1950 (before Korean War)
Greece	January, 1948	76
Palestine	June, 1948	136
Indonesia	July, 1948	68
Kashmir	February, 1949	63
Korea	May, 1950	22
Total	...	365

continuously the extent to which the Balkan nations complied with the Assembly's recommendations. During 1948 this committee established observation posts, manned by American, British, Brazilian, Chinese, Dutch, French and Mexican officers and civilians, in six sectors of the northern frontier of Greece. Since that time, they have covered the battlefields right up to the frontier, and several have been wounded by Communist fire. Their scope has been limited by the refusal of Albania, Bulgaria and Jugoslavia to admit any United Nations officials to their territory, but that refusal in itself cast revealing light on the Communist governments' claim that Greece was to blame for all friction along the border. No spokesman for the United Nations would claim that the observers have turned the tide in Greece; but Mr Dulles has expressed the American Government's belief that their activity greatly diminished the aid which the Communist nations would otherwise have given to the Greek rebels.

*

In the case of Palestine it was only after two periods of full-scale hostilities that the United Nations empowered its mediator, Count Bernadotte, to form small international teams to observe the execution of truce agreements. Several of these men lost their lives at the hands of both Arabs and Jews, and it was not until the beginning of 1949 that Dr Bunche was able to establish a workable system of United Nations observation along the armistice lines on which he had secured agreement. This system is still in operation, with the more or less willing co-operation of both Israel and the Arab states, and the presence of the UN teams has greatly limited the number and scale of conflicts along the armistice lines.

In spite of these experiences the United Nations has been reluctant to create observer systems in good time in other areas. In Indonesia a year elapsed between the first call for a cease-fire and the inauguration of a system of observation; and even then the local Good Offices Committee had to rely almost entirely on its own resources until the closing stages of the conflict. A similar delay occurred in the case of Kashmir, where, however, United Nations observers have now been continuously at work for over two years. And it is of particular interest that in Korea, although a commission had been sent to the country in 1948, it was not until May, 1950, that the first military observers for service along the 38th parallel reached Seoul. Dramatically enough, these officers completed their first comprehensive inspec-

tion of the frontier only a few hours before the North Koreans attacked; their reports completely exploded the Communist claim that the Southerners had been the aggressors. But they were too few, and had arrived too late, to test the validity of the South Korean Government's belief that their presence would have a deterrent effect on the North.

United Nations observers have never, in fact, succeeded in preventing hostilities from breaking out; but this is hardly surprising, as they have only once been sent to a danger area before the fighting started, and even that one instance, as has been seen, was a matter of "too little and too late." They have, however, substantially limited the scale of the conflicts in Palestine, Greece and Kashmir. And they have fulfilled their third purpose, that of revealing to the world which party was responsible for the aggression, in Indonesia, Greece and Korea. In the last two cases they achieved their effect in spite of being barred from one side of the threatened frontier, and in spite of the fact that the Communist governments concerned had openly defied the United Nations and were less concerned about outside opinion than, say, the Dutch in Indonesia or the Indians in Kashmir.

*

If the observer system has thus proved its worth, what objection can there be to its extension? The United Nations itself has learnt that the same results cannot be obtained by visiting missions, even when these can be persuaded to leave their hotels and slog through the mud of battle as the observers do. Every military commander knows how easy it is to fake up "window-dressing" for the benefit of visiting civilians; but it is not so simple to prepare or develop a campaign under the eyes of inconspicuous experts who may appear on a nearby hilltop at any moment. If it is argued that it should be left to the press to warn the world of impending danger, it must be pointed out that no newspaper or agency can afford to rely on competent correspondents in remote mountain areas for years on end in the hope of eventually securing a story.

But if international observation is to play its full part in the defence of peace, it must above all be timely. Korea set a precedent for the posting of observers to a danger area before hostilities begin, and provided a warning that it is not enough merely to send them in on the eve of the conflict. If conflicts are to be prevented rather than merely limited, the observers must start work early enough to master both the terrain and the local circumstances before they are required to report. There is no longer any administrative obstacle to such timely action. Although the United Nations early use of observers was a hastily extemporised affair, the position has since been changed by the approval in 1949 of a permanent panel from which the Secretary-General may select observers at short notice, by the formation in March, 1950, of the mobile UN Field Service—which supplies observers with vehicles, drivers, guards and wireless operators—and by the creation last November of a Peace Observation Commission charged with drawing the attention of the General Assembly to areas of potential danger.

There are several areas of potential trouble to which observers should be sent as soon as possible—for instance, Jugoslavia's eastern frontiers and the Punjab border between India and Pakistan. If it is argued that the arrival of observers heightens tension by emphasising the risks of a local situation, the answer surely is that the more widely the idea is used, the less alarm will be caused by each successive attempt to forestall trouble rather than deal with it at the eleventh hour. The chief remaining obstacle is the fact that the consent of the government of a country has to be obtained before observers can be placed in its territory. This difficulty could be overcome if as many nations as possible would pledge themselves in advance to admit United Nations observers at any time on a request from the Secretary-General, in the same way that many of them have undertaken in advance to accept the rulings of the International Court.

Agenda for the Age of Inflation—I

(By a Correspondent)

This is the first of a short series of articles in which the author gives reasons for his belief that prices will continue, on the average of years, to rise, and outlines some of the conclusions that should be drawn. His views should not be taken as necessarily coinciding with those of The Economist.

THE purpose of this series of articles is to show that prices will continue to rise as far as human wisdom can see ahead, that this fact must be candidly recognised and that we must adapt many of our institutions to it. Inflation, properly speaking, is not the same thing as rises in prices; it may be defined as too much money chasing too few goods, and rising prices are merely a symptom of it. Indeed, it is arguable that some price rises are deflationary. Nevertheless, common practice uses the word in both senses; and for convenience, common practice is followed here.

In the United Kingdom wholesale and retail prices have risen since 1913 as follows (1938 = 100):—

	Cost of Living	Wholesale Prices		Cost of Living	Wholesale Prices
1914.....	69	83	1939.....	97	191
1920.....	180	254	1945.....	152	167
1921.....	155	163	1946.....	159	173
1929.....	105	113	1947.....	168	189
1932.....	92	84	1948.....	182	216
1937.....	99	107	1949.....	186	227
1938.....	100	100	1950.....	189	259

Sources: Cost of Living: National Income White Papers back to 1938, then Ministry of Labour; Wholesale Prices: Board of Trade.

In the previous century, from the resumption of gold payments in 1819 until 1914, wholesale prices fell, through many fluctuations, by about 30 per cent.

While it is true that the 1920 peak has even now barely been passed, this time there has been a steady increase in the postwar period, without the least sign of a falling off. *This rise in prices will continue for so far as can be seen ahead.* What are the reasons for this moderately confident prophecy? We shall approach this matter by seeing what tendencies, inflationary or deflationary, have newly arisen since the nineteenth century, which was one of stable prices.

(1) *War and the cold war.* These are sufficient cause in themselves without any assistance from the long list that follows. History does not record a war or near-war that did not raise prices. Let us note in particular that rearmament will not cease after a few years to be inflationary, even if a bigger fighting war does not break out, for weapons of war obsolesce and require to be replaced. There is, to be sure, a mobilisation hump to be got over, but it will be succeeded by a gentle and indefinitely long climb.

(2) *The strength of trade unions.* There is a constant tendency in all free countries for trade unions to become stronger. In particular, rising prices are driving more and more salaried workers into unions. This means that wage claims are less and less resistible and there is a pressure from below on prices through costs, which, whether we call it inflation or not, is also quite strong enough by itself to raise prices indefinitely. This tendency is enhanced by full employment, to which nearly every government in the world is committed. Only an intolerable degree of unemployment could keep modern trade unions in order.

(3) *The sacrosanctity of full employment.* Since the Keynesian revolution in economic thought, inflation has been admitted to have a good side. For inflation is nine-tenths of *any* practical full employment policy. Measures for increasing the mobility of labour, the financing of public works and social services by progressive taxation and other non-inflationary measures, are mere bagatelles. The main weapons are budget deficits, cheap money, devaluation, etc., all of them more or less inflationary. Now that the connection between inflation and full employment has been grasped, the public will be much more willing to accept the former—in the opinion of the writer, rightly so.

(4) There are other aspects of Keynes's doctrines, apart from the central full-employment thesis, and not all of them equally valid. The desirability of cheap money under all circumstances, the implication that internal prosperity can be achieved without reference to international trade, the doctrine that investment automatically generates saving equal to itself, so that no extra effort is required to finance new investment: all these appear to be false, or at least very misleading. Some of them are mere misunderstandings of points on which Keynes expressed himself obscurely, and some are positive mistakes that he made. But in either case they will take a long time to root out of the public mind and their effect is inflationary.

(5) *The shift of all democratic countries to the Left.* Deflation is essentially a Right Wing measure, and, even more important, it is "undemocratic." By this is meant that it hurts a few voters immediately a great deal, rather than many voters a little in the long run, as does inflation. It is very much easier to grant some particular wage claim, tariff or subsidy, in order to level up the money incomes of those who have fallen behind, than to cut the money incomes of everyone else back to the old level, though in the long run the effect on the real income of the parties concerned is the same. The Century of the Common Man is no time for orthodox finance. Moreover, all governments underestimate the inflationary forces at work during an inflation. They are bound to accept the more optimistic of any two estimates put forward. If they do not they are replaced by governments that do.

(6) *Social services.* These are clearly an inexhaustible drain upon the government purse. So long as the government is directly responsible for the incomes of so many defenceless individuals—and this is, of course, a good thing on the whole—it will always be spending more rather than taxing less and this makes it much harder to balance the budget.

(7) *The trend towards equality of incomes and of capital wealth.* Less will be saved out of a given income the more equally it is distributed. The rich pay their taxes largely out of that part of income they would have saved, and the poor largely consume the extra income they receive. It is arguable that, given time, the rich may accustom themselves to their lower incomes and begin again to save, but it is also true—and very much more important—that communities as they grow richer become accustomed to a higher standard of living and save less out of any given income. So that if the rich may regain the saving habit the poor will certainly lose it.

(8) *The price control habit.* If demand is thwarted in one place it will reappear unabated in another, and the effect in the free sector will be more violent than ever. Only if there is no free sector at all will this system work; and the control of all prices whatsoever is not an administrative or political possibility. Price control, then, is clearly mere preaching at symptoms. It is in any case nearly useless unless very little is imported; a condition which can never hold for Britain. Nevertheless, belief in this panacea prevents governments from getting at the cause behind the symptoms.

(9) Moreover some price controls have an upward, not a downward, bias. The sellers of the goods concerned are politically so powerful that the intervention of government in the free market helps rather than hinders them. This is not true, even in a socialist country, in the case of wage-earners, though from time to time specific interventions in labour disputes do raise wages. But it is true of that more powerful *bloc*, the farming community, which unlike labour, never allows ideological considerations of any sort to inhibit economic self-seeking. Farm price support schemes and bulk or long-term contracts of all kinds tend much more often than not to raise prices.

(10) Again, all the foregoing tendencies, with insignificant exceptions, are world-wide. Even if we could master them all at home we should still have to import them. Britain is peculiarly ill-equipped to isolate itself from world trends. The cost of a successfully isolationist policy would be prohibitive in the loss of trade and political influence.

(11) Further there are a number of highly inflationary international tendencies. The first of these is *the end of free trade.* Protection always has an inflationary effect at the moment when it is imposed, for it raises the prices

of certain imports and stimulates the demand for import substitutes, while its depressing effect upon exports takes longer to work out. Similarly, the liberalisation of trade is deflationary in the first instance, and very often it is necessary to avoid inflation in order to keep trade free. It follows that not only is the end of free trade partly the effect of inflation but also in turn its cause, as the determination to keep trade free at all costs imposed a powerful barrier to increases in the quantity of money.

(12) *The end of the gold standard.* Currency controls as well as tariffs isolate the internal price level and enable it to rise above that of the outside world with impunity, at least for a time. When the inevitable correction imposes itself it may take the form of sanctifying the new internal price level and bridging the gap by devaluation. Similarly losses of gold and foreign currency reserves may long be neglected and be corrected in the end, not as of old by deflation, but by devaluation. But this latter is itself obviously inflationary.

(13) A corollary to these two items is the headlong urge towards industrialisation on the part of backward, but politically independent countries. This industrialisation does nothing to enhance the international division of labour and is not undertaken for profit. It is on the contrary very autarkic, requiring protection and subsidies. It follows that even where it raises the standard of life—a question that does not here arise—it is an exceptionally inflationary form of investment.

(14) *The new habit of inter-governmental charity.* In the past if a country, through inflation or any other cause, was running an unfavourable balance of payments it had to stand on its own feet in the end and check the outflow by deflation. Since the last war, however, inflation in Britain and Europe has been floated off by Marshall Aid and the price level has never had to come down. Similarly Indian inflation may well be floated off by the Colombo Plan. The unfavourable trade balance, in other words, is usually met by a kind fairy from without and the spending spree may continue. Moreover, the act of charity inflates the kind fairy in her turn. We have in fact passed from the Welfare State to the Welfare World. We do not equalise incomes only within, but also between, nations, and this depresses the rate of world saving still further.

Laisser faire, peace, the buyer's market for labour, gold fetishism, the religion of free trade and the belief that nothing need be, or at least could be, done to prevent unemployment have all gone, and it is very difficult to think of any new deflationary factors of any magnitude to set on the other side. Indeed, there never have been any really serious deflationary forces at work except in the nineteenth century. The whole history of mankind, but for this interval, has been one of inflation. In the nineteenth century there was no floor and no ceiling to prices. Now there is merely no ceiling.

What would be required to keep the price level stable in the circumstances? Little less, perhaps, than a wage stop, a comprehensive price stop, a large budget surplus every year, a bank rate of 4 per cent, an unemployment rate of 4 per cent and a periodic appreciation of the pound. Any one of these conditions is unthinkable, let alone the combination of them. It will be seen that, if politics is the art of the possible, stable prices are not politics. All sensible men will earnestly desire stable prices, and be prepared to make great sacrifices to this end. But no sensible man will rely on achieving it.

(To be continued)

NOTES OF THE WEEK

Mr Stokes and the Persians

The day-to-day hazards to which the Stokes mission to Teheran is being subjected illustrate vividly the chaotic state of internal affairs in Persia. On Wednesday, just when Mr Stokes was explaining the technicalities of his oil proposals to interested and important Persians, Dr Mossadegh's extremist deputy premier, Hussein Fatemi, was publicly writing the terms off as unacceptable. This in spite of the generosity of the offer, which accepts nationalisation, winds up Anglo-Iranian operations inside Persia, affords the Persian state control of extraction and exploitation of oil, and yields it an adequate financial return as well as a sure market for a period of years to be chosen by Persians. The rub for Dr Fatemi lies in the clause which prescribes that the oilfields and refinery shall, in order to retain the services of good technicians, operate under "experienced and qualified" (i.e. foreign) management.

The explanation of these contradictions in Teheran is that inside four walls—but not for admission outside them—the Mossadegh cabinet now has a divided mind. Several of its members are highly intelligent upper-class Persians, who have learnt during three months of office to appreciate a few hard facts: that Persia cannot maintain its present pattern of existence without revenue from oil; that Persians have not yet the training or capacity to extract sufficient revenue for that purpose; and that either the cabinet must come to some agreement with foreigners or else an unpaid army, civil service and police force will rebel and overthrow present leaders and, probably, the present social structure.

If Dr Mossadegh were publicly to admit these home truths, he would lose the support of the extremist faction which has formed the backbone of his personal following. So greatly do personalities dominate Persian politics that—were he to jettison this fanatic fringe—he could not be sure of replacing it with a posse of moderate supporters. Many moderates who see the great advantages of the Stokes proposals might vote against him out of unwillingness to create a situation in which he would scoop the credit for an oil agreement. What is more, any deviation, even by a little, from the position of the extremist National Front stand might cost him his life. Mullah Kashani openly warned Mr Stokes that any weakening on Dr Mossadegh's part might earn him the fate of his murdered predecessor, Ali Razmara. Dr Mossadegh is, therefore, a prisoner of the state of near-anarchy into which weakness at the top has allowed the Persian domestic scene to lapse.

*

On account of this disastrous weakness inside Persia, the odds against Mr Stokes were always great. He has done as well as he could in complex and trying circumstances. At least he has worked the Persians into a position in which the responsibility for any breakdown of reasonable negotiations will lie with them in the eyes of all the world. What else can be thought of people who know they have not the personnel and experience to process and market their wealth, but who turn down every proposal that would create in competent foreigners a willingness to do it for them?

Gromyko Will Be There

Western diplomacy has to prepare for an unruly—and possibly tense—September now that Moscow has accepted the invitation to attend the conference in San Francisco for the signing of the Japanese peace treaty. A year or two ago this acceptance, after the prolonged Soviet refusal to have anything to do with a treaty not prepared by the Council of Foreign Ministers, would have been welcomed as a sign of willingness to resolve disputes through international negotiation. Unfortunately, the bitter experience of Soviet behaviour both in the United Nations over Korea and in the deputies' agenda conference in Paris has soured such hopes. Until there is some evidence of a new spirit in Soviet foreign policy, it is only prudent to assume that the main purpose in sending Mr Gromyko to an international conference is to use it as a sounding-board for propaganda in support of the thesis that the western powers are responsible for the tension of the contemporary world.

The San Francisco meeting may afford a great opportunity for disruptive Soviet diplomacy. Although a draft treaty has now been agreed between America, Britain, and a number of the other allies of the Pacific war, there is widespread uneasiness, not least in Japan itself, at the prospect of a treaty which leaves out the Soviet Union and China; there is discontent in the Philippines and elsewhere at the cancellation of Japan's reparation liabilities; and the fundamental disagreement between London and Washington over the recognition of Communist China has been resolved only by a very unsatisfactory compromise. Mr Gromyko will presumably make new proposals at the conference and thus the old issues will be reopened. In the end he will probably not sign any treaty, but meanwhile his objections to the draft will have received some weeks of dramatic publicity.

Since Mr Malik hinted seven weeks ago at possibilities of a cease fire in Korea there have been signs that Soviet diplomacy might work towards a showdown—or a great general debate—on Asian affairs, and that the settlement of the Korean question and the signing of the Japanese peace treaty might become formally linked with the now familiar demand for a five-power "pact of peace." Whether Moscow has in mind some kind of bargain is uncertain, but it may well feel that the free world's solidarity is more vulnerable east of Suez than it is west of the Elbe. With the Communists in Korea building up their strength fast and their delegation at Kaesong showing little desire to bring the war to an end, there is clearly a possibility that events are moving not towards a settlement of the Far Eastern conflict but towards a more difficult and dangerous phase. The portents must be squarely faced by Ministers and public opinion in this country.

* * *

Polls and Prices

The summertime swing in political opinion seems to have been stopped last month. According to the Gallup Poll, this swing had by the end of June narrowed the Conservative lead over Labour in popular favour to 7 per cent of the electorate. The latest figures, published by the *News Chronicle* this week, show that at the end of July the Conservative lead had increased again to 10 per cent of the electorate—or rather, of those who thought they knew how they would vote in a general election. Though many uncertainties have to be reckoned with in interpreting this result, it means that there is again little reasonable doubt that the Conservative party could win an immediate election.

There are no clear reasons why the trend of opinion in the Government's favour should have been reversed just before the holidays; the event is consequently good reason for concern at Transport House. If the new state of public opinion is confirmed by the next poll, opinion within the Labour party will certainly become more unfavourable to the idea of an autumn election. It would, however, be rash to assume that Mr Attlee's decision to dissolve Parliament will ever be taken according to any precise tactical calculations. The party's strategists may in the meantime occupy themselves in arguing whether or not circumstances will be more favourable to Labour in the spring, but the impression they give is one of singing to keep their courage up without knowing where they are going either politically or economically.

Sir Hartley Shawcross has this week committed himself to the "hope" that prices will reach their peak by the end of the year. "After that . . . the downward trend may be expected to appear." This is what it is convenient to believe, but the basis for it seems slight. No one doubts that some raw material costs, reflecting after a lag the behaviour of the commodity markets, will at least fall before they rise again. But the movement of this country's internal costs is more certain in direction and is likely to be more important in size. Sir Hartley did, indeed, insert the proviso that the country had to be "sensible and resolute enough to avoid the dangers of runaway inflation," but since he also asserted that "certainly the situation is under control" the optimistic effect was not spoiled. Mr Jay, with more experience of economics, has been more cautious; his fair words last weekend were concentrated on the hope that in the next few months prices would not rise so steeply as they did in the first half of the year.

* * *

Shortages Begin at Home

This winter British industry may still suffer some inconvenience from the world shortages of raw materials about which Ministers, as well as Mr Bevan, have made so much complaint. But the volume of production will depend far more closely on the severity of Britain's home-produced shortages; and the worst of these shortages happen to be in the nationalised industries—in steel, transport, fuel and power. This has not been a week in which nationalisation has conspicuously demonstrated those advantages over private industry so often set out in Labour party pamphlets. The Yorkshire miners evidently do not respond to the incentive of working for the community. In spite of the manpower shortage which next year may plunge all industry into a fuel crisis, in spite of their promise to accept foreign workers as a condition of their wage increase in January, most of them have refused to admit Italian workers to the pits. The nationalised steel industry finds the promised cheapness and plenty receding into the distance. The increases in steel prices announced this week were inevitable, given the rise in costs of raw materials, wages and freight, and it is a pity that they were not made before; but it makes poor Socialist propaganda that there have been two general increases in price since steel was nationalised, and none for two and a half years before.

Power cuts in August make an even worse impression. With some generating capacity out of commission for the usual summer overhaul, supply has been inadequate for the unexpectedly cold weather; and in some northern power stations overtime is now banned in support of a claim for a 10 per cent wage increase. This is the shape of things to come. The shortage of power this winter promises to be worse than ever before. The building of new power stations lags farther than ever behind the demand at peak hours as the defence industries make new calls on supply, and as the use of electricity in the home rises steadily. That increase is the consequence of income inflation, of high sales of electric appliances—still obtainable on hire purchase and much used in new municipal houses—and of the absurd promotional advertising that the British Electricity Authority has refused to drop until this year. Thus do the policies of the planned state cancel each other out.

The Electricity Sub-Committee of the Joint Consultative Committee last week made recommendations to minimise

load shedding and the consequent loss of production. It proposed the "staggering" of working hours on a very wide scale in order to reduce the "peak load" by 600 megawatts —twice the reduction secured by similar measures last winter. (The proposals are discussed in a Business Note on another page.) The power shortage is here to stay and the makeshift remedies become more drastic. The electoral consequences of a grim winter seem far more real than the hypothetical advantages of a lower cost-of-living in the spring. When they think about the date of an election, there must be many members of the Government who would still prefer to strike while the iron can still become hot.

* * *

Mr Gaitskell and the Unions

The Chancellor of the Exchequer must have been sadly disappointed by the annual conference this week of the Confederation of Shipbuilding and Engineering Unions. It hardly supported his hopes about the "psychological" effect of dividend control. Besides agreeing on a wage claim of £1 a week for their 2,500,000 members, the engineering unions gave emphatic warning of the harshness of the criticism the Government must now expect from the unions.

The tone for the conference's debate on "the present relationship between profits, wages and the cost of living" had been set by Mr Brotherton in his presidential address on Tuesday. He began by asserting that the real earnings of engineering workers had been reduced by about 15s. a week in the last year and ended by reminding "our colleagues on the political wing of the movement" that the unions had refrained from pressing for more money "until the outrageous increase in profits and prices showed us to be the victims of an economic swindle." He did not imply that the Government had been a party to this swindle. However, he obviously felt that the Labour Party was no longer competent to deal with it. Mr Gaitskell's proposal to control dividends was "apparently supposed to have a psychological effect on the workers" but "I think this is to suppose that the working people of this country are very immature."

The unions, Mr Brotherton said, must continue to advance and protect their members' interests "irrespective of the nature of the Government of the day" or they will have no purpose or influence in industrial life. Just now "it is frankly intolerable that profits should be leaping ahead while wage advances are not even sufficient to keep pace with the cost of living"; and Mr Brotherton concluded that "the socially unbalanced results of a system of private enterprise can only be halted when the system is ended, and in the meantime we say bluntly that if profits are going up so are wages." The fallacies of Mr Brotherton's case are obvious enough, but his colleagues "on the political wing of the movement" should have no illusion that they can expose them effectively by a policy of appeasement.

* * *

Quarrel Over German Coal

The high standard of integrity and public spirit that statesmen must display if national interests are to be reconciled in Europe's co-operative institutions is seldom grasped. Those who wish to understand should study the arguments that are now raging, and will doubtless continue to rage, around Europe's coal needs. In Western Germany the threatened resignation of Herr Blücher, Minister for European Recovery Plan Affairs, from the international Ruhr Authority brings to a head the dispute over German coal exports. American, British and Benelux representatives on the Ruhr Authority, having fixed German coal exports for the current quarter at 6,200,000 tons, last week refused to reduce the amount. Since the quantity was originally fixed, it has transpired that the Germans have secured—partly, indeed, by costly American coal imports—some 2,000,000 tons more for their home consumption than they estimated. Suspicion naturally attaches to their present claim that, if industry is not to contract, they need anything up to 1,000,000 tons a quarter more than the Ruhr Authority is prepared to allow them, and that, unless exports are cut, millions of freezing, unemployed Germans will turn Communist. German threats have almost always proved exaggerated, and there are good reasons for believing that Ruhr output could soon rise sufficiently to cover all winter needs and that much more could be done to prevent waste of fuel.

As France and other countries contributing to Atlantic defence are also short of coal, the solution should be sought in greater production, rather than in attempting—as the Bonn Government has now done—to deter purchasers by raising the export price of the Ruhr product. The Germans have certainly good grounds for objecting to the uneconomic price unilaterally imposed upon them, and for claiming that the Ruhr Authority has no right to prevent them from raising it; but they should try harder to check the drift from the mines. Even the lack of investment in the mines takes second place as a cause of the disappointing output to the appalling housing conditions. Thousands of miners still live in barracks and about 12,000 men have to live apart from their families.

Herr Blücher's threat to resign and take the matter up with heads of Government involves the wider question of German participation in all international bodies on which they will appear as equals, without a veto. Will they refuse to ratify the Schuman Plan because the Ruhr Authority's decisions have given them a foretaste of the way its High Authority will work? If a majority decision goes against them, will they always protest that it is contrary to the "European spirit" and walk out? The days of penal discrimination against Germany must indeed end; and the sooner the Schuman High Authority takes the place of the Ruhr Authority the better; but for their part, Germans must cease to make "Europe" synonymous with "Germany."

* * *

Rocks Ahead in German Waters

The difficulties that Herr Blücher—who is also chairman of the Free Democrat Party—is creating for Dr Adenauer are not limited to the Ruhr Authority. He is reported to have prepared a statement of demands to be made during negotiations with the Occupation Powers. The Free Democrats, it is said, claim that the Federal Republic must henceforth decide for itself such matters as its contribution to western defence, notably the extent of occupation costs, and its relations with the Soviet bloc. In the settlement of prewar debts, the German Government must not renounce its claim to offset against its debts the German assets abroad which were seized as reparations. Lastly, the allies must not insist that the Germans undertake to contribute men to the western forces before the Occupation Statute is replaced by freely negotiated contractual agreements.

These reported demands are probably accurate. They represent the opinion of the majority of the public, and it is known that Herr Blücher has been in consultation on such matters with the *Deutsche Partei*—the third member of the Bonn coalition—before visiting Dr Adenauer in his Swiss holiday resort. His *démarche* will make it still more difficult for the Chancellor to steer the German ship smoothly into western waters.

The German Government has reason to complain that it had no hand in drawing up the estimate for occupation costs, and this is a practice which must and will end with the signing of the new contractual agreements. But the German attitude over the question of occupation costs gives little ground for hope that they will use their coming freedom to make a satisfactory contribution to western burdens. Dr Schaeffer, the Federal Minister of Finance, remains manifestly unwilling to raise taxes to meet the Allied bill.

Both the Federal and *Laender* finances are in an increasingly deplorable condition owing to mismanagement and tax evasions. Dr Schaeffer hoped to avoid raising further taxes, except some minor ones imposed for "optical purposes," by transferring DM 3,600 million of the bill for occupation costs to an extraordinary budget. It would then, he announced, probably be covered by a foreign credit. Last week, however, the High Commission informed him that no credit would be forthcoming, and that tax he must.

A voluntary German decision to join the Atlantic forces and share the western burdens is intended to go hand-in-hand with the conclusion of the new contractual agreements; but the task of drafting them is complicated and, despite American pressure for speed, the draft is not likely to be finished this year. It cannot be expected that it will satisfy all German demands. The High Commission, it is true, will become a Council of Ambassadors with no legislative powers. But the draft will ask for German guarantees that Allied measures, such as decartelisation and deconcentration, shall not be undone, and will provide various means to safeguard the security and rights of the forces stationed on German soil. It will, moreover, enable the Western Governments to resume full powers in an emergency. In order to retain the rights—particularly in Berlin—which arise from agreements with the Russians, care has been taken to see that the new contracts shall not formally constitute a peace treaty.

* * *

Anxious August for M. Pleven

On Tuesday M. Pleven's new Government will begin to test itself against the hard realities of French politics. The National Assembly has voted for the new Prime Minister and for his 37 Ministers; but it is far from certain that it will vote for his policies. During the last ten days of August the rival claims of Catholic and State schools must again be debated, with no certainty of an agreed solution. M. Pleven has listed three economic problems as requiring urgent attention: the fixing of the price of wheat, the procurement of coal, and the replenishing of the almost empty coffers of the social security system. With much of the harvest already in, the urgent need for a new price for wheat is obvious. M. Pleven, who has appointed members of the Peasant Party as both Minister and Secretary of State for Agriculture, and who is fully aware of his dependence on this group's support, must listen sympathetically to the farmers' demand for a substantial increase; but to satisfy their full demands would put prices up by 46 per cent. Even a modest increase may necessitate a new subsidy for the benefit of the consumer, and both the social security system and the coal supply programme are rival claimants for subsidies. Although France hopes to mine 2,000,000 more tons of coal this year than last, imports of American coal are rising rapidly. The new Government has indicated its intention of tackling these urgent problems vigorously by the appointment of M. René Mayer as Vice-Premier in charge of economic affairs, with authority over all the six Ministers concerned. But the continuation of the Monnet plan for economic rehabilitation—which is discussed on page 401—cannot be assured by the adroit distribution of portfolios. Whatever truth there is in Frenchmen's claims that their country gets along just as well without a government, long-term economic planning must depend on governmental stability, which is not yet in sight.

The New Rifle, Continued

At a demonstration last week before foreign military representatives and the press, the technical merits of the new 7-mm. (or .280-inch) British rifle were shown off. They are, indeed, very impressive. The most important items are speed of firing (nearly twice as fast as the American Garand and nearly three times as fast as the Lee Enfield) and weight of ammunition (a division could carry nearly a million more rounds without additional transport). Beside these, the fact that it has slightly less penetrative power is of much less moment; a division equipped with the new rifle could kill many more men, at the ranges that are likely to matter, than one equipped with any other rifle in existence. What is more, it could do so in arctic or tropical conditions and away from metalled roads.

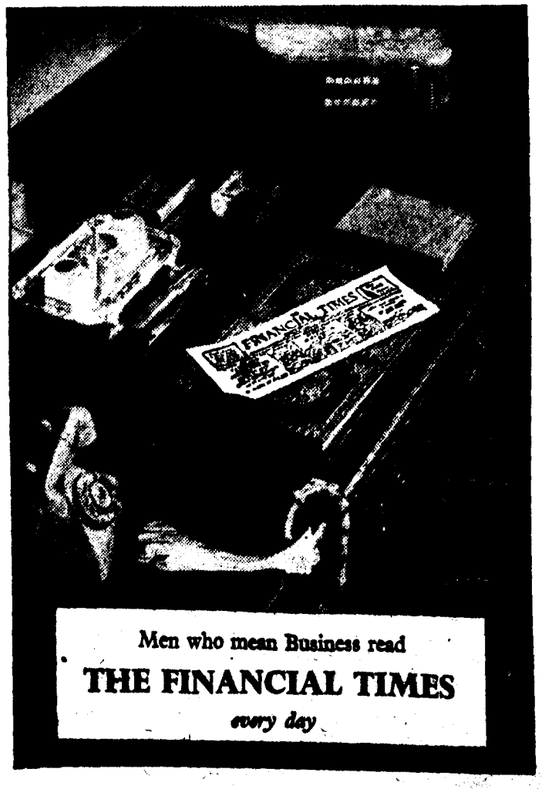
It seems, therefore, to be established that this is the best infantry weapon yet designed. But that fact unfortunately does not settle the argument. Even apart from the quite extraordinary unwillingness of the American military to accept any foreign design of anything, there is the very strong argument that any attempt to change calibres now would inevitably mean, for a period perhaps as long as four years, that the allied armies would have less, not more, small arms fire power.

Perhaps the time table can be used to work out the best solution. First, for the period of the present emergency, it would be wrong to insist on a standardisation that would involve changing the whole of the existing capacity for small arms ammunition. In point of fact, it may be that full standardisation is impossible within that period, and that if another war comes before 1955, it will be fought, as the last war was, with a multiplicity of calibres. To put off standardisation of small arms for this period would be a tragedy, and a condemnation of short-sightedness in the past; but it may well be that there is nothing else to be done.

But if standardisation cannot be hurried, it can be based on the best design. For this, the new British rifle and the calibre of 7 millimetres are obviously most impressive contenders—the more so since, in designing the new ammunition, the ease of conversion to it of existing weapons has been borne in mind. For the short run, in fact, production considerations must prevail; but for the long run, standardisation should be planned on the basis of the best available design. If the British could make it clearer that they do not challenge the first argument, they would be justified in insisting that the Americans accept the second.

* * *

One Cost of Living for All



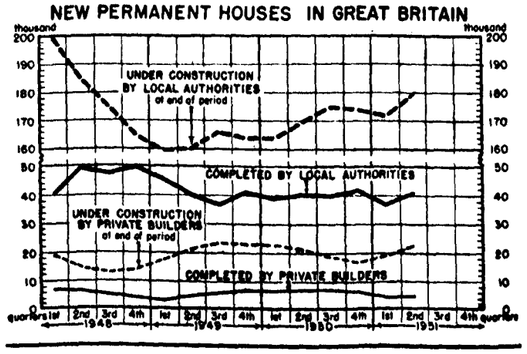
In broad outline the Government's plans for introducing a new cost of living index are now known. The Minister of Labour has accepted the recommendations of the Cost of Living Advisory Committee, and a large-scale inquiry into the spending habits of the community is to be made. The final outcome will be a new index, which will probably be related to the budgets of those households in which the main income-earner receives between £150 and £1,000 a year; this group represents about 85 per cent of the population. These income limits may, however, be modified when the results of the enquiry are known, which will not be for about two years. Details about the information required have still to be thrashed out and much depends on the technical committee's report—expected in about a month—on the working of the existing index of retail prices. Possible adjustments to the present index are also being considered as a temporary expedient.

At present the wages of more than 1,500,000 workers are linked to the interim index. This index is based on the prewar spending habits (adjusted to 1947 prices) of manual wage-earners and those salary-earners then paid less than £250 a year; these were the people covered by unemploy-

ment insurance before the war. Many salary-earners, as well as wage-earners, use the index in arguments for higher pay, though they often demand a different measurement on the grounds that the cost of living has increased more for the middle classes than for wage earners. By proposing to widen the scope of the new index to take in salary-earners and the self-employed with moderate incomes, the Government is hoping to satisfy all demands at one go. Whether it succeeds will depend on what the budget inquiry shows about the variation in spending habits between different groups. Since many wages are now higher than salaries, and social security has been extended to all, some of the prewar distinctions have been removed. What is certain is that if salary-earners still feel the need for separate index numbers, the inquiry will at least provide research workers with better material for unofficial estimates.

The interim index is in disrepute mainly because its weighting is believed to be out of date. There is an even more important aspect of the matter. In attempting to compile a single index for a fairly wide range of incomes, the Government is setting itself a hard task in selecting appropriate items to be included in the index and collecting representative information about their prices. Confidence in the result will depend on a full analysis of the budget inquiry and of the way in which its findings are used to construct an index.

While it is certainly to be hoped that the result will be a more reliable index, to be used as a guide in wage negotiations, it would be a great pity if such an improvement led to any extension of the practice of linking either wages or salaries rigidly to changes in living costs. The old problem of the contrast between "sheltered" and "unsheltered" industries is involved. Attempts to provide security in real incomes for some people are bound to mean that others must bear more than their share of the costs and gains from unavoidable economic changes.



More Houses Being Built

It is to be hoped that the rise in the number of houses under construction, shown in the latest quarterly returns, does not mean that the building programme is again getting out of control. Since the end of 1948, after the concentration on completing houses rather than starting new ones had had a noticeable effect on the number of houses under construction, the ratio of completed to unfinished houses has been fairly stable. In the quarter ended last June, however, the number of houses under construction rose significantly and is now higher than it has been for three years. The number of houses completed remained at the level at which it has been stabilised for the last two years.

Possibly the bad weather last winter delayed the start on many houses, so that the rise shown in the June quarter may be temporary. If so, one would have expected it to be balanced by a similar rise in the number of houses completed.

NEW PERMANENT HOUSES IN GREAT BRITAIN

There was a small fall in the housing labour force compared with the similar quarter of last year. If this means that labour is beginning to be drawn from houses to rearmament, it is particularly important that the smaller labour force should not be dispersed on starting more houses than can be completed at the same rate.

The June figures cannot be expected to show any results from a circular issued this spring by the Ministry of Local Government and Planning and allowing local authorities to build smaller three-bedroomed houses. But this permission, and official encouragement to build more very small houses for the old and the childless, may help to speed up the rate of building in the coming months.

* * *

Supplies for Formosa

As soon as the peace treaty with Japan is signed, Formosa will cease to be what it legally is now—Chinese-occupied Japanese territory; and there will no longer be any doubt that it is what both Mao Tse-tung and Chiang Kai-shek declare it already to be—a part of China. The question of its future will then be clarified to the extent that any action subsequently taken by the United States to keep the Chinese Communists out of Formosa will have to be based exclusively on the right to assist a friendly, recognised government against internal enemies who are also hostile to the United States. As far as can be inferred from the statements made by American defence chiefs in the MacArthur inquiry, it is now American policy on strategic grounds that the island must not be allowed to fall into Communist hands, at least until Peking has given evidence of a profound change of attitude. Such a policy logically implies continued diplomatic recognition of Chiang Kai-shek and non-recognition of the Peking Government, for support of resistance in Formosa would be incompatible in international law and in day-to-day practice with the recognition of Peking.

A somewhat similar situation to that which now exists with regard to Formosa arose in 1939 over Minorca. At that time the resistance of the Spanish Republican Government had collapsed and Spain was being taken over by General Franco, who was expected to side with Germany and Italy in the event of a European war. In France it was strongly urged that French naval protection should be given to the Republican garrison holding out in the island of Minorca, strategically placed on the sea route between France and Algeria. In the end no action was taken, but the principle involved was the same. In the present case there seems no reason to expect that American policy will quickly change from the course adopted since the beginning of the Korean war, of helping Chiang Kai-shek to hold out in Formosa. Considerable supplies are now going there for both military and economic aid, and Taipeh representatives are buying in Washington under an ECA grant. The prevailing American view is that even a small bird in the hand is worth several in the people's democratic bush. There is, however, a danger of a fresh strain on Anglo-American relations when—if at all—the Korean war comes to an end; for the British Government's hopes of a Far Eastern settlement depend on a general recognition of the Peking regime. If America follows the opposite course, Britain may have to choose between a serious conflict of policy with America and an attitude of mere passivity in Far Eastern affairs. Those who oppose aid to Chiang and would like to see Formosa in Communist hands have yet to suggest a place to which he and his 600,000 Nationalist followers might migrate.

Zionism at a Crossroads

The emotions that spring from a sense of fulfilment were amply—and quite justifiably—displayed at the opening ceremonies of the 23rd World Zionist Congress, which took place in Jerusalem this week. It is fifty-four years since the first such congress, meeting in Basle amid the distress created by the Dreyfus case, set as its aim the establishment of a Jewish national home in Palestine. This year, for the first time, the congress is able to meet in the city of Zion and in the state of Israel. The "Basle programme" is therefore out of date.

What is to take its place? If the state of Israel were economically strong enough to dispense with outside aid, or if all Zionists were so far to fulfil their creed as to consider themselves exiles and migrate to Israel, the World Zionist Organisation would have no reason for existence in its present shape. As neither hypothesis is likely to become fact, a "Jerusalem plan" must be devised in order to find a new direction for the energies of the powerful human machine built up over two generations. The attempt is causing tremendous dissension.

Some peculiar problems are raised. For instance, how far is it prudent for the World Zionist Organisation to work for political support for Israel among the Jews of the Diaspora? Many Jews feel, and with some reason, that to create a series of national pressure groups could jeopardise the position of Jews as citizens of the country of their choice. A second question, which splits opinion inside the right wing of world Jewry, is how far the collectors of the dollar gifts that keep Israel solvent shall have a say in the internal affairs of the new state. The left wing of Jewry, of which Mr Ben Gurion is the seer and figurehead, is hotly opposed to any such practice; much hangs on the attitude of the corresponding right-wing figurehead, Dr Aba Hillel Silver of the United States. A more domestic and even thornier problem is how to define the future role of the Jewish Agency *vis-à-vis* the World Zionist Organisation, from which it sprang in 1929, in order to make room for the participation of non-Zionist Jews in effort for Palestine. At many points the two bodies now overlap and clash.

Radical reorganisation of the tasks of long-standing institutions is always difficult; vested interests tend to fight for the retention of rights and duties. Jews, moreover, are notoriously uncompromising people, and the Congress faces an unenviable task. Yet it would be a tragic anticlimax if the Congress were to fail at this first meeting in Jerusalem to produce any clear-cut solutions. It would let down world Jewry as a whole were it to disperse, as at least one earlier congress has done, on a note of agreement that differing factions shall continue on their unbending ways.

* * *

The Balloons Go Up

Leaflet balloon warfare has now been launched by an organisation of East European exiles with its centre in Munich. Czechoslovakia is the first target, and the airborne leaflets will not only carry anti-Communist propaganda to the Czechs, but will also provide particulars of times and wave-lengths for the radio broadcasts which are being sent out by the organisation. Undoubtedly, this is an important and serious move in support of the resistance to Communism behind the iron curtain, but the very fact that such an extremely ridiculous procedure has to be used in order that one part of mankind may speak to another gives the measure of the sad condition into which Europe has fallen. In Czechoslovakia and other lands the Communist monopoly of thought will now be infringed by the noxious emissaries of political liberty drifting on the winds of heaven, and their rulers must indeed suffer the nemesis of the Soviet boasts in recent controversy that Communism does not try to cut off the peoples under its sway from communication with the outside world.

Practically Ministers of the Interior are faced with a number of difficult problems. They may feel that the bourgeoisie in sending balloons over the iron curtain is hitting below the belt, but that will not stop the balloons coming. As the prevailing winds of Europe are westerly, the west has the advantage over the east in this form of warfare, and in any case retaliation in kind would be useless, for the airborne leaflet loses its sting when the Communist party can do its screaming quite legally. One can, of course, shoot down balloons, but if there are a great many of them, some will accomplish their purpose; as the late Lord Baldwin would have said, "The balloon will always get through." After all the precautions that have been taken to seal the land boundaries of the Kremlin's empire with barbed wire, control points, and security officials, both canine and human, it must be quite unnerving to think of the silent messengers of the free world flitting high overhead in the darkness to wreak havoc with the people's simple faith in the sober Gottwald and the kindly Stalin. It may not be cricket, but even the most scrupulous liberal will not refrain from wishing good luck to the gunners in this long-distance mental bombardment, and to the messages that have gone with the wind.

The Fourth Birthday

On two different days of this week, first Pakistan and then India celebrated the fourth anniversary of independence. This difference of view over what is in fact one date is symbolic of the deadly hair-splitting which now goes on day in and day out between the two capitals of this divided sub-continent. This year the anniversary has come at a moment when an acrid exchange of letters, speeches, and telegrams between the two prime ministers, Mr Nehru and Mr Liaquat Ali Kahn, has carried the Kashmir dispute

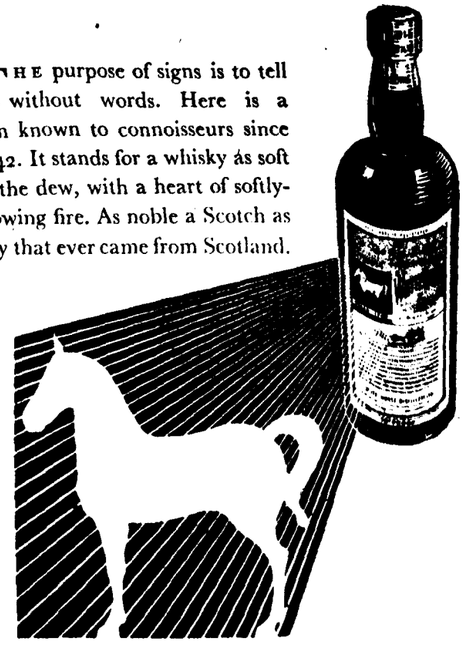
Whenever Export figures are quoted there comes the accustomed reference to 'expert British Craftsmanship.' But . . . have you stopped to ask yourself . . .

"Who are Britain's Craftsmen?"

Illustration: Courtesy of Mr. H. W. Rolls and Messrs Walter Carson & Sons Ltd. Battersea, London, S.W.11

*Introducing Harry Rolls, general foreman and chief colour-matcher in a London paint factory where he has worked for 53 years. Machines have replaced men on most paint processes, but a trained eye and skilled judgment will always be in demand for colour matching. Paint and Varnish are leading items among our list of Exports.**

But..does craftsmanship mean only hand-craftsmanship? Consider the production of the pigments, plasticizers and other materials which are blended into paint. If there has not been craftsmanship in their production also, then the skill of the paint maker and of the painter will surely be wasted. And if the finished article is to be a masterpiece must there not be craftsmanship at every stage of its production?



Monsanto think so and they follow this rule in making chemicals for a long list of British industries. Monsanto plasticizers, preservatives and basic chemicals play an important part in the preparation of paints and finishes for goods of many kinds.

Monsanto make over 200 chemicals for use in industry. Of widely varying application, they all conform to the highest standards of craftsmanship in chemical manufacture.

THE purpose of signs is to tell without words. Here is a sign known to connoisseurs since 1742. It stands for a whisky as soft as the dew, with a heart of softly-glowing fire. As noble a Scotch as any that ever came from Scotland.

WHITE HORSE
Scotch Whisky

MAXIMUM PRICES:—Bottles 35/-, ½-Bottles 18/3, ¼-Bottles 9/6, Miniature Bottles 3/8 as fixed by the Scotch Whisky Association.

another step further on the road to nowhere. Again this week Mr Nehru has spoken of his deep desire for peace with Pakistan and he is certainly sincere, with that all-excluding sincerity that has made his reputation. But there can be no denying that his terms have created an atmosphere of crisis in Karachi, and that as the summer of 1951 draws on the situation is growing worse rather than better.

For the moment, although the Pakistan press is in a hysterical mood, well-informed people in Karachi do not believe that war will start yet, simply because neither side wishes deliberately to attack the other. Nor has there so far been any exceptional movement of refugees in either direction, and this is a hopeful sign. On the other hand, there are two serious difficulties to be faced in the next two months, and September is likely to be an even more anxious period than either July or August. One will be the report to be drawn up by the UN mediator, Dr Graham. If he reports the failure of his mission, or if the Security Council fails to take prompt action on any recommendations he may make, there is no knowing when, or where, or how far the hotheads will force Mr Liaquat Ali Khan's hand. The other difficulty is the probable taking of a vote in the Kashmir Constituent Assembly for accession to India, and India's acceptance of this as a *fait accompli*. Such actions would contravene the Security Council's resolution of March 30th as a disposition of the state contrary to the agreed principles, and some Pakistanis might seek to treat that as a *casus belli*. They recognise the obvious danger that such a vote—although held in only the Indian-dominated section of the country—would give the world a colourable impression of the legality of India's absorption of Kashmir.

Although British opinion is now widely blamed in India for being pro-Pakistan, all that people in Britain desire is to be allowed to remain the loyal friends of both sides and that both should keep the peace. Whatever the rights and wrongs of the dispute, it is clear to the outsider that Pakistan must accept some of the blame for the sudden worsening of the situation. From June onwards Pakistanis seem to have lost patience very abruptly although a great deal was, and still is, running in their favour. They would be quite wrong to suppose that British sympathies would be extended to them if they now precipitated a war.

Local Government Efficiency

It is hard for the ordinary citizen to understand the crazy workings of local government, and he would be astonished if anyone were to calculate the time, typescript and talk taken for an official paid £2,000 a year to get £50 of expenditure approved. Stimulated by the Local Government Manpower Committee the London County Council has now done a useful piece of self-examination and has decided that to save manpower and to improve efficiency it will increase the area of delegation to its committees and officers.

The LCC could indeed have gone a great deal further; but under the pressure of its vast amount of business it already pushes down the chain of command a great deal of business which by other authorities is transacted protractedly and distractingly on the top. As was pointed out a year ago, in an article in *The Economist* of July 29, 1950, it would be possible to remove many of the criticisms of local government today by improvements in internal efficiency rather than by the much more cumbersome and possibly less effective method of altering the structure. Central government departments have made various efforts recently, particularly over schools and housing, to slough off some of their day to day control. None of these attempts has been startling, but they are in the right direction. Local authorities have not yet reciprocated. It may be that further reforms will come out of discussions which are now going on, but it is difficult to feel that any big changes are contemplated. As long as local authority members insist on the kind of detailed financial control they now exercise and are not prepared to give their chairmen and chief officers a much wider field of authority, so long will they be compelled, by the pressure of business, to muddle through, and to decide the biggest issues without proper discussion. It will need courage to undertake the necessary reforms, but without them more local government functions will almost inevitably be drawn into the net of central government.

Potatoes Reappear

The potato shortage which struck London and other towns last week is now almost at an end. There is always a tendency for potatoes to be scarce at this time of year; it is the "bridge period" between the earlies and the main crop which comes on to the market at the beginning of October. But this year that slight gap was very much exaggerated by the fact that the crop of second earlies was late and smaller than usual. The weather at planting time was very bad, and when at last the farmers were able to get on to their land to sow potatoes they were also busy sowing corn. The acreage sown to first earlies was 138,000 acres compared with 183,000 acres the year before. For second earlies and the main crop it was 595,000 acres in 1951 compared with 683,000 acres in 1950. Because the sowing was late the crop was backward, and because the early summer was dry the yield was below average.

The introduction of a controlled price of 2d. per lb. (unsubsidised) on August 1st encouraged farmers to sell all they could in July and as little as possible in August; it also concentrated the shortage in the towns by inducing them to sell some of their crop direct to consumers instead of to their usual merchants. The greengrocers therefore asked the Minister of Food to withdraw the price control, but Mr Webb argued that a high price for a week or two would encourage farmers to lift small potatoes, which would be better left to swell; it would thus be a wasteful use of the crop in the long run.

The whole episode certainly illustrates the inflexibility of price control in face of unusual circumstances. But Mr Webb was plainly right to stick to the control last week when once it had been imposed. His decision has been justified by the rapid recovery of supplies. This is due to the rains of the last ten days which have brought on the crop, and perhaps to the fact that farmers were glad to get their potatoes to market before the wholesale price fell by 10s. a ton on Wednesday. With the acreage of the main crop well below last year's, it is possible that the shortage may reappear after Christmas, but it is too soon to make a forecast.

Letters to the Editor

"One Way Only"

Sir,—I for one cannot agree with Mr Seers that "the threat of Communism stems from the disparity between the living standards that people believe they should have and what they actually enjoy." The threat of Communism seems to me to stem from the fact that the rulers in the Kremlin are dedicated both by Communist doctrine and by old-fashioned Russian imperialism to communise and conquer the world. That they will do without war is possible; otherwise, as Lenin remarked, he didn't mind if three-quarters of the human race perished so long as the quarter which survived was Communist.

That is not to say that we should not continue to do what we can, and as quickly as we can, to raise the living standards of the peoples of Asia and Africa. But this can only be a long-term plan which could have no immediate practical effect upon the ambitions of the Kremlin. Moreover, there is a characteristically pharasaical ring about these proposals. It is as if no one had ever given a thought to solve it. Persia is a typical (and topical) example. If ever given a thought to the problem before, still less done anything practical to solve it. Persia is a typical (and topical) example. If ever Western "economic and technical aid" made the desert blossom, it is there. There was mutual aid at its best. But I have yet to hear any of the authors protesting against Persian intransigence.—Yours faithfully,

GILBERT LONGDEN

House of Commons.

The Borderline of Treason

Sir,—Your thoughtful article in *The Economist* of August 11th must surely have made many of us re-assess certain values.

The great point that was made at the trial of William Joyce was brilliantly expressed as "Protection draws allegiance, allegiance draws protection." As was said at the time by one commentator, if William Joyce had got off then a British passport would have become worthless. In leaving these shores, Winnington travelled on a British passport. His extraordinary route to China from London was by way of Prague, where, curious coincidence, he was able to report the progress of the *coup d'état* to the satisfaction of the *Daily Worker*. Under whose protection he moves today one can only guess, but he must have reached his Communist haven on a British passport and he certainly remains accredited to a London newspaper.

In the same way, Mrs Felton must likewise have travelled on a British passport, going and returning under its protection. If we accept the impossible conception that protection need not draw allegiance, then we have only ourselves to blame if allegiance is held to draw protection on the same haphazard principle. "Treason" may indeed be a harsh term to apply; but at least we must admit that we are in these cases dealing with something that is certainly not loyalty, and it is the interest of all to define the offence and punish future offenders.—Yours faithfully,

Llandaff F. J. BROWN

*

Sir,—Disloyalty, hard to define, is easily recognised if pronounced enough to be dangerous to us or to our Allies, and will be decisively repudiated by the vast majority of us, so the risk we run from treason will be a much less evil than the injury to our rights of free speech and discussion, caused by further treason laws.

What practical damage can the *Daily Worker* reporter do to us? He is much more likely to give away useful information to the United Nations' intelligence service than to demoralise our troops or their friends at home.

It may seem hard to give so much rope to the disloyal, and so little to our fighting men; but hard cases make bad law, and if we are too extreme in attacking what is done amiss (in the absence of practical injury) we shall defeat our own ends, as the House of Commons may do, if it gets too finicky about "privilege."—Yours faithfully, W. E. HORROCKS

North Wheatley, Notts.

Dividends Under Control

Sir,—In each of the five paragraphs of the letter from your correspondent, Mr Austen Albu, MP, in your issue of August 4th, there is contained a fallacy or unpractical suggestion which, it must be regretted, is typical of much of the muddled economic thinking which we must now expect from many members of Parliament.

Thus, in paragraph 1, "there can be none [no argument] in support of a return to investors which exceeds the gilt-edged return by much more than the risk involved." Whether the gilt-edged return is, for this purpose, the yield from Exchequer Bonds or, say, 4 per cent Consols or whether the words "much more" refer to 1 per cent or 10 per cent is unstated: "the risk involved" presumably is to be decided by the Treasury, with or without the help of Mr Albu. After recent Government losses on semi-commercial projects, there can hardly be confidence in departmental ability to assess commercial risks. In this connection, Mr Albu should note that quite a number of shares of engineering, textile and plantation companies were giving yields of 10 per cent and more prior to dividend limitation, and new companies in the same categories must be capitalised on similar standards. Or does he suggest compulsory investment?

In paragraph 2, dealing with large companies, he says, "it cannot be argued that . . . dividends are an incentive to enterprise or efficiency . . . the majority of shareholders play no part in their policy or management. . . ." This will, no doubt, be gratifying for shareholders who have made the position of these great concerns possible, and thereby helped to stabilise regular employment for a large number of workpeople.

Paragraph 3 implies that the larger companies are less important in formulating new products and new processes since "in so far as they [companies distributing *less* than £10,000] are responsible for new products and new processes they will continue to receive a commensurate . . . reward." Thus, numerous small holders of the larger industrial companies are apparently less important than those in the rich one-man companies.

Paragraph 4 is particularly enlightening since "when the large public companies need new capital for similar purposes, they should find no difficulty in raising it on terms which allow only a limited return . . . 5 per cent is ample to cover all risks except those arising from a major slump." (Issuing Houses please note!) There is apparently to be no consideration of equity or of quality, and presumably the presence of a major slump would be officially notified to the industrial and financial communities by the Treasury. Also "investors will still be willing to invest in shares paying appreciably above the gilt-edged rate." Again, no explanation is given of this meaningless phrase.

Finally, paragraph 5 makes an abstract plea for different but unspecified treatment for different sized companies. No indication is given of how, when or why. —Yours faithfully,

GODFREY J. CHANDLER.

Friern Barnet.

Sulphur Shortage

Sir,—In your issue of May 12th it was said that "Reserves (of sulphur) are thought to exist elsewhere in the world, in New Zealand and Iceland, for example, which are at present unexploited."

New Zealand's sulphur resources have been carefully surveyed, and the total pure sulphur content of some thirteen deposits in the North Island has been assessed at about 16,300 tons. The element occurs mixed with pumice and other impurities.

Some 32 miles off the North Island coast there is the uninhabited, 700 acre White Island, which is a scene of geothermal activity. Several companies have worked White Island intermittently since 1843 and have extracted altogether some 10,000 tons; the last venture ended with serious loss of life. The sulphur remaining is in small quantity and is very difficult to extract.

New Zealand used 73,000 tons of sulphur in 1950. If all the native sulphur were recovered regardless of cost, the effect on our national economy would be small.—Yours faithfully,

E. J. FAWCETT, Director-General

Department of Agriculture,
New Zealand

New Rifles for Old

Sir,—In the Note in your issue of July 14th you are a little severe with the "military experts."

In order to give a high rate of aimed fire by means of a bolt mechanism worked by hand, the .303 was designed to take rimmed ammunition. The design was simple and successful and resulted in a rifle superior in respect of rapid fire to the German Mauser taking rimless ammunition, and equally accurate at long range. The 1914-18 war demonstrated the need to mechanise small arms fire in order to increase the areas which could be denied to the enemy by the volume and density of the fire sweeping them. There was a demand for a light machine gun of far greater dependability than the Lewis gun. The chief trouble was due to the problem of disposing of the spent rimmed cartridge case by means of simple, light, reliable mechanism. This problem, it was found, was greatly simplified if a rimless case was employed. The military experts considered it would be wise first to produce a new simple reliable light machine gun taking rimless ammunition to be followed by an entirely new rifle taking the same ammunition. A high rate of rifle fire being no longer so necessary, it was thought that the new rifle should be more like a sporting rifle and particularly designed for quick accurate performance at ranges beyond that of the sub-machine gun.

After long tests the Czech ZGB was selected with its rimless ammunition of the standard size used in Europe. At this stage the military encountered the civil experts (they control the purse strings!) who contended that to introduce a new calibre of rimless ammunition would render useless the stocks of .303 rimmed and the machinery for making it. It was useless to point out that existing stocks would be exhausted long before rearmament could take place. The military experts were ordered to redesign the ZGB, a long, difficult and thankless task, which failed to produce the Bren in quantity by the outbreak of war and ensured the continuance of the .303 until this day.—Yours faithfully,

Hemel Hempstead R. C. MONEY

Mauritius and the Seychelles

Sir,—The Mauritian education programme referred to in your article of July 21st is not only ambitious but successful, and it is this which constitutes the greatest potential, if not actual, problem for the island. The island is clearly overpopulated and emigration is discouraged. Hence, there is a bottleneck of intelligence and ability which the professions cannot assimilate.

The tension is normally released by recruitment on a non-commissioned level into the Royal Pioneer Corps. The recruits are transhipped for training to the Canal Zone, Egypt, where they seethe in indignation at colour discrimination and "wog" treatment, returning home to foment already strained relations.

In these respects therefore the education programme tends to do more evil than good.—Yours faithfully,

LOUIS OZANNE

The Queen's College,
Oxford

Books and Publications

Managerial Evolution

The New Society. By Peter F. Drucker. *Heinemann.* 339 pages. 15s.

Mr Drucker is not an economist; his concern is with political economy, the accent being firmly on the word "political." Throughout this penetrating, comprehensive, enormously stimulating and frequently exasperating book he studies the problem of modern industrial organisation as a political problem, a problem of power, responsibility, allegiance, legitimacy, and the techniques of government and citizenship. The unique feature distinguishing the industrial enterprise from all other political entities is that it must by its very nature give primacy to economic aims. Profitability, the production of more wealth than it consumes is its *raison d'être*. Questions of ownership leave fundamentally unaffected the harmony between the interests of the enterprise and of society, since society demands the production of that surplus as the necessary condition of a dynamic progress which it cannot renounce. Its production is the responsibility of management, essentially the most important governing body of today, a pluralistic element in the political picture. Here the argument of Mr Burnham's "Managerial Revolution" is recalled but not echoed.

The primacy of economic motives brings about a profound political disharmony within industry itself—and this regardless of whether ownership is private or public, whether management is tyrannous or benevolent, whether the workers are represented or not. To management, wages are a cost, to workers they are an income; to management, a flexible labour burden is essential, to the worker, security of livelihood is equally so. Even with full worker ownership this conflict persists. "Sure, this is my plant," quotes Mr Drucker, "but somebody has to protect my rights as a downtrodden working stiff against my privileges as a bloated capitalist stockholder." That "somebody" must be the trade union; the union is inevitably, in political terms, an opposition—and one which cannot come to power without automatically taking on the lineaments and role of its adversary. The worker, consequently, suffers from a split allegiance; the union leader, once the union has achieved recognition and respectability, suffers from a divided purpose.

Management itself also suffers from what one may call a "constitutional" confusion. It generally understands its own functions very imperfectly, it lacks mutual comprehension between its own ranks, it is, compared with other systems of authority, appallingly weak in its methods of self-perpetuation. In the workers' opposition to essential profitability, in management's unawareness of its own function, in the basic antinomy of the unions, Mr Drucker finds disquieting evidence that "the trend in American industry is towards the social melting point" where a free society becomes impossible. He is firmly anti-Utopian. The remedies he proposes will not produce an ideal society, merely, at best, "a livable society for our time." They include emphasis on the "plant community" as a self-governing social unit, a "rational" wage policy within whose framework particular bargains shall be negotiated; profit-sharing, not by distribution of dividends to individuals but by the building up of common funds; a "predictable income and employment plan" for each enterprise, offering not an impossible 100 per cent security but guarantees based on experience and enlightened forecast; reform of those union regulations which either impair civic freedom or immobilise labour; federalism in big business—a more radical and fruitful concept than decentralisation; the encouragement of competition, not by hostility to bigness as such but by removal of discriminations against the small, the young, the experimental. Mr Drucker condemns the centrally planned economy as magnifying, without resolving, virtually all the problems of big business; "middle way" democratic socialism he regards as a necessary evil for nations faced with dislocation crises akin, in their acuteness, to the strains of war. The best hope lies in free enterprise, American style; but only if free enterprise faces its own political implications.

His book stands wide open to criticism. His view of "mass production" society as something wholly novel economically and politically, to which all previous theory and experience is irrelevant, suggests a very superficial reading both of history and of economics; on trade cycle and depression theory he is naïve; he seems unaware of any possible clash between "profitability" and welfare. Nevertheless, "The New Society" is better worth reading and serious thought than many a book less open to criticism in detail

America and Russia since 1809

America Faces Russia. Russian-American Relations from Early Times to Our Day. By Thomas A. Bailey. *Cornell University Press (London: Geoffrey Cumberlege).* 375 pages. $4.00 and 32s.

The development in international relations which made the United States the protagonist in a world conflict with Communist Russia came about with extraordinary swiftness, and it is now difficult to realise how strongly pro-Soviet in 1945 were both the Administration in Washington and the main body of American public opinion interested in foreign affairs. In those days the advocacy of an American-Soviet partnership for running the world was based not so much on the fact of wartime alliance as on the contention that American and Russian national interests did not, and never had, clashed, whereas Britain and Russia had nearly always been at loggerheads; therefore, it was urged, the peace of the world depended on America and Russia getting together, as the two strongest postwar powers, and not allowing Britain to make mischief between them. As so much then was made of the tradition of American-Russian amity, it is of great interest to trace the history of these relations and see how and why they deteriorated.

Professor Bailey of Stanford University has written an account of American-Russian relations, beginning with the arrival of John Quincy Adams in St. Petersburg in 1809 as first minister of the United States to the court of the Tsar and ending with the Atlantic Pact and last year's outbreak of war in Korea. It is a very fair-minded piece of historical writing, supported by wide research, particularly on sources for American public opinion at different periods, though marred by a number of factual errors, such as the assertion that the Russians set up the Lublin government in Poland during the last war before breaking off diplomatic relations with the Polish government in London. In general, the book establishes the fact that, although there has been in the past relatively little conflict between America and Russia at the diplomatic level—questions such as that of Alaska were settled amicably—there has always been a strong American popular antagonism for the habits of Russian despotism. The frontispiece illustration reproduced for a book entitled "Siberia and the Exile System" published in 1891 might have been taken from a pamphlet on Soviet forced-labour camps at the present day.

However, between 1941 and 1945 all such things were forgotten in America, and public opinion was highly favourable to the Soviet regime, while President Roosevelt pursued a policy of staking all on Russian good will which was, in Professor Bailey's words, "in the nature of a gigantic gamble." The outcome is aptly summed up by the author with the remark that just as Pearl Harbour unified America for the Second World War, so the "crude and blustering tactics" of the Soviet leaders in the immediate postwar period aroused the American people, who were "in a mood to be lulled to sleep," to undertake a "huge and costly preparedness program," for the defence both of itself and of the whole free world.

A Change of Mind

Reflections on the Constitution. By H. J. Laski. *Manchester University Press.* 220 pages. 12s. 6d.

Professor Laski delivered three lectures at Manchester University in February, 1950, shortly before his death. They are now printed with the addition of a useful index but without the editing that sometimes makes excellent essays out of rather formless academic discourses. This should moderate criticism. Yet no revision could have changed this book's main significance. Mr Laski's last essay in political theory would still have stood as a remarkable monument to the muddleheadedness of the British Left at the beginning of the nineteen-fifties.

The subjects of the three lectures were the House of Commons, the Cabinet and the Civil Service. Although the treatment is discursive, the general impact is plain: it is conservative and optimistic; there is little wrong with the British constitution, and it is probably flexible enough to be adapted easily to such reforms as changing conditions demand. In all this Mr Laski showed a wholly admirable ability to change his mind. The muddle arises from his unwillingness himself to recognise that he had changed his mind. In 1938, in his "Parliamentary Government in England," Mr Laski propounded with some brilliance an approximately Marxist view of the British system of government. It was established by property owners in the interests of their property; it was admirably suited to the period of capitalist expansion, but it was unlikely to survive. How, then, did it come to be working so well as Mr Laski thought in 1950, after being used for five years for an attack on property by a Labour government? Mr Laski still argued, as he had done before, that until 1914 Britain was

> governed by a single party divided into two groups each of which had little difficulty in accepting the same major principles of action.

But where in 1938 he thought that the rise of the Labour Party constituted a revolution, probably incompatible with parliamentary government, in 1950 he was content to say merely that it had "profoundly" altered the character of Parliament—without, apparently, shaking the foundations of parliamentary government at all. Since the analytical basis for this change of view was not discussed, the lectures were disappointingly superficial and confused.

Mr Laski examined various proposals for constitutional reform—notably Mr Amery's—and found most of them unsatisfactory. He contributed some useful suggestions of his own. Perhaps his most noteworthy practical judgment is that "the work of the permanent civil servants at the top of the hierarchy was far less creative in the second world war than in the first"; the basis and implications of this view deserve much fuller consideration. But, while Mr Laski could call on a powerful logic to dismiss many criticisms of Parliament, he could also commit himself to such views as that "a government ought to be free, save on occasions like Munich, to choose its own time for an appeal to the electorate." Who judges what is like Munich, and have there often been occasions when an election would more certainly have confirmed an existing government in office? Again, Mr Laski asserted that Mr Chamberlain's "disastrous" foreign policy "compelled" the Labour Party to refuse to serve under him. Was it then the Labour Party, not Mr Churchill (who did serve under Mr Chamberlain), that had provided clear-sighted criticism of appeasement? But though Mr Laski was often wrong, and though in 1950 he had little to add to the understanding of constitutional theory, his last work is like all the others in being important reading—not least because of its prejudices—for students of politics and political theory.

Economic Averages

What Happens During Business Cycles. A Progress Report. By Wesley C. Mitchell. *National Bureau of Economic Research, U.S.A.* 386 pages. $5.00.

This book was intended as a tentative report on the results so far obtained by the National Bureau of Economic Research in the ambitious programme of measuring business cycles on which it has been engaged for thirty years. Unfortunately, its author died before writing his detailed sections on expansion, recession, contraction and revival, and when even the general section on business cycles was unfinished. His editor has wisely refrained from attempting to complete the original design, so that what is presented here is only the less interesting—though still valuable—first half of what would have been an important book.

The author begins by describing briefly the intentions, methods and materials of the National Bureau's research project. The details are already available in the Bureau's earlier fat volume on "Measuring Business Cycles," but they are here presented in a form more useful to the non-specialist. Part II, which occupies two-thirds of the book, is devoted to variations in the cyclical timing, conformity and amplitude of nearly 800 series representing specific activities, and to differences in cyclical behaviour within and between these series. The detailed study of these variations not only gives quantitative content to a number of generally accepted notions about business cycles, but also discloses a number of interesting details—for example, cattle slaughter varies cyclically, but hog slaughter (like the wholesale price of bananas) varies contra-cyclically. Part III makes a start at fitting all this specific information into a general account of business cycles.

One of the most important findings is that business cycles have their own peculiar time-shape, which does not seem to conform at all closely to what can be produced by a mathematical model.

It is a great pity that Mitchell died before finishing the book; Dr Burns's introduction makes clear what a great deal of interpretation remains to be done. What Mitchell completed, however, leaves unanswered two basic doubts about the National Bureau's approach. The first relates to the bureau's ubiquitous averages, which automatically create cycles where some economists see only intermittent fluctuations of activity. The second relates to its Benthamite determination to have each series count as one; where the bureau asserts that "all animals are equal," the average economist would want to add "but some are more equal than others."

Co-operative Utopia?

The British Co-operative Movement in a Socialist Society. By G. D. H. Cole. *George Allen & Unwin.* 168 pages. 12s. 6d.

The future of retail distribution is a territory that orthodox economists and socialist philosophers alike fear to tread. Here is Mr Cole rushing in—not even exploring the problems of the next few years, but actually mapping out socialist policy for a generation or so ahead. If he succeeds in touching off serious discussion of the subject within the Labour movement, his boldness will be justified.

The book's chief proposals are original enough. Starting with the co-operative movement as a socialist experiment, Mr Cole concludes that it is as undesirable as it is unlikely for the co-operatives to succeed, unaided, in establishing any monopoly of the trade in consumer goods. He then goes on to inquire what the architects of the collectivist economy of the future can hope to put in place of large scale capitalist enterprise when the time comes to socialise retail trade. Nationalisation is too bureaucratic and centralised for this purpose; municipalisation has equally obvious drawbacks. His problem is to reconcile the principle of consumers' choice (which implies diversity and competition) with that of public ownership and democratic control. His solution is to leave the existing co-operatives and a fringe of small scale private traders to go their own way, but for the state to take over the large chain and department stores and put them under a form of consumer control. These "mutual" trading concerns, reorganised on a local basis by state and municipal nominees, are intended gradually to co-opt the consumers into their management by the device of paying dividends on purchases, which will accumulate to confer shareholding and voting rights on loyal customers.

There is nothing inherently fantastic about this forcible extension of the co-operative formula, if, as Mr Cole is careful to assume, it takes place in an economic and social climate already sufficiently collectivist. This condition, however, begs the whole question. If ever public opinion is ripe for such a scheme, the whole nature of capitalist enterprise in the consumer goods trades is likely to have altered out of all recognition. Meanwhile, interference with retail trade will continue to be political dynamite. It is even probable that many professing socialists will be shocked by this cold-blooded attempt to translate the comfortable beatitudes of their creed into the stuff of everyday life.

Symposium on Incomes

Studies in Income and Wealth. Volume 13. Published for the Conference on Research in Income and Wealth by *The National Bureau of Economic Research, 1951.* XIV + 587 pages. Price $6.

The volume and variety of data on the distribution of personal incomes in the United States are in striking contrast to the dearth of such information in this country. Here the mainstay of income distribution estimates (until the 1949-50 income census is published) is an income census for 1937-38 taken on the basis of income tax returns. There it requires an army of research workers to analyse and digest for practical purposes the mass of material collected annually.

This symposium of papers was presented at the 1949 meeting of the United States Conference on Income and Wealth, a meeting devoted entirely to income size distribution. The basic material, which was discussed and analysed and which represented the fruits of about ten years statistical reporting in the United States, included ten field surveys of family income, besides returns collected by the Bureau of Internal Revenue tax, the Bureau of Old Age and Survivors' Insurance and the estimates of aggregate incomes by source and of numbers of families and single individuals made by the National Income Division of the Department of Commerce and the Bureau of the Census. Most of the fourteen authors and joint-authors have had practical experience in collecting the data they criticise. The scope and variety of the American economy gave them a wide field over which to range in their methodological discussions.

The result is a stout volume of considerable practical interest to all who make or use estimates of the size distribution of personal incomes. The emphasis is on the methodological aspects of the subject rather than on its theory or on the actual results of the surveys. There are no startling discoveries and no new theories, but there is the result of much critical and painstaking analysis of detailed statistics and much sensible criticism of the statistical reporting procedures which gave rise to them.

Shorter Notices

Annual Abstract of Statistics, No. 87 1938-1949. Central Statistical Office. *HMSO.* 319 pages. 17s. 6d.

The new Annual Abstract continues as in the previous issue to give a wealth of information in a well-presented form. As well as revising material and bringing it further up to date, some new tables have been added which include fertility statistics and a useful enlargement of national insurance statistics. A note of warning must, however, be sounded. Revision of certain series seems inevitable as later information becomes available and in some cases they have already been altered by the time the annual volume is published. This applies, in particular, to figures of employment, national income and balance of payments.

Directory of Shipowners, Shipbuilders and Marine Engineers, 1951. *Tothill Press Limited.* 880 pages. 30s.

The forty-ninth edition of this directory follows the general arrangement adopted four years ago. It gives details of leading shipping and shipbuilding companies of the world and the services they provide. A great deal of new material from Germany, Italy, and Japan has become available. The inclusion of five indexes does not seem excessive for the amount of information provided.

AMERICAN SURVEY

Fair Share for Labour

Washington, D.C.

THE economic strength of organised labour in the United States is enormous, but its political strength is at best sporadic and is now at its lowest point. Nevertheless, of its own free will labour has denied itself the use of its economic power during the defence emergency in exactly the place where it has greatest need of this, its most effective weapon. For the American Federation of Labour and the Congress of Industrial Organisations have made what is termed "an implicit no-strike pledge, limited to disputes in the area of wages," and to industries affecting the national defence. As it works out in practice, however, the pledge is much more real than the word "implicit" would suggest, and the limitation much less real. By the very nature of collective bargaining, when a trade union undertakes not to strike for wages it bars itself from striking for other benefits which supplement or take the place of wage increases.

The no-strike pledge was given in fact, though not in those specific words and not without qualification, when the two labour organisations agreed to participate in the tripartite Wage Stabilisation Board (WSB) and subscribed to its regulations. This really meant that the trade unions agreed that, in all labour disputes affecting defence production, and there are few important ones that do not, they would abide by the majority verdicts of an arbitration board made up of representatives of labour, management and the public, whose decisions are subject to the approval of one man representing the government, the Economic Stabiliser, Mr Eric Johnston.

But in labour's "implicit" pledge, there was an equally "implicit" condition, based on logic and fair play, if on nothing else. It was that, in place of labour's economic weapon, the strike, there should be substituted a mechanism to provide, firstly, for the maintenance of real wages and, secondly, for their increase by an amount roughly equivalent to the economic gains accorded to, or wrested by, other less inhibited elements in the nation. This month the WSB took the final step needed to accomplish the first objective; its major problem in the coming six or eight months is how to effect the second.

After last January's temporary freeze of wages and prices, Mr Johnston quickly allowed workers to negotiate for wage increases up to 10 per cent above the levels of January, 1950, a figure roughly comparable to the change in the cost of living since that date. A few weeks later, he permitted the continued operation of "escalator" clauses in wage contracts negotiated before the freeze, even though they might go through the 10 per cent ceiling. These clauses provide for the automatic adjustment of wages, usually every three months, to compensate for changes in the cost of living in the preceding quarter. They constitute one of the most important and promising advances toward stable labour relations made in the last decade. The decision, however, created two classes of workers, those who could maintain their real wages in the face of rising prices and the many more who were not allowed to do so. To end this impossible situation, the WSB recommended early this month that the latter group might negotiate similar escalator clauses, if it wanted to, or that its members, if they preferred more conventional flat wage increases, might seek them at six-monthly intervals in amounts proportional to cost-of-living increases. Mr Johnston must approve the recommendation as a simple matter of fairness.

A decision on this point might have been avoided, or at least postponed, had it not been for the burlesque of an inflation control law passed by Congress in July. But under its price control provisions, or rather its lack of them, there is no prospect of holding the cost of living anywhere within 10 per cent above the levels of January, 1950.

*

Congress's emasculation of anti-inflation powers will also force the WSB to find an answer to its second problem, that is how labour, as well as farmers and businessmen, can share in the rise in the nation's prosperity. Spokesmen for those groups, in and out of Congress, never tire of arguing that support prices for agricultural products, and the prohibition of effective price controls on them, are necessary incentives to production, as are also opportunities of making ever higher profits in industry and trade. Within limits, the arguments are probably right but, if so, then it is also true that the workers need some incentives too.

If labour's future economic benefits, over and above the maintenance of its real wages, could be, in fact, actual incentives to and rewards for higher production, as farm and commercial profits are supposed to be, then they could be permitted without fear of inflationary consequences. A device for achieving this is to be found in the contracts of the United Automobile Workers negotiated by the union's president, Mr Walter Reuther, who was also the pioneer of the escalator clause. In addition to the automatic cost-of-living adjustment, those contracts provide for the grant of an annual wage increase of four cents an hour, or about 2½ per cent, the estimated national yearly gain in productivity.

The WSB and Mr Johnston approved the continuing operation of these clauses in existing contracts, just as they approved the cost-of-living escalators. By the same logic, they must approve equivalent productivity bonuses for all other workers. But the problem is remarkably difficult. In the case of the General Motors Corporation, which welcomes the bonuses as enthusiastically as does Mr Reuther, it is certain that the real productivity achieved will equal or, more probably, exceed the wage increases; in any event, the company has agreed in the contract not to use them as an argument to justify higher prices for its output. But other companies may not have the same productive skill. Although, in the present tight labour market, almost all employers will be delighted to pay a productivity bonus, some of them will not realise an equivalent gain in productivity and most of them will insist on using the additional payment as an element of increased cost warranting higher price ceilings. In those cases, obviously, the bonus will have dangerous inflationary consequences.

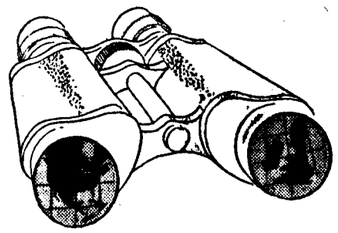
The test case will come in the steel industry. The contracts of Mr Philip Murray's United Steel Workers expire on January 1st. His men need an increase of about 12 cents an hour—four cents for the rise in the cost of living, which is easy, four cents for the increase in productivity in 1951 and four cents more for that in 1952, for the bonus in the automobile industry is anticipatory and Mr Murray must get what his young rival, Mr Reuther, is getting.

The steel industry is unlikely to object to the amount, provided, and provided only, that it can use the last two four-cent grants, as it can the first, to justify higher price ceilings for steel. So far, it shows no signs of conceding the principle of productivity gains that Mr Reuther taught the automobile industry to embrace. To complicate the matter further, it is by no means certain that Mr Murray wants the grant to take the form of a productivity bonus. For his philosophy of labour-management relations is as far behind that of Mr Reuther as the steel industry is behind the General Motors Corporation in the same field. He is an inherently conservative man, intensely distrusting Mr Reuther and his "socialistic" notions.

How Mr Murray decides to play the game will set the pattern for most of the rest of American labour, just as the attitude of the United States Steel Corporation in the case will set the pattern not only for the steel industry but, as is usual in the United States, for the rest of all heavy industry as well. And, with respect to labour and management and the country's economics as a whole, the solution of the WSB will be for the defence emergency period what the "Little Steel" wage formula was in the last war.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

American Notes



Foreign Aid Under One Roof

In the first round of this year's debate on foreign aid, the Administration has lost less than it feared in dollars—$650 million cut out of a total of $8.5 billion—but it has been routed on the control of the mutual security programme. The House Foreign Affairs Committee has recommended unanimously the creation of a single independent agency, to be known as the Mutual Security Administration, to run foreign aid, which this year for the first time was submitted in a single package. The military would continue to procure and distribute military equipment, and the responsibility of the State Department for "over-all" foreign policy is specifically safeguarded. But instead of the co-ordinating committee under State Department leadership which at present allocates aid funds and which the Administration wishes to continue, there would be a single administrator of Cabinet rank, in whom authority and responsibility would be concentrated, as they were in Mr Hoffman when the Economic Co-operation Administration was made independent of the State Department. Such a solution has additional charms for those who would not be sorry to lessen Mr Acheson's powers.

Last week the Brookings Institution published a report which, unlike most earlier private studies, argues that the State Department is the only agency to administer foreign aid programmes and co-ordinate all action dealing with foreign affairs. But this report is probably too late, even if it were enough, to convert the Senate committees, which have concluded their hearings and in their draft are likely to come down on the side of an independent agency, even though, if confusion is to be avoided, its independence cannot get very far.

The cuts made by the House Committee fall most heavily on economic aid, which loses $400 million of a total of $2.2 billion, while military assistance is reduced by only $250 million out of $6.3 billion. The same pattern seems certain to be repeated in the Senate, where even Senator Taft, though he favours a $1 billion cut in economic aid, disapproves of any reductions which might jeopardise General Eisenhower's chances of success in Europe—and give substance to the spiteful rumour that he is trying to undermine his chief rival for the Republican nomination. The Senate committees will be strengthened in their resolution by reports, filtering out of a party of Senators who visited Europe last month, though since denied, that General Eisenhower believes the United States must push ahead rapidly to rearm Europe or else abandon the effort entirely, and that in time it might even be necessary to send more American divisions to Europe.

The Senate Foreign Relations Committee has already approved $400 million for Spain, divided equally between military and economic aid, and deleted the criticisms of General Franco which its sub-committee expressed. Strangely enough, after all the MacArthur furore, the Administration's request for $307 million for General Chiang seems more likely to stir up a storm. This is presented as the simple consequence of the Korean war and the decision to deny Formosa to the Communists. But it is a third of the total allotted to the whole Far East, and even Senator Connally, one of the Administration's leaders, in challenging it, remarked scornfully that if General Chiang cannot protect Formosa he cannot protect very much.

Clear two-way view . . .
of transatlantic trade

The Chase National Bank is well situated to assist British businessmen engaged in trade with the United States. As an established American bank in Britain, the Chase affords a service based on clear understanding of British requirements and thorough knowledge of business and trade conditions across the Atlantic.

Censuring McCarthy

The shameful part Senator McCarthy and his staff played in defeating Senator Tydings of Maryland last autumn receives full, and fully justified, condemnation in a sub-committee report, laid at long last before the Rules Committee of the Senate. Senator McCarthy is listed as one of the three outside influences responsible for the odious "back-street" campaign in which a faked composite picture—purporting to show Senator Tydings in conversation with Mr Earl Browder, a former Communist leader—and insinuations against Senator Tydings's patriotism and loyalty were exploited. This was Senator McCarthy's revenge for the way Senator Tydings had dealt with his charges of disloyalty in the State Department.

The committee does not propose that Senator Butler, the beneficiary of this vendetta, should be expelled from the Senate, because there are no established rules of conduct which would provide grounds for such action. But it does suggest that such standards should be drawn up, and that violation of them, whether by a candidate or any sitting Senator, should be grounds for expulsion. Two Republicans, Mrs Margaret Chase Smith and Mr Hendrickson, who last year signed a Republican protest against McCarthyism, voted with the Democrats to condemn the Butler campaign.

The lack of any code of Senatorial conduct—and the necessity of securing a two-thirds majority—also means that Senator Benton's demand for an investigation which might lead to Senator McCarthy's expulsion is bound to come to nothing. As Senator Benton pointed out, any other Senator would have the decency to resign after such a report had been tabled, but in Senator McCarthy's case this is mere wishful thinking. Senator McCarthy is not in the slightest degree repentant or chastened; within two or three days he was once more availing himself of Senatorial immunity to list 26 employees of the State Department who, he said, were being investigated on loyalty charges. One, at least, Mr Davies, a high foreign service officer, had been cleared and restored to duty the week before with the full confidence of the Department. The only cure for Senator McCarthy is in the hands of the Wisconsin voters, who next year have the opportunity of depriving him permanently of his platform and immunity in the Senate. But the Senate will betray its own standards, not to speak of its own interests, if it does not make character assassination grounds for expulsion and thus nip McCarthyism before it spreads.

* * *

Tools Come First

The machine tool industry, which was starved after the war and almost submerged by a flood of government tools being sold off cheap, has enjoyed a solicitous and unrelenting attention ever since it was realised that aircraft producers are behind schedule chiefly because they must wait as long as two years for vital metal cutting and shaping machines. The chief task of Mr Harold Boyer, head of the new Aircraft Production Board, is to reduce this waiting period. The tiny industry, whose output before Korea was only valued at $250 million a year, will have orders totalling $2.9 billion by next June, according to Mr Charles Wilson, director of mobilisation. At present rates of delivery, this is a seven-year back-log. But Mr Wilson is convinced the industry can repeat the miracle it achieved between 1939 and 1942, when production soared from $200 million a year to $1.5 billion, even though the tools needed today are far more complex and no running start has been provided by foreign orders, as it was in 1939 and 1940.

The government is releasing the machine tools it put away in 1945 for a rainy day, but unfortunately these cannot fill the most urgent needs, which are for machines to turn out guided missiles and jet engines. Some tools are being bought abroad, from Italy, for example, though this can be only a drop in the bucket. The automobile industry has promised, if the price is right, to produce machine tools with the resources kept, in happier days, for producing new models. But not much relief can be looked for in this quarter, as long as passenger cars continue to be turned out. One reason the machine tool bottleneck is so tight today is that there is no wholesale conversion of peacetime tool resources, as there was during the war. Instead, additional plants are being reopened or built.

Mr Wilson, acting as fairy godmother to an industrial Cinderella, has produced with a wave of his wand a feast of incentives and aids, though the industry is still inclined to grumble that they fall short of what is needed. A $100 million revolving fund has been created, similar to one operated during the war, to finance production of tools even before manufacturers order them. The machine tool industry has been given first call on its own products, a super-priority to safeguard the industrial seed-corn. Steps have been ordered to protect and enlarge its supply of skilled labour. In meeting the industry's price complaints, however, Mr Wilson has been less successful. He ordered the price controllers to the rescue when it was realised that the freeze, in January, calculated on delivered prices, in reality rolled the industry's prices back to those prevailing in 1950. Manufacturers insist, however, that the new formula, which relates profits to assets rather than production, encourages them to put on the brake rather than step on the accelerator. If this is true, it is certain to be rectified, for nothing is too good for machine tools today.

* * *

Tariff Ups and Downs

The Customs Simplification Bill, first introduced last year but unlikely to get as far as the Senate floor this year, has at least begun its Congressional journey, in the House Ways and Means Committee. The sharpest objections are likely to come from whisky distillers, for under the new proposals importers of whisky and rum would pay duty only on the alcohol in the bottle, not, as at present, on the water as well. Otherwise the Bill does not provide for any specific reductions in tariffs, but only for streamlining their administration, in order to remove the suspicion that even today the main purpose of US customs regulations is to prevent imports at any price. The most important change suggested in the Bill is that in future tariffs should be calculated on the import value of the goods, not on their value in their country of origin, which often includes purely domestic levies, such as the British purchase tax.

The official arguments for the Bill are not only that it will reduce the cost of the customs service and increase foreign trade but that it is necessary if the United States is to fulfil its obligations under the General Agreement on Tariffs and Trade. But at the next meeting of the signatories of this agreement, in September, the United States will ask to be released from another of those obligations, the tariff concessions made to Czechoslovakia. The reason for this request is not the conviction of Mr William Oatis, the AP correspondent in Prague, although that explains why Congress is demanding that trade relations with Czechoslovakia be broken off at once. The request to GATT is the result of the latest version of the Reciprocal Trade Agreements Act, passed several weeks ago, which requires the abandonment of all tariff concessions to countries in the Soviet orbit. Czechoslovakia is the only one of these countries that participates in GATT; in the case of the others the United States had only to give the necessary notice that it was terminating most-favoured-nation treatment.

As with the clause in the new Defence Production Act which has just led to the imposition of strict import quotas on foreign cheese, there is a protectionist flavour about this raising of tariff barriers, although the trade affected now amounts to only about $80 million a year. But political considerations are more important, for Congress is determined that the Soviet satellites shall not draw any benefits from the United States and its allies, even if the prevention of this trade involves cutting off America's nose in order to spite Russia's face. This has already been done once, with the Kem amendment which would have stopped all foreign economic aid if the President had not suspended the measure. Representative Battle is now trying his hand at plastic surgery; his proposals, which have already passed the House, are workable, giving the President the necessary discretion, but they still leave the United States open to the charge of trying to teach its allies to suck eggs. Most of them are already conducting their trade through the iron curtain along the lines that the Battle Bill insists must be followed by those who wish to qualify for military and economic assistance from the United States.

* * *

Policemen Don't Strike

New York City's 19,000 policemen, said to be the largest force in the world, have long complained that their lot is harder than that of the rest of the community and that their wages, hours and pension arrangements compare unfavourably with those of other municipal employees. They were thus naturally disposed to listen when Mr Michael Quill, head of the Transport Workers' Union, hissed in their ears that, if they joined him, he could give them a slice of the apple he had just won for another group of city workers, the men who run the transit systems. On July 1st the transport workers were awarded a forty-hour week with no loss of pay, more than the Policemen's own Benevolent Association had ever been able to win for its members.

Early this month Mr Quill was claiming that more than half of the police force had joined his union. This was thought to be an exaggeration but, when he announced that he was about to charter a new branch for policemen only, the City Commissioner of Police promptly forbade members of the force to belong to any union at all. The order had to be amended to cover only police trade unions when some policemen confessed to membership in such harmless bodies as musicians' unions, so that they could earn a few extra pennies in the orchestra pit in their off-time. Mr Quill, always ready for a fight, promptly went to court to combat the order on the grounds that it was contrary to the State Constitution and denied the policemen their civil right to join a union. The result of the case is not yet available.

* * *

The city officials argue that a trade union has no point unless its members can strike, a luxury which cannot be allowed to policemen. There is some strength in this argument, when applied to a union led by Mr Quill, who has certainly made free and often unjustified use of the strike weapon. But there are already 62 police trade unions in other cities, all of which have signed "no-strike" pledges (as Mr Quill is also ready to do), and have managed to bargain very successfully with their employers, without holding a strike over their heads. It is also argued, again with extra point in New York, where inter-union conflicts on the water-front and elsewhere are not unknown, that policemen who belong to labour organisations might have a divided loyalty that would prevent them from keeping order with strict impartiality. Finally, city officials claim that the policemen are well served by their Benevolent Association and need no other organisation; however, not only is the quality of the service questionable, but to labour leaders the association smells of a company union. For these reasons both of the big national labour organisations are backing Mr Quill. He threatens to go underground should he lose his case, and he will have some success there as long as the city government does nothing to remedy the policemen's grievances.

Are Book Clubs Fair?

To enrol in the Book-of-the-Month Club, it is necessary only to agree to buy, usually at less than the retail price, four out of some seventy-five monthly selections during the first year of membership. There were seven books to choose from during July, amongst them Boswell's "London Journal" and General Bradley's autobiography (at $3.95 instead of $5), and the new member would also receive a free copy of "Kon-tiki" as the first of the book-dividends that come automatically with every second purchase. The basis of the system is that the book club leases the printing plates of its selections from the publishers, paying about 10 per cent of the retail price for each copy printed and guaranteeing to produce a special edition of a certain size; this is probably several hundred thousand copies in the case of the Book-of-the-Month Club and its chief rival, the Literary Guild, each of which have about half a million members.

The book trade has not shared the general business prosperity of the postwar years, for rises in prices and in sales have not kept pace with rises in costs, and many publishers depend on book club income for their profits. But the country's 3,000 booksellers blame their lack of profits on the fact that about one-third of all book sales are now made through the 50 book clubs, some of which specialise in a particular subject, yachting, for example. The booksellers' general complaint is that members of clubs, receiving their books through the post, never go into shops where they might be tempted to broaden their interests and buy more books. To this the clubs reply that the great majority of their members live in places where there are no book shops, and that many of them are people who never thought of buying a book at all until they joined a club.

The particular complaint of the booksellers is directed not so much against the book clubs as against the publishers who allow the clubs to sell their volumes at cut prices and even to give them away, while forbidding the shops to do either of these things. One large bookselling chain has retaliated by enrolling all its employees as book club members, and then selling their cheap and free copies over the counter at the normal retail price and at a handsome profit. But smaller firms can do no more than refuse to display the regular editions of books chosen by the book clubs. The Federal Trade Commission has long suspected that the publishers' discrimination against the booksellers is illegal and that the favours shown to book clubs have restricted competition in the trade. Encouraged by the recent Supreme Court decision against retail price fixing, the commission has now charged six of the leading publishers with unfair trade practices. If the charges are upheld, booksellers will be free to compete on equal terms with the book clubs, by leasing printing plates and by selling books at any price they like. Whether this improvement in their competitive position would do their profits any good is another question.

Shorter Notes

In July the employment figures broke several records; there were more people, 62,526,000, at work than ever before and fewer unemployed, 1,856,000, than ever before in this month, when many young people who have just left school are seeking jobs. There were as many women at work as at the peak of the last war.

*

The government is rounding up the leaders of the Communist party by areas; arrests in California have now been followed by arrests in Baltimore and Washington. Altogether 39 Communists have been charged since June, when the Supreme Court upheld the conviction of the original eleven leaders for conspiring to advocate the overthrow of the government by force. Four of the first batch are still at large, but since then none have escaped.

THE WORLD OVERSEAS

UNO's Army of Experts

IN June, 1950, fifty-five governments promised to contribute a total of $20,069,411 to enable the United Nations to expand its programme of technical assistance for underdeveloped countries. This sum was intended to finance the first eighteen months of the expanded programme, from July, 1950, to December, 1951. But only $11,396,328 had been received by the Technical Assistance Board (TAB) up to July 1st of this year, in spite of repeated reminders sent by Mr Trygve Lie to the governments concerned. Among the 22 nations which have paid their contributions in full, Canada, India, Belgium, Switzerland, Turkey, Pakistan, Indonesia, New Zealand and Egypt have between them provided over $2,000,000. France has paid in nearly the whole of its quota of $1,207,500, Britain two-thirds of its $2,128,255, America half of the $12,007,500 it pledged ; six other countries have handed over parts of their contributions, while 24, including Sweden, Brazil, Italy, Uruguay and Persia, have so far provided nothing at all. The Soviet Union and its satellites have boycotted the programme and given nothing towards it, although their delegates to the UN Assembly voted in favour of it when it was first discussed.

The fund as yet available is thus barely one-eighth of the sum originally cited as adequate for a two-year programme. Lack of money is one of the points stressed in the latest report of the TAB, which declares it "imperative that all governments pay their pledges in full at the earliest possible date," and shows in detail how the activities already in hand or planned will cost about $15,400,000 by the end of 1951. This report has been prepared for the Economic and Social Council, now meeting at Geneva, which must make up its mind about the scale on which the work can continue in 1952.

Helping Those Who Help Themselves

But the report also shows how various and widespread the practical activities of the Board now are. In accordance with the basic principle that the under-developed countries are to be helped to help themselves, its activities take four main forms. First, experts in many different spheres are sent to these countries to advise their governments and to start development work. Second, a modest amount of special equipment is supplied to countries which cannot easily buy it owing to currency and other difficulties. Third, men and women from the backward countries are granted fellowships and scholarships which enable them to study abroad. Fourth, international study centres and training courses are organised at which specialists from countries which face the same problems come together to learn the latest techniques and to exchange their own practical experiences. By these four methods the Board helps backward countries to develop among their own nationals enough skill to carry on the schemes initiated by the foreign experts who are loaned to these countries for a few months or years.

By July the United Nations had undertaken to provide 45 countries with 741 experts, and had actually recruited 449 ; it expected to have to find another 674 by the end of the year to meet the steady demand. It had provided 551 fellowships and scholarships, and planned to provide 590 more during 1951. Of the experts already recruited 120 were American, 49 British, 38 Dutch and 37 French ; the others were drawn from 50 different countries, including 25 of the countries receiving help. Over a third of these men and women were recruited for tasks connected with farming, forestry and fisheries, while 70 were assigned to health, 71 to education and scientific work, and 60 to industrial development.

These general categories cover a vast range of specialised activity. Indonesia, for example, began by securing a visit by a UN team which worked out a general development programme. It is now using the services of experts on agriculture, forestry, cottage industries, handicrafts, labour problems, education and nutrition. An Indian has been sent to Jakarta as the Board's representative to co-ordinate this work. In Haiti a similar representative—an Englishman—has been at work since June, 1950 ; he supervises the activities of other UN experts who are developing pond fisheries, basic education, co-operatives and small industries, irrigation and the control of cotton pests. Iraq has obtained the services of specialists in biology, chemistry and physics who are improving the teaching of these subjects in Baghdad, and is being sent experts on adult education, village crafts, farm mechanisation, livestock diseases, malaria, tuberculosis and the disease known as *bejel*. Six agricultural experts have gone to Chile to make a general survey of possibilities of development and to help deal with urgent problems such as this year's widespread potato disease ; Chile is also obtaining the services of experts on fisheries, secondary education and teacher training. Burma is being helped in the fields of manpower, wages legislation, livestock, forestry, malaria and radio. Persia has asked for expert help in the development of ports and railways, cotton, jute and silk textiles, electric power, posts and telegraphs. Eire wants the loan of experts on reclamation of marshland. Among the British dependencies receiving aid, St. Lucia has secured the loan of an Icelandic expert on the industrial use of fumaroles, or live vents of volcanic steam, in which the island abounds.

The studies now being pursued by nationals of the under-developed countries through UN fellowships cover an equally wide range of subjects, as do the international courses and study centres. The latter are generally arranged on a regional basis ; thus a three-month course for 54 specialists from Asian countries has been held in Lahore and a shorter course in Rangoon ; 50 men and women from Latin-American nations are being trained at a basic education centre in Mexico ; and over 200 social welfare workers have attended a seminar for the Arab world in Cairo. Among other regional projects in operation are a rice hybridisation programme for Asia, and a Latin-American drive to control foot-and-mouth disease.

Problem of Priorities

As regards co-ordination the technical aid programme has had to overcome mountainous obstacles. The TAB brings together, under the chairmanship of Mr David Owen, the British Assistant Secretary-General of the United Nations, representatives of Uno itself and of all its specialised agencies, such as the Food and Agriculture Organisation, the International Labour Organisation, and Unesco, each of which has a part in the programme. Uno and its agencies seem to have successfully dovetailed their earlier technical aid activities into the expanded programme which began last year, and they are making every effort to secure friendly co-operation with the Colombo Plan authorities and with the Americans who are handling their own national economic aid projects. There remains, however, the wider problem of relations with the governments of the 64 nations and dependencies which have asked Uno for help.

As the new TAB report points out, neither the Board nor any other UN body can decide which problems any given country should tackle first ; they can only meet specific requests. Some countries have asked for a general survey and for recommendations, but no government is bound to accept such recommendations. On the other hand, Uno naturally gives priority to those tasks which seem most urgent and practicable, and pursues only those which seem to be giving worthwhile results. In its report the Board criticises those governments which fail to supplement Uno efforts with their own. While admitting that many projects can go forward only when more capital is obtainable, it warns recipient governments that it is chiefly up to them to create conditions attractive to both foreign investment and local savings. It is particularly interesting to note the Board's emphasis on improving national administration and public finance, which it describes as "a necessary corollary to all phases of the technical assistance programme." It hopes to increase its activities under this head fourfold in 1952—always assuming that the contributing nations prove willing to devote another minute fraction of their resources to this modest programme, which offers such great economic and political returns.

Four Years of the Monnet Plan

[FROM OUR PARIS CORRESPONDENT]

THE office of the *Plan de Modernisation et d'Equipement* has recently published a detailed version of the report which was issued in outline earlier in the summer and noticed in *The Economist* of June 23rd. The document describes item by item the progress made in the basic sectors of France's industry which is clearly reflected in the favourable trends of the country's production and trade. The broad picture of the operation controlled by M. Monnet's office is provided by the following table:—

TABLE I

THE MONNET PLAN: INVESTMENT FROM 1947 TO 1950
(In Thousand Million Francs)

	1947	1948	1949	1950	Total
METROPOLITAN FRANCE					
I Nationalised companies :—					
Coal mines	26	48	65·5	67·4	206·9
Electricity	55	67	106	108·7	314·7
Gas	1	3	7	6·1	19·1
Railways	10	27	29·5	21	87·5
Air France	3·8	5·6	4·7	5·6	19·7
TOTAL	73·8	150·6	212·7	210·8	647·9
II Private and mixed companies :					
Compagnie nationale du Rhone (development of Rhone valley)	4	11	18·4	18	51·4
Steel and ironworks	7	20	38	49·4	114·4
Petrol and oil	6	14	23	24	67
Other industries*	12	35	50	54·8	151·8
Agriculture (including fertilisers, agricultural machinery and food industry)	32	65	82	101	280
River shipping	0·5	1·5	3·6	2·5	8·1
Merchant fleet†	0	0	0	0	0
TOTAL	61·5	146·5	215	249·7	672·7
TOTAL METROPOLITAN FRANCE	135·3	297·1	427·7	460·5	1,320·6
Total overseas territories	10	38	71	91	210
GENERAL TOTAL	145·3	335·1	498·7	551·5	1,530·6

* Non-ferrous metals, cement, chemicals, wood-pulp, artificial textiles, engineering industry, tourism. † Financed preponderantly or entirely by the Treasury under the Reconstruction Budget.

The four objectives which have dominated this essay in economic planning are: To increase production ; to achieve full employment and maximum productivity ; to expand trade and restore the balance of payments ; and to increase the national income and raise the standard of living. As the report demonstrates, the situation with regard to the first and third heads has been entirely transformed: the combined index of industrial production has now reached almost 150 (1938 = 100) and in 1950 dependence on dollars to balance payments had decreased by well over a half since 1949. Unemployment moreover has remained insignificant and at least a fair start has been made towards stepping up productivity.

The manner in which these investments were financed was dictated by the circumstance that the postwar French public was quite unwilling to subscribe to long-term loans, whether to the State or to private enterprise. The financial objective was therefore to inject public funds into industry in order to modernise it, increase its revenues, and therewith its capacity to finance itself. As the table below shows, this aim has been considerably attained, although the revenues of industry are in any case greatly limited by price-control of basic products (coal, steel, electricity). As the report puts it, "the French practice is to make the taxpayer or private saver supply the funds which the consumer is not asked to give."

TABLE II: THE FINANCING OF INVESTMENTS
(Thousand Million Francs)

Resources	1947	1948	1949	1950	Total
Public funds	11·8	193·6	310·7	356·4	872·5
of which the modernisation and equipment fund	...	153·0	259·5	312·3	724·8
Funds at the disposal of industries themselves	67·0	107·0	160·5	176·5	511·0
Bank loans and loans from special agencies	66·5	34·5	27·5	18·6	147·1

A glance at the figures for 1947 and 1948 (the first year of Marshall Aid) respectively is all that is needed to see to what extent French recovery during the four years has depended upon the francs set aside as the counterpart of the American goods sold in France by the French Government. Through American aid channelled into the modernisation and equipment fund such an industrial revival has however since taken place that in 1950 industry was itself able to finance over half of the total investment made, as against less than 30 per cent in 1948.

What may be said about the standard of living, the perpetual stuff of day to day politics? The report argues that in spite of the allocation of an average of 20 per cent of the national resources to investment between 1947 and 1950, France had by 1950 increased private consumption by 25 per cent since 1946, thereby slightly exceeding the consumption level of 1938.

In terms of products, the individual average consumption for 1950 is quantitatively slightly below that of 1934-38 for bread and fats ; slightly above it for meat and game and 10 per cent above it for milk ; while for industrial goods the average has very slightly fallen between the periods. By far the most serious economic shortage is in housing. This is recognised by the report, which gives the figure of 175,000 houses built or rebuilt since the war (with another 758,000 repaired after war damage). For 1951 the target is 100,000 (against 68,000 during 1950). But even this number is 140,000 short of normal building abroad.

TABLE III: COURSE OF CONSUMPTION*
(Thousand Million Francs of 1938)

	1938	1946	1947	1948	1949	1950
Food	145	118	116·5	125	140	146·5
Non-durable goods	35	33	34	38·5	40·5	42
Clothes, textiles and leather goods	40	33	34·5	39·5	34·5	36
Durable goods	29·5	23	28·5	33·5	33	33·5
Services	59·5	53	59·5	62	66·5	66·5
Housing	28	24	24·5	25	25	25
TOTAL	337	284	297·5	323·5	339·5	349·5

* Between 1946 and 1950 the population rose from 40·5 to 42 million.

It is obvious from these consumption figures how stern the economic ordeal of many millions of the French population has really been and, with some measure of rearmament, will continue to be for some years yet. If consumption is to rise appreciably during the next five years a great effort will have to be made towards a greater productivity in the manufacturing industries. The new ECA scheme will give impetus to this ; but unless a highly differential taxation system is adopted towards enterprises in accordance with their performance in raising productivity, it is doubtful whether the measure will prove immediately effective. The main chance of a quick rise in the standard of living remains, as always, a drastic lowering of the French tariff wall on consumption goods.

The report concludes with the opinion that the sole possibility of France's supporting a sizeable rearmament effort is to press on full steam ahead with the investment programme in order to produce more coal, electricity, steel and food at lower cost. At the same time a significant sentence is aimed, it appears, at those Frenchmen who regard France's participation in the Atlantic Pact as the main source of its economic evils :—

> Investment in those sectors producing for consumption, and especially agriculture, fulfils a necessity. For were a conflict to break out and were we to be cut off from our sources of external supply, it would be even more imperative to safeguard the very existence of the French people better than it was safeguarded from 1939 to 1945.

Thus, whether in the event France is to have peace without a very large armament effort or peace with it ; whether it is to have war with occupation of its territory or war without it, its task remains essentially the same—to equip and modernise its economy. The Monnet Plan is neutral ; neutral in home politics because no political group could shirk the task it accomplishes (Communism triumphant could only try to substitute rouble for dollar aid): neutral in foreign politics because it is irrelevant to them and they to it.

Recovery from Disillusionment

[FROM OUR CORRESPONDENT IN INDIA]

INDIA is entering its fifth year of independence a mature and stable state. There are few countries in the world today whose Government commands so general an acceptance or where totalitarianism of any sort has so small a following ; in Hyderabad the Communist revolt has been broken and no one has burnt a tram in Calcutta for over a year. The economic situation may still be difficult, and the behaviour of Pakistan clouds the future. Nevertheless the most important feature of the last year has been the increase in hope and confidence. The intoxication of independence and the bitterness of disillusionment have made way for willingness to work and to face facts.

No one who was in India in August, 1947, can forget the joy of the crowds at being free and their friendliness towards their ex-rulers, now become their equals and their guests. So great a happiness was bound to be followed by disillusionment. In this case the awakening was brutal. There were the Punjab massacres, the millions of refugees, the murder of Gandhi, and strained relations with Pakistan, when most Indians had hoped the two Dominions would be truly sisters. Worse still, it was found that many of the ills for which the British had been blamed continued even after independence. Corruption did not vanish overnight ; India remained poor ; Congressmen in office did not always practise the virtues they professed in jail. There was a spate of criticism from the public and self-vilification by Congress. The Gandhian had hoped for simplicity, hand-spun cotton, non-violence and self-sufficient villages ; he found the bureaucracy still bureaucratic, the defence forces more necessary than ever, the villager increasingly drawn into a market too often black. Those educated in the West attacked the fall in government efficiency, making no allowances for the difficulties under which the administration was labouring after it had lost over half its best senior men. Corruption has not increased overnight, but the people, trained by Congress in opposition, have become more allergic to it, especially in their own government, and those who equated Congress and Gandhi have been deeply hurt by the resultant mud-slinging.

Recently there has been a recovery of balance. The administrative machinery is creaking less ; notably, in import licensing, the appointment of a new Chief Controller has produced quite obvious improvements, and the Gorwala Report has defined what is necessary to root out corruption. Above all, the elections due in about five months have brought reality back into politics. The Congress, from being a national movement, has become a true political party of the Centre with the departure of dissidents and leftwing members led by Mr Acharya Kripalani, an ex-President, and Mr Kidwai, a Cabinet Minister and its old organiser. Despite some continuing strain between the Prime Minister, Mr Nehru, and the Congress President, Mr Purshottamdas Tandon, room for heresy and intrigue is reduced, and Mr Nehru still towers in the reduced and rejuvenated Congress—in spite of his resignation from the Working Committee—strengthened at every step by Pakistan's last cry of "Jehad" or clenching of fist, determined to squash the Right's hope of a Hindu State. His report to the Bangalore Congress, with its modesty about the Government's achievements, its frankness about its failures, was Mr Nehru at his best ; and the Congress's election manifesto is, in true Morrison fashion, all about digestion and consolidation. Zemindars are to be abolished, but there is no threat of further nationalisation ; the value of cottage industry is recognised, but there is no attack on large scale industry as such. Those who are disillusioned or disgruntled have joined either the Socialists or the Praja party ; the two put together will provide India with a respectable opposition, and even in one or two States, like Travancore-Cochin, perhaps with a government.

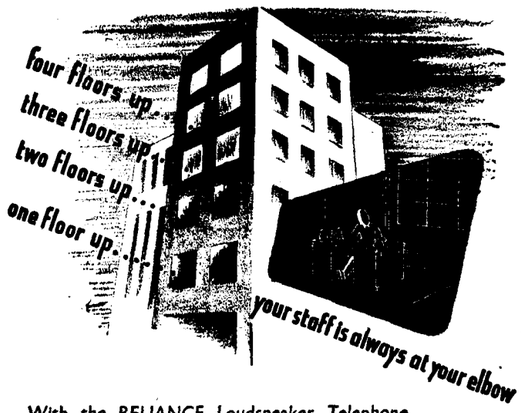
Economic Tasks Ahead

The achievements of the old Congress have, in the past five years, been so spectacular that they passed almost unnoticed ; the integration of the States, for example, thanks to the foresight of the late Sirdar Patel, went so smoothly that not even the Princes realised that a revolution had taken place. The achievements of the new Congress are bound to be less spectacular and more painstaking. Politically, now that the Congress has crystallised, all that had to be done, is done. Economically, all has still to be done. Since no coalition can carry out an economic programme, it is only now that it may be possible for old hopes to be fulfilled.

Economics has indeed been the Government's Achilles heel ever since 1947. Monsoons have been bad, prices high, labour productivity low, and industrial output unsatisfactory. The Government has tried to do too much at once in welfare and development. There was all the frustration of great dreams with little results. But here, too, the last few months have shown improvement. Production has been up in steel, coal, cotton and jute. Some new industries, like Diesel engines and transformers, are making rapid progress. The wholesale price index has been held for some months. The balance of payments has tipped from a deficit to enough of a surplus to liberalise imports. The trade and currency deadlock with Pakistan has been broken. The threat of famine in Bihar and Madras has been met ; American wheat is beginning to arrive at last. The monsoon looks promising, and even the railway strike has been averted.

Hope has rushed back ; and there are the Planning Commission Report and the Gorwala Report on state enterprise

FLIGHTS TO SOUTH AMERICA



... AND OVER 60 OTHER SOUTH AMERICAN CITIES

To business people and private individuals planning a trip to South America—Panair do Brasil offers distinct flying advantages. It is the largest internal air network in the world. It covers all principal South American cities and more than 60 others, as well. The four-engined Bandeirante aircraft of P.A.B. have crossed the South Atlantic over 1,800 times—more often than any two other airlines combined! You travel in absolute safety and superlative comfort. Moreover, frequent flights and fast service ensure that you reach your destination in the quickest possible time. And bookings are reasonable. If you are planning a trip to South America, consult P.A.B. first. Full details of flights and fares will be gladly supplied by any travel agency—or by Panair do Brasil, London Office: 193/4 Piccadilly, W.1. Telephone: Regent 7292.

Enterprise in Aluminium
for Britain's Festival...

The outstanding architectural feature of the Festival of Britain is undoubtedly the huge Dome of Discovery. Three hundred and sixty-five feet in diameter and over one-fifth of a mile in circumference, it is the largest dome ever built. It is also a dramatic illustration of the use of aluminium as a structural material and we are pleased that our construction company—S.M.D. of SLOUGH—has played a leading part in its manufacture.*

** S.M.D. fabricated the massive triangular Main Rib Girders, the Canopy extending all round the Dome and the great sloping Apron, entirely in aluminium alloy.*

as assurances that hope will not err. Mr Gorwala has insisted that state enterprise must be as businesslike as business. The draft of the five-year plan shows for the first time what can be done with work and determination; 7 million tons more food, near self-sufficiency in cotton and jute, and 300,000 tons more steel can all be achieved without more foreign aid than what has already been promised. The plan would increase the national income by 2½ per cent per annum—slightly more than the increase in population. If, in addition, India can hope for American aid on the scale given even to undemocratic countries, there would be a real renaissance.

The chances of American aid, however, have perhaps not been increased by the firmness of India's foreign policy. Yet, here again, there is more cohesion than ever. Despite all the talk about British officers and carpets, and the suspicion that the "Anglo-American" bloc is pro-Pakistan, opinion, led by Mr Nehru, is solidly in favour of the Commonwealth, and India has sent an ambulance unit to Korea—many an enthusiastic South American voter against aggression has done nothing. It is felt that Nehru's stand about crossing the 38th parallel has been vindicated by events, and that the present terms could have been obtained then. Over Kashmir, too, Indian opinion is for the first time unanimously behind Nehru: this, and not indifference, accounts for the astonishing calm with which India has met Pakistan's recent outbursts. With its own grievances unsettled and Pakistan's propaganda against the American food loan fresh in its mind, India is determined to make no unilateral concessions. Western attempts to get India to withdraw its troops or to agree to the supercession of Sheikh Abdullah, without even any mention of evacuee property or Pakistan's constant talk of war, will only meet a blank wall. For India sees no explanation of such an approach except bias.

Soviet Harvest Time

THE Soviet harvesting campaign is in full swing. Judging from the preliminary reports pouring in now from all over the Soviet Union, this year's yield should be much better than last year's, except in the Volga Region, where a drought was reported some time ago. On the whole, however, it would appear from Soviet sources that the present grain crop should substantially exceed last year's total crop of 124 million tons, which was below the planned target for that year.

The first reports came from the Ukraine, where the weather was particularly favourable and harvesting began two weeks earlier than usual. Reports have already arrived in the ritual form of cables to Stalin from most of the Ukrainian regions; they announced not only that their respective crop targets have been exceeded, but also that they have already fulfilled their supplies for the State. Despite the growing importance of Siberia as a new granary, the Ukraine still accounts for over 20 per cent of the total Soviet crop. The yield in the North Caucasus is also reported as excellent. This would fit with the rule that in this region a good harvest follows a bad one; last year its crop was poor, and this has contributed to the non-fulfilment of the Plan in the country as a whole. The daily meteorological bulletins and crop forecasts published in the organ of the Ministry of Agriculture maintain that the Siberian crop should be a good one too.

The Soviet leaders must be keenly awaiting a successful conclusion of this year's campaign. The Five-Year Plan results for grain were not very satisfactory, and for livestock-rearing they were downright poor. Moreover, the Soviet Government hopes to compensate in part for the curtailing of light industry's output of consumer goods by a more abundant supply of food. Therefore it has decided to do all in its power to step up agricultural production. It should also be recalled that this year's harvest is the first since the campaign for amalgamating collective farms started and should show how far the larger units will help to increase the yield. Hence, although it is usual for the propaganda machine to be turned on to the countryside during the periods of sowing, harvesting and delivering supplies to the State, many more combine harvesters were sent to the farms this year and the whole campaign was greatly intensified. Its extent can be judged from the fact that in the Dnieprope-trovsk region of the Ukraine alone 400 propaganda centres were set up, and 30,000 propagandists as well as three full symphony orchestras were sent into the fields.

While at the beginning of the year the main propaganda emphasis was laid on supplementary collectivisation, on plans for a new transformation of the Soviet countryside, now Soviet commentators stick more to practical everyday problems. It would seem that the more ambitious plans for bridging the gap between the town and the country through the creation of "agrotowns" have been shelved for the moment, and that Nikita Khrushchev, the Politburo member responsible for agriculture, has been told to go slow with his programme.

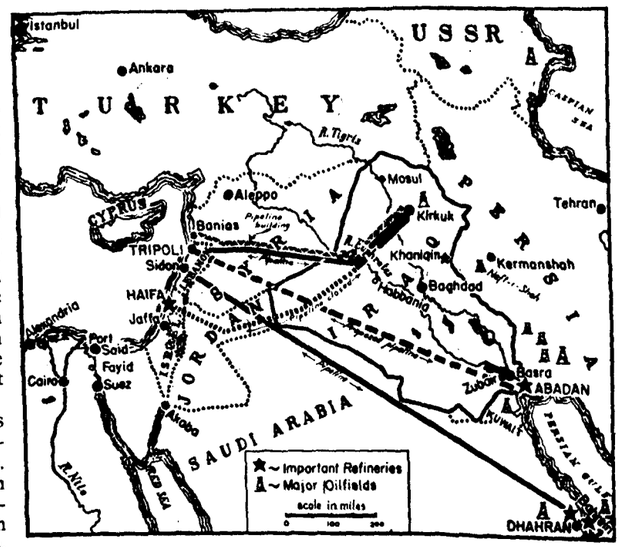
It was the more ruthless Khrushchev who replaced early in 1950 the cautious Andreyev as the Politburo expert on agriculture. He was entrusted with the task of carrying out a second agricultural revolution in the USSR, namely the amalgamation of about 250,000 collective farms into roughly 100,000 larger units. The advantages to the regime of these larger units were obvious: they would make possible a more rational division of labour, thus freeing manpower—both labourers and administrative staff—for the towns; they would allow a better control by the Party of the *kolkhoz* in general and of food supplies for the state in particular. But Khrushchev went even further in his plans. He spoke of uprooting all differences between the rural and the town workers. He drew the picture of a Soviet countryside consisting of agrotowns. He also implied that in the new giant farms and agrotowns there would be no room for private plots, only for gardens around the farmer's house.

According to Soviet sources the first part of the programme has been more or less fulfilled. The number of collective farms has apparently been reduced to some 120,000. But in his wider plans Khrushchev was rebuffed. In March, an article of his in *Pravda* was followed the next day by a notice to the effect that it expressed the author's private view and was printed as a topic for discussion. Regional Party Secretaries in Armenia or Azerbaijan, were allowed to criticise the irresponsible policy of "going too fast." This does not mean that the idea of creating agrotowns has been abandoned. The fear of resistance to a policy involving wholesale uprooting of peasants has probably decided the Politburo to shelve temporarily the projects of agrotowns and the suppression of private plots, and to wait for a "safer" period to take them up again.

Overseas Information

To enable *The Economist's* specialists to comment on events abroad a regular flow of information from our overseas correspondents and contacts is required. This information, and the judgments that are based on it, can be applied to commercial problems. Through The Economist Intelligence Unit regular reports, each designed to meet the requirements of a business or other organisation, can be commissioned.

The Economist Intelligence Unit
22 Ryder Street, St James's, London, S.W.1.



The peasant would probably have clung obstinately to his individual allotment, that remnant of rural private property. The produce of the allotment which he sells on the free market, the so-called collective farm market, still forms an important part of the peasant's income. The authorities seem to have resolved not to abolish the allotment yet, and thus incidentally they have given a breathing space to the free market, which contrary to the common belief has survived two decades of planned economy. The extent and activities of this free market will be discussed in a later article.

Iraq's Oil Wealth

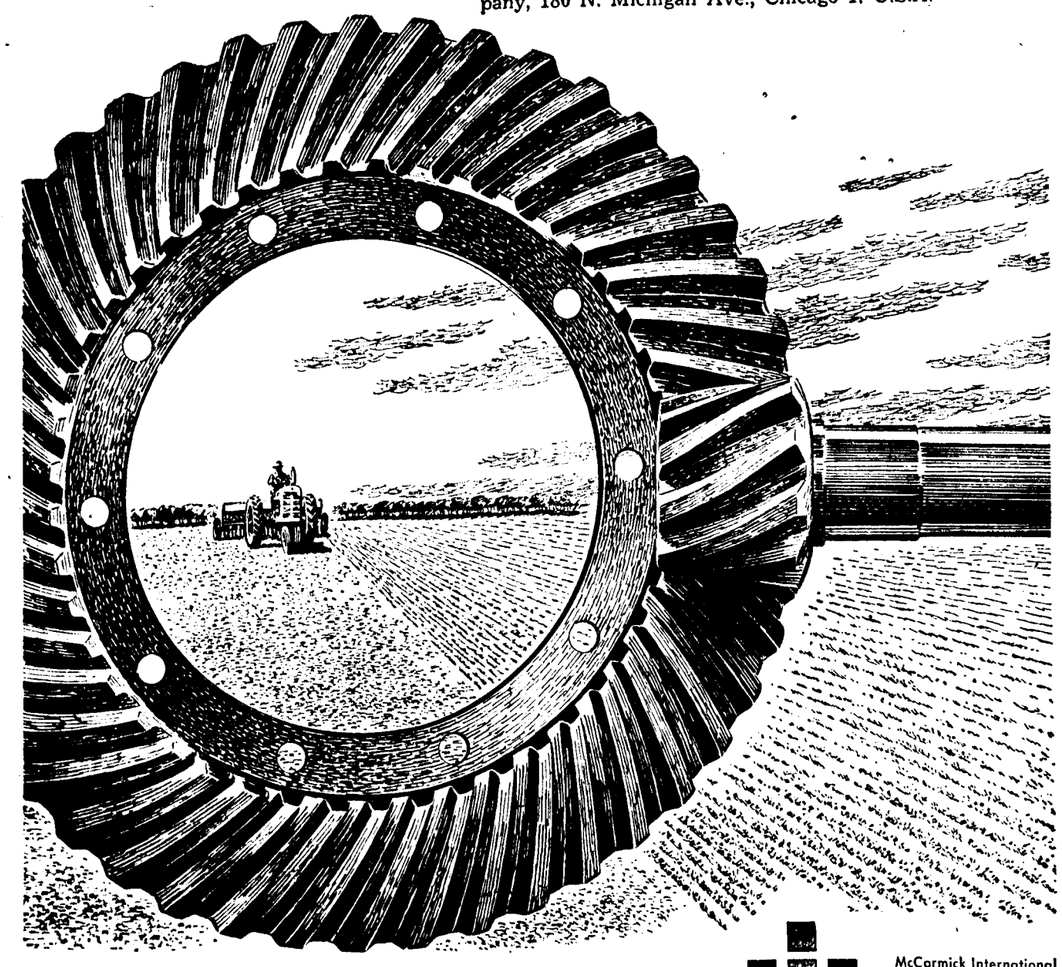
THE Iraqi Ministry of Propaganda has this week issued the text of an oil agreement reached in the negotiating committee in which Iraqi cabinet ministers and representatives of the oil companies operating in Iraq have been closeted for the last three months. The three companies, which are all under one management, are the Iraq Petroleum Company (operating at Kirkuk), the Basra Petroleum Company (due to start production on a commercial scale at the end of this year) and the much older but less prolific Mosul Petroleum Company. The terms of the agreement are so immensely much more favourable to Iraq than any earlier arrangement that they point to two conclusions: the first, that the enormous increase in oil output now taking place in the Middle East enables a company to plough back much more money than hitherto into the country in which it is operating; the second, that here is a management that can move with the times.

Agreement has been reached in committee, but there are still hurdles to be crossed before it becomes operative. The Iraq Parliament's approval is necessary. If this body is to approve at all quickly it will have to be called into special summer session at a moment when most of its members have removed themselves from the heat of Baghdad. In the ordinary course the current recess would last until December.

The agreement seems to meet most Iraqi criticisms of past practices. The first such criticism was that the foreign companies participating in IPC (these are American, French and Dutch as well as British) had always been more interested in their operations outside than in those inside Iraq, and tended to treat this last as a poor relation. Why, Iraqis asked, had 1,068 miles of large diameter pipe for Ibn Saud's Transarabian pipe-line been supplied before the mere 556 miles required for the line from Kirkuk to the sea? Another of their complaints was of dilatoriness in developing the Basra field. A third was that the company employed too few Iraqis in its higher posts. Thus Iraqi grievances were not, as are the Persian, founded on the belief that their country had been robbed of money. The Iraqis therefore harbour far less bitterness against their company than do the Persians. They merely wish to receive an overall rate per ton of oil extracted that is no less favourable than that received by any neighbouring country. One clause in the new document assures them of this.

The terms of the new agreement are as follows: Iraq shall receive 50 per cent of the companies' profits before the deduction of foreign tax. This revenue will be made up of the seaboard value of 25 per cent of the oil from Kirkuk and Mosul, and 33⅓ per cent of that from Basra. Of the total amount of oil so received Iraq will be free to market 12½ per cent for itself, either to third parties or the companies, as it may wish. The rest it will at its own wish sell to the companies at current world prices. The remainder of Iraq's half share of the profits will be paid in the form of tax, or of payments in lieu thereof. In addition to marketing some of its oil for itself, Iraq will also in the not too distant future do its own refining of oil for local consumption. It has long cherished the intention to build a refinery for this purpose near Baghdad; it is now negotiating a contract, believed to be for an £8 million plant, with an American firm. Under the new agreement, this projected refinery will buy crude oil, delivered by the companies to its door at the advantageous price of 5s. 6d. per ton. These arrangements for refining and marketing under local management will give the Iraqis valuable experience of the practical complications of the oil trade.

The Financial Gain



On the basis of present costs and prices, Iraq will receive, therefore, an overall rate per ton of 35s. 6d. in 1951, rising to 39s. 6d. in 1953 and after. Hitherto, the rate has been about 18s. 6d. per ton; that granted by the Arabian American Oil Company to Ibn Saud at the end of 1950 works out at about 30s. The difference in favour of Iraq is largely due to the fact that Kirkuk is much nearer to the terminal of its pipeline to the Mediterranean than is Aramco's field at Dhahran; its production and transport costs are therefore cheaper. Since production at Basra is to reach an annual rate of 8,000,000 tons by the end of 1955, the rate of Iraq's oil revenue is likely to rise to as much as £59 million in that year and thereafter. The dimensions of this nest-egg can be gauged from the fact that Iraq's ordinary budget has in recent years balanced at around £24 million. Iraqi directors are to be appointed to the oil companies' boards, and the present arrangements for training Iraqi technicians both at Kirkuk and in British universities are to be expanded.

If the agreement gets through Parliament, it may constitute something of a landmark. For the Iraq Parliament, by its Development Law of April, 1950, places "all the royalties which the government receives from oil" at the disposal of its Development Board. To this body it has been sufficiently broadminded to appoint, along with four Iraqi directors, an American water engineer and a British secretary. If these six men can between them get development projects under way, Iraq will be the first Middle Eastern democracy to devote all new oil wealth to schemes that are intended to improve the lot of the underdog. It will also be one of the very few governments in Asia to finance such schemes out of its own pocket. It has currently borrowed a small sum from the World Bank, but if it accepts the present plan it will in future obviously not need to do so.

Food is a question of mechanics

Maximum production from the land is essential to the well-being of farming communities and to the *physical and economic security* of entire nations. Agriculture is a *basic industry* that requires the best from men and machines . . . the right combination of farm mechanization and sound soil conservation practice.

Whether crops are grown for food or fibre . . . whether farms are measured in tens or thousands of acres, McCormick International Farm Tractors and Farm Equipment have the power and flexibility to improve every phase of the growing cycle from seed bed preparation to harvest. Here are the tools of mechanized agriculture. Their ability to revitalize farming production is shown by documented records of successful performance. International Harvester Export Company, 180 N. Michigan Ave., Chicago 1, U.S.A.

THE BUSINESS WORLD

Exchange Control and Flexible Rates

THE agitation for a revaluation of sterling now seems to be subsiding and is unlikely to be revived—at least so long as Britain remains in the throes of the latest crisis in its balance of payments. The discussion has drawn attention, however, to one aspect of the general problem of sterling's valuation that deserves much closer scrutiny than it has so far received. The true "equilibrium" value of the currency cannot be ascertained with precision even for a given point of time, and the forces that determine that true value are constantly changing; in the past two years they have been changing very violently indeed, as the swing from devaluation to revaluation propaganda plainly demonstrates. The more clearly this is recognised, and the more violent the changes, the more it may appear desirable, in principle, to abandon the system of fixed parities for sterling, and to adopt instead a "floating" or "flexible" rate. Such a rate might be either one settled in a free market subject only to the intervention of the authorities as buyers or sellers (that is, approximately the system that operated in the thirties), or a rate fixed, as now, by the authorities, but subject to variation as frequently as they deemed necessary, conceivably from day to day. Some of the advocates of an appreciation of sterling did, in fact, propose some such system as this, on the ground that if the pound were "freed" it would appreciate, just as the Canadian dollar did when its formal link with the US dollar was severed last autumn. Discussion of this particular aspect of the problem was, however, generally cut short by a flat assertion that a floating rate is, in any case, quite impracticable in present circumstances, on the ground that it would be incompatible with exchange control. In the interests of clear thinking on the whole problem, this assertion deserves to be examined separately—irrespective of the wider question of the relative merits of fixed and floating rates as such.

Although the question whether—and, if so, how—a moving rate for sterling could be reconciled with exchange control is primarily a technical one, it cannot be wholly divorced from wider issues of principle. In particular, it is highly relevant to the technical problem to ask whether the rest of the sterling area would automatically follow sterling in its floating movements and whether the freeing of sterling would similarly involve a freeing of most of the currencies outside the dollar block. If the severing of the rigid sterling-dollar link loosened the whole pattern of exchange rates, it is relevant to the purely technical inquiry to ask whether this would involve a split of world currencies into two main blocks, one adhering closely to the US dollar and to gold and the other to sterling, or whether the floating currencies would begin to float in terms of one another as well as in terms of the dollar.

These questions primarily raise issues of policy and not of technique. It must be seriously questioned whether the rest of the sterling area, other than the colonies whose monetary policy is determined in London, would leave London unfettered discretion in deciding the day to day rate of exchange between their currencies and gold—which is what would be involved if they accepted the principle of following closely in the steps of a floating sterling rate. It is true that their ownership of substantial sterling balances would tend to influence sterling area countries to maintain the parities of their own currencies with sterling, in order to save them from running exchange risks on these substantial external assets; but it is by no means certain that this would outweigh other considerations. Some members of the present sterling club might reconsider their position and choose another anchor for their currencies. Moreover, non-sterling countries whose currencies floated off their existing gold or dollar parities would probably think many times before linking their currencies to sterling in the political and economic circumstances of today. It is, therefore, more than likely that a decision to let the pound rate go free would involve not merely a fluctuating sterling-dollar rate, but an extension of this state of flux to a wide sector of the pattern of international exchange rates, including, perhaps, that within which there now exists the stability of the sterling system.

This brings to the fore the first of the technical problems that would arise if the sterling rate were allowed to float freely—the problem of the probable re-emergence of disorderly cross-rates for sterling in the many countries where it is quoted. In most of the British Government's bilateral payments arrangements, assurances have been exacted from the other parties that they will strive to maintain orderly cross-rates in their respective markets, i.e., to ensure that the rates for sterling and dollars quoted in these centres will not deviate from the parity indicated by the current dollar-sterling rate. If this rate were no longer fixed, these agreements and understandings would lose the anchor to which they are at present attached. A floating sterling rate, without free international exchange arbitrage (which must be excluded if control of capital movements remains), would in fact produce a wide diversity of cross-rates between sterling and the dollar. "Free" and largely unrelated markets in sterling would flourish in all important financial centres of the world and perhaps within what is at present the sterling area. The re-emergence of markets for cheap sterling would create new loopholes in the existing structure of exchange control and would call for new restrictions on the freedom with which sterling can be used in international transactions. The defensive measures against this re-emergence of disorderly cross-rates and cheap commercial sterling markets might, for example, call for a considerable contraction of the transferable account facilities and of the administrative tolerance by virtue of which transfers of sterling may now be made between non-sterling countries with which only bilateral agreements operate. This is a sphere in which questions of principle and technique are inextricably intermixed. So far as principle is concerned, it can be asserted, paradoxically, that a move towards freedom by letting the sterling rate "float" would have to be accompanied by a retreat from freedom in the manner in which exchange control is operated in the United Kingdom.

A second sphere in which questions of principle and technique intermix concerns the requisite size of the gold and dollar reserves, given the probability that a need for intervention would arise if the sterling rate were allowed to float. A floating rate would obviously have to be controlled by the Exchange Equalisation Account. For this purpose the gold and dollar reserve, though it must serve the needs of the sterling area as a whole, would have to be available to go into action at any moment—and, of course, without reference to the other members of the sterling area. This reserve is at present inadequate for that purpose. The matter thus becomes a question of technique as well as of principle, for it would become technically difficult, if not impossible, to maintain effective exchange control of sterling if the reserve available for intervention in the market were inadequate to prevent severe fluctuations in rates; and that, in turn, would affect confidence in sterling. Without such confidence the technical task of maintaining exchange control would be made immeasurably more difficult.

★

So far as the pure mechanics are concerned, the problem of reconciling exchange control to a floating rate should present no great difficulties. The basic objectives of exchange control are to conserve and allocate foreign exchange resources, to control capital movements, to ensure that investment abroad flows into desirable channels, and to ensure the repatriation of the proceeds of export trade. To serve these purposes all residents in Britain are obliged to surrender any specified foreign currencies that come into their possession, and to take sterling in exchange. Amounts that may be taken out of the country for expenditure by tourists or by emigrants from the United Kingdom are strictly limited. In the case of residents outside the sterling area, specific limitations are placed on the use they can make of their current sterling earnings, while capital assets belonging to them are blocked and can be invested only under rigorous limitations. All these objectives can be attained as easily with a moving as with a fixed rate. The necessary formalities, the filling of forms, the delegation of authority to the banks, would persist without appreciable difference in a regime of moving rates.

Where technique might at first give some trouble would be in the operation of the foreign exchange market. Twelve years of strictly controlled buying and selling rates, a period during the greater part of which the banks have operated as agents of the Bank of England and not as principals, have had a deleterious effect on the dealing skill of London bankers. It is true that in recent months there have been opportunities of relearning and reacquiring the necessary deftness. For some time the banks have been acting as principals in their exchange operations to the extent that they are allowed to marry their transactions provided that they settle their positions with the Bank of England at the end of each working day. That has gone a little way towards restoring the atmosphere of a market, though the advance has been minute, because official buying and selling rates remain fixed and the market has always been able to operate with the knowledge that the authorities will be there to supply their needs or take over their balances at pre-ordained rates.

The opening of a market in Canadian dollars at controlled but fluctuating rates has also given the London market modest but valuable experience in reacquiring the mysteries of this trade. Foreign exchange brokers have had to open shop again and dealers have in a very small way had to show some inkling of dealing skill. The experience gained so far with the Canadian dollar has, it is true, been of such a parochial character that it offers no guide to what would happen if the sterling rate were set free. It can be assumed that the adoption of a "free" sterling rate would not mean the reopening of arbitrage foreign exchange dealing, since capital movements would presumably remain forbidden. The need to hand over specified currencies to the authorities would remain, and no bank would be allowed to carry positions over and above the foreign exchange balances required for normal working purposes. In other words, a freeing of the rate would not involve a return to anything like the fluid and active conditions that marked the prewar foreign exchange market. But it would recreate a position in which dealing skill would once again come into its own.

Important changes would have to be made in the gold purchasing arrangements within the sterling area if the sterling rate were to be allowed to float. At present, arrangements are made for purchasing newly-mined gold at fixed prices, under comparatively long-term contracts. These arrangements would have to be amended if there

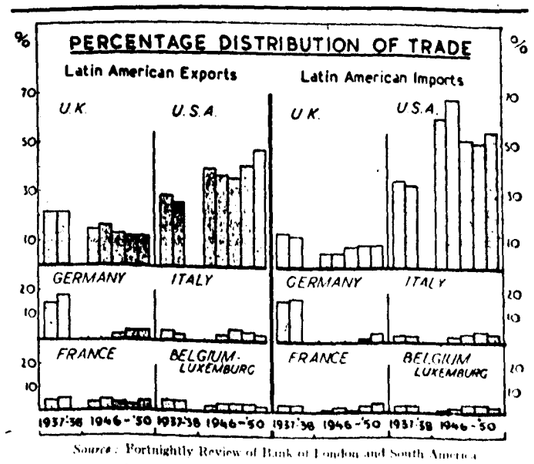
were no longer to be an official fixed sterling price for gold—not an insuperable difficulty but one that could give rise to trouble if, for example, British and South African pounds were to fluctuate in terms of one another. Another technical adjustment to a floating rate might be called for in the existing facilities for forward dealing. A moving rate would almost certainly increase the demand for forward facilities. There is no reason why these facilities should not be extended to meet all genuine requirements of international trade. The opportunity might be taken to raise the cost of these facilities; at present they are inordinately cheap. It might in fact be desirable to free the forward market in foreign exchange before freeing the spot. The authorised banks could be allowed to buy and sell forward exchange for genuine commercial transactions at rates that, while fixed in a competitive market, would give them a reasonable return and would not, as at present, be rates dictated by the authorities.



Certain technical difficulties might arise as a result of the impact of a floating rate for sterling on Britain's membership of two international monetary organisations, the International Monetary Fund and the European Payments Union. It may be doubted whether the IMF would survive the blow of sterling's virtual departure from the club—which is what a floating sterling rate would involve. It is true that IMF has shown increased toleration towards the vagaries of its members, but what can be tolerated with impunity when countries such as France or Canada diverge from the rules of the club is no measure of the disruptive consequences of a severance of the link between the two basic world currencies, the dollar and sterling. If the IMF mechanism were to be thus disrupted or discarded, a new set of technical problems would have to be faced; their eventual solution might conceivably involve a reconstitution of the tripartite agreement of the 1930s. The European Payments Union, for its part, could hardly be operated as at present in a regime of fluctuating rates. The machinery of monthly clearing of balances resulting from thousands of operations effected at varying rates would defy the ingenuity even of the OEEC experts responsible for this monument of monetary wizardry.

What, then, is to be the verdict on the possibility of reconciling exchange control and moving rates? It is, first, that a moving rate would offer no insuperable difficulty for the day-to-day operation of exchange control; secondly, that the London market would probably adjust itself quickly to the new situation and would benefit greatly from the return to more or less competitive dealing conditions where skill was still something that mattered and was rewarded; thirdly, that a moving rate might create new sets of problems calling into question the hegemony of the sterling area, possibly causing a proliferation of unrelated and divergent rates of sterling and thus perhaps damaging the position of sterling as an international currency; finally, that any such development would require considerable amendment of gold purchasing arrangements within the sterling area and might endanger the adherence of Britain to such international organisations as the International Monetary Fund and the European Payments Union. In short, any "freeing" of the pound rate is not ruled out because of technical difficulties of reconciling it with exchange control. There may be many and convincing reasons for not launching such an experiment in freedom but, if so, they lie in the realm of policy decisions rather than of technique.

The Latin American Market

WHENEVER the need for Britain to "push" exports becomes more urgent, greater attention tends to be directed towards the Latin American market. Experience in this market since the war has been frankly disappointing. United Kingdom exports to the twenty Latin American republics have indeed multiplied threefold since before the war—their value amounted to just over £150 million in 1950 compared with about £50 million a year in the late 'thirties. But this expansion has not kept pace with the expansion in Latin American purchasing power. Less than 10 per cent of all imports into Latin America last year came from Britain, compared with nearly 15 per cent in good years before the war; more than half of Latin America's imports now come from the United States, compared with about a third before the war. Germany, which is Britain's natural competitor in many products for this market, provided more than 15 per cent of Latin America's imports before the war. Its share is recovering from the negligible proportions of the early post-war years, and last year it was already providing 3 per cent of Latin American imports; in recent months German sales have been expanding rapidly. The accompanying chart, which is reproduced from a recent issue of the *Review* of the Bank of London and South America, shows the most active participants in two-way trade with Latin America before and since the war.

What are the prospects for an expansion of British exports to Latin America in the face of renascent German and established American competition? Any answer to this question involves a sharp differentiation

Source: Fortnightly Review of Bank of London and South America

between two areas of Latin America. In the southern countries (most of which are in the transferable or bilateral account groups for purposes of British exchange control) the great barrier in the way of an expansion of British exports is usually the existence of local import restrictions. In the northern countries (which are in the "American account" area for the purposes of exchange control) the main barrier is probably still Britain's lack of competitive efficiency.

Unfortunately, the prospects for expansion of British trade with the non-dollar countries do not seem very bright. Real incomes in such countries as Argentina and Brazil have not expanded since the war to the same extent as, say, real incomes in Venezuela. Both the big southern countries, together with their immediate neighbours, have chosen to push ahead with industrialisation

UNITED KINGDOM TRADE WITH SOUTH AND CENTRAL AMERICA
(£'000's)

Note.—Figures for 1951 show an approximate annual rate based on the first five months. Since some exports to Latin America are largely seasonal, some figures in this column may give an unrepresentative picture.

Country	UK Exports and Re-exports		
	1949	1950	1951 (see above)
Argentina	51,572	38,752	26,900
Bolivia	952	1,042	1,680
Brazil	34,369	43,334	53,500
Chile	5,575	6,252	4,860
Colombia	3,388	5,962	6,250
Costa Rica	442	818	1,050
Cuba	1,603	3,456	7,360
Dominican Republic	551	530	780
Ecuador	1,002	1,389	1,460
El Salvador	320	587	820

Venezuela	14,672	14,408	16,800
TOTAL LATIN AMERICA	135,773	153,796	160,560

programmes at the very moment when the terms of trade have been swinging back in favour of raw material producing countries. Two other consequences of these industrialisation programmes have been a diminution of local exports and a restriction of the use of scarce foreign exchange reserves to those imports that the local government considers essential. The typical British exports for which import licences are now freely granted are fuel, raw materials or semi-manufactures (such as cotton yarn), and machinery; all of these are goods that can readily be sold elsewhere—especially in conditions of world rearmament. A Britain that is seeking to fill the yawning gap in its external payments by increased exports of finished textiles and other consumer goods is not likely to find much new elbow room in the southern markets of Latin America.

The most important country in this region is Argentina. In 1950 Britain's exports to Argentina consisted almost entirely of coal, oil and a few other essentials. The recent Anglo-Argentine agreement provided for the establishment of a mixed consultative committee to consider the scope for expansion of "less essential" British exports to Argentina in 1951. In several recent meetings this committee seems to have made virtually no progress. It is probable that Argentina will agree to issue import permits for textile yarns (which it has lately been importing heavily from Brazil, Peru, the Netherlands, France and Italy); there may also be grants of more import permits for British chemicals. But any licences given for imports of so-called "inessential" British goods (including textile piece goods) seem likely to be of the peculiar sort that do not carry authorisation for use of foreign exchange—in other words of the sort that can be used only by Argentine importers who scrape around for foreign exchange at very high prices on the illegal (or "jet-black") market. Some £14 million worth of these tickets into the black market have apparently been given to would-be importers of British goods in the last three months. Argentina's current difficulties in producing sufficient meat for export do not suggest that its foreign exchange position will permit any widespread granting of import licences for consumer goods for some time to come.

★

Prospects for British exports to Brazil seem slightly, though not much, better. Brazil is now threatening to establish a seasonal cycle in living beyond its means. In the early months of each year it announces a grave foreign exchange crisis and sterling remittances are held up. In the spring, when the proceeds of the cotton crop begin to come through, remittances are resumed and by the late summer the Bank of Brazil begins to talk about liberalisation of import permits. Before this talk is translated into action, however, the winter's foreign exchange crisis may have arrived and remittances and import permits may again be held up. There is some hope that this cycle may be mitigated this year since the Brazilian cotton crop for 1951 was unusually good. Against this, however, German competition is reappearing in Brazil on a significant scale.

BRITISH EXPORTS TO LATIN AMERICA, 1950
MONTHLY AVERAGE

	Non Dollar Countries in Western Hemisphere*		Dollar Account Countries excl. U.S.A. and Canada†	
	£'000	Per cent	£'000	Per cent

Other goods	63	*1*	36	*1*
	9,336	*100*	3,536	*100*

* "Non dollar countries" are Argentina, Brazil, Chile, Paraguay, Peru and Uruguay. † "Dollar countries" are Cuba, Haiti, Dominican Republic, Mexico, Guatemala, Honduras, Salvador, Nicaragua, Costa Rica, Colombia, Panama, Venezuela, Ecuador and Bolivia *plus* the Philippines, Alaska, Porto Rico, Hawai and the Virgin Islands.

In most of the other non-dollar markets of Latin America, prospects for an increase in British exports seem rather brighter in 1951 than in some recent years. Chile experienced an acute balance of payments crisis in 1949 and severe import restrictions were accordingly

introduced. Despite these restrictions, British exports to Chile have lately tended to increase; Britain's share in total imports into Chile in 1950 was over 15 per cent—well back to the prewar level. Peru is a country that, just over a year ago, took the bold step of setting its exchange rate completely free and lifting all import restrictions. Since then its prosperity has increased remarkably and so has British trade to the Peruvian market; unfortunately, however, total imports into Peru are less than $200 million a year, and Britain's share can hardly mount much above a quarter (against one tenth before the war). Uruguay is another country whose total imports do not reach $200 million a year. It discourages "inessential" imports by a complicated multiple exchange rate structure and some import controls, but the British share in this market exceeds 20 per cent and is higher than before the war. Paraguay is a still smaller country and is now in grave balance of payments difficulties; it has lately taken the interesting step of asking IMF experts to decide what it should regard as "essential," and what as "inessential," imports.

The accompanying tables show that about three-quarters of all British exports to Latin America now go to these non-dollar countries; more than half, indeed, go to Argentina and Brazil. Yet it is in the American account countries to the north that the boom in oil and in the prices of primary commodities has boosted prosperity to new record heights. The dollar value of imports into such countries as Venezuela, Mexico and Colombia is now seven to eight times larger than it was in the 'thirties.

Unfortunately, however, the British share in these markets is usually small—often indeed much smaller than before the war. The fault seems to lie partly in lack of direct shipping facilities, partly in lack of market contacts, partly in British exporters' refusal to nurse these markets in such matters as firm delivery dates, and partly in the facile assumption that tastes in these countries have been so completely conditioned by American standards that a British export drive could make no impression on them. It will be interesting to see how much headway British exporters make in the Cuban market now that the pro-American discrimination in Cuba's tariff system is to be mitigated. In most neighbouring markets—where no such discrimination has ever existed—British progress in the last few years has been slight.

Far too many of the British exports that do find their way to these markets are directly related to the local operations of British companies—especially oil companies. Yet the figures in Table II suggest that there should be some scope in these northern markets for greater sales of British textiles and other products that are barred from the more closely regulated markets to the south on the grounds that they are "inessential." Certainly it is noticeable that German exporters of consumer goods are setting their cap at these northern markets. It has been said that one of the most fruitful fields for the present-day merchant adventurers of Britain may lie in the territories that border the erstwhile Spanish main. The most promising individual markets seem to be in Venezuela, Cuba and Colombia, but in some of the smaller countries in and around the isthmus an aggressive and direct sales campaign would also seem likely to yield valuable resuts.

Business Notes

"Pre-Gaitskell" Equities

The equity share markets have this week continued their rally from the shock administered by Mr Gaitskell's dividend limitation announcement just over three weeks ago. On the eve of that statement, the ordinary share index of the *Financial Times* stood at 132.9, and in the phase of the market's plunge into Daltonian "complete disorder" the index dropped to 127.1. By Monday last the whole of this loss had been regained, and two days later the index had risen to 133.6. This level, it should be noted, is still appreciably below the high point reached some weeks before the Chancellor's speech—for that had cast its shadow before. It should be noted, too, that the behaviour of this index, which is based on the prices of market leaders, does not indicate the violence of the effect upon the more volatile securities or upon those that have recently benefited from increased dividends; in these instances the fall was generally greater and the rally less marked than the movements shown by the index. Even so, the speed and extent of the recovery of the market as a whole has taken the City rather by surprise. This behaviour certainly does not signify that investors and businessmen are viewing the consequences of a legal limitation of dividends less tragically than they did at the outset. On the contrary, one of the major sources of the market's resurgence is undoubtedly the hope that the Chancellor's intentions may never, in fact, become effective—though this is a hope that has been voiced rather less widely and less firmly in the past few days than it was a fortnight ago. The other main reason for the recovery, Mr Gaitskell would do well to note, is the realisation that none of his latest proposals can have any real effect in combating the pressure of inflation. Indeed, the fact that he has been constrained to resort to mere window-dressing—by measures of price control and the "psychological" device of dividend restraint—has led many people to conclude that no real resistance to inflation ever will be offered by a Government of the present hue. In these circumstances, even with dividend limitation, sound industrial equities are still regarded as the best available hedge for many people.

This conviction explains not only much of the recovery in the equity share markets, but also the moderateness of the rise in gilt-edged. The fact that, for the time being, dividends have a ceiling but no floor, so that ordinary shares might be regarded on this ground as having even less investment merit than fixed-interest securities, had been expected to provoke some considerable switching of funds into gilt-edged. No doubt some such switching has occurred; but so far the main effect of Mr Gaitskell's move seems to have been to check the opposite movement—the switching from fixed-interest securities into equities—that had been proceeding so actively in the preceding months. In consequence, gilt-edged values are little different now from what they were three weeks ago: the long-dated and irredeemable stocks have risen on balance by a mere 1/4-5/16, and the trend in the past few days has been easier. The scope for any recovery in gilt-edged values is being narrowed, too, by the knowledge that a lengthening queue of trustee borrowers awaits approach to the market. The next in turn is British Guiana, which on Tuesday next will offer £2,180,000 of 3½ per cent stock, 1966-68, at 97. This issue was underwritten in the market last week; £680,000 of the total has been taken firm.

* * *

Wintry Prospect

By a touch of irony, a few days of cold weather have coincided with the seasonal reduction in generating capacity

(because of repairs) to produce power cuts in the north and north-west of England in every way as drastic as those that are in prospect in mid-winter. The estimates worked out by the British Electricity Authority are indeed frightening. The report of the Electricity Sub-Committee of the Joint Consultative Committee of the National Joint Advisory Council describes the prospect as being "more serious than any with which we have had to deal since 1947." That is enough to frighten industry and to freeze the marrow of the private consumer. There are no remedies for this situation. Consumers will go short; the only question is whether they can contrive to make the effects of shortage as little harmful as possible.

The sub-committee records the estimates of the BEA of potential demand at the winter peak:

Average weather	13,800 megawatts
Average Cold Spell	14,400 megawatts
Severe Weather	15,100 megawatts

"It is," says the BEA, "a matter for the committee to decide which of these weather hazards should be taken into account in planning next winter's load spreading." The committee hands back this invitation to indulge in long-range forecasting with the unassailable conclusion that, whatever the weather may be, the gap between generating capacity and potential demand cannot be closed by rearranging industry's demand. Since installed generating capacity is not likely to exceed 12,200 mw. in February next year, there is the prospect of a gap at times of peak demand of 1,600 mw., even on the best assumptions about the weather. Frequency and voltage reductions have now come to be an accepted feature of the winter months. They can be used to dilute maximum demand to the extent of about 1,200 mw., leaving under "average cold" conditions some 1,200 mw. of load to be spread or shed.

Of this margin, industry is adjured to find 600 mw., which means 20 per cent of last winter's maximum demand by industry before load spreading. And there is so little prospect of shortening the duration of load spreading arrangements that the sub-committee recommends that they should apply from the beginning of November to the end of March, from 8 a.m. to 12 noon and from 4 p.m. to 5.30 p.m., Mondays to Fridays.

These fatalistic conclusions are themselves dependent upon two other conditions. "Any dislocation of domestic solid fuel supplies" would seriously increase the maximum demand at the peak. Secondly,

> the sub-committee sees no way of securing adequate means of avoiding load shedding that does not involve some adjustment of the customary hours of work, whether by a simple alteration of working hours, the introduction of double shifts or a considerable switch to night work.

It is a choice between spreading and cuts—and spreading on a scale that is bound to cause household dislocation and can only fall unequally on different industries. It would be surprising if it could be put into operation on an effective scale, but the effort should certainly be made.

* * *

Fuel and Power

It was no part of the sub-committee's task to examine once again the economics of power production and distribution. Another winter approaches with the same old problems still awaiting solution and seriously intensified—with nothing more concrete to offer towards their solution than fanciful ideas of importing power from France. The additional 600 mw of commercial and domestic load that has to be discarded under "average cold" conditions remains a matter of exhortation; it is beyond the power of BEA to secure either by physical or economic means—though there have recently been signs of a readier disposition on its part to consider some of the methods of control that have been discussed in these columns and elsewhere so frequently in the past.

It is something that at long last the Minister of Fuel and Power has announced the composition and terms of reference of a committee to consider

> in view of the growing demands for all forms of fuel and power arising from full employment and the rearmament programme whether any further steps can be taken to promote the best use of our fuel and power resources, having regard to present and prospective requirements and in the light of technical developments.

These terms of reference would seem to leave it opn to the Committee to conclude that all possible steps are already being taken—which would certainly be an odd conclusion, since they are being asked to survey the whole question of the use that is made of basic fuels (mainly coal and oil). The committee includes no representatives from the nationalised fuel and power industries, which is as it should be; it should be capable, when it has reached the end of its burdensome task, of forming the first independent judgments on the most economic and efficient means of using resources that have become pitiably scarce in relation to the demands that are now being made on them.

This again will be of no help during the coming winter. There are other serious problems apart from the gap in power supplies. Will there be a spurt in coal output to match the effort in the spring, which succeeded beyond expectations? The National Coal Board remains optimistic that Saturday working will be generally resumed throughout the industry but it will have to start quickly if distributed stocks (now 13.9 million tons compared with 13 million tons a year ago) are to be raised to a safer level. Manpower remains precariously at the 700,000 mark and there are only a few hundred more face workers than a year ago. Stocks of gas and locomotive coal are not as high as they should be and merchants' stocks of domestic fuel threaten the breakdown of supplies of which the BEA is rightly apprehensive. Will the railways be capable of handling any increase in output? They, too, are seriously concerned about their ability to provide adequate freight transport in the coming winter. Nor is any relief obtainable this winter from greater use of fuel oil. The oil distributors expect to be able to meet the needs of existing consumers (though this may well involve a good deal of contrivance) but they will not be able to satisfy any increase in demand as they have been able to do on such an impressive scale in past years.

* * *

Steel Prices Increased

The need for an increase in steel prices was apparent long before the Government launched its latest Operation Canute. The Minister of Supply's long delay in reaching a decision has been ended at the moment when his colleagues are beginning once again to experiment with all the devices that have failed in the past to keep prices stable. Mr Strauss's belated approval of the increases announced last Monday is out of step, but though it may be late, it is certainly logical. Last April it was suggested in these columns that steel prices might have to be raised by £3 a ton if the rise in cost of materials and transport were to be fully met. Delay has meant that the increase, now that it has come, is a good deal heavier. It is difficult to see what advantages postponement of the decision has brought: indeed, keeping the price of steel products too low during the summer has encouraged demand for steel at the very time that the authorities have been trying to quench part of it by physical allocation.

There is, perhaps, a better argument in the case of steel than could be advanced for most industrial products for keeping prices as stable as possible for as long as possible. The last material increase in steel prices was in April, 1949, and

despite devaluation, rising costs of internal transport, and heavier burdens for imported raw materials, the steel industry has managed to live on the 1949 prices; it has improved its efficiency by producing more steel for a given quantity of coal consumed, and labour productivity in steel melting and rolling has shown a significant improvement. But these advances have been overshadowed by the doubling of prices of imported raw materials in the past year. Freight charges on iron ore from North Africa increased by 190 per cent in the year to June, and the landed cost of imported ore by nearly 60 per cent; because of unexpired contracts for ore and shipping space both of these increases are lower than they might have been, and may yet be. Imported scrap cost £8 13s. a ton in the second quarter of 1950 and £12 2s. a ton in the first quarter of this year; it is now over £16 a ton—for what there is of it.

All told, extra costs of imported raw materials account for 40 per cent of the total proceeds of the higher prices now announced. Another 20 per cent will be absorbed by the revised arrangements to cover the losses on imported finished steel. Such steel has been provided to British users at the home price, the difference being made good hitherto by Exchequer subsidy. This subsidy is to be discontinued and the losses are to be pooled in the steel industry's total costs. It is impossible to say exactly what they will amount to. On the prices ruling in June, imported plates showed a loss of £31 a ton, and sheets a loss of £25 a ton (in each case excluding import duty which is, in effect, remitted). Since there may be sharp fluctuations in steel prices abroad and keen competition on the part of other countries besides Britain for what foreign supplies are available, the total loss to be equalised over domestic steel prices is quite indeterminate. The new pricing arrangements, therefore, introduce a levy of 15s. 6d. a ton on ingot steel to meet the prospective loss on imports. Meanwhile, the internal accounting arrangements continue whereby steel companies that have the advantage of using relatively lower cost raw materials produced at home contribute towards the additional costs of other steel makers who rely more on imported materials. The surplus on this equalisation fund has been considerably drawn upon in recent months to meet higher import costs.

* * *

Prices and Output

The broad effect of the latest increases in steel prices is summarised by the British Iron and Steel Federation in the following table:—

STEEL BASIS PRICES PER TON

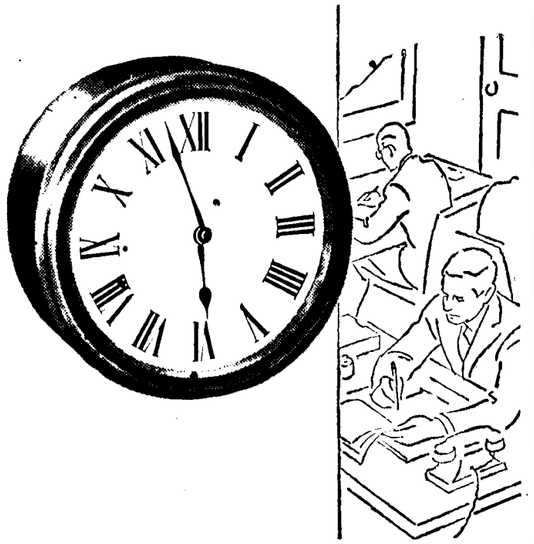
	New Price	Increase
	£ s. d.	£ s. d.
Billets	21 16 6	4 7 6
Angles	23 15 6	3 14 0
Joists	24 2 0	3 10 6
Rails	24 10 6	4 13 0
Plates	25 6 6	4 3 6
Re-rolled bars	27 11 0	4 16 0
Strip	28 6 0	4 16 0
Sheet	35 15 6	6 2 6
Bright bars	37 6 9	5 12 6
Tinplate (*a*)	2 14 8½	6 11

(*a*) per basis box.

They range from something less than one-fifth for angles and joists, and certain more highly finished products, to one-quarter for billets. The Federation claims that after giving effect to these increases, steel products will be selling on the average at 130 per cent above the prewar average—little more than half the rise shown by other constituents in the wholesale price level. The Federation also claims that "British steel prices are still fully competitive with those ruling in Western Europe and far below those of the United States." It is not denied, however, that certain German steel products will now be slightly cheaper; this is a point which British engineering concerns who are now showing signs of apprehension about future German competition are not likely to overlook. Broadly, however, the contention is true that the raising of British steel prices nearer to the world level (and distinctly nearer to the non-dollar level) should tend to ensure that steel will be used with greater care and that exports of steel products should show a greater emphasis on higher-valued products and less upon simple articles.

It remains to be asked whether, when this attempt was being made to bring steel prices more closely into line with average costs, further consideration should not have been given to the price of home-produced steel scrap and the prospects of increased deliveries, of which the steel furnaces stand in urgent need. The industry and its leading customers have done well to secure the greatest and quickest return of scrap to the furnaces. The scrap campaign is now attempting to tackle a much more difficult task—to persuade those who have scrap, but who lack the special incentives that apply to producers and large users of steel, to disgorge their supplies. These may be great in the mass, but they are usually small in the piece, and the question whether £4 a ton (plus special costs of collection in some cases) will be sufficiently attractive to get them moving to the steelworks has still to be answered. The virtues of competitive prices for British steel are not to be denied; but what happens if the scrap price on which they are partly based should prove too low to sustain the highest level of output of raw steel that ought to be possible?

* * *



Smaller Trade Gap

Provisional trade figures show that the visible trade gap was smaller in July than in June. The excess of imports (valued c.i.f.) over exports (valued f.o.b.) dropped by some £20 million from June's record figure of £148.9 million to £127.1 million in July. For the first seven months of this year, the excess of imports over exports amounts to no less than £679.3 million, compared with £347.9 million for the whole of 1950. The improvement in the July deficit results entirely from an increase in United Kingdom exports from £200 million to £222 million. Re-exports also increased slightly. Total imports in July at £358.9 million were almost identical with the June imports of £357.5 million. The value of exports approached the high figures recorded in April and May. The increase in the value of exports between June to July is about one-tenth; but export prices will probably have increased further and the July improvement makes only the beginning of a contribution towards the increase of some 20 per cent in the volume of exports which the Chancellor has demanded to meet this year's prospective trade deficit.

EXPORTS TO NORTH AMERICA
(Monthly Averages £ m.)

	USA	Canada	Total N. America
1950, 1st quarter	6·7	8·5	15·3
2nd "	7·3	10·2	17·5
3rd "	10·9	10·9	21·8
4th "	12·8	12·3	25·1
1951, 1st "	11·2	9·5	20·7
2nd "	12·5	13·6	26·1
July	12·4	15·6	28·0

Exports to North America seem to have been more satisfactory, increasing from an average of £26.1 million in the second quarter to £28 million in July. The July figure is about a fifth above that for the first part of the year. Exports to Canada increased to a record figure of £15.6 million whereas exports to the United States fell slightly. Taken as

The office clock needs watching

● CLOCKS are most expensive when they record overtime. Nowadays, the cost of office staff, in terms of space alone, must be justified by greater production per person, per day. But no organization can get this if it relies on obsolete figuring methods to provide all the facts it needs. Ideally, all procedures should be finalized within normal working hours; all accounts not only completed but proved; every desk cleared of today's work today.

Burroughs are in business to make this practicable. First, by expert advice on how to get an accounting routine working evenly, with no overloading and maximum output. Secondly, by installing the business machine exactly suited to the system that gives the best results.

The Burroughs organization is known all over the world. Experience of the changing needs of business, on the widest scale possible, helps them to solve the most localized problem *faster*. And to provide an on-call maintenance service that keeps their machines on the job all the time.

IT COSTS YOU NOTHING . . .

Many economies can be made in office departments—but problems cannot be solved until they are clearly defined. The Burroughs publication "Ways to Save Time in an Office" contains useful advice for office management. This booklet can be obtained, free of charge, from Burroughs Adding Machine Ltd., Avon House, Oxford Street, London, W.1.

CERIUM

CERIUM is one of the group of elements known as the "rare earth" metals, which are very similar to each other in chemical properties. The first steps in the discovery of this element were taken in 1751 when a 15-year-old Swedish boy Wilhelm Hisinger sent a sample of rock to the famous chemist Scheele. Hisinger thought that this rock, now known as the mineral "cerite", might contain a new metal; but Scheele failed to find it. More than twenty years later Hisinger himself discovered in cerite the new element cerium. Today the most important sources of the rare earth metals are deposits of monazite sand found in India and Brazil. Pure cerium is rarely produced, but in the form of "Mischmetall"—a mixture or rare earth metals—and in compounds with other elements it has a number of industrial uses. The luminosity of an electric arc light is increased if the carbon electrodes are impregnated with cerium fluoride during manufacture, and ceric sulphate is used in chemical analysis and in photography.

Mischmetall is used extensively to make lighter flints of which I.C.I. produces many millions every year for use in gas and cigarette lighters.

ICI

THE PERSONAL TOUCH IN BANKING

Nearly two centuries of financial experience and personal service to each customer have helped to build up the present tradition of Glyn, Mills & Co. The banking service which is provided is completely modern in all its aspects, yet has never become impersonal in its attitude towards the large concern or the private individual.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

a whole, the July figures are less disturbing, but imports are still high and show little effect, as yet, of the reaction in world prices since the spring.

* * *

CIC as a "Star Chamber"

Evidence continues to accumulate to witness the depth of the feelings that dividend limitation has aroused in the City and among industrialists. On Tuesday it touched off a characteristically explosive speech from Mr Gibson Jarvie, who told stockholders of the United Dominions Trust (whose dividend was recently restored to its prewar level) that the Chancellor's "amazing" speech had compelled him to re-write his intended address. The revised version comprised a studied attack on Government policy at large, and a plea for freedom that found echoes throughout the City—and far beyond it. The main interest in Mr Jarvie's speech, however, lay in his promised account of the Trust's efforts to secure permission from the Capital Issues Committee for a new issue of capital. He explained that the Committee turned down an application made twelve months ago, and again rejected it on re-submission towards the end of the Trust's financial year, without giving reasons for the decision. Mr Jarvie thereupon protested to the Chairman of the Committee, but failed to secure either a reversal of the decision or a statement of reasons—of the nature of which Mr Jarvie professes complete ignorance. In his opinion, this procedure of "condemning" a company "in its absence" and without stated grounds "smacks of the Star Chamber"; it is all too consistent with the huge extension of legislation by administrative decree and, now, by "arbitrary pronouncement" exemplified by the fiat on dividends.

In principle, there is much force in this criticism of the system of capital control, and it is perhaps a pity that the long overdue challenge should have happened to be launched on this particular issue. In point of fact, it is easy to discern the reasons for the rejection of the United Dominions' application, and equally easy to see that they are in line with existing Treasury policy (irrespective of the merits or de-merits of that policy). In the first place, the CIC, as agent and adviser of the Treasury, is adjured to satisfy itself, before recommending that permission be granted for an issue by a finance company, that all the projects for which the company would use the funds would be such as would be eligible for finance if they came directly before the Committee. In present circumstances, when the Chancellor even admits that the "blind" weapon of rising interest rates has a part to play in his effort to restrain investment, it is scarcely surprising that the authorities are particularly cautious when considering applications by finance companies. Secondly, the banks have been "requested" by the Chancellor to ensure "in particular" that "advances are not made for the increased finance of hire purchase particularly of consumer goods." This wording makes it quite clear that the United Dominions Trust would not be entitled to special consideration merely on the ground that any increase in its instalment financing facilities would be confined to capital goods.

Although these published directives clearly reveal why the Committee has rejected Mr Jarvie's application, it is to be hoped that the authorities will take his criticism of the general principle seriously. There are very few instances in which the reasons for rejections are as apparent as they are in this instance. For the most part, the published directives are couched only in very general terms, and, since the Committee is technically only an advisory body, the instructions can be—and apparently often are—supplemented by unpublished *ad hoc* rulings from the Treasury itself. Because no reasons for decisions are ever publicly stated in individual instances, the authorities are not even morally bound by precedent, and their decisions often appear (and probably are) inconsistent one with another. The mechanism of industrial finance must nowadays labour under appalling difficulties in any case; its burdens ought not to be further aggravated by the entirely unnecessary arbitrariness of the procedure for capital issues control.

* * *

Trade Agreement with Cuba

Britain's long-term sugar contract with Cuba came under heavy fire from the Commonwealth when the first proposal leaked out at the Torquay tariff negotiations at the beginning of this year. The contract, which runs for three years only, forms part of a general trade agreement signed with Cuba last weekend. The agreement will remain in force until December 31, 1953. Britain has undertaken to buy at least 1,500,000 tons of Cuban sugar at world prices during this three-year period at an annual rate of 500,000 tons, with the right to reduce the purchases in any one year to 400,000 tons. Some 800,000 tons of Cuban sugar have already been purchased this year, leaving a maximum commitment of 500,000 tons next year and 400,000 tons in 1953. If sugar rationing is to be abolished, all this sugar will be needed from Cuba in addition to the exports from Commonwealth countries. Britain has also agreed to license the import of Havana cigars to the value of $500,000 in each of the years 1952 and 1953. This sum represents approximately 2,000,000 cigars compared with the current annual imports of 11 million cigars from Jamaica. The import is more than a token, but hardly a threat to Jamaica; hitherto Havana cigars were excluded from the British market, in contravention of the principles of the General Agreement on Tariffs and Trade.

Cuba has agreed to reduce its import duties on specified goods from Britain to the preferential rate levied on American imports. There is also a surcharge of about 2½ per cent *ad valorem* on certain goods. British trade to Cuba will in future compete on the same footing as American trade. The basic list covers some eighty items including earthenware, tools, cutlery, instruments, colours and dyes, chemicals, wireless and television equipment, industrial and office machinery, motor cars, motor cycles and toys. The significance of this concession rests on the fact that until the agreement was signed, the duty on British goods entering Cuba was almost twice that on similar American goods; the value of such goods exported from Britain to Cuba in 1948 amounted to $2,500,000, whereas American exports reached $85 million—a difference that cannot be explained away solely in terms of inferior competitive power of British exports. Under the new agreement British exporters will be able to compete on what is virtually equal footing with the United States for $85 million worth of Cuban trade. It is true that through the operation of the most-favoured-nation clause many other countries will enjoy the same concession as Britain, but Britain stands to reap the largest harvest.

The agreement would seem to be one of those ideal arrangements that benefits both parties. Cuba has been worried about the expansion in sugar production in Commonwealth countries and the consequent loss of the British market. It has now been guaranteed a market in Britain up to the end of 1953 although of much smaller size than before the war. Again Cuba has foreseen the possible decline in the supply of American goods owing to the new defence programme and was willing to open up its market to other suppliers. As for the British undertaking, it represents no more than a promise to buy from Cuba sugar that this country would probably have bought in any case, and it is coupled with an opportunity to increase Britain's dollar exports.

* * *

Cuban and Commonwealth Sugar

The new sugar contract with Cuba in no way affects existing contracts with Commonwealth countries or the new

agreement that is to come into force in 1953—though Commonwealth producers may take a lot of convincing on this point. Britain has already undertaken to find a market for the total exportable surplus of sugar from the Commonwealth up to 1952. The new Commonwealth agreement is to come into operation in 1953 and will last until 1958; during this period exports of sugar from Commonwealth sources are expected to increase from 1,700,000 tons a year to a maximum of 2,375,000 tons. Britain has promised to find a market for more than three-quarters of this maximum quantity from 1953 onwards, and to ensure that the new Cuban contract will in no way hurt Commonwealth producers Britain has made an additional offer to guarantee a market for the whole exportable surplus up to the end of 1953. In this way Commonwealth producers have been offered a guaranteed sale for their entire output for the duration of the Cuban contract.

British consumption of sugar at the present ration scale is about 2,200,000 tons; unrationed demand might exceed 2,500,000 tons. In addition exports of refined sugar amount to about 700,000 tons. Total demand can therefore be put at some 2,900,000 tons a year on current ration scale and 3,200,000 tons or more a year if rationing were abolished. Home production this year will provide 600,000 tons, leaving 2,300,000 tons to be met from imports; of these, 800,000 tons will come from Cuba. These figures take no account of building up stocks. Imports from Commonwealth countries in the first half of this year amounted to 460,000 tons and are unlikely to reach 1,000,000 tons for the whole twelve months. The apparent gap will be bridged by supplies from the Dominican Republic.

The main difference between the Cuban and Commonwealth contracts is that Cuban sugar is bought at world prices and these at present are above the prices negotiated annually with Commonwealth producers, which are insulated from fluctuations in the world market and take into consideration variations in cost of labour and materials to give reasonable remuneration to efficient producers. It was stability of return that Commonwealth producers sought. On sugar, then, it would seem that the Commonwealth has no grounds for complaint about the new Anglo-Cuban trade agreement. Cigars may be another matter. The tariff preference enjoyed by Jamaican cigars is slight, so that next year and in 1953 Jamaican producers will have to compete with Cuban producers for approximately one-fifth of their sales to the British market. Given the General Agreement on Tariffs and Trade, however, the ban on imports of Cuban cigars would have to be lifted sooner or later and it would be surprising if its abolition next year would reduce significantly Jamaica's trade with Britain.

* * *

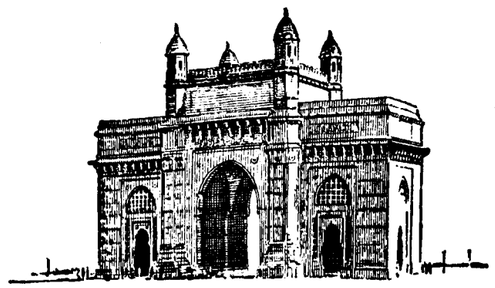
Trends in EPU

As Mr Gaitskell forecast in the economic debate, the United Kingdom's net deficit with other members of the European Payments Union deteriorated further in July. It amounted to $120.7 million (or £43,120,000) compared with some $52 million in June and $27 million in May. Just over £21½ million of gold had, therefore, to be repaid to the Union, and there was a similar reduction in the United Kingdom's outstanding credit; Britain's net gold receipts from the Union since July 1, 1950, now amount to just under £7,000,000 and its outstanding credit balance has dropped below £83 million. The deterioration in July must have been partly due to the fall in prices of sterling area raw materials sold to Europe, but the trend cannot yet be called an alarming one. In both 1949 and 1950 the sterling area showed a seasonal deficit with Europe in July.

Shortly before the preliminary results of the July compensations were announced, the managing board of EPU published its report on its first year of operations. A large part of this report is taken up with the recounting of statistics that have been previously published, but the text makes it plain that the managing board has been active throughout the year in making studies of, and tendering advice about, the economic policies of member Governments. In the case of countries showing "extreme disequilibria" in their balances of payments, this was, of course, part of the board's statutory duty. Thus the board has been in more or less constant consultation with the West German Government since October, 1950; it records its satisfaction with the steps taken and with the fact that Germany has swung back into surplus with EPU since March—though it still agrees that Germany's imports from the EPU area should be kept down, by administrative methods, to $170 million a month for the time being. The board has also been in consultation during the year with Greece (which agreed to draw up a new import programme under ECA guidance), with Austria (which has been granted $10 million of special assistance on the understanding that it carries through a number of internal disinflationary measures), with Turkey (whose request for special assistance in June seems to have been somewhat curtly refused) and with Iceland. Special consultations have also recently started with the Netherlands.

* * *

Advice to the Creditors



Among the creditors in EPU; Portugal was the first to come near to exhausting its quota. At the beginning of 1951, the managing board therefore approached the Portuguese Government and suggested that it might lift internal credit restrictions, liberalise imports and customs procedure into both the metropolitan area and overseas territories, and, above all, seek to prevent the flight of European capital to Portugal. This approach seems to have met with some success, for Portugal, which at one time had exhausted 96 per cent of its quota, ran monthly deficits in May and June. The board has also had some discussions with the Belgian Government about the flight of European capital into that country.

Finally, the board kept a wary eye on the surpluses that were accruing to the United Kingdom and France in the first nine months of EPU's financial year. The United Kingdom told the board that its surplus in the last six months of 1950 had been shared equally between the United Kingdom and the rest of the sterling area but that the tendency in the first quarter of 1951 was for the overseas sterling area to earn a much larger share of the surplus. It therefore expected the whole surplus to diminish shortly, an expectation that has since been fulfilled. France told the board that it intended to follow a more liberal commercial and exchange control policy; it too has now relapsed into deficit. On the whole, therefore, EPU has good reason to be proud of the achievements of its first year. It is clear that Europe now has not only a useful accounting mechanism that economises in the use of resources and renders discrimination against individually "hard" European currencies unnecessary. It also has a supra-national pressure group that is capable of prodding both excessive debtors and excessive creditors gently in the right direction.

* * *

What Price Wool?

The wool market is returning to its prewar form with wide fluctuations in price for little apparent reason. The trade says that it is "a period of indecision" and refuses to commit itself until it sees more clearly what recommendations on wool allocation will emanate from Washington. This policy of caution was fully felt in the resumed New Zealand auctions on Wednesday. Prices generally fell by 30-35 per cent and those for medium and coarse crossbreds were back to their level of May, 1950, despite the low level of stocks in consuming countries. But perhaps the most striking feature of the sale was the withdrawal of some 30 per cent of the offerings either because woolgrowers were dissatisfied with

The Gateway to India

Businessmen need go no further than London to find the key to the gate, for the National Bank of India can provide all commercial banking facilities needed for trade with the subcontinent of India. Moreover, the Bank's specialized knowledge of this area and of East Africa can be of great value to those interested in developing trade with these territories. Enquiries are welcome at Head Office and branches.

ASK THE MAN WHO KNOWS

Business men and bankers who have visited Australia or New Zealand will tell you that the best medium for facilitating trade with those countries is the Bank of New South Wales — largest commercial bank there.

You are invited to use our specialist services through your own bank.

BANK OF NEW SOUTH WALES

ESTABLISHED 1817 HEAD OFFICE, SYDNEY, AUSTRALIA

LONDON OFFICES: 29 Threadneedle Street, E.C.2, and 47 Berkeley Square, W.1

(INCORPORATED IN NEW SOUTH WALES WITH LIMITED LIABILITY)

GB5003E

***Trade with* AUSTRALIA**

A network of 600 branches and agencies provides a regular flow of trade information of vital importance to British business houses. For details of this service write to the Information Department of:—

THE NATIONAL BANK OF AUSTRALASIA LIMITED

7, Lothbury, London, E.C.2

Incorporated in Victoria Established 1858

Other London Offices at Australia House, Strand, W.C.2 and 8, Princes Street, E.C.2.

the new level of prices, or because, more probably, buyers were not willing to take larger quantities at even the lower prices. The outlook for next week's sale in Napier does not seem bright.

The publication of the details of the proposed Commonwealth wool scheme this week was well timed, coming as it did with this further sharp fall in wool prices. The scheme, which has been under discussion since January, 1950, is intended to fix reserve prices for Australian, New Zealand and South African wools so as to ensure a reasonable return to woolgrowers. If any particular lot at an auction fails to reach the reserve price, the wool will be bought in by the organisation and offered again at a later date. This system has been used by the Joint Organisation, which having sold last month the last bale of its accumulated wartime stock, is now to be liquidated. The Commonwealth producers apparently have no wish to lose this security of a guaranteed minimum price even though that price may vary from season to season, and Britain agreed to join the proposed scheme to give it an air of respectability by having at least one consuming country on the controlling authority. Financially Britain is committed to provide up to £12 million out of a total of £66 million and in return it gets 30 per cent of the votes.

The scheme is clearly a producers' agreement with Britain footing part of the bill. There are indeed certain safeguards to protect consumer interests such as international consultation before "substantial operations" commence, unanimous agreement of all four governments on the general level of reserve prices fixed from time to time, the institution of a consultative committee to advise the organisation and so on. But none of these provisions give any guarantee that consumer interests will in fact be given as much consideration as producer interests. The scheme, moreover, contravenes the principles of international commodity agreement laid down in the Havana charter; they stipulate equal representation and voting power of producers and consumers. There is still time for second thoughts on the proposals. The Australian woolgrowers have first to approve it by referendum and secondly appropriate legislation has to be enacted by the three dominion governments and by the British Government. The time might seem opportune for a commodity scheme for wool, but would it not be wiser to see what is decided in Washington?

* * *

Economy in Metals

An advisory committee on metals economy has been appointed to ensure the economic use of metals in engineering and particularly in the defence programme. The committee comprises a chairman and eight members, all from industry or industrial associations and its terms of reference are very widely drawn—"to bring under review . . . ways of economising in the use of scarce metals in the design, specification and the manufacturing process of metal goods for both rearmament and civil purposes." This formula includes steel and steel-alloys as well as non-ferrous metals; and the committee includes representatives of the steel industry as well as of users of non-ferrous metals. There is undoubted need and there may be technical scope for economy in the use of metals—nickel among steel-alloying metals, perhaps, and zinc, which is already subject to restriction in use. But whether another committee will ensure such saving remains to be seen. This committee has the undoubted ability to provide the best technical advice to the Government. But such advice, to be truly effective, needs to be allowed to find its effect in the relative prices of metals, so that substitution is encouraged. There has been too much evidence recently of a deliberate policy to keep British non-ferrous metal prices well below the free market prices abroad to suggest that technical advice plus a further resort to allocation and restriction can correct the consequences of excessive demand and limited supplies.

Combating Inflation in Malaya

The Malayan Government's attempts to combat internal inflation have not been singularly successful. At the end of April there was a proposal to freeze part of the producers' proceeds from the sale of tin and rubber in order to reduce the volume of purchasing power generated by high prices for these two commodities. But the proposals were submitted when the prices of both rubber and tin had already fallen some way from the peaks, and when costs of production were rising sharply. To have set aside part of the revenue from the sale of these two commodities at an earlier stage might have helped to curb the inflationary upswing in Malaya. At the present time, however, such a policy would be ineffectual economically, and (as an article on page 379 points out) it might have serious political consequences. Wages have already risen and it would need more than a government plan to freeze part of producers' revenues to bring them down.

The Malayan Government has now abandoned the idea of establishing a stabilisation fund for the tin industry. The United States has been successful in bringing the price of tin down from $1.83 a lb. to $1.03 a lb. in recent months, but production costs in Malaya have not fallen and some marginal producers have been forced out. Bolivian producers are demanding a minimum price of $1.12 a lb., but it is doubtful whether this somewhat higher price would encourage any significant increase in tin output in south-east Asia, though it might relieve the pressure on the Chinese producers in Malaya, who have been hardest hit by the recent fall in price.

The Rubber Producers' Council has submitted an alternative scheme to the Malayan Government in place of the Government's original proposals. Details of the scheme have not been published, but it contemplates the collection of funds from smallholders to finance replanting and new planting. The Rubber Study Group gives estate acreage in 1949 as a little under 2,000,000 acres, of which 553,000 acres are of high yielding stock. Smallholdings cover 1,403,000 acres, but only a very small proportion is planted with high yielding stock. The council points out that the problem of replanting is thus essentially a smallholder's problem, since estates have already replanted a sizeable area and are continuing to do so. But the scheme raises a more fundamental question to which it is important to find the right answer—whether it is wise at this time to replace even a major part of the smallholders' acreage with high-yielding stock.

Petrochemicals Progress

The financial strain upon Petrochemicals called for special measures in September last year, and the accounts of the company to June 30, 1950, published this week, occasion no further re-examination of the state of the company's finances a year ago. The important feature of the report is the statement of Sir Robert Renwick, who took office as chairman a year ago, on the position and prospects of the company. Sir Robert records, in the first place, that "the nine months since September, 1950, have proved to be a period of real progress." All the individual plants are now in operation; what has still to be secured is a balance of production at rated capacities throughout the plant. The gas conversion plants are all producing materials to the specifications required, but not as yet at rated capacity. This is expected to be achieved by the close of the year, provided that certain constructional work now in hand is completed and that sufficient chlorine can be obtained. The statement does not fail to record a full crop of technical troubles inseparable from running-in a plant of this complicated design, but it also reaches fairly confident conclusions that the measures in hand will bring all sections of the plant to full or satisfactory rates of production by the end of this year.

There will still be difficulties—shortage of chlorine and a dangerous dependence on imported styrene monomer for conversion into polystyrene that will persist until a styrene monomer plant is built. In terms of finance, the accumulated debit at profit and loss exceeded £1,000,000 at June 30, 1950, and the estimated debit to June, 1951, is put at more than £2,000,000. If the chairman's expectations are realised, the piling up of losses should now be at an end; he expects that current revenue expenditure will be covered by current income before the end of 1951, and that during 1952 net earnings, after providing for depreciation, should more than cover interest on loan stocks and indebtedness. This indebtedness is now in process of being increased by further loans to the company to restore its exhausted cash resources.

Lower Carpet Prices

After Wednesday's meeting with members of the Carpet Manufacturers' Federation, the Board of Trade announced that the maximum prices of home-produced carpets would be reduced by between five and fifteen per cent. This reduction was foreshadowed three weeks ago by Mr Hervey Rhodes in a statement that caused the industry, and possibly Mr Rhodes himself, some embarrassment. Carpet sales had been falling since the end of April, and it needed only such an announcement to bring business to a standstill. The introduction of a cost-plus system of control, also proposed by Mr Rhodes, will not come into operation with the new order, but it does not follow that this project has been abandoned.

It is probable that carpet prices would have fallen without the encouragement of the Board of Trade, though perhaps not so soon. The new prices, which are based on a cost-investigation into carpet weaving carried out by the Board of Trade in April and which take into account present prices of raw materials, are believed to be very close to those put forward by the industry. Competition from imported carpets has become severe—imports have increased five-fold since an open general licence was given at the beginning of 1950. The Board of Trade knows of no instance where home-produced carpets have been sold at less than the maximum prices, but imported carpets, which are subject to a separate price control and which probably account for 20 to 25 per cent of home sales, have frequently been sold at prices below the maximum. This week a Birmingham retailer announced a 25 per cent cut in the prices of Indian carpets. The industry and the retailers have frequently protested against such "unfair" competition, but there are signs that some of them are beginning to think that the same policy will have to be adopted for British carpets. In the light of this week's further fall in wool prices, the new maximum prices may not prompt any notable recovery in home sales.

* * *

Home Textile Sales

Neither the wholesale nor the retail sales indices for June do more than confirm the evidence of previous months. From March onwards there has been a gradual decline in textile and clothing sales, with a gradual rise in stocks. The fear of high prices and shortages that led to heavy buying by consumers and retailers in the spring has concentrated into a few months sales that would normally have been spread over the greater part of the year. Naturally enough, this rapid accumulation of domestic and retail stocks led to a sales recession in the following months. The retail clothing sales index (1947 = 100), which stood at 183 in March, had fallen to 170 by June and the figure would have been much lower but for a sharp jump in sales of shoes (from 138 to 187 between March and June) that followed the announcement of higher utility footwear prices. The index of wholesale turnover (1947 = 100) which stood at 189 in March had slumped to 121 by June, while wholesalers' stocks, which last year remained unchanged throughout May and June, rose this year in the same two months from 159 to 178. Retail clothing stocks have fallen slightly, from 206 in April to 197 in June, but they are still uncomfortably high and include an embarrassing proportion of summer clothing uncleared at the end of the season.

If the figures are compared with the level of sales during the same period of 1950, they show that retail clothing sales rose by 18 per cent and that wholesale sales rose by 23 per cent in the first half of 1951 compared with the same period of 1950. But since retail clothing prices alone (June 1947 = 100) have risen from 119 to 138.6 between last June and this, much of the increase in the volume of sales must be attributed to a rise in prices rather than in real turnover.

There are some indications of the normal seasonal recovery in wholesale sales, retailers' stocks are heavy and this fact alone will encourage them to postpone their orders as long as possible. In addition, the growing public expectation of a fall in prices—a belief that has gained much support from recent statements made by Mr Hervey Rhodes—is acting as a further deterrent to early ordering. Unfortunately, no such fall seems likely this year. The goods that are now being taken into stock by the wholesalers are those carrying the greatly increased utility prices and these prices in turn generally reflect, not the high raw material prices of last spring, but the much lower levels of last autumn and winter.

Shorter Notes

The total working population increased during June by 35,000, of whom 11,000 were men and 24,000 women. This is the second month to show a significant increase in the numbers of women in jobs. Unemployment fell further to 185,800 at mid-July. In the first half of this year there has been a fall of 142,000 in unemployed; the "Economic Survey" forecast a fall of only 28,000.

*

The Economic Co-operation Administration is to provide £3,000,000 of the total cost of £3,500,000 for the extension of copper and cobalt mining in Northern Rhodesia by Mufulira Copper Mines. The project was referred to in *The Economist* of June 9th on page 1396. Production is expected to begin in 1956 and it has been estimated that 16,000 long tons of copper and 500,000 lb. of cobalt will be produced annually. The sum of £3,000,000 comes out of the 5 per cent of Marshall aid counterpart sterling funds earmarked for the purchase of raw materials or for development of mining projects.

*

The result of wage negotiations between the cotton weavers and employers, which had not been announced when last week's issue of *The Economist* went to press, proves, as expected, to be a 5 per cent increase in current earnings plus a special payment at Christmas, making up the total to an effective 10 per cent increase. The terms are identical with those negotiated with the spinners earlier last week. The award affects about 150,000 rayon and cotton weavers and the annual cost to the industry of the two awards is about £4,500,000. Since the end of last year, cotton workers have in fact obtained an effective wage increase of no less than 21 per cent.

*

The preliminary figures of Tootal Broadhurst Lee for the year ended June 30, just published, may seem disappointing in comparison with recent results achieved by other textile concerns. Group profits are higher by £90,608 at £1,977,781, but the net figure after tax of £1,310,000 (£1,030,000 for last year) is down by £189,000 at £667,800. Nevertheless, as the carry forward is more than doubled at £820,669 against £404,871, the reduction in the ordinary dividend payment from 15 per cent (which last year absorbed £77,113 less tax, including employees' shares) to 13¾ per cent can presumably be explained only as an act of submission to Mr Gaitskell.

Company Notes

Furness Withy.—In the report for the year ended April 30, 1950, published last September, the chairman said: "The benefits to be derived from the widespread interests of a group such as ours become daily more apparent." These benefits are clearly apparent from the record profits shown in the preliminary statement for the year ended April 30, 1951; group profits, after all charges, including taxation and the transfer of £730,482 to taxation equalisation account, have risen by £369,403 to £1,515,308. The allocation to fleet replacement account has been increased to £340,000, compared with £200,000. The burden of replacement costs—which the chairman estimated a year ago might be as much as three times the amount of capital originally employed, threatens indeed to become still heavier.

	Years ended April 30, 1950 £	1951 £
Group net profit (a)	1,145,905	1,515,308
U.K. taxation	907,102	725,494
Attributable to holding company	557,933	696,982
Fleet replacement	200,000	340,000
Ordinary dividend	264,000	291,375
Ordinary dividend, rate %	8	9¼
Carry forward	298,684	323,979

The £1 ordinary stock at 35s. 3d. yields 5¼ per cent.

(a) After all charges including taxation, and transfer to Taxation Equalisation Account of £730,482 (£724,715).

The declaration of a 9¼ per cent dividend for the year raises an interesting point on dividend limitation. For the four previous years the distribution to ordinary stockholders was 8 per cent, but, in addition, in March of this year a special distribution was made of 2½ per cent, tax free, from a surplus on investment sales to mark the company's diamond jubilee. Can this distribution be regarded as part of the last pre-Gaitskell dividend? (As it does not rank for any rebate of tax which can normally be claimed on tax-free dividends, it must be reckoned as gross.) If it can, the standard dividend would seem to be correctly interpreted as 9¼ per cent. The White Paper, however, appears to afford no satisfactory elucidation. According to paragraph 3 (a), which relates the average amount of dividend to that distributed in respect of the "last two accounting periods before July 27, 1951, for which a final dividend has been paid," the company's standard dividend would be no more than 8 per cent. Paragraph 5 (c), on the other hand, states that a dividend will in every case be treated as paid for the accounting period ending last before the date of distribution, "except where it is expressed to be a dividend for the period in which the date of distribution falls." As the special 2½ per cent distribution was not related to any specific accounting period, it would thus appear correct to regard it as part of the previous year's distribution, as the directors evidently have done. Which interpretation is correct? If the company is right, all well and good, but if the Treasury does its worst stockholders might next year be penalised by a cut in their dividend to 6¼ per cent.

★

Ruston and Hornsby.—Although there have been substantial increases in costs, a further increase in output and despatches has enabled Ruston and Hornsby to maintain its trading profit at a figure very little short of last year.

The chairman's comments on the report and accounts include particularly important passages on plant replacement. An estimate has been made of the capital sum required to replace machine tools, etc., which were acquired in pre-inflation days, and which should be replaced in the next eight years or so. For this purpose an amount of at least £1,400,000 may be required. Plant replacement reserve has accordingly been brought up to £795,000, and it is the board's intention to set aside £100,000 annually to this reserve in future.

	Years ended March 31, 1950 £	1951 £
Consolidated earnings :—		
Trading profit (a)	1,671,125	1,627,661
Total income	1,782,633	1,803,132
Depreciation	320,609	280,285
Taxation	978,393	1,040,407
Group earnings for ordinary shares	504,396	512,465
Ordinary dividend	169,125	193,725
Ordinary dividend (per cent.)	7½	9
Retained by Subsidiaries	141,860	95,797
Added to general reserves & carry forward	209,951	222,943
Consolidated balance sheet analysis :—		
Fixed assets, less depreciation	2,080,161	2,202,108
Net current assets	6,212,506	6,880,805
Stocks	5,171,436	4,595,362
Cash and tax reserve certificates	912,200	2,250,591
Reserves	3,657,340	4,482,208
Ordinary capital	4,100,000	4,100,000

The £1 ordinary shares at 36s. yield £5 0s. 0d.

(a) After charging depreciation and setting aside £120,000 (£75,000) to cost of plant replacement.

Taxation now payable by the company tops £1,000,000, which the chairman, in the course of some pungent remarks, describes as a "staggering" figure, given the need for building up funds for replacements. The ordinary dividend, declared before publication of the White Paper, is raised from 7½ per cent to 9 per cent, the net amount of which, together with the preference dividends, represents a return of no more than about 2 per cent on the capital employed.

As to prospects for the current year, there is no lack of business coming in—orders on the company's books at the end of the financial year constituted a record—but the material situation is stated to be "deteriorating rapidly," with shortages in greater or less degree in all commodities needed for the company's products.

★

Rickett Cockerell.—The group trading profits of this coal-distributing company show a rise from £207,901 to £269,063. Taxation, however, has eaten very deeply into profits, the total figure being £96,959 out of a group net profit of £162,450; in fact, on a rise in gross profits of approximately 30 per cent the company is paying nearly 90 per cent more in taxation than in the previous year. An increasing strain on the company's finances must also be the maintenance and replacement of its large road transport fleet.

	Years ended March 31 1950 £	1951 £
Consolidated earnings :—		
Group trading profit	207,901	269,063
Depreciation	74,394	81,050
Taxation	51,796	96,959
Group earnings for ordinary shares	43,816	64,794
Ordinary dividend	25,507	24,348
Ordinary dividend rate per cent	10	10
Retained by Subsidiaries	8,467	19,650
Added to Group carry forward	9,842	20,796
Consolidated balance sheet analysis :—		
Fixed assets, less depreciation	612,708	602,651
Net current assets	731,630	782,796
Stocks	320,364	321,454
Cash	58,477	76,470
Reserves	567,906	610,588
Ordinary capital	465,770	465,770

At 12s. 6d. the 10s. ordinary shares yield £8 0s. 0d. per cent.

Apart from the steep increase in taxation, the group profit and loss account calls for no special comment, except that this time there is no allocation to the deferred repairs reserve, which last year received £7,000. The ordinary dividend is repeated at 10 per cent, at which rate it has been steadily maintained every year since 1937-38. While the consolidated balance sheet shows net current assets up by £51,166, it may be significant that bank overdrafts have risen from £35,070 to £48,451, which offsets most of the £17,593 rise in the cash item.

Statistical Summary

EXCHEQUER RETURNS

For the week ended August 11, 1951, total ordinary revenue was £69,681,000, against ordinary expenditure of £56,151,000 and issues to sinking funds £130,000. Thus, including sinking fund allocations of £4,588,000, the surplus accrued since April 1, 1951, is £86,263,000 compared with a surplus of £108,176,000 for the corresponding period of the previous year.

COMPANY MEETINGS

THE TUNNEL PORTLAND CEMENT COMPANY, LIMITED

RECORD TRADING RESULTS
IMPROVED PRODUCTIVE CAPACITY
CONTINUED HEAVY DEMAND
MR N. M. JENSEN ON THE WIDESPREAD ACTIVITIES

The fortieth annual general meeting of The Tunnel Portland Cement Company, Limited, will be held on September 10 at 105 Piccadilly, London, W.1.

The following is the review by the chairman and managing director, Mr N. M. Jensen, which has been circulated with the report and accounts:—

Ladies and gentlemen,—The profit on trading, before charging depreciation, has increased from £882,894 to £1,252,764. This is largely due to the fact that we have had the benefit of a full year's operation at our Padeswood works and of new machinery installed at our West Thurrock works. Another factor is that we have absorbed the business of our wholly owned subsidiary, Tunnel Cement (Pitstone), Limited, and profit on part of the operation of the Pitstone works is therefore included here, whereas in previous years it was under investment income.

On the other hand, depreciation on the Padeswood and Pitstone works has substantially increased the charge under this heading.

The higher profit attracts additional taxation and this has been accentuated by the increase in the standard rate of income tax, as well as profits tax, and also the fact that we were not entitled to such a large initial allowance as we had in the previous year. The income tax equalisation reserve has, however, a levelling effect, as we have only had to transfer £100,000 to this reserve, compared with £200,000 last year.

Continuing the policy which we introduced in connection with the 1949-50 accounts of providing for replacement of fixed assets by building up the general reserve, we have made a transfer to this of £250,000, bringing the reserve up to £1,500,000.

We have paid an interim dividend of 2½ per cent., less tax, on the "A" ordinary shares and "B" ordinary stock, and it is now proposed to pay a final dividend of 12½ per cent., less tax, for the year. There then remains a balance of £669,029 to be carried forward.

BALANCE SHEET

Net additions to property, plant and equipment include the Pitstone works, the cost of completing the works at Padeswood and new installations at West Thurrock. The cost of the additions during the year was actually £739,002, but we have deducted £178,548 in respect of plant scrapped or sold during this and previous years, leaving the figure of £540,454 for net additions. At the same time we have eliminated £159,148 from the accumulated depreciation, so that the net adjustment is only £19,400. After these adjustments have been made, the figures in the balance sheet represent, as they should do, the cost of and the depreciation written off property, plant and equipment which were actually in existence at the date of the balance sheet. The reason why we could not make the adjustments before is that we had no register of the old plant at our West Thurrock works, and when in previous years we disposed of any plant all we could do was to eliminate the written down value from the cost figures, leaving depreciation unchanged. This meant that, although the total written down figure was correct, both the cost and the depreciation amounts contained balances in respect of plant no longer in existence. It was a formidable task to compile a plant register for our West Thurrock works, but we have now completed this and have, therefore, been able to put the matter right.

CONSOLIDATED PROFIT AND LOSS ACCOUNT AND BALANCE SHEET

The change to direct ownership of the Pitstone works also affects the consolidated profit and loss account and the consolidated balance sheet. When we purchased the outside shareholding of the Pitstone Company in 1944 we paid a premium of about £93,000. This has now been reduced by £65,707, being the undistributed profits of the Pitstone Company, which is in course of liquidation.

DEMAND FOR CEMENT

The output at our works has been nearly 200,000 tons more than for the preceding year, due mainly to the fact that our new Padeswood works had a full year's run and also to an increase in our capacity at West Thurrock. We were, therefore, in a position to increase deliveries at home as well as for export.

The demand for cement continues to be heavy in both the home and export markets.

The cost of paper sacks has risen steeply from about 2s. per ton of cement before the war to approximately 20s. per ton at present. Recently, the industry has revised its price schedule so as to encourage consumers to take cement in bulk, and there are indications that bulk deliveries will be greatly increased in future. It may interest shareholders to know that 360,000 tons of cement which your company has delivered for the construction of London Airport were all supplied in bulk, mainly from our Pitstone works.

EXTENSION OF PRODUCTIVE CAPACITY

Last year I indicated that I was hoping the extension of the works belonging to Ribblesdale Cement, Limited (of which company we hold half of the capital), would be in operation by the end of the year. Unfortunately, in this particular district, there is such an acute shortage of labour that the erection was not completed in normal time and the new unit therefore only commenced to operate in July of this year. The labour situation at the Ribblesdale works is so serious that steps have now been taken, after consultation with the trade unions, to recruit additional labour from abroad.

The extension of our Pitstone works is proceeding and we are hopeful that it will be completed by about December. Normally, we would undertake to erect the machinery ourselves, but as we are also troubled with a shortage of labour in this district, we have had to call in outside contractors to assist us.

At our West Thurrock works we have decided to replace one of the oldest kilns with a new one identical with that installed two years ago.

You may be interested to learn that we have recently commenced the manufacture of a new type of cement, namely, Masonry Cement, which is particularly suitable for making mortar. It has been tried out on a number of important contracts and everybody who has used it speaks highly of it. It produces a mortar that has great workability and water-retentivity when plastic, but gains strength rapidly and, when hard, has very high adhesive strength, freedom from cracking and reduces efflorescence. We have installed the necessary plant to manufacture Masonry Cement on a fairly large scale.

With the further reconstruction of the West Thurrock works, the total increase in capacity which your company has provided since the war or has in course of building amounts to just over half a million tons per annum. This is a generous contribution on the part of your company to meet the increasing demand in the home market and, at the same time, to maintain exports at a high level.

OVERSEAS INTERESTS

We are examining the possibility of interesting ourselves in new works overseas, and in this connection I might mention that Mr J. A. Mackintosh recently paid a visit to New Zealand and I have personally visited Cyprus. In both countries there is a shortage of cement and, provided new works are well sited, it should be possible to see a reasonable return on capital invested, in spite of the fact that it now costs three times as much to build a cement works as it did before the war.

In Egypt the Helwan Portland Cement Company, in which we hold 50 per cent. interest, has again had a record year, both as regards output and deliveries. The recent extension of the works has just come into operation, but notwithstanding this, it would appear that there is still likely to be a shortage of cement in that country.

The new works at Alexandria, which was built under the auspices of the Helwan Portland Cement Company, has likewise been working satisfactorily.

In the Sudan, where we hold a substantial interest in the Sudan Portland Cement Company, the company has suffered from labour troubles, and unusually heavy rains have impeded the regular supply of raw materials and also affected deliveries of cement. Therefore, the results have been a little disappointing. There is plenty of labour available, but it will take some time yet before it can be regarded as efficient. Unfortunately, matters have not been helped by the introduction of trade unionism in the Sudan in what I would regard as too advanced a form. The workers are not yet sufficiently educated to appreciate fully the obligations and benefits of the trade union movement as developed at home.

Last year Lord Margesson and I paid a visit to Egypt and the Sudan, when we had an opportunity to discuss problems with the managements of the respective works.

As you know, we have a small interest in the Caribbean Cement Company, and I am pleased to say that the new works which is being built near Kingston is now nearing completion.

The National Portland Cement Company, in the U.S.A., has again had a very busy year. A short while ago that company decided to repay 20 per cent. of its preferred stock, and, as a result, some of our interest has been redeemed. The proceeds available to us amount to nearly half a million dollars, which, with the consent of the Bank of England, we have temporarily invested in American securities and bonds. The reduction of capital will make it easier for the National Portland Cement Company to deal with arrears of preferred dividend and, provided the present demand for cement is maintained in the U.S.A., I think we can look forward to receiving regular payments from this investment.

BURDEN OF TAXATION

Although the profits of your company constitute a record, I feel I must call attention to the heavy burden of taxation. Roughly speaking, 55 per cent. of your company's profits, after providing for depreciation, are paid or reserved for taxation; 18 per cent. are paid in dividends to the shareholders and 27 per cent. are retained in the business by way of transfer to reserves and increased carry-forward.

I might also add that out of the profits, before taxation, approximately 16½ per cent. emanate from investments and interest; 24 per cent. are profits derived from sales in the home market and 46½ per cent. from export sales. Thirteen per cent. relate to income from other activities. From these figures, you will gather that our present prosperity is very largely derived from the substantial profits obtained from export sales.

SPURLING MOTOR BODIES, LIMITED

RECORD TURNOVER

The fourteenth annual general meeting of Spurling Motor Bodies, Limited, was held on August 15th at Hendon.

Mr W. F. Spurling, chairman and managing director, after explaining that they had decided not to proceed with the further issue of shares, thinking it wiser to refrain from further immediate expansion in the face of an uncertain world situation, said that the reason for the reduction in the final dividend to 17½ per cent., making 30 per cent. for the year, against 37½ per cent. paid for several years, was that inflation and penal taxation entailed a strain on their resources and called for a larger amount of liquid capital. He was satisfied that it was wise to husband their resources.

Last year had been a busy one, every branch of the business being fully employed and the new depots doing particularly well. Demands for their body work had been healthy, and the turnover of Marble Arch Motor Supplies, Limited, which dealt in motor-cycles, spares and accessories and general merchandise, had soared to new heights. During the year they had increased their turnover by some £400,000, giving them a grand total turnover of £2,434,382, an all-time record. Net assets had increased and their profits improved.

All departments remained very busy. The business and profit-earning of Marble Arch Motor Supplies, Limited, during the first period of 1951-52, had exceeded anything previously known, and they were anticipating a record by way of turnover and profit therefrom. Granted no major disturbances, the results for the present year appeared likely to show an improvement.

The report was adopted.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

UNITED DOMINIONS TRUST LIMITED

VITAL IMPORTANCE OF RISK CAPITAL

MR J. GIBSON JARVIE ON THE DIVIDEND FREEZE

The twenty-ninth annual general meeting of United Dominions Trust Limited was held on August 14th in London.

Mr J. Gibson Jarvie, the chairman, in the course of his speech, said: In my brief statement which was circulated with the accounts, I referred to the proposed increase in our dividend, and it was not my intention to refer to it again today. But the amazing speech of the Chancellor of the Exchequer on the economic position delivered in the House on July 26th has compelled me to revise my views and rewrite my speech. Let me say right away that neither I nor the other members of the board make any apology for recommending an increased dividend. We believed, and we still believe, that the proposed increase is more than justified, and if the Chancellor's statement accurately foreshadows the legislation which will follow, it would appear that our recommendation has been made opportunely in that it will have the effect of placing the company on its pre-war dividend basis of 17½ per cent.

The Chancellor's statement has shocked the whole business community. Despite our company's record year's results, and the success which has attended so many other companies, even the dullest and most partisan person must recognise—if he will review the facts—that Great Britain today is in a most unenviable condition: that, in fact, we are facing imminent disaster unless adequate steps are taken, and taken quickly, to cope with the situation.

FREEZING OF DIVIDENDS

The Chancellor of the Exchequer delivered his Budget speech in April, but twice since then he has had to come to the House and admit that his estimates and calculations were wrong: that the general position had worsened: and that new estimates and new remedies had to be found. He now proposes to freeze dividends! It would almost seem that thrift, either by a company or an individual, has become a deadly sin if not yet a criminal offence.

By freezing dividends the New Issue Market will be frozen. How does the Chancellor propose that trade will find new risk capital? If there is no risk capital there can be no new ventures and no new ventures means no progress.

NATIONALISATION A FAILURE

In the "bad" old days, we did get good coal at low prices; we exported vast quantities: and there was ample labour. Today under nationalisation and the "planners" we are woefully short of coal and the coal we get is of bad quality, and our exports comparatively speaking are negligible. We have actually been importing coal. Under nationalisation gas and electricity supplies are more costly and less reliable. The inefficiency of British Transport Services—railways and road—has become a joke, but it is a costly and tragic joke. The theoretical planner has proved a very expensive and useless luxury.

Serious as are the apparent consequences of the Chancellor's speech on our economy, it has a still more serious aspect. I refer to the fact that the Chancellor's statement of intention—to which he demands an immediate response—has no sanction in law—yet! The Chancellor's demand, if we accept it, is an attempt at government by Arbitrary Pronouncement. Government by Arbitrary Pronouncement is a direct threat to constitutional practice and to our very freedom. It is a threat we cannot afford to ignore if freedom and law are to persist in this country.

It is proposed also that company profits must be "reduced." "Reduced profits" is just one more vote-catching cry: the pretence that by making things more difficult for or further penalising the capitalist, the lot of the thriftless will be lightened. Reducing profits will not cut down the cost of living of the people.

If ever there was a time when we needed profits, it is now. Government spending has reached astronomical figures; taxation is a crushing burden. Where is the revenue to come from to meet it? Capital is running dangerously short. How is capital to be supplied if not at least partly from profits? There is a persistent demand for new equipment as machines wear out and new processes are introduced. Who and what will pay for it? A grave crisis is developing: yet the Government appear determined to punish or destroy every man or business fulfilling his or its function successfully.

CAPITAL ISSUES COMMITTEE

I now turn to the Capital Issues Committee, *vis-à-vis* ourselves. As I informed you last year, we had at that time made an application for permission to increase our capital. In their wisdom the Capital Issues Committee refused our application. As we had ample funds at our disposal, we made no immediate further move, but towards the end of the financial year your board decided to renew the application. Again it was refused and again without any reason being given. To put it quite bluntly, the position is this: our application has been judged in our absence and a decision has been reached by the Capital Issues Committee, or some government department, without permitting us to answer any of the objections or criticisms which they may have had to our original application, but of which we had no knowledge. And we are told there is no appeal! We are judged and apparently condemned in our absence. This is entirely contrary to a right conception of British justice or equity. It is, I think, pertinent to bear in mind that for some years the company's largest shareholder was the Bank of England. Our various lines of business today are definitely calculated to strengthen the country's position, and if the Central Institution were justified in supporting us in that earlier period of our history unquestionably the Government should approve of and encourage us now.

We need a Government which will understand that freedom is a prime essential in any prosperous country, and that therefore controls of all kinds must be reduced to the absolute minimum and discontinued entirely when conditions permit. It must govern for the nation as a whole and not for any class, and must recognise the value of thrifty individuals and of prosperous companies, and never seek popularity by pandering to the thriftless and shiftless. We need a Government which will be equally strong in facing the enemy at home as the enemy abroad reckless of party or personal consequences. Granted such a Government, I have faith in the early recovery of the country: in the re-establishment of its greatness and its influence in international affairs.

The report was adopted.

OLDHAM AND SON LIMITED

CONTINUED ALL-ROUND PROGRESS

MR JOHN OLDHAM'S REVIEW

At the thirty-second annual general meeting of Oldham and Son Limited, held on August 16th at the company's head office, Denton, Manchester, the chairman, Mr John Oldham, O.B.E., J.P., said that results achieved during a difficult but successful period reflected the increasing value and effectiveness of a policy continuously directed towards re-equipping the business and broadening the base of its activities.

Net profit of the Group for the year ended March 31st last amounted to £265,179. In comparing this with the results of the previous period, it must be borne in mind that the accounts then covered only ten months. Accordingly, the annual rate of profit comparable with the above figure was £252,192.

Demands for the company's portable mine lighting equipment and electric storage batteries had continued to increase. On the production side a fine job had been done to offset rising costs and maintain flow of production in face of abnormal difficulties. An important programme of retooling had been carried out.

INCREASED ACTIVITIES OVERSEAS

The chairman announced that, following his visit to America last year, an important arrangement had been concluded with the Dewey and Almy Chemical Company, of Cambridge, Mass., for them to manufacture under licence the new Oldham "Fibrak" battery separator. Large-scale production was timed to commence this autumn from a plant now being set up near Boston, and the separator would be distributed by Dewey and Almy throughout America and Canada under the trade name of "Darak."

The overseas manufacturing companies were playing an important part in relation to the firm's general production programme. Oldham and Son Africa Limited, in which the company had a 50 per cent. interest, had made substantial progress in its second year of operation. The completion of a new battery plant would provide additional potential for this firm to manufacture and service electric storage batteries, which would considerably extend its sales and production capacity.

The French subsidiary, Société Française des Procédés, Oldham, could be said to be well on its feet. Since the end of the financial year, Sir Charles Henderson, K.B.E., who had a wide knowledge and experience of French industry, had been appointed as chairman.

In India, after unavoidable difficulties and delays, manufacture of storage batteries had commenced, and in the days to come Oldham and Son (India), Limited, should give a good account of itself.

Concluding, the chairman said that the future was dominated by the demand and priority for more production against a background of scarcity of both materials and labour. All the qualities for which British technicians were renowned would be taxed to the full to find a solution to this problem. He felt this was no bad thing, however, as, by centring and stimulating the search for new and alternative materials and methods, higher standards of efficiency and new techniques would be developed.

The continued expansion of the company's business, and the essential nature of its products, provided the best evidence on which shareholders could rely that in the period ahead it would be fully and profitably employed.

The report and accounts were adopted, and a final dividend of 15 per cent. was approved, making a total of 30 per cent. for the year.

AMALGAMATED ANTHRACITE COLLIERIES, LIMITED

WIDESPREAD ACTIVITIES

The twenty-seventh annual general meeting of Amalgamated Anthracite Collieries, Limited, was held on August 15th in London, Mr John Waddell (the chairman) presiding.

The following are extracts from his circulated statement:—

Since last year there appears to have been practically no change with regard to clearing up the position of the collieries which vested at January 1, 1947—now nearly five years ago. A great deal has happened, however, during the year arising from the setting up of a body in South Wales to try and speed up the division of the modest global sum allocated to that district. Without some speeding up it may well be another five, or even more, years before we shall know where we are.

TRADING DEVELOPMENTS

I feel you would like to hear some of the details of the major affairs of the trading group in order that you will appreciate the widespread nature of these activities which is the greatest security for stable results in the future. Dealing with the past, we have received the sum of £180,000 as compensation for completely closing down our business as colliery sales agents. Dealing with the future, we have been steadily consolidating and bringing up to the maximum pitch of efficiency our other retail and wholesale coal distributing businesses. We have expanded substantially our number of registrations which now reach nearly 300,000, and these companies are showing steady and improving results.

The Concordia Company's results for 1950 were substantially better than for the previous year, and those for 1951 are showing a further good improvement. Copigraph Limited, manufacturing carbon paper, etc., at the Treforest Trading Estate near Cardiff, has been able to double its factory and has greatly expanded its output and profits during 1951. Some of our older activities in wagon repairing and brick manufacturing are proceeding steadily.

We were able to acquire a half interest in United Kingdom Chemicals Limited, and United Carbon Black, Limited, who are directing and operating a new factory for making carbon black at Port Tennant, Swansea. This project is of a very substantial nature and will ultimately involve an investment between £300,000 and £400,000, representing our half share.

A VALUABLE ASSET

In the British Anthracite group you have a very valuable asset. The company is stronger than ever and on a much better foundation. We are no longer dependent on any one particular line of trade, but have a business widely based on our traditional knowledge of coal and transport, on certain of our old original manufacturing activities which have been modernised and expanded, on a compact field of sound industrial units and now with a substantial stake in a basic branch of the chemical engineering industry which is also a substantial dollar saver.

I would rather not make any prognostications about dividends but the funding certificates are getting nearer and nearer to complete redemption and, when available, the amount devoted to this purpose would immediately be beneficial; added to this the general outlook of the company should have a very material effect on the prospects of both preference and ordinary stockholders.

The report was adopted.

RICHARD THOMAS AND BALDWINS

RECORD RESULTS

MR E. H. LEVER ON RAW MATERIAL PROBLEMS

The annual general meeting of Richard Thomas & Baldwins Limited will be held on September 6th at 47, Park Street, London, W.1.

The following is an extract from the statement by the chairman and managing director, Mr E. H. Lever, which has been circulated with the report and accounts:

We are again greatly indebted to the management, staff and workpeople for their excellent work during the year, resulting, as it did, in the best results the company has ever shown.

The balance of the trading accounts shows an increase of £1,288,882; this figure includes extraneous profits which increased by £420,565. The other main factors contributing to the good results were good outputs and good markets. As already mentioned, the results constitute a record. Taxation, however, took a heavier toll in a year in which expenditure on development was also heavy. Nevertheless, the financial position of the group remains strong.

While the results were highly satisfactory, the year was a very difficult one. It opened with some decline in demand, but a strong sellers' market quickly developed due to war in the East and to the announcement of the rearmament programme. Coincident with increased demand came acute shortages in raw materials, although these did not affect our production to any material extent prior to March 31st last. These shortages have, however, persisted since that date, and your group, in common with others in the industry, have found it necessary to close works. In our West Wales Section, Bryngwyn Steelworks, and Landore Steelworks have already been closed and Whitford Sheetworks is about to close.

IMPROVEMENTS AND MAINTENANCE

Very good progress has been made with our schemes of modernisation and some of our new operating units came into production during the past year. Our expenditure on capital account during the year amounted to over £3,000,000. All operating works have been maintained in good order.

Considerable progress has been made in the development programme of The Steel Company of Wales Limited. The slabbing mill started to operate in December, 1950, the hot strip mill last month, and it is hoped that the sheet cold reduction mill will start up in August next. The trading results of The Steel Company of Wales were again satisfactory.

With regard to the valuation of our collieries and ancillary undertakings under the Coal Industry Nationalisation Act, 1946, progress continues to be slow. We are disappointed that negotiations to bring about an early settlement by agreement amongst owners in each district have not made the headway that had been hoped. It now seems that in most districts recourse will have to be had to the slower procedure under the above-mentioned act.

In the vital fields of research and education your board and management have had the position constantly under review. Existing practices and methods have been closely studied and changes have been made from time to time when they were manifestly justified and necessary.

In these and in the allied field of management-men relationships, I am satisfied that the company has a record of which it may well be proud.

WHITEHALL ELECTRIC INVESTMENTS LIMITED

The following is a summary of the report of the directors for the year ended December 31, 1950, which was submitted at the twenty-ninth annual general meeting held at Winchester House, London, E.C.2, on August 15th:

The consolidated gross income amounts to £148,893.

The valuation of the assets, excluding the London premium, on U.S. investments, is as follows:—

$6 preference stock of American & Foreign Power, £1,101,100.

Other investments at market prices, £2,534,353.

Unquoted investments, £664,505.

Gilt-edged investments and net floating assets, £867,313. Total £5,167,271.

Deduct minority interests, £223,950, leaving attributable to the company, excluding any valuation of Athens £4,943,321.

The trend of earnings of American and Foreign Power has continued upwards and the outlook is for continued improvement in the exchange situation and corresponding increases in the remittances of interest and dividends. A further capital reorganisation plan was filed with the Securities Exchange Commission in January of this year.

In Athens the electricity company brought additional generating plant into commission during 1950 and sales increased from 384,000,000 kWh to 451,000,000 kWh, but the transport company experienced a further reduction in the number of its passengers, owing to intensified competition by individual bus operators. The revenues of both companies have benefited from adjustments in their rates but in the absence of exchange remittances the improved results in local currency have not led to any return upon the investment. The further extension of the electricity undertaking to meet the constantly heavier requirements for electricity supply, calls for the provision of large amounts of new capital. These are being sought in accordance with the recognised procedure from the proceeds of aid under the control of the Economic Co-operation Administration.

The annual general meeting at which the report and accounts were adopted and the retiring directors re-elected was followed by meetings in connection with the proposed scheme of arrangement for the partial repayment of capital. At these meetings the scheme of arrangement was approved and special resolutions passed in connection with the reduction of capital.

THE RHODESIA BROKEN HILL DEVELOPMENT COMPANY, LIMITED

ANNUAL GENERAL MEETING

The annual general meeting of The Rhodesia Broken Hill Development Company, Limited, was held on August 8, 1951, at Kitwe, Northern Rhodesia, Mr H. F. Oppenheimer, a director of the company, presiding.

The statement by the chairman was circulated with the directors' report and accounts for the year ended December 31, 1950, and published in the press.

At the meeting Mr H. F. Oppenheimer added the following supplementary remarks:—

This is the first annual general meeting which has been held since the removal of control of your company to Northern Rhodesia. In the statement by the chairman which accompanied the annual report and accounts reasons were given for this change. I would like to add to what was said then about the transfer of control to Northern Rhodesia of this and other important companies operating in this territory that in our opinion the change is of importance in a wider sense than merely facilitating the administration of the company or in the lightening of its tax burden.

Rhodesia has advanced a very long way both economically and in national consciousness since these companies were incorporated and we believe that the time is passing if it has not already passed when the major industries can properly be controlled from outside the country and we hope and believe on the analogy of what has happened in the Union of South Africa and elsewhere that an increasing part of the share capital of these mining companies will come to be held in Rhodesia itself so that the mining industry which is already the mainstay of the economy of this territory will become in every respect a national industry.

It seems to us to be of special importance in view of the proposals that have been put forward for closer association between Northern and Southern Rhodesia and Nyasaland. It would obviously be out of place for me to express any opinion on the particular proposals which have been made but I think I can say that any scheme for closer association generally accepted in the territories concerned will be welcomed by and will receive the full support of the mining industry.

The report and accounts were adopted.

The payment of the dividend was approved and the retiring directors were re-elected.

NCHANGA CONSOLIDATED COPPER MINES LIMITED

ANNUAL GENERAL MEETING

The annual general meeting of Nchanga Consolidated Copper Mines Limited was held on August 8, 1951, at Kitwe, Northern Rhodesia, Mr H. F. Oppenheimer, a director of the company, presiding.

The statement by the chairman was circulated with the directors' report and accounts for the year ended March 31, 1951, and published in the press.

At the meeting, Mr H. F. Oppenheimer added the following supplementary remarks:

This is the first annual general meeting which has been held since the removal of control of your company to Northern Rhodesia. In the statement by the chairman, which accompanied the annual report and accounts, reasons were given for this change. I would like to add to what was said then about the transfer of control to Northern Rhodesia of this and other important companies operating in this territory, that in our opinion the change is of importance in a wider sense than merely facilitating the administration of the company or in the lightening of its tax burden.

Rhodesia has advanced a very long way both economically and in national consciousness since these companies were incorporated, and we believe that the time is passing, if it has not already passed, when the major industries can properly be controlled from outside the country and we hope and believe, on the analogy of what has happened in the Union of South Africa and elsewhere, that an increasing part of the share capital of these mining companies will come to be held in Rhodesia itself so that the mining industry, which is already the mainstay of the economy of this territory, will become in every respect a national industry.

It seems to us to be of special importance in view of the proposals that have been put forward for closer association between Northern and Southern Rhodesia and Nyasaland. It would obviously be out of place for me to express any opinion on the particular proposals which have been made, but I think I can say that any scheme for closer association generally accepted in the territories concerned will be welcomed by and will receive the full support of the mining industry.

The report and accounts were adopted.

The payment of the dividend was approved and the retiring directors were re-elected. In addition Mr H. Rissik was appointed a director of the company.

A. LEWIS AND COMPANY (Westminster) LIMITED

MULTIPLE TOBACCONISTS

The twenty-second annual general meeting of the Company is to be held on August 30th and the following are extracts from the chairman's statement circulated with the accounts for the year ended March 31, 1951.

The consolidated trading profit amounts to £225,445, which is £29,000 less than the previous year. The main reason for the fall is the increased cost of wages. After providing £102,781 for taxation the net profit is £77,045, a decline, of about £18,000. The directors are recommending a final dividend of 30 per cent., making a total of 45 per cent. on the £250,000 of ordinary capital.

Since April, 1950, we have added twenty branches, of which nine were established businesses and eleven new ventures; and we also completely refitted and modernised nine of our older branches.

While I have remarked that the decline in profit was mainly due to the increased cost of wages, I must point out that costs of all sorts have been continually increasing for some years past, and that we were able to take them in our stride because our turnover was increasing also. This year, however, we noticed a slight tendency for the consumption of tobacco to fall. This did not surprise us, as the continual rise in the cost of living means that people have got to cut down somewhere; but it did surprise us when the Government sought to push the blame for the increased cost of living on to the unfortunate shopkeeper and threatened legislation against price maintenance. It may also surprise you, as owners of this Company, to know just how little you really get out of it all. (In the full statement figures are given showing that a 3s. 6d. packet of cigarettes costs us 3s. 2d., of which 2s. 9½d. is duty, leaving after all charges, a net profit of ½d., and tobacco at 4s. per ounce costs us 3s. 9d., of which 3s. 6d. is duty, making a loss of ½d.) How any legislation against price maintenance could reduce the price of pipe tobacco it is difficult to see; but it is said that a smoker should be able to change his tobacconist and find one who will take less than ½d. out of 20 cigarettes. It could surely be simpler to change the Government and get one which will take less than 2s. 9½d.

The rate of Tobacco Duty holds the whole clue to the future of your Company. It was 9s. 6d. per lb. in 1939, and today it is 58s. 2d. The public has stood for it so far, and we have been able to build up a successful business. Since the duty provides over £600 million a year to the State, we can only assume that no Government will defy the law of diminishing returns by maintaining the duty too high for too long.

Foreign Traders

BRADFORD EDUCATION COMMITTEE
TECHNICAL COLLEGE, BRADFORD

Applications are invited for appointment as Lecturer in the Department of Economics in the College. The Lecturer should have qualifications in Economics (including Government). Ability to offer Law as a subsidiary subject will be an advantage.

The salary will range from £900 to £1,000 per annum.

Further particulars of the appointment and forms of application may be obtained from the Director of Education, Town Hall, Bradford, and completed forms should be returned to the Principal of the College as soon as possible.

A. SPALDING, Director of Education.

EXECUTIVE POST: SCIENCE GRADUATE. A large and well-known food manufacturing company in the Greater London area requires a graduate in chemistry to train for an important executive position in its production division. While technical qualifications for the post are essential, the company is looking equally for a man who has, or can develop, administrative ability. An intensive and well-planned course of training (6-9 months) will be given to the successful candidate to equip him for management responsibilities. From then on the opportunities for promotion are excellent. The appointment carries a starting salary of from £500 to £750 per annum according to qualification, together with non-contributory pension, life assurance and sickness benefits.

Graduates with 1st or 2nd class honours between the ages of 22 and 28 are invited to write in confidence giving full details of education and career to date, to Box 720.

WINE is so easy to enjoy; see if you have a natural palate; enter the Wine-Tasting Competition. First prize, a week among the vines. No charge whatever. Closing date for 1st Round is August 30th! Don't delay!—Apply The Friends of Wine, 1, Vintners Place, London, E.C.4.

OXFORD graduate (law), diploma in economics with statistics, qualifying the Bar in September, 26, ex-officer, sound administrative experience, accustomed responsibility, fluent French, Japanese. Seeks worth-while post October where he can put his talents to good use. Box 727.

CAMBRIDGE UNIVERSITY SCHOOL OF AGRICULTURE

Applications are invited for three posts in the Provincial Agricultural Economics Service. Starting salary £400-£500 according to qualifications and experience. Applicants should possess a good degree in Economics and/or Agriculture and if appointed will be required to take part in investigational work in farm management and enterprise costing.—Applications, in writing, to the Secretary, School of Agriculture, Cambridge, with names of two referees, not later than August 20, 1951.

CEYLON. Leading Firm of Chartered Accountants invite applications from young, single, qualified Accountants for appointment for an initial period of three and a half years with a view to renewal if suitable. First-class passage and 6 months' leave on full pay at conclusion of period. Interview in London by appointment.—Please write giving full particulars to Box "E.N.," c/o J. W. Vickers and Company Limited, 7/8, Great Winchester Street, London, E.C.2.

THE Board of the School of Planning and Research for Regional Development invites applications for the post of Principal. The applicants should be conversant with the principles of practice of Town and Country Planning and be familiar with recent trends in planning education. Qualifications in the economic and sociological fields will be considered equally with technique and design. He should have a broad and constructive outlook and be able to undertake original investigations. He will be expected to undertake work in his particular subject outside his academic duties. Further particulars may be obtained from the Secretary, School of Planning, 34, Gordon Square, London, W.C.1 Closing date for applications September 30, 1951.

ULSTERMAN (21), good education, including two years' university, knowledge of economics, French, etc., seeks position with industrial or commercial concern, preferably one having branches abroad, where transfer might eventually be possible.—Apply, Box 721.

ACCOUNTANT, acting also as confidential private secretary, required Nassau, Bahamas. Salary £1,750 with free furnished accommodation. 3-yr. contract, renewable. Good accounting and audit experience. Age about 35/40. Interview London. Write very fully to Box 724.

BLAZING away into the brown seldom brings down a bird, and hit-or-miss advertising similarly wastes ammunition. Successful advertising concentrates its fire on a well-chosen target.—Consult Samson Clark & Co., Ltd., 57-61, Mortimer Street, London, W.1. MUSeum 5050.

ITALY. Scotsman, aged 35, six years' business experience in Italy, with efficient command of language, at present holding executive position with British organization Milan, seeks change and would accept managerial position with a British firm already established or about to establish itself, in Italy. Excellent references can be supplied both in U.K. and in Italy and advertiser could come to London Aug./Sept. to discuss concrete proposition. Please write Box 728.

ECONOMICS. Twelve-lecture course planned to explain basic principles of economic science. Evenings 7 to 9. Begins September 17th. Fee 1 guinea. Enrol now or ask for further information.—SCHOOL OF ECONOMIC SCIENCE, 11, Suffolk Street, S.W.1. Telephone: Trafalgar 6415.

MANAGING DIRECTOR, age 41, Public School, Cambridge University (Honours Degree Engineering), available shortly. Successful record backed by thorough experience in all aspects of industrial and business administration.—Box 722.

BUSINESS man aged 51. Experienced administrative, executive, organiser. University Hons. degree, good knowledge accountancy, costings, statistics, exports, engineering, finance both at home and abroad, seeks change U.K. or overseas. Write Box 725.

Nothing But Folly

THE Anglo-Persian oil negotiations have broken down. When Mr Stokes's proposals for doing business were met with a wealth of answers that did not match, he sensibly confined them to a single essential point: was it the Persian intention to retain the services of British technicians? If so, the only condition in which qualified men would work for the National Iranian Oil Company was under British management. This the Persians refused to countenance. Mr Stokes therefore returned to London.

It is now clear that the mission never had a chance of success. The only comforts that can be drawn from its failure are that Mr Stokes conducted it well, and that it has revealed to all the world—and particularly to the Americans—the difficulty of dealing with nationalists who rate slogans as more important than domestic security or prosperity. It is now perfectly clear that no acceptable bargain can be struck with Dr Mossadegh's government—or, indeed, with any Persian government that is in sight. For the time being, Persian oil must be written off. Talk of reopening negotiations is perfectly futile, and therefore harmful. It is to be hoped that this is as clearly understood, now, in Washington as in London.

But if negotiation is useless, what follows? It goes without saying that the British case must be pressed at The Hague, in order to establish that what the Persians are doing is illegal. And when that has been done, the important thing will be to demonstrate to the Persians that felony does not pay—not, indeed, for the purpose of punishing the Persians, but of providing an object lesson for others who may be feeling the same temptation. It will be said that this will produce economic chaos, which can only play into Russia's hands. So it may; but there is going to be economic chaos in any case, and there is nothing to be lost by showing that it is the direct result of the oil expropriation.

What, within this pattern, should be done at Abadan? One possible course is to seize the refinery by force and work it on crude oil from other sources. The disadvantages of this are that it would be likely to be frustrated by labour troubles on the spot and that it would lead Britain into impossible complications with the Americans and the United Nations. The other clear-cut solution would be to withdraw all British subjects in a body, so as to make it quite clear that what happens hereafter is entirely the Persians' own doing. The British Government then could declare—as it hardly could so long as any British staff remained on the spot—that it would regard any oil coming out of Abadan as stolen property. The middle course between these two extremes would be to leave at Abadan as many civilians as can be persuaded to stay, partly in order to be able to say that there was no withdrawal, and partly in the almost certainly vain hope that something may after all be patched up. The middle course is not always the right one; in this case, it would simply confuse the issues once again. It would be much better to be forthright: either to use force, or else to leave the Persians unequivocally to stew in their own oil.

Party of Privilege

IT is time to start thinking what, after six years of war and six years of opposition, a Conservative government will be like. If there had been a general election last week about 130 seats would probably have changed hands and a Conservative government would now be installed with an overwhelming majority in Parliament. This is the straightforward deduction from the Gallup poll's latest findings on the state of public opinion, which were published by the *News Chronicle* on Monday. The full interpretation of the figures is not, of course, so straightforward. The poll reports how people think they would vote if there were an election tomorrow ; the practical political question is always how they would vote in a month's time, if Parliament were dissolved tomorrow. People change their minds, and some only make up their minds at all, during an election campaign. But after every reasonable qualification, the fact of the Government's unpopularity remains—and makes it very likely that whenever they are given the chance the electors will turn Labour out.

It is true that Labour was equally unpopular once before, in February, and made a considerable recovery in the early summer. But shortages of fuel and meat provided plenty of reasons for unpopularity in February. That the Government's popular support should have sunk back to the same level now, at the height of the holidays and without any great disaster or discomfort, is much more significant. The Conservatives can be pretty confident of getting their opportunity to show how they can run the welfare state.

They may still, of course, have to wait some time before Mr Attlee decides or is forced to give them the opportunity. In the meantime, there are two important conclusions to be drawn from the present state of opinion. The first is that the class war no longer wins votes in Britain. Mr Gaitskell's attack on dividends plainly has not impressed or pleased anyone who is not already a staunch Labour supporter. The middle voter is not so simple-minded as to believe that capitalist profiteers are to blame for high prices. The Gallup poll's probing into public attitudes may not prove much in detail, but the general drift is significant. The majority of people seem to see the ways to better living in lower Government expenditure, hard work and more competition. They now have little faith in controls and subsidies, still less in nationalisation. If on these points the Government makes further concessions to the views of Mr Bevan or of the TUC, it will not be earning popularity but drifting farther away from the trend of public thinking.

The second conclusion is that it is the politicians, not the voters, who have been debased by ten years of welfare politics. The electorate still dislikes weakness ; in difficult times it looks for firm action from its leaders. The Government could hardly have lost so much support if people thought Mr Gaitskell's policy an adequate response to the trade deficit and the fuel shortage. The swing in opinion demonstrates once again a truth that is not less evident because politicians are generally too timid to believe the evidence. The popularity of a government depends on facing up to its difficulties, even if toes get stepped on in the process. In a crisis the British people will respond, now as in the past, to firm leadership, provided it is honest. They do not expect to be soothed and left alone.

The Labour party is too tied to its preconceived notions for anyone to hope that it will take the lessons of the past month to heart. The Conservative party has no excuse for ignoring them. In the near future it will have to make up its mind on a policy. Recent ruminations may be expressed in a pre-election statement of Tory principles, but that is much the less important part of what is needed. The Tories will win an election not on the strength of what they say but because of what Labour has failed to do. They need a policy not in order to gain votes but in order to govern when they have gained them. They will come to power in difficult times, if not at the height of an economic crisis. After so long—and, for most, unaccustomed—a period of opposition, their leaders will have many emotional readjustments to make. If they are not to be as timid and confused as Labour they must know quite well what they want to do and how to do it.

*

The obstacle to a firm Conservative policy is the party's past. Because its reputation is that of a party of wealth and privilege, it has self-consciously to study all the time to behave as a party of the common man. Although its leaders know that a sound economic policy must impose some sacrifices, they are under constant pressure to fall over backwards rather than do anything that seems unpopular. The reason why so much attention has been paid to Mr David Eccles's speech three weeks ago is that it pointed to a way out of this dilemma. Mr Eccles sought to present the Tories as a party not of wealth but of the creators of wealth, as a party not for those who are made in life but for those who are on their way up. It cares for private property, the argument runs, not as a privilege for the few but as a reward for talent, initiative and hard work.

This is an important and, as far as it goes, a valid conception. The weakness is that it recognises only half of the dilemma. The Tories are a party of privilege in two senses. The party is older than universal suffrage and the welfare state. It existed when all politics were to a large extent the politics of wealth and privilege. There is nothing to be ashamed of in such historical roots ; they are in no way incompatible with the role in which Mr Eccles would now cast the Conservatives. But there is a second aspect of their association with privilege. Within the old ruling class, the Conservatives were the party of the landed interest against the trader, the party of privilege against the new wealth—against the creators of wealth in Mr Eccles's sense. What he is asking of his party is much more than that it should make a natural transition ; he is asking it to revolt against its tradition. It is true, of course, that the conflict of the nineteenth century is long dead, that Conservatism is now much more the doctrine of the businessman than of the heir to great estates. But the transition occurred because business, not the Conservative party, changed its spots. British capitalism lost its nineteenth-century spring, it became restriction-minded and protectionist. Conservatism has never in the past been the doctrine of the vigorous, expanding capitalism that Mr Eccles now wants his party to foster. It has been no more the party for the creators of wealth, for the men on the way up, than has the Labour party. Mr Eccles asks it, in economic policy at least, to deny its past. What he wants to graft on to modern Conservatism is not something new but the inheritance of its old enemy, nineteenth-century Liberalism.

The findings of the Gallup poll suggest that this objective is politically shrewd as well as praiseworthy. The British people show no signs of being so imbued with the doctrine of equal shares that they resent a frank recognition of wealth as the legitimate reward of initiative and talent. What they rejected in 1945 was not the acquisitive society. It was a capitalism that had become inefficient in acquisition, that had so lost its own character as to weight the scales against venture capital and in favour of the privilege of the established monopolist, a capitalism that had replaced the expansion of production at lower prices by mass unemployment. If the Conservatives will really make themselves the party of a vigorous, dynamic capitalism, which can provide a rising standard of living and thereby make the burdens of the welfare state easily supportable, then their future as a popular party is assured. The "active producers of wealth" will get their rewards with the blessing of the British public. The Conservative party will not only get into office on the strength of Labour's failures but will know what it is doing when it gets there.

But is the revolution in Conservative thinking possible ? In opposition, indeed, the party has shown considerable flexibility. What no one knows is how deep the new liberal-mindedness really runs. If the Conservative leaders are honest with themselves, they will apply two simple tests before they start to pay lip-service to Mr Eccles's doctrine. Would a Conservative government have the courage sharply to reduce the higher rates of surtax on earned incomes, and at the same time to raise the duty on large inheritances of wealth ? That would be the logical policy for a party rejecting privilege but welcoming wealth as the legitimate reward of individual ability. But how many of the Conservative party's most devoted—and generous—supporters would be offended by it ? The second test perhaps cuts even deeper. Would a Conservative government really try to break up monopolies and price-fixing associations, and re-enthrone real competition—the sort of competition that gets results because it is not afraid to hurt? That is the necessary policy for a capitalism of opportunity, but, again, it is the leaders of the price rings who are among the party's most active supporters.

Everyone knows that these pressures towards privilege still survive within the Conservative party. Its leaders cannot try to assume them away. Nothing would be more welcome, or make the future of the Conservative party brighter, than to know that they have been overcome. But the independent voter will want practical evidence before he believes it. If the Conservative leaders are not confident of passing these two tests, they will deceive only themselves, and confuse their own policy when in power, by pretending that they are the new liberals.

Congressional Battle Axe

THERE comes shortly before the American Senate a measure—the Battle Bill—that calls for some protest on principle from this side of the Atlantic and some reminder to Congressmen of the facts of economic life outside their own country. Its purpose in a nutshell is this: countries receiving American assistance are threatened with the loss of it if they do not come into line with the United States' policy of applying economic pressure to the Communist world. That, at least, is what the Bill says ; and wide powers to influence the trade policies of America's allies will be placed in the hands of a Washington official, to be known as the Mutual Defence Assistance Officer. In practice he may well turn out to be a very reasonable person and his recommendations will have to be approved and carried out by the President himself ; indeed, some governments may have to make little or no change in the policies they are already applying to trade with Communist countries. But the fact remains that Washington is to assume within the next three months a right of veto against its allies, that a foreign policy decision of high importance to the free world is being taken unilaterally, and that the working of the Battle Act is liable to cause much friction between friends.

There are, however, some things to be said in favour of the Bill, which has already passed the House of Representatives and will doubtless pass the Senate. Some of those who support it are doing so with the excellent intention of frustrating the far more drastic plans of Senator Kem, who would deny every kind of aid to a government exporting to Communist countries anything that could possibly be described as of strategic value. The allies of the United States may console themselves with the thought that things might be worse, that they might have been forced into the position of deliberately refusing American aid rather than accept the conditions attached to it. It can also be said that it is better to have the whole matter finally set down in the black and white of a Bill than that trading policies should be month in and month out at the mercy of Kem amendments. If the Republican vendetta against the State Department must go to such lengths, this is as good a method as any to protect the allies of the United States from the full fury of its politicians. For the Battle Bill leaves room for administration in a generous and realistic spirit.

The chances of that happening are best seen by examining the duties of the Mutual Defence Assistance Officer, who will henceforth be called Mr X. His first duty will be to make sure that countries receiving American military, economic or financial assistance do not send to

> any nation or combination of nations threatening the security of the United States, including the USSR and all countries under its domination . . . arms, ammunition, implements of war, atomic materials, petroleum, transportation materials of strategic value . . . and those items of primary strategic significance used in the production of arms, ammunition and implements of war.

Thirty days after the Battle Bill is enacted Mr X will have ready his list of what goods come under these

headings and pass it on to countries receiving aid. Much of the list has, fortunately, been agreed already. During the following sixty days governments will prepare and send to Washington the facts and arguments on which they base their claims to be protected from the Battle axe. At the end of that period Mr X will recommend to the President the exemptions which he considers justified and the penalties to be applied to those countries which have failed to make a case and yet go on exporting to Communist countries goods that are on his black list. In making his decisions the President will take into account some or all of the following points: that arms are not reaching Communist states from the country in question and that its controls on the export of strategic materials are adequate ; that it is making its full contribution to "the mutual security of the free world" ; that American security will benefit by continuing aid to it ; and that the imports received from Communist sources by the exporting country are of "strategic importance."

There is clearly plenty of room left here for the use of discretion and common sense ; the British Government should come well out of all these tests. If it seems unfair, even exasperating, that doubts should be cast on an allied government's good faith and ability to look after the common strategic interests, the answer presumably is that it is also exasperating to Congressmen to feel that there is the slightest risk of the American taxpayer's money benefiting the enemy in the cold war. If the conditions now to be attached to their aid by the Americans are unprecedented, so are the scope and generosity of their aid. That must not, in all fairness, be forgotten.

*

But the real rub comes over goods other than war materials. Section 201 of the Bill declares it to be United States policy to regulate exports of commodities other than those already listed in order "to oppose and offset by non-military action acts which threaten the security of the United States and the peace of the world." Mr X is directed to "negotiate" with assisted countries programmes for controlling such exports. This, rigorously interpreted, would be tantamount to organising economic warfare under the direction of a single official in Washington. Mr X may have the best intentions, and he is bound to consult with the State and Defence Departments as well as with the Economic Co-operation Administration. But, like any other Washington official, he will be exposed to political pressures whenever he has to recommend decisions on such matters as Russian purchases of sterling rubber. Senator Kem, for example, regards as a "shameful business" the export by Britain to the Soviet Union of machine tools, electrical generating sets and other equipment, small though the deliveries are ; he objects also to Italian exports of ball and roller bearings worth some $1,100,000 to countries behind the iron curtain. But he appears to approve of Norway's exports of aluminium to Poland and the Soviet Union because it gets manganese and coal in exchange. It is difficult to understand his standards of judgement.

It is not difficult to guess with what kind of exports Mr X will be chiefly concerned: machinery of all kinds ; rubber, tin and copper ; tankers and cargo ships ; industrial diamonds ; ball bearings and machine tools. Nor is it difficult to guess with what imports from Communist countries he will be concerned: coal, timber, food, grain and other consumption goods which in Europe are in short supply. Merely to mention the nature of these exchanges is to show how immensely complicated will be the decisions thrust on one man. Even if his recommendations eventually leave matters very much as they are, there are already signs that the Russians and their satellites will take a stiffer attitude over their future deliveries ; for the Battle Bill is casting its shadow before. From now on every east-west trade deal will be conducted in an atmosphere of uncertainty and awareness that Mr X is watching at the bottle-neck in Washington.

At this stage an American may ask: If the Battle Bill is likely to leave exchanges with the Communist world very much what they are now, thanks to the discretionary powers left to the President, what is all the fuss about ? The fuss is, and will remain, about three points. The first is that this method of bringing pressure to bear on allies is novel and highly distasteful. American assistance to allies has so far been characterised by trust, tact, generosity and a spirit of equal partnership in a great enterprise. The Battle Bill infringes that spirit. If nothing had been done already, by free agreement, to deny war materials to Communist countries much of this could be justified as an act of righteous indignation. But in fact a great deal has been done, and the back of the job has been broken already by joint action and consultation with allies in a body known as the Paris Committee. The Battle Bill implies either that America's allies are disloyal or that they are incapable of deciding for themselves what is the balance of gain and loss in their exchanges with the Communist countries—in short, that they are either fools or rascals.

The second point is that it is by no means self-evident that the time has now come for economic warfare *à outrance* against the Communist states. As Sir Hartley Shawcross said last week, this should be a matter "of high international policy" ; he might have added, "to be settled in consultation between allies." In the present state of the cold war, trade with countries behind the iron curtain may be a source of strength to the west and to stop that trade may be a cause of weakness ; a national government must reserve the right to cast the balance and take its own decisions about its own trade, even though it should listen to the views of its allies.

The third point is that a rigid interpretation of the Battle Act can only cause friction and suspicion between the allies—friction and suspicion of the kind that the Communists foment by every means in their power. At this moment they are drumming out hard their appeals for more trade with the free world, and the Russians have sent the head of their trade treaty department to discuss prospects of east-west trade under the auspices of the Economic Commission for Europe. Quite apart from the fact that they are playing from a hand that is said to hold a good harvest, they know quite well that the Americans in the past have urged on Western Europe the need to increase its trade with the east as a way of relieving the dollar difficulties that are now reappearing. (The practical possibilities of east-west trade will be discussed in a subsequent article).

Against all this there is the fact, which will seem decisive to many Americans, that they are giving free aid to their allies. He who pays the piper can surely call the tune ; and if America's allies wish to be treated on a basis of strict equality, let them provide some aid to America. It is as well to speak perfectly plainly about this. There is no doubt at all that Congress has the indefeasible right to pass as many Battle Bills and Kem Amendments as it wishes ; there is no court of law which can grant an injunction, and no grounds on which diplomatic protests can be based. If Congress wishes to convert the present alliance into a relationship of patron and clients, it is perfectly free to do so. But Congressmen should be put upon notice that, if that is their choice, they will finish up with many fewer clients, and much less reliable ones, than they now have allies. If the Battle Bill is moderately administered, most countries may swallow it, for the moment. But it will become a powerful reason, in the minds of all of them, for breaking away at the earliest possible moment from a relationship which it would have made injurious to self-respect. It is always a sound rule, when dealing with people of another country, not to assume that they have less pride and patriotism than one has oneself, and it would be a good test for Congressmen to apply, as they consider the Battle Bill, to ask themselves whether they would accept it, if the rules were reversed, even as the price of aid received.

It is clearly too late to prevent the Battle Bill going through in some form, but it may not be altogether too late for its form to be altered. The objection, to repeat, is not to the action that is likely to be taken under it, but to the principle of unilateral and dictatorial action. Is it quite impossible to amend it so that the penalties are imposed, not by a unilateral American decision, but by a decision of an international body—say, the North Atlantic Council ? By such an alteration America would gain, in practice, everything that the Battle Bill will achieve, but the all-important spirit of the alliance of the free world would be preserved.

The Deal with Franco

UNDER American pressure, the unreality of relations with Spain is becoming another casualty of the cold war. As the pace quickens in this vast struggle, the voice of the United States becomes more and more insistent in the conduct of western affairs. What the British had several generations to learn in their era, the Americans have learnt and are learning in less than one. And in assuming and conducting the leadership of the free world at such brief notice, they are inevitably applying to these immense new problems some of the methods whereby they themselves built up the modern United States, in which energy and directness are more evident than delicate perception of other people's feelings. But if the Battle Bill is an example of the blunders into which this habit can lead American policy, the case of Spain may be a more favourable example of the way in which it can refuse to let positive action be impeded by the legacy of the past. Until recently, the State Department, for reasons of world politics, resisted the pressure of the friends of Spain. But it has been converted, and it is Mr Acheson himself who stated the new policy in the simplest terms on July 19th when he said of the late Admiral Sherman's visit to Madrid:—

> Military authorities are in general agreement that Spain is of strategic importance to the general defence of Western Europe. . . . We have been talking with the British and French governments for many months about the possible role of Spain. . . . We have not been able to find a common position on this subject, for reasons of which we are aware and understand. However, for . . . strategic reasons . . . the United States has initiated these exploratory conversations.

Decisions such as this are still national decisions as opposed to something which commits the whole free alliance. The countries of Western Europe are not being asked to join in the new policy if they do not like it ; but American policy is now clearly on the road to making an ally out of Spain on the basis of mutual help. The questions which matter are no longer whether this is a good thing, but what it will cost and how effective it will be. Both are considerations which depend as much on the needs and attitudes of the Spaniards as on the wishes and intentions of the Americans. Broadly, the anticipated basis of an exchange between Washington and Madrid is the use of Spanish naval and air bases in return for support of the Spanish economy and for limited supplies of American military equipment and know-how. The precise terms of any such deal have not yet been fully settled and General Franco may still be expected to try to drive a hard bargain. In reality, the cost and effectiveness of the deal must depend largely on the state of the Spanish economy and on its ability to subsist without giving grounds for violent upheaval.

This is not easy to determine, since the Spaniards have a great capacity for enduring hardship and, owing to droughts and world shortages, Spain has scarcely had what might be called a normal year since the end of the civil war in 1939. Certain leading facts stand out, however. In general, Spain is better off this year than it has been for some time, owing to a higher rainfall. There has been a wheat crop perhaps 30 per cent above last year's, which was in turn better than that of 1949 ; it may now exceed 4,000,000 tons and just enable Madrid to avoid importing grain next spring—this year's allocation from the International Wheat Council was 100,000 metric tons. The current olive, sugar beet and potato crops are also expected to be good. For industry, there is a very much better supply of electric power than has been usual of late ; the reservoirs are 75 per cent full, which is good for the time of year. These improvements, nevertheless, are relative. Spain is a poor country, with a heavy backlog of capital development and renovation held up for lack of foreign exchange, with a dangerous degree of inflation, with deficits last year in its budget and overseas balance of payments (if the shipment of gold as collateral for a private dollar loan is taken out of the accounts), and with a level of agricultural production still well below that prevailing before the civil war began in 1936.

*

Madrid's official economic interest appears to lie primarily in industrial rather than agricultural development. In spite of a farm colonisation programme, only about one per cent of the budget and very little foreign exchange was devoted to agricultural improvement last year. There is, however, a patent and laudable desire to do away with some of the onerous controls over the production, transport and marketing of food, as soon as supplies permit ; an important step towards internal liberalisation has been the creation of a free market in wheat. In industry, the general index of production,

including mines, is standing about 25 per cent above the level for 1929, and last year activity was the highest on record. This has been achieved in spite of a great shortage of electric power, of lack of adequate raw materials such as cotton for the mills of Catalonia, and of a low labour productivity owing to much dissatisfaction among the workers. It demonstrates both the potential improvement which a relatively small dose of foreign aid might produce and the fact that, although the present government is doing what it can to build up industrial capacity, Spain's achievements stand a long way behind those of its neighbours.

During the past two years Madrid has tried with considerable success to redress Spain's adverse balance of payments. This rose each year after the world war to 340.5 million gold pesetas in 1948. Last year it was reduced to 2,200,000, but by cutting imports rather than by expanding exports. In addition, owing to Spain's exclusion from OEEC and the European Payments Union (EPU), exchange difficulties have dictated more rather than less bilateralism in foreign trade; at the same time, while Britain is the biggest buyer of Spanish exports, the United States replaced it last year as the main source of imports. A good deal has been done to promote more efficient export, including allowing compensation accounts, giving individuals the right to retain a proportion of their exchange earnings and, a year ago, establishing a limited free exchange in Madrid designed to undercut the black market in the peseta.

Despot and Democrat

The work is going on. The harvest is fast ripening for the sickle. While the Princes of Germany are crushing civil rights by wholesale; while the Sovereigns of Italy are decimating patriots in detail; while the first are trampling out freedom by sweeping perjuries and national oppression, and the second by elaborate and studied cruelty to individuals; while the tender-hearted sigh over the suffering, and the good murmur at the wrong, and the just inveigh against the crime, there is a class of men who regard these proceedings with a stern and vindictive delight. The fettered revolutionist in his dungeon; the banished republican from his exile; the baffled demagogue from his hiding place; the man to whom political convulsion is a savage pleasure; the man to whom it is a sacred means—all are watching . . . the wild and brutal blundering of their triumphant foes, in the very extravagance of whose crimes they read the certain prophecy . . . of their own day of deliverance and retaliation. . . . The Red Republican chuckles with a fierce delight as he hears of crimes which make "his own transgressions whiten in their shade." The Socialist gloats over follies wilder and insaner than his own. The sober Patriot feels that the time is fast drawing on when scruples must be cast aside. The moderate Constitutionalist perceives that moderation for the future would be untimely, out of place, and suicidal;—that as the despots confound him with the lowest democrats in their indiscriminate hostility, so must he make common cause with the democrat in his future warfare. Every day now sees, throughout the whole of Europe, quiet liberals converted into uncompromising republicans, and steady conservatives passing over with undisguised reluctance into the ranks of the Movement. Each fresh iniquity that comes to light is a democrat the more—a royalist the less.

The Economist

August 23, 1851

On the other hand, although anxious for dollar help and agreeable in principle to the new investment of foreign capital, the Spaniards have moved cautiously in this respect. New foreign participation is in practice limited to 25 per cent of a firm's capital, foreign management is prohibited, and it has continued to be difficult to repatriate the dividends of existing foreign investments. Consequently, Spain has failed to attract money which it needs and might have had, both as foreign purchasing power and to supplement the limited internal capital market.

*

It is against this economic background that, in September last year, the United States Congress voted the authorisation of $62.5 million for Spanish loans through the agency of the Export-Import Bank and that, now this month, specific new American military and economic missions are heading for Spain. Madrid has negotiated release of the existing loans only gradually, and the spending of some $30.5 million has now been arranged, mostly on agricultural requirements such as fertilisers and tractors with the last sum of $7,500,000 being reported as for the hard-pressed railways. Interest is at 3 per cent and the capital repayable in twenty-five years. An ECA mission is now to spend three months in Spain and is officially interested in studying means of increasing the output of Spain's agriculture and mines. It would be wrong, however, to expect the Spaniards easily to accept extensive commitments to repay foreign loans even in the distant future. They have a strict record of meeting government foreign debts and are very chary of increasing them. They will be bound to press for a large part of any substantial increase in aid to be made in the form of grants rather than loans.

The Americans accordingly still have a delicate and difficult task ahead of them in giving effective expression to last month's shift in their Spanish policy. Projects submitted by Madrid for the use of dollars already exceed the $62.5 million loan, and, while it seems likely that some of these may now be approved, aid to the extent of between $400 and $500 million would probably be needed to have much effect on the Spanish economy. If, on the other hand, most of any additional aid is to go on primarily military expenditure, this economic effect will be considerably reduced. There is, however, almost no question of having to prop up General Franco's economy on the argument that, if it is not propped up, it will collapse into Communism; in spite of their poverty, Spaniards take pride in the view that they are not as other—Marshall plan—nations are. As they see it, if anything is done, it will be done as a deal and in order to make a positive Spanish contribution to the struggle against Communism.

In this respect, all that America is doing is far more likely to redound to the ultimate benefit of the western world than to its disadvantage. There is a strong case to be made—as the British, French and Scandinavians make it—for saying that Nato cannot afford politically to cover General Franco's Spain during the phoney peacetime of a cold war. But if the Americans are prepared to use their own money, and to pay the price the Spaniards fix, in order to set in train at once some of the things which would be necessary—and might have to be brought about under much less favourable circumstances—in war, it seems illogical and unnecessary for their European allies to resent it.

Agenda for the Age of Inflation—II

(By a Correspondent)

THE preceding article set out fourteen separate reasons for believing that the upward trend of prices will continue for as far ahead as human wisdom can see. The argument, it should be emphasised, is not that prices will rise continually. There will, of course, be minor setbacks, lasting perhaps at longest two years. Peace in Korea might start such a setback. The abolition of resale price maintenance, or the liberalisation of foreign trade, might knock a point or two off the indices. But these would be once-for-all measures. The contention of this series of articles is that the long-run influences are all on the other side.

Britons are unused to long rises in prices. We have no social defences against them, no accounting devices to make them tolerable. We cannot really believe them to be normal; it "must" be possible to stop prices rising. It is not too much to say that as the axiom of parallels was to Euclid, the straightness of the path of light to Newton, or Say's Law to the classical economists, so is stable money to British accountants. All our accounting conventions and textbooks, our company law, our insurance practices and our investment habits, the very syllabuses of the professional examinations, rest on a nineteenth century base. We must, then, bow to the inevitable and create a whole "non-Euclidean" financial system. We have made our inflationary bed and we must lie on it: but we might as well be comfortable. Hitherto reforms have been piecemeal; we shall here glance briefly over the whole field, no doubt not without serious omissions.

(a) The replacement of fixed assets and of stock-in-trade must be freed of income tax. This is a question not of preserving the real value of company profits, but of defining them correctly, and making the incidence of the tax equitable between the companies with new assets and those with old ones. We may tax profits as heavily as we please, but we must calculate them net of replacement cost. Such a reform would also have the effect of keeping the capital value of equities intact, since the equity which represented at the foundation of the firm a certain machine would continue to represent that machine or its replacement, instead of representing an ever-diminishing part of it. This effect would, it is true, favour the owners of property; but it is surely no bad thing that *some* property should maintain its capital value, instead of none as at present. Very likely equities—or, to be precise, shares in investment trusts that hold only equities—would then become the obvious trustee security. A society which provides no trustee security for the care of widows and the maintenance of charities is simply failing in one of the more elementary amenities of a civilised community.

(b) We should tie *most* constituents of wages to *some* cost of living index. There is no need for absolutism here; to tie all wages rigidly to the cost of living would hinder movements in relative wage rates, whereas under this system much would be left open to negotiation. Again, the advantage to the government of the automatic fall in real wages as prices rise is in these warlike times very precious and should not be jettisoned altogether. The more moderate proposal would on the other hand avoid some strikes and much injustice to less organised workers. It would also preserve the essential minimum difference between skilled and unskilled, which flat-rate cost-of-living bonuses have tended to obliterate. It is too often forgotten that inflation has been a great equaliser of incomes *within* the wage earning group; indeed it seems that here more than anywhere else equalisation has gone too far.

(c) Salaries should be similarly treated, that is, tied to a cost of living index, but in such a way as slightly to lag behind it. It must be admitted that since 1939 inflation has caused a very wholesome equalisation of real incomes between classes, precisely because salaries have lagged behind wages. But from now on it is fair to assume that the hierarchy of real incomes is about right and should be preserved. Moreover, the stickiness of salaries under rising prices is far and away the chief cause of the unionisation of the salariat. But the introduction of the union spirit affects their morale, their efficiency and their sense of professional obligation. It is surely to be avoided.

(d) The same applies to social services and state pensions. There is most injustice of all when these lag badly behind prices.

(e) More controversial is the question of interest and capital in debentures and government bonds. Private enterprise and the nationalised industries should certainly be allowed to link debenture interest and capital to the cost of living if they wish. Indeed it is strange that this has not already been done; a debenture with the capital guaranteed in this way should logically be issuable at par, nay well over par, for zero per cent. Such bonds would provide another logical form of trustee security: indeed, with dividend limitation a more logical form. A flotation of dated bonds, bearing no interest but redeemable at par multiplied by the rise in the cost of living, could hardly fail to be a great success. There is an especially good case for doing the same for National Savings, which should become the poor man's equity. As it is, the poor suffer a far greater injustice in the capital market than the rich, for no small savings media offer any hedge against rising prices at all. Such measures would encourage savings and therefore be deflationary, not, as at first appears, inflationary.

(f) This raises the question of external debt. We shall not be able to go on repudiating our foreign debt for ever, though it is remarkable how the sterling area has so far held together in face of the perpetual depreciation of the sterling balances. One day—may it be long distant—our foreign creditors will all imitate Argentina and insist on a price index clause in trade agreements. We cannot in justice deny them this, and would benefit equally ourselves from the operation of such a clause on foreign currencies.

(g) The lower exemption limits of the income tax are at present fixed in money terms and seldom greatly altered. This gives an automatic buoyancy to the revenue and brings in yearly more victims. But it is

extremely expensive to collect small sums from large numbers, so this state of affairs should be reconsidered. Income tax is a very inefficient method of taxing the poor. It is also very wrong that the surtax limit of £2,000 should have been unchanged since before the war.

(h) Many fines, fees and charges are written into parliamentary statutes or the constitutions of the bodies that impose them, or are subject only to annual scrutiny. Thus the price of an oath is still 2s. 6d. as it was before the war, and many ecclesiastical fees have completely failed to react. Parliament or the bodies concerned should arrange for greater flexibility. If they do not, things will be as difficult for us as for ancient Rome. Aulus Gellius provides us with an awful warning against inflation:

> Don't you agree with me that the punishment for assault is a bit mild? "The fine for assault is 25 *asses*." For who is so poor that 25 *asses* will curb his bloodlust? Your friend Labeo in his *On the Twelve Tables of the Law* points out the absurdity: "L. Veratius," he says, "was a perfectly shameless character and thoroughly perverted in his tastes. He used to amuse himself by slapping free men across the mouth, and he had a slave following him with a purse full of *asses*; so that when he had slapped anyone he would order 25 *asses* to be counted out at once, according to the Twelve Tables."

To such a pass had rising prices brought the Roman Law, until the praetors adopted the solution we have here urged: they

> gave out that the law was obsolete and invalid, and declared that they would appoint arbiters to appraise damages. (Noctes Atticae, XX/1).

The lesson for ourselves is surely that the notices in railway trains, "Penalty for improper use, £5," should in future be made of wood, not metal.

(i) There should be a new basis for most kinds of insurance. At present the insurance contract is of the form "I pay the company a fixed sum annually, and when I die or retire or the untoward event happens, it pays me a fixed sum, which it hopes will be covered by my premiums." We should substitute where possible a contract of the form "I pay the company an annual premium increasing yearly with the cost of living and it promises me a sum that increases in the same way." By this method the company pays the claims of my predecessor out of what I currently pay in, and similarly my successors pay for me. By the present method all insurance is biased against the insured, who pay in good money to receive bad.

(j) Land and house rents should be treated at least as company profits in (a); there should be full and unconditional allowances for all rises in costs that have to be deducted before net rent is declared. For the rest, arrangements on the lines of (e) should be permitted, whether or not there are more radical reforms. Quite apart from this, owing to past price controls, rents need drastic upward revision. Rent tribunals should cease to regard historical cost as a fair basis for rent.

(k) If price controls have any useful purpose at all there is certainly no justification for prohibiting an automatic increase in prices with an increase in costs. No price, rent, wage or other ceiling should be issued in a statutory order unless it is automatically adjustable—with the same sort of lag as for wages—either by the suitable index or by some other arrangement. In this way the number of conferences and disputes and the volume of political pressure would be minimised, and no controlled price could become a ludicrous anomaly as have rents, while the braking effect of price controls on a general rise would be preserved. Price controls that get out of hand are the best possible way of making inflation more uncomfortable than it need be. No price control would be better than inflexible price control.

(l) A special kind of controlled price is that which the government, acting as a sole or predominant buyer, pays for some goods or service it itself requires. The government is constantly getting itself into difficulty by "setting a good example," or offering less than the price necessary to call for the quantities it needs. A gross case of this is teachers' salaries: the shortage of teachers in state schools is largely due to the government's exercise of disinflationary restraint at the teachers' expense. There is also the category of "headline" prices, or prices in the public eye. The chief of these are passenger fares, which cannot be changed without permission of some statutory tribunal and the maximum of general noise. They therefore invariably lag, and this imposes an entirely unjustified disadvantage upon the transport industry, especially the railways. The procedure for fare adjustment should be drastically hastened. Indeed much of it should be made automatic by some sliding scale.

(m) Like price controls, subsidies are essentially partial, and cannot operate everywhere. Unlike price controls they are of no use at all except in a finite period of inflation. But in the present period of indefinite, if not infinite, inflation they merely distort relative prices and constitute an evermore intolerable tax burden. There is no reason why subsidies should be a vested interest of the poor as we commonly suppose them to be. The burden of taxation upon the poor is much greater than the relief afforded them by subsidies.

(n) An increase in rates of interest is often advocated. While this might be a brake on the rate of rise in prices, it could hardly by itself outweigh the immense array of inflationary influences. It is ridiculous to suppose that any tolerable rate of interest would prevent aggregate demand from exceeding aggregate supply. We may hazard the guess that, unaccompanied by a wage and price stop, no Bank rate under 6 per cent would keep prices down; and this rate would have to be permanent. Above all, it is false that interest rates deflate painlessly. They deflate, as does any measure, by causing unemployment and taking money out of people's pockets. The distress of individuals is as great in this way as in any other. The demand, nay the absolute necessity, for output of all kinds is so great today that a volume of unemployment sufficient to keep down prices would not be tolerated on grounds of public policy, let alone grounds of humanity. But this is not to say that interest rates ought not to be higher for quite other reasons. Principally we need a high rate to enable us to dispense with rationing and controls in the capital market. There is also the remarkable fact that the "real" rate of interest on both short and long bonds is negative: that is to say that an investment which accumulates at 5 per cent compound loses purchasing power because prices rise by more than 5 per cent compound. It thus pays people to indebt themselves at fixed interest—if they can find a lender—merely in order to hold goods. This state of affairs is both irrational and inflationary.

(o) The trade cycle has now become an interesting feature of economic history. As it began in the eighteenth century, at a certain point of time, so also has it ended in the twentieth, at another point. The trade cycle was never inevitable at all, nor in any sense a law of nature. It was a feature of a certain type of economic organisation, now dead. Cycles there will be, but the old investment, employment and prices cycle, averaging nine years in length, has passed away. There will be slumps in individual commodities still, and possibly on the Stock Exchange; there will be temporary unemployment in particular trades, caused by shortages of raw materials. But the general level of prices will scarcely fall, nor will there be unemployment due to deflation. The problem of maintaining full employment is no longer that of ensuring markets, but of ensuring raw materials.

(p) The Acts governing the investment of trust funds should be altered so as to forbid the purchase of fixed interest securities. The enormous shift in the holdings of investors entailed by this would, of course, absolutely disorganise the capital market unless at least some action were taken to provide securities with interest varying in accordance with rises in prices. In the first instance the Government might convert a limited amount of its stock into special variable interest issues, linked to the cost of living, the opportunity to convert being offered only to trustees.

(To be concluded)

NOTES OF THE WEEK

Breakdown at Kaesong

The breakdown of the Korean armistice talks at Kaesong is one of the most ominous events since the end of the last war. It shows Communist determination to take a calculated risk of spreading the open fighting far beyond Korea; the evidence that the United Nations forces had violated the truce talks area by bombing will not stand up to examination for a moment—the United Nations observers are reported not to have been allowed even to see the supposed bomb craters in daylight, and the American Fifth Air Force has denied that any of its aircraft were over the district at the time. From the United Nations' point of view there was no reason why their negotiators should ever themselves have broken off the talks, since they want peace—on certain minimum terms—and there is no other way to get it.

It looks as if the Russians may have made a genuine error of judgment in assessing the UN's minimum terms, the kind of error which in some circumstances might risk starting a world war without either side making a positive decision to do so. It appears possible that, with Moscow making the running for a militarily discomfited Peking, Mr Malik originally put out his feelers for an armistice because certain American statements had led the Russians to believe that they could get a truce line along the 38th parallel. Hence the nailing of the Communist flag to that illusory and elusive mast. The facts, on the other hand, are that for months past the aim of the UN command has been to secure a militarily defensive rather than a political frontier; that, even when Mr Malik spoke, the UN forces were well north of the 38th parallel in the central and eastern sectors, and could hardly be expected to withdraw all the way to the parallel; and that, during the past few weeks, General Ridgway has wisely fortified a very rugged base line which swings north of the parallel as it goes east.

This has been a very critical period. The possibility of an armistice depended not only on a change in the Communist estimate of the situation, but on the Communists withdrawing claims to territory that they once held—which is something they have not done since the war. For Peking, of course, there is also the thought of losing face in eastern Asia, the failure to remove a dagger pointed at the heart of China—the Japanese showed how Korea could be used as a jumping-off point for invasion—and the impact of American power. But Chinese blood has flowed in Korea and it was the Chinese who wanted peace. The 38th parallel probably has less significance to them than to the Russians, and hopes had been aroused by the fact that Peking recently appeared to have taken over the running at Kaesong, since that might have meant that the claims to the parallel could be quietly dropped. Once they had been, genuine negotiation about an armistice line could have begun. As it is, in deciding to resume the fighting, the Communists have shown a grave lack of realism. So far as the military prospects can be foreseen, the eventual demarcation line is unlikely to be fixed any further south than the present battle-line, and it might be much further north.

* * *

The Road to San Francisco

There is now some danger that signature of a Japanese peace treaty may be delayed after all. By accepting the formal American invitation to what had been intended as little more than a signing ceremony at San Francisco on September 4th, the Russians look as if they propose trying to reduce the meeting to the farce which has become usual at some of the international conferences that they attend. There have already been eleven months of intense negotiation for this treaty in which, by oral exchanges and in ten lengthy drafts of memoranda, the Soviet Union has had the same opportunity as everyone else to contribute to the present text. The final compromise text was circulated among the nations in July and the majority of those concerned in the Pacific war are understood to be in favour of it. Russia fought Japan for five days only. Everything must now be done, by ensuring watertight rules for the conference and by interpreting them with downright and courageous chairmanship, to see that Mr Gromyko does not filibuster for longer than the five days which the conference is scheduled to take. The choice of chairman will be most important and there is much to be said for the possibility that Mr Lester Pearson, the Canadian Minister for External Affairs, should preside.

If they are bent on making trouble by playing on the doubts and hesitations of Asian powers, there are many subjects that the Russians can raise. It is sadly true, for a start, that any peace treaty with Japan which is not signed by either Moscow or Peking is a dangerously second best. Then there are openly expressed objections in Asia to the liberality of the proposed treaty; there is fear about Japan's freedom to rearm and resentment at the way it is escaping reparations—a country like Burma will bear the scars of Japanese aggression for very many years. Perhaps the most serious Asian inhibition is also the least tangible. It is the feeling that the treaty may drag Japan behind the chariot wheels of a new Americanised western imperialism; American bases in Japan are quoted as examples of the trend. In Delhi, as a result, there are still grave heart-searchings as to whether India should attend the San Francisco conference at all or should try to sign a separate treaty.

In reality this treaty represents the best that can be secured in the present circumstances of world divisions and tension. It is high time that Japan's relations with the bulk of the world were put on a normal peacetime footing. Nearly fifty nations have now accepted invitations to the San Francisco conference, including Japan itself; it is to be presumed

that almost all have acted in good faith. Whatever the Kremlin's tactics, it should not be allowed to stop the legitimate processes of diplomacy at this stage.

* * *

Convenient Martyrs

The fact that British Communists mean to launch a series of meetings to be addressed by young men who attended the Berlin Rally, and to make this campaign a special feature of their activity during the winter, puts into perspective the recent events in Austria, where many Berlin-bound youths were turned back. The keynote of these meetings will be not peace and goodwill, but anti-American hate propaganda, built around stories about brutal behaviour by United States soldiers at Saalfelden, the railway station where the travellers to Berlin were halted on their second attempt to get through.

The propagandists are already confusing two wholly separate issues: the general principle of freedom to travel—which Communist governments honour much more in the breach than in the observance—and the special responsibilities of the occupying powers in Germany and Austria. The fact that nearly a thousand young Britons travelled to Berlin by sea without let or hindrance will be conveniently forgotten, and attention will be concentrated on the "martyrs" whose passage through Austria was forbidden on the legally unassailable ground that they had not obtained the "grey cards" on which the Russians, not the western governments, have always insisted.

Speakers at Communist-sponsored meetings will presumably not explain why these pilgrims to Berlin rejected the short, comfortable and cheap sea route in favour of the expensive, complicated journey through occupied Austria; why their leaders failed to pass on to them the offers of help made by the British Consul at Innsbruck; or how it happened that threatening crowds of Austrian sympathisers appeared in the quiet little town of Saalfelden as soon as the trouble started. Nor will they explain that most, if not all, of those against whom force had to be used had already been turned back once and were attempting deliberately to flout what they knew to be the law.

There can therefore be very little doubt that the American authorities were within their rights in what they did. But that does not answer the allegations, supported by many witnesses, not all of them Communists or even connected in any way with the Berlin Rally, that what the Americans did at Saalfelden they did with quite unnecessary brutality. The American authorities in Austria would be well advised to conduct a thorough inquiry into the disturbing and circumstantial allegations that are being made against their military police and soldiers. To know the full truth can do nothing but good.

* * *

TUC in Two Parts

The General Council of the TUC displays, in its annual report published this week, an alarming case of split personality. In bolder terms than Mr Gaitskell would now use, it says that the increase in defence expenditure "inevitably means some reduction in the standard of living of the community as a whole, either by higher taxes or by higher prices or by a combination of both. The Government . . . places the emphasis on a rise in prices rather than on a rise in taxes." The Council does not dissent from this policy, but has done what it can to make it ineffective. It admits the difficulties of price control, yet urges that there should be more. It recognises that it would have been impossibly expensive to stabilise the prices of basic necessities in the current year. It grants that subsidies benefit the rich as well as the poor; indeed, the absurd roundabout of subsidies was never more dizzily described than in the following sentence: "Apart from the direct cost of the increased subsidies the Chancellor would almost certainly find it necessary, in the interests of avoiding inflation, to mop up by taxation a bigger proportion of incomes, since if prices of subsidised goods were stabilised people would have more money to spend on other goods which, because of rearmament, are in short supply." Yet "as far as practicable" the Council has urged that subsidies should be raised.

The report recognises that a large increase in British costs and prices "could easily lead to the melting away of our gold and dollar reserves and the impossibility of maintaining adequate supplies of food and raw materials." It observes that these costs include wage costs. It points out, too, that "higher money incomes will not be accompanied by a rise in the volume of goods for sale" and "must be fully reflected by a rise in prices." And after all this, it states that "in the present situation trade unions must endeavour to maintain the real wages of their members by demanding wage increases." So the reduction in the standard of living, which it began by calling inevitable, is all to be at the expense of other people.

It is understandable that the TUC should take this view. The rank and file of the unions are not concerned with the intricacies of the economic situation, and their confidence in their leaders was weakened by the TUC's long, though confused, support of the wage freeze. But the TUC cannot be at the same time the mouthpiece of the unions and the economic advisory council to the Government—or more—which it claims to be. Indeed, the report implies that Mr Gaitskell's dividend control is just what the TUC ordered. But if it must behave in practice as the instrument of sectional interests, the TUC would be wise to recognise the fact and turn out its economists and statesmen, who will only bring conflict into its deliberations and contradictions into its annual reports.

* * *

Controls and Consumption

The TUC's confusion is greatest in its attitude to price control. It thinks that "the present apparatus" of controls and taxes is "insufficient" to prevent wage increases from being fully offset by price increases. And since at this point the TUC has forgotten its belief that the standard of living must fall, and is seeking to increase real wages, more controls are desirable, in spite of their admitted defects.

But at least the TUC knows what it wants to achieve by price controls. Some of the Government's supporters have other ideas. A letter on page 445 appears to argue for controls because they will—if helped by rationing and allocation schemes—reduce consumption. The TUC and the Labour backbenchers would be horrified. Mr Worswick seems to confuse himself as well. There is none of the contradiction he alleges in recent articles in *The Economist*. Price control will divert, not reduce, expenditure and thereby it will increase consumption, since with the same monetary expenditure consumers will obtain more goods—if the price control is effective—than they could otherwise do. This increase in consumption is the main effect of price control; it is what the TUC and others want control for. Mr Worswick entirely ignores the primary effect in favour of speculation about the secondary and indirect effects. Among those he attaches most importance to the effect on consumers' expectations. If people stop expecting prices to rise they will consume less. When wages are rising the truth of this is doubtful, but the argument in any case assumes more faith in the efficacy of controls than the public now possesses. There are, of course, other—and conflicting—secondary effects of controls. Their net influence is highly uncertain, but it is most unlikely to compare in importance with the direct result of making money

go further and therefore drawing some resources from exports and rearmament to civilian consumption.

Mr Worswick complains that *The Economist* has not said whether it would like at this moment to scrap price and dividend controls altogether. That is disingenuous. The argument in these columns has always been that, while price controls may have a limited usefulness in conjunction with an effective disinflationary policy, they are no substitute for such a policy. To suppose otherwise is the real folly that experience since 1939 has amply demonstrated. Alone, controls will, in a situation like the present, do more harm than good; if the Government will not have disinflation it would be better not to have the controls. The attitude of *The Economist* to the statutory control of dividends has been made equally plain. Such a measure is bad economics at all times; and when wages are not controlled it is also bad ethics. The way to prevent too much money getting into the hands of shareholders is by disinflation.

* * *

Nationalisation in Patches

At the annual conference of the Confederation of Shipbuilding and Engineering Unions last week the executive council produced the "*Plan for Engineering*" that it was asked to draw up by the conference of 1949. Mr Jack Tanner introduced it in a somewhat defensive spirit. The plan would show the Government that "the confederation does not believe that there has been too much nationalisation, but in fact that there has not been enough."

In fact, however, nationalisation is advocated for only a part of the industry. The council could not have done less, for it had been instructed to determine "which sections are appropriate for nationalisation," not whether any of them are. The planners regarded four circumstances as indicating fitness for nationalisation: great economic importance to the nation, a high degree of monopoly interest, a need for larger capital investment than private sources would be likely to supply, and substantial dependence on a public authority for orders. The council seems to have been most influenced by the last of these, on the strength of which it recommends nationalising the manufacture of aircraft, coal mining machinery, marine engineering and heavy vehicles. This emphasis seems strange, since an industry which is really dependent on the orders of a public authority is effectively subject to control. But the existence of monopoly is held to justify the public ownership of factories making builders' and domestic castings and metal fittings, and perhaps also of the main firms manufacturing heavy electrical equipment.

For the manufacture of locomotives and wagons, motor cars, textile machinery and wagons, radios and machine tools, development councils are proposed. Besides the usual objects of co-ordination, research and development, the engineers have two other considerations in mind. In some industries they see development councils as a means of increasing the unions' influence, in others—for example, the motor industry—as a means of protecting the workers' jobs when conditions become less favourable. The prescription here is not for efficiency but for sectional self-defence. Again its terms of reference obliged the council to think along such lines, but even so it is surprising that so much faith in an old nostrum should survive when existing development councils have had, on the whole, so little success. It is, however, significant that nationalisation is no longer regarded as the proper solution for every problem, even by so left-wing an organisation as the confederation.

* * *

Stockpiling and Stable Prices

If American official spokesmen mean what they say, there is to be a welcome change of policy over stockpiling. As usual, no official pronouncement has been made, but it looks as if the United States Administration will in future resort to large-scale buying for its stockpile only if the world supply of what is considered a strategic material is in excess of world requirements. Had this principle been kept in mind in the months following the start of the Korean war there might have been some hope of checking the dramatic rise in world commodity prices.

Since 1945 the American stockpiling authorities have been singularly unfortunate in their operations, for their periods of peak buying have always coincided with a large commercial demand. They have had to pay dearly and have made manufacturers pay dearly, too. Their buying policy, it is true, was largely determined by authorisations from Congress: when business activity declined there was a tendency to reduce funds for stockpiling and as business conditions improved Congress became more generous. These vicissitudes are therefore understandable, but they had the effect of aggravating instead of moderating wide swings in world prices. In future, it seems, government buying for stock should help achieve a more stable price level.

The decision, of course, also creates new problems. The Americans are such large users of industrial materials and are becoming so much more dependent on imported supplies, that their decisions have a considerable effect in world markets. To attempt to stabilise prices is a courageous policy, but what level is to be chosen and who is to choose it? It is not merely a matter of deciding what is a reasonable return to the producer; there is the far wider consideration—which is important to American foreign policy—that the dollar-earning capacity of the whole sterling area depends largely on the price levels of certain commodities. Admittedly, the stockpiling policy of a great power is a domestic affair and there are good security reasons for keeping its details secret. But it should clearly not be left to the wisdom of one government to take decisions of world-wide effect, especially now that there exists in Washington a competent organisation, the International Materials Conference, for consultation with others affected.

* * *

The Cost of the Foreign Service

The Foreign Service has come through the examination of the Select Committee on Estimates gracefully and almost unscathed.* Some of its immunity seems to have been due to the intense interest taken by the Committee in the cost of maintaining ageing diplomatic cars and in the prices realised for them at Ministry of Supply auctions; and its members showed noticeably less acuteness in their questions about the information services, which cost £1,500,000 last year against £29,000 in 1938-39, and in their inquiries into the rise in the annual cost of foreign allowances from £250,000 to £2,578,000 in the same period. On the other hand they elicited much interesting information, none of which suggests that British representation abroad is conducted on extravagant lines. The Moscow Embassy is perhaps an exception, in view of the fact that its opportunities for entertaining Russians are so limited; its annual cost is over £455,000 and the kind of problem that is presented there is illustrated by the fact that £34,000 in sterling is needed to get roubles worth £9,000. Those who are interested in comparative costs of living in different countries will find some startling material in the appendices to the report.

The way in which the total expenditure of the Foreign Service is presented in the opening pages of the report is seriously misleading in so far as it suggests that normal diplomatic activity costs £38,468,402 now against £1,893,418 in 1939. In fact over £25 million of the increase is due

* Seventh Report from the Select Committee on Estimates: The Foreign Service. HMSO. 11s. net.

to the abnormal commitments undertaken since the war under the title of grants and services: £10 million for the reconstruction of Korea, not yet spent; £3,750,000 lent to Burma; £2,000,000 for Palestine refugees; nearly £5,000,000 for the Jordan. There is also the cost of new international institutions, over which there is strictly speaking no Parliamentary control: for example, £413,000 on the OEEC, and £192,000 for missions to Uno.

There have, of course, been large increases of staff and expenditure in the service proper. A rise in staff of over 8,000 in twelve years suggests that embassies, like infantry divisions, may be cultivating a rather long tail, although much of the expansion is due to the reorganisation recommended in 1943 and to the new tasks of information officers and special attaches. The committee shows some concern about the high cost of foreign allowances and suggests that five inspectors are not enough to ensure that scales of living and entertainment are not excessive. It also suggests that too much is spent on furnished accommodation for officers abroad and recommends the provision of some permanent accommodation for the use of missions. A point which the committee does not make, but might well be made, is that the rewards of an Ambassador or Minister compare too favourably with those of civil servants with posts of equal responsibility and greater exertion in Whitehall.

* * *

France and the Arabs

From time to time a violent outburst of French feeling about Arab problems breaks on the head of an astonished Britain. For the depths of French grievance on the score of British policy towards the Arabs—only too well plumbed in France—are little known to Englishmen. This week, the Paris newspaper *Le Monde* has published such an outburst. The several gross mistakes in its article (all of them on points which could easily have been checked) will not improve its repute with its well-informed reading public in London.

Briefly, *Le Monde* infers that France is being elbowed out of the Mediterranean by Britain and Britain's new love, America. As instances of this policy it cites first the reception given in London to the Tunisian nationalist leader, M. Habib Bourguiba, who it says "saw Mr Morrison" and broadcast on the BBC, and, secondly, the activities of "5,000 British officials" in Libya, most of them "specially trained" in anti-French techniques in the old days of the British and French mandates in the Levant. These points are cited to prove that Britain is egging the peoples of Asia and Africa to oust France from French North Africa. The facts are that M. Bourguiba did not see Mr Morrison; that he did broadcast on the BBC (but why not? His party, the New Destour, is represented in the Tunisian cabinet in co-operation with which France is working) and that there are only 430 British officials in Libya.

What is the clue to *Le Monde's* virulence? Is it pique that Mr Morrison has, in no speech so far made, uttered such favourable references to France as he has to the United States? Or are nerves raw on account of the formidable problem of reconciling the irreconcilable rights of two north African communities—Arab nationalists and French residents—that besets France? The British are sympathetic, not blind, to this problem; they know it from their experience in Ireland and Palestine, and they know it to be aggravated by the imminent independence of Libya. But they did not choose the Libyan settlement; most of them, indeed, think it very premature. It was imposed by a vote of the United Nations. The most plausible explanation of the article is that it comes from some pen that likes venom but has not had a chance to dip into it since the old bitter days in the Levant came to an end.

For how long must France keep re-opening the wounds of 1945? Can Frenchmen not yet count their blessings in the postwar Arab world? These are not unmixed; they are non-existent in Morocco. But they include some good work in difficult circumstances by the Resident-General in Tunisia, M. Perillier, and a near-brilliant five years of diplomatic and cultural policy in the Levant States, by which France has already reaped the advantages of political exodus. It has won back its old corner in Lebanese hearts, and is winning ground even in the stonier soil of Syria.

Lancashire's Future

Lancashire contains 5,000,000 people, of whom 2,000,000 live in the administrative county and 3,000,000 in the seventeen county boroughs. Many of these county boroughs—especially Liverpool, Manchester and Salford—are badly overcrowded and need to "export" a large proportion of their present population. The county council's development plan, which is now ready, makes provision for a planned migration of 300,000 from county boroughs to county by 1971; together with a modest allowance for "voluntary migration." The reasonableness of this figure, as indeed of the whole county plan, depends to some extent on whether Lancashire's tendency to economic decline will be arrested.

In any event, decentralisation on this scale will be a vast undertaking, especially since the county district councils

expect to be fully occupied in meeting their own local needs. The administrative problem could be eased by extending the boundaries of some county boroughs, but much of the redevelopment will have to take place at a distance from the big cities. It is suggested that the machinery of the New Towns Act should be invoked in only one case—at Skelmersdale. Elsewhere reliance is placed on co-operation between county council and county districts, backed up by a special housing allocation from the Ministry. To a small extent such a policy is already in operation; and it is hoped to build a new town at Leyland in this way. But prospects would be brighter if the resources of Manchester and perhaps other cities could be harnessed to the task.

The big uncertainty about the plan concerns industry, which already brings many workers daily into the Manchester area and which is now also being steered to Merseyside by the Board of Trade. It would be far from satisfactory to move large numbers of people from these big centres to other parts of Lancashire (and also to Cheshire) if industry must stay behind. The county planners have wisely modified their original schemes for new towns in the north of the county, although they cling to the notion of rejuvenating the decaying weaving towns in north-east Lancashire. It is hard to guess whether their present plan will prove to be economically feasible. But they have a clear right to better guidance and proper co-operation from the Board of Trade, without which no plan for Lancashire could work.

The Land Board's Report

The report of the Central Land Board for 1950-51 (HMSO, 9d.) suggests that some improvements have been made in the machinery of the 1947 Town and Country Planning Act. It is satisfactory that, because of the wider range of exemptions introduced last year, the number of applications for development charge fell by about 25 per cent. The Board disposed of 78,000 such applications during the year, although it imposed a charge in only 20,000 cases, yielding £4,455,000. The fact that so many applications were found to be exempt, or were given a nil assessment, suggests that liabilities for development charge are very imperfectly understood. It is also disturbing to find so many applications withdrawn or dismissed as premature.

Progress in settling claims for compensation under the 1947 Act is slow, and less than a quarter (and those mainly minor ones) of the total of 825,000 claims have so far been determined by the Board. When all claims have been determined, it is the responsibility of the Treasury to frame a scheme apportioning the fixed sum of £300 million between the agreed claims. This scheme is meant to be produced by 1953 at latest. Further delay would be unfortunate, since as long as the scale of compensation payments is left in doubt, the land market will be upset by this uncertainty.

The Board points out that most land sales continue to take place above existing use value, which is contrary to the Act's intentions. The apparent reason, apart from the desire of some owners to cover themselves against loss on their compensation claims, is the scarcity value attaching to the possession of a building licence. The result is to force up the total cost of new development. The Board has used its powers of compulsory purchase very sparingly in its attempts to counter this tendency. It is anxious, however, to persuade local authorities to use more freely their powers to acquire land for resale to private developers, as a way of keeping down the cost of land for development.

Legal Aid

The Law Society has now published its first report on the working of the Legal Aid and Advice Act, 1949. The period covered is only six months, up to March 31, 1951, and the sections of the Act in operation over that period (and now) are only those which provide for legal aid in litigation in the High Court. The report is chiefly concerned with the preliminary work done by the Lord Chancellor's Department, the Law Society and the Bar Council in creating a machine within which the Act could be used. The outline of the scheme itself is by now reasonably familiar. The state guarantees all or part of the fees of solicitors and counsel—up to 85 per cent of the normal legal charges—for people with a disposable income of less than £400 a year and disposable capital of less than £500. The report shows that of the people seeking assistance 34 per cent made no contribution, 63 per cent made some contribution, and only 3 per cent were found to be above the designated means standards. The total number of certificates issued in the period was 15,219 and the net cost (allowing for costs recovered in the litigation assisted) was £351,792, of which about half went in administration and half in fees. But the figures for this first period are, of course, no real guide to the future of the scheme.

The scheme is unique among welfare services in that it is administered entirely by the legal profession itself, and, apart from divorce cases handled by the Law Society's own salaried staff, the services are provided by the legal profession on the existing basis of professional relationship. It may later provide some interesting comparisons between the costs of Civil Service and other administration. Certainly this report is a considerable tribute to the way in which the Law Society has planned and built up an organisation giving aid through some 117 local and partially voluntary committees of professional men.

Both the Law Society and the advisory committee regret that the Government has still deferred the full operation of the 1949 Act. The legal aid scheme has parallels with the health service. The best place in which to check the onslaught of the disease of litigation would be in the legal advice centres, for which the Act provided. But, as with the health service, Government economy has fallen most heavily on the preventive stage of the service. It is as true of the legal profession as it is of the medical profession to say that it exists to keep people out of trouble, far more than to cure them once they have sickened. And that should surely apply particularly to the part of its work financed by the state.

Liberals at Uppsala

The congress of the Liberal International which ended on August 11th brought out very clearly the differences on economic policy between the radical wing of Liberalism, represented by the British and the Scandinavians, and the continental *laissez-faire* school of thought. On the whole the more conservative elements had their way, but there were a number of successful compromises, and in the end only one resolution failed to obtain unanimous support. The gathering at Uppsala was taken more seriously than any of the three previous congresses, and the quality of the delegations was high; virtually every important Liberal newspaper in Europe was represented at the special meeting of editors which took place during the congress. Unfortunately, however, the simultaneous political crisis in Paris reduced the French delegation to one representative.

The outstanding achievement of the congress was the adoption of the Uppsala Appeal, described by Señor de Madariaga as no mere attempt to better the Communist-sponsored Stockholm Appeal, but as an appeal for freedom without which no real peace could be secured. The Appeal declared that no government which held down its own people by force could be trusted to remain at peace with the rest of the world; the basic freedoms were essential guarantees against preparation for aggression. The fact that it had the personal support of Professor Bertil Ohlin, the Swedish Liberal leader who may well head his country's next government, throws interesting light on the future course of Sweden's foreign policy.

* * *

Perón Prepares for Re-election

In imposing a temporary ban on all exports of meat last week, General Perón's Government was not merely concerned with the growing shortage of basic foods in Argentina. It was also seeking to ensure the feeding of this week's mass rally in Buenos Aires, which has strained the national transport system to such an extent that none but loyal Peronistas travelling to the capital can even buy a railway ticket until the rally is over. Since its declared

purpose is to bring together enough of the General's supporters to persuade him to offer himself for re-election in November—and to persuade Señora Perón to stand for the vice-presidency—it has of course been given priority over almost everything else ; for the whole life of the country is now being geared to ensure a sweeping victory in the first presidential elections to be held under the new constitution of 1949. The return of General Perón is not in doubt for a moment ; but every effort is being made to bring the size of his vote up to the level of virtual unanimity which is nowadays *de rigueur* in totalitarian states.

Since the beginning of August eighteen leading Socialists and several prominent Conservatives and Radicals have been arrested on charges of conspiracy and agitation. The Radical party's printing works has been shut down by the police, and it has proved impossible to find any independent printer bold enough to risk printing opposition campaign literature. Señor Balbin, the Radical candidate for the presidency, has not yet been arrested, but faces 27 separate charges on which it has been computed that he could be sentenced to 57 years' imprisonment. This action against the opposition parties has been taken against a background of charges that they are plotting "terrorism." The Minister of the Interior bracketed Communists, Socialists, Radicals and Conservatives together as being responsible for this conspiracy, while a Peronista party manifesto added resident foreigners to the same list and ordered party members to "shadow" them.

To date the only visible signs of this alleged campaign of violence have been the attempts to blow up railway lines around Buenos Aires on August 1st, which led to some 200 arrests and the placing of all railway workers under military control. Discontent among the organised workers, hitherto General Perón's staunchest supporters, is undoubtedly growing, and any setbacks which the Government may meet in the November elections will probably stem from this source.

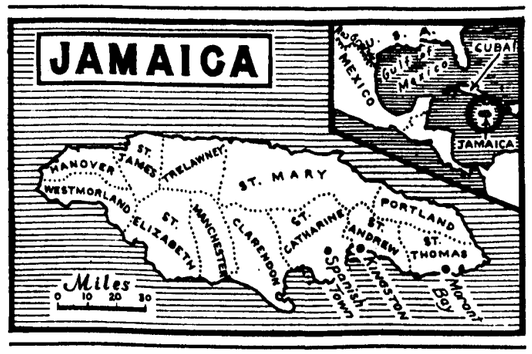
Of Unsound Mind

The report of the Board of Control for 1950 gives a slightly less gloomy account of conditions in mental hospitals than was to be found in the report for 1949—which appeared only a short time ago. Overcrowding, which increased in 1949, was by the end of last year little worse than in 1948. The recruitment of nurses also improved last year with a consequent reduction in the ratio of female patients to nurses from 7.4 to 6.9. Yet the shortages are still bad enough. The 1950 report states that over 15,000 additional beds are needed ; and the practical effects of overcrowding, which means that patients sometimes cannot be classified according to the degree and nature of their illness, are worse than is indicated by the statistics. Moreover, the female nursing staff must increase by 40 per cent if the ratio of female patients to nurses is to be brought down to the level on the male side. An even bigger increase would be needed to staff the additional beds required.



Unfortunately, there is every sign that the shortages will become worse. The number of patients notified to the Board of Control as under treatment for mental illness shows a steady increase year by year—it was 147,546 at the end of 1950. This increase is partly due to the normal growth of the population, partly to the ageing of the population, and partly to a wider recognition that early treatment of mental illness is often essential to recovery. The most important of these at present is undoubtedly the larger numbers of old people in the population. Because of the better care they now receive in mental hospitals, patients live longer. More serious, from the point of view of overcrowding, is the shortage of suitable provision for old people who have become mentally unfit to take care of themselves in their own homes. As the Board of Control points out, many of these senile people are certified because there is no other means of disposing of them. They then have to be admitted to mental hospitals, often at the expense of younger patients whose chances of recovery may be jeopardised if they do not have early treatment. Part, at least, of the overcrowding in mental hospitals would disappear if simple, inexpensive care could be provided for these old people outside the mental hospitals themselves.

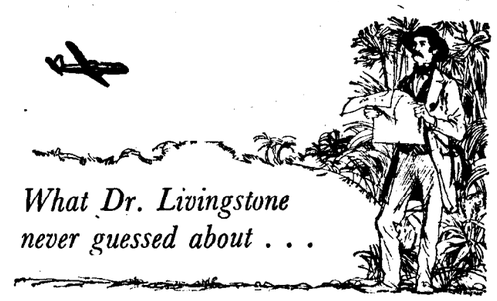
High Wind in Jamaica

Those who remember Mr Richard Hughes's novel will appreciate the tremendous drama caused by the hurricane that swept Jamaica last weekend, probably the worst in living memory. It is more difficult to give a clear picture of the economic consequences—partly because communications have been so disrupted that the full extent of the damage in the interior of the island is still not known.

What is known, or soberly estimated, about the destruction of crops and property is terrible. The total damage is put at £20 million—equal to about two years' revenue for the island's government. Jamaica's total exports in 1949 were valued at nearly £12 million. Sugar, which since the war has accounted for nearly a third of the total, stands up to hurricanes better than other crops, and fortunately this year's crop had already been harvested. But Jamaica's other important crops have suffered severely. The banana industry was slowly recovering from its wartime eclipse, and in 1949



its exports were valued at £2,271,000. First reports say that 80 to 90 per cent of the banana crop has been destroyed, and it may even prove to have been entirely wiped out. The damage to the citrus crop (mainly oranges and grapefruit) has also been severe. Although the actual loss is not so great—the value of citrus exports is less than £500,000—it is significant because the growing and exporting of citrus are an important example of the island's attempts in recent years to diversify its economy and lessen its dependence on sugar. Also serious is the damage to coconuts. The loss here is not to the export trade but to Jamaica's internal economy, for coconuts supply the raw material for manufacturing edible oils and fats. Of future concern is the loss of the soil washed away by the heavy rainfall which is said to have amounted to 17 inches in twelve hours.

Worst of the immediate effects is the destruction of property, described as appalling. The north and north-west of the island appear to have escaped serious damage. But in Kingston and Morant Bay houses have been destroyed wholesale, and 25,000 people—out of a total population of less than 1,500,000—are said to be homeless. Before the war, the Royal Commission described the squalor of housing in parts of Kingston as "beyond imagination." Now slum clearance has been carried out with a vengeance, but the rebuilding needed will throw a huge burden on the island's finances. The relief fund that has been opened deserves the widest possible support.

SEVEN PAGES SAYING YES

IT is important to everybody that the Government's cost-of-living calculations should be up to date with the facts of living today. Plain folk might expect urgency in putting a misleading index right. Here is what gets done about it.

In *December*, 1950, the Minister of Labour, then Mr. Isaacs, puts an easy (maybe unnecessary) question to the Cost of Living Advisory Committee. Should details be collected for a new index ?

Time goes round to *February*, when the committee is gathered together. Over half a dozen months it holds half a dozen meetings.

In *August* the committee answers the Minister. It says yes. This takes seven pages in small type. It looks as if the committee must have had a tremendous wrestle with complexities. Until one reads it. Then one realises that it could pretty well all have been said eight months ago without any meetings. The public cannot be blamed if it seems to them a weak excuse for taking a long time.

Two Years More

The public will not be soothed, either, to be told that it will take another *two years* before a new index can be got working. *They will be infuriated to learn that the possibility of temporary changes meantime is still only being looked into.*

Any industrial organisation would be horrified by such delay. If the Social Survey and other Government organisations do not possess a great deal of the information already, there must be something the matter with them.

This leisurely, academic attitude makes a laughing-stock of the Civil Service. While it may be right for the study of history, somebody should remind them that people who are alive now are awaiting the results. *We do not believe that reform of the index cannot be greatly speeded up.* What is needed is a little unacademic persuasion from the rear.

Letters to the Editor

Defence with Tears

Sir,—Your article in your issue of August 18th sets forth the national problem with admirable precision. Your conclusion is less admirable, and is self contradictory. You rightly doubt whether any political party will take "resolute action to cut consumption" and then hopefully assume that a general election will give one party a large majority. Presumably you then expect this party to take "resolute action." But is this party to conceal from the electorate during the election its intention to make the electorate weep as soon as it gets office ? Because if it takes for its programme your admirable and essential proposals it will—on your own admission—not get the votes. As one who has twice fought seats on a "hard" and not a "belly politics" programme, I am sure you are right in your belief that no party can win votes by promising to hurt the electors if another party is promising not to hurt them.

The only way out of this dilemma, and it is only a question of how serious the crisis will become before we abandon the attempt to make 2 + 2 = 5 or even 6, is for our political leaders to issue a joint statement setting forth the facts of our economic situation and then form a National government. An immediate appeal to the country should then be made on a specific programme for the period 1952-55.

It is essential to provide a political opportunity for that element in the make up of the majority of the electors which, given the chance, will put the needs of the nation before those of short-term self interest. The proposal I make would not be acceptable to the Bevanites, who would provide the necessary opposition. The real and only genuine issue in British politics today [i.e. is the present rearmament programme necessary ?] would then be brought into the open on the floor of the House.—Yours faithfully,

STEPHEN KING-HALL

London, S.W.1

•

Sir,—Your reduction of "all the complexities of current economic discussion" to the "simple proposition" that "solvency and security must be provided out of the mouths and off the backs of the British people" is incomplete and out of date, since you appear to ignore the one factor which is fundamental to our modern democracy—the willing consent of the British people. This blind spot in your analysis accounts for (1) your too easy dismissal of the extra £62 million which a tax of 20s. in the £ on all income over £2,000 a year would bring in, and (2) your failure to calculate the psychological effect on the trade unions of the knowledge that "the rich" have an escape route in saving less or drawing on capital.

I agree that the sum of £62 million is a mere drop in the bucket, but its imposition or something like it is necessary to help remove from the workers' minds a suspicion based on their own daily observations that some "mouths" and some "backs" will not suffer, come what may. Looked at from this angle, the sum of £62 million assumes a symbolic significance out of all proportion to its monetary size.

Secondly, it is surely no longer good economic analysis to describe an escape route which is open to "the rich" without venturing even an opinion on how the route could be closed. For again, the workers do not need an economist to tell them of the existence of the escape route ; they know already, and the knowledge stops them from adding to the drop in the bucket their own vast sacrifices.

Mr Gaitskell is not unaware of all this. But he is trying to walk the razor's edge between upsetting private enterprise and upsetting the trade unions. Events (Mr Bevan is no more than a substantial shadow cast by them) will either split the Labour Party or drive it back on to its early inspiration of social justice. At present, the Government's appeal for sacrifices all round falls rather flat on a community where inequalities so obviously exist. It would do better to stake its electoral chances on a bold socialist policy. The inconsistencies which you so untiringly cane stem very largely from its attempt to bring about socialism without tears.—Yours faithfully, T. A. ROBERTS

Utley, Yorks

Price Control

Sir,—The insistence in your articles "Cold Class War" and "Resort to Price Control" that Mr Gaitskell's policy of dividend limitation and tighter price control is devoid of economic substance and inspired entirely by motives of political opportunism, seems to imply that you think it would be wise at the present juncture to do away with both altogether. It would be of great interest to your readers if you would state explicitly your views about this.

Nor is it clear precisely what you think the consequences of tighter price control will be. At one point you say: "Tighter price control will not reduce expenditure, it will merely divert it." But you also say that "it will increase domestic consumption, drag resources from the export drive, from the rearmament programme and from essential capital investment." I should be the last to dispute that universal price control—in so far as it reduces the share of profits and raises the share of wages in the national income—will to some extent increase the propensity to consume, and so raise effective demand. But this is not the only influence. Demand is also very much influenced by price expectations, an important point which receives no attention in either of your articles. The really dangerous point in inflation comes when the majority of people become convinced, not only that prices are going to rise, but are going to go on rising. It is not unlikely that the rather sharp increase in personal consumption expenditure in the first half of the year was stimulated by just these considerations, the more so that the Chancellor himself, earlier in the year, was giving some support to that view. His decision to tighten up price control now is calculated to allay fears that the increase will be allowed to get out of hand. He can be fairly criticised for delaying his decision so long, once the rearmament programme was clearly under way. The delay also makes it more likely that rationing will have to be re-introduced, especially for textiles and clothing.

On balance the immediate effect of tighter price control should be to steady consumer's demand. The effects on supply are not likely to be very marked in the short run. No doubt some manufacturers will reduce production of price-controlled goods and find more profitable markets. Some of these resources may find their way into the "free" domestic sector: but some surely will go into exports or rearmament, where profits will now be relatively more attractive. This again will make it more likely that rationing will have to be introduced, or heavier purchase tax imposed upon non-essential consumer goods. (There is little harm done if surplus consumer's expenditure is diverted towards services which require little direct labour or raw materials, such as cinemas.) It may also, as was the case in 1939-45, be necessary to allocate materials to the price-controlled sector.

Your article draws attention to many of the anomalies inevitably created by price control. In this respect Mr Gaitskell's announcement shows a welcome attempt to try to overcome some of them. Since your article contains no constructive proposals for further improvement of the technique of price-control, one can only presume, from your parade of all the familiar anomalies, that you want to drop the whole thing. In the light of the experience of both this country and the United States since 1939, that would seem to be an act of calculated folly.—Yours faithfully,

G. D. N. WORSWICK

Magdalen College, Oxford

[This letter is referred to on page 438. —EDITOR.]

"One Way Only"

Sir,—In your issue of August 11th, Mr D. Seers pleads for greater assistance to the under-developed countries at the expense of rearmament. There are two major errors in his reasoning.

First, the appeal to egalitarian sentiment introduces an irrelevancy. We are invited to think of the proposed policy "in the familiar terms of 'redistributing' income towards the most needy, which has always had the double appeal

of relieving both our conscience and political tension." I do not wish to digress in order to discuss whether such a levelling down is really the best way of encouraging world economic development, and I shall confine attention to the fact that there is really very little trace of international egalitarianism in Mr Bevan's policy. For it is not suggested that we should reduce our own standard of living for the benefit of the needy overseas; on the contrary, we are to enjoy both a happy conscience and a higher standard for ourselves. Philanthropy and greater comfort are to be achieved at the same time by the simple process of cutting expenditure on defence. Moreover, as you pointed out, only a minor part of the resources to be released by such cuts is to be devoted to the lofty international purposes on which Mr Seers concentrates attention.

The proposal to incur so grave a risk to our security is supported by Mr Seers's claim that "the threat of Communism stems from the disparity between the living standards that people believe they should have, and what they actually enjoy . . ." It is surely extraordinary that, in the light of postwar experience, anyone should hold such a view today. This is the second fallacy. May one ask Mr Seers how many of the countries at present under Communist control could have been saved if the standard of life had been raised a little by international investment? Of course, foreign aid may sometimes help, but we are not dealing primarily with issues which will be settled by a fair democratic judgment of economic performance. We are dealing with an aggressive military dictatorship which will not be more reluctant to expand its territories if the prizes are made richer by our efforts and our ability to protect both them and ourselves correspondingly weakened.

The argument that external aid is needed to fight Communism overseas is respectable, but it is ominous that it is only our defence programme, surely modest enough in the present situation, which is to contribute to this end. Even if such a policy does not secure adoption, it is good Communist propaganda. It divides educated opinion in the West and exploits the perennial tendency of liberal-minded people to search for panaceas when faced with an ugly military situation. It fosters discontent in the poorer countries with the policy pursued by the West and thus strengthens the local Communists, whose efforts it is ostensibly intended to frustrate. It would be quite unfair to suggest that everyone who supports the Bevan line is insincere in his professed opposition to Communism. But those who are sincere must be singularly lacking in judgment to allow themselves to be used for the furtherance of Communist purposes. — Yours faithfully,

Oxford T. WILSON

Slow-Footed Messenger

Sir,—The Stationery Office desires to give a good service to its customers, and the criticism in your issue of August 4th has therefore caused some concern. With one and a half million transactions with the public each year occasional mistakes are inevitable, but no general complaints from libraries are known, and, to the best of the Stationery Office belief, libraries are receiving a satisfactory service. If the difficulties from which your criticism arises can be made known to the Stationery Office, they will be investigated and remedied.

Slowness in releasing international publications arises from distance, as your comment admits, and because the organisations find it impossible, with reports of immediate political interest or news value, to wait for simultaneous release in all countries. Press summaries appear, or direct subscribers receive copies by post, before the main supply, which because of expense must come by sea, reaches the Stationery Office.

If the criticism of the lack of imagination in handling important publications relates to the recent report on "Maternal Care and Mental Health" from the World Health Organisation the error of judgment in under-estimating the initial demand, with the result that it was out of stock for some time soon after its release, is regretted, and apologies have already been made to the author. This report was exceptional, and the breakdown is not typical of the care taken in handling this important class of official publications.—Yours faithfully,

T. C. D. EVANS
Director of Publications

His Majesty's Stationery Office, E.C.1

Rhapsody in Blue Shirts

Sir,—After the Sheffield Congress had been banned last year, you commented that although Communists had no right to protest, it was the duty of non-Communists to do so, because such an action violated the Western conception of freedom.

May I then, as a non-Communist student member of the British delegation travelling to the Youth Festival at Berlin last week, protest at the way in which the American and Western Governments, while remaining technically within their rights, have done all in their power to prevent us from reaching Berlin? It is the moral issue which is of primary importance for freedom of travel and communication is one of the most vital of human rights. There is a constant danger that if the majority of a group is Communist, the rights of the individual concerned will be denied, which is a tragic miscarriage of the Western conception of justice. It is of course unnecessary to point out that the policies of the governments have played into the hand of the Communists, and enabled them to make capital out of the whole affair.—Yours faithfully,

GILLIAN BALLANCE

Hatfield, Herts

The Borderline of Treason

Sir,—Mr. Brown is, I think, right in demanding that the law should reconsider the position of those displaying "something that is certainly not loyalty." But the heresy that "protection draws allegiance" must not pass unchallenged, at any rate for acceptance as a general rule. Taken to its logical conclusion it means that an alien can be given the rights and duties of a British subject, allegiance and all that flows from it, by enjoying effective protection, that is, by being issued with a British passport whether properly or improperly. The doctrine that the passport office, by issuing a passport obtained under false pretences or one erroneously delivered, can take the place of the whole naturalisation procedure, appears to me more than doubtful, but it is clearly implicit in any such statement.—Yours faithfully,

F. M. M. STEINER

Invention and Development

Sir,—In your issue of August 11th you refer to a statement by the Duke of Edinburgh on the "buying-up and suppression of patents . . . to protect equipment from becoming obsolete."

It would be interesting to know what evidence exists that this practice is, or has ever been, adopted to any but negligible extent in this country. Extensive investigation of the question by several committees during the last twenty-five years, including the Swan Committee whose work formed the basis of the present Patents Act, 1949, has failed to bring to light any convincing evidence of a single occurrence; and the Patents Acts which have been in force during that period have contained provisions which operate against the successful suppression of any patented invention of merit and commercial promise.

I suggest, with respect, that it is time this unsubstantiated myth was dispelled. —Yours faithfully, F. W. G. GREENER

London, E.C.1

"Prisoners' Friend"

Sir,—In deprecating the Home Secretary's decision to prevent prisoners being allowed the services of a "prisoners' friend," I did not intend to imply that visiting magistrates are not anxious to see justice done. But, as Mr Townroe in his letter to you very fairly points out, "the present system is not always perfect," and the difficulty is "to find suitable men and women with the leisure and ability to work up each case and plead for the prisoner."

The Howard League has for some time now advocated the appointment of full-time, trained social workers to all prisons. It is among these men and women that suitable prisoners' friends might be found. Although I do not think that prison social workers should be put into a position where they have to take sides against one party or another, I believe they could, if so desired by the prisoners, state their case for them intelligibly and coherently. It is precisely some such thought which underlies Section 52 (2) of the Criminal Justice Act, 1948, which merely ensures that a prisoner charged with an offence "shall be given proper opportunity for presenting his case." It is, in fact, only an enabling clause, and any arrangement under it could perhaps only be put into effect slowly and cautiously. But why render it inoperative before it has been given a fair trial? Surely it is worth demonstrating even to—indeed, particularly to—the more anti-social individual that no effort is spared to treat him justly.—Yours faithfully,

HUGH J. KLARE

Self Control for Machines

Sir,—Readers of your article on automatic control mechanisms may be interested to learn that the British Iron and Steel Research Association has been studying the automatic control of thickness in the rolling of steel sheet and strip. Earlier this year demonstrations were given on an experimental rolling mill of a new method of automatic control developed in the association's laboratories. This is essentially a "faster-than-human" method of control made necessary by the high rolling speeds of modern mills in which, should a change in rolling conditions occur, many feet of "off-gauge" strip may be produced before a human operator has had time to make the necessary readjustment. A peculiar refinement of the method is that the rolls themselves are used to measure the thickness of the strip at the same time as they roll it, and the measurement is automatically "fed back" to the adjusting controls in a fraction of the time that it can be "fed back" by human agency.

It is perhaps worth pointing out that this country leads the world in the application of automatic control systems to the open hearth steel furnace. The association has been closely connected with this development through one of its committees which was set up as long ago as 1946 to study the instrumentation and automatic control of such furnaces.

The association's staff also includes a small team of engineers specialising in the theory and practice of automatic control mechanisms and their application to the steel industry generally.—Yours faithfully,

W. C. F. HESSENBERG,
Deputy Director

British Iron and Steel Research Association

A Deal with Franco

Sir—I have just returned from a visit to Malaga. The news that the United States is about to acquire naval and air bases in Spain has been followed by a marked strengthening of the peseta. In the free market of Tangier the peseta now stands at 133 to the £ as against 148.50 three weeks ago. There has been a similar improvement against the dollar. Signs are also evident of an improvement in the internal purchasing power of the peseta. Prices in Andalusia, which had been rising steadily for years, have fallen with dramatic suddenness in the last two or three weeks. The articles chiefly affected, however, are foodstuffs and agricultural produce, and the fall in prices must be ascribed at least in part to this season's good harvests. It remains to be seen whether the decrease in prices will spread to industrial products.—Yours faithfully,

MARJORIE GRICE-HUTCHINSON

London

Books and Publications

The Russian Jew

The Jews in the Soviet Union. By Solomon M. Schwarz. *Syracuse University Press.* 380 pages. $5.00.

Interest in this book derives from the fact that pre-revolutionary Russia was the "classical" country of anti-Jewish pogroms and that the Bolsheviks, when they took power, set out to cure Russia of age-old racial and religious hatreds. How far have they succeeded in this? More important still, how far have they stuck to their original intentions and policies?

The author, a former official in Kerensky's government and himself a Jew, is in some ways extremely well qualified to answer these questions. He has assembled an impressive wealth of material from Russian and Jewish sources, showing that Soviet policy towards the Jews has been inconsistent and opportunist. Officially, the equality of all peoples and races remains the unchallenged principle of the ruling ideology; and almost any manifestation of antisemitism is illegal. But, here as elsewhere, divergences between theory and practice have occurred even if they have been carefully concealed. The deep-seated anti-Jewish feeling in the mass of the people has not been eradicated, as witness the response of the Ukrainians to Nazi incitement during the last war. This points to a significant failure in social and political education; and Mr Schwarz ought perhaps to have concentrated on this aspect of the problem more than he has done.

There have been many reasons for this failure, not the least important being official ambiguity. The Communist Party has often adopted a pro-Jewish attitude; it has encouraged education and literature in Yiddish and, partly against its own precepts, it has experimented with re-settling Jews in compact communities. But the Politbureau has not been averse from exploiting popular antisemitism when this suited its purpose, for instance during the decisive struggle, in the nineteen-thirties, with the various opposition groups, among whose leaders were many Communists of Jewish origin. The ambiguity has increased since the war. While in the United Nations Russia conspicuously backed Zionist aspirations, the Politbureau reacted strongly against the enthusiasm of Soviet Jews for the new state of Israel. The apparent eclipse, since 1948, of the previously encouraged Yiddish theatre, literature and press has given rise to anxious speculation and even alarm among western Jews. In the recent campaign against the "cosmopolitanism"

of the intelligentsia, anti-Jewish tones could also be detected. Mr Schwarz concludes that

> since the middle of 1949 antisemitism in the USSR has shunned making any open display. But the stealthy variety of antisemitism . . . continues to exert its undeniable influence on Soviet society.

The value of this well documented book is diminished by its author's bias. "Underlying and ultimately determining Soviet policy," he says, "is the denial [by the Communists] of the existence of a Jewish nationality"; and this, the "assimilationist" attitude has, according to Mr Schwarz, vitiated Soviet policy. All too often he identifies, unconvincingly, the policy of assimilation with antisemitism, with which it has nothing in common. The only real alternative to assimilation was and still is Zionism. Yet Mr Schwarz is not a Zionist, and to Zionism he devotes almost no attention. He approaches his subject from the angle of the *Bund*, the Jewish Socialist Party of Russia and Poland, which was strongly opposed to the idea of a Jewish state, yet claimed that the Jews were a separate nation and ought to enjoy autonomy in the countries where they lived. This is an unrealistic and illogical attitude; and its rejection by the Bolsheviks does not seem to have been either as wicked or as stupid as the author suggests. (It was just as strongly repudiated by the Mensheviks.) Mr Schwarz is distressed because Soviet Jews tend to discard Yiddish in favour of Russian and to send their children to Russian rather than to Yiddish schools; but this movement towards assimilation is inevitable, and he ought not to use it to substantiate part of his indictment of Soviet policy.

The "assimilationist" policy was the only logical alternative to Zionism in eastern as well as western Europe. True enough, it has not worked in eastern and central Europe. Nor has any other policy, including that advocated by Mr Schwarz. All schemes for the solution of the Jewish problem perished together with six million Jews in Hitler's gas-chambers. The author does not relate the fate of the Jews in the Soviet Union to this tragedy. This is a pity. Mr Schwarz has the knowledge needed for a genuine analysis of the Jewish problem in Russia, but he has produced merely a Jewish contribution to current anti-Soviet literature.

The Material of History

Survey of International Affairs, 1938, Vol. II: The Crisis Over Czechoslovakia. By R. G. D. Laffan. *OUP for the Royal Institute of International Affairs.* 475 pages. 30s.

Documents on International Affairs, 1939-1946. Vol. I: March-September, 1939. *OUP for the Royal Institute of International Affair*. 576 pages. 50s.

The previous volume in the "Survey of International Affairs" (1938, Vol. I) was published in 1941, and the previous volume of "Documents on International Affairs" (1938, Vol. II) in 1943. All who have used the earlier volumes, which reach back to 1920, will welcome the resumption of these two valuable series.

Not the least testimony to their value is the fact that their usefulness does not diminish with age. Anyone who has undertaken research into the international situation in the 1920s and 1930s—and the number of such students is growing—will vouch for the accuracy and good judgment which have gone to the compilation of the earlier volumes and which make them, if not an indispensable guide, at least the most convenient introduction available to the sources and problems of the period.

The difficulty of selection and compilation has increased each year since the series began. If international affairs are not more complex than they ever were, the mass of published official documents emanating from national governments and international organisations has never ceased to grow. The effect of the second world war was not only to delay the publication of volumes but also to throw up further mountains of material, which would otherwise have remained secret, notably in collections of documents on British and German foreign policy. But the present volumes are proof that the increasing difficulties are being faced and overcome; and although these other collections are rivals, to some extent, of the Chatham House series, this will in no way affect the value of the latter as more selective but more comprehensive source books for the study of international affairs.

The arrears are being tackled manfully. A third volume of the "Survey" for 1938 is already in preparation, and work is proceeding simultaneously on a series of "Survey" volumes for 1939-1946 and on the annual series which will continue the record from 1947. Volumes of the "Documents" for the period 1939-1946 and for the years since 1947 will appear in parallel with the "Survey" volumes, and will be more closely co-ordinated with them than was the case before the war.

With so much work proceeding at once, and considering the ever-increasing amount of material, it is no surprise that Professor Arnold J. Toynbee is no longer able to do most of the actual writing of the Surveys as he did before the war. The present excellent volume on the Czechoslovakian crisis is the work of Mr R. G. D. Laffan, with assistance from the staff of the Institute; Mr Laffan and Viscount Chilston will be chiefly responsible for the third volume for 1938; many of the volumes for the years since 1939 will, it appears, be the work of other authors. But the "Survey" will remain, and the "Documents" have now been put, under Professor Toynbee's general editorship; and this should be a further guarantee, if one were required, that the high standard of both series will be maintained.

Personal History

The Rise and Fall of the Japanese Empire. By David H. James. *Allen and Unwin.* 409 pages. 21s.

Captain James's qualifications for writing this book are an intermittent residence in Japan since the age of three, knowledge of the Japanese language, and personal experience as a British intelligence officer in the Malayan campaign and subsequently as a prisoner of war in Japan. The parts of the book which are based on his own experience and observation are lively and interesting and make a valuable contribution to the literature of the Pacific war. Unfortunately Captain James sets out to be an historian and to explain the why and wherefore of great events. The further he gets away from what he has himself seen and known, the wilder and more confused is his thinking, and the mental chaos is reflected in the writing. Even when the idea is quite clear, the style is of an unusual extravagance.

> However, by this time, perfidious Albion—of continental derision—with the aid of the decadent British Empire (of Nazi fiction) had accepted the role of dictator in the tragedy of "Blood, Sweat and Tears" under the stage-management of Winston Churchill, the pugnacious epitome of civilisation's fight for freedom against tyranny, and was striking back slowly but effectively.

The autobiographical sections are in a simpler style, for Captain James is essentially a modest man and does not regard his own life as worthy of such literary flourishes. He belongs to Kipling's world, to the company of those who, as empire-builders or pioneers of trade, as sahibs or old China hands, sustained a Britain outside Britain without the native hue of resolution being sicklied o'er with the pale cast of thought. In our time that world has gone to

A good secretary deserves a really good typewriter

Olivetti have been famous in typewriter design for over forty years. The business has been built up to a world-wide organisation on the simple precept that nothing but the very best in design and workmanship is worthy to bear the Olivetti name.

row2

pieces, and dejected men of action, dimly conscious of a vast and adverse process of history, are trying to find out what has happened. The author personally enters the story on page 127 and subsequently we get glimpses of a varied and adventurous life—gold-mining in Alaska in 1899, tax-collecting on the Yangtse for the Chinese Government, coal-mining in North China, controlling Chinese labour on the Rand, serving with the Imperial Light Horse in the Zulu campaign of 1906, selling steel in Japan, Korea, China and Siberia, service in the Chinese Salt Gabelle, service in the British Army in the First World War, postwar intelligence service in the intervention period in Siberia, and so on.

In May, 1941, we find him on his way to Singapore as an intelligence officer, and from this time on, the narrative is alive with personal experience of the great drama of the Pacific war. No book has given a more devastating account of the incredible complacency and fatuous optimism which reigned in Singapore in the months before the blow fell. Captain James had very little understanding of Japanese politics—his account of the mutiny of February 26th, for example, is quite erroneous—but he knew enough of the Japanese national temper and fighting capacity to realise that the British and Dutch military authorities in South-east Asia were living in a world of illusion. Having been posted to Borneo, he was recalled in disgrace for expressing the view at a conference that the Japanese on landing would capture Kuching within seventy-two hours; in the event they did it in eight hours.

Input-Output Analysis

The Structure of American Economy, 1919-1939. By Wassily W. Leontief. *Oxford University Press.* Second Edition, Enlarged. 264 pages. 35s.

Some skim through a book from the beginning; others start at the end. Here is a book which should definitely be read backwards. All the material has appeared in print before; the first three parts are the original text of the 1941 edition of the book and the last part comprises articles published since 1944. The development of Professor Leontief's well known "input-output" technique, as extended and simplified during the past ten years, is best viewed in retrospect. The last section is an admirable survey, taking up fewer than twenty pages, of the whole field, and was written for a general audience at the American Economic Association Conference in December, 1948. The preceding sections of Part IV, published in 1944-46, can then be tackled with greater understanding. They give a clear account of the basic construction of the technique, and of the range and limitations of its application in the making of policy with examples taken from the structure of the American economy in 1939.

The applications of the theory are all in the field of comparative statics and attempt answers to such questions as: If consumers demand an additional million automobiles, what new jobs are created? If an export surplus is eliminated, how does output shift between different industries? If all wage-rates rise by 10 per cent, how do the prices of various goods and services change? Professor Leontief is now working on an extension of his technique which introduces dynamic elements. Others are applying the methods to the data and problems of different countries; Dr Barna's work on British data is notable. The development of high-speed computing processes has made the full application of the technique feasible just at the time when the conclusions are likely to be most useful. One looks forward to the publication of the results of the work now proceeding.

Generalised Ideas

The Idea and Practice of General Education. (An Account of the College of the University of Chicago by present and former members of the Faculty.) *University of Chicago Press. Cambridge University Press.* 333 pages. 26s.

The problem of mass university education is one with which the Americans are far more familiar than we are. The right to be educated is a primitive American belief, and faith in the effectiveness of education is in America as widespread as it is attractive. Because Americans have always had to deal with this problem they have often been patronised by Europeans who were unaware of its existence. Degrees in journalism, theses on restaurant-keeping and professors of physical culture do not fit in with the Oxford and Cambridge conception of university life. But it is always a mistake to suppose that the Americans—the most self-critical of peoples—are unaware of their own failings, and in the last few years there has been much hard thinking, of which this book is an impressive example, about university education in general, and about the problem of a general education in particular.

Nowhere has the thought been more serious or the experiment bolder than at the University of Chicago since the arrival there of Chancellor Hutchins in 1929. Anyone who reads this book will be struck by the radical nature of his reforms. The educational tradition in America is not very deep; taking advantage of this fact, Mr Hutchins started afresh. Tiers of committees were created, fundamental questions were put to them, the curriculum was altogether revised, and today a B.A. degree at Chicago can be obtained in two years—though it takes five years to get an M.A. degree which corresponds roughly to an English B.A.—after a series of general courses which are "exact, penetrating treatments of the basic principles of" the humanities, the social sciences, the natural sciences, mathematics, writing, languages and, finally, "integration" to pull the whole thing together. The faculty is far from satisfied with either the curriculum or the methods of teaching and examining, and these are under constant review by further committees in order that youth may emerge better prepared "to deal with the personal and social problems with which all men in a democratic country are confronted."

De Tocqueville noted that the Americans are "much more addicted to the use of general ideas than the English," and nowhere is this more apparent than at the University of Chicago. The mind boggles at the way in which Mr Hutchins and his colleagues have put their faith in general ideas. Not only do they expect to teach the American student straight from high school "the basic principles" of knowledge before he can have had a chance to absorb much of the matter, but also their teaching is based on their answer to the question "what is a general education and what is it for?" To some Englishmen this must seem an almost improper question. For is not education necessary for everything? And if we could answer the question, would not the answer include the answer to larger questions (such as what is living for?) which few would dare to answer?

Bliss and Horror

Wisdom, Madness and Folly. The Philosophy of a Lunatic. By John Custance. *Gollancz.* 252 pages. 16s.

It is unusual to encounter a man who suffers from periodic bouts of depression and of manic excitement—one of the common forms of mental illness—who can describe in vivid detail his experiences during these abnormal phases. Most manic-depressives lack the descriptive power or are unable afterwards to recall their feelings during the attack, or else, like Boswell, look upon these episodes as unpleasant interruptions in the enthralling stream of everyday life—to be passed over as quickly as possible.

In the early chapters of this book there is a full and fascinating account of the author's experiences in these phases of bliss and of horror, and his description far surpasses the pale and second-hand accounts to be found in the textbooks of psychiatry. Unfortunately, as is plain from the subtitle, the main reason for this book is the author's conviction that he has more to communicate than rich emotional experiences. He proceeds in the remainder of the book to develop, with a wealth of allusion and erudition, an extremely comprehensive but barely comprehensible philosophy. This derives mainly from Jung and is based on the concepts of pairs of opposites so familiar in theology, mythology and earlier psychology. It would be as well to remember, however, that the ecstasy of acute mania may well prove to be as biochemically determined as delirium tremens with its terror and its pink elephants. Whereas society views the sufferings of the inebriate with tolerant amusement, the author seems to postulate that the manic, by virtue of his peculiarity, should be regarded as possessing the key to the universe.

An appendix contains some strong criticisms of mental hospital administration and nursing. These, like much of the book, have been written in a state of mild manic excitement, and whatever the rights and wrongs of his case the author himself in a relatively stable phase adds later "I see the point of view of the authorities more clearly than I did, but I still see my own . . . I must have been an appalling nuisance."

AMERICAN SURVEY

Strategy by the People

Washington, D.C.

PRESIDENT TRUMAN and his Secretary of Defence, General Marshall, might be justified in believing, with the hero of Mr Masefield's "Odtaa," that life is "one damned thing after another." No sooner was the end of the task of persuading Congress to accept the foreign aid Bill, in something not too far from its original form, in sight than the men responsible for framing American strategic policy were faced with a renewed demand for a vast increase in the strength of the United States Air Force—from the present target of 95 groups to a figure which has been put as high as 175 groups. The President's civilian advisers on defence policy have every reason to resist this expansion. They are only too keenly aware that the present rearmament programme is far behind schedule, and the production experts have given a stern warning that the diversion of resources which would be entailed by such an expansion of the Air Force might put an insupportable strain on the national economy. It would certainly mean that even fewer of an already inadequate supply of machine tools would be available for the output of tanks and other weapons. The Bureau of the Budget is also, not unnaturally, opposed to a proposition which would involve spending as much on the Air Force in each of the next three years as last January's Budget allowed for the whole of the armed forces in 1952.

Finally, the strategic planners can point to the dangers not only of spending billions of dollars on types of aircraft which may become obsolete, but of committing the United States to a type of strategy which may become outdated. The rapid development in the technology of guided missiles and pilotless aircraft, together with new advances in the manufacture of smaller atomic bombs, have made the planners highly doubtful whether an increase in bomber groups is really the best way to expand the offensive power of the United States.

The President and his defence advisers still adhere to their belief in the principle of "balanced forces," partly for strategic reasons which have been powerfully strengthened by the lessons of Korea, partly because it is the formula best calculated to ensure harmony between the three services. It is true that General Marshall has suggested a modification of the principle because of the important role that the Air Force must play in European defence, but he is not prepared to recommend abandonment of the principle altogether. And the President is anxious, for political reasons, with an election campaign approaching, to avoid a repetition of last year's cut-throat warfare among the Chiefs of Staff.

The pressure to expand the Air Force is, in fact, the result of an alliance between the Air Force itself and a group in Congress headed by the Republican Senator Lodge and the Democrat Representative Carl Vinson, who is the chairman of the House Armed Services Committee. At present there are three Bills before Congress. One seeks to double the size and increase the influence of the Marine Corps. A second calls for the construction of two super aircraft carriers for the Navy, and is commonly regarded as a sop to naval pride and ambition should the programme for an expanded Air Force become a reality, for there can be no prospect of starting work on these carriers for a long time to come. The third calls for an Air Force of 163 groups. The detailed facts and figures with which it is being advocated suggests that its sponsors are being supplied with information from highly placed official sources in the Air Force.

★

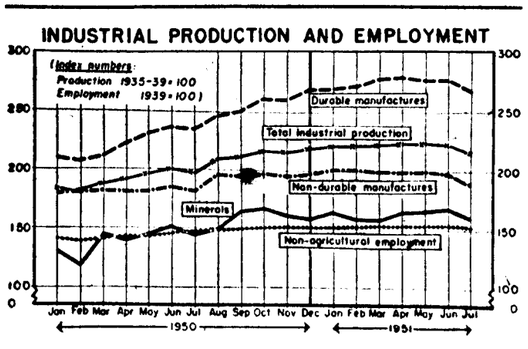
For the past three years Congress has shown far greater zeal for a large Air Force than has the Administration. While the Defence Department was planning on a basis of 48 air groups, Congress repeatedly tried to force 70 groups down the Administration's throat. After the invasion of Korea last summer, the Administration itself raised its sights to 95 groups, a target which was confirmed by the President early this year. Now, less than six months after Congress has got an Air Force considerably larger than it originally wanted, it is demanding a further enlargement of about 80 per cent. Perhaps the crowning move in this game of "think of a number and double it" is the demand of General Carl Spaatz for 250 groups.

In a Congress which has been too little interested in the planning of military security and too much interested in petty budget-cutting (last week it reduced the appropriation for civil defence by 90 per cent), the sight of Congressmen clamouring for an even bigger Air Force seems paradoxical. The fact is, however, that these men represent, not a strain of bellicosity in American public opinion, but that complex of fears and hopes which used to be known as isolationism. In the minds of many ordinary Americans a gigantic fleet of bombers is the means by which America can defend itself without exposing its sons to the corrupting influences of long occupation or fighting "over there." It has the additional attraction in their eyes that an Air Force can be built in American factories and can to a great extent be based and maintained on American soil, and so will not depend for its efficiency or strength on the co-operation of foreign allies.

The public clamour for an expanded Air Force derived its impetus not so much from Senator Lodge, whose arguments were based on a tenable strategic theory, but from Senator Taft who, though he does not know the first thing about strategy, yet perfectly expresses the muddled public thinking about what air power can achieve on its own. In January he made a stirring speech in which he accepted the defence of Europe as an American obligation, but demanded that it should be discharged by air power and not by the stationing of American troops overseas. Vague as he was, he offered

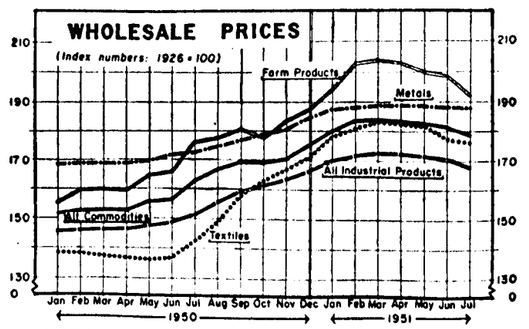
"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

a way out of their confusion to the many well-intentioned Americans who wish to do their duty by the free world but do not wish their sons to leave America to do it. It is not without significance that the theories of Major Alexander Seversky, the arch-priest of the "Victory-through-Air-power" sect, have been widely acclaimed only in the more isolationist sections of the press.

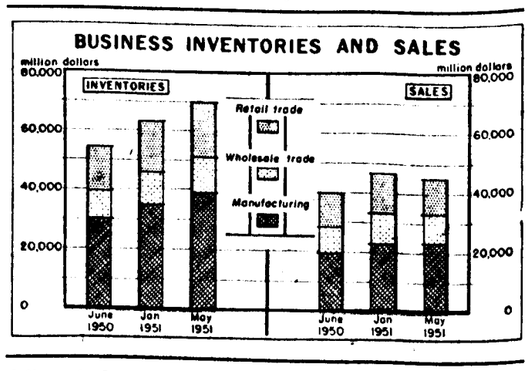


*

The importance of this public discussion on the size of the United States Air Force is not so much that it may lead to a wrangle among the planners of American strategy, but that it may become a first-class political issue which the Republicans might be able to capitalise. The fact that President Truman is known to have appealed to the Joint Chiefs of Staff to reconcile their differences on the subject in private is clear evidence of what he fears could happen if they were to settle them in public. There would be nothing remarkable if they did. The American people throughout their history have always regarded military strategy as a fit subject for popular discussion and decision, not after the battle, but before it. Indeed, Senator Connally, chairman of the Senate Foreign Relations Committee, warned Congress last March that it should not try to dictate strategy to the Generals. "Look," he said, "what happened at Bull Run"—the opening battle of the Civil War, a battle which was fought by the Federal Generals only because they had been pushed into it by Congressional pressure, a battle which they lost and, in so doing, gave to the Southern Confederates a confidence which enabled them to continue the war.

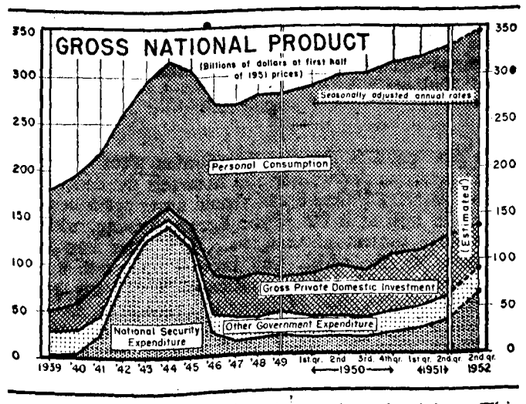


The present popular interest presents the Administration with an awkward problem which it is not in a strong position to deal with. Ever since the Korean war began, it has had to issue repeated warnings that the United States is faced with an acute international situation which may lead to a third world war. The Administration can scarcely go on appealing for sacrifices from the people and demanding urgent measures for rearmament if, at the same time, it appears to reject the generous offers of Congress to provide it with the bombers, aircraft carriers and marines which are the popular panaceas for the ills which it describes.



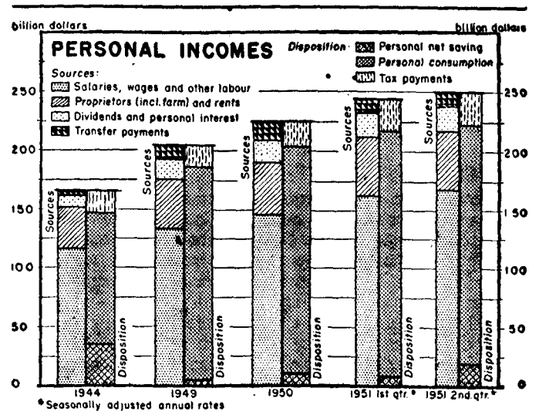
No Butter Without Guns?

THE signposts to the American economy are today pointing in opposite directions, and there is as great a divergence among economists who try to assess which way that economy will be going in the next few months. The business indicators which climbed steadily and sharply to record heights after the Korean outbreak have now levelled off and have even in some cases declined; but, when they are analysed, it appears that this is the result not of a uniform trend, but of conflicting forces pulling two ways at once. The first chart, for example, shows that the Federal Reserve Board's index of industrial production, until July, when holidays caused it to fall off sharply, had been almost stationary since the beginning of the year. But in recent months, at least, this was largely because a decline in the index for non-durable manufactures was offset by a rise in that for mineral production. The stability of the durable manufactures index since March masks a similar tug-of-war: increases in production of armaments, machinery and other defence requirements have cancelled out decreases in output of consumer goods such as automobiles, which have been caused not only by shortages of materials but also by a falling off in demand.



The same influences can be seen in the wholesale price indexes; the index for all commodities had, until this month, been dropping steadily since the spring, but the fall would have been more severe had not the firmness in such industrial products as metals and building materials, needed for the rearmament programme, offset the weaknesses in textiles and other civilian goods that ordinary consumers have been leaving on shop shelves. It is this fall in sales of almost all types of civilian goods that is the most ominous sign in the present business situation. It means that inventories have been built up to an alarming degree, for orders placed last winter, when sales were breaking all records, are now being delivered. It means too that new orders have been comparatively few and far between recently, although since May they have been picking up as inventories have at last begun to decline.

Some of the economists who study this situation believe that the peaks of business activity, employment and commodity prices have been reached, if not passed, for the remainder of this year at any rate; a few say for much longer than that. Others, who are as well informed and have proved to be equally good prophets in the past, consider that the present brief lull will be over before the winter and that boom and inflation will then get going again for a period which is variously estimated at from six months to two years.



The main forecast on which the two schools split is future government spending on national security programmes, a category which covers military payrolls, arms for both the United States and its allies, and other foreign aid. As the chart shows, this expenditure will, according to present plans, rise more rapidly than the total supply of goods and services can reasonably be expected to do, for the labour force is already fully employed and there are limits to the possible increases in working time and productivity. This seems to mean that consumers will have more money to spend, probably about $15 billion more, and no more goods and services, if as many, to spend it on. They will compete amongst themselves and with the government for available supplies and the result can only be inflation, since Congress is most unlikely to permit the drastic tax increases which would cut disposable personal incomes down to fit the supply of goods and services.

The opposite view is that expenditure on armaments will not in fact rise so far or so fast as at present planned, because the United States will be persuaded by Russia's latest moves that the Soviet threat is neither so great nor so immediate as it has recently seemed to be. With the government taking a smaller share of the very large national output, and with not only business inventories but also consumers' stocks at unprecedentedly high levels, as the result of last winter's buying spree, the present lull will, according to this view, become a real recession, probably more severe than that of 1949. In fact all the economists, whose predictions have been somewhat uncompromisingly expressed above, agree that the American economy is vulnerable; at this point they disagree only on whether, and to what extent, international political developments are going to hurt it. In this field they have no claim to be expert forecasters.

There is, however, a further disagreement in the economic field itself. The argument, as stated so far, suggests that the United States can no longer have prosperity unless a significant proportion of its output is either given away or wasted on war or preparations for war, that Americans can only afford butter when they are making guns. But the truth of this is very far from proven, and in the present situation there are indications that the opposite is the case.

Price reductions produce demand, as the retail price wars have recently shown once more, and prices would fall with a decline in military demand. Consumers still have many unfulfilled wants and today, far more than ever before, they have the means to make their demands effective. Another contradiction shown by today's business indicators is that total personal income has risen to record levels and that more of it is in the very liquid form of wages and salaries, yet the percentage saved has, since the early spring, been greater than at any time since the war years, when consumer goods were not to be had. Surveys show that there are still many things which consumers plan to buy, but that they are restraining

...requires a well-planned and executed sales program. As one of America's oldest commercial banks, Irving Trust Company knows this great market thoroughly and, if you wish, will work with you in locating competent organizations in the United States to help develop or expand your sales there.

themselves in the expectation that prices will drop, and also because the continuance of plentiful supplies of goods has convinced them that the wartime shortages they feared last winter are not as imminent as they thought. If this is so, a drop in prices might uncover a sufficiently large volume of latent demand to prevent any fall in production.

Even when present wants are satisfied, new ones are being created in almost every direction by scientific and technological developments—colour television, for example—which are now an economic force of really great power. Then, too, in every branch of business, machinery is cheaper than it has ever been compared with labour, even in the United States where labour has always been a higher cost of production than elsewhere. So the present remarkable rate of expenditure on new industrial equipment would not necessarily slacken substantially even if the defence effort were relaxed. Finally, as was shown to some extent in 1949, both the government and private business have in readiness many plans and devices for defending the country against a depression, and these would certainly have some effect.

It, therefore, seems likely that even if government spending on armaments rises less quickly than expected, the worst that the economy would have to face would be, not a "slump," but a "readjustment." But what is to the United States only a readjustment could be a painful dislocation to the rest of the world.

(Charts based on the Council of Economic Advisers' Midyear Report, July, 1951, and on later releases from the Federal Reserve Board and the Bureau of Labour Statistics.)

American Notes

No Report on MacArthur

Recognising the obvious impossibility of arriving at a unanimous conclusion on their inquiry into General MacArthur's dismissal, the Senators concerned decided last week, by 20 votes to 3, to make no report—or reports—at all, since they felt that both the Korean truce negotiations and the signing of the Japanese peace treaty would be adversely affected by such an open parade of the country's disunity. But to avoid any suggestion that discussion was being undemocratically cut off, the conclusions of individual members of the investigating committee are to be printed in the final record of the hearings. Eight of the eleven Republican members, including the party's Congressional leaders on foreign affairs, Senators Wiley and Smith, promptly took advantage of this arrangement to issue a statement which was a minority report in all but name, calculated to revive the bitter controversy which the absence of a formal report had been intended to allay.

The statement began with a short recapitulation of the evidence, slanted to suit the subsequent thesis, and then listed the "areas of agreement" and disagreement which, in the opinion of the eight Republicans, had been outlined during the hearings, which covered the whole of United States policy in the Far East since 1944, with special reference to the Korean war. The 30 points on which the whole committee was supposed to agree began, and ended, uncontroversially: the right of the President to remove General MacArthur was recognised, as was the lack of tact, which few dispute, with which it was done. Nor is anyone likely to deny that the Administration had no positive plan for achieving victory in Korea, or to fail to pay tribute to the gallantry of the American troops there. But in between were sandwiched many points which more properly belong in the section on disagreements: examples are the assertion that America's allies have been laggard as regards both troops for Korea and economic sanctions against the Soviet, and that the Secretary of State usurped military functions by forbidding the bombing of bases close to the Russian frontier.

The 18 official points of disagreement began with the statement that Yalta was a great tragedy of American diplomacy, in which the United States "yielded to Russian imperialism . . . for mythical reasons," an opinion which was disproved, as it has so often been before, by Mr Harriman's latest account of what actually happened at Yalta, given to the investigating committee in July, but only just released. The rest of the points of disagreement boil down to the old allegations that the Administration in general, and Communist influences in the State Department in particular, were responsible for the collapse of the Nationalist government in China and the stalemate in the Korean war. Throughout, no opportunity was lost of praising General MacArthur and condemning Mr Acheson, and of insisting that the Administration had no policy except to appease Communism, at least until the investigation forced it to reverse itself on such significant matters as the protection of Formosa and the admission of Communist China to the United Nations.

*

The final point is that the Constitution gives Congress the sole power to declare war and from this the conclusion is drawn that the United States should never again become involved in war, as it did in the Korean fighting, without the previous consent of Congress. The other important conclusion, or one which may become important if the Korean truce negotiations are resumed, is that any peace short of the "unification of Korea is a delusion" and any "settlement south of the Yalu is to admit the success of the Chinese aggressors."

Senator Morse, the Republican black sheep, rushed to point out that his colleagues' statement neglected the fact that General MacArthur had proved himself so out of sympathy with his government's policy that any President who did not remove him would have been disregarding his constitutional duty to maintain the supremacy of civilian authority. But, however often Senator Morse may say that the statement is not his party's official policy, and however much Senator Saltonstall, another constructive Republican, may deprecate its undermining of the authority of his country's leaders, it is nevertheless clear that the eight Senators, who nailed together all the well-worn MacArthur planks to make their statement, designed it as a platform from which to launch their election campaign against President Truman.

Cotton Farmers Run for Cover

The farmers who planted about 29 million acres of cotton this season were shocked to discover, from this month's estimate of the probable yield, that they were bringing a record crop down upon their heads. Except for drought in Texas and floods in Missouri, the weather has been favourable and the boll weevils have been kept under better control than usual. As a result, the latest forecast is for a yield of over 17 million bales, compared with 10 million last year and a ten-year average of 12 million; by the time the crop has been ginned, it is possible that it may break the 1937 record of just under 19 million bales.

Last spring, when the price controllers put a ceiling on cotton of 45.76 cents a pound at the farm, the price then prevailing, the indignant growers protested that it would discourage planting and that all they asked was to be left free to manage the market as they thought best. The crop report refuted the first contention and the farmers themselves have now proved the hollowness of the second by running to Washington for cover from falling cotton prices. Spokesmen for the cotton growers insist that they are being "penalised by the very abundance which they have so generously provided" at the request of the government, which urged them to make up the deficiency that developed in cotton so quickly after the Korean outbreak.

Even the Congressional cotton bloc does not seem to have had the face to press for an increase in the price, of over 31 cents a pound, at which the government is required to support the cotton market. But Southern Senators have demanded that 3,000,000 bales of cotton be bought by the government for the stockpile, which is supposed only to contain reserves of commodities that must be imported; the intention is apparently to prevent cotton falling so low that it will automatically become government property under the price support system. The Secretary of Agriculture would go no further than to promise that the possibility of buying cotton for the stockpile would be explored, and he pointed out that there was in fact unlikely to be an unwieldy surplus of cotton this year, in spite of the record crop, since from 5,000,000 to 6,000,000 bales would be exported. The restrictions which were imposed on cotton exports as the result of last year's shortage were lifted as soon as this season's favourable forecast was received. Domestic consumption depends, of course, on the demand for cotton textiles; this has recently been very poor, which is partly why the price has declined, and it has been suggested that the armed forces should place their future orders for textiles at once, in order to encourage mills to build up stocks of cotton.

Election Quadrille

The candidates for the 1952 presidential election do not officially take the floor until after the nominating conventions next July, but already the most polished performers are being pressed to say whether they will enter the quadrille. For with the new year come the practice performances, the state primary elections in which party voters show their preferences for possible candidates. Senator Paul Douglas has already taken the opportunity to say, like Lewis Carroll's snail, that he "would not, could not join the dance," but, even so, his name is apparently to appear on the Democratic ballot in the Oregon primary without his permission. President Truman delights in mystifying the regular questioners who ask "Will you, won't you, won't you join the dance?" No one expects him to answer until the last moment, but it is thought that his present intention is to stand, for his fighting spirit has been roused by the "scandalmongers'" attacks on the members of his Administration, and by Congress's refusal to give him the economic powers that he wants.

If Mr Truman does not stand, he is expected to give the Democratic nomination to the Chief Justice, Mr Vinson. He made it clear at a recent press conference that he had no intention of giving it to General Eisenhower although, as his Commander-in-Chief, he would gladly allow the General to run for the Presidency. This confirms what was already taken for granted, that if General Eisenhower is a candidate, it will be as a Republican. The General has, however, been even less ready to commit himself than has the President and it is thought that he will not do so unless the nomination is guaranteed to him. Except in the *Chicago Tribune*, there has so far been no open attack upon the people's favourite hero, but this does not mean that all Republicans welcome the General with open arms, even though victory would seem to be certain with him as their candidate.

General Eisenhower's reticence poses delicate problems of tactics and timing for the group of progressive Republicans, which includes such leading figures as Governor Dewey and Senator Duff of Pennsylvania, who are trying to "draft" him for the Presidency. The group of conservatives who are trying to do the same thing for Senator Taft have no such difficulties. They declare that they already have signed, even if not sealed, two-thirds of the convention votes needed to nominate him. Mr Taft's strength in the party is concentrated in the middle-west and south, but he has learnt by previous failures that this is not enough. That is perhaps why he chose this week to tread his first official measure in the election quadrille at a clambake in Maine, on the east coast.

Moratorium for Amortisation

America's phenomenal industrial expansion is at last being restricted, even if only temporarily, by shortages of structural steel, copper and other building materials. Mr Charles Wilson, the Director of Defence Mobilisation, has taken the opportunity to declare a moratorium, for sixty days at least, on the granting of the certificates which permit accelerated amortisation, for tax purposes, of much of this expansion. There are a few exceptions to this order, mainly for facilities for the production of urgently needed military items and critically scarce raw materials, where the need for government assistance is undisputed. The availability of construction materials has not hitherto been considered when issuing these certificates, but now that shortages are becoming severe, an attempt will be made to strike a reasonable balance.

But the real reason for the moratorium is to allow a review of the whole programme. Since it was authorised under last year's tax law, about $9 billion worth of new facilities have been declared eligible for these amortisation benefits, and over 3,000 certificates of necessity have been granted, permitting, on an average, 70 per cent of the cost to be written off in five years, instead of the usual 15 to 25. The actual percentage of total cost on which this fast rate of depreciation is permitted is supposed to depend upon the extent to which the new facilities are needed only for emergency purposes and have no normal civilian use. But so far roughly 40 per cent of the certificates, by value, have gone to the steel and chemical industries, and expansion is being encouraged by this means in many other types of industrial capacity that serve civilian as well as military needs. Congress, which thought it was helping expansion for defence purposes only, is naturally complaining that too many certificates are being given for too large a proportion of the new investments.

It is a complaint that does not make allowance for the unusual character of the present long-term defence programme, under which the whole industrial base of the country is to be broadened so that, once the initial push is over, standards of living can resume their rise in spite of rearmament. As far as plans for industrial expansion are concerned, the top of that initial push is now in sight, and Mr Wilson is, therefore, preparing to tighten his standards and make more definite rules for the issuance of certificates. When the moratorium is over, it is expected that quick amortisation will not generally be allowed for such a high percentage of cost as in the past. The pill is, however, sugared, for military procurement officers are to be permitted, when negotiating contracts, to calculate costs of depreciation on the basis of accelerated amortisation, to the extent that it has been permitted, instead of on the normal basis that has previously been required.

Shorter Note

As expected, the Economic Stabiliser, Mr Eric Johnston, has approved the formula under which all wages, not simply those covered by contracts containing "escalator" clauses, will be allowed to rise in step with increases in the cost of living. He has, however, ordered that the formula be applicable only until March 1st. The immediate effect is to permit a further rise of 2 per cent in wages, in addition to the 10 per cent above the levels of January, 1950, already permitted under the old formula.

TWA's *New York Ambassador*

Now you can sleep your way to New York in luxurious, *spacious* comfort. TWA leads the way with the first *all-sleeper* service to New York. Accommodation in this "Luxury Sleeper" Constellation is limited to 18 full-length sleeper berths—so that *every* passenger enjoys deep, refreshing, undisturbed sleep. And, of course, there's the much-appreciated, friendly TWA service—excellently-prepared meals and drinks whenever you may want them. Buy a TWA Sleeper Ticket for your next U.S.A. business or vacation trip. You can fly TWA *all the way* to any of the 60 important U.S. business centres.

Departs London every Sunday at 8.00 p.m., arrives New York Monday at 6.10 a.m.

Departs Paris every Monday at 7.00 p.m., arrives New York Tuesday at 6.40 a.m.

THE WORLD OVERSEAS

The Russian Farmers' Free Markets

(From Our Special Correspondent)

WHEN comparisons are drawn between the standard of life in the West and in the East, Soviet consumption is likely to be somewhat underrated through the omission of many foodstuffs which are purchased not in state stores, but in a free and open market. The idea of a Soviet market in which prices are determined by the pulls of supply and demand seems strange. It is often assumed that free trade was eliminated in the USSR with the introduction of the planned economy. Yet in the thirties purchases in the free market, the so-called collective farm market, accounted for between one-eighth and one-fifth of the total Soviet retail trade turnover. The proportion rose sharply during the war and, though it has declined since then, it is still quite substantial.

How did this free trade survive two decades of planned economy? Why does the Soviet planner allow the existence of some 4,500 markets in which prices move freely and even maximum prices are not controlled by the state? The collective farm market is the planner's concession to the property instinct of the peasant masses. When the collectivisation drive was drawing to an end the carrot was added to the stick: collective farms were allowed to sell on a free market the surplus they had left after fulfilling the compulsory deliveries to the state. The collective farmer was also left a small plot and he could sell the product on the free market. At present the surplus of the collective farms provides approximately 20 per cent of the supplies to the free market, while the remainder comes from the 20 million or so allotments, averaging in size one-fifth of a hectare. These small plots are one of the main sources of income for the collective farmer. On the *kolkhoz* cultivation is extensive, but the allotment is cultivated intensively with a particular emphasis on vegetables. The farmer also keeps his own poultry, pigs and sometimes a cow.

Wartime Boom

The war obviously created conditions particularly favourable for the free market. If its share in the total retail trade was less than one-fifth before the war, it rose to over one-third during the conflict, probably even more as regards foodstuffs. Improvised markets were set up in the neighbourhood of railway stations. With insufficient rations and shortages in the state stores prices soared on the free market. With the tacit approval of the authorities, who were aware of the acute scarcity of labour, collective farmers "borrowed" land from the *kolkhoz* and sold the produce on the free market.

After the war the situation changed. At first, free prices fell slowly and were higher than the prices of rationed goods, and even higher than the so-called commercial prices, i.e. prices of goods sold in the state shops outside the ration. But the abolition of rationing, the greater supply of foodstuffs in state shops, the reorganisation of collective farms, were all severe blows to the free market. The Soviet authorities now claim that "the forces of the market could not sustain the struggle with the Plan and have capitulated" and that prices on the free market are often lower than in state stores.

It is, however, interesting that the attack on private trading was indirect. The institution itself has been preserved. True, the improvised railway markets have mostly disappeared, but the official 4,500 free markets in the small and larger towns of the Soviet Union are still there. In the centre of the market one finds the large stands belonging to the collective farms as such. Sometimes next to the stand there is a lorry full of produce. Around the central stands collective farmers with carts or barrows sell their own wares. The market officials are there only, at least in theory, to watch over the cleanliness and the quality of the products.

According to Soviet statistics, the co-operative and free markets combined still account for one-third of total Soviet retail trade, which would suggest that the free markets alone account roughly for one-seventh of the total. Yet this figure, like the prewar figures quoted above, is probably below the mark, since it is computed on the basis of the farmers' declarations and the farmers certainly played their marketing activities down in order to minimise taxation. One-fifth or even more would be nearer the truth and for certain products, such as vegetables, meat or dairy products, roughly one-third of the quantity consumed in the towns is provided by the free collective market.

Indirect Curbs on Private Trading

Important though it is, the role of the free market in the Soviet economy is limited. The central planner may hit the "free trader" quite painfully by increasing the quota to be supplied to the state or by raising the price of manufactured goods purchased by the farmers. One of the aims of the revaluation of the rouble was to cut down the accumulated profits of the farmers. But the time had not yet come to remove the source of those profits altogether. The free market is considered as a useful source of additional food supply, and its elimination would involve too great a social upheaval to be attempted in the present circumstances.

The free market is as sensitive as a stock exchange. The prices in this market are affected not only by the prices and quantity available in the competitive state stores, but also by the quantity available and the prices of the manufactured goods which can be purchased with the money gained. The Government follows a special policy towards both the free market and the countryside as a whole. At the time of the harvest it directs the supply of all the popular products of light industry into the countryside so as to encourage the sale of agricultural products. If, on the other hand, a region regularly fails to fulfil its quota, it is "starved off," i.e., the quantity of manufactured goods supplied is cut down.

For the time being the free market has been given a breathing space. It is expected that it will be contained within reasonable limits by regular state supplies. The co-operatives, too, have been ordered to buy directly from the peasants, even at free market prices, in order to minimise the importance of the market itself (the co-operatives may for instance sell at a loss). But as long as private allotments are maintained and foodstuffs have not become "free goods," the free collective market will continue to play an important, if limited, role in the Soviet planned economy, supplying a large proportion of potatoes or vegetables, milk, butter, meat or other foodstuffs consumed in the towns.

Prospects for Signor De Gasperi

[FROM OUR ROME CORRESPONDENT]

THAT political developments in Italy threaten to crystallise into a new Fascist era is the general implication of four lengthy articles, ostensibly on different arguments, in the current *Rinascita*, the important and instructive monthly review edited by Signor Togliatti for the use of the higher Communist intellectuals. In the quite differently coloured pages of the dispassionate Liberal *Mondo Economico* one reads that "... in this terrible country we are going towards the frame of mind of 1921-22!" The expectation of a new Fascism in Italy may, however, mean more than one or even two things (in a clerical or Social Democrat organ it would probably stand for the expectation of rule by Togliatti). It is plain that the Communists themselves do not mean by it that the neo-Fascists or official extreme right are likely to supplant the present Government. They mean that Signor De Gasperi himself will be drawn inexorably into replaying the role of the Duce. A reason which they give for disregarding apparent dangers to his tenure of office is that he is America's man. This, for the Communists, is the most damning indictment of Signor De Gasperi. Others may read it as a credit mark for present American diplomacy, which appears to desire in Italy, and other Atlantic Pact countries, a political leadership which will be scrupulous of the decencies even in times of gathering stress.

Although Signor De Gasperi's seventh Government has now received respectable majorities in both Chambers, there is likely to be little peace for it beyond the recess. Decrees passed at the first Cabinet meeting to extend the immediate application of the advatice measure of agrarian reform knock the main internal opposition in the Christian Democrat party on a tender spot. Inquiry into direct taxpayers' incomes on quite unwontedly stringent lines is due to begin in the early autumn—another tender spot. The first mention of the new syndical law had the left wing angrily growling. The third batch of nationwide municipal elections, due in the autumn, has been deferred until next year on the plea of an awkward clash with a census. This delays expected triumphs of the extreme right, though the extreme left, of course, raises a shrill outcry.

Elections Likely Next Year

Moreover, general elections in 1952, and not at the statutory date of 1953, are now seen to be probable for the technical reason that by 1953 altogether too many old Fascists of the Mussolini vintages would have outlived their postwar sentences of five years' deprivation of civil rights. In preparation for these not very distant elections the Government is, or will be, preparing new refinements of the electoral law, calculated to enable the anti-Communist majority in the country to defeat their common chief adversary without tying themselves up in unpopularly close-knit coalitions or combinations. This, for the Communists, is another predestined step for Signor De Gasperi along the Fascist path, and indeed Mussolini's first electoral law (1923) had much of this character. All this, according to present prognostications, will be taking place in an atmosphere of harder times, after the steady and almost wholly unacknowledged improvement in the average citizen's lot in recent years. (The tale told by comparisons of present tobacco, coffee and sugar consumption, motor-car and motor-cycle registrations, compared with prewar as well as postwar dates, is the opposite of lugubrious.) Such will be the elements of the situation in which the Communists will be waiting for the Prime Minister to throw off the liberal and democratic mask.

If De Gasperi's permanence is—as not only the Communists say—championed by America, the quarters where the Italian leftwinger had hitherto been taught to suppose he enjoyed his warmest local backing seem to have cooled quite a bit. That agitation for a political change is rife in the high prelacy was as good as publicly stated by the Premier when a week or two ago, at Florence, he compared present "pressures" with those of the early twenties. As older Italians well remember, thirty years ago the predecessor of the Christian Democratic Party, the *Popolari*, was rather abruptly dropped and disclaimed in the interests of Vatican cordialities with Signor Mussolini. Though the present problems and personages are quite different, there is much curiosity in Rome about the intentions of Dr Luigi Gedda, a downright youngish Catholic politician who seems to be agog for action. It is said that Monsignor Montini, one of the Acting Secretaries of State who has been regarded as a keen admirer of America and a friend of Signor De Gasperi, has lost his influence. Scarcely anyone is in a position to know such things. But a certain curgent of "neutralism" emanating from the Vatican has been perceptibly present in Italian Catholic political discussions on the world situation in the past six months. Such views do not seem to be incompatible with a stiff plan for silencing the Communists inside Italy.

It will probably be a notable achievement if American policy—to say Anglo-American policy would be out of place in view of the very wide recrudescence, in Italy, of Fascist-like sentiments towards Britain and Britain alone—helps to keep Signor De Gasperi in his place, and if Signor De Gasperi on his side, pure as he is of Fascist sentiment in regard to anyone, steadfastly refuses to give the Communists the martyrdom which their intellectual cocksureness and fear of free air causes them practically to demand.

Arms for Africans?

[FROM OUR JOHANNESBURG CORRESPONDENT]

THE opening last Tuesday of the African defence conference at Nairobi, at which the Governments of Britain, South Africa, France, Belgium, Italy, Portugal, Southern Rhodesia, and Ethiopia are represented, brings to the fore once more the problem of South Africa's refusal to make use of native troops. If Dr Malan persists in his adamant opposition to the rearming of Natives, whether inside or outside the Union, he will find himself at variance with the British, who have been considering how to make better use of Native troops in the Commonwealth defence effort.

It is true that the Voortrekkers used Native fighters in their battles with other Natives, and the Natives on the Voortrekkers' side were on the whole extremely loyal. But in the Boer War General Hertzog shot out of hand any Native prisoners he took. South African Natives played a notable part in the first world war, which the Nationalists opposed, and also in the second world war, when some Nationalist supporters were trying to blow up troop trains. The part played by non-Europeans in the second world war helped indeed to harden the Nationalists' non-European policy, and the war's aftermath gave them a further argument. When Dr Malan was asked to explain his *apartheid* policy in September, 1948—nine years almost to a day after the outbreak of the war which he opposed—the very first thing he emphasised was the wartime role of South Africa's non-Europeans. It had, he said, "given them an entirely different outlook and caused them to make demands which never previously entered their heads." This was because they had been "summoned to bear arms and to be arbiters between European and European."

In a little over two years there have been great changes in Nationalist thinking. In the course of the speech already quoted, Dr Malan practically equated the United Nations with world Communism. Today South African airmen are fighting and dying in Korea, under the United Nations banner, and they were sent to Korea by the Nationalist

Proud Inheritance

Little Boy with Big Ideas . . .

Only a wide-eyed little powder-monkey, twelve years old, busily filling cartridges in Woolwich Arsenal . . . yet within the next few years his mechanical genius had found full expression. The slide-rest and the screw-cutting lathe were both invented by him before he was thirty; and the micrometer soon followed. Henry Maudslay made engineering history, and many machine tools used today are dependent on the principles he established. For accuracy was his passion, and he knew that it was impossible without the machine: yet because he was first and foremost a craftsman himself he recognised it not as the enemy but as the ally of craftsmanship.

This capacity for mechanical invention . . . the ability to see engineering problems stripped of their complexities and to apply the direct and often simple solution . . . has been inherited by the Maudslay Motor Company of today. In the fine modern Maudslay Plant in Warwickshire the resource and ingenuity of the creative engineer is still allied to the true principles of craftsmanship: and the design and workmanship of the vehicles built there today worthily uphold the tradition begun by Henry Maudslay more than one and a half centuries ago.

Government. Not a single Nationalist voice will be raised in favour of neutrality, if war comes. Instead, Nationalists talk of the danger of Communist "sabotage of the war effort"—a phrase which in South Africa a decade ago connoted activities associated not with Communists but with Nationalists. The Minister of the Interior, Dr Donges, has said that South Africa must "arm to the teeth," and the Minister of Defence, Mr Erasmus, has assured Parliament that "the country has never been in such a state of preparedness," and that three divisions could be mobilised in a short time. Government offices are full of plans for switching industries on to a war footing, and for directing manpower and controlling commodities.

Yet on one point the Nationalists have not changed. They may now agree wholeheartedly that the new potential enemy is theirs as well as Britain's and America's, and may even outdo the United Party in their zeal for full-blooded South African participation in a war against Russia. But they are still resolutely opposed to the use of non-European troops in such a war—even if those troops are raised in other African territories.

Obviously, if South Africa is to play its proper part in the defence of Africa, it must co-ordinate its plans with those of other African countries. But, despite all the internal energy, considerable coyness is still manifest about such co-ordination. At the end of January Mr Erasmus confessed that "no steps have been taken to bring about a military liaison between the Union and Southern African territories." The possible reason for the delay appeared in February, when Mr Erasmus disclosed to the Senate that "negotiations are still in progress" in connection with representations he had made to other African states that Natives should not be trained in the use of arms. Unwilling to have Native troops itself, the Nationalist Government has carried its opposition to such troops to a point where it might well be accused of that very sin of "meddling" in other countries' internal affairs which it so deplores when its own internal affairs are in question.

Africans as Auxiliaries

It is a painful dilemma. How can Nationalists train non-Europeans to be soldiers when they believe that this act of the previous government was chiefly responsible for creating the "serious and pressing colour problem" that Dr Malan came into power on a promise to solve? But how, with all their new good intentions, can they hope to co-operate seriously with the rest of Africa in defence, when they oppose the raising of Native military units even in African territories beyond the Union? To do him justice, Mr Erasmus is not entirely nonplussed by these questions. He has explained that the intention is to allow non-Europeans to join auxiliary services, "and to act as "guards, watchmen, drivers of mechanised transport, fire pickets and fire-fighters, and in other non-combatant capacities." But he added that these non-European non-combatants would serve only "within South Africa." In their new mood, the Nationalists will almost certainly be prepared to send European soldiers beyond the Union's border in time of war. Thus the position is that the white soldiers would leave their non-European auxiliaries behind—but would find themselves fighting cheek by jowl with non-European troops from other African territories, since Mr Erasmus's representations have certainly not induced the British and still less the other Powers in Africa to abandon the practice of using Native troops. This position must strike even Nationalists as illogical. If white South Africans are going to have Natives as comrades-in-arms anyway, they might as well have Natives from their own country. Moreover, it should not be overlooked that if the Natives, Coloured people and Indians were encouraged by their part in the last war to "make demands which never previously entered their heads," the Nationalist measures to combat those demands have since hardened non-European opinion into a resolve not to take part in a future war, even if asked to do so. Dr Malan thought they should never have been allowed to become "arbiter between European and European." The Natives, Coloureds and Indians may have no wish to defend Europeans against either an Asiatic or a Communist foe. For, thanks to the Nationalists, they have less than ever to lose.

Peace or War in the Punjab?

[FROM OUR CORRESPONDENT IN PAKISTAN]

Does India mean to attack Pakistan? If not, what plausible explanation can there be for the massing of nearly the whole of the Indian Army on the frontiers of Pakistan? These are the questions which are being asked wherever two or three are gathered together in Karachi. A subconscious feeling perhaps persists that war between two countries with such close ties and so much common history is unthinkable, that such a thing "can't happen here." It is otherwise in Lahore; reports from that city disclose the existence of acute nervousness, which is only to be expected as it lies only a few miles from the Indian border. Mr Nehru's statement that India had no troops nearer than twenty miles from the border made most reassuring reading, but unfortunately, according to recent travellers between Amritsar and Lahore who have had the evidence of their own eyes, it is simply not true.

Mr Nehru, the Indian Prime Minister, is a man of peace, and even in Pakistan he is generally credited with a genuine hatred of war and a desire to gain his ends peacefully. But gain his ends he must, at any rate where Kashmir is concerned. He will "tolerate no nonsense" in this matter. If world opinion is against him on this issue, we are to believe that it is biased or has been hoodwinked by Pakistan's clever presentation of its case. Mr Nehru reminds one of the Irish juryman who was in the minority of one—"Eleven more obstinate men I never saw in my life." Certainly he does not want war, but if his refusal to follow the path of settlement marked out by the Security Council should lead to a conflagration, a very grave responsibility will lie on his shoulders.

Appeal to Cæsar

In one of his recent communications to Mr Liaqat Ali Khan, the Prime Minister of Pakistan, Mr Nehru ends with an appeal to the verdict of history. It will be strange if the future historian, even if the issues become blurred by the mists of time, finds it possible to reconcile his insistence on mediation in the Korean dispute with his refusal to agree to it in the Kashmir dispute, or his attitude towards the accession of Junagadh to Pakistan with his attitude to the accession of Kashmir to India. (Incidentally, Pakistan's protest against India's seizure of the Junagadh state is still pending before the United Nations.) In any case, people ask in Pakistan, why should the verdict of some future historian be awaited when the verdict of the Security Council, as the effective organ of world opinion, can be obtained here and now? "Hast thou appealed unto Cæsar? Unto Cæsar thou shalt go," is what the Security Council should reply. It has already in its resolutions of March 30th prescribed that in the event of the failure of Dr Graham's mission both parties shall be called on to accept arbitration. If Mr Nehru's appeal is not merely rhetorical he should surely be willing to risk the verdict of world opinion in this shape. Mr Liaqat Ali Khan has all along urged that in arbitration lies the only solution and indeed it is obvious that nothing else can possibly break the current deadlock. "I am prepared," said he at the end of his last message to Mr Nehru, "to abide by the judgment of any impartial person."

As one of his reasons for rejecting any arbitration proposal Mr Nehru claims that the fate of Kashmir is too important to be decided by this means. Quite right, but here he seems to forget that the scope of the proposed arbitration is limited. The fate of Kashmir is to be decided by a free and impartial plebiscite. To that both sides have agreed, and the present deadlock is (ostensibly at least) simply due to a disagreement about demilitarisation and other arrangements for ensuring a fair plebiscite under independent control. These should be regarded as mere intermediate steps. The main method of resolving the dispute as a whole was agreed upon long ago and the Security Council at the moment is merely concerned with the mechanics of the thing.

But of course Mr Nehru does not forget this. The truth is that it has been made abundantly clear that India has changed its ground during the past three years: it evidently regrets its agreement that the future of Kashmir, which is now described as an integral part of India, should be decided by the plebiscite, and is determined to make it impossible for a fair expression of the will of the people to be obtained. It is noticeable that in recent months Mr Nehru has repeatedly brought out his insistence that Kashmir now forms an integral part of the Indian Union. His intention seems to be to reinforce this claim by the farce of the Kashmir Constituent Assembly so that he may finally argue that the state is no longer a disputed area and there is no longer any Kashmir problem. He has already claimed, in the Indian Parliament, that "the battle for Kashmir has been won." Meanwhile—this is the generally accepted answer to the second question asked at the outset—Indian troops have been massed on the frontiers in order to keep Pakistan overawed while the Kashmir Constituent Assembly plays its predained part of formally voting for accession to India. India cannot be afraid that Pakistan, however greatly provoked, would launch an attack on India proper; but Pakistan might have been tempted to start trouble in Kashmir by letting in the tribes. By emphasising that his Government regards Kashmir as part of India, Mr Nehru has made it clear that, if anything of this kind happens, India will take it as an act of aggression and will react accordingly on the frontiers of the Punjab and of Bengal.

Those who counsel patience point out that Pakistan should await further developments with confidence and self-control, in as much as the Security Council resolution of March 30th both makes it clear that the vote of the Kashmir Constituent Assembly will not be regarded as a settlement of the problem, and provides for the arbitration which Pakistan desires. Pakistanis tend to point out in reply that India has already rejected this resolution and that, judging by its past record, the Security Council is very unlikely to bring adequate pressure to bear. There may be grounds for this pessimism, but is the Security Council to fold up simply because one party to a dispute rejects a resolution and refuses to co-operate? If so, the United Nations will be signing its own death warrant as a peacemaking body, just as the League of Nations did when it failed to press sanctions in the Abyssinian affair.

The Argentine Economy—I

No Halt to Inflation

[FROM A CORRESPONDENT]

The newly arrived visitor to Argentina is agreeably surprised to see signs of evident prosperity. There is apparently no lack of spending power. Shops appear well stocked, even if imported lines of consumer goods are not so plentiful as elsewhere. Shops, theatres, cinemas, cafés and restaurants are packed; and the restaurants offer an abundance of *bifes* (beefsteaks) of a thickness, juiciness and cheapness well calculated to impress the foreigner. But meat is relatively the cheapest article of food in Argentina, and the tourist is probably quite well supplied with "grey-market" pesos;

whereas the Argentine citizen cannot measure prices by the yardstick of pounds or dollars at grey-market rates or any other equivalents. His only standard of measurement is with prices a few years ago, last year or last month; and the comparison tends to be alarming.

Prices in Argentina have risen three, four or five times over within recent years; and the cost of living indices, even by official reckoning, rose from 119.4 in 1945 (1943=100) to 322.9 last November, or, by rather more comprehensive private reckoning, from 100 in 1939 to 475 last January. This picture is no means unique in a world beset with post-war inflationary problems. But in few countries did the postwar trend begin so late as in Argentina, probably in none is it still proceeding at such an accelerated tempo.

The root of the problem lies in unbridled government spending, and the regime shows no sign of wishing to tackle it at its root. The only "remedy" is to meet rising costs with round after round of enforced wage and salary increases. The latest wage-adjustment decree, for example, gives 40 per cent increases to the sugar workers of the northern provinces; increases of 60-65 per cent in 1949 quickly increased the retail price of sugar from 65 centavos to 1.50 pesos, and it is calculated that the new increases will raise it to 2.50 pesos—over five times the price four years ago. New pay-scales decreed early this year for the railway personnel bring the lines' total payroll to an amount exceeding their total revenue, and according to Perón the railways had a deficit of 1,000 million pesos in 1950. In spite of the improved pay discontent still smoulders amongst railway workers.

Official utterances give little indication that the regime understands the real nature of Argentina's problem. Perón's speech to Congress on May 1st, ostensibly a "report on the state of the nation," did not even mention inflation, although it again asserted that "Argentina has no economic problems." But in a later speech to provincial functionaries he said that world inflationary trends must be expected to have repercussions in Argentina, and—with an unwonted note of hysteria—he asked what was the use of his giving the workers higher pay if traders took it from them in higher prices, suggested the formation of an "economic police force," and threatened that unscrupulous middlemen ("saboteurs") would be sought out and finished with "even if we have to eliminate the entire retail trade and replace it" [by state trading].

In his report on the state of the nation the President also said:

> In five years the nation has created a magnificent mercantile marine, has paid off its foreign debt, has nationalised its railways, telephones, ports, insurance and reinsurance, and has carried out public works for a total amount of 11,000 million pesos; and striking a simple balance we now find that we have in external means of payment as much as we had in 1946.

Such an enormous expansionist programme could not, in any case, have been carried out without taxing the country's economic resources to the utmost; and, *pace* General Perón, there is evidence that Argentina's economic problems have surpassed anything anticipated by the planners.

Between 1946 and the end of 1950 the net national funded debt (that is, less bonds held by the government) more than doubled, rising from 7,950 million to 15,997 million pesos. To these totals must be added the floating debt, which was 2,880 million pesos in 1946 and over 2,162 million (an incomplete figure) in 1950, as well as the very extensive government borrowing from the official banks and the borrowing by autonomous official entities such as IAPI (the State Trade Promotion Institute); the latter alone has borrowed an estimated 7,000 million pesos from official banks.

Government borrowing now monopolises nearly half the total of bank advances as against about 27 per cent in 1946. Total bank advances last December reached 23,717 million pesos, well over four times the corresponding figure for 1946, and exceeding the total of bank deposits by some 650 million, or about 2.8 per cent. Moreover, the gap may be considerably bigger than this, as the figures published by the Ministry of Technical Affairs probably do not include the Industrial Credit Bank, an official body lending on long-term mortgage or chattel mortgage for industrial development requirements. How the gap is to be met is a matter for speculation; presumably further recourse will be made to the printing press. The Central Bank's note issue in the hands of the public and with banks by last May had passed the 14,000 million mark, about three and a half times the December, 1946, figure. The normal rate of increase for some time has been about 150 million pesos per month, but of late it shows a tendency to achieve new records.

Argentina's economic picture presents several seemingly paradoxical features. Parallel with the public's exuberant spending power and an official policy of relatively cheap money, there exists a thriving grey sellers' market for temporary private lending at percentage rates quoted by the month. Concerns of established commercial status are forced to resort to this market to finance renewal of stocks, as prices rise and normal banking sources of credit are strained to the utmost (rates of as high as two per cent a month have been known). In the prevailing inflation, too, the stock exchange touches new levels of deflation. The investor no longer turns avidly to industrial equities for protection of capital, although dividends have been well maintained so far. But shortage of cash, needed for renewal of stocks, and capital erosion, force joint-stock companies to make scrip distributions on an increasing scale, and the abundance of new industrial paper, as well as the general feeling of uncertainty amongst the public, weigh heavily on the market. A recent suggestion (so far it is no more than that) of a tax on joint-stock companies' capital and reserves of up to 2 per cent per annum over ten years adds its quota to the prevailing depression.

(To be concluded)

Harsh Contrast in Iberia

[FROM A SPECIAL CORRESPONDENT]

THE uses of a trained economist are nowhere better illustrated than in the visible contrast between Portugal and Spain. In the one country a dictator with an economic education and the army's backing has known how to take what lay at hand, bring order out of chaos and make it thrive. In the other a dictator trained only in army ways has known how to seize power and hold it, how to apply spit and polish to a capital

SIMON ENGINEERING GROUP

Aspects of enterprise

No. 9

In Turkey two complete new coal preparation plants are being built by Simon-Carves for a group of collieries. They include two of the largest coal washeries in the world, with dirt handling plant for dumping the washery discard into the Black Sea over distances of up to a mile. This £2-million order was secured in competition with the United States, France, Belgium and Germany, and it is significant that the Simon-Carves tender was not the lowest; the contract carries stringent performance guarantees and was placed on the strength of the Simon-Carves designs, specifications and reputation.

VAUXHALL MOTORS LIMITED · LUTON · BEDFORDSHIRE

city, but not how to keep an economy going. Portugal is visibly balanced and prosperous, well cared for, expressing its sense of controlled well-being in such unrelated ways as the flower-hung cleanliness of railway stations and the quick grace with which fisherwomen move about their work. Spain is bleak, harsh, sparsely cultivated, ragged and—outside the capital itself—doing little about it.

The border crossing brings a sense of shock. Even by plane from Lisbon to Madrid the green pattern landscape of the western Tagus valley thins and browns as the river narrows toward Spain. Roads peter out, mountains rise higher, the landscape takes on the austere solitude of the Spanish Estremadura. The airstrips of Barajas have a meagre appearance of having been laid down temporarily in a desert. Surely this airport is inadequate for Madrid.

The trip by train in the opposite direction sharpens the contrast. Leaving Madrid in the early evening a Spanish train of soiled antiquity takes one down the same Tagus valley, over the same mountains, in fourteen hours. (The plane takes an hour and half.) This way the passage is from sparseness to abundance. The traveller who goes to sleep in the uplands of the Spanish Estremadura wakes amid the cultivated plains and lush terraces of the lower Tagus. This is the same river that rings Toledo, but in Portugal it becomes lavish. Rice in the flooded fields on the valley floor, grapes on terraced hillsides, sugar beet, wheat, barley, peas and beans—every inch of soil is farmed and the land made a garden. To come thus to Lisbon is to re-enter the twentieth century.

Trains Old and New

By plane the frontier is crossed in the air, by express it is crossed by night. It is in the day trip from Lisbon to Seville that the two lands, towns and peoples offer the sharpest contrast to the travelling eye. The trip can only be made three times a week, on Tuesday, Thursday or Saturday. It covers 582 kilometres, takes three trains and more than twelve hours. First the Lisbon-Porto express—clean, brisk and businesslike, stopping at a junction to let out travellers who go east. Then a small one-car diesel train, skittering along the good roadbed, clean, sure of its power. And at the border a one-car Spanish diesel, made perhaps by the same manufacturer, but resembling its neighbour in nothing else. It takes on passengers at Badajoz, scene of the much-disputed bullring massacre of 1936 and obviously forgotten by man and Franco ever since.

Customs officers examine money and luggage, but with an air of resigned incompetence. In place of flower-hung walls and shining faces here are hunger, rags, and fierce despair. Scabrous children clutching hardly more than half a garment compete for tips with angry station guards. This is where the traveller, unfed since early breakfast, is supposed to eat, in a dark station restaurant hung with bead curtains meant to keep out flies and beggars. The town centre lies a mile or so away, but despite the two and a half hours waiting time there is general discouragement of any attempt to go and see it. No taxi cabs seek fares, no guides lure tourists to see the proud spots of this provincial capital. Perhaps there are no proud spots, but only misery, and spirits charged with a resentment that makes itself felt in every gesture.

Shabby as it is, smelling of low-grade hot oil, the diesel is a relief. Anything that took one away from Badajoz would be a relief. The rails lead across wide uplands, up and down mountain ranges from the Tagus valley to the Guadiana, from the Guadiana to the Guadalquivir, and the diesel follows them as best it can. On flat stretches it runs reasonably well, but given a hill it slows and shivers. No Spanish train likes a hill, but these diesels like them neither climbing up nor coming down. They are under-powered for the climb, and on the down-grade they trust neither the curves, the rails nor the switchmen. A hill-top represents victory behind and fears ahead. A siding must be approached with the greatest caution.

The result is that each passenger, however lacking in mechanical sense, becomes charged with a sense of personal responsibility for the driving. The shivers, the sudden stops, the slow and painful startings on a grade become his personal problems. It is no good trying to sleep away the hot hours—no smooth gait induces somnolence. These are the manners of a diligence, full of uncertainty and alarms. That the horses feed on oil instead of hay is merely a twentieth century accident.

Outside the open windows the land grows cork, olives, grain and grapes, live oak trees. One big new irrigation system looms on the right. Otherwise all is, as usual, hand-tended. The cork forests, olive orchards, grain fields, and vineyards served by this railroad might form the basis of a prosperous agricultural society. Yet so awry is this economy that Estremadura is one of the poorest provinces in Spain, holding large tracts of unworked land valued by absentee landlords chiefly for the shooting.

Dirt and Decay

The sun grows hotter as it drops, the train more cautious as it starts down the last set of gradients toward the Guadalajara plain and Seville. During most of the trip from Badajoz people have appeared only at railway stations, but now they and their houses increase in numbers. It is not only that they wear so few clothes—so do bathers on Portuguese beaches. It is not only that they are so ragged, not only that they are so dirty. Perhaps it is that neither they nor anyone else seems to care. Naked children tumble at the door of earth-floored huts, and both are sprung from the same desolation.

It is true that poverty is not new in Spain, that Andalusia has had four years of bad harvests. Though the rains have been kind this year, it takes time to recover from forty-eight months of drought. But these are excuses. They do not explain away a growing certainty that the prevailing deterioration is eating deep into people as well as into their tools. Railroad equipment is tottering on its rickety wheels, held up by bits of baling wire. Passenger coaches are ancient, unkempt, unmaintained. Goods wagons are falling apart. The Seville station is a shabby disgrace to a city of pride and standing. Broken-down taxi cabs, slab-sided street cars apparently unpainted since purchase, tired horses hitched to open victorias that once were gay—these form the city's transport system.

On the other hand the Moorish Alcazar is more elegant than it used to be when the King used it as a palace, and an apartment is being prepared there for the Generalissimo's newly married daughter. Its entrance court is newly paved with marble. Meanwhile the price of food continues to soar. It is not merely the contrast with Portuguese plenty which fills the traveller with a sense of foreboding.

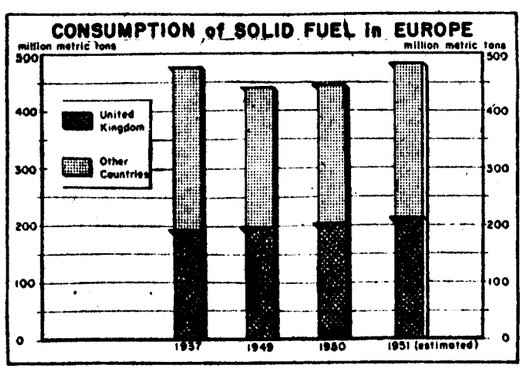
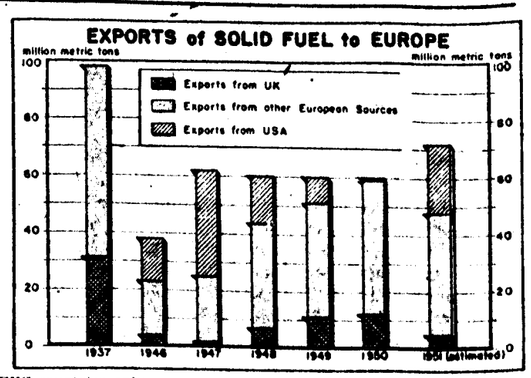
THE ECONOMIST, 22 RYDER STREET, LONDON, S.W.1.

THE BUSINESS WORLD



Britain and European Coal



SINCE the war the European coal market has been dominated by two features: first, the inability of Britain to regain its prewar level of coal exports; secondly, the import of large quantities of coal from America (which was previously quite abnormal). In the single year 1937, Britain exported about 30 million tons of coal to Europe. (In this article "Europe" refers to European countries that are members of the Organisation for European Economic Co-operation.) In the six years between the beginning of 1946 and the end of 1951 exports of British coal to Europe will have amounted to about 40 million tons in all. In the same six years, Europe's imports of American coal will have totalled over 100 million tons. The comparison suggests that Europe's imports of coal from America can be linked directly with reduced exports from Britain.

Such a conclusion needs some modification because the other exporters of coal in Europe have also been supplying less to their European customers than they did before the war. But the fact is that other coal exporters have for the most part been catching up more quickly than Britain. Western Germany, which exported about 35 million tons in 1937, is now exporting at the rate of 25 million tons a year. Poland's exports to Europe (quite apart from the large amounts which it supplies to Eastern European countries and to Russia) have since 1947 been roughly in line with what was provided in 1937 from the mines that Poland now controls. France, together with the Saar, is also exporting at about the same rate as before the war. Belgium and the Netherlands are some way behind in their recovery but they have largely offset this lag by reducing their imports of coal. These countries together accounted for nearly 70 per cent of the European market in 1937; their share in 1951, of a smaller market, will be between 55 per cent and 60 per cent. Britain, which covered the remaining 30 per cent of the market in 1937, is likely to contribute no more than 7 per cent this year, less than half of this country's share in the last two years.

British exports are low for familiar reasons: output is still below the prewar level, while consumption at home is considerably higher. But this bald statement does not give a full impression of what has happened. For example, it obscures the fact that last year 23 million tons more coal was produced from the pits than in 1946, with a labour force much smaller than was employed in the mines in any prewar year, though with more capital equipment. Britain is the only coal producing country in Europe with fewer workers in the mines than before the war. The comparison also obscures the fact that the high and rising level of coal consumption in Britain is a reflection of British industrial expansion, which has not been without certain benefits to other countries. But when all proper qualifications are made, the low level of British coal exports is damaging both for Europe and for Britain.

In the calendar year 1951, between 20 and 25 million tons of American coal are likely to be brought into Europe, of which 8,000,000 tons were imported in the first half of the year. This is a measure of Europe's coal predicament. The blame for this state of affairs cannot be laid wholly at the door of Europe's normal suppliers. Between 1946 and the middle of 1949, large quantities of American coal were imported to help out while European mines were being re-equipped after years of wartime damage or neglect. But from mid 1949 until the closing months of 1950 there was, to all appearances, enough European coal to go round. Import requirements of the European countries seemed to have stabilised at a point considerably below the prewar level, as the accompanying chart on exports shows. This show of stability, in turn, reflected the fact that most countries (with the notable exception of Britain) were consuming less coal than before. Other sources of energy—hydro-electricity, fuel oil and natural gas—were being rapidly developed to take the place of solid fuel, particularly by countries with limited coal resources of their own, such as Italy, the Scandinavian countries, and Switzerland.

"Europe" refers to OEEC countries only.
Estimated figures for 1951 include 5-10 million tons for restocking. "Other European Sources" refers to Western Germany, France, Saar, Belgium, Netherlands, Poland and Czechoslovakia.

Even France, with a comparatively large coal production, seemed to be turning increasingly to other forms of energy.

This led to the conclusion in Europe (though not in Britain, where the demand for coal showed no sign of falling) that there might before long even be too much coal in Europe. There followed a manoeuvre by importers and buyers who held off the market in the hope that prices would fall—a manoeuvre in which they were encouraged by the American attack on dual prices. Consumers depleted their stocks to the point of exhaustion, while pithead stocks mounted alarmingly. Miners were laid off at high cost pits in France and Belgium, and a million tons of output or more was lost. The sudden upsurge in economic activity that followed the outbreak of the Korean war and the decision of the free nations to defend themselves presented buyers of coal on the Continent with an awkward situation; they had at once to meet a rising current demand and also to replenish dangerously reduced stocks. To make matters worse, there were smaller supplies of export coal because the exporting countries required more for their internal needs. In these circumstances, recourse once more to American coal was inevitable.

★

What are Europe's coal prospects for the next twelve months? There seems little hope that European exporters will increase their supplies. Western Germany will almost certainly absorb any additional coal that it produces. It is only because of decisions taken by the Ruhr Authority, against the wishes of the Germans themselves, that German exports have been maintained at their present level. France (including the Saar), Belgium and the Netherlands are also unlikely to export more; Polish exports to the West show little sign of variation; and there is not much hope, for some time to come, of more from Britain. During the coming winter, in fact, importers will be lucky if they continue to receive European coal at the rate at which it is being supplied now. Their needs are unlikely to abate. Coal is still urgently wanted for stocking against the winter months, especially in the Scandinavian countries, and to meet growing industrial demands. The present gap between supply and demand (estimated at over 10 million tons a quarter by the Economic Commission for Europe) is likely to persist well into next year, and it may even widen.

The only palliative immediately possible is for Europe to keep on importing American coal. But this cannot meet the need. For one thing, there is insufficient shipping. The 16 million tons of American coal which European countries consider they need until the end of the year already exceed the capacity of the ships that are available to carry it; and more demands may come along later. For another thing, Europe is short of coke, as well as coal, and for technical and supply reasons, no coke shipments can be made from America. Europe needs another 2,250,000 tons of coke, according to the latest ECE estimates, and the only way of getting this quantity is by bringing into operation more coke ovens in Europe. There may be enough ovens in about two years' time, if present plans materialise, but this is by no means certain. Meanwhile, insufficient coke will be added to the list of shortages that now afflict European steel production.

Thus the import of American coal cannot solve Europe's fuel problem during the next few months, but it can go a considerable way towards doing so. Indeed, without American coal, European recovery would by now have been seriously jeopardised. Is American coal, then, to become a permanent feature in the European economy? The answer largely depends on what happens in the British mines. If Britain cannot produce enough coal even to continue exporting at the present restricted rate, a gap will be left which other European producers would not be able to fill for years—and there are certain types of British coal, such as Welsh anthracite and dry steam coals, which cannot be provided from any other source. Any continued import of American coal over a long period would severely drain Europe's dollar resources and would draw shipping away from more normal and economic trades. These objections emphasise the need, from every point of view, that British coal exports should be maintained and quickly expanded. This is one vital way in which Britain can make a contribution to European progress. It is in Britain's direct interest also. Coal is nowadays a bargaining counter of prime importance in international trade. Many countries insist on receiving coal in return for the

essential commodities they supply; trade negotiations would have been easier in the past if this country could have offered more coal. It will be quite essential in future bargaining.

What can be said of the future course of British coal exports? The Coal Board, when they issued their national plan last October, made it clear that they expected to have a large stake in the export market in the 'sixties. Without venturing as far ahead as a decade, it is difficult to see how British coal exports can be increased during the next year or two if present trends of production and internal consumption continue. Only three remedies appear possible. One solution would be to restrict internal consumption by rationing and allocation; but it is difficult to see how the domestic consumer can be squeezed much more and restrictions on industrial supplies would cure one evil only by creating dozens of others. A second step would be to resort to the costly and uneconomic expedient of importing other people's coal in order to export our own; but it would surely be difficult to justify this as a long-term measure. The last and only permanent solution is simply to increase production. It is difficult to believe that everything has yet been done to achieve this. This, indeed, is the first task of the new Coal Board.

Business Notes

TUC Calls the Tune

After their flurry and wide fluctuation provoked by the dividend freeze, the stock markets have this week subsided into a listlessness that is characteristic of the dog days. The one notable spasm of activity was that caused by the launching of the British Guiana loan. This had been so heavily "stagged" that allotments had to be sharply scaled down—with the result that, when dealings began on Wednesday afternoon, quick sellers actually secured a smaller premium than those who sold on the closing quotation of 5/16-7/16. Despite the depressing news from Persia, the gilt-edged market made a small advance on that day, but this still left prices no higher on the week. High-grade equities—except for tobacco shares—have been sagging in shrinking markets as investors reflect upon the crippling uncertainty that the Chancellor has caused and upon the many readjustments that still have to be made (such, for example, as the reduction in the issue price of the Johnson, Matthey offer to shareholders).

This malaise in the markets may deepen when investors ponder the economic sections of the annual report of the TUC, published this week. Unless they are wide awake when reading it they might well imagine that large passages from the Chancellor's end-July speech have been slipped in by mistake. But the alert ones will quickly perceive a more sinister reason for the closely parallel sequence of ideas. Before the Budget the TUC told the Chancellor that statutory limitation of dividends "in its most practicable form" would give "less stability than had been secured until then through voluntary restraint." The Chancellor duly echoed this conclusion in his Budget speech and raised the distributed profits tax instead. But by July the TUC had changed its mind and urged legal control, evoking an equally quick somersault by the nimble Mr Gaitskell. Similarly, in his turn on price-control, the Chancellor's antics followed the stage-managers' directions with quite extraordinary care. Although quite realistically acknowledging the weaknesses of price-control, the TUC appealed for its reimposition upon goods decontrolled in recent years and, in particular, for measures "to enable differential treatment to be given to firms of various levels of profitability"—if necessary with the supporting reintroduction of physical controls. Mr Gaitskell now projects action upon all three points, and justifies each by the TUC arguments.

*

On subsidies the Chancellor went his own way last April, and the TUC agrees with him that "certainly it would not be practicable to raise by taxation enough extra money to keep the cost of living completely stable by subsidisation." (Can any reader guess which of the two penned that unexceptionable conclusion? No prize is offered.) Now the TUC remarks that "some" increase in subsidies could be afforded if its request for increased taxation of higher incomes and profits were granted—and has evoked from Mr Gaitskell his recent offer of a "slight" increase if that would secure agreement "on a measure of internal stabilisation." Does this imply that the next stage-management by the TUC would mean still higher taxation of profits—and/or the capital gains tax for which it also appeals? The wider audience will not find much to console it in the knowledge that there is one turn that the TUC has already rejected—statutory controls of the profits of individual firms would "introduce a disastrous rigidity into industry and would break down of their own weight." So, of course, would the Chancellor who tried it—even if he had Mr Gaitskell's agility as a tumbler.

Rubber Growers and Dividend Control

The plea for exemption from dividend control that has been submitted to the Chancellor by the Rubber Growers' Association should be obligatory reading for all left-wing politicians. It provides an object lesson on how the proposed freeze would not only be useless and spiteful (as most politicians in their hearts, must already know) but also positively harmful to the British economy and wildly unfair between different shareholders. The rubber industry has always been heavily dependent on risk capital. Since it takes seven years for a rubber tree to become productive, potential supply could be equated with demand only if producers could forecast world economic activity seven years ahead. This is patently impossible, and rubber investors have therefore to accept violent fluctuations in their annual returns. If they are now to have a ceiling imposed upon them in one of their infrequent spells of prosperity—with no floor for any subsequent recession—it is clear that capital will "shy away from British enterprise in favour of foreign-owned enterprise." Since British rubber production is now doing almost as much to close the dollar gap as all the export industries of the United Kingdom put together—sales of sterling area rubber earned $210 million in 1950, and sales of Malayan rubber to the United States alone earned $228 million in the first half of 1951—this is a matter of grave concern. As the RGA's letter wisely implies, the net effect on the British working man of a freeze on rubber dividends would be that he would get, not more wages, but less wheat, cotton and tobacco.

Moreover, the basis on which the White Paper proposes to freeze dividends is absurdly, and differentially, unfair to the rubber industry. During the war most plantations were in enemy hands; since the war dividends have been restricted because of the need to plough back profits for rehabilitation and to repay loans from the Malayan Industry Rehabilitation Finance Board. The annual average dividend paid by a sample of 105 rubber companies in the last ten years has been only 2.58 per cent gross on issued capital—and much less than this on real capital. Some companies had begun to pay more adequate dividends since devaluation, but the axe that fell on July 27th means that those companies that had just published their accounts by that date would be able to pay about half as much again during the next three years as those that had just failed to do so. Companies that had recently announced interim but not final dividends, and companies that operate in Indonesia (many of which are only just getting back their estates) would also be differentially—and quite inequitably—hit.

The case for granting exemption from a freeze to the rubber industry—and, indeed, to all other overseas plantation and mining industries that have only recently emerged from years of enemy occupation and whose dividends include a substantial element of return of capital—is overwhelming. The only counter-argument is political. Lord Pakenham announced recently that while published dividends paid by British industrial companies rose by 14 per cent in the first half of 1950, published dividends by all British-controlled companies, "including those in the oil, rubber and mining industries abroad," rose by 20 per cent. Earlier in the same statement he had admitted, in response to a question, that the rise in all ordinary dividends in 1950 had amounted to £10 million gross (against rises in wages of £241 million). It is only by concentrating its propaganda on percentage increases instead of on money increases—and by weighting those percentage increases through the inclusion of industries that paid virtually no dividends in the war—that the Government can stir up "psychological" resentment, which it can then exploit as an excuse for a freeze

The effect of all this on such dollar earning treasures as the rubber industry—and through it on the British standard of life—should make even those who have no concern at all for justice to the shareholder beg Mr Gaitskell to think again.

* * *

Indecision about Coal

The weeks pass, and there is still no decision in principle about importing American coal during the coming winter. Since the experience of last winter's hastily contrived imports must surely have taught the lesson that last-minute decisions cause dislocation in shipping which in turn affects other industries including steel, is it to be concluded that the Government sees no need for imports of American coal this winter? It has not said so, and if it did there would be many (including members of the Coal Board itself) who would not accept the wisdom of such a decision. It seems more probable that Ministers are afflicted with the same feeling of autumn helplessness about coal that has been all too common in recent years. If there is a spurt in production, it may—so it seems to be hoped—be sufficiently determined and prolonged to see the first part, at least, of the winter through safely.

There is nothing in the latest coal figures that would justify this vague optimism. Output is showing its seasonal recovery after the holidays, but this year the holidays have entailed an actual drawing on stocks, the total of which fell from 13,886,000 tons on August 4th to 13,570,000 tons on August 11th. To reach the 18 million tons which is regarded as the "safe" figure at the beginning of the winter thus means adding 4,500,000 tons to distributed stocks in the space of eleven weeks. Since inland consumption has increased by 5,000,000 tons in the first 32 weeks of this year, the chances of obtaining this increase in stocks are not high. They would be better if it were not for the dismaying fall in the number of faceworkers that has occurred in the past month; the numbers on July 14th were 288,800 and on August 11th 287,600—a bare hundred more than a year ago. It remains to be seen how this decline in manpower at the face will affect productivity; up to the holiday period, this had been showing a promising improvement.

* * *

Steel Control in December

The Ministry of Supply has given notice that it will resume control over carbon steel supplies from December 3rd. The new arrangements will, it is stated, broadly restore the controls that were in operation up to May last year, but building and engineering firms will receive a notice in due course from the Ministry of Works telling them how to apply for the steel they need. The present controls over sheet and tinplate will remain unaltered. The restoration of control over carbon steel generally will mean that from December 3rd no one will be allowed to buy carbon steel without an "I.S. authorisation" which will be issued to firms to acquire specific quantities of steel for specific purposes. During the coming weeks, the apparatus of control will be re-erected, with all the former procedures for filing applications for steel through the appropriate departmental sponsors. Meanwhile, the Ministry of Supply will be engaged on the heavy task of collating the returns from the census of steel stocks and requirements; until this is done it will not be possible to hazard any guesses about how individual industries and firms are likely to fare. Indeed, this will depend on the "essentiality" of their production for defence, export and key requirements at home.

There is a general impression that many sections of industry, despite their objection to allocation in principle, will not complain at the restoration of control over steel supplies. This is not because their experience of nearly ten years of control during and after the war was uniformly happy, but because they have been concerned about excessive buying of steel in recent months (in which the long delay in raising steel prices played some part) and because they have reason for doubt about the ability of the steel industry—given its problems of raw materials supplies next year—to meet the intense weight of demand that essential purposes alone will impose upon it.

No doubt this broad approval will in due course be seriously qualified when the scheme comes into detailed operation. Schemes which start with the firm intention of applying refined methods of control such as are suggested by phrases like "specific quantities of steel for specific purposes" have a habit of fitting rather indifferently into the way that industry works. The degeneration of the earlier system of control, which was allowed to inflate itself to the point of breakdown, carries a serious lesson that should not be forgotten. If control is the only solution, then it must be sternly applied, if the priorities that it is intended to secure are in fact to be achieved. For this, the controllers will have to show a resistance to the claims of some industries—and no doubt of some trade unions—that they have not always displayed in the past.

* * *

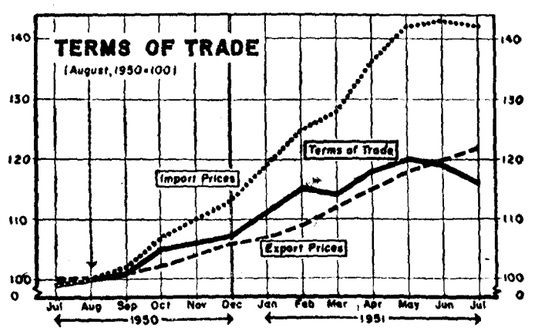
United Sulphuric Acid Corporation

The co-operative project in which eleven large users of sulphuric acid are participating to set up a new plant capable of producing 150,000 tons of sulphuric acid from anhydrite deposits has now reached the stage of financing. The capital requirements of the new company, United Sulphuric Acid Corporation, are put at £4,200,000; this includes working capital and allows for a "steep rise" in costs. Of this total, £1,200,000 is to be subscribed in ordinary shares by the eleven participants, in proportion to the tonnage of acid that each is taking. These quotas are given below:—

	Tonnage		Tonnage
Alumina Co.	4,500	ICI	35,000
British Celanese	5,500	J. H. Dennis	6,000
British Enka	10,000	McKechnie Bros.	6,000
Clayton Aniline	13,500	T. Bolton	9,000
Courtaulds	20,000	Transparent Paper	3,500
Fisons	35,000		
		TOTAL	148,000

The remaining capital requirements are covered by an issue of £3,000,000 debenture stock, placed by Hoare and Company with institutional investors; this stock carries interest at 4¼ per cent and is redeemable by fifteen annual instalments starting in 1956 and ending in September, 1970. The eleven participants severally guarantee the interest on the stock during the period of construction. It is hoped that the plant will be in commercial operation within four years, and the eleven companies have undertaken to buy their quotas of sulphuric acid at a price that will cover interest and sinking fund on the stock during its life. No Stock Exchange quotation will be sought for this issue; a further £1,200,000 of ordinary capital will be subscribed by the guarantors in case of need to service the stock and to complete the plant if the estimates should be exceeded.

Given the technical experience of ICI in supervising and starting up the plant—thus drawing upon a body of established experience gained with a similar plant at Billingham—there is no reason to doubt the technical prospects for the new venture. The economics of the scheme are based on two main conditions—first, the supply of anhydrite, a relatively cheap indigenous raw material, which British Plaster Board has contracted to provide at the rate of 240,000 tons a year; secondly, the sale of cement clinker, a joint product of the process, on which an agreement is being concluded with Associated Portland Cement, who will build a new plant at Widnes, close to the new acid plant, where about



140,000 tons of clinker will be processed. The new venture will start with no apparent sign that elemental sulphur is likely to become much cheaper or more plentiful for some time to come. It would take a severe setback in the price of sulphur to reverse the economic and financial bases on which the plans have been drawn up.

* * *

Import Prices Drop

It was a whim of fate that in July, while the Chancellor of the Exchequer was warning the nation of a threatened trade crisis caused by the deterioration in the terms of trade, the cost of imports should have fallen, for the first time in two years. The Board of Trade index of import prices declined from 143 to 142 (1950=100). This may seem nothing to shout about. Its significance, however, lies in the fact that at long last the decline in world commodity prices, which began last February, has been reflected in the cost of British imports. The index of export prices rose a further two points to 122 (1950=100), so that the cost of imports in terms of exports (as shown in the accompanying chart) declined by 2 per cent. It is too much to hope that this improvement in the terms of trade—if it continues—will do more than reduce the large prospective deficit to one of slightly smaller size. But that would be a welcome relief.

The visible trade gap in July was also smaller, partly because of the higher value of exports. The volume of exports also increased, particularly of metals and engineering products. For example, the quantity of machinery and parts exported rose by about one-seventh, from 1,530,310 cwt in June to 1,743,176 cwt. in July. More vehicles were also exported; car exports increased from 23,170 in June to

24,712 in July, commercial vehicles from 4,992 to 5,295, and motor cycles from 7,166 to 9,922. A larger volume of most types of electrical goods was also shipped abroad. The expansion in the export drive has still come mainly from those industries that have borne the burden in the past and that are likely to be affected by rearmament in the future.

The value of textile exports last month was higher than in June, but was less than the average for the first half year. The volume of cotton yarns exported increased, but the quantity of woven piece goods declined from 72 million square yards to 65 million square yards. Exports of woollen and worsted manufactures increased from 13,888 cwt in June to 15,944 cwt in July, and more rayon manufactures were exported. But the total volume of textile exports in July was still below the average of the first six months of the year. Their increase by value has been almost entirely due to higher prices. Yet it is the textile industry that will have to shoulder an increasing share of the export trade if Britain's rearmament programme is not to create a bigger trade deficit.

Commonwealth Talks on Raw Materials

The meeting of Commonwealth ministers in London to discuss problems of raw material supplies has been fixed for September 24th. The first intimation of such a conference was given by Mr R. R. Stokes, the Lord Privy Seal and Minister of Materials on June 27th, during the second reading of the Ministry of Materials Bill. The agenda has not yet been finally settled, but the conference is apparently intended to provide an opportunity for joint consultation rather than to draw up specific development schemes. And since the Dominions and India are separately represented on the various committees of the International Materials Conference in Washington (Britain, Canada, Australia and India also have seats on its permanent central group), it is highly desirable that free and friendly discussion on each country's peculiar problems should take place. But it would be a pity if the coming conference did no more than that.

The mounting deficit in Britain's total trade and in the sterling area's trade with dollar countries has clearly revived the old fears about the dollar problem. Last year's experience showed that it is temporarily hidden from sight when American industrial activity requires large imports of raw materials; this year's experience shows that it remains a reality. The development of Commonwealth supplies to replace dollar materials is long overdue; opportunities were wasted immediately after the war, and the fiascos of the East African groundnut and the Gambia egg projects are a bitter reminder of the difficulties. But these failures should not deter further development provided the mistakes that have been made in the past are frankly recognised. If the September meeting paves the way for a new era of Commonwealth expansion, it will certainly be fruitful. But the theme of the conference would have to be "what countries can give" rather than "what countries can get."

* * *

Tin and Stockpiling

Tin producers have long been an easy target for American politicians and administrators. Some months ago, a report of a US Senate sub-committee described tin producers as "gouging" the American taxpayer by forcing up the price of tin. More recently Mr Stuart Symington, administrator of the Reconstruction Finance Corporation, which controls the Texas tin smelter and all imports of tin into the United States, repeated this charge. He sought to show that the cost of running the Texas smelter was worth while to the American public, and to substantiate his claim he described how the RFC had pulled the world price of tin down from 183 cents a lb to 103 cents in the past three or four months. It has indeed been an impressive episode, but it has nothing to do with "gouging" and little to do with the Texas smelter. Until last February, the United States was buying as much tin as it could lay hands on, and was paying penal prices. As soon as America stopped buying tin in March, the price fell.

Mr Symington was on good ground when he claimed that exorbitant prices encouraged the development of substitutes. He might have added that a high price for a material makes its user more careful and encourages avoidance of waste. These are simple truths that were amply confirmed when tin was booming. At £1,600 a ton, tin was preposterously dear. But the accusation that foreign producers are trying to maintain an artificially high price for tin is disproved by reference to the facts and to America's own success in forcing tin down by not buying.

The sharp rise in commodities in the nine months after the invasion of Korea has had one salutary effect. It has led the United States Government to revise its stockpiling policy. Last week President Truman authorised the sale of 25,000 tons of copper from the stockpile to meet defence needs. This quantity is to be restored to the stockpile by June, 1952, unless "replacement would not be in the interests of national

A MEMBER OF THE THREE BANKS GROUP

THE ROYAL BANK OF SCOTLAND

The Royal Bank of Scotland was incorporated by Royal Charter in 1727. Retaining its Scottish character and traditions, its influence, though deeply rooted in Scotland, now extends to every part of the commercial world. The Head Office is in Edinburgh; the Royal Bank of Scotland is a member of the Three Banks Group.

defence." It would seem that the American Government is now following the principle that it is better to have a stock of weapons than only a stock of strategic materials; that, after all, was what stockpiling was for.

* * *

Sugar and Dollars

One week after the signing of the new Anglo-Cuban trade agreement under which Britain has guaranteed to buy not less than 1,500,000 tons of Cuban sugar (to be paid for in dollars) during the next three years, the Ministry of Food has announced that the supply of sugar to manufacturers and caterers will be reduced from November 4th in order to save dollars. The British public may be excused the thought that this decision comes very oddly so soon after the Cuban agreement, but this is not the real ground of complaint. The trade agreement was negotiated many months ago—before the Chancellor of the Exchequer had any fear of a dollar crisis this year; the decision to cut dollar imports was taken only four weeks ago when the possibility of a crisis could no longer be ignored, and sugar apparently stands high on the Government's list of dollar imports that are not "vital."

The real criticism is, first, that the proposed cuts will have a negligible effect on the balance of dollar payments. Purchases of sugar for this year have already been completed, so that no saving will be realised until 1952. Next year Britain has agreed to buy all the exportable surplus of sugar from Commonwealth countries and at least 400,000-500,000 tons from Cuba. The only scope for economy is in purchases from the Dominican Republic. Nor will the cuts free larger supplies of sugar for export, for this market has been declining. This year only 650,000 tons are expected to be sold abroad compared with 750,000 tons in 1950.

The actual size of the cut in supplies of sugar to manufacturers and caterers has not yet been published, but it is unlikely to exceed 10 per cent, equivalent to 100,000 tons of sugar worth less than $10 million. It is doubtful whether this kind of snipping serves a useful purpose. The dollar account is not to be balanced by petty economies of this kind, but by broader policies that encourage the earning of dollars. Large quantities of dollar sugar were purchased this year when the price rose to a peak of 8 cents a lb.; next year, when the "saved" sugar comes to be sold, the price is likely to be much lower. Manufacturers buy their sugar at an unsubsidised price, and since a smaller quantity will be sold at this higher price and (presumably) the same quantity for domestic users at the lower subsidised price, the total cost of the sugar subsidy will increase. If this increase cannot be absorbed by a corresponding reduction in the subsidies on other foods or by raising the limit of the total subsidy bill, it will have to be passed on to the consumer in the form of a higher retail price for sugar.

* * *

Cars for the Home Market

The Ministry of Supply has fixed the home market quota of passenger cars for 1952 at 80,000. When the quota for 1951 was reduced from 110,000 to 80,000 because of reduced sheet steel allocations, the Ministry promised that any cars produced above a total of 460,000 could be equally divided between the export and home markets. No such elasticity has been given to the quota for 1952.

The early announcement of the 1952 allocation seems designed to check any false hopes about future supplies for the home market that might have been raised by the opening of the Margam sheet-making plant. The continuing shortage of raw materials makes it less likely that the output of cars can be increased—production in the first half of the year was at an annual rate of less than 500,000 and the trend is downward. Army orders that have been placed with the motor industry go to those sections making commercial vehicles, but the greater weight of materials required for those vehicles, combined with a possible demand for extra labour, will have some repercussions on passenger car production even though military vehicles are not actually being built on passenger car assembly lines.

The factor that decides the rate of deliveries to the home market is, however, not so much the rate of production as the rate of export shipments. Last year, when more than 522,000 cars were produced, export deliveries were maintained at a high rate and the number of cars sold on the home market exceeded the quota of 110,000 by only a narrow margin. Last spring, when production started to fall, shipping difficulties held up the export of many cars destined for Australia, New Zealand and, to a less marked extent, to South Africa. To prevent these cars from piling up on the docks or in the factories, many of them were diverted on to the home market, a practice that has the full approval of the Ministry. In the first five months of this year the number of new British registrations reached 53,000, more than half the home market's allotted quota. There is rather more shipping available now than there was in the spring, but exports to Australia, New Zealand and South Africa could be increased if there were more still.

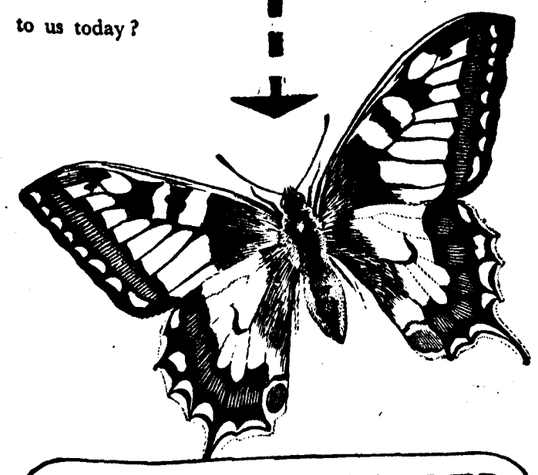
Prospects for Wool

Australia has refused to take part in any international allocation scheme for wool or to consider imposing maximum prices. This announcement was made by Mr R. G. Menzies, the Australian Prime Minister, on Wednesday, and it will at least remove one uncertainty when the Australian wool sales re-open next week. The negotiations on allocation have lasted, on and off, for almost twelve months, and in July it seemed as if the United States would have its way. Now that this question has been finally settled, for international allocation of wool without the world's largest exporter is obviously unworkable, the wool committee of the International Materials Conference will have to decide whether it can serve a useful function in co-ordinating government purchases of raw wool for defence needs.



The New Zealand wool sales held at Napier this week showed some signs of recovery. There was no marked rise in prices, but the tone was firmer and it improved as the sales progressed. American buyers returned to the market on a moderate scale. Prospects for the opening of the Australian season thus seem brighter than they did ten days ago, despite the fact that, for the first time since the war, production of raw wool in the current season will equal or exceed the prospective rate of consumption. Larger clips are forecast for Australia and New Zealand and the world total for 1951-52 is tentatively put at 2,365 million lb (clean). In addition some 85 million lb has been held over from last season, giving a total supply of 2,450 million lb. World consumption in the first half of this year has been running at an annual rate of about 2,350 million lb, and there is as yet no eagerness on the part of manufacturers to accumulate large stocks.

These conditions differ greatly from those of twelve months ago, when wool prices jumped 30 per cent on the opening day of the Australian season. World consumption was then running at 2,650 million lb a year with available supplies at 2,370 million lb; and the scramble for supplies was beginnnig to gain momentum. A lower level of wool prices might indeed encourage a higher rate of consumption. But manufacturers will want to be convinced that retail sales are likely to be maintained and that they will not have to compete against governments for supplies in the near future. Wool textile industries throughout the world have been substituting other materials for wool and this trend is unlikely to be quickly reversed. Even after this substitution,

CATERPILLAR OR BUTTERFLY?

Utility or beauty? Well, as far as it concerns refrigeration we are happy to provide both or either. For 70 years now, we have been producing refrigeration units for every conceivable purpose for trade and industry . . . for big projects such as ice rinks, marine storage, or meeting the more modest requirements of shops and businesses by way of store cabinets and showcases. We also make it our special concern to ensure that each of our customers, big, medium and small, receives a first-class service in the maintenance of his equipment. Our experience, in other words, is as broad as it is long, and therefore, whether yours is a caterpillar or a butterfly of a problem, we will be only too glad to help you. Why not write to us today?

You can't make friends with a robot

SCIENTISTS have invented highly ingenious *Mechanical men* which can work out sums, cross a floor without bumping into furniture and answer questions almost as knowledgeably as Professor Brogan. Nevertheless, most of us would rather have real human beings as companions in our daily lives.

It's rather the same with wood. Wood has a *feel* and a character all its own. No matter how it is sawn, carved and planed, it remains somehow *alive*. You can *make friends* with it.

Naturally, architects specify wood for its traditional purposes wherever they can. The difficulty, these days, is in knowing what timbers are available and in what quantity. A card to the Timber Development Association will bring you details of many excellent woods which have recently come into the market.

There's nothing like **WOOD**

ISSUED BY THE TIMBER DEVELOPMENT ASSOCIATION · 21 COLLEGE HILL LONDON · EC4 and branches throughout the country

the relationship between the consumption of virgin wool and other materials is only back more or less to its prewar level.

A lower level of wool prices should be welcome to importing countries and not serious for the exporters. It would help to curb the income inflation in Australia, New Zealand and South Africa and to damp the cost inflation in Britain, the United States and Europe. Current wool prices, despite the sharp fall of recent months, are still well above the reserve prices fixed by the Joint Organisation and these reserve prices in turn were fixed well above estimated costs of production. Yet it is proper to recall that Sir Douglas Copland, Vice-Chancellor of the Australian National University, has recently expressed the view that a substantial drop in wool prices within the next eighteen months might involve Australia in the worst depression of its history.

New Selling Procedure for Cotton Yarn

The Raw Cotton Commission recently extended the period for which it is willing to sell raw cotton forward, and it is now quoting for most of the important growths up to next June. But spinners have been unable to take advantage of these new facilities because their own forward sales had to be kept within the four-monthly allocation periods. In any one period a spinner could accept orders only up to the end of the following period so that his order book fluctuated from 4 to 8 months. As a new period became due, all the orders for the next period were booked in a very short space of time—often in the first week—and this cyclical pattern of intense activity concentrated into the first week or two of each four-month period was reflected throughout the industry. Converters have always objected to the scheme because they had to buy when spinners could offer yarn and not to suit their customers, often overseas importers.

From next month, however, the Cotton Board will introduce a modified buying and selling procedure for spinners, doublers and weavers. The four monthly allocation periods are to be abolished and instead spinners can contract to deliver yarn up to the equivalent of 40 weeks output. This limit applies at any point of time, so that if the spinner has reached it in any one week, he can take in new orders in the following week to bring his total up to 40 weeks again. The same procedure applies to doublers and weavers. Few spinners are expected to be booked as far as 40 weeks ahead, and it would seem that the idea of limit is retained in order to keep some control on the placing of orders.

These modifications are to some extent an experiment, but the greater flexibility they introduce will bring relief to Lancashire. In future, business can be spread more evenly over the year. Converters can place orders from week to week instead of from four months to four months, while spinners can take advantage of the discounts offered by the Raw Cotton Commission on forward quotations.

* * *

Labour in the Mills

The past three months have seen a gradual fall in the labour force of the cotton industry. A seasonal loss of workers always occurs at this time of year, and the losses recorded so far are not startling, the weekly excess of wastage over recruitment being between 100-200 whole-time workers, mainly from the spinning sections. No single significant cause accounts for the decline, unless it is the high average age in the industry. No more workers are being brought in from Europe, and Lancashire is wholly dependent on the local labour.

Last year, the cotton industry showed a net gain of 10,000 workers, bringing the labour force up from 200,000 at the end of the war to more than 300,000. So high a rate of gain could not be expected to continue indefinitely, and the net gain in the first half of this year was 2,370 compared with 4,210 in the same period of 1951. The chairman of the Bleachers' Association last week gave expression to a feeling prevalent in Lancashire that labour had once again become the limiting factor on the industry's output and that if exports were to be expanded in the coming year, "the question of labour supply should receive the early and urgent attention of the responsible Government department."

It must be hoped that these will prove to be gloomy forecasts. If there has been a rather higher rate of wastage this year than usual, the cotton industry also appears to be getting more than its customary share of new entrants from the schools. The cotton mills have not yet felt the effects of the competition for local labour that will undoubtedly follow the start of rearmament production when this year's programme of re-tooling is completed, but the new and generous wage increases should put them in a strong position to meet such competition. There is also considerable scope for labour economies within the majority of mills, and an impending scarcity of labour might restore the impetus to redeployment schemes that was lost when the recruitment figures began to rise. Given a continual increase in its labour bill, and the clear signs of a buyer's market throughout the world, the industry will be under greater compulsion to improve its efficiency.

Temporary Reprieve for Nickel Users

The date at which the ban on the use of nickel in a number of civilian goods was due to come into force has been postponed for another six weeks, from August 22nd to October 1st. The date from which a licence is needed for the sale of those articles has been extended to the end of the year. The articles affected by the order come into two classes, those using nickel alloy and those that are nickel plated. They include farm machinery, catering equipment, passenger car and radio components, shop fronts, certain hand tools and a wide range of household equipment. Licences for the continued use of nickel were to be granted when they could be justified on technical grounds; by reason of the article's high conversion value on the export market; or even because of "exceptional personal hardship."

The list of prohibited uses was published in June and, as in the case of the earlier ban on zinc, the subsequent flood of applications for individual licences to extend the time-limit showed that the Ministry had under-estimated the stocks of nickel alloys and anodes at the factories or the time that it took for that nickel to be converted into the finished product. The date at which the ban comes into operation has therefore been extended to give time for these stocks to be used up, and for production methods to be changed. There is no prospect of the ban itself being lifted. Already numbers of new cars are appearing with painted instead of plated radiators and wheel hubs but no estimate has been given of the amount of nickel that may be saved by these economies. Much will depend on how leniently the Ministry intends to treat applications for exemption, for the terms on which licences can be granted appear to leave a good deal of discretion.

"Unabsorbed Availability" in Europe

The Ministry of Supply has been drawing the attention of defence contractors to the use that might be made of the facilities of the Ministry's European Purchasing Commission. This Commission was set up in May with a number of offices in Western Europe and is the government agency responsible for placing defence orders abroad. It has two functions—to find foreign manufacturers able to meet defence orders that cannot be placed in this country and to discover capacity in Western Europe that could be employed on British defence orders, and thus relieve the pressure on manufacturing capacity here.

Only a small proportion of such capacity is likely to be employed by the Commission, and it is now being suggested that manufacturers might make use of the information collected by the Commission on what one of the Ministry's regional boards has seen fit to call the "considerable unabsorbed availability" that exists in various countries. Such information could help British defence contractors to find foreign sub-contractors when capacity here is fully employed. The activities of the Commission would be limited to providing information; it would not take part in any subsequent negotiations.

Since several tentative government negotiations have already fallen through because the foreign companies have refused to find raw materials, the scope for such sub-contracting may prove limited. Its greatest possibilities seem to lie in fields where production demands a high degree of skill and where the quantities of materials required is small. One manufacturer has made independent arrangements to obtain precision components for aero-engines from Switzerland, but spare capacity of such a highly specialised kind is likely to be as scarce in Europe as it is here.

* * *

Jute Prospects

Political difficulties between Pakistan and India still interfere with the world trade in jute. Supplies of jute from Pakistan to India have been inadequate and as a result Indian exports of jute goods have declined by as much as 30 per cent. The new season Pakistan crop will shortly be on the market; it is not likely to be much more than 7,000,000 bales and there will be very little carryover unsold from the 1950-51 harvest. Earlier forecasts of the jute crop have proved too optimistic. Nevertheless, prices have continued to fall on the expectations of the new crop and as a result buyers are holding off the market, especially in the United States.

Jute has fallen in Dundee from £240 per ton in April to £149 per ton this week. New crop jute does not arrive in this country until the end of the year. Imports, however, have been good. In July total imports of jute into this country were 15,000 tons, compared with 10,000 tons in June. During the first seven months of the year imports totalled 83,000 tons compared with 70,000 tons for the same period last year and 62,000 tons a year earlier. Supplies are assured until the new crop arrives, since these imports have been in excess of consumption.

Both in this country and in the United States jute remains insufficient for demand for hessian cloth and jute bags. In both countries cotton and paper are increasingly replacing jute. Later this year the shortage may be alleviated to some extent when the Pakistan crop is available in the Indian mills and their working hours can be increased. But jute is likely to remain scarce until India and Pakistan reconcile their differences. Whether the ground lost by jute to other materials will ever be wholly regained is doubtful.

Timber for the Trade?

The timber trade is pressing for a larger allocation of softwoods now that timber supplies in this country are becoming more ample, while the Government is more concerned to increase its stockpile. Imports have increased rapidly and in the seven months to July amounted to 726,000 standards, compared with 316,000 standards last year and 438,000 standards in 1949. Stocks at the end of May were 245,000 standards, representing an increase of 67,000 standards in twelve months. The total import this year on both government and private account is expected to reach 1,600,000 standards, of which a million standards would represent Government purchases. Consumption has been at an annual rate of about 1,100,000 standards, and if this rate is not increased, 500,000 standards will go into stocks.

The size of the Government's intended stockpile is not known. But it would seem highly probable that some 100,000-200,000 standards at least could be spared to increase the monthly allocation to the trade; it would mean an addition of 10,000 to 20,000 standards a month to the present allocation of 90,000 standards. Such an increase would allow more timber to be used for housing. It may indeed seem strange to the layman that, whereas the timber trade is keenly advocating more timber for housing, the Government is refusing to allow it.

* * *

Equalisation and the Local Authorities

The Ministry of Local Government and Planning announced last week that the rateable value of all property in England and Wales rose from just over £325 million in 1949-50 to just under £331 million in 1951-52. Simultaneously, rate receipts of local authorities rose from £283 million to £293 million. The average rate levied therefore rose from 17s. 9d. in the pound to 18s. in the pound—the spread ranging from Whickham in County Durham with 11s. 2d. in the pound to Bedwas and Machen in Monmouthshire with 30s. in the pound. Bournemouth remained the lowest rated borough with 12s. 2d. in the pound.

These figures lend topicality to an enterprising article in the current issue of *Accounting Research*. This article, which is part of a report prepared by a research working party that is inquiring into local government finance, examines the effect of the Exchequer Equalisation Grant introduced by the Local Government Act of 1948. The object of this grant was to equalise local authorities' resources, measured in rateable values, per head of weighted population (the weights were drawn upon a complicated system to compensate sparsely populated areas, which have little opportunity for spreading overheads, and areas with large child populations, which have heavy educational commitments). From analysis of questionnaires completed by the finance officers of county and county borough councils, it has been found that the Equalisation Grant had significantly reduced the spread of rate poundages; the rate poundages reported by county boroughs ranged from 131.6d. to 479.2d. in 1947-48, but only from 145.4d. to 313.7d. in 1949-50. But the working party also found that there had been virtually no trend towards equalisation of services. It believes, in fact, that there was much less inequality of services before the passing of the 1948 Act than had been supposed. This was due to the "overwhelming importance of a few closely regulated services—notably education, which was maintained very near to the national average by 'rich' and 'poor' authorities alike. Such inequality as did exist was due to the necessary sacrifice of less essential services—such as cultural facilities and measures to reduce drabness—by the poorer authorities. Since the introduction of the Equalisation Grant, any extension of these less essential services has been inhibited by the general rise in prices, the increased cost of controlled services and the scarcity of physical resources. The working party believes that these circumstances are likely to continue to prevent any pronounced movement towards equalisation of services in the near future.

Germanium Valves

Important progress has been made in the design and production of tiny germanium valves for radio circuits. The "transistor," as it is called in America, is expected to open up new fields of development in both the civil and military applications of electronics. Crystals of germanium are already used in television sets on both sides of the Atlantic, but until recently their employment was restricted to rectifying oscillating currents and turning them into direct current. Its extraordinary properties are now being developed in other ways. Germanium, a rather rare metal, is a relatively poor conductor of electricity; mounted on a metal base and touched by two "cat's whiskers," it will act as an amplifier in a radio circuit in much the same way as a thermionic valve.

The Bell Telephone laboratories in the United States first published information about the transistor in 1947, but at that time the new valve was unstable, fragile, and created too much radio "mush" to make it suitable for widespread employment. It also required crystals of a fantastic degree of purity. The new product, however, is said to be extremely robust and may be made in the form of a blob of plastic about the size of a pea. The problem of chemical purity has been partially solved, and the valve is now suitable for use wherever fairly low-power amplification is required. A number of American radio and valve corporations are spending large sums on research and development in this field. Two of the largest British companies in electrical engineering and radio are also well advanced towards production on a commercial scale, and at least one of them expects to have its version of the transistor on the market next year. There are still considerable production difficulties, including the accurate positioning of the "cat's whiskers" on the crystal and the need to ensure that these contacts will not shift during the lifetime of the valve.

The new valve seems to offer many advantages over the vacuum tube in many uses. Its small size, longer life, and simplicity—it needs no low tension heater current—are ideally suited for use in electronic computors and control equipment. For similar reasons it should play an important part in the development of guided missiles and radio proximity fuses. It should also find employment in radio and television sets, deaf aids, and in telephone exchanges where the saving on power for valve heater current should be considerable. At the same time, the continual development of the vacuum valve is unlikely to come to a halt.

Shorter Notes

As expected, the special "holiday increase" in the fiduciary issue, which was authorised at the end of July, has been rescinded this week; the fiduciary issue therefore declines from £1,425 million to £1,400 million. The return of notes from active circulation has, in fact, been most satisfactory since the holiday. In each of the last two weeks it has amounted to some £13 million, compared with £10 million and £12 million in the corresponding weeks of 1950. The active circulation, however, still stands at £1,367.8 million, compared with £1,307.5 million a year ago.

*

The first modern-type catalytic cracking unit to be built in Europe has been recently completed at the Shell Petroleum Company's Pernis refinery, near Rotterdam in Holland. Its capacity will be about 1,250,000 tons a year. The Pernis refinery is now the largest in Europe and with this new unit the major part of its postwar rehabilitation will have been completed.

Company Notes

Tootal Broadhurst Lee.—Many difficulties beset Tootal Broadhurst Lee in the year ended June 30th. Not the least was "the violent up-swing in the price of raw materials after the outbreak of the Korean war." The rise in the price of wool and Egyptian cotton to "fantastic" levels and the subsequent recession in prices have confronted the company with the difficult task of adjusting selling prices. Other textile concerns in Lancashire, however, have had to face similar problems and it is in comparison with their recent achievements that Tootal's earnings appear to be disappointing. Group trading profits have fallen slightly from £2,134,139 to £2,105,294 and although the directors were prepared to recommend more, the ordinary dividend has been reduced from 15 to 13¾ per cent in submission to the dividend control proposals. Some of the other trading difficulties are indicated in Sir Kenneth Lee's explanation of the rise in stocks from £2,287,294 to £3,560,559; this was "partly due to the longer time it has taken to convert material into finished goods" and partly to shipping delays which left a much larger volume of goods awaiting delivery in the company's warehouses on June 30th.

	Years to June 30, 1950	1951
Consolidated Earnings:—	£	£
Trading profit	2,134,139	2,105,294
Total income	2,171,604	2,142,401
Depreciation	126,175	163,348
Taxation	1,081,500	1,319,788
Group earnings for ordinary stock	*701,914*	*472,263*
Ordinary dividends	77,113	66,124
Ordinary dividends (per cent)	15	13¾
Added to group general reserves and carry forward	644,080	420,920
Cons. Balance Sheet Analysis:—		
Fixed assets, *less* depreciation	1,000,476	1,291,530
Net current assets	6,800,400	7,052,641
Stocks	2,287,294	3,560,559
Cash and money on deposit	2,608,954	2,015,479
Reserves	4,323,200	5,010,837
Ordinary capital (*a*)	934,700	934,700

(*a*) Includes £134,700 employees' shares.
£1 ordinary stock at 80s. 0d. yields £3 0s. per cent on 13¾ per cent dividend.

The company seems to have had a chequered experience with certain new developments. For example, the experiment of carrying out finishing processes in the United States has proved to be neither successful nor profitable and the American subsidiary has made "a very substantial loss" despite an increase in turnover. The company is, therefore, reverting to the old method of exporting finished goods directly from Britain. In Tasmania, where the company first arranged to build a stitching works, it has now been decided to install plant for the whole range of textile processing from spinning to finishing. This widening of the scope of the project involves delays. Group capital commitments on June 30th amounted to £1,035,515 and it is estimated that a further £200,000 will be needed to complete the new developments. This programme has made and will make considerable inroads upon cash resources.

Sir Kenneth's statement is not reassuring when he comes to speak of future prospects. The difficulty in selling goods in some markets, the "considerable set-back" in the

American textile trade and the lower prices of American cotton goods in comparison with British prices all lead him to the conclusion that "we are coming to the end of the boom period and, in consequence, shareholders must not expect the recent inflated profits to continue."

★

Watney Combe Reid.—The decline in beer consumption, except of the "heavier" bottled ales, has been persistent in the last two or three years. A year ago, the chairman of Watney Combe Reid connected the fall in demand and in brewery earnings with the high level of beer duty. The latest figures of beer output show that production in June was the lowest for that month since 1938. To round off this tale of difficulties, the fall in sales has been particularly marked in Southern England, where the biggest proportion of Watney's trade is concentrated.

It comes, therefore, as no surprise that Watney's group profits show a further fall from £1,696,797 to £1,571,123 after charging £307,660, against £414,651, to a provision for deferred repairs. As taxation is actually higher at £788,966, against £745,200, group net profits have fallen from £951,597 to £782,157.

A year ago, in view of future uncertainties, the company reduced the ordinary dividend from 20 to 17 per cent. This latter rate has now been maintained and this may suggest some revival of confidence. There are some grounds for this belief. First, beer prices have been raised, which will help to cover increased costs of production and distribution—though the effects on consumption may be another matter. Second, the company, by acquiring the business of Charles Hammerton, the stout brewers, has widened its interests in the more popular bottled trade. Third, the company has extended and modernised its own plant. The offer of £2,000,000 4 per cent debenture stock may be used to finance further capital projects. Alternatively, it may be needed to meet further investment commitments in current assets.

In the advance in industrial shares earlier this year, some interest was taken in the shares of breweries specialising in bottled beers, but it would not be unreasonable to characterise the brewery shares market as comparatively listless and, given present prospects, rightly so. Watney's £1 deferred shares at 59s. xd. yield 5½ per cent.

★

Pinchin, Johnson.—The latest trading year of Pinchin, Johnson, to March 31st, was marked by raw material shortages and rising costs, which finally forced the company to raise its selling prices. Demand, however, has been so well maintained that new production and sales records have been set up in this country and by certain overseas subsidiaries. The improved results of these overseas companies contributed "substantially" to the advance in group trading profits from £1,344,355 to £1,648,599. The ordinary dividend has been maintained at 25 per cent, which will be the controlled rate if dividend control becomes effective.

	Years to March 31, 1950	1951
Consolidated Earnings :—	£	£
Trading profit	1,344,355	1,648,599
Total income	1,400,226	1,739,425
Depreciation	127,186	153,577
Taxation	659,540	844,477
Group earnings for ordinary stock	*459,594*	*465,411*
Ordinary dividends	343,517	350,092
Ordinary dividends (per cent)	25	25
Retained by subsidiaries	42,067	74,273
Added to carry forward	75,175	103,276
Cons. Balance Sheet Analysis :—		
Fixed assets, *less* depreciation	2,185,420	2,450,497
Net current assets	4,802,312	4,898,140
Stocks	3,412,340	3,992,514
Cash	1,401,776	753,059
Reserves	3,574,658	3,671,839
Ordinary capital	2,629,800	2,629,800

10s. ordinary stock at 14s. yields £5 14s. per cent.

The balance sheet, naturally enough, reflects the effects of price inflation. Stocks are up from £3,412,340 to £3,992,314, and debtors from £1,923,375 to £2,341,006. Some strain has therefore been imposed on liquid resources; bank overdrafts have been reduced from £373,434 to £271,263, but cash balances have fallen from £1,401,776 to £753,059. The chairman's statement points out that each 10s. ordinary share is covered two and a third times by tangible assets at book value. This valuation is a conservative one, for it ignores "the very considerable excess of the real values of fixed assets over the book values." The paint industry is keenly competitive, and the chairman once again emphasises that profits can only be maintained by a larger volume of sales.

★

Distillers.—The remarkable expansion in Distillers' profits and the company's dividend policy was discussed in a note in *The Economist* on July 28th. If the Government's dividend proposals come into force then the ordinary dividend will be controlled at a maximum rate of 21¼ per cent. The full accounts reveal some important changes. One is a rise of one-fifth in stock values, from £35,588,938 to £42,770,446, and a big jump in debtors from £8,043,559 to £13,539,693. There is no comment on these increases in the report; they clearly have a connection with the rise in raw material prices, but they also pose a problem about working capital.

Here also there are significant changes that will no doubt be explained at the annual meeting; cash balances of the group have risen from £5,644,794 to £10,322,940, but the book value of "quoted investments" has been reduced from £10,673,843 to £4,846,289. This mobilisation of cash during a year which saw the issue of £10 million of new loan stocks is perhaps to be regarded as timely preparation against further increases in prices, but the report does not explain it. The directors draw attention to the creation of a stock contingencies reserve, which stands at £439,190, in respect of stocks held by certain subsidiaries which is considered desirable in view of "recent increases in the costs of raw materials."

Additions to fixed capital have been covered by last year's twin issues of £10 million of unsecured loan stocks. This development programme is on a considerable scale; in the latest year the gross book value of plant, machinery, etc., has risen from £7,789,648 to £10,328,699, and outstanding commitments are estimated at £2,306,000. The rise in the book value of the group's trade investments from £3,457,701 to £5,221,516 illustrates the widening fields of industrial activity into which Distillers is branching out. It is a policy that has transformed the industrial progress and prospects of Distillers in recent years. Would it not be helpful to the stockholders and to the group's employees to say more about these achievements in the annual report and to describe the several component parts of the business—each of which is a major industrial undertaking?

	Years to March 31, 1950	1951
Consolidated Earnings :—	£	£

COMPANY MEETINGS

BLEACHERS' ASSOCIATION LIMITED

HIGHER TRADING PROFIT EARNED
RESERVES FULLY EMPLOYED
TAXATION AND HIGH COST STRUCTURE
MR R. C. REYNOLDS ON COTTON INDUSTRY'S FUTURE

The fifty-second annual general meeting of Bleachers' Association Limited was held in the Assembly Room, Blackfriars House, Parsonage, Manchester, on Wednesday, August 15, 1951.

Mr R. C. Reynolds (the chairman) presided.

In proposing the motion for the adoption of the report and accounts, Mr Reynolds said:

Ladies and gentlemen:—The Report of the Directors and the Accounts have been in your hands for several weeks. May I have your agreement that they shall be taken as read? (Agreed.)

It must be seldom that in two successive years a company has to deplore the loss of its Chairman in office—but so it is with us—and it is with the deepest regret that we have to record the death of Sir William Clare Lees on May 26th last after rather less than a year of office as Chairman in succession to Sir Alan Sykes.

This second blow has been a severe one for the Company to sustain, as Sir William had for so long been associated with the higher direction of the Company's affairs, previously as Deputy Chairman and before that as Chairman of the Management Board. His unexpected death has deprived us of a leader whose wise counsel and high example we had hoped to enjoy for quite a few more years. He was pre-eminently fitted for the office which he held and his loss will be felt over a wide area of the industrial activities of Lancashire.

Your Directors have done me the honour of appointing me as their Chairman.

We have also to record with regret the death, through an accident early this year, of Mr T. H. Cooke, the latest recruit to our Board, whose appointment was confirmed by you at our last Annual General Meeting. He was a comparatively young man whose ability held high promise of a successful career, and we shall miss him.

Our late Secretary, Mr Herbert Johnson, retired on pension at the end of the financial year, after spending the whole of his business life in the service of the Association. I am sure you will wish him health and happiness in his retirement, and that you will welcome his successor, Mr E. G. Goold, who has been with us for several years as Assistant Secretary and whom we have now appointed to the office of Secretary.

BALANCE SHEET AND RESERVES

In the Association's balance sheet, which is submitted for your approval, the value of fixed assets shows a net increase of rather more than £63,000 over the corresponding figure a year ago. This increase results from net capital expenditure amounting to £202,000, after allowing for sales, less the year's provision for depreciation of £138,600.

Investments are higher by some £45,000 and the total of current assets by rather more than £250,000. The latter figure includes an increase of over £50,000 in our cash balance, and the remaining £200,000 represents the increase in working capital required to finance business under present conditions of high prices and the need to maintain adequate stocks of materials in short supply.

On the left-hand side of the balance sheet, the total of revenue reserves and undistributed profits at £1,720,900 shows an increase over the total at the end of the previous year of £238,000. I will return to this item in a moment or two to explain the allocation of the reserves when I have completed the survey of the balance sheet. The only other changes in the balance sheet are a small decrease of £5,000 in loans, and an increase of £88,000 in provisions and current liabilities which arises almost entirely under the heading of trade creditors.

From the figures which I have quoted, it will be realised that after allowing for the full utilisation of the year's provision for depreciation, the total additional capital resources required by the past year's business have amounted to about £360,000. Against this may be set the increase of £88,000 in current liabilities and provisions, leaving rather more than £270,000 to be provided either out of undistributed profits or by the reduction of available liquid resources. I have been anxious to establish this point even at the cost of burdening you with more figures than I like, because it is the key to the appropriations which the directors have made and those which they submit for your approval.

To return now for a moment to the revenue reserves. The general reserve fund has been increased by a transfer of £100,000 from the profit and loss appropriation account, making the total of the fund £800,000. The investments contingency fund has been augmented by a small profit of £3,200 arising out of an exchange in one of our investments. We have transferred £250,000 from the contingencies fund to form the foundation of a fixed assets replacement fund, and have added to this new fund a sum of £100,000 out of the year's profits, making the total into £350,000 and reducing the contingencies fund to £125,000.

ADDITIONAL WORKING CAPITAL

These appropriations, together with a transfer of £23,000 from profit and loss account to the taxation allowances equalisation account and an increase in the balance of the profit and loss account carried forward after providing for the recommended dividends, make up the total increase of £238,000 in our revenue reserves which, together with an increase of £40,000 in the reserve for Income Tax on current period profits, have provided the increased capital resources required during the past year.

Apart from our investments in gilt-edged securities, which are no more than equivalent in amount to the general reserve fund, our accumulated reserves are fully employed in the business, and since the business has required this year some £270,000 additional working capital, your directors have decided that not less than £200,000 of that sum must be set aside out of the year's profits before considering the amount which can be recommended to be applied to the payment of dividend upon the ordinary stock.

As long as Government policies maintain the inflationary pressure and as long as Government taxation practise is draining the capital out of industry that, I hope, will be our policy. Otherwise we should fail in what, I believe, should be our first consideration, and that is to protect the value of your capital. That value depends upon the maintenance of the value of the assets and of their earning capacity. The appropriations which have been made to the reserves are no more than is necessary for that purpose, and although it would have given your directors as much pleasure to recommend a larger dividend on the ordinary stock as it would have given you to receive it, I believe that stockholders who will take the trouble to examine our accounts in the light of these remarks will agree that the recommendations we have made are the best that could be made in their interests.

LIMITATION OF DIVIDENDS

The Government have now intimated their intention to limit the distribution of dividends by statutory enactment. If this is carried into effect the matter will pass from our control and questions of policy will no longer arise. The explanations offered for this grossly unfair proposal are so unconvincing that it can only be regarded as a political move and therefore, perhaps, unsuitable for discussion here. It does, however, give rise to one thought. The rate of tax on distributed profits was raised by the recent Finance Act from 30 per cent. to 50 per cent. for the express purpose of discouraging the payment of larger dividends, and to encourage the retention of profits in business. If, in future, dividends are to be rigidly controlled by statute, there would appear to be no reason why the rate of distributed profits tax should not be restored to the 30 per cent. level, thereby leaving more of the profits in companies' reserves. This would at least provide ultimately some compensation to the ordinary shareholder for the arbitrary restriction with which he is now threatened.

TAXATION AND INFLATION

The Association's profit and loss account shows a trading profit for the year, before providing for taxation, of £873,500, compared with £795,800 in the preceding year—an increase of nearly £78,000 or almost 10 per cent.

The provision for income tax and profits tax, however, is nearly £67,000 higher, and with an increase of almost £10,000 in the transfer to taxation equalisation account, the available net profit for the year is little more than £1,000 higher than that of the year before.

Taxation last year absorbed 55½ per cent. of the profit, although the increased rate of distributed profits tax applied to only a portion of the year. To the extent that the increased cost of taxation is attributable in part to the cost of the rearmament programme, we must regard it as the price to be paid for safeguarding what in current parlance is termed "our way of life." But even without the added cost of the safeguard, the "way of life" is a costly affair when it is translated into the "welfare state."

Most of us, I believe, would regard the improvement which has been effected in the standard of living of a large section of the population as a desirable thing, although we may not all agree that it should have been achieved by quite so drastic a redistribution of income, and that it would have been more soundly based if it had rested on the increased productive effort of those who have benefited. But few can regard with equanimity a system which by taxation is rapidly reducing our capital and converting

it by subsidies, or by the provision of free services, to additional consumer purchasing power which, although constituting an improved standard of living for some, is contributing substantially to the inflation which is raising the cost of living for all.

By such means we are building up in this country a high cost economy which must react against the sale of our products abroad and depleting our capital resources to an extent which, if continued, will ultimately undermine the employment of our workpeople.

There is little else in our accounts that calls for comment. The consolidated balance sheet shows no important changes, but it will be noted that in the consolidated profit and loss account the profit carried forward is about £98,000 more than that which is carried forward in the Association's accounts. This additional profit is retained in the accounts of the subsidiary companies, as their available funds are required to finance their current business at the higher level of costs now prevailing.

FUTURE PROSPECTS

Our future prospects are almost entirely dependent upon those of the cotton industry as a whole. As finishers we do not own any of the cloth we process and our work is practically all with merchant and manufacturer converters who distribute their own products in the finished state.

There is, therefore, little that we can do to regulate the volume of our production beyond giving the highest quality of finish and the best service we can to our customers. There appears to be every prospect of the cotton industry being fully employed, certainly to the end of the current financial year, and in the absence of a major crisis, for some time beyond that.

Under present conditions there is some uncertainty with regard to the future price of cotton, and a natural unwillingness on the part of those who may be affected thereby to commit themselves too far forward on a basis of price which may not be sustained. This hesitancy is, for the moment, retarding business, but it should be no more than a temporary pause.

The capacity of the cotton industry to meet the demands which will fall upon it is, however, entirely dependent upon its ability to retain its labour force, which it is becoming more difficult to do in face of the demands created by the rearmament programme. Since the Government is relying upon the cotton industry to increase substantially its exports, in order to balance the diminished exports of engineering products and also to help in narrowing the gap which has recently re-appeared in our external trade balance, the question of labour supply should receive the early and urgent attention of the responsible Government department. Even if we succeed in avoiding any depletion of our labour force, it is almost inevitable that the required increase in exports must involve some contraction in supplies to the home market, and so add a little more weight to the inflationary pressure.

Looking further ahead, our main concern must be first with the threat of the high cost structure which is being built up in this country under our present system of national finance and taxation, and secondly, with the rehabilitation of the Japanese cotton industry, as well as the continued industrialisation of some of our still important export markets.

For our part we have done our best to ensure that we can face the future with confidence. We have, as you will have seen from the accounts, incurred an increased expenditure upon repairs and maintenance, and we have spent substantial sums on capital account for the renewal and modernisation of our plant. Much attention has been given to means to increase our productivity per unit of labour either by improved methods of working or increased mechanisation. Our research organisation has been actively engaged in the investigation of new finishes or more efficient methods of production, and the Association's works are well equipped to play their part in maintaining the progress of the cotton industry.

I am sure you would not wish me to conclude without expressing on your behalf, as well as for myself, our sincere thanks to my colleagues on the management board, to our executive and other directors, to all our branch managers, and to the staff at head office and at our works, as well as that fine body of craftsmen and operatives upon whom we depend, for all that they have done to contributed to the results we have placed before you.

Mr P. L. Wright seconded the resolution and the meeting approved the report and accounts.

The retiring directors were re-elected and the fees of the joint auditors, Messrs Jones Crewdson and Youatt and Messrs P. and J. Kevan were fixed.

A vote of thanks to Mr R. C. Reynolds for presiding was moved by Mr E. R. Clark and carried unanimously.

JEREMIAH AMBLER AND SONS LIMITED

RECORD RESULTS

MAJOR E. BEDDINGTON BEHRENS' STATEMENT

The fifty-eighth annual general meeting of Jeremiah Ambler and Sons Limited was held on August 14th in London, Major E. Beddington Behrens, M.C., Ph.D., the chairman, presiding.

The following is the statement by the chairman, which had been circulated with the report and accounts for the year ending December 31, 1950, and was taken as read:—

As I forecast in my statement last year, I am again able to present to you "satisfactory" results of the trading of 1950. Profits for the year to December 31st, after all provisions, except taxation and debenture interest, amounted to £222,244, as compared with £220,118 for 1949, and constitute a new record. After deducting income tax and profits tax totalling £116,504, debenture interest £9,563, the fixed dividends on the preference shares £9,075 net, and the interim and proposed final dividend totalling 14 per cent. for the year on the ordinary stock £21,189 net, there remains £65,913. Adding to this amount the balance brought forward from last year and reserves no longer required gives a total of £325,273 to be carried forward.

This amount carried forward is equivalent to nine times the amount (£36,121 after tax) required to pay a full year's interest on the existing debentures, together with the fixed dividend on the preference shares and dividends at the present rate of 14 per cent. on the ordinary stock.

As shown on the schedule attached to the accounts, the ordinary dividend of 14 per cent. only represents approximately 1¾ per cent. on the capital actually employed in the business, less the nominal amount of the debentures and preference shares. The fixed assets, freehold and leasehold properties, and plant and machinery, shown in the balance sheet of the group at the written down value of £309,118, are valued for insurance purposes at £2,201,000.

BONUS ISSUE APPLICATION REFUSED

As it is proposed, subject to the appropriate resolutions being passed, to make a further issue of debentures, to which I refer later, it was necessary to apply to the Capital Issues Committee for permission to repeat the bonus distribution of nearly 3 per cent. as last year, by an issue of £7,244 of ordinary stock, which assuming the maintenance of the present rate of dividend, 14 per cent., would only require an additional £532 net per annum. Bearing in mind the conservative dividend policy that has been followed (the dividend has been kept at 14 per cent. since 1946) and the excess of the net value of the assets employed in the business over the issued capital, your board regarded this request to the Capital Issues Committee as most reasonable. Permission has, however, been refused, and I regret therefore that we are reluctantly unable to make a bonus issue this year. As you will have seen in the press in the case of certain companies permission has been given for substantial issues of bonus shares, while other applications of apparently equal merit have been refused. On what grounds the Treasury base their decisions in such cases is not at all clear.

NEED FOR FURTHER WORKING CAPITAL

The rapid rise in the price of wool and other fibres during the year under review made the provision of further working capital necessary, in spite of the fact that the larger part of the profits have been retained in the business. Taxation at present levels leaves our group, in common with the rest of the wool textile industry, with inadequate funds to replenish raw material stocks. Accordingly during the year £150,000 four and a-quarter per cent. debentures, being the balance of the total of £300,000 then authorised, were issued.

Although group stocks have been kept at the lowest possible level compatible with efficient production, at December 31, 1950, they amounted to £1,127,010, as against £647,860 the year before, an increase of £479,150. After taking into account the proceeds of the additional issue of £150,000 of debentures, the net overdrawn bank balance of the group at December 31, 1950, was £147,349, as compared with a balance in hand of £121,557 and a holding of £118,925 of tax reserve certificates the year before.

DEBENTURE ISSUE

In order to provide the group with further liquid resources it is proposed to issue a further £200,000 of debentures, and meetings of the debenture stockholders are being called at which resolutions are to be proposed increasing the total authorised issue of debentures from £300,000 to £500,000, and increasing the rate of debenture interest from 4¼ to 5 per cent. Resolutions are also to be proposed at the annual general meeting increasing the directors' borrowing powers to an amount equal to one and a-quarter times the issued capital of the company. The Treasury has already given its consent to this proposed further issue of debentures.

Our physical output for the year was 8 per cent. in excess of that for 1949, with a more than corresponding increase in value due to rising prices. This increased production has been achieved with approximately the same labour force, the increase being due to improved efficiency resulting from the policy of modernisation and re-equipment that has been followed since I became chairman and the extension of incentive bonus systems for our operatives resulting in higher individual average wages but a lower labour cost per unit of production.

During the year under review, wool, our principal raw material, more than doubled in price, and the other animal fibres we use correspondingly increased. Your board had, however, adopted a very prudent policy with regard to raw materials, which the recent considerable fall in the price of wool has fully justified.

DEVELOPMENT OF SYNTHETICS

The high cost and scarcity of natural fibres is leading to an increased use of synthetics, which not only cost considerably less, but the prices of which are more stable. Although this tendency is now being arrested by shortages of the raw materials required to make rayon and nylon, we have made good progress in the development of specialised yarns of mixed wool and synthetic fibre combining the advantages of both. Approximately 8 per cent. of our output now consists of synthetic fibres.

In Ulster, where the labour position is easier than in Bradford, our wholly-owned subsidiary Jeremiah Ambler (Ulster), Limited, is now operating continuously on a two-shift basis and making a satisfactory contribution to the profits of the group.

THE CURRENT YEAR

During the current year to date the profits have been maintained, and having regard to the existing contracts I feel confident that I will again be able to present shareholders next year with equally "satisfactory" results. Taking a long-term view, the wide fluctuations in the prices of raw material must create serious concern. After the large re-equipment undertaken in recent years we have come to the conclusion that in present unsettled world conditions it is now prudent for the company to slow up the installation of additional plant and equipment and the increase of productive capacity, and to husband its resources against a rainy day.

Towards the end of the year Mr A. S. Bower joined the board and became managing director in place of Mr J. S. Ambler. Mr Ambler has served the company for a great many years, and on behalf of the company and the board we extend to him our very good wishes in any future activities in which he may be engaged.

In conclusion I wish to express my appreciation of the services of my co-directors, and of those of the directors and managers of our subsidiary companies and the staff and workpeople of the whole group, and to congratulate them on the excellent results achieved.

CHAIRMAN'S ADDITIONAL REMARKS

In answer to a question Mr Beddington Behrens stated that as a member of the Council of the Federation of British Industries he had adhered to the recommendation of the Federation not to increase dividends. The company's earnings in the last four years had averaged 67 per cent. on the nominal ordinary capital of £282,516 (represented by assets at replacement value of £2,595,638) and had only paid 14 per cent. to shareholders, or less than 25 per cent. of available earnings. Thus, companies like ours who have strictly supported the Government in their plea for moderation of dividends, are penalised as compared with other companies who had decided, wisely as it now seems, not to co-operate with the Government. This is extremely unfortunate, as it had always been in the tradition of British industry to co-operate fully with the Government of the day, of whatever party.

The report and accounts were unanimously adopted.

EDGAR ALLEN AND COMPANY, LIMITED

MR W. H. HIGGINBOTHAM'S REVIEW

The fifty-second annual general meeting of Edgar Allen and Company, Limited, was held on August 16th at Imperial Steel Works, Sheffield, Mr W. Higginbotham, F.S.A.A., F.S.S. (chairman) presided. He said that during the year ended March 31st every department of the company's varied business was very actively employed; as a result the total turnover, in value, was roughly 12 per cent. higher than in the preceding year and the highest yet recorded. Although sales of steel declined in the latter part of the year (restrictions having been imposed on certain exports) sales of steel castings were maintained at the level of the previous year; those of small tools and permanent magnets were substantially higher; and the turnover of the engineering division increased by nearly 45 per cent.—largely by completion and delivery of a considerable amount of equipment which was in an advanced stage of progress at the beginning of the lyear. The profit on this fell, of course, into this year's accounts. These factors, and particularly the last mentioned, accounted in the main for the increase in trading surplus (before depreciation) for the year to £547,549 as against £454,352 last year. The overall ratio of profit to turnover had not increased —in one or two instances it had actually fallen slightly, and although price increases had occurred they had done little if anything more than offset the advances in wages, materials and in other costs.

The balance sheet showed total assets of £3,172,774 comprising fixed assets of £1,223,285, or 38.6 per cent.; current assets at £1,769,964, or 55.8 per cent.; and interests in subsidiary companies and trade investments amounting together to £179,525, or 5.6 per cent. As compared with the previous year the value of fixed assets was less by £21,743; under the head of current assets, values of stocks and work in progress were greater at £842,506 by £98,788; book debts now £690,278 were higher by £130,135; and cash balances at £237,180 had increased by £38,507.

Current liabilities appeared as £429,108 and showed a net increase on the year of £52,077. Of this amount £33,751 arose under the head of sundry creditors, £9,892 in respect of income tax and profits tax, and £8,434 in the provision for dividends. In addition to these liabilities there was a further liability for taxation due at a later date, amounting to £191,500 and showing an increase of £25,500 over the corresponding figure of last year, and further their total liability, present and prospective for taxation amounted to £311,638 or more than the rest of their external liabilities put together.

The surplus of current assets over current liabilities was £1,340,856; addition of the value of interests in subsidiaries and that of investments (together £179,525) raised that surplus to £1,520,381 which was greater by £200,690 than last year's corresponding figure. The net worth of the company's business without consideration of the value of goodwill, comprised paid-up capital of £730,945, revenue reserves (derived from the taxed profits of the past) £905,911—making together £1,636,856—and capital reserves of £850,260, totalling £2,487,116.

Summarising the trading results and the appropriations of profits they found that net earnings, before tax, at a rate of 18.9 per cent. in relation to net worth were reduced after taxation to 8 per cent.; from this 6.3 per cent. was ploughed back into the business, and dividends took the balance of 1.7 per cent.—the proportion taken by the ordinary shares was 1.36 per cent. net.

The report was adopted.

WILLIAMS AND WILLIAMS LIMITED

SUCCESS OF OVERSEAS VENTURES

The forty-second annual general meeting of Williams and Williams Limited, was held on August 17, 1951, at Reliance Works, Chester. In the absence of the chairman, Mr B. A. Williams, O.B.E., M.I.P.E., on company's business abroad, Mr T. Sarl-Williams, A.C.A., presided and read the remarks of the chairman, of which the following are extracts:—

Ladies and Gentlemen,—I am disappointed at being unable to be present at the forty-second annual general meeting of your company, especially as it will be the only annual general meeting of the company I have not attended. However, I, with the other members of your board, after careful consideration, decided your interests would be better served by my attendance with directors of your subsidiaries in Europe and Africa at special conferences being held abroad.

Since our last meeting, Mr J. K. Vivian and I have visited many of your subsidiaries in North America, and we are glad to report that they, in common with your other interests, continue to make progress. It has been necessary during the year for three of your subsidiaries to extend their buildings and to install additional plant and machinery. Such development, although costly, must receive priority, notwithstanding the heavy claims made on the company's liquid resources, so severely restricted by the burden of taxation. Of your overseas companies I would in particular refer to the one in Manila which, during the first year of its operation, proved an outstanding success and fully justified the expectations expressed in my remarks at the last annual meeting.

I would also report the resignation of Mr A. M. Maddox, who for many years has expressed a desire to return to India, where he has joined some very good friends of ours. We were glad to be of some assistance to him in achieving his ambition, and would like to record our appreciation of his loyal and distinguished service.

THE YEAR'S RESULTS

Turning now to the profit and loss account and balance sheet, you will observe that the year's trading has shown a consolidated net profit of £236,939 after providing for all chargeable expenditure other than taxation and after adding the sum of £164,609 brought forward from previous years, a balance remains of £401,548 which your directors recommend be dealt with in the manner set forth in their report.

Your directors recommend that a dividend of 17½ per cent. be paid on the ordinary share capital of the company. In submitting to you this recommendation I would remind you that the last increase in the rate of dividend was recommended to you fourteen years ago and has been maintained consistently ever since. Whilst the directors are fully mindful of the continued need for restraint, they consider it only fitting that some modest but tangible indication of the success of your overseas ventures should be made, and it is in the growing promise of these ventures that this recommendation should receive your consideration.

Doubtless you would like me to say a word or two about the future. I will refrain from depressing you with a catalogue of difficulties such as power cuts and restricted supplies of raw materials, but will end on the note of assurance that, confident of the loyal co-operation of your staff and employees to whom much of your progress is due, we shall unitedly meet these difficulties in the future with the same determination as we have met them in the past.

The report was adopted.

GLOBE TELEGRAPH AND TRUST COMPANY, LIMITED

SUCCESS OF RECONSTRUCTION

The seventy-eighth annual general meeting of The Globe Telegraph and Trust Company, Limited, was held on August 17th in London.

Sir Edward Wilshaw, K.C.M.G., the chairman, after expressing regret at the death of Mr B. W. Bloomer, and stating that Mr Harold Vennils and the Rt. Hon. Lord Pender, C.B.E., had been appointed to the board, in the course of his speech, said:—

The accounts cover the year to June 30, 1951, during which period the capital of the company has been reconstructed. The result to date of that reconstruction will, I venture to say, be found to be most satisfactory. In recommending to you today, as I shall do later, the adoption of a final dividend of 4½ per cent., less income tax, making in all 7 per cent., less income tax, for the year, I feel that you will agree that I have fulfilled my prediction that your income from the company would exceed that which you received prior to reconstruction.

Whether or not we shall be able to maintain this rate of distribution in the future will depend upon the regulations in force at the time, but it should be obvious to all that the proposals in regard to the limitation of dividends and even their reduction, as announced by the Chancellor of the Exchequer, subsequent to the compilation of our present accounts and to the issue of our report, must not only have their effect on the income which we receive in future from our investments, but also limit the amount which can be distributed to you. In the case of companies whose capital structure has changed in the last two years, the effect of the proposed legislation is far from clear.

DETERRENT TO RISK CAPITAL

It cannot be too widely known that a very large proportion of the securities which have thus been affected are held by people of small means, and the registers of our public companies will show how small is the average individual shareholding.

Apart from the upheaval in prices which this measure has brought about, the effect must be to make registration of companies in this country less attractive than ever, and to offer to the foreigner—who might otherwise be prepared to bring financial resources to this country—the greatest deterrent from so doing. Nothing is more discouraging to the provider of risk capital, whose aid we need so much at the present time, than the fear of political action.

The value of the quoted investments (£6,136,073) included in the portfolio, alone amounts to £8,623,544, an appreciation of £2,487,471, or a little more than 40 per cent.

The profit of the year before taxation amounts to £314,961, or 8.1 per cent. on the issued capital, and these profits do not include a full year of our new investments. You will have received an increase in income from the company somewhat greater than the most optimistic forecasts that could have been made when the reconstruction scheme was put before you. The dividend for the year is 7 per cent., which we hope to be a maintainable minimum. It represents an increase over the former dividend of 5 per cent., free of income tax, paid on the Ordinary capital before the reconstruction scheme.

In the circumstances, I think you cannot but be exceedingly pleased with the results, and I have every hope and confidence that so far as it lies within our powers, these results will be maintained.

The report was adopted.

WM. CORY & SON, LIMITED

IMPROVED TRADING RESULTS

The Rt. Hon. Lord Leathers, C.H., presided on August 23rd at the fifty-fifth annual general meeting of Wm. Cory & Son, Limited, held at Cory Buildings, Fenchurch Street, London, E.C.3.

The following is an extract from his statement circulated with the accounts:—

We have completed concentration of ownership of the fleet of steam colliers in the holding company.

The net profit is £676,637, an increase of nearly £25,000 over that of the previous year.

The tonnage of coal distributed by your company in this country (including imported coal) was 5 per cent. greater than in the previous year. The percentage carried in our own coasting collier fleet was less than in the preceding year. Your company placed orders for three new ships before Budget Day. The coal exports from this country were lower than in the previous year, but the company's tonnage was much higher because of coal exports from sources outside this country.

The company's discharging installations on the Thames, as well as the lighterage section, handled tonnages well above those of last year. The Group immediately after the war embarked upon a building programme of some 250 barges and eight tugs, involving an expenditure of more than a million pounds, which is practically completed. As the barges are larger and the tugs correspondingly more powerful, the fleet has been more than maintained.

The oil department had another good year with a tonnage increase greater than that recorded last year. Since the close of the financial year, the action of the Persian Government has brought about the cessation of shipment of oil from Abadan, which provides a very substantial part of your company's activity in oil supplies for marine and other purposes.

The subsidiaries in South Africa had a successful year in 1950, with exports at peak figures for both volume and price. The situation in South Africa has seriously deteriorated since early in May, through an unexpected shortage of rail transport. So acute has the position become as to make it necessary for the South African Government again to apply the Coal Export Permit system and to decline to issue permits meantime, which means, for the present, a cessation of all coal exports.

John Kelly Limited, of Belfast, in which business your company holds a half interest, has again had a satisfactory year. Contracts for three new ships have been placed.

The report was adopted.

SANDAC RUBBER

In his statement accompanying the annual accounts of Sandac Rubber Estates Limited, for 1950-51, the chairman, Sir Eric Macfadyen, stated that the year's crop was 944,190 lb. and the profit realised was £46,899, reduced by taxation to £20,249. From this balance, £12,790 had been transferred to replacement reserve, bringing that provision for replanting and new planting up to £20,000, and a dividend of 12½ per cent. was recommended on the company's issued capital of £88,744, leaving £7,221 to be carried forward, against £5,111 brought in. The balance sheet showed securities and cash £46,070, and stocks and sundry debtors £27,615; and, on the other side, £26,650 required as a reserve for future taxation liabilities. There was a new capital reserve of £3,497, being a first payment of one-quarter on account of the amount receivable from the war damage compensation fund in North Borneo. Replanting had been resumed, but could not be pushed forward rapidly owing to the difficulty of securing more labour; the company had, however, set aside money as above to provide for more rapid progress when this difficulty could be overcome. No problem before the Government of North Borneo was more pressing than that of securing a more adequate labour supply. The accounts showed that the cost of working the estates had increased considerably, expenditure on revenue account being £53,786 against the previous year's £39,298. He had had an opportunity of visiting the estates in March last and had found them well managed and in a state of cultivation not, in essentials, below that prevailing prewar. North Borneo had so far been immune from the unrest and terrorism which had recently been the bane of neighbouring territories.

CORK MANUFACTURING COMPANY, LIMITED

ANOTHER SUCCESSFUL YEAR

The twenty-seventh annual general meeting of the Cork Manufacturing Company, Limited, was held on August 23rd in London, Mr A. Coote, M.A., M.I.N.A. (the chairman), presiding.

The following is an extract from his circulated statement:—

It has been my good fortune for many years to begin my remarks by announcing another successful year. I am glad to be able to do so again today. On the Cork side of the business there has been a considerable increase both in turnover and in production; the latter in spite of shortages and the rise in price of raw materials. On the plywood side, sales have also increased.

Increased costs of raw materials have necessitated increased selling prices. Such increases have been kept as low as possible and so far as I can see have not caused any diminution in demands for our products.

In the opinion of your directors the present liquid resources of the company are insufficient. We are, therefore, at present carrying out negotiations for the issue of debentures to raise the additional cash which is considered necessary.

The directors recommend the payment of a final dividend on the Ordinary shares of 12½ per cent. actual, less income tax, making a total dividend for the year of 17½ per cent. actual, less income tax.

I would say that in spite of raw material and other difficulties, the company is prospering and our order books are in a satisfactory state.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting, the chairman said: In my statement which was circulated with the accounts, I mentioned a proposed debenture issue and stated that I hoped to be able to give shareholders further information at the general meeting.

I am now able to say that permission has been received from the capital issues committee for the issue at par of £150,000 mortgage debenture stock at the rate of 4½ per cent. per annum. The issue will be privately subscribed by institutional investors and provisional promises to accept allotments up to the total amount of the issue have already been received.

The trust deed is now being drawn up, and when this is approved, as is expected shortly, the issue will then be completed.

I will add that sales for the current year continue to be highly satisfactory.

The report was adopted.

INCORPORATED ACCOUNTANTS

THE SOCIETY OF INCORPORATED ACCOUNTANTS AND AUDITORS' EXAMINATIONS

EXAMINATIONS, NOVEMBER, 1951

The Society's November, 1951, Examinations will be held on the following dates:—

Final, Part I.	13th and 14th November, 1951.
Part II.	15th and 16th November, 1951.
Intermediate	15th and 16th November, 1951.
Preliminary	15th and 16th November, 1951.

The centres will be Belfast, Birmingham, Cardiff, Dublin, Glasgow, Leeds, Liverpool, London, Manchester and Newcastle-on-Tyne.

Applications on the appropriate forms, which can be obtained from the Hon. Secretaries of District Societies, must be lodged with the Secretary, Incorporated Accountants' Hall, Temple Place, Victoria Embankment, W.C.2, not later than Monday, September 17th.

BOARD OF TRADE announce Vacancies for Statisticians in London. Salary range, £1,000-£1,375 (men); £880-£1,200 (women). Starting pay according to qualifications and experience. Appointment in a temporary capacity but with F.S.S.U. benefits. Candidates should have University degree in statistics, or in mathematics, economics or other appropriate main subject combined with statistics, with at least Second Class Honours or equivalent. Work requires a combination of technical ability in selection, preparation and interpretation of relevant statistics with broad understanding of nature of administrative problems and is mainly concerned with statistics of trade and industry at home and abroad, including Trade Accounts for U.K. and Censuses of Production and Distribution; also general economic studies relating to national income, capital expenditure, and the export trade. Written applications, giving date of birth and education, full particulars of qualifications and experience (with posts held, including dates) should be addressed to the London Appointments Officer, Ministry of Labour and National Service, 1-6, Tavistock Square, W.C.1, quoting JN.129, by September 6, 1951. In no circumstances should original testimonials be forwarded. Only candidates selected for interview will be advised.

INFLUENTIAL national body, central council of a group of Trade Associations, headquarters London, requires Secretary to take full charge of its work, including committee structure, relations with Government departments, preparation of surveys, study of statistics, issue of weekly publication. Age not below 40, administrative ability, capacity for verbal and written expression, good presence. Salary according to qualifications but not less than £1,500.—Apply, with full particulars, to Box 732.

ECONOMICS. Twelve-lecture course planned to explain basic principles of economic science. Evenings 7 to 9. Begins September 17th. Fee 1 guinea. Enrol now or ask for further information.—SCHOOL OF ECONOMIC SCIENCE, 11, Suffolk Street, S.W.1. Telephone: Trafalgar 6415.

Postal Tuition for B.Sc.ECON.
The London University B.Sc. Econ. Degree is a valuable qualification for statistical research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894): fees are reasonable and may be paid by instalments if desired.

Mr Gromyko at San Francisco

MR GROMYKO's 61-minute speech at San Francisco on Wednesday revealed only part of his hand. It revealed what the Russians want, but not how they propose to try to get it. He has, however, succeeded in stealing the show and there is an element of petard-hoisting in the position of the Americans, who arranged the conference as an opportunity for oratory and propaganda and now find the world once more hanging on what the Russians will say.

It is not that there has ever been any question about their objective. They want to prevent the signing of a treaty that is an achievement of their opponents and excludes them from any legal authority in the Far East. And it is altogether probable that their tactics will be those they regularly use when trying to prevent something they do not like. They will declare it to be intolerable and will but barely conceal the threat that if their wishes are not met they will unleash total war. What the world wants to know is how far they will push these tactics. It is certainly no accident that the cease-fire negotiations in Korea have been brought, for the duration of the conference, to a position from which they can be turned either to peace or to war.

Fortunately there is not much sign of anybody being greatly impressed by the threat. It may, indeed, be a real one; but the free world has long ago made up its mind to face the threat of Russian aggression while preparing to be able to prevent it. It is unlikely in the very highest degree that the Japanese treaty by itself would make the difference in Stalin's mind between war and peace. If he is prepared to go to war about it, it is because he has made up his mind to go to war in any case—and in that event, to yield to the threat at San Francisco would split the free world for no purpose at all.

The Japanese treaty is not perfect, and the fact that it will have so few Asian signatories is certainly a very grave drawback. But its authors can at least take one credit for it, that much the greater number of the criticisms that have been levelled at it are on the score that it is too liberal. Liberal peace treaties must expect to be unpopular at the time they are signed. But they stand up very well to the test of history, and the signatories at San Francisco may well be content to await that test.

But in any case the time for expressing doubts has passed. A large majority of the governments entitled to a voice in the matter had made up their minds, before the Russians said they would come to San Francisco, to sign the treaty. Nothing could possibly be sillier than, having decided to do what it was known the Russians did not like, to hesitate now merely because Mr Gromyko's presence at San Francisco underlines the Kremlin's threats. He has undoubtedly succeeded in introducing an element of the farcical into the proceedings; but the farce must be played out according to the advertised programme.

The Age of Inflation

AT Blackpool this week Mr Gaitskell made another plea to the trade unions for moderation in pressing wage claims. In the past similar pleas have met with some response. But the omens are now that the unions will turn a deaf ear, not because they have suddenly grown more wicked or less responsible, but because they feel themselves under greater pressure from the rising cost of living. The Chancellor told them that they could not have a larger slice of the cake ; but they think they are defending their present slice, and they will go on with their claims even though they know that to do so will put the cost of living up again. There could hardly be a clearer demonstration of how the standards of economic conduct deteriorate just as soon as it becomes the general belief that the value of money will go on falling.

The accepted standards of behaviour in an age of rising prices formed the subject matter of a series of articles by a correspondent which have appeared in the last three issues of *The Economist*. Our correspondent has two main theses. The first is that the value of money will continue to fall for as far ahead as can be seen. The second is that a number of consequential actions should be taken, most of them having the form of revising the various forms of monetary contract to make them adjustable by an index number of prices. These two theses are logically quite separate, and it is possible to be impressed by the strength of the arguments for the one while still rejecting the other. The first of our correspondent's theses, in fact, seems to us to rest on much firmer grounds than the second. But both are matters which deserve the most careful consideration by all who have at heart the continuance of a liberal civilisation built up on trust and contract.

There can be no denying that the inflationary tendencies at work in present-day society are very strong indeed. It is plain that many of the social and institutional forces determining the direction of the economy have decisively changed ; the bias has been shifted from deflation to inflation. Redistributive taxation has sapped the sources of saving ; the growth of state planning has put the control of monetary policy into the hands of men whose occupational temptation must always be to take the optimistic view and to hand out more claims to wealth than the economy can in fact redeem ; full employment has enormously strengthened the bargaining power of trade unions ; the breakdown of free trade and the gold standard has removed the main restraints against inflation —there is no need to repeat the catalogue, which can be found set out in detail in the first of our correspondent's articles. Some of his arguments seem to us to be overstated. For example, we cannot believe that the tendencies towards self-generating fluctuations which are so strong in a mature industrial society have been so completely overruled as to abolish the trade cycle completely—though that may only mean that the upward trend of prices will not be quite so continuous as our correspondent thinks. Or, as a special case of the same exception, we cannot believe that the present rearmament programme is going to be as inflationary in its later stages as in its first heave—indeed, when the rate of increase of spending on arms slows down there may even be deflationary reactions. Nevertheless, taken in their entirety, the arguments for our correspondent's first thesis are very impressive indeed. It takes an uncommonly hardy degree of optimism to deny them. In economics man has stumbled on a peculiarly diabolical form of perpetual motion and has embodied it in a steamroller which all sensible men will wish away but whose progress they seem powerless to arrest.

*

If, then, the first proposition—that prices will continue to rise indefinitely—can be accepted, at least as a strong hypothesis, the argument moves on to the second and much more debatable contention. If inflation is likely to be permanent, what should be done about it ? Mankind, the argument runs, must lie on the inflationary bed it has made ; it may as well recognise the fact and decide to be as comfortable as possible. The chief social objection to inflation is that it is unfair. In effect, it defrauds—for the benefit of the rest—all those people whose claims on the community are at present fixed, or nearly fixed, in money terms. It defrauds, that is to say, pensioners, holders of fixed-interest securities of every kind, creditors in general, most people who save, people who insure themselves, many salary-earners, and those wage-earners whose bargaining strength is relatively weak. The essential proposal of the articles is that the money value of most of these claims should in future be related to the cost of living. The scheme is not perfectionist: some anomalies would remain—for example, salaries would follow the cost of living only after a time-lag. But, broadly speaking, all claims on the real national income would be insulated from the effect of inflation. As money depreciated, everyone would get more of it. By making the fraud universal, no one would be defrauded.

Basically, this argument is a humanitarian one. Since inflation is inevitable, and will cause a great deal of individual hardship, let us do what we can to alleviate the hardships. But like many other humanitarian arguments it ignores the effect that it is likely to have on society as a whole and therefore, at one short remove, on the individual whom it is designed to relieve. The basic defect of all devices to take the sting out of inflation is that they make more inflation inevitable. In attempting to relieve the hardship caused by rising prices, they make prices rise still faster. This is true for two quite separate reasons. First, it is inevitable in the logic of the matter. Inflation does not just happen ; it is caused by the issue (or, more accurately, by the coming on to the market) of more monetary claims to wealth than there is wealth to satisfy ; the only way by which the economic mechanism can solve the problem is by putting prices up until enough people are cheated of their expectations of wealth to make ends meet. The cheating, in other words, is the object of the process ; and the more arrangements are made to see that nobody is cheated, the longer the process must go on. The anomalies and injustices of inflation are the brakes restricting its speed ; remove them, and even a small excess of demand over supply will result in a very large rise in prices.

In practice, however, this is likely to be less important than the second, or psychological, reason for saying that

all attempts to soften the pain of inflation in fact increase the amount of it. The major brake upon the speed of inflation is the degree of confidence that, even in a manifest inflation like the present, people still place in the value of money. (For example, more life insurance is being sold now than two years ago, when the general view was that prices were as likely to fall as to rise.) To destroy this confidence is to take the brakes off inflation. But this is exactly what our correspondent's proposals would do. Every one of them would be a public proclamation that money will not keep its value. Every one of them is an open invitation to the public to lose what confidence in its currency it still retains. Yet once it is generally believed that continuous inflation is inevitable, and particularly if the belief is formally embodied in the economic structure as would be done by these proposals, then that belief automatically makes inflation worse. In a moderate inflation the fraud works by money losing its value when people expect it to remain stable ; if they start expecting prices to rise, then the fraud must work by prices rising faster than they expect. When expectations are revised accordingly, the actual increase must become greater still. And so on. This is the galloping inflation familiar enough in countries hitherto less fortunate than Britain.

Our correspondent rightly claims that his proposals would not in themselves create such a process ; but they might well tip the balance which is already so uncertain. In some respects they would make a runaway, as well as a moderate, inflation less intolerable. Bond values tied to the cost of living would help people to keep their capital intact, and everyone would have the security of knowing that his future real income would not be cut. But such considerations would not affect the main fact that if everyone expects prices to rise appreciably every month, money in the pocket or in the bank becomes something to get rid of. It loses its functions as a store of value and a unit of account, and becomes satisfactory as a medium of exchange only if it can be exchanged at once. Bonds (even at zero interest) cannot fulfil the functions of cash. Once the inevitability of inflation is accepted, its consequences are no longer those of moderate inflation—inconvenience and inequity affecting countless individual transactions. They are a flight from the currency and the broad social and economic disorganisation that it involves.

Here, then, is a very painful dilemma. If a continuous rise in prices is thought to be inevitable, there will be very strong humanitarian and political pressures for adopting the sort of measures of relief that our correspondent advocates. Indeed, it will be very difficult to resist these pressures, for to do so is to stand by while the strong, the ruthless, the fast-moving, the well organised, the selfish protect themselves and the weak, the modest and the public spirited, the pensioner, the widow, the orphan and the ward of charity go to the wall. Yet the other horn of the dilemma is at least equally intolerable. For to do all these things is to make the inflation more certain and more swift until at last it becomes a torrent. Galloping inflation is not only socially and economically destructive beyond the imagination of anyone who has not experienced or observed it, it can also be fatal to political liberty itself. If modern liberal civilisation were to become so committed to inflation as the articles suggest, then how it can be made less uncomfortable is not the only question to be asked. There is the question whether such a civilisation can survive. Inflation may make mankind mad enough to turn with relief to the sort of collectivist economy that can solve its problem, after a fashion, by arbitrarily decreeing a large reduction in prices overnight, in the style of Russian practice.

*

From this dilemma there is, in our opinion, no escape. One horn of the dilemma means intolerable individual injustice ; the other means certain destruction of the free society as we know it. Thus if our correspondent's first thesis is accepted, it matters very little whether his second is accepted or not, for the choice is only between different forms of social suicide. If anything more than a very gradual fall in the value of money becomes the normal expectation of ordinary people, then there is acute danger ahead for democratic society.

The argument must therefore be taken back to its beginning. In spite of the very impressive weight of the reasons for the thesis that inflation is inevitable, it is imperative to reject it. What is more, it can be rejected if there is the will to do so. The proposition that inflation is inevitable is not an acknowledgment of economic determinism but a political judgment that the will to control inflation has disappeared. Six years of postwar experience seem an inadequate basis for quite so pessimistic a conclusion. The brave new economic planning is surely not a robot that has already completely mastered its creators. The political will is obviously and lamentably weak, but the right course for those who see realistically the strength of inflation is not to accept its inevitability. It is still to do—with however sinking a heart—all that can be done to strengthen the will to stop inflation before it is too late.

Germany and the West

A YEAR has almost passed since Mr Acheson informed the surprised Foreign Ministers of Britain and France that the American Government had decided to accord Germany the right to rearm, in return for a greater measure of sovereignty. It was inevitable that this reversal of previous policy should have thrown confusion into the relations between the Germans and the occupation powers ; but few could have realised at the time that twelve months later the cleavage between the two would be actually greater than it was last September.

On the eve of the meeting of Foreign Ministers in Ottawa, it is very doubtful whether the gains in the relationship between the Germans and the western governments during the last twelve months have not been more than offset by losses. On paper, some progress has been made—the agreements for the Schuman Plan and on the basis of a European Army are cases in point—but these paper agreements have not been implemented and those who observe the tone of German politics can only wonder if they ever will be. On the credit side, it can be recorded that the hostility of the German man-in-the-street to the idea of rearming even for defence has diminished. The majority is no longer dominated by the nihilistic slogan "*ohne mich*"—"count me out." For this change various factors are responsible, notably the display of American determination and strength in Korea, the conception of a European army, and the lead given by the German generals to their former troops. But once the Germans realised the strategic bargaining position in which they found themselves and the chance which rearmament offered them, they launched upon a campaign of self-pity, criticism and importunate demands which in turn is in a fair way to alienating the western governments. There is still a little time for an objective reassessment of the position on both sides and perhaps for a lightening of an atmosphere which is beginning to be dangerously charged with emotions.

At present the German leaders, with the notable exception of Dr Adenauer, and an irresponsible press, are fostering the national tendency to run to extremes and make claims without regard to practical possibilities of their fulfilment. The public is being whipped up to resentment against the western powers in hysterical terms which are often ridiculous when set alongside the facts. Though Americans would be wrong to conclude that the $4 billion in aid which they have given Germany ensures them any gratitude or automatically justifies everything that has been done since Potsdam, the Germans for their part are grossly exaggerating their complaints. They are convinced they are oppressed, and are determined to shake off all shackles ; and they are completely unaware that their record of stubborn, distorted opposition to necessary burdens and reforms is causing indignation among those who have kept them alive.

The German press has recently listed those grievances which, it is said, destroy Germany's will to join in defence of the West. They are the Ruhr Authority's insistence that nearly 25 million tons of German coal must be exported to other countries this year ; the refusal to admit Western Germany's political sovereignty over the Saar ; the refusal to reduce the bill for occupation costs ; the removal of foreign securities owned by Germans ; the Allied law establishing the seizure of these and other German assets abroad as reparations which will not be offset against the Reich's foreign debts ; an Allied measure to prevent German courts from condemning spies who provided information to the western powers, and, last week, the High Commission's sharp reminder that the Germans must not go back on the undertaking they gave (as part of the negotiations on the Schuman Plan) to dissolve their monopoly coal-selling organisation. Under the heading "First die—then live !" the refugee press adds to this list Mr McCloy's intimation that Congress can hardly be asked to provide a billion marks for the German refugees until the Government makes a practical contribution to Atlantic defence.

*

These are some of the main grievances of the Germans. Their positive demands have not been precisely formulated. But it would be well to examine them as far as they can be ascertained, and see whether they constitute too high a price for a German contribution to the manpower of the Atlantic forces. These demands are certainly not low. They start with insistence on complete equality with other sovereign powers, more particularly in the organisation of the European defence force (which means that if the French keep a general staff, the Germans must have one, too) ; they proceed to territorial claims—an end to the political autonomy of the Saar and an assurance that Germany's lost lands beyond the Oder-Neisse line will eventually be returned ; and they make it clear that these things must be combined with a higher standard of living and a complete system of social security. Further, the German Government has intimated that Germany will establish a defence force only if the United States will pay for it ; every pfennig that is spent on a German army must be deducted from the amount now levied upon the Government by the western powers to meet the costs of occupation—indeed, more than that, for the occupation budget must first be reduced by the one or two billion marks which the Federal Government declares it cannot raise. Another billion marks must be contributed by the United States and other nations for the Germans exiled from the territories east of the Oder-Neisse and elsewhere, for, it is threatened, the refugees will otherwise be consumed by a nihilistic will to destroy. An assurance must be given, it is claimed, that General Eisenhower will not retreat from the Elbe, but will carry any war immediately to the Vistula, for Germans are not willing to see any of their territory devastated again—neither the present Federal Republic nor those homelands in Eastern Europe which, they demand, must be returned to them without fail.

The former German army, led by the ex-generals, has added its own particular claims to the rest. It declares that the honour of the German soldier, including the *Waffen SS*, shall be acknowledged in word and deed. The men who fought for their Fatherland and "for Europe," and the officers who kept their oath to their Supreme Commander, must be rehabilitated, and the Allies' work of "glorifying treason" must be undone.

The western governments, it seems, must at once issue a declaration of collective innocence to the Germans. Otherwise, it is implied, the Allies will only have themselves to blame if in the midst of battle a German general decides that his patriotic duty lies not in obeying General Eisenhower, but in joining fellow Germans in the Soviet-German ranks.

The impression must not be given that the Federal Government itself subscribes to all these extravagances. The financial demands mentioned above have been officially put forward ; but for the rest, Dr Adenauer has pursued a far-sighted and moderate course. His insistence that the first steps in German rearmament must be entrusted to soldiers whose hostility to Hitler is not in doubt has brought him into conflict with an influential section of the military community, and his deliberate expression of support for the survivors of the July 20th plot against Hitler in a recent broadcast was largely censored by the German press. This action shows how far public opinion is being encouraged—by the press, by the Opposition and even by minor politicians of the Government parties—to race ahead of the moderation of the Chancellor himself, who may, before long, find himself compelled either to subscribe to the whole extreme programme or see his coalition fall to pieces.

It is not necessary to ask whether any of these demands rest upon a basis of justice, since it is perfectly obvious that they are not going to be granted. Even the formulation of demands such as these, when they percolate through to western public opinion, will lead to an outburst of anger. No American or British or French government could think of conceding even a small fraction of the programme that is now being built up by the press and the minor politicians of Western Germany. If these are the conditions for German co-operation with the West, then there will be no co-operation.

For the present state of affairs the blind arrogance of the German temperament is partly to blame. Surely no other people would be so wholly unable to see themselves as others see them. But the follies of Allied policy towards Germany must also bear a very large share of the responsibility. A long chain of mistakes, starting with the doctrine of unconditional surrender, the destruction of all governments in Germany and the policy of Potsdam, has led to the present position. It was always perfectly clear that a policy towards Germany that started off by being too strong would finish up by being too weak, and that the longer the delay in recognising the idiocy of Potsdam the more sudden would be the somersault into appeasement. It is very little comfort, indeed, to those who, like this journal, repeatedly predicted what would happen to see their predictions so completely fulfilled. The task now is to cope with the situation that exists, and the central fact about it is that willing German co-operation with the western allies has become something that appears much more valuable to the western allies than it does to the Germans. That this puts the Germans in a strong bargaining posiion cannot be helped. The clumsiness of American policy last year underlined the fact and gave the Germans an open invitation to blackmail ; but the strength of their position is too obvious to have gone undiscovered for very long. At the moment, the roles are almost reversed ; it is not the victors who face the vanquished, but those who want something and those who have it to give or to withhold.

The Germans, characteristically, are greatly overplaying their hand. They may lose the game in so doing, but it serves no useful purpose to pretend that their hand is not a strong one. Before the final tricks are played, however, it would be as well for both sides to ask themselves where their real interest lies—and perhaps the best way of clearing minds on that is for both sides to ask themselves if they really prefer the alternative to striking a mutual bargain.

*

The advantage to the western allies of incorporating Western Germany in the North Atlantic community, and using its manpower and industry in the common defence, is too obvious to require any re-arguing. Indeed, perhaps it has been overstated. It is certainly very great ; but not so great that any price at all can be exacted for it. The time has come to talk plainly about the alternative. If willing German co-operation is refused—or is offered only on terms too fantastic to be accepted—then the alternative is not, as it might have been two years ago, that the western powers would wash their hands of Germany and evacuate their troops. So long as the danger of war with Russia continues, the Allied troops are obviously going to remain on the Elbe and start fighting there—any other proposition is madness. Whatever happens, Germany is going to continue to be occupied and will be involved in a new war if it comes. The difference is that, if German co-operation is refused, Germany will have to be treated as potentially hostile territory—and the Germans themselves are in the best position to know that armies can fight very effectively even if the inhabitants of the country they are fighting in do not want them to. Another consequence would be that the strategy of the West would no longer have to include the defence of Germany against destruction as one of its objectives. Clearly, such a state of affairs would be very much less desirable to the western allies than to have Germany as a willing ally, equally sharing the burdens. But it would also be very much less desirable to the Germans. Do they realise, with all their wild talk, that the alternative to co-operation with the West is not to find themselves in the position of a neutral, but in no man's land ?

If there is any common sense left in Western Germany, a bargain can still be struck. And since the Allies are seeking something of value to themselves, they must be prepared to pay a price. They must be willing to take risks in withdrawing the restraints upon German sovereignty in advance of the German *quid pro quo*—but only if they have good reason to believe that the *quid pro quo* will be forthcoming. They should be willing to meet the Germans halfway on the question of occupation costs, since to have their armies in Germany serves a valuable purpose of their own—but here, again, they will not be willing to put money down for nothing. The Germans will have to realise—to put the matter in its bluntest terms—that it is a question whether they can be trusted. And the way that most of them have been talking in recent months does not encourage a favourable answer.

INDEX

The Index to Volume CLX of *The Economist* (January to June, 1951) is now ready. Copies, price 2/6 post free, may be obtained from:

The Tourist Industry—I

The Value of Visitors

FROM the publicity that attaches to each increase in the volume of tourist traffic, one might conclude that it is something entirely new for Britain to be a tourist centre—an ingenious new way of making up some of the income from overseas investments which disappeared in the course of the war. The truth is very different. As an earner of foreign exchange, tourism's postwar achievement is a parallel not to, say, the booming motor car industry, so much as to the struggling cotton trade. Britain's gross income from tourism in 1950 was almost double what it was in 1938; but as the value of money was halved in that period, the return in real terms was very much as it was before the war. Moreover, in proportion to Britain's total overseas receipts, the contribution from tourism was smaller than before the war. In 1938 it brought in £30 million, out of total receipts of £938 million—about 3 per cent. In 1950 it brought in £58 million out of total receipts of £3,132 million—less than 2 per cent.

Tourism, moreover, still shows a net deficit in the balance of payments. This was always so, for British people are inveterate travellers as soon as they have enough money. In 1950 holidays abroad cost the country £82 million in foreign exchange (though this official figure is somewhat too high, since it is based on the travel allowances granted and does not take account of the unused travellers' cheques which holidaymakers returned). On the other side of the account, foreign tourists spent some £58 million in the United Kingdom. These receipts and payments are not comparable, however, because the figure for outgoings includes some fares paid for foreign transport on international routes, whereas the figure for income does not include fares paid by foreigners to British shipping and airlines. If these are included, Britain's earnings from tourism amounted to £81 million. In short, the net deficit was small, and moreover involved exchanging soft currency for hard; for British tourists go mainly to the Continent and Eire, whereas American and Canadian tourists form a large part of the incoming traffic. But it was still a deficit.

*

Why, then, is there so much talk about the postwar development of tourism? It refers to the *number* of visitors to Britain, which has increased from less than 450,000 in 1938 to over 600,000 in 1950. In real terms the average expenditure per head of these people was only about three quarters of what the average visitor spent in 1938—a reflection of the fact that Britain is not the only country which has been redistributing its national income. The number who came to Britain in 1950 was still low compared with the 3,050,000 who visited France or the 3,500,000 who visited Italy. But visitors to Britain stayed longer; in terms of "tourist nights," Britain had a better record than Italy in Holy Year—some 18½ million compared with Italy's 17 million.

To correct the impression—probably fairly common—that tourism is a new source of income to Britain, and a vastly more important one than before the war, is not to belittle its importance or deny the usefulness of efforts to develop it. In these times it is a particularly good way of earning foreign exchange because it uses a very small amount of raw material. The purchases of tourists certainly contribute heavily to Government revenue, through indirect taxation and especially through liquor duty and entertainments tax. Above all, it is a way of earning dollars. American and Canadian visitors to Britain in 1950 spent $61 million, not including their fares—equivalent to some 42 per cent of the total expenditure by all tourists in Britain. American visitors alone, if fare payments to British shipping and air lines are included, were worth some £25 million to Britain, or about one quarter of total physical exports to the United States. An average American tourist, travelling on a British ship, is worth as much in dollar earnings as the export of a motor car.

This year the number of American visitors has declined. Between January and July, for example, they numbered 73,000, compared with 78,140 in the same months of last year. The Festival of Britain was not enough to offset the fear of war. But potentially there is a large "pool" of American tourists still to be tapped. According to a study made by the Unites States Department of Commerce, some 80 per cent of Americans employed in private industry in 1948, and 97 per cent of all office workers, got holidays with pay for a minimum of two weeks. For two weeks it is impossible to come to Europe except by air; the air fare—now £241 return from New York to London—is high, but not impossible to save for in a country where average weekly earnings in industry now amount to $41, or £15. There are already cheap fares in the winter and, if the present intentions of the airlines are realised, there will in a year or two be "second-class" air fares across the Atlantic. As travel comes within reach of their purses many Americans want to visit their relatives in Europe. The Department of Commerce estimated that there are nearly 30 million Americans of first or second generation of European descent, and over 3,000,000 originating in the United Kingdom.

All these Americans with their family ties, their desire to taste the culture of the old world and to know the peoples with whom they have thrown in their lot, form collectively what is known to the inhuman statistical world as the "dollar tourist potential." Its existence has brought into being a whole crop of organisations, national and international, for the promotion of tourism, and above all of dollar tourism. In Britain the body with the task of promoting the tourist industry is the British Travel and Holidays Association. This was reconstituted in 1950 and is a semi-official although independent body receiving Government assistance. At first the Exchequer contributed a pound for every pound contributed by the members. The share was increased to two pounds in every three, and now the procedure is that the association presents its budget, and broadly speaking the Government makes up the deficiency that cannot be financed in other ways. It is a very large deficiency. Last year a grant from the Board of Trade provided £591,000 out of the association's total income of £712,956, and the members a mere £59,432.

About four-fifths of this income is spent on overseas publicity, whose object is the general one of getting people to "Come to Britain." BTHA has published a large number of booklets, for example, on such subjects as castles and cathedrals, and there is an excellent magazine called "Coming Events," with attractive photographs and descriptive articles, which is distributed free in strategic places. Most of the publicity is directed towards the United States. One effective trick is to photograph an ordinary American family outside, say, Buckingham Palace, and send the photograph to their local paper.

Of the members, only local authorities, or rather their towns, are specifically mentioned in the publicity. According to an Act of 1931, local authorities are permitted to levy a rate up to a maximum of ½d. for the purpose of overseas publicity conducted through an appropriate agency. This power is exercised to such effect that local authorities make a far larger contribution (£31,788 in 1950) to the funds of the association than any other class of member—a fact which perhaps outweighs the disadvantage that they are not always the towns which, on aesthetic grounds, one would advise the foreign tourist to see.

*

Since, apart from the mention of certain places, BTHA's publicity is all of a general character, it is clear that the small section of the trade which subscribes to its funds is benefiting other sections which make no contribution whatever. The people concerned with tourists and travel—whether by the British at home or by overseas visitors, whether by road, rail or sea—form a larger manpower group than is employed by any other industry, or about 6 per cent of the working population. The hotel and catering trade alone employs some 650,000 workers; yet it contributes only £5,857 to the association.

There are exceptions to all generalisations, but the hotel and catering industry as a whole is little interested in foreign tourists, who are considered to give too much trouble. If European, they speak the wrong language and complain about the food. If American, they are always demanding hot water or iced water—anything but water as God made it—and the noise they make disturbs the old ladies in the palm court. The average hotel keeper much prefers the Englishman, who makes no complaints and no demands, sits quietly in the bar all evening and goes off to bed in a harmless stupor. And with roughly half the adult population of Britain going on holiday every year the hotelier does not need to attract the foreign tourist to fill his hotel in the summer. A provincial hotel has an exceptionally large foreign tourist clientèle if this constitutes more than 5 per cent of its total trade. Moreover, only a limited number of places are on the foreign tourist's map: London, Oxford or Cambridge, Stratford, Edinburgh and perhaps the Trossachs—and Britain, except to the more discerning tourist, is done.

It is arguable that as the trade's contribution to the funds of BTHA is so small, it might be better to dispense with it altogether, so that the association would have a freer hand in dealing with the trade. Only then, for example, would it be possible for it to draw up an objective hotels guide, on the lines of "Auberges de France," which might do much to raise the standard of British hotels. But to make the association entirely dependent on Government funds would have two considerable disadvantages. The first is that its approaches to the trade would then be regarded as the meddlesome interference of a Government department, especially when it passed on a client's complaints—one of the functions that it now performs. As it is partly acting for the consumer, it is not a trade association in the usual sense; but the members know that it is concerned with their interests too, and not merely with Britain's balance of payments.

The second disadvantage of an association wholly dependent on the state is that, although the development of tourism has received official blessing, it conflicts at many points with the rest of the planned economy—at least as now planned. In practice a large part of the association's time is devoted to pleading the cause of tourism against competing claims and against controls of various kinds. It is therefore better that it should speak with something of an independent voice. Even today, when foreign travel is no longer the preserve of the rich, tourism is still largely a luxury business; and as such it accords ill with the inelegant egalitarianism of the politicians. The difficulties of fitting tourism into the welfare state involve, however, wider questions than this, and will be discussed in a second article.

The Essential Liberty

Have the Christian Socialists faced the idea of the shameless and tremendous despotism they will have to conjure up in order to ensure the working of their scheme? . . . How are they to deal with those independent workmen who, either from rejection or from choice, have remained free and unassociated? Are they to be condemned to inaction and starvation? . . . Are they to be forbidden to work except for a certain number of hours and at a prescribed rate of wages? Is the individual capitalist to be prevented from employing them on any terms which he and they . . . may mutually agree upon? If not—if they are to be free to work how they like, as long as they like, for whom they like, and at what remuneration they like, then all your boasted extinction of competition is at an end; the very basis of your scheme for revolutionising the existing arrangements of capital and labour crumbles in the dust; the essence of your panacea for regenerating society evaporates in air; and the golden age is as far removed as ever. If, on the other hand, these floating, isolated, unattached freemen are to be debarred from the first element . . . of liberty—viz., the right to sell their own labour on their own terms and to a customer of their own choice; if the associated guilds are to be endowed with power to crush all outlying rivals and competitors, or to compel them to a forced and loathed incorporation—then you are not only casting out Satan by Satan's agency, but you are bringing seven worse devils than the old one into the chamber you have swept and garnished for your mad experiment; . . . you are summoning Tyranny to do the work of Justice; you are rashly calling in the worst foe to civilisation . . . to aid you in your glorious aims of indefinite improvement and universal emancipation; you are asking spirits from hell to do the work of angels from heaven,—and they laugh in scornful amazement at your blind temerity and your wilful and headlong self-delusion.

The Economist

September 6, 1851

NOTES OF THE WEEK

The West Confers

Next week an historic round of international conferences begins with tripartite talks in Washington between the foreign ministers of America, Britain and France, after their return from the signing of the Japanese peace treaty in San Francisco. If the Russians do not put this time-table out by their tactics over Japan, Mr Acheson, Mr Morrison and M. Schuman are due to assemble on September 10th for three days. They are to conduct a general *tour d'horizon*, but the three main items on their agenda are, first, Germany—its contribution to western defence, contractual relations with the occupying powers, and the Pleven plan for a European army—secondly, the Middle East, including the organisation of its defence and the trouble with Egypt over the Suez Canal, and, thirdly, the revision of the Italian peace treaty.

On September 15th the Council of the twelve powers of the North Atlantic Treaty Organisation (Nato), each represented by its foreign, finance, and defence ministers, assembles in Ottawa for a week—Mr Morrison is booked to sail for home in the *Queen Mary* on the 21st. The first two agenda items for Ottawa are the admission of Greece and Turkey to Nato—now sponsored by France as well as by Britain and America—and the wide range of problems involved in sharing the burden of rearmament, to be discussed specifically in the light of the confidential report just drawn up by the FEB (Financial and Economic Board) in Paris. Probably the next two topics to be dealt with will be the Italian peace treaty and Nato's relations with the Mediterranean and Middle East command structures. The keynotes of Ottawa are thus Nato's own organisation and the economics of its task. If all goes well, the result of these discussions should be a very distinct increase in Nato's prestige and authority.

Another coming event is the annual meeting in Washington next week of the World Bank and of the International Monetary Fund. Then on September 21st Mr Acheson is expected to receive General de Lattre, the French High Commissioner in Indo-China, and on about September 22nd Signor De Gasperi, the Italian Prime Minister, who will also have been at Ottawa in his additional new capacity as Italy's foreign minister. Over in Europe on October 8th, Dr Adenauer, the Federal German Chancellor, is to pay a five-day visit to London—the first German Chancellor to do so for twenty years.

In the last week of October the Council of Nato is to meet again, this time in Rome and possibly with foreign ministers only represented. The purpose of this meeting is for Nato to come to grips with the crucial problem of Germany; this is not on the agenda for Ottawa, though, depending on the progress previously made at the tripartite talks in Washington—for which the British, American and French High Commissioners in Germany will also be available—the subject will certainly be discussed informally. Indeed, apart from the need to tackle the economic problems of rearmament, the basic task of the coming meetings will be to try to get enough practical agreement to achieve a really decisive turning point in western relations with Germany.

Finally, on November 6th, the United Nations General Assembly meets in Paris—and while it is in session there is probably to be another round of direct talks between Mr Morrison and M. Schuman.

* * *

Dr Mossadegh's Ultimatum

Dr Mossadegh has been trying to tell the Persian Parliament that he is about to present an ultimatum to the British: either they agree to negotiate on his own conditions or he will turn out the British engineers who remain at Abadan. The opposition have frustrated this move by refusing to provide a quorum in the Majlis, and it is therefore uncertain whether the ultimatum will ever be sent. If it is, it will be rejected, for the conditions are fantastic. It is therefore as well to assume that Dr Mossadegh will be left to carry out his threat, and that will pose a pretty problem for the British Government, which no doubt is his intention. Under prodding from the Conservatives, the Government has on more than one occasion declared its opposition to complete evacuation. It would seem to follow that the threat to evict the last British at Abadan will lead to a British occupation of the island by force. But if Dr Mossadegh's method of evicting the British is simply to withdraw their residence permits, one by one, the British would be put in the position of using force to counter an ordinary administrative act that is certainly within the competence of any sovereign government. It would be a poor case to argue at the United Nations, and Dr Mossadegh would have made a breach in the present unassailable legal case of the British.

Before any action is taken, it is therefore to be hoped that the British Government will ask itself exactly what purpose is served by insisting on 300-odd British subjects remaining at Abadan. It is not as if they were still effectively in control of the refinery; that point has been conceded long ago. They have, in fact—or soon will have—nothing to do. It is said that once the evacuation is complete, it will be universally assumed that the British will never return. But it is difficult to see any logical basis for this belief. Whether or not the British ever return will be settled by decisions taken in Teheran, London, Washington and other places, and the presence of 300 unemployed British residents of Abadan will have very little bearing on the matter.

On the other hand, so long as they are there, they can be made the scapegoats of anything that happens or does not happen. It is not past Mr Makki to blow up the refinery, when he finds he cannot work it, and say the British did it. It is a perplexing decision to have to take, particularly as the British Government's pride is involved. But on the whole it seems better to take the men away before Dr Mossadegh turns them out and to tell the whole world, as the Anglo-Iranian Oil Company is doing, that any purchaser of oil from Persia will be pursued in the courts of the world as a receiver of stolen goods.

Bluntness at Blackpool

The Chancellor on Tuesday presented the Trades Union Congress with a commendably clear and frank review of economic facts and prospects. It could hardly have been more different in temper and tone from his last review, to the House of Commons in July. Then, of course, he was leading up to the announcement of dividend limitation. It was as well, at least for the sake of the internal consistency of his speech this week, that no serious attempt to justify that measure was considered necessary before a trade union gathering.

There is no doubt that Mr Gaitskell's candour made a deep impression on the delegates at Blackpool, many of whom were ready, not so long ago, to dismiss some of his policies as an insult to their own intelligence. Whatever the further results, his immediate achievement was to prove, to an audience invariably suspicious of "intellectual" Socialists, that Mr Bevan is not the only Labour politician who has the courage of his convictions. But the TUC naturally liked Mr Gaitskell more than it liked the things he said. Presently, perhaps, when the delegates return to their individual unions, they will see what they can do to help him. He left them in no doubt at all that the country's problems, and the problem of inflation in particular, cannot be solved except with the TUC "acting for industrial labour as a whole," which is just what the TUC's General Council has in effect said it cannot now do. He insisted that the Government could not secure full employment without inflation unless it had the unions' help. And the way to help was to remember the "special need for moderation during the next few months," and to renounce restrictive practices because "fear and inertia on both sides of industry" were making life in this island at present "thinner, poorer, harder and more burdensome than it need be."

This is all very fine in principle, but it is not a policy and it makes an unfair demand on the union leaders. To ask for particular restraint in wage claims "during the next few months" is to ask for the impossible. Too many unions have already undertaken to demand more money for their members; their leaders cannot retreat now. The need to make so urgent and unrealistic an appeal is a confession that the Government is failing in its own task of ensuring that inflation cannot get out of hand. But if the unions cannot be expected to respond at once, they certainly should take Mr Gaitskell's frank and gloomy words to heart. Their apparent willingness to reflect on them is one more demonstration that the British Labour movement admires courage and will generally follow, within reasonable limits, the people who tell it the truth. It is by this, and not by subtle manœuvring to dish Mr Bevan, that the Government will keep its followers behind it—and might even, if it were consistent, regain some of the support it has lost in the country.

* * *

Return to Whitehall

The first full Cabinet meeting since Parliament adjourned was held on Tuesday, and normal ministerial work has been resumed—though, temporarily, with much of its attention concentrated on this month's series of international conferences in North America. It must be a considerable relief to hard-pressed Ministers that at least their holiday from Parliamentary duties is continuing for the first time in four years. In 1948 Parliament was recalled in September for the Bill to reduce the House of Lords' delaying powers (and, incidentally, by the Berlin blockade); in 1949 it was recalled by devaluation, and in 1950 by the launching of the rearmament programme. It now seems likely that this summer, despite the stresses at home and abroad, the Government will be able to get through the recess without such an emergency sitting.

But the closed season for politics, with MPs scattered in prewar fashion across half Europe, has ended. Most of the current issues, from wages to Bevanism, have been paraded at the TUC. The Cabinet meeting had no new problems to face, but all the old ones—Persia, the Korean truce talks, the balance of payments—were there in worsened form. The failure to make any progress in the Korean and Persian negotiations is a particular disappointment to Ministers; it robs them of what they had undoubtedly hoped to make their chief card for the autumn campaign—whether that is simply a propaganda campaign aimed to restore public confidence in the Government before the winter or a definite election campaign.

Speculation about the timing of an election is certain now to be intensified. Mr Attlee can hardly avoid making up his mind, for or against the autumn, during the next three weeks—before the Labour commanders and NCOs assemble at Scarborough. The balance of opinion among the professional prophets now puts the odds slightly against an autumn election. The reasons are not particularly strong. The party organisers at Transport House are known to want to wait until June, but that proves nothing: it is the disease of organisers always to believe that they could be better prepared if they had more time, and Mr Attlee has rejected their advice before. More important, the strategy of delay is reputed to have Mr Gaitskell's support—in the belief that world prices will fall. But to wait through the winter is to risk a further fuel crisis, the demoralisation of a further session of pottering about at Westminster, and the possibility of by-election defeats forcing the Government's hand. The decision boils down to the balancing of two considerations. On the one hand is the danger, if the election is delayed and Labour's position deteriorates further, not only of being defeated, but of being very thoroughly defeated—which would increase Mr Bevan's chances of displacing the present party leaders. On the other hand, there is always the hope that things will after all look up. The hope in itself seems very faint, but inertia works in the same direction. Whatever its intention, it is at this moment in the Government's interest to discourage talk of an early election—because the more widely that is expected the more the Government will appear to have been forced into a reluctant appeal to the country. Yet Mr Attlee must know that Labour's mandate, such as it was, is now politically, as distinct from legally, exhausted. The atmosphere of a continuous pre-election campaign is in these circumstances unavoidable, and it is good neither for government nor for any political party. Nothing but an election can end it.

* * *

Paris Sets the Pace

European co-operation is about to enter its second stage of development, one which will try the patience of officials and the temper of participating governments. Last week, the Council of Ministers of the Organisation for European Economic Co-operation issued a manifesto declaring that the broad objective will be to expand total production in Western Europe by 25 per cent over the next five years, and that governments "will work together to take such steps in common as are necessary to attain this objective." The new concept is "taking steps in common." Hitherto, co-operation has meant putting the interests of member countries before the interests of other countries which had no close political relationship, but second to interests of domestic importance. When, for example, the British Government was faced with the prospect of an inadequate supply of coal, it could—and it did—within the previous concept of co-operation, reduce its exports to Western Europe to husband its domestic supplies. In future, if the manifesto means anything, Britain would first have to agree such a policy with member countries of the OEEC. One wonders whether the logic of this was clear in Mr Gaitskell's mind.

This new development became apparent some months ago in the negotiations on freeing European trade from quantitative restrictions. The original plan allowed countries to choose which goods they wanted to "liberalise," and they were deemed to have honoured their commitment when a relatively small part of their "private" (non-governmental) trade was liberalised. But as the proportion approached 75 per cent of total private trade, countries realised that real freedom could be achieved only if they all removed import quotas from the same type of goods. A common list was therefore prepared. This same idea has also been adopted in the preparation, in the interest of economy, of a common list of prohibited end-uses for certain non-ferrous metals. When this list is accepted all countries will forbid the use of these metals in the same kind of goods. In other words, in the past co-operation meant that so long as countries walked in the same direction they could go as they please; now they are to try to keep in step.

Common action is in many respects part of the material development towards Western Union, and the significance of last week's manifesto lies in the fact that member countries have agreed to take this step. Whether they will have mis-

givings later on remains to be seen. Countries pursuing policies of full employment jealously guard their sovereignty over domestic economic affairs, but it may in fact be a godsend for those governments composed of unstable partners or working with slender majorities because Europe can be held responsible for any unpopular measures. Nobody expects common action to be achieved without some sacrifices of sovereignty, but if those sacrifices prevented the standard of living of Western Europe from falling during the next three years they would surely have been worth while.

* * *

Europe Can Take It

Having welcomed the principle of common action, however, it is vital to assess what chance there is of really achieving a 25 per cent increase in the gross national product of Western Europe. At first sight, it looks suspiciously like the old formula of arms without the tears that everyone knows have got to be shed. Has the OEEC, then, merely subscribed to the popular belief that rearmament must not hurt, and gone from there to postulating the conditions—however improbable—under which it will not hurt?

Few things are more difficult than to know what guesses about future productivity can be considered reasonable. On the one hand, there is the recorded fact that the production of goods and services in Western Europe increased by 9 per cent between 1947 and 1948, by 7 per cent between 1948 and 1949, and by 6 per cent between 1949 and 1950. If even the lowest of these rates could be maintained, an increase of 25 per cent within five years should be easily attainable. On the other hand, past experience over a longer period holds no warrant for the belief that rates of increase such as these can be sustained for more than a few years at a time, and the high figures of the last few years may be due to precisely those elements of recovery from a war—such as the easing of materials shortages and payments difficulties—which are now about to be reversed. It should not be forgotten that the natural rate of increase in the working population of Western Europe is nearly 1 per cent a year, and that the large capital investment of recent years should by now be showing results in higher productivity. Perhaps the conclusion should be that the OEEC has, quite properly, placed its target well within the limits of the possible but beyond what the mere continuance of present methods will achieve.

Moreover, there are some specific difficulties to be overcome. Total production depends disproportionately on progress in certain basic industries, specifically in coal, electricity and steel; and it would take more than the normal course of events to achieve an adequate increase in any of these fields. The shortage of manpower in British mines would have to be cured, and it can only be cured by opening the doors to surplus Italian labour; there would have to be a concerted programme to expand electrical installations, to conserve scrap and to increase the production of iron ore and coke. As with industries, so with countries; all plans and past precedents must go by the board unless the balance of payments problem for each individual country remains manageable, which may well require an expansion or alteration in the functions of the European Payments Union.

To say this is not to dismiss the possibility of a substantial increase in production. It is to conclude that a new attack on these problems is necessary and, if made, would have a real chance of success. That is the recognition which is, or ought to have been, behind last week's announcement by the members of the OEEC.

* * *

Egypt Arraigned

At the end of last week the Security Council passed by eight votes to nil, with three abstentions—Russia, India and Nationalist China—the resolution introduced jointly by Britain, America and France calling on Egypt to lift its partial blockade of the Suez Canal. The last-minute surprise was that Mr Tsarapkin, the Russian delegate, abstained from voting and, above all, did not veto the proposal, in spite of his intervention in the debate a few days earlier with every apparent intention of exercising his right to make trouble. The Russians clearly have a vested interest in maintaining the freedom of the seas owing to their own land-locked maritime approaches. But they may also be expected not to maintain indefinitely their present neutral attitude in the Arab-Jewish struggle, if they can see any profitable discomfiture for the West in their supporting the Arab world. Thinking that Mr Tsarapkin was at last going to come down off the fence, the Egyptians had already begun licking their lips last week. Now, they would do well to reflect that only three years ago Russian backing for the Jews of Palestine was partly instrumental in creating Israel.

Two points of particular interest emerge from this resolution. First, it is worth noting what a dilemma the Turks were in before they decided to vote in favour. They were elected to the Security Council as representatives of the Arab bloc and are now being roundly cursed for betraying their trust. In reality, they have acted as true internationalists, conscious of the wider issues and of the role the Security Council must play if it is to survive as a force for law and peace in the world. Their vote was by no means a toadying to the West.

The second point is to know what the Security Council can now do to enforce its decision that the Suez Canal should remain free to all shipping, as was originally intended in the Convention of 1888. Contrary to every tenet of international law, the Egyptians appear ready to defy the new resolution, and in this they are receiving support from the Arab League. The suggestion that a United Nations naval escort should be provided for ships in the Canal is ridiculous. The case of the *Amethyst* ought to have taught the lesson that in the narrow waters of rivers and canals warships are more likely to be a liability than an asset; it would be the easiest thing in the world for the Egyptians to block the passage of the Canal entirely. The fact is that there is nothing the Security Council can do at the moment. This, however, in no way absolves the powers from treating Egypt, when the occasion arises, as a bandit-state without the right to sympathetic consideration in sundry other claims which it customarily puts forward—such as the power to tear up its existing treaty with Britain.

* * *

Breaking a Bottleneck

It is welcome news that Dr Dalton gave last Saturday. The Government intends shortly to take powers to set up decentralised public markets for the auctioning of fruit and vegetables. Too many Labour proposals for reducing the cost of living or checking its rise are really only proposals for shifting its incidence from the more favoured to the less favoured classes of the community. Dividend limitation and price controls are merely attempts to ensure that less of the national money income shall go to businessmen and more of it to consumers; they do nothing to alter that basic disparity between the total national money income and the total supply of goods which is forcing the cost of living up. It is refreshing to see the problem attacked by way of an effective increase in the supply of goods and economy in their distribution.

One need not be afflicted by the congenital Labour distrust of the private merchant, or the Labour propensity to look for a greedy monopolist behind every tree, to regard the system by which British fruit and vegetables are distributed as faulty. Probably in few other countries are the costs of distribution so heavy in proportion to the costs of actual horticultural production; perhaps in no other country are

vegetables allowed to deteriorate so heartbreakingly between garden and shop counter. To "nationalise" distribution, as some trade unions and constituency Labour parties have demanded, would probably be to make it even more cumbrous and wasteful and yield only the dubious satisfaction of doing the private trader out of his profit. Experience of official meat distribution is certainly not encouraging. To provide public, but optional, facilities for competitive private enterprise is, on the contrary, a move which Adam Smith himself might applaud.

The gain in cheapness and quality, and the avoidance of waste both from decay in transit and from the growers' frequent refusal to market a crop unable to carry present distributive charges, may be less than is expected; there is a general tendency, not confined to Labour, to regard distribution from grower to seller as an easy and costless proceeding—a view very remote from reality—and to underestimate the specialised skill of the merchant at every step. This underestimate probably accounts for the frequent failure, even after initial success, of the occasional efforts made by growers to market their produce direct to the public. So long, however, as no magical transformation is expected, and so long as there is no compulsion on either grower or buyer to make exclusive use of the new markets, there should be a real gain to growers, housewives, and the nation's vitamin intake—a gain not measured merely by the often fallacious test of the price tag but by a real economy in labour and in goods.

Investment: Home or Overseas?

In the current *District Bank Review*, Professor W. A. Lewis sets out some disturbing facts and arguments on the vexed question of capital export. Using statistical material from League of Nations and United Nations sources, he demonstrates that the present world shortage of primary products, so far from being a mere reflection of exceptional rearmament demand, results from a secular and continuing decline in primary production relative to world population. Even before Korea, the demand for primary produce generated by a rate of industrial growth actually smaller than that obtaining around 1900 was steadily outrunning the still smaller increment in primary production. Even the most improbably complete political *détente*, therefore, would leave the deficiency essentially unaffected. Unless progress in primary production can be accelerated, shortages, mounting prices, and the consequent worsening of Britain's terms of trade, will continue.

Professor Lewis is, of course, no Malthusian Jeremiah despairingly preaching autarky. On the contrary, he concludes that British investment should be channelled less into the development of home industry, yielding yet more exports to be sold at yet worse relative prices, than into the development of world primary production, yielding cheaper and more plentiful imports. The necessary techniques are known; merely to raise the most backward primary producers to the average level would double or treble the existing rate of increase. A world agriculture now yielding painfully diminished returns to crude manpower would yield generously increasing returns to capital, particularly to capital invested in education. The long-run marginal productivity of investment is, in fact, much higher in such uses than in most British industries; and the moral is that Britain, in its own interests, should "take the lead in organising the flow of skill and of capital in the world overseas."

*

For many obvious reasons this flow cannot be a matter of purely private investment, still less of predominantly British private investment. A balance of payments so precarious that a single year without deficit is hailed as a triumph is hardly consistent with a massive overseas investment programme; though were the luxuriance of home investment scaled down much could be done without net loss. Whether the machinery which Professor Lewis favours, with governments or international agencies acting as guarantors and intermediaries between private lenders and ultimate borrowers, could be really effective is a question deserving further discussion. Sensitive assessment of credit worthiness, nice adjustment of credit terms, the specific commercial skills of the foreign issue market, remain desirable; and their exercise may not be possible under the necessarily rigid regulations of an official agency.

Meanwhile, Britain gets the worst of both worlds. When not actually disinvesting, as at present, by the accumulation of sterling balances, it gets all the disadvantages of capital export, and very few of its advantages, by the running down of balances previously accumulated. Immediately "unrequited" exports, which ultimately cheapen the supply of essential primary produce, are one thing; "unrequited" exports merely serving to keep Egyptian pashas in the style to which they are accustomed are quite another. Nothing in Professor Lewis's arguments justifies complacency about this debilitating drain on British resources. It would be regrettable, however, were preoccupation with the immediate balance of payments and with hyper-full home employment, or an obsessive desire to keep capital closely under the tax-collector's eye, to hamper constructive policy for strengthening the weakest sector of the world economy—a sector from whose weakness Britain is the chief sufferer.

* * *

Chaos and Darkness

The power failure in the north of England on Monday is a frightening reminder that the amenities of modern life hang by a thread. It affected 2,000 square miles and reduced Liverpool to chaos. Trains were stopped, trams blocked the streets, small fires started as transformers blew out all over the city, the telephone system was partly out of action. The British Electricity Authority has explained that the cause was "a chance in a million." The line between Carlisle and Kendal developed a fault and was automatically disconnected, throwing its load on the other two lines which connect the area with the main grid. Before the load could be shed these two lines also became automatically disconnected.

Unfortunately this chain of events is far from being a "chance in a million." It happened once before, on a Sunday in 1948; and it is only too likely to happen again. The grid was designed to cut out the least economical power stations in time of low demand, and to transfer current to an area where the supply had temporarily failed. It was never intended to transfer bulk supplies from one part of the country to another, as it is now doing; and the load—although not as heavy as it was during the war—is constantly 50 to 80 per cent above the load for which the transmission system was designed. One area manager recently remarked that his control lines got "hot enough to cook eggs and bacon."

Lord Citrine, BEA's chairman, was caught with the TUC in the blackout at Blackpool. He is reported as saying that the only way to prevent the system becoming overloaded is "either by controlling the load, or by putting in larger mains or lines, and that is a big job." But the second takes time, and the first method, as this incident shows, cannot be relied on to prevent dislocation or even catastrophe. The root of the problem is that demand is still rising faster than the capacity of the electricity industry, and there is nothing for it but "staggering," a higher price for electricity to restrict demand, and faith—or load-shedding and occasional blackouts.

South African Parties Merge

The South African Nationalists have now merged with Mr Havenga's Afrikaner Party and Dr Malan, the Prime Minister, can face the next election—not later than 1953—with an added cheerfulness. After the 1948 elections the Afrikaner Party, with its 9 seats, held the balance between the two major parties—the Nationalists with 70 seats and the United Party with 65. Mr Havenga has in point of fact supported Dr Malan and acted as Finance Minister in his Cabinet, but there was always a degree of uncertainty in this arrangement, because of differences over native and coloured representation policy. Mr Havenga was a member of the Hertzog cabinet which passed the native legislation of 1936, with its assurance that native representation—by Europeans—would be maintained, and to this day he feels himself bound by the moral obligation which that Act imposed on him. Although Mr Havenga concurred when the Cape Coloured people were taken off the common voter's roll a few months ago, now that the Nationalists are planning to abolish native representation as well they will probably wait for Mr Havenga's retirement, reckoned to be not far off, before pursuing their object.

Under General Hertzog, the Afrikaner Party broke with the Nationalists ten years ago, not on native policy, but on the question of equality of rights for English-speaking South Africans. The programme of the new merged party does, in fact, accept a broader recognition of these rights than the present Nationalist programme. It promises "non-partisan protection of the rights and privileges of every section of the population." At the same time, there is a new clause professing republican aims, with a complete separation from the British Crown, though granting that a republic must be brought about "only on the basis of the broad will of the people." This profession, however, is not likely to satisfy the more extreme republicanism of the authoritarian Ossewabrandwag and Mr Pirow, who are talking of forming a "people's movement" to bring about a republic through "people's candidates." In comparison with these younger nationalist firebrands, Dr Malan and Mr Havenga appear almost moderate. But the facts are that the Prime Minister himself is an elderly, ageing and satisfied man; that many South Africans have lately come to realise how much their security depends on the outside world; and that, although a storm is brewing for the future, South Africa is unlikely for the moment to make any drastic move to cut itself adrift from the rest of the Commonwealth.

* * *

Backfire in Buenos Aires

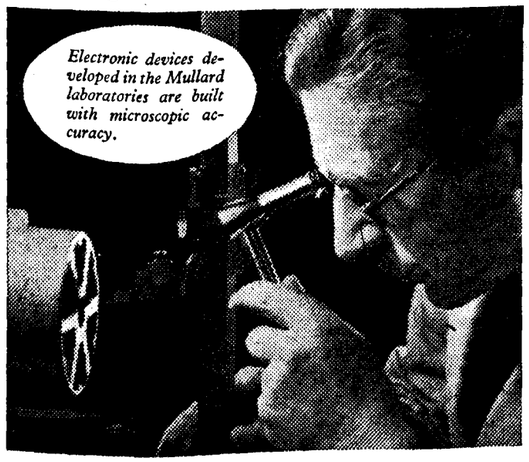
The Peronista regime in Argentina has met with its first visible setback. The great rally in Buenos Aires on August 22nd, preceded by weeks of intensive propaganda and planned on a scale which disorganised the life of the whole nation, was a failure. In a democratic country the spectacle of 300,000 supporters of General Perón vociferously demanding that he and his wife should become candidates for the presidency and vice-presidency in the forthcoming elections might well have sufficed to convince rival parties of the strength of the general's following. General Perón, however, was concerned to impress his popularity, and that of his wife, upon the dissident groups within his own movement rather than upon his ostensible opponents; and in this he failed. He had undertaken to attract two million Peronistas to the rally, and when they did not appear the dissidents were emboldened to press their arguments against Señora Perón's candidacy. In a broadcast on August 31st Señora Perón—a former radio actress—announced her withdrawal in a voice broken with emotion.

Before the rally it had been assumed that the army was the only doubtful factor in the Peronista front, and that the chief aim of the demonstration was to overawe discontented officers. Now it is apparent that the divisions within the governing party are more widespread. As a professed champion of labour, Señora Perón could have expected the trade union confederation to bring to Buenos Aires enough demonstrators to silence the army's murmurs against her. The confederation was, indeed, pledged to call a general strike in support of her nomination, should this become necessary. It must now be considered doubtful whether the trade unions are sufficiently united or disciplined to stage such a strike. At the same time, there are growing complaints among right-wing Peronistas about the favour which the President has shown to the trade unions. And the army, although mollified by the sacrifice of Señora Perón, has not been wholly satisfied; it would have preferred to see Colonel Mercante, the governor of Buenos Aires province, as vice-president. General Perón's decision to give a second term of office to the present vice-president, Dr Quijano, in itself reveals the extent of the rifts within his party, for Dr Quijano is a colourless personality whose only qualification is inoffensiveness.

* * *

From the Dustbin of History

That the Americans should have thought it worthwhile to lift Alexander Kerensky out of the dustbin of history and to brush him up for political and propaganda purposes is something to marvel at. It shows to what depths of spurious ingenuity "psychological warfare" can sink. This seventy-year old lawyer once sat in the Duma as a Labour member, though he was in fact a social revolutionary; he orated eloquently during the February Revolution; as last Prime Minister of the Provisional Government, he was ridiculed by both Right and extreme Left. He fled from the October Revolution and his attempt later to march on Petrograd was an utter failure. In short "Kerenskism" is a synonym for indecision and failure in action. It is better forgotten.



It seems highly probable that the American Committee for the Liberation of the Peoples of Russia will burn its fingers badly with this and other projects which have their headquarters in Munich. Dissension between groups is notoriously part of the tradition of Russian *émigrés*, and what political backbone they had was lost between the wars, when murder and kidnapping took their toll of the few effective leaders. Since 1945 their political life has been immensely complicated by their intermingling with hundreds of thousands of Russians left in German camps, to say nothing of Soviet citizens from the Ukraine, the Caucasus and Central Asia. These have not found it easy to shake down with monarchists (who, incidentally, regard Kerensky as a traitor), Fascist elements, collaborators with the Nazis, and that complicated class known as camouflaged Leninists, who oppose the regime of Stalin but believe in the Soviet system. At the moment it looks as if the National Labour alliance, headed by a former follower of General Vlassov, is fairly effective; but the real question is whether an effective anti-Soviet bloc can be formed out of this and such other groups as the former Socialist Revolutionaries, the Union of Soldiers of the Liberation, and the League of Struggle for National Freedom. If British experience with political exiles is any guide, success is most unlikely—and undesirable.

Houses per Acre

Hertfordshire County Council is one authority to take a critical view of the notion that housing densities ought to be increased with a view to conserving agricultural land and cutting costs. A report by the County Planning Officer on planning standards finds the agriculturist's case not proven—

Progress in Electronics

RESEARCH The great variety of subjects under continual investigation in the Mullard laboratories include some that are truly revolutionary. Ultrasonics is an example. This science, involving the use of sound waves far beyond the range of human hearing, is likely to find increasing applications in numerous industrial processes. Its development is typical of Mullard initiative in research.

PRODUCTION Bringing the benefit of this research to industry and the community is the other function of the Mullard organisation. Every year, in great factories in Lancashire and Surrey, millions of valves, electron tubes and components are produced for Britain's electronics industry. In other plants complete electronic equipments are manufactured for specialised purposes. Behind the name Mullard, therefore, is a store of experience in electronics that may well prove of immense importance to your own organisation.

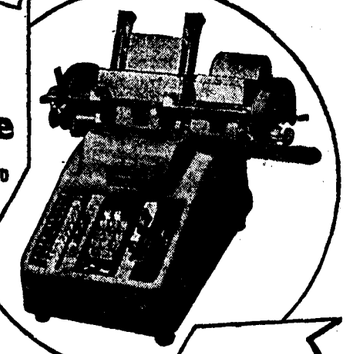
BERMUDA

A Coral Island Holiday after your New York trip

Bermuda is favoured above most corners of the world. Its gentle climate, its beaches of warm pink sand and its flowering trees, the charm of its old buildings and the comfort of its modern hotels make Bermuda a very special place indeed. You can play golf or tennis, swim or sail, go game-fishing or riding, enjoy carriage drives and dancing under the stars. And you can relax—for Bermuda is above all a restful place, where work-a-day cares float away on the warm water of the Gulf Stream.

One of the regular routes from London to Bermuda is via New York, from which, in any case, Bermuda is readily reached. Why not take advantage of this, and enjoy a break there on your way home from a business trip to America. The currency is sterling. No limit on the amount you may use there.



Write for free illustrated booklet and information about fares and hotel charges, to P.R. Officer, Bermuda Government Information Office, Regent House, 89 Kingsway, London, W.C.2 (Tel. Holborn 0487), or any Travel Agent.

pointing out as an example that it is not sensible to deprive 3,000 families of their kitchen gardens in order to save 150 acres of farm land. It remarks that the closest type of building development—that involving a high proportion of flats—is also the costliest. The Council rightly believes that it is a short-sighted policy to cramp the living conditions of citizens who move out from London to Hertfordshire, and thus to take away what is after all the main attraction for making the move, once the immediate housing shortage has been rectified. On this basis, it is opposed to plans "for very close development" put forward by the London County Council at Oxhey (which is in Hertfordshire) and (of all authorities) by the Stevenage Development Corporation.

Private enterprise building in Hertfordshire, even since the war, has usually not exceeded six houses to the acre, and public schemes have kept within the customary prewar maximum of twelve houses to the acre for the development of open sites. It is now necessary for planning authorities to redetermine their density standards. It is surprising to find that Hertfordshire County Council, when it leaves principles to go into details, is prepared to accept for future schemes an average in density of 13.3 houses to the acre and a maximum density of 14.6 houses. This standard seems to be accepted reluctantly as a compromise with agricultural and economic pressures, and the Council hopes that "it will normally be possible to improve" on it. On this basis, the Council lays down minimum land requirements for a residential neighbourhood including the needs of education, recreation, and so on. They work out at 463 acres per 10,000 persons. This figure falls in between two alternative sets of standards laid down in the Greater London Plan.

* * *

The Gremlin at Transport House

A poltergeist, jinx or gremlin undoubtedly haunts the Labour party's publicity machine. The mercifully unretentive public memory might, if left to itself, forget that charming photograph of a Royal baby once circulated in a Labour pamphlet as an illustration of the radiant health bestowed on the working-class child by the National Health Service. It might be equally oblivious of the prewar, private-enterprise houses similarly annexed, for propaganda purposes, to Labour's housing programme. But the public memory does not get left to itself; Transport House, or Transport House's irrepressible familiar demon, can be relied upon to jog it. The scene of the gremlin's latest feat is Glasgow, where two young housewives in a shopping queue were interviewed on behalf of an occasional propaganda magazine with the revolting title "Womanfare." Their photographs, complete with names and addresses, subsequently appeared—embellished, comic-strip fashion, with balloons enclosing snappy excerpts from the Labour propaganda line—as illustrations to a full-page article; an article which, with singular lack of tact, attributed to them a personal memory of the shopping conditions of the "lean 'thirties." Now, it appears, both housewives have denied voicing a single one of the sentiments attributed to them; and one may assume that at least in the immediate neighbourhood of two Glasgow homes "Womanfare" is enjoying a *succès de scandale* quite unwished for by its compilers.

Labour is not alone in relying on the sort of propaganda which, without being actually scurrilous, induces in any reasonably civilised reader an overwhelming desire (as Mr Peter Ustinov's French colonel puts it) to clean his teeth. Presumably party headquarters have their own means of judging the general level of civic intelligence, and act accordingly; a depressing thought. The Labour estimate of that level does, however, now seem to be a fraction more abysmal than the Conservative; which may be why the gremlins concentrate their activities rather on Transport House than on Abbey House.

No Sausages for the Poles

Polish townspeople are reported to be suffering from a serious shortage of meat. This is not a new experience for them, nor are the Poles the only East Europeans to have trouble with their meat supplies—a similar state of affairs was reported from Slovakia recently. But it is three years since the last serious meat crisis in Poland and the government seems to be anxious to allay popular discontent and to guarantee better supplies in the future by proffering fresh inducements to the peasants to breed more pigs. Those who enter into individual contracts with the state will be guaranteed a fixed and profitable price for every pig delivered. They can claim an advance payment as soon as their contract is completed as well as financial help and other privileges. The target under this contract scheme for the year ending September 1, 1952, is nearly 7,000,000. Whether it will be reached will depend, of course, on the attitude of the peasants, especially of the richer ones who carry on most of the pig breeding. Their unwillingness to sell to the government must have contributed to the present shortage, and since the currency reform last October wiped out most of their savings, they are not very impressed by financial incentives.

Meanwhile, the Polish townsman has been warned that no swift improvement in the supply of his sausages—by which he sets great store—can be expected. He will be all the more surprised by their disappearance since, according to the recent Polish census, the pig population has made a remarkable recovery since the war. If, as seems probable, the present shortage is partly due to increased meat exports to the Soviet Union, Communist officials will certainly keep quiet about it. They are trying hard to divert popular discontent on to meat profiteers and those found guilty of illegal slaughtering. It may, indeed, well be true that the illegal meat trade has assumed "serious proportions." The taking over by the state, earlier this year, of the retail meat trade, must have left many rebellious butchers outside the state scheme with every inducement to sabotage it.

Australia Asks for More

Mr McEwen, the Australian Minister of Commerce, has come to Britain to ask for higher prices for butter, cheese and meat. Under the long-term contract with Australia, the maximum annual variation in price is 7½ per cent either way. Mr McEwen has already made it clear that such an increase will not satisfy him this year. He also wants the contracts to be extended for a much longer period. He apparently has two arguments. The first is that since Australian wool growers are earning large profits, despite the recent sharp fall in wool prices, the production of dairy produce and meat can be maintained only by giving these farmers similarly large profits. The second is that Australia is losing 7d. on every pound of butter it sells to Britain; there is no reason to think that he can substantiate that claim.

Mr Webb will certainly reply that the effects of large profits on wool are a matter for the Australian Government, not for him. Admittedly Britain needs all the food that Australia can export but it is doubtful if the Government would be willing to pay 4s. a lb. for butter. If Britain accepted the Australian claim, its prices to all other suppliers would have to be increased correspondingly. It is doubtful whether an abnormally big increase in prices would raise supplies, and of what value would it be to Australia? It might add, temporarily, to the popularity of the Australian Government, but it would also add to the fires of inflation already burning fiercely enough in Australia and elsewhere. Mr Webb might say that Australia could contribute more to international welfare by exporting more dairy produce and more meat than by exporting its own inflation.

DANGER SIGN

THE rise of Western Germany as a serious competitor with Britain in the export markets was inevitable. Japanese competition also will be. It is no good complaining about it. We shall simply have to adapt ourselves to the facts of competitive trading.

The switching of part of our industry to defence is bound to make things easier for Germany, but it would be a mistake to imagine that this is already the reason for the dramatic increase in Germany's figures. *Sheer hard work* has earned Germany's promising recovery, which is probably not unconnected with the fact that the country has 2,000,000 unemployed.

It is this old-style incentive which will have to be answered by new-style full-employment Britain if we are to keep our full employment and our social services.

How? The T.U.C. has seen the point already. We have to make the new style more efficient than the old. In two words, we require *higher productivity*. That is the only means to bring our export prices to a competitive level without taking it out of the skin of our workers.

It means that every machine must be used to its full capacity and there must be an end of wasting manpower. *We repeat once more that restrictive practices on either side of industry are suicidal.*

Letters to the Editor

Conjurer of Wealth

Sir,—You are right to ask for a closer definition of a policy of tough expansion. I am going to offer this to you, and, in advance, I acknowledge the help which you, the most fashionable general practitioner in economic ideas, have given me. But I must confess that for some time you have appeared to me too pessimistic about the scope for increasing the national income. Every Tom, Dick and Harry may have a job, but how many of us are fully employed? And if the production of key commodities could be improved, what effect might that have on the output of others?

Allowing for the big growth in the numbers in work and for the improved methods and equipment, the present level of production is a failure. But, essentially, the failure is not economic. What is on trial is the British character, and I believe you underestimate the rapidity and vigour with which a different Government could rouse the virtues of enterprise and patriotism. So when you accuse me of being too starry and I accuse you of being too earthy we are not thinking of the same things.—Yours faithfully,

DAVID ECCLES

House of Commons

McCarran Follows McCarthy

Sir,—The article entitled "McCarran Follows *McCarthy*," in your issue of August 11th, not only was biased and distorted, but insulting toward Senator McCarran to boot. Senator McCarran is a Democrat who has been in the Senate for four terms. He has always been pro-Labour, but has not otherwise slavishly followed the New Deal-Fair Deal line. This has made him some enemies among the Left Wing Democrats, but has also made him a "big Senator" to independent Democrats (including the writer) and to most Republicans.

Your Washington correspondent first refers to Senator McCarran in relation to "his somewhat more notorious colleague from Wisconsin, Senator Joseph McCarthy." There are various things the matter with this reference. In the first place, it is doubtful whether more than a minority of the people in this country consider Senator McCarthy as "notorious." In the second place, I have never heard anyone say that Senator McCarran is "notorious" before. I doubt that your correspondent can cite any supporting opinion aside from the *Daily Worker*, and possibly *The Nation* and a few other Leftish organs.

"It is abundantly clear," says your correspondent, "that Senator McCarran and his committee intend, if they can, to bring about the jailing on perjury charges of Professor Owen Lattimore . . . and Mr. Joseph Barnes. . . ." Well, if they should be shown to have committed perjury, why should they not be jailed? Thus far two witnesses have testified that Mr Lattimore was a Communist and four have so testified about Mr Barnes—and the hearings are far from over. Why criticise Senator McCarran? Both Mr Lattimore and Mr Barnes were high officials of the Office of War Information and both were deep in the formulation of our disastrous China policy. It is hardly an academic matter. Why not wait and see what eventuates?

Has your correspondent forgotten the cases of Hiss, Marzani, Remington, Coplon, Fuchs, and a dozen others? It should be remembered that President Truman on seven separate occasions called the Hiss charges "a red herring" before Congressman (now Senator) Richard Nixon finally brought Mr Hiss to trial and eventual conviction. Anyone who thinks the McCarran hearings are a witch hunt is either blind or prejudiced, after what has been uncovered in earlier investigations.

Your correspondent's account of Mr Barmine's testimony about Mr Lattimore and Mr Barnes is both incomplete and misleading. It is said that Mr Barmine based his testimony on what the former Soviet Military Intelligence General Walter Krivitsky told him in Paris, after both had escaped the Soviet purges of 1937. Actually, the main part of Mr Barmine's testimony related to what he was told by General Jan Birzin when the latter was Chief of Soviet Military Intelligence and while Mr Barmine was ostensibly an economic attaché but actually was assigned to arm, secretly, pro-Communist elements in China. The Krivitsky quotation was merely a later and corroborative piece of evidence.—Yours faithfully,

MONTGOMERY M. GREEN

Havre de Grace, Maryland, USA

Price Control

Sir,—Your remarks on the efficacy of price controls in an anti-inflationary policy surely neglect the fact that the pressure for wage increases is dependent mainly on the prices of a relatively limited range of goods which are necessities or near-necessities. It is the working housewives, not the Horners, of this world who are the prime movers in wage inflation. Place some check upon the rise of the cost of maintaining a family in reasonably decent conditions and half your battle against inflation is won; the price level of most commodities can rise considerably further than those of the daily-bread variety without provoking any clamour.

Nor does this necessarily divert resources from export or rearmament. If the price-controlled articles have a relatively inelastic demand, the effect of price-control is not so much to affect the volume of resources employed as to divert demand elsewhere. If the articles receiving the additional demand are relative luxuries—as seems likely—the high incidence of purchase tax on them will absorb inflationary pressure; it is also likely that the diverted demand will reach tertiary industries, such as the cinema and transport, in which, as Mr Worswick points out, the marginal demand for labour (and other factors) is small. In any case, since price control, in your own words, "will divert, not reduce, expenditure," it is also true that it will not increase expenditure, so that no net increase in the consumption of resources occurs. Control prevents a rise in price in certain commodities; the rise in other prices is *pro tanto* greater. If diversion from exports or rearmament occurs with price control, it would have occurred without it; it is merely the direction, not the volume, of diversion which is affected.—Yours faithfully,

EDWARD NEVIN

Corpus Christi College, Cambridge

[It has never been denied in our articles that price control may, in practice, be a fraud, raising some prices fully as much as it reduces others. But (a) there is likely to be a time-lag, during which it will tend to divert resources from exports and rearmament to home consumption; (b) when the fraud is perceived when it is found that on balance real wages have not been maintained—such stimulus to wage restraint as price control ever provided will disappear. —EDITOR.]

"One Way Only"

Sir,—Mr T. Wilson asks me how many of the countries at present under Communist control could have been saved if the standard of life had been raised a little by international investment. The answer is, all. If there had been something like ERP in 1918, Russia herself might have been saved and assistance in the thirties could have made the states of Eastern Europe more viable. Whether the situation could have been retrieved once the Russian army was there is doubtful, but Mr Molotov was at least afraid of the consequences of the satellite countries taking part in ERP. Would Mr Wilson deny that a large number of other European countries were saved from Communism by postwar American aid? This is the relevant point.

It is indeed uncertain whether we can afford much overseas aid in view of Soviet strength and ruthlessness. There are, however, three unanswered questions. First, will a large military programme on a weak economic base make us stronger from a strictly military point of view: is it worth having extra divisions but violent inflation and smaller coal and steel reserves? Secondly, will depriving backward areas of goods and shipping space, and thus of political stability, impair the "total" strength of the West? Thirdly, from our own viewpoint, will the shortage of foreign exchange and basic materials weaken British influence on western policy? Perhaps it is re-

armament on the scale envisaged that is the "panacea."

Very few people will think that a point of view should be suppressed merely because the Communists can make use of it. To cry "Bolshie" at one's opponent is becoming a controversial cliché, but surely this is the first time one of your correspondents has used "liberal-minded" as a term of disparagement and has feared division of opinion. Here, if one stooped to argument by abuse, is "good Communist propaganda."—Yours faithfully,

DUDLEY SEERS

Accra, Gold Coast

Fiji

Sir,—A number of statements about Fiji made by your correspondent in your issue of July 28th are apt, unless clarified or amplified, to give a misleading picture of the situation. It is stated that prices are no longer left to chance and that the British Ministry of Food buys the whole of the copra under bulk buying contracts through the statutory Copra Boards which are non-profit making organisations. The inference is, although it is not specifically stated, that this arrangement is all to the good from the Colony's point of view. In fact, this is one of the few of the British Government's bulk buying schemes which has since its inception been to the almost exclusive advantage of the British Government. It is a nine-year contract with provision for a price adjustment of 10 per cent up or down each year. As the basic price, however, was fixed in 1948 in sterling and no provision was made for exchange adjustment the contract so far has meant that the Fijian producer has now for a long time been getting considerably less than the world market price for his copra. Admittedly the producer even so is receiving a high price by all previous standards and has the advantage of security—a very great benefit to a section of the community which has very bitter memories of the time when copra slumped so badly that it was practically unsaleable—but the high price is largely offset by universal inflation and £50 or more per ton was on any reckoning a heavy price to pay for security.

The main criticism, however, which must be levelled against your correspondent's article is that it makes no mention of Fiji's fundamental problems which are the land tenure problem and the allied problem of relations between the Indian, now numerically the single largest community, and the Fijian.

Only one-ninth of Fiji's total area is alienated freehold land. The balance is native land or crown land. By far the larger proportion of native land is communally owned and all dealings in native land have to be approved by the Native Land Trust Board, a body on which Fijian influence predominates. All dealings in crown land have to be approved by the Lands Department. The Fijian's methods of agriculture are primitive. The Indian would almost undoubtedly make better use of the land and in fact does so on such land as he is able to obtain, but he cannot obtain enough. Under the Deed of Cession the British are obliged to protect Fijian interests. On the other hand, the British are responsible for the presence of the Indian and now preach democracy in all colonial territories. Democracy in the last resort is the rule of the majority and the Indians are in a fast increasing majority.

Government policy, if it can be said to be a policy, is to let sleeping dogs lie. So far it has been lucky. Thanks largely to the general prosperity of the Colony, there has been no communal trouble of any magnitude. That situation, however, cannot last indefinitely and the communal make-up in Fiji nurtures the seeds of another Malaya or Palestine.

The present division of non-official seats in the Legislature—five each to Europeans, Fijians and Indians—is not a solution. It is only a compromise. The problem of introducing the electoral system into a community still largely feudal in make-up has still to be faced. It is to be hoped that the fundamental problems have been brought to Mr Dugdale's attention in the course of his recent visit and that he will not have been exclusively occupied with the "development colony," the colonial equivalent of the welfare state. Development projects we have in plenty although up to now we have seen more personnel than material, but the outlook for the future would be brighter if more attention was being paid to the mental and economic development of the Fijian and less to his physical welfare. What the Fijian most requires at the moment is a little more twentieth-century economic and social freedom and responsibility and a little less feudal paternalism.—Yours faithfully,

J. GOUGH

Books and Publications

Twentieth-Century Pioneer

Beckoning Frontiers. By Marriner S. Eccles. *Alfred A. Knopf, New York.* 499 pages. $5.

The frontier of Mr Eccles's title, the one that still calls him, is a world at peace where "we can use our human and material resources for the well-being of all men." But in his search for that distant and challenging land he has staked out claims on frontiers nearer home, frontiers that he has now established even if he has not managed to leave them entirely safe from attack. It is these that are described in his readable book, which he calls "an adventure in capitalism, or an autobigraphy in economics." Mr Eccles is as much a pioneer as was his Mormon father from the slums of Glasgow, who made a fortune out of the barren valleys of Utah and the forests of Oregon. But the son went back to the cities, to pioneer in the world of government, to clear the underbrush of Wall Street out of Washington, to reclaim American enterprise from the outgrown philosophy that was choking it in the nineteen-thirties.

The prophet, who came out of the west in 1934 and was within a few months head of the Federal Reserve Board, was no star-gazing professor but a successful businessman who never took a university degree, no Socialist (although he was often called one) but a solid Republican, no theorist but a banker who had been convinced by practical experience that government planning had become necessary to economic survival. That is presumably why he proved tougher than the other "brains-trusters," why he alone stayed the Washington course for seventeen years, leaving only a few weeks ago. It is a tribute to him, and to those who worked with, and against, him for so long, that when he left the regret was genuine and universal. His departure seemed to signify that the New Deal had come of age and even those who wished it had been strangled at birth saluted the man who had nursed it so conscientiously.

Mr Eccles never sacrificed his economic convictions to political expediency, never expected gratitude or hesitated to criticise even his friends (nor does he in this book), and as head of an independent government agency always maintained his statutory freedom from outside influence, whether of the Administration, the Congress or the financial community. By these methods he succeeded, unexpectedly to those who know the climate of Washington, in founding two settlements in the economic wilderness.

The first of these, worked out from what he saw around him in the great depression without any help from the works of Keynes, was the theory of the managed economy, in which the government compensates for the deficiencies of, but does not supplant, private enterprise. That theory was written into law in the Employment Act of 1946, largely as the result of the educational work done by Mr Eccles, but that does not mean that the theory has ever been wholeheartedly applied. President Roosevelt was apparently just learning, as much from the depression of 1937-38 as from Mr Eccles' teaching, that deficit spending must be on a lavish scale if it is to do its job, when the war came. When the war was over, President Truman and the Congress took up where their predecessors had left off, relaxing controls, reducing taxes and expanding credit, instead of listening to Mr Eccles's lectures on the dangers of inflation and the need for frugality, restraint and a balanced budget in the completely different circumstances of the postwar world. The new defence programme has postponed the uncomfortable day when Mr Eccles will be proved right.

He was, of course, although his book does not stress the point, only one of

many Americans who hit on the compensatory economy as the answer to the depression of the thirties. But he seems to have been alone in realising that if credit was to be manipulated, the Federal Reserve Board must have greater power. He pushed through almost single-handed the 1935 legislation that freed the Board from the domination of the New York banks, although he never achieved the further legislation for "bank unification" that would have concentrated all government examination and supervision of banks in the Board. This he needed as an additional weapon in his struggle with the Treasury, which arose out of the conflicting duties of the two agencies—one having the responsibility of financing the government as cheaply as possible, the other having to regulate money and credit in the interests of economic stability. When this old clash over cheap money finally became an open breach early this year, the public was on the Federal Reserve Board's side, thanks again to the clearness with which Mr Eccles had put its case. As a result the Treasury came to terms and Mr Eccles's second task was accomplished, too late to provide this book with its happy ending, but not too late to crown his Washington career.

Stuffy and Bumptious

British and American English Since 1900. By Eric Partridge and John W. Clark. *Andrew Dakers.* 341 pages. 18s.

For large chunks of this book, one of the series "Twentieth Century Histories," the reader wonders what on earth it is getting at. The two principal authors enjoy themselves so thoroughly riding their own particular hobby-horses, which take them into some extraordinary digressions, that it is very difficult to find and follow the book's main theme.

The difficulty is enhanced because no attempt has been made to co-ordinate—that blessed twentieth-century word—the various contributions, and in addition to Mr Partridge and Mr Clark there are eight other authors, writing on Dominions English (including India), on Cockney and on the teaching of English. This maintenance of independence is quite deliberate, and it makes the book much more entertaining than if it were the work of a committee. But the effect of reading two majority and several minority reports, which, quite often and quite bluntly, contradict each other, is a very blurred impression of the state of the English language in the middle of the twentieth century.

It is not until near the end of the book that two sentences by Mr Clark (author of the section on American English) catch the eye—and the penny drops. Discussing the difference between American and British (or, as we would prefer to say, English) English, he says:

> Another way of saying it is to say that British English has more *frein* and American English more *élan*. Yet another is to say that British English is stuffy and American English bumptious.

Stuffiness . . . of course. This explains why Mr Partridge is so anxious to unbridle written English; why he spends so much time on the modern poets, particularly Mr T. S. Eliot, who employ "the natural resources" instead of the conventional and therefore "unnecessarily restricted resources" of the English language. It explains, too, his championship of dialects, particularly Cockney, and his plea for a greater encroachment of the vernacular on literary English. Just as Vulgar Latin, the Latin of the vernacular, overcame Classical Latin, so will vernacular English, Mr Partridge believes and hopes, overcome literary Standard English. In so doing, it would become less illiterate and imprecise than it is today, but English would, in the victory of the vernacular, shed many of its grammatical formalities. We shall be writing "between you and I" as well as saying it. Mr Partridge may be right. But one is left wondering why, if he believes this, he himself chooses such a difficult and unvernacular style in this book. To read many of his sentences is like watching an obstacle race. They are full of fun and variety. But one sighs with relief when he has successfully passed over all his parenthetical phrases and relative clauses and comes into the straight without losing his subject, main verb and object somewhere behind him.

Mr Clark, by contrast, is all for some tightening up. He deplores the effect of the Educators (capital "e") on American children's education and the belief that education should be based on the abilities of the average child. American English, according to him, is being debased. He would like a greater concentration on grammar and less "corruption of the vocabulary." Children should be given at least "the refusal of a high standard of usage." They should not be taught "a minimum standard of language" any more than "a minimum standard of table manners or bodily cleanliness; it is mental subsistence farming."

Perhaps it is not surprising that with Mr Partridge and Mr Clark expressing themselves so vigorously, the writers on Dominions English should be more moderate. Dominions English, though it has diverged from the home standard and has been influenced by American English, has achieved an independent idiom in each Dominion. Mr F. E. L. Priestley, who writes on Canadian English, quotes Sir Basil Brooke as saying that "Canadian neckties may look startling to the English, but to Americans they seem to verge on the dowdy." The Canadian, declares Mr Priestley, would

> insist that a closer examination of the neckwear would reveal something of an exclusive Canadian pattern.

A Book on Books

The Making of Books. By Sean Jennett. *Faber.* 474 pages. 42s.

"The Making of Books" has plainly been a painstaking attempt to combine in one volume a cyclopædia of technical information about printing, a primer on typographical design, a history of printing processes and a type specimen. But in trying to do so much Mr Jennett has tried too hard. In many of his instructional pages he shows unmistakable signs of becoming a pedant instead of a demonstrator, a compiler instead of an elucidator. The book is almost top-heavy with information and unfortunately the information is mainly given by words. Such an encyclopædia carries its own paradox, of course. Each of the many sections really needs a book to itself, especially the sections on the history of type design and the specimens of type designs.

In such a book, graphic demonstration is a prime necessity, and "The Making of Books" is extremely weak on understandable illustration. For instance, a reader could easily be made to understand the evolution of the design of a title-page in, say, four or six illustrations, whereas to explain that evolution in words is almost impossible, however precise and logical the words, and Mr Jennett uses too many words. Many processes cannot be explained by anybody, and explanations should not be attempted. It is virtually impossible to give any understandable explanation of the collotype process merely by being shown a collotype illustration and by reading a few notes on the process. The whole thing eludes explanation outside a printing office or a printing school. These things can only be demonstrated. A first duty of the instructor is to confine himself to first principles, to what is likely to be understood. Mr Jennett never seems to have stopped to ask himself at what point words fail, a strange failing in a poet.

For the student who is training at an art school or a printing school Mr Jennett's book will prove a useful companion volume for his own notebooks, especially near examination time, but amateurs of book collecting, who would like to know how books are made, may well be daunted by the abundance of Mr Jennett's agglomeration of technology.

Study of Behaviour

The Changing Culture of a Factory. A Study of Authority and Participation in an Industrial Setting. By Elliott Jaques. *Tavistock Publications Limited.* 341 pages. 28s.

This is an important book, but one that may not have a very favourable reception. It is important because it is, so to speak, the log of a pioneering venture. It will be criticised on several grounds. For one thing the activities of a group of human beings are here described in terms which seem unnecessarily obscure. Some of the obscurity is perhaps legitimate since it derives from a particular theoretical framework. Some of it is less so. In addition the purist will find odd jargon of which the participle "scapegoating" is an example. But criticism of this sort may cloak a deeper rejection. In the words of the introduction,

> each one of us, in the course of development, has painfully worked out a set of assumptions as to what is real and what is important in determining our behaviour; . . . these assumptions give meaning to our lives and offer some protection from fear and uncertainty; . . . and even personal attempts to modify such deeply rooted assumptions arouse anxiety and resistance.

The book gives an account of a three-year study carried out by the Tavistock Institute of Human Relations in an engineering works employing some 1,500 people. The study was not merely theoretical but involved at every stage an attempt to modify the behaviour of people within the firm so as to make communication and co-operation more effective. The starting point is stated in these terms.

> Changes in real behaviour do not take place as quickly and as easily as do changes in professed attitude or in administrative arrangement. But these have less effect on what people actually do. People behave as they do for motives and purposes of the utmost importance to them. Though some of these are conscious, others are not; and if some go well together, others conflict. To assist in bringing about rational and planned changes in group relationships that would change real behaviour of those concerned meant, first and last, assisting members of the firm to obtain a clearer understanding of their motives and purposes, and where these were in conflict and where they were not.

We know enough about human behaviour now to realise that this programme represents, at the very least, one important line of approach. Industrial negotiation tends to be undertaken on the naïve assumption that all participants understand what they want and if they do not state their wants are refraining as a matter of deliberate policy. This is just not so. It is legitimate to regard an industrial firm, or a member of that firm, as being in some sense a "case," and one that requires a particular kind of help before a full awareness of difficulties and motives is possible—although some will feel that this view denies to ordinary individuals full responsibility for their actions or that the procedures suggested break the established rules of the social game.

From Appeasement to Preparation

Documents on British Foreign Policy, 1919-1939. Edited by E. L. Woodward and Rohan Butler, assisted by Margaret Lambert. Third Series, Volume IV. *HMSO.* 647 pages. 35s.

The latest volume in the series of documents on British foreign policy covers the first three months of 1939. It deals with the period in which the British Government, while advised that Hitler was resentful of the Munich Agreement which had baulked him of a successful local war, and warned that he would take further action in the spring, was yet uncertain—as was Hitler himself—whether he would first move against the east or against the west. In this state of uncertainty it was compelled to abandon the policy of appeasement and to attempt the formation of a common front against further German aggression.

The effort failed; and this volume, in all its detail, will assist in giving a picture of the enormous difficulties which stood in the way, not the least of which was the indecisiveness of the British Government itself. Even at so late a date as the first quarter of 1939, and even remembering that we now judge after the event, the process of conversion from appeasement to preparation will strike the reader as extraordinarily halting and slow. As late as February 19 the Prime Minister, despite the evidence reaching the Foreign Office and despite—one almost concludes—the evidence of his senses, was writing to the Ambassador in Berlin to the effect that he hoped soon "to begin to talk about disarmament" and that, "if all went well, we should have so improved the atmosphere that we might begin to think of colonial discussions." The problem of a common front was still unsolved when, as a direct result of the German destruction of Czech independence on March 15th, the Government decided to guarantee Poland—and was unsolved because of this earlier lack of realism. That guarantee marked an abrupt revolution in British foreign policy.

Lack of realism was not the only element in the failure, but this collection of documents is less revealing about it than it is about some of the other elements; than it is, for example, about the mutual distrust between Great Britain and Russia and between Russia and Poland. Like its predecessors in the series, the volume is largely confined to telegrams to and from the Foreign Office and at a time when the formulation of foreign policy was less the work of the Foreign Secretary and more that of the Prime Minister than at any time since Lord Salisbury combined both posts, the Foreign Office documents are an inadequate record of the Prime Minister's foreign preoccupations.

But this limitation is imposed by the subdivision of archives over which the editors have no control. In the field over which they have been given full freedom of selection and arrangement they have again done a good job, and one which incidentally reveals, in comparison with the lack of policy at the centre, the marked efficiency of the British diplomatic service.

NICHOLAS MONSARRAT

and although it's a British novel about the Royal Navy

THE BOOK-OF-THE-MONTH CLUB CHOICE IN AMERICA

"Nothing can stop its becoming a front rank best-seller and it is absolutely right that it should be"
— MORCHARD BISHOP, *John O'London's Weekly*

"The Cruel Sea has all the hall-marks of best-sellerdom"
— JOHN BETJEMAN, *Daily Telegraph*

"It will make many novels seem listless and lifeless for some time to come. It glows with warmth and humanity. Conrad would have liked it and that's a worth-while judgment. He gives us atmosphere, he gives us the feel and smell and every shake of the *Compass Rose*, we accept, we believe" — JAMES HANLEY, *Time and Tide*

"It is one of the best novels that have yet been written about sailors at war"—MARK ARNOLD-FORSTER, *Spectator*

Philosophy with Gusto

A History of the Political Philosophers. By George Catlin. *Allen and Unwin.* 802 pages. 30s.

This is an English edition of a book published in the United States twelve years ago. Mr Catlin is a resolute populariser, and this is a work designed not for the scholar or expert, but for the general reader, a volume similar in intention, though not in execution, to Bertrand Russell's "History of Western Philosophy." It attempts to cover the whole field from Plato and Aristotle to Chicago University in the 1930s.

The besetting sin, and almost inevitable criticism, of such a book is superficiality, and more than once Mr Catlin's narrative comes near to a catalogue of names, interspersed with anecdotes. But Mr Catlin also has his virtues as an author. He believes in the importance of what he is doing, and does it with gusto, not in the half-ashamed, self-deprecatory fashion of an Oxford don caught broadcasting on the Light Programme. He writes with passion at times, and the book gains by it; he is never dull, an achievement in a work of this length, and he brings to his judgments a personal quality, so that the reader is conscious of the author at his elbow all the time. If this becomes irritating at times, when Mr Catlin trots out his prejudices, it gives the book the character of an argument and saves it from becoming a text-book.

Mr Catlin pays proper attention to the origins of political thought, but he throws the main emphasis on the more modern period. The American and French Revolutions are reached on page 300, while the last three hundred pages are taken up with Hegel and his successors. There are two fat chapters on Marx and the Marxists, including the Revisionists and Trotsky, as well as Lenin and Stalin. The American origin of the book is reflected in a long chapter on contemporary English political thought, which is the least satisfactory in the book. It consists almost entirely of an account of the intellectual development of Harold Laski and, oddly enough, John Strachey. More than twenty pages for Strachey, only six lines for Tawney, and two pages for the Webbs and the rest of the Fabians gives a lop-sided picture of even Left-wing political thought in this country. It is a pity that this chapter was not rewritten for the English edition.

The last two chapters of all have the hurried, grasshopper characteristics of many last chapters in historical surveys. When so many textbooks of political theory stop short on the threshold of modern sociology, Mr Catlin is prepared to plunge on. But he leaves himself too little space to do justice to what could have been the best section of his survey—the transition from classical political thought to the age of the social services. Mr Catlin's book lacks the balance, solidity and authority of Professor Sabine's "History of Political Theory." But it has two important virtues, enthusiasm and a style which makes it easy to read; this is more than can be said of most introductions to political thought.

New and Enlarged Edition

INTRODUCTION
TO
ECONOMICS

SECOND EDITION, 1951

by

Alec Cairncross, Ph.D.
(Cantab).

Professor of Applied Economics at the University of Glasgow

CAIRNCROSS has long been one of the most widely used textbooks on Economics—its first Edition running into seven impressions—and with the appearance of a new Edition this famous work is brought into line with the latest developments in present-day economic thought.

The book is written simply, practically and consecutively, and is therefore easily understood, even by those approaching economics for the first time. There is no attempt to over-simplify, and no part of economic theory is left out merely on account of its complexity.

Text and Reference Books

Quin's Metal Handbook. *Metal Information Bureau.* 611 pages. £1.

An annual review of metal statistics is no nightcap. Yet "Quin's Metal Handbook," of which the 1950 edition has recently been published, is not a compilation of figures only. It has useful sections devoted to descriptions of the properties and uses of the principal metals, a large number of minor metals, and the main commercial ores. These sections are in addition to the figures of world production, consumption, imports and exports. One of the main difficulties in any consideration of metals other than tin, which is served by the International Tin Study Group, is to get up-to-date figures of world production and consumption. Quin's handbook has many figures for 1950, although 1949 is the last year for which full figures are available. But apart from the yearbook of the American Bureau of Metal Statistics, also recently published for 1950, there is nothing with better coverage. In Britain the Imperial Institute's yearbook is always a few years behind with its data, and the monthly bulletin of the British Bureau of Non-ferrous Metals gives only British figures. Even for iron and steel, although the Federation's Monthly Bulletin adequately serves the industry, the handbook is a useful source. Thus Quin's handbook, now in its thirty-seventh year, has not only established its reputation, having begun before the British Bureau of Non-ferrous Metals was thought of, but also is one of the essential reference books needed by anyone who deals in or uses metals. Moreover, the previous two editions were divided into two volumes: one for iron and steel and one for non-ferrous metals. The 1950 edition is in one volume which is of pocket size.

The Scope Year Book of Industry, Trade and Finance, 1951. *Scope Books.* 611 pages. 45s.

The second edition of this reference book compiled for business and the professions has been greatly enlarged and improved since its first issue last year and is now a most useful source of information. It is designed to be of general rather than specialised interest and therefore gives comparative as well as the latest information.

Part I reviews the British economy in 1950 with particular reference to controls, legislation and other changes affecting business. A diary of economic events at home and overseas is included. Part II contains essential facts about public and private authorities, institutions and organisations and marketing information on every country. Part III gives economic statistics for the United Kingdom and foreign countries.

The South African Financial Year Book, 1951. *Thomas Skinner.* 1434 pages. 55s.

Information concerning all the companies operating in South Africa and known to the South African and London Stock Exchanges has been brought up to date to April, 1951. General articles deal with taxation and succession duties, South Africa's balance of payments, Government loans and technical and mining terms.

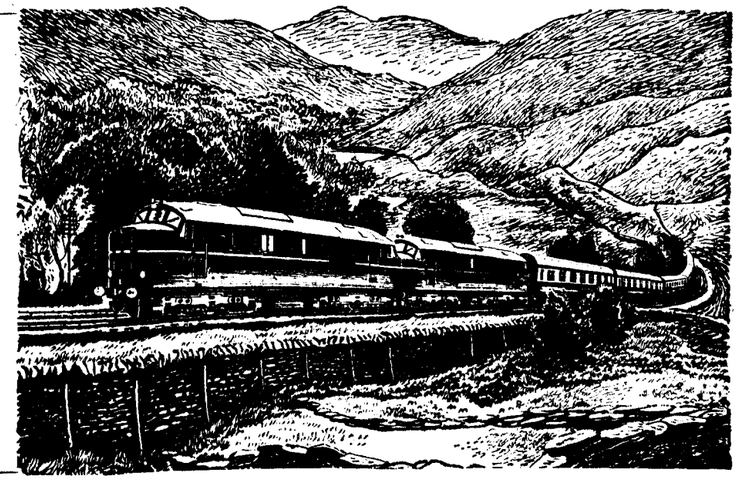
Guide to the Coalfields, 1951. *The Colliery Guardian.* 457 pages. 18s.

The main part of this guide consists of descriptions of the deep mines of Great Britain showing the type of mineral extracted, the numbers of workers and the names of officials. Maps based upon Ordnance Survey maps show the exact position of the collieries.

Other sections relate to the Ministry of Fuel and Power, and other organisations connected with the coal industry.

Building Societies Year Book, 1951. *Franey.* 555 pages. 18s.

The Official Handbook of the Building Societies Association gives a general summary of the operations of the building societies for 1950 and deals in more detail with the members of the Building Societies Association. The latter consists of 407 out of the total of 821 societies but represents £1,203 million of the total of £1,255 million of building society assets.



The International Who's Who, 1951. *Europa Publications.* 1067 pages. £4.

The fifteenth annual edition of the International Who's Who continues to provide short biographies of eminent living personalities in all countries. It incorporates changes up to April, 1951.

The Statesman's Year-Book, 1951. Edited by S. H. Steinberg. *Macmillan.* 1624 pages. 36s.

The familiar pattern which has made this a standard reference book has been maintained in the eighty-eighth annual edition. While most of the statistical information is for 1950 some financial data are available up to April, 1951. For the first time a paragraph on the statistical offices and similar agencies has been included for the countries where they are known.

'ENGLISH ELECTRIC'

No smoke streams over the coaches of this Royal Scot. No boilers demand constant stoking. These 1,600 h.p. diesel-electric locomotives haul freight and passenger expresses with equal efficiency. Their diesel engines and electric equipment were designed and built by 'ENGLISH ELECTRIC'.

bringing you

All over the world 'ENGLISH ELECTRIC' trains and locomotives are bringing quieter, cleaner, more comfortable travel. All over the world, in all kinds of ways 'ENGLISH ELECTRIC' uses the power of electricity to bring better living to millions of people.

better living

AMERICAN SURVEY

Presidential Preoccupations

Washington, D.C.

As a lover reads and re-reads the letters of his lady, as a gambler caresses his cards, so Americans are now preoccupied with the prospect that is nearest and dearest to their collective heart. It is the 1952 Presidential election, its potentialities and uncertainties, its perils and promises. The summer of 1951 fades and it is less than a year until the conventions at which the parties will nominate their candidates. General Eisenhower (and not General MacArthur, who is not at this point regarded as a serious contender for the Republican nomination) is the man who is giving next year's prospect its special excitement. The fact that his political views represent *terra incognita* (his family is known to have long been Republican, but he is on record as having voted for Roosevelt in 1944), and the further fact that substantial elements in both the Republican and Democratic parties are anxious to see him nominated in their respective interests open delightful avenues of speculation and prediction. They are not, however, quite as new and as untravelled avenues as most of the current comment suggests.

The American people have elected nine fully-fledged Generals to the Presidency since the Republic was founded—nine Generals, that is, who have actually held active commands in the field; among them have been Generals Washington, Jackson, Grant and Benjamin Harrison. Nine successes out of a possible thirty-three suggests that the Generals have generated more than a normal proportion of the glamour which leads to political power. But any impression that a military hero always wins needs correction. Five other Generals have run for the Presidency and have been defeated.

Another inaccurate notion is that General Eisenhower is the first American General whom the people and the politicians have been prepared to embrace without knowing which party he favours. When, soon after the Civil War, General Grant ran successfully for the highest office in the land, there was considerable doubt about the direction in which his political convictions lay. And earlier, in 1849, General Zachary Taylor, who became the 12th President of the United States, was of such uncertain affiliation that he contemplated nomination by both the Whig and the Democratic parties.

Enough signatures have already been secured to place General Eisenhower's name on the ballot for the primary election at which Democrats in Oregon will express their preference for their party's possible candidates, and it was reported last week that petitions designed to ensure that the General's name would also be on the ballot in the Republican primaries in the same state were now being circulated. It is conceivable that this enthusiasm will wane before either of the two parties meets in Chicago for its nominating convention—the Republicans first, the Democrats about a month later. But it may not. In any case it now seems unlikely, short of some quite unforeseen development, that General Eisenhower himself will be able to control the trend. He may declare himself not to be a candidate: he may repeat and strengthen his earlier protestations that he is a soldier who wants only to be a university president, and not a politician. But all precedent suggests that any such display of reluctance will make him more, rather than less, attractive to the party strategists and to the electorate itself.

The most fruitful topic of discussion is still, therefore, whether General Eisenower will be drafted and nominated and, if so, by which party. Though it can be persuasively argued that the devotion to the work which has taken him back to Europe aligns him closer to Democratic than to Republican policy, a good many judges seem to think that the Republicans have the better chance of snaffling him. If so, the second fruitful topic is at once opened up: will President Truman run again?

★

The recent amendment to the Constitution providing that Presidents in future shall serve for only two terms exempts Mr Truman: he may lawfully run as many more times as he and the Democratic Party may desire. There is no reliable intelligence to show whether any of the considerations which are supposed to be swaying the President—his desire to return to the Senate, Mrs Truman's unwillingness that he should embark upon another four years of stress and strain, his sense of dedication to the struggle for peace and his anxiety to see his policies vindicated—are going to be conclusive.

Senator Douglas of Illinois suggested in a radio programme recently that the President is now "standing under the mistletoe, waiting to be kissed." It may be so: it may be that Mr Truman has decided to run again. (The one apparent certainty is that, whether or not he has made such a decision, he will say nothing between now and convention time to take himself out of the race, since to do that would be to throw away his present authority both in the White House and in the Democratic Party.) Or it may be that he has determined that his final "Yes" or "No" shall depend upon the Republican choice of a candidate. The third fruitful topic for discussion is thus introduced.

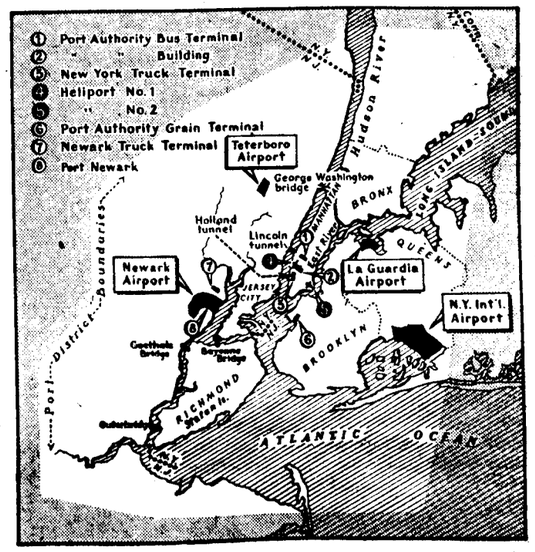
Senator Taft of Ohio, the most spectacular victor in last year's mid-term Congressional elections, seems to seasoned observers in Washington to be playing the steady, experienced game of a man who believes that the Republican nomination is nearly in his grasp and, furthermore, that he knows how to close his hand on it. His supporters often claim not even to be afraid of General Eisenhower, and they express the hope that Mr Truman will be nominated by the Democrats, alleging that their man would surely beat him. Mr Truman's supporters, on the other hand, say that they pray for nothing better than that their opponent should be Senator Taft.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

But just as the Republican Party itself, if it is to win, will have to find a way of obliterating in the public mind the idea that it is the party of wealth and economic privilege (an impression which the Gallup Poll has lately shown to be still prevalent), so Senator Taft, if he is to secure the nomination, will have to combat a widespread conviction within the party that he is a bloodless candidate, a man for whom no popular national enthusiasm can be engendered. And when that issue has been decided, there will remain the question whether his record—his wild rides with isolationism, his insistence upon the role of a twentieth-century Canute confronting the new waves of liberal realism—can be reconciled with the mood of the times.

Other names swirl and eddy on the edges of the discussion. In certain circumstances Governor Warren of California might stand an excellent chance of winning the Republican nomination. And does the flame of hope still secretly burn in the breast of Governor Dewey, twice defeated and now an enthusiastic backer, in public, of General Eisenhower? Mr Stassen is considered to have by no means abandoned the struggle. And what will be the effect of Senator Duff of Pennsylvania, a shrewd operator who may well come to the Republican convention with a lot of votes in his pocket?

On the Democratic side—if there is to be no Eisenhower nomination—is it conceivable that there could be no Truman nomination either? And if so, who could it be? Senator Douglas? The Dixiecrat rebellion in the South is thought to offer a much more serious threat for 1952 than it did for 1948; for now Governor Byrnes of South Carolina, Senator Byrd of Virginia, and Senator George of Georgia—mighty men, all of them—are reported to be in league to bring down the Truman leadership. How seriously is Senator Mundt's plan for a formal coalition between the Republicans and the Southern Democrats to be taken? Could Mr Truman make his peace with the Dixiecrats by adopting a Southerner as his running-mate in place of the amiable but aged Vice-President, Mr Barkley? If so, which Southener? And so the fascinating discussion gathers speed as the weeks go by.



"Let the Port Do It"

[FROM A CORRESPONDENT IN NEW YORK]

The Port of New York Authority, now celebrating its thirtieth birthday, owes its original pattern to the Port of London Authority. In form a public corporation set up by compact between the states of New York and New Jersey, it was meant to rescue the seaport from chaos and obsolescence by reorganising railway terminal facilities, piers and water traffic. Thwarted in this first task by the same interests whose conflicts called it into being, it then turned to the wider task of planning and developing the commerce of the port as a whole. Since 1921 the authority has built, bought or taken over for operation four interstate bridges, two under-river tunnels, four airports, five terminals (for buses, lorries and grain barges) but only one unit, Port Newark, of the seaport itself. Its latest additions are a helicopter, enabling its engineers to hop from office roof to the furthest possible point of trouble in fifteen minutes, and two heliports, one a forty-foot square landing space on top of its own building, the other a hangar on the river.

Given its natural site and its international importance, the port of New York ought to be the most modern and best run of the world's receiving centres. Actually, it is a conglomeration of the up to date and the obsolete, with vested interests holding fast to practices that were old-fashioned in 1900. The glaciers made the harbour a wonderful complex of land and water; Manhattan Island in the middle is flanked by the navigable Hudson River on the west (with New Jersey and the continent behind it and canals linking it to the Great Lakes), on the north by a deepened cut called the Harlem River, on the east by the swift estuary called the East River (with Long Island on the other side). Staten Island—the Borough of Richmond—guards the harbour's southern entry. The largest ships can dock alongside Manhattan's shore in less than an hour from the open sea and within half a mile of the best hotels.

This maritime paradise is split between two sovereign states, a city government technically subject to one of them but commanding more financial power than either, the federal government which controls navigable waters, and

a series of smaller towns. Private interests work through these competing authorities or wage their own private wars: railway companies control a large portion of the Hudson's western shore and give way for no man; lighterage firms, shipping concerns and trade union politicians exert their various influences in various places. As long as New York City's commerce came by boat, the island site was lucrative. Railways added to the city's prosperity, one with a franchise down the middle of Manhattan, another entering by tunnel under the Hudson, the rest sending goods and passengers by ferry from their terminals on the Jersey side. But motor traffic had a contrary effect. As it increased, New York was shocked to find its valuable waters were a handicap. Cars could be ferried across the Hudson, but too slowly. The city began to fear isolation from the continent, the continent clamoured for quick entrance to the city.

Out of this confusion the Port Authority was born in 1921. Its first fruitful attack on the problem was to build bridges on the city's fringe, between Staten Island and New Jersey. The first motor way to enter the city direct from the west was a four-lane tunnel under the Hudson River, built by the two states but taken over by the Port Authority in 1930. A year later it opened its George Washington Bridge, suspended over the Hudson far above the tallest ship, carrying eight lines of motor traffic. It finished a second tunnel in 1945, but now finds it crowded past capacity and is planning

a third tube for it. The combined capacity of the Hudson River crossings (including ferries which still run) is 184,000 vehicles a day. Present traffic is 158,000 and growing fast.

If getting motor traffic into New York was the Port Authority's first engineering problem, deploying it was a second, and harder, one. Huge buses full of suburban dwellers, ten-ton trailer lorries full of goods, were now able to reach Manhattan under their own power; they brought trade, but also they clogged the streets. In the last three years the authority has moved them to the edge of town and speeded their loadings and unloadings by providing consolidated facilities, shunting them into a freight-forwarding terminal for less than carload lots (in the Port Authority's own building), two truck terminals (the less successful one in New Jersey) and a bus terminal.

The authority's success in moving goods and people back and forth between its two parent states landed it with the headache of handling air traffic for them. It took over La Guardia Airport, sinking into Flushing Bay and into bankruptcy, and rescued it from both. It took over Idlewild, the International Airport, another city dream too big for city resources, and is making it the hub of transatlantic and transcontinental plane service. It transformed Newark Airport from La Guardia's limping competitor to its prosperous complement. It then bought Teterboro Airport (also in New Jersey) from a private operator to serve the metropolitan district as a centre for air cargoes and irregular flights. In dealing with air traffic the authority has had a freer hand than in trying to regulate older forms of transportation. It has even been able to base its plans on a general service for the district as a whole rather than on competitive facilities. This has not, however, always been to the liking of the airlines which have hitherto been able to profit by rivalry between airports.

*

In its thirty years of life the authority's financial skill has had to keep pace with its engineering accomplishments. Its money came in the beginning from the two states that created it. New York and New Jersey each put up $2,000,000 for the first two bridges, and from time to time they have added special loans, but the project was intended to support itself mainly from its own revenues. A credit structure had to be built which would attract private capital, and the right granted to it to issue tax-free bonds secured by proven earning power has become one of the authority's most valuable assets. Its total investment in structures and facilities had grown to $370,760,000 at the end of 1950 and its income that year was $42,198,000, of which three-fourths came from motor tolls paid at bridges and tunnels. The airports, most of them losing money when the authority took them over, are now making operating profits; the new terminals have done less well financially.

The authority's method of financing public improvement by tax-free revenue bonds is not new, but its success in using the method, and in defending it from federal attempts to eliminate the tax-free element, has inspired a host of imitations by states, towns and counties for all sorts of purposes. Critics in Washington claim that such bonds compete with commercial issues and should be taxable. Critics in Wall Street complain that the financial soundness of these operations is dependent in the beginning on hope and managerial skill; that they make it possible for towns to overstep their legal debt limits and even to finance projects forbidden by their local charters; that they confuse the public which thinks they are backed by taxing power. Thus far these criticisms have had little effect on the popularity of the "authority" as a form of public enterprise. The test will come when some of the more shaky ones capitulate to rising costs and a tighter money market. As for the New York Port Authority, it had the great good luck to meet these handicaps in its early days and overcome them. If, or when, its plans for much-needed pier development are accepted, it may be grateful for having already had experience with hardship.

American Notes

Clouds over the Rising Sun

Americans naturally feel cheated that the Russians have descended on San Francisco to turn what was intended to be an orgy of peace-making into just another round-table wrangle. But even before the shock of the Russian acceptance they had begun to perceive that others among the invited guests were not as enthusiastic as might have been expected about the party that was to celebrate the rising of a reformed Japanese sun, with its spots polished off by the American occupation. That the Philippine Republic and Australia and New Zealand needed the encouragement of a little special treaty-signing before the main affair was understandable, but it was a real affront when India refused to come in spite of the concessions that had been made. Apart from anything else, India's absence, coupled with what to the average American seems an incomprehensible inability to agree on which China should be invited, means that the major Asian powers are not represented.

This in turn reduces the propaganda value of the conference very substantially, and it is for propaganda purposes that the treaty is being signed in public and with ceremony instead of in private and at leisure. (The US Senate is not expected to find it convenient to give its necessary approval until next year.) The idea was to provide the Voice of America and other political warriors with ammunition showing that the "peace-loving" nations are honest in their pacific intentions; that the United States is genuinely anxious to form a partnership of those devoted to peace, now that the universal peace union formed at that same San Francisco in 1945 has collapsed. But with the Russians at the conference and with the managing directors of the new partnership in a hurry to get back to Washington and Ottawa and the practical details of preserving the peace, it will be only too easy for the Communists to argue that what is being celebrated at San Francisco is the establishment of an American dictatorship.

From the point of view of domestic politics, however, the party may be more successful. The uncertainty and the publicity provided by the Russian delegation will hold the attention of the 45 or more million Americans who, it is estimated, will be able to hear and see the proceedings; for the transcontinental television link has been rushed to completion to be inaugurated by the conference. And these viewers will perhaps come away with a better appreciation of the difficulties that go to the making and application of even a bipartisan policy for the Far East. Not even the Republicans can criticise the Japanese treaty, negotiated by their own Mr John Foster Dulles on a groundwork laid by General MacArthur (who has, incidentally, refused the Administration's invitation to address the conference). Before long the Republicans may have the satisfaction of seeing their, and the General's, advice taken in other ways. Already, during the breakdown in the Korean negotiations, Rashin, the base on the Soviet frontier, has been bombed, as General MacArthur long ago urged. And if, as is feared, the final collapse of the truce talks quickly follows the end of the San Francisco conference, it is expected that the Korean war will be intensified along the lines laid down by the General.

Cuts Near the Heart

The Senate has dealt even more drastically than the House with the mutual security programme, reducing President Truman's requested $8.5 billion to $7.3 billion. The major cut was in economic aid, now down to $1.3 billion, while almost $6 billion is still allowed for military assistance. The authorisation which finally comes out of conference with the House may possibly be slightly more generous than this, but then the whole operation must be gone through again, for the money has still to be appropriated. This is the stage when deeper cuts are to be expected, for by the time foreign aid funds come to be voted on Congress—and the country—will have begun to realise how very little flesh has actually been taken off the other parts of the President's budget, in spite of all the talk of paring it to the bone.

The House has admittedly cut a number of minor programmes to the heart: it has allowed the National Science Foundation, only set up last year and intended to foster the basic research so important for the development of new weapons, $300,000 instead of the $14 million requested; it has taken 85 per cent off $535 million needed for civil defence; it has refused any money at all to the Displaced Persons Commission which was given a new lease of life as recently as last June. The illogicality of killing off schemes which are essential supplements to the enormous and inviolate military appropriation that makes up about two-thirds of the budget is so obvious that the Senate is almost certain to patch these programmes up. But it has gone along with the House in reducing funds for political warfare.

So far action has been completed on six appropriation Bills amounting to some $13 billion; a saving of about $1 billion has been made here and the House has saved a further $2.5 billion on the other Bills it has passed. Such estimates are, however, necessarily vague, since no one knows exactly what will be the financial result of the Jensen-Ferguson amendment, now being attached to nearly all appropriation Bills. This amendment broke the deadlock between House and Senate, between Republicans and Democrats, which was one of the reasons why all government agencies were still being financed on an emergency basis in the second month of the new fiscal year. The compromise provides that Mr Jensen's formula, for replacing only one of every four persons who leave government employment, shall be followed until Senator Ferguson's reduction of ten per cent in all government payrolls is effected. It has already faced the Atomic Energy Commission, which is doubling its activities this year, with a dilemma which the agency threatens to solve by reducing its security staff. But other defence agencies are exempted, and these and other exceptions make it impossible to calculate how much will actually be saved by this unjustifiably painful method of fund cutting. Furthermore, even when Congress has finished with all these regular appropriation Bills, as it expects to do by the end of the month, there will be deficiencies to be made up. Already the House has passed its first supplementary appropriation Bill for $1.6 billion.

* * *

Reports on Corruption

The two Congressional investigations that hit the headlines and the television screens last winter have now come quietly to an end. On September 1st the Senate's special Crime Investigating Committee handed over its work to the Interstate Commerce Committee, which is expected to concentrate on getting its predecessor's 22 legislative recommendations through Congress. They deal with such matters as the transmission of gambling information and the prevention of drug addiction, and most of them are designed to assist the local efforts which are the preferred way of dealing with criminal activity. Since there appears to be no hope of getting speedy authorisation for a Federal Crime Commission, the committee recommended the organisation of local commissions, to be helped by a privately financed, and not very happily named, National Crime Co-ordinating Council.

Organised crime, the committee pointed out, could not exist on a large scale without the protection of officials who have been bribed or politicians who want support at the polls. Another aspect of corruption in government, favouritism and improper influence in the lending operations of the Reconstruction Finance Corporation, was the subject of the report issued ten days earlier by Senator Fulbright's investigating committee. This report also concentrated on legislative remedies, although its major interim recommendation had already been carried out, when the RFC's five-man board was replaced by a single administrator, Mr Stuart Symington, who has already won the committee's approval by his stringent reforms of the agency's lending policies. Senator Fulbright has never during this enquiry whitewashed the Administration he supports, but the Republican minority on his committee, less responsible than their colleagues on the crime committee, could not refrain from political mud-slinging in a sarcastic and controversial minority report.

They concentrated in particular on recent allegations that Mr Boyle, chairman of the Democratic National Committee, had been instrumental in obtaining an RFC loan for a Missouri firm at a time when he was its legal adviser. President Truman, as was to be expected, exonerated Mr Boyle completely, but the matter is now being investigated further by another Senate committee. The House of Representatives is doing its bit, too, with enquiries into the Securities and Exchange Commission and into the administration of the internal revenue laws, with special reference to the methods by which gangsters and gamblers have avoided paying taxes. This widespread search for dirty linen to wash in public should satisfy Mr Hoover, for he thinks that such a display is a sign of moral stamina. To others it is a sign that an election is coming.

* * *

Letting Sleeping Taft-Hartleys Lie

The chains of what the trade unions used to call the slave labour, or Taft-Hartley, law have chafed less since a more sympathetic counsel was appointed to the National Labour Relations Board and since the rearmament drive began to promise prolonged prosperity. The unions' great fear was that the law might be used to destroy them in a period of economic crisis. In Congress, the question of repealing the Act is a sleeping, if not a dead, issue. Even the President failed to wave this old battle-flag in his State of the Union message last January, and most of the trade unions probably would be content, as he was, to ask merely for "improvement of the labour laws." One improvement would be to permit closed shops in those industries, such as shipping, where they are favoured by both management and labour; another would do away with what have proved to be pointless elections which must precede the adoption of a union shop, a compromise arrangement under which workers must join, and remain, members of a union.

The sleeping Act came to life with a start in July when the National Labour Relations Board ruled, in a case involving the Ford Company, that a union shop clause was invalid because, at the time the contract was signed, the officers of the Congress of Industrial Organisations (CIO), the local union's parent body, had not signed anti-Communist affidavits. Under the Taft-Hartley Act, no union may use the services of the NLRB unless its officers have signed such affidavits, and it is the NLRB which holds the election which must precede any union shop arrangement.

Early in the life of the Act, the NLRB decided that officers of parent organisations were exempt, but this view was overruled by the Supreme Court in May, and an alarming

prospect opened up of having to hold 4,700 fresh elections to legitimise as many union shops, most of them in CIO territory. The national officers of CIO did not sign their anti-Communist affidavits until late 1949, two years after those of the American Federation of Labor complied.

The NLRB hastily reversed engines, in the Ford case, relying on the unquestioned good faith of labour and management in this instance. But this is no guarantee of safety for all such contracts, and Senator Taft and Senator Humphrey, an oddly assorted pair of knights but impressive for that very reason, have charged to the rescue. The Bill they are sponsoring, which has been approved by the Senate, would legalise all such union shops and in addition would eliminate entirely the requirement for a union shop election.

* * *

Rail Rates Rise

At the end of August railway freight rates for nearly all commodities rose for the ninth time since the end of the war. This rise replaced last April's interim increase, but is not itself permanent, for the Interstate Commerce Commission proposes to review it early in 1953, if not before. The Commission feels that the time has come when railway revenues will lose, rather than gain, on a long-term basis, by further increases in freight rates. It recognised, however, that the case put up by the railway companies was unanswerable in present circumstances. Not only have costs of labour and materials risen so high that adequate profits are unattainable with existing rates, but the companies have been involved in additional expenditure by the needs of the rearmament programme—$760 million for goods wagons and $334 million for diesel engines, for example—which cannot be curtailed without hampering the national defence effort. And if the dispute with the three big railway trade unions, which has kept the army in nominal control of the lines for over a year in order to avoid a strike, is ever settled, it will undoubtedly mean a further, and probably retrospective, increase in wages.

Although the ICC overruled the protests of the Office of Price Administration against the inevitable inflationary effect of the rise in freight rates, it was not prepared to give the railways all they asked. According to their estimates, they need an additional $1 billion in annual revenue, which would have meant a 13 per cent increase in rates. The rises that have been permitted will, it is calculated, give them only $564 million. Railways operating in the west and south were allowed to raise their rates by only 6 per cent, while those in the east went up by 9 per cent. The reason given for this differentiation was that eastern railways have been earning less than those in other areas, but the variation will also further the ICC's long-term objective of equalising freight rates all over the country. A more direct attack has also recently been made on the discriminatory freight charges which penalise southern businessmen who wish to sell in eastern markets, and so, it is alleged, hamper the growing industrialisation of the south. The commission has ordered rail carriers to file, before the end of the year, uniform freight rates for all shipments of manufactured articles. This will mean reductions in the amounts charged firms in the west and south and an end of the old system which made it 20 per cent cheaper to send goods from Chicago, in Illinois, to New York than from Atlanta, in Georgia, although the distance travelled is the same in both cases.

* * *

Canute in the Composing Room

The International Typographical Union, the printing workers' organisation, has at last read the writing on the varitype machines and the teletypesetters, but it is still fighting against, instead of coming to terms with, the future foretold by these mechanical invaders of newspaper composing rooms. Recent printing strikes, particularly the lengthy one against the Chicago dailies that ended two years ago, have proved that processes such as varitype and photo-engraving provide a feasible, even if not an entirely satisfactory, substitute for human typesetters. Other strike-bound newspapers had a better alternative available in teletypesetters. Not many of them, however, had thought it worth while to install these machines, since the union always insisted on a man being employed for each machine, even though one linotypist can take care of a whole group of machines equipped for teletypesetting.

Last April, however, the tide against teletypesetting turned when the Associated Press opened a teletypesetting circuit in North and South Carolina. The other two big news agencies followed its example and already five circuits serving 100 daily papers are working. This means that, for all practical purposes, an operator in one central office actually sets type for all the newspapers on the circuit. The news reaches the publishing office through a machine which produces a readable copy for the editor and a perforated tape which can be fed into the linotype machine. The ITU has evidently realised that such a flood cannot long be stemmed by its old make-work methods, but instead of swimming with the tide it is trying to find a new way of escaping it. That at least seems to be the explanation of its latest venture, a chain of nine tabloid-size daily papers, some of which are already on sale.

*

Unlike the *National Reporter*, a daily for labour news only now being planned by another group of trade union officials, the ITU papers will have a general coverage of local, national and international news of all sorts, 15,000 words of "easy to read, honest and responsible" copy, provided by its own Washington bureau and local staffs. The union alleges that these papers can succeed commercially with individual circulations of about 10,000 each, but it will be surprising if they do at a time when smaller newspapers are fighting a losing battle against rising costs all over the United States. The frequent failures of independent papers have of course meant a perturbing increase in the power of newspaper chains and monopolies, just as the news agencies' use of teletypesetting will discourage individuality in news presentation. For these reasons there will be much sympathy for the ITU's desire to "keep the news free" and destroy monopoly. But there can be little doubt that its real purpose is revealed by its second objective, to show that "present printing machines operated by skilled craftsmen are still the best methods of producing a daily newspaper." The impression that the main consideration is to ensure that, whatever happens, there shall be jobs for union members is borne out by the fact that several of the new dailies are being started in towns where teletypesetters are in use and have enabled newspapers to continue publishing in spite of strikes.

Shorter Notes

It is expected that the copper miners will return to work now that an injunction against the strike has been issued under the Taft-Hartley Act. Hopes of a settlement were high last week, when an agreement for a "package" wage and pension increase of 19½ cents an hour was concluded with the Kennecott Copper Corporation, supposed to set a pattern for the industry. But the other major companies refused to accept this agreement, on the grounds that it would put wages above the ceiling set by the government's stabilisation authorities. Already the strike has necessitated drastic reductions in the amount of copper allowed for civilian production in the last quarter of the year.

THE WORLD OVERSEAS

The Outlook in Japan

(From a Correspondent recently in Japan)

THERE have been remarkable changes in Japan during the past year. But although in some processes and industries mechanical progress has been striking, on the whole the technical level is much below European standards—to say nothing of American. The crudity of many basic processes and the inefficiency of various essential services, obviously lessens, to some extent, the prospect of effective Japanese competition in world markets. Probably there will be at least a timelag, during which the Japanese will painfully have to learn abroad and adjust at home. Opinions differ as to how far the shortcomings are technical, and how far they are organisational; in the nature of the case, the Japanese are "out of touch" in matters of management, marketing and leadership, far more than in those of workshop practice.

Japanese expectations of increasing partnership with, and direct investment and personal collaboration by, American entrepreneurs in Japan have been disappointed. Accordingly, Communist propaganda, depicting a "hand-in-glove" relation between Japanese and American capitalist interests, is wide of the mark. Another of its current miscalculations, as far as the Japanese are concerned, is its insistence on a "controlled" economy; for bureaucracy is at the moment a bogy or a scapegoat. Practically all controllable functions of public administration have now been transferred from Occupation officials into Japanese hands; this process has been going on, with increasing zest and rapidity, over the past year.

In this hand-over every item must be transferred to some specific and equivalent Japanese organisation. Japanese officials are out of touch with much that is normal or general in the postwar world. Local precedents are largely those of a complicated totalitarianism. Yet there is a psychological compulsion, which is understandable enough, for the incoming Japanese controllers to change the names, titles and signboards especially associated with the Occupation, and to reallocate the various duties. So there is already a whole new crop of initials and abbreviations, and a new labyrinth of departmentalisation. Already the simplest tourist, coming for a holiday, must fill up forms in triplicate, and be interrogated before landing, in a manner only too reminiscent of prewar days in Japan. The procedural complexities facing the business man are irksome and varied; his burdens of taxation and paper work are heavy; and it is feared that in this respect the worst has still to come.

A Sense of Strain

In this and other ways, there is a sense of strain which is immediately noticeable among all classes and in all occupations. The Korean war gave the Japanese economy a headlong impetus. Japan has served very actively and profitably as the forward supply base of the United Nations. This boom, however, has not gone on for a year without showing great distortions within the Japanese economy, as well as some diversion or thwarting of its long-term development.

It is noticeable that different answers are given in Tokyo and in Osaka to the question of what should have been done about these distortions which were widely foreseen by many Japanese. The two cities stand, in various practical matters, in a certain antithesis. Tokyo is the metropolis and the seat of the Occupation; it sees everything in terms primarily administrative, political and diplomatic. But Osaka is the foyer of the manufacturing interest and the trading viewpoint. From its windows, the view is not mainly eastward across the Pacific to the Americas, but southward and westward, to Asia, Europe and Africa. The tendency of Tokyo (with Yokohama) is to propound "politicalised" analyses and to prescribe "administrative" solutions; whereas Osaka (with other southern centres) deals in factual and economic considerations, calling for "business" handling. Commercially and financially, the Kwanto (Tokyo area) now looks significantly towards the United States; whereas the Kwansai (Osaka and its region) looks, in what are fashionably called "ideology" and "orientation," rather to East Asia, the sterling area and the rest of the world.

The Dulles *versus* the Dodge "Line"

In up-to-date Japanese parlance, this may be expressed by saying that the "Dulles line" finds support in Tokyo, whereas Osaka people would generally prefer to have remained on the "Dodge line." The name of Dodge stands, of course, in Japan for the policy of rationalisation, retrenchment and internal reform prescribed by the Dodge Mission and applied in Japan with great effect, during the first half of 1950; while the name of Dulles stands for the present "geopolitical" basis, the grand design of the impending peace treaty. Japanese commentators have pithily stated that the "Dodge line" placed first the economic and material rehabilitation of Japan as a precondition of external security; whereas the "Dulles line" now imposes, conversely, an external pattern of world security, within which Japan must shape its efforts to earn its livelihood.

More bluntly speaking, the peace treaty faces Japan with some deep and painful paradoxes. Is an iron curtain to be drawn between Japan and China, whose economy is so greatly and logically complementary to that of Japan? Is there a proper realisation of the part Japan could, and presumably should, play in the economic development of South-east Asia, particularly of the underdeveloped areas? Or has the development conception itself been jettisoned, since, over the last two years, the once grandiose publicity about "Point Four" has died away to silence? If the answers to such questions are in the affirmative, how far and in what manner is the corollary to be faced, that the United States (or United Nations) must make some alternative provision for supporting and financing Japan, to the extent that it is deprived for political reasons of its normal economic opportunities?

These are the major questions which now confront the Japanese. The dangers of error are vividly realised and much feared. Too many people are canvassing merely political issues and solutions, and too few are warning or preparing the people for the shocks and toils that must come in the future; but this state of affairs is, of course, no novelty, in Japan or any other country. In no other country, however (except perhaps Spain), is local attention so disproportionately drawn to the field of foreign affairs, with hopes mainly centred on an extrinsic solution, at the expense of attention to internal efforts and improvements, which must eventually be no less decisive. The Japanese people await the peace treaty as a prisoner awaits the expiry of his parole period; with a great longing, tempered with nervousness about the problems of getting a living, and of getting back into ordinary society.

Uncertain Future in Greece

[BY A CORRESPONDENT]

EVERY Greek election is a minor tragedy; not only because people usually vote in dislike of a personality or cause rather than in hope for a programme; and not only because the government that appears a few months after the polling often bears so little relation to the actual votes. But chiefly because each election reveals the bankruptcy of Greek politics, while even if a new party or new figure comes forward to raise a flicker of hope, that hope is soon dashed in the morass of Athenian political practice. The last election, a year and a half ago, produced a new centre party under General Plastiras on which many pinned their hopes. But in a few months his coalition government had foundered and the election might never have been. It was succeeded by a series of ineffective coalitions typical of postwar Greece, often consisting of a minority government dependent on the qualified support of the opposition.

This time, when Greece goes to the polls on Sunday, there is an entirely new figure on the political scene—Field-Marshal Papagos, former Commander-in-Chief and hero of two successful campaigns. His entry into politics was a shock to the old professional politicians (except to those who managed to attach themselves to his following), and already his formation of a new party—the Greek Rally—has effected a radical redistribution of party strengths. The Right-wing Populist Party and Papandreou's Democratic Socialists (a centre party and Socialist only in name) have suffered most from defections to Papagos. Kanellopoulos has dissolved his small centre party and joined the former Commander-in-Chief, while Markezinis, who has long tried in vain to use Papagos as a vehicle to attain his own political success, at last seems nearer to his objective as a leading member of the newly-created party.

The Parties at the Polls

Seventeen parties are contesting the election, but of these only seven are of any size; the remainder—although the new "reinforced proportional" electoral system has discouraged the usual profusion of one-man parties—include such ecceatricities as the Socialist Palaeo-Marxist Party and the National Rally against Political Parties with the self-denying symbol "Down with parties." Some parties have disappeared. That led by Maniadhakis, for example, former minister of the Metaxas regime, has joined the Populists, thus pushing a party already unpopular through political incompetence and implication in public scandals still further into the Right-wing wilderness. The Liberals have been strengthened by the adhesion of Tsoudheros, one of the former joint leaders of EPEK. But all these parties differ little in their outlook except the United Democratic Left (EDA) and the Svolos Socialists (ELD).

The appearance of EDA is an indication of where potential Communist and extreme Left-wing votes may go. The party has the full support of the Communist Free Greece Radio and many of its candidates (including General Saraphis, the former Commander-in-Chief of ELAS) are at present in prison or in detention on Greek islands for their actual or suspected implication in the guerrilla war. It is possible that many of these candidates will be returned, especially in Piraeus, Athens and Kavalla, where wretched working conditions combine with strong Left-wing traditions. For the chances of the rest of the parties, Papagos is expected to win a large proportion of votes, although insufficient to gain an absolute majority in the parliament of 250 deputies, while the Liberals and EPEK may prove strong rivals.

This election, more than any other since the war, has given rise to alarmist rumours of all kinds which have gained wide currency in sections of the Athenian and European press. It is natural for speculation to surround the entry of so outstandingly successful a soldier into politics, especially in Greece, where the use of the *coup d'état* as a political weapon is a memory fresh in many minds. Reports of a military league in the Army and the publication of a memorandum from the Chief of Staff to the King advising that the Army should not be allowed to vote, have helped rumour's tongue. Much of this can probably be discounted, but there are undoubtedly disturbing factors in the Greek scene today; one of the most serious is the jeopardising of the crown's reputation by King Paul's openly expressed distaste for Papagos as a politician.

Meanwhile the fundamental economic problems of the country are ignored by the politicians. These remain unchanged:—continued distrust of the drachma and popular trust only in gold; and an adverse balance of payments aggravated by the increasing difficulty of finding a market for the most vital export, tobacco, and by Western Germany's failure to honour its agreement to take a proportion of the crop.

No party has any economic programme, other than generalisations which differ little from each other. Papagos at least has had the courage to stress the need for hard work. In entering politics, however, he may suffer the fate of so many politicians of high ideals and fall gradually but inevitably into the political web. That would be a personal tragedy and his character may save him from it. If he could transform Greek politics into something other than an Athenian parlour game it would be admirable. But if his military experience is too strong for him to endure the ways of politicians, then this election could prove a major tragedy. Yet looked at in the perspective of Greek political history, this Sunday may perhaps be regarded, as one Greek observer put it (with no intended cynicism), as "the first normal election since the war."

The Dutch Economic Scene—I

Holland Tackles Inflation

[FROM A CORRESPONDENT]

THE Netherlands, like Germany nine months ago, has been concerned over its mounting deficit with the European Payments Union. Its present economic difficulties spring from the same basic factors which are troubling the governments of nearly all the countries in Western Europe: the terms of trade which have deteriorated sharply since Korea, have aggravated an already serious unbalance in overseas payments; American aid for civilian purposes has been reduced; and defence expenditure must be increased. In one important respect, Holland's position is more vulnerable than that of the other members of Nato; by virtue of its overwhelming dependence on overseas trade (which comprises 36 per cent of its total production), the Dutch economy is particularly exposed to the impact of international events on world prices and availabilities. This has come increasingly into conflict with the principles of government policy, which, since the first postwar period of reconstruction, has aimed at returning to a free economy through the abolition of price-control and rationing, and the progressive lowering of subsidies.

Even before Korea, external influences were working against a smooth transition along these lines. The devaluation of September, 1949, immediately upset the delicate equilibrium between wages and prices; internal prices had already been freed, and the impact of the rising costs of imported goods was such that as early as January, 1950, the government felt compelled to relax the general wage freeze in favour of a 5 per cent "compensation" all round. Simultaneously the subsidies, which before September, 1949,

were running at only 50 million guilders a year, had to be raised to a new rate of something over 200 million guilders. This was a serious blow to the government's hopes that it would soon be in a position to abolish subsidies altogether.

Thus, up to the outbreak of the Korean war, there was already in progress a gradual but steady rise in the price-level. With the advent of the post-Korean boom, all hopes of ending this movement disappeared. By September, 1950, wages were once again so far in arrears of prices that another compensation of 5 per cent had to be granted. At the same time, the government decided, come what may, to keep the subsidies down to 200 million guilders.

The subsequent developments in world markets meant that by the beginning of 1951, the situation cried out for a new economic plan, which attempted to restore stability at a higher level. Owing to a prolonged political crisis, it was not until the beginning of March that the government could agree on any plan which could be presented to the public. When it came, the plan was broadly on the following lines: an additional 2 billion guilders was to be spent on armaments in the coming four years, bringing the existing rate of 1 billion guilders up to 1½ billion guilders a year. Half this additional 500 million guilders a year was to be met by new taxation; the other half by government loans. An attack on the balance of payments deficit was to be made by reducing consumption by 5 per cent and the rate of investment by 25 per cent; in the absence of rationing, consumption was to be tackled through manipulation of the income tax, higher purchase taxes and cuts in the subsidies; the level of private investment was to be influenced indirectly through higher taxes, and by restricting credit and government loans; public investment was to suffer a direct cut of 150 million guilders during the year 1951. At the same time, rationing and price control were not to be reinstated; liberalisation of trade would continue, and there would be no tightening up on import restrictions.

Decrease in Economic Tension

These plans undoubtedly made a valiant attack on the wage-price spiral which had been at work since devaluation; but there were some major obstacles to carrying them out. Since September, 1950, prices had risen 10 per cent more than wages; even if the 5 per cent cut in consumption was accepted in principle, the trade unions had grounds for claiming a further 5 per cent compensation in wages. This was duly granted, with a ceiling of 200 million guilders a year, but simultaneously the subsidies, as prescribed in the plan, were cut back to 175 million guilders a year. With this immediate stimulus to the prices of essential goods, and in an atmosphere where uncontrolled prices looked as though they were going to continue to outstrip the rise in wages, the trade unions showed every sign of insisting on considerably more than the proffered compensation of 5 per cent. This rather critical situation has been at least temporarily relieved by the weakening in world prices during the summer. By August, the immediate economic tension in Holland had certainly decreased. The cost of living, after reaching its peak in May, has since remained more or less stable.

For the future, much will depend on developments in the international scene. It must, however, be recognised that, even with the present lull in world markets, there are still factors at work in the domestic situation which by themselves could precipitate a further inflationary movement of wages and prices.

On the other hand, there are also some encouraging symptoms in the domestic scene, which suggest that a genuine shortage of money contributed to the present economic *détente* and may continue to do so. In the period of buyers' mania, during last winter and spring, it was not only industry and trade which had been building up stocks; unhampered by rationing, the public had been doing exactly the same. But when subsidies were lowered in March, it began to emerge that there were more goods than money available to the consuming public. In some sectors—especially textiles—buyers went on strike; while the retail trade and industry also began to suffer from large inventories and a shortage of ready cash. Some weeks before the normal summer clearance sales, some sort of price war broke out, and, again mainly in textiles, prices were slashed by 50 per cent or more. It is significant of the temper of the whole economy that price cuts have to be, or appear to be, sensational before the public will respond to any great extent.

Thus, while it is perhaps too early to prophesy, there is some chance that the government's attack on the inflationary situation by indirect methods may succeed. It may, indeed, be argued that the position remains explosive so long as there is no direct control over prices. But where the national price level is so largely determined by international price movements, the effect of price control at home would be somewhat dubious; at best, it would do little more than disguise and delay genuine increases in production costs. On the other hand, an important factor in Holland's postwar recovery has been the existence, since 1945, of a wages control—indeed, practically a wages freeze; and it may become psychologically impossible to maintain this control in future in the teeth of an uncontrolled rise in prices. Up till now, wage increases have only been granted after very careful consideration, after a lot of political pressure, especially by the socialists, and after more pressure from the trade unions. Up till now, also, the trade unions have shown considerable restraint; but the difficulties in March made it clear that their patience is now stretched to breaking point.

A further increase in wages would obviously set the inflationary spiral once more in motion. The government may, therefore, have to be prepared to face the alternatives of imposing price control or abandoning wages control. Apart from its immediate economic disadvantages, the end

who has the world's most secure communications?

When messages flash from one unit of the Commonwealth to another, they may be anything from top-secret to public news. But whatever its content, every message transmitted by cable reaches its destination in absolute security. A British company operating telegraphic communications in more than 70 countries, controls more than 100 wireless circuits and about 155,000 nautical miles of cable. This vast system of communication makes this company the greatest undertaking in the Commonwealth cable system and the world of telegraphy today.

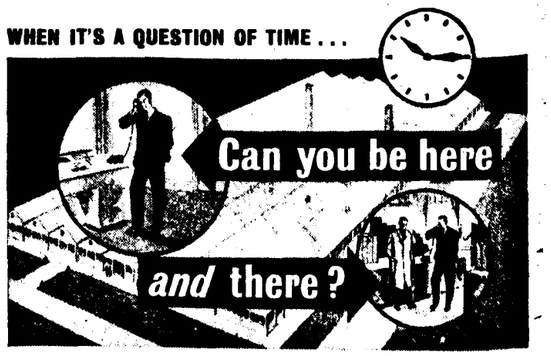
Who

puts history on to microfilm?

In 1938 Kodak copied on to microfilm the whole file of 'The Times.' A single filing cabinet thus contains the day-to-day history of 155 years, and libraries and universities all over the world are able to obtain copies of even the early rare issues. The copies of many other famous newspapers are now available in this compact form. Kodak were the pioneers of microfilm recording for banks, business and industry as well as for newspapers. Over 2 million records are processed in the Kodak laboratories every 24 hours — many of them are developed overnight and available for use the next morning. This speedy reliable service is the result of nearly 20 years experience, research and invention by Kodak micro-recording specialists.



Ask a Recordak representative to advise you on the application of microfilming to your business.

WHEN IT'S A QUESTION OF TIME . . .

There are times when a man *must* stay in his office. At such times he should be able to contact anyone anywhere in the premises without moving from his desk, and without engaging his telephone operator's time. But, when he needs to move around the place, he should be able to deal as expeditiously with anything as if he were still in his own room, to make and take 'phone calls without anyone having to hold on while he is being found. With T.R. Service you can have it both ways, and many other facilities besides. Spend a profitable moment now to write for full particulars.

of all control over wages would have serious consequences for the bona fide trade unions themselves, for it would oblige them to compete with the vociferous and destructive demands of their Communist counterparts and might land them in extremely deep waters. There remains price control, for which there is virtually no economic justification, but which may prove to have unanswerable psychological arguments in its favour.

In the attitude of labour towards the government's anti-inflationary policy, there is one major consideration which has so far been overlooked; the trade unions have only accepted the principle of a cut in consumption, provided that investment would really be cut by the 25 per cent specified in the government's plan. How far this has been, or is likely to be, achieved will be the subject of a further article.

(To be continued)

Protecting the Colonial Worker

ONE of the criticisms which used commonly to be levelled against the colonial system was that it was based on the exploitation of cheap labour. Workers in their thousands were required for the mines, plantations and farms established by overseas enterprise; the wages offered were sufficient to attract them away from their lands, and to disintegrate the traditional ways of life, but insufficient to assure them tolerable living conditions. This fostered a deepening sense of resentment as the colonial worker gained opportunity to make comparisons between his own lot and the higher standards of the Europeans with whom he was now coming into contact. Until the last war, trade unions, or any other device for protecting the rights of workers, were all but unknown in the Colonies. Pioneering protective work was done by the ILO conventions, but they could do little more than set certain standards, depending on the good will of administrations and employers to implement them. Thus, growing racial consciousness and depressed economic conditions combined, during the nineteen-thirties, to foment a widespread labour unrest, culminating in the West Indian disturbances with their heavy toll of life and property, and lasting legacy of bitterness.

During the war years, the neutral attitude of colonial governments towards the problems of labour underwent a radical change—induced partly by the need for industrial peace under war conditions, and partly by an awakening of the British conscience after the West Indian troubles. A positive policy of protecting labour, encouraging trade unionism, and introducing effective labour legislation was embarked upon, until today a most impressive administrative framework has been created to handle every aspect of labour problems. This framework is described in a recent White Paper issued by the Colonial Office.*

The first step in this work was to set up a labour department in every Colony, except the very smallest. These are staffed by nearly 400 officers, of whom about 180 are recruited locally: some of these men were former district officers, but many had learned labour administration in the British Ministry of Labour; others came from the British trade union movement. The appointment of British trade unionists as labour officers was a special experiment started in 1942, when six men were sent out to different Colonies. The experiment succeeded, and ten more have since been recruited. Some later became labour commissioners, and one is now assistant labour adviser to the Secretary of State. There is, in fact, a labour advisory staff of three in the Colonial Office, and a lively labour advisory committee composed of British employers and trade union representatives. The advisers spend part of each year travelling around, so that supervision from the centre is quite effective. Training courses for labour officers are organised regularly by the Ministry of Labour.

The labour departments in the Colonies have had a mass of labour legislation to handle in these years, with the object of bringing colonial labour legislation as close as possible to the British model. They have had to establish machinery for conciliation and arbitration in trade disputes, and machinery for minimum wage fixing; to prepare cost of living statistics; to make provisions for the prevention of industrial accidents, and for the regulation of young persons' and women's employment; to introduce workmen's compensation laws and to supervise the implementation of ILO conventions. In the meantime, the trade union movement has taken root; today there are something like a thousand trade unions in the Colonies, with a membership of about 600,000—in Nigeria there are as many as 115 unions; in Malaya and Singapore 251; in Cyprus 108, and in the Gold Coast 48. The training of trade unionists in the principles of unionism has been a specially complex task—summer schools and lecture courses have been held; scholarships given for study in Britain; pamphlets distributed, and correspondence courses offered by Ruskin College in Oxford.

But all this excellent work has thrown up a host of unanticipated problems. The labour officer, particularly if he is himself a trade unionist, has not had an easy row to hoe. His desire may be to help and advise the workers and to secure orderly industrial relationships, but his very position as a government official imposes on him an impartiality which draws abuse from every side. Colonial employers have at times been unsparing in their criticism of the activities of labour officers, and workers have seen in them either "imperialist agents" or "employers' stooges," and have fiercely demanded non-interference.

Chequered History of Unions

In spite of some degree of government supervision over trade union finances and organisation, many of the unions have had a chequered history. There have been unscrupulous leaders, funds have been mishandled, a multiplicity of unions has wrecked the strength of each. Confusion has reigned as to the very purpose of trade unionism, which has proved, in some places, a powerful political weapon in the nationalist struggle, rather than an industrial organisation for the betterment of workers' conditions. Employers have, at times, been unwilling to recognise the unions, and, with neither side in a conciliatory mood, conciliation machinery has proved a tender plant. What is more, trade union effectiveness was bound to be limited in countries where only a fraction of the people are regular wage-earners. In Nigeria, for example, there are no more than a quarter of a million regular wage-earners in a population of 25 million. Collective bargaining cannot possibly cover the needs of the great majority. Even where there is good soil for trade unionism the difficulties of inducing the loyalty which will ensure regular payment of dues are overwhelming. Workers drift in and out of unions according as wage increases are secured them, and in some cases the leaders have appealed for dues to be subtracted from wages by the employer—a practice sternly frowned upon by British trade unionism. Under such conditions, how are good trade union officials even to be paid?

A recognition of all these difficulties is now opening a new phase of thought on colonial labour problems. The trade unions have come to stay, and are today receiving yet further encouragement from the international trade union movement. They are, in any case, a most important factor in the development of civic responsibility, which is a fundamental of the democratic society which official policy is

* Labour Administration in the Colonial Territories, 1944-50. Colonial No. 275. HMSO. 1s.

fostering in the Colonies. But it is now recognised that British institutions cannot be transplanted overseas, without many modifications—and that, in any event, collective bargaining alone cannot meet the real needs of the Colonies. New forms of organisation and new machinery must be evolved to suit the different conditions, and ways have to be found to bring both employers and workers into a reasonable relationship, with more give and take on both sides. It is a challenging problem, which the Colonial Office is trying to tackle in many ways—one move is the convening of a conference in London this month, where the labour commissioners of all the Colonies will be posed with some of these fundamental questions.

Spurring on the Czech Worker

THE Czechoslovak Prime Minister, Mr Zapotocky, recently went to the microphone to exhort workers and management alike to co-operate willingly in carrying out the government's measures to transfer 77,500 administrative workers to industry. The redundant clerical workers have been told that if they volunteer to move before September 30th they will be able to choose which of the factories requiring more labour they go to. They have also been assured that their transference is not in any sense a punishment and that they will not have to undertake work which requires any special physical strain. All the same, it is hardly surprising that they have not shown much alacrity in transferring themselves from their desks to a work-bench.

But Mr Zapotocky's broadcast made it clear that many managers are also proving obstructive. Those called upon to get rid of redundant workers have been dismissing only the old and the unfit. Those at the receiving end have been refusing to take on untrained workers or those over forty—in spite of the government's appeal to retired people and pensioners to go back to work if they could. Even some labour offices have been delaying matters by attempting new definitions of the term "administrative workers" and maintaining that commissionaires and drivers could not be included in it.

This drive to cut down the number of administrative workers, which is supposed to be completed by the end of the year, is only the latest of a series of measures to increase Czech industrial production. The Communist leaders are obviously afraid that the five-year plan, now in its third year, which was stepped up last February, may break down, either totally or in part. Although Czechoslovakia is the most industrialised of the Soviet satellites, the attempt to reach the new targets has led to an acute manpower shortage in industry. It is true that the Czech manpower reserve was considerably depleted by the expulsion of the Sudeten Germans. In 1948 there were 1,350,000 industrial workers. The original five-year plan envisaged an additional 250,000; but the revised plan demands that as many as 550,000 new workers should be found.

Last April, in an effort to reach this target, the government issued a decree which made practically all physically fit persons liable for industrial employment. At the same time it undertook a far-reaching reshuffle of those already in industry which was designed to shift the younger and fitter workers into the heavy industries from which the most drastic increases in production are being demanded. These changes are said to be voluntary; but in practice the individual is generally at the mercy of the planners. Only key workers and "necessary politically progressive cadres" have a chance of staying put.

In July, the government announced that the measures taken to make the best possible use of the available manpower were not in themselves enough. It was also necessary to reduce the actual costs of production, and the official statement gave details of the extent of the economies to be achieved in the various sectors of industry. It went on to make a comparison between the capitalist and socialist ways of reducing production costs. Under capitalism the economies always affected the workers' pockets, but under socialism they were directed towards savings in materials, fuel and power. In fact, however, it hardly seems possible that wage packets can emerge undiminished from the present production drive. In the first place, almost all overtime pay has been abolished. Communist leaders have been frequently complaining that overtime was not the result of any extra keenness on the part of the workers; it had simply been turned into a device to get more pay.

Confusion in Wage System

In the second place, the government has ordered yet another upward revision of norms, while at the same time insisting that the measures introduced last April to limit and regulate the wage bills of individual enterprises are more strictly and comprehensively enforced. At present the wage system in many industries is, on the Communists' own admission, in a state of confusion. If and when it is sorted out the workers may not find their wages actually cut, but they will certainly have to work harder to maintain their present income. According to Mr Kliment, the Minister of Heavy Industry, most of the present norms must be regarded as too "soft"; and although the object of the new revision is said to be to stabilise norms until the end of 1952, the workers, judging from their past experience, can hardly fail to suspect that in a few months the new ones may in their turn be considered too "soft."

Certainly the output of the Czech worker seems to be extremely uneven. The official Communist newspaper, *Rude Pravo*, for instance, has reported that while the Skoda works at Pilsen took 221 minutes to finish a comb-knife, another factory at Celakovice took 650 minutes, and a third factory at Brno took as many as 1,101 minutes. There has also been a notable reluctance to go over to shift work; the revised five-year plan reckons on having two shifts fully manned by 1954 and the third shift half manned. The Czech worker, moreover, is frequently accused by his rulers of bad discipline while on the job; and from the evidence available it seems probable that these accusations are justified. For he is frequently outraged by the technically incompetent party stooges who are put in authority over him; he has little incentive, in the way of material reward, to work harder; and he must be aware of the destination of most of the goods he helps to make. Mr Kliment let the cat unusually far out of the bag the other day when he said:—

> The development of our industry and the fulfilment of the orders we have received—and I am speaking particularly of the orders from the countries of the peace camp—depend on the work that is being done in our factories.

ECONOMICS—Postal Tuition

- Founded in 1887, U.C.C. provides tuition for the B.Sc. Econ. Degree of the University of London, open to all without residence or attendance at lectures. **The College is an Educational Trust, not conducted primarily as a profit-making concern,** and has a staff of highly qualified Tutors. Fees are moderate, and may be paid by instalments if desired.
- SELF-EDUCATION COURSES are available in Economics, Economic History, Statistics, Foreign Languages, etc.

SIMON ENGINEERING GROUP

Aspects of enterprise

No. 10

Under the auspices of the Medical Research Council practical research was undertaken in the Simon engineering works on a new type of dressing for minor injuries. Investigations by the sister-in-charge of the Simon health centre and a member of Manchester University, supervised by the Simon Engineering Group's medical officer, gave positive results which may be useful to industry at large. The new dressing brought about an average saving of twenty hours in the treatment of every hundred minor wounds, with benefit to the patients, the first-aid staff and the works output.

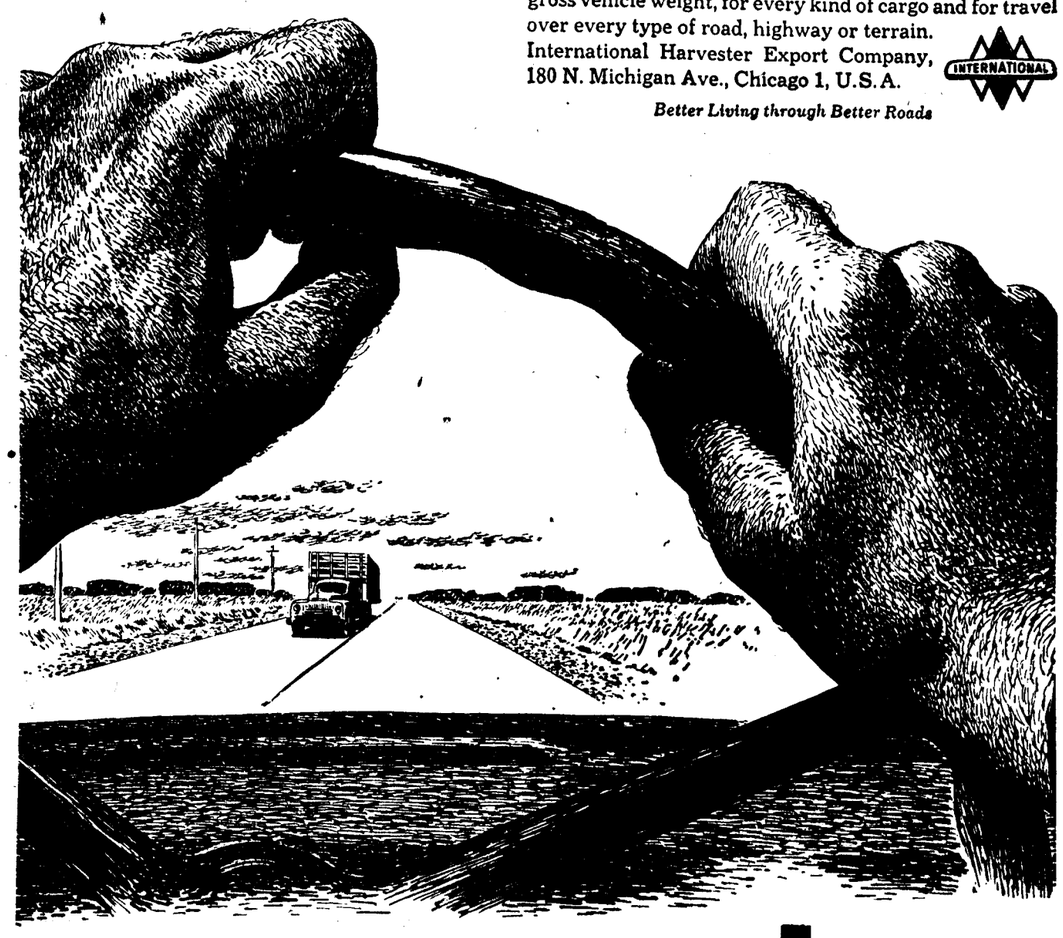
Handhold on security!



Whether it travels a rutted road or skims over a smooth express highway, the modern motor truck represents an invaluable national security reserve in the form of transportation.

Here is service vital to the *physical and economic security* of individual communities and entire nations. Given the necessary equipment, the trucking industry has tremendous cargo capacity that might well underwrite the security of *all* transportation in an emergency.

Consider your transport facilities on a national basis, or in relation to your own immediate hauling requirements. Either way, the dependability, economy and performance of International Trucks will serve you well. They are built in sizes ranging from two to forty tons gross vehicle weight, for every kind of cargo and for travel over every type of road, highway or terrain.

THE BUSINESS WORLD

Payments Agreement with Japan

IT is fitting that on the eve of the San Francisco Conference, which is to admit Japan to the comity of free and independent nations, a sterling payments agreement should have been signed in Tokyo between representatives of the British and Japanese governments. The previous payments arrangements between sterling countries and Japan had been negotiated solely with the Supreme Commander Allied Powers, Japan (SCAP), and had been operated under his authority. On this occasion, too, an agreement has been concluded with SCAP, and will for the present be operated under the same authority ; but as soon as the peace treaty comes into force between Britain and Japan, this procedure will lapse and will be superseded by the identical agreement reached with Japan's own representatives. The arrangements are, therefore, a symbol of the imminent return of Japan to financial and commercial autonomy. They come at a time when Japan's postwar recovery is making the country again an important force in world commerce, and they prepare the way for closer relations with the sterling area.

The sterling payments agreement is significant also for a more technical reason. Previous payments arrangements with Japan were dominated by a dollar clause. SCAP's Japan was in effect a monetary extension of the dollar area, and the yen had therefore to be treated by sterling countries as a hard currency. It is true that trade between Japan and the sterling area was transacted in sterling—but only on the understanding that SCAP on behalf of Japan would not be expected to hold any larger amount of sterling than that required as a necessary working balance. This provision, admittedly, was fairly liberally interpreted—a balance of £17 million was allowed before the dollar or gold convertibility clause came into operation. It is reported, indeed, that on the date of the agreement SCAP held on behalf of Japan a sterling balance of about £40 million ; more than half of this sum was, however, committed for future payments, so that the net balance was probably not far from the £17 million "working" balance. The main feature of the new agreement is that it drops the dollar clause. This does not imply that there will be unlimited "swings" in the payments arrangements between the yen and sterling areas ; they will not be expected to give each other unlimited credit facilities. Measures will be taken to keep the "swings" within reasonable bounds ; but these measures will have none of the harshness and restrictive rigidity that are often induced by gold or dollar conversion clauses.

The new agreement will run for twelve months from September 1, 1951, replacing the agreement of May 31, 1948. It provides that all payments between residents of Japan and those of the sterling area shall normally be settled in sterling, though, needless to say, certain disbursements of a personal and kindred character will necessarily have to be made in yen. The agreement is of the bilateral type that is familiar in some of Britain's payments arrangements ; but this bilateralism is softened and liberalised in the usual way, by the fact that the sterling party to it is not merely the United Kingdom but the whole sterling area. That is to say, any sterling accruing to Japan is available for expenditure within the whole sterling area, but is not automatically expendable outside.

The bilateralism will also be very considerably softened by the wide measure of "administrative" transferability of sterling that Japan is being promised. In an exchange of letters that accompanies the full text of the agreement, Japan is promised that, subject to authorisation by the appropriate sterling exchange control authorities in each instance, facilities will be afforded for transfers of Japanese sterling to countries outside the sterling area in settlement of direct current transactions with them. This provision, which seems to imply that prior permission will have to be given by the Bank of England for innumerable individual transactions, may appear somewhat restrictive. This impression should, however, be largely removed by the further announcement that Bank of England approval will be given for any sterling payments by Japan in settlement of direct current transactions with any country in the "transferable account" system or with the group of countries with which Britain operates bilateral agreements tempered with administrative transferability. In effect Japan is promised many of the advantages of membership of the transferable account system without any of its obligations. It is given blanket authorisation to meet in sterling its current debts to transferable account as well as to "other" countries. At the same time no corresponding obligation is put on Japan to accept sterling from these countries. It is true that transferable account countries will not be compelled to accept sterling from Japan as they are from one another ; even so, it can be claimed that the facilities offered to Japan go far to remove fears held by that country that its holdings of inconvertible sterling may grow to inconvenient proportions.

The exchange of letters makes it clear that all parties to the agreement recognise that, to ensure its smooth working, Japan's sterling balances will have to be maintained within reasonable limits. In order that Japan may hold sufficient sterling to meet its requirements without, however, accumulating an excessive amount, the two parties to the agreement have agreed to meet at short notice, which may be given by either party, "in order to discuss any aspect of the development of the payments relationship between the two countries which may appear to call for special consideration."

The corrective machinery is deliberately left vague, but this does not suggest that it will not work. By the appropriate tightening or relaxation of control by "administrative" transferability, by contracting or

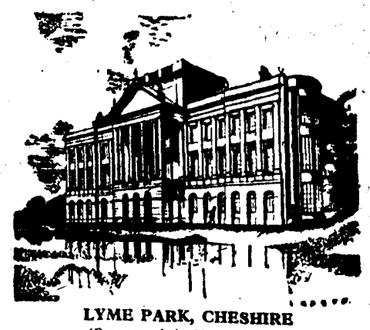
increasing the right of Japan to use sterling to make payments to other countries—or, conversely, to receive sterling from other non-sterling countries—a wide range of discretionary measures should be available to keep Japan's sterling resources within desirable margins. Failing an effective functioning of this machinery of administrative transferability, it should be possible to correct any disequilibrium by appropriate adjustments in import or export licensing.

The payments agreement provides a monetary framework within which trade between Japan and the sterling area may satisfactorily expand. Whether, however, the commercial relations between the two monetary areas do develop satisfactorily in fact will depend on future commercial negotiations between Japan and the various members of that area. At present their trade is regulated by an agreement signed in Tokyo last November between Japan and the sterling area countries, other than Burma, Hong Kong and Pakistan. This agreement specified the types of goods that the governments concerned would use their best endeavours to thrust into commercial circulation between Japan and the sterling area. It set a target of £185 million for aggregate trade (imports and exports combined) between Japan and the sterling area countries, in the twelve months to June 30th last. This figure compared with a total of £130 million for the preceding twelve months. The direct trade between Japan and the United Kingdom alone has grown considerably more than these aggregate figures would suggest, as may be seen from the accompanying table, showing the trade in the first six months of this year and the two previous years. The expansion of British exports to Japan over the past two years, it will be seen, has been steeper than the corresponding movement in imports from Japan. The bogy of Japanese competition in the home market is still no more than a bogy.

UNITED KINGDOM TRADE WITH JAPAN
(In £'000's)

	1949	1950		1951
		1st Half	2nd Half	1st Half
Imports	10,796·6	2,721·6	5,154·7	6,701·8
Exports	1,170·8	1,092·3	1,628·4	5,627·6
Re-exports	27·5	32·7	120·0	312·2

It is not intended that new commercial agreements shall be negotiated between Japan and the sterling area countries in the immediate future. The agreement covering the twelve months that expired on June 30th last has been renewed, with the intention of letting it run for a few months, so that it can be seen how trade develops under the new monetary arrangements, and then to proceed, in the light of that evidence, to the negotiation of more permanent commercial agreements.



The main obstacles to trade between the sterling area and Japan will not have to be faced until those commercial agreements come to be negotiated. These obstacles are the vested interests, not only in Britain but throughout the sterling area, that have already begun to raise loud voices against the possibility of "unfair" Japanese competition. When these agreements come to be discussed the British government will have to declare its hand about the reservations it recently made about granting Japan most-favoured-nation treatment. That will also be the occasion for reconsidering the "Congo Basin" treaty of the early part of this century, a treaty that gives Japanese goods non-discriminatory right of entry to the African territories concerned, some of which lie within the Commonwealth. It is interesting, though not altogether surprising, that some of the loudest voices urging the exclusion of Japanese goods have come from the very countries within the Commonwealth that have also shown the greatest resentment at the absence of reparation clauses from the Japanese Peace Treaty. Spokesmen for the Australian secondary industries have been particularly vocal in their expressed fears of Japanese competition, while it is also from Australia that some of the most vehement criticism has been heard of the intention to make the Treaty with Japan one of reconciliation. These various hurdles need not be jumped in the near future; but, now that trade between Japan and the sterling area is being freed from some of the exchange restrictions by which it was previously impeded, it is well to recognise the barriers that will eventually have to be surmounted or removed if this commerce is to develop fully.

Australia, prime producers of the world's wealth in opals, and home of the rare Black Opal, looks toward other countries for part of the infinite variety of goods demanded by its people — a demand which presents considerable trading opportunities for British business houses . . . But a sound move when planning any Australian business project is to consult the Commonwealth Bank of Australia. The Commonwealth Bank *knows* Australia — and its closely integrated branches throughout Australia and New Guinea can supply, through its Financial Information Service at Australia House, information on any facet of Australian life and industry. British business houses are invited to make full use of this service.

Meanwhile, there is no doubt about the vigour of the recovery of Japanese industry and commerce during the past year. The index of industrial production, which was no more than one-fifth of the 1937 volume in 1946 and had grown gradually to an average of nearly two-thirds in 1950, has this year just about recovered the prewar level. Japanese exports, which totalled $509 million in 1949 and rose to $820 million in 1950, have this year been running at a rate of $1,200 million. Under the impact of hostilities in Korea, prices have been rising fast in Japan, but wages have been held well back and there can be no doubt that Japanese industry is in good competitive trim for the battle of world markets.

The payments agreement with Japan, synchronising, as it does, almost exactly with the admission of Germany to the sterling transferable account system, provides welcome evidence that the recovery of sterling as a currency used for international trade, not only by the sterling area but among third parties, has not altogether lost its momentum. With Germany in the transferable account system and with Japan half in it, the range of international transactions invoiced and paid for in sterling should undergo a further welcome extension.

Chemicals from Oil—II

Gauging the Market

THE first of these two articles showed that leading oil and chemical companies in this country have invested large sums of capital in cracking and gas separation plants from which are obtained the large tonnages of hydrocarbon gases that form the basis of the new petroleum chemical industry. This first stage is now within sight of completion, and it is possible for provisional judgments to be made about it. There is an important element of flexibility in each of these plants in that they can be set to produce one or a number of particular products according to need. What has now to be put to the test is the size of the market, at home and for export, that these products can attract and hold. The scale of the new plants and the range of their products had to be decided largely on estimates of demand without the benefit of market experience. At the time when several of the schemes were being drawn up there was a severe slump in the American chemical market and it is to the credit of those concerned that discouragements of this kind did not affect their decisions to go ahead. Nor is the fact to be held against them that they appear at this early stage to have underestimated the potential size of some markets and perhaps to have overestimated others.

It is difficult to talk in standard terms about the size of the new plants or the markets they supply because the final products are not fairly measurable either in tonnage or in value. At a rough estimate, the Shell Chemicals plant at Stanlow was originally designed to turn out between 20,000 and 24,000 tons of solvents, of which a quarter would be acetone, but now that ethylene products will be made there, as well as those from propylene and butylene, this is probably an underestimate. The capacity of the ICI oil plants at Wilton should be about 25,000 tons of ethylene products and possibly a similar quantity of acetone. The Petrochemicals plant has a nominal capacity of about 75,000 tons of chemicals a year, more than half of which will be based on benzene, toluene and xylene, chemicals usually obtained from coal tar, leaving a smaller proportion of chemicals based on ethylene, propylene and butylene, the three principal gases used by the other companies. British Petroleum Chemicals will produce about 35,000 tons of ethyl and about 25,000 tons of isopropyl alcohol, most of which can be converted to acetone.

Present prospects suggest that the production of bulk chemicals by these new methods will not be a highly profitable operation. Prices of the final products have risen, but perhaps not as rapidly as construction and other costs; in some cases, margins of profit may be even more limited than were assumed in the original estimates. But the schemes cannot be judged by the bulk chemicals business alone, because each project allows for further processing of these basic materials into the more profitable chemical intermediates. Provision has been made at Stanlow, for example, for the production and sale of isopropyl alcohol, a bulk chemical; of acetone produced from isopropyl alcohol; and also of acetone derivatives such as methyl isobutyl ketone. The value of each product increases with each stage that it travels from the original propylene gas. The economics of the Petrochemicals plant are based on the same principles, which makes the achievement of the full range of products from this complicated plant of particular importance. Petrochemicals sells "aromatic" products such as benzene or naphthalene and their derivatives in competition with the same chemicals made from coal tar, and it relies on the high purity of the oil-based product to cover the more expensive method of production.

The economics of the Wilton and Grangemouth plants are also complex. These projects were undertaken to supply raw materials for processing plants of the ICI and Distillers groups respectively, and their output is to con-

ɛist almost wholly of bulk chemicals. Most of the basic products produced from the chemicals plant at Wilton are expected to be consumed within ICI, and although British Petroleum Chemicals will have some outside sale of the ethyl alcohol it produces, in practice the greater part of the plant's output of chemicals is expected to go to factories in the Distillers' group making solvents or plastics. There is thus a growing tendency towards vertical integration in this branch of chemicals, and the reasons are not difficult to find. Capital investment in chemical plants is extremely heavy—and as some would hold, too heavy to be undertaken without an assured market. When it came to build the Stanlow plant, Shell was in a good position to judge the British market for solvents because it had already built up an important trade in products obtained from the United States. The Distillers Company no doubt had access to information of the same kind through British Industrial Solvents. But when it is a case of putting up a new and expensive chemical plant to produce raw materials for a completely new product, the commercial risks are very great—often too great to be undertaken without a partner unless the company decides, as ICI has done, to process the chemical into the finished product.

Thus it happens that Monsanto Limited has a half interest with British Petroleum Chemicals in a third company, Forth Chemicals Limited, that is due to start producing styrene monomer next year. Ethylene from the British Petroleum Chemicals "cracker" is an essential material for the production of styrene. No styrene has yet been produced in Britain, and for years it was not easy to persuade anyone that there would be any need for a plant to produce it. Rapid progress in the use of the plastic, polystyrene, has reversed these views. Monsanto started making polystyrene last year at a new factory in Monmouth, using imported styrene monomer. The original capacity of Forth Chemicals' plant was put at about 8,000 tons, the whole of which is earmarked for delivery to Monsanto. But the latter company's plastic-making capacity already exceeds this figure; before the styrene plant is completed, therefore, demand already exceeds its rated capacity, leaving nothing to spare for further expansion of polystyrene from home produced materials and nothing for new uses, of which synthetic rubber might one day be one. Styrene is also to be produced by Petrochemicals, but the building of this unit has yet to be started. Two factories on the Partington estate near Petrochemicals' plant have already been built to use styrene monomer from this plant to make polystyrene and styrene paints; Petrochemicals has a half interest in them jointly with Erinoid and Lewis Berger. Until the styrene monomer plant is built, these factories, too, are working on imported styrene.

By way of contrast, the impending shortage of acetone is likely to prove temporary. It is caused by a falling off in imports before the British plants come into full production. Exports of acetone have been stopped in order to maintain deliveries to the home market, but even so acetone is likely to be scarce in the next few months. By next year, however, home-production is expected to be so high that there is some doubt whether home and export markets together will be able to absorb it; conceivably, however, a reduction in the price of acetone could easily stimulate interest in some of its less-developed applications.

It is arguable whether the under-estimation of the demand for styrene—as it now turns out—is a sign that sights have been set too low in the petroleum chemicals scheme as a whole; perhaps it is not an isolated example. Shortages of chemicals occur so far from the consumer's eye that he often does not notice them as such. A number of such shortages can be discerned that unquestionably arise from a lack of chemical capacity. One is the shortage of nylon and the lack of production of any other new synthetic fibre on a significant scale. Another is the slowness with which a number of developments in plastics and surface coating techniques have been put into general use. As for the future, the comparatively modest capacity of the Wilton terylene plant—5,000 tons a year—may prove when it starts operating just as incapable of meeting demand as the £10 million nylon plant proved to be when that came into production.

*

Once the cracking plants exist, it would in theory be possible to use more ethylene to make ethylene glycol for terylene, and to use less for products such as ethylene oxide. But this degree of flexibility is unlikely to be seen in practice. Developments in the United States, and the limited evidence so far acquired in this country, strongly suggest that the increased consumption of chemicals is general; it is not a matter of expansion in one direction that is offset by a fall in consumption in another. The plastics industry provides an obvious lesson. Many new and improved plastics materials have gone into production since the beginning of the century, yet the sales of the first plastic material of all, celluloid, have never fallen. As each new plastic has appeared, the market has absorbed its output without any contraction of the sales of materials already established. Indeed, in many cases these sales have continued to expand. There is no indication that the synthetic fibre industry will develop in any different way.

It is highly probable that immediate steps will be taken to expand the styrene plant at Forth Chemicals and that the company will no longer be relying on a guaranteed outlet for the entire tonnage of styrene that will be produced there. It has also only recently been decided to work up the ethylene stream at Stanlow, in addition to the propylene and butylene of the original project. Expansion of the basic chemical plants has been under discussion, but decisions will be influenced by the fact that total cracking capacity, and therefore the output of the spectrum of bulk chemicals, has itself to be increased to make possible expansion in the output of one specified end-product. The industry is not at this moment convinced that the British home and export market could absorb this extra tonnage, although it is willing enough to admit that sales of one or two specified products could be increased many times over. The future policy of the industry must be influenced by the knowledge that the opening of the new petroleum-chemical plants has meant the appearance of a large extra tonnage of chemicals on the British market, many of which have not been available in quantity before. Time must elapse before the effect of so big an increase in supplies can be assessed. On the other hand, not all the schemes for petroleum chemical plants on the Continent have materialised; although various plans are still under serious consideration, there is the opportunity for the new British industry, if it chooses, to assume responsibility for supplying part of the Continental as well as the British market. Some experts profess to believe that the consumption of chemicals cannot expand at its present rate, but if their views are tenable, they fly in the face of all the known evidence.

This point raises another aspect of petroleum chemicals. Oil is becoming the starting point not only for those chemicals that can most economically be produced from it, but also for chemicals that are more economically produced by other means. Ethyl alcohol is now being produced from oil because supplies—as well as prices—of molasses fluctuate too violently to provide an assured basis for the extra quantities required. But at certain price levels, molasses is the cheaper route. In the United States, large tonnages of benzene are now being produced from oil because there is not enough coal tar to meet the demand. Yet only a few years ago, when it was proposed to produce benzene and other tar products from oil at the Petrochemicals plant, the project met with some scepticism because a shortage of coal tar then seemed inconceivable. It is not so scarce here as in the United States, but commercial development of organic chemicals here is also some years behind the American development.

Provision has been made at each of the big chemical plants for some increase in capacity without the need for building new cracking plant, but the time does not seem far off when all available capacity will be fully employed. It is not suggested that a new programme of capital expansion should be undertaken before the new plants of the first programme have even been run in. But the new industry in this country did not start building its cracking plants until it was certain of a cut-and-dried market for the bulk of its products and even then it seems in some cases to have erred on the side of caution. Several years are needed to build a chemical plant and bring it into operation; this fact suggests that if British developments run true to form, there may be another shortage of organic chemicals in a few years' time, followed by a year or so of plenty as a further batch of projects materialise more or less simultaneously. Because heavy capital investments are involved, the chemical companies will obviously wish to keep in step; there is no reason why they should march abreast.

Business Notes

Home-truths about Dividends

In his address to the TUC this week Mr Gaitskell seemed at first glance to be trying to make some slight amends for the unconscionable tone of his now notorious speech at end-July in which he launched the dividend freeze. That, at least, seemed to be the general impression in the City and also, apparently, among the audience at Blackpool—where Party enthusiasms were obviously damped down by the Chancellor's demolition of the last vestiges of the Socialist case for further income re-distribution. Mr Gaitskell pointed out again that no scope is left for raising the general standard of living by "soak the rich" policies or by raiding profits. If all dividends paid in 1950, he estimated, had been "fairly savagely" cut by one-quarter (which, of course, would have meant a much more savage cut in equity payments if they alone had borne this hypothetical burden) the sum released would have been equivalent to a mere 3d. in the £ on the national wage bill —before allowing for the Treasury's resultant loss of surtax. Again, if all incomes in excess of £2,000 a year were confiscated, the net sum secured would be no more than £53 million—which, if applied in reduction of tobacco duty, for instance, would reduce the price of a packet of cigarettes by a mere 2½d. As for profits, Mr Gaitskell is satisfied that their rise has not been "an important cause" of the rise in the cost of living.

These home truths not only demonstrated the futility and virtual impossibility of the further drive against profits and large incomes that many trade unionists would like to see; they also indicate the pointlessness, from the standpoint of countering inflation, of the dividend freeze. The quantitative implications here, of course, are measured, not by the total sum paid in dividends, but by the extent of their rise. To round off the Chancellor's figures, it is worth quoting some data assembled in the current issue of *The Banker*, which estimates, on the basis of official statistics, that if the gross incomes of ordinary shareholders had been completely frozen since the dividend limitation policy was introduced in early 1948, "the funds withheld might theoretically have been sufficient to relieve the cost-of-living by rather less than 0.04 per cent—say, ¼d. per person per week"—before allowing for the consequential loss of tax revenue by the Treasury.

Such figures as these—not to mention the fact that trade unionists have been quite unimpressed by the Chancellor's "psychological" gesture—make nonsense of the dividend freeze project; in the circumstances it is scarcely surprising that Mr Gaitskell refrained from quoting them. But, in any case, on closer scrutiny his latest speech appears a good deal less reassuring than it seemed to many people at first sight. Although recognising the impossibility of further income redistribution, he was definitely inciting his Blackpool audience to devise new schemes for further redistribution of property. In particular, he refused to admit that there is any symmetry between his plan to freeze dividends and the notion that wages should so far as possible be frozen for the same period. Not content with rejecting the idea of any firm wage-stabilisation, he seems to be toying with the idea that workers should get a share in the increases in undistributed profits resulting from the dividend freeze. At all events, he threw out the suggestion that trade unionists should study the possibility of schemes for bonus issues of shares to workers. This is a particularly odd suggestion, for it comes only a little while after the collapse of a project on precisely these lines put forward by the board of Associated Electrical Industries. This scheme had to be dropped because the Inland Revenue ruled that the employees to whom shares were allotted would have had to pay tax on the "bonus element" conferred upon them.

* * *

Control of Bonus Issues

The Chancellor's suggestion looks even more odd when set beside this week's injunction from the Treasury to the Capital Issues Committee on the subject of bonus issues. Sir Wilfrid Eady, in a letter to the chairman of the Committee, observes that, under statutory control of dividends, companies that raise funds through issues involving a "substantial bonus element" may thereby get an advantage over those that make an issue to the market—"a consequence which we would clearly wish to avoid." This consequence was implicit in the terms of the White Paper, and emerged specifically as the Treasury's intention when, a few weeks ago, Sir Wilfrid confirmed to the Issuing Houses Association that any calculations to allow for additional capital would

"not have regard to the price at which shares are sold to the public." The natural conclusion to be drawn was that, in this one particular, the Treasury was anxious—or at least was prepared—to allow a little flexibility within the general rigidities of the strait-jacket it hopes to impose on company finance. Nothing, it now appears, was further from its thoughts. It has instructed the Capital Issues Committee (although that Committee "has, of course, no responsibilities in the matter of control of dividends") to examine all applications to ensure "that the price proposed is fair and reasonable having regard on the one hand to the current value of existing shares and on the other the need for making the offer sufficiently attractive to investors if it is to be a success."

In other words, the Treasury puts the clock back five years, to the chaos of Daltonian efforts to regulate the "bonus element" in new issues; even the obstinate Dr Dalton eventually had to admit this policy to be harmful and impracticable—whereupon he compromised with his own principle and imposed the equally unreasonable bonus issues tax, which his successor abandoned. If the Treasury's object were to complete the paralysis of the capital market for venture capital, and to block up any tiny crack through which such funds may flow to industry, it could scarcely have devised a more ominously effective method than this.

But even that is not the worst of this sorry behaviour. The CIC is now to be put to purposes for which it was never intended; its task is to reinforce other controls over investment outlay, not to act as policeman for soak-the-rich policies by concerning itself with the prospective return to shareholders and by interfering with the business judgments of those who have to take the risk of market operations. It is, in fact, being required to carry a share of the very responsibilities that the Treasury declares it not "of course" to have. Worse still, there is no suggestion that this new control is contingent upon, and will not take effect until, the passing of the dividend freeze into law. The CIC is obviously expected to act upon Sir Wilfrid's injunction forthwith. Any company that is prejudiced should challenge the Treasury to state by what powers it imposes a control to deal now with a situation that cannot arise until a Government project becomes law.

* * *

Rank Organisation Out of the Red

Whatever the plight of the British film industry in general, the business of the major cinema groups has evidently improved slightly during the past year. Signs of this were apparent in the recent report of the Associated British group. Now come the preliminary figures of the Rank Organisation, with their record of continued recovery from the group's bitter trading experience in 1948-49. Odeon Theatres trading profits have risen from £3,293,426 in 1949-50 to £5,125,230 in the year ended June 23, 1951, and there is a net profit of £138,227 to set against a net loss of £1,095,626 in the previous year. Gaumont-British trading profits are up from £1,794,720 to £2,852,264, and a net loss of £71,232 has been replaced by a net profit of £426,920. During the year under review, it may be noted, cinema attendances were probably slightly more stable than in the previous year, when they declined sharply; and a rise in admission prices last September will also have been of some advantage to the exhibitors. This summer's increase in prices is also calculated to increase the earnings of cinema exhibition; though there has been some fear in the trade that this might cause patrons to stay away or transfer to cheaper seats, the cinemas should surely benefit from higher earnings and shortages of consumer goods in the coming rearmament period. Odeon, at any rate, shows some confidence in these prospects by its decision to reduce arrears of preference dividends; it is paying a year's dividend on these 6 per cent shares up to June 30, 1950, out of the profits of the current year, ending June 28, 1952. Investors will welcome the return of Gaumont-British to the list of dividend payers; after a year's suspension of payment on equity capital, the directors recommend a dividend of 5 per cent.

Economies within the group, of course, have centred in the curtailment of its film production activity. A year ago Mr Rank said:

> I am satisfied that we now have the worst of our own problems arising out of our large-scale production programme behind us.

The preliminary figures would appear to justify his confidence, though shareholders—and the film industry in general—will await his speech at the annual meeting for a fuller explanation. Film production commitments tend to be reflected in a film company's indebtedness to the banks; it is especially significant, therefore, that the Odeon statement records that the consolidated balance sheet will show a further reduction of bank loans, by £3,736,290, so that within the two years of economy these have been reduced by £7,072,835 to £9,213,746. The more modest production programmes of the group should be assisted in the coming year, moreover, by the distribution of the "Eady levy" to film producers and by the continued operation of the "group system" of production in conjunction with the National Film Finance Corporation.

Bumper Profits from Rhodesian Copper

The quarterly revenue statements of Roan Antelope and Mufulira had prepared the way for publication of bumper profits for the full year to June 30, 1951. Even so, the year's revenue statements, summarised in the accompanying table, show that forecasts thus framed have fallen short of the mark. Mufulira's estimated profits (before tax) are nearly twice and those of Roan Antelope more than twice their level of 1949-50. An appreciable increase in production of blister copper by both companies has contributed to this striking advance, but it has been chiefly brought about by the rise in copper prices. Devaluation brought an automatic increase in price, so that by June, 1950, the Ministry of Supply's selling price for electrolytic copper, which is based on the American price, had risen to £186 a ton; in September the price was stepped up to £202 a ton. At the beginning of April, 1951, the Ministry raised the price to £210, although the American price had not altered. A month later, when the American export price was raised 3 cents to 27½ cents a lb. (equivalent to £220 a ton) the Ministry raised its selling price by a corresponding amount of £24 to £234 a ton; but this steepening of the trend came too late to have any effect upon producers' earnings in the latest financial year, as the companies sell their output forward.

ESTIMATED REVENUE AND EXPENDITURE
(In £'000s)

Years to June 30:—	Roan Antelope		Mufulira	
	1950	1951	1950	1951
Sales revenue	7,895	13,138	8,761	14,646
Operating expenditure	4,553	5,954	4,149	6,049
Added to stocks value	98	115	345	381
Operating surplus	3,440	7,299	4,957	8,978
Estimated profit	2,432	6,275	4,185	8,198
	In Long Tons			
Blister copper production	62,059	74,520	69,350	83,681

The companies' costs in the same period lagged well behind these price increases, so that while revenue per long ton of blister copper sold rose by some 38 per cent, from approximately £127 to £176, Mufulira's operating costs

Banking with Barclays

A banker's work

touches life at an extraordinarily large number of points and in the nature of things he must in his working life learn quite a lot about the reason for the success or failure of people in every form of business. His experience can be of great use to others embarking on a particular venture, and if you are launching out in uncharted seas it will almost certainly be a good thing to have a chat with one of our managers. He will tell you of the ways in which Barclays can help you.

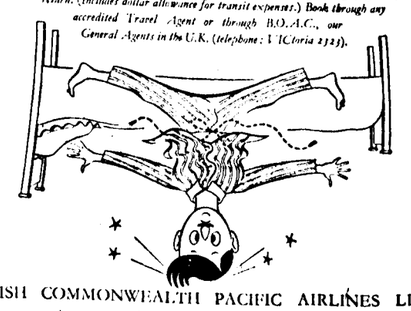
Nuwara Eliya is 100 miles inland from Ceylon's port of Colombo—7,000 miles from the English fields where a famous Jersey herd is bred. There were risks to be faced in having the bull calf and three heifers shipped out across the world. Their new owner – like so many wise men of all nations—covered those risks with a British Insurance Company.

British Insurance Companies back World Enterprise

Issued by the British Insurance Association

"Good Gracious — I'm in Australia!"



No special Act has been passed, but England and Australia are getting closer and closer. When we went to press, they were only four days apart.

If things go on like this you'll soon be able to tumble out of bed, rub your eyes and exclaim: "Good gracious—I'm in Australia!"

British Commonwealth Pacific Airlines already make this nearly possible with a luxurious free sleeper service across the Pacific from San Francisco and Vancouver, via Honolulu and Fiji.

Excellent connections are available from London, Glasgow or Shannon via New York or Montreal.

FARES: *Sydney £260 single, £468 return. Auckland £279 single, £502.4.0 return. (Includes dollar allowance for transit expenses.)* Book through any accredited Travel Agent or through B.O.A.C., our General Agents in the U.K. (telephone: VICtoria 2323).

BRITISH COMMONWEALTH PACIFIC AIRLINES LIMITED
in co-operation with B.O.A.C., T.C.A., T.W.A.

rose by 20 per cent from £60 to £72 a ton and Roan's costs by only 9 per cent from £73 to £80 a ton. The companies' estimates of profits are made after providing the same amounts for replacement and obsolescence as in the previous year, when Mufulira set aside £700,000 and Roan £900,000. In view of the general inflation of values, it will be surprising if the directors do not decide to increase these allowances. But if the increase in profits is startling in this year of booming prices and lagging costs, so will be the claims of the British tax collector—for Roan Antelope and Rhodesian Selection Trust, which owns 64 per cent of Mufulira's issued capital, each decided against a change in domicile to Rhodesia. In normal circumstances, equity shareholders would confidently anticipate higher dividends from the considerable surplus available for distribution. But if the proposals to control dividends become law and if the Treasury refuses a plea of "exceptional circumstances," equity shareholders in Roan Antelope can expect to receive a dividend of 13.2 per cent which, after allowing for the bonus issue, means that the amount distributed will actually be reduced; the sum distributed to RST's shareholders will be unchanged.

* * *

Manpower for Rearmament

As early as July, with rearmament in most sections of industry only just beginning to mesh into gear, shortages of labour were already beginning to delay defence production. That is the most important news given by the Select Committee on Estimates in its second report on rearmament. In its interim report, published in May, the Committee expected manpower shortage to affect only localised areas and particular trades in the first year of the programme. But the onset has been faster than anyone expected. According to the Ministry of Supply, even the initial demand from defence contractors for a small number of skilled and unskilled workers has proved hard to satisfy; this affects almost all the industries as yet concerned with defence, including aircraft, the ordnance factories, machine tools, and the radio industry. The Society of British Aircraft Constructors in evidence to the Committee was particularly gloomy about manpower prospects:—

> No solution of the labour problem can be seen within the present limits of Government policy. The labour market is for all practical purposes saturated. Recruitment into the aircraft industry is sluggish and some factories are scarcely holding their numbers against wastage

As yet, the industries concerned and the Ministry agreed there is no sign that restriction of supplies or raw materials to less essential firms has squeezed out any labour for defence work. There is plenty of evidence of under-employment in certain industries whose material supplies have been cut, such as the motor industry, but there and in smaller sections of engineering a tendency to hold labour in the hope of improved supplies or eventual defence contracts has continued.

Some transfer of labour to rearmament may admittedly have been only delayed. Shortages of materials, eked out by drawing upon stocks, take some time to seep through to the level where an employer finally decides to let labour go: but eventually some of them will. Certain shortages, and the consequent allocation schemes, have yet to take their real effect: steel is the obvious example. Nevertheless, this single lever in the hands of the Government is a slow-acting and inevitably clumsy one: and the first result is that six weeks ago the Ministry of Supply was ready to report that delivery dates for aircraft, certain types of vehicles, weapons and electronic equipment were beginning to fall short of the programme. Machine tool deliveries (more than half come from abroad) are also slightly behind-hand: but so far as tools made in Britain are concerned, the Ministry is able to avoid the effect of these delays by diverting tools from existing home and export customers.

Manpower for rearmament—and for the basic industries such as fuel and transport that are essential to it—therefore seems likely to be the most serious and lasting difficulty of the programme. The special shortages of skilled workers, such as draughtsmen, can to some extent be dealt with slowly by upgrading workers within industry and in the Ministry's training centres; at a higher level, though the existing supply of graduates seems adequate to supply the majority of scientific staff, some special steps may have to be taken to acquire the essential leavening of exceptionally high-grade men. But the general labour situation, with some 500,000 vacancies in industry as a whole and 200,000 unemployed, is due to be worsened by the fact that roughly 25 per cent fewer young people will be available to enter industry or the services this year than in 1939.

* * *

Progress with Contracts

The Ministry of Supply reported to the Select Committee that orders had been placed for some 45 to 50 per cent of its share of the production required under the £4,700 million defence programme. The Admiralty also stated that the bulk of its major orders—generally involving long-term production—had been placed. Of the total Ministry of Supply orders, about 10 per cent are being handled by the ordnance factories and the remainder by private industry. In addition to the orders placed, demands in process of being cleared within the Ministry cover about 17 per cent of its production requirements, so that industry is aware of detailed requirements to a greater extent than actual contracts indicate. The evidence of industry in this second report appears to confirm that, on the whole, the placing of orders is no longer lagging; the radio industry commented that little in the way of quantity production orders seemed to have come to the electronic assembly manufacturers, but surmised that the main demand might be for specialised types and small quantities.

One type of defence stores for which orders are behind-hand comprises textile requirements, in particular canvas equipment. These needs had been re-examined during the first half of the year by the Ministry of Defence and the Board of Trade; during this period no orders were placed. It has since been ascertained that production capacity will be available for all the battledress needed by the War Office and most of the cotton clothing; but supplies are not likely to be satisfactory until the end of 1952. It did not seem likely, upon investigation, that over the three years sufficient canvas to meet service requirements would become available. But this question, said the War Office, "was being attacked again." Such evidence as the Committee obtained from certain trade associations showed that prices had increased since February, in some cases steeply: in its inquiries concerning production of the .280 calibre semi-automatic rifle, the Select Committee gathered that this would cost roughly £34, compared with £17 10s. for the existing .303 rifle. Arrangements for re-tooling, they were told, had been set in train for the .280 ammunition, but not, at that time, for the new rifle.

More Dividend Freeze Anomalies

Hardly a day passes now without bringing to light new anomalies or injustices that will be perpetrated if the dividend freeze becomes law. The suspicion that British companies that have shifted their seat of control overseas would not on that account escape the Chancellor's net has

now been confirmed—by a Treasury response to an inquiry by Tanganyika Concessions. The White Paper affirmed that the control would extend to "every company registered under the Companies Act, 1948, or its predecessors, and to any company incorporated by Act of Parliament or Royal Charter." The "Tanks" company, which comes within this definition, has now been informed that its status for dividend control is not affected by the fact that last November it removed its seat of management and control to Southern Rhodesia. That, at least, is the Chancellor's design; it should be emphasised that, even though it be assumed that the control will become law, neither he nor any Treasury official can give a "ruling" about the form it will take—the most that can be said is what the Government Bill will contain. Meanwhile, the board of Tanks, which had hoped to distribute 25 per cent, estimates that the controlled maximum would be "in the region of 10¾ per cent"; a further announcement is promised.

Many other companies have been more forthright in their response, and are declaring dividends beyond the hypothetical maximum—either because they hope that the whole unreasonable plan will be still-born or because they think they may bring themselves within the privileged category that the Treasury, in its wisdom, may declare to be governed by "exceptional circumstances." If it could be supposed that an unreasonable plan would, none the less, be administered reasonably, the already long list of candidates for special consideration would be entitled to their optimism. As it is, one can scarcely hope that some of the reasons put forward, such as "jubilee celebrations" (advanced by Whitworth and Mitchell this week), will soften the Treasury heart. The case of the rubber producers (discussed in these columns a fortnight ago) and of the tin companies (instanced by the plea to the Treasury from Beralt Tin and Wolfram) rests on an entirely different footing. So, too, perhaps, does that of insurance companies that have the misfortune to make up their 1950 accounts after the Chancellor's zero hour, while some of their fellows, who reported earlier, had already declared increased distributions. Mr H. K. Goschen, of the Mercantile and General Reinsurance, has seized this particular bull by the horns: the company is declaring a tax-free dividend of 10 per cent, although the controlled tax-free maximum would be a little under 5 per cent, and this action will, if necessary, be supported by a strong plea for exemption. It can be argued that harsh treatment of insurance companies would do particular damage to Britain's international credit; but, this consideration apart, the company's arguments are very widely applicable—too widely, perhaps, to encourage hopes that the Treasury would give way. But what will it say to the tail-twisting argument of the Triplex board, which this week has justified a modest increase in distribution by the fact that its employees' wages are kept in step with the rise in the cost of living? There can hardly be any "psychological" dangers here. Or would Mr Gaitskell like to see the sliding wage-scale dropped as well?

Winter Transport Dangers

Industry, as represented by the Federation of British Industries and the Association of British Chambers of Commerce, has for some weeks been discussing with the Railway Executive the dangers of transport dislocation this winter. The two industrial organisations have now circularised their members with a plain statement of the potential difficulties, avoiding recriminations and setting out soberly some measures that industrialists can take to ensure that, from their side at least, railway operation will be unhampered.

The danger of rail dislocation arises mainly from one factor—shortage of staff. The railways are short of 5,000 footplate workers, 1,200 guards, 1,600 signallers, and some 4,500 permanent way staff: this staff largely governs the number of trains that can be run each day, and it is continuing to be drained away by more attractive conditions in other industries. The Executive's physical resources—locomotives and wagons—should be adequate for winter movement demands. Whether the human resources will be sufficient is much more doubtful. The Executive is asking the Government to defer railwaymen due for military service; attempting to recruit labour from Northern Ireland and Italy; discussing with the trade unions temporary restoration of a 48-hour working week; considering further cuts in passenger services (having already decided to stop summer passenger services a fortnight earlier than usual); and improving lodging allowances to encourage staff to transfer. The effect of such emergency measures upon the operating grades of staff in areas such as London and the Midlands may be the decisive factor in avoiding—or failing to avoid—a crisis.

Industrialists are being asked by their organisations to co-operate with the railways in co-ordinating freight movement. Use of wagons to maximum capacity, correct timing of the flow and loading of traffic, and planning to avoid the delay of wagons awaiting loading or discharge are suggested as arrangements that may avoid dislocation. This sensible co-operation from transport users in face of the dangers of winter breakdown is welcome; it is to be hoped, however piously, that the Executive's approach to the problem, which it claims is "being tackled resolutely and with foresight," may succeed in removing transport from the list of nationalised industrial crises promised for a hard winter.

'WHITE LEAD PAINT' *said Washington*

The year was 1793. George Washington's estate manager wrote post haste from Mount Vernon, the President's lovely house in Virginia. "*Indeed,*" said he, "*there is a Great deal of painting wanting. The pillars of the Piazza are very naked . . . if Your Excellency Chuses to have them done there is no danger of sending too much White Lead.*" Four days later came Washington's reply: "*I will, by the first Vessel to Alexandria, send oil and paint agreeably to your memorandum . . . I will have both sides and ends painted and sanded, as well as the Pillers.*"

The year is 1951. George Washington's beloved mansion stands as firm today against the searching winds and rain from the Potomac as it did in his lifetime. Its rendered surface looks like stone . . . but it is *wood* . . . wood sound and strong after a hundred and sixty years, through the protective care of coats of White Lead Paint.

Oil that is in a laboratory test tube today will fly the jet aircraft of tomorrow. Work in progress at Anglo-Iranian Oil Company's research stations includes the preparation of new aviation fuels and lubricants. New processes and plant are being designed to improve the output of Anglo-Iranian's many refineries. Looking even further ahead, Anglo-Iranian is prospecting for new oil-bearing strata beneath the surface of four continents.

Anglo-Iranian Oil

COMPANY, LIMITED

THE BP SHIELD IS THE SYMBOL OF THE WORLD-WIDE ORGANISATION OF ANGLO-IRANIAN OIL COMPANY, LTD.

Belgium agreed to make available a month ago, on the basis of fifty-fifty finance by gold payments and by new credits, is being drawn upon. The position is about to be reached at which further credits accumulated by Belgium with EPU will have to be settled by 100 per cent payments in gold. The managing board of EPU has already held a preliminary meeting in Paris to examine Belgium's position and to advise on measures to be taken to correct this excessive creditor position vis-à-vis the rest of EPU membership. The first of these measures is the setting of a definite limit upon the export of certain types of consumer goods from Belgium to the Netherlands. This will hit certain Belgian industries, notably textiles, but it will affect the balance of payments position at its most critical point—for it is the boom in Belgium exports to the Netherlands, made possible by the Benelux dismantling of customs barriers between the two countries, that provides the main explanation of Belgium's net surplus with EPU as a whole. Belgium will also consider easing the quotas that still hamper Belgian imports of agricultural produce from the Netherlands. Finally, Belgium has also undertaken to divert a wide range of its imports of consumer goods from the dollar area to EPU countries.

These events reveal how difficult it is for divergent import policies to be maintained within a group of countries that "enjoy" the benefits of multilateral payments. Belgium has in recent years prided itself on a policy of nondiscrimination in imports, buying where goods were cheapest, irrespective of the hardness or softness of the currencies concerned. That orthodoxy must now be sacrificed by reason of the contagion of difficulties experienced by other members of EPU. It is difficult to walk straight when in the serried ranks of a company of limping cripples.

* * *

Germany in Transferable Account Area

After many months of striving on Britain's part, and of doubtful hesitation on the part of Western Germany, an agreement has finally been made that draws Germany within the "Transferable Account" system of sterling payments. As in the case of all other transferable account countries, payments to and from the new German transferable accounts from and to other transferable account countries, can be made only in respect of direct current transactions between them. These new arrangements should have little direct effect on Anglo-German trade, since payments between Germany and the whole sterling area are now operating under the smoothly working machinery of the European Payments Union. In fact, the now successful British attempt to draw Germany within the sterling transferable account system was made mainly in pursuit of consistency and logic—which require that Germany should be given the same rights to use sterling as other members of EPU, many of which have long been in the transferable account system. It should be realised, however, that the new arrangements may work distinctly well for Germany. Germany is now well set as a creditor country on current account and, in so far as non-European and non-sterling countries pay Germany in sterling, those payments will be brought into the EPU reckoning and will ultimately be settled in favour of Germany, partly in EPU credits and partly in gold. These new transferable account arrangements came into operation on August 31st. British banks have been advised by the Bank of England of the amendments involved.

* * *

Wool Weakens Further

Wool prices have continued their fall this week, but the rate of decline appears to be slackening. In Australia on Monday, prices fell by 2½-5 per cent, showed no change on Tuesday, but by Thursday had fallen another 5 per cent. At least the rate of decline is slowing down. Merino

64's are now about 118d. a lb compared with 148d. at the opening of the season and about 206d. a year ago. The South African season opened this week and the market started off on a better tone than in Australia. Prices were 45 per cent below the closing rates of the last South African sales in May, but slightly above current Australian prices. On the second day, however, the market became noticeably weaker and finished below the Australian level. This same cautiousness in buying was experienced in New Zealand, and prices this week dropped back to the level of August 15th when the postponed sales were resumed. In the intervening period they had risen by 10 per cent.

There is little doubt that manufacturers are concerned about the trend of retail sales. The declining trend in sales of wool textiles is not peculiar to Britain. It is also happening in both the United States and Canada, and in these two markets British exporters are beginning to feel the effect of consumer resistance. In Western Europe, too, retail sales have fallen, chiefly because of the sharp rise in the cost of foodstuffs and other essential goods. When incomes have had a chance to catch up with the rise in cost of living, the public might indulge in another buying spree. But they might prefer to buy television and washing machines until they have begun to wear out some of this spring's new clothes.

Films and the Duty

During the past eighteen months the Board of Trade has been publishing the first authoritative statistics of the British film industry ever gathered, thus inserting a framework of fact into the somewhat inchoate controversy concerning the industry's economic health and future. In its latest and sixth quarterly report, published last week, the Board's Statistics Division searches back beyond its own verified data to provide a valuable comparison between postwar and present financial rewards of the industry. Inevitably, the figures are estimates only—but they are independent estimates derived from the best available figures; earlier comparisons quoted in the recent discussion of Entertainments

ESTIMATES OF CINEMA ADMISSIONS AND TAKINGS
1936-1950

Year	Number of Admissions	Gross Box-Office Takings	Net Takings
	Million	£ Million	£ Million
1936	917	38·6	33·4
1937	946	39·9	34·5
1938	987	41·5	36·0
1939	990	41·7	36·1
1940	1,027	44·9	38·2
1941	1,309	65·0	52·2
1942	1,494	87·2	64·0
1943	1,541	103·5	68·8
1944	1,575	111·8	72·1
1945	1,585	114·2	73·4
1946	1,635	118·3	75·9
1947	1,462	105·4	67·7
1948	1,514	108·8	70·0
1949	1,430	103·3	66·8
1950*a*	1,396	105·2	68·0

(*a*) Actual figures taken from quarterly enquiries.
Source: Statistics Division, Board of Trade.

Duty, such as those made by the exhibitors or those hazarded in these columns three months ago, derive wholly from estimates made at different times within the trade that may be liable to accusations of bias.

The Statistics Division is to be congratulated upon a piece of research that will be of considerable value in the impending discussions upon the whole form and incidence of full-rate Entertainments Duty. Its estimates are based upon prewar and wartime estimates of the prices paid for admission to cinemas in the thirties, Excise returns of Entertainments Duty, and postwar estimates preceding the collection of its own full-scale statistics. The most uncertain item in these figures is the number of cheap seats paid for that fall outside the scope of Entertainments Duty and are not recorded in its returns; but the resultant error is not likely to affect the estimates of total box-office receipts very much.

It is perhaps worth noting that the Division's estimates, while greatly modifying the comparisons put forward on behalf of the trade this summer, do not wholly vitiate the argument it had based upon them. The exhibitors were claiming in May that their net box-office takings had risen since before the war by only 40 per cent, whereas many of their expenses had risen by 100 per cent or more. The Board of Trade estimates suggest that in fact net box-office takings may have risen by nearly 100 per cent between 1940 and 1946, but that since then they have fallen by 10 per cent. With 1950 net takings some 88 per cent greater than those of 1939, it still seems likely that they have risen considerably less than costs, the increases in some of which may even have been underestimated by the trade. In the same period, incidentally, Entertainments Duty has grown sevenfold; it now represents 35 per cent of the cinemas' total gross takings, in contrast with 13 per cent in 1939.

India and Sterling

The Annual Survey of the Reserve Bank of India, cabled extracts from which reached London last week, gives interesting information about the extent to which the financing of India's external trade is being divorced from sterling and from the traditional method of the bill on London. During the year to June 30, 1951, the proportion of India's export trade proceeds received directly in hard

THE GLASGOW SCHOOL OF MANAGEMENT STUDIES

THE ROYAL TECHNICAL COLLEGE
and

The Glasgow and West of Scotland Commercial College,
Department of Business Administration,
Pitt Street, GLASGOW, C.2.

currencies rose to a little over 40 per cent, compared with 20 per cent for the previous year. Over the same period the use of sterling in financing external trade dropped from 62 per cent to 40 per cent. These are at first sight somewhat startling figures in their indication of the extent to which Indian external trade is now by-passing the London markets and the channels of sterling finance. It should be realised, however, that the percentages of non-sterling finance include the substantial Indian-Pakistan trade that is invoiced and transacted in rupees and involves sterling payments only so far as ultimate net balances are settled by transfers between the respective "No. 1" sterling accounts of the two Dominions. India has also been negotiating bilateral payments agreements with such countries as Germany and Austria. If these figures of the use of non-sterling currencies in Indian external trade have any menacing significance for the future hegemony of the sterling system, that must lie in their reflection of the direct trade now done by India in terms of dollars. The growth of such direct dollar trade will have no seriously unfavourable implications for the sterling area if India continues the practice of holding in dollars no more than working balances and adheres to the principle of pooling its net earnings of hard currencies.

The report of the Reserve Bank underlines the substantial improvement that has occurred in the country's balance of payments since the devaluation of the rupee. On June 30th last the foreign exchange reserve amounted to Rs.8,560 million, compared with Rs.8,070 million at the end of September, 1949. The improvement in the balance of external payments has been such as to obviate the need for any draft on the "agreed releases" portion of India's sterling balances under the agreement governing those balances. These releases will, however, have to be drawn upon as India's part of the Colombo Plan gets under way.

* * *

Cheaper Knitting

Retail drapers have had hardly any alternative this week but to accept the loss upon their stocks of knitting wool that has been imposed upon them by the sharp price cuts announced by the largest producer, Paton and Baldwins, and followed by other manufacturers. Attempts to dispose of present stocks at the old prices would seem impracticable. Even without the promise of wools 25-30 per cent cheaper elsewhere or in a few days, knitting customers have needed no prompting to hold off buying in recent weeks. "Customer resistance," indeed, may well be the primary reason for the cuts, which follow smaller reductions at the beginning of June: the fall in raw wool prices has simply made it possible for the manufacturers to take heroic measures to revive dormant sales.

Price cuts in knitting wools, of course, do not necessarily presage any early falls in the prices of other drapery goods. From the production side, knitting wool has naturally a far shorter processing period than materials or made-up garments; and the effect of changes in the price of raw wool is therefore passed on to the consumer much faster. Many other textile goods, as the chairman of the Wholesale Textile Association emphasised last week, take up to twelve months from wool purchase to counter sale—and in their prices, it follows, the proportion of raw material cost is in any case considerably smaller. From the marketing side also, it might be that demand for knitting wools would respond to price changes more sensitively than demand for other textile items. This is impossible to test from published figures: the WTA's monthly indices of textile sales and stocks, for example, do not separate knitting wool as a particular item—partly, perhaps, because a smaller proportion of this item passes through wholesalers' hands. But the comments of individual retailers upon this week's price cuts suggest that stocks of knitting wools had been accumulating on shop shelves for some months. The rebates offered by manufacturers to retailers on account of purchases made during the past month, for that reason, will do little to mitigate the cost of the price cuts to shopkeepers: there had been little buying of knitting wool during August.

Whether equally strong customer resistance will build up for other textile products is not easy to judge. The WTA's latest figures of sales and stocks show that June sales were lower than in May by more than the usual seasonal decline. At the same time the stocks index rose by 12 per cent (it remained level between the same two months of last year). Stocks of garments, fancy goods and miscellaneous items rose, and those of furnishings nearly doubled. There is some feeling in the trade that customers ought soon to be spurred by further price rises into renewed anticipatory buying before the "peak in prices" that may or may not arrive by the end of the year. But at the moment the public is not behaving according to the trade's prognostications.

How the Zinc Cuts were Felt

Industrial statistics are now beginning to make clear the actual results of the shortages and reduced allocations of certain raw materials that began to take effect early this year. As was to be expected, the first fears and protests were somewhat exaggerated—though not often as much as in the expectations about the rayon industry, which has achieved record output despite the sulphur shortage. The Zinc Development Association last week reviewed the effects upon the zinc-using industries of the rationing scheme introduced in January. The effects have been uneven, as indeed were the permitted supplies of different grades of zinc; galvanising was more seriously affected than any other industry concerned, while the brass trade, despite cuts in its virgin metal supplies, managed to consume more zinc than in the first half of last year, by running down stocks.

The galvanisers were considerably less affected by the varied prohibitions of end-uses for their wares than by the sharp cut in their total supplies—at first to 50 per cent of their average consumption in the first nine months of 1950, and later to 55 per cent. For some specialist galvanisers concentrating on particular products, the ration was even less. By using up stocks of metal at the works, and by emptying baths that could no longer be kept working, the general galvanising trade kept its activity in the first six months of this year up to about 65 per cent of that in the same period of 1950; but by the end of June its stocks of zinc had fallen to 3,996 tons compared with 7,634 tons at the end of October, 1950.

Galvanisers use ordinary grade zinc, which was cut the most sharply of any. The other trades suffered less

Capital Security

THE Church of England Building Society now invites investments up to the maximum holding of £5,000. The Society's fully-paid Shares, issued at £25 each, are not subject to Stock Market fluctuations; they are withdrawable on agreed notice being given.

Share interest at the rate of 2½% per annum is received by the investor half-yearly on 31st May and 30th November; the Income Tax on the interest is paid by the Society. Interest is calculated from the date of the investment up to the date of withdrawal.

The Society's substantial assets consist of First Mortgages secured upon carefully valued properties situated in selected districts in many parts of the country. This "spread-over" of mortgages enhances the already solid security enjoyed by our Investing Members.

Since its incorporation in 1882 this old-established Society has never failed to pay the agreed rates of interest at the agreed times, and in spite of wars and crises its stability has remained unshaken. As a medium for the non-speculative investor, who seeks, above all, security of capital, yet desires a reasonable, steady return, it is today an excellent proposition.

ASSETS EXCEED £6,500,000 • RESERVES £350,000
OPEN ACCOUNTS 16,000

A copy of the latest balance sheet, together with an explanatory booklet, may be obtained from the Secretary.

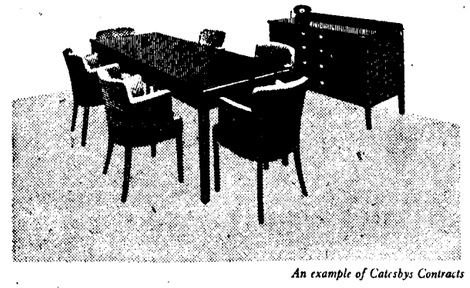
With over 80 Branches at the leading centres of Industry and Commerce in India, Pakistan, Malaya and Burma, The United Commercial Bank is well equipped to serve Banks, Commercial Institutions and individuals carrying on business with India or intending to open connections with that country.

B. T. THAKUR, General Manager.

FLIGHTS TO SOUTH AMERICA

Fly
QUICKLY AND SAFELY TO
Rio, Montevideo, Asuncion, Buenos Aires



. . . AND OVER **60** OTHER SOUTH AMERICAN CITIES

To business people and private individuals planning a trip to South Amerioa—Panair do Brasil offers distinct flying advantages. It is the largest internal air network in the world. It covers all principal South American cities and more than 60 others, as well. The four-engined Bandeirante aircraft of P.A.B. have crossed the South Atlantic over 1,800 times—more often than any two other airlines combined! You travel in absolute safety and superlative comfort. Moreover, frequent flights and fast service ensure that you reach your destination in the quickest possible time. And bookings are reasonable. If you are planning a trip to South America, consult P.A.B. first. Full details of flights and fares will be gladly supplied by any travel agency—or by Panair do Brasil, London Office: 193/4 Piccadilly, W.1. Telephone: Regent 7292.

Fly *PANAIR DO BRASIL* to South America

heavily. Use of zinc for die-casting alloys (in which form the metal is of considerable importance in motor components) was less than 5 per cent lower than in the first half of 1950, and that for rolled zinc products about 17 per cent lower. Consumption of zinc for zinc oxide in the first half of 1951 fell to 17,607 tons, compared with 23,287 tons in the first half of 1950: but for brass it rose to 55,361 tons compared with 49,204 tons in 1950. How long activity in these trades can be bolstered by running down stocks is uncertain, since the stocks in most sections except brass foundries are already lower than they have been at any time in the last eighteen months. There seems no immediate prospect of an improvement in zinc supplies, and the present restrictions upon industrial consumption are likely to be maintained at least until the end of the year.

* * *

Improvement in Raw Materials

The raw material crisis that threatened Britain and the world ten months ago has not materialised. There is no era of plenty just round the corner. But the prompt and resolute action taken by the United States and Britain in controlling civilian consumption, and the sharing of supplies of certain materials through the mechanism of the International Materials Conference in Washington, has permitted a high level of industrial activity to be maintained. The danger, as seen towards the end of last year, was not that supplies of all raw materials would be inadequate to cover demand, but rather that a few vital raw materials, such as sulphur and zinc, would be really scarce, and might through their ubiquity curtail total production quite seriously. International action in this field, although somewhat limited, has certainly been successful in preventing one country expanding its industrial output very rapidly at the expense of others.

A survey of the present raw material position in Britain, published in last week's issue of the *Board of Trade Journal*, gives a quite encouraging picture. There has been no deterioration in prospects for any commodity compared with six months ago and an improvement has been recorded in 70 per cent of them. Britain has been able to get much larger supplies of sulphur, tungsten and molybdenum than it expected, thanks to the IMC, which is allocating all three materials. Owing to increased world production, the prospective scarcity of jute, cotton, cotton linters and chemical pulp has been forestalled. The improvement in softwood, aluminium and magnesium, as far as Britain is concerned, has been due to larger purchases; Britain bought large quantities of timber from North America and signed another large contract with Russia. The long-term contract with Canada for aluminium has begun to prove its worth, and allocations to fabricators have been increased by 2,000 tons a month and are now at a higher monthly rate than last year. As for magnesium, Britain has entered into long-term contracts with overseas suppliers and has reopened its wartime plants.

The improvement in rubber, tin, wool and sisal has come more from a reduction in demand than from an increase in output. Civilian consumption of rubber and tin is controlled by governmental decree in the United States; it is much smaller than twelve months ago. Stockpile purchases have also been reduced. The decline in the consumption of wool and sisal is in part a reaction to the large-scale buying, twelve months ago, by both manufacturers and final consumers. Copper and lead have shown little change during the past six months and are not expected to raise any new difficulties, but the supply of zinc, nickel, mechanical pulp and kraft paper is still uncertain, and may yet provide a headache for the Government and manufacturers. All these latter materials are still under discussion at the IMC in Washington, though so far no agreement has been reached about their allocation.

Rubber and the Stockpile

The rubber market has still not learnt to treat with complete disdain the alternate blasts of hot and cold air from across the Atlantic. A few months ago the United States Government announced that stockpiling of rubber would be reduced and that the programme would be completed by the early months of the next year. This week the Senate Armed Services subcommittee reported that less than one-fifth of the total amount of rubber to be stockpiled was bought in the twelve months ending last June, and went on to state that the United States "must stockpile and conserve rubber as though our very lives depended on it, because that may be a reality." At first the price of rubber in London hardly reacted; it rose by only ½d. to 3s. 8½d. a lb. on Tuesday. But on Wednesday it jumped to 3s. 11d., and closed on Thursday at 4s. 1d. a lb.

The United States, having burnt its fingers in the scramble for commodities last year, has recently become much more concerned with prices than supplies. It would be surprising, to say the least, if its stockpiling authorities rushed into the rubber market just because of a Senate subcommittee report. Civilian consumption of rubber in the United States is still drastically curtailed, despite some minor relaxations five months ago, and if large quantities are needed for the stockpile they are more likely to be found by reducing home consumption than by increasing purchases. American authorities feel that the present price of rubber is reasonable both for producers and consumers and are consequently reluctant to start a new rise.

World production of rubber in the first half of this year amounted to 957,500 tons, compared with consumption at 797,500 tons, while total stocks declined by 20,000 tons, indicating a disappearance of some 180,000 tons into government stocks during the period. Government buying is clearly still an important factor in the market. Supplies to China have been greatly reduced and sales to the Soviet bloc are controlled. Rubber producers will, of course, prefer to see the United States increase civilian consumption rather than put more natural rubber into the stockpile, since that must always be considered a potential threat to them. And recent reports have suggested that government control on the use of natural rubber may be relaxed in the first quarter of 1952. American production of synthetic rubber is being expanded to the limit of existing capacity; immediate postwar experience showed how difficult it is to get the American Government to relax compulsory use of synthetic rubber. But if the American economy expands each year—helped by the rearmament programme—a higher level of consumption of natural rubber seems inevitable, unless new synthetic rubber plants are to be built.

Shorter Notes

Industrial production in June, according to the official interim index, showed a rise of six points over the (revised) figure for May, during which production was affected by the Whitsun holidays. The June provisional index figure, 149, compares with 143 in June, 1950: the manufacturing component of the index reached 157, compared with 149 in May this year and 138 in June last year. The index as revised, therefore, continues to support the estimate of a rise of 4 per cent in industrial production this year made in the Economic Survey.

*

On July 1st this year there were only 15 ships with a gross tonnage of 48,910 tons laid up in United Kingdom ports, apart from those awaiting or undergoing repair. This is the lowest quantity of idle cargo space recorded since the war; the amount of shipping laid up has fallen steadily since the Korean war began. The swollen demand for shipping of the last year—also reflected to some extent in the lower tonnage of shipping taken out of service for repair—reflects the other abnormal requirements of last winter and spring; and it shows that there is practically no reserve of British shipping to meet any further calls of that nature.

A Unit in Britain's Most Important Industry

THIS IS a typical "factory" in Britain's most important industry. There are 13 million such "factories" providing the essential services without which the nation could not survive — shelter, warmth, food, light and the care of the next generation.

They employ 13 million women — the biggest labour force in the country — and the work is of a most exacting nature. It is made harder still by rising prices, rationing and general shortages.

We at Hoover Limited derive satisfaction from the knowledge that our electric cleaners are doing so much to relieve unnecessary domestic drudgery; and we are proud that their average retail price, exclusive of purchase tax, is only 30% higher than before the war, despite the fact that both quality and design have been improved. We are equally proud of our popularly-priced electric washing machine, specially designed for the very small as well as the larger home.

We look forward to the day when, with purchase tax abolished and free supplies of raw materials available, we shall be able to maintain maximum production of both cleaners and washing machines. It is our aim to supply these *essential* pieces of equipment to all housewives in all sections of the community at the lowest possible prices.

HOOVER LIMITED

Makers of Electric Cleaners, Washing Machines, F.H.P. Motors, Commutators etc.

FACTORIES AT: PERIVALE, GREENFORD, MIDDLESEX · MERTHYR TYDFIL, SOUTH WALES · CAMBUSLANG, SCOTLAND · HIGH WYCOMBE, BUCKS.

Company Notes

Triplex Safety Class.—It is unlikely that the Triplex decision to raise the ordinary dividend from 12½ to 15 per cent will rank as a privileged special case, as Mr Gaitskell would define it. But if the avowed object of dividend control is to avoid the "psychological" effect of dividend increases upon workers and their claims for higher wages, Triplex can retort that its employees' wages have been raised to keep pace with the increases in the cost of living. The extra payment by Triplex amounts to £6,500 net, to be shared among 8,000 to 9,000 stockholders.

On financial grounds, the year's results amply justify the increase. Footage sales have risen, and group trading profits have advanced from £278,849 to £389,783. The year has also seen the acquisition by the company of three general engineering concerns; this is reflected in the rise in the gross book value of fixed assets from £582,022 to £821,257 and in a reduction in the portfolio of government securities from £493,748 to £194,000. Undoubtedly, these engineering concerns will ultimately make their contribution to earnings, but future profits will still largely depend upon the production schedules of motor manufacturers. If the Treasury rejects the company's plea of "exceptional circumstances" in raising the dividend, shareholders will have to resign themselves to the prospect of a 7½ per cent. dividend next year—if the government's proposals are carried through.

	Years to June 30, 1950	1951
Consolidated Earnings :—	£	£
Trading profit	278,849	389,783
Total income	312,508	423,589
Depreciation	36,501	83,774

Stocks	259,899	456,029
Cash	73,322	111,671
Reserves	514,226	507,596
Ordinary capital	647,127	647,127

10s. ordinary stock at 26s. 9d. yields £5 12s. per cent.

Whitworth and Mitchell.—The list of claimants to increase ordinary dividends beyond the "standard" rate on the grounds of "exceptional circumstances" grows rapidly. Whitworth and Mitchell was among the first, but, in compliance with the government's proposals it has maintained its ordinary dividend at 12½ per cent. The company had intended to celebrate its jubilee by paying a bonus of 5 per cent; a sum necessary to cover this bonus has been placed in reserve—in the hope that the Treasury will permit its distribution.

	Years to June 30, 1950	1951
Earnings :—	£	£
Trading profit	363,978	406,698
Total income	364,468	407,180
Taxation	142,962	189,000
Earnings for ordinary stock	*119,788*	*92,930*
Ordinary dividends	34,375	33,458
Ordinary dividends (per cent)	12½	12½
Dividend reserve	...	13,125
Added to general reserve and carry forward	85,413	46,367
Balance Sheet Analysis :—		
Fixed assets, *less* depreciation	94,867	97,355
Net current assets	1,235,890	1,356,889
Stocks	963,745	1,225,276
Cash	155,041	319
Reserves	649,698	429,385
Ordinary capital	500,000	500,000

£1 ordinary stock at 38s. 9d. yields £6 9s. per cent.

The accounts themselves repeat a familiar story of higher profits, up from £363,978 to £406,698, bigger claims by the tax collector and an increase in stock values. Inflated values of current assets have made further calls on liquid resources, and cash holdings of £165,041 have been converted into an overdraft of £41,443.

Both the volume of business and monetary turnover have increased, but gross profit margins have fallen slightly and the increase in turnover has been obtained exclusively in export markets. At home, trade has declined, for the company largely manufactures non-utility goods, the sales of which "are very seriously affected by the high rate of purchase tax they have to bear." The rise in raw material prices, particularly of cotton, and hence in the company's costs and selling prices, which has led to "strong consumer resistance," is giving rise to considerable anxiety. Moreover in estimating future prospects, equity shareholders will wonder if a fresh appeal for capital funds is foreshadowed—however faintly—by the chairman's remark that "it will become increasingly difficult, in view of high taxation, to finance extra business of any magnitude without obtaining further liquid resources."

★

Watney, Combe Reid.—The effect of the fall in beer consumption upon the trading fortunes of such leading brewers as Watney, Combe Reid was discussed in a note on the company's preliminary profit statement in *The Economist* on August 25th. The company's chairman, Mr S. H. Combe, now anticipates a further decline in consumption and argues that as the biggest cost of beer is attributable to the high level of duty the only way to reverse the downward trend is by a sharp reduction in duty. The recent increases in beer prices were inevitable because of the alarming rise in costs; hops and barley, for example, now cost some 300 per cent more than in 1939 and at the same time beer duty per barrel has risen from 104s. to 321s. In these circumstances the chairman considers the small fall in group trading profits, from £1,546,012 to £1,528,369, as "not unsatisfactory."

	Years to June 30, 1950	1951
Consolidated Earnings :—	£	£
Trading profit	1,546,012	1,528,369

Reserves	5,919,907	6,173,477
Deferred capital	3,247,910	3,247,910

£1 deferred stock at 59s. 0d. yields £5 15s. per cent.

The cash requirements of the group are "enormous and increasing"; to provide for the upkeep of the company's properties, for the eventual replacement of its plant, and for the purchase of Charles Hammerton an issue of £2,000,000 debenture stock was made last year. Of the issue proceeds, £1,103,937 had been received by the end of the financial year; but despite this reinforcement, cash holdings are down from £1,124,438 to £948,742.

A few factors can be set against the dismal trend of rising costs and falling consumption. First, the company by purchasing Charles Hammerton, the stout brewers, has broadened its interests in the more popular bottled trade. Secondly, arrangements have been made to sell the company's output of yeast to a concern that is to produce a new cereal food in the profits of which Watney will have a share.

COMPANY MEETINGS

MERCANTILE AND GENERAL REINSURANCE

ACCOUNTS REVEAL CONTINUED EXPANSION

IMPORTANT DOLLAR CONTRIBUTION

MR H. K. GOSCHEN'S VIEWS ON DIVIDEND LIMITATION

The annual general meeting of The Mercantile and General Reinsurance Company, Limited, will be held on September 25th, at the company's chief office, 25-31, Moorgate, London, E.C.

The following is a statement by the Chairman, Hugh Kenneth Goschen, which has been circulated with the report and accounts for the year ended December 31, 1950:

My first duty is to record with deep regret the death, on May 23, 1951, of our colleague, Sir William M. Goodenough, Bt., LL.D. We benefited immeasurably from his wisdom and great fund of common sense. His advice, whether on general policy or on matters connected with the staff in which he took such a kindly interest, was invariably founded on those high principles which characterised his whole life.

I have also to record with great sadness the death, on August 26, 1951, of Mr C. M. Woodbridge, a director for 25 years. He took the keenest interest in our affairs and attended our committee meetings to the end. His cautious but always sympathetic approach to the problems of a rapidly expanding business has been of very great benefit to the company and we shall all miss his wise counsels.

It will be my pleasure at the general meeting once again to propose a vote of thanks to the management and staff. They have worked loyally and efficiently throughout the year and under the able guidance of Mr Calburn, our general manager, have well maintained their high standard. I must here mention that Mr Carlton Hall, a manager of the company, retires on August 31, 1951. We started our accident department when he joined us 30 years ago and he has been responsible for this department ever since. With his profound understanding of the business, and his ability in devising means of fulfilling accident reinsurance needs, combined with great gifts, in the fostering of personal relationships, which are so important a part of our business, he has succeeded in building up a strong and well-balanced accident account. We wish him many years of health to enjoy his retirement.

RECORD NET PREMIUM INCOME

The accounts for 1950, now submitted for your approval, show continued expansion. The net premium income amounts to the record figure of £5,445,251, against £4,283,916 in 1949—an increase of 27.11 per cent. To some extent this increase is due to the devaluation of sterling and consequent rise in the sterling equivalent of foreign currency premiums; the full effect of this change was not apparent in the 1949 accounts as the devaluation had only taken place in September of that year. The establishment of new business connections at home and abroad has also contributed very considerably. Compared with the previous year the exchange fluctuations in the many currencies in which we do business have been relatively small and, in consequence, our accounts show practically no net difference under this heading. I am also glad to be able to note that our authorities are now showing a more sympathetic understanding of our need to hold our technical reserves in the currencies in which we have liabilities.

DEPARTMENTAL RESULTS

The departmental results have, on the whole, been satisfactory. In the fire department, the general experience in almost all the territories where we do business was good. The year was characterised, however, by large losses, some due to natural phenomena, the extent of which is even now not fully known. We have, therefore, deemed it prudent to reinforce the reserve for outstanding losses in appropriate measure. High prices for commodities have resulted in a continuing demand for increased coverage. It has been a source of satisfaction to us to be able to be of assistance to our friends in this direction.

The results of the accident department show an improvement, although the motor and general third party business is not yet on a satisfactory basis; it is, of course, particularly vulnerable in this era of general inflation. Motor premium rates at home have been revised and steps are being taken in many places abroad to adjust the rates to current experience. It will be some years, however, before the rates catch up. The third party business is the cause of some anxiety, for many of the awards made by the courts have assumed proportions quite out of line with the existing rates of premiums. The aviation business continues to improve, although there is still a small loss.

In our Marine account the underwriting year 1948 is running off satisfactorily, but in view of the delays in settlements the account will not be closed until the end of 1952. In the meantime our marine fund is building up and now stands at 130.06 per cent. of the premiums. In spite of certain adverse features in the future prospects of both hull and cargo business, there are no signs of an abatement in the considerable competition for marine treaties in the international market. Our own acquisition policy remains very conservative and we were spared serious marine casualties in 1950.

The life department again shows great vitality with another record of £6,503,600 for net new business written in 1950, against £5,485,000 in 1949. Whilst the overseas business has continued to increase, this year it is the home side which shows the greatest expansion. It is satisfactory to note the continued growth of our transactions with the larger British companies. We have organised our department so that we are able to act as a clearing house for the large lines which are now being insured in the market, and this service has already been used on a number of occasions.

The investment department, with a portfolio of £5,427,922 at market prices, has expanded by over £1,100,000. There was a general rise in the market values of Government stocks, and this has enabled us to regain some of the losses sustained in the previous year. I have referred before to the small margin which inevitably exists between the cost and market values of our investments; I can report, however, a small increase in the margin of appreciation against the previous year. The company has continued to follow the traditional policy of holding a large proportion of its investments in British Government securities; at December 31, 1950, these accounted for 52.30 per cent. of the portfolio. But during the year the opportunity was taken of increasing the holding of first-class equity shares where this could be done without sacrifice of the prime requirements of liquidity and security. As you will see we have also increased our investment in mortgages.

You will notice that there appears in our balance sheet for the first time an item for "fixed assets." During the year we made arrangements to buy 48-54, Moorgate, a freehold site near our present offices, which we hope will one day become our permanent home. Unfortunately, we are precluded for the moment from undertaking the necessary rebuilding.

MISSIONS ABROAD

During 1950 our officials travelled far and wide in their efforts to foster and extend our business connections in the world's insurance markets. I would like to take this opportunity of saying thank you to our friends both at home and abroad for the warm welcome and great hospitality with which our representatives are greeted wherever their missions take them.

In an endeavour to make our contribution towards the solving of the country's dollar problem we have made great efforts since the war to build up our business in North America; in the United States we have friends of long standing who favour us with a share of their large and important business, and in Canada we now have many and valuable connections in the fire and casualty business. Our business with Canada has, in fact, grown to such an extent that we have found it necessary to become a licensed reinsurer in that company. With this end in view we formulated plans during 1950 to set up a subsidiary company in Toronto, and the necessary Bill granting to our subsidiary a Dominion Charter successfully passed through the Canadian Houses of Parliament early this year and received the Royal Assent on May 31, 1951. The new company, which is a wholly owned subsidiary, is called "The Mercantile and General Reinsurance Company of Canada, Limited," and is located at 304, Bay Street, Toronto, Ontario. Mr D. G. Barnard has been appointed manager, and the company is starting operations forthwith in all branches except life and marine.

DIVIDEND LIMITATION

As will be seen from the figures and explanations which I have given, the results for the year have been satisfactory. The directors feel that it is only right that the shareholders should participate in those results now that the company has built up a strong reserve position. They have accordingly had it in mind for some months to follow the example of many of the leading British insurance companies by declaring a moderate increase in dividend for 1950. Unfortunately, however, our accounts are issued late in the year and we are, therefore, faced by a dilemma as a result of the Chancellor of the Exchequer's proposal to introduce legislation for the limitation of dividends. The White Paper explaining the Chancellor's proposals says, broadly speaking, that during a period of three years the gross amount which may be distributed in dividends will be the average of the amount distributed in the last two years; this is to be applied retrospectively to July 27, 1951. On a strict interpretation of these proposals, we should require to reduce our dividend for 1950, since it is paid tax free and income tax has risen this year. But we do not know whether these proposals will ever become law. They have naturally been severely criticised. They can have virtually no effect on the inflationary situation; the Chancellor himself sought to justify them on psychological grounds. They would react most unfairly as between the shareholders of one company and another, and they must inevitably induce a sense of grave uncertainty in the minds of foreign investors.

For these reasons and many others, there is much doubt whether these proposals will ever become law. If they do reach the Statute Book, it is laid down in the White Paper that in exceptional circumstances the Treasury may decide that the amount of dividend permissible may be increased. We have a very strong case for special treatment and will make application for such permission, should it become necessary. In all the circumstances, we have decided that it is right to recommend a dividend for 1950 of 10 per cent., free of tax. In doing so, we are satisfied that we are not going beyond the moderation and restraint which we recognise to be desirable in the national interest.

IRRESPONSIBLE ATTITUDE

I am devoting more space to these proposals for dividend limitation than is perhaps justified by our own particular case, because there is a principle involved which strikes at the very root of our business. Were the proposals to nationalise parts of the British insurance industry, which now, let us hope, are for ever muzzled, to be taken at their face value by our friends abroad, they could do untold harm in the international insurance market in which this country has so large a stake. The proposals for dividend limitation to be applied by retrospective legislation—coming, as they do, only three months after the Chancellor had specifically recognised the need for moderate increases—are just another manifestation of the same irresponsible attitude towards the international business which forms such an important part of this country's life. How can people abroad be expected to continue to invest in our industry and commerce when they are liable to be thus restricted for "psychological reasons"? Penal taxation and exchange control restrictions to which they are subjected are already serious considerations. If they put their money here at risk, they must be allowed to reap their rewards. If foreign investors are to be frightened away, will not the future of British insurance also be threatened, based as this is on the belief that our traditions of common sense, fairness, and integrity will prevail? No company is more anxious than we are to co-operate with the Government in its fight against inflation, but we cannot subscribe to measures, temporary expedients though they may be, which strike so hard at the very basis of British credit, built up over many years and to such advantage to the economic prosperity of the country. We are told that the late Lord Keynes wrote a memorandum in the last few days of his life, in which he reminded ministers and officials that "the springs of national policy must be sought in national honour." Would that that text could now be disinterred, re-read and digested!

LONDON TIN CORPORATION

CHAIRMAN'S SPEECH

The twenty-fifth annual general meeting of London Tin Corporation, Limited, was held on September 3, 1951, at The Chartered Insurance Institute, Aldermanbury, London, E.C.

Mr. J. Ivan Spens, chairman of the Corporation, who presided, said: The accounts of the Corporation and the consolidated accounts have now been in your hands for the usual period, and there is little on which I have to comment. The results show a further strengthening of the financial position and are, I hope, considered by shareholders as satisfactory.

I should point out to shareholders that in the profit and loss account the figures of taxation have been set out in a different form. In previous years the *net* figure has been shown after deduction of the amount of United Kingdom income tax recovered against losses incurred in the past. This year the full charge for taxation on the Corporation's profits has been set out and "U.K. income tax recovered" for the year to April 30, 1950, shown as a separate item. The Corporation's income tax "losses forward" are to all *intents* and purposes exhausted; accordingly the substantial recoveries of the last few years will not be repeated and the method now adopted makes clear the taxation on the results of the current year's trading only.

Shareholders will appreciate that the backbone of our income is dividends from tin mining companies and I shall have more to say on this subject later. With regard to tin mining companies, these are operating with equipment purchased in the years prior to the second world war and in ground acquired over the years since their inauguration. Equipment of this nature, while it can be and is reconstructed and modernised from time to time, cannot last indefinitely and replacements cost now probably not less than four times as much as *in the* period 1937-41. Reconstruction and modernisation costs would be on a similar basis.

Actually in the period 1937-41 seventeen dredges were reconstructed and modernised and five 18-cubic foot dredges, four of which can dig to a depth of 130 ft., were installed for companies under the management of Anglo-Oriental (Malaya), Limited. During the same period the companies in Nigeria under our management were equipped with a new dredge and several draglines and additional equipment was obtained following the occupation of the tin-producing countries in the Far East. Orders for additional earth-moving equipment of a new type to deal with harder ground have been placed and deliveries are expected to start before the end of 1951.

New alluvial areas, especially in Malaya, are difficult to obtain.

I am fully aware that in mining companies shareholders expect increased dividends when conditions are favourable to compensate for lower dividends when times are bad, and that many tin companies paid no dividend at all during the war years and the subsequent period while rehabilitation was under way. It would be imprudent, however, if directors were to adopt a dividend policy which took no thought of expenditure to be incurred in future to maintain the position and output of their respective companies. In certain cases provision has to be made in advance for road and river deviations, as well as the removal of dredges to new areas.

As the Corporation's accounts show, the general level of dividends from tin producing companies has shown a substantial increase, and I am confident that shareholders will regard as a source of strength the fact that at the same time reserves against the future have been accumulating.

INVESTMENTS

From what I have said already you will appreciate that wherever our influence can be brought to bear the policy is to build requisite reserve positions within the operating companies. In addition the Corporation continues to build up its own reserves. It is the intention of your board, when favourable opportunities occur, to invest some of the Corporation's surplus funds in investments other than in gilt-edged or in tin-mining projects. By so doing it is hoped that the basis of your Corporation's portfolio will be widened and its revenue increased. The *Memorandum* of Association provides the necessary power.

PRICE OF TIN

During the year under review the price of tin has fluctuated violently. The price in the early part of the year was much lower than the comparable price of other strategic materials. But with the opening of the war in Korea a scramble for tin took place which forced the price temporarily in 1951 to levels in excess of anything which could have been foreseen. As the report of the "Preparedness Sub-Committee of the Committee on Armed Services, United States Senate," issued in early 1951, indicated price increases resulted from a frantic and almost hysterical scramble for tin by domestic consumers and U.S.A. Government agencies.

Tin is, of course, sold on the open market in Singapore and London. Producers do not control the price, and there is no cartel whatsoever in existence. The price of tin depends on and responds to the common formula of supply and demand. In Malaya, especially, a high level of production has been maintained in conditions which obviously cannot be realised by those who disparage what has been achieved.

I do not propose to comment further on the Senate Sub-Committee's report or on certain statements which have appeared in the Press attributed to Mr Stuart Symington, Administrator of the Reconstruction Finance Corporation, Washington, USA, except to state that a large part of the report and the said statements are inaccurate and misleading. I would, however, refer shareholders to the comprehensive statement made by the chairman of the Malayan Chamber of Mines in London at its annual general meeting on July 11th, which dealt with these matters and which was published in the Press.

In October, 1950, the United Nations Organisation called an international meeting to consider a draft international agreement prepared by the Tin Study Group. This draft agreement set out to minimise the fluctuations in the price of tin and to produce a scheme for the future which would deal with conditions which would arise after stockpiling had been completed when the supply of tin exceeded commercial consumption. The conference, which I attended as an adviser, was adjourned as the views of the various countries differed to an extent which could not then be reconciled. Had it been possible to come to some such agreement as had been suggested, which was based on the principles of the Havana Charter, the result would have been beneficial both to consumers and producers.

Referring back to my earlier remarks and in regard to the question as to what is a fair price for tin, I must point out not only that operating costs have risen considerably but that present published figures do not yet reflect the full increases in costs. The costs of stores and supplies of steel nearly all of which have to be bought outside the countries where tin is produced are not reflected in the accounts until many months, probably up to two years, after the orders are placed. Stores are charged out to "operating" at the prices at which they were purchased, so that this time-lag on a rising market masks the full effect of the increases.

Moreover, it is obviously desirable that producers, especially in Malaya, Indonesia, Siam and Burma, should be in a position to place to reserve sufficient amounts to ensure

that the finance is available for the various purposes that I have already indicated.

MALAYA

Conditions in Malaya have undergone no appreciable change since I last addressed you. The resettlement of squatters and regrouping of labour have been going forward steadily but it is yet too early to judge how far, and when, this is going to affect the issue with the terrorists. Schemes such as these must take time and it is earnestly to be hoped that an improvement in conditions will take place in the not too distant future. The emergency has now continued for over three years and the staff, both European and Asiatic, deserve our gratitude and appreciation for the way in which they have discharged their duties throughout this trying period.

Three more dredges under the management of Anglo-Oriental (Malaya), Limited, came into production during the twelve months under review and three more are in course of rehabilitation. One dredge, which after rehabilitation operated on its old area for four years, has been moved to a new area and is now again operating.

Prospecting remains almost at a standstill and the need for its resumption on a large scale becomes more urgent as time passes.

Some war damage compensation claims have already been assessed and it can be hoped that the remainder will be dealt with at an early date.

BURMA

Conditions in the tin-mining district of Lower Burma have brought mining to a standstill. European staff are, by Government order, confined to Tavoy town, and are not allowed on to the mines for security reasons. The Government of Burma has sent troops to the district, but these so far have not been sufficient to do more than protect the townships. Conditions in other parts of Burma have improved and it is confidently hoped that more troops will become available to subdue the Communists who now terrorise the district.

It was with deep regret that we heard that Mr H. G. End, who was acting district superintendent at Tavoy, was murdered by Communists while inspecting a bridge some 12 miles out of Tavoy town.

SIAM

Conditions in Siam have changed little during the year and the working of the mines there has been uninterrupted.

I am glad to say that a third dredge (the Tongkah Harbour dredge) started production in June, 1950.

A lump sum agreement for war damage compensation was arrived at between His Majesty's Government and the Siamese Government and war damage awards have now been paid. I would like to express our appreciation to H.M. Foreign Office here and to H.M. Ambassador and his staff in Bangkok for their great assistance in co-operation with the Association of British Commonwealth Mining Interests in Siam in getting this matter settled.

NIGERIA

Conditions in Nigeria showed no marked change. Production was adversely affected by the lack of rain and the curtailment of electric power supplies. The Government of Nigeria have increased the scale of royalties both on tin and columbite but seem oblivious of the fact that costs have increased and the increased price of tin in itself yields additional revenue. The position has been reached where the scale of royalties now payable to the Government is unrealistic with existing working costs. Protests have been made and figures provided and the Government asked to deal with the matter realistically, but so far without response. With the price of tin at its present level and with these heavy royalties areas of lower grade ground become uneconomical.

DIRECTORATE

It was with great regret that we received from Mr T. E. Baring his resignation from the Board of this Corporation. Mr Baring joined the Board in 1935 when the affairs of the Corporation were being reconstructed and his advice throughout has been of great value.

STAFF

The Corporation has again been ably served in Malaya, Siam, Burma, Nigeria, Australia and London by the management and staff of its subsidiary companies. Anglo-Oriental (Malaya), Limited, are responsible for some 40 per cent. of the production of tin from dredging operations in Malaya, and 24 per cent. of the whole of Malay's output. A. O. Nigeria Limited are responsible for 40 per cent. of the production in Nigeria. Of the total tin production of the world the share of the companies under our management is 11 per cent., the mines managed by Anglo-Oriental (Malaya), Limited, alone accounting for about 8 per cent.

I would like to pay tribute to all the staff and employees for the work they have done and continue to do, and especially to Mr Warren, chairman of Anglo-Oriental (Malaya), Limited, and to Mr Wilson, chairman of A. O. Nigeria, Limited.

In Australia we have lost the services of an old and valued friend in Mr H. A. Coates, who was chairman of A. O. (Australia) Pty., Limited. Mr Coates was a prisoner of war in Malaya throughout the Japanese occupation and the strain of those years has had its effect on his health. He has our best wishes for a long and happy retirement.

The report and accounts for the year ended April 30, 1951, were adopted and the retiring directors re-elected.

GOLD MINES OF KALGOORLIE LIMITED

The Annual General Meeting of Gold Mines of Kalgoorlie Limited, was held on September 5th, in Melbourne (the figures quoted are in sterling).

Sir Walter Massy-Greene (the chairman), in the course of his speech, said: The tonnage treated was 163,115 tons of which 163,108 tons came from the Company's leases and returned 42,670 ounces of fine gold, equivalent to a yield of 5.23 dwt. per ton. The gold realisation, after meeting realisation charges, averaged 65.05s. per ton of ore treated, an increase of 9.75s. Operating costs increased by 6.34s., or 16.76 per cent., to 44.16s. per ton.

The net result was that the profit before appropriation amounted to £163,848, being £23,986 more than in the previous year. The interim dividend of 1s. 3d. per unit paid on April 9, 1951, took £76,844, and the proposed final dividend of 9d. per unit will absorb £46,106, leaving a carry forward of £37,979.

Since the close of the period 3,281 feet of development have been completed, of which 721 feet have been in ore assaying 17.1 dwt. over 59 inches.

There will shortly be sent to Stockholders a letter giving full details of a proposal to place this Company in voluntary liquidation and to dispose of the whole of our undertaking for fully paid shares in a company to be formed and registered in Victoria, Australia. Subject to the necessary approval to the proposal by Members of the Company they will receive five shares of 10s. each (Aust.) in the new company for each four shares of 10s. each (English) held in the liquidating company.

The report was adopted.

THE MORGAN CRUCIBLE COMPANY, LIMITED

LARGE INCREASE IN PRODUCTIVITY

MR P. LINDSAY'S REVIEW

The seventeenth annual general meeting of The Morgan Crucible Company, Limited, will be held on September 26th at Battersea Works, Battersea Church Road, London, S.W.11.

The following are extracts from the statement by the chairman, Mr P. Lindsay, O.B.E., M.C., which has been circulated with the report and accounts for the year ended March 31, 1951:

At our annual general meeting in 1946 I drew attention to our urgent need to effect a substantial improvement in productivity, and I suggested that our future depended primarily on the success of our efforts in that direction.

This year the fruits of five years' effort are revealed in the accounts. The measures of reform adopted affected many sections: costing, progressing, job grading, shop layout and management.

Having regard to the wide range and diversity of our products, a yardstick of productivity (so essential to any improvement) was not easily established—but that difficulty has been overcome. On the comparative basis established our productivity in the year under review is 16 per cent. above the average of the past three years.

DIVIDEND

The directors' report recommends a final dividend of 1s. 9d., making, with the interim, a total distribution of 12½ per cent., less tax, for the year—which is the same as for the previous year, and is equivalent to under 7 per cent. on the capital employed in the business.

This decision will disappoint many stockholders, and I share their feelings.

The profit and loss statement reveals an increase of profit of nearly £400,000 before taxation, but I must again remind stockholders that as the statutes by which profits are determined for purposes of tax assessment do not allow adequately for wear and tear, we suffer assessment of tax on illusory profits in addition to a penal rate of tax.

In consequence, after making a tax provision of £902,956 (against £591,298 in the previous year), the surplus available after payment of the modest dividend proposed is sufficient only to place £200,000 to reserve and slightly increase the carry forward.

It may be felt that the appropriation to reserve and carry forward is a considerable sum in comparison to the share of profit set aside for stockholders; that is so in terms of money, but not when related to our needs. This will be better appreciated if I remind you that £1,500,000 appropriated out of profits and placed to general reserve in the last ten years (after providing over £4,500,000 in taxation as against £1,400,000 in net equity dividend) is entirely employed in the business.

PROSPECTS

In these days it would be presumptuous to indulge in prophecy; I may say, however, that we have every confidence in the competitive quality and price of our unique range of products, which, moreover, being essential and consumable, have a lower than average susceptibility to serious fluctuations in demand.

Against this it is true that rapid development, high cost of building and plant—coupled with high taxation—are laying up for us future problems of finance, but I see no reason to be unduly perturbed on that score.

You may conclude, then, that, judged on factors within our control, prospects are favourable

BOOKER BROTHERS, McCONNELL AND COMPANY, LIMITED

(West India, African and general import and export merchants, sugar estate owners, rum blenders and importers, shipowners and shipping agents, and store owners)

TAXATION AND COLONIAL DEVELOPMENT

REVIEW OF WIDESPREAD INTERESTS

The fifty-first annual general meeting of Booker Brothers, McConnell and Company, Limited, will be held on September 26th at the registered office of the company, 37-41, Gracechurch Street, London, E.C.3.

The following is the chairman's statement, circulated with the report and accounts for the year ended December 31, 1950.

FINANCE

We have again dealt in the directors' report with the main features of the accounts, but I would call your attention to the further improvement in the company's liquid position. Last year I said that a new bout of inflation was full of financial problems for us. It is, indeed, as is the case with all businesses. In Bookers, however, the nature of our undertakings and of the economy of the Colonial territories where we operate tends to some extent to insulate us from the most exaggerated features of inflation, or, at any rate, to postpone their impact. In their report your directors foreshadow a dividend policy primarily designed further to improve our liquid position and to conserve our cash resources against such elements of inflation as come upon us. Furthermore, in a business of the size and sweep of Bookers, there are bound to present themselves from time to time new projects for which we feel we must find finance. We cannot afford to pass by new investment which we regard as essential to the well-being of our existing business and of the Colonies where we trade.

TAXATION

The present high level of taxation adds immeasurably to our problems. Certain Colonial Governments, recognising its deterrent effect upon enterprise and development, have recently adopted the enlightened policy of granting substantial tax relief to new industrial concerns. In so far, however, as investment in new Colonial industries comes from the United Kingdom—as it is largely bound to—the taxation system of H.M. Government entirely nullifies these Colonial tax concessions. The West India Committee have submitted to the Royal Commission on the taxation of profits and income a memorandum calling attention to this anomaly. It will not be out of place to quote a letter on this subject from your vice-chairman which was published in *The Times* on May 12, 1951.

"It is remarkable that, while it is the stated intention of His Majesty's Government to encourage Colonial development, much of their recent financial planning seems designed actively to discourage it.

"To give three examples: First, the proposed bar to transferring abroad the management and control of United Kingdom companies. This will effectively prevent that partnership between United Kingdom capital and Colonial control and management which can alone create the proper climate for Colonial development.

"Secondly, the omission of Colonial development from the Chancellor's 'priorities' in his latest memorandum of guidance to the Capital Issues Committee. This omission, coupled with the Chancellor's emphasis on projects designed to improve the supply of raw materials and to save dollars, will confirm Colonial suspicions that the interest of the United Kingdom in Colonial development lies rather in the potential value of Colonial resources to the United Kingdom than in the benefits which such development brings to Colonial peoples themselves.

"Thirdly, several Colonial Governments have recently enacted legislation granting substantial tax concessions to developmental enterprises; in particular relieving dividends paid in early years from taxation in the hands of their recipients. United Kingdom legislation, far from complementing this constructive arrangement, entirely ignores it, with the result that the United Kingdom takes advantage of tax revenue specifically sacrificed by the Colonial Governments in question. This largely nullifies Colonial attempts to attract United Kingdom capital."

Since that letter was written, H.M. Government have conceived the limitation of dividends. It is alleged that this measure, which is really nothing but a perpetration of political expediency, is to protect the standard of living in the United Kingdom. It seems most improbable that it will have this or any other beneficial result. One result, however, that it certainly will have is gravely to jeopardise the standard of living of British Colonial peoples. It is difficult to imagine any more effective way of drying up the main source from which money for Colonial development must still come—British private enterprise. How can any company here raise money for Colonial development if this measure comes into force—and it is only by continued development of their resources that increasing colonial populations can maintain, let alone improve, their present low living standards.

REORGANISATION

Last year I told you that we had reached the final stages of preparing a comprehensive scheme for the internal reorganisation of the group, and that we aimed to put the scheme into operation on January 1st this year. This has been done and we are fully satisfied that our administrative and financial organisation is now appropriate to our diverse businesses. The supplement which we are circulating with the 1950 accounts illustrates this new organisation. It will also, I hope, give you a new impression of the fascinating diversity of Bookers.

SUGAR

Our sugar undertakings in 1950 were more profitable than in 1949 and prospects for the current year are satisfactory so far. In the field our managerial and scientific staffs are ever seeking ways and means of improving yields while maintaining a healthy agriculture. Despite their sterling work diseases and pests will inevitably fall upon us from time to time and, towards the end of the year, a leaf disease new to British Guiana was discovered there. It is being energetically dealt with and the experts tell us that there is no reason for undue alarm. Encouraging progress is being made with experiments in mechanical field cultivation. Work on modernising our factories goes forward well.

The group of estates for which Bookers are responsible either as owners or agents, produced 138,772 tons of sugar in 1950, as against 120,755 tons in 1949. Even higher output had been confidently expected, but abnormally heavy rainfall in the first two months of the year and consequent flooding of large areas of cultivation upset calculations badly and did considerable damage to some of the canefields. Weather is one of the great hazards of tropical agriculture and we provide against it as far as is economically possible. Present estimates are that the 1951 output will exceed that of 1950.

Labour—It is never safe to prophesy about the labour situation, for unfortunately political agitators and self-seekers are always with us. They aim for their own ends and directly contrary to the interests of the workers, to inflame opinion against the industry and bring about major stoppages of work. Happily, in 1950, their attempts were largely abortive; thanks to the good sense of our workpeople, and thanks to the fact that normal labour negotiations with the recognised trades unions were conducted in that atmosphere of mutual understanding and goodwill which can alone inspire successful human relationships.

We attach much importance to welfare and the personal touch. As an indication of what is being done, I cannot do better than quote from the annual report of the social welfare organiser of the British Guiana Sugar Producers' Association: "The managers on the sugar estates of this Colony are giving welfare a real place in their annual programmes and a marked advance can be noted."

Markets—I told you last year that an agreement had been reached which, "while it by no means affords the security which West Indian circumstances justify, at least affords a minimum measure of security against which we can plan for the next eight years." In recent months you will have learned that H.M. Government, before this Commonwealth Sugar Agreement could be signed, and without consulting the Commonwealth Governments and producers with whom they had negotiated it, chose to open separate negotiations for the contractual purchase of Cuban sugar. These, which culminated in the signing on August 10th of a trade agreement between the United Kingdom and Cuba, have, not unnaturally, complicated and delayed the signing of the Commonwealth agreement. The present position is, therefore, clouded and uncertain, and Commonwealth producers are most perturbed by the lack of co-ordination between H.M. Government departments which has brought about this new uncertainty.

Perturbed as we are, I must, nevertheless, express our sincere appreciation of the help and understanding which we can always be sure of receiving from the Colonial Office. The British West Indian—and other colonial—people are fortunate in the constructive way in which this department fulfil their most complex responsibilities.

The future of the Canadian market is also

causing us much anxiety because currency control and other interference in traditional Canada/West Indies trade relations are leading Canada to turn to non-Commonwealth sources for her sugar. It would be disastrous for the British West Indies, from much more than the sugar point of view, were this tendency to bring about permanent estrangement—estrangement for which the British West Indies themselves could in no way be held responsible.

SHOPKEEPING

The concentration of the group's trading and shopkeeping activities under Campbell Booker Carter, Limited (late Campbell Brothers Carter and Company, Limited), has proceeded smoothly.

In Central Africa our trading interests have been split into three sections, each of which has been given a financial structure which should be adequate for the expanding environment in which they trade. In 1950 they had a deservedly good year.

In British Guiana 1950 results were about the same as 1949; given reasonable general trading conditions we hope to do better in future, despite price control and increased competition. In Trinidad, Stephens, Limited, improved upon last year's results and current returns show continued expansion.

Price controls operate with varying degrees of severity in British Guiana, Northern Rhodesia and Nyasaland. Their departmental effects are particularly noticeable in the retail trade in British Guiana and in the wholesale trade in Northern Rhodesia. In Northern Rhodesia negotiations have been opened with Government upon which will depend whether or not we shall be able to continue to extend our wholesale trade in that territory. We cannot believe that measures of price control (and taxation) which make it impossible for the trader to find the money to replace stocks at unavoidably higher prices, can possibly be in the interests of the community as a whole. Indeed, in colonial territories, whose developing economy depends upon the ready supply of consumer goods, ill-conceived measures of price control may well impede development and thus reduce the standard of living.

There is a fine spirit of co-operation and goodwill between, and throughout, our various trading enterprises, and the pooling of experience of trading conditions in Central Africa and the British West Indies must be beneficial. Facing pages 1 and 20 of these accounts we show interior photographs of two of our shops—one in British Guiana and one in Northern Rhodesia. In the supplement to these accounts we show other photographs which I hope you will find interesting.

The problem of suitable housing for overseas staff is always pressing and causes us considerable concern—particularly in British Guiana where building costs are excessively high. This is not a problem impinging upon our shopkeeping undertakings alone. The easy solution is, of course, to abandon the high standards which we have established, but it is one that we will not lightly accept in this—or any other—aspect of our responsibilities.

Shareholders may not, perhaps, be aware of the extent of Campbell Booker Carter's business as an export, shipping and confirming house for clients throughout the Union of South Africa, the Rhodesias, East and West Africa, Ceylon and Hong Kong. Their current figures of turnover are the highest we have known.

SHIPPING

On January 1, 1951, the company's Liverpool office was formed into a separate company, under the name of Booker Brothers (Liverpool), Limited. This is now the parent company of the group's shipping and allied interests. It holds the shares in Booker Line, Limited (formerly The Arakaka Steamship Company, Limited), Bookers Shipping and Trading Company, Limited, and Bookers Shipping Transport and Wharves, Limited, the last being a company registered in British Guiana and responsible for the operation there of the group's coastal shipping services, shipping and air line agencies, stevedoring, warehousing and wharfingers businesses and road transport.

Because this new organisation did not come into operation until January 1st this year, 1950 was not affected by it. It will, however, be convenient to refer briefly to the 1950 results under the new grouping.

Booker Line, Limited.—Arakaka and Amakura operated successfully in spite of the formidable task of completing twelve voyages in the year between them. Towards the end of the year, in order to improve our service, it was decided to charter a third vessel.

The Line is always faced with the possibility of having to contend with adverse factors beyond their control, notably bad weather which can affect not only the steamers' sailings but also loading and discharging. Only once during the year were sailing schedules upset through labour disputes—a waterfront strike in Georgetown. The outstanding morale and loyalty of our sea-going personnel do much to help us overcome difficulties.

It is not surprising that operating costs continued to increase, but this was largely offset by higher rates of freight.

Apart from our own shipments, it is satisfactory that we are able to rely upon the valuable support of so many shippers from this country to British Guiana.

In common with other shipping companies, the Line is faced with the problem of providing, out of current revenue, funds required in due course to replace ships at prices which at present can be calculated only by guesswork; but which guesswork suggests will be incomparably above their original cost.

Bookers Shipping and Trading Company, Limited.—Results were encouraging. Shipping and forwarding work undertaken for outside shippers continues to increase and progress made by the department responsible for booking sea and air passages is particularly pleasing. We are sending shareholders with these accounts a booklet describing the services which the travel department of this company has to offer.

Demerara Shipping Interests.—Difficulties have been experienced in restoring coastal craft to first-class condition after the war. In particular motor coasters have been laid up owing to slow delivery of spare parts. The results of all departments were, generally speaking, worse than in 1949, the main factor responsible being rapid increases in operating expenses not balanced at the time by corresponding increases in revenue. The prospects for the current year are rather more reassuring.

RUM

It is with deep regret that I have to record the death in February, 1951, of Mr R. P. Gray, a senior director of United Rum Merchants, Limited, and one of the past owners of the business. For over 20 years he had done a great deal towards its success.

United Rum Merchants, Limited, had another good year in 1950 with an outstanding increase in sales on the home market of their principal brands, Lemon Hart and Lamb's Navy. This increase was all the more encouraging because total rum consumption in the United Kingdom declined during the year. It gives us ground for believing that the company's advertising, with which most of you will be familiar, is proving effective in bringing before the public brands which they like. I am glad to be able to say that this favourable trend has extended into 1951 and indicates continued public confidence in the names Lemon Hart and Lamb.

As in other parts of the group, returns from satisfactory sales are being offset by sharply rising costs of production and distribution. We are most anxious to avoid raising the price to the consumer and can only hope that further increased sales will make this step unnecessary.

United Rum Merchants' peak trading period coincides with the end of Bookers' financial year. As may be inferred from your directors' report, United Rum Merchants' short-term borrowings were, on December 31st, very high. This borrowed money, being required to finance duty recoverable from customers, is a reflection of the high volume of branded sales.

PROPERTIES HOLDINGS AND SERVICES

Of the smaller companies in British Guiana (now subsidiary to Bookers Properties Holdings and Services, Limited, formed on January 1, 1951), the R. D. Balata Company, Limited, had a satisfactory year, and Bookers Manufacturing Drug Company, Limited, improved on its 1949 results. The B.G. Lithographic Company, Limited, did well and shows considerable promise for the future. We look to Bookers Properties Holdings and Services, Limited, to foster any new projects which we may decide to undertake in British Guiana.

MANAGEMENT AND STAFF

Apart from the many problems of these troubled times, the process of reorganisation has thrown a great deal of extra work and worry upon our management and staff. I am sure, however, that the company's employees—as well as its shareholders—will benefit from the greater efficiency of our new administrative machinery working, as it is, more smoothly every day.

Our finest asset is the team of men and women who operate our businesses and because we know that they are good and bear the responsibility and do the work allotted to them, we can face with confidence whatever the future may have in store for us.

CHARRINGTON, GARDNER, LOCKET & CO., LIMITED

WIDESPREAD PROGRESS

The forty-eighth annual general meeting of Charrington, Gardner, Locket & Co., Limited, was held on September 6th, in London, Sir John Charrington, chairman, presiding.

The following is an extract from his circulated statement: I am glad to be able to report further progress in the affairs of your company. Profits have improved satisfactorily and this improvement is evidenced in almost all sections of our many activities. The group profit has increased by some £68,000 following an improvement of about £48,000 a year ago.

The winter of 1950-51, though not the coldest, must have been the longest and most trying for many years, and this put a severe strain on our staff in all sides of the organisation.

Sympathy is due to the householder, who, for a variety of reasons, so often finds himself denied the warmth in winter which is so needed. It is, however, encouraging to us to know that the demand for solid fuel for the home is as strong as ever, and the fact that—unlike gas and electricity—it can be stored in the home in summer undoubtedly prompts people to continue to rely upon coal and coke for their main heating and hot water provision. It remains, however, a matter for great regret that the supplies of suitable solid fuel for domestic purposes are still insufficient to meet this demand in full.

ADVISORY SERVICE

To help householders to use solid fuel as efficiently and economically as possible we provide an advisory service which is available without charge. As an outcome of this service we now undertake the sale and installation of modern appliances. These sales are expanding rapidly and we have a showroom at our head office where members of the public who wish to inspect a wide range of modern appliances are always welcome.

The more even spread of our domestic deliveries, due to the reintroduction of lowest summer prices to which I referred last year, has enabled our retail section to achieve greater efficiency, and to absorb to some extent the ever increasing costs of operation with advantage to the consumer. With the full approval of the Minister of Fuel and Power this arrangement has been renewed this year.

As we are dependent for supplies at nearly all our depots upon efficient railway working I am afraid that I view the outlook for next winter with some anxiety. Our experience during last winter suggests that the drift of railwaymen to other industries is the cause of the trouble, and I hope that steps to remedy this state of affairs will be taken without delay.

We have recently combined all our London trading under one company, Charrington, Gardner, Locket (London) Limited, and we are using the trading name Charringtons throughout this organisation.

The report and accounts were adopted.

CROPPER AND COMPANY, LIMITED

(Carton Manufacturers)

RECORD OUTPUT AND PROFIT

MR FRANK W. J. SMITH'S STATEMENT

The fifty-fourth annual general meeting of Cropper and Co., Limited, was held on August 30th at the registered office of the company, Thatcham, Berks, Mr Frank W. J. Smith (chairman and managing director) presiding.

The following is the chairman's statement which was circulated with the annual report and accounts for the year ended June 30, 1951:

In my statement of last year, I mentioned that the year had been the most successful in the company's history with one exception. I am very happy to state that this year has provided an all-time high record in volume and value of output, and in profit, which stands at £452,934 after deducting all charges except taxation.

This result has been largely due to our policy of continually installing new machinery, embodying the latest improvements and so keeping the plant thoroughly up to date. Many machines which have been on order for a long time have been delivered in the last year and more machines are on order for delivery as soon as they are ready.

The estimated amount required for taxation is £261,966, or 58 per cent. of the profit. After adding the balance of the profit and loss account brought forward from last year, and deducting the dividend upon the preference shares and the interim dividend of 12½ per cent. upon the ordinary shares paid January 31st last there remains a disposable balance of £213,360.

DIVIDEND AND APPROPRIATIONS

The directors recommend the payment of a final dividend upon the ordinary shares of 25 per cent., which with the interim dividend mentioned above will make 37½ per cent. for the year. They also propose to transfer £100,000 to general reserve, which will then stand at £250,000; £30,000 to reserve for replacements; £5,000 to reserve for possible future bad debts; £5,000 to employees' benefit fund to cover such cases as are not provided for in the company's pension and life assurance scheme; and to carry forward the balance of £44,123.

It is gratifying to be able to report that our workpeople are sharing in the continued prosperity of the company. Although the number of employees has only slightly increased, the amount paid in wages during the year has increased by over one-third compared with the preceding year.

It is also gratifying that both our subsidiary company, Containers, Limited, and our associated company, Colthrop Board and Paper Mills, Limited, in which this company has a substantial interest, have had a record year in tonnage of output and profit, mainly for the same reason as in the case of the parent company, namely, the installation of machinery designed to increase production.

STRONG FINANCIAL POSITION

I should also like to draw your attention to the financial position. The fixed assets have been written down to a very low figure. The investments in our associated companies, as mentioned last year, are worth very much more than the figure at which they stand in our books. The current assets are more than three times the amount of the current liabilities; and the tax liability of £261,966 appearing in the profit and loss account is covered by tax reserve certificates of £275,000. It is also of interest to note that the net dividend on the ordinary shares is covered more than four times by the net profit for the year.

The general reserve, after making the proposed transfer of £100,000, will stand at £250,000 and is in excess of the issued ordinary capital, which amounts to £222,760. To bring the issued capital, which now stands at £369,446, more nearly into line with the capital employed in the business, amounting to £945,212, the directors recommend the capitalisation of £44,552, being part of the general reserve and that the same be applied in making an issue to the shareholders of one ordinary share of £1 each for every five ordinary shares held on August 15, 1951.

In conclusion, I wish to thank my co-directors, the staff and employees for the energy and ability they have displayed throughout the year. It has not been an easy year owing largely to the frequent advances in the cost of raw materials and it is more than usually difficult to forecast the future, but we are well equipped in every way to face the current year with confidence.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting, the chairman said: While the reports were in the hands of the printers, the Chancellor of the Exchequer announced that the Government proposes to restrict dividends on ordinary shares for each of the next three years to the average gross distribution of the past two years.

You may wish me to give an indication of the way this company would be affected if the proposal becomes law, especially in view of the issue of bonus shares, which will be the subject of a resolution at the next meeting.

The dividends declared in the last two years have been 25 per cent. and 37½ per cent., an average of 31¼ per cent., but as the Chancellor's proposal means that the gross amount distributed may not be increased, the maximum rate of dividend on the ordinary share capital, as increased by the bonus shares, would be 26 per cent.

I am opposed to making political speeches at our general meetings or I might have followed the example of so many chairmen of industrial companies, who have severely criticised the proposals; and I do not doubt that your feelings on the matter are much the same as my own, but I have tried to adopt a moderate tone, always bearing in mind that the proposals so far are contained only in a Government White Paper and may never reach the Statute Book.

I now propose: "That the report of the directors and the accounts of the company for the year ended June 30, 1951, be, and they are hereby, approved and adopted; that a final dividend of 25 per cent., less income tax, be paid to ordinary shareholders registered at the date of this meeting; that £100,000 be transferred to general reserve; that £30,000 be transferred to reserve for replacements; that £5,000 be transferred to reserve for possible future bad debts; that £5,000 be transferred to employees' benefit fund; and that £44,123, the balance of the profit and loss account, be carried forward."

Mr Stuart W. Butters (assistant managing director) seconded the resolution and it was carried unanimously.

The retiring directors (Mr H. V. Dove and Mr C. Priestley Forster) were re-elected, and the fee of the auditors (Messrs. Deloitte Plender Griffiths and Company) was duly fixed.

BONUS ISSUE APPROVED

At a subsequent extraordinary general meeting, resolutions were unanimously passed increasing the capital to £600,000 by the creation of 100,000 additional ordinary shares of £1 each and authorising the distribution of 44,552 ordinary shares as bonus shares in the proportion of one for every five ordinary shares at present held.

Mr E. Royden Alltree, in proposing a vote of thanks to the chairman, directors and staff, said it was difficult to find words adequately to express the gratitude and the delight of the shareholders for the results which the directors had produced for the past year. He wondered if his fellow shareholders realised, as he did, not only the hard and arduous work, but also the painstaking thought and, in fact, brilliant forethought which was necessary to achieve such results. The distressing problem of obtaining raw materials had been before the board all the time. He thought the success of the company was largely due to the fact that it had an expert at the head of every department, and a chairman who gave wise guidance and sage advice based upon long experience, for which there was no substitute.

Mr F. E. Armstrong, in seconding the motion, thanked the board for giving shareholders a participation in the great prosperity of the company which had been brought about by the ability and genius of the chairman and the board. Even if dividend limitation became law, he said, shareholders would be better off than if the directors had not increased the dividend.

The motion was carried unanimously, and after a brief acknowledgment by the chairman the proceedings terminated.

JOHN BROWN AND COMPANY, LIMITED

SHIPBUILDERS AND ENGINEERS

IMPORTANT ENGINEERING ENTERPRISES

LORD ABERCONWAY ON THE COMPANY'S MANIFOLD INTERESTS

The eighty-seventh annual general meeting of John Brown and Company, Limited, was held on August 31st, at 4, The Sanctuary, Westminster, London, S.W.

The Right Hon. Lord Aberconway, C.B.E., LL.D., D.Sc., the chairman, who presided, said:—

You have in your hands the accounts and directors' report, which I think clearly explain to the shareholders the financial position of the company, and the expansion of its share capital.

I will therefore deal only with the present industrial and business position of the company.

The steel-making firm of John Brown and Company, of Atlas Works, Sheffield, was purchased from John Brown, later Sir John Brown, its original owner, in 1864—87 years ago—by Mr Henry Davis Pochin, my grandfather, and a small group of Manchester friends. It has been largely under the care of these men, their families and their successors, ever since.

The company became at one time the largest makers in the world of rails for railway construction, but gradually gave up that business for more elaborate steel manufacture—forgings, armour plates, shell and alloy steels among other products.

The Iron and Steel Corporation of Great Britain has now taken over these works and apparently has no use for the freely proffered assistance either of John Brown's skilled staff or of its fine organisation.

SHIPBUILDING

The company purchased the Clydebank shipyard and engine works of J. and G. Thomson Limited, 1899, partly as an outlet for their marine forgings. Under a succession of most able managing directors, this relatively small concern eventually achieved a pre-eminent position among the leading shipyards of the world. The shipyard and engine works have been responsible among other vessels for the "Aquitania," the "Queen Mary," the "Queen Elizabeth," the last two unrivalled in size, and a huge host of naval vessels, large and small, including the battleship "Vanguard." In the last few years the building berths have been supplied with new and heavier cranes, so that large sections of steel, fabricated under cover alongside, can be lifted into place on the ships.

Our order book is eminently satisfactory, and includes contracts from the most famous of British owners and from a number of well-known foreign clients. Among the ships building are a large passenger liner, several refrigerated cargo ships of the highest class and tankers of the largest size.

FUNCTION OF ENGINE WORKS

The engines for these vessels were all built at the engine works attached to the shipyard, an engine works now equipped with the latest machinery. To it must be attributed much of the great success of the large geared steam turbine. The engine works more recently has, without interfering with its marine work, undertaken in co-operation with the company's subsidiary, Markham and Company, the construction of big water turbines for the Scottish hydro-electric schemes, and for uses in other parts of the world.

It has also undertaken research into and development of gas turbines suitable for land and marine use. This type of power plant though still in its infancy is capable, we believe, of very great development. It is expected that the 12,500-k.w. set for the North of Scotland Hydro Electric Board at Dundee should be running next year. A great many running hours have been obtained on the company's experimental units, and work is well advanced on the burning of coal and peat. A turbine for waste heat recovery from an industrial process has been designed, and is now in course of manufacture.

LAND BOILER DIVISION

As experienced makers of marine boilers, the company was recently asked by the State-owned British Electricity Authority to be one of the firms to manufacture for them the largest size of land boiler. Contracts were accepted and the company is putting up works at Whitecrook, near its Clydebank shipyard, to manufacture some of the principal parts of these boilers.

FIRTH BROWN TOOLS LIMITED

John Brown and Company in the year 1931 combined its Atlas Steel Works with the neighbouring Norfolk Steel Works of Thos. Firth and Sons, Limited, with whom it had for some years been associated. These combined works were, however, all taken over under the iron and steel nationalisation scheme. The company's important collieries in Yorkshire had also previously been nationalised. When the steel works were nationalised, the manufacture of engineers' tools was retained as a separate company, known as Firth Brown Tools Limited, which is successfully manufacturing a wide range of high-class engineering tools including tungsten carbide products.

It has a wholly owned subsidiary in Canada.

IMPORTANT ENGINEERING INTERESTS

John Brown and Company has also wide and important interests in various other engineering products, and it was determined, when nationalisation came into sight, further to develop the manufacture of these. Apart from the water turbine, the gas turbine, and the land boiler projects, the company already possessed all the ordinary share capital of Cravens Railway Carriage and Wagon Company. Its works at Sheffield have been largely rebuilt in the last few years, and it has substantial home and export trade of the highest class of vehicle. The company also owns the heavy engineering concern of Markham and Company Limited, of Chesterfield, builders of winding engines and other intricate machines of many types. The company recently purchased the ordinary shares of Wickman Limited, of Coventry, makers of the very highest class of precision machine tools, with a rapidly expanding output both for home and export use.

AIRCRAFT INDUSTRY

Your company holds as well a half interest in Westland Aircraft Limited, maker of service aeroplanes, and a pioneer of the practical production in Europe of the helicopter. The S.51 has been produced and sold in large quantities as the "Dragonfly" as the standard helicopter of the Royal Navy. The company is just putting into production the larger 12-seater S.55, and designing and developing larger models still. Its naval single-seater fighter, "The Wyvern," has been adopted by the Royal Navy. The associate company, Normalair, Limited, continues with its research and development work in high altitude flying, and its equipment is found in almost every British designed and built military and civil aircraft.

OIL REFINERY PLANT

With Richard Costain and Company, a per cent. alliance has been formed in a company under the title of Costain-John Brown Limited, for the erection and manufacture of oil refinery and similar plant: Messrs. Richard Costain being responsible for the civil engineering work and Messrs John Brown for the mechanical side of these plants. It has successfully completed a number of important contracts, particularly in connection with the erection of the Grangemouth Refinery. It has a great deal of other similar work in hand, and we look forward to further steady development of this company and with it the manufacturing work which it can bring to our various companies.

Your company undertakes, in addition, a large number of difficult general engineering contracts from its various works. An interesting experiment in this connection is the designing and building for research purposes of the power generating windmill in Orkney for the North of Scotland Hydro-Electric Board.

ELECTRO-CHEMICAL INDUSTRY

An exception to general engineering is the company's undertaking, in conjunction with other financial partners, the establishment in Southern Rhodesia of an electro-chemical industry, commencing with the manufacture of low carbon Ferro Chrome. The plant, the Rhodesian Alloys Limited, as the company concerned is named, has involved some very interesting engineering and metallurgical problems and should be in effective operation towards the end of next year. It is hoped that it will make a substantial contribution to the raw material supply position to the United Kingdom, and at the same time save dollars.

TRIBUTE TO STAFF

The board and its staffs, both engineering and business, who have been responsible for the success of the steelworks and collieries now taken from the company, and of the Clydebank Shipyard, will be available for the general supervision of these other enterprises.

Stockholders will appreciate that the changes that have taken place during the year and the additional activities which the company has undertaken, has placed considerable pressure upon the company's technical and management staffs. It is with great pleasure that I have to record that these further activities have been, and are being, carried out with the greatest possible ability and success. We accord to our staffs our very sincere thanks for the efforts they have put forward and the success they have achieved.

It is believed that with its very skilled staffs and fine organisation, backed by substantial reserves of capital, the company's engineering business can be carried on with increasing success to the advantage of the nation and for the benefit of the company and its shareholders. These engineering businesses will, it is hoped, to a substantial extent compensate for the loss of the company's steelworks and collieries.

The report and accounts were adopted.

GEORGE NEWNES LIMITED

ANOTHER GOOD YEAR

PROBLEM OF RISING COSTS

SIR FRANK NEWNES'S STATEMENT

The fifty-fourth annual general meeting of George Newnes Limited, was held on August 30th at the company's office, Sir Frank Newnes, Bt. (chairman) presiding.

The following is his statement circulated with the accounts:—

The combined profits of the group amount to £928,918, as compared with £904,582 last year. After taxation, the net profit is £551,164 as against £500,308. These are gratifying figures and are a testimony to the policy of the company in recent years in spreading its interests and activities over a wide field.

During the year under review there were heavy setbacks in earnings on certain of the periodicals, largely as a result of the dispute in the London printing industry. In particular, two of the companies in the group, Temple Press Limited, with its important trade and technical journals, and C. Arthur Pearson Limited, with its general publications, suffered severely—the bulk of their printing production being carried out in London. Notwithstanding the heavy repercussions sustained by these two companies, the overall position has been well maintained by increased earnings in other directions. The parent company, Newnes, has done well in all departments—indeed the profits are a record in the history of that company. The book side of the business has been most satisfactory, and considerable benefit has been obtained from the first full year of marketing the new CHAMBERS'S ENCYCLOPÆDIA, a major undertaking upon which the company had been engaged in the preparatory work over a period of six years, and upon which very considerable sums had been expended.

THE ACCOUNTS

The Newnes accounts show a net profit of £320,606 after deducting all charges including taxation. This is a record for the company as already stated, and compares with £252,252 for the previous year. With the amount brought forward from the previous year, and after paying preference dividends and 5 per cent. interim dividend on the ordinary shares, there is an available balance of £327,031. The directors propose that a final dividend of 10 per cent. be paid on the ordinary shares together with a bonus of 5 per cent. making with the interim dividend a total of 20 per cent. as for last year; that £6,500 be transferred to the employees' sick and pension fund, £25,000 to supplementary pension account, £75,000 to general reserve, and £60,000 to paper cost equalisation, leaving £85,531 to be carried forward to next year's accounts.

There are no items in the balance sheet calling for special comment. As will be seen from an examination of the figures in conjunction with the comparative figures for the previous year, what differences there are merely reflect the variations of normal trading.

GROUP FIGURES

Turning to the consolidated accounts setting out the figures of the group as a whole, the position disclosed is one of impressive financial strength and resources. The capital reserves and revenue reserves have now reached a total of £1,279,305. In addition, development and reconstruction reserves standing at £483,491 are available at any time for use in developing existing publications, and for promoting new enterprises when conditions become propitious. A further sum of £200,000 has been set aside to be applied, if necessary, to help equalise the abnormally high cost of paper, which has become a very serious problem for periodicals. Undistributed profits carried forward in the accounts of the various companies amount to £313,650. Cash and tax certificates amount to £1,243,513, as against £1,540,769. The reduction is largely accounted for by an increase of £216,463 in stocks, mainly due to high costs of paper and printing production.

As will be seen from the consolidated profit and loss account, the accounts for the year have been credited with an amount of £48,714 in respect of taxation previously provided by two of the subsidiaries and now no longer required. It may also be noted, for purposes of comparison, that in last year's accounts a sum of £6,600 no longer required was brought in from contingencies reserve, and in addition a sum of £24,643 was taken from development reserve to meet special expenditure.

SALES POSITION

The publications comprised in the group—53 in all—can record a state of robust health over the year, notwithstanding the more difficult conditions with which they had to contend. Until May last, circulations were fully maintained at the high peak previously established, but the increase in the selling price of newspapers at that time started among the reading public an economy movement which spread to the sales of general periodicals as well.

The position today is that although circulations are on a somewhat lower level than they were a few months ago the fall now shows signs of working itself out: indeed, there are indications of an upward trend again in some directions. The effects would thus appear to be temporary, but even making allowances for somewhat lower sales the aggregate circulations of periodicals, more particularly those catering for women and the general reader, are far in advance of anything experienced in pre-war days. Today there are more weekly periodicals with circulations of around a million or more (some nearer two millions as in the case of our colour-gravure weekly WOMAN'S OWN) than at any time in publishing history. This simply confirms that the periodicals have become a part of the daily life of a very large section of the people, and that in the services they perform and the relaxation they bring they are regarded as necessities and not luxuries. So although the domestic purse strings may have to be drawn a little tighter, the periodicals should continue to hold their important position among the vast public they cater for.

RISING COSTS

The principal problem today is how best to deal with ever rising costs. In all directions the movement is persistently upwards, the most disturbing of the increases being in respect of paper, the largest item of production, which has soared in price to unprecedented levels. During the financial year under review, although paper increased in price by about 45 per cent., we were able, as disclosed by the figures, to meet the situation satisfactorily by various adjustments in production and by increases in selling prices and advertisement rates. The current financial year, however, is presenting new problems. At the beginning of May there was a further very heavy rise in paper prices, the effect of which was to increase the group's paper bill by over £350,000 per annum. This has been followed by another big rise taking effect two weeks ago, which adds a further £250,000 per year to the bill; so that over the past few months our paper costs alone have risen by more than six hundred thousand pounds per annum. In addition there have been very substantial increases in cost of printing and other items of production and distribution. The situation has been met to some extent by further increases in selling prices and advertisement rates, but at the moment there is still a wide gap unbridged.

The new Australian company, formed nearly two years ago, has completed its first full year of trading, its first concern being to market the new CHAMBERS'S ENCYCLOPÆDIA and other important volume works of the company on that side of the world. The results to date are very encouraging, and there is every promise that the prospects entertained at the time the company was launched will be fully realised.

Concerning this year's prospects the uncertainties already expressed as to trends of costs makes it unwise to venture even an opinion. The most that should be said is that the business is strong and healthy with adequate resources to help meet whatever new difficulties may emerge. To date the trading has been maintained on a satisfactory basis and with the experience of dealing with many different problems over recent years we do not doubt the ability of the organisation to meet in the best possible way whatever new circumstances present themselves.

STAFF PENSION SCHEME

Reference has been made on previous occasions to the company's intention to institute staff pension schemes in the various units of the group on a wider basis than the existing staff sick and pension funds. The time has now arrived where the necessary reserves have been created in the accounts of the various companies for these arrangements to go ahead. The provisions in question aggregate £510,000, that sum being required principally to cover back service liabilities, and detailed plans are now being prepared with a view to bringing the schemes into operation at the end of the year. It is a matter of pride and pleasure to the company to be be able to bring these proposals to fulfilment in the recognition that in existing economic circumstances it becomes more than ever necessary to do all possible to secure that retirement and freedom from anxiety go hand in hand after long and loyal service.

In the same spirit the directors again record their deep appreciation of the splendid services rendered by an able and hard-working staff during the year.

The report and accounts were adopted.

TRADING OR ESTABLISHING In CANADA or the WEST INDIES?

If you are trading with or contemplating establishing a plant in Canada or in the West Indies, we can be of help to you.

Through 345 branches across Canada and 23 in the West Indies, we can provide information on business conditions, exchange regulations, exports and the establishing of branch plants.

Your enquiries will receive prompt and courteous attention.

PEDDLING mechanised! The Festival Authorities have recognised a social change in shopping habits by showing one of our magnificent "N.C.B. Electric" Self-Service Mobile Shops—for one of the largest London Mutiples—in the Transport Pavilion at the South Bank. If you are interested in Retail Distribution of Food you might care to have a look at it. Our experience in Mobile Shop operation is at your disposal by consulting Smith's Mobile Shop Advisory Service, Princesway, Gateshead on Tyne, 11, who will also be pleased to send you a reprint of an article in "Facts for Industry" under the above subject heading.

LEADING Agency House has vacancy for a young plant physiologist or general agricultural scientist as Assistant to their Director of Research in Malaya. Academic qualifications in Agriculture, Plant Physiology, Botany, Agricultural Chemistry or allied subjects are required and some experience of tropical agriculture is desirable though not absolutely essential. Rubber is the principal culture in which fundamental studies are undertaken, and research advisory work is carried out. Terms dependent on age, qualifications and experience; for a man with some previous experience salary plus allowances would be likely to be in the range £1,750—£2,000, together with free housing and basic furniture, water, light and firewood. In addition to these emoluments there is a generous provident fund and a commission scheme under which awards are customarily substantial.—Applicants please write with full details to Box 214, Dorland Advertising, 18/20, Regent Street, London, S.W.1.

ADVERTISER, early 30s, seeks appointment as Sales Executive. Wide experience with front rank national firm. Sound working knowledge home and export trade. Fluent several European languages.—Box 740.

MAN aged 41, experienced writer and research worker (used to *statistical methods*), occasional broadcaster, free shortly to accept new appointment. Widely travelled and speaks three European languages. Experienced administrator (local government). No ties, immense energy, strong personality. Present salary £1,400 but would accept less for interesting work. Box 693.

WARMTH, comfort and good food at a first-class hotel in Devonshire. Winter terms £5 5s. per week from October 1st for a stay of not less than 3 months. Write Major Morris, The Arundell Arms Hotel, Lifton, Devon. Telephone: Lifton 244.

AN ADVERTISING ORGANISATION, such as our own, owes its success and reputation to contributing in turn to the success and reputation of its clients—with economy. If you are not entirely satisfied with your own advertising, we believe that our experience, facilities and director level co-operation could more efficiently progress your purpose. We shall be happy to be of service to you.—Townend-Smith Limited, Advertising, 40-41, Conduit Street, London, W.1. REGent 2600.

UNIVERSITY COLLEGE, LONDON

Applications are invited for the post of RESEARCH ASSISTANT in the Department of POLITICAL ECONOMY. Salary £400. Duties to commence October 1, 1951. The Research Assistant will be expected to assist in research into certain aspects of the location of industry. —Applications, to be received by September 17, 1951, should be sent to the Secretary, University College London, Gower Street, W.C.1, from whom further particulars may be obtained.

UNIVERSITY OF ABERDEEN

RESEARCH FELLOWSHIP IN ECONOMICS

Salary £500 per annum with F.S.S.U. Applications to be lodged by September 14, 1951. Particulars of appointment and form of application may be obtained from the undersigned.

H. J. BUTCHART, Secretary.

The University, Aberdeen.

UNITED NATIONS is seeking Senior Economists in the fields of International Trade, International Finance, Economic Stability and Economic Development available for immediate or future employment at UN Headquarters, N.Y. Candidates should possess the highest academic qualifications in applied economics and economic theory, have wide practical experience in directing research projects, and be able to produce reports in a form suitable for publication. Excellent knowledge of English and working knowledge of French or Spanish essential. Entrance salaries between US $6,000 and $7,300 free of all taxes plus various allowances. Candidates need not be immediately available. Send full particulars including age, nationality and record of employment to Recruitment Section, Bureau of Personnel, United Nations, New York, USA. Applications which do not meet minimum requirements will not be acknowledged.

MONSANTO CHEMICALS LIMITED invite applications, (in writing) for the following vacancies in the Purchasing Department. 1. Planning Officer. *Applicants must* have good chemical background and be able to develop quantitative assessments, and supervise the preparation of statistics in connection with the purchase of raw materials. Age group 25/40. Please quote Ref.: 124/A. 2. Deputy to Engineering Buyer. Engineering background is essential for this post, but personality and energy are important. Age group 25/40. Please quote Ref.: 124/B. Both appointments are progressive and pensionable, and carry a minimum salary of £750 p.a. according to age and experience.—Apply by letter only, giving full details of age, qualifications and experience to Chief Personnel Officer, Monsanto Chemicals Limited, 8, Waterloo Place, London, S.W.1.

YOUNG EXECUTIVE (aged 28-35) required for North Country Silk Mills with plans for further expansion overseas. Prospects extremely good for right man, possessing personality, energy and initiative and prepared travel abroad. First-class commercial or professional experience essential. Minimum commencing salary £1,200 per annum. House and car provided.—Write, giving full details in first instance, to Messrs Singleton, Fabian and Co., 30 Southampton Buildings, W.C.2.

CRICKET IN THE SUMMER and football in the Winter, but J.V.R. 3 Star Brandy all the year round. 37s. 6d. per bottle, 19s. 3d. per half-bottle.

Postal Tuition for B.Sc.ECON.

The London University B.Sc., Econ. Degree is a valuable qualification for statistical, research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894): fees are reasonable, and may be paid by instalments, if desired.

Creation of Wealth

THE two ways of finding resources for rearmament are either to produce more in total and rearm out of the surplus or else to divert some production from its present civilian purposes. The relative emphasis put on these two methods will most sharply express the differing approaches to the economic problems of defence taken by the ministers of the North Atlantic countries when they talk in Ottawa next week. The two methods are never, in practice, simple alternatives. However quickly production as a whole is increased, a large rearmament programme is bound to cut into the supplies of those civilian products—such as motor cars—that require the same type of plant, materials and labour as do the main items of armament production. Nevertheless, the contrast between American optimism, at one extreme, and British pessimism, at the other extreme, is sharp. The Americans, naturally influenced by their own wartime experience, think of rearmament primarily as a problem of increasing production. The British people had to fight the last war differently, and therefore tend to think of rearmament differently. They see its problems primarily in terms of diverting resources, of cutting down civilian consumption; they do not, in general, expect total production to rise so quickly as to take care of rearmament without tears.

These two views are bound to be to some extent mutually irritating. The American view can be dubbed selfish and the British view defeatist. It is important to remember that they reflect a wider, and more familiar, difference in economic outlook. The American attitude is expansionist and the British attitude is—haltingly, and with an uneasy conscience—restrictionist. The question is whether the British attitude is also realistic. In a letter published in our last issue Mr David Eccles accused *The Economist*, in particular, of being too pessimistic about the scope for increasing the British national income. He gave three reasons for optimism, which may be re-stated as follows:—

(1) The present level of production in many industries represents a very disappointing return from all the new methods adopted and the new equipment installed since the war. It must be regarded as a failure so far, and could be improved on.

(2) If the output of a few key goods—and particularly of coal—could be substantially increased, productivity in many other industries might for that reason alone be improved dramatically.

(3) There would be many more goods to buy if full employment really meant that everyone's energies were fully engaged in useful work. In fact, much employment at present represents featherbedding of one kind or another.

These three propositions are unexceptionable. They are worth constant statement even though the second and third are truisms. The list could usefully be extended. The re-equipment of British industry since the war has been extensive but inadequate. Particularly in manufacturing—as opposed to the basic industries that Government

policy has most favoured—productivity could be greatly increased by further investment. A speedier practical application of the results of scientific research would also show large returns. There is much scope for improvements in management; to bring the least efficient firms near to the standards of the best would raise productivity considerably. And there is even more to be gained by the elimination of restrictive practices by labour and capital.

Such points as these are indisputable. But they are also entirely irrelevant to the practical question whether a cheerful or a gloomy view of future productivity is reasonable. *The Economist* is as convinced as Mr Eccles of the economic and technical possibilities of increasing production, of weaving four yards of cloth where three are woven now. But possibility is not the same as likely achievement. Our doubts are not technical or economic but political. Will either a Labour or a Conservative government do the things that are necessary to translate possibility into achievement? Is either party really interested in the policy of tough, vigorous expansion that Mr Eccles wants? At the moment, the pace of postwar expansion is certainly slackening. According to Mr C. F. Carter's estimates, the real product of the United Kingdom (that is, the gross output of services and agriculture as well as of industry), which remained almost stationary from 1946 to 1947, increased by 5 per cent in both 1948 and 1949. The latest calculations, published in the current *Bulletin* of the London and Cambridge Economic Service, show that last year the increase was only 3 per cent. There is every indication that this year it will be smaller again, and may be very small indeed. Moreover, the productive labour force has increased since the end of the war. Over the four years from 1946 to 1950, productivity—in the loose sense of real product divided by the number of people employed outside the armed forces—increased by only 8 per cent. With the natural forces of postwar recovery exhausted, there is no reason to believe that present policies and present administration will sustain an increase of anything near this 2 per cent a year.

*

How would a Conservative government change those policies? Mr Eccles asks people to put their first faith in its moral influence. It would "rouse the virtues of enterprise and patriotism." The importance of those virtues is not in dispute. But something has to be done to rouse them. Mr Eccles seems to believe that the mere existence of Conservative ministers in Whitehall would do the trick. Is that anything but wishful thinking? Is it any less simple-minded than the Labour Party's belief, before the days of disillusionment, that railwaymen would automatically work harder and abandon restrictive practices if the four main-line companies and their shareholders were replaced by the British Railways Executive and the state? To suppose that either trade unions or employers would suddenly become less restriction-minded after an election is fantastically unreal. Would the miners automatically work harder or longer, or accept Italians? A Conservative government will get a response by what it does, not by what it is. It has to establish the conditions in which more wealth will be created, not to conjure up wealth by expressing the right sentiments.

It is easy to understand why British pessimism makes many Americans impatient. They do not see why, if technically it is easy to increase production, something so plainly in everyone's interest should be politically difficult. They naturally do not appreciate how deeply defensive attitudes, which are almost inevitably restrictionist, take hold of a country that has seen its industrial supremacy pass and its basic industries rot. The Conservative party, which played so large a part in creating these protectionist restrictions, should be well aware of their strength. Economic liberalism, the attitudes of a tough expansionist society seizing on every technical possibility for increasing production, is the natural philosophy of the successful economy. But though most of its doctrines are equally valid for the less successful economy, for the industrially second-rate their validity is far less apparent. Expansion is then just as much in the general interest, but the number of particular interests that are hurt in the process is proportionately far greater. To believe that a British government will quickly expand the national income involves, if it is realistic, a belief that it will begin by doing many unpopular things. *The Economist* will become optimistic when it sees evidence of such courage in one or both of the main political parties.

*

Mr Eccles said, in his deservedly well-known speech at Sturminster last month, that a Conservative government would "legislate for more and fair competition." It will mark a complete revolution in Conservative thinking if such legislation in fact breaks up all the price rings and restores the sort of vigorous competition that would quickly and greatly increase industrial efficiency. It would be foolish to despair of such a revolution, but there is certainly no evidence that it has swept the Conservative party yet.

Vigorous legislation against monopoly could not, in any event, produce its main results within a year or so. There are many smaller but useful measures by which a Conservative government could, and no doubt would, encourage higher production in the meantime. It is not difficult to create a few more incentives than there are now, or to remove a few restrictions. But such changes are entirely subordinate to one main point of policy. It is necessary to avoid further inflation. Mr Eccles himself has neatly defined the constructive aim. "We shall make both ends meet by expanding the national income and taking care to live within it." Living within the national income means, of course, keeping the claims on production down to the level that can be met: it means avoiding inflation. And inflation, as again Mr Eccles himself has said, is "by far the most damaging restrictive practice. . . . It pins down capital and labour and encourages short working and low production." It may not, of course, absolutely prevent production from increasing if the other forces pulling production upwards are strong, as they have been during the stage of postwar recovery. The confidence that full employment inspires is, taken by itself, a force making for expansion. But if full employment is only sustained by inflation—and particularly by the inflation of consumers' incomes—the extra production it calls forth will not go to strengthen the economy at its weakest points. The extra goods are mortgaged, before they are produced, to higher consumption at home, and do not increase exports; they do not enable this country to earn the imports of raw materials required to keep production expanding.

The conclusion is plain from Mr Eccles's own arguments. A Conservative government can do what he promises of it only if it starts with a disinflationary policy. And disinflation means reducing the claims on the national income to those that can be met from the present income, not the income that may be produced if all goes well after two years of Conservative government. If the defence programme is to be fulfilled, if Britain's overseas payments are to be balanced, if productive capital investment is to be increased (as, for Mr Eccles's expanding economy, it must be), then the claim to the national income that must in the first place be reduced is domestic consumption.

Once that necessity is accepted by the government, whatever its party, optimism can begin. It would perhaps be too much to say that the foundations for an expanding economy will be laid, but at least the site will be cleared. The congestion that now clogs the economy will be cut away. If disinflation is followed by a real attempt to break monopolies and restore vigorous competition, if the penalties on saving and risk-taking are removed and the incentives to hard work strengthened all round, then within a year or two the technical and human possibilities of increasing production will be realised. Productivity will begin to rise quickly and will far outweigh the initial cut in consumption imposed by disinflation.

That cut is small in amount (no one, it should be unnecessary to say, proposes to provoke a slump); but it is the essential condition of the rest. If Conservative propaganda ignores the condition, if it promises a bigger national income and rising living standards from the start, then a Conservative government will never have the courage to adopt disinflationary policies, still less to go on vigorously to restore competition; nothing else it does will then create an expanding economy. If it is pessimistic to be conscious of this danger, then *The Economist* is pessimistic and will remain so until the leaders of one party or the other demonstrate their determination and capacity to stop inflation. But the source of pessimism is not any lack of faith in the capacities of the British people and their economy. On the contrary, if the politicians will give the economy a chance, if they will have courage temporarily to cut consumption to the resources immediately available, then there is every reason to believe that a quickly increasing productivity can provide security, external solvency and a rising standard of living thereafter.

Atlantic Issues

WITH the Japanese treaty signed and the San Francisco Conference adjourned on schedule—a triumph of Mr Acheson's stage management—the round of further conferences in North America can proceed. Simply to call the roll of these meetings, with their slightly shifting personnel and their overlapping agendas, is merely confusing. But it is clear that one meeting of the series, that of the North Atlantic Council in Ottawa next week, overshadows the others in importance.

It would take the rhetoric of Mr Churchill to put glow and significance into the agenda chosen by the North Atlantic Treaty Powers for the meeting. It is true that the items are important, and that some of them are crucial. But they are too familiar, too pitted with controversy, to stimulate either fresh hope or new loyalty in the western peoples whose ministers will be in council. For all that Ottawa can do with these issues is to induce compromise where it has been refused over the past ten months, to show that Ministers of Foreign Affairs, Defence and Finance can reach in the Council of Nato agreements that they have not allowed their officials and military advisers to reach in such subordinate bodies as the Council of Deputies, the Standing Group and its Military Committee, or the Financial and Economic Board. Such a demonstration will not impress ordinary people, who are already asking why allies dedicated to such an urgent and vital task as the defence of free Europe find it so hard to agree about commands, finances and other issues which would be settled in a matter of days if war broke out. The Council of Ministers will not impress by just taking, with reasonable speed and competence, decisions that should have been taken months ago. Their record to date is not good enough.

It is time for a new initiative. The apparatus for knitting the free world together exists, but it exists at present more as a collection of components than a framework of action. That the North Atlantic Treaty Organisation exists at all is a very considerable achievement; an effort comparable to that required to set it up is now needed to make it work. How urgent this has become can best be seen by considering the present state of some of the specific tasks that now face the allied powers of the Atlantic community. One of the current issues—the relationship of Germany to Nato—was discussed in *The Economist* last week; some of the others are shortly dealt with in the following sections of this article.

1. Organisation

The first of these issues is to find means by which the member governments of Nato can reach decisions which will be binding upon them and on which their servants can act. Next week's meeting of the supreme authority of Nato is long overdue. Questions vital to the future of the organisation and decisions necessary to the firm planning of Europe's defence have for months been allowed to shuttle back and forth within a badly integrated political and military hierarchy. There have been occasions when the political department of Nato (the Council of Deputies), the military departments (the Standing Group in Washington and the Supreme Commander in France) and the economic committees in London and Paris have all been working simultaneously on the same problem with no clear division of responsibility or chain of command. Every delegate in Nato has had his master—a minister in London or Paris or The Hague—but Nato itself has had no master. To take only one example of the lack of arrangements and capacity for decision: if the Supreme Commander of Nato's forces, General Eisenhower, wants a political decision of importance he must address himself formally

to the Standing Group of chiefs of staff in Washington, which then passes the request to the Deputies in London. But the Deputies can take no decision ; they cannot even formulate a joint recommendation. Their job is to see that a recommendation on which general agreement is likely goes to each Foreign Minister through each Deputy. There is, in short, no Nato decision unless the Council meets—and the Council last met in December, 1950. There are, of course, informal ways of circumventing this procedure, for General Eisenhower is entitled to approach personally any government or minister whose aid he requires. But the inevitable result of such practices will be that every kind of matter will be diverted for quick solution to the Supreme Commander's desk ; indeed, the process has already begun and there is more than one high officer in Shape who has been asked for help in such non-military matters as preparing a national budget or preventing a coal crisis.

*

In other words, the organisation called Nato has been lacking firm decisions and regular direction from the top. Whether the whole Council of twelve could take on this role—as it should according to the Treaty—is a matter for argument. In case of war it should certainly entrust political direction to a small group as strategic direction is already entrusted to an American, a British and a French officer in the Standing Group. But in peacetime it seems that national suspicions and jealousies are still too sharp to make possible such a delegation of powers ; thus, for this Ottawa meeting the Council may be up to thirty strong. The experience may well be salutary and should start governments thinking whether the affairs of Nato do not now require, at the top, some organ of unquestioned authority in much more frequent session.

Nato, in fact, has been trying to do too much and achieving too little. It has bitten off a great deal and its scope has tended to widen, both in the range of its concerns and also in its territorial spread, for Greece and Turkey are now to be invited to join, and Nato's writ may be made to run even further into the Middle East. Nato, is thus not far from becoming a substitute United Nations for the free world. Before it begins to overhaul its organisation and methods of work, a clear conception is needed of what it is expected to be and do. The original design was simple: to bring to Europe the pledge of immediate American and British aid against aggression and to place twelve nations as quickly as possible in a posture of defence. What could be done quickly has been done and the effort to make the West stronger is now being planned not in months but in years ahead. The patterns of defence expenditure in this country and others show that the allies are now engaged on a medium-term programme ; and the delayed decisions and the carefully leaked controversies of 1951 show that some of the urgency and fear of a year ago have gone out of the counsels of Nato.

*

Perhaps the most important question of principle to ask is whether Nato is regarded as the embryo of a permanent and developing union of the free nations, or as a piece of machinery to do a specific job and then to be dismantled. Formally, it is the latter, and many of those chiefly concerned with it take the view that it is an operation with a definite closing date. In General Eisenhower's headquarters it is fair to say that thoughts about the future play as much around the question whether Europe will be strong enough by the time the Americans want to withdraw their troops as around the more familiar question whether the West as a whole can be strong enough by the time the Russians decide they can afford a war. Certainly this specific job has first priority, and unless it is performed successfully there will be no future for Nato. But those who hope that, when the emergency passes, the organs of unity, strengthened by their achievement, will be left behind, will have an eye to this wider future in settling the immediate arrangements. Organs are needed that can both function expeditiously while the pressure lasts and can also legislate for the free world in the larger days of full peace.

On the best form of organisation at the top, something more is said in the final section of this article. But there is one piece of clarification lower down to which brief reference should be made. On the military side, the chain of command is tolerably clear and the towering personality of General Eisenhower imposes unity. But on the economic side, there is still some confusion between the functions of the Financial and Economic Board and the Organisation for European Economic Co-operation. Both are concerned with the inter-relationship of American aid to Europe with the European nations' own efforts, but FEB is a subsidiary of Nato and deals with rearmament, while OEEC, the executive organ of the Marshall Plan, deals with the general economic activities of its constituent countries. Clearly the two subject matters overlap, and will do so increasingly, and it might seem the obvious course that the two bodies should be merged. This has hitherto been prevented by the fact that their membership is not identical ; OEEC includes the "neutrals," such as Sweden, Switzerland and Ireland, which are not members of Nato and hence not of FEB. Though the two bodies exist side by side in Paris and are largely served by the same national delegations, there is a tendency for them to grow apart, with a wall of security between them. This would be lamentable, and if the two organisations, with their differing memberships, have to continue to have formal separate existence, it is essential that they should have but one staff, even if this means excluding the neutrals from it. Competent international civil servants are too scarce to be wasted in duplicated effort.

2. Sharing the Burden

THE second and equally important task facing the North Atlantic powers is the co-ordination of defence efforts both within Europe and as between the two sides of the Atlantic. The Financial and Economic Board has submitted a report to the Ottawa conference showing the impact of rearmament on member countries. It was intended to be a "burden-sharing" exercise to suggest how American aid could best be administered, though with their limited resources and the short time available—they had only two months in which to get agreement among 12 countries—the staff of FEB could hardly have done more than outline the main problems that should be considered. But some assessment of relative burdens is clearly needed. On the one hand, if one of the partners were doing demonstrably too little, public opinion in the others would be restive. And on the other, it would be the height of folly to let any one country

carry a burden so heavy as to endanger its stability. Moreover, the allocation of American aid to Europe cannot in justice be determined until the actual efforts of the different partners are known.

The main means employed to assess and compare the defence efforts of the different countries is the currently fashionable one of showing defence expenditure as a proportion of gross national product. The test is an imperfect one, but it does not have to be very delicate to reveal the major lesson of the exercise: that the defence efforts of the United States and of the United Kingdom are on an entirely different plane from those of the other European members of Nato. The United States is to devote 20 to 25 per cent of its gross national product to defence expenditure. The British figure, at its peak, will reach 13 to 14 per cent and in recent months the placing of orders has been accelerated to such an extent that 10 per cent of gross national product is already committed. The American and British programmes differ from the European not only in their size but also in their independence of aid. The American programme is, of course, wholly self-financed. Although the British Government at the outset expressed the hope that American aid would be available to cushion the impact of rearmament on the standard of living of the British people, less and less has been heard of this hope, and the programme was never made dependent upon it.

Unfortunately, the same cannot be said of other European countries. Programmes have grown in profusion in the fertile imaginations of defence ministers, nurtured with the hope that the United States will foot the bill. But few contracts have yet been placed. France claims that when its plans are put into operation 12 per cent of its productive resources will be devoted to defence. But this must be largely dependent on American aid, since a self-financed programme equivalent to only 10 per cent of its gross national product would impose a severe strain on the French economy. The extent to which Germany can contribute to the common defence of the West is difficult to estimate for it rests, in the final analysis, on political considerations. In the order of things, however, it should take its place after France, committing, say, 8 per cent of its productive resources to rearmament. At the other end of the scale are the smaller countries such as Denmark which are planning to devote no more than 2½ to 3 per cent of their gross national product to rearmament.

It would obviously be absurd to expect a uniform percentage from all countries. The richer peoples can afford not only larger absolute sums but larger proportions of their incomes—a simple application to international burden-sharing of the principle of progressive taxation. Countries with very little industry are physically incapable of making a large contribution to an operation that is so largely mechanical as modern war. Moreover, the statistical estimation is too imperfect to bear much weight: no agreement has been reached on a uniform method of calculation of such concepts as national income and gross national product, and it is impossible to express statistically the political and psychological effects of a reduced standard of living in the different countries. For all these reasons there cannot be any rigid formula, and the judgment of what is fair must rest on commonsense.

This having been said, however, it must be added that the figures now arrived at do not, in the light of commonsense, indicate a rough equality of burden. Continental Europe is not yet doing, or planning to do, as much as it could or should. This judgment is reinforced by an examination of what the different countries regard as being defence expenditure. Belgium, for example, on the argument that the lines of communication would lie across it, considers that any money spent on modernising port installations or on improving roads and railways is a legitimate part of the defence budget—although it is by no means clear that all this expenditure is incurred solely, or even mainly, for defence reasons. It may be politic to permit a poor country to expand its domestic investment under the cover of a rearmament programme—Germany is a case in point. But the same procedure can hardly apply to a country that for its size is one of the richest in Western Europe.

*

The impact of rearmament differs greatly from country to country, quite apart from the different proportionate shares of the burden. In Britain the extra burden of defence will cause a reduction in the standard of living ; but its sharpest effect will be felt in the balance of payments, because precisely those industries which are the mainstay of the export drive will have to turn over to defence production. In France the impact will be less on its external trade and more on its internal economy ; the shortage of consumer and industrial goods is likely to cause a further sharp rise in prices and jeopardise the internal stability of the currency. The effect in Germany may be a slowing down of the rate of improvement in the standard of living of the German people ; rearmament could yield either a trade surplus or a trade deficit according to the type of goods that German industry

has to produce and the method for paying for them. For Belgium rearmament may even be a boon, by enabling it to use its unemployed manpower for domestic investment financed by American dollars. Even in the United States itself, the increased burden of defence will mean no more than postponing for a year or two the steady rise in the material standard of living of the American people that has taken place since the war ; and even this will be offset by the creation of productive assets many of which —especially in the raw material field—will be of permanent value.

The international comparison of efforts made, of burdens borne, and of need for external aid, is thus a highly complex affair which cannot be reduced to the two simple formulæ of such-and-such percentage of gross national product expended and so-and-so-many dollars of aid required. Aid is, indeed, necessary, for even if the European countries can achieve their recently announced objective of increasing total production by 25 per cent in five years, Britain would still have its trade deficit and France its internal financial instability. The chief moral to be drawn is that aid, to achieve its purpose, requires to be extremely flexible, in method and duration as much as in amount.

The need for flexibility in method can be illustrated by the contrast between Britain and France. The stability of sterling is of paramount importance to the economic stability of Europe and, indeed, of the whole world. If because of balance-of-payments difficulties, Britain had to revert to bilateral trade negotiations, the recovery of Europe would be reversed, for it would cause other countries to adopt similar tactics to preserve their own gold reserves. The most direct way of guarding against this danger would be to inject dollars into the British balance of payments, dollars which would have to be free to be spent anywhere on anything, since they are needed to be handed over to other people. It is difficult to imagine anything less likely to appeal to Congress ; but that does not affect the logic of the argument. France, on the other hand, can best be assisted by supplies of goods.

In one sense, of course, it is not for the recipients of aid to say how it shall be given. But since it is given to achieve a purpose, they can properly suggest which methods would best achieve that purpose. There can be little doubt that this need for flexibility reinforces the arguments for a single agency in the United States charged with dispensing aid—always provided that Congress would give it a large measure of discretion within its total authorisation.

3. Raw Materials

THE International Materials Conference is not formally a part of Nato—again for the reason that it includes countries which are not signatories of the North Atlantic Treaty. But this is a formal distinction ; it is obvious that the progress of the Nato countries' rearmament depends upon a fair and efficient sharing-out of world supplies of raw materials more than on anything else. The IMC was set up in Washington last March following a proposal by Mr Attlee during his visit to President Truman ten months ago, which received the support of the French Prime Minister. The United States, Britain and France became the joint convening powers.

The conference has a very loose and flexible organisation, consisting of a number of autonomous committees each dealing with a single commodity or with a group of related commodities. The task of the committees is to study current and prospective trends in supply and demand ; to examine methods of expanding production and reducing consumption ; and to introduce international allocation if an equitable distribution can be secured by no other means. Their recommendations must be unanimous and are made direct to the participating governments for concurrence. The work of the individual committees is co-ordinated by a central group. It has no control over the committees but merely ensures that the same approach is adopted for common problems.

Some twenty-seven countries are at present participating in the conference. Eight are represented on the central group, which also includes representatives of the Organisation of American States and the Organisation for European Economic Co-operation. The three convening powers are represented on each of the seven commodity committees ; so, too, is Germany although it is not a member of the central group. Otherwise each committee is differently composed, in order to represent some 80 to 90 per cent of the producers and consumers. But countries that are not members of a particular committee have access to and can put their views before it. In that way, it is claimed, the interests of all countries of the western bloc are safeguarded.

The membership of the various committees is shown in the accompanying table. It will be seen that all the commodities covered, except wool, are those in which the United States has a particular interest as a supplier. Tin and rubber have been kept outside the scope of the conference, contrary to American wishes, on the official pretext that existing organisations are competent to cope with any problems that might arise. So far international allocation has been introduced for three materials: tungsten, molybdenum and sulphur. Allocation schemes for copper, cobalt and nickel are expected to be announced shortly, while another for pulp and paper is still under negotiation. Allocation for cotton and cotton linters has been dropped, since supplies this season will be adequate to cover both defence and civilian requirements owing to the large American crop and the general increase in production in other countries. The wool committee failed to reach any agreement on the principle of allocation, for which America was pressing, because Australia felt that it would be politically undesirable to interfere with the auction system in peacetime.

The success of the IMC to date, then, has been due to the willingness of the United States to ration internationally the supplies of those materials that it controls. It is true that America is a net importer of tungsten, but when IMC was set up, the United States was about to conclude long-term contracts with overseas suppliers, which were dropped in order to make international allocation possible. Britain's sole contribution to allocation has been to agree with the United States last July that it would be desirable for wool ; but the Commonwealth exporters could not be convinced. It may now be necessary to offer tin or rubber for allocation by IMC in order to redress the balance.

The comparatively small number of operating allocation schemes should not, however, be taken as the measure of IMC's achievement. In the main, the problem of raw material supplies is being tackled and

even solved. The scarcity of certain raw materials that threatened industrial production in both Britain and Europe has been alleviated, and more or less adequate supplies have been guaranteed at either fixed prices or

at prices within an agreed maximum or minimum limit. Producers are thus assured a reasonable return and consumers are safeguarded against fantastic rises in price. The threat of an immediate world scarcity of raw materials has largely retreated into the background.

A large part of the credit for this belongs not only to the work of the IMC but to the measures taken first by the United States and then by Britain to restrict domestic consumption of scarce materials. But it is also safe to say that none of these governmental measures, national or international, would have been of much avail if the market had not turned round as last winter's tide of demand receded. And in this there is need for caution. For though the curve of purely speculative buying has risen and fallen, the underlying curve of genuine industrial demand is still rising and must rise still more steeply as the production of munitions gets under way. The natural expectation must be that materials will get tighter rather than easier ; and it is this expectation that lends urgency to the Commonwealth raw materials conference, which is due to open in London in ten days' time and will be largely concerned with measures to increase output. This summer's conditions have given IMC a breathing-space to consolidate its position ; but most of its work lies ahead.

★

In this case, governments will have to make up their minds whether they really prefer international oversight of materials, and allocation where necessary, or a free-for-all like last autumn's, and if they choose the former they will have to be prepared, in the wider political interests of the world alliance, to override the wishes of their own producers, who are naturally concerned only with the one material. Australia has been pilloried, and deservedly, for an outstanding example of political weakness in the face of producers' short-sightedness. But perhaps a more comprehensive example can be found nearer home. The British Government was clamorous, a year ago, for control of materials. It had chiefly in mind, of course, those materials of which the United States controlled the supply and lack of which was threatening to bring British industry to a standstill ; sulphur is the arch-example. These British requests have been met by the United States in quite gratifying measure. When it comes to materials that are produced in the sterling area, however, the British Government not only has to deal with organisations of producers, who always dislike allocation schemes, it also has to remember that high prices, though they may be indefensible, do bring dollars into the sterling area's reserves. Hence the anomaly that Britain, which first asked for the allocation of materials is now, in many cases, resisting it. This is not a position that can be maintained for long. Once again the need is for the continuous application to these detailed and difficult problems of the highest political judgment, which can put them in their proper place in a grand design.

4. A New Initiative

To point out defects and difficulties is not, of course, to underrate what has been achieved. Indeed, if one can for a moment recapture the mentality of 1947, it is little short of miraculous that there should be a North Atlantic Treaty Organisation and that it should give such evidences of life and vigour. That it has obvious weaknesses should not be taken too seriously. There is a large element of muddling through in every successful human endeavour and an organisation that proceeds by ambulant solutions of specific problems as they arise is likely to be more effective than one that springs in logical perfection from some planner's mind. Nevertheless if progress is by evolution, the prizes in the race go to the organism that can manufacture opportunities out of its difficulties. It does not take much insight to see that Nato, at the moment, has a problem that could be a golden opportunity.

The problem is to find means whereby it can equip itself with some guiding principles of action. What can be done *ad hoc* and by unanimous agreement has, broadly speaking, been done, or at least set in train. If more is to be done, there will have to be a clearer vision of the goal and of the way to get there. If the word had not been so much abused, one would say that there needed to be a plan, that the various pieces of policy that are emerging from *ad hoc* practice should be fitted together. This, manifestly, is the position that has been reached in the exercise of adjusting the various national burdens to each other and applying the lubricant of American aid. It is hardly less manifestly the case with the sharing of raw materials.

But there is a still wider reason for some attempt at this stage to evolve some general principles of action. In wartime, when there are no limits to the requirements and no time to provide them, nations are forced to do things that they know will create endless trouble for them when the war is over. The deliberate squandering of Britain's external resources between 1939-45, and the postwar

difficulties that have resulted, are the clearest example of modern times ; but all war has the form of a deliberate distortion of economic patterns which have to be painfully put straight again later on. Even in a quarter-war, and even after its first hectic stage has been passed, something of this sort is inevitable ; but there should also be time and opportunity to stop and inquire if all the possible precautions are being taken. It should be somebody's job to think out if there are alternative ways of doing things which would be almost as effective now, but would cause less disturbance hereafter. For example, is everything possible being done to prevent the rearmament programme of the free world from making the dollar shortage more intense, and more insoluble, than ever? Is it right to develop the supplies of raw materials so intensively in the United States, where, in peacetime, they will cut out imports, and so sporadically in the sterling area, where they could be a valuable means of balancing accounts? Is everybody agreed that there must this time, in sharp contrast to what happened during the war, be no transfer of export markets from those who are carrying heavy burdens to those whose effort is smaller ?

But a plan, or a programme based upon consistent principle, needs political authority. It has no hope of survival if every point of it is subject to the *liberum veto*. It is true that planners cannot defy the whole world (though they sometimes try to) and that they must seek general approval for their objectives and their methods ; but they must also have behind them an organ of authority armed with the power to insist. This is what Nato has always lacked ; and if Nato is to go forward to real achievement, this is what it must now acquire. In the wartime alliance the periodic conferences between the President and the Prime Minister fulfilled this role. The two major powers, with others assisting, then pooled some of their sovereignties and took decisions which were final. Obviously this highest political instance cannot be exactly reproduced in the changed circumstances. But the task for the statesmen of Nato is to get as close to it as they can, and the least with which they can afford to be content is that each government should nominate a Minister of Cabinet rank to sit with his fellows in very frequent session and take decisions. The subjects on which binding decisions can be taken would, of course, have to be laid down from time to time; no government is prepared to sign a blank cheque upon its sovereignty. But the time has come when it is possible to say, strictly as a matter of the practical administration of urgent real problems, that there must be some willingness to pool and delegate national sovereignty or no further progress can be made.

*

This challenge will have to be faced in the coming months, and it will either be met or refused. Let us hopefully assume, for the moment, that the statesmen rise to the opportunity, and create, for the first time in peace, an international executive organ. If that triumph of statecraft can be achieved, is it to be used only for the limited purposes of Nato as originally conceived, purposes limited in scope and time? That, surely, would be a cruel waste of political skills. If Nato can get that far, surely it should be encouraged to regard itself as an embryo of world government. The thought will frighten the timid. But there are influential strands in American opinion, described by a correspondent in Washington on page 625, to which it should appeal. And whoever else dislikes it in principle, the British Government ought not to be of their number, for the development of Nato would be a movement in the direction that the British Government has always said that it wanted to move—or at least, to put the same point negatively, it avoids the faults that Whitehall has always found in the various other plans for international unity that have sprouted since the end of the war. Nato is an arrangement between governments ; unlike projects of federalism, it represents peoples through their governments, whose authority is thus not undermined. Its scope is inter-continental and oceanic ; it does not try to confine Britain to one continent. And it emerges from specific and practical problems ; unlike other plans, it does not first create grandiose institutions and then look round for something for them to do.

On the Continent, there is less enthusiasm for the idea of an Atlantic community, which has been too often presented (largely by British fault) as an alternative to such closer European projects as the Schuman and Pleven Plans. But there is no real incompatibility. Indeed, the concept of a European army within the larger forces of Nato points the way to a most fruitful concept. The free world divides naturally in a threefold way. The nations that will have to bear the brunt of the campaign of preparedness, and would have to do most of the fighting if war came, fall (with very few exceptions) into three natural groups: North America, the British Commonwealth and Western Europe. Let each group organise itself as tightly or as loosely as it will ; and let the three come together to form the supreme organ of the free world's will. This is the pattern of the Standing Military Group ; it was the original pattern of the International Materials Conference. It could be the means by which, within the free world, representation is combined with decision.

It would not be right to attempt here to give more than the vaguest sketch of this line of thought. Perhaps enough has been said to show how the method of meeting the present needs could be turned into a great opportunity. There is, however, one final argument for the same thesis.

It is easy to forget how very narrow is the basis of political stability in the free world. Of the governments gathered at Ottawa next week, almost every one is based either on a precarious coalition or on an exiguous majority. At the time of the recent French and Italian elections there was a moment when public opinion saw the danger and realised the need somehow to create a body of positive support and enthusiasm, and not merely of tired compromise, behind the policies of moderation and goodwill that the governments try to practise. In addition to its military and its economic activities, the united organisation of the free world badly needs the backing of faith and emotion if it is to succeed in its gigantic task. And if the military and economic organs of Nato cannot get any further without some willingness to pool national sovereignty, it is safe to say that the Faith-and-Emotion department could not even approach its task unless the same requirement were granted.

This is the opportunity for courage and imagination at Ottawa. Let us hope that the divine efflatus blows through the council room.

The Tourist Industry—II

Welfare for Visitors

THE previous article suggested that measures to expand the tourist industry are hard to reconcile with some aspects of the welfare state. Much of the official planning for foreign tourists is concerned with extricating them from the effects of various other plans. This is particularly true of American and Canadian visitors, and a number of invidious distinctions are made between them and visitors from other countries.

The chief requirement for expanding the tourist industry is to increase the amount of suitable hotel accommodation, especially in such places as London, Edinburgh and Oxford. In London alone there are perhaps 2,000 fewer beds than before the war, for several large hotels have been turned into offices. There is enough accommodation of the medium type, but the luxury hotels are constantly turning people away, and there is no doubt that considerable dollar trade has been lost in this way. But to judge from a recent incident, an application to build a luxury hotel is not certain to meet with success, for fear of an outcry that scarce materials are being used to provide pleasure for the idle rich instead of houses for the workers.

It is rarely indeed that anyone now wants to build a hotel, for costs are too high. The British Travel and Holidays Association has suggested that the Government should help by lending money at 1½ per cent for building hotels that would earn foreign currency. It is hardly surprising that this proposal has been coolly received, though the principle seems to be accepted that the exports credit scheme should apply to hotels established with the aim of attracting American and Canadian visitors.

If in present circumstances there can be little or no hotel building, what are the prospects of re-equipping existing hotels that are now somewhat below the standard that tourists expect ? For the purposes of building licences a hotel is treated as a private house, and only £100 worth of alterations can be done without a licence. A hotel which has a high proportion of American and Canadian tourists has little or no difficulty in obtaining a licence, but others are more hardly treated. During 1950 applications were made for £4,000,000 worth of licences for hotel building and extension, but only half that amount was granted.

The same discrimination has been adopted in the attempt to free dollar-earning hotels from the effect of purchase tax. In July, 1950, the Government introduced, for one year only, the Hotel Grants Scheme. This had two parts. First, a hotel keeper who could produce "a well thought out and comprehensive scheme" for attracting dollar tourists might obtain a grant equal, at the maximum, to the total purchase tax that he would pay in carrying out his scheme. Second, it was also possible to get a rebate of purchase tax paid for replacement, the rebate depending on the proportion of American and Canadian visitors staying in the hotel. The reaction to this offer was slight. For all but a few hotels, the amount of purchase tax to be refunded hardly made it worth while to keep all the invoices, record the passport numbers and fill in the forms.

Purchase tax not only bears heavily on hotels but is a nuisance to the tourist himself. Its purpose is, after all, to stop people from buying, and that was obviously inappropriate for the foreign tourist. Concessions were therefore made, but of a guarded kind. It is very tiresome to be obliged to have purchases delivered to the ship in order to avoid the tax ; and even for Americans and Canadians, who again benefit from a special scheme, it is irritating to have to fumble for coupons, and may be inconvenient that whenever the tourist wants to buy £5 worth of tax-free goods he has to cash an additional £10 of travellers' cheques. Would it be better to allow all foreign visitors to escape purchase tax simply by showing their passports ? The authorities fear that the shops would then be full of foreigners making purchases on behalf of their British friends. But it might be worth taking that risk for the sake of some additional dollars.

*

The welfare state has produced one major irritant for which as yet no relief has been found for the tourist. This is the impossibility, due to the way the Catering Wages Act works, of getting a meal except at rigidly limited times. This Act can, it is true, conveniently take the blame for everything that goes wrong in the hotel and restaurant trade. But there is no doubt whatever that its effect has been deplorable. Travellers who have to make an early start may have to go without breakfast because it would cost the proprietor far more in overtime than he could charge for the meal. In the days when the maximum price of a meal was five shillings a well-known hotel served dinner to a tourist who arrived at 9 o'clock ; it cost the proprietor 42 shillings. At a certain tourist resort in Scotland the only train arrives after the hour at which meals are served. Such examples could be multiplied indefinitely. An ironical touch is that one of the duties of the Catering Wages Commission is to promote the tourist industry.

The Act thrust factory conditions on an industry for which they are utterly inappropriate. The problem is relatively manageable in the large hotel where a shift system can be worked, although it puts up the running costs. But the chief sufferers are the medium-sized hotels. The country hotel keeper scratches his head over the long schedule of jobs in the catering trade, each with its appropriate wage and conditions. Chef Entremetier, Commis Garde-Manger . . . how should he classify old George who has always carried up the luggage, taken the visitors their early morning tea, wrung the chickens' necks when necessary, and many jobs besides ? George used to be about from morning till night, but he slept all afternoon when there was nothing to do. Now the maximum "spreadover" of his work must be 12 hours (or if the hotel has less than 35 rooms, 14 hours). He used to be on half-pay during the winter ; now he is sacked because the hotel cannot afford to pay his wages. Some of the small hotels and inns have found it worth while to close their bedrooms to bring the number down to four, when the Catering Wages Act does not apply. The only other way for the proprietor of a small hotel to give satisfactory service in spite of the Act is to have all his relatives working in it.

In the hotel industry there is very little organisation either of employers or of workers. The negotiations which led up to the Act were therefore conducted by people not really representative of the trade as a whole. The same could be said of the Catering Wages Commission which was set up under the Act. Last year an enquiry into its working produced a few minor recommendations which have not been put into effect; and the Government now takes the view that if changes are needed they can be made within the existing machinery. This ignores the essential fact that the Commission cannot revoke the decisions of its wages boards. There is little that can in fact be done without a drastic amendment of the Act.

*

While tourists often complain that they cannot eat when they like, they rarely say they do not get enough. They have read grim stories about British food rationing, and are usually pleasantly surprised to find that they can eat very well (if someone tells them where to go) without having to surrender coupons, and that chicken, game and other alternatives to red meat are not rationed for anyone. Yet when the British Travel and Holidays Association set out to tell Americans that food is not scarce in British hotels they were bitterly attacked by the press, by Conservative MP's, and strangest of all, by the hotel trade itself. This was unfortunate, for the fear of starvation keeps many tourists away from this country.

There is one improvement that might help the tourist industry a great deal. New legislation should be introduced to tighten up the regulations about clean food. The standard of cleanliness in Britain is far below that of North America, and many a visitor to this country must see, in snack bars and sometimes in restaurants, sights to make his hair stand on end. Last year the Catering Trade Working Party made some useful, if mild, recommendations on this subject, but nothing has been done to implement them. The increase in the number of cases of food poisoning has made many people in Britain aware of this problem for the first time, and vigorous action would be widely welcomed.

Another field in which legislation is required is to amend the licensing laws. It is too much to hope that the system of "permitted hours" should be abolished altogether, but at least some of the worst anomalies could be removed. The British Travel and Holidays Association has just presented a memorandum to the Government, recommending among other things that the hours in which alcoholic drinks can be served with food should be extended; that travellers who have passed the Customs formalities at international airports should, no matter what time it is, be able to buy a drink; that the licensing justices in England and Wales should consider applications more often than once a year. The memorandum said nothing about the duties on wine; but there is no doubt that to European visitors they make a visit to Britain something of an endurance test. It would be to the advantage of everyone except the brewers to reduce them; it would certainly be an act of economic co-operation with Europe; and the loss to revenue would be small, for they represent only £15 million out of £4,236 million of ordinary revenue. Unfortunately the reduction of the duties is farther than ever from practical politics, for the puritanism that engendered them has now been reinforced by the desire to tax the rich man's drink—although only the tax has given wine that status.

Legislation on these lines would certainly do more for tourism than complicated failures like the Hotel Grants Scheme. It would benefit people at home even more than the visitors. But it would also benefit the rich rather than the poor, and that is sufficient to get it dismissed as unnecessary even if not actually wicked. Yet it is surely unrealistic to pretend that the tourist industry can be greatly developed solely on the principle that now guides its promotion—the principle of fair shares for all and a little bit extra strictly for the man with dollars.

NOTES OF THE WEEK

The Solid Mass

The meeting of the Labour party's executive on Wednesday passed off without giving away any hint of the further intentions either of Mr Attlee or of Mr Bevan. Indeed, apart from a few of the Left-wing journalists, the Labour movement seems to be at the moment peculiarly united in its desire to avoid all the unpleasant and important issues.

In that desire the eighty-third Trades Union Congress last week resembled, of course, many of its predecessors. Nothing of any importance was said at Blackpool that was not also said by the TUC a year ago. It would be wrong, however, to take this to mean that the opinions of trade unionists have not changed at all. The point is rather that few feel that they know where they are moving to, and most prefer to say as little as possible. The dominant tone of last week's Congress was a sort of dignified bewilderment—expressed in the attentive respect with which Mr Gaitskell was heard and the calm determination with which two days later his advice was ignored. The trade unions left Blackpool as they arrived: determined to confine themselves to expressing their present discontents without feeling obliged to say with any definition what they would like the Government to do about it. The only possible outcome of this attitude is that the traditional business of pressing wage claims should continue—not because the unions collectively disbelieve Mr Gaitskell's warning that it will do them no good, but because no one knows what else to do.

Mr Bevan's supporters have naturally made the most of the unions' evident feeling that the Government ought to try, at least, to provide its followers with something more than Mr Gaitskell had to offer. But in fact it was plain that as yet discontent in no way implies willingness to support Mr Bevan. It is true that the General Council treated the resolution criticising the Budget charge on glasses and teeth as if it were purely a Bevanite heresy, and yet secured the defeat of the resolution by only a small majority. But the voting on this rather artificial issue proved nothing. The only resolution implying general support for Mr Bevan was put at the end of the long and complex agenda, and was consequently withdrawn; it would not, however, have been withdrawn without a fight if its sponsors had expected to collect substantial support. Mr Bevan's opponents will not enjoy the same freedom of manœuvre at the Scarborough conference in a fortnight's time, but they can reasonably feel that they owed their victory at Blackpool to more substantial causes. Most of the unions were plainly anxious to affirm, as usual, their loyalty to the movement and their faith in the ultimate wisdom of the majority of the party's leaders. That is not a basis on which the Labour party will ever restore its vitality and public respect, but it will serve to hold Mr Bevan at bay.

* * *

Bonus Distribution

The TUC at Blackpool was determined to maintain the principle that the Government, like the Fabian Society forty years ago, must provide the brains to match the unions' brawn. The Congress was rewarded to the extent that the least ancient of the suggestions put to it did come from the Government. This was Mr Gaitskell's proposal that the undistributed profits of companies should be capitalised as an issue of bonus shares to their workers.

The Chancellor was careful to "throw out" this notion as something for the unions to "chew over" for a year or two, not as a forecast of Government policy. It was greeted without enthusiasm, but with some flicker of interest. That is significant enough. A few years ago it would certainly have been howled down. Within the labour movement, the idea is revolutionary; the interest has always been in redistributing income and collectivising property, and rarely if ever in redistributing property. Indeed, apart from the hastily improvised and never understood scheme for "mutualising" industrial assurance, Mr Gaitskell's proposal is almost the first fruit of all the Labour party's desperate searching for something to do with property other than to nationalise it.

*

It is perhaps a measure of mental bankruptcy rather than of flexibility that the search should have led, however tentatively, to the familiar and essentially capitalist notion of profit-sharing. The form of Mr Gaitskell's proposal seems to have been dictated by his interest in wage stability: the unions have hitherto been reluctant to be persuaded that undistributed profits are a necessary part of the country's savings, not mysterious additions to capitalist fortunes that ought to be available for immediate consumption as wages. But in essentials the idea is identical with many other proposals for profit-sharing and, apart from practical difficulties, is open to four main objections in principle. First, the undoubted success of some individual profit-sharing schemes depends on understanding and willing co-operation within the factory; to impose such schemes on a uniform pattern by legislation is almost certainly to lose their potential advantages. Secondly, there is an injustice in attaching to the rewards of the wage-earner an equity element dependent on the fortunes of a particular concern. The worker takes his risk when he decides to work for the concern; if the choice turns out to be bad, he incurs the penalty of having to move to another job and possibly of a period of unemployment. It is inappropriate that he should also have to bear the risk of a reduction of income whenever his firm meets a temporarily bad trading year. In practice, of course, dividends on the bonus shares would at present be fixed and would quickly be regarded as a part of wages—and therefore woe betide the firm that cut its dividends. That would be an interesting situation, but it is certainly not what Mr Gaitskell has in mind and its advantages are hard to detect.

Thirdly, profit-sharing reduces the return on risk capital and thereby weakens once again the incentives to innovation and expansion. This objection is particularly strong in the case of Mr Gaitskell's scheme, which would cut the shareholders' interest in the equity more sharply the more successful or financially prudent the concern had been. And, fourthly, profit-sharing that really rouses enthusiasm in the workers is bound also to increase industrial rigidity. To give workers a stake in a particular firm is to make them more reluctant to change jobs and thereby to make it harder to maintain full employment without inflation—which depends on flexibility in face of changing demands.

The unions, however, will not search diligently for such flaws as these in a scheme backed by the Chancellor's authority. It is most unlikely to be accepted, but more is likely to be heard of it—and in less guarded terms than Mr Gaitskell used.

* * *

Korea after San Francisco

To the front line soldier in Korea, last week's events in San Francisco leave things exactly as they were. The war goes on. And, for the moment at least, the armistice talks at Kaesong appear to have reached the stalemate which, so far as the soldier is concerned, is the equivalent of a breakdown; he was in any case always sceptical about stopping this very destructive, bitter, unpleasant and extraordinary campaign. To the delegates who are now on their way home from San Francisco, however, the picture can never look quite the same again. In the Far East a new situation has arisen, with the Japanese once more able to shape their own destinies, and in the world as a whole, the Russians have taken a knock which almost certainly widens rather than narrows the gulf between them and the free democracies. Indeed, there is something mysterious about the way in which Mr Gromyko so painstakingly went to San Francisco, hired a large villa for a month's stay, and then not only failed completely to make any impression on the fate of the Japanese treaty but also even missed the glorious opportunity of making propaganda capital in Asia. The Americans, and Mr Acheson personally, have secured one of the most outstanding diplomatic triumphs since the cold war began.

In Korea the right course for the United Nations must now be to prepare for either extreme, for peace or a new enemy offensive, but to expect what is perhaps even more trying—something in between, neither a truce nor an all-out war. The one certain fact in recent weeks is that the first move for an armistice did come from the Communists. Presumably therefore they wanted one. At the same time, they have since deliberately made this impossible to attain and today the Chinese are as aggressive in pursuit of their claims to all Korea as they ever were. The United Nations' interest remains exactly the same as before—to do everything possible to prevent the war spreading beyond Korea, and to bring the fighting to an end on a defensible line. General Ridgway has now given the Communists an opportunity to reopen the armistice talks without loss of face, by apologising for an attack on buildings in the Kaesong neutral zone by a UN aircraft. His task, which he has been performing admirably, is to distinguish between yielding nothing to the froth and bubble of insult apparently inseparable from Communist manœuvrings and the need to prevent the strength of his own position making him and his negotiators too rigid in outlook.

THE AGE OF INFLATION

The three articles by a correspondent, and a fourth article expressing the editorial views of *The Economist*, are being reprinted as a pamphlet, price 8*d.* (including postage).

Special prices for bulk orders: 1 dozen, 7/-; 6 dozen, £1.19.0; 12 dozen, £3.6.0.

Vacillations in Teheran

Dr Mossadegh has issued his ultimatum to Britain on his personal authority and without the sanction of the Majlis. It prescribes negotiation on his terms within fifteen days, or else the expulsion of the 350 British technicians remaining at Abadan. The circumstances in which it has been delivered show that his position is weakening at home. British and American policy makers now have to decide, by means of the action which they take or avoid, whether or not to increase that weakness. Their decision can be effective because of every Persian deputy's inclination to wait and see what others do before he plumps for a course of his own. But if the British leave a door ajar or if Mr Harriman, by agreeing to serve as a postman, were tacitly to sanction Dr Mossadegh's latest action, the mounting opposition does not know to which side of the fence to lean and so does nothing.

It would be disastrous if the policies of America and Britain were to deviate at this juncture. It is to be hoped, therefore, that concurrence was secured before the British issued their statement of last week that, in view of Dr Mossadegh's behaviour, the oil negotiations were not merely suspended but broken off. Certain American voices were raised in immediate criticism of this stroke of policy, arguing that it would, by rousing nationalist ire, merely strengthen the backing for Dr Mossadegh. At one stage this would have been a forceful argument, but in Teheran, once the tide of opinion starts turning, old arguments lose their validity. Before condemning the policy, its critics should reflect that its immediate result has been twice to deny Dr Mossadegh a quorum for voting his "ultimatum" in a Majlis which has hitherto been a slave to all his tantrums, and to cause a marked increase in the number of voices which are criticising him for his worst failing—a total lack of constructive domestic policy. For the other recent acts of British policy, entailing the denial to Persia of several exceptional facilities once afforded to Britain's principal oil-supplier, there can be no breath of criticism. These measures are described in full on page 642.

* * *

Tories for Peace

All that the Conservative party has as yet finally settled about its new statement of policy is that it will be published before the party conference on October 11th. Mr Churchill has completed one redrafting, but after returning to London this week he will take further advice, and considerable revisions may still be made, as has happened before, at a late stage.

One point, however, may be taken for granted. The statement will contain a firm rebuttal of Labour charges that the Tories are war-mongers. It may be doubted whether those charges are now of any propaganda value to the Government. They might have had some influence if Labour ministers had this autumn been able to present themselves to the country as the men who saved the peace. The suspension of the Korean and Persian negotiations has for the time being removed that opportunity, and if it cannot be supported by the positive claim, however thin, the negative act of slinging mud at the Tories is unlikely to impress anyone.

It is understandable, none the less, that the Conservative strategists should be anxious to give the mud no chance to stick. They cannot do better than follow the lines of the pamphlet "Pattern of Peace," by Brigadier A. H. Head, MP, which the Conservative Political Centre has published this week (price sixpence). There is no blimpishness here. Brigadier Head sharply and rightly criticises the weakness and short-sightedness of some British policies, particularly in the Middle East, but he does so without saying anything that can be held to support the charge that, as the Labour policy pamphlet put it, the Tories "demand the use of force even at the risk of starting a world war without the support of Britain's allies." On the contrary, the pamphlet shows a lively sense of Britain's vulnerability. In general, it provides a clear and realistic statement of the principles of foreign policy—and their military implications—that were, in a more confused fashion, almost completely agreed between the parties until Mr Bevan published his heresies and Mr Morrison decided that he was more at home in party bickering than in the serious discussion of foreign affairs. It is surely the right tactic, as well as the duty of statesmanship, for the Tories to continue to emphasise that national unity even if Mr Morrison finds it convenient to pretend that it has vanished.

* * *

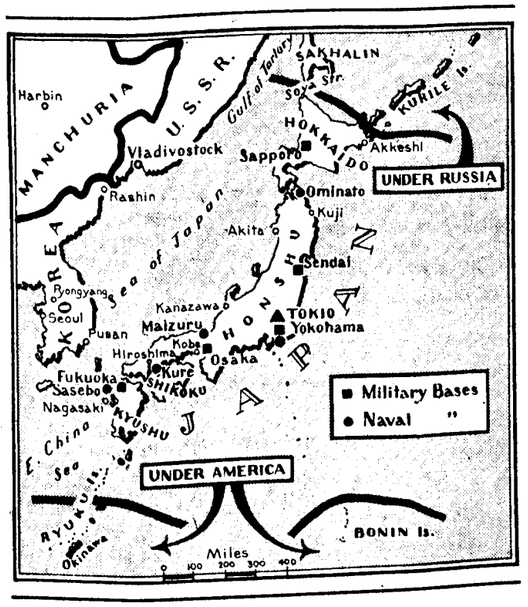
Conservative *Avant Garde*

The Conservative Political Centre has just issued, in its discussion series of pamphlets, a booklet on "Employment"* which might, or might not, be a portent. According to Mr R. F. Harrod's foreword, it is "of public interest as reflecting—subject to the author's personal emphasis and shading of particular matters of detail—the attitude of modern Conservatism." With due respect to Mr Harrod, that is just the question; does it reflect the attitude of "modern Conservatism" or that of a quite untypically liberal intellectual fringe?

The booklet is an excellent broad statement of economic theory; it takes the essentials of the Keynesian analysis and sets out their practical implications, puts in due perspective those employment problems to which Keynesian techniques are apposite and those to which they are irrelevant or worse, hammers home the case for mobility and adaptability—and pillories restrictionism and Protectionism. "Restrictions designed to exclude goods which can be made more cheaply abroad are a direct attack on the standard of living" says this astonishing spokesman of Conservatism; and again, "... The State can help by discouraging certain tendencies, such as the attempt to stifle competition. In the 'thirties, the record of the State was a long series of restrictive practices." How would any normal Conservative party gathering receive such heresies? Mr Gaitskell explaining to the TUC that the traditional Socialist recipes for prosperity have achieved their utmost effect, and must be supplemented, has a less uphill job than Mr Wood persuading Conservatives actually to reverse and condemn their most cherished policies. Uphill or not, however, the job is being tackled: and Mr Wood has at least so much of an official blessing as is implied by the Conservative Political Centre imprint.

A party whose ideas are never challenged from within and whose internal organisation offers no forum or areas for such challengers must eventually pay the penalty of intellectual obsolescence and become a mere last resort or lesser evil, thriving, if at all, only on the grosser mistakes or misfortunes of its opponents. It is from such a plight that a liberal-minded *avant garde* is trying to rescue Conservatism. Will the rescue come in time? Labour had nearly fifteen salutary years in which to cultivate, in the wilderness, the fruits of that lively self-questioning which followed the catastrophe of 1931. The next test of the adequacy of Tory ideas will probably come in a matter not of years but of months. If that test reveals mental bankruptcy, there may be only too much time later—in a still more comfortlesss wilderness—for the uncongenial process of re-education that is still required before the Conservative party becomes a genuine party of progress for modern times.

* * *



America Signs up with Japan

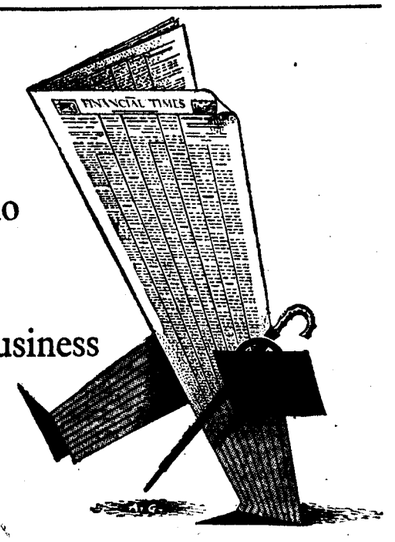
The American-Japanese defence pact, which provides for the stationing of American troops in Japan after the end of the occupation, was signed at San Francisco as soon as the Peace Treaty itself had received the signatures of all the nations at the conference except the states of the Soviet bloc.

* "Employment" By John B. Wood. Conservative Political Centre. 36 pp. 6d.

These troops are to be available not only for the defence of Japan against external aggression, but also, on the request of the Japanese Government, for the suppression of internal disturbances due to the "instigation or intervention of a foreign power"—a provision which is meant to cover the possibility of such a situation as that which formerly existed in Greece. The American troops will co-operate for these purposes with a Japanese army which, according to official forecasts in Tokyo, will consist of eight divisions of 16,000 men each.

The smooth working of this arrangement will require tact and adaptability on both sides. It is not easy for a military force which has been occupying an ex-enemy country for six years, with virtually unlimited administrative powers and great social privileges, to reduce itself suddenly to the role of a guest on a footing of equality. Yet the Japanese certainly do not intend that the future sojourn of the Americans in Japan shall merely continue the occupation under another

name; they are already demanding the return of the hotels, public buildings and private houses requisitioned by the occupation authorities. It is not yet clear in what places the American garrisons are to be stationed in future. But it would certainly be well for them to be kept outside the main centres of population—however unpleasant the jolt to some military personages who, in the words of a correspondent, "have never had it so good before."



The Russians gave a remarkably clear revelation of their own strategic ideas about Japan when Mr Gromyko demanded at San Francisco that the straits through the Japanese islands should be open to the warships only of the countries with coasts on the Japan Sea, that is, the Soviet Union, Korea and Japan itself. This is the same formula as that which Russia formerly proposed for getting control of the Turkish Straits. Indeed, apart from the general purpose of preventing at any time a Soviet invasion of Japan—which could most easily be launched from Sakhalin against Hokkaido—the most important strategic function of an American force in Japan would be to bar egress from the Japan Sea through the Tsushima or Tsugaru Straits. For this, it seems that the former naval bases at Sasebo and Ominato must be revived. If Japan is to be defended at all, it should be done adequately, so as to create what Mr Acheson calls "a situation of strength," not another Bataan

Mr Nehru and Japan

Mr Nehru, who is Foreign Minister as well as Prime Minister of India, has done his country no good by refusing to go to San Francisco, and then offering the Japanese a separate peace treaty on very similar lines to that which has just been signed by the forty-eight states. His performance looks to the outside world like a personal whim and it will certainly prejudice his reputation as an Asian statesman. There has been some discussion, since the triumphant defeat of Mr Gromyko's attempts to throw a Russian spanner into the Japanese peace treaty, whether the Americans could have got the Indians to the conference if they had handled Mr Nehru more tactfully. They need not worry. Everyone knows that many Asian leaders had many misgivings about the liberality of the Japanese treaty. But the Indonesians, Pakistanis and Filipinos all had the statesmanship to understand that, their views having been taken as fully into account as possible in the negotiations which led up to the final draft of the treaty, a compromise was now essential. Mr Nehru did not, and by his attitude that everyone is out of step except himself he has forfeited much of his claim to lead Asian opinion.

Inside India, however, Mr Nehru's position is probably as strong as it has ever been. Although his tactics have naturally provoked strong criticism, he has scored a resounding personal success in securing his own election to the presidency of the Indian Congress Party in the place of Mr Tandon, who was supported by the Hindu die-hards. Able to choose his own working committee, Mr Nehru is now in executive control of the Congress Party as well as the government. After resigning as a result of Mr Nehru's withdrawal of support, Mr Tandon said of him: "Mr Nehru is not an ordinary member of the working committee; he represents the nation today more than any other individual."

The motives which led the Indian Prime Minister to reject the invitation to San Francisco are discussed on page 633.

Men who

mean Business

read

THE FINANCIAL TIMES

every day

What Indians must now ask themselves is how far they can afford to continue to leave foreign affairs so exclusively in Mr Nehru's hands. During the struggle for power before the British left India, he established an intellectual supremacy in this field. Other Congress leaders were willing to accept it since their own attentions were fully engaged on domestic issues. Now India has stepped forth into the footlights of the world stage. If it is to play the prominent role in free Asia to which its population, resources and civilisation entitle it, there is a strong case for putting a more realistic and more consistent hand at the helm of the ministry of foreign affairs in Delhi.

* * *

Changes in Prague

The exact significance of last week's changes in Prague is, of course, shrouded in mystery. What seems fairly certain is, first, that the changes in the organisation of both the Communist party and the government are fundamentally designed to overcome Czechoslovakia's increasing economic difficulties; and, secondly, that there is no convincing evidence that they are the result of a growing Titoist movement. It is true that Rudolf Slansky, who has been displaced from his immensely important post of secretary-general of the party by a three-man committee headed by President Gottwald, has always been a loyal follower of Moscow. But Gottwald's fidelity to Stalin is also in no doubt; and by uniting supreme power in one person—himself—he is, like President Bierut of Poland in 1948, only following in the master's footsteps. It was on the eve of the German attack on Russia in 1941 that Stalin, until then officially only secretary-general of the party, assumed the post of President of the Council.

Although the Russians probably approved the new dispensation in Prague, it does not seem an ideal arrangement from their point of view. They will have less room for manœuvre in their dealings with the Czechs. Hitherto they could pass on their orders through party or government channels; now they will find the same faces wherever they turn. Moreover, they would probably have preferred to entrust supreme power to Slansky if only he had been efficient. In spite of his loyalty, Gottwald has never been an ideal Communist in Russian eyes; he is too easy-going and too anxious to keep up some appearance of respectable independence. But Slansky has—temporarily at any rate—blotted his copybook, in particular by his failure to take effective action against the Sling-Svermova deviationists. There is, however, no reason why Slansky's new post of vice-premier, although comparatively unimportant at present, should not become a stepping-stone to better things.

The administrative measures taken to deal with Czechoslovakia's economic crisis also show no sign of a desire to shake free from Russian influence. There is not the faintest suggestion that the system of planning itself might be to blame. The multiplication of economic ministries and the imposition of more controls are remedies copied straight from the Russian book. And Mr Bacilek, who has been put in virtual control of Czechoslovakia's economic life as head of the new Ministry of State Control, can be relied upon to carry out orders.

* * *

Farmworkers or Machines?

The Anglo-American Council on Productivity has been turning its attention from industry to the land. The farming team, whose report is now published, was not primarily concerned with the productivity of the land, which is as high in Britain as almost anywhere in the world; they were studying output per man and the fullest possible use of machines. The report contains interesting descriptions of American machinery and methods, some of which might be employed here. But its recommendations are unexceptionable generalisations, of less specific and practical usefulness than is usual in the reports of the productivity teams. The main reason for this is, no doubt, that in farming local conditions vary more widely than in most industries: it is harder to generalise without becoming indefinite. But it does also seem that questions of productivity have as yet received less attention in farming than has lately been given to them in most industries.

American farms of the kind visited by the team are less mixed than British, with the result that the range of machinery needed is less. The report urges British farmers to plan their farms to give the greatest possible scope to machinery, and especially to large machinery. They should develop greater co-operation in the ownership and use of machines, and more farms should be electrified. There should be continuous collaboration between the makers and the users of agricultural machinery; and agricultural education should lay more emphasis on management and on such techniques as "job analysis" and "work simplification." It is interesting that the report goes out of its way to emphasise that the object of mechanisation is not only to get more output with a given number of workers but to save manpower. The present shortage of agricultural workers is acute enough for the workers' representatives to accept that prospect cheerfully. On the employers' side, the increase in the farmworkers' minimum wage, which was recommended by the Central Agricultural Wages Board this week, will certainly stimulate the wish to replace men by machines. The increase of 8s., to 108s. a week, will add some £16½ million a year to the agricultural wage bill.

The Sleep of Civilisation

The truth is, it is a dangerous thing for a nation to achieve civilisation and commercial prosperity before their civil and religious rights are completely and securely won. Since the Reformation, and especially since the war of independence, wealth and comfort, and the pacific and self-indulgent habits which these bring with them, have penetrated deeply among the German people; the stern virtues and the spirit of self-sacrifice, needed for fighting the battle of freedom, have been much impaired. . . . When the English won their civil liberties and made good their spirtual emancipation, the genius of commerce, literature, and refinement had not yet pervaded the nation, and men held ease and riches cheap in comparison with the right to govern themselves and to worship God; —and now that these inestimable blessings are consolidated and secure, the heroic virtues which originally won them are no longer needed. . . . But the Prussians, though they fought nobly and successfully for their religious freedom in more stirring and self-denying and uncompromising times, yet unhappily stopped short and sank into the sleep of civilisation, before they had obtained that civil liberty which alone can make that sleep safe or that religious freedom secure and unassailable. They won their treasure, but they omitted to build the fortress which should guard it. . . . The German people—with all their patient industry, with all their noble literature, with all their cultivated taste—have yet to learn that the arts which adorn life, the luxuries which sweeten it, the amenities which embellish it, the philosophy which ennobles it—can safely engross the attention of those nations only which have first secured, by the needed effort and the needed sacrifice, the weightier matters of mental emancipation, civil rights, and constitutional legality.

Providing Power for Production

Out of This World

A new concept of inter-planetary travel was made public at the International Congress on Astronautics held in London last week. An eminent designer of rockets described in some detail a return expedition to Mars, making the journey in three hops and taking three years. The stopping points would be man-made planets launched into space, the first revolving eternally in an orbit round the earth, the second round Mars. On these satellites components of rockets for the next stage of the journey would be assembled and launched.

The calibre of the men who pledged their scientific reputations to the practicability of inter-planetary travel has raised the notion to a new and more dignified status. There are now enough theoretical data to make the project possible. It by-passes most of the complications involved in launching a manned rocket direct from the earth to a planet and, indeed, the building of at least one man-made planet revolving round the earth is already a serious military possibility. But the key lies in a phrase used by one of the British speakers, who said that "moderate advances in technique" were needed before such planets could be built. In those "moderate advances" lies the dividing-line between fantasy and fact. The difficulties are those of engineering rather than of design; on a much smaller scale, the same problems face the same scientists in their work on guided missiles. In spite of the great advances in rocket engineering and electronics, the day of the rocket air force is some years off. For similar reasons, the first manned space ship may not be launched within the lifetime of most of the 5,000 people who have applied for seats on it. But launched it no doubt will be if sufficient reason is found for what will be a most costly journey.

* * *

Greek Electors Try Again

Last Sunday the Greeks went to the polls in another attempt—the second in eighteen months—to secure for themselves a stable representative government. At the time of writing the final distribution of neither the votes nor the seats is known. But it is already clear that the Greek political scene has suffered some striking changes. A complete newcomer, Marshal Papagos's Greek Rally, has carried off the largest number of votes, and General Plastiras's Progressive Union (EPEK) and Mr Venizelos's Liberals are the only other parties to get more than a handful of seats; the left-wing EDA, with about 10 seats, is the fourth largest.

In spite of these changes, however, the prospects of a stable government for Greece do not seem very much brighter; it looks as if the politicians may be able to produce nothing better than the mixture as before. Marshal Papagos will certainly get considerably more seats than anyone else; but he is not thought likely to secure an absolute majority over all other parties. The alternative would be a coalition between the Liberals and the EPEK, but they also are unlikely to secure an absolute majority between them. The obvious solution, of course, would be a coalition between Papagos and the Liberals. As far as their stated aims and policies are concerned, there is no real reason why they should not work together. But unfortunately the Marshal is adamantly opposed to co-operating with any of the old parties. Yet if he does not himself secure an absolute majority, he must clearly either overcome his allergy to all politicians who have not enlisted under his banner, or else incur the odium of obstructing the formation of a strong and stable government in Greece. Similarly the politicians will have to overcome their often vindictive dislike of the soldier who has undertaken to show them how they should do their job.

A German Soldiers' Trade Union

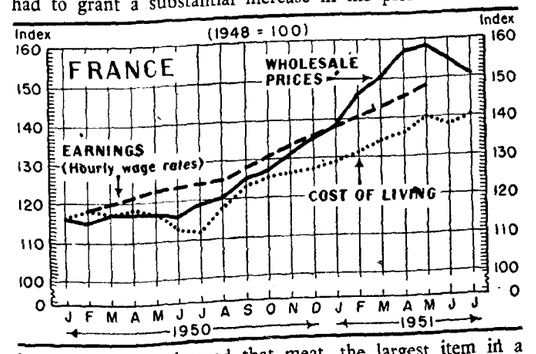
The Western German political scene is dominated by the pressure groups which are now being formed by sections of the community. Spurred by the power which the Trade Union Federation has secured by direct dealings with Dr Adenauer, the refugees and the ex-soldiers are also consolidating their forces. The League of German Soldiers which was established last week-end by the heads of various ex-service organisations is a merger formed in order to urge claims on the state, and lay down terms for co-operation in its defence.

Some disquiet must be felt over the emergence of a military pressure group in the Federal Republic. Parliamentary government and political sense are still weak in the new Germany, and there is clearly a danger that the military caste will try to re-establish the superior position it so long held in the Reich. The ex-soldier has counted for nothing in the postwar community, and has bitterly felt the loss of his prestige and illusions. General Friessner, the chairman of the new League, says in the *Deutsche Soldaten Zeitung*

> After the collapse we former soldiers were outlawed as the result of blind hate propaganda. *Vae Victis!* Now that the waves of hate have gradually calmed down and events in the world have taken their own course, we are being asked for. We shall formulate our reaction to this development.

The sponsors of the new League affirm that it stands for "our democratic State" and rejects, however, extremes of right or left. So far, the organisation appears to be in the hands of moderates who, in north Germany if not in Bavaria, are mainly connected with the conservative, protestant, Free Democratic Party. General Friessner and Generals von Manteuffel and Krakau—two other leaders—have a large following. The notorious General Remer, an upstart who cuts very little ice with other generals, has been kept out of the negotiations which led to the merger. On the other hand, the League is also backed by Generals Guderian and Ramcke, who were as good Nazis as Remer and show no signs of having become supporters of democracy. Major-General Gille of the SS "Viking" Division and SS Colonel-General Hauser, who was the original operational commander of the *Waffen SS*, have also taken part in the merger, and it is certain that the new League intends to demand the full rehabilitation of Himmler's army. The Norwegian, Flemish and other units in the "Viking" Division are now said to deserve special honour as forerunners of the European army. Since the Allies made no distinction between the *Waffen SS* on the one hand and the security forces and Gestapo on the other, but condemned the entire SS as a criminal organisation, they will find it hard to meet this demand.

The League's first claims will probably be addressed to Dr Adenauer and his Minister of Finance. The *Waffen SS*, which is said to have numbered 1,000,000 by the end of the war, was omitted when Bonn restored pensions to the former members of the *Wehrmacht* last year. The League demands that this discrimination should be removed, regardless of the deficit in the Federal budget. Dr Adenauer, who has been successful in securing the support of the trade union pressure group, will now have to perform fresh political feats in order to prevent the generals from establishing an opposition *bloc*.



* * *

Operation Bifstek

The latest manœuvres of the French Prime Minister, M. Pleven, serve as warnings of possible labour unrest in France. The fact is that the French economy is on the brink of a very difficult period. It is true that the cost of living index, having risen by over 25 per cent since July last year, has been more or less stable since May. But if the position is not to deteriorate, the government must now

adopt, and above all enforce, a policy which is bound to offend some sections of the community—a necessity which all the coalition governments of postwar France have so far been unable to face. Today the problem is as tough as ever, since the section of the community which it is now most necessary to offend is the peasant farmer, whose slightest whim, for political and never for economic reasons, successive governments have heard and humoured.

M. Pleven has started courageously. He has admittedly had to grant a substantial increase in the price of wheat;

but he has now decreed that meat, the largest item in a Frenchman's budget, shall in future cost 10 per cent less. He has reinforced this by tinkering with the protective trade barriers built up round the domestic producers, and by calling all prefects back from their holidays to see that the butchers put the right price-label on to the right pieces of beef. Following this attack on the cost of basic diet, the government announced a 13 to 14 per cent increase in the minimum wage (from 17,400 to 20,000 francs a month) to compensate for the rise in the cost of living since March and for the new 20 per cent increase in the price of coal. Thereafter M. Pleven hopes to stabilise wages.

His initial efforts have been met with a fierce blast of ill will from the trade unions, which took one look at the new minimum wage, called it a parody, and dismissed it out of hand. A severe trial has also been the motion put up by the Socialists for a sliding wage scale with its implicit threats both to hopes of stabilisation and to the government's position in the Assembly. Then there are further demands to be faced for increases in agricultural prices; there are already new claims for milk. And by the end of the year consumers will be feeling the indirect effects of the rise of coal prices on steel, gas, and transport, and to a lesser extent throughout industry. Finally M. Pleven has still no assurance that his precarious budget can remain balanced, even on paper, if American aid fails to come up to expectations.

Under these circumstances, the government's only hope of retaining stability is to go on resisting the farmers, which means a competitive import policy, a firm hand with price demands and far more active enforcement measures than those M. Blum conceived in 1946. For agriculture is not only the one sector of the economy which it is really within the government's power to restrain; it is also the sector that can best afford sacrifices and the most important element in the cost of living. If M. Pleven can succeed here, he may succeed in restoring some semblance of sanity to industrial relations and some restraint in the wage demands of the unions. Success would be the first real act of social justice to the credit of the Fourth Republic.

Letters to the Editor

Controls and Consumption

Sir,—In my letter published in your issue of August 25th, I did not, as you say, ignore what you call the "primary" effect that price control might increase consumption. My words were "I should be the last to dispute that universal price control—in so far as it reduces the share of profits and raises the share of wages in the national income—will to some extent increase the propensity to consume, and so raise effective demand." If only some prices are controlled, while the rest are free to rise, the shift from profits to wages in the controlled sector will be matched by a corresponding shift the other way in the free sector, and the propensity to consume will rise less, or not at all. Your own argument on this point, that "with the same monetary expenditure consumers will obtain more goods—if the price control is effective—than they would otherwise do," contains, I am afraid, one of those elementary mistakes in economic analysis we are all apt to make from time to time. If prices are reduced below what they would otherwise be, so also is someone's money income—in the first instance, usually, profits. Shareholders are consumers as well as wage and salary earners, and unless they save less, or dissave, they must spend less on consumption.

All this to the exclusion of the influence of price expectations on consumer expenditure. That these influences can be very strong is remarkably illustrated for several countries in the ECE Bulletin for Europe in the first quarter of 1951 (table 2, page 2). Though much less marked in the United Kingdom than elsewhere, I think that the influence has been important, and could become dangerous if people become increasingly convinced that prices will go on rising.

In my letter I was concerned only with the varied influences of price control on consumer demand in the present circumstances. Even if the net effect of these influences were to raise demand (which I contested, and still contest) the amount of goods which consumers actually get will still depend on supply. I have always assumed that rearmament was to be taken seriously, and that if shortages of particular components or materials appeared, the Government would by persuasion or control ensure adequate supplies for the rearmament programme. It is most surprising to find you opposing such elementary prudence.

If my question whether you wanted to abandon price control altogether was "disingenuous" your answer that if the Government refuses to disinflate (I presume this means reduced expenditure on social services, or subsidies) it would be better not to have controls either, simply takes one's breath away.—Yours faithfully,

G. D. N. WORSWICK
Magdalen College,
Oxford

[Mr Worswick's "present circumstances" must be those of fairyland. If his analysis is supposed to apply to the real world, then the "elementary mistake" is his, not ours. Effective price control will not at present reduce any person's money income; in 99 cases out of 100, the shareholder will get his controlled dividend just the same. The reduction will be in the undistributed profits of companies—that is, in savings; consumers of all kinds will have the same incomes and by this fact alone (irrespective of any change in the propensity to consume out of personal incomes) will be able to buy more goods if prices are lower.

No one disputes that consumption can be reduced by preventing the goods from being produced. But that has nothing to do with the effects of price control. Perhaps the real difference between us is that Mr Worswick seems positively to like rationing, allocation, etc., whereas such measures seem to us entirely inappropriate to the conditions of one-quarter war.—EDITOR.]

The Free Trade Unions

Sir,—The note in your issue of July 21st, dealing with the second congress of the International Confederation of Free Trade Unions, held at Milan on July 4th-12th, was below your usual standard. You said:—

> The American Federation of Labor, which has its own regional offices in Asia and Europe, has so far not agreed to contribute to the fund. . . . There is some resentment in Asia against the separate offices of the AFL there, and a general suspicion of these "lone wolf" tactics.

This is not so. The only regional free trade union committee of the AFL, regional bureau established last May at Karachi by the ICFTU with AFL

assistance. The representatives of the free trade union committee of the AFL, studying the problems and working with Asian free trade unions upon their request, are no more an AFL regional office in Asia than are the trade unionists from Europe and Asia working together in the United States with our labor unions, or German or Japanese trade union regional offices in America. Nor does the AFL have a Regional Bureau in Europe.

You also criticised the AFL on the ground that it has refused to contribute to the fund set up by the ICFTU for regional organisation. The fact of the matter is that we contributed heavily to the setting up of the ICFTU regional organisation in Latin America.

The AFL has also made generous contributions directly to the ICFTU, and to some of its affiliates, upon their request. These funds come from the treasuries of our unions, which have to vote upon their appropriation and allocation. Thus, the AFL executive Council has voted to recommend favourable action by the forthcoming convention on the matter of our contributing to the ICFTU fund for regional activities.

You said that "The divergence between the Americans and the rest is that the former see the work of the ICFTU too exclusively in terms of the fight against Communism." This conjured-up "divergence" does not exist. In the declaration on the role of the free trade unions in the struggle against the totalitarian menace, presented to the Milan Congress on behalf of our Secretary-Treasurer, Mr George Meany, it is emphatically pointed out that:

> The struggle of the free trade unions against totalitarian dictatorship cannot be merely negative. Anti-totalitarianism—whether it be anti-Communism, anti-Nazism or anti-Fascism—alone is not enough. . . . The free trade unions must provide the dynamic initiative, leadership, and effective programme for eliminating the social and economic conditions in which the germs of totalitarianism breed.

You further state that "The undercurrent of friction revealed itself in an impassioned debate about a resolution on totalitarianism devised by an American group of delegates." But the fact is that in every essence the policy towards "totalitarianism," outlined in the resolution of Mr George Meany, was unanimously adopted by the Milan Congress. For example, the AFL declaration stressed that "The Russian brand of dictatorship—totalitarian Communism—has become the most virulent and dangerous expression of despotism and the most pernicious threat to world peace." The Milan Congress resolution emphasised that "The well-spring of this menace is the Soviet Union, which, in its thirty-four years of dictatorship, has become a society where the citizen is oppressed in the name of freedom . . . where peace means war, and democracy means tyranny."

This identity of viewpoint between the AFL and the ICFTU refutes your conclusion that "there is obviously some distance to travel before American workers are likely to see eye to eye with their fellow trade unionists in Europe and Asia."—Yours faithfully,

MATTHEW WOLL
Chairman, International Labor Relations Committee, American Federation of Labor.

Books and Publications

Fissures in the Monolith

Soviet Staff Officer. Ivan Krylov. *The Falcon Press.* 298 pages. 13s. 6d.

Is there no real life going on under the monotonous surface of Soviet politics? Has Stalin succeeded in moulding revolutionary Russia into an amorphous mass of uncritical and unthinking citizens dominated by a monolithic Politburo? Both apologists and detractors have tended to stress Russia's uniformity. This vivid account of Soviet Russia during the last war now reinforces the opposing theory that the apparent lifelessness of the Soviet political stage is deceptive.

Mr Krylov's book is far from being a panegyric on the Soviet regime. Yet it is not an indictment according to the usual pattern of Russian refugee literature. Mr Krylov depicts the events and succeeds in recreating the atmosphere of wartime Russia. He was, it seems, in a good position to find out what was going on in Soviet ruling circles between 1940 and 1945. As a captain of the General Staff and an intelligence officer at the Ministry of War he had interesting dealings both with foreign diplomats and high Soviet officials. He also fought in the front line.

The book starts on the eve of the German attack on France when the Politburo had to choose between two conflicting policies. The Chief of Staff, Marshal Shaposhnikov, a professional soldier imbued with the Tsarist tradition of a French alliance, advocated an attack on Germany. Marshal Voroshilov, a soldier politician, thought that every move should be made to conciliate Germany. The Politburo seems to have contained all shades of opinion between these two extremes. On the whole Voroshilov's view prevailed up to the outbreak of the war, although the Politburo often wavered. During this time Stalin's voice was certainly decisive, but he often preferred to spread responsibility. He emerges as a shrewd, if unscrupulous, statesman. The comment he is reported to have made when at last he had time to think of other perils than the German seems typical:

> I'll take the title of Marshal . . . because the main danger for the moment is Bonapartism. But if to-morrow the main danger came from the Church then I would not hesitate for one moment to accept an invitation of Congress to let myself be elected Patriarch of All the Russias—and I'd say Mass in the cathedral of the Kremlin.

Voroshilov is Mr Krylov's villain. Shaposhnikov is naturally his hero, because he belonged to the latter's inner circle. Shaposhnikov's divergence of views was not limited to the German problem. This former Tsarist officer, though he had joined the Communist Party, was determined to carry out his "Russian" policy even against the Politburo. Hence, he surrounded himself with officers entirely devoted to him. His circle had secret meetings, special sources of information and members in many key posts, but its aspirations were never very clear. Towards the end of the war, after Shaposhnikov's death, the circle, intoxicated with Russia's new power, agreed to work hand in hand with the regime. By then Stalin was already aware of its existence and a member of the Politburo, General (now Marshal) Bulganin seemed to be at its head. But by this time Krylov was dissatisfied with its new ideology and had left the group.

He joined another secret group—the *Mayak* (Beacon) consisting of young officers. Here meetings were mainly taken up with discussions on such subjects as the merits of the various 19th century liberal constitutions. What is striking about both these groups is the lack of any concrete aims. The *Mayak* was more liberal and more in keeping with the prevailing mood. The thirst for greater freedom, for a "democratic Soviet regime" was apparently so strong that the NKVD felt it necessary to spread the news that after the war real elections and a second party—the Peasant Party—would be allowed. Another striking feature is the relative ease with which these secret societies sprang up and could be entered. There must have been many other similar groups and from conversations described one gets the impression that criticism of the Stalinist regime was more outspoken than is generally thought. Controls have probably now been tightened again, and Russia is certainly not a volcano on the eve of eruption. On the other hand, Mr Krylov's fascinating book confirms the view that there are fissures in the apparently monolithic structure.

History of Life Insurance

Pioneers of British Life Assurance. By Hartley Withers. *Staples Press.* 112 pages. 6s.

In 1940 the United Kingdom Provident Institution decided to mark its centenary by commissioning the author to write a brief history of life assurance in this country. Under the pressure of events the manuscript was pigeon-holed and the text had not been revised when Mr Withers died in 1948. References to modern insurance problems in the part of the manuscript dealing with more recent years are now out of date and the present book, therefore, comprises only the early chapters and in these some of the author's passages have been expanded.

This little book was the last of the many written by Hartley Withers over more than thirty years and in it his gift for imparting his wide knowledge of economic subjects to the ordinary man in a manner which is both interesting and readily understandable had certainly not diminished with advancing years. He has not sought originality and quotes freely from works on the history of insurance; the interest of the book lies in the manner in which the development of life assurance has been traced against the social and economic background of the eighteenth and the first half of the nineteenth centuries. Nowadays, when it is taken for granted that the financial strength of the life offices is virtually impregnable, it is not always remembered that in the pioneering days of the business failures and frauds on the public were quite common. In a delightful chapter on "Frauds and Failures," Mr Withers entertains his readers with the story of two rogues—one a shoemaker and the other a tallow chandler—who launched the "Independent and West Middlesex Fire and Life Insurance Company" in 1836. Apparently this grandiloquently named body succeeded in defrauding the public of some £250,000 over three years and "the money rolled in and was handsomely spent by the organisers of this monstrous swindle, who kept carriage-horses and saddle-horses and servants in gorgeous liveries and entertained on a sumptuous scale." The author hastens to point to other striking weaknesses of the country's economic organisation between 1815 and 1840, lest his readers should receive the impression that only insurance has some blots on its escutcheon.

The last chapter deals with the strong prejudice against total abstinence which was shared by most doctors a hundred years ago. Total abstainers were considered to have impaired constitutions and a shortened expectation of life and were able to obtain life assurance only upon payment of an extra premium. It is hardly surprising that in 1840 one Robert Warner with other abstainers founded the "Association for mutual assurance for persons wholly abstaining from alcoholic beverages," which flourishes today as the United Kingdom Temperance and General Provident Institution. Although its temperance section is now a minority, distinctly better terms are offered to total abstainers than those extended to the other policyholders.

The book is eminently readable and should have an appeal well beyond insurance circles. It is worth while to dwell for a time on the early struggles of an industry which now administers assets exceeding £3,000 million—and interesting, as the Festival of Britain draws to a close, to be reminded that in 1851 the "attention of all classes was unusually diverted from the ordinary course of business by the Great Exhibition."

Cuba

Monetary Problems of an Export Economy. By Henry C. Wallich. *Harvard University Press.* (*London: Geoffrey Cumberlege.*) 357 pages. 32s. 6d.

Cuba suffers from the same economic malady as many other Latin American countries and many British colonies. It derives a preponderant part of its national income from the exports of a few staple crops. When the prices of these crops are high, Cuba has a large export surplus and roaring internal inflation; when they are low, Cuba has a foreign exchange crisis and, in the absence of effective Government action, its currency depreciates. Dr. Wallich is one of a very able band of American economists who believe that the best way to overcome these unhappy cycles is to reason with governments at boom times when they are full of good intentions, and to persuade them to create a new central bank (if possible under expert and politically neutral American management), and to oblige that central bank to take certain specific disinflationary or reflationary steps whenever economic indices flash a red warning. Dr Wallich and the group with which he is associated have been remarkably successful in setting up central banks of this sort in Latin America since the war; a similar constitution has been drawn up for the new central bank in Ceylon (described on page 1240 of *The Economist* of June 3, 1950). There is no doubt that these institutions have much greater potential value for underdeveloped economies than the more orthodox type of central bank which, in Latin American conditions, could put up precious little defence against becoming the milch cow of improvident governments. Whether they will succeed in keeping local governments to the path of financial wisdom if depressions return is another matter. Meanwhile, however, all who have to do with the financial management of underdeveloped economies will profit from reading Dr Wallich's Cuban case study.

B.SC. ECON. LONDON UNIVERSITY

- This Degree, which may be taken *without residence*, is a valuable qualification for men and women who seek executive appointments in commerce or industry, government or municipal posts, or promotion in the teaching profession. Study for the Degree covers a course of wide and interesting reading. U.C.C., founded 1887, prepares students by post for the required examinations.
- The College is an Educational Trust, with a staff of highly qualified Tutors. Moderate fees; instalments if desired.

PRINCIPLES OF SOCIAL AND POLITICAL THEORY
By SIR ERNEST BARKER *Probable price 25s. net*
This volume contains an inquiry into the principles which lie behind the existence and action of National Society and the National State. It is divided into six books. In the first two books the inquiry turns on the distinction and the relations between Society and the State, first in their historical development (Book I) and then in their present form (Book II). The third book is an analysis and discussion of the idea of Justice, regarded as the purpose which creates and controls the State. The fourth book deals with the conception of Rights, and with the principles of Liberty, Equality, and Fraternity (or Co-operation) which govern the allocation of Rights: it is also concerned with the relation of these principles to the idea of Justice, with the connexion between Justice and Law, and with the enforcement of Law. The fifth book is an inquiry into the grounds and limits of political obligation; and it deals, in its course, with the problem of the 'general will,' the problem of sovereignty, and the problem of resistance. The sixth and last book is concerned with the functions of government, with the causes and results of their extension, and with the general issue between collectivism and individualism.

AMERICAN SURVEY

America and Europe

Washington, D.C.

THE view that Western Europe can only increase its security and raise its standard of living by a merger of economic and political sovereignties has been held by most leaders of American opinion since the end of the war, but the intensity with which it has been put forward has varied. In 1949, when Mr Paul Hoffman, then the Economic Co-operation Administrator, was barnstorming the capitals of Europe with the demand for a speedy integration of European economies, it looked as if the European governments might be forced to take a radical step towards unity. But with the emergence of the Schuman Plan and the creation of Shape under General Eisenhower, American enthusiasm seemed to be diverted into other channels. Those Europeans who believe that the American desire for an integrated Europe is based on a superficial deduction from the success of their own federal system breathed more easily. However, it is clear that the pressure is again rising.

European union or integration has always been a "popular" policy in the sense that it has been advocated in Congress, in the press and by private groups rather than by the President or the State Department. Undoubtedly the most spectacular convert to this view has been General Eisenhower, who made his views known in his speech in London on July 3rd. But General Eisenhower's conversion was not the sole cause of a revived demand for the creation of a larger and stronger political unit in Europe and the abolition of trade barriers. There is a growing irritation with the low productivity of European industry. At the same time there has been a growing doubt as to whether the North Atlantic Treaty Organisation is capable of performing the task of political unification, one of the aspects of its work which made it attractive to the American public when it was first discussed.

The first of these two developments found expression in an amendment to the Mutual Security Act sponsored by Senator William Benton of Connecticut and passed by 61 votes to 4. It requires that the assistance provided shall be disbursed in such a way as to discourage cartels and monopolies on the one hand and encourage the non-Communist labour unions on the other. Although couched in this form, the amendment was not really intended to tie the hands of ECA in the administration of economic aid; it was a solemn expression of the profound and bitter disillusion of the ECA officials in France and Italy, including Mr Joyce, the recently appointed expert on productivity, with the restrictive practices and conservatism of European businessmen. In addition, a number of American trade union leaders who have recently been in Europe have returned with tales of horror at the extent to which management in Europe is prepared, for the sake of a quiet life, to do business with the Communist unions. There is a general feeling that, while the Marshall Plan may have succeeded in its primary object of averting economic collapse and raising the standard of living in Europe, it has failed in its secondary objects of promoting economic integration, raising the standard of industrial efficiency, and liberalising the economies of Europe. And it has failed to achieve these—so the argument runs—because ECA has not been tough enough with European governments and businessmen. The Benton amendment represents, not the view of the reactionaries that Europe must be brought to heel (Senator Taft, indeed, opposed the amendment as "a most outrageous interference with the internal affairs of other nations"), but the impatience of liberally minded Americans with the lack of economic radicalism in Europe.

*

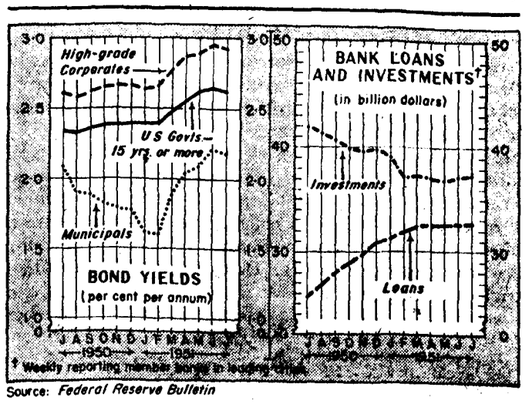
Concern over the future of Nato seems at first sight to be an entirely different question, but the complaint is really the same, namely that Nato, like OEEC, is losing sight of one of its main objectives—political unification—and addressing itself solely to the task of military unification. Moreover, the cumbrousness of the Nato machinery is directly attributable, in the eyes of many Americans, to the fact that it is composed of twelve nations of unequal size and importance. A North Atlantic Organisation which is merely a welter of committees, in which the majority rule does not apply and in which the United States has to deal separately with each European country, makes little appeal to the American sense of political symmetry. If its military function were ever to decline in importance this might lead to a swift drop in American enthusiasm for it. As it is, the North Atlantic Organisation probably has little or no meaning for the average American apart from its connection with General Eisenhower.

This view is argued with considerable skill and cogency in a pamphlet issued recently by the National Planning Association (roughly the Washington equivalent of PEP), called "Making Europe Defensible" and written by two young ex-officials of ECA. This specifically exempts Britain from the general problem of European unification, and argues that, while continental Europe continues to be governed by a number of weak sovereign states, there is neither sufficient confidence in the state to raise the will to resist the Russians, nor sufficiently strong government to impose the rigorous economic policies which hold out the only chance of increasing wealth and productivity. What it proposes is an Atlantic Organisation composed of the units which accord with the reality of power, the United States, the British Commonwealth, and Western Europe. This would be largely consultative, but more effective than Nato, since it would be smaller and policy would be laid down by a council of the heads of states. Continental Union would be achieved by handing more and more fields of activity over to authorities of the Schuman Plan type while keeping sovereign parliaments undisturbed. The central political institution would grow naturally out of the creation of more and more central administrative agencies.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

There are also many advocates of Atlantic Union, which is a more orthodox proposal to create a federal system embracing all the countries which signed the Atlantic Pact (and presumably Ireland). A resolution asking the President of the United States to call a federal convention from all these countries has been before both houses of Congress since January, and has the support of 28 Senators and 110 Congressmen. It seems doubtful whether there will be much further action along that line for the time being. There is also a good prospect that a joint meeting between a delegation from Congress and one from the Council of Europe will be organised either in Strasbourg or in Washington within the next few months to consider how Europe and the United States can be brought more closely together. It will undoubtedly do a great deal of good to confront parliamentarians, who too rarely meet each other, with their opposite numbers, but it is only the convinced internationalists in Congress who have shown any marked enthusiasm for the project.

It is easy to overestimate the strength of American feeling on the question of European or Atlantic union. It is unlikely to become a political issue except in so far as it involves expenditure and taxation. Nor is it very easy to believe that such enthusiasm as there is for Atlantic Union will ever stand the test of a concrete proposal to abrogate a large degree of American sovereignty. But a great deal of the idealism that went into the construction of the United Nations is now transferred to the concept of a reformed Atlantic organisation, and more particularly of a prosperous United Europe in which men and goods may travel unhampered from Calais to Cadiz, whose government succeeds in collecting its taxes and whose business and trade union leaders behave in the enlightened fashion of American labour and management. But almost simultaneously with this recurring fervour for a social, economic and political revolution in Europe, the means of executing it have been very much reduced. When the House and the Senate between them virtually halved the amount of economic assistance which will be devoted to Western Europe during the coming year, they removed the main lever by which to promote social and economic change.



Saving Graces

[FROM A CORRESPONDENT IN NEW YORK]

THE scars left by the tremendous crash of 1929 and the long disappointing years that followed probably explain the strange fears that prevail today among both economists and business men. They are afraid that the defence programme will not provide a market for all the production that will roll out of factories, mines, and fields. They gloomily predict that it was not just a temporary lag in defence spending which caused inventories to accumulate, which bred price wars, and drove prices in the futures markets below spot prices. To them America's productive machine is like the sorcerer's apprentice and will turn out more guns and more butter than can be sold. Indeed, the return of the stock market averages to something approaching the levels of 1929 seems to have stimulated not so much joy as dread of a recurrence of the nineteen-thirties. There are repeated reassurances that this time things are different, as is proved by even a glance at dividend yields or price-earnings ratios, and in the next breath warnings that not even the recent relaxations of restrictions on instalment and mortgage credit will make it possible to sell more television sets, automobiles or houses.

These instinctive twinges whenever the scar of 1929 is touched by a slackening in consumer spending come at a time when disposable personal income and employment are both at record peaks, and when neither show any sign of ceasing to climb. But that, groan the pessimists, is the way things looked in 1929, too. It is true that the Federal Reserve Board's index of industrial production fell sharply in July, but that was mainly because the index does not give enough "weight" to the now widespread practice of closing down plants completely for vacations. Some things are clear. The country's money supply (bank deposits and money in circulation) rose to a new peak at the end of July and it is certain that the total climbed higher in August. Bank loans have begun their seasonal increase, a trend that should continue for the rest of the year. The large crops that are in prospect, particularly cotton, and the still developing programme of capital expansion promise substantial additions to the volume of borrowings, already at the highest levels in history.

The capital markets have now recovered their equilibrium, following the withdrawal of central bank support for Treasury securities in March, so that new issues are eagerly bid for by investment bankers and placed with buyers without too much difficulty. Open market purchases of Treasury

Source: *Federal Reserve Bulletin*

securities by the Federal Reserve Board have been conspicuously lacking. Since the beginning of April it has barely done more than buy or sell a few short-term Treasury bills, a complete change from the early months of this year. This change also means, of course, that the central bank is not adding to bank reserves at all, probably greatly to its own relief. For in the spring some of the reserve-creating results of buying several hundred million dollars' worth of bonds a month, to support the prices of government securities, were offset by an outflow of gold and by the Treasury's cash operating surplus. Now, however, the gold has begun to move back to the United States and the Treasury is running a considerable deficit (of $3.6 billion in July and August). The Treasury has filled its early requirements for funds by selling about $1.5 billion in additional 90-day bills at the weekly auction; most of these have been taken by non-banking corporations, so that the central bank's bogy of inflation by way of bank financing of the deficit has not yet begun to walk.

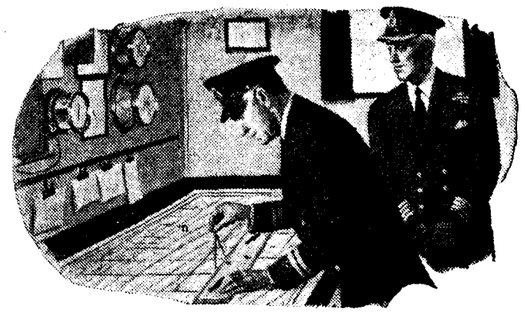
Even so, under the prevailing conditions, there is much to fear, especially as Congress continues to reduce possible yields from the pending Tax Bill. There is no doubt that, in this monetary realm at least, the saving grace thus far has been the recent successful co-operation between the

Treasury and the Federal Reserve Board. Since March the Treasury has handled several refunding operations with virtually no market supporting purchases being required of the central bank. The bank, in turn, has not been hampered in carrying out its restrictive—or better, restraining—policy. All the dire warnings of what catastrophes might occur if Treasury bonds were unpegged have been proved false; instead the unpegging and the subsequent price declines have given powerful support to efforts to check expansion in real estate credit and to the voluntary credit restraint programme. Finally, the large insurance companies and savings banks, who were allegedly unable to lend because they were "frozen" into their investments by paper losses, have found themselves in the happy position of accepting new premiums and deposits sufficient not only to meet their outstanding commitments for credits, but also to enable them to go shopping for some of the attractive yields placed on new high-grade corporate bonds.

And this latter development is one of the results of the other, and greater, saving grace. People are saving more of their incomes than at any time since the war. The change from the first quarter to the second was astonishing and puzzling to most economists; the Department of Commerce estimates—the figures are subject to later revision—that consumers saved 2 per cent of their income during the first three months of the year and 9 per cent during the second. The latter rate works out at the annual equivalent of more than $20 billion, and the evidence suggests that savings are still growing. Some of the spurt in savings undoubtedly reflects the conviction that talk of shortages was overdone, and that controls will keep price rises in check in spite of Congress's emasculation of the legislation authorising these controls. Nor is it surprising that consumers have slaked their thirst for refrigerators, carpets and television sets—for a time at least—after their buying sprees of last summer and this January. For many of them, certainly, the present is a period of restoring depleted savings accounts or repaying instalment credit.

*

There can be little doubt, too, that the sharp drop in residential building is playing a big part in reducing demand for consumers' durable goods, since so many of the articles in this field are those household appliances that tend to be bought for a new home. This decline in housing construction has been widely attributed to the restrictions imposed on real estate credit terms last autumn; like the criticism made against the controls on consumer credit (that they brought on the "depression" in consumers' durable goods), this reasoning seems more than a little weak. It is quite clear to the lending institutions that their reluctance to give building credits this summer stemmed from the losses they would have had to take if they sold government securities in order to get the funds with which to make real estate loans.



Meanwhile, under a confusing crossfire of warnings that further inflation threatens and that a major depression is right around the corner, the businessman seems to be carrying on with business as close to usual as he can make it. He produces as much as his allocations of materials allow, he sells as much as he can with all the sales promotion devices he can recall from prewar days, and he watches the unsold portion accumulate in inventory, hoping the further inflation school turns out to be right. He has now been told that his allocations for the fourth quarter will be less than he had been promised and that metal shortages will persist through 1953. The prospect that automobile output will average only 60 per cent of 1950 production will presumably make it easier to sell cars in spite of the price increase of about 5 per cent that has now been allowed.

This price rise typifies the cost factors recently cited by the staff of the Congressional Joint Economic Committee, when it warned of further inflation to come. The staff also pointed to the increasingly widespread use of cost-of-living compensation in wage contracts and to farm price supports, in arguing that there are now causes of inflation more fundamental than last year's wave of scare buying. Certainly the new price control law nullifies previous efforts to make producers absorb increases in costs, in part or in whole. The fear which disturbs the rest of some economists is that a few of these permitted price increases may shake the serene confidence of consumers and make them stampede into the shops again. They have certainly got the liquid assets to do that, as well as the money income, and if they did the saving grace would soon be dissipated.

American Notes

General Marshall's Year

General Marshall consented to come back to Washington temporarily a year ago only because he realised that his prestige and experience were needed to give the rearmament programme a satisfactory start. When he returnd to the Pentagon, that programme was being pulled all ways at once by the dissensions arising out of Mr Louis Johnson's tenure of office. When General Marshall left again last Wednesday, rearmament itself was driving straight for its goal of giving the United States and its allies a defensive strength that will make them impregnable. Controversies have been bigger and better than ever in Washington this year, but they have

Charting a Course
for British trade with the U.S.

Trade problems involving shipment, exchange, credit, marketing and collection are greatly simplified by use of the Chase's wide connections. Through its three London offices, the Chase National Bank, with extensive facilities in the United States, helps to remove many obstacles from the path of those engaged in International Trade.

A United States Corporation with Limited Liability
LONDON—6 Lombard Street
51 Berkeley Square Bush House, Aldwych

centred on the domestic consequences of the programme, on the foreign policy that made it necessary and on how America's military power should be used. General Marshall was responsible for much of the foreign policy, as the President's special representative in China and later as Secretary of State from 1947 to 1949, and for most of the military decisions in the Far East and in Europe during the past twelve months. But attempts to pull him down into the MacArthur and McCarthy arguments were soon abandoned, for it was obvious, even to the most short-sighted Republicans, that the political dividends of these particular controversies would be reduced if they involved "smearing" so respected and beloved a man as General Marshall.

Congress, which the General praised for its "very remarkable co-operation," has now not only given the armed forces all the money requested for them, but is pressing more upon them; and it has at last allowed a beginning to be made on the scheme for universal military training which is near to General Marshall's heart. The only rebuff he has suffered this year has taken the form of starving the plan that bears his name, but Congress has behaved rather more generously towards the military aid for America's allies that is now replacing this economic assistance. This change is stressed by the fact that Mr William Foster, the present head of the Economic Co-operation Administration, is moving to the Defence Department to be Deputy Secretary in place of Mr Robert Lovett, who succeeds General Marshall.

Mr Lovett, a New York banker, has been a high government official and a close and devoted assistant to General Marshall for most of the past eleven years, in the War and State Departments, before he came to the Defence Department with the General. He has two advantages over his former chief, as well as that of age (he is 56); he is a civilian, as the Secretary of Defence is supposed by law to be, and he is a Republican, while General Marshall, of course, had no political affiliations. The General is retiring entirely at his own wish, to the deep regret of the President, the Congress, the country and the country's allies. He would not have done so had he not been certain that he was leaving his work in the hands of a man in whom he, and everyone else who knows Mr Lovett, has complete confidence. The retirement of this distinguished American is also being taken as a sign that he does not expect a full-scale war in the near future, for in that case he would never have withdrawn from his country's service.

* * *

Sixty Billion for Defence

The $56 billion appropriation for defence, a peacetime record when it passed the House, has had something new added in the Senate, a $5 billion gift for additional air strength presented before the Joint Chiefs of Staff had even reached a decision on how much new expansion in the skies was possible or desirable. To underline its intentions, the Appropriations Committee, which is almost certain to be supported by the Senate this week, provided that the Air Force, instead of being limited to 95 wings, as at present, should not fall below that number. The House, where Mr Vinson, chairman of the Armed Services Committee, is leading the Air Force-inspired agitation for 163 wings, is not likely to find fault, even though the new blank cheque brings the appropriation to $61 billion. Not more than three-quarters of this is likely to be spent this year, but to it must be added almost $6 billion for construction of bases at home and abroad, now authorised, and approximately $5 billion for this year's costs of the Korean war.

Revelations in secret sessions concerning fantastic new weapons now being developed, non-atomic, but "as startling as germ warfare"—the same instrument of destruction to which President Truman referred so chillingly and even more vaguely at San Francisco—convinced Senators that the extra air power was needed. Whatever these newest weapons may be, there are many signs that new atomic weapons, now presumably to be regarded as almost conventional, are steadily moving from the laboratories to the proving grounds. The Atomic Energy Commission has announced a new series of tests at Las Vegas, Nevada, its "back-door" bombing and gunnery range, where it is believed atomic artillery is being tried out which may revolutionise European defence. The AEC has awarded a contract for an air-frame capable of being powered by atomic energy; the Navy three weeks ago let a contract for an atomic submarine. Guided missiles, using atomic warheads, will absorb $1 billion this year.

The new $5 billion is only a drop in the bucket of Air Force aspirations and, moreover, must be shared with the Navy and Marines, whose support of ground troops in Korea has won the admiration both of the Army and members of Congress. It is a very sore point with the Army that the Air Force, upon which, since unification, it depends for air cover, attaches, no doubt quite properly, a higher importance to attaining mastery in the air and attacking enemy troops and supplies than to close co-operation with ground forces. The Air Force recently established a tactical air command equal in status to its strategic and air defence commands, but flatly refused to be drawn into any competition with naval and marine aircraft at the joint manœuvres held at Southern Pines last month. It also declines to give the Army control of any aircraft during an offensive, alleging they would be wasted, in "penny packets." Concessions to the Army, in the form of joint training and exchanges of pilots, may, however, be necessary if the Army is not to be driven into the retrograde step—from the viewpoint of unification—of demanding air power of its own.

* * *

Steel Squeeze

Ordinary consumers have not yet felt the pinch that, heralded by mobilisation officials, is now supposed to have arrived in civilian goods because of the growing military demand for metals. But Senators are more than ordinarily sensitive to anything that may bruise their chances of re-election, and they were badly hurt when they were told it was impossible to repair cuts in the amounts of steel allotted for road building. This will delay construction of the highways which, it was hoped, would bring grateful voters to the polls in the right frame of mind next year. Salt was rubbed into the Senators' wounds by the simultaneous report that Britain, where a Socialist Government must also fight an election before long, was to be given at least 2,000,000 tons of steel during the next year, a week's output from American steel mills. The truth was that Mr Gaitskell's request for only 800,000 tons was being considered and, when this was explained, the cries of pain abated.

But 800,000 tons is nearly as much steel as has been allotted to the consumers' durable goods industries for the fourth quarter of this year, and perhaps more than they will get in the first quarter of next. The allotments, the first made to these industries under the comprehensive controlled materials plan, which now covers all users of steel, copper and aluminium, were for only 58 per cent of the steel used before the Korean outbreak, instead of for 70 per cent as in the current quarter. This reduction was unexpectedly sharp, but it is in structural steel that the squeeze is most severe. The Senators' concern over the highway programme is matched by that of natural gas and public utilities companies over the lack of steel needed to carry out their plans for expanding operations. Only new facilities for making directly military items and the aluminium needed for aircraft are getting as much structural steel as they require in the fourth quarter. The steel industry itself is being allowed only half as much steel as it wants for its expansion programme and projects not yet begun will receive no structural steel at all.

If this special stringency continues, the promise of plenty of steel for everyone by 1953 will not be fulfilled. Meanwhile, however, the steel industry is likely to be more immediately hampered by shortages of scrap. This year 36 million tons of purchased scrap will be needed, in addition to the home scrap produced at the mills themselves, compared with 29 million tons last year. A scrap collecting drive is under way and the government is proposing to buy 300,000 tons of steel scrap from the United Nations, to be salvaged from the Korean battlefields, and 250,000 tons of iron scrap from India. Private firms have failed to bring in this foreign scrap, partly because they are unused to negotiating with governments, partly because the higher prices offered for scrap in Japan made that country a more tempting market.

* * *

After the Flood

Big cities and large industrial concerns have managed to dig themselves out of the debris left by July's floods in the Missouri basin, though, if September waters had been a few inches higher, they might have had the job to do all over again. It is the small businessmen and farmers, whose land is covered several feet deep in sand and gravel which it may cost $100 an acre to turn under, who are the hardest hit. To help them, and speed the recovery, still only 10 per cent complete in an area which produces nearly a third of the nation's food, Mr Truman in August asked Congress for $400 million. This would provide indemnities, on a sliding scale, for lost property, loans to individuals and to the states, help for farmers to rehabilitate their land, and, finally, a new system of flood insurance.

Hearings began this week in the reassembled House, where Congressmen of both parties in the flooded states are convinced that substantial federal help is essential. Flood insurance may be more controversial; virtually none was in force in the stricken states, as the private companies fight shy of so incalculable a risk. Mr Truman proposes a scheme of government backing for private policies similar to the war damage system.

The best form of insurance, of course, would be a comprehensive scheme of water management for the whole Missouri Valley, but there is a risk that Congress may be swept along, by the flood, into authorising and paying for more of the very loosely co-ordinated schemes bound up in the Pick-Sloan plan, a shotgun marriage of the often conflicting ideas of the Corps of Army Engineers and the Bureau of Reclamation. Already the Senate has hastily restored to the flood control and rivers and harbours Bills the $124 million removed by the House, which for once had refused to give the Engineers a blank cheque.

The moment may be favourable for a new, impartial survey of what has been done and what is needed. A flood that costs $2.5 billion jolts the most complacent, and the Engineers themselves have come under unaccustomed fire. In Kansas City they are accused of giving inadequate warning, and of insisting, up until the moment when the waters surged over, that their dikes would hold. In Washington, a sub-committee of the House Appropriations Committee, after a year's study, has raked the Corps from stem to stern for its inadequate planning and faulty estimates. These accounted for $800 million, at least, of a $3.4 billion increase in the estimated costs of 182 projects. Funds to begin most of these were requested without the completion of the full survey required, and granted because these great construction projects shower such benefits in favoured constituencies. It would be too much to expect that this report would give either the President or Congress the courage to follow the Hoover Commission's suggestion that the civil functions of the Engineers should be transferred to the Bureau of Reclamation, but it may induce Congress to authorise another look at the Missouri Valley.

Labour Disunited

Last March the United Labour Policy Committee, then only three months old, brought trade unionists from the American Federation of Labour, the Congress of Industrial Organisations and the Railway Brotherhoods to Washington by the thousand, to demand their rightful share of the defence programme. Their success in getting what they wanted from the Administration seemed to prove that CIO leaders have been right in insisting that the way to the long-discussed unity in the labour movement is through "functional" co-operation to achieve specific and practical objectives. But justification for the CIO view was the last thing that the AFL wanted, for it has always maintained that "organic" unity, a complete merger between the two organisations, is the only remedy for the fifteen-year long split between them. The AFL has just broken up the Labour Policy Committee by withdrawing from it, to the regret of the CIO, arguing that the committee was only intended to be a temporary expedient and is no longer necessary now that the emergency has got into its stride and labour representatives are safe in their places near the tops of the various mobilisation agencies.

But wounded pride seems to be the real reason for the AFL's withdrawal. It feels that it has not been treated with the respect due to its age and size, and that the bright young leaders of the upstart CIO have been given more favours and greater influence in the counsels of the government and in such bodies as the Economic Co-operation Administration and the International Confederation of Free Trade Unions. It is largely because the AFL's nose is so easily put out of joint that organic unity, for which the AFL once more appealed on leaving the committee, seems such an academic question. For an amalgamation of the two organisations, and their member unions, at both the national and local level, could not be achieved unless AFL officials were prepared to take their share of second places. The existence of this double set of entrenched trade union bureaucrats is in fact the main obstacle to unity by any route.

The AFL may be hoping that at least part of the obstacle will be removed next year. For Mr Philip Murray has announced that he will retire from the presidency of the CIO in November, 1952, and the result may be a war of succession, which could tear the CIO apart and drive its member unions piecemeal into the arms of the AFL. Such a struggle would intensify the union rivalry in plants and industries which many fear will in any case break out again as a result of the new disunity between AFL and CIO. Rivalries may also make things difficult for government officials and political leaders who will now once more have to deal with two groups instead of with one committee.

Shorter Notes

The 1948 Sugar Act has been extended to 1956; under this Act the Secretary of Agriculture estimates the requirements of American consumers each year and apportions marketing quotas among producing areas. The only important changes in the renewed Act are a slight reduction, to 96 per cent, in Cuba's share of the import trade, and increases in the quotas allowed from two United States dependencies, Puerto Rico and the Virgin Islands.

*

Congress has directed that within the next few months a Fur Product Name Guide shall be published, listing the "true English names" of the animals which masquerade as "mouton" and "lapin" when they are made into fur coats. Furthermore, sellers must say on the label whether the fur has been dyed and where it comes from. Hudson Bay seal will now be revealed as dyed muskrat (musquash to the British) and the buyer of a mink coat will know whether it is a democratic or a Communist product.

THE WORLD OVERSEAS

The Problem of the German Refugees—I

The Refugees' Place in the Federal Economy

(By Our Special Correspondent Recently in Germany)

FOR several years, it was universally asserted that there were 12 million expelled Germans—the so called *Vertriebenen*—in the Federal Republic, and that several million had died in transit. The statistical position is now more accurately established. Of the Federal Republic's 47.6 million inhabitants, 9,400,000, or nearly one in every five, are people who were not living there before the war. The Federal Republic's population is over 20 per cent more than before the war, though the density is still below that of Britain, Belgium and the Netherlands. The 9,400,000 are composed of 7,500,000 *Vertriebenen*, i.e. Germans evicted from the territories outside the four zones of occupied Germany ; 1,600,000 are people who have come over the border from the Soviet zone. This last figure continues to grow at the rate of about 200,000 a year. The remainder are displaced persons of non-German origin—about 300,000 in all.

The refugees are still extremely unevenly distributed, and plans for resettlement are badly lagging owing to lack of housing to receive them in other areas. A third of the population of Schleswig-Holstein still consists of its 840,000 refugees ; and Lower Saxony is close behind with 1,850,000 refugees, or 32.5 per cent of its population ; Bavaria has 1,900,000 refugees, or 21 per cent of its population. Only the French zone has a negligible number, as the French until recently took advantage of their exclusion from Potsdam to refuse to accept refugees.

Skill and Energy of Newcomers

A very distorted view of the situation is given if these statistics are not judged in the light of others, which show the astonishing extent to which the newcomers have found a place in the West Germany economy. So much have they enriched their new homeland with their skill and enterprise that it would now be a catastrophe were they to leave. Each of the overfilled *Laender* is in fact now debating whether it can afford to lose its refugees to any other *Land* in the redistribution plan ; each *Land* hesitates to relinquish able-bodied and often skilled workers, and the subsidy from the Federal Government which is supplied for their relief and housing. In a less decentralised state than the Federal Republic, such a question would not arise ; it would be plainly to the advantage of the nation (and the whole of the Western world) if unemployed, or under-employed refugees from, say, Schleswig-Holstein were to be moved for retraining as, say, miners in the Ruhr. But Germany lacks a strong central direction to carry out sensible reforms.

The refugees are too often depicted as a dead loss. This is unfair to the people themselves and to the local authorities who have done so much to aid them. The newcomers have contributed a considerable share to the national income, and to Germany's foreign trade. About 5 per cent of all handicraft establishments now belong to refugees. The famous producers of cheap jewellery from Gablonz in Czechoslovakia have secured a dollar revenue from exports which exceeded in one year the credits they obtained for re-establishing themselves in Bavaria. Silesian textile manufacturers have also performed extraordinary feats from a beginning made without machinery or capital. Of all the newcomers to the West, the farmers and landworkers have proved the hardest to place and the most discontented.

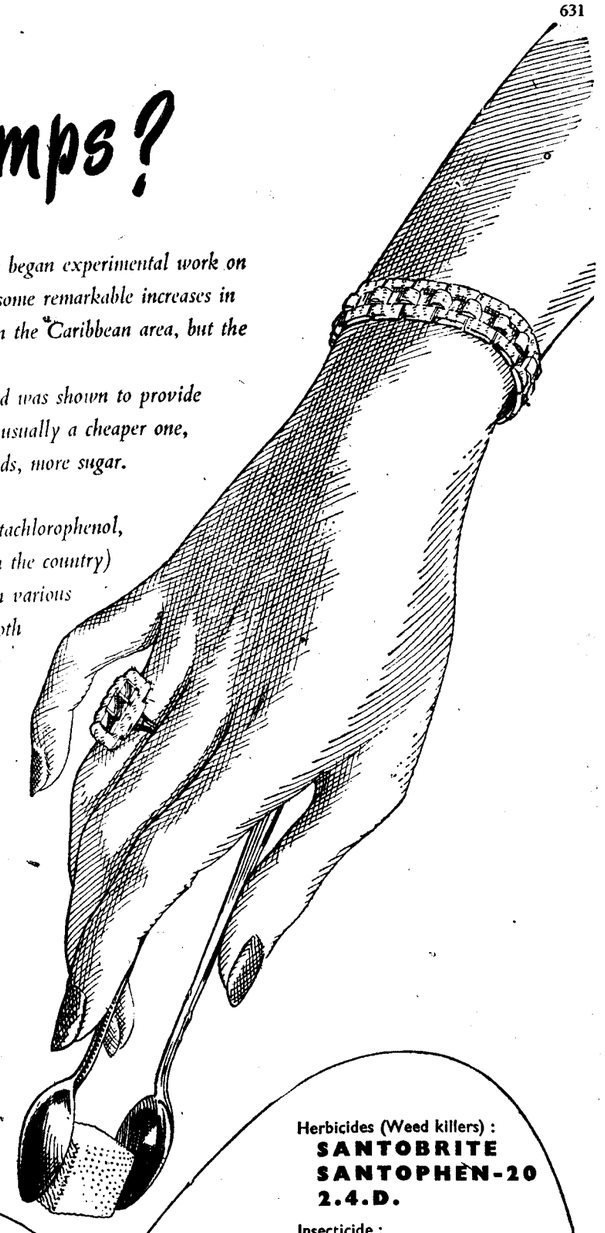
Since 1946, no fewer than 3,000,000 of the refugees have found employment. Unemployment among them (5 per cent) is higher proportionately than among the indigenous Germans, and accounts for about one-third of the total of 1,250,000 registered unemployed. It must be borne in mind, however, that the refugees usually secure seasonal work on the land, which is not always revealed to the labour exchanges. At the moment it is unusual to find more than a few unemployed among the campers in the cities or on the land. An unemployed refugee often thinks twice about taking on work, or about reporting it, if it does not bring in much more than the dole of DM70 per month (nearly £6) which he receives. The complaint is now heard that women refuse to go out as domestics except at impossibly high wages.

The Germans certainly exaggerate, therefore, when they depict an entire community verging on despair, without the barest elements of civilised existence. Those days are past. Camps now boast radio sets, and decent furniture. The valiant local authorities find it hard to shift families from the cities ; an independent life, even with four in one room, is naturally preferred to sharing with a reluctant householder. Is there, then, no real economic problem left to solve? To maintain this would be to exaggerate in the other direction. By any standard, the over-crowding in the cities is appalling, and moral deterioration is setting in among the under-employed in the country. Building already goes on very fast indeed, particularly where private capital is behind it. Last year, for example, the ground floor and first story of a luxury hotel in Hanover was built and occupied within eight days by dint of working 24 hours a day and laying bricks at twice the rate of British workmen. Some 300,000 flats were built in 1950, but 5,000,000 are still needed. And the stream of newcomers continues. About 5,000 a month pour into the frontier camp at Uelzen from the Soviet zone, all penniless and mostly under-nourished. With the British Resident as its benevolent guardian, Uelzen provides a good example of international charity in collaboration with selfless German workers.

There can be no excuse for not knowing how to tackle the residual economic problem of the refugees. A very detailed and excellent plan is available in the Sonne report, named after the American economist of Danish extraction, Christian Sonne. With a team of American experts, Mr Sonne prepared a plan for the Bonn Government early this year, as part of the ECA technical assistance scheme. His plan as a whole would take six years to carry out, and cost DM12.5 billion. (For the sake of comparison, occupation costs for the current year are estimated at DM6.6 billion, or about 6 per cent of the national income.) As housing is the first essential, the report proposes spending DM1 billion at once on building. Most of the unemployed could then be shifted to the places where jobs are available, and the rest integrated into the economy by planned investment.

Very guarded use is being made of the Sonne plan. It presupposes a preliminary expansion of credit, and the German authorities are determined not to take any risks with

How many lumps?



A year or two ago Monsanto agricultural chemists began experimental work on sugar plantations, and they have already assisted some remarkable increases in productivity. The tests were conducted mainly in the Caribbean area, but the results apply wherever sugar cane is grown.

Pentachlorophenol figured largely in these tests and was shown to provide a far more effective method of killing weeds, and usually a cheaper one, than the traditional hoeing by hand. Fewer weeds, more sugar. Lower costs, cheaper sugar.

Monsanto have pioneered the development of pentachlorophenol, which is now being produced (for the first time in the country) at their Newport works. It can be formulated in various ways, and for the Caribbean tests they used both Santophen-20 (pentachlorophenol) and Santobrite (sodium pentachlorophenate).

Santobrite and Santophen-20 formulations are easy and safe to handle by spraying and other methods of application.

Besides its usefulness as a weed killer, Santobrite is a most effective preservative for timber, and it is rapidly becoming a leading product in the new group of Agricultural Chemicals offered by Monsanto. These chemicals are an important addition to the wide range of Monsanto products, and add one more name to the list of major industries served by Monsanto.

Dictaphone TIME-MASTER leads both in efficiency and looks

BUSINESS MEN all over the country have found their ideas about office dictation changed over-night by the Dictaphone Time-Master. In terms of speed, ease and smoothness of working, Time-Master simplifies their whole office day.

But at the same time, Time-Master is such a neat machine—a trim streamlined beauty you can be proud of on your desk.

So small. The complete Time-Master is only 4¼ ins. high, slightly larger than a letterhead, and light enough to be easily portable.

So efficient. Time-Master records on Memobelts, expendable plastic belts that give uniform, crystal-clear recording, yet fold flat for mailing or filing without damage.

So dependable. Time-Master retains the tested Dictaphone principle of cylindrical recording and is backed by the Dictaphone reputation and service.

ONLY THE TIME-MASTER OFFERS ALL THIS

1. Streamlined machine, only 4¼ ins. high, slightly larger than a letterhead. 2. Uniformly clear recording and reproduction. 3. Uniform back-spacing, immediate place finding. 4. Simple automatic operation. 5. Mailable, filable, expendable Memobelts, low-cost plastic medium. 6. Nation-wide service, Dictaphone dependability.

Write for TIME-MASTER literature to Dictaphone Co. Ltd. Dept. O., 107 Kingsway, London, W.C.2.

the currency. Furthermore, it contains some acute and unpalatable comments on the regressive German taxation system ; if this were reformed, and no more were to be spent on defence, the report says, the whole plan might be financed from German resources, to the benefit of the social structure. The German authorities prefer to concentrate on one recommendation in the plan—that some foreign credit might be raised. As all the available first mortgages have gone to private builders, the Federal Government has asked the Americans to advance the comparatively small sum of DM400 million for this purpose, as a start. The answer has been a bitter disappointment ; the Germans were told that Congress would first want to see that some contribution was being made to Western defence by Germany, and that they were taking steps to implement their share of the Sonne plan. Hysterical abuse greeted this reply. For venturing to suggest that Congress was, after all, faced with a big bill for defence, the moderate Minister for Refugee Affairs, Lukaschek, has added fuel to a fire which threatens to consume him. The episode revealed the extent to which political passions dominate the refugee question.

(To be continued)

As India Sees the Treaty

[BY OUR CORRESPONDENT IN INDIA]

INDIA accepted Mr Nehru's decision not to go to San Francisco with the same unenthusiastic loyalty that it would have accepted a decision to go. Indeed it is said that Mrs Pandit, the Indian ambassador in Washington, and several members of the Cabinet urged signature but were overruled. The reasons for the lack of enthusiasm about Mr Nehru's decision are obvious enough. Most Indians have accepted Japan as an American responsibility, and they do not see why India should again make itself conspicuous over issues which do not particularly concern it. They feel that the distinction between a bilateral US-Japanese agreement over bases—which India is perfectly willing to accept—and the military clause in the treaty to which India objects is rather finely drawn. Nor are they altogether convinced by the logic of Mr Nehru's delicate distinction between Yalta, at which South Sakhalin and the Kurile Islands were definitely promised to Russia, and Potsdam where the Ryukyus and Bonins were only negatively taken away from Japan. People fail to see why Mr Nehru is so chivalrously determined to fight Japan's battles for it on issues where the Japanese themselves have mostly said nothing, or what in practice is the alternative to doing nothing about Formosa. Many, too, feel friendly towards America, especially after the wheat loan, and regret any increased friction between the two countries.

On the other hand, the reasons why Mr Nehru has been so loyally supported are important ; it is, for instance, a fact that only one major commentator has criticised his decision. Basically the reason would appear to be that Indians feel that the new treaty draws the lines of the cold war in Asia with uncomfortable clarity and uncomfortably near home. They do not in fact want to offend Peking. The Japanese, as they see it, are to be, not a bridge between America and China—probably an impossible aspiration anyway—but an American ally, more definitely an American ally indeed than anyone else on the mainland of Asia. There in Japan, instead of the varying degrees of neutrality and helplessness by which the Chinese Communists are elsewhere surrounded, they are faced with Asia's only great industrial power, now to be allowed to rearm in effective alliance with America, and to be made to serve as a base for American troops.

Korea, in Indian eyes, has shown what war means in Asia, but in Korea there are still hopes of truce. A Japan which harboured American bases and had made its treaty with the China of Chiang would inevitably be treated by Mao Tse-tung as a permanent enemy, at the very least to be subverted. Asia would be provided permanently with one of the very hottest frontiers in the cold war, hotter perhaps than Berlin itself. This is an unpleasant prospect for an India which both wants to be on the best of terms with America and also shares a very long frontier with China.

The other reasons for not going to San Francisco are less important. There has been some resentment at what appeared to be an American *diktat*—an invitation to a conference at which India could only sign on the dotted line ; on this issue, nevertheless, there has also been considerable appreciation of America's difficulties and motives. There has been considerable feeling about colonialism, still an ever fresh issue in Indian minds. An American trusteeship over the Ryukyu and Bonin Islands, whose inhabitants have for so long been Japanese, rouses too many echoes of the imperialist past for impartial examination of its justification. It is, however, some sign of India's growing self-assurance, of its capacity to forget the past, that these motives alone would never have prevented anybody from going to San Francisco.

Certainly India has no desire to line up with Russia over this treaty. It has been officially pointed out, for example, that India has raised no objection in principle to Japanese rearmament, and the fact that there would be a defence agreement with America was generally taken for granted. Some Indians even argue that one of Mr Nehru's reasons for refusing to go at all was that he did not want to be put in a position where, on certain issues, he would be alone with the Soviet bloc. It would be quite wrong to say that Mr Nehru's India is being anti-American in order to be pro-Russian.

Progress in the Philippines

THERE was never much doubt that the Philippines would sign the Japanese peace treaty at San Francisco. But their representative, General Carlos Romulo—president of the United Nations' General Assembly in 1949—did so only with the strongly-expressed reservation that the Philippines must retain the right to negotiate with Japan for war reparations at a later date. This episode is typical of the strong yet difficult position in which the Filipinos find themselves. It is strong because they can rely on American support to protect them from invasion and at least to buttress their economy just enough to prevent its collapse. It is difficult because the Filipinos are quite as conscious of their new nationhood as any of their neighbours on the mainland of South-East Asia and do not relish undue American tutelage ; because they are in a state of chronic civil war against the Hukbalahaps ; and because the administration of their economy has been so corrupt that the United States has imposed certain conditions as the price of renewing its aid.

At the end of last month a new period opened in the history of the Philippines' relations with Washington, relations which form the basis of all Filipino foreign policy. In the presence of President Truman and President Quirino, Mr Acheson and General Romulo signed a mutual defence pact similar in nature to that which the Americans have now also signed with Australia and New Zealand. Taken in conjunction with the security pact, signed by America and Japan in San Francisco immediately after the peace treaty, this put the Philippines firmly and formally within the ring of American defences in the Western Pacific. This, however, does nothing to quell the internal revolt of the *Hukbo Mapagpalaya Bana*, alias the Peoples' Liberation Army, the Hukbalahaps or just plainly the Huks. This is still going strong and, while the government forces are now doing better than a year ago largely as a result of the new drive put into the campaign by the energetic Secretary of Defence, Mr Ramon Magsaysay, there is no sign yet of an end to the revolt.

The government has now deployed 24 special battalions, each about 1,000 strong, against a Huk force variously estimated at between 10,000 and 20,000 men. In recent months, the Huks have been broken up into smaller groups, they

have lost ground in their original stronghold of central Luzon, and some of their political leaders have been executed or deported. They have no firm base from which a determined government drive cannot flush them ; and their relative failure to check agricultural production, even in the main rice area of central Luzon, is shown by the steady rise in the Philippines' rice production from 1,623,000 metric tons in 1946 to 2,606,000 last year.

On the other hand, support for the Huks has now spread to some of the other islands including Cebu and Mindanao, the rate of damage to property in Luzon continues very high, deliberate attacks have begun to be directed against foreigners, and, above all, there is more and more evidence that the Communists are extending their grip over the movement. Based on the poverty of the peasants, the Huks emerged at the end of the war as militant agrarian reformers. Since last November, however, the *Partido Komunista*

Filipinas—the PKF—has managed to organise a system of regional commands under a Central Committee, of which the head of the Politburo, and secretary-general of the party, is Dr Jesus Lava. Also on the Committee's secretariat is Luis Taruc, one of the original Hukbalahap leaders. The Party takes its line from Peking.

A year ago the Philippines reached a very low point in their post-war economic story. American aid was coming to an end and corruption was rife. The aid had run to a total of no less than $2 billion over the previous five years, largely in respect of war damage compensation, but nevertheless a fantastically large sum compared with the amounts being given even now as aid to the whole of the rest of South-East Asia. Since then, in order to meet the requirements of the report made by an American economic mission under Mr Daniel W. Bell last October, the Philippine Government has taken three distinct steps to put its house in order. These have paved the way for an immediate grant of another $15 million of American aid and the prospect of a further $250 million over the next five years ; $25 million worth of military equipment is also scheduled for delivery this year.

The first step was to pass a minimum wage law, long overdue. The second was to increase corporate income and excise taxes ; the corporate income tax is now 20 per cent on profits up to 100,000 pesos and 28 per cent on higher figures. Lastly, the administration of import controls has been greatly tightened up, largely under the guidance of Mr Miguel Cuaderno, Governor of the Central Bank ; certain export controls were also imposed in June. From a balance of payments deficit in 1949 of 665 million pesos, the figure was reduced to 27 million pesos for last year, and, aided by the commodity boom of the Korean war, looks like turning into a surplus this year ; in the first five months there was favourable balance for the first time for ten years. None of these measures takes the Philippines out of the wood. But combined with the improvement in the Hukbalahap campaign they do hold out hopes that, if, as now seems possible, the Communist onslaught on South-East Asia can be checked, the Philippines will share in the renewed atmosphere of confidence and prosperity.

The Dutch Economic Scene—II

Government and Investors

[FROM A CORRESPONDENT]

An essential part of the economic plan introduced in March this year (discussed on page 569 of *The Economist* of last week) was a 5 per cent cut in the level of consumption and a 25 per cent cut in the level of investment. In trying to carry out this plan, one of the government's main difficulties has been the fact that, while it can tackle consumption more or less directly, through the subsidies, it has no direct or immediately effective approach to private investment. Yet for political as much as for economic reasons, the success of the whole plan may be prejudiced by failure in this field.

The present Cabinet which produced the March plan is *par excellence* a coalition—comprising six Catholics, five Socialists and four others (Protestant, Liberal and Independent); and its plan, like itself, was in consequence an uneasy compromise between a right-wing and a left-wing approach, with the bias if anything to the right. The methods by which it proposed to deal with consumption were more direct and more obvious than those which it prescribed for investment—if only because, under the conditions of minimum state intervention in the economy in which it believed, consumption was the easier target. But it is precisely on this point, on the weakness of its control over investment, that the socialist party and the trade unions—whose good will is vital—have concentrated their attention.

It would be unjust to say that the government has made no progress on this issue ; but at best, its progress has been slow and fumbling. Since January, 1951, a form of credit restriction has been in operation through the Central Bank. A few months ago, a bill was introduced designed to enforce this restriction and to keep the commercial banks more closely in step with central policy ; but parliament has so far done nothing about the bill except to submerge it in bitter political wrangles. It is true that a few weeks ago, parliament finally accepted proposals for heavier taxation on industrial enterprises ; but, while this may or may not prove to be an effective disincentive to investors in the future, it may have hardly any effect on investment projects already in progress and will certainly do nothing to relieve the immediate inflationary pressures.

It is thus impossible to predict how far the measures so far taken will ultimately be successful. All that can be said is that recent trends have been in the opposite direction. In 1950, credits extended by private banks to industry were 450 million guilders more than in 1949, and they increased by a further 187 million guilders in the first quarter of 1951. That this is a manifestation of a consistent trend since 1947 is illustrated by the following table, even when allowance is made for the declining real value of money.

Thus in 1950, private investment was 40 per cent higher than in 1949, while for the same period total national income available for expenditure rose by only 12 per cent, and personal consumption by 10 per cent. A large proportion of this increased investment, however, can be attributed to the exceptional circumstances induced by the post-Korean boom ; of a net private investment of 3.5 billion guilders in 1950, it is estimated that between 1 and 1.5 billion guilders was actually spent on exceptional purchases for stock. Here, therefore, is one field where it should be comparatively painless to achieve a saving.

See business figures as news, not history

TO REMEMBER the past is good; to cherish its practices is bad and, in office departments, to put up with annual accounts, when you could have them monthly, or even daily, is to hang on to the past. Yesterday's methods of accounting and calculation mean that vital figures are never available when wanted. The result is waste. Waste of staff; waste of time; waste of money.

Burroughs are in business to make figures *news*. They have expert advice to offer on the adoption of an accounting routine that will serve you best. And they can install business machines that solve any figuring problem—faster.

Burroughs are known all over the world. Wide experience of the changing needs of business helps them to solve localized problems *faster*. And to provide an on-call maintenance service that keeps their machines on the job all the time.

IT COSTS YOU NOTHING . . .

Many economies can be made in office departments — but problems cannot be solved until they are clearly defined. The Burroughs publication "Ways to Save Time in an Office" contains useful advice for office management. This booklet can be obtained, free of charge, from Burroughs Adding Machine Ltd., Avon House, Oxford Street, London, W.1.

We've solved some problems in our time!

WANTED: two 6 volt batteries to power a pair of electronic tortoises. Queerest, perhaps, of all the demands that the Chloride Company has met in more than 50 years of pioneering new uses for the electric storage battery. But not, as it proved, a difficult problem. Elmer and Elsie, brain children of Cybernetics research worker Dr. W. Grey Walter, asked nothing of us but a reliable battery apiece. We fitted each with an Exide.

¶ You will meet the robot tortoises at the Festival Exhibition of Science in the South Kensington Science Museum. You'll see how Elsie leaves her hutch to investigate any extraneous source of light. How she gently, persistently butts her way past every obstacle that intervenes. How, when her output of energy leaves her feeling a little run-down, she returns of her own accord to her hutch, hitches up to her trickle charger and can't be coaxed out again until she has fully recuperated. Sensible Elsie! An Exide type, we like to think. A really *reliable* little tortoise.

* * *

On the South Bank Site Chloride, Exide & Exide-Ironclad batteries have been chosen to power the emergency lighting & crowd counting systems and to provide the subject of many exhibits.

But apart from this, it may not only be difficult to implement cuts ; it is an open question whether it is wise to try to do so, except on a highly selective basis. Holland is now the most densely populated country in Europe, with the highest birth rate and the lowest death rate (the population of 10½ million is increasing at the rate of 150,000 a year). Furthermore, as there is virtually no unused capacity in the Netherlands, the government is pinning its faith on a substantial increase in productivity both to compensate for the deterioration in the terms of trade (about 20 per cent over the last year) and to soften the impact of rearmament.

(Concluded)

Nations United Against TB

AFTER four years of work in twenty-two countries, the international campaign against tuberculosis jointly conducted by the United Nations and the Scandinavian Red Cross has been officially wound up. In a world full of plans for international betterment which never get beyond the committee stage, this campaign has been a shining example of what can be done with modest resources by a small group of men and women dedicated to an idea which transcends frontiers. Some 16,700,000 children and young adults in countries ranging from Ecuador to India have been vaccinated with the new BCG vaccine, after more than twice that number had been tuberculin-tested so that vaccination could be confined to those to whom it could give effective protection.

The campaign, which began as a purely Danish enterprise in the spring of 1947, quickly showed its worth in the disease-ridden Europe of the first postwar years ; as more appeals for help came in, the Danes were joined first by the Swedish Red Cross and Norwegian Relief for Europe and then, early in 1948, by the United Nations Children's Fund and World Health Organisation. The total UN contribution has been £1,000,000, and that of the Scandinavian groups £640,000, while the governments of the assisted countries have matched or slightly exceeded these sums ; the whole cost of the campaign has only been £3,500,000.

Now the Scandinavians are withdrawing, but the United Nations is continuing the work on a similar scale. There has been a steady shift of emphasis from postwar Europe to selected areas in Asia, Africa and Latin America. While only a beginning has been made with the immunisation of the vast child populations of these regions—some 1,250,000 have been vaccinated in India, 1,010,000 in Morocco and 610,000 in Egypt, to cite only three countries—the scale of operations in the East may yet exceed what has already been accomplished. For the stimulus of international aid has led many governments to take BCG vaccination in hand themselves, and eighteen of the twenty-two countries are continuing the work begun during the joint campaign.

In addition to the main UN tuberculosis centre at Copenhagen, regional centres are being set up in India, Egypt, the Philippines, Mexico, Ecuador and Uruguay, where medical workers will be trained and vaccine manufactured for use in neighbouring countries. The international teams sent out by the UN and the Red Cross have already trained large numbers of local doctors, nurses and medical orderlies in the simple techniques involved, and in most countries those who first received training are passing their knowledge on to a widening circle. Trained personnel are, indeed, a more important limiting factor than cost ; even the poorest nation can hardly claim that the campaign represents an intolerable financial burden, for the vaccine itself costs only about 4d. per head, and no expensive apparatus is required.

Reports and analyses reaching the UN's Copenhagen tuberculosis centre are already showing the effects of the campaign. Special valuation surveys have been made in Denmark, Finland, Egypt, India, and other countries, and these are expected to yield valuable information not only on the success of the BCG vaccination drive but on the whole question of the incidence and prevention of the disease in varying climates and circumstances. Never before have such a large number of people, in so many different geographical areas, been subjected to such uniform treatment with such uniform materials ; the opportunity which this fact offers to scientific investigation is obvious.

As usual, some doubts may arise as to the wisdom of trying to save so many people from disease in countries where the pressure of population on food and other resources is already severe. But in the case of TB economic arguments can easily be found to support the overwhelming moral case for reducing human suffering. While TB is admittedly a great killing disease, it weakens and cripples far more people than it kills, and most of its victims thus become unable to play their full part in production—which, in Asia, usually means the production of food. If these millions can be saved from becoming useless or near-useless charges upon their communities, the international tuberculosis campaign will have made an outstanding contribution to the economic advancement of the poorer countries.

THE BUSINESS WORLD

The New Aircraft

THIS year marks the tenth anniversary of the first flight of a jet-powered aircraft; it will be remembered in future as the year when rearmament brought back to the aircraft industry the prosperity that it lost at the end of the war. The annual air display at Farnborough, the focal point of the aviation year, is being held this week in an atmosphere of excited interest that makes any attempt at critical assessment difficult and seemingly carping. But the display and its accompanying exhibition provides the most convenient stage at which the year's progress can be reviewed. Most of the aircraft on show are in production, though several are being seen in public for the first time. This state of affairs is in marked contrast to previous displays, when prototypes far outnumbered aircraft actually in production. The aircraft exhibited this week are the nucleus of the new air force; they represent the culmination of plans laid at the end of the war when contracts for their development were first given to the industry. By 1952, when the heavy jet bombers are expected to appear, the pattern will be complete.

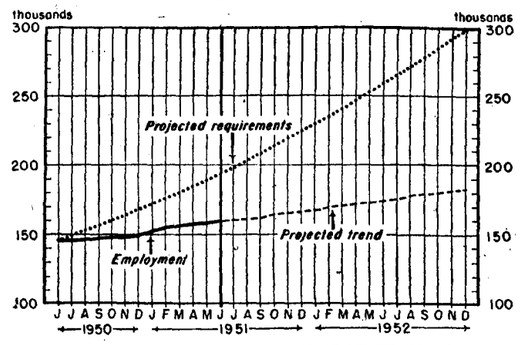
British supremacy in aero-engines, which dates from the late twenties and not simply from the debut of the gas turbine, has not always been matched by supremacy in airframe design. It is a new mark of the development of the aircraft industry that engine designers now acknowledge that the new airframes are the first since the war to be satisfactorily matched to their engines. A native British school of design has developed during this past decade, its distinguishing feature being a cleanness and sweep rarely matched by designers of any other country. This feature has a more than aesthetic appeal; it is of primary importance in high-speed flight and wedded to engine performance it accounts for the great interest shown by the United States army and aircraft industry in British designs.

The Farnborough display leaves the strong impression that the leading companies of the year are Rolls-Royce and Vickers-Armstrongs. The Rolls-Royce Avon engine powers each of the new military jet aircraft. It is the standard engine of the new air force with the Armstrong-Siddeley Sapphire as its alternative. Vickers are putting three new machines into production: the Valiant bomber, openly described as an atom bomb carrier of great range and speed, with four Avon engines giving a combined thrust of about 30,000 lb.; the Avon-powered Swift fighter; and a new twin-engined 508-type fighter for carrier operation. Besides these types, the company has in production a slower carrier-borne fighter, a trainer, and the Viscount turbo-prop airliner. This versatility is not matched this year even by the Hawker Siddeley Group. The Hawker company itself, the rival of Vickers' Supermarine works since Spitfire-Hurricane days, is putting the Avon-powered 1067 fighter into production. This has been built to Ministry specifications identical with those of the Swift; competition between the two companies for fighter orders, it seems, has for once ended in a draw. The performance of the two machines is believed to be unequalled by that of any other fighter in production—a claim that cannot be judged solely by displays at heights of a few thousand feet, for these fighters will operate at ceilings of seven to eight miles.

In the years since the war, the ordering of an aircraft has meant employment for the company responsible for its design and the likelihood of unemployment for the others. With the revival of rearmament, employment is being spread evenly over the industry through a highly developed system of sub-contracting. The Rolls-Royce Avon engine is being built in factories run by Napier, Bristol Aeroplane, and the Standard Motor Company. The Armstrong-Siddeley Sapphire engine will be built in the plant of a Hawker Siddeley company that once made pre-fabricated houses. The de Havilland Venom fighter will be built by Bristol Aeroplane. The English Electric Canberra bomber is being built by Handley-Page, A. V. Roe and Short Brothers. Orders for Meteor fighters have been distributed to other companies within the Hawker Siddeley Group. When production of the new bomber and the fighters is under way, this method of sub-contracting will be extended. In addition, there are specialised companies that make sections of aircraft, such as wings, for assembly by the big constructors.

This system serves two purposes: it provides employment for the resources and skill of companies that have no designs of their own ready for production; and it ensures the best use of the industry's large assembly capacity. Although the aircraft construction programme is heavy, the industry is not likely to be too heavily pressed for factory space. Only one new engine factory is being built from the ground upwards, and while factory extensions and conversions may take place between now and 1954, no large-scale building programme is necessary. Less, too, is being heard of threatened bottlenecks in the delivery of tools and of materials. Tools for engine production lines are apparently arriving on time; those for airframe production are so much more simple that they have never caused concern. The general shortage of nickel and high-duty steels has prompted members of the industry to express equally general fears about the adequacy of future deliveries to meet rising production but there are other grounds—and probably sounder ones than this—for questioning whether the industry will be able to fulfil the rearmament programme on time. One is concerned with production techniques and the other with labour supplies.

Production of the new airframes involves no new techniques but the engine programme means putting into mass production a gas turbine power unit which is the product of a branch of engineering that has never before been adapted to quantity production. This fact could result in production delays while tooling techniques are evolved for some of the more complicated components. Essential accessories, like fuel pumps, might be very short until the accessory suppliers were able to adapt their plants to meet greatly expanded demand. This journal has not escaped criticism for emphasising the difficulties of producing the several million compressor blades a month that will be needed for the new engines; but it is still the plain fact that such a great physical volume of blades involves production problems as yet unsolved.



The dilemma of the moment is undoubtedly the supply of labour. The number of extra workers needed for the aircraft programme is not known with accuracy, but the most common estimate of an extra 150,000 may well be too low. The accompanying diagram shows that even if this total were enough, the modest rate at which the industry's labour force has been expanding since rearmament started in mid-1950 will be wholly insufficient to provide it. Fewer than 40,000 extra workers will have been recruited by the end of 1952 if there is no improvement in recruitment. Pressure varies from one company to another. Companies such as de Havilland and Handley-Page, with factories near London, may find men easier to get than, say, Bristol Aeroplane, whose plants are in an area that is less densely populated. The labour problem in some other districts is not so serious that it cannot be solved by the building of a few extra houses or the attraction of workers from other occupations. The industry no longer expects to recruit trained workers, and many of its heaviest demands for labour are for operations that involve little more than elementary machine minding; this explains the gradual transfer of certain plants to areas where there is no tradition of skilled engineering but where there is a supply of adaptable and easily trained labour. In spite of these measures, the figures show that a grave and growing gap exists between the probable supply of labour and a moderate assessment of the industry's requirements. Many people in the industry assert that the gap cannot be closed by the unaided efforts of the industry, and the campaign for some form of direction of labour, which is certainly unpalatable and may also be inopportune, is gaining considerable support. The alternative appears to be to spread the construction programme over a longer period.

*

What of the future? The British aircraft industry is this week receiving proper credit for its achievements in military and civil design and its whole pre-occupation is with expansion. This prosperity, which has brought back pride and self-confidence to what was a sadly dispirited industry is being built on the foundations of a rearmament programme that is due to end in 1954. Unless war has broken out by that date, the tremendous tempo of production for which the industry is now working might be brought to a more or less abrupt halt, leaving each company elaborately equipped, fully tooled; heavily staffed and unemployed.

This is a possibility that must be squarely faced. There will always be redundant capacity in the industry in peacetime; but need there be as much as there was in 1946? Before the present emergency, exports of engines and of aircraft were becoming substantial. Parallel to this growth in exports was the sale and licensing of British designs abroad. The granting of licences has increased since commitments at home forbade the further export of complete aircraft; the most important development here is to be found in the licensing agreements made with the United States, from which the industry has gained as much in prestige as it has in hard cash. Many of the leading British engines, from the wartime Rolls-Royce Merlin piston engine to the untried Bristol Olympus jet, have been either licensed or bought outright for production in the United States. The same practice is now being followed in the licensing of British airframes. The licensing of the Canberra design in America could easily be the first of a series of similar design exports; in particular, American interest in the Valiant has been very great and more than one American manufacturer would be prepared to negotiate for a grant of the Comet design if de Havilland were willing to part

LABOUR FOR AIRCRAFT

with it. The sale of designs, however, will not keep British factories employed.

Apart from the export of certain types of military aircraft to countries in Asia, South America and the Middle East, civil aircraft are the chief means of filling British factories in peacetime. Thus it may be that the industry will in a year or two have to face the prospect of employment for a few and disappointment for the rest of the industry. The only big civil market is for machines like the de Havilland Comet and the Vickers Viscount, both with Rolls-Royce engines and both judged to be supreme of their class. Orders for these aircraft are now coming in slowly, but may expand more rapidly when the British airlines put them into scheduled operation within the next year. Because of the importance of these sales, the two companies will probably find that their civil building programmes will not be seriously affected by the pressure of military production. The turbo-prop version of the Handley-Page Hermes may have a promising future, and the Bristol Aeroplane company is carving out for itself an important place in the helicopter industry. Bristol, together with Blackburn and General Aircraft, is seriously engaged on freighter design and production, for which there should be a fair civil market, and Bristol engineers maintain that the freighter type is the aircraft most suited for the new "tourist" class travel. All these are secondary markets. This fact promises cold comfort for the bulk of the aircraft industry unless military customers can be found. It is not a wholly encouraging picture in this time of bright optimism. The Farnborough show has proved clearly that the British aircraft industry has designing ability of a calibre not surpassed in the world. It would be disappointing, indeed, if the industry's commercial ability was not equal to the task of finding a world market for its products.

Fund and Bank

AN interesting contrast has been observable between the proceedings at this week's meetings in Washington of the International Bank and the International Monetary Fund. The reports that have come from Washington, abbreviated though they have necessarily been, make it clear that a robust self-confidence has been the keynote at the Bank meeting, while a certain amount of self-criticism and a note of apology appears to have marked the discussions of the IMF. This contrast is not surprising. The Bank, as shown by the record of its activities over the past year, is doing a full-size job and as such it received a commendatory pat on the head from President Truman in his inaugural speech at the annual meeting. If there is today any real substance in the President's "Point Four Programme," it is the lending activity of the International Bank that provides it. By contrast with this activity, the Fund in the past year seems to have been inert.

The chairman of the IMF board of Governors, who this year is Mr Douglas Abbott, the Canadian Finance Minister, this week took up a defensive attitude from the first sentence of his opening address. He acknowledged that during the year the Fund had engaged in only one new exchange transaction—a sale of £10 million of sterling to Brazil. For the rest, in accordance with its Articles of Agreement, the Fund has unwound some of its earlier business ; member countries have been repurchasing balances of their own currencies previously sold to it. At first glance, it might be felt that this inactivity of the Fund is a cause for gratification. In a classical banking structure, if the lender of last resort transacts no business, the implication is that there is stability and equilibrium in the money market. And in the mechanism for settlement of international balances of payments, the IMF is supposed to be in the position of such a lender ; its role is to give relief by furnishing the currencies in short supply when all other channels have proved inadequate to meet the need. Unfortunately, any such reassuring explanation of the inactivity of the Fund will not pass scrutiny. International balances of payments are far from enjoying that natural equilibrium in which the lending functions of the Fund would be, for the time being, necessarily inert. The main reasons for this inertia—apart, of course, from the limitations set by the Articles within which it works—must be sought in such developments as the conscious decision to withhold sales of dollars to European countries so long as Marshall aid was in operation.

In Washington last week, there seems to have been a concerted attack on the policy of the IMF by members of the British Commonwealth—with Sir Leslie Rowan, a second-secretary of the British Treasury, as principal spokesman. The gist of his criticism appears to have been that the Fund's resources should be used in a much more active manner for the purpose of international stabilisation and, in particular, that they should be used to minimise price inflation and price fluctuations and to ensure stability both of international exchanges and of balances of payments. This is a great deal to ask of the IMF ; and it has doubtless been remarked in Washington that the request comes from representatives of member countries that have all along shown strong resentment of any suggestion for delegation of national autonomy to this or any other international institution. There is a good case for demanding that the Fund should act more effectively as a provider of scarce currencies, especially now that civilian aid from the United States to the rest of the world is dwindling to negligible proportions. But the remedies for inflation, for undesirable price fluctuations and for instabilities of balances of payments, must be found by each member country concerned without any delegation of responsibility. The basis for such remedies must be laid in sound domestic financial and budgetary policy, and the governments concerned cannot evade their responsibility for taking unpalatable action at home by appealing for new forms of relief from international bodies.

*

In this phase of inertia in the sphere of actual business, the work of the Fund has perforce been focused upon its supervisory, not to say hortatory, functions. Abundant evidence of work in these spheres is to be found in the latest report of the executive directors, as well as in some of the formal speeches made in open sessions of the governors' meeting. As was to be expected, the Fund's report has a great deal to say on the problem of world inflation and of the methods by which it should be countered. Since this inflation has been accompanied by widespread scarcity of essential goods and by violent swings in prices and in the terms of trade, the Report admits that some measures of direct control may be necessary ; but it emphasises that "their existence involves a risk of uneconomic use of resources in the civilian sector." The executive directors therefore firmly side with the orthodox, and rapidly spreading, view that "in the face of a pervasive price increase caused by a generalised excess of effective demand, reliance should as far as possible be placed on monetary and fiscal measures in order to counteract inflationary tendencies." These sentiments, which must have received the approval of Britain's representative in the Fund, scarcely harmonise with the latest shift in British domestic policy.

The executive directors have some harsh and effective comments to make on the suggestion that member countries should try to escape from the perils of inflation —in particular from those of "imported" inflation—by raising the exchange value of their currencies. The Report points out that many of the spokesmen of this school of thought are to be found in countries whose exchange rates are still supported by the crutches of exchange control and discriminatory import and export licensing. The great majority of countries do not have strong and persistently favourable balances of payments maintained without the help of restrictions ; currency revaluation, it is declared, would weaken their balances of payments further. The menace of world inflation calls for concerted deflationary measures. It cannot be countered by mere reversal of the tactics of the 1930s—when, through competitive devaluation of their currencies, the principal countries of the world tried to escape the hardships of deflation but were successful in doing so only to the extent that they foisted them on their neighbours. Indeed, the creation of the International Monetary Fund was itself due in no small measure to the realisation that the world had been ill-served by the exchange policies of those years ; the executive directors now see in the competitive revaluation proposals an exact counterpart of those earlier and defective policies.

The Fund report also replies at some length to the contention that, since no calculation of correct or natural exchange parities can be made in present circumstances, no useful purpose can be served by attempting to impose rigid parities on member countries. Needless to say, this argument is attacked root and branch, since it strikes at the whole basis of the philosophy of Bretton Woods. The executive directors point out that "there is no such thing as a natural level for the rate of exchange of a currency."

> The proper rate in each case will depend upon the economic, financial and monetary policies followed by the country concerned and by others with which it has important economic relationships. If the economy of a country is to adapt itself to a given exchange rate, there must be time for the producers, sellers and buyers of goods and services to respond to the new set of price and cost relationships to which the rate gives rise.

The report adds that when a rate of exchange becomes clearly inappropriate, the provisions of the Fund's Articles are sufficiently broad to permit any necessary and justifiable changes in par values. It also points out in parenthesis that in the arguments for fluctuating rates there is generally the implicit assumption that some major currency will remain stable in terms of gold, to provide a point around which to operate the fluctuating rates.

The problem of exchange restrictions has naturally figured prominently in the report of the Executive Directors and in the deliberations in Washington. In March, 1952, as an article in these columns recalled a fortnight ago, all member countries that maintain restrictions on current payments are required by the Fund's Articles to secure its assent to their retention. In its comments on this issue, the Fund keeps the flag of convertibility and nondiscrimination fluttering bravely. It "retains the conviction that, despite strong postwar tendencies towards bilateralism and restrictionism, there is much to be gained from the pursuance of trade and payments liberalisation and the reduction of discrimination." Moreover, President Truman urged in his inaugural address that no member of the Fund should use the pretext of rearmament to justify trade and exchange restrictions not needed for defence. Mr Douglas Abbott was even more forthright, declaring that "in certain cases members have not moved as rapidly towards achieving the aims of the Fund through the elimination of exchange restrictions and discriminations as their circumstances would have permitted." The main target for Mr Abbott's shaft was evidently Britain ; the most effective defence against it was to let the facts speak for themselves. Sir Leslie Rowan accordingly pointed out that the sterling area's dollar balance of payments for the third quarter of this year would be substantially in deficit. This, he said, would prove the contention that the dollar and gold earnings of the sterling area in the first and second quarters were abnormal, so that Britain was not yet in a position to lift exchange restrictions.

*

On the highly controversial subject of gold, the Fund report sheds little additional light. It refers to the decision of the Executive Board last March, when it declared that the existing arrangements and practices of several countries that sell their gold at premium prices "are no longer a satisfactory basis to implement the Fund's gold policy." This subject was still under investigation when the Annual Report was prepared. Whatever may have been said about the problem of premium gold sales in Washington has evidently been uttered discreetly in closed sessions. There have been reports from Washington that the Fund may relax its stand against free sales of gold in the world's markets, but any such arrangements are unlikely to involve more than the extension to all gold producing countries of the special facilities accorded to South Africa. The one definite statement about gold that has emerged from Washington has come from Mr John Snyder, Secretary to the US Treasury, who affirmed that he saw no reason to change the oft-repeated view of the United States that its own official price for gold should remain unchanged at $35 an ounce.

In contrast with the somewhat fevered and controversial agenda of the IMF, the proceedings at the meeting of the International Bank for Reconstruction and Development seem to have been peaceful and congratulatory. The Bank's report covers a year of record achievement, a year in which 21 loans, totalling the equivalent of $297.1 million, have been made to 11 countries. These activities, now recounted in the Bank's report, have already been traced in repeated comments in these columns as they occurred. A more interesting aspect of the report is the account of the Bank's activities in the field of technical assistance, in response to the obvious fact that, in the development of underdeveloped countries, it is more often the lack of trained personnel than of capital resources that provides the main obstacle.

Commercial Bank of Australia

EVERY DESCRIPTION OF BANKING BUSINESS TRANSACTED
Trusteeships and Executorships Accepted

The Bank has in consequence sent out a number of specialised missions to study specific aspects of the development programmes of the countries with which it has been concerned. It has arranged study groups or seminars in which specialists from member countries have exchanged views with the staff of the Bank. It has sent Bank staff to member countries for extended periods to help in carrying out specific development projects. Finally, the Bank has participated in the first of a series of training institutes designed to acquaint government officials of underdeveloped countries with the techniques of framing programmes and of controlling projects. Some this work has already yielded fruit. The reports of the survey missions to Colombia, Turkey, Guatemala and Cuba have been published, a report on Iraq is almost complete, and further survey missions to Ceylon and Surinam are being organised. This is real spadework, which it is to be hoped will merge more and more intimately with the similar work being done by the Commonwealth countries towards the Colombo Plan.

Business Notes

Riposte to Persia

Dr Mossadegh's "ultimatum," by decisively confirming the breakdown of the negotiations with Persia, gave the signal for a firm counterstroke by the British Treasury. It was announced on Monday evening that certain special financial and trade facilities previously extended to Persia were to be withdrawn forthwith. The official announcement emphasises that these measures are neither reprisals nor sanctions; and, although the Persians will doubtless think otherwise, there is substantial justification for this contention. Throughout the period of British exchange control, Persia has been accorded a privileged status in its relationships with the sterling area and the British system of international payments, a status reflecting the importance for Britain and the sterling area of the supply of Persian oil—"sterling" oil. The dollar-saving value of this oil for Britain was the means of securing for Persia quite unusual facilities for use of the sterling payments mechanism and for access to the British market. Persia was not only admitted at an early date to the select circle of "transferable account" countries, giving it freedom to buy and sell in sterling throughout this area as well as the sterling area, but also enjoyed a special right to convert its sterling balances into dollars—a privilege not normally available to countries outside the sterling area. This right of convertibility was subject only to the provision that the dollars were needed to buy essential goods not available "on equal terms" within the sterling area—and it is understood that in practice this condition was not enforced at all rigorously by the British authorities. In effect, therefore, British trade with Persia was tantamount to "dollar" trade—a situation that was emphasised by the fact that Britain gave Persia especially favourable access to supplies of certain scarce goods in the British market (notably sugar, machinery, steel manufactures and vehicles and locomotives). Finally, Persia's sterling balances, now estimated at about £15 million, have long been protected by a gold valuation clause.

Since these special facilities were the *quid pro quo* for the receipt of "sterling" oil, and the flow of oil has stopped, most of the privileges are being withdrawn. Under the Orders made this week, the facility for conversion of Persian sterling into dollars is suspended, and so is the right to buy scarce goods in the United Kingdom. The supply of such goods has been cut off by the revocation of outstanding export licences. These measures follow in strict logic from the stoppage of oil supplies, and the Treasury states that the suspension of dollar facilities makes it necessary for all payments of sterling to or by Persia to be made subject to specific Treasury sanction. This device—which, if utilised to the limit, would impose a complete blocking of Persian balances—is to be used also to ensure that Persia cannot employ sterling facilities to further any plans it may hope to mature for selling its oil direct. The strict logic of the Treasury argument is not readily apparent here, but the action itself is unquestionably justifiable—even if the justification is measured merely by the direct loss of dollars in which Britain is being involved in the effort to secure alternative supplies of oil. In any case, the Treasury declares that this power to stop Persia's use of sterling will normally be used in such a way as to allow all transactions except those involving dollar convertibility or oil. The "intention is to limit the harm which has been caused to the United Kingdom economy by the actions of the Persian Government"—and the measures can be revoked whenever Persia makes possible a solution of the oil dispute. These measures may not be sanctions, but they show that a big stick is not far out of sight. The next move is up to Dr Mossadegh—or his successor.

* * *

Confusion and Dividends

Confusion about dividend control becomes weekly more confounded. The draftsmen cannot be enjoying themselves as they proceed with the bill. As for the investor, there is little light that he will gain from the Treasury's latest pronouncement. After recently praying in aid the Capital Issues Committee to make sure that new ordinary shares are not issued on generous "rights" terms that might create a loophole by which control could be partially avoided—a piece of Pooh-Bah departmental expediency that is of the most dubious character—the Treasury has this week let fall the fact that wholly owned subsidiaries will be exempted from the provisions of the bill. This is not so much a concession but simple common sense. It remains to be seen, however, whether it goes far enough, for there are many cases, even in the biggest industrial groups, where there remains some small residual public interest in companies that are, for all practical purposes except the Chancellor's, wholly owned subsidiaries of the parent concern. The sensible flexibility that is offered to wholly owned subsidiaries will, it seems, be denied to others where a dividend increase substantially accruing to the parent company for further distribution within the terms of the act-to-be would have the incidental effect of putting a few pounds (less tax) into the pockets of a few individual shareholders.

It is, at any rate, good to know that the Treasury, without giving any individual "rulings," has been turning over in its mind the merits of cases where the prescribed dividend standards "might be inappropriate"—the examples given are where a holding company has been interposed whose standard is smaller than the company acquired and "a successful family or similar business where profits had for the most part been ploughed back" that has recently become a public company. The Treasury statement also discloses that note has been taken of the case of rubber companies "deriving their income from properties in the Far East which have been overrun by the enemy." No mention is made of certain tin companies that have been in the same predicament. Nor is there any reference to the submissions made

A MEMBER OF THE THREE BANKS GROUP

WILLIAMS DEACON'S BANK LTD.

Williams Deacon's Bank Ltd. originated in 1771 and has always been closely associated with the industrial and commercial life of the North of England. The Governing Office is in Manchester, so long a centre of the export trade, and the Bank's world-wide connections enable it to further this trade, now more than ever of the greatest importance in the life of the nation. In London the Bank was one of the first Members of the London Clearing House. Williams Deacon's is a Member Bank of the Three Banks Group.

Ploughs, shillings and pence

"What is the import duty on petrol-driven ploughs in Chile?" was a question recently fired at us by one of our clients who had been asked to tender for an important contract. At our finger tips was an extract from a Chilean decree mailed to us from one of our branches and stating that agricultural machinery could now be accepted in Chile free of duty. We were also able to quote the exchange rate that would apply. This prompt information helped our client to submit a quotation weeks ahead of his competitors.

The advantages of being here and there

As the only British Bank with branches throughout Latin America, we can offer you special services—either direct or through your own bank. These services are set out clearly and concisely in our leaflet "The advantages of being here and there". We shall be glad to send you a copy on application to:—

The Research Department

Head Office: 26 Bishopsgate, London, E.C.2.

COFFEE: The earliest witness to the tonic effect of coffee was possibly an Arabian goatherd who noticed that whenever his flocks fed on a certain shrub the effect on their behaviour was immediate and remarkable. Greatly daring, he ate a handful of the berries and found the effect so exhilarating that he ran *non-stop* to his village to break the news of his discovery.

Although the popularity of coffee was well established by the middle of the nineteenth century, it was only at the beginning of the *twentieth* that Kenya Colony began to grow it. To-day Kenya specialises in the *arabica* variety which is the finest quality grown.

Full and up-to-date information from our branches in Kenya on the coffee industry and on general market conditions in the Colony is readily obtainable from our Intelligence Department.

TIN.

THE element tin has been known and used since the earliest days of history. Egyptians of the 14th century B.C. alloyed it with copper to make mirrors, and Homer tells in the Iliad how Hephaestus, the god of Fire, used tin to decorate a shield for Achilles. Tin obtained from the moors and streams of Cornwall was the one famous product of Ancient Britain. A natural tin oxide—"cassiterite"—is still mined in Cornwall today, but most of the world's supply comes from alluvial deposits in Malaya and Indonesia and from ores mined in Bolivia, Africa and Australia. By far the most important uses of tin are in the production of tinplate for the canning industry, and the tinning of articles such as milk churns and kitchen utensils. Tin is also an important constituent of alloys such as gun-metal and bronze, and it is used to make bearing metals, soft solder and pewter. Compounds of the element are used in dyeing and medicine, and in the production of glazes and enamels.

Besides manufacturing tin dichloride for use in the dyeing and finishing of silk, I.C.I. produces large quantities of tinned copper sheet and tubes for dairy and food-producing equipment.

ICI

on September 3rd by the British Overseas Mining Association, which stress the damage to new mining enterprise and production that dividend control would cause.

The three Rhodesian copper companies in the Selection Trust group have taken the lack of law on dividend control into their own hands, and in doing so have caused a stimulating breeze in the market. The directors of Mufulira, Roan Antelope, and Rhodesian Selection Trust preface their declarations of increased "second interims" on their companies' new capitals with the straightforward comment that "since no legislation governing dividend limitations is in existence, they should proceed on the basis of declaring dividends in respect of the past year to the extent that they would have done had no suggestion of statutory dividend limitation been made." If dividend limitation becomes law, part of the dividends now declared will have to be regarded as advances on account of future years. But it is not yet law, and it is difficult indeed to quarrel with the directors' reasoning; they have already been poorly rewarded for their decision to keep their companies registered and controlled in this country by being fenced in by Section 36 of this year's Finance Act.

* * *

Fawley on Stream

Like the new Margam steel plant opened two months ago, Esso's refinery at Fawley—which was to be opened by the Prime Minister some hours after this issue went to press—has a more than simply practical significance in the industrial development of this country since the war. Fawley bristles with superlatives, as befits the largest oil refinery in Europe; but it has another affinity with Margam, for it remains only one among a number of massive new installations in its industry's development programme. Its completion marks a decisive stage in the maturing of the British refinery programme. It is also the largest single manifestation of American participation in British postwar industrial development; this influence no doubt had something to do with the fact that the refinery was completed four months ahead of schedule, in just over two years. The British contribution in materials and equipment as well as men has, however, been greater than Esso originally thought likely; two-thirds of the materials that have gone into the refinery came from Britain, though the major refinery units, such as the catalytic cracker, the pipe stills and the Edeleanu plant, had to be obtained from the United States.

The practical importance of the plant, however, needs little emphasis. Setting a date at which a refinery can be said to be "open" is a somewhat arbitrary business; by the time of the official opening this week, the pipe stills had been in operation for several weeks, but the "cat cracker" will not start working for a week or two. By the end of the year, however, the refinery is expected to produce 2,000,000 tons of petroleum products from Middle East crude: the annual capacity of the present units is rated at some 5,500,000 tons, to be brought up to 6,000,000 tons in 1952-53 by the addition of plant for the production of tractor fuel and lubricating oils.

Esso's catalytic cracking plant at Fawley is the first to be completed in Britain: four others, being constructed by Shell and Anglo-Iranian, should be completed by the end of 1952. These units will be of much the same capacity and type, about 1,250,000 tons annually, using a "fluid" powdered catalyst: the catalyst normally used is a mixture of silicon and aluminium oxides, either combined artificially or in the natural combination found in certain clays. This combination accelerates the breakdown of the chemical structure of the feedstock and at the same time promotes the formation of high quality motor spirit and valuable gaseous fractions. Catalytic cracking provides greater gasoline yields from a heavier type of oil than thermal cracking, and produces normally a higher octane spirit. Fawley, which is designed essentially for the production of high grade motor spirit, will for the present adjust its highly flexible pattern of output from the distillation and cracking units to produce the single standard grade of petrol. Next year, with the other "cat crackers" coming into operation, there will be considerable technical arguments for using these modern units to produce the highest grades of motor fuel—as Shell's cracker at Pirnis in Holland is doing already. The problems imposed by events in Persia and Korea, however, will presumably set the timing of Government policy upon this question and upon the reintroduction of branded petrols.

* * *

Lubricants from Coryton

The Vacuum Oil Company's refinery at Coryton on the Thames is a more specialised adjunct to the British refinery programme, for its emphasis is on the production of lubricating oils. The project is a joint undertaking of Socony-Vacuum and Powell Duffryn. Vacuum Oil was formerly Socony's British selling agency, but when Powell Duffryn sold the Coryton oil storage and blending business of its subsidiary, Cory Brothers, to Socony, it acquired in return a half interest in Vacuum Oil.

The capital cost of the Coryton project is put at about £10,000,000, a proportion of which has been provided by the Finance Corporation for Industry, and the plant is due to come into operation at the beginning of 1953. It differs from most other British lubricating oil plants in not operating on "topped" crude, that is, crude oil from which the light motor and diesel fractions have already been removed. Certain types of crude from Pennsylvania and to a lesser extent Venezuela and Texas, are peculiarly suited for lubricating oils, while others, notably Middle East crude, lack certain constituents necessary to produce the full range of lubricants that the market needs. Because of these differences in the physical composition of the crude, there is a considerable import of finished lubricating oils and of topped crude for further processing into lubricants from the Western Hemisphere. The accompanying table gives some indication of the trade in lubricating oils.

PRODUCTION AND CONSUMPTION OF LUBRICATING OILS IN BRITAIN
(Million Gallons)

	1947	1948	1949	1950
Total consumption	152·3	156·7	173·9	183·0*
Home production	84·0	90·2	92·0	104·0*
Imports :—				
Total	85·1	86·4	72·7	120·0
United States	66·2	79·0	62·7	95·0
Netherlands W. Indies	18·5	7·3	9·9	21·0

* Provisional

The Coryton plant is to operate on Middle East crude alone, and will use about 18,000 barrels a day. This means that the refinery will work up the light fractions of the oil as well as the heavy lubricant fractions and Vacuum will for the first time undertake the re-forming and marketing of motor spirit and diesel oils. Socony's own design of catalytic cracker is being built to get the maximum motor spirit yield but the distillation process that initially separates the crude oil fractions is designed with the needs of lubricant production as the first consideration. This should give Vacuum closer control over its lubricant feedstock than would topped crude. On the other hand, the composition of Middle East crude imposes certain limitations on the range of lubricants that can be supplied from Coryton. Vacuum will still have to import refined lubricating stocks from the Socony plants in the United States for blending with the Coryton lubricants. The company has two blending plants at Birkenhead and in Wandsworth where this process will be carried out.

Railway Wages

The three railway unions have rejected the offer of the Railway Executive, and their claim now goes to the Railway Staff National Tribunal, which meets next Tuesday. All three unions, railwaymen, footplate staff, and salaried staff, presented a joint claim for a 10 per cent increase for all grades, which would cost about £19 million in a full year. The Railway Executive's offer would have involved about half this sum, and itself could have been provided only by a further increase in charges. But it was essentially different in character from the unions' all-round demand, in that the increases offered were greater for grades where the shortage of labour is most acute. The minimum weekly rate would have been raised by 4s. 6d. to 107s. but for locomotive and permanent way staff the increases offered by the Executive would have provided a differential that would have assisted the recruitment of staff in grades where they are urgently needed. Thus it represented an attempt to meet the men's case—which on several grounds was a reasonable case—and at the same time to go some way towards restoring the differentials that have been reduced by the more rapid advance of wages in the lower grades.

The Executive's offer puts on record its desire to use wage incentives to bring train crews and permanent way gangs nearer to normal strength. Whether the National Tribunal will be responsive to this principle, and whether its findings will be accepted are two important matters that have yet to be disclosed. The Executive, it will be noted, has made no attempt on this occasion to associate the question of wage increases with productivity. This feature of the February award, in which a promise "to discuss" the more effective use of labour was associated with the wage increase then imposed on the Executive, has not justified the hopes that were placed on it. There has been agreement about van guards and "knockers-up," but none on lodging turns. The channels of discussion remain open, but nothing seems likely to flow through them.

* * *

Hope and Coal

One of the few encouraging signs that have begun to appear in the coal industry in the last few weeks is the way its new chairman talks about production. It is the harder work of the miners, certainly, that has provided the evidence for Sir Hubert Houldsworth's confidence and this greater hope is still heavily qualified. Though the men in the industry are steadily falling in numbers, they have raised 200,000 tons more than last year in each week of the past month. Words are easier to produce than coal. But it would have been easy and safe for Sir Hubert to join the chorus in the dirge that has been chanted over coal this summer: and it may be a good thing for the morale of the industry that he has chosen not to.

Even a continuance of the better performance of the last month, however, would not provide the "safe" stocks of 18 million tons by the beginning of the coal winter in November, assuming that consumption in the next six weeks runs at something like the level of last year. Inland consumption may well be 7,000,000 tons higher over the full year; it has already risen by 5,000,000 tons over that in the same period of 1950, at the expense of parlous cuts in coal exports to Europe. There is a disposition to accept the decline of Britain as a major exporter of coal with some complacency, and it is certainly true that without some turn in the trend of manpower and production the present low level of exports can hardly improve. But it is impossible to over-emphasise the damage that this failure is doing to Britain in European economic relations, and the need for early results from the technical developments that Sir Hubert Houldsworth so often mentions is no less pressing for exports than for use at home. Imports for this winter are still being canvassed: but there is a feeling in the industry that the Government, having delayed its decision so far, simply could not get the coal shipped in time.

Since the end of April the industry has lost 5,000 men, and since mid-May it has lost 2,300 from the coalface. After the welcome but brief increase of the winter and spring, the manpower graph of the industry seems to have resumed its secular decline. Up to this week the National Coal Board had brought 662 Italian workers for the mines to Britain; 543 were still learning the language, and 112 had reached the coalfields, mainly still in training; very few are as yet working underground. For the moment, the Board's intentions seem to be limited to bringing in about 1,000, and the present difficulty of placing the Italians is already beginning to affect the numbers it can take from Italy. Sir Geoffrey Vickers some weeks ago spoke of the need for possibly 5,000 Italians that was being frustrated by the unwillingness of many mining lodges to accept the foreign miners; at the present rate of arrival, considering the capacity of its reception and training "pipeline," the Board could hardly have brought in half that number by the end of this year. Nevertheless, rank-and-file mining opposition, most exactly measured in Yorkshire but evident to varying degrees throughout all the four divisions most seriously in need of manpower, is hampering this method of reinforcing mining manpower. Though the National Union of Mineworkers is giving what official assistance it can in this direction, some of its leaders sometimes speak in a way hardly calculated to improve the willingness of their members to receive the newcomers.

Lancashire and Japan

When Sir Raymond Streat, chairman of the Cotton Board, said in Holland this week that although Japanese cotton exports were still only half their prewar volume, they now accounted for 20 per cent of the world's trade in cotton goods, he was expressing a concern that has been current in Lancashire for many months. Japanese output and exports have been expanding rapidly this year and—more important

On the job for 158 years

There is a purposeful ring in the air of a Newton Chambers engineering shop. For here men work with a vigour, a sureness of touch, and a sense of pride which betoken a skilled team. In this same place have worked the fathers and grandfathers of present-day craftsmen, and here, most likely, will work their sons and grandsons. And everything that leaves these workshops carries with it this spirit—this background. *At Newton Chambers every present-day development rests on the sure foundation of 158 years of hard-won experience.*

Foresight on blue glass

LONG BEFORE THE PAPER was made on which today's news appears Albert Robbins* had all the information he needed. In charge of the giant grindstones which reduce logs to pulp at the only groundwood mill in the United Kingdom—one of the group of Bowaters' mills in Kent—part of Robbins' job is to ensure that the wood is ground to give exactly the right fibre for the manufacture of good paper. Every few minutes he scoops samples from the watery pulp flowing from the grinding machines and examines them on a blue glass under a strong light. Largely upon Robbins' skill and practised eye depends the satisfactory operation of the newsprint machines.

Drawn by A. R. THOMSON, R.A.

The hum of the grinders drowns the cries of the gulls wheeling over the mud flats of the Thames Estuary, and the siren blasts of distant ships. Thoughts of his hobbies—the allotment, his football team and the bowling green—do not distract his attention. As he chats Robbins' eyes and ears are alert. For each of the five great paper-making machines at Kemsley consumes some 10,000 spruce trees every week—the raw material of newsprint for the free press of the democratic world.

* *Fictitious name for a real character.*

—the emphasis has shifted from the export of grey to that of printed cloth. The Cotton Board's statistical review shows that in twelve months since the limitation of 4,000,000 spindles was lifted from the Japanese industry, the number of spindles installed has risen from 3,885,000 to 5,055,000. The output of piecegoods averaged 461,900,000 square yards in the first quarter of the year compared with a quarterly average of 385,500,000 square yards in 1950, and the second quarter's output is expected to be even higher. This rising output is being reflected in Japanese exports, which rose from 256 million square yards in the first quarter to 342 million in the second. By the middle of the year, one-third of these exports consisted of printed piece goods compared with only a quarter in June, 1950. The percentage of grey cloth exports has fallen in the same period from 46 per cent to 23 per cent.

In the first half of 1951, Japanese exports to Britain, which consist largely of grey cloth, and provide one of the foundations for the finishing industry, represented less than 40 million yards out of a total Japanese export of nearly 600 million square yards. Meanwhile, British merchants in London supplying Empire markets are getting more and more Japanese samples, the majority of them of much higher quality than before the war, at prices 25 to 30 per cent lower than those of the equivalent British goods. The steady growth in the volume of goods coming from Japan can hardly be said to have taken Lancashire by surprise, but there is no sign that it has any new policy with which to meet it. The cry of protection against cheap labour, which is voiced equally by Ministers and by some spokesmen for the industry, is certainly not the answer.

* * *

Slightly More Steel

Steel output is beginning to reflect the benefit of the larger imports of iron ore that have been coming in for the last two months: but it is still well below last year's level. August production figures, published this week, show that an annual rate of 13,855,000 tons of ingots and castings was maintained, compared with the July rate of 13,317,000 tons; but this compares with August output in 1950 at the annual rate of 14,530,000 tons. Pig iron output in August was at an annual rate of 9,409,000 tons, rather lower than in July but higher than in August last year. Stocks of scrap, imported ore, and home ore at steelworks are beginning to rise; but there seems little likelihood that they can be built up to the levels held at the ends of 1949 and 1950.

Mr Gaitskell's request in Washington for an allocation of 800,000 tons of steel next year was to be expected. Whatever the final level of production attained this year, the cut in supplies of German scrap—to some 30,000 tons a month, as it now appears—must curtail output next year, and throw all the greater pressure upon supplies of home and imported ore. Steel allocation, to be introduced in December, may tend to limit non-essential demand: but now that the rearmament programme is gathering pace, "essential" demand for steel may well be ahead of supplies early next year. Imports from America are now about 3,000 tons a month and consist of certain special types. A more direct form of assistance from the American steel industry to Western Europe, it may be noted, would be the import by American steel producers of less ore from the sources that normally supply European steel producers. But given the present state of steel demand in the United States—domestic requirements are being cut and some opposition is being raised to larger exports for Europe—this second form of relief does not seem likely to materialise as yet.

* * *

Trend of Employment

The total working population increased during July by 39,000, of whom 25,000 were women. The steady increase in the working population during this year continues a trend since 1948, which is described in the annual report of the Ministry of Labour for last year. In 1950 there was an increase of 218,000 in the total working population, of whom 127,000 were women. From the middle of 1948 to the end of July of this year there was an increase of 462,000 in the total working population from 22,904,000 to 23,366,000, the bulk of the increase being accounted for by women, of whom there were 306,000 more compared with 156,000 more men. The numbers of young people entering employment remains low because of the low birth-rate in the 1930's and is unlikely to increase significantly until about 1957.

For the first time during this year the total of registered unemployed rose between 16th July and 13th August. In mid August the total was 204,900, representing 1 per cent of the estimated total number of employees. Of the 19,000 increase, however, 13,700 were summer school-leavers who normally swell the August figures. In the development areas, Scotland, Wales and the Northern area, the unemployment rate ranges between 1.9 and 2.3 per cent. Among the principal changes in civil employment in July was the loss of 1,000 more workers from colliery books. The textiles industries are also losing workers. Three thousand were lost in July, compared with 4,000 in June and 2,000 in May. Here also there was a gain in the early months of 1951, but now the numbers, at 1,030,000, are below the end-1950 figure. The metals, engineering and vehicles industries also lost workers as in May and June. There has been a seasonal gain in agriculture and fishing, as in June and significant gains in transport and communication, public administration, professional and miscellaneous services, and food, drink and tobacco. Thus in spite of the increase in the numbers of the working population there have been losses in the basic industries and gains where the need is not urgent. In metals, engineering and vehicles this is offset by some shortage of materials. Nevertheless, labour is not moving where it is most urgently needed.

* * *

The Deficit Grows

Any hope that the trade deficit might be on the point of improving received a sharp setback last month. The preliminary trade figures for August show a deficit even larger than those for July. The adverse balance of £128.4 million brings the deficit for the first eight months up to the extraordinarily high figure of £807.7 million. In the corresponding period of 1950 it was only £270.2 million; in 1949 £290 million, and 1948 £321 million. These figures tend to exaggerate the true deficit in that imports are calculated c.i.f. and exports f.o.b. But the trend they reveal is far from satisfactory. Exports showed a fair increase in value during the month from £231.8 million to £239.8 million in August, while imports were also increased from £358.5 million in July to £368.2 million in August. Both the July and August trade figures compare poorly with those for May despite the improvement of the terms of trade up to July. Imports in August are often high, and this year are believed to have been augmented by purchases for defence purposes, particularly from western European countries. At this stage, it can only be hoped that the trade deficit for the whole year will not reach the alarming figures suggested by the deficits for August or for the eight months to date.

TRADE TRENDS (£ mn.)

	Exports (f.o.b.)	Imports (c.i.f.)	Deficit
Average Jan.-March	204·6	283·0	78·4
April	241·2	311·5	70·3
May	241·2	338·0	96·8
June	208·6	357·5	148·9
July	231·8	358·5	126·7
August	239·8	368·2	128·4

Imports may be reduced in future months as a result of Governmental limitation, but the main shortcoming is that the rate of exports is not sufficient. Coal exports are perhaps

the most obvious failure, but manufactured exports are not adequate. Workers are again being lost from the textiles industries and apart from pottery no other consumer goods industry has shown that its exports can be expanded and the full effect of rearmament has still to fall on the engineering and vehicles industries.

* * *

The "Air Coach"?

The International Air Transport Association had on the agenda of its annual general meeting that was held in London this week, the first serious inter-airline discussions on the introduction of "coach-class" air travel at reduced fares. No airline can alter the fares that it charges on any of the recognised routes without the consent of IATA, and a body of this kind is by its membership pre-disposed to weigh very carefully any such reduction. During recent years a growing body of opinion in the aircraft industry, as well as among airline operators, has come to the conclusion that a really big reduction in fares is the only way by which air transport can be put on the broad popular basis that offers its only prospect of solvency. In their reports published last month, the two nationalised and subsidised British airlines both came out strongly in favour of the introduction of a dual tariff.

Tourist air travel is commonly described as "austerity" travel; this phrase brings to mind the strictly functional lack of amenities of a troop transport, but it would be much better to compare standards in the "air coach" to travel in a road coach as distinct from an express with restaurant and other amenities. Except for the free food and drinks, the benefactions that the airlines have pressed on their passengers in an attempt to attract them from other operators do not add to the cost of operating the aircraft; but food is more costly and needs space for carrying and eating and stewards to serve it. The economic argument for the air coach is to put to use older aircraft that are sub-standard only by comparison with the latest types and to carry more passengers in them, thus spreading their flying costs over a greater number of tickets. The test of "first" and "second" class would thus depend particularly on seating density and this in turn would depend on the duration of the flight.

No aircraft is permitted to fly above the maximum all-up weight specified by its designers. Therefore if it were sought to carry more passengers on an aircraft already at the maximum load, the permissible weight of fuel and freight would have to be correspondingly reduced. A tourist class airliner crossing the Atlantic might for this reason need to re-fuel at both Iceland and Gandar. Under present regulations the passengers must be disembarked while the fuel is pumped, and there would need to be a delay of up to an hour for each re-fuelling stop. The fare, however, could be reduced from £242 to £180 for a return ticket.

* * *

Ups and Downs in Tin and Rubber

The little flutter in the rubber and tin markets that attracted public attention last week has died down. Tin at one point (a week ago last Thursday) reached almost £1,000 a ton; it is now only £930 a ton. After many false reports, it has been officially confirmed that the United States has signed a provisional 30-day contract for Bolivian ore at $1.12 a lb. (£896 a ton), including smelting charges. The contract can be extended up to 90 days and the price is subject to revision. A joint mission of the State Department and the Reconstruction Finance Corporation (which is responsible for the Texas smelter) is at present studying current costs of producing tin in Bolivia. If it is satisfied that the provisional price is too low, the new price will be paid on all shipments after May 31, 1951, when the last RFC contract ended. Once this study of costs has been completed, the American authorities are expected to sign a long-term contract with Bolivia. In the United States, however, a long-term contract usually implies one of twelve months duration. In view of the speculation about what the new price for Bolivian ore might be, it is not surprising to see the price of tin in the London market hovering between £930 and £1,000 a ton.

The interest in rubber last week arose from the implication in a report of a Senate sub-committee that the stockpiling authorities had not been buying sufficient natural rubber. The price rose from 3s. 8d. to 4s. 2½d. a lb. in one week. It has since dropped back to 3s. 11d. a lb. There is still no indication from the United States that the tempo of buying for the stockpile will be increased. For some months past, the authorities have been more concerned with price than with supplies and unless the political situation deteriorates suddenly, this policy is unlikely to be altered. On the other hand, it seems very probable that the control on the use of natural rubber for civilian purposes in the United States may be relaxed next year. This view is supported not only by certain unofficial reports, but also by the fact that the production of synthetic rubber is now reaching the limit of existing capacity. If total rubber consumption continues to rise, the additional supplies will have to come from the natural rubber producers.

* * *

Supplies of Copper

The copper strike in the United States has been temporarily settled. An injunction against the strikers was secured last week under the Taft-Hartley Act, and most of the men have now returned to work. The Kennecott Corporation has meanwhile reached agreement with its employees to increase the hourly rates by 15 per cent, and no doubt other copper producers will follow this lead. The question now arises whether, in consequence of this wage increase, the official price of copper in the New York market will be raised. At present two prices exist in the United States: 24½ cents a lb (£196 a ton) for domestically produced copper and 27½ cents a lb (£220 a ton) for copper produced from imported concentrates. The market may well take this opportunity of establishing a single price again, namely 27½ cents a lb. The Ministry of Materials selling price of £234 a ton was already higher than the American export price of 27½ cents a lb to allow for British purchases at free market prices. On Thursday, however, the Ministry reduced its selling price by £7 to £227 a ton, because for the time being it will cease to buy at prices exceeding the American export price.

The strike has had little effect on copper supplies outside the United States, although some 90 per cent of American output was brought to a standstill. The release of 25,000 tons from the American stockpile was sufficient to prevent any immediate shortage, and if the strike had been prolonged no doubt further releases from stocks would have been made. But the present balance between supply and demand for copper is so delicate that it could be easily upset. For that reason, the copper-lead-zinc committee of the International Materials Conference has been considering for some months the feasibility of allocating copper among participating countries, and quotas for the fourth quarter of this year are expected to be announced shortly. Most of Britain's supplies are covered by contracts with Rhodesian and Canadian producers, and these contracts are unlikely to be affected by any action taken in Washington. But international allocation might well prevent the Ministry of Materials from buying supplies for its stockpile from outside sources, and this would seem to be the inference of the Ministry's recent decision to reduce its selling price. Is British stockpiling to be stopped or will it be continued at the expense of current consumption?

Corporation, as one of the largest companies in the industry not directly linked with cinema ownership, may give some pointers. Its results this week would seem to confirm the outsider's impression that the internal economies carried out by producers, in conjunction with the external assistance that the Government has been providing in the past two years, are bringing the production side of the industry into a slightly better state of health.

The British Lion results would not justify more than very cautious optimism. Once again the directors have had to increase their estimate of losses likely to be incurred on films completed on or before March 31, 1949—this time by an additional £798,219 on top of the £1,388,797 already provided. On the year's trading the company made a net profit of £19,384; but with the extra provision mentioned above and the accumulated loss brought in of £1,142,990, the debit carried forward amounts to £1,921,825.

The company's investments in film productions are now £3,037,656, against £3,956,772, reflecting the amount written off; and there has similarly been a slight decrease in indebtedness to bankers and "others" (among whom the largest creditor is, of course, the Government's National Film Finance Corporation). Bankers' advances have dropped from £1,494,881 to £1,178,701; advances from "others" have increased from £3,202,884 to £3,429,055. The National Film Finance Corporation loan of £3,000,000 is due for repayment this autumn: in the review published with the balance sheet the chairman, Mr Harold C. Drayton, makes no reference to any arrangements discussed between the company and the Corporation. He is able to tell shareholders that several of the films released last year are proving successful, and will contribute profits to the company this year and next, while the Eady schemes, given a fairly steady continuance of business, may bring British Lion an extra £500,000 a year for the three years from August 5, 1951. Given the present burden of loss, the company has little interest for investors. A film is unlikely to earn profits for a year or more after it is completed, so that the internal economies the company has been carrying through will not bear fruit for some appreciable time.

* * *

Britain's Prewar Liabilities and Reserves

The Treasury and the official statisticians deserve congratulation for their efforts in recent years to present steadily more comprehensive estimates of Britain's external balance of payments and the trend of external reserves and liabilities. The latest, and very welcome, contribution—presented for the benefit of the many economists and others who try to get a reliable long view of such trends—sets out (in Cmd. 8354) quarterly figures of Britain's gold holdings and half-yearly figures of external liabilities for the war years and for the prewar period extended back to 1931-32. Some of the data for these periods has been published previously, but never before has it been possible to observe an uninterrupted series. Now, in effect, the Treasury presents aggregates of virtually all the data on these matters that it has at its disposal, since much of the relevant information was not collected at all until after the work of the Macmillan Committee in 1930-31 and the creation of the Exchange Equalisation Account in 1932. Naturally, the 20-year series, now obtainable by linking the new figures with those published in recent years in the half-yearly White Papers on the Balance of Payments, are not strictly continuous in the statistical sense. This is true even of the new information, since the figures of external liabilities for the period 1931-41 are based on different material from those more systematically collected subsequently. For this reason, the scope of the figures is somewhat narrower than that of later estimates, and the broad geographical classification does not align with the quite detailed breakdown that is now available. There is a similar, though less significant, break in the series on gold reserves, since until the outbreak of war the total gold holding was divided between the Bank of England and the Exchange Account, whereas since September, 1939, virtually the whole of the gold has been concentrated in the Account. These qualifications should be borne in mind when examining the accompanying table, which assembles, for yearly intervals only, the salient portions of the data over the whole period.

UK Reserves and Liabilities
(Year-end Figures: £ million)

* At values current at each date. Excludes Bank of England holdings after 1939, since when the amounts have been negligible. † Includes mandated territories and Egypt. ‡ At June 30th. § Figure shown in Bank of England return of December 30,19 31, re-valued at market price on that day.

One of the most striking facts that emerges is the extent of the growth of external liabilities in the pre-Munich phase. Between 1931 and end-1937, the total liabilities rose by nearly £400 million, and slightly less than half this inflow comprised British Empire balances. In the subsequent two years of approaching war, no less than £266 million of the foreign money was repatriated; over the same period Empire balances dropped by only £25 million. It should be noted, too, that these annual figures do not reveal the full extent of the strain upon Britain's gold in the opening phase of the war. In the six months from end-December, 1940, the reserves dropped from £108 million to only £65 million—and all but a tiny part of that small holding was earmarked against immediate debts, so that the barrel was indeed being scraped. Thereafter, Lend-Lease gave relief, and the gold reserve was steadily replenished, principally because of the large expenditures of American forces stationed in British territories.

Company Notes

Furness Withy.—The very satisfactory achievement of record profits by Furness Withy and the company's dividend policy, which gave rise to an interesting question of interpretation of the White Paper on dividend control, were discussed in *The Economist* on August 18th. The chairman's statement throws a fresh light on the advance in profits, for it shows that although gross earnings in the shipping industry have been on a higher level in recent months, these earnings "have been very largely offset by violent increases in operating expenses and inordinate delays in port"; indeed in the past financial year 1,299 ship days have been lost through "industrial disputes and kindred occurrences."

The chairman, Sir Ernest Murrant, provides a thorough analysis of the whole problem of ship replacement. Furness Withy's combined fleet account stands at £19,824,940, including payments of £1,191,822 on ships building; in addition the liability in respect of uncompleted shipbuilding contracts was £5,106,177 on April 30th. The ships are, of course, worth a great deal more than this; indeed £11,618,590 has been written off first cost in the last four years alone. Such figures as these indicate the magnitude of the burden of replacement at present costs. Sir Ernest drives the moral home by pointing out that if one-twentieth of the fleet were

replaced each year, it would cost at current values some £3,500,000 a year. The recent rise in steel prices will increase these replacement assessments still further. The relief given by the Chancellor which permits the application of initial allowances to ships ordered before the date of the budget statement is welcome so far as it goes—which is not very far. Since high construction costs and the high level of taxation are likely to be with the industry for some time to come, no shipping lines chairman—or shareholder—is likely to regard this concession as being enough.

	Years to April 30, 1950	1951
Consolidated Earnings :—	£	£

£1 ordinary stock at 34s. 6d.xd yields £5 7s. per cent.

(*a*) Includes subsidiaries' holdings £743,713 (£1,004,029).

There are, however, some factors in Furness Withy's favour. The recent earnings record of the company—as indeed of the whole shipping industry—is encouraging. Secondly, some 46 ships out of a fleet of 70 have been built during or since the war; Furness Withy's fleet is thus comparatively new, so that part at least of the replacement problem will not arise for a few years.

★

Kelsall and Kemp.—The painful reversal of the fortunes of Kelsall and Kemp caused by the fall in wool prices and the revaluation of stocks at market instead of cost price was discussed in a note in *The Economist* of September 1st. The full accounts add a few more details about the circumstances that have transformed a group trading profit of £410,964 into a loss of £14,596. Group stocks appear at £1,488,013, against £1,004,076, an increase that prompts speculation about their original cost and the burden of revaluation. The fact that the group borrowed £801,818 from the banks last year must be primarily due to heavy stock commitments. The chairman, Mr J. N. Walsh, suggests that while the severe fall in wool prices has been "generally attributed" to the cessation of US stockpiling, "it has unquestionably been accentuated by consumer resistance to the purchase of woollen goods at the inevitably high prices which,

£1 ordinary stock at 37s. 6d.xd yields £6 13s. per cent.

however, never reached replacement cost." It was a fear of short-time working that prevented the directors from cutting wool purchases drastically and Mr Walsh now draws attention to two factors which add to the difficulties of maintaining a skilled and trained labour force. These include the high labour mobility of European volunteer workers and the attractions that employment in the armament industries holds out to labour, particularly to women workers. These comments, however, hardly lessen the pertinence of the question whether the best adjustment to "highly competitive conditions" that a firm can make is to hold on to its labour force whatever is the cost in terms of short-run losses. And there is no consolation to be found in Mr Walsh's remarks that: "trading at the time of writing is at a standstill. Confidence has completely disappeared and consumer resistance continues to be world wide." It is hardly surprising that the £1 ordinary shares are now a difficult market at 37s. 6d.

★

International Tea.—Recovering from its 1949-50 trading setback, International Tea has achieved a new record turnover and an increase in group trading profits from £1,700,907 to £1,817,917. Increased prices have made a substantial contribution to this new record, but the volume of sales has been greater than ever.

Satisfaction with these results will, however, be somewhat tempered by the cautious tone of the chairman's statement. Mr Frank Wilson points out that while costs are increasing "gross profit percentages" in the grocery trade are contracting. Furthermore the burden of financing stocks, which have risen from £3,954,410 to £4,651,767 in the latest year, is becoming more and more onerous; in consequence "reserves, large as they undoubtedly are, are used almost to the limit in financing our essential day-to-day needs." The chairman then admits that the appropriation of some £150,000 to group general reserves is "quite insufficient" to meet all requirements in these days of mounting costs. The directors had, therefore, decided—before the publication of the White Paper on dividend control—against increasing the ordinary dividend, which has been maintained at 16 per cent since 1947. Further evidence of the inflationary problem is to be found in the appropriation of £140,000, against £152,000, to a "reserve for improvements to premises, replacement of plant, etc."

	Years ended April 29, 1950	April 28, 1951

Ordinary capital	1,550,000	1,550,000

5s. ordinary stock at 16s. 3d. yields £4 19s. per cent.

Rash optimism about the future is therefore out of place, but the earnings record of the company and its reasonably strong financial position are such as to prevent undue anxiety. The company is enjoying some success with the establishment of self-service stores and is planning to add to their number. The final outcome of this policy will be awaited with some interest, but Mr Wilson's statement includes a reminder that the backbone of the business is still the "service" branches.

After increasing Exchequer balances by £177,529 to £3,369,525, the other operations for the week increased the National Debt by £2,109,991 to £26,382 million.

COMPANY MEETINGS

FURNESS, WITHY AND COMPANY

SIXTY YEARS OF CONTINUOUS EXPANSION

SIR ERNEST H. MURRANT'S STATEMENT

The sixtieth annual general meeting of Furness, Withy and Company, Limited, will be held on September 28th at Furness House, Leadenhall Street, London, E.C.

The following is an extract from the statement by Sir Ernest H. Murrant, K.C.M.G., M.B.E. (the chairman), which has been circulated with the annual report and accounts for the year ended April 30, 1951.

As stockholders are aware, we have reached a landmark in the history of the company, this being the sixtieth year since incorporation as a public company. The record has been one of continuous expansion and today we are able to present accounts which reveal the results of a long period of careful husbandry and enterprise.

The statement by the Chancellor of the Exchequer in his Budget speech that it was intended to withdraw the initial allowances was a severe shock to the shipping industry as it was felt to be an unfair handicap in respect of shipbuilding contracts already entered into in good faith for deliveries which may extend well into 1954, or even beyond that date. Fortunately the Chancellor received the industry's immediate representations with considerable understanding and sympathy, with the result that amendments were accepted which will permit the application of these allowances to shipbuilding contracts placed before the date of the Budget statement.

NEW TONNAGE

The combined fleet account stands at the increased figure of £19,824,940, which includes payments on account of ships under construction amounting to £1,191,822. In the course of the year six new ships have been brought into commission, being part additions to the combined fleets and in part replacements of three ships withdrawn from service. For the purpose of writing down at once part of the excessive initial cost of this new tonnage, a transfer has been made from the fleet replacement account.

Notwithstanding the substantial payments already made on account of new tonnage, the liability in respect of uncompleted shipbuilding contracts at April 30th was £5,106,177—approximately £840,000 in excess of the corresponding figure a year ago. Eight ships are either under construction or on order; some will not come into commission until well into 1954 and it is inevitable that in the interval other new ships will need to be ordered if the group fleet is to be maintained. Being well aware of the revolving necessity to build for replacement alone, your directors are deeply perturbed at the continuing increase in the cost of construction and the very long period which elapses between ordering and obtaining delivery of new tonnage, and as things stand today it is not true to say that because we are building faster, better and more expensive ships, we can make two do the work of three. On the contrary, in the majority of our long distance trades, the voyages are taking longer time, notwithstanding faster speed at sea and improved cargo handling facilities.

LOSSES CAUSED BY INDUSTRIAL DISPUTES

It is perhaps appropriate at this point to mention that our records show that in the past financial year ships of the combined fleet have been idle for no fewer than 1,299 ship-days in various parts of the world through industrial disputes or kindred occurrences.

TRADING RESULTS

The gross profit from ships trading and all other ancillary businesses amounted to £4,646,996. Of this amount £1,969,163 has been provided for depreciation of wasting assets; £774,895 is required for current income tax (here and abroad) and profits tax, and a further £730,482 is required to provide for the future taxation liability in respect of initial wear and tear allowances. The result is that the net amount brought into the parent company's account is £696,982, of which £340,000 has been transferred to fleet replacement account.

As stated in the directors' report, a dividend of 9¼ per cent. on the ordinary stock of the company is recommended, being the average of the gross distributions for the past two years. But for the Chancellor's statement and the White Paper issued on July 27th, which foreshadowed legislation limiting the dividend permitted to be paid on equity or risk-bearing capital, it had been your board's intention to recommend the payment of 10 per cent. on this occasion. It is claimed that dividend limitation is necessary to arrest inflation; in fact it is merely another political expedient—one of a long series of such expedients.

We regret that our 12,000 ordinary stockholders are among the many who must suffer from the effects of the increased cost of living without being permitted to enjoy any compensating increase in income on their savings.

THE OUTLOOK

Whilst the U.K. has more than recovered its pre-war volume of tonnage, the position is not so satisfactory if expressed in terms of the percentage of world tonnage.

It would seem therefore that both from the point of view of national defence, and the domestic necessity of maintaining our fleet, it is right to continue to build new ships for the requirements of our various trades, notwithstanding present inflated costs. It follows that we must continue to put aside large reserves for that purpose. It equally follows that there must be a gradual decline in our ability even to maintain the present volume of tonnage if taxation and methods of assessment continue on the present level and basis. It is therefore to be hoped that the Royal Commission on the Taxation of Profits and Income will take serious and understanding notice of the representations which have been made by the shipping industry, and will bear in mind that while it is practicable to shear a sheep once a year, skinning it has dire consequences.

In recent months gross earnings of the shipping industry have been on a higher level, but it should not be overlooked that gross earnings have been very largely offset by violent increases in operating expenses and inordinate delays in port.

As regards the earnings of the Furness Group of Companies, a substantial proportion is derived from businesses other than shipowning, and outside the United Kingdom, added to which some of our ancillary businesses abroad have derived benefit from the devaluation of sterling.

Our current business continues to be satisfactory; we have good tools to work with, an enthusiastic staff and a widespread organisation. We also have confidence in the future of British shipowning provided the achievements of the past and hopes for the future are not shattered by the introduction of doctrinal theories such as have resulted in costly disillusionment in other key industries.

CONSOLIDATED TIN SMELTERS

INCREASED TONNAGE TREATED

The 22nd annual general meeting of Consolidated Tin Smelters, Limited, was held on September 13th in London, Mr Ernest V. Pearce, A.M.I.M.M., (the chairman), presiding.

The following is an extract from his circulated statement:—

Production of tin in concentrates for the calendar year 1950, as revealed by the Statistical Bulletin of the International Tin Study Group, totalled 168,000 tons as compared with 162,000 tons in 1949. The Far Eastern producers—Malaya, Thailand and Indonesia—each showed an increase in their production while the production of Bolivia and Nigeria declined. The tonnage of concentrates treated in both of our smelteries during the year under review was in excess of that treated in the preceding year. No prospecting of any moment has been carried out in Malaya for years, and this factor, if it continues, must have serious results on the production of tin there.

In my last review I referred to a request to the Secretary-General of the United Nations by the Tin Study Group for a conference on tin. This United Nations Tin Conference was held in Geneva from October 25th to November 21, 1950, and was attended by delegations from twenty countries. A draft agreement, referred to as the Paris Draft, proposals relating to the formation of a buffer stock, control of exports and action in the event of a tin shortage were debated and considered. Various opinions were expressed on the proposals submitted, but as these differed so widely, particularly as between consumers and producers, the Conference was adjourned, the delegates having concluded that further examination by Governments was necessary. This seems to me to leave the industry in a state of uncertainty, and it is to be hoped that member Governments can settle their differences amicably and to the ultimate benefit of producers and consumers.

TIN PRICES

The London Metal Exchange and the Singapore market operated throughout the year. The outbreak of the Korean war in June, 1950, resulted in an increased demand for tin, and prices on the London and Singapore markets advanced gradually for a time. The desire of some countries to obtain tin for stockpiling further increased the demand and forced the price to a record figure of £1,615 per ton on the London Metal Exchange on February 14, 1951. This rapid increase can only be ascribed to the rush for tin by certain countries. Fortunately for the industry this high price operated for one day only and a recession started on the next day. I venture to suggest that no responsible tin producer in the world had any desire to see the price maintained at so high a level, knowing as they did that such a high price must bring its own unfavourable repercussions.

Producers are, however, entitled to a fair price for their tin, and in deciding what is a fair price due regard must be given to the fact that tin is a wasting asset and there are no means of replacing it once it has been mined.

The net revenue of the company is £309,125 compared with £236,227 for the preceding year. Your directors have decided to recommend for approval a dividend on the ordinary stock of 2s. together with a bonus dividend of 6d., making a total of 2s. 6d. per £1 stock.

The report was adopted.

PINCHIN, JOHNSON & ASSOCIATES, LIMITED

RECORD PRODUCTION AND SALES

SATISFACTORY YEAR'S TRADING DESPITE MATERIAL SHORTAGES

MR G. R. T. TAYLOR'S STATEMENT

The annual general meeting of Pinchin, Johnson & Associates, Limited, was held on September 12th at the Connaught Rooms, Kingsway, W.C.2, Mr G. R. T. Taylor (the chairman) presiding.

The following is the chairman's statement circulated with the report and accounts for the year ending March 31, 1951: Before reviewing the results of the company's trading for the year to March 31, 1951, I must refer to the grievous loss sustained by the P.J.A. group of companies in the death of Mr E. P. Thompson.

Mr Thompson became secretary of the company in 1927 and was partly responsible for the details of the amalgamations with many of the present associated companies. In 1934 he was elected a director and became a joint managing director in 1939. In 1949 he retired from his managing directorship and continued as financial director. Shortly before his death he was elected vice-chairman of the board.

The gap created by the loss of Mr Thompson's services will not be easily filled, but the additional burdens of my fellow directors and myself had been previously moderated by the appointment to the board, on October 11, 1950, of Mr T. S. Dally and Mr P. Evans. Both of these gentlemen have very successfully filled for many years important executive positions with the company, and we are confident that their long experience of our industry will be of the utmost value in dealing with problems which we still have to face.

I will now refer to items in the accounts which may need clarification.

ACCOUNTS

The total profits of the group, after providing for all charges, amount to £1,494,153, against £1,201,351 for the preceding year.

Included in the figures for the period ending March, 1951, is the sum of £25,813 in respect of exchange profit applicable to previous years. This has occurred by the conversion of overseas profit and loss account balances at the official rates of exchange ruling on March 31, 1951, the profit arising therefrom as a result of the devaluation of sterling, not having been dealt with in our accounts to March, 1950.

Total taxation has absorbed approximately £185,000 more than in 1949-50, while minority shareholders of our subsidiaries have taken a larger sum, leaving the parent company's proportion of net profits, after deduction of tax, £552,116 against £485,234, an increase of £66,882.

The parent company's portion of transfers to reserves in the subsidiary companies' accounts are shown in the consolidated profit and loss account. Assuming that the final ordinary dividend of 17½ per cent. is approved, it will be noted that our portion of undistributed profits carried forward in the consolidated profit and loss account is increased by £132,865.

You will be pleased to learn that the increase in net profits has been almost equally divided beween (*a*) the parent company and (*b*) our overseas subsidiary companies. The company's interests are widely spread throughout the world, and most of our associated companies have improved upon their previous results.

The parent company's balance-sheet reveals that there were further expenditures during the year under the headings of "Investments—subsidiary companies" and "trade investments" amounting to approximately £396,000. The value of these assets considerably exceeds the book value. Shares in subsidiary companies shown "at under market value" at £931,882 are quoted and at March 31, 1951, had a market value of about three times their book value.

With regard to floating assets, you have doubtless observed that stocks and debtors show large increases over the previous year. The present world-wide inflationary pressure on the level of prices is responsible for a much larger working capital being required to finance current trading and the cost of capital projects continues to rise. While this pressure exists, and bearing in mind that a reaction in the price level may occur in the future, it is your directors' constant care that the funds of the company be conserved as much as possible.

The consolidated balance-sheet shows that shareholders' funds, based on book values, amount to £7,101,639, each ordinary share of 10s. being covered over two and a-third times by tangible assets at book value.

This valuation is extremely conservative, ignoring as it does the very considerable excess of the real values of fixed assets over the book values.

The increase in the consolidated share premium account from £1,850,620 to £1,918,975 is due to premiums obtained on the recent issue made by our Australian company.

The alterations in the other consolidated reserves, not detailed in the accounts, are caused by adjustments due to the conversion of overseas reserves at the official rates of exchange ruling on March 31, 1951.

GENERAL REVIEW

The directors' report has referred to the production and sales records which were again achieved in the past year. This satisfactory position has been made possible by the modernisation and extensions of our main factories which have taken place in the last few years.

Shortages of some raw materials were, and still are, retarding our full development programme, but our technicians made profitable use of those materials which we were able to secure, with the gratifying results disclosed in the accounts.

You will be interested to know that in this festival year, a considerable volume of your company's products were used for the decorations at the South Bank, London, exhibition. We are also pleased to record that we were called upon to meet increased demands for our surface coatings by an ever increasing number of the industrial undertakings in the country.

In common with most other manufacturers in the great majority of industries, we have been forced to increase selling prices to meet part of the additional cost of raw materials and other expenses of production. We regret the necessity for such action but any other course would bring disaster to your company.

Competition in the industry remains keen and the rate of profit per unit of output is low.

I said last year, and I reiterate, that profits can only be maintained by a larger volume of sales. It is therefore particularly pleasing that the volume of sales again achieved a record in the past year.

EXPANSION ABROAD

Between December, 1950, and February, 1951, I visited the plants of your companies in Australia. I was impressed by the progress being made by these companies, and especially by the tremendous scope for our industrial specialities in the Australian market. Mr P. Evans, one of the directors recently appointed by your board, is now in Australia where he will be fully occupied for some months on the company's business.

The development of Australia's secondary industries is gathering momentum and our companies there are recording a large increase in turnover despite the difficulties they are having in obtaining sufficient raw materials to enable them to plan their production in the most advantageous manner. The income we have derived from our Australian companies has increased during the past year and it is probable that the additional capital recently invested will earn a reasonable rate of profit in the future.

During the past year some of our overseas companies have been partially reconstructed and this process is still continuing, involving re-capitalisation in the coming months.

The pages attached to the annual report may serve to illustrate to shareholders some of the overseas ramifications of your company.

THE PAST YEAR AND FUTURE OUTLOOK

The year under review has been one of consolidation and expansion both at home and abroad. Increasing demands for our materials—both decorative and industrial—is an encouraging sign of the wide acknowledgment of their superior quality; manufacturing consumers recognise that the use of first-class finishes on their own products provides an important stimulant to their sales and we are confident that this old-established undertaking is better equipped than ever before to maintain our lead in the industry.

In conclusion, I am sure you will agree that our thanks are due to the management, members of the staff and all other workers throughout the world for their co-operation and loyalty.

The report and accounts for the year ended March 31, 1951, were adopted and a final dividend of 17½ per cent. (less tax) was declared on the ordinary shares, making 25 per cent. (less tax) for the year.

The retiring directors were re-elected and the auditors' remuneration was fixed.

RICHARD THOMAS AND BALDWINS

ANNUAL GENERAL MEETING

The annual general meeting of Richard Thomas and Baldwins, Limited, was held on September 6th at 47, Park Street, London, W., Mr E. H. Lever, chairman and managing director, presiding.

The chairman moved the adoption of the report and accounts for the year ended March 31, 1951, and the payment of a dividend at the rate of 15 per cent. per annum on ordinary stock, less income tax, for the period February 15 to March 31, 1951.

The chairman of the Iron and Steel Corporation of Great Britain seconded the resolution and it was carried unanimously.

Mr E. H. Lever announced that owing to illness Sir Andrew Agnew, C.B.E., did not wish his name to go forward for re-election, and the chairman of the Iron and Steel Corporation expressed his regret.

The remuneration of the Auditors, Messrs Peat, Marwick, Mitchell and Company, having been duly fixed, the proceedings terminated.

THOMAS DE LA RUE AND COMPANY, LIMITED

IMPROVED RESULTS

MR B. C. WESTALL ON SUCCESS OF BOARD'S POLICY

The fifty-fourth annual general meeting of Thomas De La Rue and Company, Limited, was held on September 12th in London, Mr Bernard Clement Westall, C.B.E. (chairman and joint managing director) in the course of his speech, said:—

The net profit for the year, before taxation, shows an increase from £503,953 to £623,103. This increase is entirely brought about by an improvement in the trading results of the industrial side of your company.

During the course of the year new contracts were obtained for the security printing division. It should be borne in mind, however, that the contract for the printing of all documents of monetary value for the Dominion of Pakistan will be transferred gradually to the Pakistan Security Printing Corporation at Karachi, in which the company holds a 40 per cent. interest.

EXPANSION OF INDUSTRIAL SECTIONS

As long ago as 1943 your directors foresaw the possibility of a contraction in the security printing division, and so, with a view to meeting such a situation, they decided on a policy of expansion of the industrial section of the business. The scale of expansion of the plastic and gas divisions was such that it was inevitable that a considerable passage of time should elapse before these large undertakings could reach a profit-earning basis. For the first time a substantial proportion of the profit for the year has derived from the industrial divisions. I am of the opinion that during the current year the major part of the profits will derive from this side of the company's interests.

In the plastics division sales were double those of the previous year. In particular, there has been a big expansion in the export of laminated plastic products which are sold under the trade names of Formica and Delaron, and from the orders on hand your board has reason to believe that even a greater proportion of sales during the new financial year will be for overseas. With the volume of raw materials at our disposal, we have good reason for confidence in the results of the current financial year.

The stationery division showed a somewhat better result for the year and contributed a modest profit. In due course it is hoped that this section of the company's interest will be expanded, but the nature of the business will make such an expansion rather a slow process.

THE GAS DIVISION

The prospects of the gas division for the current year are also good. The new gas cookers which we have designed have met with an excellent reception and the output of the factories has been sold for a long time ahead. Production of the Multipoint heater has been transferred to the Tynemouth factory with beneficial results and sales have slightly increased, chiefly for export.

I think stockholders will agree that the policy which has been consistently pursued by the board of expanding and developing the industrial side of the business, sometimes in the face of setbacks and difficulties, has now been proved to have been a wise one. Insofar as it is possible for any human to foresee the future in these difficult days, it would appear to me that there is every prospect that the scale of profits and the rate of dividend can be maintained.

The report and accounts were unanimously adopted and a final dividend of 35 per cent., less income tax, making 50 per cent. for the year, was declared.

ARTHUR BALFOUR AND COMPANY, LIMITED

YEAR OF GREAT ACTIVITY

LORD RIVERDALE'S REVIEW

The fifty-second annual general meeting of Arthur Balfour and Company, Limited, was held yesterday at Capital Steel Works, Sheffield, 3, Lord Riverdale, the chairman of the company, presiding.

The secretary, Mr W. H. Eyre, A.A.C.C.A., read the notice convening the meeting and Mr J. Wortley, of Joshua Wortley and Sons, read the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended December 31, 1950:

This is the first annual general meeting since the conversion of this enterprise into a public company. I am glad to be able to report the completion of a successful year's trading.

The accounts of the group show a profit, before taxation, of £483,889. The year has been one of great activity, but some profit is due to a strong and especially favourable wind, which has already abated, and may even change its direction. For this reason your board have decided to increase the reserve for stocks and contingencies by an amount of £25,000 to make a total of £100,000, and this is additional to a substantial increase in general reserve. The ever-present possibility of a head wind in this world of disturbances such as might be caused by a sharp fall in material values or selling prices, whether or not accompanied by trade recession and the consequent effect upon the values of stocks and work-in-progress, make a cautious policy the more desirable, if not indeed a necessity.

By December, 1950, the full effects of the rise in prices, of alloys in particular, and the difficulty or restriction in the supply of raw materials had not taken effect to the degree under which we are now operating. The company must suffer from some handicaps in this respect during the present period.

The present excessive rate of taxation is bound to constitute a drain on the capital required to replace stocks, maintain the volume of business and the sales organisation.

The needs of the rearmament programme, while likely to ensure active trading, must eventually cause some dislocation in the export trades which are an important part of the operations of your company. Every effort will be made to safeguard the selling organisation with a view to the future.

CURRENT YEAR'S PROSPECTS

While endeavouring to take a prudent and cautious view and fairly assess the uncertainties of today, I am happy to tell you that the operations of your company in the first six months of the present trading period have been maintained at a high and satisfactory level, comparing favourably with the same months of 1950. I and the board share the view that we can look forward to the future with reasonable confidence. In our long experience the widespread nature of our operations has, in the past, withstood many strains and stresses, and I see no reason to doubt our ability to maintain our position in the future.

The possibilities of further expansion in overseas activities are under continual and active review, and preliminary steps are now being taken to augment the capacity of a producing unit in the Dominions.

The subsidiary companies have had a satisfactory year and made an increased contribution to the results shown in the accounts. A steady policy of re-equipment and improvement has been pursued and will be maintained so far as restrictions permit.

I should like to pay full tribute to the excellent work of management and staff, and indeed all employees of our companies. There have been instances of enterprise, ingenuity, and merit, but realising that such results as shown by the accounts cannot be achieved without the team as a whole, I am sure you would desire me to thank all at every level at home and overseas in the parent company and the subsidiary companies of the group.

The consolidated profit and loss account showed a net profit for 1950 of £180,630 after deducting £287,576 for taxation, as compared with £162,253 for 1949 after deducting £143,254 for taxation.

The report and accounts were adopted and a final dividend of 10 per cent. (making 16 per cent.) plus a bonus of 1½ per cent. on the Ordinary shares were approved.

The retiring director, the Hon. F. H. Balfour, was re-elected, as also were the Lord Riverdale and Mr S. Meggitt, who retired in accordance with Section 185 of the Companies Act, 1948.

Messrs Peat, Marwick, Mitchell and Company, chartered accountants, Sheffield, were appointed joint auditors of the company.

GEORGE WEST (WEATHERPROOFS)

FURTHER EXPANSION BOTH HOME AND OVERSEAS

The twenty-fourth annual general meeting of George West (Weatherproofs) Limited was held at Aquascutum House, 100, Regent Street, London, W.1, on September 12, 1951.

Mr Gerald M. Abrahams, the chairman, presided.

The following is an extract from his circulated statement:—

I am happy to report the conclusion of another satisfactory year's trading. Our sales have expanded, both on the home and overseas markets, and, with the improved results, your directors are pleased to recommend a dividend of 12½ per cent. for the 12 months ended January 31, 1951, which represents an increase of 2½ per cent. per annum over the rate paid last year.

The expansion of turnover and higher prices for raw materials have caused further increases in stocks and debtors, and here I can inform you that our raw material stocks were purchased in the main just before, or at the beginning of, the price rises in wool in the autumn of 1950, which put us in the favourable position of not having to buy when prices subsequently rose very much higher. In the circumstances, our stocks can be considered satisfactory.

Further progress has been made in the sale of your company's products in the many overseas markets we now serve, and I can report good results from our own Canadian subsidiary company, which, you will recall, only commenced operations two years ago. In the United States of America, we established during the past year our own American subsidiary companies in order to effect the most efficient distribution in that country, and we are confident that these new arrangements will increase the sales and give added strength to our export business. However, the difficult and competitive nature of the market, together with the price controls which affect imported merchandise there, make it unlikely that this will be a very profitable business for some time to come; but, in the national interest, your directors are continuing to use their best endeavours in every way possible to increase your company's dollar earnings.

Of our well-known brand names, the sales of good quality rainwear at popular prices by Telemac Limited and Mattamac Limited continue to increase. At the same time, our retail shop in Oxford Street, George West Limited, further enhances its reputation with probably the finest selection of inexpensive rainwear available in London. The name Aquascutum, however, which is celebrating its Centenary this year, and which became a member of the group in 1933, has now become one of the best known names for quality throughout the world; therefore, your directors consider it appropriate that the name of the parent company should be changed from George West (Weatherproofs) Limited to Aquascutum and Associated Companies Limited. A resolution to this effect will be put to an extraordinary general meeting to be held immediately after the conclusion of the annual general meeting.

Since business is affected at short notice by world and domestic political considerations beyond our control, it is not possible to forecast what will happen in the future. However, I can report that our sales to date, in the current year, show an increase over those of the year under review.

I cannot conclude without expressing, on behalf of myself and my colleagues on the board, our appreciation to the staff of all our companies for their continued loyal service.

The report was adopted and the resolution for change of name to Aquascutum and Associated Companies Limited was approved at the extraordinary general meeting which followed immediately after the annual general meeting.

WESTERN MINING CORPORATION LIMITED

SATISFACTORY DEVELOPMENTS

The Annual General Meeting was held on September 6th in Melbourne.

Sir Walter Massy-Greene (the chairman), in the course of his speech, said: The appropriation account balance brought forward at April 1, 1950, was £A455,544, which, adding the net profit for the year of £A101,611, gives a total of £A557,155. After deduction of dividend No. 8 of 6d. per unit, £A69,859, there is a balance to carry forward of £A487,296.

The affairs of the companies in which Western Mining Corporation has substantial interests have recently been reviewed at the annual meetings. Developments, though varying from mine to mine, have, in general, been very satisfactory.

Over the last few years the Corporation has been dependent for its profits on dividends from Central Norseman Gold Corporation N.L. and Gold Mines of Kalgoorlie Ltd. and occasional profits on the sale of properties. The two dredges of Central Victoria Dredging Company N.L. have now been brought into commission and it is expected that dividends from this Company will be received during the current year. New Coolgardie Gold Mines N.L. has nearly finished its construction programme and we may look forward to the gradual repayment of its debt. At Great Western Consolidated N.L., it appears that the mine will come into production in the latter part of next year.

Apart from the various capital expenditures on plant, etc., the circumstances of the last few years of steadily rising costs and uncertain dates of delivery have led to an increased lock-up of capital by the various companies in stores. Taking into account these factors and the expected results of the various operating companies it is anticipated that the Corporation's revenue in future will increase.

The report was adopted.

ALLIED SUMATRA PLANTATIONS

INDONESIAN PROBLEMS

MR A. L. MATHEWSON'S STATEMENT

The twenty-fifth annual general meeting of Allied Sumatra Plantations, Limited, will be held on October 17, 1951, at the offices, 1-4, Great Tower Street, London, E.C.

The following is an extract from the statement of the chairman, Mr A. L. Mathewson, which has been circulated with the report and accounts for the year ended December 31, 1950:—

The difficulties with which the estate owner in Indonesia has to contend are now so well known to the investor here as scarcely to require recapitulation. Apart from the present insecurity under which the staff are working, crop thefts often reach as much as 50 per cent.; labour strikes and unrest are skilfully fomented by Communist dominated trade unions and there is general unwillingness to give a fair day's work, despite, or because of, the exaction of ever higher and uneconomic rates of pay and of free issues in kind. Fiscal burdens in Indonesia alone absorb not merely half of the estate's profit but today are the equivalent of half the value of the product. We are faced with continually mounting inflation.

Looking for a bright side to a sombre picture I think there is now a growing awareness of the critical nature of the situation. Indonesia is not without intelligent and patriotic leaders. It is unthinkable that, alive to the danger, they should fail to exert themselves to the utmost to arrest the present decline and to counteract the schemes of communistic agents actively seeking to dominate Indonesia and her 75 million people. Indeed, the numerous arrests recently reported in Djakarta, Medan and elsewhere would appear to provide welcome evidence of official determination to deal firmly with subversive activities.

ESTATE TITLES

If, as we earnestly hope, these efforts lead to the establishment of law and order and conditions conducive to the efficient operation of the plantation industries, one of the major questions to which it seems to us the Indonesian Government would be well advised to give especially careful thought is that of estate titles. We learn that it is the intention of the authorities to tackle this particular problem now in so far as it concerns North Sumatra, where they apparently contemplate negotiating and substituting new titles for old. Speaking generally, while a few leasehold titles have between 30 and 40 years unexpired, with, in some cases, an option to renew for a further 50 years, others have recently expired and a large number have relatively short remaining lives.

Under present conditions more and more countries appear to be studying ways and means of attracting investment from overseas. From every point of view therefore it would seem desirable that before definite provisions governing the issue of estate titles are written into the Statute Book, the Indonesian authorities should take steps to ascertain that whatever provisions they contemplate are such as will attract and encourage foreign investment on the requisite scale.

For instance, it is reported that a maximum term of 30 years for new leasehold estate titles has been mooted in official quarters. That, or indeed anything shorter than the renewal option period to which I have referred, can be shown to be quite inadequate for long lock-up investments like plantations of rubber, tea, oil palms, etc., and I have no doubt that inquiry in competent quarters here would readily establish that serious informed investors would regard such a term as an unattractive basis for a venture of that nature.

COAST LINES, LIMITED

SUCCESSFUL TRADING YEAR

The thirty-eighth annual ordinary general meeting of Coast Lines, Limited, was held, on September 11th, in London, Captain A. R. S. Nutting, O.B.E., M.C. (chairman of the company) presiding.

The following are extracts from his circulated statement:

We have enjoyed a successful year of trading. The consolidated net profit, subject to taxation, amounted to £1,036,584, against £684,616 last year, an increase of £351,968. The profit of the Group, less taxation, amounts to £430,207, of which £12,042 is attributable to outside shareholders in subsidiaries. The net profit of Coast Lines, Limited, available for dividends and reserves is £335,825, an increase of £162,059 over 1949. An interim dividend of 5 per cent., less income tax, was paid upon the ordinary stock on July 23, 1951. The directors recommend no further payment for 1950.

The board has come to the conclusion that steps must be taken to equip the group with adequate vessels to replace those whose useful life will be ending in the next few years. In furtherance of this policy, orders have been placed in 1951 for the construction of a passenger vessel to relieve our passenger liners while undergoing overhaul and survey, a cattle carrier and two cargo ships.

We are encouraged by the progress which has taken place, and we hope that your company's interests will over the years yield a satisfactory and increasing income. Our trading profits for the months of the year 1951 encourage the hope that the improvement in 1950 will be maintained.

The report was adopted.

INDIAN COPPER CORPORATION, LIMITED

SATISFACTORY RESULTS

The twenty-seventh annual general meeting of the Indian Copper Corporation, Limited, was held on September 12th in London, Sir Godfrey Fell, K.C.I.E. C.S.I., O.B.E., chairman and managing director, presiding.

The following is an extract from his circulated statement:

The gross profit for the year 1950 was £612,682—£19,130 more than in 1949. The proposed dividend is 12½ per cent., less tax. The financial results for the year may be regarded as satisfactory. 386,156 short tons of ore were treated in the mill. This is the highest since 1941, when 397,390 short tons were treated. The production of refined copper increased by 224 long tons. On the other hand, the output of rolled metal was lower by 1,863 long tons.

Although the total footage driven was 229 feet less than in 1949, the payability increased by 5.4 per cent. to 63.5 per cent., the highest since 1945, owing to development in more favourable ground. The increase of 288,765 short tons, bringing the total of the estimated ore reserves to the record figure of 3,087,195 short tons, is most gratifying.

The possibility of recovering sulphur products at Moubhandar was the subject of prolonged consideration prior to the outbreak of war in 1939. Your directors came to the conclusion that the project was, at that time, uneconomic: The problem, which is now of considerable importance, is being reconsidered, and an eminent expert is now visiting the property to report and advise on the project.

The report was adopted.

Factory sites in Canada

Our Foreign Business Department can assist you in finding suitable factory sites in Canada. This department is a ready source of information on markets, sources of supply and kindred subjects of vital interest to business men.

London Offices—

UNIVERSITY OF LONDON

DEPARTMENT OF EXTRA-MURAL STUDIES
UNIVERSITY EXTENSION COURSES

The following are some of the evening courses arranged for the Session 1951-52, commencing in September:

Price Determination in Theory and Practice
British Foreign Policy
Economics of Distribution.
Human Problems of Industry

Many other University Extension Courses in arts and sciences, some residential will be held at centres in London and the Home Counties. Further information may be obtained from the Director, Extra-Mural Department, University of London, Senate House, W.C.1.

UNIVERSITY OF ABERDEEN

APPOINTMENT OF SECRETARY TO THE UNIVERSITY

The University Court will, in the Autumn, 1951, proceed to the appointment of a Secretary to the University which office will become vacant on September 30, 1952. It is intended that the person appointed should take up duty some months before the present Secretary demits office.

Salary at least £2,000 per annum with F.S.S.U. and Children's Allowance. The University pays a proportion of removal expenses.

Further particulars and form of application may be obtained from the Secretary, with whom applications should be lodged not later than September 30, 1951.

H. J. BUTCHART, Secretary.

The University, Aberdeen.

SCHOOL OF ECONOMICS, DUNDEE

17, BELL STREET, DUNDEE.

Courses of study are provided for the external degree of B.Sc.(Econ.) of London University with the following Special Subjects:

Analytical and Descriptive Economics;
Modern Economic History;
Industry and Trade.

Next Session begins October 2nd.

I CAN offer exceptional qualifications for remunerative mission or employment. Wide experience in marketing and advertising, knowledge of four languages, engineering training and literary experience. Would travel anywhere or tackle difficult problems but must be interesting.—Write Box 745.

EVERY BUSINESS this small Agency works for has Grown: many from small beginnings, some to top level in their fields. We can give the service that Builds to the firm that needs it: advertising, mailing, brochures, catalogues, exhibitions, etc.—Fordham Sadler Advertising Limited, 33, Torrington Place, W.C.1. Euston 3721-3.

OPENING sought by young executive, 28, at present assistant to managing director, University education, preferably on sales side. —Box 737.

AN Industrial Company with London Headquarters is about to make an appointment in its Personnel Department. It calls for a man used to dealing successfully with executive staff rather than operatives. Applications would be welcomed from gentlemen of University education standard, 35-40 years of age, with industrial and service experience. The appointment which is pensionable would have a commencing salary of £1,000 a year with excellent prospects. —Full details of qualifications and experience to Box 738.

CHARTERED ACCOUNTANT, 39, Prize Winner, Public School and Cambridge University, Director and Chief Accountant of Large Group of Public Companies, several years top-level commercial experience, seeks new position in Accountancy or Finance. Languages, German and fluent French.—Box 742.

LARGE Group of Engineering Companies in North West require a Training and Education Officer. Candidates should have a degree in a faculty of Engineering and experience of industrial education in all its branches. The position carries a salary of between £750 and £950 per annum according to qualifications, experience and potential capabilities. Non-contributory Pension Scheme in operation.—Reply Box 739.

WARMTH, comfort and good food at a first-class hotel in Devonshire. Winter terms £5 5s. per week from October 1st for a stay of not less than 3 months. Write Major Morris, The Arundell Arms Hotel, Lifton, Devon. Telephone: Lifton 244.

October 25th

IT is just two years since the devaluation of sterling prompted speculation that Mr Attlee might go to the country in the autumn rather than wait for the following spring. An election campaign has been running almost continuously ever since. In five weeks' time, unless the mischance of an indecisive result is repeated, it will be ended at last. That is the chief importance of Mr Attlee's decision on an October election. Whether the Conservative or the Labour party can provide the better political leadership for these times is by comparison a minor issue. It may be that in very quiet times the country could be well governed with as small a Parliamentary majority as Mr Attlee has commanded for the past nineteen months. As things have in fact been, no party could have governed well. The difficulties facing the British people are now growing harsher. The firm and effective government required to meet them can come only from a party firmly established in power and able to look beyond immediate popularity when the need is for measures that will show their good results in two years' time rather than next month.

Mr Attlee deserves praise for his recognition, belated though it is, of this need. Power is the purpose of politics and no party leader can be expected to surrender power easily, however much it appears to be to the long-term advantage of his party as well as of the nation. It cannot be taken for granted that Labour will be defeated. Yet it is extraordinarily hard to see any method by which the floating voter can now be won back. Last year the differences between the parties concerned means, not ends, and within that setting both were essentially on the defensive. The Tories campaigned not on their own policies but on the discontents experienced under a Labour government; and Labour, for its part, campaigned neither on what it had done nor on what it had left to do, but on the memories of prewar discontents under Tory rule. The economic situation—discussed in a succeeding article—now makes it more unrealistic even than it was in 1950 for either side to promise better things soon. But prewar memories have grown fainter and present discontents have grown greater. If the campaign is again to be negative, Labour has little chance indeed.

One thing it is appropriate to say at once. These columns will be concerned with analysis, not exhortation. *The Economist* will not presume to take sides or to advise its readers how to vote. The function of an independent journal of opinion is to comment on particular matters on their merits. It sees good and evil in all parties. Since 1946, and particularly in the past two years, the weaknesses of the Labour government have required unremitting criticism; but it cannot lightly be assumed that a Conservative government would on balance be better. The task of the commentator is to examine carefully all the various weights that lie on each of the two scales. How they point the balance is the decision that each voter must make for himself on October 25th.

The Balance of Achievement

NOW that a peace treaty has been signed by nearly all the countries that went to war against Japan, it is worth once again considering how the free world stands with Russia and the Communist powers—none of which signed the treaty. The present is a particularly suitable moment to look at the assets side of the balance sheet. There have been a good many items to the credit of the West during the past year which are all too often overlooked, and the treaty with Japan rounds off a situation in which the Russians have, at least for the time being, driven all three of their ex-enemies—Germany, Italy and Japan—into the arms of the West.

Perhaps the most striking feature of the scene at this moment is Russia's failure to prevent Japan and Germany, inevitably two of the pivotal countries of the world, moving closer to the western alliance. Many of those in the western countries who fought against the Germans and the Japanese only six years ago are not a little worried that too much is now being done, and done too quickly, to strengthen both these incalculable and formidable peoples. But whatever reservations there may be in the West, they are at least offset by relief that Germany and Japan are not drifting Moscow-wards. For the Communists themselves there is no such comforting reflection. This is very largely the achievement of the past twelve months. A year ago there could be no certainty that a peace treaty could be achieved with Japan against the will of Russia and favourable in virtually all respects to the American point of view ; Mr John Foster Dulles had not even begun sounding other friendly powers on their willingness to accept a liberal treaty which would enable Japan to rise again. Today Japan is to return to the international scene as a definite partner in the American sector of the free world. At present its people are predominantly anti-Communist and, if the West plays its cards right, there is no inherent reason why they should not remain so. As yet it is impossible to tell how many of the outward forms of democracy, planted by the Americans during the occupation, the Japanese may root out in the months to come. The prospects are not too encouraging, especially in the field of industry and labour relations. But that is a long way from meaning that the Japanese Communist party will be able to seize power—particularly if Japan is allowed the economic scope it needs to develop its overseas trade.

Over Germany, too, the period of disagreement which began in earnest with the meeting of the western foreign ministers a year ago has finally been brought to an end. Last week's decisions to put relation between the Federal German Republic and the western powers on a contractual basis and to recruit Germans for a European army are a milestone in the postwar world. They have been greeted with considerable enthusiasm in Western Germany by the forces behind Dr Adenauer. How strong those forces are, in opposition to the increasingly bitter and vocal nationalism of both the Left and the extreme Right, it is too soon to say. But there is at least ground for hoping that the Germans will accept the equality they are offered—and that they will accept it in respect of the obligation to rearm as much as in the proposed ending of the occupation statute. If they thus regain their sovereignty much earlier than anyone could have expected, they owe it to the Russians, who have forced the western powers to agree on the terms of a virtual peace treaty that will place Western Germany as firmly in the ranks of the western powers as the eastern zone is now being cemented into the Soviet bloc.

Compared with the Japanese peace terms, the Italian treaty of 1947 is now clearly obsolete, and it is no accident that Signor De Gasperi, the Italian Prime Minister, who is in Ottawa for the Atlantic Council, will go to Washington this week end to seek American agreement for revision of this treaty. For the moment it would be impractical to give him more than a declaration of principle, since the difficulty still has to be overcome of getting round the fact that Russia is also a signatory to the treaty. Nor is the actual revision momentarily urgent, since the Italian contribution to western defence is still well within the limits of armament permitted by the treaty. But this matter now transcends merely technical clauses, and the case for removing even theoretical restrictions on the Italians if they are to pull their weight with their allies is overwhelming. This again shows a change from two years ago, when Signor De Gasperi and Count Sforza were still engaged in a hard fight both at home and abroad to secure Italy's membership of the Atlantic Pact. And once again the change has been due to Moscow's pressure tactics.

★

So much for the peace treaties. Present relations with all three of these countries represent an outward and visible sign of western success in denying the bulk of their resources to the Communist bloc, a success which was by no means a foregone conclusion when the western countries took up the Soviet challenge some four years ago. The feeling is growing that the Russians are losing the diplomatic initiative. It may well be that, in spite of all the perplexities and dangers and in spite of the immense effort and care now required if the western powers are to continue on the course they are setting themselves, 1951 will turn out to be the turning point in the cold war. Today, as the signing of the Japanese treaty has shown, not only are the Russians no longer always setting the pace, but they sometimes give the impression that they do not quite know how to react to the moves made by the western powers.

It is now clear, for instance, that the Kremlin has not been able to make any particular propaganda success out of the abortive meetings of the foreign ministers' deputies in Paris earlier this year. Least of all has the original design in the Russian mind, to put a brake on German rearmament, been in any way fulfilled. The West has gone ahead with consolidation in Europe and so far has lost nothing by doing so. Nor can it be denied that the Communists, having turned to Asia for success, have so far fumbled their tactics in Korea. This is true at present whatever may happen in the future. The original aggression in Korea itself has failed ; the western world has been alerted ; the United Nations have developed a more definite and costly policy than ever before without sacrificing their unity—rather the reverse ; and any intention that the Russians may have had to use the Kaesong armistice talks as a weapon at San Francisco has patently not come to anything.

In the rest of Asia and the Middle East, the recent Communist performance has been little better. In Indo-China the Vietminh have reverted to guerrilla warfare, in Malaya the government's campaign is at last paying higher dividends, and in Burma, if the war is not going better, it is at least going no worse. The Indian Communists, owing to internal divisions, have been singularly unsuccessful during the past year, and in the Middle East it is remarkable how silent the Russians have so far been, in view of the acute Anglo-American embarrassment in Persia and the very difficult situation which has arisen on the Suez Canal.

It is essential, when so much is at stake and it is all too easy to be pessimistic, that these things should be recognised and a balance of achievement struck. There may, of course, be a series of grave disasters just round the corner. The Russians' present relative inactivity may be deceptive. Even without the ultimate calamity of world war, the western peoples will never achieve full peace of mind until military parity is achieved with the Soviet empire, and that is certainly not something which can be accomplished this year, or possibly next year either. But the fact is that for one reason or another, in this crucial period through which the world is at present passing, the Russians have so far done surprisingly little to counteract the historic steps now being taken towards greater western integration and the establishment of a western defence framework that may well last for very many years. At this moment, as the last days of the summer campaigning season of 1951 run off, that is a reflection for which the free world should feel profoundly thankful.

A dangerous Russian move could yet come overnight in Berlin or Jugoslavia or Persia or elsewhere, and at the least it could embarrass as well as hasten western efforts to achieve military parity. Whether it does come or not, however, it cannot now invalidate either the achievements or the lessons of the past year. For the Russians, it is clear that nothing like the events in Korea can be repeated without an even greater risk of world war. For the West, the lesson is that to meet the challenge with vigour and courage is the only chance of defending the peace in the end.

There is no doubt where the major credit for the achievements of the past year belongs. The western world as a whole can claim some of it, most particularly the ordinary people of the western countries who (save for one brief moment last winter) have kept their nerve most admirably. But in looking back over the twelve months, what has been most impressive is the balance that has been secured between strength and restraint, and for that the credit belongs to the much-abused architects of American policy. Mr Truman, Mr Acheson and General Marshall have been told by some people, chiefly outside their own country, that they have been too aggressive and too reckless. In America they have had to listen to a flood of accusations of weakness and appeasement. Just how wrong both sets of critics have been can be seen by trying to imagine what would have happened by now if their wishes had been followed. Had the western policy been weaker, the Soviet advance would not have been checked. Had the bombers been let loose *à la* MacArthur, there might well have been total war. If the aim is to contain Communism without another world war (and it is perhaps a good thing to remind the Republican firebrands that no other aim will command the material or moral support of the free world) the balance has been about right. The task now is to keep it so. Peace cannot be secured by either arms or diplomacy alone, but only by both together.

The Third Crisis

THE third economic crisis since the war is now plainly in sight. While the political parties are preoccupied with electoral calculations the gap between Britain's imports and exports becomes more disturbing every month. This summer the country has lived almost as far beyond its income as it did in 1947, at the peak of postwar dislocation. The fact has naturally made little impression on the public mind ; no more did the payments deficit of 1947—until its consequences were expressed in the suspension of sterling convertibility, savage cuts in imports, and harsh increases in taxation. The economic crisis of 1951-52 is now at an early stage. There is none the less clearly at work a process that threatens to destroy the sober hopes of 1950 as thoroughly as the brave plans of 1945 were shattered by the realities of 1947.

A heavy responsibility rests on the politicians. They are not compelled to treat the first emergence of a deficit in overseas payments as a crisis, a point when policies must be changed. The crisis comes later, when it is impossible to sustain the deficit, when the rest of the world becomes unwilling to supply Britain with more goods than Britain exports in return. While it can be sustained, the deficit is red meat and strong wine for weary politicians. It subsidises their constituents, providing a higher standard of living than the country is earning. It means that the consequences of their inflationary policies are borne—for a time—by the rest of the world, which does not vote at a British general election.

The unpleasantness is not in living on the overdraft but in repaying it. And the rest of the world certainly will not allow this country to overdraw without limit. If the British deficit continues at its present rate, it is unlikely to be many months before confidence in sterling is broken as it was in 1947 and 1949. Foreign countries will not only refuse to go on extending new short-term credits to Britain ; they will also demand goods or dollars in exchange for some of the large sterling balances they already hold. At that point, if nothing is done before, the crisis will come overnight. But only those who resolutely refuse to read the signs will believe that, as Dr Dalton claimed in 1947, the storm has blown up suddenly. Its brewing is plain enough.

In the first eight months of 1951 the visible trade gap, the difference between the recorded values of imports and exports, was £800 million. For two reasons this exaggerates the true deficit on overseas payments. First, the values of imports are reckoned including the costs of insurance and freight, which are in fact paid largely to British firms rather than to foreigners. Secondly, no account is taken of invisible transactions—payments for services rather than goods—which yield a net surplus to Britain. These two factors can be roughly allowed for.

The true deficit in the past eight months was rather bigger (at an annual rate of £380 million) than the deficit incurred in 1946, the year when demobilisation was in progress, when the civilian labour force was three millions smaller than it is now, when many export industries had not been turned over from war production or rebuilt after wartime concentration.

The deficit was small at the beginning of this year and has grown rapidly. In the past four months alone it has been, so far as can be calculated, equivalent to a rate of £630 million a year. The deficit in the great year of crisis, 1947, was £545 million.

This comparison is misleading, because prices have risen since 1947. In the table the balance-of-payments figures for each postwar year are revalued according to the changes in British export prices. The final column of figures measures, in constant prices, the quantity of

BRITISH BALANCE OF PAYMENTS

	Surplus (+) or Deficit (−)	Index of British Export Prices	Surplus or Deficit Revalued at 1947 Prices
	£ mn.		£ mn.
1946	−344	91	−380
1947	−545	100	−545
1948	− 30	110	− 25
1949	+ 30	113	+ 25
1950	+229	120	+190
1951 annual rates during :—			
8 months, Jan. to Aug.	−380	139	−275
4 months, Jan. to April	−130	133	−100
4 months, May to Aug.	−630	145	−435

goods that it would have been necessary each year to add to exports—and so take away from the British consumer—in order to balance overseas payments. It shows that for the past four months the deficit has been bigger in real terms, as well as in money value, than it was in 1946; it has been only one-fifth smaller than in 1947. For all the postwar expansion in production and exports, the British economy is almost as far from paying its way as it has ever been. Although export values will rise, there is little hope that on balance the final four months of 1951 will yield any better results than the middle four months. And it has to be pointed out that the exports of 1947 were those made after, not before, a winter of fuel shortage. The danger that the economic stringencies of 1952 will be even more severe than those that have gone before is patent.

The public mind has grown accustomed to dramatic swings from crisis to recovery and from recovery back to crisis. So far they have made remarkably little difference to the living standards of ordinary people. To talk of a payments deficit is now to suggest, at most, another dreary round of import cuts, new shortages, tighter restrictions and higher taxation. That is serious enough: each successive bout of restrictionism is bound to cut more deeply into the foundations of incentive and innovation on which the prosperity of the British economy depends. But the danger is also more immediate. In 1947 and 1949 production and living standards were recovering rapidly from the effects of war. The crises were interruptions in the trend; thanks to American aid, which provided time for gentle remedies to take effect, the payments gap could be closed without any actual reduction in living standards. Both the trend and the aid are uncertain now. A deficit of the proportions of 1947 is far more serious when it occurs in the conditions of 1951. If it is allowed to run on unchecked to the point of crisis, the consequences can only too easily be severe dislocation to industry, unemployment, and a lower standard of living.

The new crisis comes when exports have almost reached the famous "target" of 75 per cent above the 1938 volume, which was supposed to balance British payments in the postwar world. There are people who seem to conclude that Britain therefore has nothing more to do, that the fault lies with foreign countries for making the things Britain imports so dear, that the British deficit must be removed by mysterious international action to reduce commodity prices. This is a classic demonstration of how rigidly set the minds of planners may become. The hard fact is that the postwar world has turned out to be an even more difficult place than was foreseen in 1945. The terms on which exports can be traded for imports are likely to remain unfavourable to Britain. If they were more favourable—if this were a less inflationary world—it is doubtful whether British goods would be competitive enough to sell in their present volume, and the gap would still exist. It is a complete fantasy to suppose that Britain would benefit from a world depression.

In the world as it is, and as it must be accepted, this country is not exporting enough to pay its way. It is not exporting enough because the pressure of inflationary demand in the home market is too strong, and the only effective policy for reducing the payments deficit before it leads to crisis is disinflation. This is not a matter of theory and commonsense alone. The recovery of Western Germany this year, as well as that of Britain in 1948, has demonstrated clearly the effectiveness of the disinflationary remedy. There is no reason to think that the British people will now shrink from such a remedy when the facts are made plain to them. They understand well enough that a payments gap has to be closed eventually and is better closed earlier and less painfully rather than later and more painfully. It is the politicians who must be blamed for lack of foresight and weakness of will. Those who find the courage to adopt a realistic policy are not only more likely to save the country from a crisis if they are in power; they are also more likely to be entrusted with power next month.

THE AGE OF INFLATION

The three articles by a correspondent, and a fourth article expressing the editorial views of *The Economist*, are being reprinted as a pamphlet, price 8*d*. (including postage).

Special prices for bulk orders: 1 dozen, 7/-; 6 dozen, £1.19.0; 12 dozen, £3.6.0.

An Army in Embryo

THAT there should have been a chorus of approval for the idea of a European army from men of such eminent and varying capacities as General Eisenhower, Mr Acheson, Mr Morrison and now Mr Strachey is something of a miracle. A few months ago every staff officer in Europe had his little joke about the practical difficulties of any such plan; now the sceptics are silent and the enthusiasts hold the field. Behind the idea, and determined that it shall be made to work, stands a group of men who cannot by any stretch of argument be described as starry-eyed; among them are fighting soldiers from Korea who have helped to create in most unfavourable circumstances a United Nations army and a Commonwealth division. Moreover, since the Washington conference of American, British and French foreign ministers the idea has become western "policy" in a sense that it has never been before. An impromptu French aspiration has become part of a deliberate programme. It remains as true as ever that the sight of the French Deputy for Nato, M. Alphand, explaining the French thesis to an audience of military correspondents is like watching an art master defending his subject before a sceptical education committee. Yet the European army, once regarded as a luxury, is becoming a necessity.

It is as well to recall why this has happened. It is not because the political urge for European unity has swept all military objections away; although it is true that many American military experts have been inspired by the Strasbourg gospel. Nor is it because anybody regards the European army as a good thing in itself in present circumstances. It is quite simply because the western allies faced this dilemma: to defend Western Europe and to provide against the day when American land forces will be withdrawn from it, another ten divisions are required in addition to the available Nato forces, and they can only come from Germany. As the French want Europe defended but will not—indeed, a French Government dare not—give Germans the right to recreate an independent *Wehrmacht*, the integration of German divisions in a European army has become the basis of a political compromise. In other words the motive of the plan is not the confidence of French and Germans that they can work together in such intimacy—though men of goodwill on both sides are hoping to do so—but French distrust and fear of Germany. This is not necessarily a weak point in the scheme; for political arrangements that do not recognise political facts are useless. But it is a point that should not be lost from sight if wishful thinking is to be avoided. It is safer and wiser to talk of the European army not as a means of uniting Europe but as a function of Franco-German relations.

If the fears and hopes that underlie this enterprise need realistic appraisal so do its military aspects. The present proposal is that a complete, practical plan for the European army should be ready in about six weeks' time for consideration by the governments of the North Atlantic Treaty Organisation and by the Federal Government of Germany. If agreement and approval were secured, then in the New Year the German pledge of a contribution to Europe's defence could be formally exchanged for the west's recognition of German independence.

It is most unlikely that the time schedule will be observed, whatever hopes have been encouraged by statements from Washington and Ottawa. In the first place the military experts of the five governments interested in the plan of an integrated European army are deeply divided on essential practical points. For example, only the arbitration of General Eisenhower's headquarters is likely to achieve an agreement between the French desire for small divisions and the German desire for large—an argument that might well be compromised on the basis of national divisions 12,000 strong. Secondly, if the military experts are divided on military matters it is far from certain that the political experts can agree on political matters. Both in France and Germany public opinion is only just waking up to the fact that what is being proposed is the extinction of purely national armies and the surrender of national sovereignty in defence policy. In Germany a powerful opposition with every prospect of one day gaining power is bitterly attacking the plan; and in France both extremes of political opinion, Gaullists and Communists, will fight the idea tooth and nail in the Chamber. In Germany, too, it is noted with irritation that there is still to be an army of North Africa under the control of Paris and an army of the Congo under control of Brussels; but it is proposed that Bonn will control nothing and have an incomplete general staff minus operations and intelligence departments. Thirdly, it is inconceivable that what is called the political part of the defence plan—the superstructure of executive commission, deliberative assembly, secretariat, budgetary committee and so on—will be set up between now and the end of the year. It took nine months to agree on the Schuman Plan organisation, and the issues then raised meant little to the ordinary politician and man in the street. But the Pleven defence plan affects every able-bodied man under 45 west of the Elbe. Above all, it raises the question of how the European army is to be paid for.

On the face of it, therefore, it looks as if the plan for a European army is politically desirable, but psychologically unrealistic and militarily superfluous. It looks, too, as if the political organisation which the French insist on having agreed with the Germans before they will consent to the recruitment and training of German soldiers will keep officials and statesmen arguing for months; whereas what Nato wants is urgent action—a German division by the end of 1952, five divisions by the end of 1953 and eight to ten divisions and a tactical air force by the end of 1954. The prospect of sufficient Franco-German agreement to get this integrated defence organisation started is therefore gloomy. But the remarkable fact remains that those who know the difficulties best and are responsible for overcoming them—that is to say the international staff at Shape and its political masters—believe success is possible and intend to work for it. Indeed, it is true to say that the Supreme Commander gives priority to this political task over all military problems. And even the most confirmed sceptic must recognise that to overcome traditional enmities, to insist that wartime memories shall be buried, to urge new and close relations between suspicious neighbours is precisely what Marshal Rokossovsky is trying to do in Poland and Eastern Germany. It cannot be seriously argued that nothing of the kind is possible in Western

Europe if the Americans have made up their mind that it is.

This contrast between the unpleasant facts and the vigorous American and European will to overcome them puts British policy into a difficult position. So far it has been content to send rather undistinguished and disinterested observers to the conferences in Paris. They have stood on the touchline and commented in whispers. Now that Mr Morrison and the highest authorities of the western world have given the Pleven plan their blessing the British will have to speak up. Clearly, so long as it is their policy, as it is the Americans' to support but stay out of this European defence organisation, they can neither barrack nor cheer wholeheartedly. Yet, as the strongest military power in Western Europe, with an unprecedented peacetime force on the Continent, they are entitled to speak and to be heard with respect.

What then are they to do and say? First, they can usefully act the judicial role. They can point out persistently that the military preparations needed for Europe's defence and the political experiments needed for Europe's unity should be kept apart at every point where they might clash. Otherwise the latter will frustrate and delay the former. It is, for instance, possible for the British—and only for the British—to remind General Eisenhower that Paris would be secretly delighted if two years hence there were not a single German regiment under arms. Likewise, the British can see to it that the drive for a European army—from which Denmark, Holland, Norway and Portugal still stand aloof—shall not divert attention and energy from the need to integrate the much more powerful Nato forces. The British, too, can make much of the fact that the European Defence Organisation, even if it came into being within the next three years, could afford neither the naval forces, nor the strategic and tactical air forces, nor the ground defence against air attack adequate to make them independent of British collaboration.

In short, the British must and should reserve judgment about their own relationship to this defence organisation until it is clear beyond any doubt what is involved. For no other decision is possible so long as two questions remain unanswered: first, will the embryo army—for it is nothing more—becoming a living thing? Second, what exactly are American military intentions for the future? And reserving judgment must mean for Britain staying outside the proposed defence organisation but helping it along, which is precisely what the Americans are now doing. It is possible that five years hence the problems of Western Europe's defence will have been transformed, and that it will be revealed that General Eisenhower worked so well that Europe can dispense with everything American save the latest weapons and scientific advances, the strategic air force and the formal ties of the Atlantic Treaty. In that case Britain will be glad it stayed outside, for it can then concentrate on its duties to Nato and the Commonwealth. But it is also possible that the defence organisation, after a year or two of experiment, will break down on the reefs of the German problem. For the time being the role of Britain is that of understudy to the United States as it tries to supply that outside encouragement and pressure and leadership without which no European organisation will work. If it one day has to play the role itself, it will play it all the more effectively for having, like the Americans, given its support to the European Army from outside.

Booksellers' Price War?

(By a Correspondent)

WHEN he announced the Government's intention to abolish resale price maintenance, the President of the Board of Trade said that this legislation would not necessarily apply indiscriminately to all trades; there might be some that could make out a good case for exemption. The obvious exceptions are those—such as the sellers of wireless sets and electrical apparatus—that provide technical services. A more difficult, and perhaps a marginal, case is the book trade, which is covered by a tight system of resale price maintenance under the Net Book Agreement.

This agreement is the sheet anchor of the whole trade, for it marked the transition from a period of hard struggle to comparative prosperity. There was a time when university booksellers—now honoured academic institutions—habitually wore their customers' cast-off clothing. It may be regarded as symbolic that the first "net book" was Marshall's "Principles of Economics," published in 1890. The experiment was successful enough to lead to the general adoption of the system ten years later.

The net book agreement stipulates that all booksellers shall sell at the retail price fixed by the publishers, and includes provisions about fixed dates of publication and the length of time that must elapse before books may be sold as second-hand or reduced in price. The members of the Publishers' Association agree that they will supply books to any bookseller who breaks the agreement only at the full net price that he must charge to the public. A policy of price-cutting would thus soon lead to the extinction of the offending firm.

The argument for abolishing resale price maintenance is that it prevents the public from benefiting from free, or more or less free, competition. In general that argument is overwhelmingly strong. But the book trade's claim for exemption is not based solely on the self-centred belief that the abolition of net books would throw it into confusion and damage its interests. It is also based on the fact that from the nature of the market there cannot in any event be free competition in the retailing of books. It is not at all certain that the abolition of the agreement would reduce prices and benefit the public in the long run. For price competition to be effective in reducing retail prices a "market" fulfilling two conditions must exist. The purchaser must be able to compare prices and choose his price; the retailer must also be able to compare prices in order to calculate his own. Without these conditions the argument that competition will reduce distributive costs and prices becomes shaky. There are two reasons for believing that these conditions do not exist in bookselling: first, the fact that so many books are published, and secondly, that competition in the book trade tends to be at a distance.

In 1950 alone 11,211 new books and 5,334 reprints were published. How many works were in print altogether is not known, but in 1940 there were 600,000. Few bookshops will attempt to deal with all these books, but many have stock lines running into several thousands. At present the bookseller can discover the prices of all these books from catalogues. It would be a formidable task if instead he had to watch the prices of every book to see that it was competitive.

Competition varies with distance. Even if there were no net book agreement the bookseller in a small town would have little incentive to reduce his prices. His is often the only bookshop in the town, and the nearest competition is several miles away; the number of customers that even the smallest bookshop can economically serve is much greater than that on which most small retailers can subsist; and it is the size of the shop rather than the number of shops that varies with the demand. A bookseller of this kind might perhaps reduce his prices in expectation of increasing demand and higher profits. But the demand is comparatively inelastic, at least in the upward direction; for much of any short-term increase in reading will be absorbed by the local library, while a short-term decrease will first be felt by the shop.

A bookseller in a larger town has competition on his doorstep; and at considerable cost he might be able to compare his prices with those of his competitors. But this extra cost might be sufficient to prevent him from making any worthwhile reductions in his prices. The rate of production of new books and the complexity of demand facing the general bookseller in a large town have already led to specialisation, reducing the competition between different shops in the range of books they keep in stock. Price competition would aggravate this tendency.

Specialist bookshops—among which the best known are the university booksellers—offering as they do a specialised knowledge and a high standard of service, would fit particularly badly into a competitive free-for-all. They rely not only on sales across the counter, but also on postal business over a wide area; one of them has said that a good bookshop should be able to operate behind closed doors. The specialist bookseller's market is on the librarian's desk and his showroom is a catalogue. It is a high-cost business; the staff must be suitably paid for its knowledge, and a high proportion of the stock retails at comparatively small discount. It would add impossibly to his costs if he had also to provide a staff to check the price lists of, say, twenty other bookshops, competing in price in a number of titles which might range from two or three to ten or twelve thousand.

Cutting across the structure of the trade are the very large, heavily capitalised bookshops and the chain stores. Both might profit from the abolition of the net book agreement, for they could probably sell books as though they were boot-polish, at a low overall margin of profit. This would undoubtedly lead to a great reduction in the number of bookshops. At first sight that would seem desirable, as a means of avoiding wasteful duplication and stimulating economies in sales methods; but the reduction in the service which the book trade now gives would be damaging in other ways. It is in the public's interest, as well as that of the trade, that books should be shown, as now, over a wide area, and that the bookseller should render, as he frequently does, services without sale and without visible recompense. It is, moreover, by no means certain that the economic advantages of lower distribution costs would be permanent. In the first stage of a price war the smaller booksellers would disappear. The struggle would then continue between the larger ones; but because of the heavy capital required to enter the business there might afterwards be a trend towards monopoly prices.

That the abolition of the net book agreement would lead to lower prices is not borne out by experience in the United States where no such agreement operates. The English bookseller makes 33⅓ per cent on most general books, 25 per cent or less on textbooks. His American counterpart expects more than 40 per cent on general books, about 25 per cent on textbooks, and in addition scores of complicated bilateral agreements between publishers and retailers must be set up where the British book trade works efficiently on one. The second-hand market in this country is another case where there is no agreement, and it is noteworthy that most second-hand booksellers expect to make a larger percentage of profit on a second-hand copy than on a new one, and will not buy unless they can do so. Distributive costs appear to be quite as high, if not higher, where there is no net agreement.

*

The complaint is often heard, however, that even at 33⅓ per cent the bookseller's margin is too high. It seems at first sight absurd that on the sale of a 10s. 6d. novel the bookseller probably makes 3s. 6d., while the author makes only a few pence and his publisher, after paying his overheads, little more. But the bookseller does not make this profit without considerable risk. If he buys three copies of this novel, he will pay a guinea for them, and he thus makes no profit at all until such time as he sells the third copy. The sale of the first two does not even cover him, for it does not pay a penny towards his overheads. The reading public is fickle, as any bookseller knows, and this means that his stock is, in a sense, highly perishable. A book which is selling like hot cakes today may be just dead stock in a month's time. The stock is perishable too in the sense that copies are on show to be read and frequently deteriorate rapidly from handling, perhaps becoming unsaleable. In another sense, however, books are far too durable from the bookseller's point of view. The satisfied toothpaste purchaser comes back for another tube; the satisfied book buyer treasures his copy, may lend it to friends, and rarely requires another copy for his own use.

The bookseller is human and fallible; to judge the probable sale, through his shop, of even the few thousand titles which are shown to him by the publishers' travellers during the year must involve errors which, unless he is remarkably good at his job as a buyer, will show up in the form of expensive dead stock at his annual stock-taking. This stock represents a considerable amount of capital invested for little or no return. It takes up valuable space, a commodity which is always, somehow or other, at a premium in any bookshop, thus reducing the shop's capacity for more saleable books. After he has held the stock for two years the bookseller can cut prices, since he is then no longer bound by the net book agreement to sell at the published price. Or he can auction his dead stock off to anyone who cares

to buy it—to second-hand dealers, for instance, for a fraction of his original outlay. Books that are unsold during the period when they enjoy public interest will hardly sell at any price at all later.

Enough has been said to show that the bookseller cannot be accused of making what the White Paper on resale price maintenance calls "profit without risk." He has, compared with other retail traders, a large amount of capital tied up, in stock which is mostly, for one or another reason, perishable. He must be extremely careful of overbuying, because of the high capital value of his stock. And yet he cannot be too cautious, for to underbuy is to lose the sales which must support him. He is buying, and trying to sell, a great many untested articles, on which little or no market research may have been done, and on which he may have little time to do his own market research. In these conditions price competition would operate in an unusually hit-and-miss fashion. The choice is between evils. The present arrangement keeps the less efficient bookseller in business and book prices high enough to yield him a moderate return. On the other hand, there is no doubt that the abolition of the net book agreement would throw the trade into considerable difficulty and confusion; bookshops would become, as they are sometimes accused of being in the United States, mere stalls for the disposal of best sellers, and the well-stocked shop, in which it is a pleasure to browse, would disappear. That might be worthwhile if the effect were also substantially to reduce the price of books. It seems more likely that the reduction would be small, and it is even possible that after a time the retail prices of many books would be higher (in relation to publishers' prices) than they are now. There can certainly be no confidence that on balance the public would gain; and that is perhaps a strong enough argument for leaving things as they are.

NOTES OF THE WEEK

The Decision

Mr Attlee has decided to grasp the nettle and appeal to the country on October 25th because no one could show him why he should not. The greatest weakness of almost all modern Prime Ministers is that they rarely have time to think. And without reflection the instinct of political self-preservation, the instinct to do as little as possible and cling to office in the hope that something will turn up, is dominant. It was dominant throughout the summer in spite of the demoralisation of Mr Attlee's administration last winter and spring. But in the quiet of his Norwegian holiday Mr Attlee had time to take stock. It seems that he came back in the mood to decide on an autumn election unless any of his close advisers could offer strong reasons against it. He saw that Labour had nothing to wait for. He knew that the country required strong government such as no party could provide on a trifling Parliamentary majority, and with its eye continuously on an election to come. He saw that the Government would face an increasing risk of losing by-elections, and of being defeated in the House of Commons by illness among its supporters; yet once the autumn had gone, winter hardships would compel it to try at all costs to avoid facing the electorate before June.

When these arguments had settled in Mr Attlee's mind, as they seem to have done last month, they were clearly overwhelming. His colleagues and the party organisers could set against them nothing but the wish to stick to office, the moral feebleness of nursing slender hopes, the perpetual reluctance of careful organisers to put their organisation to a sharp test. These are not the qualities of Mr Attlee's own mind. Once an issue has commanded his full attention he can be, as he has shown before, bold in decision. And he possesses also a modest self-confidence. It is perhaps a conviction that, whatever they tell the public opinion pollster beforehand, when they come to the ballot-box the British people, like the American people in 1948, feel safer with a little man trying to do his best.

It seems unlikely that Mr Attlee finally rejected the opinions for delay—some of them expressed across the Atlantic—until last week-end. But once the decision for an autumn election was taken there was no point in leaving it until November, and it would not have been in Mr Attlee's character to delay the announcement while hints and speculation inevitably gained currency. He has given his own party as well as the Opposition just five weeks in which to decide what the issues are and put them before the voters.

The Way of the Meteor

Mr Bevan is now unimportant enough to be judged by his friends more than by his own actions. He seems, indeed, to be letting the friends do the running in the campaign that is still doctrinally so vague as to have no name but Mr Bevan's own. They are not a co-ordinated group; so many have let themselves be nominated for the next Labour party executive committee that in the voting at Scarborough they are likely to defeat each other. That may be attributed to too much enthusiasm or too much ambition, but it is not the only evidence of their political inexperience.

"Going Our Way," a pamphlet continuing the argument of "One Way Only," was published this week. Mr Bevan contributes only a brief and vague introduction; he appears to have had little to do with the rest. One of the anonymous contributors has let himself be so carried away by the journalism of personalities that a main section of the pamphlet is devoted to a verbose attack on those trade union members of the Labour executive who have supported Government policy—and, in particular, the executive's statement of Labour doctrine in "Our First Duty: Peace"—although their own unions have opposed various points in the policy. It is charitable to conclude from this that Mr Bevan has lost interest in the movement associated with his name. He can hardly have been guilty of so gross a blunder as to fire guns that can be turned with the greatest ease against himself. He has not resigned from the Labour executive and therefore shares responsibility for the policy statement published in its name. Yet it is he and his immediate friends alone, not the unions, who in their other statements reject that policy almost in its entirety.

For the rest, the pamphlet fails to make its authors' argument any more coherent or relevant than it was before. There are perfectly good grounds for arguing about the level of armaments that the West would be wise to have in 1953. But if the need for rearmament is admitted at all (and Mr Bevan's friends continue to admit it), then plainly the effort can achieve its purpose of deterring Russia only if it is made as quickly as possible. This year and next, it can hardly be too great. The pamphleteers continue to ignore the obvious and to suggest that less rearmament should be done now as well as in 1953. By this one consistency they have lost any right to serious consideration that their status in the Labour movement once gave them. "Bevanism" has proved to be a strange meteor in a dull summer sky. It is almost burned out now.

Secret Sessions at Ottawa

There has been a very proper secrecy about most of the figures and some of the arguments put before the foreign, defence and finance ministers of the Nato governments at Ottawa. For not only are many of the problems before them, such as the medium-term defence plan, of crucial military importance but many of the demands made and arguments used could be politically embarrassing to ministers in their own countries. The attempt to find some method of sharing and adjusting the costs of rearmament is proving even more difficult than was expected; and Mr Gaitskell has found himself in the position of agreeing with the French that the Americans should be asked to slacken the pace from a gallop to a canter.

In general there seems to have been in Ottawa a tendency for the weaker members to ask the stronger members to be a little less tough and rather more sceptical of the immediate threat from the Russians. The Norwegians and Danes, it is true, have given way to the military arguments for bringing Greece and Turkey into Nato, but without surrendering the sound political arguments against pretending that the Near East can be regarded as part of what the conference is increasingly calling the Atlantic community. And ministers from other countries have been complaining that the drive for results and efficiency will give the Big Three too much power in an ostensibly democratic body.

These complaints are not new and should be treated with sympathy; but the answers will not be obvious until the ministers have done some fresh thinking about the future scope and organisation of Nato. That they should have gone into committee for this purpose is one of the best pieces of news that have come out of Ottawa.

* * *

Mossadegh Keeps His Stance

Even those who most deplore Dr Mossadegh's lack of constructive policy must admit that he is masterly at keeping critics at bay. He can no longer muster a quorum in the Majlis but he is full of devices which show how well he knows his public. These include slow-motion play with his "ultimatum" to Britain (to which Mr Harriman has sensibly refused to give endorsement), his stream of announcements of profitable oil sales about to be negotiated, and his conjuring up of plots—new or old—against the regime and royal house. He gauges to a nicety Teheran's famous capacity for turning a crumb of rumour into a whole meal. He remains in office, therefore, as the hero who got rid of the Anglo-Iranian Oil Company.

Those who wish for his replacement by someone more ready to treat with the west must not be dismayed by the time it is taking. Their purpose would be defeated if he were to be pushed from office while still wearing the halo of patriotism—a potential martyr. They will gain their end only if he falls in circumstances which make it clear to the Persians that he has stopped the wheels of their oil industry, lost them markets and virtually halved their revenue.

If British judgment of psychology were good, nothing would be said or done to lessen the chances of facts sinking home. Naturally the British ban on delivering "scarce and dollar-worthy commodities" has been represented in Teheran as a sanction, and—though it has heartened Dr Mossadegh's political opponents—it has provided him with a fresh propaganda item for the anti-foreign smoke-screen in which he cloaks his failings. But a few non-deliveries of steel-rails have little impact on the man in the street. Much more important is the fact that the ban includes one staple article of daily diet—sugar. Persia grows some of its own sugar, and it has ample stocks. Its total import has in the last few years never exceeded 150,000 tons. The maximum dollar cost of 150,000 tons of sugar, delivered, is under three-quarters of a million dollars. Even if all the import came from this country (which it does not) this would be a cheap price to pay for depriving Dr Mossadegh of the chance to blame every flaw in sugar distribution upon Britain. Some over-zealous dollar-saver in Whitehall has blundered, and has made the Tudeh party a gift of the argument that Russian sugar is readily available.

* * *

Japanese Attitudes to the Peace Treaty

In spite of the remarkably generous spirit of the San Francisco treaty, with its lack of humiliating phrases or permanent restrictions of sovereignty, it has (together with the supplementary American-Japanese security pact) evoked some strong criticism in Japan. This is not to be attributed merely to cantankerousness in a people now free to talk after a period of foreign tutelage and suppression. The Japanese cannot help feeling nervous at a treaty which formally binds them to the distant United States while leaving them treaty-less in relation to their two most powerful Asian neighbours. Even though the new security pact assures them of assistance in the defence of their country against possible attack, it also seems to them to increase the risk of being involved in war—particularly a war which might break out between America and the Soviet Union over an issue which did not concern Japan. The Japanese have shown remarkable martial qualities in what they believed to be the service of their emperor and country; but the outcome of the last war deflated militarism and produced a sense of helplessness, combined with a desire to withdraw into the national shell and keep clear of the quarrels of a world which still remains full of strife. There is envy of the position of India, whose position on the fence in the current world conflict seems to many Japanese the one which their country should try to imitate.

The peace treaty has, of course, to be ratified by the Diet, and even if this is done—which should be assured by the majority commanded by the Liberal and Democratic parties, both represented on the delegation sent to San Francisco—the debate and the voting will indicate the political strength of the opposition. The Prime Minister, Mr Yoshida, evidently takes the matter seriously, for the Liberal Party is organising a campaign with meetings all over the country to explain the treaty to the people and counter the criticism of it.

A Japanese periodical, commenting on the treaty, has argued that, as current American sympathy for Japan is due to anti-Communism, it is liable to disappear either if there should be a Soviet-American reconciliation or if Japan failed to "act in line" with American policy. It is for the American Government—and Congress, which holds the purse strings for Asian economic development—to demonstrate in practice that the American attitude towards Asia is not merely strategic and selfish, but is based on a real interest in the welfare of Asian peoples. Otherwise that anti-western, Pan-Asian sentiment which is so widespread in the Far East and so cleverly exploited by the Communists may gain a hold on Japan so strong as to deprive the peace treaty of its intended effect.

Dr Dalton's Boycott

The protests wrung from the textile trade by Dr Dalton's attempt to instigate a buyers' strike are probably music to his ears, since they suggest that the attempt will succeed. So, within limits, it may. A purchase postponed does often prove to be a purchase abandoned, and so represents a net reduction in demand. Thus an expectation of lower prices, however unwarranted by the existing state of supply and demand, may be to some extent self-justifying; the arousing of such expectations may to that same extent

be an effective method of reducing prices. The kindest thing one can say of Dr Dalton is that he may realise, and be acting on, this fact. His manœuvre remains none the less an obvious exercise in buck-passing and an irresponsible piece of electioneering.

It is buck-passing because control of the volume of home demand is properly the Government's responsibility. When, as now, it is desirable that fewer goods—textile or other—should go to home consumers, and more for export, the obvious and effective course is to deflate home incomes. The result, it is true, will be a certain amount of frictional unemployment, but identically the same result must follow on any adequate reduction in home demand by exhortations like Dr Dalton's. The difference is that in the first case Government policy can plainly be held responsible, while in the second case the chain of cause and effect is less obvious to the unsophisticated. Or, of course, one can ration; but a return to rationing and its inconveniences would, once again, bring odium to the Government. Renouncing both methods in favour of hit-and-miss exhortation, Dr Dalton descends to the level of a Ramsay MacDonald exorcising the slump by incantations of "on and on and on and up and up and up"—but without MacDonald's excuse of lacking any other proved prescription.

Dr Dalton's manœuvre is also irresponsible electioneering, because only a little of its effect will be to put off some purchases for ever. The greater part of the fall in selling prices, which is a response to mere postponement of demand, must be temporary. Such a passing trough in the trend provides, if it is properly timed, handy election material; but it is provided at the cost of business stability. Price fluctuations genuinely registering the underlying changes of demand and of costs are the normal stuff of rational business decision; price fluctuations generated by artificially induced aberrations in consumers' behaviour reduce business to a gamble. The case for the planned economy has always rested largely on its supposed (though, to put it mildly, unproven) ability to abolish irrational price fluctuations and ensure that price trends conform to basic economic realities. Deliberately to increase fluctuation is a piece of irresponsibility verging on sabotage of the planning Dr Dalton loves.

Controlling the Hospitals

The hospital service has come to the parting of the administrative ways. That is the general conclusion of the report of the Select Committee on Estimates on the regional boards and management committees (HMSO, 12s.). It was originally intended, both by the Government and by Parliament, that the boards and committees were to enjoy as much financial independence as possible. In fact, in the three years since the health service was introduced, the freedom of the boards and committees has become smaller and smaller and the Ministry of Health's control ever tighter.

Thus the major question of policy that has to be decided is whether the regional boards are really necessary as executive bodies. If the Ministry of Health wishes to exercise an increasingly direct control over hospital finances, then many of the boards' functions become redundant and their presence as a supernumerary controlling authority between committees and Ministry merely causes irksome delays. They should therefore become purely planning and advisory bodies, and in matters of hospital budgeting the Ministry should deal directly with the management committees. If, on the other hand, the Ministry does not wish to dispense with the regional boards, it must be willing to give them greater scope and responsibility than they have at present.

The Select Committee could not itself make a recommendation on this matter of policy. But there is no doubt from the recommendations it does make where its sympathies lie. For instance, it recommends that the power to allow management committees to transfer expenditure from one subhead in their estimates to another should be restored to the regional boards. On unspent balances, it recommends that if hospital authorities have been able to make real savings on their estimates, they should be given some recognition of the fact in the approval of their subsequent estimates. Both these recommendations, if carried out, would go some way towards the principle of financing the hospitals by means of block grants—a principle urged by nearly all the witnesses examined by the Select Committee. The committee itself does not go so far as to recommend the block grant system. But it is sympathetic towards the proposal—which is all the more significant because the Ministry of Health's main objection to the block grant is that Parliament would never agree to it.

* * *

Too Much Meat

This week the country has experienced a grave new problem. The meat ration is too large. The butchers say that it has not been fully taken up, and they therefore object to paying to the Ministry of Food a surcharge of 10d. in the £ on the wholesale price. This surcharge is part of the strange system by which the butchers pay the Ministry when the ration is above 1s. 8d., and the Ministry pays the butchers a rebate when the ration falls below that level—the general aim being to give the trade a fair profit in the light of what it earned before the war. With the ration at its present level, the shop assistants must work overtime and this, with the higher surcharge, is said to reduce the butchers' gross profits. The Ministry has agreed to an investigation of their costs.

The problem, however, has found its own solution. The 2s. 2d. meat ration ends this week, for the peak period of home killings is over. (Actually the peak was lower than had been expected, owing to strikes of Irish dockers and British slaughterers, and Mr Webb's promise of a 2s. 2d. ration was kept only by drawing on imported supplies.) Next week, when the ration is 2s., the butchers still expect to be left with some surplus meat, but with the surcharge at only 6d. and less overtime, gross profits will be perhaps 1 to 1½ per cent higher than their present level of about 14 per cent.

It would be hard to imagine a combination of more absurdities than the system which gives the butchers a vested interest in handling less meat, pays them for not selling it, freezes the trade at its prewar size, although the quantity of meat to be handled is much less, and leaves meat piling up at some butchers while others, in wealthier districts, could sell twice as much. Never was scarcity organised with such intricate care.

Towards German Equality

The British, French and American Foreign Ministers announced on September 13th their agreement to "transform completely" the relationship of their states with the German Federal Republic. There is no reason to doubt that they intend to grant the Germans treatment as liberal as the Japanese received, in so far as the division of Germany permits. But, were full sovereignty to be conferred in a peace treaty it would mean abandoning the Allied rights which are based on four-power agreements with the Russians. In particular, their forces would no longer have a legal claim to occupy Western Berlin. The Allies will therefore retain special rights in questions affecting Berlin and Germany as a whole. In other words, they will continue to deal with Moscow and General Chuikov, in consultation

PRECISION

To one of the TI Companies precision can mean making a tube which will fit inside another tube rather finer than a hair. A useful kind of accomplishment in an organisation which, in Britain, operates factories mostly concerned with light engineering. Bicycles and cycle components — electrical appliances — pressure vessels — precision steel tubes — metal sections — aluminium sheet, strip, extrusions — all call for a high degree of accuracy, and TI makes them all.

with Dr Adenauer or his successor. There will be no German Ambassador to the Kremlin. Finally, they will retain certain rights to safeguard the security of their forces in Germany.

The contractual agreements which will be concluded with the Federal Republic will not be a *Diktat* in the Versailles manner. They will be freely negotiated with Dr Adenauer and his advisers. The guiding principle that has been followed is, indeed, as the communiqué states,

> the integration of the Federal Republic on a basis of equality within a European community, itself included in a developing Atlantic community.

The High Commissions will be transformed into embassies (which will presumably become a charge on their respective treasuries instead of the German budget); the armies of occupation will have the status of defence forces stationed in Germany.

The Allied embassies will no longer have the right to interfere with German legislation or other domestic affairs. On the other hand, the Allied Governments will ask the German Government to undertake not to undo the reforms which have been imposed upon them. It is easy to forecast that trouble will arise over the Allied decartelisation measures, which the Americans regard as essential to democratic freedom. The Japanese have already indicated that they intend to repeal similar regulations made in Japan, so the Bonn Government will probably continue to evade the issue. In any case price rings flourish even under the eyes of the American High Commission.

The Allies will also retain the right to resume powers in an emergency. This decision is intended as a safeguard against a Communist *coup-d'état*, though German democrats hope that it would also be used to protect the state against overthrow from the extreme right.

The Washington communiqué makes it clear that Western Germany is to join the Atlantic defence forces at the same time as it regains its liberty. Dr Adenauer has again welcomed this proposal; he sees the European army and the Schuman Plan as means of linking Western Germany with the West before it is united with the Soviet Zone. But Dr Schumacher is once again blindly opposing him.

* * *

No Heirs for Dr Adenauer

Dr Adenauer is due to visit this country in the middle of October. It is to be hoped that, if the election campaign should interfere with this arrangement, his visit will only be postponed for a very short period. The Federal Chancellor has been to Paris and Rome since the war, and he is constantly in touch with the American High Commissioner, Mr McCloy; but his relations with Britain have not been so close. This is a reflection of the fact that Britain is not taking part in either the Schuman or the Pleven plan, to which the German Chancellor devotes so much of his attention. For Dr Adenauer is a genuine West European, one of the few Germans who do not simply mean "Germany" when they say "Europe," and "my own interests" when they say "Germany." Inevitably, he exasperates the other members of his government by the concessions he makes to their political opponents—notably the Trade Union Federation—and by his tendency to make decisions over their heads. He is no economist, and is too easily impressed by the last pundit he has happened to speak to. But when all is said and done, it is more important that the German Chancellor keeps clearly in view his overriding aim—to link Western Germany firmly with its neighbours as quickly as possible, because time is short.

Time presses not only for Western Germany, before it joins with the Sovietised east, but for Dr Adenauer personally. The British are too much inclined to act as though Dr Adenauer were there for ever, instead of being a seventy-five-year-old politician with a mounting opposition against him. The Bonn coalition has frequently been strained of late, but has survived for fear of the common enemy—Socialism as represented by Dr Schumacher. At best, however, elections cannot be postponed beyond 1953, and will come much earlier if Dr Schumacher has his way. Then Dr Adenauer may well go down under the charge of having "capitulated" to the French and the Trade Union Federation.

In any event, the Chancellor's age suggests that, vigorous though he is, he should be appointing a successor in the Christian-Democrat ranks. Unfortunately, events in Germany since Hitler have eliminated the younger generation in politics—the *Nachwuchs*. After 1945, recourse had inevitably to be made to the survivors of the Weimar Republic; the rest had been Nazi party officials, or nothing. The Russians faced this situation and made no bones about it; they have simply passed over the lost generation, and have given authority to the young men of twenty, who learn as they make mistakes under the eyes of their elders. Their policy has much to be said for it. It is, however, too ruthless for the West. London, when it greets Dr Adenauer, should realise that he has no heirs.

* * *

First Case for the Battle Act

While Mr Morrison was explaining Britain's trading policy with the East to a still sceptical American public, the British Government was illustrating his thesis by concluding a contract for one million tons of grain from the Soviet Union (discussed in detail on page 704). As the Foreign Secretary stated it, the doctrine was simple and sensible; restrictions on East-West trade, beyond the point where goods of direct strategic significance were involved, will entail a loss to the West far greater than the corresponding gain to the East. In other words, Britain does not trade with the Russians and their allies out of cussedness and political wrong-headedness, but as a business proposition deemed to the advantage of the West as a whole. But a complication has crept into the grain contract; for, like the timber contract which preceded it, it contains a clause under which Moscow may suspend or reduce deliveries if it cannot spend on sterling area rubber the sterling earned under these contracts.

This clause—which appears, perhaps deliberately, to be as vague as vague can be—has still to be interpreted. In the last two years, the Russians have imported rubber at the rate of about 55,000 tons this year, 82,000 tons in 1950, and 100,000 tons in 1949. Britain, on the other hand, is publicly committed to the principle that no goods of strategic value shall pass through the iron curtain; and it has equally accepted the principle that, while rubber in itself is not a strategic commodity, rubber in quantities in excess of normal requirements becomes a strategic commodity. It looks as though Moscow's normal requirements must be assessed at somewhere between 50,000 and 100,000 tons; but the combined proceeds of the timber and grain contracts will, at present prices, provide sufficient sterling to buy roughly 100,000 tons of rubber.

This is the measure of the possible political complications. The vagueness of the conditional clause suggests that Britain has decided to face it only when it arises, and not before. But with the advent of the Battle Bill, this ceases to be a question with which Britain alone is concerned. In fact, before the Bill is cold from the lips of Congress, before it is even ratified, its still unknown administrator is already provided with a classic model of the tasks before him.

There is, of course, an alternative for Britain: it is that it should buy American grain. But there are no longer any ECA dollars which could be used for the purpose, and Britain itself is heading for a new crisis in its dollar balance of payments. It is already buying as much as it can from non-Russian, non-dollar sources. What alternative has it but to make up the balance from Russia?

* * *

Emaciated Technology

The Government has now published in a White Paper* its views on the vexed question of higher technological education. It cannot be said to have produced any clear-cut policy. Technological education outside the universities is to advance, in so far as it advances at all, in the hands of the local authorities. Such is the outcome of the prolonged discussions and numerous reports during the past six years.

The universities are to continue to expand in their own way and in their own time; no new technological university is to be provided; selected technical colleges, almost all of which are local authority institutions, are to receive increased financial assistance; a new body (to become Royal as and when it grows to a sufficient stature) is to be set up to grant a new award of associateship to technical college students who take "approved" courses.

This hotch-potch of decisions will offend no one. It is designed not to. It may even effect some gradual improvement in the technical colleges over the years. But the White Paper evades the knotty problems with a suavity which must itself call forth admiration. The universities have strenuously opposed the setting-up of any rival institution such as the Massachusetts Institute of Technology; the Government has contrived to please them while tactfully doing so on grounds of economy—that an investment of some £6,000,000 with a return some ten years hence is not justifiable at the present time. Will any time be right and a hopeful experiment ever be made? The result is that the Government relies too heavily on the technical colleges. The White Paper says that the national advisory council on education in industry and commerce will shortly announce the details of their proposals for making improved financial assistance available for selected colleges and courses. Final judgment must await their publication, but it is difficult to feel confident that the advisory council will be strong enough to resist the claims of a multitude of colleges. Its temptation will be to spread the resources too widely and too thinly, to promote too many colleges from third-class to second-class status and to have none in the top rank. This is a policy which will please local education authorities. It will not help technological progress.

Focus on the BBC

The BBC's annual report† demonstrates, as usual, an impressive range of intellectual effort and technical achievement. Among the good and interesting things recorded are the increased contributions of the Regions to national programmes, the expanding audience for serious entertainment, the growth in North America of the habit of rebroadcasting BBC programmes, and the desire to interest the public in radio experiments. Among the bad things are the highly conventional handling of news bulletins, the most unsatisfactory wave-length position under the Copenhagen agreement, and the reckless belief that television should penetrate every hole and corner of national life.

The people's taste in the age of the common man still presents some curious features. Twelve million people now listen to the fairly serious Saturday Night Theatre, and promenade concerts can be heard on the Light Programme;

LOTUS SHOES

FOR ALL MEN AND MOST OCCASIONS

INJUSTICE

IF you offer money, out of the goodness of your nature, for a specific charitable purpose, is it really to be tolerated under the law of England that authority can make you hand it over against your will to be used for something else ? With one voice every member of the public who believes in liberty and justice must say No. But somebody at the Ministry of Health has been trying to say Yes—as far as money collected before July 5, 1948, is concerned.

At stake is part of £24,000. It was raised by the Peanut Club, and that, in the vernacular, ain't peanuts. It was contributed during the war by well-meaning people for one object and one object only—a children's wing at the world-famous Queen Victoria Hospital at East Grinstead, in Sussex.

But, apparently, the Ministry of Health took the attitude that they cannot promise to use the money for the purpose for which is was subscribed. In those regrettable circumstances one would suppose that the sum must remain where it is, in the control of the organisers. That is not the Ministry officials' idea. *They have claimed that the law establishing the Health Service gives them the right to demand this money and use it for general health purposes.*

Clumsy Handling

We find it hard to believe that the courts would have to uphold a claim so clearly against the common good. *But if the Ministry are right and the legal position is as they say it is, then there is only one thing that must be done. That is to change without delay a law which is morally wrong, a law which deserves the description of robbery.*

The clumsy handling of this case has roused the town of East Grinstead. It will rouse the people of Britain. It is not enough to find a way out that may satisfy East Grinstead. The principle is of national importance. *It must be laid down that the Ministry have no right to seize such private funds, even if it needs an Act of Parliament.*

Reprinted from the editorial column of the Daily Mirror of Sept. 19. The Daily Mirror's net sale—over 4,400,000—exceeds that of any other daily newspaper in the world.

but any evening between 6 and 10 p.m. out of every 100 listeners 63 are taking the Light Programme, 36 the Home Service and one the Third. Likewise the serious talk of the thirties is quite obviously giving place to the bonhomous technique of "Any Questions," and the controversial standards of the third-class carriage are displacing those of the Brains Trust.

Indeed, this prickly question of how to present controversy is one of the most interesting topics of this report. It is clear from remarks contributed to the report by North Region that not everyone is happy about the present trend towards slapstick. Certainly the invitation to "have a go" that the BBC issued to politicians and intellectuals last summer has had bad as well as good effects. In the radio programme called "Argument" and in the television programme called "In the News" there have been quite shocking examples of bad manners, intellectual clowning and downright misleading statements which go uncorrected. If a politician talks boorishly or inaccurately in the House of Commons or in public there is some chance that he will be corrected, and the correction will appear in Hansard or the press. In broadcast controversy, which aims above all at pace, liveliness and high tension, this will not happen, and some debaters take advantage of the fact. The desire to entertain and show off is an essential ingredient of good talk and lively argument; and the BBC is to be congratulated on the experiments it has made. But observance of the simple rules and good manners of debate is an important part of the British *mores*, and the common man and his family should not be encouraged to think that they do not matter.

Malaya Sets Its Sights

That the founding in Malaya of a political party with independence as its aim should receive an official blessing is something peculiarly British. There is no reason to believe that the blessing is not genuine, and there is every reason to hope that Dato Onn's new Independence for Malaya Party which was launched on Monday will prosper. For there are at least three clear points in its favour. In the fullness of time the colonial status of the Federation is bound to change, and it is best that this should happen through the gradual evolution of experienced political parties working within the present constitutional framework. The appearance of the new party represents a historic step in Malaya, since it is the first to cut across communal boundaries with any real chance of success and to make its appeal to all races equally—Malays, Chinese, Indian, and indeed Europeans and Eurasians. Last, but by no means least, this is the first attempt to offer an alternative to the banned Malayan Communist Party as a focus for nascent nationalism.

A host of questions present themselves which only time can answer. It is most doubtful, for example, whether Dato Onn's idea of independence within seven years is practicable, and it would be wrong for anyone to count on it or for the British to make any definite statement on the matter at this stage; there can certainly be no satisfactory state of independence unless Malaya achieves the racial accord at which the party aims. Nor is it clear that independence is to be within the Commonwealth. Dato Onn declares, quite rightly, that no decision can be made today. Then there is doubt about how much support the Independence Party will get from the various communities. Dato Tan Cheng Lock, president of the Malayan Chinese Association, presided at the inaugural meeting, and the other main backing at present comes from the Malayan Indian Congress and the Malayan Trades Union Council. Many of the leaders of the Malays are now prepared to follow Dato Onn, even though he has reversed his former view that "Chinatown," the colony of Singapore, should be kept separate from Malaya. The outlook is good for this statesmanlike venture which, in the words of a correspondent, aims at giving Malaya a soul.

Signor De Gasperi in America

Italy has been both lucky and unlucky in the way its relations with the Western Big Three have developed. On the credit side Rome must place the fact that its request to rescind the peace treaty is being favourably received. On the debit side is the fact that the Jugoslavs are competing hard for western support in disposing of the perennial problem of Trieste. These two matters at present take up a great deal of attention in Italy, and this is a factor which cannot be ignored when calculations are made about its contributions to Nato. Indeed, many Italians are apt to judge the value and progress of western co-operation by the success which their Prime Minister may now achieve over these two questions in his talks with western colleagues at Ottawa and Washington.

The difficulty about revising the peace treaty is that the Russians are most unlikely to agree to any change, and are vetoing Italy's entry into the United Nations, whose machinery the treaty provides as the only method for revision. And it is, of course, absurd in any case that Italy should not now be a member of Uno. This week at Ottawa Signor De Gasperi made a statement showing how the treaty might be "abolished." He asked the Great Powers to make a general declaration denouncing it and then to re-negotiate individual clauses with Italy in the light of today's requirements. This, however, would be to fall into the error of making an illegal unilateral denunciation and will have to be avoided at all costs. It would play not only into the hands of the Russians, but into those of nations everywhere—the

Constitutional Monarchy

Our English Queen reigns not only over the throne of these wide realms, but in the hearts of all her subjects; wherever she moves through the length and breadth of the land, her progress is a *spontaneous* ovation; and old men, who have lived through three reigns without seeing a Sovereign to whom they could worthily and heartily bow down, rejoice to have been able to experience, once before they die, the sentiment of genuine loyalty! . . . By what spell has our Queen thus won the love and devotion of all ranks, classes, and parties of her subjects? It is not mere youth and beauty. . . . It is not mere domestic virtues and the decorums of a well-regulated life—respectable as these are always, and fascinating as they are in a lofty rank, and amid the dazzling and intoxicating splendours of imperial station. . . . It was these things in part, but not these alone. In addition to these and more than these, Her Majesty's popularity is due to her rigid adherence to and observance of the constitutional principles of Government; to the cheerful promptitude with which she has waived personal predilections . . . in deference to that safe and healing maxim of English law which requires the Sovereign to govern in conformity with the wishes of the Parliamentary majority; and perhaps still more to that ready sympathy with the feelings and sufferings of her people . . . which she has manifested on every possible occasion, and in every possible manner which etiquette and salutary custom would allow . . . and to the conviction which has thus grown up in the heart of the nation that she is, life and soul, devoted to the furtherance of their welfare. The People—taking that scandalously narrowed and misused word in its widest signification—feel that their Queen is with them—*is on their side;* not, as on the Continent, a hostile and controlling power, but a friend, a comrade, and a fellow-labourer.

The Economist

September 20, 1851

Persians and Egyptians occur at once to mind—who seek to tear up their international agreements. What the western powers would have every justification in doing, now that Italy has given proof of a genuinely democratic and peace-minded attitude, is to waive their rights to individual clauses.

Signor De Gasperi's other two objects in going to Washington are to seek more American economic aid and more progress towards a settlement in Trieste. The latter is perhaps her most vital task. During the past two years relations between Italy and Jugoslavia have much improved for obvious reasons. Marshal Tito, however, gave solemn warning a few days ago in a Note to Rome that this did not mean he would abandon any of his claims to Trieste. His protest was timed to coincide with Signor De Gasperi's arrival in America and it certainly faces the western powers with a very delicate choice. It is obvious that neither Rome nor Belgrade can now give way on this question without possibly very serious political embarrassment. On the whole, however, Marshal Tito stands to lose less prestige and to gain more solid diplomatic and military support than Signor De Gasperi by a partial compromise over Trieste for the sake of opening a new era of friendship between their two countries. A friendly instead of a hostile Italy would secure his rear, and this is what the west must seek to bring about during the next few weeks.

From Blackboard to Screen

Those who view the television habit with fear or with distaste will welcome frigidly the scheme announced by the BBC and the School Broadcasting Council this week. Yet after school broadcasting, school television is a logical step; the spread of scientific discoveries cannot be stopped at the schoolroom door. In due course, therefore, television will be added—in some form and to some extent—to the list of methods of school instruction, however reluctant some may be to see its use.

The day when this will happen on any large scale is still at least as far ahead as the autumn of 1954. The immediate proposal is to conduct a pilot experiment among a small sample of secondary schools near Alexandra Palace. If this is successful, a larger experiment will be tried the following year. Meanwhile the authorities remain uncommitted to any final decision.

The development of school television has been hampered so far by three difficulties. The first has been the absence of the necessary knowledge of techniques; this the experiments are intended to provide. The second was the restricted geographical area covered by television. Thirdly, no receiving sets have yet been manufactured which would enable a whole class of 30 or 40 children to see the screen without eye strain; the prospects of overcoming this difficulty now seem much nearer, provided that manufacturers can expect a reasonable demand from the schools.

While the stage seems to be firmly set for the development of school television, the BBC is at pains to emphasise the tentative nature of the present proposals. The technical questions are less important than careful thought about the distinctive contribution television may make to education. It is fatally easy for these aids to teaching to be used as substitutes for education, for the easy inlets of the eye and ear to deprive the child of the wish either to read or write. Those who advocate school television must make their case that education is better and not just easier with its assistance. Success requires not only skilful programmes but also highly skilled teachers. Unless the schools know clearly what they are trying to achieve, it is the teacher who will be the weakest link in the chain.

Books and Publications

The Personality of Castlereagh

Castlereagh. By Ione Leigh. *Collins.* 383 pages. 21s.

"The more I study the matter the more I consider it makes Castlereagh greater and Canning less." With these words of Lord Morley, the revival of Lord Castlereagh's reputation may be said to have begun at long last, though Lord Morley's perception was not quickly followed up. It was not until 1931, more than a century after his death, that Castlereagh's foreign policy was accorded serious historical treatment, and not until 1936 that one of the greatest of British Foreign Secretaries was granted an adequate biography. Since then his stature has generally been appreciated among historians; but he remains no more than a name—if that—to the wider public.

Miss Leigh's new biography would be welcome if only because it sets out to remedy this public ignorance; it must also be welcomed for merits of its own. Her book, consciously aimed at a wide audience, is so effectively constructed and readably written that it should easily gain one; and its fresh and sympathetic yet accurate drawing of its subject should do much to widen the appreciation of Castlereagh as a man and as a statesman. She has taken measure of the serious difficulties and has solved them to a large extent.

For Castlereagh is not an easy subject for biography. By temperament he was elusive and aloof; his mind was cautious and balanced rather than dramatic; as a House of Commons man he was an indifferent speaker though a courageous and skilful organiser; and while he has left us no glowing phrases as an orator, his public career was dogged by controversy and overshadowed by mighty contemporaries and even mightier events. Napoleon, Wellington and Castlereagh were all born in 1769. Castlereagh's first public office, as Acting Chief Secretary for Ireland, involved him in the suppression of the rebellion of 1798 and the passing of the Act of Union of 1800, and thus embroiled him—both with contemporaries and with historians—in that monumental controversy that is the Irish Question. His acknowledged model in foreign affairs was no less a person than the Younger Pitt, though he did more than work on Pitt's lines in this field. And, though he was not interested in domestic matters, he was less successful than Pitt in avoiding contempt and odium for his association with the repressive measures of the governments of his time. And if the other Prime Ministers under whom he served were no more successful in this than he was himself, Addington, Perceval and Liverpool were nonentities; while Castlereagh's work abroad—in initiating the Peninsular War, in organising the coalition which finally overthrew Napoleon and as the chief architect in the subsequent Vienna settlement—has been belittled because of his unpopularity at home as well as on account of the modesty of his methods and of the complexity of the events with which he had to deal.

To unravel these controversies and events, to isolate and assess the contribution which Castlereagh himself made, and to delineate the true character and temperament of a man who was not one to assert himself—these are the formidable tasks facing Castlereagh's biographer; and Miss Leigh has risen to them most competently. Castlereagh as a person emerges fully and clearly from her book: this is its most original part, for the unpublished papers used by the author are chiefly of a personal character. In dealing with Castlereagh's contribution to public life and events her book has, understandably, little to offer by way of original material; but it provides an adequate and well-balanced statement of the facts. And if, in compiling this statement, Miss Leigh has usually been content with narrative rather than argument and analysis, this is forgivable in a book which does not aim at becoming a standard work for historians and which succeeds as the popular account of Castlereagh that has long been wanted.

The Inflationary Gap

A Study in the Theory of Inflation. By Bent Hansen. *Allen and Unwin.* 262 pages. 18s.

This is a book written by an economic theorist for his fellow theorists. Its argument is abstract and rigorously presented, and the layman will find no ready-made remedies for our present troubles or more than illustrative references to recent events. For the specialist, however, it is a valuable addition to the literature of the subject.

The first three chapters deal with the relationships between such aggregates as the prospective demand for and supply of all finished products and labour, prospective investment and prospective saving. The discussion is a development and application to inflationary conditions of the system of concepts given in Part One of Professor Lindahl's "Studies in the Theory of Money and Capital" (which was published in the same series) and though largely a matter of definitions is by no means useless. The chapter on the inflationary gap is particularly interesting; Dr Hansen shows that the size of the gap bears no simple relationship to the magnitude or even the sign of the difference between prospective investment and saving. In the past most economists have assumed that the inflationary gap was one and the same thing as the prospective excess of investment over saving; it is now evident that it is important to analyse inflation in terms of the pressure in the labour market and the market for current output, each taken separately, instead of lumping them together in a saving-investment analysis.

The middle part of the book deals with repressed inflation in terms of this improved approach. It vindicates Dr Hansen's claim that the neglect of some post-Keynesian writers to consider separately and explicitly the inflationary pressure in the labour market was a serious defect. Thus he demonstrates how the closing of the inflationary gap by increased taxation or other measures will not necessarily abolish or even reduce the inflationary pressure in the labour market. Even though the output of all firms taken together will then just satisfy total demand, prices and costs may be such that each firm separately would find it profitable to increase its output and so try to bid labour away from its competitors. Dr Hansen also shows the inadequacy of both a "Red" policy (prices fixed and wages free) and of what he a little unfairly calls a "Liberal" policy (wages fixed and prices free) to restore equilibrium, and devotes a whole chapter to considering the effects of changes in productivity. The analysis is original and instructive, though some readers will find the simplifying assumptions a little too sophisticated.

The last three chapters contain, in order, a model of open inflation which is as ingenious but less revealing than the model of repressed inflation, a high-brow and uninstructive analysis of "the problem of homogeneity" in the models, and a discussion of the concept of monetary equilibrium where the analysis is applied to the problem of maintaining full employment without inflation.

As its title indicates, the book is a contribution to the theory of inflation and not a general treatise; many aspects of the inflationary process are hardly mentioned. But it is an original work of great interest, not only because of its subject matter but also because it proves that the Stockholm School is not yet dead.

Smoke Rings

The American Cigarette Industry. By Richard B. Tennant. *Yale University Press. (London: Geoffrey Cumberlege).* 411 pages. $5 or 32s. 6d.

Although it is almost one hundred years since some of the ladies of New York were reported to be smoking "through a weaker and more feminine article which has been most delicately denominated 'cigarette'," the American cigarette industry was not really born until 1890, when the American Tobacco Company was incorporated. It spent its first years in the successive violences of the plug war, the snuff war, the cigar war, the English war (which ended with the formation of the Imperial and British-American Tobacco Companies) and the Turkish war, which saw the quick defeat and absorption of the independent producers of Turkish cigarettes. But in 1911, in the year that it reached its majority, the "Tobacco Trust" was itself defeated by an enemy of exactly the same age, the Sherman Anti-Trust Act.

The tobacco ring, which by then was making 80 per cent of America's cigarettes, was split into three sections, which soon found themselves challenged by a fourth company and in the midst of the "Camel Revolution." Before long the industry was set in the pattern it has followed ever since, with Camels and Lucky Strikes competing for first place, with Chesterfields a fairly close third and, in the last decade, with Philip Morris and Old Gold tagging along behind, and the rest nowhere. In the twelve years between 1913 and 1925 net output was more than quintupled, and in the sixty years of its life the industry's annual production has grown from 2,500 million to nearly 400,000 million cigarettes.

The Camel revolution was two-humped: the new cigarettes were for the first time a blend of Virginian, Turkish and Burley tobaccos, in the now familiar packs of twenty, and the difference between the rival brands was, and is, not in the product or the price, but in the advertising. This brought the industry once again into conflict with the Anti-Trust laws, and in 1946 the three leading companies were finally convicted of criminal conspiracy to monopolise the trade, to fix prices and to limit competition in other ways. But five years later the Government still does not seem to have decided how the industry ought to be reorganised in order to remedy these faults. The explanation, in Professor Tennant's

A STUDY IN THE THEORY OF INFLATION

Dr. Bent Hansen

In this study of some of the central problems of our post-war world, Dr. Hansen, of the Institute of Economics, University of Uppsala, deals with suppressed inflation and examines open inflation, with particular regard to scarcities of goods and labour. 18s. *net*

PRINCIPLES OF PRIVATE AND PUBLIC PLANNING

Professor Wilhelm Keilhau

Believing that the laws governing private and public planning are the same, Professor Keilhau provides a scientific exposition of the theory of Economic Planning. Pointing out the uncertainties of the future and of human behaviour, he examines public planning in the light of these difficulties. 16s. *net*

opinion, is that, while present practices in the cigarette trade may be the result of collusion between the companies, existing methods of pricing and marketing are the most satisfactory from the point of view of both tobacco producers and cigarette consumers.

Professor Tennant's detailed and exhaustive analysis is intended not only as an essay in economic history but as a study in the economic theory of competition and of public policy towards monopoly. The combined approach produces an interesting and valuable book, although hardly one that will appeal to the general reader.

Philosophy of Freedom

The Law of Freedom as the Remedy for War and Poverty. By Emil Korner. *Williams and Norgate.* Volume I, 562 pages; Volume II, 663 pages. 42s.

This book offers something new and not very interesting in the way of exposition of the doctrine of *laisser faire*. Mr Korner is apparently deeply versed in German metaphysics and the writings of the classical economists, but his command of economic theory is rudimentary in the extreme. His style of writing, too, creates such a wilderness of italics, inverted commas, indented paragraphs, quotations, and cross-references, to say nothing of idiosyncratic concepts, that the reader is often forced to return to Dr Amonn's introductory summary to discover the drift (a word that is only too appropriate) of the argument.

Volume I is largely concerned with the theory of liberty. Assisted by Adam Smith and the concepts of the Ego and the Self, the author reaches the familiar conclusions that individual freedom produces the best economic and ethical results, and that the role of the state is to protect freedom and do only what individuals would like done but cannot do for themselves. An important but questionable part of the argument is that *laisser faire* is only possible in a World State, and that national states are solely responsible for wars, so that *laisser faire* will eliminate war as well as poverty. The author breaks some new ground in tackling the ethics of actions which affect only the individual who performs them, but his conclusion that one should do to oneself only what one would like one's loved ones to do to themselves seems to presuppose the ethical standard it is trying to establish.

Volume II is concerned with specifically economic problems. Unemployment, according to Mr Korner, is attributable solely and simply to the fixing of the length of the working day; his solution, the "working time screw," is to vary the length of the working day so as to share out the available work. The magnificent simplicity of this suggestion is untrammelled even by recognition that unemployment fluctuates differently in different trades. Full employment is to be secured by free trade and free exchange rates, which will permit each country to export whatever it does not consume at home—a blatant fallacy, underlined by the author's admission that exports and imports must pay for each other.

The main theoretical contribution of this volume, according to the author and Dr Amonn, is the discovery of a stable standard of value. The argument, which is tortuous, smothered in obsolete terminology, and completely definitional, leads to the unit of unskilled labour. The practical conclusion that monetary stability can be achieved by fixing the wages of unskilled labour has been developed (for what it is worth) more simply by other writers.

The same comment may justly be made about the book as a whole: it lacks even the readability and realism of good propaganda. Mr Farnell deserves credit for having translated it into intelligible English.

A good bookshop reflects the interests of its clientele. Our stock of books is designed to meet the needs of university lecturers and other authorities on the subjects in which we specialise.

Shorter Notices

Outer Mongolia and its International Position. By Gerard M. Friters. *Johns Hopkins University Press and Allen and Unwin.* 358 pages. 25s.

The American edition of this book was reviewed in *The Economist* of April 29, 1950. The English edition has enabled Professor Friters to add in his new preface a certain number of facts not available for the American edition. He notes that the Russian press in November of 1948 at last mentioned the existence of the much-rumoured rail connection between Kakhta and Ulan Bator, and he asks whether it is supposed to link up with the more eastern connection of the trans-Siberian railway from Choibalsang (Bayan Tumen) to Boryza, and—still more important—whether it is intended to carry the line on to Paotou in Inner Mongolia, which would give a direct rail connection with Sinkiang. He suggests that the establishment of relations between Communist China and Outer Mongolia in July, 1950, may have been a *quid pro quo* to the Chinese for their recognition of the North Korean régime. Most interesting of all is the fact that Outer Mongolia is now known to have gone over in 1946 to the Russian alphabet. This would have the effect of weakening the links of the Mongols with Inner Mongolia and suggests that Russia's aims are still defensive rather than expansionist. Professor Friters has also added a few general reflections omitted from the American edition which suggests that he is less convinced of the happiness of the Mongols under Soviet influence than is Mr Owen Lattimore in his long and rather curious introduction.

Samuel Butler's Notebooks. Selections edited by Geoffrey Keynes and Brian Hill. *Cape.* 327 pages. 12s. 6d.

This seems likely to be the definitive version of the jottings that Butler himself regarded as the mark of a literary instinct. The editors have been back to the original manuscripts and have found a few worthwhile things overlooked by the two earlier selectors; they have also included some notes previously published only in Festing Jones's "Memoir of Samuel Butler" or in "Butleriana." The notes are now printed as Butler wrote them; this is undoubtedly the best method, but it creates a need for a much better index than this book possesses. The editors have, however, fully succeeded in their primary task of illustrating, by their selections, the range and quality of Butler's mind. And they have therefore provided almost endless material for fascination and stimulation.

Executors and Administrators. By B. A. Milne. *Stevens.* 107 pages. 4s.

This addition to the "This is the Law" series of handbooks for laymen is well up to the standard already set. It steers a useful middle course. It describes and discusses the general run of problems that an executor or administrator is likely to meet. It does not attempt to answer every possible complexity that could arise but it does suggest at which points they are most likely to do so. Even if the layman does intend to rely on legal advice in carrying out his duties, to read this book first will be a great help to him. There is one small point of criticism; the author might have devoted more space to the position of both widow and executor with regard to life policies of various kinds, and pensions and allowances, both public and private, for these play an increasingly important part in the new order of things.

The City of London. Compiled by Raymond Smith National Book League. *Cambridge University Press.* 40 pages. 1s.

This is a book list selected by the Librarian of the Corporation of London. Its publication is part of the Corporation's activities in celebration of the Festival of Britain. The list is restricted to books about the City and the emphasis is on British books in print or available without much difficulty at secondhand. The list is divided into sections, such as history, finance and commerce, government, social services, physical aspects and the pictorial record. The books included will be on exhibition in the Guildhall during the period of the Festival.

Letters to the Editor

Atlantic Issues

Sir,—You have done a great service by focusing attention so clearly on the need for an international executive organ to give decision and direction to the present welter of inter-governmental committees and councils. But if the free world is to confront the Kremlin dictators with the faith and emotion for which you so rightly call, then our own institutions must be democratic and not totalitarian.

We are in the process of signing away to these international committees not only sovereignty, but democracy itself. There is virtually no popular control over what goes on in the international field, because in present circumstances no national parliament could repudiate a committee decision accepted by its government without prejudicing the whole fabric of the free world's co-operation. Those who talk of the political impossibility of transferring some part of sovereignty to an international body are merely ostrich-like, because the transfer has to a large degree already taken place. You, sir, by advocating that the sovereignty transferred should reside in a centralised international executive organ run by Ministers of Cabinet rank nominated by governments, put yourself in the position of abrogating democratic control over how we are to fight the cold war against Communism. Concerted international action and democracy will only be compatible when those who make the executive decisions are responsible to a federal parliament exercising necessary and specified sovereign powers.—Yours faithfully, MARTIN MADDAN

London, W.5

Age of Inflation

Sir,—In the third of his articles your correspondent makes the claim that "rising prices have recently been the chief agent for redistribution of income from rich to poor." The figures which he gives to support this contention are, however, misleading, since they imply that business taxes have no effect on the distribution of personal income.

The figures given show that before personal income tax is deducted the share of wages has increased from 37 per cent in 1938 to 45 per cent in 1949, whilst the share of rent, interest, dividends, etc., has decreased from 37 per cent to 28 per cent. A glance at the 1950 National Income White Paper [Cmd. 8203] reveals that your correspondent has based his calculation on *personal* income from work and property, i.e., after deduction of business taxes and undistributed profits. But unless it can be assumed that business taxes have no effect on the amounts set aside for payment of dividends this increase in the share of wages cannot be attributed solely to inflation. In fact if undistributed profits and business taxes are included in the calculation—we are thus concerned with the distribution of *national* income as distinct from personal income—then in 1949 the share of wages is 41 per cent, salaries 23 per cent, armed forces 2 per cent, rent, interest, profits and other income 34 per cent; the 1938 distribution is almost unaffected. In other words the growth of national income in this period was accompanied by an increase in the share of wages of some 3 or 4 per cent, a gain not at the expense of trading profits whose share also increased substantially (from 12 per cent to 17 per cent), but at the expense of fixed incomes, e.g. rent, professional earnings, etc.

As your correspondent points out, the share of wages is further increased to 48 per cent in 1949 as against 39 per cent in 1938, after deduction of income tax. Thus of the net gain of 9 per cent over the period less than half can be attributed directly to inflation, the remainder being due to taxation plus the restraint upon dividend distribution. Of course the high level of undistributed profits is a consequence of inflation, but even taking this into account it cannot be said that taxation redistributes income less than inflation.—Yours faithfully,

G. W. MAYNARD

University College of Wales, Aberystwyth

★

Sir,—I feel impelled to register a protest against the series of articles to which you have recently given an airing.

The doctrine that inflation is inevitable and permanent is surely not only irresponsible but also highly pernicious; for it is among the primary tasks of government not only to reject inflation with all its attendant injustices but so to arrange our affairs as to achieve stability. The fact that the present regime of overfull employment and low interest rates renders the task much more difficult is no excuse for throwing up our hands in despair.

Your correspondent's own plan for tethering everyone and everything to a cost of living index would on the one hand, as he himself admits, make prices rise faster than ever, and on the other hand promote universal ruin. Some of his more detailed proposals for his brave new world appear to betray a fine ignorance of practical affairs. He talks, for instance, of a new basis for life assurance whereby both premiums and benefits are tied to a cost of living index. How does he think it could be worked?

This letter was written before the appearance of your editorial rejoinder in your issue of September 8th, but I do not think I want to alter it.—Yours faithfullly, G. R. RECKNELL

London, E.C.2

★

Sir,—The new basis for most kinds of whole life or endowment insurance, suggested in your correspondent's article on August 25th, apparently overlooks the fact that increases in the cost of living leave less margin out of which to meet the increasing yearly premium.

Any existing policy holder who might wish to achieve the same effect as that envisaged may always, subject to satisfactory evidence of continued good health, offset the deterioration in the value of money by effecting further policies of such amounts as the individual himself considers appropriate. The additional premium payable on such later policies in view of the policy holder's advancing age is insignificant compared with the amount of such extra sums assured.

Surely the criticism of the present form of insurance contract is largely directed against without-profit policies; the obvious solution to the state of affairs visualised is a with-profit policy which, enjoying the right to participate in the profits of the life assurance society, embodies a natural hedge against the effects of inflation.—Yours faithfully,

M. G. HEPBURN

London, W.C.2

The Tourist Industry

Sir,—In your second article in your issue of September 15, attention is rightly drawn to the extremely guarded nature of the purchase tax concessions to foreign visitors, especially in so far as their complexity results in the loss of dollar sales to American and Canadian visitors. But you go further than is necessary when you suggest that every foreign visitor might be rebated purchase tax on simple production of his passport. One has only to cite what is done in France to discover a solution at which no one could cavil, since it maintains every existing safeguard under the British plan, but cuts out all the formalities and other disincentives which mar it.

All Paris shops likely to attract the dollar-spending visitor, even the smallest, display cards indicating that *if purchases are made in actual dollar travellers' cheques the tax normally charged will be rebated.* The purchaser has to supply his Paris hotel address, his overseas address and produce his foreign passport for the details to be written on the sales slip. That is all. Any small sum over from the exchange of the dollar cheque into francs is naturally given to the customer. The exchange rate applied to the transaction is the full official rate, which the shopkeeper in turn receives back from his bankers. And the traveller can leave France without being stuck with one franc more than he voluntarily changes.—Yours faithfully,

AMERICAN TRAVELLER.

★

Sir,—As a hotel-owner may I be permitted to endorse your remarks regard-

ing our basic preference for Englishmen. Although humorously expressed, your reasons are very near the mark.

One can add the following. Foreign visitors generally only book for one or two nights—useless to a resort hotel—and then often don't turn up. They also generally book through an agency, which demands a percentage roughly equal to half our nett.

I can also say that the preference for English visitors (*when they have any* money) is also shared by most Continental hoteliers of my acquaintance, nostalgically in many cases.

As I do not want to lose favour with the powers that be as a suspected laggard in the drive for dollars, please allow me to sign myself.—Yours faithfully,

INSULAR

Bonus Distribution

Sir,—Since Liberals took up profit-sharing before Mr Gaitskell, may a Liberal endeavour to answer your objections?

(1) The disadvantages of compulsion can be overstated. A disputed wage claim can leave bitterness in its wake. But a change in status applied universally should have no such result. Certainly to get positive advantages out of it, the change must be accepted by management with good grace and by workers with restraint. But this is surely a test of industrial leadership within the particular business. It is wrong to assume that management would necessarily be antagonistic. By and large its loyalty today is less to the shareholders than to the undertaking. Anything which got more co-operation from those engaged in the undertaking should be welcomed.

(2) So long as trade union wage rates are maintained why should it be "inappropriate" that a worker should suffer if his firm has a bad year? Unless the bonus is to be regarded as an unrequited dole it is precisely that which would provide an incentive. As to your further objection that a firm which "passed" a bonus would be "for it," surely this answers your fourth point about the possible rigidity of labour? Would not workers tend to flow to industries and firms where profits were highest, i.e., the most efficient generally speaking?

(3) Whatever the immediate sacrifice, risk-taking in the future need suffer no discouragement. It would *hurt* more to part with 50 per cent of surplus profits amounting to £100,000 than with 50 per cent of £10,000, but it is what's left that matters. Risk-taking requires no absolute rate of interest. If gilt-edged is 3 per cent it will always pay to take a normal commercial risk for 5 per cent and a "super" risk for 7 per cent. Admittedly the margin between gilt-edged and the risk return might be reduced too far, but a reduction from 10 per cent to 7 per cent would not discourage risk-taking unless 10 per cent was still available elsewhere for the same risk element. The margin required is a question of relativity.

The Liberal proposals provide for a higher initial rate of interest to new businesses for a limited period just to encourage risk-taking.

Mr Gaitskell's suggestion contains fewer technical difficulties than do the Liberal proposals, which have a broader scope in that they extend to a share in management for the workers. For this very reason it will lack the same incentive. The Liberal objectives aim not only at a wider distribution of property but at higher productivity at lower cost and better industrial and human relations.—Yours faithfully,

Huby, nr. Leeds S. E. GRAHAM

Price Control

Sir,—Mr Nevin maintains that price control does not increase consumption. This is not true, as you have previously pointed out in answer to Mr Worswick. Even if demand for the controlled goods is inelastic, money saved by buying them at a price below equilibrium will be partly spent on other goods. Therefore total consumption increases. In itself, then, price control may well make inflation worse. "The high incidence of purchase tax" will not, as Mr. Nevin contends, absorb fully the extra inflationary pressure directed to non-controlled goods; the tax must be increased to achieve this.

There seems to be some confusion also about the effect of price controls on exports and armaments. If there are no controls, and demand for exports and armaments remains unchanged, then rises in prices tend to cause diversion from exports and armaments into civilian goods. If the prices of necessities are kept down, and purchase tax is not increased, then the effect on exports has two opposite parts. Exports of goods similar to those controlled will now become relatively more attractive than if prices were not fixed. (They are not increased, but merely prevented from falling.) The extra demand for uncontrolled goods will make them relatively more attractive than exports of similar articles and will cause such exports to decline more than if the prices of necessities had not been kept down.

The net result depends upon the types of goods exported (or used for the defence programme). In any case, exports tend to fall.—Yours faithfully,

Birmingham. M. MCMANUS

Mauritius

Sir,—I do not propose discussing the opinions expressed in the article on Mauritius in your issue of July 21st, but would like to refer to statements of facts on which they are based, which are particularly misleading.

Mauritius with its original population of French white settlers was ceded to Britain in 1814. This population has not "remained French" as stated. The people became British subjects in 1814 and have remained so since. They have fought and died in the British services in two world wars. They could not change their blood or their culture. Clash of ideas with some of the British administrators (modern or ancient) is not special to French white settlers. This is of permanent occurrence in every colony. The United States and many Dominions owe their existence to such clashes, and settlers, "long removed from Europe" or not, could find their lead from this country in discussing administration.

From 1926 to 1939 colonial sugars were bought in this country at miserable prices, usually below costs of production, notwithstanding the recommendations of the Government Commissioners, Sir Francis Watts (Mauritius) and Lord Olivier (West Indies), in 1930. Mauritius, exclusively dependent on sugar to maintain its population and find the costs of its administration, had no revenue to improve its social services during such a period. Increased revenue is fallaciously determined by comparing present trade values with those of 1945, the most disastrous cyclone year in Mauritius history, when production and revenue were reduced by over 60 per cent. Increased revenues are not due to markets guaranteed by Britain. During the last years, colonial sugars could have been sold at higher prices anywhere outside Britain. If the statement "the new era of prosperity is due more to good luck than good administration," is a gibe at plantation owners, sugar production should be examined:

	AVERAGE
1940-43	320,000 tons
1947	347,000 „
1948	391,000 „
1949	416,000 „
1950	456,000 „

If it is a gibe at the British administrator (ancient) notice should be taken of the considerable progress made in social services when financial resources became available to the "modern British Administrator."

It is also stated that white plantation owners "jib against taxation" and that income tax was "only due to be introduced in 1951." Tax on income was introduced in Mauritius in 1932 as a poll tax differing from income tax in providing no allowances relief to the taxpayer. This has now been remedied.—Yours faithfully, J. P. RAFFRAY

London, S.W.1

The Red Sox

Sir,—I am surprised and, as Noah Webster would say, astonished at your unbelievable slip of the pen in your reference to the Chicago Black Sox Scandal of 1919, in the article on "Slaves of the Baseball" in your issue of September 1st.

The Boston American League Club are and have been known as the Red Sox, and their reputation is as unsullied as an umpire's conscience.

I can scarcely credit that your London editorial staff is confounding our Red Sox with Chicago's graceless Blacks (since 1919 rechristened the "White Sox"). Say it ain't so!—Yours faithfully, LEO M. LINEHAM

American Consulate General, Singapore

VR

ER KINGS' GR

SECRETARY

The most intimate Royal Memoirs

"... Life at Marienbad was very hard work, as I spent so much time seeing people who were difficult to get rid of. For instance ... a beautiful lady from the half-world in Vienna who wanted to have the honour of sleeping with the King (Edward VII). On being told this was out of the question, she said if it came to the worst she would sleep with me, so that she should not waste the money spent on her ticket; but I told her to look elsewhere for a bed. ..."

★ ★ ★

"... When I persuaded the King (George V) to send a sympathetic message to Ramsay MacDonald on the illness of his wife, all the Conservatives were upset at the King toying with anarchism, as they put it. ..."

★ ★ ★

"... When I attended a 'Court' I was always struck by the incongruous music the band played, and determined to do what I could to have this remedied.

I argued that these popular airs robbed the ceremony of all dignity. A presentation at Court was often a great event in a lady's life, but if she went past the King and Queen to the tune of 'His nose was redder than it was,' the whole impression was spoilt. ..."

Next Sunday the Sunday Express begins publication of the most important and the most fascinating Royal memoirs ever written.

They are the private diaries of Sir Frederick Ponsonby, first Lord Sysonby, for 40 years a private secretary to King George V, King Edward VII, and Queen Victoria.

He lived in such close intimacy with the Royal Family, first at Osborne, then at Buckingham Palace, Balmoral, and Sandringham, that before he died he stipulated that his memoirs were not to be published until after the death of all Queen Victoria's children.

These enthralling documents will arouse the most widespread interest.

They are as piquant as Pepys, as frank as the Duke of Windsor. 'Kings' Secretary' is the greatest story of the year.

Begins on Sunday in the

SUNDAY EXPRESS

AMERICAN SURVEY

Washington's Week

Washington, D.C.

WASHINGTON'S *Grande Semaine* is over and the international celebrities who arrived from the San Francisco Festival at one weekend left, during the next, for the Ottawa Games. It takes, however, more than one international conference to make any kind of week in Washington ; there are usually two or three going on in some obscure corner of the city even in quiet periods and there were a good half-dozen between September 10th and September 14th. The little groups who were discussing standardisation of arms and of release of atomic information and such detailed matters were, luckily for them, completely forgotten among the more glamorous gatherings.

It is two years since the annual meeting of the Governors of the International Bank and Monetary Fund was held in the United States and brought Finance, as well as Foreign, Ministers together in Washington. Since then Britain has changed both Foreign Secretary and Chancellor of the Exchequer and there was some curiosity as to how the new Ministers would perform by comparison with their predecessors. Though, as members of a Socialist-Imperialist government, they were never quite free from suspicion, Mr Bevin and Sir Stafford Cripps had made a deep impression which finally deepened into popularity. Their successors had something to live up to. Mr Morrison had not been in the United States for more than five years and had been neglected as a purely domestic figure. Mr Gaitskell's only visit, last year, took place just before he became Chancellor, when few people realised his approaching importance. News of his qualities had preceded him this time, however, and much was expected.

The Foreign Secretary had the easier task, but he made the lesser impression. In the field of foreign policy there were few corners which had not been thoroughly grazed at previous conferences. Agreement between the three Ministers was practically assured on most subjects long before they met last week and those on which there was no agreement did not occupy an important place on the agenda. The results of the meeting of the Foreign Ministers were satisfactory—more satisfactory than usual—as the declaration and the communique showed. But Mr Herbert Morrison created doubts about the future by his slender grasp of his subject, and his unwillingness to take the trouble to learn it. He seemed ready to agree, without too much thought, to any American suggestion which would not cut across the Labour party's shibboleths and risk the loss of votes at home. But fortunately the problem of the Far East had been left behind in San Francisco and that of Spain was not relevant to the week's conversations. East-West trade, the most immediate bone of contention, was more the Chancellor's headache than Mr Morrison's and his reference to it in his speech to the National Press Club elicited little but sour comments from the uneducated.

Mr Gaitskell's troubles sprang from the fact that a hard-luck story, like a funny one, meets with less response after each telling. In the end the Russians may find that the only residual benefit of their Korean adventure is that, by forcing Western rearmament and turning the terms of trade drastically against the United Kingdom, they returned that country to the list of suppliants and caused the United States to lose patience. The Chancellor presented his doleful tale and his statistical proof of it to agency after agency and left the facts to speak for themselves. Much of it was no doubt news to the United States Treasury and, even in better-informed circles, it was a shock to discover that the sterling area would have a large, and continuing, deficit with the European Payments Union. However, confirmation that the bleak figures were not exaggerated—indeed the suggestion that they were underestimates—came from American sources in Europe. But there was criticism that the British party seemed to have no ideas for ameliorating the situation.

*

It soon became apparent that the situation was not a British monopoly. M. René Mayer arrived in Washington and explained at once that France would need more help if she was to carry out her planned military expansion and continue her efforts in Indo-China. And soon it was realised that Ottawa would be strewn with the wreckage of well-intentioned, but overambitious, programmes. Most European countries had bitten off more than they could chew and the American Congress had reduced the expected flow of gastric juices. But, as usual, Britain found itself in a special position. Other countries were still receiving economic aid and could make a case for having it increased ; but Britain had stopped getting funds from the Marshall Plan and did not relish the idea of becoming dependent again—even if it was possible to go to Congress for more money—if there might be some way of getting on without it. The fruits of Mr Gaitskell's visit, if there are any at all, are likely, therefore, to be long-delayed and there is no chance that they will be as satisfactory to everybody as the agreements Mr Morrison made.

The Chancellor's problems were made worse by the International Monetary Fund, at whose annual meeting dogma was riding high. Sir Leslie Rowan presented the British case and suggested that the fund would be well advised to use its $8 billion of unemployed resources in areas where they could do some good—helping member countries to avoid price inflation, exchange fluctuation and variations in their balance of payments—rather than hoping for relaxations of trade controls and exchange restrictions in a situation very different from that envisaged at Bretton Woods. There were probably many delegates who agreed with him and many who agreed with the fund's new manager, Mr Ivar Rooth, who was worried that the vested interests created by restrictions would "become an impassable obstacle to a freer flow of international trade and payments." But there is a general attitude of gloomy resignation towards an institution in which the United States, Formosa and a few Latin-American satellites can always provide a majority of votes.

It is only fair to the other American government departments to say that they did not share the views of the Treasury theologians, whose efforts were confined to the fund. The Treasury had written into the President's opening speech, however, an endorsement of its creed, which gave it unwarranted importance. In the end Mr Snyder had grudgingly to admit that nobody would take any notice of his pressure and, announcing that the fund's resources would continue to remain idle, he sentenced it to a further term of impotence.

It is not easy to see what will be the end of the present complicated set of problems. The United States is pressing its allies to do a number of things which, rightly or wrongly, they all agree are impossible, certainly taken together. In Nato, the State and Defence Departments are asking for ever greater efforts ; in the fund, the Treasury is demanding more liberal exchange and trade policies ; Congress, and probably a majority of the country, insist on putting an end to East-West trade and denying Europe one of the few sources of materials which do not need dollars. Exhortation is all very well but it should be accompanied by some understanding of the dangers of pushing everything and everybody too far. There is no economic equivalent of the European army, no reservoir of unmobilised financial Germans to provide for Mr Gaitskell and M. Mayer the satisfactory end to their efforts that Mr Morrison and M. Schuman appear to have reached. The Chancellor will not be able to take back to London anything very tangible in the way of results. It would be better for him not to try ; the eventual cost of anything which could be got at this moment would be high.

'AMERICAN SURVEY' is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect ; all others are the work of the editorial staff in London

American Notes

Fresh Start for Bipartisanship ?

The Japanese peace treaty, the only issue in foreign policy that has recently been kept above the fog of domestic politics, was launched in a blaze of bipartisan sunshine. Put together by the patient work of Mr John Foster Dulles, it was guided down the slipway by the most controversial of Democrats, Mr Dean Acheson, the Secretary of State and Senator McCarthy's favourite target. And thanks to the new transcontinental television network, 40 million Americans, nearly one-third of the population, saw the man who, according to his critics, would never hurt a Communist if he could help it, decisively and repeatedly beat down all Soviet attempts to hold the treaty back, and give Communism its most publicised postwar defeat. Television has brought another star into the homes where Sir Gladwyn Jebb and Senator Kefauver already shine and Americans have at last begun to appreciate why the slurs on Mr Acheson have so shocked the world. As President Truman gleefully said, on his return from the conference, Mr Acheson proved himself "smarter than these guys who have been attacking him."

That tribute was only to be expected, since Mr Truman has always been Mr Acheson's admiring champion, but when such violent enemies of the Administration as the *New York Daily News* and such Republican opponents of its Far Eastern policy as Senators Knowland and Smith went out of their way to praise Mr Acheson's handling of the conference, it began to look as if the bipartisan sun might be going to shine again on other aspects of foreign affairs. Governor Dewey, too, has made a constructive contribution ; after a friendly visit to the White House on his return from his Far Eastern trip, he declared that in his opinion Asia was as important as Europe, although no more so, and that, if further Communist encroachment was to be prevented, closer political and military alliances must be made with countries in the Pacific area, presumably on the lines of the security arrangements that are supplementing the Japanese treaty. When Mr Dewey started his tour it was suggested that he might be preparing to succeed Mr Acheson as Secretary of State, but now there is no likelihood (if indeed there ever was) that bipartisanship will receive this encouragement.

For if Mr Acheson's new popularity is maintained, Democrats will no longer insist that his weight must be taken off their party's shoulders before next year's election. It was very doubtful whether Mr Truman would ever have consented to do this, but now he has stated unequivocally that Mr Acheson will be Secretary of State as long as he is President. A direct counter-offensive against Senator McCarthy's methods of "character assassination" by unsubstantiated insinuation had already at long last been begun both in Congress and in the country, with every indication that the Administration and its supporters intended to base their election campaign on this issue. But if a fresh attempt is to be made to rebuild a bipartisan foreign policy, the Republicans might be well advised first to help clear away the mud of McCarthyism in which all foreign policy has been bogging down.

Skeletons in Chinese Cupboards

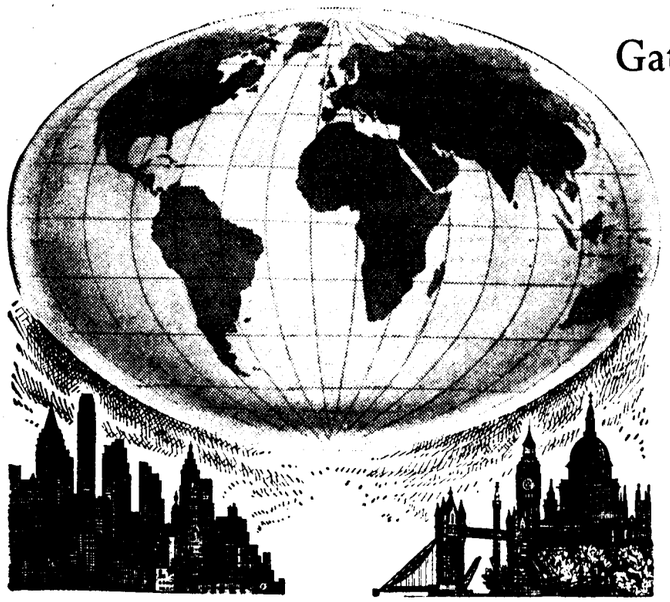
The demand that two high officials of the Chinese Nationalists should return to Formosa has unlocked Chinese cupboards in Washington and revealed long-suspected skeletons. Lieutenant-General Mow, head of the Chinese Air Force office and long in charge of procurement, and his aide, Colonel Hsiang, turned the key to justify their appeal for asylum in the United States ; they contend that if they return, to face trumped-up charges of corruption and Communist sympathies, they face a certain firing squad. Corruption being a criminal, and not a political, charge and the Chiang regime a friendly, if slightly fly-blown, power, the appeal is an awkward one for the State Department, which has so often been dragged over the Congressional coals for its lukewarm attitude toward the Nationalists.

The story of General Mow and Colonel Hsiang, which has now appeared at length in the American press, is that they are being victimised for their efforts to protect Chinese funds from the depredations of an American firm, Commerce International of China, and General Chou, the commander of the Chinese Air Force, who recently had CIC made official contractor to the Nationalists. For almost a year Colonel Hsiang has been supplying information to the Senate Preparedness subcommittee on the dubious and illegal practices of CIC. With the approval of the subcommittee's counsel, Colonel Hsiang affected a willingness to accept a bribe of about $200,000 for passing a contract for the purchase of fighters. The purchase of these rather nebulous aircraft from private sources was encouraged by General Chou, although he turned down a firm offer of 59 Thunderbolts to be bought direct from the US Air Force, which afforded no possibilities of "squeeze." The subcommittee approved of General Mow's refusal to deal with CIC, whose affiliates in other parts of the world have not been above doing business with the Chinese Communists. New light is also thrown on the case of Mr Michael Lee, who, it appears, was denounced in Congress as pro-Communist and forced out of the Commerce Department because of the scepticism he displayed in dealing with Chinese applications for export licences.

The defence of CIC is that they, too, were laying a trap, but for Colonel Hsiang ; they did not, however, take any

American officials into their confidence. Even if this is only a case of the pot calling the kettle black, there is ample evidence that graft continues to flourish—a matter of interest to Congress, which has added a new $300 million to the billions advanced, over the years, to the Nationalists. So far, the revelations do not touch directly on the "China lobby," whose alleged use of American aid funds to influence American policy and whose support for McCarthyism led Senator Morse and Senator McMahon in June to demand an investigation into the lobbying activities of all foreign governments. But they have encouraged Senator Morse to renew his demand of a Congress which is straining toward adjournment and, perhaps, a little tired of investigations.

* * *



Spotlight on Misery

Mystified and angered by heavy demands for public assistance in a year of piping prosperity, half a dozen States have petitioned Congress to permit them to make public the names of those receiving relief. Most experienced welfare workers do not share their illusion that stingy relatives can be stung into generosity, or undeserving cases shamed off the rolls, in this way; they suspect that it would be the sensitive and deserving, rather than the brazen, who would avoid the humiliating publicity. Moreover, throwing open the record might stimulate those who felt they were getting less than their fair due to agitate for increases. It would certainly cause much heart-burning. Nevertheless Indiana has actually passed a bill opening its relief rolls, including addresses and payments, to public inspection.

The immediate result has been the loss of $20 million in federal contributions to help Indiana support its aged poor, fatherless children, blind, and disabled. Mr Ewing, the Security Administrator, has found that the new act conflicts with the requirements of the federal Social Security law, has suspended payment, and has been upheld by a federal district court, though this decision is likely to be appealed. The matter may not end there. The Senate, but not the House, has already passed an amendment to the Social Security Act permitting the names of those on relief to be made public.

No doubt there are some "chisellers" among the 5,500,000 persons now receiving public aid of more than $2 billion a year. But the real reasons why the demand for relief has failed to decline are the high cost of living, the greater increase in the number of aged and children than in the population as a whole, and hiring policies which make employment almost impossible for the elderly and the disabled. When the Social Security Act was passed, before the war, it was believed that, in time, contributory federal insurance would take care of most of the aged, at least. But until last year, when benefits were raised and coverage extended, many were not eligible to receive benefits and those who did could not live on them. The average benefit was $26 a month for a single person, not much more than half the average found necessary for public assistance grants.

It is only since last September that average insurance benefits have equalled average assistance payments, which surely is the least a worker who had contributed toward his pension is entitled to demand. Since then, the number of those receiving benefits has increased by a million, and the relief rolls have begun to turn down. Yet the new balance between assistance and benefits is precarious. The Senate has already passed a bill raising federal contributions to the States so that $3 a month more will be available to the blind, aged, and disabled, and $2 a month for dependent children. This is a modest recognition of the rising cost of living. Yet if insurance benefits are not equally increased, relief may have to be extended, once more, to many who imagined that their old age was provided for by federal insurance.

Gateway to the World

TODAY, business men engaged in overseas trade must think and act globally. The National City Bank of New York is their gateway to the world.

The National City Bank holds a leading place in the financing of world-wide trade centred on both London and New York. Business executives will find, at its London branches, a staff widely experienced in British banking and fully equipped to handle overseas transactions.

The London branches of The National City Bank of New York are more than a part of the London scene. They are a major link in a world-wide international banking organization. This organization, with headquarters in New York, operates 53 branches in principal cities throughout the world, and has, as well, banking correspondents in every commercially important centre.

This global network has been designed specially to help those whose dealings are international, and it is uniquely equipped to advise on the important two-way trade with the dollar world.

THE NATIONAL CITY BANK OF NEW YORK

ESTABLISHED 1812

(Incorporated with limited liability under the National Bank Act of the U.S.A.)

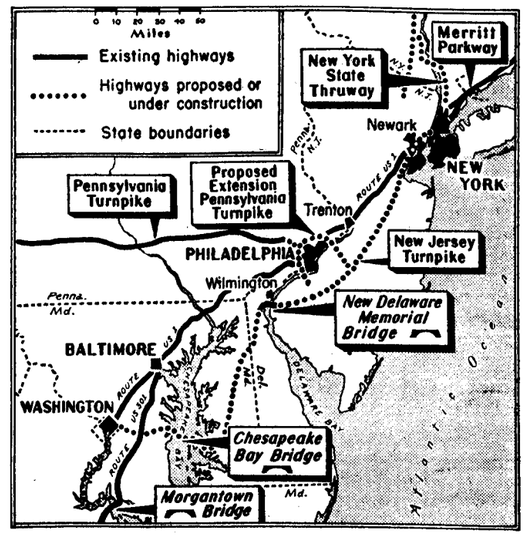
HEAD OFFICE: 55 WALL STREET, NEW YORK

LONDON OFFICES: 117 OLD BROAD STREET, E.C.2 • 11 WATERLOO PLACE, S.W.1

Housecleaning at Internal Revenue

Senator Kefauver's broom and those of some of the state commissions investigating crime have reached into some very murky corners of the Bureau of Internal Revenue and started, in that sanctum, a much overdue housecleaning. Because of the Internal Revenue Code, which provides a $1,000 fine and a year in jail for the divulging of information about tax returns, Congress and the public seldom get a peep behind the scenes. But last year the California Crime Commission accused the Bureau of failing to prosecute well-known gangsters and racketeers for tax frauds, and the Kefauver committee when it arrived in California heard testimony to the effect that field officers, for a price, were adjusting cases of fraud.

In St Louis, the Tax Collector resigned when a grand jury began to receive evidence that those who purchased insurance from a firm in which he was interested might get tax advantages, and he also was shown to have received fees from the American Lithofold Corporation. The name of this busy concern, already familiar because Mr William Boyle, chairman of the Democratic National Committee, is charged with helping it to secure a government loan, has also cropped up in New York. There a subcommittee of the House Ways and Means Committee, laying the foundations for a full investigation of the Bureau of Internal Revenue, has discovered that the head of the alcohol tax unit was paid $750 a month by American Lithofold, allegedly because the liquor companies under his authority felt it desirable to use the printing services of his firm. He also sold them lorries, and in his spare time spent an hour or two a day at the tax office. As a former adviser on public relations to several liquor firms, Mr Olson's original appointment was hardly a desirable one. A number of other tax collectors in New York have been replaced, and in Boston a grand jury is investigating the conduct of one who has been discharged. The Commissioner of Internal Revenue, perhaps by a coincidence, has also resigned, because of poor health, and his deputy has been moved to another job for the same reason.



Tax collectors no doubt are too few and, like most American civil servants, underpaid. Nor is it surprising that racketeers and gangsters, against whom the income tax is often the only effective weapon, have made a determined effort to corrupt the tax-gatherers. But at a time when taxes are about to rise by another $6 billion a year—the third increase in two years—the public is likely to give short shrift to the Bureau if it attempts to conceal the weaknesses of its employees. This is something of which the Treasury appears to have been guilty at St Louis; evidence in its files was not made available to the grand jury until Senator Williams blasted it out.

* * *

Return of the Turnpike

The $44 million Delaware Bridge, replacing the Pennsville Ferry, was opened on schedule in August, but the 118-mile New Jersey Turnpike, which travellers to New York have watched hopping on steel girders across the flats south of the city, is now unlikely to be finished in time to carry residents of Wilmington to Fifth Avenue for their Christmas shopping. This is because of the severe shortage of structural and reinforcing steel, which may also delay the Chesapeake Bay Bridge, due to be opened next summer. When it is available and when the State of Maryland has decided it can afford the super-highways needed to link the bridge with Washington, residents of the capital will be able to drive direct to New York at 60 miles an hour without having to negotiate the traffic tangles of any large city, or indeed without stopping at all except to pay tolls.

The charge for driving a car the full length of the New Jersey Turnpike will probably be $1.75 (12s. 6d.). It costs $2.50 (almost 18s.) to go 260 miles from Philadelphia to Pittsburgh along the Pennsylvania Turnpike, opened in 1940 and the first of the revived toll roads. It is to be connected with the New Jersey Turnpike and an extension to the Ohio boundary is almost finished. Ohio is planning to take over at this point and one day the road may go as far as Chicago. Plans for a "Thruway" from New York City, 535 miles across the state, past Albany and Syracuse to Buffalo on Lake Erie, are well advanced. There are already super-highways linking New York with Portland, Maine, except through Massachusetts, a state which has rejected the turnpike system because it thinks tourists would race by to the northern resorts without stopping to spend money.

Altogether some 2,000 miles of toll roads are planned and nearly half the states have decided that a return to the turnpike is the only answer to the high cost of constructing modern super-highways; with at least four lanes, divided down the centre, with bridges, underpasses and no direct intersections, it takes from $1,000,000 to $3,000,000 to build a mile of such a road in a populous district, even though they by-pass all built-up areas. This is more than can be met by local bond issues or state taxes. While turnpikes are a solution for the difficulties of long-distance traffic—they are welcomed by trucking companies even more than by the private motorist—the problem of local highways remains. Already out-of-date and inadequate for today's heavy vehicles, they were wearing out faster than they could be repaired even before present scarcities of materials developed, although states were spending more than ever before on them.

Part of the blame rests on inflation, but most of it on the increase in motor traffic; annual mileage is now about 1,200 billion ton miles, a figure which had not been expected until the nineteen-sixties. The number of vehicles on the roads has doubled since 1936 and about 25 per cent of them are lorries, many with huge trailers.

* * *

Bags Full of Synthetics

Nylon fur is replacing wolf skins for the linings of Arctic flyers' hoods, but the fall in the price of wool has postponed the day when the chemical factory will make the sheep as superfluous as it has the silkworm. When wool cost nearly $4 a pound, the mobilisation authorities were

ready, with tax amortisation benefits, to encourage an expansion in the infant synthetic wool industry which would have provided the annual equivalent of 225 million pounds of wool, roughly one-third of annual consumption. Now, however, the price of wool has been more than halved and steel for new factories is almost unobtainable, so the offer has been withdrawn for the presept.

But there is little doubt that the chemical companies will go ahead with their plans by themselves as soon as possible, for there is a growing demand for these new fibres, most of them made from petroleum products. Nylon output is now running at an annual rate of 100 million pounds and it may not be long before this figure is reached by the wool substitutes. The wool crisis came just at the time when the teething troubles, both of making and using these substitutes, were being overcome, and textile manufacturers were only too glad to turn to raw materials on which they could rely. Now that they have spent substantial sums on telling their customers about the advantages of Dacron suits and Dynel socks, they will want to go on offering them, especially since textile markets, for the moment at least, are so depressed that only firms which have something new to sell can hope to do good business.

The chief advantage of synthetic over natural fibres is that they are always available at stable prices. But the manufacturers also insist that for many purposes they are actually better than natural fibres, since by mixing them with each other and with wool or cotton unsatisfactory characteristics can be overcome, and entirely new fabrics made to order for almost any purpose. The synthetic fibres are usually crease resistant, unappetising to moths, washable and hard wearing. Orlon, unlike nylon, is warm, and so is Dynel, which also has a special resistance to chemicals that makes it useful for factory overalls. Dacron, once called Fibre V, known in Britain as Terylene and made under licence in the United States, replaces light-weight worsted for summer suits. A pure Dacron suit for men, "individualised to your special proportions," sells at $95 in New York, but mixed with rayon it can be made into a suit at the "popular" price of $40. The armed forces have so far made little use of these wool substitutes, although they caused consternation in the wool market this summer when they began to order a blend of wool and nylon for uniform cloth.

While these new developments obviously present a serious long-term threat to wool producers, and will certainly exercise a restraining influence on prices, they will not necessarily supplant wool altogether. For Americans spend about 10 per cent of their incomes on clothes, and in the last decade annual consumption of textile fibres rose from 37 pounds a head to 45.5; as long as both prosperity and the population continue to increase, there should still be room for sheep in the American market.

Shorter Notes

Mr Loy Henderson, a career diplomat with wide experience of the Middle East, is to succeed Dr Henry Grady, whose long-expected resignation from the Ambassadorship to Iran has at last taken place. The new Ambassador to India, following Mr Henderson, will be Mr Chester Bowles, if the Senate confirms his nomination. But his experience as an able Price Administrator in the last war, and more recently as Democratic Governor of Connecticut, while certainly entitling him to the President's gratitude, hardly qualifies him for what is at the moment a tricky diplomatic post, and the Senate may make this an excuse for rejecting a man it dislikes because of his Fair Deal record.

*

Many fear that the new DX super-priority rating may be the beginning of the multiple priority system which caused so much confusion in the last war. It is intended to break bottlenecks in deliveries of articles vital to urgent military programmes. Authority to issue orders with this rating is reserved for the National Production Authority, instead of being available to about a dozen government agencies, as are ordinary DO priorities, and NPA promises to use it as sparingly as possible.

*

The Senate has set a good example to State authorities by setting up a special committee to investigate crime in the District of Columbia, which is directly governed by Congress. This was recommended by the Crime Investigating Committee in its final report, which said that, from the evidence, the national capital appeared to be a pivotal point for both gambling operations and the drug traffic.

*

Soviet officials in Washington now have to pass the standard American road test if they want driving permits. Until recently they were excused as a diplomatic privilege, but the test which Americans in Moscow have to pass is so difficult that they have in practice been unable to obtain Russian driving licences. The American move, inspired by the State Department, will, perhaps, induce the Soviet government to give up a practice which has forced all Americans in Moscow to have Russian drivers, who are thought to be members of the secret police. The Washington authorities may also be asked to "fail" all Russians automatically if such additional pressure proves to be necessary.

Who Will Help Jordan?

THE return of the Emir Talal to Amman and his proclamation as King of Jordan have brought to an end a series of false rumours: that he was too ill to rule, that he was anti-British, that his younger brother the Emir Naïf was Britain's nominee as King Abdullah's successor, and that he was being detained in a Swiss nursing home under false pretences. The facts are that he had for years suffered an experience not unknown in the British Royal Family; though old enough and fully able enough to shoulder responsibility, he was given little or none by an autocratic parent. Thwarted existence led to an intermittently grave nervous breakdown, now pronounced by his Swiss doctors to be cured. The legend that he is anti-British doubtless dates from past criticism of his father's policy. But this may well turn out to have been levelled at that policy's author, not at its trend. He is said to have stated, when on his way home to take up the reins, that no change had taken place in "the old relations of friendship between Jordan and Britain." A load of responsibility is sometimes a cure for nervous ills, and this he is now called on to shoulder on a daunting scale. For the

aftermath of the Palestine war has created in Jordan problems—both political and economic—that are weightier and more difficult to solve than those in any other of the victim states.

The chief political difficulty arises from King Abdullah's inescapable but burdensome annexation of a slice of former Palestine in 1949-50. Broadly speaking, the peoples born on the east bank of the Jordan (formerly Transjordan) have a filial affection for the Hashimite house. Those born on the west bank (formerly Palestine) hate it because, by the act of annexation, it tacitly recognised the partition of Palestine. The hate spreads to the east bank on account of the presence there of nearly four-fifths of the 467,000 refugees who are living in Jordan on United Nations relief. The murder of King Abdullah was a manifestation of this feud; it was also reflected at the trial of his murderers, which was punctuated by telegrams from abroad begging for clemency and signed by various anti-Hashimite implacables. At the elections to Jordan's second Parliament, held on August 29th, the local anti-Hashimite element slightly increased its strength in the lower house. The upper house is nominated by the crown.

This ill-feeling is of the type that would improve with improving economic conditions. But the prospect of a change for the better is not bright. The old Transjordan, which was always poor, owed such prosperity as it achieved to good harvest years, to sales of its agricultural produce to Palestine and to a certain amount of profit from the transit trade in goods (including oil) exported and imported via Haifa. This year all these assets are absent; Haifa is in Israel; rainfall in 1950-51 was only two-fifths of the average; the frontier with Israel is closed so that the Jordan valley's early vegetables abound on the stalls of Arab Jerusalem while Jewish Jerusalem goes hungry for them. Imports and exports must travel either by way of Damascus and Beirut at the exorbitant transit charges made by Syria and Lebanon (who insist on use of their expensive railways), or else by the Jordanian port of Akaba. This latter route is little more profitable because of the long desert haul involved. Jordan produces nothing sufficiently rare or valuable to warrant an air lift. Its need for peace with Israel is immeasurably greater than that of any other Arab state.

How is a country that is poor anyway, that is saddled with a refugee horde that forms one-third of its total population, and that is denied its usual access to its handiest port and market, to balance its international payments? In 1950, Jordan's exports (including sales of local produce to the UN Relief and Works authorities) amounted to 1,900,000 Jordan dinars (1 dinar = £1 sterling) and imports, controlled by careful licensing, to J.D. 10.7 million. On a superficial reckoning, this unbalance is righted by three items. These are the United Kingdom's annual grant to the Arab Legion (£4,700,000 in 1950; £6,500,000 in 1951); expenditure by UNWRA (approximately J.D. 3,000,000 annually), and releases from Jordan's fast dwindling sterling balance. But in fact a forecast of essential imports for 1951 as against estimated earnings leaves a gap of nearly J.D. 3,000,000. It should be remembered that, of the grant to the Legion, only about 40 per cent is spent locally. The rest pays for arms and equipment bought in Britain.

Low Morale in Refugee Camps

These figures prove that without U.N. relief funds and without the British subsidy, Jordan would be insolvent. Even with both, it cannot make ends meet in 1951 without a windfall from some other quarter. Last spring's poor harvest worsens the outlook. Refugee morale is not bad among the professional and capitalist minority, who are turning Amman into a business centre, ousting the one time Syrian and Lebanese agents for merchandise, and building competent professional practices and small factories. But it is bad in the UN camps; no one is really hungry, but idleness is breeding increasing disorderliness. It is at its worst among 60,000 or so frontier peasants who, having retained their homes, do not count as refugees or get fed, but who have lost their former lands and markets, now inside Israel. "Every night," says the *mukhtar* of the frontier village as he produces coffee from somewhere for his visitor, "I go nearly mad with sleeplessness from uncertainty and worry about what to do."

The government's chief trouble in handling these people is that the more it helps, the more of them flock in. In most Arab countries they are unwanted; in Jordan, they are citizens. No wonder that they come. It can settle them more

cheaply than does the United Nations, but it is handicapped by its poverty; the British gift of £1,000,000 made in 1949, is nearly spent. It is also hampered by the fact that there is little to choose between the poverty of a refugee and that of many of the original inhabitants of Jordan. Why, then, should the former be favoured? Problems of land tenure and the unwillingness of landlords to sign leases also abound. UNRWA, with its more costly machinery, is no better placed because its funds run to little beyond day-to-day relief. Together with the government, it seems to have been whirled into a vicious circle in which the latter, preferring to please the people by winning them rations today, will not strike the less needy off ration lists in order to release money for settlement tomorrow.

Even if there were peace with Israel and even if ample funds were forthcoming, it is highly doubtful whether the country could permanently support more than another 100,000 of the unemployed and homeless refugees, in addition to maintaining the workless who still possess homes, and those have already found themselves work. This calculation leaves at least 300,000 people without a future. Here is the worst politico-social problem confronting the Middle East at the moment. Since it threatens a faithful British ally with ruin, it is Britain's problem also. Shall its solution be sought through British or Anglo-American action, or must the few interested powers prod the many indifferent ones to subscribe through the United Nations?

Australia's Vote on Communism

[FROM OUR MELBOURNE CORRESPONDENT]

AUSTRALIANS are being asked at a referendum poll today to agree to amend the Commonwealth constitution so as to give Parliament absolute freedom to deal with Communists and their ways. Since the Liberal-Country Party Government was returned in December, 1949, Mr Menzies, the Prime Minister, has made the issue of Communism a key plank of his platform. Before he was elected, Mr Menzies pledged himself to outlaw the Communists and to confiscate their property. During nearly two years of office, he has never lost sight of this object.

In its efforts to outlaw the Communists, Mr Menzies' government has suffered much frustration and delay. It now finds it necessary to appeal to the people on this issue, because the appropriate legislation to ban the Communists, although passed by both Houses of Parliament and given Royal assent, has been declared invalid by the High Court of Australia which found that the powers could not be sustained under the defence powers of the constitution.

Mr Menzies, therefore, is making what must be his final bid to obliterate Communism in Australia by direct appeal to the people through the very democratic procedure of referendum. In Australia, however, appeal to the people in this wise rarely succeeds, for the Australian elector, like his counterpart in the United States, is very wary of constitutional amendments. Of the 23 proposals which have been submitted to referenda since 1901, only four have received the assent of the electors. The first of these, in 1906, was concerned with the election of Senators, the second and third, in 1910 and 1928 respectively, affected state debts, and the fourth in 1946 validated payments for social services. Australians regard their constitution with a degree of respect rarely seen in the Commonwealth with the result that proposals for amendment are not taken lightly. This particular referendum, moreover, directs attention to the vital function of the High Court which is popularly—and properly—regarded in Australia as the guardian of the constitution.

With this background behind the highly explosive issues which have been put to the country by Mr Menzies and Dr Evatt, the leader of the Opposition, it is not difficult to see that the case for constitutional amendment tends from the beginning to be unpopular. Against this is the fact that Communists and their ways are not liked by either the Labour or anti-Labour forces in Australia and the natural inclination of the Australian elector is undoubtedly to vote for their political extinction.

Mr Menzies's case for a "Yes" vote is that Communist activity in Australia has become a grave menace to industrial peace, to production, to national security and to defence. Although the Commonwealth Parliament has some power to deal with Communist activities by means of the Crimes Act, he says that it has no power to deal with Communists or Communism as such. That has been made abundantly clear by the High Court. To this, Dr Evatt replies that the Referendum Bill represents a direct frontal attack on all established principles of British justice. Passage of the referendum, he says, would enable blanket powers to be given to Parliament that would lead to the partial overthrow of the basis of the constitution. If carried, he says, it would divide, weaken and even destroy the political and industrial movements of Australia.

Divisions in Both Parties

These then are the broad issues which have been placed before the people by the two political parties. There are, however, many side issues which are certain to confuse and confound the voters, and which makes prediction about the result of the poll exceedingly difficult. It is fairly clear that the issue will not be decided on orthodox party lines, for there have been signs of division in the ranks of both the Labour and the Liberal parties. Labour has been presenting a united front, since the Federal Parliamentary Labour Party, the Australian Labour Party Federal Executive and the Australian Council of Trade Unions all formally pledged themselves to oppose the government's proposals. There is, however, a strong section of right wing Labour, including one Church group, which would be very unhappy to espouse the Communist cause. On the other hand, there are many government supporters to whom discrimination against persons or groups because of their political beliefs is abhorrent to a degree. This was reflected in the suspension of the Vice-President of the Young Liberals Movement in Melbourne for urging in a letter to the press that electors "vote according to their consciences."

Feeling has run high as the two political leaders have gone around the country warning the electors of the dangers of the other's point of view. Dr Evatt warned that Mr Menzies' government, in its referendum proposals, was following the road that led to the horrors of Belsen. On his part, Mr Menzies is prepared to blame the Communists for most of the difficulties which Australia is at present facing.

Danger of "Thought Control"?

But the strongest weapon in the hands of the advocates of a "No" vote is the fear that general power to outlaw the Communist party might in special circumstances lead to a suppression of persons other than Communists, whose political opinions may not be in line with whatever government is in power. It could lead, in other words, to "thought control." Mr Menzies says that it is "fantasy, a resounding falsehood," to suggest that under the amendment the government "could declare unlawful the Australian Labour party, the trades unions and many other political, social and even religous groups." The Communist Party Dissolution Act, which the High Court invalidated, defines a Communist as "a person who supports or advocates the objectives,

policies, teachings, principles or practices of Communism as expounded by Marx and Lenin." This, opponents of the amendment contend, could well embrace persons whose crime was nothing more than being politically opposed to the government, for, as Dr Evatt said on the hustings, "if anyone interrupts the Prime Miniser at a meeting he is a Communist!". But the question is whether detestation of Communism as such will outweigh all other considerations in the minds of the Australian electors.

The Problem of the German Refugees II

Dangerous Political Tides

[BY OUR SPECIAL CORRESPONDENT LATELY IN GERMANY]

IN theory, the political dangers to German democracy and world peace which are inherent in the presence of 7,500,000 exiles in the Federal Republic should decrease as their economic conditions improve. To a certain extent they do so. But to believe that everything can be settled by, say, an international loan to the refugees would be to put the economic cart before the political horse. And in this particular cart the horse is a German charger—an animal more noted for valour than decorum.

It may even be said that the political problem has increased lately, in spite of the growing numbers of refugees who are finding a livelihood in the Federal Republic. This is due to the stimulus given to German nationalists by the Western call for their aid in defence, and to the irresponsible policy of most of the refugee leaders. The exiles' leaders are for the most part landowners or high officials who have themselves failed to find satisfying positions in the West; they believe it to be their duty to conduct an unremitting campaign for the return of their lost *Heimat* (or "homeland"), and for a share in the capital assets of the West Germans (to be secured by the so-called *Lastenausgleich*). There is no doubt that the men who head the regional refugee organisations known as the *Landsmannschaften* are deliberately hindering the assimilation of the exiles, for the same reason as they are opposing emigration. They aim to maintain as large a body as possible to press German claims for revision of the Oder-Neisse frontier, and for a return to the Sudetenland. They are particularly afraid that the young people who have now lived for five years in Western Germany will forget their *Heimat* in the East, and that, when the day comes, there will not be enough willing to return and take over all the farms and posts.

Members of the Bonn Government, faced with demands they cannot fulfil, are in a difficult position. On the whole they concentrate upon the economic settlement of the refugees, and make occasional speeches in which they declare that at some time the lost territories will return, without war. Mr McCloy, the US High Commissioner, has done the same. Such assurances, however, by no means satisfy the demands of the exiles, who now demand a precise plan for securing their rights.

The Bonn politicians in their turn use threats when they press the Americans for help. They do not promise that the refugees will be good if they get foreign aid, but that they will be bad, very bad, if they do not. According to the official argument, about a third of the refugees are settled in something approximating their former circumstances, but about 40 per cent are in unstable jobs, below the holders' former standard. This latter category, rather than the unemployables, will, it is said, prove most dangerous. Many of them are landless farmers. They will not turn Communist, but, it is threatened, nihilistic. They will not want to establish a new social order, but simply smash the existing one. And they refuse to defend Western Europe, because they feel they have nothing for which to fight.

Some Moderating Influences

It is hard to say how far this threat is exaggerated. General Remer's neo-Nazi party did not draw much support from the refugees in the Lower Saxon election. But the danger of some form of destructive neo-Nazism among the dispossessed is real. One reason is that the refugees are concentrated in those areas which were most solidly Nazi in the past, and which are today more nationalist than the industrial communities. Another, more important, reason is the encouragement given to extremism by the refugee press and the orators who rouse emotions at their frequent mass re-unions. Some of the political leaders are sincerely trying to steer the refugees between the extremes of right and left. The Minister for Refugee Affairs in Bonn, Dr Lukaschek, is a notable example of moderation (for which he is bitterly attacked); and the party known as the *Bund der Heimatvertriebenen und Entrechteten* (BHE) has good intentions. The BHE was formed to champion the ex-Nazis as well as the refugees; it supports the demands of the former to restoration of their civic rights, and of the latter to a drastic capital levy for the equalisation of war losses. In the Lower Saxony government it has formed a curious alliance with the Social Democrats.

The *Stimme der Vertriebenen* (the leading organ of the Oder-Neisse exiles) recently printed under the sensational heading: "Chaos is Here! Germany is on the Move!" an article announcing the imminent end of Germany's present form of democratic government. The antiquated parties, it said, in familiar Hitlerite phraseology, had failed, *vis-à-vis* the Allies and the country; the time was at hand for the men they had spurned (i.e., the Nazis) to establish a state with authority, which would grant mandates to the efficient. Preparatory work done by the small but numerous political discussion groups outside the parties had not been

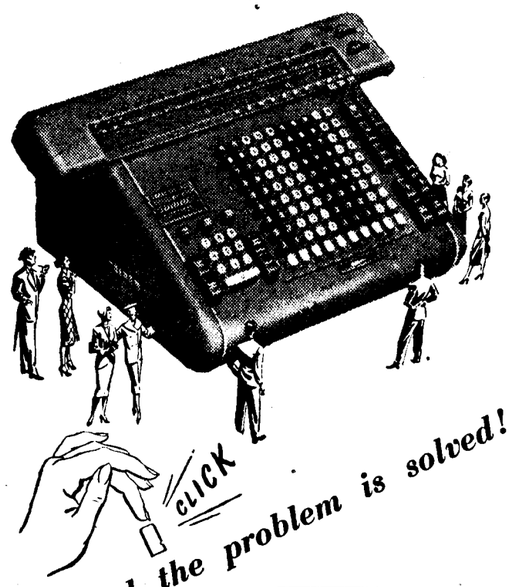
SIMON ENGINEERING GROUP

Aspects of enterprise



No. 11

For forty-two years Simon-Carves have almost continuously maintained a resident engineering staff in India on coke oven construction. The first Simon-Carves ovens in that country were built in 1908 and the latest were put to work in 1950. Eleven of the fourteen batteries now working in India have been built by Simon-Carves, and a large new battery was recently ordered. The eleven existing plants handle nearly 85 per cent. of the 3½ million tons of coal carbonised annually in Indian ovens, and the completion of the twelfth will bring the figure to nearly 95 per cent.

A hundred years ago—David Laing and his son James with a few day labourers building in a Cumberland village.

growth

To-day—an organisation employing thousands of men and the most modern machines, constructing factories, steel works, cement works, power stations, aerodromes and schools in Britain and overseas.

What produced this growth? Just hard work—and good work. Then, the resolve to take on a bigger job.

What came later—fifty years ago, the first fully integrated costing system to be applied to civil engineering; thirty years ago, a comprehensive staff selection and training scheme; progressive investment in new equipment; laboratories; expanding organisations for welfare, plant development and maintenance—all these represent scientific management applied to one aim—the job: a better job and a speedier job.

in vain; there was a new feeling of community among them; all were apart from the state, and often in opposition to it. This disquieting article was published in response to many letters from readers.

Refugee Leaders' Muddled Oratory

It is rare for any refugee leader to argue for collaboration with the West; most exhaust their rhetoric in attacking the Americans, or the Bonn Ministry for Refugee Affairs, and in issuing flaming demands for restoration of the *Heimat*. Unlike the empirical British, the Germans are supremely indifferent to the practical possibility of securing their demands. Dr Goebbels sustained their faith in victory to the end by arguing that the war would be won because otherwise history would lose its meaning. Refugee leaders find nothing illogical in demanding that the West shall return territories now in Polish, Russian, and Czech hands, while at the same time as declaring that they will not help in Western defence. They attack the Americans for saying that Germany should aid the Atlantic forces before demanding more money for the refugees; they fulminate in a way to suggest that they want a war to restore the *Heimat*, and declare that they oppose war, because they must have their homeland back intact. They constantly state that their aim is to re-establish a united Germany in a united Europe, but pour abuse on the democratic Czechs and Poles in exile.

It is, in fact, impossible to trace any clear, practical aims in the vague, inflated verbiage that pours from the refugee writers and orators. The authors themselves do not know exactly what they mean; they only express emotions—those their public like to hear. It would be wrong, for instance, to deduce that they seriously demand that the lost territories shall be returned by the West, *before* Germany makes a contribution to defence; but that is what the following declaration from the *Stimme der Vertriebenen* might be taken to mean:

> Germany to the Germans, from the Memel to the Saar! The question of readiness for defence would then solve itself, as we should then know what we have to defend.

How much of the lost territory the Germans demand back is not at all certain. The minimum can, however, be judged from the flags which were hung at the recent celebrations of the foundation of the Federal Republic. As well as Silesia, they consisted of East Prussia (now divided between the Soviet Union and Poland), West Prussia and Danzig. Silesia, however, is taken to include the industrial area of Upper Silesia, with Kattowice, which went to Poland after the 1914-18 war; and the refugees still speak of the *Warthegau* (the name given to the Polish territory annexed to the Reich by Hitler).

Sudeten German Propaganda

The Sudeten Germans' propaganda maps comprise the whole of Bohemia and Moravia under the title *Heimat Sudetenland*, but they admit that they will have to share it with some Czechs. The Sudeten German organisations, however, denounce the "criminal monster Benes" and hector the American authorities for daring to allow the "ridiculous" Czech emigré National Committee to broadcast on Radio Free Europe from Munich. Their leader, the Social Democrat Wenzel Jaksch, has formed a pact with the more or less Fascist emigré, General Prchala. Search is being made for some Poles who will be equally ready to return the Oder-Neisse territories. In the meantime, the *Landsmannschaften* are nominating burgomasters for the day the Germans return.

At the moment an important movement is taking place to consolidate the two main refugee organisations into one pressure group. The Central Union of Expellees is merging with the *Landsmannschaften*; open fingers, it is declared, will thus become a clenched fist. This merger, like that of the ex-soldiers' organisations, has been prompted by the success of the Trade Union Federation as an extra-parliamentary pressure group. It is opposed by the BHE and its ally, the Social Democrat Party; they aim to secure the support of the powerful voting force represented by the refugees and fear that Dr Adenauer's Christian Democrat Party will now outmanœuvre them. This would end their hopes of a SPD-BHE coalition government after the next general elections. For the general interests of the West, it would be most satisfactory if Dr Adenauer were to win the refugee organisation, but the price, it seems, will be the revision of Germany's eastern frontiers in some way or other. That is a price which the West is not in a position to pay.

(Concluded)

Conflicting Viewpoints at Victoria Falls

"THERE are three things we fear in Nyasaland," said an African chieftain to Mr Griffiths during the consultations on the Central African federation proposals, "the leopard, the lion and federation." This is a pithy summary of the state of mind which the Colonial Secretary encountered among Africans in what must have been wearisome travels throughout Nyasaland and Northern Rhodesia. African opposition had been anticipated, but not to this extent. It has proved to be all but unanimous.

The reasons for this opposition have varied; prejudice and ignorance have played their part, but there has also been reasoned analysis. Sometimes there was an ungrounded fear that land would be taken away; on other occasions it was "simply because we do not like Southern Rhodesia"; in yet others, there was anxiety that the link with the British throne would be severed. Among the nationalists of Nyasaland, any form of closer association (and there is no different word in the local language for "federation" and "amalgamation") seemed to obstruct the path to African self-government on the Gold Coast model.

In general—and this was felt most keenly on the Northern Rhodesian Copperbelt—the root of the trouble lies in suspicion of the Europeans. The very fact that Europeans have on the whole favoured the proposals has added an edge to this sentiment. On the Copperbelt it was pointed out that political safeguards were bound to be worthless, as the recent South African experience had shown. Not only that, but the continued existence of an industrial colour bar in the mines, in spite of recommendations by British Commissions of Inquiry, coupled with the increasing influx of Afrikaners, had confirmed the Africans' forebodings. These suspicions derive, also, from the whole history of the federation proposals, with the unfortunate 1949 conference at Victoria Falls to which no African was invited. That the present proposals had been prepared by an all-European group of officials did nothing to sweeten tempers.

How strong is the value put by Africans on the direct British connection was well demonstrated. At a meeting of the Northern Rhodesian African Congress, a small but vocal party, Mr Godwin Lewankka—a former president—said:

> First I would put the value that Africans attach to the unbiased judgment and fairness of treatment received from the Colonial Office. . . . It is not simply upon the fair-mindedness of the individual Minister that the Africans rely. The Minister is answerable through the House of Commons to the people of Britain.

The same view was expressed in Nyasaland, where great store is set by the country's position as a British Protectorate.

It is probably in Nyasaland that the opposition is most determined. Mr Griffiths was first met with a blank refusal even to send representatives to the Victoria Falls conference. But he is a compelling orator, and in the end both Nyasaland and Northern Rhodesia have sent African delegates, though with a strict mandate to oppose. Africans in Southern Rhodesia will have no representatives at the conference (a fact obviously calculated to harden northern opposition to closer union with that country), but in consultation with Mr Gordon Walker their hostility to federation as proposed was clearly expressed. A resolution of the Southern Rhodesian African National Congress opposed federation on the grounds that it might result in bringing Africans further north under the same "restrictive tendencies" from which they themselves suffered.

Challenge to Colonial Office

European reactions have not been so firm and unanimous. The small community in Nyasaland has favoured federation, partly for the anticipated economic benefits, and partly because they hope it will make their own future more secure. The Northern Rhodesian settler community has been strongly in support. They see a strengthening of their own political position in unity with the south, a challenge to the irksome shackles of "Colonial Office rule," and an insurance against a possible depression in copper prices which would be disastrous to their one-sided economy. The hesitations have come, rather, from Southern Rhodesia. For many there, Dominion status is now the goal, so that the federation proposals are obviously a retrograde step; in particular, the position of the Minister for African Affairs, with his direct appeal to London ("the cuckoo in the nest" he has been called) is found unpalatable. This is the attitude of the opposition Rhodesia Party. For those who think this way a straight amalgamation with the North is preferable, but others turn rather to unity with South Africa. An Afrikaner Party has just been formed in Southern Rhodesia, giving power and point to the pro-Union movement.

The only forthright Southern Rhodesian support for the proposals in their present shape is likely to come from Sir Godfrey Huggins and his United Party. But Sir Godfrey, apart from some sympathetic generalisations, has so far held his hand. It is believed that what he eventually favours will be decisive for his white countrymen. Yet in spite of these doubts, events are pushing most people towards a compromise. The creation of the Afrikaner Party is a warning writing on the wall; and Dr Malan's recent declaration that the incorporation of the Protectorates will be an issue in the next South African election is only another pointer that there may be dangers nearer at hand than the fear of Whitehall interference. At Victoria Falls the main political parties are represented; the Afrikaner request for representation was refused on the ground that the Southern Rhodesian delegation had already been constituted.

South African Reactions

What of South African opinion? The Nationalists' first reactions were bitterly hostile. This was nothing more than another "British Imperialist" move to fly the Union Jack a little longer in Africa, and set up a "liberal" state on the Union's very borders. But these extreme reactions have now been modified. Perhaps the Union Jack is, after all, preferable to another "Gold Coast" in Central Africa; and maybe the "liberal" set-up will not be quite what they feared—the widespread African opposition to the plan has encouraged this hope, and signs of a tough attitude towards the black man on the part of the Southern Rhodesian opposition parties have been cheering to the Malanites. The United Party has a different worry—that federation may *not* come about. In their eyes there are two dangers. One is that the Africans will not only reject federation (and be listened to by the British Government), but will go on to demand much fuller political rights. The other is that in the absence of federation, the nationalistic Afrikaners will spread their doctrines to the north. In the manifesto of the Afrikaner Party in Southern Rhodesia there is, for example, no mention of the entrenchment of English as the official language.

Two basic fears thus meet and clash at Victoria Falls—the African fear of anything that is likely to increase European power; and the European fear of Afrikaner "imperialism." These two emotions demand diametrically opposed treatment. African opposition to federation can only be appeased by strengthening the political safeguards held by Britain; European opposition can be won over only by granting greater powers to the white communities on the spot. Mr Griffiths, representing the Colonial Office, and Mr Gordon Walker, of the Commonwealth Relations Office, are pulled in directly opposite directions. Between them they have a hard row to hoe.

A Leader for Malaya

DATO ONN BIN JAFFAR is the most remarkable man in Malaya. Tall, good-looking and with a distinguished presence, he has built up his reputation as a nationalist Malay leader without himself being more than partly Malay. With Ceylonese blood in his veins he was born into the family of the Sultan of Johore at Johore Bahru in 1895. As a boy he first went to the local Malay school and then was sent to complete his education for six years in England at the Aldeburgh Lodge School in Suffolk. On his return to Malaya, he entered government service and by 1936 had become a member of the Johore State Council.

Between then and now, Dato Onn has played an increasingly important part in the destinies of Malaya. He has made several journeys to Britain and one to the United States, and today at 56 he stands in that small band of Asian statesmen who see the development of their peoples against a world setting. When he is not at Kuala Lumpur or travelling, Dato Onn lives in a cool and pleasant house on the outskirts of Johore Bahru and not far from the causeway which connects the Federation of Malaya with the island of Singapore. His daily life there is a mixture of the oriental and the European, in food, in clothes and in the furnishings of his home. Into this background, so accessibly placed within forty minutes' drive of Singapore, come many of the most prominent visitors to that cross-roads of South-east Asia. They come to listen to his quiet but vibrant accounts of the past and future of Malaya, and, though they may not always realise it, to give him in return something of the smell and taste of the world outside.

Dato Onn began his political career with the foundation of the *Pergerakkan Melayu Semananjong*, the Peninsula Malay National Movement, which in 1946 became a charter member of the United Malay National Movement (UMNO) with Dato Onn as president. At the outbreak of war he had joined the Johore Defence Corps and then, under the Japanese occupation, served in the Food Control Department. By that time his influence with the Malays was considerable, and as the Japanese empire broke up he threw his weight into the effort to prevent the anti-Japanese underground movement from becoming anti-British. He had discovered to his surprise and disgust that the Malayan Communist Party was already making considerable strides in that direction.

In character and political inclination Dato Onn is an apostle of gradualism, however rugged the objectives he may set himself. That was why, although in favour of the return of the British, he led UMNO into bitter opposition to their postwar plans for a Malayan Union. He successfully fought and defeated those plans because he considered that they aimed at giving the Chinese too many rights, too easily and too quickly. Holding that the formulation of a new basis for Malayan citizenship must precede a constitutional

Andrew Heppleback and the forgotten factor

The other day, for the first time since leaving school, Heppleback* got a sum wrong. Off to Cairo for a big oil deal, he worked out the time he'd save by flying.
His arithmetic was right—as far as it went. But he forgot that flying saves not only travelling time but "waiting-to-travel" time. Take Heppleback's destination, Cairo. Only 11 hours from London with 21 flights weekly. And that's just one example of B.O.A.C. speed-plus-frequency on worldwide routes!

Ode to an artificial Violet

Shelley, Wordsworth and Keats *might* have written odes to artificial flowers—but it hardly seems likely. Ingenious as they are, flowers of paper and silk have little to inspire the poet.

It's much the same with substitutes for wood. Wood is a natural *living* material with a character all its own. No two pieces of timber are ever exactly alike. Each is a thing of beauty in itself.

All very well, you may think—but what about the timber supply situation? Well, there are certain shortages still—but on the other hand there is a steady expansion in the supply of timber, and many hardwoods are being imported which can be obtained without licence. There may be one exactly fitted to the job you have in mind. Why not drop a line to the Timber Development Association and find out?

There's nothing like **WOOD**

Issued by the Timber Development Association · 21 College Hill · London · EC4 and branches throughout the country

change of that magnitude, Dato Onn has played a leading role in the establishment and efficient working of the Federation of Malaya. He is now Member for Home Affairs in the experimental "cabinet" which was set up earlier this year.

Today things have changed only to the extent that Dato Onn has decided the moment has come to bring the communities together and to try to set a time limit for the next stage on the road to an independent Malaya, probably, if his past is any guide, within the Commonwealth. A new basis for citizenship is in fact now going through the lengthy processes of legislation. While it is doing so, Dato Onn is making a bid to take politics out of the rut of communalism. This has provoked anger and disappointment among many of his Malay followers. But it is in full keeping with his previous ideals, and gradually they are seeing that he is right. From Britain's point of view the chief doubt must be whether the seven years which he stipulates for the achievement of independence is not much too short. What at least is certain is that, if the Communists are kept at bay during this period, Dato Onn will play a vital and on the whole a salutary role in the growth of his country to nationhood.

The Trial of the Polish Generals

[BY A CORRESPONDENT]

THE Warsaw regime is making much of what they call *Spychalszczyzna* (Spychalskism), their newly coined word for the Polish form of nationalist deviation. It is taken from the name of General Marian Spychalski, former under-Secretary for War and Head of the Army Department of Political Education and one-time leading Politbureau member, who is now in prison. This and the nature of the public prosecutor's examination of Spychalski at the recent trial in Warsaw of four Polish generals and other high-ranking officers would seem to indicate that Poland is at last to see a full-dress political trial on the lines of those that led to the execution of Rajk in Hungary and Kostov in Bulgaria. In picking out Spychalski to fill the role of arch-traitor rather than, as generally expected, the expelled Communist Party Secretary-General, Vladyslav Gomulka, the Kremlin is apparently out to kill two birds with one stone, to strike terror into Polish Titoists in both the army and the Party.

It has, of course, long been evident that Stalin's major preoccupation in Poland was less the Party than the army, not unnaturally since the latter has always been the strong-hold of a passionate nationalism as well as possessing as good a fighting reputation as any force in Europe. The Kremlin's distrust of the Polish army, even of units organised on Russian soil, has been continually demonstrated, in particular by the policy of maintaining Soviet officers and technicians in key positions throughout its postwar organisation.

It will be recalled that among Spychalski's confessions at the famous Party Plenum session in November, 1949, which resulted in his expulsion, was that he "had prematurely allowed the departure from the Polish army of valuable trained Russian specialists" and appointed "prewar Polish officers to high posts." And within a few weeks of this affair, Marshal Rokossovsky was despatched from Moscow to become Polish Commander-in-Chief.

Since then Rokossovsky has laboured hard through purges and propaganda to make the Polish army submissive, loyal to the Soviet Union and ideologically sound. Yet, after almost two years of these exertions, it is found necessary to resort to the extreme catharsis of a "Moscow trial" with four of the army's most outstanding generals in the dock on charges involving every variety of treachery. It is a matter of conjecture why the death sentence was not imposed on any of the accused. Whether or not the extreme penalty is being reserved for Spychalski remains to be seen. The case against him, as expounded in the Polish press, is to be made comprehensive enough. On August 16th the army newspaper *Zolnierz Volnosci* stated that:—

> Spychalski prepared the ground for the plotters' activities in the army where he planted them. The fumes of *Spychalszczyzna* have numbed the revolutionary vigilance within the forces, making enemy penetration easy.

Spychalski is prepossessing and imposing in appearance. From the cautious nature of his replies at the officers' trial he does not appear to have been "conditioned." Certainly he gave a more dignified performance on this occasion than did the abject, penitent figure who confessed at the Party Plenum session in 1949. The reason for putting Spychalski in the witness box was clearly to enable the public prosecutor to build up some plausible legal basis for the charges to be made against him. (The fact that he was also allowed to implicate Gomulka suggests that he too may at last be brought to trial.)

Spychalski's Admissions

Spychalski admitted that he knew the four accused generals, Tatar, Herman, Mossor and Kirchmayer and that he had told Gomulka that Herman had been Chief of AK intelligence and that Gomulka had agreed to his admittance to the new Polish army, despite his previous contacts with the west. (AK was the underground wartime army, directed by the Polish government in exile in London, which is now constantly vilified by the regime.) Spychalski went on to admit that he had agreed to Herman's request that three of his subordinates, now all under arrest, should also be allowed into the new army. Finally he admitted that he had tried through Herman to establish contact with General Rzepecki (Commander of the AK when it was secretly operating against the regime in the early postwar years). He had first discussed the matter with Gomulka who had agreed that he should give Rzepecki a safe conduct to enable him to come out of hiding without risk of arrest. The pass was given and discussions took place at a rendezvous outside Warsaw, but without result.

Thus the bill of indictment against Spychalski is already taking shape according to the recognised east European pattern. His crime is that he promoted the admittance to the postwar Polish army of Polish officers who fought in the west. This must inevitably make them anti-Soviet, which in turn must have inevitably led them to plot against Russia. From this it follows with what purports to be Euclidean logic that Spychalski himself was plotting.

For the record it may be recalled that the Polish regime in 1945-46 itself offered an amnesty to nationalist AK guerrillas, and that there was constant pressure by Bierut government representatives on Polish soldiers, including officers, in England and elsewhere to return to the homeland which badly needed their services.

THE BUSINESS WORLD

Commonwealth Raw Materials

THE meeting of Commonwealth Ministers concerned with supply and production, as next week's conference is officially described, opens in London on Monday with a full agenda. Its purpose is to give an opportunity for a free and frank discussion on all problems connected with commodities. But it will be surprising if the talks are restricted even within this wide perimeter, for most Commonwealth countries are interested not only in what they can produce and export, but also in what they can import in return. The dollar problem is not specifically on the agenda, but discussions about supplies of raw materials that do not refer to the United States or to the sterling area's dollar income and expenditure would hardly be realistic.

Experience on the International Materials Conference in Washington, where Commonwealth countries are individually represented, has shown the need for understanding among Commonwealth countries on commodity problems. In the recent IMC discussions on the international allocation of wool, Britain with the United States supported the case for some measure of international control, while Australia, New Zealand and South Africa argued the contrary case for a free market. If the IMC is to continue to share out scarce dollar materials—and Britain and the Commonwealth have undoubtedly gained by getting larger supplies of sulphur and other materials as a result of its work—the benefits cannot indefinitely be one-sided. Price stabilisation, closely related to allocation, is a subject on which the British Government sets great store. Price stabilisation, so it is argued, would protect importers from a cost inflation and exporters from an income inflation. Moreover, if schemes could be devised for materials produced in the sterling area on the lines of the wheat agreement, the sterling area would be assured of a minimum dollar income from the sale of its commodities each year. But price stabilisation would encroach upon the domestic politics of the different Commonwealth countries. The Australian Government, for instance, has already refused to interfere with the normal auction system except "in times of emergency."

The emergence of a Commonwealth view about the future of IMC and the possibility of price stabilisation must depend on the possible trends of supply and demand of the more important raw materials. If rearmament is accompanied by a general increase in industrial production in the western world, output of primary products must expand during the next five years if scarcity is to be averted. But producers of certain commodities are already faced with the more immediate prospect of surplus. Of the commodities to be considered by the Commonwealth Ministers next week, nine are metals—copper, lead, zinc, tin, manganese, tungsten, molybdenum, nickel and cobalt; cotton and wool, rubber and sulphur complete the list. Jute and sisal, both important sterling area exports, are unlikely to be discussed.

The Commonwealth is a net exporter of copper, lead, nickel, manganese, tin, rubber and wool. It is a net importer of zinc, tungsten, molybdenum, cotton and sulphur. Canada provides most of the nickel, some of the zinc, some special copper shapes and some lead. From the narrower standpoint of the dollar problem, the Commonwealth will be concerned with expanding the output of those materials of which it is a net importer for dollars. Zinc production in Australia could be expanded if the Australian Government allowed more reasonable prices in the home market—the domestic price is less than a third of the current world price. Increased supplies of tungsten and molybdenum rest on new discoveries and their exploitation. More cotton could be provided by growing American middling staples in certain colonial territories—on the lines already begun in East Africa—and by expanding total acreage. Sulphur involves exploitation and conversion to substitutes such as pyrites; most of the Commonwealth countries are net importers of elemental sulphur.

Tin, rubber and wool are three commodities that face the possibility of surplus. Tin was long supported and distorted by American purchases for the stockpile, and its behaviour in recent months is a vivid illustration of what can happen when America stops buying. Yet, if recent reports that the alluvial deposits in Malaya are rapidly approaching exhaustion are correct, in ten years' time tin might be as scarce and as precious as it was in ancient times. Rubber is also directly affected by American policy. Purchases for the stockpile are due to finish next year and if American civilian consumption of natural rubber continues to be drastically curtailed, surplus supplies may well burden the market. Yet despite the threat of an immediate surplus, there could be a shortage in 1960. Again, the future of both tin and rubber rest on a delicate political situation in south-east Asia. Consumption of wool since the beginning of this year has fallen well below world output, yet the eventual prospect is for a further increase in the demand for wool, despite the development of synthetic fibres. The sterling area Commonwealth is more or less self-sufficient in copper, though it has to be helped out with a certain amount of electrolytic refining in the United States (until the new Rhodesian refineries come into full operation) and by the import of special copper shapes from Canada.

* Excluding trade via Kathiawa ports.

★

To expand the production of scarce primary commodities involves much more than simple increases in acreage planted, numbers of sheep or a few new mine shafts. Ancillary services have to be extended as well —more facilities for preparation of rubber, concentrating and refining of ores, better transport and communications, expanded ports, more houses, improved water supply, electricity and public services. Exploitation of Commonwealth resources calls for development in its widest meaning. It requires the most extensive capital risks and commitments, as the groundnuts fiasco showed; yet, not content with this object lesson, the British Government has lately done all that it could by threats of dividend limitation, and the forbidding enclosure set up by Section 36 of the Finance Act, to scare capital away from mining and other projects of the same kind. And the addition of another call on manufactured resources to make new development schemes possible, further increasing those already barely met for investment, exports and defence would heighten the present troubles that arise from attempting too much with limited resources. Again, can production be encouraged to meet a prospective long-term shortage when the more immediate outlook suggests surpluses of certain commodities? What form of guarantee—say long-term contracts or other methods—would act as an incentive to producers? It might be easier to exploit Commonwealth resources if some scheme of international price stabilisation could be introduced with American partnership. But what range of prices will satisfy consumers and simultaneously encourage an increase in output, and who would be left to fix it? The dominions have always tried to get prices for their primary products related to current prices of imported manufactures which in a period of rearmament and relative scarcity are likely to rise; in other words, they want to lock the terms of trade in their favour. Nor would it be easy to fix a programme of development that will satisfy producers of different countries. And the greatest difficulty of all would be to get the United States to commit itself for a period as long ahead as, say, five years.

So much for expanding Commonwealth production. The reverse side of the picture is what Britain can send to the other member countries. The proportion of its total exports sent to the Commonwealth has been steady; it was 49.2 per cent in 1946 and 48.6 per cent in 1950, but the actual volume of exports sent to the Commonwealth rose by about 80 per cent in the period. The proportion of British exports sent to the sterling Commonwealth in the first six months of 1951 was 42.9 per cent compared with 42.8 per cent last year; in 1946 the proportion was much higher (45.7 per cent) though the volume was very much smaller. If the analysis is taken a step further it will be seen that this year 49 per cent of Britain's exports of vehicles went to Commonwealth countries, 49 per cent of its machinery and 55 per cent of its exports of iron and steel manufactures. These proportions are a little below those of 1950 but for vehicles and machinery they are higher than in 1946 when the quantities were much smaller.

TABLE II.—BRITISH EXPORTS TO COMMONWEALTH COUNTRIES
(Expressed as percentages of Britain's Total Exports)

	1946	1947	1948	1949	1950	1951 6 mths.
	%	%	%	%	%	%
To Commonwealth	49·2	52·7	52·7	51·1	48·6	48·5
To Commonwealth, excluding Canada	45·7	48·9	48·3	46·7	42·8	42·9
Volume of exports to all countries :— 1947=100	91	100	127	140	162	167
Main Items of Manufactures :—	%	%	%	%	%	%
Pottery	55·5	61·0	61·9	61·6	61·4	59·4
Iron and steel mfrs.	40·4	41·1	45·8	49·4	57·5	55·1
Electrical goods	54·0	55·1	58·3	63·3	57·8	55·5
Machinery	50·7	46·9	49·5	48·2	48·5	48·6
Textiles	51·9	60·3	67·0	61·8	52·9	53·8
Vehicles	47·4	43·5	47·4	52·8	53·8	49·2

Note :—The Irish Republic is excluded from 1949 onwards.

The future, however, raises certain doubts. Britain's rearmament drive is certain to reduce the volume of iron and steel manufactures, machinery and vehicles, and the dollar markets will have to be given priority if the sterling area's gold and dollar reserves are not to be depleted more rapidly than at present. Yet it is precisely these types of goods that Commonwealth countries want in any case and will want all the more if development is to proceed. If these conflicting demands are to be met, the British Government will have little option but to introduce some form of priorities. Price could not be the arbiter, if Britain hopes to get the benefit of stabilised prices for raw materials.

This welter of problems confronting the Commonwealth Ministers suggests that no clear-cut decisions will emerge. To solve them would demand not a "meeting" but a year-long conference. The meeting cannot do more than enable countries to understand more clearly the difficulties lying ahead so that each can adjust its own policy accordingly. The Commonwealth is back to 1946; the need for developing existing and potential resources was as obvious then as it is obvious now. The same need exists as then to promote an energetic dollar export drive, and once again British industry is faced with the need for reconversion, this time towards defence. The parallels between the two periods are close. But on this occasion, perhaps, the mistake of giving Commonwealth development the lowest priority will not be repeated.

Iron Ore and Steel Prospects

THIS week's reports of an Anglo-German scrap agreement underline, if underlining is necessary, how much more directly than in recent years the level of British steel output now depends upon supplies of pig iron and therefore of iron ore. Scrap imports this year are likely to be less than a third of last year's 1,890,000 tons, and in 1952 they are not likely to reach 400,000 tons: even the successful scrap drive, assisted by more realistic prices, cannot prevent a decline in total supplies of steel-making scrap next year. In the last two months, fortunately, ore supplies have improved. Home iron ore output is high, and stocks are being built up to a level almost embarrassing, in sheer bulk, to some consumers. In both July and August arrivals of imported ore reached roughly 1,000,000 tons, and stocks have risen substantially; if about 900,000 tons a month can be brought in to the end of the year, the industry will obtain the 8,600,000 tons it planned for in 1951. The industry as a whole is now perhaps more confident, as the British Iron and Steel Federation always has been, that 16 million ingot tons of steel can be produced this year. Nevertheless, the industry is now, naturally, looking beyond 1951. For 1952, the raw material prospect, particularly for iron ore, is to say the least uncertain; it has already driven the Government to ask the United States for special steel supplies next year. And in 1953, the Steel Committee of the Economic Commission for Europe pointed out last month, Western Europe must expect a shortage of rich iron ore. On the postwar rate of scrap charged into steel furnaces, the Committee estimated this at 2,890,000 tons of "ferrous content," or some 7,000,000 tons of iron ore with 40 per cent Fe content. On the lower prewar rate of scrap charge—which with the growing scrap shortage may be all that Western European steel producers can achieve—the shortage is estimated at about 5,000,000 tons of ferrous content or about 12 million tons of ore.

Estimates of this kind need to be treated with some care: but it is worth noting that the raw material shortage in the Western European steel economy this year was foreseen four years ago by the OEEC steel committee—representing most of the same national experts as sit on the ECE committee. This year's shortage has not come about exactly as OEEC forecast; the trend of steel output was somewhat affected by the buyers' market of late 1949 and early 1950, and demand recovered only from July. Then the European coal shortage of last winter—of which the National Coal Board may be said to have pulled the trigger—advanced the impact of ore supply difficulties for certain countries and created a coke shortage throughout the continent. As the OEEC committee now sees the Western European steel output picture for this year, the participating countries will have capacity for some 62 million tons of steel production. They have planned a total output of about 58 million tons. There are steel making materials for some 55-56 million tons, given sufficient coke, but sufficient coke may not be available.

The deficiency of British ore imports last winter also arose—though by a different route—from the shortage of coal. The British coal production failure last winter made necessary coal imports that disorganised the freight market, besides boosting rates. The industry had contracted to purchase 9,300,000 tons of ore from overseas in 1951, but it soon became obvious that no more than 8,600,000 tons could in fact be shipped. On occasions since, even this figure has seemed unlikely to be achieved, but the industry is now more hopeful. This winter, at least, shipping is unlikely to be thrown into chaos by any last minute decision to import coal. There is some uncertainty whether the large tonnages expected for the next few months can be handled through the ports; and considerably more uncertainty whether inland transport will be able to carry them to the plants.

*

But the British difficulties concerning iron ore imports no longer involve merely a temporary lack of supplies: they are now impinging upon a real shortage of rich iron ore. Reserves of ore throughout the world are plentiful and in some parts of Europe, even developed fields and production facilities are idle. These countries used before the war to utilise their home ores—generally low-grade—to a greater extent than they do today. The change has come about partly through the high capital cost of blast furnaces, favouring the higher output from rich ores, partly because the emphasis on flat products in new steel finishing capacity tends to require better-grade steel. But it came about largely, in the first place, through shortage of Ruhr coke to smelt European ores that need more coke. In theory the next 18 months should bring in enough extra coke oven capacity to end the present coke shortage, but this may not be so certain in practice, and in any case the requisite coking coal does not seem certain to be there. The world's exportable surplus of iron ore this year will probably be lower than the world's total import needs. The vast expansion of American steel output is threatening to outgrow its ore supplies, and for the next two or three years at least the United States is certain to be competing for ore with Europe. Whether or not the depletion of American orefields like the Mesabi range is yet as complete as is argued—producers have to pay tax in Minnesota on declared ore reserves, and have therefore an interest in underestimating them—the vast ore projects of American steel companies outside the USA and the location of new plants on the eastern seaboard demonstrate its new reliance upon imported ore.

The ore shortage has been blamed as a consequence of a general postwar hesitation in developing raw material supplies to feed the manufacturing plant that the world has been installing apace. This may be true in part, but developments have been under way since 1947, when among other authorities BISC(ORE), the British steel industry's ore importing company, surveyed future ore prospects. It immediately began to send experts to all its ore suppliers to promote more efficient output and organised some prospecting. By 1949 BISC(ORE) had successfully negotiated with Newfoundland a long term contract that would have raised the export surplus of Wabana ore from 750,000 to 1,500,000 tons by 1952; though the Treasury then refused dollars for a £1,250,000 capital advance, the Newfoundland company found local finance and has since closed a long term contract with BISC(ORE) for a million tons a year. The company has for some years been urging development of the Tonkolili ore deposits in Sierra Leone: this project is behindhand, and cannot be expected to produce its full results—4,500,000 tons a year including output from the present Marampa deposits—before 1957. At Conakry in West Africa, in partnership with French interests, BISC(ORE) is developing a field of ore that has a high alumina content but will be relatively cheap. This should start production in 1953 and will eventually reach 3,000,000 tons a year, of which Britain should receive a large proportion. A new project being actively examined is in Mauretania in French West Africa; though this would need considerable rail and road construction—and much time—to develop, the present indications are of high grade ore. The British steel industry, moreover, is hoping for some benefit from the output from American ore developments. It has already purchased on the open market a test cargo of ore from Republic Steel's new orefield in Liberia, from which a third of output may be made generally available (for dollar exchange). Some marginal supplies might be had, too, from the new Labrador developments (ready in 1954-55, rising to 10 million tons a year). But the real significance of these new American developments and those beginning to mature in Venezuela and Chile will be that by 1954-55 the United States may be expected to cease buying ore from the European industry's normal ore suppliers, relinquishing the 3,000,000 tons a year it is at present purchasing. Certain important developments are being carried out by European ore producers, such as the reconstruction of Norway's Sydvaranger mine, and the conversion from opencast to underground ore extraction at Sweden's Kiruna mine in Lapland, possibly by 1953-54, that will increase exports by some 3,500,000 tons a year.

*

It is clear that ore expansion has not been ignored since a shortage was first foreseen, but ore development takes a long time. It is also clear that hardly any extra rich ore will be available in the export market before 1953-54; and that competition for it will not diminish but increase. Until the middle fifties America must be expected to stay in the market for about the same amount as it has been taking; Germany will be in the market for more. German steel producers are thinking in terms of 16 million tons of steel by 1953 (which incidentally would increase the ECE "deficit" calculation for that year by the raw materials needed for an extra 2,500,000 tons of steel); this increase in output may receive special support from the United States. Sweden is already setting the pattern for this autumn's ore bargaining. With a coal and coke shortage certain this winter, it is making ore contracts partly dependent on firm guarantees of fuel exports; and of the four countries that could offer it coal—Britain, Germany, Poland and the United States—each needs iron ore. Other countries are following suit, and the bilateral bargaining seems certain to be hard. Britain's inadequate coal output this winter may not affect ore shipping, but it may hamper the conclusion of adequate ore purchase contracts. As the ECE Committee sees it, no country in Europe is prepared to commit itself to a firm forecast of its pig iron output. More steel, it expects, will be made in Europe in 1952 than this year, and perhaps more in 1953 than in 1952. But which particular countries will make more—apart from Germany—is anybody's guess.

*

It is not surprising, therefore, that in the British steel industry today there is some cautious optimism about prospects for 1953-54, or certainly later—but considerable reserve about 1952. Solutions to the problem are easier to canvass than to apply. More home ore is already being produced: output is already up to about 15 million tons a year, of which 14.3 million tons will be consumed in 1951. Next year the home ore industry is being asked for 16 million tons, and, given a modest increase in labour, this should be achieved. But there are economic and physical limits to the feeding of more and more blast furnaces with home ore, if only in transport. Moreover, with home ore, averaging 30 per cent iron content against 55 per cent in imported ores, substitution of home ore will certainly keep furnaces working, but it will decrease their effective capacity. More blast furnaces—fortunately to a considerable extent sited and designed for home ore—will be coming in this winter and next year, and will promote a better balance in the industry as German scrap imports decline. But every ton of iron smelted from home ore needs 4 cwt. more coke than a ton from imported ore; and coke supplies might very possibly hold up pig-iron output. With the new capacity coming in next year, the industry could indeed use more than 10 million tons of imported ore in addition to the larger consumption of home ore. British pig iron capacity for 1952 will be 11 million tons a year, which at the expected scrap level would make possible the production of 16.5 million tons of steel, from a steel capacity that by the end of 1952 will probably reach over 17 million tons a year. But that would require abundant ore supplies. If in fact the industry obtains as much imported ore next year as it does this, it will probably have done well.

The only thing certain about ore supplies and steel output in 1952, therefore, is that they are going to be difficult, as Mr Gaitskell's negotiations in Washington have already advertised. If steel production is even to be maintained at the 1951 level, a pig iron output of at least 10.6 million tons will be necessary. This could be achieved with 9.75 million tons of imported ore and 15 million tons of home ore; since this imported ore figure would be 400,000 tons more than the industry could purchase for 1951 and 1,150,000 tons more than it is likely to ship, home ore output is being raised to provide a margin. But, as the British Iron and Steel Federation says in its current statistical bulletin, the outlook for raw materials is "somewhat obscure." It concludes:

> Whether the requisite tonnage can be bought and shipped to this country will depend largely upon factors outside the industry's control. Above all else, it will depend upon the provision of sufficient coal both to avoid the shipping shortage of last winter and to keep the country's traditional export markets adequately supplied.

If only because the coal and the shipping are not to be had this winter, the Federation's hope that coal imports will not interrupt its ore imports may be fulfilled. But if steel output depends to any considerable extent upon British coal exports, the outlook will be not obscure, but gloomy.

Business Notes

Markets and the Election

In many spheres of finance and business the four weeks before the election—and even the phase beyond that while the new Government settles itself into the saddle—will inevitably be a period of uncertainty. But in the stock markets Mr Attlee's announcement has been everywhere regarded as the ending of uncertainty; at all events, the markets are now firmly framing their judgments on the assumption that a Tory Government will be returned, with the corollary that statutory limitation of dividends, nebulous plans for new drives against capital and for further nationalisation can all be relegated to the limbo of loves Labour lost. These same assumptions—including the expectation of an autumn election—had indeed been widely held in the City for some weeks, which partly explains why the equity markets, though quiet, had firmly held their recovery to the level ruling on the eve of Mr Gaitskell's end-July speech. A week ago the *Financial Times* industrial share index stood at 133.2, compared with 132.9 on July 26th, while many of the shares that stood to suffer more from dividend limitation than those included in this index had also regained their losses. But for these anticipatory adjustments, the response of prices in the past few days would have been even more marked—but it has still been substantial.

The principal advances have, of course, occurred in those industrials and in the rubber, mining and oil groups upon which a dividend freeze would wreak exceptional injustice. The price rises in such cases have generally been appreciably larger than that indicated by the rise in the industrial index from 133.6 on Tuesday to 138.6 on Thursday. In estimating the scope for further advance, it is right to recall that the price-level had subsided considerably even before the dividend bombshell was launched; the peak reading of the index was 140.4, at mid-June. But it is still more important to realise that even the most courageous shift in economic policy—in the direction of a firm disinflationary drive to restrain the continuous rise in prices and costs, and perhaps in the easing of the disproportionate weight of taxation on business capital—could not rapidly give relief from the troubles that beset industry. Moreover, on many sectors of the economy, the impact of the necessary and salutary treatment would be painful. There are no short and easy roads through the dark entanglement of economic and financial difficulties that will confront the new Parliament.

Institutional investors in the gilt-edged market are perhaps more alive to such problems than investors whose interests lie elsewhere, for at least it is clear that a salutary prescription would include one brand of medicine of which the gilt-edged market has always stood in fear—a determined resort to monetary policy and a deliberate raising of money rates. In point of fact, there is room for dispute whether such a dose would disturb the gilt-edged market—or at least its long-term section—as much as is generally supposed. But this is a view that is not common in the stock exchange, and it certainly does not explain the behaviour of gilt-edged stocks since last Wednesday. The immediate effect of the election news was to arrest the sagging tendency that had become rather obtrusive since the end of last week despite (or perhaps because of) the big response to the Nigerian loan, and despite the cessation of the "tap" for 2½ per cent Funding 1956-61.

* * *

The Dalton Lever

The textile industries' reaction to Dr Dalton's week-end speeches has been much sharper than their response to similar sentiments expressed less provocatively by Mr Hervey Rhodes a few weeks ago. The common fear behind the sharp retorts that have been published by manufacturing, wholesaling and retailing organisations alike is that such statements from an important member of the government will prolong what the trade fervently hopes is only an exceptionally marked seasonal decline—but one that is beginning to look uncommonly like a slump—in the textile market. In particular it is feared that foreign buyers might mistake Dr Dalton's bull-roaring as the considered policy of the Government and will be guided accordingly. The clothing industry's principal trade union, now meeting in Blackpool, has felt it necessary to state publicly that the buyers' strike is "not the best method to adopt" to bring prices down; evidently the threat to textile employment is of greater concern to them than the attempt to lever prices down by week-end speeches.

Prices for wool and cotton goods are expected to come down next year, but the extent of the fall is much less than consumers are being led to expect. According to the Wholesale Textile Association, raw materials in general represent less than 2s. in every pound that goes across the counter, and costs are rising sharply in other directions. There have been wage increases in every section of the industry during the year, the biggest being in the cotton industry where raw material prices are now believed to have reached their lowest level, and where there is the possibility of a price recovery. A fall of between five and eight per cent in the price of cloth would be accepted in Lancashire as a reasonable adjustment. At the same time, changes made last April in the schedules for utility cotton cloth will have a profound effect on the prices of the utility clothing and piece goods that will be coming into the shops next spring. The effect of the changes has been to remove most of the restrictions on the type of cloth that may be sold as utility, and some of the price ceilings have been doubled in order to permit better quality cloths to be sold without tax. Since non-utility cotton cloth was almost unsaleable at home, and utility cloth unsaleable abroad, the new and flexible specifications should remove artificial distinctions between production for home and for export markets. The knowledge that goods intended for export can, if necessary, be sold at home without the prohibitive burden of purchase tax, will give some confidence to the cotton industry in what promises to be a difficult trading period.

The Board of Trade has announced that the new specifications for clothing made with this cloth have been completed and the distributors' margins will be worked out within the next few weeks. While the result will be a "wider range of better quality cotton dresses and blouses in utility" the prices may surprise some consumers. The top retail price of a cotton dress will be four guineas compared with the present ceiling of 27s.

* * *

No Confidence in Bradford

The wool industry is still working within price margins that were drawn up on the basis of the raw wool prices of last October. Present prices are now below those levels, but not low enough to allow big reduction in prices that consumers are being led to expect. The spectacular cuts that are being made now in the retail prices of carpets, blankets and knitting wool are special cases. In part they represent an attempt to move high priced stocks, but in each of them raw wool accounts for a high proportion of the final selling price, whereas in cloth and clothing processing costs account for the greater share. The retail prices of these particular goods rose earlier this year almost as sharply as they are now falling, and the big cuts in retail carpet prices usually apply to imported carpets only; the Board of Trade's new prices for home-produced carpets show a maximum reduction of only 15 per cent.

Unlike Lancashire, the wool industry sees no immediate prospect of greater stability in raw material prices. This lack of confidence has checked buying from the wool merchants to the retailers, and is now beginning to affect the industry's output of cloth. Until April, this had been maintained at the reasonably high level of between 37 and 38 million square yards a month but by July it was down to 34,500,000 square yards, the lowest figure since the "exceptionally low" level of deliveries a year earlier. Consumption of raw wool has fallen for eleven successive months and by July it was 25 per cent lower than in the previous summer. The country's wool stocks had fallen by the same month to 153 million pounds compared with more than 300 million pounds in the summer of 1949. This lack of buying has had its effect on employment in the combing and spinning sections of the industry. Although the weavers were still taking on more workers in the summer, the total level of employment in July was 5,000 lower than it was in January, when the figure reached 171,000.

* * *

Optimism from Mr Rank

Mr. J. Arthur Rank this week provided a fuller picture of the continued recovery of the Odeon group than the silhouette given a fortnight ago in its preliminary figures. Those figures were discussed in a note in *The Economist* of September 8th and the full report and accounts are examined in a Company Note on page 715. These confirm that considerable retrenchment in film production since the calamity of 1948-49 has been supplemented by fairly stable cinema attendances and some impressive economies in the group's two exhibiting circuits.

Cinema exhibition contributed £4,155,379 to the group's final trading profit of £5,125,230 for the year ended June 23, 1951, compared with £3,487,613 from exhibition and a trading profit of £3,293,426 in the previous year; and manufacturing profits rose from £432,954 to £974,365, the group's subsidiaries outside the film industry having been highly successful. On the other hand, losses on film productions, taking into account net distribution revenue, were still very large, though reduced: £1,182,099 for 1950-51 against £2,002,215 the year before. Mr. Rank, however, is confident that provisions for losses on film production in the current year will show "a very substantial reduction." Of the group's bank indebtedness of £9,213,746 (reduced by some £7,000,000 in the last two financial years), only £3,338,944 is now owing by companies concerned with film production and distribution. In the balance sheet, the stock value of film productions is put as £4,457,614; apart from the reductions in production of films since 1949, this also represents further writing down of films produced during that year. The basis of valuation of films is the estimated ultimate producers' net share of revenues, the aggregate being below cost: such valuation can only depend upon the shrewdest guesses available, and the directors are wise to stress "the impossibility of predicting future conditions" for so volatile a commodity.

Mr Rank describes the first and second "Eady plans" together "doing much to assist in solving the immediate production problems and placing the industry on a satisfactory basis"; he also welcomes this year's agreement as the first assistance since 1943 to film exhibitors, enhanced as it is by the promise to review the scale of Entertainment Duty. However, he emphasises that the three years of the present scheme will not be long enough: if Government assistance of this kind were then wholly withdrawn the industry's production problems would soon recur and any good work done would be undone very quickly. This comment is immediately followed by a declaration of Mr Rank's renewed faith in British film production, as essential to national interests and "to the film industry of the country." Mr Rank's sentiments are understandable: but outside observers of the film business may not place quite the same faith in an industry that never seems prepared to look forward to the point where it may be able to do without special financial assistance.

* * *

Railway Winter

An uninviting list of prospective winter shortages set out in "Bulletin for Industry" published by the Treasury gives particular prominence to the likelihood of trouble on the railways. This threat has been obvious since midsummer; the Railway Executive has assured the representatives of the Chambers of Commerce and of the Federation of British Industries that an intensive examination of "all possible measures" to assist railway operation during the autumn and winter has been carried out. Apart from these measures—which presumably have been particularly concerned with improvement of traffic arrangements at key junctions and marshalling centres—the Executive has curtailed the summer passenger services a fortnight earlier than was intended, and has made no secret of the fact that further curtailments will have to be made according to the severity of the pressure on the various systems. Already it is clear that the London Midland region will be under the heaviest strain, but other centres in the Midlands and the North will not be in much better shape.

The Railway Executive claims that its physical equipment for handling the winter traffic is better than at any time since the war; its difficulties are attributed to shortage of locomotive crews and other key operating staff. Its primary object will be to ensure, as far as it can, that no pit is brought to a standstill for want of transport to clear its output. Coal, iron ore and other heavy mineral traffic now require immediate movement, whereas in times of severe winter strain on the railways before the war it was possible temporarily to suspend their movement. Even given the most efficient movement of these heavy traffics by block trains, and the greatest diversion of heavy traffic to road and coastwise transport, the risks of serious delays and partial breakdown under severe weather conditions and a heavy sick list are only too obvious. The railway passenger must expect to be at the bottom of the queue for winter transport; but the consignor of merchandise of anything less than top priority is also likely to suffer even if the weather is kind, and even if the railways tackle their winter burden with the greatest energy and efficiency.

* * *

Ratting on Gatt?

The sixth session of the contracting parties of Gatt opened at Geneva last Monday and is expected to last for at least six weeks. There will be no tariff negotiations at this meeting; most countries have not had time for their appetite for these to revive in the short period since Torquay. The session will deal with four types of business. First, it will discuss items arising out of the operation of the General Agreement; under this heading the basic issue of discrimination in the application of import restrictions will once again hold pride of place. Secondly, members will discuss items arising out of the recent actions of member governments. The most important issue here is the commercial rupture and "termination of obligations" between the United States and Czechoslovakia. Thirdly, the administration of the agreement itself will come up for review; a proposal to establish a standing committee that could deal with certain business between the regular full sessions, and a proposal to maintain a permanent secretariat, will be debated and probably decided on. Fourthly, there will be a general discussion on tariffs and tariff negotiations—and especially on the disparity of European tariffs, a problem raised with some vehemence by the low-tariff Benelux and Scandinavian countries in the course of the Torquay conference.

The controversy about discriminatory import restrictions may again be the focal point of the session. Gatt has now received replies to the questionnaire that it sent out to each contracting party asking for information on import restrictions applied for balance of payments reasons. This information will form the basis of a report. There is certain to be considerable debate on whether this report should be a purely factual document or whether it should lead to further "consultations" with the International Monetary Fund. If the IMF should be called in—and if it put Britain in the pillory as it did at Torquay—this might have an unfortunate effect on Britain's already cool attitude towards the whole Gatt organisation. In his speech at Geneva this week, Sir Hartley Shawcross somewhat petulantly remarked that Britain was not finally committed to acceptance of the General Agreement; he announced flatly that Britain does not at present intend to grant most-favoured nation rights to Japan, and he suggested that the setting up of a standing committee of Gatt would be a waste of experts' time and taxpayers' money.

* * *

Redundancy in Steel

Sir John Green, deputy-chairman of the Iron and Steel Corporation, is at the head of a small committee the corporation has set up to handle the question of closing steelworks made redundant by new capacity completed under the industry's maturing development plan. This inevitable process was, of course, taken into account when the plan was framed: and so were the human consequences, evidenced this week by the requests to the Minister of Supply to postpone the demolition of smelting furnaces at the Blochairn works of the Steel Company of Scotland. Though demolition at the works does not in fact appear actually to have begun, the representations by a number of the work's employees and by local authorities were to be expected: mobility of labour is too infrequently experienced in the British economy today for its enforcement to be welcome. The change, according to Sir John Craig of Colvilles, the parent company, will affect less than 5 per cent of the 1,700 men in the group. The decision to close the cogging mill at Blochairn follows logically upon the progress of plans to transfer production to Motherwell and Clydebridge though Sir John noted that it had yet to be approved by the Iron and Steel Corporation; and plans of "a special nature" are also being submitted in connection with a works at Newton in Lanark.

Sir John Green's committee is hardly likely to be able to ease or postpone such decisions to any great extent; it would be wrong if it did. This year's shortage of raw materials has rather hastened the closings, since in a year of abundant raw materials and rearmament demand the industry might have prolonged the working of old plant to achieve record output. But capacity is likely to be the least short factor in steel production next year, and the claims on raw materials of the half-dozen or so small steelworks that have been closed so far weigh little in the industry's central councils beside the massive demands of Margam. The committee will have a rather different question to consider when it turns to the handmills of South Wales. The packmills have this year turned out a considerable tonnage of tinplate, which is still short; and it has been expected that they would be kept in operation for a time after the opening of the new tinplate mill at Trostre to augment total output. But Margam is already beginning to drain some labour from the handmills; and more will be needed for Trostre, which is due to come into commission by the end of this year. How many of the handmills can be expected to continue may well be a matter upon which decisions can only be taken on the spot: it seems likely that even those closed down will be kept in being pending a decision whether to increase tinplate capacity in South Wales still further.

Persia's Bank Robbery

Britain's decision to stop the export of scarce goods to Persia has been put into speedy effect by the diversion of cargoes already on the high seas; the Foreign Office has requisitioned 3,000 tons of railway track equipment and 2,000 tons of sugar now *en route* to Persia, and has accepted responsibility for reimbursement of any money already paid out by the Persian consignees. In retaliation for these steps, the Persians are now venting their spleen on the British Bank of Iran and the Middle East. The bank is apparently to be prohibited from carrying out foreign exchange business in Persia and the Ministry of Finance is reported to have also ordered all official and quasi-official Persian bodies to withdraw their accounts from it. Some of Dr Mossadegh's supporters are trying to persuade private Persian citizens to withdraw their accounts also; it remains to be seen whether this campaign will succeed—the moneyed classes, including some Government politicians, have learned to value the bank's inviolable adherence to the banking tradition of keeping accounts secret.

Four years ago the decision to prohibit its foreign exchange business in Persia might have been a very serious blow for the British Bank of Iran. Since 1947, however, it has been extending its business in Syria, the Lebanon, Iraq and other Middle Eastern countries, while contracting that in Persia. The wisdom of this decision was amply shown in March, 1949, when the Persian Government introduced a decree ordering the bank to lodge 55 per cent of its deposits at the Bank Melli Iran without interest and to submit to most onerous restrictions on its foreign exchange business and internal lending operations. Since that date the bank has made no profit at all in Iran (although last year it made £108,089 outside it). A dwindling number of branches have been kept open in Iran to show the flag and wait for better days. Just before General Razmara's murder, negotiations were in progress to lower the obligatory rate of deposit with the Bank Melli Iran—and the bank managed to withdraw about £1,000,000 of semi-blocked funds. Dr Mossadegh's essay into the field of bank robbery will thwart these hopes of improvement, but it is the Persian economy rather than the bank that will suffer most positive and immediate harm.

* * *

Russian Grain Again

Despite the Battle Bill, now passed by both houses in Congress, Britain has gone ahead and signed another grain contract with the Soviet Union. This time it is for a million tons of grain compared with 800,000 tons a year ago; the larger quantity is indicative of the excellent harvest that Russia has had this year. Britain will receive 300,000 tons of maize, 425,000 tons of barley and 75,000 tons of oats—all these quantities are the same as last year—and in addition 200,000 tons of wheat said to be of millable quality. Since Britain is getting no more feed grains from Russia than it did in 1950-51, total imports during the current crop year will be maintained at last year's level only if quite substantial quantities are again purchased from the United States. But dollars are again becoming scarce so that the prospect is rather of a smaller supply of fodder grains unless bumper harvests in Argentina and Australia come to the rescue.

The inclusion of a relatively large quantity of wheat in the contract is a new feature, though before the war Britain bought sporadically from Russia and in considerable volume from the Danube basin. The 200,000 tons is presumably to help make up for the smaller British harvest, which this year will barely total 2,200,000 tons compared with 2,600,000 tons in 1950. It might also be a useful bargaining counter in trying to get "agreement wheat" this season below the maximum of $1.80 a bushel set by the international agreement, for Canada is reported to have a bumper crop. The announcement about the contract gives no indication of

Spotlight on Australia

In the business world today attention has been focussed on the remarkable industrial development in Australia. The Union Bank of Australia has therefore published two Booklets: "*Industrial Australia*" containing authoritative information on industrial resources, markets, labour and finance, "*Company Formation in Australia*" providing a general guide to Company Law with notes on current taxation and the establishment of a business in the Commonwealth. Anyone contemplating business in Australia, will find in these Booklets the preliminary information they require. Copies of these Booklets will be sent on request.

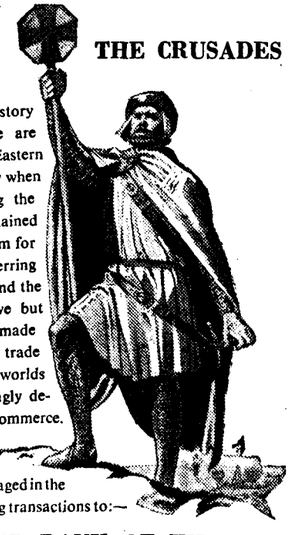
Finance for the Private Company



Rising costs of plant, stocks, and work in progress have combined with taxation to set new problems for the Private Company in raising additional capital or long-term funds. To assist sound enterprises in solving such problems within the limits of today's priorities is one of the functions of I.C.F.C.

I.C.F.C. operates on commercial principles and offers despatch, economy and flexibility in method.

Full particulars of the facilities offered may be obtained from

The General Manager, 7, Drapers' Gardens, London, E.C.2.

IT BEGAN WITH THE CRUSADES

We take some pride in our long history but the business in which we are engaged is older than we are. Eastern banking began in the 12th century when the Knights Templar, protecting the lines of communication which sustained the Crusades, devised a mechanism for exchanging currencies and transferring goods between Western Europe and the Asian Continent. This primitive but highly efficient banking service made possible a rapid expansion of the trade between the Eastern and Western worlds—a traffic which has been fittingly described as the foundation of all commerce. Nowadays travellers along the Asian trade routes and merchants and manufacturers engaged in the Eastern trade entrust their banking transactions to:—

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA
(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2.
West End (London) Branch: 28 Charles II Street, London, S.W.1.
Manchester Branch: 52 Mosley Street, Manchester, 2.
Liverpool Branch: 27 Derby House, Liverpool, 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank, under British management directed from London, are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

prices. The practice hitherto has been to base prices on the equivalent Chicago quotations and presumably this procedure will again be followed.

As with the recent timber contract, Russia has inserted a clause giving it the right to withhold shipments if it is unable to buy rubber. No specific quantity of rubber is mentioned, but this reversion to quasi-barter transactions might well have repercussions in the United States which are discussed in a note on page 673. The timber contract still stands at 128,000 standards; the Russians have the option to ship an additional 64,000 standards, but so far they have given no indication that they will avail themselves of it. Shortage of cargo space is delaying the shipment of the basic quantity.

* * *

"Air Coach" Experiments

A sub-committee of the International Air Transport Association has remained behind in London after the close of the annual general meeting to work out details of a six-month "controlled experiment" with tourist class fares on the North Atlantic and London-Johannesburg routes. These details must be approved by the governments of each of the IATA members involved but unless there are unexpected changes of policy the scheme seems likely to go through for trial.

The meeting is expected to define "coach" travel. It will have to draw up standards of seating density for each type of aircraft now used on these services and will specify the minimum number of seats that must be installed in a machine making a flight at coach rates. The fares are expected to be 36 per cent less than those of the normal flights. Each operator will be allowed a maximum of four coach flights a week for the six months of the experiment. The committee may also try to define the services to be offered—whether the passenger pays for his food, whether the food is served in the air or on the ground during refuelling stops, and similar details. This controlled experiment may start next spring, and when it ends the records of the participating airlines will be carefully examined and the dual tariff will come up again for review by IATA in the light of the results. If the system is then approved for general operation on any routes, there will be no limitation on the number of "coach" flights.

The success of reducing fares by such a big margin involves the spreading of operating costs over a greater number of tickets per flight. Until the seating density per aircraft has been decided it will not be possible to calculate exactly how many extra seats will have to be sold for the flights to break even. It is possible that at the end of the six months, some operators will be less keen on the dual tariff than they claimed to be at the start—its working is bound to be a challenge to the administrative efficiency of the individual airlines. The biggest unknown is the passenger's possible reaction to a choice of services. The ultimate distinction will, however, always be that of speed of travel, a distinction that will become more marked with the introduction of jet airliners.

Britain Repays EPU Gold

Britain's net deficit with the European Payments Union in August was £67,260,000, or $188.3 million, the biggest monthly deficit incurred since EPU began on July 1, 1950. To meet this deficit the United Kingdom paid back to EPU $19.6 million in gold. This completed the repayment of the gold previously acquired from EPU, which at its peak, at the end of April last, had amounted to over $119 million. The rest of Britain's net deficit with EPU went to reduce the credit balance previously accumulated with the Union, bringing it down to $62.9 million. At the rate at which payments have been running with other EPU countries, that credit balance will more than probably have been exhausted by the end of this month, and the next EPU settlement may show the United Kingdom ranking among the debtors.

The largest net surplus accumulated by any member in August was the $63 million that accrued to Belgium-Luxemburg; half of this was taken in gold. In order to correct its chronic creditor position with other EPU countries, the Belgian Government has announced some new and interesting discriminatory steps this week. The most important of these is to block 5 per cent of the proceeds of Belgian exports to EPU countries for a period of at least six months. The money that is thus blocked will be retained by the collecting bank and paid over to a special account in the National Bank of Belgium; the resulting balances will be non-transferable and will not be available as security against credits. The main objective of these measures is to divert Belgian exports away from EPU countries towards the dollar area; whether the 5 per cent margin will be sufficient to pull Belgian export trade from its traditional channels is a moot point.

The recovery in the German balance of payments continues to make good headway. In August, Germany showed a further net surplus of $51.1 million; it took $10.6 million in gold and had the balance deducted from its overdraft with EPU, which has thus been reduced to $140.7 million. Another welcome item of news emerging from the latest settlement is that the Netherlands secured a surplus for the first time as a member of EPU; unfortunately, however, this surplus—which amounted to the sizeable figure of $25.7 million—has been officially stated to be the product of some exceptional receipts. Portugal, the colleague of Belgium as a persistent creditor, secured a surplus of $3,200,000, of which 50 per cent was taken in gold.

* * *

Boilers for BEA

In an average cold spell this winter, according to cold-blooded official estimates issued this week, electric generating capacity, after allowing for frequency and voltage reductions, will be about 1,200,000-1,300,000 kilowatts short of national demand at peak hours. Widespread realisation of this fact, and the load-shedding it threatens, has intensified industrial interest in expedients for extra power production, both privately, in factories and by the British Electricity Authority. One suggestion that has just been revived—encouraged, or at least provoked, by Lord Citrine—is that British boiler exports should be curtailed. Boiler installation, the BEA has frequently reported, has been perhaps the most difficult to hasten of any of the electrical equipment supply industries. By value, some 40 per cent of British boilers are being exported. The conclusion seems simple: cannot sufficient boilers, or the productiive capacity to make them, be diverted to easing BEA's most serious bottleneck?

As might be expected, the watertube boiler manufacturers argue that the conclusion is too simple; and they are not without support among electricity supply experts. Of the programme of 57 major boiler installations for BEA this year, fewer than half have been completed; but a substantial proportion of the remainder are nearing completion, and the manufacturers think that the programme will be largely fulfilled in time. The boiler installations—which involve not the supply of a completed piece of equipment but the erection on site of a massive industrial structure several storeys high—are now probably not to any considerable degree out of phase with the installation of other major equipment. The manufacturers, of course, have always denied that lack of boilermaking capacity has occasioned any considerable delays in the power station programme: and when the new boiler-making plant of John Brown Ltd. comes into production, they feel their industry should be

well able to handle home and export orders. At the present moment, as has happened before, materials and not capacity provide the limiting factor. A certain proportion of the industry's exports are boilers for generating plant similar to those delivered to BEA; the curtailment of boiler exports would bring about a similar cut in exports of generating and ancillary equipment. Since most of the equipment in question goes to Dominion power industries that might otherwise turn to American manufacturers, the consequences in dollars might be considerable. The additional capacity grafted on to the watertube boiler industry is due to come into commission in the mid-fifties. In view of the time lag involved in turning over plant making other boilers for export to boiler production for BEA, the case for diversion seems rather doubtful. What is perhaps more important is that BEA should be in a position to place orders booking the industry's capacity as it becomes available in the next few years.

Powell Duffryn Expansion

Within four years of the nationalisation of its mining assets, Powell Duffryn, Ltd., has reorganised its investments in a way that holds out the prospect of full employment for the company's considerable capital. The new chairman, Sir Herbert Merrett, in the company's latest report, makes it quite clear that no repayment of capital is now contemplated. Powell Duffryn has so far drawn £10 million of compensation stock, and this has been reinvested partly in new ventures and in short-dated securities.

The most important of the new investments is in the Wankie colliery in Southern Rhodesia. Powell Duffryn is now the largest shareholder in Wankie, and the deputy chairman, Mr Foot, is chairman of the colliery. Wankie is managed by Powell Duffryn Technical Services, and has a ready market in the Rhodesian copper industry, which can be expanded as soon as transport is improved. Reorganisation and re-equipment is expected to make Wankie a profitable investment within the next two years, and a big expansion of the colliery should be in prospect.

The company also has a half interest in the new Vacuum Oil refinery being built at Coryton. The role of this refinery was described in *The Economist* of September 15th. Powell Duffryn, whose main contribution has been the valuable Coryton site, has invested £5,000,000 in Vacuum Oil to date and is prepared to put up another £1,750,000 towards the catalytic cracker and other plant that was not included in the original scheme. Socony-Vacuum, the other partner in Vacuum Oil, and contributor of the technical expertise, is also willing to provide an equal additional amount. As building progresses, further capital will be provided by the Finance Corporation for Industry, and the refinery is expected to come on stream in 1953.

A third line of expansion is the production of a construc-

tional carbon known as "delanium." The material has most of the properties of graphite; it is impervious to chemicals and has a low rate of neutron absorption, coupled with a considerable mechanical strength. Such a combination of properties gives the material a wide range of uses in engineering generally, but particularly in chemical and nuclear engineering. This material is now being produced at Hayes, and will soon be in production in the United States. The development of "delanium" has been difficult and accounts for a good proportion of the development losses referred to by the chairman. These losses have, however, "reached peak level during the year and are now declining."

* * *

Bank Advances and Prices

The latest quarterly analysis of bank advances by categories of borrowers reveals very clearly that the strain upon industry's working capital is mounting fast. In the three months to mid-August, aggregate advances in Great Britain rose by £69.6 million, which is an appreciably smaller movement than occurred in either of the two preceding quarters of peak seasonal demands; but in the corresponding quarter last year there was a decline of £23.9 million. Not all of this marked divergence from last year's experience is attributable to the needs of private trade and industry. In particular, the publicly-owned utilities were in both periods making repayments of bank loans from the proceeds of capital issues; but last year's net repayments by the utilities group amounted to no less than £43 million, whereas in this latest quarter only £7,500,000 was repaid on balance. If allowance is made for this factor, it will be seen that the net requirements of all other borrowers expanded in the three months to August, 1951, by almost four times their growth in the similar period of 1950.

Among the industrial groups, the biggest additional demand during the quarter came from the engineering industries, advances to which rose by fully £11 million to £112 million, compared with £92½ million in August, 1950—a movement that affords the first unmistakable sign that armament work has reached the point at which it adds substantially to the stress on liquid resources. The same influence doubtless underlies the increased demands from certain other groups, but the classifications are too broad to justify any such deduction from the figures themselves—especially in view of the fact that most groups must also have been strongly influenced by the rise in prices. But it is noteworthy that advances to the residual industrial category (labelled "unclassifiable") rose steeply, by £17 million to £130 million, and that an additional £8,500,000 was absorbed by the financial category that includes loans to the two finance corporations. Among the groups that might perhaps have been expected to experience some relief through the relapse in commodity prices, only the non-ferrous group has reduced

B.Sc. ECON. & B.COM.
LONDON UNIVERSITY

- Men and women seeking a suitable qualification for executive appointments in commerce or industry, or higher government or municipal posts, should consider taking one of these London University Degrees, which are obtainable *without residence*. Study for either Degree covers a course of wide and interesting reading.
- U.C.C. prepares students by postal lessons for the required examinations. The College, founded 1887, is an Educational Trust, and has a staff of highly qualified specialist Tutors. Fees are moderate, and may be paid by instalments.

Proud Inheritance

So well remembered . . . by A.E.C.

BATTLE OF THE SOMME, 1916

The grey months of the wartime winter of 1915-16 seemed never-ending. Out in the trenches the rain hardly ever stopped; the whole war seemed bogged-down in a sea of mud. In England, too, it was a winter of discontent. Then with the first snowdrops in the London parks came the rumours of a new offensive; and by the time the Summer sunlight was gleaming on the cheerful red buses, the news arrived of victory on the Somme.

The sterling service that the A.E.C. 'B' type buses were still providing in the London streets was hardly less important than the great performance of the A.E.C. Army vehicles at the Front. Forty per cent of the entire supply of W.D. 3-4 ton lorries bore the famous initials on their bonnets, a sign which Englishmen everywhere grew to trust and respect—and which after the final victory of 1918 grew steadily in public esteem until it became the great symbol of service to the public that it is today.

A. E. C.

PIONEERS IN THE WORLD OF MOTOR TRANSPORT

A.E.C. Limited, Southall, Middlesex is a member of the Group of Companies controlled by Associated Commercial Vehicles Ltd., of which the selling organisation is

A.C.V. SALES LTD., 49 BERKELEY SQUARE, LONDON, W.1.

its dependence on the banks—by £3,000,000. The three textile groups, which in the preceding quarter had shown slight signs of such relief, have each increased their borrowings—the cotton group by £4,700,000, wool by £1,000,000, and other textiles by more than £9,000,000. In the similar period of 1950 the three groups together absorbed only an additional £5,000,000. Advances to the iron and steel industries declined—but by appreciably less than they declined last year.

The curve of demand from agriculture, retail trade and the food, drink and tobacco group is also rising. Agriculture during these summer months absorbed an additional £17.7 million, in contrast with £11.5 million last year. Retail trade absorbed an additional £2,800,000, whereas last year it repaid over £10 million. The food and tobacco group repaid £8,600,000—little more than half the sum it repaid in the same months last year. The one major group in which the curve shows clear signs of flattening is the big personal and professional category, which rose during the quarter by a mere £4,700,000 ; at a total of £438 million, its proportion of the banks' aggregate lendings now stands at no more than 22.3 per cent, compared with 25.1 per cent twelve months previously and 28.2 per cent when these analyses were first published after the war.

* * *

Cotton Prices Raised

Prices of American cotton in Manchester were raised this week for the first time for five months, when the standard price of American growths for delivery in January-June, 1952, was increased by 1d. to 36d. on a lb. Brazilian, African, Indian and Peruvian cottons were also raised by a 1d. a lb, while Egyptian cotton was increased by 3d., bringing standard Karnak to 68d. a lb ; ten days ago this price was raised by 6d. a lb. The reason for these changes is the firmer tone on both the New York and Alexandrian markets, particularly for future cotton. During the summer months it seemed that the Raw Cotton Commission had renounced its policy of keeping its selling prices in line with those ruling in the world market. Then prices were falling and the commission was late in making its adjustments, although the new cover schemes for spinners and weavers and the selling procedures were designed to give the RCC greater flexibility in adjusting its prices. But it is of little help to Lancashire if adjustment is swift only when prices are rising.

* Preliminary and partially estimated. *Source* : International Cotton Advisory Committee.

The world cotton crop this year has shown a marked increase thanks to the much larger American crop. The total is provisionally put at 36 million bales against 27½ million bales last year. But, as the carry-over stock is some 5,700,000 bales smaller, total supply will only increase from 44.1 to 46.9 million bales. If world consumption during the present season maintains last year's high level (33.2 million bales) carry-over stocks next August will show a modest increase of 2,800,000 bales, making a total of 13.7 million bales, which is by no means large, as part of it will be earmarked for government purposes.

At least there should be adequate American cotton for Lancashire in 1952 unless the prospective dollar crisis forces the Treasury to restrict dollar purchases. In the past, cotton has always been high on the list of dollar goods that are not absolutely essential, according to the Treasury's way of thinking. But, despite Dr Dalton's forecasts, there is little prospect of any drastic fall in prices unless world consumption of cotton declines.

* * *

Distillers' Activities

It was not easy to gather from Distillers' accounts (reviewed in Company Notes in *The Economist* of July 28th and August 25th) the extent to which each of the group's manifold commercial activities contributed to its remarkable increase in profits—from £12,837,691 to £17,934,520. At the annual meeting last week, Mr Henry J. Ross contributed an interesting descriptive survey of these widespread activities. It cannot be said, however, that he indicated very clearly the balance of effort or earnings between the group's older interests in the distilling of potable spirit and the complex, expanding pattern of organic chemical industry that it has been developing more recently.

Mr Ross reported that all sections of the company had contributed to the substantial increase in group trading profits. The Scotch whisky blending companies had the benefit of adjusted prices in the United States and elsewhere following the devaluation of sterling: but import restrictions by various countries had increased the difficulties of export, while what Mr Ross described as an "iniquitous rate of tax" encouraged higher duties abroad as well as threatening the gradual extinction of whisky drinking in the United Kingdom. This effect, however, seems likely to be delayed ; during the past year the industry was in the event permitted to release 46 per cent more for the home market than the Government had originally allowed. Gin and yeast production was also profitable.

Mr Ross did point out that

> The increased outputs obtained from the extensions and improvements brought about by the expansion programme have played a very important part in obtaining these good results.

This expansion programme, of course, is largely in the field of chemicals and plastics. The company is associated with Anglo-Iranian and with Monsanto in the development of petroleum chemicals and a styrene plant ; its production of yeast and of polyvinyl chloride is being increased ; and its subsidiaries producing solvents and biochemicals had a successful year. During the period the group became complete owners of the Magnesium Elektron Ltd. by purchasing the remaining shares from Imperial Chemicals Ltd.; the current year has already seen the reopening of magnesium production at its Clifton Junction plant to provide this vital metal for the rearmament programme. On the current year's activities in general, Mr Ross was able to tell shareholders that profits to date are running at a rate in excess of those in the year to March 31, 1951.

Freight Market Changes

A big drop is recorded in the Chamber of Shipping's index of tramp freights for August, which stands at 149.3. This is the lowest figure so far this year ; it compares with about 179 for the two previous months and a peak of 203.8 in May. It would be a mistake, however, to assume that a marked recession in freight rates has occurred, since the index is confined to fixtures in sterling only, and a feature of recent weeks has been the activity in North Pacific and American Atlantic markets. This has been due to the large volume of grain and coal for shipment, particularly to continental destinations.

Vessels were being fixed with coal from Hampton Roads to Antwerp and Rotterdam at $12.50 per ton and over when the US National Shipping Authority decided to establish a maximum of $10.50 for ECA coal cargoes. Owners resisted until so many vessels remained unfixed that voyages began to be undertaken at NSA rates. Shipowners, however, feel that they are in a strong position to resist accepting freights some $2 below market values, and charterers, taking a similar view, have been exploring means of compensating shipowners in other ways, such as improving the other conditions of the charter The NSA naturally dislikes this ; although it has the power to release further vessels from the American laid-up reserve fleet, it is doubtful if sufficient could be made ready in time to cope with current export demands. It seems likely, therefore, that it may have to raise its rates, even if the British Government decides to see the winter through without imports of American coal.

Meanwhile, there is a continuing strong demand for tonnage on charter to the liner companies, and for arrears of exports from the United Kingdom, and high rates continue to be paid. A view of the prospects for the future can be seen from the interest of characters in fixing vessels for long-period time charters at current high rates. While homeward trading from the Mediterranean, the East, Australia and the Plate, has been dull, the attraction of tonnage to North American waters is likely to make itself felt in these trades before long. This is already noticeable in the Mediterranean, where the lack of outward coal cargoes has reduced the amount of handy tonnage in the area.

* * *

Valuing Imports

The recent work of the European Customs Union Study Group to evolve a standard customs procedure to be adopted, eventually, by all countries, has much to recommend it. The group has decided in favour of an *ad valorem* method of taxing imports ; it has obtained agreement on regulations for weights, tares and packaging and it has drawn up conventions embodying uniform customs descriptions and a uniform definition of customs value. The success of the study group is of some credit to this country, for much of what has been agreed conforms closely to present British law and practice. If a standard procedure is adopted, the work of exporters will be considerably reduced, for at present they must know intimately the numerous variations in procedure, definitions and basis of valuations that exist from country to country.

But British exporters at any rate are not a little worried about the proposed basis of valuation. The study group is composed of customs officials who have naturally approached their task from the standpoint of collecting revenue. They agreed that the normal commercial price of a good is the true basis of import valuation, but since a customs definition is law, it must be precise and simple to administer. For this reason, they have decided to adopt the British and European method of valuing imports on their cost including insurance and freight. But many of the countries which are important British export markets, such as the Dominions and the United States, accept imports for customs on their free on board value. If such countries adopt the new suggestion of a common c.i.f. value, British exporters will find that they will have to negotiate a higher tariff hurdle. It has been suggested that countries that make the change from f.o.b. to c.i.f. should make some reduction in *ad valorem* duties by way of compensation. In that case, those exporters situated nearer the market would have an advantage over those situated farther away.

The study group was originally concerned with drawing up a uniform procedure as the first step towards a European customs union and all European countries value imports on a c.i.f. basis. But after agreement was reached, it was decided to put the convention into operation straight away and to allow any other countries in the world to join it. Clearly this second step raises the question whether a method of valuation that is properly applicable to Europe, where transport costs do not form a large item of total cost, can or should be extended throughout the world. If a world wide convention is sought, would it not be preferable for European countries to change from c.i.f. to f.o.b.?

Shorter Notes

The directors of Imperial Tobacco are seeking powers to increase their present borrowing powers by £54½ million to £137 million. They point out that working capital requirements have risen greatly owing to increased costs, and that although "in normal circumstances" additional capital would be raised by preference or ordinary shares, "the incidence of current taxation on companies' profits makes this method of financing . . . too costly."

*

Following discussions held by the International Air Transport Association on traffic control methods when jet airliners come into service, representatives from the Commonwealth are meeting in London next week to pursue these questions in detail. The Comet jet airliner is due to start regular flights on the first stages of the Empire route early next year, and will eventually be used for the full distance of the London-Australia trip. To land these aircraft with the minimum of delay—for they cannot be kept circling, owing to their heavy fuel consumption—will entail considerable improvement in methods of traffic control at the busier airports.

*

No news has come from Washington about the proposed allocation of copper for the fourth quarter of this year and unless agreement is reached soon, the introduction of the scheme may have to be postponed until 1952. Chile is reported to be asking for a higher price than the other countries are willing to concede. Much of its revenue is obtained from an export tax on copper which is related to the official New York price.

*

The wool market has been steadier this week. The first London sales of the season opened on Tuesday and prices were on par with current Australian levels but 20 per cent above those ruling in New Zealand. London, however, is not a good guide because of the unrepresentative types of wool offered. In Australia the market has also been steadier and prices have fallen only slightly. Cotton prices which a fortnight ago had reached their pre-Korean level have started to rise once more during the past ten days.

*

The announcement that a pilotless squadron of ground-controlled aircraft had been formed in the United States is unlikely to mean that a technical revolution is about to take place in the aircraft industry. Guided and ground-controlled missiles of all kinds make exceptionally heavy demands on electronic components, and usually for those least adapted to mass production.

Company Notes

Odeon Theatres.—Mr J. Arthur Rank characterises the financial year of Odeon Theatres to June 23rd last as "one of steady and . . . heartening progress." The full accounts certainly indicate a considerable measure of recovery from "the unfortunate reverse of 1948-49." Group trading profits are up from £3,293,426 to £5,125,230, and a net profit of £138,227 replaces a net loss of £1,095,626. This improvement is due to greater earnings from the exhibiting and manufacturing companies and a reduction in the amounts that have to be provided for film production losses. After taking into account distribution revenue the amounts thus provided are £1,300,000 in respect of the Odeon and GCF group and £135,000 in respect of the Gaumont-British and Gainsborough group as compared with £1,750,000 and £575,000 respectively in 1949-50. The differences in these provisions account for about half the improvement in trading results. The group's gross operating profits have increased from £5,298,641 to £6,307,329 while gross losses on film production and distribution, which are deducted before striking the balance of trading profits, are down from £2,005,215 to £1,182,099.

The group's gross profits earned by the exhibition of films in the British Isles rose in the year from £3,487,613 to £4,155,379, but gross earnings from exhibition overseas fell from £619,741 to £562,081. Speaking of the exhibition side of the business, on which profits and the future fortunes of the group largely depend, Mr Rank points out that while the public paid £27,918,192 in admission prices to the group's 554 theatres, no less than £10,527,761 was claimed off in entertainment tax; this is equivalent to 37.71 per cent of total takings. The adjustment of prices of admission in August last will mean that if attendances remain constant in corresponding price groups an additional sum of £11,800,000 will be paid by the public. The Treasury will retain £6,300,000 of this sum, the producers under the "Eady plan" £1,900,000 and the exhibitors £3,600,000. There is also the promise that the Treasury will confer with the industry and "review the whole basis upon which this tax is levied in an endeavour to work out a more equitable formula."

	Years Ended June 24, 1950	Years Ended June 23, 1951

Bank loans	12,950,036	9,213,746
Reserves	713,453	991,053
Ordinary capital	946,991	946,911

(*a*) After providing for film production contingencies (1951: £87,213; 1950: £250,000). (*b*) After deducting contingencies provision (1951: £337,213; 1950: £250,000).

Further evidence of recovery from near disaster is to be found in the balance sheet. The major economies have been concentrated on the curtailment of film production, and they have led to a further substantial reduction in bank loans from £12,950,036 to £9,213,746. Of the existing loans, only £3,338,944 is now owing by the film production and distributing companies; the rest is lent to the manufacturing and theatre-owning companies. The value of film productions is shown, before providing for contingencies, at £4,457,614, against £7,300,237. The basis for valuation is an estimate of the ultimate net producers' share of revenue from each film, estimated surpluses on successful films being offset against estimated losses on unsuccessful ones; the aggregate value is stated to be below cost. The directors consider that the valuation is "reasonable, and should be realised in the ordinary course of business," but they emphasise that these sums can only be recovered over a long period of time.

The return of Gaumont-British to the list of dividend-payers was welcomed by investors, and the group results encouraged a slight rally in cinema share prices. After a year's suspension of payment on Gaumont-British ordinary a dividend of 5 per cent is to be paid. The directors of Odeon have declared a year's dividend on the 6 per cent shares up to July 1, 1950, out of the current year's profits. Mr Rank adds that this payment would not have been made unless there was "a reasonable prospect of being able to clear the arrears in due course and resume the payment of regular dividends." Odeon 6 per cent preference shares now stand at 13s. 9d., the 5s. ordinary shares at 12s. 6d. and Gaumont-British 10s. ordinary shares at 6s. xd to yield £8¼ per cent.

*

British Celanese.—Record turnover and profit figures are more the rule than the exception in this period of rising prices, but the expansion of British Celanese net profits before tax from £4,100,000 to nearly £7,300,000 is outstanding among the achievements of British industrial concerns. Unfortunately for the holders of British Celanese ordinary stock the accounts were prepared after the proposals to freeze dividends were announced and in compliance with these proposals the ordinary dividend has been reduced from 10 to 9 per cent—a poor return wholly unrepresentative of such a remarkable year. To ordinary stockholders, who have patiently attended the nursing of British Celanese through convalescence into good health, Mr Gaitskell's proposals are not concerned with dividend limitation so much as plain dispossession.

	Years ended July 1, 1950	Years ended June 30, 1950

Retained by subsidiaries	546	40,446
General reserves	600,000	1,000,000
Added to carry forward	9,417	75,267

10s. ordinary stock at 35s. 9d. xd yields £2 10s. per cent.

Even after the tax-collector has claimed £4,100,000, against £2,500,000, a considerable surplus is available to buttress reserves. Property and plant replacement reserves receive £1,000,000, against £200,000, and a further £1,000,000, against £600,000, is put to general reserves.

The 10s. ordinary shares were marked down when the dividend announcement was made, but the price of the shares quickly improved and more than recovered this earlier loss, as it was hoped that the sharp improvement in profits would ultimately mean larger dividends for equity holders. The coming election may mean the death of dividend limitation and then the hopes of increased distribution are hardly likely to be falsified. The earnings cover is such that quite a large increase is possible and this would repay the patience of equity shareholders in the years before the war when no ordinary dividend was paid and preference dividends were in arrears.

*

Gestetner.—Excellent trading results are again reported by Gestetner. Sales at home and abroad have increased substantially; indeed, the company has exported a higher

proportion of its output than in any previous year. In the last months of the financial year the company was forced by pressure of rising costs to raise its selling prices slightly, but the improvement in group trading profits from £847,123 to £1,199,740 must owe far more to an expansion in turnover. Newly established subsidiaries in Pakistan and in the United States, whose figures are included in the consolidated accounts for the first time, have made a profit; the report claims that in the United States the "company's products can more than hold their own in that highly competitive market." In normal circumstances the success of this new venture might perhaps have been signalised by the raising of the ordinary dividend. Dividend control, however, has intervened, and the same rate of 18¼ per cent. has been paid on £859,336 capital, as increased from £806,836 by the capital reorganisation scheme, under which £500,000 4½ per cent. cumulative preference stock replaced £262,500 7 per cent. cumulative preference stock.

5s. ordinary stock at 21s. 3d.xd. yields £4 9s. per cent.

The new capital raised in the year has been largely spent on fixed assets, the net book value of which has risen from £453,890 to £684,767. Mr S. Gestetner remarks that "the expanded manufacturing programme has necessitated increased stocks," but the rise from £792,320 to £1,392,451 is so substantial that increased values of raw materials must have played some part in it. The rise in debtors from £774,966 to £1,152,890 is a reflection of increased sales. The Treasury have consented to a share bonus of one 5s. "A" ordinary share for every four ordinary or "A" ordinary shares held, which will involve the capitalisation of £214,834 from reserves. A Conservative victory at the polls would alter the future outlook of equity shareholders in Gestetner entirely. Instead of the meagre prospect of a controlled dividend of 15 per cent. on the increased ordinary capital of £1,074,170, they could look forward to at least the maintenance of the present rate of 18¼ per cent. and the possibility of greater distributions in store.

BRITISH CELANESE LIMITED

The Report and Accounts for the year ended 30th June, 1951, contain the Directors' recommendation for the payment on 10th November, 1951, of the following dividends to Stockholders registered at the close of business on 29th September, 1951:—

A final Participation Dividend of 0.5203% less tax, on 7½% Participating Second Cumulative Preference Stock in respect of the year ended 30th April, 1951, and

A final dividend of 3% less tax, on Ordinary Stock in respect of the year ended 30th June, 1951.

An interim dividend of 6% on the Ordinary Stock and the appropriate Participation dividend of 1.0406% on the 7½% Second Preference Stock were paid on 14th July, 1951. The dividend on the Ordinary Stock of 9% for the year (which compares with 10% for the previous year) represents the maximum amount payable, having regard to the implications of the White Paper on Control of Dividends.

The following details are extracted from the Report of the Directors and audited Accounts for the year ended 30th June, 1951, which will be posted to Stockholders on or about 2nd October, 1951.

Statistical Summary

EXCHEQUER RETURNS

For the week ended September 15, 1951, total ordinary revenue was £45,285,000 against ordinary expenditure of £76,000,000 and issues to sinking funds £350,000. Thus including sinking fund allocations of £9,070,000, the deficit accrued since April 1, 1951, is £8,970,000 compared with a surplus of £90,823,000 for the corresponding period of the previous year.

COMPANY MEETINGS

THE DISTILLERS COMPANY LIMITED

SUCCESSFUL RESULTS—RECORD PROFIT

TAXATION TAKES OVER £9,500,000

INCREASED PRODUCTIVE CAPACITY FROM EXPANSION PROGRAMME

EXCESSIVE WHISKY DUTY

MR HENRY J. ROSS'S REVIEW OF COMPANY'S WIDENING INTERESTS

The seventy-fourth annual general meeting of the company was held in the North British Station Hotel, Edinburgh, on Friday, September 14, 1951, when the chairman, Mr Henry J. Ross, presided.

The chairman said: The only changes which I have to report amongst the directorate since we met a year ago are the retiral from executive duty of Mr David S. Forsyth, which coincides with this annual meeting, and the elevation of Mr T. F. A. Board and Mr R. S. Cumming to the management committee.

Mr Forsyth joined the D.C.L. in 1912, and, consequently, has rendered close upon 40 years of continuous and devoted service to the company. Allied to his natural inclination for hard work is a charm of manner which has endeared him to colleagues and customers alike, and I am sure the stockholders will want to join with his fellow directors in thanking him for his exceptional services, for his unfailing loyalty, and for his great courtesy at all times, and to wish him improved health and a long number of years in which to enjoy his retirement.

Messrs Board and Cumming have spent their entire business lives in the service of the company, and I am confident the management will be strengthened by the inclusion of their names on the committee.

PROFIT AND APPROPRIATIONS

From the statement of accounts it will be seen that the manufacturing and trading profits of the company and its subsidiaries amounted to £17,934,520 as against £12,837,691 for the previous year. To the profit is added income from investments and a small gain on exchange, making the total revenue £18,411,095. Taxation takes the very substantial figure of £9,519,035, and after making the usual provisions for depreciation, writings off, interest on debentures and loans and allowance for interests of outside shareholders, the net profit attributable to the group is £6,858,925 against £5,930,557 in the previous year.

The revenue reserves in the books of subsidiary companies have been strengthened by transfer thereto of £3,265,847 and the directors have agreed to appropriate £750,000 to the general revenue reserve of the parent company. As mentioned in the report by the directors the surplus on the superannuation and provident reserves of the participating companies amounting to £388,644 has been credited to profit and loss account.

The balance available is £3,231,722 and after provision for the dividends distributed or recommended, the carry forwards are increased by £458,812 to £6,445,165.

PHENOMENAL PRESSURE OF DEMAND

The profit at nearly 18 million sterling is a record in the long history of the company. It is satisfactory that all sections of the company have contributed to this substantial increase of a little over £5,000,000. The Scotch whisky blending companies continued to have—and, in fact, still have—the benefit of the adjusted prices for the U.S.A., Canada and other parts of the world, following the devaluation of sterling. This brought additional revenue to the companies, although there was an offset to this in the increased costs of production and selling. The increased outputs obtained from the extensions and improvements brought about by the expansion programme have played a very important part in obtaining these good results. The yields now being obtained from the money put into the new capital development schemes are proving very satisfactory and mainly in excess of the estimates. In saying this it must be remembered that under the conditions ruling at present in all sections of our organisation there is little difficulty in selling outputs; in fact the output itself is only limited by the essential raw materials available, and in those plants where there is no difficulty in this respect, by the capacity of the plant. This undoubtedly reflects a phenomenal pressure of demand which is world-wide, and which must be regarded as abnormal.

Raw material prices have risen considerably—to what is an artificial level due mainly to inflation—and this is a factor that has caused anxiety to your board. This rise has had its influence to some extent on the increased valuations of stocks shown in the consolidated accounts. The general level of prices may turn downwards without much warning, with substantial losses to be faced in the future. As a consequence the board decided to create a stock contingencies reserve and appropriate thereto out of profits the sum of £440,500. It appears certain—at least at this stage—that a similar course will have to be adopted at the end of the current year. Prudence, if not safety, will demand it.

BALANCE SHEET ITEMS

The legal balance sheet of the company calls for the following comments:—

(1) The ordinary capital has been increased by 51,000 shares of £1 each credited as fully paid issued to The United Molasses Company Limited in exchange for £50,000 ordinary stock of Anchor Line Limited. The premium of £204,000 has been credited to share premium account. The board is satisfied that this transaction will unite even closer the two companies, and in future will bring advantages to both;

(2) The amount at credit of the investment reserve has been used (a) to write down certain investments by £400,000, and (b) to add to the general revenue reserve £1,000,000. The board feels that this reserve is no longer required;

(3) Unsecured loan stocks stand at £10 million. This money was borrowed on reasonable terms. The cash provided has increased greatly the liquidity of the company;

(4) The superannuation and provident reserve has now been taken from the balance sheet following the formation of the trusts; and

(5) There are large increases in the amounts for trade investments and advances to subsidiary companies. These reflect payments in connection with the expansion programme, to which reference has been made in past years.

CONSOLIDATED FIGURES

In the consolidated balance sheet the effect of these developments is again shown by the increase in the book value of the fixed assets of the group by some £4,000,000. Among current assets it will be observed that the value of stocks has increased by approximately £7,000,000 and that debts due to the group have risen by about £5,500,000.

The net liquid assets of the group increased during the year from approximately £50 million to £61 million but, as mentioned, the company augmented its liquid resources by borrowing £10 million.

The group capital reserves have increased by £650,000, due mainly to the premium on issue of the new shares already referred to, and to gains on realisation of investments. In addition, the proportion of profits retained in the business is such that despite the elimination of the group superannuation reserve, the total capital and reserves is practically unchanged at £53.5 million.

I have already referred to the fact that taxation has this year absorbed £9,500,000 out of the company's profit. The full effect of the latest increase in profits tax is not revealed in the results for the year under review, and if profits remain constant, the Government's share may be still greater next year. It is imperative that some measure of relief from taxation should be given to industry, if it is not to be forced to restrict the volume of trade through lack of funds.

WHISKY DISTILLING

The company's malt and grain distilleries secured good outputs during the year under review and as a consequence the stocks of maturing whiskies of the blending companies in the group obtained satisfactory additions.

The cask position has improved over the year but still gives cause for some anxiety.

SCOTCH WHISKY SALES—HOME AND EXPORT

Our activities still remain substantially under Government direction and are largely patterned to the national interests. The result is that certain markets receive a special degree of attention denied to others and a situation is thus created which is not in the long term interests of either the company or the industry. This state of affairs will undoubtedly continue until such time as our stock position is capable of meeting all demands on an age and quality basis. It is not a matter of gallons alone; it is gallons plus age and quality—the basis on which this great industry has been built and on which alone it can be maintained. Unfortunately this fact is not easily impressed upon the official mind.

Last year I was able to report that a slightly larger gallonage had been permitted

to the industry for home trade release, namely 2,600,000 proof gallons for the year ended April 30, 1951. Actual releases for that period, however, were 46 per cent. in excess of the target. The unsatisfactory feature of these excess clearances is the high price the trade and public are called upon to pay.

The rate of duty still remains at the excessive level of £10 10s. 10d. per proof gallon or, if expressed in perhaps more easily understood terms, slightly over 24s. 7d. per bottle. A continuance of this iniquitous rate of tax can only lead to the gradual extinction of Scotch Whisky as a beverage on the home market, but it also serves to encourage overseas markets to increase their rates of duty on what is admitted to be, if not the most valuable, at least one of the most important commodities this country possesses. Representations were made to the Chancellor of the Exchequer during the course of the year and the subject came under review in the debate on the Finance Bill in the House of Commons. Although the results were negative, I think that the compliment paid to the industry by the Financial Secretary to the Treasury is worthy of repetition. He said—

"The highest marks of all go to the whisky industry and if one measures it in terms of dollars its record is far more remarkable and better than that of any other industry. It is a remarkable feat by this great Scottish industry to have earned this high amount of dollars and yielded so much revenue to the Exchequer at the same time."

This Governmental tribute may offer some slight ray of hope for the future because there is no doubt that our industry has played a most distinguished part in the efforts to assist and improve the postwar economy of the nation. In this your company has taken a very notable share.

The problems and difficulties of our export trade continue to increase rather than diminish. Import restrictions by various countries, exchange difficulties and other artificial restrictions on the free interchange of merchandise are a growing feature, symptomatic of the times and world conditions. It is to be hoped that with the passage of time, many of these hindrances to world-wide trade will disappear, but outwith these obstacles Scotch whisky, and in particular the various brands within our group, continues to grow in popularity. Our trade with the priority Markets, notably the U.S.A. and Canada was not only maintained but increased during the year under review. In South Africa, unfortunately, there has been no alteration of the position whereby supplies to this market are still subject to import licences, the amounts of which are disappointingly small.

GIN

Once again I am happy to report a most satisfactory year's trading by our gin companies, with substantial increases in both home and export markets. Our gin plant at Linden in the U.S.A. continues to provide very good results, and our American gin sales for the year created yet another record.

YEAST

The yeast factories were fully employed throughout the year with good yields and a product which earned the approval of our customers. The new factory under construction in Bristol should be ready for production at the scheduled time early in the next calendar year.

INDUSTRIAL SECTION

In our industrial section the year has been most active. This is primarily due to the large increase in our productive capacity resulting from the heavy capital programme on expansion on which we embarked after the war, the major part of which has been in commission during the year under review.

In the industrial alcohol department output and efficiencies were well maintained, but the supply of molasses, as I foreshadowed last year, has become very difficult owing to the abnormal demands of the U.S.A. market. Fortunately, through the efforts of our buying agents, the United Molasses Company, Limited, we have been enabled substantially to meet the requirements of the trade, although the greatly increased cost of this raw material compelled us to increase our selling prices correspondingly. There is some indication that the supply position may ease during the current year, but I fear we cannot at present foresee the substantial reduction in price which we desire.

The carbon dioxide trade has also remained at a high level, and recently we purchased from Messrs Turner and Newall, Limited, their interests in this industry, comprising (a) shares in the Carbon Dioxide Company, Limited, and (b) two production units located respectively at Manchester and Bootle.

Our industrial organic chemical companies, British Industrial Solvents, Limited, and Commercial Solvents (Great Britain), Limited, had a satisfactory year, most of the plant included in the expansion scheme at the Hull factory now being in production. Output was, however, hampered to some extent by raw material shortages, and in one major chemical—acetone—we were compelled to ration supplies on account of the shortage of isopropyl alcohol. This position should now be rapidly rectified with the coming into operation of the Grangemouth plant.

In this connection I am glad to tell you that since the end of the year under review the plant of British Petroleum Chemicals, Limited, at Grangemouth has been commissioned. You will remember that this company is jointly owned by the Anglo-Iranian Oil Company, Limited, and your company. It is now producing synthetic ethyl alcohol and isopropyl alcohol, which will make a substantial and vital addition to the supply of these products.

The construction of the initial styrene plant of Forth Chemicals, Limited, also at Grangemouth, is making satisfactory progress, and it is hoped to commission this during next year. Active consideration is now being given to proposals for a substantial increase in the capacity of this plant in view of the growing demand for this important material.

The Biochemical Company at Speke, Liverpool, has more than fulfilled our expectations and has fully justified our entry into this field. The favourable reception accorded to the "Distaquaine" group of penicillin products which I mentioned last year, was just a forerunner of the continually increasing world-wide demand for these specialities. Continued technical progress has not only resulted in increased production of these and other forms of penicillin, but has enabled us to make further considerable reductions in the selling prices. Streptomycin and Vitamin B_{12} have been added to our production range, and major extensions to our plant, now in hand, should provide greatly increased quantities of these two products by the end of 1952.

INCREASED DEMANDS FOR PLASTIC MATERIALS

In my statement to the shareholders in 1949, I foreshadowed the benefits to be derived from the concentration at Barry, South Wales, of the plastic manufacturing units which were previously located in various areas. The increased demands for plastic materials, which started in 1950, have continued throughout the year, and British Resin Products, Limited, is now obtaining the improved efficiencies and lower operating costs expected from the expanding use of the large new units installed. Here again, we have been seriously handicapped by the acute shortage of certain important raw materials, and considerable effort has been directed to the study of alternative materials in replacement of those in short supply. This work is bearing fruit, and will, we feel confident, lead to a steady expansion of our plastics activities. British Resin Products, Limited, are now in regular production of polystyrene, which is sold under the trademark "Distrene." Plans are now under consideration for increasing this production in view of the proposed additional manufacture of the intermediate material, monomeric styrene by Forth Chemicals, Limited, at Grangemouth.

The sale of polyvinyl chloride materials manufactured by British Geon, Limited, has continued to expand and following upon the 50 per cent. increase in manufacturing capacity to which I referred last year, a further extension of one-third has since been authorised and should shortly come into operation. The remarkable developments in the application of this versatile plastic suggest that still further increased production may have to be undertaken by your company in the near future.

In Australia and South Africa, our associate companies, Robert Corbett Pty., Limited and National Chemical Products, Limited, have made very satisfactory progress during the past year. Plans are now in an advanced stage whereby your company's participation in the expanding industries of those companies may be substantially extended.

Last year I reported that your company had acquired a majority interest in Magnesium Elektron, Limited. Recently we have purchased the remainder of the shares which were held by Imperial Chemical Industries, Limited. Magnesium Elektron, Limited, whose factory is at Clifton Junction, near Manchester, is the sole producer of magnesium metal in this country, and is today supplying this vital raw material for the Ministry of Materials to meet the demands of the air-frame and aero-engine manufacturers. Use of the special new alloys of magnesium containing zirconium and the rare earth metals developed by Magnesium Elektron, Limited, for jet engine and other purposes, has expanded steadily. Very satisfactory licence arrangements under the company's patents have been made with magnesium fabricating companies throughout the world.

Research continues to play an important part in the development of our industrial activities. The company's research is now divided between our central station at Epsom, Surrey, and out-stations located adjacent to the large operating factories. This method of de-centralisation has proved effective, particularly as it enables day to day problems of consumer research and process development to be dealt with in close association with the staffs concerned with production and sales.

FUTURE PROSPECTS

Although I have endeavoured to point out the difficulties and uncertainties of the present position, I consider it only right to tell stockholders that so far as the current year has gone the profits of the group are running at a rate in excess of those obtained in the year to March 31, 1951.

STAFF

The relationship between management and staff and employees has continued excellent throughout the year, and it gives me great pleasure on behalf of the board to record our appreciation of the services so loyally and willingly rendered by all ranks.

The report was adopted.

UNITED DAIRIES LIMITED

RESERVES EXCEED £6,000,000

DETERIORATION IN MILK PRODUCTION

DIFFICULTY OF MEETING FULL DEMAND

MR LEONARD MAGGS'S STATEMENT

The thirty-sixth annual general meeting of United Dairies Limited, was held on September 14th, at the Connaught Rooms, Great Queen Street, London, W.C., Mr Leonard Maggs (chairman and manager director) presiding.

The secretary (Mr Ernest Evanson, A.S.A.A.) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman to the members which had been circulated with the report and accounts for the year ended March 31, 1951, and was taken as read:—

In theinterests of many members who were unable to attend the annual general meeting on September 14th, I am again circulating my remarks with the directors' report and accounts.

The consolidated statements published give a clear picture of the financial position of the whole group, so the accounts do not call for much comment.

As mentioned in the directors' report, of the group net profits of £954,595 there has been brought into the parent company's accounts £850,717. It was considered desirable to leave the balance of £103,878 to be added to the undistributed profits of the subsidiary companies so that it might be available to meet the higher costs of replacement of assets.

PROVISIONS

(a) £1,883,813 for taxation:—

The increase of 20 per cent. (from 30 per cent. to 50 per cent.) in the profits tax on distributed profits has had to be provided.

(b) £166,000 to be applied for the betterment of the staff pension and life assurance scheme:—

As I advised you last year, in common with other large companies we found that the arrangements made originally for the superannuation of salaried staff were inadequate under the changed present-day conditions. The £166,000 which we are setting aside this year, with the £220,000 set aside last year, will completely provide for the liability in connection with past service in consequence of this betterment.

Although the £166,000 has been provided out of taxed income this year, it will be paid over a period of years to the insurance company operating the scheme: these annual payments will be allowed as an expense for taxation as and when paid in subsequent years.

RESERVES

The following are the reserves of the group at March 31, 1951:—

The share premium account ...	£5,814
Capital reserves:	
Profits, less losses, on realisation of:	
Properties	£151,305
Investments in subsidiary companies	£99,157
Revenue reserves:	
General reserve	£2,750,000
Insurance fund	£100,000
Depreciation not required on properties sold	£45,438
Future income-tax	£1,358,442
Profit and loss appropriation accounts	£3,040,077
	£7,550,233

The total of these reserves at March 31, 1950, was £6,810,293.

Excess Profits Tax—Postwar Refund.—The liability of the group for excess profits tax has not been finally agreed with the taxation authorities. Adequate provision has been made for this liability in the reserve for taxation, but no credit has yet been brought into the accounts in respect to excess profits tax postwar refund, which is estimated at approximately £130,000, after deducting income tax.

CAPITAL REPLACEMENT

On account of present-day high prices the charges for depreciation are increasing as new equipment can be installed, as is evidenced by a comparison between the charge of £613,323 in this year's accounts for depreciation on plant, machinery, etc., in respect to the subsidiary companies, and the £530,764 charged in the previous year's accounts.

These increased costs of new equipment have to be provided out of retained revenue, as the depreciation funds on the replaced equipment are insufficient to meet the higher costs of the new.

The book value of our assets, all of which have been maintained in the best possible condition, is considerably below present-day values. As an example, the properties of the group stand in the balance-sheet at £3,726,319 (cost less depreciation), while the value placed on these for fire insurance purposes is £12,350,000.

Consideration has been given to the question of revaluation of assets, but we have decided not to take any action at present.

Deferred Repairs.—This reserve remains at the same figure as last year—namely £1,132,203. During the four years ended March 31, 1951, £641,674 has been expended on deferred repairs, provision for which was included in the reserve, but the whole of this amount has been included in the charge against profits, and not against the reserve. This course was deemed prudent as, owing to the delay in getting work done, other repairs arising are constantly having to be deferred.

This fund is temporarily available as working capital.

DISPOSAL OF GROSS REVENUE

The following statement shows how every pound sterling received by the group in respect to sales of milk, milk products, and other products was absorbed during the year under review, with comparative figures for the previous year:—

	1951 s.	1951 d.	1950 s.	1950 d.
Cost of milk, goods for resale, and raw materials for production of other goods	14	8	14	8
Salaries and wages	2	4¼	2	5
Other expenses, including containers, depreciation, rents and repairs	1	11	1	10½
Taxation		8¼		7½
Paid as dividends		2		2
Retained in business for development		2		2¼
	20	0	20	0

The above covers the whole of the operations of the group.

On the milk side of the business—including activities which it is difficult to segregate, such as goods purchased for resale in the shops, and (in Scotland) the bakeries—the net profit was only 1.043 per cent. of the turnover.

MARGINS ON MILK

From July 1, 1951, there was an advance of 1d. per quart in the price of milk to the public. The whole of the amount accruing from this increase goes to the Government to reduce the amount of the subsidy paid to milk producers, and as a contribution towards the cost of free and cheap milk to certain priority consumers.

The margin we now receive in London on pasteurised bottled milk is just over 1¼d. per pint bottle—and this has to cover processing, wastage, provision of bottles, bottling, delivery, collection and cleansing of empty bottles, accounting and so on. This is approximately the same margin as that ruling before the war, when the costs of everything were considerably lower than they are today, so it is quite obvious that we are not being overpaid for the service we render, and that the standard of efficiency reached by the industry is very high.

Wages and transport costs constitute a very substantial proportion of the expense of distribution. Wages are continually increasing to offset the ever-rising cost of living, while the substantial increase in vehicle running expenses, due to the imposition of purchase tax on commercial vehicles, the further tax on petrol, the higher prices of tyres, etc., is having a marked effect on the costs of distribution.

Although it is no longer obligatory for consumers to register with distributors for milk, in London distributors are maintaining the zoning of deliveries, owing to the shortage of labour and in order to make it possible to operate within the margin allowed.

MILK SUPPLIES

Although the production of milk during the first part of the year under review was very satisfactory, towards the close supplies declined considerably, and to date this year the production has been most disappointing. Looking at the peak month (May) the production in England and Wales was 17 million gallons less than in May, 1950. The result was that in May, 1951, throughout England and Wales only 28½ million gallons were manufactured, compared with 49 million gallons in May, 1950.

The deterioration in the production is attributable to the lack of winter feed for the cattle owing to the weather conditions last summer, coupled with the Government's very attractive price for beef, which is diverting from the dairy herds to the butchers a large number of cows and heifers already in calf—a trend which is influenced also by the reduced labour required on the farms for stock-rearing compared with milk production.

Although all restrictions on the sale of liquid milk to consumers have been removed, there is considerable doubt whether there will be sufficient milk available during the later months of this year to meet the full demand. With the abandonment of the system of registration it is going to be very difficult, in any periods of shortage, to ensure that everyone receives a fair share of what is available.

SALE OF CREAM

When the Minister announced last year his intention to permit this year the manufacture and sale of cream it was most welcome news, and quite a wise decision with conditions as they were then. However, when the time arrived production of milk had declined very seriously, and it was a surprise to us that the decision was not rescinded.

After a lapse of eleven years it was a considerable strain on the trade to complete arrangements for the processing and distribution of cream, particularly with the difficulty of providing containers. However, judging by the volume of our sales our customers must have been well satisfied.

I cannot forecast whether the manufacture and sale of cream will be permitted in 1952, as this is a matter for Government decision.

In the meantime we are, in London, selling by retail synthetic cream manufactured by our subsidiary company, the Farma Cream Product Company, Limited.

WELCOME LEGISLATION

Food and Drugs (Milk, Dairies and Artificial Cream) Act, 1950.—Under recent regulations made by the Minister of Food under this Act, when an area is "specified" no milk is permitted to be sold in that area unless pasteurised, sterilised, tuberculin-tested, or (temporarily) accredited—in the last case derived from a single herd. The first areas to be specified are London and Portsmouth, to take effect from October 1, 1951.

Being advocates and pioneers of pasteurisation we welcome this legislation.

Yoghourt.—The sales of Yoghourt have increased quite considerably during the past few years. Yoghourt is a soured milk, and great curative properties have been claimed for it. A director of the Pasteur Institute, Elie, Metschnikoff, observed that the peasants of Bulgaria, Turkey and Armenia lived to a ripe old age, and attributed this fact to the consumption of Yoghourt, which he said prevented intestinal infections and putrefactions. Modern scientific opinion does not go so far as that, but it does seem that the absorption of calcium into the blood may be facilitated by consumption of this product.

ENGINEERING AND TRANSPORT COMPANIES

The Dairy Supply Company, Limited, has continued to supply milk churns and bottle crates to the trade. Wire bottle-crates have become popular, but production of these may be affected by the shortage of steel wire, and especially by the shortage of zinc for galvanising, as no substitute for this essential material has been found.

The U.D. Engineering Company, Limited, has scored a success with its latest bottle filler, the "V.S.S.": good progress has also been made with an improved bottle washer. Orders for refrigerating plant continue to increase.

Mickleover Transport, Limited, in addition to work for fellow subsidiary companies, has developed a trade with commercial and Government undertakings in the building and mounting of special bodies for lorries.

OVERSEAS INTERESTS

Australia.—The position is the same as I reported to you last year, our business being still in the development stage. During the past season we were able to re-equip one of the factories for the reception of liquid milk in place of farm-separated cream, but unfortunately the area in which that factory is situated experienced the most severe drought in living memory. We expect the similar re-equipment of another factory to be completed very soon. At the third factory we are building, on a new site in the vicinity, an entirely new factory to be equipped to receive liquid milk and to manufacture milk powder and condensed milk, but only slow progress is being made owing to the difficulties in getting materials and labour.

It is inevitable that some time must elapse before we can hope for results from the investment.

New Zealand.—Our subsidiary company, which is well established, has had an excellent year's trading, and earned a record profit.

APPRECIATION OF THE STAFF

In conclusion I should like to take this opportunity of expressing the thanks of the board—and I am sure I may include the shareholders—to the officers and staff of the company for their loyal and devoted services during the past year.

The report and accounts were unanimously adopted and a final dividend on the ordinary stock at the rate of 10 per cent. actual, less tax, making 15 per cent. for the year, was approved.

The retiring directors, Mr William A. Blake, Mr Andre Bracher, Mr Leslie L. Ferris, Mr Douglas A. R. Knight, Mr Kenneth W. Pocock and Mr J. Gordon Stokes, were re-elected; and the remuneration of the auditors, Messrs Peat Marwick Mitchell and Company, was fixed.

The proceedings terminated with a vote of thanks to the chairman, directors and staff.

WILLIAM BEARDMORE AND COMPANY LIMITED

ANNUAL GENERAL MEETING

The annual general meeting of William Beardmore and Company Limited, was held on September 14th, at 207, Shettleston Road, Glasgow, E.1. Mr Alex Williamson, chairman and managing director, presided, and Mr C. Dale represented The Iron and Steel Corporation of Great Britain.

The report and accounts for the year ended December 31, 1950, which showed a net profit for the year of £144,074 after providing for depreciation, taxation and other charges, as compared with £206,190 in the preceding year, were adopted.

In the course of his statement the chairman thanked for their past services Mr Wilson Harvey and Colonel B. C. Lockhart-Jervis, two of the retiring directors, neither of whom sought re-election.

Mr Alex Williamson, Mr J. G. Girdwood and Mr T. M. Service were re-elected directors and Mr D. M. Cameron, C.A., secretary of the company, was elected a director.

The remuneration of the auditors, Messrs J. Wyllie Guild and Ballantine, having been fixed, the proceedings terminated with a vote of thanks to the chairman.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

The Reporting Manager,
The Economist,
22 Ryder Street, S.W.1

MUREX LIMITED

The thirty-second annual general meeting of Murex Limited was held on September 19th in London, Mr George P. Joseph (chairman of the company) presiding.

The following is an extract from the chairman's circulated statement:—

During the year under review there was an unprecedented rise in the world prices of certain essential raw materials. The price of wolfram in particular rose from 95s. per unit in May, 1950, to a peak of 670s. in March, 1951, falling subsequently to 510s. at the end of April, 1951: there was a marked advance also in the price of copper.

The increase of over 40 per cent. in the value of sales for the year is very largely attributable to higher selling prices of the products of these raw materials. I am pleased to say, however, that there has been a real and satisfactory improvement in the volume of our sales. We have spared no effort in recent years to expand exports and it is unfortunate that shortages of raw materials and prior demands at home have prevented us from meeting overseas demands in full.

When the present emergency has passed, a marked fall in the current abnormal price levels of raw materials is likely and losses may well arise on a falling market. Your directors have therefore set aside out of profits of the year £400,000 for such a contingency.

After making all necessary provisions and appropriations, the balance of profit available enabled your directors to recommend a modest increase of 2½ per cent. in the ordinary dividend for the year, which becomes 12½ per cent., compared with 10 per cent., which had been maintained since 1937.

Since the announcement of the final dividend on July 20th the Government has made known its proposals for statutory limitation of ordinary dividends.

OVERSEAS INTERESTS

Turning now to our overseas interests, the production of tungsten carbide tipped stems at the factory of Hard Metals, Limited, Springs, Transvaal, for drilling in the gold mines on the Rand and in the Orange Free State, commenced in March, 1950, and they are proving very satisfactory.

Sales for the year 1950 amounted to approximately 14,500 stems per month and it is estimated that this figure will be increased substantially during 1951. That company is producing also wire drawing dies and other tungsten carbide components required by local industry. The trading results for the year 1950 were satisfactory at the level of output achieved.

In October last we announced that in conjunction with Australian associates we had participated in the formation of a new company known as Murex (Australasia) Pty., Limited. Production commenced in June of this year.

THE OUTLOOK

In the opening months of the new financial year the overall demand for your company's products has continued to exceed available supplies, although there are indications of some gradual improvement in the raw material supply position of essential commodities of the parent company.

The shortage of steel supplies and non-ferrous metals is once again a limiting factor in the production of welding electrodes and equipment in the face of a rapidly expanding demand both at home and overseas. In April last Murex Welding Processes were compelled to ration supplies in the home market; in consequence, exports have been substantially reduced.

The report was adopted.

SALTS (SALTAIRE)

RECORD SALES

The *twenty-eighth annual general meeting* of Salts (Saltaire) Limited was held on September 19th at Saltaire, Yorkshire.

Sir Frank B. Sanderson, Bart. (the chairman), in the course of his speech, said: The year under review has been one of continued progress and expansion, and a very gratifying one for your company. The sales of the group have reached a total which establishes a record in our history.

Profit on trading of the group, before charging depreciation of fixed assets £76,526 and auditors' remuneration £1,694 amounts to £1,950,882. After making provision for these items, there remains a profit on trading of £1,872,662, compared with £989,758 for the previous year.

After adding income from trade investments £9,830 and providing taxation £1,011,365, there remains an available profit amounting to £871,127, as against £500,178 for the previous year. The board recommend a dividend on the preferred ordinary shares of 1s. 6d. per share and a dividend on the ordinary shares of 9d. per share.

DIVIDENDS AND TAXATION

In deciding to recommend an increased dividend your directors had in mind that the capital employed in the business is greatly in excess of the issued share capital and the fact that in 1933 the amount of £1,480,000 of capital was written off and cancelled. The net amount to be paid in dividends upon all classes of shares amounts to £206,229, whereas the group taxation charge for the year amounts to no less than £1,011,365, equivalent to 54 per cent. of the profits for the year, and is therefore approximately five times as much as is distributed to members.

Dr Dalton's speech at Swansea as reported in the press is one more instance of what I consider to be a most unfortunate statement in regard to matters on which it is apparent he is misinformed. His remarks are as ill timed as they are undeserved and may cause serious injury not only to the home trade but to our export trade in textiles which the President of the Board of Trade is so anxious should be increased, and it is already creating difficulties for the industry whose main consideration is the welfare of the country and the desire to maintain full employment.

EXPORT MARKETS

We are making continued efforts to increase our export trade, and during the year the deputy managing director has visited South Africa and other high officials of your company have paid visits to Canada, Egypt, and the Near East. Our greatest handicap is still, however, the import restrictions in many countries, including practically all South America and, as I stated in my speech at our last annual meeting, we look to the Government to do everything possible to ensure a more free importation of textiles in world markets.

You will appreciate that until supplies and prices of wool become more stabilised, it is not only difficult, but impossible, to forecast with any degree of accuracy what the future holds. Whilst there is considerable resistance to the present high values, the demand for the productions of your company continues, and it is reasonable to expect your directors will be able to place before you satisfactory accounts to the end of March, 1952.

The company's activities and results are something of which the management, staff and operatives have reason to be proud.

The report was adopted.

SILENTBLOC LIMITED

ANOTHER RECORD

MR H. VEZEY STRONG ON THE GRATIFYING PROGRESS

The sixteenth annual general meeting of Silentbloc Limited was held on September 19th in London, Mr H. Vezey Strong (the chairman) presiding.

In the course of his speech, the chairman said: I am today in the happy position of being able to report to you gratifying progress. You will have observed the substantial increase that has taken place in the net profit which before taxation amounts to £187,236. The net profit, after tax, for the year under review, has exceeded that of two years ago by no less than 174 per cent.

In the altered political circumstances your directors propose to maintain the final dividend at the acoustomed rate, but to set aside for further distribution a sum equivalent to 2d. per share (less income tax) on the issued capital in May 31, 1951, together with the additional profits tax thereon for payment just as soon as it becomes legally possible.

Your board further proposes to capitalise out of the reserves the sum of £110,000 by the issue of 1,100,000 ordinary shares, fully paid up, to shareholders registered on September 6, 1951, in the proportion of one share for every two held.

At home both Silentbloc and the Andre Rubber Company shaped well. The first two months of our current financial year show progressive improvement; combined orders in hand total £1,200,000.

OVERSEAS INTERESTS

Hitherto, owing to difficulties largely connected with patent rights, it has been almost impossible for your company to trade with France, Germany or Italy, either by way of licence agreements or otherwise. I am now happy to be able to inform you that all difficulties have been successfully overcome. What amount of income will eventually come to us from these sources is at present conjectural, but the signs are propitious.

During the last three years the virtues of Silentbloc devices have been so energetically and skilfully demonstrated in the United States by our two licensees there, the Harris Products and General Tyre and Rubber Companies, that the demand which started as a placid stream has steadily been gaining momentum and now seems to be approaching full spate. Therefore, at the suggestion of the president of the former company, I and one of my colleagues on the board recently visited the States to discuss this situation and devise means to take full advantage of it.

With Harris Products, too, we discussed the Canadian situation. This company, as you are aware, owns half the stock in Silentbloc of Canada and is in charge of the management. We have decided upon a completely new set-up, the details of which are in process of completion. I hope and believe as a result that, by this time next year, I shall be able to report the receipt of net income from Canada.

We have had a successful year; it is not unlikely that others will follow. But how much better could we all do with a lighter load and greater liberty of action.

The report and accounts were adopted and the final dividend of 4d. per share, making 7d. per share for the year, was approved.

Resolutions were also passed authorising the bonus issue of shares and amending the articles of association.

OLD BLEACH LINEN COMPANY LIMITED

A GOOD YEAR'S TRADING

The eighteenth annual general meeting of The Old Bleach Linen Company Limited, was held on September 18th, in London, Mr Arthur H. Johnson, O.B.E. (chairman of the company), presiding. The following is an extract from the chairman's annual report:—

It is pleasant to be able to record another good year's trade. While The Old Bleach Company's reputation was built up over a long period on high-class linen goods, the company now enjoys the advantage of manufacturing a great variety of merchandise.

The production and sales, both in volume and value, show a large increase over the previous year. For the first three months of the present financial year the sales are up by 25 per cent. over the same period of last year. Export sales have been very satisfactory. Our furnishing fabrics are now firmly established in the U.S.A. The introduction of new colours and qualities into our carpet section will assist equally the sale of carpets in the export market. The prospects of increasing business abroad can be considered good. Our export sales for the first two months of this year already ensure a satisfactory increase in export sales. Home market sales are substantially increased over last year.

The consolidated profits are £160,458 as compared with £146,448 for the previous twelve months. In view of proposed legislation on the limitation of dividends your directors considered it prudent to adjust their recommendation for a final dividend on the ordinary shares to 4 per cent., making 9 per cent. for the year.

The report and accounts were adopted.

SCRIBBANS-KEMP LIMITED

MR H. OLIVER-KING ON RISING COSTS

The twenty-fourth annual general meeting of Scribans-Kemp Limited, was held on September 20th in London, Mr H. Oliver-King (chairman and managing director) presiding.

The following is an extract from his circulated statement:—

The trading profit of the group, before taxation, etc., amounts to £1,770,086, as against £1,597,492 last year.

Reviewing the year as a whole, it appears to continue the difficulties I mentioned in my last statement and to bring a fresh crop in its train. Raw materials are still rationed to biscuit and cake manufacturers, which restricts to some extent the expansion of the manufacturing side of our class of business. Last year I reported to you the quite extraordinary rise in the cost of raw materials, packing materials and general expenses, but since then costs have jumped to an astonishing degree.

Since the end of the year there has been a recession of trade in some of our manufactured goods, due mainly to the reduced purchasing power of the public purse.

Considering the retail side of our business, which is mainly the sale of sugar confectionery, profits have been maintained, and it has been possible to extend our interests by the acquisition of a further 31 shops. It has only been by a constant increase in sales that the amount of profit has been maintained.

Taxation on the year's profits amounts to £835,976, an unprecedented figure, and the highest in the group's history, and it is after providing for this figure that the available profit, after bringing in £113,355, is £450,140 as against £400,621.

The report was adopted and the total dividend of 7 per cent. approved.

GORDON (MALAYA) RUBBER ESTATES, LIMITED

IMPROVED POSITION

The twenty-eighth annual general meeting of Gordon (Malaya) Rubber Estates, Limited, was held on September 19th in London, Mr T. J. Cumming (the chairman) presiding.

The following is an extract from his circulated statement:—

The crop harvested was 2,752,047 lbs., which was about 100,000 lbs. less than for 1949, and although the estate expenditure was about £40,000 higher, the amount received for sales exceeded last year by about £200,000, thanks to the greatly enhanced price which continued throughout the period.

It is proposed to pay a dividend of 5 per cent., less tax, on the ordinary stock. Following the welcome improvement in our position, we have been able to pay off all arrears of preference dividends and have also liquidated the loan which was outstanding from the Industrial Rehabilitation Board.

Only the necessary work to up-keep the properties has been undertaken during the year, and there is still much to be done when conditions are more settled and more labour becomes available.

The centrifuging plant came into operation in November, but unfortunately there was a serious breakdown very soon after, and owing to the great delay in obtaining a new part it could not be re-started until July. It is hoped there will be no further trouble and that the supply of Lacentex will proceed without interruption. In this connection we have taken a small financial interest in a foam producing company, and have agreed to supply them with a small proportion of our output on special terms.

Prospects for the future are difficult to forecast.

The report and accounts were adopted.

VITAMINS LIMITED

SHARE STANDING ENHANCED

At the annual meeting Mr H. C. H. Graves, chairman, said that the improvement in trading profits was from £10,870 to £63,755 after providing £19,950 for depreciation against £13,411 last year.

They had maintained the present level of dividend for many years, so that, their shares had properly come to be regarded in their class as "gilt-edged." This continuity of policy had enhanced the standing of the company's shares in the market, but, with current inflationary trends, had resulted in a lower real return to shareholders.

The Balance Sheet showed that Current Assets at £512,637 had increased by £175,797 on the year, following on a previous increase of £110,775. The explanation was that turnover was, again, by far the highest in the Group's history. This necessitated increased stocks and the financing of increased trade debtors as predicted last year.

The lack of adequate space and plant for their growing output had increased costs in some cases. It was all the more creditable that the results should have been as satisfactory, but equally they had an obvious target for savings when the new factory at Crawley was available.

Sales of Vitamealo concentrates for Cattle, Pigs and Poultry continued to expand. It was highly satisfactory to be able to state that at the last Smithfield Show Vitamealo-reared pigs gained three out of five championships. 61.1 per cent. of all pigs exhibited were fed on Vitamealo. They won 63.5 per cent. of all prizes.

The vital necessity for a Research Department such as they had had for over 20 years was now widely accepted. The facilities in their new 300 acre home at Walton Oaks were unrivalled among comparable commercial organisations in this country. Among the products of the Research Department was one incorporating a new principle in the compounding of rations for farm animals. This they expected shortly to be marketing.

On the pharmaceutical side of the business all their products continued to be prescribable under the terms of the National Health Service and, as he said last year, in appropriate cases this applied also to Bemax.

In the export field, the phase of hard salesmanship was successfully entered and now it was a case of their manufacturing department striving to keep up with the orders which it seemed came in almost faster than they could cope with them.

The report and accounts were adopted.

NOTICES

THE WEST OF SCOTLAND AGRICULTURAL COLLEGE

The Governors invite applications from Graduates in Agriculture, Agricultural Economics or Economics for the following posts in the Agricultural Economics Department:—

(1) Agricultural Economist. Applicants must have experience in the Provincial Agricultural Economics Service or an equivalent qualification from post-graduate work.
Salary Scale—£635 x £25—£760 x £30—£900 (Intermediate).

Shirking the Issues

THE character of the general election will not be firmly set until close to polling day. But unless there are dramatic changes in the next three weeks, it will have two distinguishing features. It will be an election fought between only two parties and without any issues. It is true that the parties are only now trying to put teeth into their policy statements. They are working, however, on unpromising material. Theoretically, at least, either the Labour or the Conservative programme, or even the principal speeches of the campaign, might after all bring out clear, general issues between the two parties. Theoretically, too, the poverty of the Liberal party in human as well as in financial resources might not be decisive; the Liberal programme might be so realistic, and at the same time so plainly and convincingly differentiated from the others, that a third party could at the last moment become important.

Both of these developments are possible, but both are very unlikely. The election campaign has in effect been running for almost two years on the present pattern; no party seems willing or able to inject into it new issues, at once large and precise, at this late stage. The two principal parties appear to remain as firmly united as ever on one main proposition—that the electors should not be allowed to give a verdict on the real issues facing the British people. Although most of its actions imply the opposite, when Labour appeals for votes it claims in effect that postwar Britain is the Government's firm and stable creation, and that its troubles come only from external difficulties that are no fault of the Government. And so, the implied argument runs, Labour's lack of significant new policies is natural because none is needed. The present benefits—no war, no unemployment, cheap food, low rents, comprehensive social services—will continue, provided only that the voters will leave the same men in charge.

The Conservative challenge is, or at any rate has so far been, hardly more definite. It is a claim that a Tory government could and would have achieved all that Labour has achieved, and a bit more besides—more houses, faster rearmament, yet fewer shortages, more production and lower taxes. Again, hardly anything has yet been said about the policies that will secure these ends; the claim is simply that new men doing much the same things will do them a lot better.

Campaigns planned on these bases can only be negative. The Conservatives try to treat present hardships as evidence of Labour incompetence. Labour goes back to recollections of the thirties to try to demonstrate not only Tory incompetence but also Tory ill-will towards wage-earners. These generalisations have so little practical significance that both sides are compelled to inflate the sham issues by emotion. Conservatives profess to see in Labour as a whole, and not merely in its Left wing, a deliberate drive towards the omnipotent, authoritarian state that is certainly far from Labour intentions; on the other side, Labour professes to see the Tories as "warmongers" and

grinders of the faces of the poor. Such charges could have no influence on anyone but stalwarts of the parties that make them unless they were accompanied by large differences about concrete policies. Since in fact the parties appear to differ very little when they come to details, the floating voter can rightly dismiss them as so much froth intended to conceal the lack of serious policy on both sides.

In the thirties, depression and the division over foreign policy gave to political differences a sharper edge than has been usual in the past two hundred and fifty years of British history. Now, with the majority of the Labour party embracing the doctrine of " consolidation " and the Tories at least a little liberalised, there are again no great dividing issues of principle. Political differences are about means, not ends. So much may be said in justification of the politicians' caution. What cannot be justified is their refusal to bring their competitive means into the open. Their motive for relying in effect on slogans and personalities is certainly neither the freshness of the slogans nor the attractiveness of the personalities. It is chiefly fear. The leaders on both sides know perfectly well that so far the economic weather of the postwar world has been, on balance, remarkably favourable to this country. They know that the improvements they promise or hint at cannot be achieved, and that present living standards probably cannot even be maintained, unless some government soon takes measures to toughen the British economy, to make it more competitive, more flexible and more expansive. But both parties have persuaded themselves that such measures—which would necessarily hurt some people immediately for the benefit of everyone in the longer run—would be unpopular.

There is much evidence that in this belief the politicians are mistaken. The consequences of acting on it are likely to remain damaging to both sides. If they continue to avoid real issues, presenting the electorate with a dull choice between almost identical vague aspirations, then there is every reason why the choice should remain indecisive ; the next government, whatever its party, may also have a small majority and such a government is incapable of decisive action that offends some sectional interests. Even if, as is perhaps more likely, the new government has a safe working majority, it will have no mandate for the sort of measures that a balance of payments deficit at the present rate will soon force on it ; the remedies are likely once again to be too little and too late. By believing that they cannot talk frankly about prospects and policies, the politicians themselves ensure that they will be unable to do what is needed, that they will fail in their tasks. The party that wins on such terms, even if it is with a large majority, is likely soon to find its supporters disillusioned and itself enfeebled and discredited.

An election without substantial issues, because the real issues are painful, is to the advantage of neither side. To persist in such a campaign is to confess the inability of both parties to shoulder the responsibilities of statesmanship for the nineteen-fifties. It is not too late for them to change their minds. Both would gain by deciding and defining what they propose to do in office. If either definition were moderately clear and coherent, that party would at least be likely to get more votes on October 25th than it would get if the polling were today. But on all the present evidence the voter will have to do the best he can to make up his mind without such aid to decision. He has to choose not between policies but between groups of politicians who will not say where they are going ; and neither the devil he knows nor the devil he has almost forgotten is impressive.

Outlook After Ottawa

NEITHER in its reporting nor in its comment has the British press done justice to the Ottawa conference which ended on September 20th. It was perhaps too readily assumed that the Council of the North Atlantic Treaty Organisation would do nothing more than talk amiably about decisions reached in the Washington discussions of the American, British and French Foreign Ministers and in the headquarters of General Eisenhower ; and certainly the past record of the Council suggested that it was as likely to shadow-box as to get to grips with reality. Instead—as Mr Gaitskell's statement on Tuesday clearly suggested—there was a real and useful contest of wills and views, which could only have been staged by bringing together the foreign, defence and finance ministers of the twelve allied nations. Nato, in fact, has had its first real council of cold war, and is the better for it. An organisation of this kind tolerates no vetoes, accepts no majority votes, has no executive powers ; it must, therefore, talk and persuade before it can act. There is now some hope that the way is open for a joint approach to the root problem of the Atlantic alliance—to make the Europeans' defence of Europe as strong as it should be by 1954 without ruining the economic defences against Communism built up by the European Recovery Programme.

Because the Atlantic Council, as it is coming to be called, talked mostly about economic matters, its political gestures and decisions should not be forgotten. It cleared the ground for the new status of Germany, the revision of the Italian treaty and the admission of Turkey and Greece. It encouraged, mostly in the corridors, much talk about the growing sense of an " Atlantic community," which was welcomed by its Canadian hosts. It issued a cool and sensible joint challenge to the Soviet peace campaign. It appointed a committee without any representative of the Big Three to recommend ways of getting frequent consultation on foreign policy, " with particular regard to steps designed to promote peace," and to start thinking of the problems of " economic stability and social well-being " that will arise " both during and after the present period of the defence effort." All this will help to give Nato some political personality. Finally, it was healthy and useful that the smaller members should have asserted their right to be consulted on major issues, great though the need still is for Nato to concentrate such powers of decision and action as it can acquire.

That there would be frank talking and even a head-on collision of economic views was certain in the circumstances that faced Ministers, especially Finance Ministers, in Ottawa. For here were the Allied chiefs of staff in the Standing Group and General Eisenhower asking for more men for a European arms production programme one-third greater than planned ; Europe balking at the domestic impact of their rearmament plans, and Britain facing a large unexpected deficit in its balance of payments ; Congress cutting the economic aid programme for the year to next June by nearly one billion dollars ; and Mr Snyder saying sternly that the Americans could not discuss or contemplate any additional aid in the immediate future. Moreover, Europe had hoped that Congress would produce a flexible programme of aid that would give both stability and impetus to its economy while it made the double effort to produce more arms and yet to maintain reasonable living standards. It had hoped for dollars to use in increasing productive capacity—dollars, for example, to buy copper and zinc with which the French claim they could make tank-destroyers much more cheaply than the Americans.

This was how Nato members had conceived that " burden sharing " might work in practice. Instead they found that aid would be of an orthodox kind, governed by artificial distinctions between military and non-military needs and offering a dole instead of a fund for investment in joint production—generous and valuable, but still a dole. Likewise, the British representatives found themselves facing, without prospect of American relief, a deficit in sterling and dollars far beyond anything foreseen when they undertook the three-year rearmament programme a year ago. The Americans were affected by caution and second thoughts, arguing that their productive capacity is beginning to feel the strain and that consumers in the United States cannot be asked for further sacrifices unless they can be convinced that Europe is doing everything possible for itself. These critical points of difference were unfortunate and they show the need for better joint planning in the future. The fighting men's claims and the politicians' misgivings have been confronted. That is Nato's job, and the fact that the Ottawa conference did not take final decisions on these matters does not write it off as a failure.

The outcome of the conference can be summarised under two heads: action and assurances, and suggestions for the future. The most important decision is the creation of an executive bureau of twelve, with a representative of each government, to re-examine national rearmament programmes and produce its recommendations by December. There are two things to be said in favour of this step. First, the new body has the power to negotiate directly with General Eisenhower and governments and to seek a compromise between their points of view. Secondly, if this body succeeds, there will exist for the first time early next year a Nato plan for what has to be done and who will do it. National legislatures and cabinets will have international sanction for unpalatable decisions, recommended by men of high political position ; for it is hoped that the work of this body will be done—as it obviously should be—by a select group of three men of the calibre of M. Monnet, Mr Harriman and Mr Gaitskell. The operation will be delicate and difficult ; but it must not be allowed to fail. There will be great temptation, even as things are, to scale down the European effort ; there will be greater resistance to doing more, even if the military need for more is proved beyond doubt. The first need is to secure the carrying out of current plans in the hope that joint action will bring lower prices, a check to inflation and more aid from America in a new form.

American officials, aware of the mistakes made in presenting Europe's case for aid to Congress, will do their best to bring relief with the powers and resources they have. It may not be much, for it must be realised that Americans have to be convinced that much is needed. Europe's half-hearted attempts to start executing its paper plans for rearmament are hardly calculated to convince Washington that it is in danger of overtaxing its strength. There is no such doubt anywhere about the British effort. There is talk of placing valuable military orders in Europe, of advancing $500 million towards the cost of building airfields and improving the communications of Nato's forces on the continent, of action to provide raw materials and to keep a rein on their prices. Such measures would help France and Italy and the Low Countries, but are less likely to benefit this country. Beyond this it is quite clear that no additional direct aid from America is to be expected between now and next June, and that no assurances have been given about what will be asked of Congress when it considers the burdens of 1952-3 next January. General Eisenhower believes it necessary and possible that Europe should create its own army and fulfil its plan of producing $1½ billion worth of " hard goods " by next June, and raise to $3 billion its production plan for 1952-53, with a prospect of easing off in 1954. Congress knows this. And so the circle within which Nato members must work is clearly drawn: the amount of aid that Congress will grant next year depends on the performance that Europe produces now.

If the picture is depressing it cannot be called surprising, nor is its appearance at this moment to be regretted. There had been a tendency for western governments to say as little as possible about rearmament and to leave it to political opponents to proclaim that strength could not be achieved without harder work or less comfort. The debate is now open and the issues frankly stated. Americans who know Europe well believe that it can greatly increase its defence production and take most of the effort in its stride. Europeans maintain that Americans underestimate their political difficulties and do not realise that success depends not only on American economic aid but also on the way the Truman Administration directs its own defence programme. The bickering drowns the one fundamental truth about common defence—that its success depends upon its being carried out quickly and that a heavy burden now offers the only chance of a lighter burden in future. Clearly, the need for agreement and action is so urgent that the debate cannot go on very long. Nato's " three wise men " must find some solution by the end of the year. And it will be found only if governments live up to the ideal they themselves set out in Ottawa—that henceforward they should deal with their common defence programmes and economic policies as a team and not as twelve allies pulling in diverse directions. The price of security is high but there should be no talk of slowing down the pace of Europe's effort to attain it. General Eisenhower has the right to ask for a bigger effort, and if Europe and Britain persist they will earn the right to ask Americans to regard the further assistance that may be necessary from them as no more than their fair share of the total burden.

The Liberals' Choice

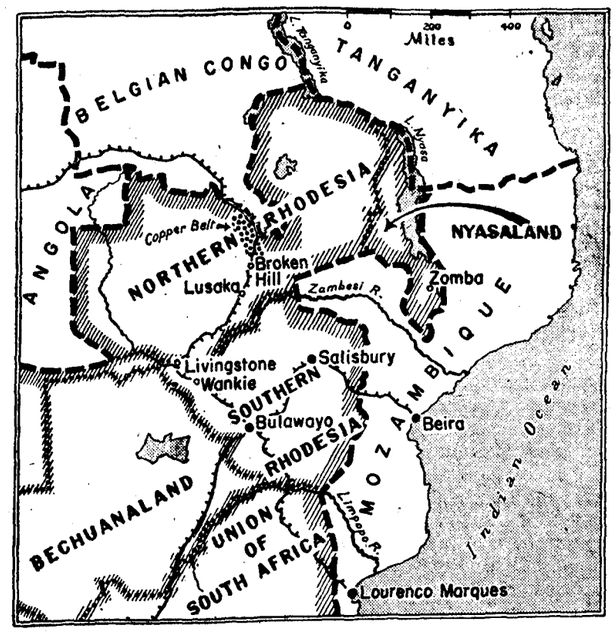
ALTHOUGH the two main parties seem set on frustrating the main purpose of this election, that purpose is nevertheless plain. It is to establish a firm government, to break the political deadlock of the past eighteen months and to provide—if possible for three or four years—relief from the atmosphere of continuous electioneering. To the liberal-minded voter the differences between Labour and Conservatism are small enough for an effective government of either of them to be in present circumstances a lesser evil than an ineffective government of the other.

This is presumably as much the view of official Liberals as of any independent observer. But an obvious question follows from it. Is it logically compatible with that view to vote for any but one of the two principal parties? The influence of the nine Liberals in the present narrowly divided Parliament has been negligible. How many more would there have to be to exert an effective influence if the margin between the two major parties were greater than it was after the last election? If there were only a few more, and even if they began to agree among themselves, they would still have little influence unless the division between Labour and Conservative remained as narrow as it is. A Liberal vote is likely to be a contribution to the decision of the country's future policies only if the stalemate continues—if, that is to say, there is no decision at all. To vote Liberal may be more effective as a negative gesture of disapproval of contemporary politics than abstention. But, except where one of the main parties is supporting a Liberal candidate against the other party, it cannot be much more than that. In a three-cornered contest a vote for the Liberal candidate—even where he has a good chance of victory—runs the risk of being in effect a vote for the continuation of stalemate. That would be the worst possible outcome.

This is a deeply distasteful conclusion, to the resistance of which legions of wishful arguments will at once be called up. The past of the Liberal party is so great that even its palest survival rightly commands large funds of affection and respect. The Conservative and Labour parties embrace extremes, on the Right and on the Left, that are equally objectionable to any British Radical. Yet the fact of the two-party dominance of modern politics cannot be simply set aside. It is easy enough to understand why, in spite of some circumstances in its favour, there has been no revival of Liberalism since the war. Within both the other parties the centre of gravity has in the past ten years shifted a long way towards liberalism. The official Liberal party need not have been squeezed out by this pressure from two sides. The way to escape the thrusts would have been to get above them. The Liberal party could have remained a force if it had had in modern times a doctrine distinct from either of the others—a policy on a different political plane rather than a vague half-way house between two party programmes that already pay each other the sincerest flattery of imitation. In fact, so far from courageously defining a clear position for itself, the Liberal party has let itself fall victim to the vicious spiral of Parliamentary impotence and further electoral defeat. Official Liberalism has become, for all the brightness of its inheritance, an ill-assorted collection of disconnected and often unrealistic policies, whose proponents have leaned, on no predictable pattern, at some times to the Left and at others to the Right.

The strategy of the last election—the Liberals' appearance as a national party contesting the vast majority of constituencies—was a brave attempt to arrest the spiral. It might have been worthwhile, but the hope was forlorn. In the event, it failed intellectually as well as statistically; it clarified Liberal policy no more than it strengthened Liberal representation in the House of Commons. By its nature, it was a last gesture. Whatever hopes may have been legitimate before, since 1950 the Liberal party—in the sense of a national organisation seeking political power—has been kept alive by little but the reluctance of men to let an old institution die. It may well have an important future as a less ambitious organisation, concerned more with political thought and research than with the contest of elections outside the surviving Liberal strongholds. It is important that after the election the party's leaders should realistically consider such possibilities. But in this campaign the point has come where no Liberal can think of his vote primarily as an instrument for advancing his own party cause. He should ask what are likely to be its actual effects on the course of British politics in the next few years; and those effects have to be realistically thought of in terms not of the Liberal party but of the relative strength of Labour and Conservatism.

★



This is not an argument against voting Liberal. It is to say that the Liberal faces, if he examines his position carefully, a dilemma even more unpleasant than that of the floating voter honestly trying to assess the issues between the two main parties. Should the Liberal party contest as many seats as it can find money and candidates for, even though it knows that very few can win? Should the individual who has the chance vote for his Liberal candidate, even though he knows that thereby he can have no direct influence whatever on the course of British government in the next few years? To do so is made reasonable, in an Alice-in-Wonderland fashion, by the weakness and unrealism of the Labour and Conservative parties. To cry "a plague on both your houses" is perhaps as useful as anything that can immediately be done.

It is important—for the other parties as well as for Liberals—to recognise that this is the deeply pessimistic view implicit in each Liberal vote cast, in a three-cornered contest, on October 25th. The people who would like to support the Liberal party if they thought it had a chance still represent a very large section of British opinion. They draw on traditions more intimately associated with Britain's greatness than those of any other party. Yet to vote Liberal now is to say that for such people there are no immediate political results worth securing, that there is so little to choose between the two main parties that it is proper to register distrust of both even at the risk of helping to continue the stalemate between them. If things are really as bad as that, the Liberal party is right to try to keep a flag flying bravely in the storm; but Liberals must be the first to hope, even if they cannot believe, that British politics have not really sunk so low.

Federation and Fear

IT was never intended that the conference at Victoria Falls on the proposed federation of British Central Africa should make any far-reaching decisions. The conference was merely the culmination of a series of conferences held by the two Secretaries of State in the Rhodesias and Nyasaland. Its purpose was to help the governments concerned to decide whether or not to proceed with federation on the basis proposed, not to bind them to any particular course.

Viewed in this light the statement put out after the conference adjourned is not so inconclusive as it appears on first reading. In the first place, in spite of the Africans' uncompromising attitude before the conference, the discussions on federation are to go on. It is hoped, according to the statement, that the conference will reassemble in London in the middle of next year. Further, the delegates from the United Kingdom, that is, the Secretaries of State for the Colonies and for Commonwealth Relations, by endorsing the declaration in the statement that with the exception of the Africans the conference showed itself favourable to the principle of federation, have committed themselves more deeply than they have done hitherto.

What has persuaded them to do this in the face of the African attitude? Last June, when the report of the officials on federation was published, Mr Griffiths emphasised the assertion in the report that the need for federation was urgent. It was assumed that this urgency was caused by the racial policy pursued in the Union of South Africa and the fear of the spread of Afrikaner ideas and politics to the Rhodesias. It is true that, both last June and since, attempts have been made to present an economic case for federation. The dependence of the Northern Rhodesian copper mines on Southern Rhodesian coal is usually cited as an example of the dependence of the two territories upon one another. Another economic argument put forward is that the development of the three territories, particularly essential because their populations will have doubled in twenty-five years, could take place more easily if they were in closer association—if, for instance, the Zambesi were a source of power for the two Rhodesias instead of a frontier between them.

Yet the argument that political federation is necessary for closer economic association has never been convincing. If federation had been a simple matter to bring about, the economic case for it would have been stronger. But the known opposition of the Africans to federation must have made the British Government hesitate from embarking on the proposals, still less from proceeding with them after the African attitude had crystallised, if the main case had been economic. The political case has certainly more weight. While the Secretaries of State were in Central Africa, the formation of a so-called Democratic Party was announced in Southern Rhodesia, membership of which is restricted to Afrikaners. It is feared that in Northern Rhodesia increasing Afrikaner immigration may, in a few years' time, lead to an Afrikaner majority on the Legislative Council. But if it is agreed that the spread of Afrikaner ideas to Central Africa can be more effectively countered by a federation of the three territories than by each separately—an argument that is by no means proven—then that is an argument for doing something quickly. As it is, even on the most favourable assumptions, it will be a long time before the proposed federation can come about. The conference at Victoria Falls did not get beyond discussions of the principle of federation. Now comes the hard task of persuading the Africans in the three territories to agree to the principle. Only after all sides have agreed on this can the discussions on the proposed form of federation begin. At Victoria Falls the Southern Rhodesian and other delegates gave notice that they had reservations on some of the detailed proposals in the officials' report. It is probable that whereas Southern Rhodesians will want a majority on the federal parliament, the two protectorates, and particularly their African inhabitants, will insist that this wish shall not be granted. To reach a satisfactory compromise on this and other points is bound to take a long time.

The question is still asked therefore, now as in June, why the British Government is trying to achieve the very difficult and complicated task of federation when the fruits are so problematical. Perhaps the real answer is not the Zambesi's power or Wankie's coal or the import of Afrikaner ideas, but the very real and urgent need for better racial relations within the territories themselves. The main reason why Africans opposed federation was their fear of losing the protection of the British

Crown and being placed under the dominance of the European settlers led by Southern Rhodesians. They were afraid that they might lose their land and their political rights. And they hold these fears because of an increasing mistrust of Europeans, which is merely another aspect of the African nationalism that has been flowing at full flood since the war ended.

This very nationalism, coupled with the British Government's policy towards it, particularly in West Africa, has provoked corresponding fears of the Africans in the minds of Europeans. Hence the demand by the Northern Rhodesian Europeans for more self-government —for themselves. Hence the periodic requests from Southern Rhodesia for full Dominion status, which would remove the last vestige of the British Government's control over the colony's native policy.

On the face of it, to propose federation may appear a strange way of attempting to resolve inter-racial distrust. After all, it is not the first time that it has been proposed —and wholeheartedly opposed by the Africans. They could hardly be expected to look upon the new scheme as anything but another ruse to preserve the dominance of the Europeans. Yet there is just a chance that in attempting to allay the Africans' fears about federation the conference at Victoria Falls may have gone some way towards releasing the tension that has grown up between the two races. For instance, the statement declares that in any federation the protectorate status of Northern Rhodesia and Nyasaland will be accepted and reserved. This means that amalgamation of the three territories is ruled out unless a majority of the Africans themselves wants it. Secondly, the statement declares that land and land-settlement questions in the protectorates will remain the responsibility of the territorial governments, and not be given to any federal authority; and that the land rights of the Africans will remain secured in accordance with existing orders-in-council. Thirdly, it is declared that the political advancement of the peoples in Northern Rhodesia and Nyasaland will remain the responsibility of the territorial governments. It is further stated that these declarations should be enshrined as an integral part of a federal constitution.

Much more important, however, for the immediate future than these promises is the announcement, also contained in the statement, that Northern Rhodesian Africans would be willing to consider federation on the basis proposed "after the policy of partnership [between Africans and Europeans] had been defined, and as defined put into progressive action." It is still too early to appreciate the full significance of this announcement; but it is understood that round-table talks between the two races are to begin shortly. Thus, the meeting of Africans and Europeans in conference at Victoria Falls, in itself a step forward to racial harmony, is to be followed by further, more detailed, inter-racial discussions.

Economic and political partnership between the races, the statement goes on, is the only policy under which federation could be brought about. If some concrete progress is made towards this partnership, then all the discussions will have been well worth while, even if the scheme itself in the end comes to nothing. Without some such advance, for which the Europeans must take the chief responsibility, federation, even if it could be enforced, would achieve nothing. If Europeans and Africans in the three territories cannot co-operate, if the tension between them persists and increases, there can be no proper economic development—and no means of stopping the spread of the bitter racial politics associated with the Afrikaners.

Migrants Mark Time

THE international conference on migration which opens in Naples next Tuesday will have before it reports indicating that, if Europe's problem of surplus population is to be solved, over five million Europeans will have to cross the oceans to Australia and the Americas by 1956. Overseas emigration on such a scale has not been seen since the first decade of the century, when Europeans were crossing the Atlantic at a rate which at times exceeded a million a year. Today, when the doors of the North American continent are no longer wide open to all comers, the hard fact must be faced that emigration at that pace is beyond all practical possibilities. The thirty national delegations at Naples will serve their ends best if they refrain from all excursions into the realm of the ideal, and concentrate on seeing what can in fact be done to relieve Europe of some part of the pressure created by its population.

The choice of Naples as a meeting place is, however, unlikely to permit the delegates to underestimate the urgency of the problem. For the core of Europe's surplus population is to be found in Italy, and particularly in southern Italy. In March the Italian Government informed the Council of Europe that there are more than 3,000,000 potential emigrants in Italy, and estimates prepared by the International Labour Organisation for discussion at Naples put the figure even higher. With a potential increase in its working population of 250,000 a year, and a volume of unemployment which returns to the 2,000,000 level with monotonous regularity every winter, Italy provides Europe's most notorious population problem. Without Italy, indeed, there would be virtually no European pressure for emigration, for the problem of the German refugees from the East, discussed in the last two issues of *The Economist*, stands on its own.

This is not to deny the existence of substantial pockets of surplus population in other countries. The ILO has assessed the potential emigrants in Greece at over 300,000 and those of the Netherlands at 65,000 a year, while in Germany and Austria it estimates that there are over 1,300,000 *Volksdeutsch* and other candidates for emigration. But in the case of Germany there is considerable doubt about the numbers actually willing to leave Europe; a German estimate last March put the figure as low as 150,000. Even if the higher figure for Germany is taken as correct, it is probable that Europe could rid itself of most of its present surplus population by the normal processes of emigration if it were not for the exceptional pressure in Italy.

At the moment the scale of emigration is sub-normal. Between 1945 and 1949 nearly 2,000,000 persons left Europe to settle in other continents, the rate of movement being particularly high in 1948 and 1949; but during 1950 there was a sharp fall in emigration, which has been only partially remedied by some degree of recovery in the early months of 1951. This fall was due in part to the tapering off of the work of the International Refugee Organisation and the reduction of the displaced persons from Eastern Europe in its care to a relatively small hard core. But it also represented a slowing down in the rate of movement of ordinary migrants, as distinct from refugees; for example, emigration overseas from Italy, which in 1948 and 1949 had been running at nearly 200,000 a year, fell to below 140,000 in 1950.

To some extent this falling off was inevitable. After the war many former emigrants exerted themselves to bring their families to join them in their new homelands, and a fall in emigration was to be expected as soon as movements of this type which had accumulated during the war had been cleared away. It is doubtful, however, if this backlog accounted for more than 75,000 migrants from the whole of Europe in 1949. The greater part of the decline can be attributed to other factors, among which two are outstanding. At the receiving end, several governments—especially in Latin America—that launched grandiose immigration schemes in the first flush of peacetime have now exhausted both their enthusiasm and their funds; at the European end, a large proportion of those intending emigrants who had the money to buy passages have already crossed the oceans. Those who remain are mostly too poor to finance themselves.

The situation has been made worse by the fact that, at the very moment when overseas emigration began to dwindle, migration within Europe came to an almost dead stop. Intra-European migration seemed during the first postwar years to offer real hopes of easing the surplus population problem, particularly for Italy. Four years ago, when the European Recovery Programme was being shaped, the Committee for European Economic Co-operation estimated that some 680,000 workers were needed in various west European countries. Between 1945 and 1949 over 1,100,000 persons did in fact migrate from one west European country to another; but by the beginning of 1950 this flow had virtually dried up, and the OEEC then estimated that no appreciable shortages of labour remained in its member countries. Although intra-European migration has been a favourite topic at gatherings concerned with European unity ever since the Hague Congress of 1948, most delegates to Strasbourg are by now fully aware of its strict limitations, and in May the Consultative Assembly gave formal recognition to the fact that "since the problem of surplus population cannot be solved within the framework of Europe, some solution must be sought on the inter-continental level."

What form is that solution to take, and how is it to be initiated? The Council of Europe itself has not got beyond the stage of creating a European Manpower Board and collecting information. The ILO, however, held a preliminary conference on the problem in the spring of 1950, and the conference which it has now convened at Naples will be presented by its Director-General with an outline plan for the transfer of 1,700,000 Europeans to new homelands within five years. It has been made clear that this programme would supplement, rather than supplant, existing national schemes for helping immigrants. As well as providing a clearing-house where aspiring migrants could be matched with immigration possibilities, it would assume the much more costly responsibility of making interest-free loans, repayable over thirty months, to the poorer migrants and for making outright grants to the poorest. It might even operate its own shipping, as the International Refugee Organisation did.

It is only to be expected that most of the interested governments will give this project a warm welcome in principle, and then explain why they cannot, for a variety of reasons, contribute generously to the necessary funds. The costs of such a scheme must be considerable; at present transport rates, for example, the ILO estimates that the shipping of an average migrant family to South America or Australia costs between $700 and $800. The Naples conference is being asked to provide a budget of $10 million a year, and a revolving fund of $25 million from which loans to migrants could be made. But the countries most interested in shedding surplus population or receiving immigrants are either already committed to substantial expenditure under existing migration schemes, or are unlikely on their past records to contribute any large sums to the common pool. And the United States, which is already relieving most of these countries of a large share of their economic burdens, can hardly be blamed if it interprets any suggestion that it should foot the bulk of the migration bill as merely a new attempt to extract economic aid.

The Naples conference, however, may well lead to the expansion in some form or other of the resources available for the transfer of European migrants overseas. Any achievements secured by the ILO initiative will be welcome, not only for the economic benefits which a healthy rate of emigration can bring to both Europe and the receiving countries, but because some lessening of the population pressure is essential to the political stability of several European countries. Time is as important as money; even a modest improvement in migration, if made with the minimum of delay, can be more valuable than ambitious long-term projects which show no immediate results. The problem is partly psychological; many a European will be more heartened by the knowledge that a limited but steady flow of emigrants is actually on the move than by lavish promises of great things to come.

Even negative decisions may have their value. Recent debates in the Economic and Social Council suggest that a number of Latin American states are loth to invest in immigration schemes before seeing how far they can persuade the United States to finance them, and a firm pronouncement from Washington might stimulate some of them to act more briskly on their own account. There is, after all, no dispute about the value of suitable European emigration to the receiving countries, and most of these have every reason to expect more economical and more lasting benefits from an international programme than from their own sporadic and often unsuccessful efforts. Similarly, a frank discussion of real possibilities may induce certain European governments to consider whether they are not pitching their estimates of surplus population somewhat too high, and whether they could not in fact ensure a decent living for many of the people of whom they have hitherto hoped to rid themselves. What is required at Naples, in fact, is not only an effort to get a practicable scheme going at the earliest possible moment, but also a ruthless puncturing of unfounded illusions on all sides.

NOTES OF THE WEEK

The King

During this week the nation has anxiously awaited the bulletins about the King's health. His medical advisers have properly emphasised that the period of anxiety after his serious operation last Sunday is not at an end; yet his people at home and abroad have heard with relief and thankfulness the news of his progress and hope that it will continue. King George VI has completely captured the sympathy, admiration and affection of his people; for his strength of character and his devotion to public service have been plain for all to see. He has never spared himself, even after ill health first struck him two years ago; and the heavy burden of public duty has exacted its toll. All of his subjects in Britain and beyond the seas pray for his complete and rapid restoration to health.

Dilemma in Persia

Mr Attlee's Cabinet, at the moment of writing, has to take a momentous and difficult decision. The wild but cunning Dr Mossadegh, without support from parliament and on his own responsibility, has withdrawn the residence permits of the British employees of the oil company still left in Abadan. And the stern protest made by the British Ambassador in Teheran, coupled with reports that London and Washington were consulting about the action to be taken, have merely prompted the Persian Prime Minister to alert his forces in Khuzistan and threaten destruction of the Abadan installations if British forces should land. This may be bluff, but it is what Dr Mossadegh wants believed; and this wanton suggestion that he might destroy the great refinery he has tried so hard to seize is further proof of the fanatical determination with which British policy has to deal.

There must be considerable sympathy with the Government over a grave issue which should normally be kept above party disagreements. For whatever decision it takes—to use force now, to use it later, or to use it not at all—must affect the election campaign now beginning. Yet Mr Attlee's dilemma is largely of his own making, and Dr Mossadegh is merely exploiting the situation created by the British decision neither to withdraw all personnel from Abadan nor to protect British property there by force. In the hope that the regime would not survive Persian realisation that the oil industry faces ruin, a posse of the oil company's staff was left in Abadan to keep the flag flying. Now nearly two months have passed since Mr Churchill unwisely declared in the House of Commons that the Conservatives would "oppose and censure by every means in their power the total evacuation of Abadan"—and Dr Mossadegh is still there, defying the mounting but ineffective Persian opposition to his policy. The Cabinet must feel bound by Mr Attlee's reply to Mr Churchill that "our intention is not to evacuate entirely" and by the Lord Chancellor's assurance that the Government "accept all the implications that follow from that decision," even though Washington advises against the use of force.

*

Complete evacuation of British staff two months ago might by now have brought Dr Mossadegh down; but now there is no middle course. The Persians have been told to show every courtesy in their expulsion of the British next week, so guarding against the possibility that insult or injury to them would make London act in anger. The choice is between sending strong forces now and leaving Abadan completely in Persian hands. It is easily made only if the Government is quite clear what it wants to achieve. It can do without Persian oil, both crude and refined, important though it is to the free world; for the supplies can in time be replaced by oil from other Persian Gulf fields. It can go on hoping that hard economic facts might yet bring a change of government in Teheran and the return of the British. In other words it can go on being patient and leaving Dr Mossadegh to alienate opinion in Persia and in the free world. Thereby it would avoid the dreaded accusation of "brutal imperialism," which Asian and Middle Eastern powers might make in the United Nations, and would avoid bloodshed and its consequences. It is the course one would expect most members of the Cabinet to favour.

On the other hand, to abandon Abadan is clearly to invite confiscation and pilferings in other parts of the world. "Nationalisation" is already appearing as a slogan in other areas developed by British work and capital. Restraint commands little respect in the present mood of the Middle East and Asia. These are not points that British policy can brush aside. Without an election around the corner Mr Attlee might well have decided to wait a little longer for economic disaster to bring Dr Mossadegh down. As it is, he must be sorely tempted to say that, for once, it is Britain's patience that is exhausted.

Making Room for Defence

Mr Gaitskell's statement on his return from Ottawa should do much to clear away misconceptions and misreporting of British views on the defence programme. To have made it clear that this country has no intention of discarding any part of the £4,700 million programme to which it is committed was obviously desirable; equally it was legitimate to stress the weight of the burden which it imposes, concurrently with a formidable balance of payments problem, upon the British economy. All these matters were discussed at Ottawa, but "the general feeling" was that the execution of the programme, though difficult, was not impracticable—provided that co-operation among the allies and an equitable distribution of the burden of defence can be secured. Meanwhile, the burden-sharing exercise proceeds, whereas the burdens of high import prices, the loss of Persian oil and the fall in dollar earnings of the sterling area are already being felt in force. Whether Mr Gaitskell or a new Chancellor has to bear the responsibility for tackling these problems after October 25th, they will call for courageous and unpopular measures that will have to go well beyond the "further steps to restrict imports and expand exports" that Mr Gaitskell mentioned.

Although some of the assumptions on which the present programme was based have not been realised, the present British effort will not be reduced or delayed. But the Ottawa meeting raised the much more difficult problem whether present programmes are sufficient to satisfy military needs. Mr Gaitskell was perfectly frank about the economic implications for this country of such a decision, if in fact it should prove necessary to take it. To carry out more than the present programme would, in his judgment, involve "something like a war economy" for the member countries of Nato, both internally and in their relations with each other. It is very difficult to quarrel with this conclusion. Ottawa revealed much concern about the repercussions of the present programmes on standards of living, and Mr Gaitskell mentioned "the dangers that any too severe impact of that kind might bring" though he did not take issue with the broad conclusion in the discussions that these dangers could be surmounted.

To admit the need for a quasi-war economy if the present defence effort should prove inadequate and have to be increased is to concede for the first time that room has to

be found for defence. Hitherto, it has been supposed that the needs of defence could be found from expanding production, by a modest reduction in consumption that has not in fact occurred, and by sacrificing the surplus that Britain earned abroad last year. Instead, there is a large deficit of which the reserves can take care temporarily but not indefinitely, and a struggle of competing needs for defence, exports, capital construction and consumption that is being resolved, if at all, only by the crudest methods of control. The new government, whatever it may be, will have to take more determined measures than these if defence, even on the present scale, is to be pushed forward at speed.

Germans Face a Vital Decision

Critical decisions about the future of Germany had to be taken this week in Bonn. The West German parliamentary leaders have had to make up their minds how to answer Herr Grotewohl's latest proposals for re-establishing unity of the West and East German Republics. The governments of the Occupation powers are not intervening; they made their own proposals for free all-German elections as far back as May, 1950, and are still waiting for an answer from Moscow. Now Dr Adenauer must be trusted to handle his own colleagues and the Soviet German premier as he thinks best in Germany's interests.

An extremely difficult situation faces the Chancellor. He has just begun talking with the Allies about carrying out the Washington decisions, which mean in effect an alliance of Western Germany with its neighbours. On the other hand, Herr Grotewohl has made some genuine concessions to the western view and has hinted that more might come. As a result, the West German leaders are much more divided in their opinons than before. They differ, it is true, only on tactics, as none of them wishes to live in a Germany united under Communist domination. Dr Schumacher, however, has taken a stand which makes it extremely difficult for the Chancellor to plead for rejection of the Soviet German proposal on the grounds that the Washington decisions will give the Federal Republic a stronger stance from which to talk unity later. Dr Schumacher has already declared that anyone taking this line is open to the suspicion of being a tool of the occupation powers. He believes it would be best to challenge the Russians to show their hand. Dr Reuter, the Social Democrat Lord Mayor of Berlin, has taken an initiative of his own. He has suggested that a start be made on all-Berlin elections, as agreed laws already exist in the city. The Soviet German side has lost face by rejecting this proposal.
