Parley On The Parallel

THE crumb of comfort proffered a fortnight ago in a broadcast by Mr Malik has become a tough but recognisable crust. Diplomacy by radio has continued between General Ridgway, United Nations Supreme Commander, and the North Korean and Chinese Commanders-in-Chief. If all goes well, the emissaries of both sides meet on Sunday to discuss preliminaries to a cease-fire and armistice. So far General Ridgway can claim credit for three clear proofs of a desire to negotiate from strength: his were the first invitations to talk, the imaginative suggestion that the venue should be a hospital ship, and the acceptance of the Communists' preference for Kaesong and some days' delay. From the other side have come through the Chinese press signs of a determination not to lose face and a shrewd sense of the military advantages of a truce, all of which justifies fully the utmost caution and restraint. Indeed, fighting has been lately more bitter than for a long time, with the United Nations losing men at the rate of 400 a day. All the more reason then to remember that the whole initiative for a truce may turn out to be nothing but a manoeuvre for propaganda or military advantage. To guard against the first, there must be no discussions at Kaesong about anything but the means of establishing and keeping a truce on the battlefield. To guard against the second, the UN forces must beware of accepting, as a truce line, positions that are strategically untenable.

While people hope and pray that reason and humanity will prevail in this parley, it behoves those who address the public to keep pens and tongues in leash. Last Tuesday an ambiguous sentence in a speech by Mr Stokes, Lord Privy Seal and Minister of Materials, was served up as a political scandal, the *pièce de résistance* of breakfast reading for many millions of readers on both sides of the Atlantic. Mr Stokes was not in fact advocating a relaxation of effort—in fact, quite the contrary—but he was made to appear to be doing so. At a moment of anxious uncertainty about what events in Korea really portend, such journalistic irresponsibility was disgraceful. It has provided material in the United States for some unfair and damaging aspersions on the sincerity of the British Government's rearmament policy. British Ministers have a right to expect at such a moment that the London press will not fabricate missiles for Britain's enemies and critics abroad, and that Americans will not pounce on such shabby little shreds of evidence as it provides.

The British, even at the risk of misunderstanding, have always insisted that Korea was only one—and not the most important—sector in the cold war. For that very reason, they will be the less ready to relax if the Korean war is over. A slackening of effort and resolution and of the willingness to submit to economic restraints in the cause of human freedom is, in fact, very much less likely in this country than it is elsewhere. This is pre-eminently a time for concentrating on domestic beams rather than on foreign motes.

Outlook Uncertain

ON July 6, 1949, Sir Stafford Cripps announced that in the preceding three months the dollar position of the sterling area had worsened by $302 million compared with the first quarter of the year; on Wednesday this week Mr Gaitskell announced that the dollar position in the second quarter of 1951 had worsened by $306 million compared with the first quarter. The announcement of 1949 marked the beginning of the devaluation crisis, or at least of its public recognition as a crisis; this week's announcement marks, in all probability, the beginning of a new period of economic stringency.

The parallel, it should at once be emphasised, stops at this point. In 1949 the deterioration meant the doubling of what had already been in the first quarter a considerable dollar deficit. In 1951 the same deterioration means only that the considerable dollar surplus of $360 million in the first quarter has been cut to a mere $54 million in the second quarter. There is still—or, at least, there was over the past three months as a whole—a surplus. There is no reason for swinging from the recent optimism to a panicky pessimism about sterling.

But there are good reasons why even the Government should be prepared to re-examine closely and critically the assumptions on which present economic policies are based. In the inflationary world of the first half of the year the British economy has fared badly. It is not only that the dollar surplus of the whole sterling area has almost vanished. More immediately important is the fact that the balance of payments of the United Kingdom itself with all other countries, including the rest of the sterling area, has moved sharply from surplus to actual deficit. And internally, prices and wages appear to be rising rather faster even than the Government bargained for. The difficulties will not be short-lived. Many of the changes for the worse have grown stronger in the past month or two, and there is little hope that they have as yet exhausted their force. The economic outlook at mid-year is more difficult than in January, but it is also—and this is a point of much sharper significance—far more difficult than it was a mere three months ago, when the Economic Survey was published.

It is peculiarly hard to guess what may happen in the next six months. There are, however, two points of fundamental importance to British policy that should be stressed at once. The first is that rearmament is emphatically not the simple, direct cause of British difficulties that is often supposed—not only by Mr Bevan and his friends. The second point is that the screwing down of more controls, which is still the Government's reflex action in face of any shortage or difficulty, will not remove the economic strains and will not even make them on balance easier to bear.

The most likely cause of real disaster for this country—of a sharp fall next winter in production and exports, and a consequent crisis in the balance of payments—has nothing whatever to do with the outside world and almost nothing to do with rearmament. It is that the country will fail to mine enough of its own coal. The sluggishness of coal production is old-established. On the other side of the scissors—the rise in the demand for coal—the point of crisis was reached last autumn before the expanded defence programme had been translated at all into more arms production in the factories. If the National Coal Board were able to meet the foreign demand for British coal, instead of having to call in aid marginal imports of American coal for the British market, the chances of importing iron ore, steel, pyrites and timber from Europe would be far better and British industry would have some hope of satisfying the demands of both rearmament and exports. In fact Britain has so far this year exported 2,500,000 tons of coal, compared with 6,750,000 tons in the same period of 1950, and the Minister of Fuel on Wednesday made it plain that exports will remain the coal industry's residuary legatee, in a world where residuary legatees are lucky to get a crumb.

*

The coal crisis is the plainest example of a general failure. Broadly, the country's economic efforts are not yet being redistributed to meet the most essential claims first. In the first quarter of the year people consumed 5 per cent more, in real terms, than in 1950, although the Economic Survey calculated that in order to liberate resources for rearmament and exports they would have to make do, in the year as a whole, with a little less. Mr Gaitskell suggested on Wednesday that the discrepancy mattered little, and was no indication of weakness in budgetary policy, because much of the extra consumption was anticipatory. Such complacency could be justified only if the consumer's stocking-up with household goods and clothes had been at the expense of producers' and distributors' stocks. In general, it has not; it has been matched by current production. A large part of this year's extra industrial output—an increase, so far, of 5 per cent instead of the anticipated 4 per cent—has been production of consumers' goods rather than of armaments, exports and investment goods. The "planned" switch of resources has proved to be slow.

The importance of the lag at this stage would be slight if there were any sign of an effective policy for accelerating the switch. There is none. Mr Gaitskell reported (very cautiously) the impression that some workers are under-employed; in inflationary conditions it pays, as firms have learned by experience, to hang on to labour even when raw material shortages prevent its full employment. "I would appeal earnestly," Mr Gaitskell said, "for a change of approach to this matter. . . . If everybody took that line, we should never get the defence programme carried out." But what else can be expected in an economy more tightly stretched than ever before? How can labour be anything but immobile, as far as changes between industries or between regions are concerned, when inflated demand has driven the unemployment ratio down to as little as one per cent of the working population? Planning by exhortation never has suceeded, and it certainly will not move this mountain.

Such, very briefly, are the issues of internal policy that are as large a part of the British problem as anything happening in the world outside. And they are

JL
Xm56,M43EC (M43)61 162857

...ing issues, intensified but not created by the ...f rearmament. This is the first of the two fundamental points of diagnosis on which any effective remedy should be based. The second point is that restrictionist policies alone have very little relevance to the kind of economic difficulties that this country is facing.

In so far as Mr Gaitskell indicated any lines of action at all, they were restrictionist: it was necessary to be "extremely careful" about dollar expenditure; for coal there was far more emphasis on measures to restrict consumption—by any means, of course, but higher prices—than on increasing the supply; thoughts of a new export drive turned on the limitation of supplies to the home market.

Almost no one will deny that the present situation makes some new restrictions and controls unavoidable. But the need is for specific controls, serving limited purposes for a limited time, and they are worse than useless unless they are backed by an adequate monetary and fiscal policy to restrain inflation.

Internally, the problem is an inflationary excess of demand; to sit on the lid at one point merely ensures, in itself, that the demand will pop up—and draw resources away from rearmament and exports—at another point in the economy. Externally, British trade (visible and invisible) can enjoy no future adequate to the country's needs—either in a continuing cold war or in something a little nearer to peace—if sterling is to remain indefinitely the one major currency subject to effective exchange controls.

The opportunities of the past eighteen months have been missed, and this is clearly not an ideal moment for a dash to freedom either at home or in trade and exchange policies. Yet, just because some retreat into controls and restriction is now inevitable, it is more imperatively necessary than ever to give the world, and the British people themselves, some convincing reason to believe that there will some time be a possibility of escape. Increasingly the outside world wonders whether any time will ever suit Britain for shaking off the shackles of a war economy, or whether the British people have not come by long addiction to love their chains. If rearmament can permanently harm the British economy it is not by any small impairments of social security or by setting limits to consumption expenditures but by creating the impression here and abroad that there never again will be a fair field in Britain for enterprise and efficiency. Once this grows into a conviction, Britain's commercial prosperity, by which its people live, will be at an end. Sooner or later, rather than face the penalties of economic isolation must will be necessary to take a plunge back into f the Bri whether by then the water has grown iciere of a Mid Meanwhile the raft of controls will not be made States lashing on another log.

European Consolidation

GENERAL EISENHOWER'S speech in London on Tuesday is not one that can be ignored. It has long been apparent that if any real progress is to be made towards the unification of Western Europe it will not come through the incentive of economic gain but rather through the pressure of political needs and defence requirements. The Supreme Commander was exercising this pressure. His speech was as deliberate as it was blunt. He was telling the peoples of Western Europe that he could not do his job—or at least that he could do it only with greatly increased difficulty—unless the European signatories of the North Atlantic Treaty would create among themselves more unity than they have today. This is a serious matter. Nothing can more deeply disturb a government than to be told by its commander-in-chief that he cannot assure the safety of the realm. The Supreme Commander is now giving this warning to all the governments concerned.

This speech brings out into the open what has been common knowledge for some weeks among those who have had contact with General Eisenhower and his entourage. The system by which a single general is, in effect, responsible to over a dozen governments and has to deal with each of them separately is not working at all well. Tuesday's speech was in general terms; but by reading between the lines it is easy to see that what chiefly irks the general is the absence in Europe of any central organs of decision. During the war, he was responsible to the President and the Prime Minister in joint session; the edifice of allied co-operation had its essential organ of supreme decision; and it is this that is now chiefly lacking.

Had he been able to be still more candid, General Eisenhower might have gone on to say that it is not only in their lack of coherent organisation that *The Economi* Western Europe are deficient, but that ...ges in the Bill e... thing wrong also with their spirit and ... nonsense of th recent elections in France and Italy have ...ory campaign a the public opinion of the western countries complacency: the Italian elections did not u...es during De Gasperi and the French elections guaranteed ... mainta tinuance of moderate governments of the centre. ...ter the revelation that these elections make of the state of mind of the French and Italian peoples ought to be regarded as most disturbing. In the third year of the Marshall Plan, which has succeeded beyond expectation in rebuilding the European economies, in conditions of prosperity and restored standards of living—in short, in what ought to be a good year—a quarter of both the French and the Italian electorates vote Communist. And if they do these things in a green tree, what shall be done in the dry? If the good year is succeeded by a bad, if the French or Italian electorates come under the pressure of fear or misery, how much of democracy will survive? There is, at best, on the Continent a certain stubborn willingness to stick by the present governments and regimes as less bad than the visible alternatives. There is almost nowhere a positive faith in the possibilities of progress, such as the Russians and the Americans, in their different ways, both have. Those who can look beneath the surface find it difficult to be happy about the present state of Europe.

It was surely not by accident that General Eisenhower made his speech in London, in the presence of the Prime Minister and the Foreign Secretary. For however much the British themselves may dislike and resent it, the key to European unity lies in London. It is quite true that many of the appeals that are so frequently made on the

Continent for "a bold new British initiative" are mere escapism. But the fact remains that the problem of Western Europe cannot be solved without the most active and positive British co-operation. The British instinctively shy away from any description of themselves as Europeans, and they certainly cannot afford to be Europeans only, or even Europeans mainly. The simile of the three intersecting circles, first used by Mr Churchill, is a true one: Britain is the only ground that is common to Europe, to the Commonwealth, and to the English-speaking fellowship of the North Atlantic. But if it is true that Britain cannot belong exclusively to any one of the three, it is equally true that it cannot contract out of any one of the three. It is just barely conceivable—no more—that a British government might declare itself indifferent to the economic fate of Western Europe. But no British government can be other than deeply concerned when the political soundness and defensive stability of Western Europe are in question. That is the situation today, and General Eisenhower has deliberately served notice on the British Government that it must make an effort to provide leadership for [illegible]rope.

$360 mill[illegible]
$54 millio[illegible]

least, there[illegible]fortunately, far easier to see the need for such —a surplus[illegible]an to compile a practical agenda for it. The recent optim[illegible] of course, have their all-embracing solution. But there[illegible]ally not within the field of practical politics should be p[illegible]a super-government for a federated Europe the assumpti[illegible]period of time with which General Eisenhower based. In the[illegible] The American cry "look what we have year the British[illegible]ibly naïve, no matter how eminent the lips that the dollar[illegible]heard. America is not Europe; and the almost vanished[illegible]ry is not the twentieth. To urge the fact that the bal[illegible] in present circumstances is to obstruct dom itself w[illegible] of the ste[illegible]

actual[illegible]uch more fruitful approach would be to try to [illegible] the Supreme Commander what he most urgently needs, an organ where decisions can be taken quickly and collectively, the peacetime equivalent of the meetings of the President and the Prime Minister. There is a long list of things that the European nations already decide collectively, and the organs through which they do it are scattered over half a dozen capitals. Because these organs are dispersed and the functions of each one are circumscribed, they are manned by officials and their authority is partial and intermittent. The first task surely is to bring together in one place, and, so far as possible, in one organ, all these scraps of international machinery. When they are brought together, it should be possible for each government to send out a plenipotentiary minister, empowered to make bargains and to take decisions; indeed, the whole scheme might be give[illegible] impulse by a Conference of Prime Ministers. Th[illegible] a plea that governments should, in the first pha[illegible] least, cede to international bodies any authority that not already in theory ceded to them, but rather that the existing machinery should be concentrated for action. The generals, the economic organisers, the materials co-ordinators would then have a *locus* where they could deal with all the governments at once and get decisions. Unquestionably, if it worked, its functions would multiply.

The first job that such an organ would have to tackle would be to define the aims and dimensions of the common effort. One of the things that lies at the root of the current *malaise* of the European people is their feeling that they are menaced by the unknown. The demands that the policy of resisting Soviet imperialism puts upon them seem to be unlimited; there is no end to them in time or in variety; the cry is always for more and more quickly, until sometimes it seems that the means of avoiding war are, on the economic and social sides, as painful as war itself. That this impression has been allowed to grow up is a gigantic blunder. Nobody, of course, can define the programme in exact terms; but it should be easily possible to say what it does not amount to. In the roughest terms, the British programme is equal to about one-quarter of a total war—and the British programme is the biggest in Europe. It is simply not true that the peoples of Europe have to ruin themselves in order to be safe. It is fully possible to draw up a programme which will at one and the same time be large enough to convince the Americans that a real effort is being made and moderate enough to convince the European peoples that they will not be ruined.

*

The immediate agenda is therefore one of European consolidation—a consolidated organisation working out a consolidated programme. There is nothing of which the present British Government need be frightened in launching such an initiative. Indeed, they could justly claim that it is merely the international application of their new slogan: "Peace, then Plenty"—and it would assuredly do them no harm at home to demonstrate that they could still bring imagination to the rescue of foreign policy. The more valid criticism of what has here been suggested is not that it is too much but rather that it is pitifully little. So it is; but there are two things that can be urged in mitigation of the offence. The first is that politics is the art of the possible; and the governments of Europe today are all of them so narrowly based that large gestures will upset their equilibrium. Certainly the British Government, with its narrow majority and the exhaustion of its personnel, cannot be expected to move any further than this in the coming months. The other thing is that there is a limit to what can be done by governmental action and administrative devices in the absence of an active public opinion based on common belief in a positive creed of action. This is what is missing in Europe today. We know what we reject; we do not know what we believe in. It is within the power of statesmen to give an impulsion to thought and to create an atmosphere in which minds can come together. But the creation of a new faith is not within their powers. For that Western Europe still awaits its prophet.

THE ECONOMIST, 22 RYDER STREET, LONDON, S.W.1

Nato and Turkey

IF Signor De Gasperi is asked to try to form a new Government and is successful, he will have to solve problems of extreme difficulty during the two years which presumably remain before the next general election. Perhaps half the Christian Democratic Party wants to halt agrarian reform at its present stage of merely initial realisation; some would even go back on that. A highly contentious governmental Trade Union Reform Bill now, at last, lies before Parliament. Its application as law would cut profoundly into current trade union routine and would clearly challenge the position of existing trade union leaders. To these specific problems must be added the need for a greater and more convincing skill in combining the exigencies of confidence in the currency and of fuller employment, and in compromising between the need to concentrate rearmament production where it is economically likely to be efficient and the social and political need to place it where it will help in the rehabilitation of depressed and backward regions.

All these are questions which would continue to be pressing even if the Italian political spectrum stopped short at the centre and conservative segments of Christian Democracy. The Chamber, however, includes a good fifty members further to the right, of whom a couple of dozen could be counted as extreme right. It may be exaggeratedly gloomy to recall that the Fascists got into power in 1922 without finding it necessary to have more than 33 members, but certainly the extreme right in Italy has a traditional tendency to serve as a tail wagging a portly and moderate dog. In the municipal elections of this summer, according to the calculations of Togliatti—in this case a fairly detached observer—the Christian Democrats have already lost half a million votes to the MSI, the specifically Fascist party, though the final batch of these elections, including Fascist strongpoints in Rome, Naples, and elsewhere in the south, have still to be held. The recent sufferings of the De Gasperi administration had as their background an undoubted exuberance, in the country, of right extremism.

Youth and Dynamism

The MSI, like early Mussolinian Fascism, offers itself as the final goal of the pilgrim moving rightwards, though, as is the case with Communist leftness, these designations have become partly paradoxical. The comparative "moderates," agrarian Liberals, Monarchists, and the deviationists of Christian Democracy known as the "Wasps"—responsible for recent near-defeats of De Gasperi in the Chamber—have much more of a traditional rightish appearance. The MSI fully perpetuates the Mussolinian mythology of youth and dynamism, and is prepared in its domestic programme to out-socialise Socialism—on paper. An MSI demonstration in a large town will almost always prove to have a nucleus of university students, a far more numerous class than in Britain. This youthfulness, however, by all precedents, means that financing, and probably more than mere financing, comes from outside sources. The immense pageantry and oceanic pamphleteering produced by the MSI this summer in Sicily must have been financed from very imposing sources. From North Italy, it is said locally. In fact the present political struggle behind the scenes doubtless includes fierce tussles between the organisers of the late government and the extreme right for the moneybags of industrialists seeking safety from Communism.

The MSI as it emerged from its feeble showing at the 1948 general elections failed to throw up a political leader of consequence. It is now rumoured, however, that Prince Valerio Borghese, a much decorated naval hero in his forties who followed Mussolini in his last adventures in North Italy, and who was soon amnestied after getting a twelve year sentence for treason in postwar Italy, is meditating in a castle, and preparing himself for the role. The Roman Prince has a magnetic presence, heady and resourceful eloquence, and the strand of foreignness commonly found in very ardent nationalists (he is partly Levantine-Dutch and has a Slav wife). Another last-ditcher old Fascist who openly led the recent MSI campaign in Sicily is ex-Ambassador Anfuse. These names at once bring out the difficulties of the extreme right movement in Italy today and its involvement in historical complications unknown to proto-Fascism. The old Fascist party fell asunder in 1943 when those who followed Mussolini to the north regarded the faction of Ciano and Grandi as traitors. The later faction, in fact, as yet lives only on the margin or outside the MSI but it has money, talents, and experience.

A similar or greater difficulty besets efforts to bring the MSI together with the Monarchists, despite their equally inflamed nationalism. The two regard each other as smirched with the brush of treason in the events of 1943. The Monarchists were stronger than the MSI at the 1948 general elections but appear now to be losing their appeal. There must be mentioned also a third (or fourth) extreme right, lacking a party description but possessing a dynamic leader, Dr Luigi Gedda, the clerical-nationalist, and close friend of the Pope. Dr Gedda has in recent years created and led the "Civic Committees," a financially potent and extremely active anti-Communist propaganda institute which has become progressively detached from the Christian Democrats and especially from Signor De Gasperi. It represents a pole of attraction for Catholic right wingers, and has recently been courted, but in vain, by the MSI whose "pagan" tendencies no clerical can hide from himself. The Monarchists, meanwhile, sometimes revive the tradition of 19th century liberal anti-clericalism.

The complexities of right-wing affiliations have come strongly into the picture in Sicily. The island enjoys an autonomy on similar lines to Northern Ireland, and has just elected a new local Parliament. Of its 90 members one third are Christian Democrats, one third extreme left, a handful are of the left centre and the rest are split between Monarchists and Fascists. The Christian Democrats could form a centre-ish Government with Monarchists and left centre, and this the local Monarchists wished to do, apparently with the approval of ex-King Humbert. But they have been ordered by their Rome headquarters, for higher reasons, to act in combination with the MSI. Some of the leaders have therefore split away; no government has been formed in Sicily six weeks after the elections. The crystallisation needed to give consistency to the mounting forces of the Italian extreme right has thus not yet been realised; but that is a process which, if things began to go really badly in this hotly imaginative country, might happen pretty quickly.

for the summer ; at the very best, a new treaty could not get through the barrage of committee hearings and reach a vote on ratification until, say, Easter of next year. The Administration's influence on Congress is low, and may well be lower in a presidential year ; and it has now admitted that it would in any case prefer another method. This adds up to a virtual certainty that no substitute pact is possible at least for a long time. The European members of Nato really cannot hope to force on the Americans a course which neither they nor the Turks want. It looks like a clear choice between Turkish membership of Nato or a rebuff to Turkey the consequences of which are difficult to foresee.

The argument must be brought to an end, and the only way to do so is to accept Turkey and Greece as members of Nato. But if this is to be done, it is only fair to ask of the Americans recognition of three essential points. The first is that nobody shall be asked to say that it is a good solution of the problem ; it may be the only practical one, but it will remain a piece of diplomatic botching. The second, which follows from the first, is that it shall set no precedent. General Marshall mentioned Spain as well as Turkey and Greece ; but the Spanish case is entirely different. Turkish neutrality would be a disaster ; but it is difficult to see what Spain has to offer that is worth paying such a price for. Thirdly, even if there cannot be a Middle East [illegible] it is high time that the Americans, the organisers, the materials as the strategists, began to take a constructive responsibility for its defence. They have a considerable interest in the Middle East. They have, very few resources to spare for a new area, but have the British, and yet the Middle East cannot be left to go by default. In the event, it would be a responsibility of the combined Supreme Command ; nothing is to be gained, and much risked, by failing to recognise it as such now.

Removing the Stigma

An extract from Hansard of July 1, 1967, on the occasion of the second reading of the Welfare State (Consequential Provisions) Bill.

THE Minister for the Co-ordination of Social Services: In moving that a second reading be given to this Bill, I am more than usually conscious of the shadows of former occupants that are grouped around the [illegible] of course, have their all-embracing solution.

But there [illegible] really not within the field of practical politics [illegible]uld be pre[illegible] super-government for a federated Europe [illegible] assumption[illegible]period of time with which General Eisenhower [illegible]ed. In the[illegible]. The American cry "look what we have [illegible]r the British [illegible]federation, go ye and do likewise" is, in [illegible]t the dollar subly naïve, no matter how eminent the lips [illegible]ost vanished. [illegible]eard. America is not Europe ; and the [illegible]t that the balan[illegible]ry is not the twentieth. To urge the [illegible]m itself with[illegible] in present circumstances is to obstruct the sterlin[illegible]

[illegible]ual de[illegible]uch more fruitful approach would be to try to [illegible]e the Supreme Commander what he most urgently needs, an organ where decisions can be taken quickly and collectively, the peacetime equivalent of the meetings of the President and the Prime Minister. There is a long list of things that the European nations already decide collectively, and the organs through which they do it are scattered over half a dozen capitals. Because these organs are dispersed and the functions of each one are circumscribed, they are manned by officials and their authority is partial and intermittent. The first task surely is to bring together in one place, and, so far as possible, in one organ, all these scraps of international machinery. When they are brought together, it should be possible for each government to send out a plenipotentiary minister, empowered to make bargains and to take decisions. [illegible]

White Paper. It is not that the Government is frightened by the astronomical figures that the Actuary has presented—it has never been the tradition of our public life to pay too much attention to a situation expressed in terms of pounds and crowns, as I believe the saying is. Rather, it is that we believe that [illegible] and the British programme is the biggest in Europe. It is simply not true that the peoples of Europe have to ruin themselves in order to be safe. It is fully possible to draw up a programme which will at one and the same time be large enough to convince the Americans that a real effort is being made and moderate enough to convince the European peoples that they will not be ruined.

*

The immediate agenda is therefore one of European consolidation—a consolidated organisation working out a consolidated programme. There is nothing of which the present British Government need be frightened in launching such an initiative. Indeed, they could justly claim that it is merely the international application of their new slogan: "Peace, then Plenty"—and it would assuredly do them no harm at home to demonstrate that they could still bring imagination to the rescue of foreign policy. The more valid criticism of what has here been suggested is not that it is too much but rather that it is pitifully little. So it is ; but there are two things that can be urged in mitigation of the offence. The first is that politics is the art of the possible ; and the governments of Europe today are all of them so narrowly based that large gestures will upset their equilibrium. Certainly the British Government, with its narrow majority and the exhaustion of its personnel, cannot be expected to move any further than this in the coming months. The other thing is that there is a limit to what can be done by governmental action and administrative devices in the absence of an active public opinion based on common belief in a positive creed of action. This is what is missing in Europe today. We know what we reject ; we do not know what we believe in. It is within the power of statesmen to give an impulsion to thought and to create an atmosphere in which minds can come together. But the creation of a new faith is not within their powers. For that Western Europe still awaits its prophet.

NOTES OF THE WEEK

A Shilling for Our Thoughts

This first issue of a new volume of *The Economist* is the appropriate moment to answer the many inquiries that have been received about the selling price of the journal. There has been a fantastic rise in the cost of paper in the last twelve months and printing charges move steadily upwards. Like all other periodical publishers, we have had to review our accounts most carefully. But having done so we still think that it will be possible to keep the price of *The Economist* at a shilling, at least for the time being. If costs continue to rise, a time will come when we shall have to give way ; but that time is not yet.

The price of *The Economist* was raised from eightpence to one shilling in June, 1920. There are not many things of which the selling price has remained unchanged for over thirty years. The credit for this achievement belongs to the support we receive from our readers, both directly in raising the circulation to about five times the prewar level, and indirectly in making the paper an increasingly attractive medium for general advertising. We shall continue to do our best to make *The Economist* worth a shilling—encouraged by the fact that the task gets easier month by month.

* * *

Politics of Truce

A truce in Korea—if there is a truce—will not make the British Government shut its eyes to danger and reduce the present defence programme. On this point the Prime Minister's statement on Wednesday had to be regrettably general, because it was designed to cover up loose talk by his colleagues, but it was still plain enough ; one must hope that, in spite of Mr Churchill's harrying, Mr Attlee convinced both allies and possible enemies abroad. The point should, indeed, have been too obvious to need making. To put the matter at its lowest, Labour ministers have faced considerable trouble with their supporters in order to commit themselves to rearmament. Having once made the effort, they can hardly be so foolish as to turn back just because the Kremlin blows a little softer—without in any way reducing the risks that a three-year defence programme was designed to meet.

Mr Stokes's speech on Monday, which caused part of the trouble, was obscurely phrased but was not really open to anything but deliberate misinterpretation. Mr Shinwell was more foolish ; he had said that "at the slightest sign" the Government would be only too willing to curtail rearmament. But Mr Shinwell's week-end volatility should by now be too well known to be taken seriously. It must be remembered that he sees himself as the leader of the Left that has stayed right, instead of following Mr Bevan's deviations, and is therefore under compulsion to provide some feints of deviation himself.

But while a Korean truce would change defence policy little if at all, its other political effects might be considerable. The possibilities are now being actively canvassed at Westminster. The Bevan group appears to be delighted ; the as yet unhatched truce is supposed to show that rearmament was never so necessary as the Government thought. It is hard to imagine that many new adherents can be won by this simplicity. What a Korean truce may in fact show is, plainly, that negotiation may succeed when it is negotiation from strength ; it will confirm the effectiveness of rearmament, not demonstrate its redundancy. But by October this may be old history, and it is only too possible that in an atmosphere of relief the Government would by then have more difficulty in answering Mr Bevan's criticisms within the Labour Party. There is a consolation. More and more Labour MPs seem to be convincing themselves that Labour's only way is to go to the country in the autumn as the party that has proved its ability to save the peace. And then, of course, promises of plenty—with lower prices—would fit in.

* * *

The Finance Debates

The Finance Bill was read a third time in the House of Commons on Tuesday night, and the dozen days of debate are over. Both sides have emerged well pleased. The Government has passed the test that many people thought likely to prove its undoing even before the contents of the Budget, and Mr Bevan's objections to it, were known. The Chancellor of the Exchequer had secured the passage of his contentious changes in the national health service before he brought in the Finance Bill, and Mr Bevan's group did not choose to make any other serious flank attacks. The effective battle was with the Tories alone and though long—the debates occupied altogether 120 hours—the Government not only kept its majority but suffered few moral defeats. On the other hand, the Tories obtained enough changes in the Bill—particularly in the tax avoidance clauses—to justify their energy, which led them to force a total of 70 divisions. By the end, they could claim to have opposed intelligently and well. There was, of course, an element of filibustering in the tabling of 250 amendments and 90 new clauses to a Bill of 38 clauses, but in practice the opposition at a narrowly party level was certainly no greater than the political situation made unavoidable. Captain Crookshank was entirely justified in pointing out that the changes in the Bill eventually conceded by the Government made nonsense of the Prime Minister's attempt to label the Tory campaign a "sham battle."

Although there were a few bad patches during the all-night sittings, the debates were on the whole maintained at an exceptionally high standard. The fact that the lawyers so far outshone the economists and financiers can perhaps be attributed to the concentration of attention, during the committee and report stages, on the tax avoidance clauses. Sir Frank Soskice, who proved imperturbable during even the most exhausting periods of the debate, was matched in clear headedness by Mr Selwyn Lloyd, a back-bencher whose place in any future Tory Government is probably now assured. Unfortunately it cannot be said that any reputations for the handling of general economic policy have been noticeably improved on either side of the House.

* * *

Persia and Foreigners

For the first time, Dr Mossadegh seemed to pause in his campaign to get British hands off Persian oil when he withdrew his anti-sabotage Bill. By tabling this measure in the Majlis, he had threatened to place all oil company employees in an intolerable position, exposing them to summary trial by military courts for happenings which might well be accidents caused by inexperienced Persians. The British staff still in the country unanimously rejected the Persian government's offer to employ them in the national company, and their position is little mitigated by the action of the Persian Ambassador in Washington in issuing a memorandum explaining that Persia means no harm to foreigners. Certainly their security of life and limb has not yet been violated, but Persian hands have been laid, in unwarranted fashion, upon their houses and their brief cases. Simultaneously, Dr Mossadegh is insisting that all moneys earned by the British staff with British apparatus are now

The Finance Debates

The Finance Bill was read a third time in the House of Commons on Tuesday night, and the dozen days of debate are over. Both sides have emerged well pleased. The Government has passed the test that many people thought likely to prove its undoing even before the contents of the Budget, and Mr Bevan's objections to it, were known. The Chancellor of the Exchequer had secured the passage of his contentious changes in the national health service before he brought in the Finance Bill, and Mr Bevan's group did not choose to make any other serious flank attacks. The effective battle was with the Tories alone and though long—the debates occupied altogether 120 hours—the Government not only kept its majority but suffered few moral defeats. On the other hand, the Tories obtained enough changes in the Bill—particularly in the tax avoidance clauses—to justify their energy, which led them to force a total of 70 divisions. By the end, they could claim to have opposed intelligently and well. There was, of course, an element of filibustering in the tabling of 250 amendments and 90 new clauses to a Bill of 38 clauses, but in practice the opposition at a narrowly party level was certainly no greater than the political situation made unavoidable. Captain Crookshank was entirely justified in pointing out that the changes in the Bill eventually conceded by the Government made nonsense of the Prime Minister's attempt to label the Tory campaign a "sham battle."

Although there were a few bad patches during the all-night sittings, the debates were on the whole maintained at an exceptionally high standard. The fact that the lawyers so far outshone the economists and financiers can perhaps be attributed to the concentration of attention, during the committee and report stages, on the tax avoidance clauses. Sir Frank Soskice, who proved imperturbable during even the most exhausting periods of the debate, was matched in clear headedness by Mr Selwyn Lloyd, a back-bencher whose place in any future Tory Government is probably now assured. Unfortunately it cannot be said that any reputations for the handling of general economic policy have been noticeably improved on either side of the House.

* * *

Persia and Foreigners

For the first time, Dr Mossadegh seemed to pause in his campaign to get British hands off Persian oil when he withdrew his anti-sabotage Bill. By tabling this measure in the Majlis, he had threatened to place all oil company employees in an intolerable position, exposing them to summary trial by military courts for happenings which might well be accidents caused by inexperienced Persians. The British staff still in the country unanimously rejected the Persian government's offer to employ them in the national company, and their position is little mitigated by the action of the Persian Ambassador in Washington in issuing a memorandum explaining that Persia means no harm to foreigners. Certainly their security of life and limb has not yet been violated, but Persian hands have been laid, in unwarranted fashion, upon their houses and their brief cases. Simultaneously, Dr Mossadegh is insisting that all moneys earned by the British staff with British apparatus are now

the property of the Persian government. He expects too much of human nature if he imagines that in such circumstances he will get these British employees to assist in the immolation of a company that has been a good master. Despite his withdrawal of the anti-sabotage measure, therefore, their departure is still on the cards. Their notice expires on July 27th. It remains to be seen whether his slender sense of the realities of the oil industry will once more come into play before that date.

By then production will be virtually at a standstill unless Dr Mossadegh alters his present insistence that receipts for oil shall be made out to the National Iranian Company only, and shall in no way safeguard the Anglo Iranian Company's partial rights. The American Ambassador, indefatigable in the pursuit of compromise, is still seeking an acceptable draft. Production has already slowed down because, now that all tankers have refused to sign the Persian form of receipt and have left Abadan, it is restricted to the amount of oil that can be stored locally. Production cannot continue beyond the end of July unless the tanker problem is solved.

Meantime the Persians are recruiting other foreigners, and are having—it seems—some success in collecting a handful of Germans and Italians. These people are as much at liberty to take the jobs as are the British to go. That they will find no easy taskmasters is evident in the fact that many Indian and Pakistani employees at Abadan wish to get away. Other foreigners lately in Persian employment can also give warning that the Teheran government is neither a regular nor a willing payer of promised salaries.

* * * *

The New International

It is a sign of the times that Mr Morgan Phillips, secretary of the Labour Party, should play the leading part in recreating the Socialist International and persuade over thirty Socialist parties to accept a statement of principles in which the spirits of the Webbs and Keynes trample on the ghost of Marx. There was probably a respectable proportion of Marxists among the European and non-European delegates who gathered last week in Frankfurt, but they must have felt the sands blowing away beneath their feet. They were asked to break with the doctrinaire past, to admit that the lot of workers has improved in many countries, to renounce proletarian revolt and the class struggle, and to taste respectfully the fruits plucked by the Labour Party from six years of experience in power. Nationalisation is no longer to be the universal panacea, but something of which the relevance and value will vary from country to country. Its place at the centre of doctrine is taken by planning: and the whole task of planning does not necessarily fall to the state, for decentralisation may be wise or necessary. This can be interpreted both as a reflection of British administrative experience and as a concession to the syndicalism that is still strong in France and growing stronger in Western Germany.

Anxious as they are to define clearly their differences with the Communists, the Marxist Socialists seem to have found it hard to argue against the practical achievements claimed by the British, the Australians and New Zealanders, and the Scandinavians: subsidies, housing programmes, expanded social security, and managed economies. They found themselves voting for what is virtually a British electoral programme of "full employment, increased production, social security and a just distribution of incomes and property."

If the new Socialist International can be made harder headed than the old Second International that was founded in 1889, much will have been gained, and the leadership that has fallen to Mr Morgan Phillips and his colleagues can prove useful as well as flattering. But one wonders whether the British delegates had the courage to point out that the ease and relative success with which they had made their experiments in this country owed much to the civic virtues and patient tolerance of the people—qualities that are notably lacking in parts of Europe. It is roughly true that in Britain the middle-class long ago stopped playing the economic and social game according to Marxist rules, whereas in France and Germany there still exist political parties which see to it that the game goes on. The new organisation should be able to do something to restrain any tendency of Socialist parties to fall towards totalitarian habits in their efforts to outbid the Communist Party.

* * *

Shooting in Bangkok

The importance of the attempted *coup d'état* in Siam last weekend is that for twenty-four hours it had much of the free world wondering whether the Communists were directly behind it or not. This anxiety was an indication of the extent to which Siam is a key state in South-East Asia and its Prime Minister, Field Marshal Pibul Songgram, a key figure in the evolution of the area as a whole. So long as he remains in power, Siam will probably play an active role in the United Nations and in the struggle against Communism; his rule has already meant that Bangkok has recognised the Bao Dai government in Vietnam, has helped to patrol the Siam-Malaya border and has sent troops to Korea. If, on the other hand, Marshal Pibul were overthrown, Siamese foreign policy would probably veer away from its present line, either into traditional neutralism or into alignment with the Communist bloc.

The architect of the plot last weekend appears to have been Lieutenant-General Kach Sönggram, who had enlisted support in the only quarter outside the government where power nowadays resides—the navy. General Kach was one of the three men who originally helped Marshal Pibul to seize power in 1947; however, unlike the other two—General Phin, who was rewarded with supreme command of the army, and General Phao Sryanond, who became the effective head of the police—General Kach quarrelled with Marshal Pibul and was exiled last year to Hongkong. General Kach is strongly nationalist and anti-foreign. He would probably not have wished to ally Siam with the Sino-Soviet bloc any more than with the anti-Communist powers. But two of his reported associates in the attempted coup were less unattached; they were Admiral Taharn, who has sympathies wtih Marshal Pibul's rival as a Siamese elder statesman, Pridi Phanamyong and also Momrajawongse Seni Pramoj, a former prime minister who has also been regarded as a possible sympathiser if Nai Pridi returned to Siam. The significance of this is that while the plotters were in contact with Nai Pridi, he in turn is now generally believed to have contacts with the Communists. The plot was not therefore Communist but, if it had succeeded, the road to eventual Communist domination would have been open. The same pattern has already been seen in the other recently attempted *coup d'état*, that in Pakistan, and may yet appear in Persia, following the murder of Ali Razmara and the assumption of power by the unstable nationalist, Dr Mossadegh.

Having ridden this latest storm with unprecedented success—for the army, air force and newly mechanised police force were all loyal to the prime minister, although he had been kidnapped by the plotters—Marshal Pibul is probably more secure in power now than before the coup was attempted. This result is of positive value to the free world, even if the Marshal is more of a dictator than a democrat.

* * *

Dalton's Weekly

Dr Dalton's weekend homilies have rarely struck a more Utopian note than that sounded in his speech at Croydon last Saturday. He promised a full-scale attack on "all the pernicious practices of monopoly capitalism"; he condemned

with equal vigour the "ruinous selling below cost" of the "bad old days of Tory misrule." He opined that high profits were clear proof that price control had so far been too tender, and should be "stiffened"; at the same time he looked forward to seeing "more efficient firms" absorbing the labour force and the materials now inefficiently used by high cost traders. The lion of competitive efficiency and the lamb of social justice and security are in fact to lie down together under the shadow of the White Paper on Resale Price Maintenance.

Dr Dalton was once an economist, and one, moreover, whose *forte* was the explanation of elementary truths and of common errors in simple terms to uninstructed minds. His abilities in that sphere need not be supposed to have atrophied. It would be interesting to hear them applied to the proposition that no commercial mistake should ever be recognised by selling below cost—eggs from Gambia, for instance?—or to the delineation of the moral frontier between virtuous and "ruinous" competition. It would be still more enlightening to watch him trace the sequence of motive and action by which the "more efficient firm" is supposed to attract the resources of the less efficient, in face of the certainty that any resulting increase in profit will be the signal for a "stiffening" of control and for the public obloquy due to the profiteer.

One really cannot have it both ways. It is an excellent thing that Socialists should be rediscovering the virtues of competition, and that a sap should be driven under the buttresses of what Mr Morrison has called private unenterprise. But the reward of enterprise is profits; the reward of superior enterprise is superior profits. And if not only superior but inferior enterprise is reaping an abnormally high surplus at a time of rising prices, it is those rising prices that are enabling them to do so; it is not their profits that are making prices rise. Or so Dr Dalton used to inform his neophytes, long ago. It is a pity that the exposition of elementary economic interconnections should now be entirely sacrificed to a blend of Utopian promises and full-blooded denunciation. But, in politics as in commerce, there are profits to be won from a debased currency.

* * *

Fifty Years of Education

Instead of its usual annual report the Ministry of Education has published a survey of "Education 1900-1950."* Progress in this period has been by fits and starts, but the total result has been, nevertheless, a revolution in the schools, particularly for the non-academic child. Apart from the all too frequent survival of obsolete buildings, the life of a school-child is now unrecognisably different from what it was fifty years ago. Within this period there are three principal milestones: the 1902 Act followed by the Morant administration; the 1918 Fisher Act, much of which was made inoperative by the Geddes economy committee; and the 1944 Butler Act. It is too soon to say how far economies, present and to come, will prune the last, but already the reorganisation of secondary education and the raising of the school-leaving age have become too established to be undone. The crux of the problem is to maintain existing standards for a growing number of school children, without a proportionate increase in teachers and classrooms.

Pupils and Full-Time Teachers in Grant-Aided Schools
(Thousands)

Year	Grant-aided Elementary Schools			Grant-aided Secondary Schools		
	Pupils	Teachers	No. of Pupils per Teacher	Pupils	Teachers	No. of Pupils per Teacher
1900-01	5,772	119·4	48·3	...	...	...
1910-11	6,062	162·8	37·2	160·6	10·0	16·0
1920-21	5,502	167·9	35·2	349·7	18·1	19·3
1930-31	5,572	171·8	32·4	438·3	22·6	19·3
1937-38	5,098	169·8	30·0	601·8	26·2	19·6
1950	5,121	179·3	28·6	685·7	30·4	18·8

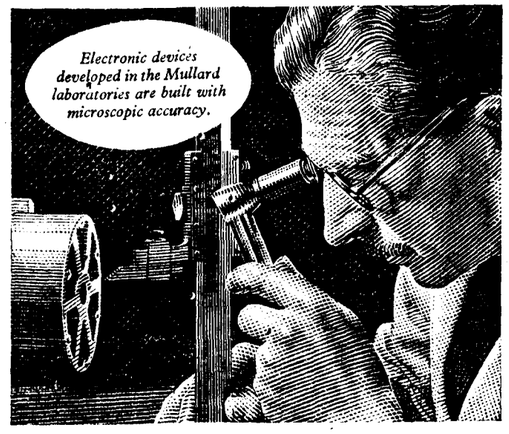
* Cmd. 8244. 7s. 6d.

Surprisingly, the number of children in grant-aided schools at the beginning and end of the period differs insignificantly—5.77 million in 1900 and 5.8 million in 1950. What is significant is the change in their age distribution. In 1900-01, 43 per cent of children under five and some 2 per cent of children aged 14 or over were in grant-aided schools. In 1950, 12 per cent of children under 5 and some 32 per cent of children of 14 and over were at school. The percentage of very young children at school has diminished enormously—and has fallen particularly quickly since 1945, because they have been crowded out by the increasing number of children of compulsory school age. The increase in the percentage of children at school over the age of 14 is one of the two major educational advances of the century. The other is the improvement in the ratio of pupils to teachers, which is shown in the table. Primary school classes are still much too big, and do not in the immediate future look like decreasing, but the difference between 48 and 28 children, on the average, to a teacher represents an enormous increase in individual attention and far less regimentation.

* * *

Identity Card Concessions

The test case on identity cards, discussed in *The Economist* last week (page 1550), has been followed by official action. In the light of Lord Goddard's strictures, and after consultation with the Home Secretary, the Commissioner of the Metropolitan Police has ordered the police to demand an identity card only when it is "absolutely necessary"—for instance, where serious crime is suspected or where the person concerned is suspected of being a deserter. It is expected that a similar restriction of the police's powers will be made throughout the provinces.



A notable victory has thus been won. But it has been won only because this particular use of the identity card could readily be tested in the courts. Mr Willcock was summoned for failing to produce his identity card when asked to do so by a police-constable. If a person fails to produce an identity card when it is demanded for purely administrative reasons, he will not be summoned—and have the chance of repeating Mr Willcock's moral victory—but he may be deprived of some of his rights. He will not be given a new ration book. He may be prevented from drawing money from his post office savings account. He may be refused dental and ophthalmic treatment under the health service. It is time that the authorities concerned asked themselves whether the identity card is "absolutely necessary" in all these cases. The post office managed very well without it before the war, and it does not prevent fraud now.

Prize Day for the Dean

The top boy of the class has been to Moscow to receive his prize. The Stalin Peace Prize is worth—if spent on consumer goods—some $5,000, and the recipient, the Dean of Canterbury, made a touching little speech in praise of the headmaster. He said that Stalin was the greatest man in the world and the greatest fighter for peace. Today the word "peace" had been banned in America and was persecuted in England, but, speaking on behalf of the British people, he could say that they would never be deceived by the propaganda for war on which the Americans were spending so much money. Two thousand years ago a great appeal had come from the east for peace and for the brotherhood of

Progress in Electronics

RESEARCH The great variety of subjects under continual investigation in the Mullard laboratories include some that are truly revolutionary. Ultrasonics is an example. This science, involving the use of sound waves far beyond the range of human hearing, is likely to find increasing applications in numerous industrial processes. Its development is typical of Mullard initiative in research.

PRODUCTION Bringing the benefit of this research to industry and the community is the other function of the Mullard organisation. Every year, in great factories in Lancashire and Surrey, millions of valves, electron tubes and components are produced for Britain's electronics industry. In other plants complete electronic equipments are manufactured for specialised purposes. Behind the name Mullard, therefore, is a store of experience in electronics that may well prove of immense importance to your own organisation.

man; now a similar appeal was again coming from the east, and it should become the common cause of all Christians.

Nobody in Britain is likely to grudge this ecclesiastical dignitary his prize, or to deny that he has fully earned it by the assiduity of his political services to a country not his own. There may, however, be some doubt as to the appropriateness of the Dean's implied comparison between Stalin and Christ. In the centuries that have elapsed since Christianity became the religion of the Roman empire and first began to be involved in affairs of the state, there has been much controversy on the conduct proper to a Christian in public office and on the degree to which the personal Christian ethic may have to compromise with *raison d'état*. However, it is improbable that any theologian before Dr Hewlett Johnson would have found anything specially Christ-like in the attitude towards peace expressed by Stalin in a speech in 1923; speaking of the Brest-Litovsk Treaty, he then said:

> The Party did this [signed the treaty] for the sake of preserving the alliance with the peasants thirsting for peace, in order to gain a breathing space, to create a new army, and thus to secure future strategic gains.

To win over the peasants "thirsting for peace" by peace propaganda, until new military power could be built up, seemed good politics to the Bolsheviks in 1918; to win over masses "thirsting for peace" throughout the world, until the military power of the Soviet Union is strong enough to subdue them, seems good politics to the Kremlin now. There is not, and never has been, any other significance in the "peace" campaign. Viewed in terms of political realism, it is simply a clever *ruse de paix* in the Stalinist struggle for world domination, and it is one that is quite permissible under the Marxist-Leninist code. But whatever divergences of opinion there may have been in the past about the moral teaching of Christ, it has hitherto been supposed to signify something different from callous and fraudulent power politics. It is only in this age that we have churchmen who are prepared not merely to flatter a secular tyrant, but even to equate him with the founder of the Christian religion.

* * *

The Molotov Version

Those who see or foresee in Korea signs of a general—as distinct from a local—relaxation in Soviet policy should take some trouble to acquaint themselves with the picture of events that has been, and still is, presented by the Soviet press and wireless to the Russian people. Even after every allowance has been made for the fact that no totalitarian system can be expected to admit frankly either failure or an involuntary change in policy, it is a disturbing picture.

All around the Soviet Union—it is said—there are aggressive preparations for war in which the United States takes the lead. The South Korean and American "aggression" in Korea was, in the words of Mr Molotov's mouthpiece, the "direct and most open expression" of this policy. The North Koreans and the Chinese "volunteers"—without, it appears, any Russian aid at all—have brought the aggression to a standstill, so frustrating American plans that "threaten the vital interests of all Asian peoples." If Mr Malik has been able to propose an end to the fighting, it is because General Ridgway's troops have failed in their purpose and refuse to "perish for the sake of the interests—which are alien to them—of a handful of millionaires and multi-millionaires." Against their failing morale has been pitted the "warm sympathy of all progressive mankind" for little North Korea. All this could have been avoided if the Americans and their fellow-conspirators in Uno had accepted last year Soviet suggestions that all foreign troops should withdraw and leave the Koreans to attain unity and democracy in their own fashion.

It may well be that those who direct Soviet policy do not believe all or anything of this travesty of the facts; but it is what they would like to believe and insist on the Russian people and the Communist-controlled world believing. The important point is that Communist representatives, whether in negotiations about Korea or other matters, have to work towards a train of events and agreements that fit into this picture. To assess accurately the significance of the points of detail that are raised by this process, western negotiators have to perform mental operations of the kind that would be needed to turn the story of Cinderella into something that might have been written by Grimm. Opinion in the free democracies will have to show great patience with their diplomatists.

* * *

Trial of an Archbishop

With the trial and condemnation to fifteen years' imprisonment of Archbishop Groesz, the Hungarian Communists hope that they have dealt a telling blow at the prestige and influence of the Roman Catholic Church in Hungary. Dr Groesz, who succeeded Cardinal Mindszenty as leader of the Hungarian Catholics, was accused of—and confessed to—carrying on the Cardinal's illegal and traitorous activities. These are said to have included conspiring to overthrow the present government with American help, and black market and illegal currency dealings. The western world recently received a vivid reminder of the methods that were doubtless used to secure the compliance of the Archbishop and his eight co-defendants, when Mr Robert Vogeler described his experiences in Hungarian prisons.

It is, at first sight, surprising that the government should risk alienating still further the strongly Catholic peasantry just before the harvest is due to be gathered in. But since it appears that the strains and stresses within the Hungarian Workers' Party are particularly aggravated just now, a great show trial may have seemed to have many advantages. It would make a diversion from internal discords, provide Moscow with a demonstration of the zeal of the present holders of power, and be a source of much useful propaganda against the Americans and the Church.

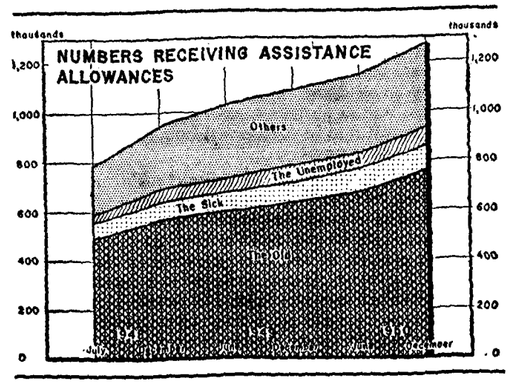
In any case, it has been clear for some time that another attack on the Church was on the way. As in Poland, the church-state agreement made in Hungary last year proved only a very temporary palliative. Last April the Communists accused the Roman Catholic bishops of breaking this agreement by their refusal to sign the latest Communist "peace" appeal. It was not until a month later that most of the bishops succumbed to pressure and signed the appeal. Through a committee of dissident priests the government is trying to worm its way into a controlling position within the Church. It is also trying to alienate the lower from the higher clergy, and at the trial of Dr Groesz a great effort was made to discredit the clergy in the eyes of ordinary people. The stories of clerical dishonesty, immorality and deception of the faithful ("prompted by thirst for profit") were greeted with a series of "boos" by the well-drilled working-class audience. Hitler used similar disgusting methods against the clergy of the Rhineland.

* * *

American Opinion and the Colonies

Americans are traditionally suspicious of "colonialism," particularly British colonialism, and their lack of reliable information about the Empire does nothing to mitigate their prejudices. On the contrary, suspicions are strengthened by contact with the growing number of African and West Indian students in American universities. The colonial student abroad, particularly if he has been abroad for some time, is often a violent and not very accurate nationalist. It is difficult for him to keep in touch with the rapid developments in his home country; also—and this is especially true of the student in certain parts of America—he is confronted with attitudes to race which, quite understandably, colour

his approach to the white man. In Britain there is nearly always someone who can challenge the wilder misstatements that are put about; in the United States anything may be said and believed, without challenge.



An example of the inaccuracies which are circulated in American journals is a paper written by a Nigerian Assistant Professor at Howard University, Washington, entitled "International Co-operation in Africa." The journal is *Social Research* (March, 1951), published in New York by the New School of Social Research and the Institute of World Affairs. The writer's theme is that "the United Nations is no more a guardian of the sacred trust of civilisation than a hungry English mastiff is the keeper of a piece of rare steak"; that all the activities of the colonial powers are "preponderantly exploitative" (even the new universities); that the best hope lies in Point Four; and that the United States should now lead us away from our past wickedness. This thesis is jumbled up with a ludicrous misrepresentation of the British Colonial Development and Welfare Plans, with assertions of the sinister intentions behind colonial educational policy, and a notable silence on such matters as the dramatic political advances of recent years, the Africanisation of the civil services, and the growth of trade unions and co-operatives.

The British Information Services in America have been valiantly attempting, in these last years, to spread some reliable facts about British colonial policy; whatever they say is discounted as mere "official propaganda," and the American press barely touches the subject. Perhaps the best, and only effective, answer will come from the African leaders themselves—if they are as invigorating as Mr Kwame Nkrumah appears to have been in his recent visit to the United States.

More People on Assistance

The gradually widening scope of the national assistance scheme is well illustrated in the Report of the Assistance Board for 1950. At the end of July, 1948, the number of assistance allowances was 784,778, excluding the blind and tuberculous cases who are assisted on a special scale. The accompanying chart shows how the total has increased in the two and a half years to December, 1950. Of the total of 1,272,309 persons who were then receiving assistance

allowances (again excluding the blind and tuberculous), as many as 962,823 were receiving them as a supplement to their old age pensions or other benefits under the national insurance scheme. This is a measure of the extent to which the rate of benefit has fallen below the cost of living.

It will be seen that there was a sharp increase in the number of assistance allowances granted in the second half of 1950. In June last year the Assistance Board raised its scale of needs, with the result that some people who had previously been ineligible for allowances were subsequently granted them. The higher scale was also responsible for the higher average rate of assistance allowance, which was 17s. 9d. in 1950, compared with 15s. 4d. in 1948.

The further increase in the Assistance Board's scale of needs, which will come into force in September, will similarly affect both the numbers of the assisted and the size of their allowances. Moreover, this year the Board has been empowered to make grants to people in full-time employment who would suffer hardship if they were required to pay the new statutory charges for false teeth and spectacles. The Board's place in the social security scheme, which was originally intended to be very small, is obviously going to grow in importance for some time to come.

The Assessment of Damages

Lord Justice Singleton, in the Court of Appeal this week, suggested a new method for the assessment of damages in High Court cases involving loss of life or personal injury. The assessment of damages in serious cases was, he said, a most difficult task, and one better performed by a jury than by a judge sitting alone. He went further; he suggested that the best possible tribunal would be one consisting of three judges of the King's Bench Division. Such a tribunal could put the assessment of damages on a more stable basis and, in his view, the decision of the tribunal on the question of damages could be made final. Since every inhabitant of the country runs the risk of personal injury on the roads (and for several thousands each year the risk is converted into the fact itself) proposals for any alteration in the method of assessing damages are of the widest interest.

One most difficult instance is the assessment of damages for the loss of expectation of life, a right which has existed for barely twenty years. For this there can be no objective measuring rod; who can prove what the expectation of life was worth to a man when he is dead? But, here, the courts in general have laid down a reasonably uniform set of rules for their assessment, largely in the series of cases that followed the sinking of the cruiser *Curaçao* by the *Queen Mary* during the war. A second category of difficult cases is that which follows the death of, say, a professional man on the threshold of his career. What has the family of a doctor or a solicitor lost if he is killed in a road accident at the age of thirty-five? There is no certainty that in fifteen years' time his income would have been very much greater, but there is a strong probability. A third class of case is that of the active man so crippled or paralysed in an accident that he becomes a physical, and economic, burden on his family for the rest of his life. What measure of damage is adequate to offset the result of the negligence that caused the injury? Lord Justice Singleton's proposals would at least meet one unsatisfactory feature of the position today, the lack of uniformity in the assessment of damage between one court, or one assize, and another. It is impossible to lay down a standard set of figures as a guide—the change in the value of money over the years must rule that out. But it is desirable that the standard applied by all the courts, at any one time, should have some uniformity. That the judges themselves are best able to secure.

Cabinet-making in Italy

Now that some time has elapsed since the second round of the recent local elections in Italy, it is possible to establish three facts which emerged from the two rounds taken together. They are that the tide of Christian Democracy is on the ebb; that Communism, for all its fireworks, is making no advance, with a tendency to depend increasingly upon back-

ward regions rather than the Moscow-weary working class; and that, against general expectation, something has happened to give a new lease of life to the extreme left-wing, fellow-travelling Socialists. This something is probably the mood of neutralism now growing up in Italy. It is caused by an unwillingness to vote for the Atlantic Pact and by a feeling that it is no longer satisfactory to go the whole hog and vote directly for the Cominform either. In addition, there has been a sharp but still not very menacing advance by the extreme Right, mainly localised in the South. The actual voting in the provincial elections was 5.8 million Christian Democrat, 3.2 million Communist, 2.1 left-wing (Nenni) Socialist, 1.4 million Social Democrat, and 0.6 million neo-Fascist.

Now arises the question whether and when the Prime Minister, Signor De Gasperi, might be wise to embark on a major reconstruction of his Cabinet. Apart from the possible advisability of reflecting the decline in the Christian Democrat vote by increasing the representation of other parties in the coalition, the Cabinet has in any case been on a rather provisional basis ever since the "Saragat" Social Democrats left the government earlier this year. A general view at the time was that when they had linked up with the group under Signor Romita the new union of anti-Communist Socialists—who, since May 1st have been known as the PSSIIS, or PS, the *Partito Socialista*—would be glad enough to become partners in a reconstructed ministry.

To re-open cabinet-making, however, is a major operation. And for the Prime Minister to do so deliberately might be unwise as well as unnecessary, since there is no question of the government having an insufficient majority in parliament. The Christian Democrats themselves are in any case sufficiently racked by dissension on agrarian reform and financial policy—and indeed on the very issue of association with lay parties at all—to make Signor De Gasperi think twice. On the other hand the next Italian general election must take place by 1953 at the latest, and the present year would seem none too soon for the government to make preparations for the last lap of the present legislature. The best course would probably be for Signor De Gasperi to defer reconstruction till after the last round of the regional elections in the late summer, but then to do all he can to secure the effective participation of the newly formed Saragat-Romita *Partito Socialista* in the work of government.

Polish Loan—Soviet Style

With the gradual transformation of the East European economies into the Soviet pattern many Soviet devices have been introduced into these countries. Thus, a few months after the revaluation of its currency, the Polish Government has decided to impose a dose of forced saving. This is an established Soviet treatment for too much money chasing too few goods. On June 18th, in a long speech, in which he claimed that Poland is already more industrialised than Italy and is catching up with France, the Prime Minister, Mr Cyrankiewicz, launched a 1,200 million zlotys "National Loan for the Development of Poland's Strength." The loan is redeemable over twenty years. The unit-bonds are 100 zlotys with fractions down to 25 and multiples up to 500. Half the bonds will be redeemed at par, while the other half will win prizes (in lottery drawings twice a year) equivalent to an overall rate of interest of five per cent.

Technically the loan is a faithful copy of the Soviet model (described in *The Economist* of May 12). The subscription campaign, too, is carried on with Russian intensity, and with all possible institutions, including the Catholic Church, mobilised. There have been reports of mass meetings in factories, offices and farms at which bonds are purchased "enthusiastically." The loan is likely to be subscribed and oversubscribed. Though it is in theory voluntary, the Polish trades union chiefs have already decided that workers must buy bonds for at least the equivalent of two weeks' wages (this form of voluntary compulsion was already known in prewar Poland).

Yet this state loan is on a much smaller scale than in the Soviet Union, where workers are made to save one month's wages. The amount set for the loan accounts for roughly two per cent of the total 56,000 million zlotys budget revenue, while its Soviet counterpart accounts for over seven per cent. Hence the linking of the present loan with vast projects of development in all branches of industry and agriculture makes sense as propaganda but not as practical economics. In all economies on the Soviet pattern it is indirect taxation—not personal savings, compulsory or otherwise—that provides the principal basis of saving. The actual level of personal savings in Poland is not known; but it may be gathered that it is very small, since there are now only 750,000 holders of savings books against some five million before the war. On the other hand, in view of the understandable reluctance to save, state loans are a useful and convenient secondary device for mopping up excess purchasing power; as such they have probably come to stay as a permanent feature of the Polish economy and may become routine annual operations as in the Soviet Union.

* * *

Survey of Family Expenditure

During the next three months the Social Survey will be carrying out for the Central Statistical Office an inquiry into family expenditure. This is one more in a series of experimental surveys, and it differs from the others in several ways. Previous records have shown that the postal method yields poor results and that it is much easier to get information about what is spent by the housewife than about how the rest of the family spend their money. This time all members of the family over the age of 15 will be asked to record their expenditure, and each will get a bonus (a maximum of 25s.) if all the others complete the forms. Another innovation is the attempt to obtain records for as long as four weeks; interviewers will call to explain the method and will collect the records at the end of each week.

People are usually willing to co-operate in these surveys, but the information now requested is certainly very detailed. Each person must say, for example, not only how much he spends on beer, but whether it was bottled or draught. In fact, the evidence on the kind of beer will be more accurate than the sums entered. In the Ministry of Labour's prewar surveys the expenditure on beer and tobacco that people confessed to was so obviously understated that the weights for these items had to be constructed from the total expenditure in the whole country.

The classification of expenditure is itself more detailed than anything that has been attempted before. It is difficult to find one that suits all the purposes to which this kind of information might be put, and the headings chosen broadly follow the analysis of consumer spending in the National Income White Paper. It is to be hoped that the information will be published in some form, but it will be of limited use, for the survey will cover only 1,500 households. Its chief value will lie in the lessons learned about the technique of obtaining information rather than in the information itself. It will prepare the ground for the big survey which must sooner or later be made in order to construct a new retail price index.

"The Royal"

At Cambridge this week, the Royal Show has unfolded its 150 acres, its 5,000 head of the choicest livestock that

the country produces, and its hundreds of exhibition stands showing "dead stock" of every description, from the latest cafeteria battery from which the hens help themselves to the newest crawler tractor. The farmyard smell nowadays is one part Bottom's "good hay, sweet hay" and two parts diesel oil. Half the Royal showyard is occupied with machinery and implements, and this state of affairs has its critics who fear the growth of commercialism and the decline of real farming interest in the Royal. But although there is a profusion and diversity of implements that prompts the thought that agricultural engineering is still only part of the way through its industrial revolution, it is also clear that the larger producers with their "systems" of machinery and tractors attract the greatest interest. There are pedigrees among the machinery stands that are as eagerly discussed as any in the cattle rings.

This year, as in the hundred shows from 1839 onwards, there is the same emphasis on education and emulation. The farmer with the average dairy herd goes home a better man for seeing milking breeds at their best. In a compact display, the Ministry of Agriculture summarises before his eyes years of careful experiment in raising crops and stock, making its lessons as simple as they are significant. It would be untrue to say that there were unhappy farming faces at Cambridge this week—the escape from haymaking half completed was not the least of the pleasures of this year's "Royal." But there was a more serious concern about rising costs of equipment, farm materials (baling twine costs £270 a ton, against £160 a year ago) and the new wage demands than at any time since the war. The easy days are over; the job now is to improve average standards of farming so that they can compare more respectably with the best that "The Royal" has to show.

* * *

Village Schools

The arguments for the preservation or extinction of village schools are finely balanced. It is difficult to weigh the intangible advantages of personal contact and rural life against the more obvious material merits of better facilities, classes grouped according to age, and a wider spread of costs in the larger school. But whatever the general, theoretical arguments, individual circumstances may make nonsense of the theory. This appears to be the case with a particular school in the village of Little Easton, Essex, which has 17 pupils, the prospect of another 32 now under the age of five, and a teacher regarded as outstandingly good. It is proposed to close the school and to transport the children to a rather larger school, which is not to be modernised for another ten years. In the process the present teacher, who is entitled to retire almost at once but is prepared to carry on only in her own village for another five years, will be lost to the profession and another will have to be recruited. The only explicit justification given for the closure is the high cost per pupil in the existing school. Insufficient evidence of this has been provided, and the governors of the school are fighting the closure to the best of their ability.

The proposal appears to be an example of what the bureaucrats can do if they are given a free hand. It may be that there is a better case for closure than the governors have been able to elicit. What on present evidence is inexcusable is that, in anticipation of improvements in another school ten years hence, one flourishing school should be extinguished, and this without any clear statement to the governors of the reasons. If local interest in schools is to be encouraged education authorities should deal more generously and wisely with those affected by their decisions. This is not the only example of high-handedness. Other local education authorities have been as insensitive to local feeling.

July

In July many of us, like the sunflower, turn towards the sun. As holidays approach, arrangements have to be made, and here the Midland Bank can help, not least by providing for the encashment of your cheques at a branch near to where you will be staying, and by looking after your valuables and documents while you are away.

MIDLAND BANK LIMITED

Letters to the Editor

The Vacuum

Sir,—It was rather surprising to find *The Economist* apparently suggesting that the main obstacle to a spectacular recovery of the British economy was the lack of "some new policies"; as if the whole scene would miraculously change if only some political leader would have a brain-wave. This view seems to me to be highly dangerous, because so many of our economic difficulties can be ascribed to the attitude of mind encouraged by those who declared that all our material troubles would disappear if only Parliament would pass a few Acts and nationalise a few industries. Conservatives have constantly endeavoured to expose the illusion that prosperity can be provided by a wave of the Government wand, and rather to assert that it can only follow from increased production and higher efficiency.

The statement that the Conservative party has no policy is manifestly inaccurate, and I doubt whether any party at any time has had a more detailed or carefully considered statement of policy than "The Right Road for Britain." The need is for strong leadership and effective administration rather than further slogans or catchwords.—Yours *faithfully*,

JOHN BALDOCK

House of Commons

[There was no suggestion in our article that a policy must be expressed in legislation rather than in administrative action; our criticism of the Conservative Party is that neither "The Right Road for Britain" nor more recent declarations on policy—such as the housing proposals—give much promise of "strong leadership and effective administration."—EDITOR.]

The New Examination

Sir,—May one who has followed with interest over the past couple of years your articles on the new examination add a postscript to the article on this subject in your issue of June 30th?

The point you bring out which has been insufficiently appreciated is how very unfair the age limit is to the smaller schools. As you remark, the bigger schools, and in particular the independent schools with their more generous staffing ratio, can cope with the difficulties which it produces, but these difficulties will bear very hard on the smaller schools with a less generous staffing ratio. This point about the unfairness to the smaller school is one on which many of us feel strongly but which has *not* been given the publicity it should have had.

The vexing thing is that the solution is so easy. Let boys take not more than two subjects in the new examination before they are 16, let no boy be issued with a certificate until after he is 16, and all the difficulties disappear, while the main objectives of the age limit are attained.

There are arguments against a multiplicity of marks of distinction, and though not all of us may agree, we should perhaps accept the single pass at "ordinary" level; but that a boy who has taken and reached a certain standard in scholarship papers should get no recognition therefor is a point on which both schoolmasters and schoolboys feel equally strongly. Surely we could have a pass at "scholarship" as well as "advanced" level?—Yours faithfully,

H. D. P. LEE

Clifton College, Bristol

Sir,—The article in your issue of June 30th ignores a recent official gloss, by which "the Age Regulation will not apply to candidates from schools outside England and Wales. This decision includes schools in Scotland, Northern Ireland, Eire, the Isle of Man, and the Channel Islands."

In the hot pursuit of parity of esteem amongst themselves the English and Welsh appear to have sacrificed equality of opportunity with other inhabitants of the British Isles.—Yours faithfully,

LAWRENCE STONE

Wadham College, Oxford

A Higher Pound?

Sir,—The recent correspondence about a possible revaluation of sterling has been stimulating and informed, and I hesitate to contribute what seems to me to be an air of reality to the proceedings.

There can be little doubt that a balance must be struck somewhere between fixed and free exchange rates. Two manipulations within 21 months could hardly be expected to inspire or sustain confidence in sterling.

There is another aspect, however unimportant, which so far seems to have been neglected by your correspondents, and that is the effect of a revaluation on the gold mining industries. September, 1949, brought welcome relief here to the pressure of ever-rising costs on stable revenue and enabled extensive new capital expenditure to be undertaken, particularly in the Orange Free State, with a moderate degree of confidence. In this respect, revaluation of sterling would be a severe blow to the whole South African economy and would do little to narrow the present unhappily growing gulf between our two countries. —Yours faithfully, PETER R. LODGE.

Johannesburg, South Africa.

Inquest on Farming

Sir,—Mr Cyril H. Kleinwort claims that "to prove that the community is not getting a fair deal from British agriculture, it would be necessary to show that a person of normal intelligence, farming ordinary land, is making a greater return for his capital and labour than he would do in other industries." This represents a very common attitude of mind among farmers and others, who would probably not think of themselves as Socialists and yet I believe it to be a purely Socialist concept of a fair deal.

Because the land, capital and labour available at any given moment are fixed quantities, they cannot be used in more than one way at the same time. You cannot use a piece of land for a factory, race-track or aerodrome and also farm it. You cannot have the same money invested in a television factory and also in farm tractors. A man cannot work as a farm worker and as a bank clerk at the same time. Nor can any man of normal, or even exceptional, intelligence claim any particular return on his capital and labour as a farmer merely because he wants to be one. What would happen if everyone wanted to be a farmer? Who would reward them for their services? What is a coal-miner worth if no one wants coal?

The saffron-growers who gave their name to Saffron Walden have long since gone out of business. The men who made armour for our ancestors went out of business, not because they were inefficient but because no one wanted their armour. They have had to bow to laws which respect neither normal intelligence nor ordinary land, the inexorable laws of supply and demand. The right price for a farmer is what he can earn in a free market. There is no hope at all for agriculture until this fact is realised once more by our farmers and rulers and our polices are shaped accordingly. Then the good farmer will have the opportunity of growing rich and prosperous in terms of pounds which keep their value and the bad farmer will have the opportunity of making way for someone better. The rest of us will be relieved of our present obligation, as a result of being deliberately cut off from alternative sources of supply, to buy what our farmers produce at prices which are intended to ensure for them a standard of living comparable with that of men employed in other industries. The free market and profit and loss account are the only ultimate tests of efficiency.—Yours faithfully, OLIVER SMEDLEY

Saffron Walden

Burma Off Balance

Sir,—In your issue of June 9th you said that "Burma's adverse balance of trade in 1950 was greater than in 1949." This is not true. Burma's balance of trade (exports *v.* imports) has been favourable in both the years. According to the world trade statistics published in your *Records and Statistics Supplement* of May 26, 1951, the value in U.S. dollars of Burma's exports exceeded the value of imports by $109 million in the year ended September, 1949, and by $49 million in the year ended September, 1950.—Yours faithfully, SAN LIN

Union Bank of Burma, Rangoon

[The argument in the article was that, in spite of very favourable world conditions, results in 1950 were less good than in 1949; on Mr. San Lin's figures this remains valid. There are frequently discrepancies in statistics about Burma; they are difficult to avoid when, for instance, the embassy in London states that it still does not have figures for 1950.—EDITOR.]

Books and Publications

African Colonies

Native Administration in the British African Territories. By Lord Hailey. *HMSO.* In four parts, Part I, 17s. 6d.; Part II, 10s. 6d.; Part III, 17s. 6d.; Part IV, 5s.

Probably no one but Lord Hailey could have written this massive survey of British administration in Africa. It is dry and methodical in marshalling a formidable amount of facts; cautiously objective in evaluating them; and judicious in the recommendations offered. Though intended as a reference book for government officers who feel the need for information about administrative practices followed in territories other than their own, this report is also the most comprehensive and authoritative source as yet available for the historical study of British colonial administration in Africa. This applies particularly to the first three parts, which deal respectively with the East African territories, the Central African territories and the four West African colonies. Part IV reviews some general problems that emerge from the descriptive parts. Much of the material was obtained on the spot during visits paid by Lord Hailey to the African colonies between 1939 and 1947. The survey is of special value as a record of changes in colonial administration during the past decade.

Lord Hailey's main concern is with the machinery and processes of administration at the level of what is increasingly being called "local government." Constitutional developments pertaining to the central government are referred to only as they impinge on local administration. At the same time one of the striking facts made clear by Lord Hailey's method of presenting the data in a historical framework is the degree to which the actions of the central government continually shape local administration to the geographical, economic and ethnographic exigencies of each territory. This has made the distinction between "direct" and "indirect" rule an anachronism. In each territory there is a "principal ordinance" emanating from the central government which regulates the powers and functions of the Native Authorities. In Nigeria, for instance the classical home of "indirect rule," traditional tribal authorities do not *ipso facto* constitute the Native Authorities. The latter hold office, exercise powers of taxation, provide local services, and act as a court of law by appointment from the central government. In Nyasaland, on the other hand, where local administration is much less advanced, the traditional basis of tribal authorities tends to be more emphasised. In the Gold Coast, again, constant revision of the "principal ordinance" has been necessary to make clear the source of Native Authorities' powers; and here, as elsewhere, advances towards self-government immediately react on local administration.

Lord Hailey's survey brings out the great variety in the forms of native administration that have grown up in the British African territories. It shows, moreover, that they have been far from static; and changes made in response to local circumstances, historical accident or mere expediency have often been happier than those due to policy. Indeed, deliberate policy still sometimes results in Native Authorities being established which neither understand nor are capable of adequately exercising the powers conferred on them. Many factors contribute to such failures. Apart from lack of indigenous institutions on which to build, sheer poverty, absence of large numbers of men as labour migrants, or exclusion of literate people may all play a part.

In spite of obvious differences, which may be very great even within one territory, native administration in the British African territories has common features and aims. These give rise to common problems. Local taxation is the basis of native administration; and the development of skill and responsibility in using the proceeds for local services is a common problem everywhere. The judicial functions of Native Authorities also raise common problems. There is the problem of separating them from the executive functions of the Native Authorities. There is the difficult problem of adapting customary law to modern economic conditions. Lord Hailey discusses what is being done to meet these problems by bringing educated men into local administration, by setting up advisory councils, and by appointing specialist officers to guide Native Authorities. The historian will be particularly grateful for Lord Hailey's masterly analysis of the land law and policy of each colony and its influence on the structure of native administration, so strikingly seen in Uganda. Land law has caused anomalies in the growing urban areas, where local government has been least successful. Lord Hailey's support for measures to give greater scope to the urban middle class in municipal government will be welcomed.

In his final summing up Lord Hailey expresses tempered confidence in the broad lines of the policies at present being followed. He stresses the value of building up a sound body of knowledge of the social and economic facts to which constant adaptations must be made. He has given enough data, in this survey, to show that haste and dogma in the further development of local administration in British Africa can lead only to failure.

Philosopher Kings

Education and Leadership. By Eric James. *Harrap.* 112 pages. 6s.

This is a book by a man of courage, for both on leadership and on education he is against the current popular view and his defiant blasts are not muted by any cotton wool of compromise. Briefly, his thesis is that in Britain today we have finished with the process of "natural selection" based on ability to pay; having given the gifted from whatever economic background their chance, we had better realise that the Platonic guardians of the new order need special attention if they are adequately to assume their role of philosopher kings.

Dr James writes on this subject with a unique authority for his teaching experience has been in two schools whose records of scholarship and leadership are pre-eminent. Winchester and Manchester Grammar School both attract ability and can afford to repel mediocrity; to them go among the brightest of the nation's young. Dr James is at pains to stress that leadership requires intelligence, although it is true that this doctrine is not shared by those who draw an artificial distinction between brain power on the one hand and character on the other. The intelligence of the leader must be higher than the national average, but this does not mean that all leaders require to be "double firsts" or "intellectuals."

If this ability for leadership exists—and Dr James is commendably free from cant in his definitions of that vexed quality—then it requires especial care to bring it to its full potential. The future leader in government, science, the arts and industry must be exposed to the influence of first-rate minds and given opportunity to grow in an environment designed to meet his needs. It does not mean, argues Dr James, that he should be sent to some boarding school for

LONGMANS

future permanent-secretaries and chairmen of national boards, but it does mean that the grammar schools of England should be recognised as having peculiar needs for a peculiar purpose. Not unexpectedly, he is against the egalitarian frenzy for the comprehensive school displayed by a number of contemporary writers, whose ideas are hopelessly out of date and postulate a social order which had passed a long time before the 1944 Education Act. Some of the most effective passages in "Education and Leadership" deal with the confused thinking of the present day, which identifies "equality" with identity, and fails to appreciate that the job of the democratic process is to produce an aristocracy based on ability rather than birth, money or party loyalty.

Dr James's book is astringent, and written with clarity, knowledge and integrity. Into its hundred pages is packed more earthy common sense and high idealism than is to be found in ten times that space of contemporary educational writing.

Joe

The Life of Joseph Chamberlain. Vol. IV, 1901-1903. By Julian Amery. *Macmillan.* 533 pages. 30s. net.

When he died in 1914, the name Joe still, despite the tragic over-clouding of his later years, meant Joseph Chamberlain to his fellow countrymen. It is not so today; what now looms up is the sinister figure of "Uncle Joe." Is anybody, in 1951, sufficiently interested in the Joe who broke up first the Liberal and then the Conservative party to read a volume of 530 odd pages covering but three years of his life, to say nothing of the earlier three—and final fifth—volumes in the series?

Mr Julian Amery handles with genuine skill and authority the three years in question. If he had been free to draw a portrait in a single volume, a readable book of quality might have resulted. The portrait could then have been set against its whole background and scaled to fit it. As it is, a subject admirably suited for a powerful black and white drawing lacks the depth and the variety that justify a massive canvas and oil paint. Mr Amery was not so free. The scale had been set by J. L. Garvin, who in 1915 took on the task before which Milner, whom the Chamberlain family had selected for it, had quailed. At that time a five-volume biography may well have seemed reasonable. It was the fashion—a fashion which is happily dying.

By 1934 Garvin had produced three volumes. His successor in the task inherited a mountain of material and a design from which he could not escape. Within the conditions thus set, he has done well. But he is at times defeated by the difficulty of giving sustained interest to a man whose horizon was limited to the political arena of his time: an individual of force, drive, courage and integrity for whom too many aspects of the human situation simply did not exist. Even the vision of Empire, with whose exposition to Milner the book dramatically closes, is somehow without the spark that might have kept the words alive. Disillusioning as it may be to see the enthusiast go down before the cynic, it is impossible not to feel that this narrow mind deserved to be defeated by Balfour's subtle and various one. Mr Amery tries to remove the impression that the person had, somehow, got lost in the politician. It is not his fault that he fails.

European Economics

Twentieth Century Economic History of Europe. By Paul Alpert. *Henry Schuman (New York).* 466 pages. $6.

Dr Alpert begins his book with an account of the economic structure of Britain, France and Germany in 1914 and carries it down to the Schuman Plan, in so far as agreement had been reached on the plan by the end of 1950. This is a useful survey and it has been well done. For the present generation it is all too easy, in the years following the Second World War, to regard today's economic problems as without precedent. In reality the position of Europe at least was fairly similar after the war of 1914-18. There was then, as there has been again, a very high degree of inflation; this had its origins in tremendous budgetary expenditure during the war and immediately after it, as well as in the pressure for higher wages as a result of scarcity and higher prices. Then, as now, there was a great shrinkage in international trade and a severe dollar shortage.

In the early nineteen-twenties, as Dr Alpert points out, the dollar shortage was by no means as grave as in the late nineteen-forties; and there existed then greater resources which could be mobilised to meet it, particularly foreign assets. Nevertheless, recovery after the First World War was in many respects slower than it has been after the second, in spite of the much more universal economic distress in the nineteen-forties and in spite of the very much greater and more widespread physical destruction in Europe itself. The reason for the greater success today has undoubtedly been a combination of direct American aid on a large scale through ECA, and the growing power of governments to intervene with comparative success in both internal and external economic fields.

Dr Alpert deals with these problems in a manner at once both crisp and scholarly, and he has produced a book which bears the hallmark of the best type of painstaking American research. He himself was educated in France and worked in Paris before the war; he is now associated with the universities of New York and Wyoming, after being arrested by the Gestapo during the war. Dr Alpert has kept remarkably clear of bias either for or against the trend of the last quarter-century towards greater state control. Indeed he poses with sympathy the fundamental question with which all European governments have been faced, and which is now also becoming the inevitable question mark in American political life—how to combine the maximum of political liberty with the economic needs of the modern state.

The course of the book has been well charted. It takes in all the main economic developments in the bigger countries—including Russia—throughout the period, as well as the leading factors affecting Europe as a whole. It covers the repercussions of the Bolshevik Revolution and the period of war debts in the nineteen-twenties, the great depression and the pinnacle of Nazi power, the British war effort, and the reconstruction of France under the Marshall plan. Dr Alpert has indeed succeeded in giving an interesting and readable survey of a peculiarly difficult and diversified field of contemporary history.

Bigwin Conference

The Changing Commonwealth. Proceedings of the Fourth Unofficial Commonwealth Relations Conference, September 8-18, 1949. Edited by F. H. Soward. *Oxford University Press for the Canadian Institute of International Affairs, 1950.* 268 pages. 16s.

The fourth in the series of unofficial Commonwealth Conferences organised by the Royal Institute of International Affairs and its sister institutes was held at Bigwin Inn in September, 1949. By general consent it was the most successful. The publication of this summary of its discussions does a good deal to explain why this was so. The Commonwealth, for the time being at least, has ceased to be introspective. Questions of status are no longer a principal preoccupation of its members, and this allowed attention to be focused on wider problems to an extent not hitherto possible at such gatherings. At the same time the Commonwealth has received an infusion of fresh blood from Asia and it is apparent that the questioning yet constructive approach of the Asian delegates gave to the Bigwin Conference the stimulus of novelty and a wider perspective. For these reasons no one should allow himself to be discouraged from reading Professor Soward's book because it appears in the unprepossessing form of a conference report. It contains one of the most enlightening discussions on contemporary Commonwealth affairs that has been published in recent years.

BRITISH COMMONWEALTH PACIFIC AIRLINES LIMITED
in co-operation with B.O.A.C., T.C.A., T.W.A.

It was a speaker from Ceylon who said that he did not like the term "New Commonwealth" because it implied a loss of traditions and imponderables which were its essence. Yet while the addition of its Asian members may not have changed the character of the Commonwealth it has unquestionably increased the complexity of its relationships. An Australian could "regard Britain and Australia as one community sharing the same way of life, pursuing the same ideals and, not the least important fact, being one folk." For Canada and South Africa the bond of kinship has been less pronounced and for the Asian dominions it is lacking altogether. For them membership of the Commonwealth is consequently something to be valued on its merits, not to be accepted as part of a natural political order. This is not necessarily a bad thing. The Commonwealth has suffered as much as it has gained from effusive proprietary sentiment in the past, and in a changing world critical appraisal may well have wholesome and unexpected consequences. One conclusion of the Asian delegates who indulged in it was that the Commonwealth had greater opportunities for co-operation in economic and social policy than had been hitherto recognised. They were, in fact, advocates of a Colombo Plan six months before Colombo, and the welcome accorded to their ideas at Bigwin is in itself a tribute to the constructive temper of the conference. But with this new spirit of enquiry has come a real need for better understanding of what the Commonwealth can and cannot do. The merit of the Bigwin Conference and of this record of its deliberations is that they help to meet it.

Disintegration of a Party

The Irish Parliamentary Party, 1890-1910. By F. S. L. Lyons. *Faber and Faber.* 284 pages. 25s.

The events which led to the "Parnell split" in 1890 and those which took place during the passage of the third Home Rule Bill were so dramatic that they have attracted the attention of many modern historians. The intervening twenty years have been comparatively neglected. But during that period the Irish parliamentary party was torn by feuds and quarrels; it was heading for the great disaster in which it was annihilated by the Sinn Fein movement. The gap in the political history of modern Ireland has been ably filled by Mr Lyons, of Trinity College, Dublin, who has worked upon the vast mass of letters and other manuscript material in Irish public and private collections. He shows that the party underwent a process of slow disintegration which injured its unity, its discipline, its policy and its power. The seeds of its subsequent destruction were sown in the two decades that followed the "split."

The years that witnessed the slow decline of the parliamentary party were marked by considerable economic and social reform. The land question, the congested districts, local government, agricultural improvement and university education all received attention. Many of the constructive measures on these subjects were passed by English rather than by Irish votes. The parliamentary party refused to co-operate with the progressive Unionists in these fields lest it should be accused of weakening on the national issue. It was this refusal that drove William O'Brien and his influential supporters from the party. The party was blind, on the other hand, to the more advanced political and cultural ideals of the younger generation, to the industrial and linguistic revival. The party leaders staked everything on the achievement of home rule by constitutional means and on the alliance with the Liberals. But the fact that later events frustrated their hopes does not prove that their policy was not well advised at the time when it was adopted; if it had succeeded it would have averted armed rising, civil war and the partition of the country.

Shorter Notices

London's Underworld. Writings of Henry Mayhew. Edited by Peter Quennell. *Kimber.* 434 pages. 18s.

"London's Underworld" is a disappointment after the earlier companion to this volume, "Mayhew's London." In the earlier book Mr Quennell selected a much more varied part of Mayhew's writings, and the impression they conveyed was Dickensian in character, with a multitude of persons and trades swarming in the pit of London. In the present volume only prostitutes, thieves and beggars appear and the account is strangly monotonous. A sordid tale one might have expected, but not something so dull. Mayhew had indeed no intention of entertaining: his purpose was to describe and to reform, but the lighter touches, extracted by Mr Quennell in the earlier volume, are here much rarer. Instead Mr Mayhew faithfully records and Mr Quennell extracts a succession of conversations and visits round the purlieus of Piccadilly or Southwark and the other haunts of London's underworld which end by being repetitive. A double gin or half-a-crown seems to have been enough to make any prostitute or burglar recount a life story. The pattern of degradation of most men and women and the accounts they give vary surprisingly little. As plain reading the book is heavy going. As a record of the seamy side of Victorian life round about the eighteen fifties it has plenty of material to offer. Anyone who wants to show how much or how little better we are than in 1851 has Mr Quennell to thank for doing half his work for him. For the budding novelist of the Victorian underworld Mr Mayhew is recommended reading.

A History of the Worcestershire County Cricket Club, 1844-1950. By W. R. Chignell, with a Foreword by Maurice F. S. Jewell. *Littlebury.* 443 pages. 21s.

Worcestershire has produced many famous cricketers including members of the Foster family whose ability at playing cricket merited the county being described as "Fostershire." This excellent history is dedicated to the memory of H. K. Foster, captain in 1889, 1901-1910 and 1913. Mr. Chignell has written an interesting book showing the ups and downs experienced by Worcestershire cricket through the years. The book begins by tracing the history of the county before it secured first class status in 1899. Since promotion to first class rank, their record has been one of which the club has no reason to feel ashamed. In 1907 they ended the season second in the championship table and in 1949 they came third. The success of the players is revealed in the admirable year-to-year story from 1899 to 1950. There are some excellent photographs. The book is well indexed and is worthy to be placed on a bookshelf with the county cricket histories that have already appeared.

Factory Law. Fifth Edition. By H. Samuels. *Stevens.* 719 pages. 63s.

New features in the latest edition of this standard work include a useful summary of the changes made to the Factory Act of 1937 by the 1948 Act and references to recent court decisions in industrial law cases.

AMERICAN SURVEY

MacArthur Fades Away

Washington, D.C.

SINCE he had his great day on April 19th, Old Soldier MacArthur has faded away into Politician MacArthur. Meanwhile the investigation into the circumstances surrounding his dismissal finally faded into a forum where the Democrats, by calling on one or two sober professionals such as Admiral Badger and General Barr, tried to offset the stream of digruntled second-raters brought in by the Republicans to give their rancour and bitterness one more public airing. With the hearings over and every piece of evidence in the record four or five times, the committee now has to consider its next move. It is a sad commentary on the present state of the Senate that nobody believes that there will be one report, non-partisan and objective. Senator Russell, the chairman, even wonders whether it is worth trying to draw up a formal report at all. It is generally agreed now that no Republican will try to deny the President his constitutional right to relieve a commander in the field and that most, if not all, Democrats will join the opposition in regretting the lack of tact with which the relief was carried out. But that is probably as far as agreement will go.

On the questions of whether General MacArthur's proposed policies were good or bad and on the merits of the State Department's performance in the Far East during the last six years, there will undoubtedly be two or more conclusions. But, however many there are, they are likely to prove that most of the Senators took their prejudices into the investigation at the beginning of May and brought them out intact at the end of June. This is, perhaps, more true of the opposition because their prejudices were better developed before the inquiry began and because they, who demanded the investigation, never intended it to provide facts for an unimpassioned discussion of American foreign policy. They hoped that the catch would include some juicy scandals for future use; instead it consisted mostly of old boots with, unfortunately for them, one or two electric eels.

The entire MacArthur episode was but one stage—how many more there will be is anybody's guess—in the continuing attempt by some Republicans to escape from the consequences of the policy of containment of Soviet Russia, to which they subscribed with some fine anti-Communist gestures when it was proposed by Mr Truman in March, 1947. Since then, however, they have found that it is cheaper, more fun, and politically more satisfactory to hunt Communists at home than to try to contain them abroad. Few of the party's leaders, except Senator Vandenberg, understood that the Truman Doctrine, if it was to be successful, meant a long period of uneasiness and tension, and one which called for patience and wisdom. Without Mr Vandenberg's guiding hand, they became increasingly restive and found their feelings echoed among the public, which had never quite understood the policy from the beginning.

When it was certain that Mr Vandenberg would never come back to the Senate, the revolt of the right wing began. Its first manifestation was the reception given to Mr Hoover's speech in December, when he proposed that the United States should leave Europe undefended and retire to a fortress in the Western Hemisphere. Hardly had the attack on the containment policy from the isolationist flank been beaten off than a second, and more violent, one using General MacArthur as its instrument, was launched from the opposite flank. It is now clear that this second attack has also failed. Both, probably, were foredoomed to failure because they were based on emotions, the chief of which was fear, instead of a considered alternative policy.

The most curious aspect of the whole business is that the same people were responsible for both campaigns. Mr Herbert Hoover who, four months earlier, had warned the country of the dangers of becoming involved in continental warfare anywhere, sat in New York, telephoning to General MacArthur in Tokyo and making the arrangements for his speech to Congress and his triumphal reception in New York. Many of the Senators who acclaimed both Mr Hoover and General MacArthur no doubt failed to appreciate that their policies were diametrically opposed, but it is hard to believe that ignorance was the reason for Mr Hoover's performance.

The third attack was a more subtle one, a quiet infiltration of the Administration's position rather than an assault upon it. It was the product of the devious mind of an experienced politician, Senator Wherry, though it was fathered on to a decent mediocrity, Senator James Kem of Missouri. His amendment to the Supplementary Appropriations Bill, by which financial and economic aid was to be withheld from countries supplying strategic materials to Russia or the satellites, sounded like good, patriotic common sense to the public of a country which can live without imports. It cannot understand why anybody else needs them or has to pay for them with materials which might, in some obscure way, help the Communist war effort. The amendment sounded so good that not a single Senator could be found from either party to vote against it, though a clear majority knew that some way would have to be found of avoiding its consequences if the rearmament of the West were to continue.

★

It would be too much to hope that the last has been seen of the attempts to escape from containment as a policy—or from any policy which entails long-term considerations and continual vigilance. What the inhabitants of the central plains of the United States, and those who represent them, want is a policy which will make it possible for them to retire into their own preoccupations. The enemy outside must be kept out by drawing some magic circle beyond which he cannot pass (the Monroe Doctrine worked once; some similar declaration might work again) or else he must be destroyed by the waving of some magic wand (the atomic bomb ended one war in a few days; it might end another as quickly). These men are dangerous to sober policies only when there is no alternative Republican leadership in the Senate. But today it is one of their own group, Senator Taft, who is leading the opposition.

The Republicans on the Foreign Relations Committee, who looked to be a sound team when Senator Vandenberg was chairman in 1947 and 1948, have gone off in all directions. Senator Wiley, who is now the senior Republican, is doing his best. He showed good sense and a complete freedom from partisan feeling in his contributions to the debate on troops for Europe and he proved again, in a broadcast on Colonel McCormick's Chicago station, that he will not desert the idea of bi-partisanship in foreign policy. But he is not as astute as was his predecessor, and he does not carry his party, or even the members of his committee, with him. Next in rank to Mr Wiley is Senator Alexander Smith of New Jersey, who was one of Mr Vandenberg's most useful assistants during the Marshall Plan period. The combined influences of General Chiang Kai-shek and Dr Frank Buchman have since curtailed his usefulness. Senator Lodge seems no longer to have the courage of his convictions, as he once had. He came to the rescue at the last moment more than once over troops for Europe, but he never seemed to be able to make up his mind during the MacArthur investigation whether to toe the party line or to be the statesman many have hoped he would become.

The Republican Party has, indeed, nobody at the helm of its foreign policy and, as a result, the ship of State Department policy has often to steer a zig-zag course to avoid being run down. It managed to avoid being pushed on to the Scylla of isolationism, but it had to bear in that direction to the extent of tying itself to a set number of divisions for Europe. It also avoided the Charybdis of preventive war, but again it steered fairly close to the rocks with aid for General Chiang Kai-shek, acceptance of Formosa as a necessary bastion of the American position in the Pacific and with Mr Dean Rusk's speech. But it is quite unable, and will be for a long time, even though General MacArthur is no longer a danger, to crowd on all sail and hurry through the straits into the deep water beyond. If the Malik proposals come to anything and if a cease-fire is arranged before the winter on terms meaning clear defeat for the aggressor, the Administration's position will be immensely improved. The Republicans will cry appeasement, but once again they will be found to have nailed their colours to a falling mast.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Grub-Stakes for Miners

[FROM A CORRESPONDENT IN COLORADO]

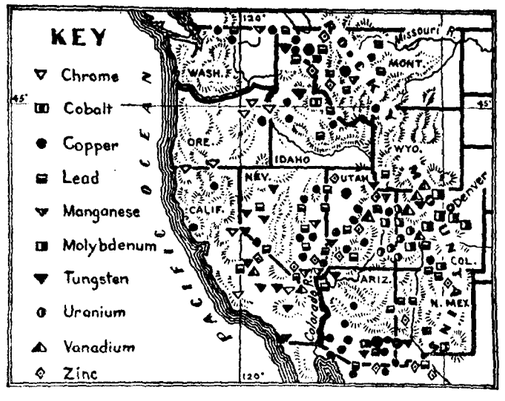
THE American government is spending a huge amount of money, perhaps a billion dollars or maybe even more, in order to be sure that, wherever possible, the non-ferrous metals needed for the rearmament programme shall be obtainable from domestic sources. These sources are mostly in the Rocky Mountains. In the year since the Korean invasion, the government's attempts to encourage both the opening up of new mines and greater output from existing ones have mainly taken the form of granting very large inducements to the giants of the industry; this has been done through long-term contracts, loans, and tax concessions for developing mines and for constructing new mills, smelters, and refineries. The general effect will be to make the big companies even bigger and to increase their domination of the industry. For reasons both of security and politics, this programme has not received much publicity. But the small miner in the west who imagines himself to be "the backbone of the industry" (a relic of wishful thinking from the last century which is encouraged by his political friends) has by now heard something about it; as a result he feels he has been left out in the cold and is furious.

True, as always in war, something has been done to encourage these small operators. This time, the principal device has been exploration and development loans, for which $5,000,000 in all was set aside for the fiscal year just ended. This is the "grub-stake plan" called after the old western custom by which stay-at-homes in the towns furnished the "grub" for a prospecting trip, shared in the profits, if any, and if there were none matched their lost money with the prospector's lost time. The name has sometimes been taken very seriously: the Bureau of Mines' regional office in Denver recently received a wire: "Am sinking shaft. Need $50,000. Please send airmail." In this five-state region (Colorado, Wyoming, New Mexico, Utah and Arizona) some 20 loans amounting to about $1,500,000 have been made in all to people developing small mines, usually on a fifty-fifty or matching basis; if the metal being sought is badly needed, the government can, however, contribute as much as 90 per cent of the joint stake. If the prospect "pans out," the government collects its loan without interest over a period of years; if it does not, the government takes its loss along with the prospector. The programme is politically interesting, but actually insignificant from the point of view of present production, though deposits discovered through it may eventually prove important.

The assistance given to the giants of the industry is quite

THE HANOVER BANK
FIDE ET FIDUCIA
NEW YORK

Linking the two financial centres of the world, London and New York



THE HANOVER BANK
(Incorporated with Limited Liability in U. S. A.)

NEW YORK . . . 70 Broadway

another story. A good example is the contract with the Climax Molybdenum Company which, in its "molybdenum mountain" on the very top of the Rockies, has most of the world's visible supply of this vital steel alloy. Defence agencies have guaranteed a market for $100 million worth of molybdenum, about five years' production, and the company has been granted tax concessions on the new facilities which are to produce it. Dr James Boyd, head of the Defence Minerals Administration, has revealed that similar contracts are being made with the largest producers in many non-ferrous fields. For manganese alone these amount to $157 million, for tungsten $90 million, for copper $366 million, and so on. And he has said that new facilities for which tax concessions have been recommended will produce each year an additional 90,000 tons of zinc, 35,000 tons of lead, 139,000 tons of copper and 4,000 tons of molybdenum.

Most of the contracts bind the government to purchase output up to the values stated at prices greatly above market prices: for one section of the programme Dr Boyd said the government estimated that its loss would be $84 million in cash, and that the cost of handling the metals over several years would bring the total estimated loss to $118 million. In a few instances, agreements had been made below present market prices, but in most cases the government will apparently take any loss from a fall in price and the producer get any increase.

So far most of these contracts have been given to the few giants at the top of the industry. In copper, for example,

MAJOR NON-FERROUS METAL DEPOSITS IN THE WEST

$35 million has gone to the Kennecott Copper Corporation, $66 million to the Anaconda Copper Mining Company, $35 million to the American Smelting and Refining Company, and $76.5 million to the Phelps-Dodge Corporation. The idea seems to be to subsidise the largest and most efficient producers, in order to ensure large stocks of strategic metals quickly. In the last war, the opposite policy was followed: the high-cost miners were subsidised selectively while the very large, efficient, integrated producers were left to shift for themselves.

These specific facts are as yet largely unknown to the western public and to the numerous small miners and prospectors in the west. They have votes while the large corporations have none and, when the full implications are realised, politicians from the west will probably have a field-day. In the non-ferrous mining industry the giants have been growing bigger and fewer for many years and the small producers have been at an ever-increasing disadvantage.

Their representatives say flatly that the present mineral expansion programme has been from the start in the hands of those who think it is a waste of time and money to encourage small producers, because the utmost they could contribute would be but a drop in the bucket.

When it comes to uranium, the story is different. Here the Atomic Energy Commission is in complete control and its production programme seems an unqualified success which has satisfied the little fellow as well as the big. The low-grade deposits are widely-scattered in relatively small bodies of ore. The AEC itself has spent millions of dollars in finding such deposits and in providing milling facilities, granting special subsidies to overcome the disadvantages of hauling these ores to market, and so on. The result is that, whereas immediately after the war there were only two mills producing uranium oxide, there are now seven, all except two privately owned.

The new discoveries have spread far beyond the confines of the so-called "Colorado plateau"— the term refers to the river, not the state—which is the traditional home of the American vanadium-radium uranium industry, so that there are now some 40 more or less promising sources of uranium in some 300,000 square miles of the mountain west. So far none has been of pitchblende ores, the igneous ores of uranium; but even with only relatively low-grade sedimentary deposits, the visible supply now constitutes, according to the experts, the second largest known reserve in the world, being exceeded only by that of the Belgian Congo. Considerable uranium is being produced as a by-product of the mining of copper and other metal ores, and apparently it can also be produced as a by-product of phosphate mining.

American Notes

Congress on the Fence

The prospect of a truce in Korea rose above the Congressional horizon in the last week in June, the week in which Congress ought to have renewed the Defence Production Act and to have appropriated the $70 billion which the Administration wants for the fiscal year which has now begun. Congress had, however, been fiddling with investigations of crime, corruption and foreign policy while the session burned away, and so found itself obliged to rush through emergency measures providing for a temporary extension of the Defence Production Act and for funds to keep the government going for the next few weeks. It is thus, luckily perhaps but certainly not by good management, able to sit on the fence until it can judge the effect of Korean developments on both the international situation and the national economy. In addition to a final version of the Defence Production Act, it still has the Mutual Security Programme, the Tax Bill, and twelve appropriations Bills on its "must" list. The Senate, as always far more dilatory than the House, is preparing to remain in Washington without a break until at least mid-September, a decision taken with less heart-burning than usual this year, since the Capitol is now air-conditioned.

The Administration is desperately afraid that, if the Korean war does cool off into an armed truce, Congress will decide that efforts to counter communism abroad and inflation at home can be relaxed. Whatever happens in Korea, the omens for the Mutual Security Programme are not good; when appropriating emergency funds for this month, Congress dealt very stingily with both economic aid and Point Four, although the Administration did succeed, after protests, in getting what it wanted for military assistance. And the omens for the price controls and credit restrictions in the DPA are no better. In spite of the Administration's

insistence that events in Korea will have no effect on the pace of the rearmament programme, the general opinion is that the rate at which defence orders are being placed will inevitably slacken should the fighting end, and that the present reluctance of the public to buy will inevitably increase. However, if Congress sits on the fence long enough, those who prophesy inflation may be proved right. And at least the Administration has been given a last chance to mobilise a public outcry against the dangerous loosening of price and credit controls which Congress is proposing.

For by the time the Senate had finished mutilating the DPA, the President must have been glad that the House's refusal to be rushed made a temporary extension of the old Act necessary. But even the extension contains the worst feature of the Senate's new Bill, the prohibition on price "roll-backs," which Senator Douglas called "a Trojan steer." Intended to prevent the price stabilisers stealing a march on the cattle men before the permanent Act is passed, it in fact prevents planned reductions in the prices of a variety of things, machinery, textiles, lead scrap and so on. This was part of a readjustment, which would also have meant some price increases, designed to smooth out inequities which had been caused by the original price freeze. Now they can only be removed by a general levelling-up of prices. If the prohibition is confirmed in the new Act, it will, it is estimated, mean a rise of about 6 per cent in the cost of living.

The South States its Terms

As the MacArthur threat from outside the Democratic Party fades away, so does the truce between North and South inside the party. In Congress it is southern Democrats who are sabotaging the Defence Production Act, and in Atlanta last week, at a celebration dinner intended to demonstrate the party's unity, Senator Byrd, of Virginia, the most outspokenly defiant of southern guerrillas, announced the terms on which the South would consent to remain in the party in 1952. He demanded restoration of the voting rule requiring a two-thirds majority for the presidential candidate in the party convention, which would in practice enable the South to prevent Mr Truman's nomination; and he insisted that "socialistic" domestic policies and "profligate" spending must be abandoned, as must attempts to curtail the independence of State governments and to guarantee civil rights for Negroes; finally, there must be a clean-up of the pockets of corruption within the party.

The last has a particular point in the South just now, since a recent patronage scandal in Mississippi has been blamed, by a Congressional investigating committee, on interference from the Democratic National Committee in Washington. As regards civil rights legislation, the Administration is understood to have tacitly agreed not to press this before the election, but this does not mean that it can prevent such liberal northerners as Senator Humphrey of Minnesota from doing so. And the mid-western and western party leaders, who met recently at Denver to plan the next campaign, have certainly no intention of abandoning the social security and other Fair Deal measures which they believe will attract the voters as satisfactorily in 1952 as they did in 1948. In public, at least, these leaders promised Mr Truman their whole-hearted support should he decide to run for President again. And the latest indications are that he has so decided, although there is, of course, still plenty of time for him to change his mind.

It therefore seems unlikely that the southern Democrats' conditions will be accepted, and so, if they persist in their refusal to compromise; they will be walking out of the party convention a year from now as they did in 1948. They will be a more impressive group of rebels this time, organised well in advance and probably led by Governor James Byrnes of South Carolina, formerly Secretary of State and Justice of

I always fly on

The Transatlantic Favourite*

The famous Lockheed Constellation has earned its reputation as The Transatlantic Favourite by crossing the Atlantic far more times than any other airliner. 30,000 times! *That's more Atlantic crossings than all other modern airliners combined.* Only Constellations have this enviable record of day-after-day dependability. No wonder important people prefer to go by Constellation.

**And world favourite among modern aeroplanes.* †

Lockheed Constellation

† FROM LONDON VIA: *Air India · B.O.A.C. · El Al · Pan American · Panair do Brasil · Qantas · South African Airways · TWA*

the Supreme Court. But it will not be any easier for them to decide what to do next. If the Republicans have already chosen General Eisenhower—and the likelihood that he will be in the running becomes greater every day—the rebels will be very tempted to enter a coalition with the Republicans. And the knowledge that this was possible might induce the Democratic convention to make concessions to the southern resistance movement, for it is calculated that General Eisenhower with local Democratic support could carry enough southern States to make Mr Truman's defeat certain. So the speculation goes on, and will go on, until Chicago provides the answer next July.

* * *

Newspapers Without Competition

Inflation is carrying forward the concentration of newspapers which has been so noticeable, and so much deplored, in the past forty years. The straw which broke the back of the *St Louis Star-Times*, the latest daily to give up the fight, was the prospect of another 10 per cent increase in the price of newsprint. St Louis, with a population of 850,000, has, with the sale of the *Star-Times* to the *Post Dispatch*, only one morning and one evening newspaper. But local monopoly is far more common than competition. In 1945, out of 1,394 cities with daily papers, only 117 supported more than one, while ten entire States were without competition in the newspaper field, though a measure was supplied by the radio, and today by television. In the preceding sixteen years, 747 dailies had either failed or submitted to mergers; since late 1948, though authoritative figures are lacking, it is estimated that one daily has gone under every month. Many of these boasted only tiny circulations, but it is the small newspaper which has contributed so much to the diversity and independence of opinion. Today there are 1,772 daily papers; in 1909 there were 2,600. There is a school of thought, exemplified for example by Mr John Cowles, who with his brother owns four non-competitive papers in the middle west, that only under monopoly can high standards of responsibility be maintained and the search for sensations and scoops avoided. The Department of Justice, however, does not subscribe to this philosophy. Early this year it brought the first civil anti-trust suit against a newspaper, the *New Orleans Times-Picayune*, with the avowed intention of halting the drift toward greater concentration.

The *Times-Picayune*, which controls not only an afternoon paper in competition with the *New Orleans Item*, but a morning and a Sunday paper as well, was charged with injurious practices in that its standard contract required advertisers to buy space in two or more of its papers. In its reply, the *Times-Picayune* has invoked the freedom of the press. This was ruled out, however, as irrelevant in an earlier case in Ohio, where the *Lorain Journal* was found guilty of attempting to monopolise advertising and news. An injunction was granted against its practice of refusing to accept advertising from merchants who also patronised the local radio station or the weekly newspaper.

The relation of monopoly to freedom of the press is, however, not so straightforward as might be imagined, in a period when even influential and respected newspapers are having difficulty in keeping their heads above water. In Georgia last winter the Senate passed, but fortunately the House shelved, a Bill which would, on the score of newspaper monopoly, have broken up the merger of the *Atlanta Constitution* and the *Atlanta Journal*. Their real crime, however, was their outspoken criticism of Governor Talmadge and the antiquated voting system of Georgia on which he relies.

* * *

Detroit Tightens Its Belt

The materials squeeze, slowly tightening, has at last begun to hurt in Detroit. Automobile manufacturers, who this quarter may use only 65 per cent of the steel, 60 per cent of the copper, and half the aluminium they used on an average in the first half of 1950, are laying off about 33,000 men. Other firms are putting off the evil day by ordering temporary shut-downs. The permitted consumption of metals should allow a production of 1,200,000 cars in the next three months, compared with 3,200,000 in the last six. It is unlikely, however, that even without the metal shortage the assembly lines would have continued to move at their former pace; dealers' showrooms are full of new cars stranded by credit restrictions and the over-buying of the past. But to the automobile unions, at least, the ability of war plants to absorb these unemployed quickly will test the planning of the defence programme. So far, in other cities, there has been remarkably little trouble; unemployment was at a postwar low of 1,600,000 in May.

The automobile companies and other producers of durable consumers' goods are not guaranteed their ration of scarce metals; they are the orphans of the Controlled Materials Plan, which officially came into existence at the beginning of July. Instead of relying on priorities and allocations, now becoming worthless as the result of over-issue, companies in the defence and defence-supporting industries will be told exactly how much they may use, and expect to receive, of steel, copper, and aluminium. In addition, they will receive priorities for other scarce materials. Other industries must hunt down their own supplies in the diminishing free market; whether they will be enough to sustain life depends on the austerity with which CMP is administered. Unless ruthless cuts are made in the allocations requested, it seems likely that the basic metals will have to come under CMP for all users in the next quarter.

With the introduction of much more precise and far-reaching industrial controls, Mr Wilson, the defence mobiliser, has taken the opportunity of eliminating some of the kinks in his own organisation. Mr Fleischmann, the administrator of the National Production Authority, and the father of CMP, becomes, as well, the head of the Defence Production Administration. The latter body, which comes directly under Mr Wilson's eye, was meant to shape policies; these were to be carried out by the NPA, which was situated in the Department of Commerce, and thus responsible to Mr Sawyer. With Mr Fleischmann, who is an exceedingly efficient administrator, at the head of both, the direction of industry's role in the defence effort should no longer be hampered by overlapping authorities and consequent delays.

* * *

Shorter Notes

Mr James Wadsworth, a Republican from New York, who was a military expert when in Congress, has been appointed head of the new commission which will prepare, during the next four months, a detailed programme for permanent universal military training and, if it is approved by Congress, will supervise it when it comes into effect after the present emergency is over. The other civilian members are Dr Karl Compton, who headed the Presidential Commission that studied the question for two years after the war, and Mr William Clayton. Admiral Kinkaid and Lieutenant-General McLain are the service members.

*

Technological progress was the reason for the strike against United Air Lines by its pilots. They are paid on the basis of hours a month in the air, and they argue that the latest aircraft are not only more difficult to fly than their predecessors, but are so much faster that the pilots are being made to get an extra trip out of their 85 hours a month. They are asking for a new basis of 70 hours or 17,500 miles a month, and have now returned to the air while an inquiry into their demands is held.

THE WORLD OVERSEAS

Handbook for Soviet Diplomats

(By A Correspondent)

WRITING on current history is a most perilous task in the Soviet Union. Changes in the Party line provide pitfalls for the most adroit. Even the "Soviet Diplomatic Dictionary,"* the second and last volume of which has just reached this country, did not avoid some of these pitfalls despite the diplomatic skill of its editor-in-chief, the Foreign Minister, Andrei Vyshinsky. The first volume, published three years ago, has now been withdrawn from circulation. This is hardly surprising. Written before the break with Tito it included, for example, the following praise of the Jugoslav Foreign Secretary, Kardelj: "His decided struggle in international conferences for the cause of peace, security and democracy gained him a special authority in diplomatic circles. . . ." How the present volume—in which the name Clementis is mentioned without the epithet traitor and that of Henry Wallace without the attribute renegade—will stand the test of time remains to be seen.

Generally speaking, there is now in the Soviet Union a greater emphasis on foreign affairs. Before and immediately after the war, these were relegated to some back page in the Soviet press and filled no more than one sixth of the total space; now they share the limelight with domestic events and fill at least half the paper. The same trend is noticeable on the radio. Moreover, the innumerable "peace meetings" in factories and collective farms are also mainly concerned with international politics. The increased circulation of the "Diplomatic Dictionary" fits into the same pattern; 10,000 copies of the first volume of this book were printed; there are 50,000 copies of the second volume.

The Dictionary contains a skilful and painstaking exposition of the orthodox Soviet view on most topics of international politics. It also provides a "Who's Who" in Soviet diplomacy. This throws more light on the change of guard in the Soviet diplomatic service, which was carried out in two instalments. In 1939, with Molotov's advent, some new blood was infused. The old hands were put aside, but not completely released. When the anti-Nazi war started, they regained favour. In 1946, however, with the adoption of a stiffer line towards the west, they were considered no longer suitable and were replaced by the new generation introduced by Molotov.

Thus one of the oldest members of both Party and diplomatic service, Mr Litvinov, who was never involved in opposition factions, left in 1946. In the Dictionary his biography is strangely brief. It is mentioned that he ceased to be People's Commissar for Foreign Affairs in May, 1939 (on the eve of the Nazi-Soviet Pact), but there is no mention of the fact that he was subsequently expelled from the Central Committee of the Party, as a victim to the policy of good relations with the Nazis. Only indirectly, in the review of international politics, is there a hint of the reason for Litvinov's dismissal in 1939: "The international situation was getting tenser . . . this required that Soviet foreign affairs be directed by an experienced and popular leader." Molotov, who, at that time was certainly less experienced—and who knows if more popular—was considered to possess the qualities required.

For Litvinov's departure in 1946 no explanation is given. I. Maiski, the ambassador popular in this country, was dismissed at the same time. He is still one of the contributors to this Dictionary and has also been elected to the Academy of Science. In Czarist times retired dignitaries were made senators; now they are turned into academicians. Another diplomat turned academician in the same period is S. Lozovsky, ex-head of the Red Trade Union International (Profintern), former vice-minister for foreign affairs, popular during the war as head of the Soviet press service (Sovinformbureau). He was co-editor with Vyshinsky of the first volume. Now he is not even a contributor, and his biography is omitted.

Of the old guard there still remain in active service D. Manuilski and Madame A. Kollontai. Manuilski is vice-premier and foreign secretary of the Ukraine S.S.R. In postwar international conferences he played second fiddle to Vyshinsky. Madame Kollontai (now 79 years old), an old revolutionary and first woman ambassador, still held a key post during the war as Soviet envoy to Sweden. Now, she is listed as a counsellor in the Ministry for Foreign Affairs.

The Younger Generation

Molotov's departure from the Foreign Office in 1949 cannot be attributed to any change in policy. Vyshinsky is at pains to make this clear in the present Dictionary. Molotov is praised in many places and it is asserted that his resignation was due "to the need to concentrate all his activity on the post of vice-premier." He is quoted as one of the "Great Stalin's closest collaborators" and "an extraordinary resistance and calm, which often disarm the opponent" are included among his virtues.

The men who first under Molotov and now under Vyshinsky have formed the backbone of Soviet diplomacy are all in their forties or early fifties. With the exception of a few, who entered the service a year or two earlier, most of them started their diplomatic career in the first years of Molotov's tenure of office and they came to the top after the war. It was then rumoured in the west that most of them came to diplomatic posts straight from collective farms. Now, for the first time, these rumours may be tested; according to the Dictionary they turn out to be fairy tales. With their background the Soviet diplomats of the new generation are rather reminiscent of a Hugh Gaitskell or a Harold Wilson. Before embarking on diplomacy they usually lectured or directed some economic departments. They were trained for diplomacy in one of the three special schools run by the Ministry: the Institute for Diplomatic and Consular Workers; the Institute of International Relations, and the High School of Diplomacy. There they were taught not only by ex-diplomats with a revolutionary tradition like Troyanovsky, Maiski or Stern, but also by specialists in diplomatic protocol and orthodox international law like the Soviet judge at The Hague, S. Krylov and Professor Korovin. They were given official titles and, since 1943, have worn ceremonial uniforms.

* *Diplomaticheskiy Slovar. State Publishing House for Political Literature, Moscow. First Volume: Editors-in-chief S. A. Lozovsky and A. Y. Vyshinsky* 1948. *Second Volume: Editor-in-chief A. Y. Vyshinsky* 1950.

There are in the Moscow Foreign Office many vice-ministers who, though there is no such post in the Soviet Union, are akin to British permanent under-secretaries. Vice-minister Andrei Gromyko entered the service when Molotov became People's Commissar for Foreign Affairs. He had graduated in 1934 from the Minsk Institute of Agricultural Economics and became lecturer at Lenin's Institute of Economics in Moscow. Before taking his diplomatic post he was acting editor (the Russians call it secretary of the editorial board) of *Problems of Economics*, the authoritative economic journal of the Academy of Science, edited at that time by Varga.

Vice-minister F. Gussiev, former ambassador to this country, graduated at the Leningrad Institute of Economic Development and up to 1937 worked as an economic planner in the Leningrad region. Then he studied at the Institute of Diplomatic and Consular Workers and in 1938 entered the western department of the Foreign Office. Vice-minister Malik's background is similar, only he studied economics in Kharkov and worked in the Ukraine. Yet another vice-minister, A. Lavrentiev, graduated from and lectured at the Moscow Molotov Institute of Energetics. Before entering the Foreign Office in 1939 he was in charge of power-station building and one wonders whether his experience with dangerously high pressures predestined him to be an expert on the Balkans.

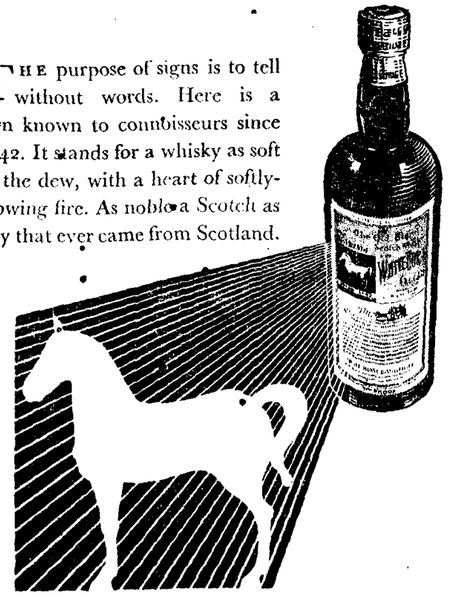
From Errand Boy to Ambassador

Among the envoys, Ambassador Zarubin's career is perhaps the most startling. The present Soviet envoy to the Court of St. James's started as an errand boy. He served for six years in the Red Army, then studied technology and became head of the Molotov Technical Academy in Moscow. Subsequently he directed the educational establishments of the Ministry of Light Industry. On the eve of the war he was chief artistic adviser of the Russian delegation to the New York World's Fair. Yet, in his subsequent diplomatic career, he does not seem to have exhibited a specifically artistic temperament. A. Pavlov, envoy to Belgium, V. Lebedev, recently ambassador to Warsaw and now minister in Helsinki, and A. Levrentiev, Soviet representative to Turkey, after taking their degrees in law or economics all lectured or had chairs before entering the diplomatic service in 1939-40. The ambassador in Washington, A. Panyushkin, studied at the Frunze Military Academy in Moscow and specialised in Far Eastern questions before going to Washington.

Generally, the biographies of Soviet diplomats, past and present, are characteristically short. It has been judged safer to lavish compliments on former Russian Ministers. Thus for example the "enlightened prince," A. Gortchakov, "brilliant stylist, speaker . . . (who) thanks to his abilities gained success and authority in diplomacy," gets more praise than Tchitcherin, for a long time Soviet Commissar for Foreign Affairs, who had the misfortune of being censured by Stalin. Another explanation may lie in the search for "continuity." This would also explain the building up of Ivan the Terrible and Peter the Great as in some way forerunners for Stalin. In this volume the idea of "continuity" is not accompanied by that of Panslavism which was fashionable during and just after the war. The term has been dropped altogether and those of its exponents who are mentioned are described derisively. Nor is there any reference to "slavs," "slavonic" or "slavophil." Thus the uniformed and protocol-minded Soviet diplomats are fed on a mixture of Tsarist tradition and Marxist theory. This Dictionary is to serve these new men, particularly of the lower ranks, as a sort of handbook with orthodox explanations of the intricacies of international politics. For the outsider, too, it is an interesting guide to present-day Soviet views and personalities—as long as they remain orthodox.

Start of the Colombo Plan

ON July 1st the great Colombo Plan was officially inaugurated. This six-year scheme for "co-operative economic development" in South-east Asia envisages the expenditure of £1,868 million in the six Commonwealth countries though non-Commonwealth neighbours have been invited to participate and some have sent observers to the discussions. According to the original estimates, about half the money was to be provided by the Asians themselves; it is now reckoned that the rise in prices of primary products has so improved their position that they may do even better. Britain's contribution will be £300 million; Australia and Canada have made lesser contributions. America has now joined the Consultative Committee, and it is expected that some of the $375 million aid for Asia under the new Foreign Aid Bill will be devoted to the plan. The International Bank is also interested. Finance is not, therefore, the limiting factor. Lack of equipment and materials is more likely to create bottlenecks, so that Mr Gaitskell's goodwill message on July 1st promising that Britain would do her utmost to maintain the flow of capital goods was particularly appropriate.



The striking feature about the Colombo Plan is that it is founded on a clear conception of planning peculiarly fitted to the special needs of South-east Asia. The basic idea is that development in these countries will be achieved by big multi-purpose projects combining irrigation, flood control and the production of hydro-electric power. The newly-irrigated land will then be cultivated and productivity in general increased by the use of fertilisers, double-cropping, seed farms, improved transport and the provision of electric power—a close resemblance to the ideas which inspired TVA. And, together with the expansion of generating power, will come the development of industry.

This is the clue to the plan. Fundamental development requirements—agriculture, transport, communications and electric power—account for over 70 per cent of the total programme; health, education and housing for only 18 per cent. To appreciate the boldness of conception, some of the projects should be examined in more detail; on a number of them work had already begun, before the idea of any co-ordinated scheme had seriously arisen. But all these major projects are now being included in the general plan, and external finance and technical help is expected to hasten their conclusion.

Six Million Acres for India

Of the total of £1,868 million, £1,379 million will be spent in India, where there are no less than eleven River Valley projects either already being constructed or under investigation. The three big schemes on which operations have started are the Damodar Valley project—to cost £37.5 million; the Hirakud dam project costing £22.5 million and the Bhakra Nangal costing £56.8 million. The Damodar plan, designed to control the floods of the Damodar River, contemplates the construction of eight storage dams with hydro-electric stations having a generating power of 440,000 kW in all, a power transmission grid and an irrigation barrage with canals. The richest mineral basin in India will thus be opened up to full development; the project will be completed in 1954. The Hirakud dam will control the Mahanadi River; it will create a vast lake for irrigating the barren lands around it, and provide power for cottage industries. The two hydro-electric stations will have a capacity of 32,100 kW. This scheme will be completed in 1954-55. The Bhakra Nangal scheme is for two dams across the River Sutlej, one of which will be not much smaller than the Boulder Dam in the United States. Power will be provided for the northern cities, including New Delhi, and areas, now arid, will be opened up for the resettlement of refugees.

THE purpose of signs is to tell without words. Here is a sign known to connoisseurs since 1742. It stands for a whisky as soft as the dew, with a heart of softly-glowing fire. As noble a Scotch as any that ever came from Scotland.

The missing volume

ONE of the most important volumes in the Social History of England has—so far as our knowledge goes — yet to be written. It will deal with the Twentieth Century Housewife and the way her life has been transformed by the introduction of scientific labour-saving devices. Naturally enough, this is a subject of the greatest interest to Hoover Limited, since it is difficult to believe that in this Twentieth Century any two mechanical appliances have done more to ease the lot of the housewife than the Hoover Cleaner and the Hoover Electric Washing Machine. Nor should it be forgotten that Hoover F.H.P. Electric Motors are used in many other domestic appliances. It seems fair, therefore, to assume that if the missing volume ever comes to be written, a special chapter will be devoted to the activities of Hoover Limited.

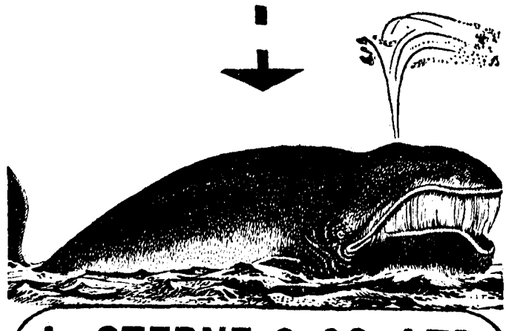
ZINC

THE element zinc occurs in "zinc blende"—a natural form of zinc sulphide—and in certain ores of lead and silver. A hard bluish-white metal, zinc was originally produced only in China and Sumatra, and substantial quantities were once mined in Britain, but most of the world's supply now comes from the Americas and Australasia. Centuries before zinc was discovered in the metallic form, the Ancient Greeks were smelting its ores with copper to make brass, an alloy that has become indispensable to modern industry. Apart from its use in alloys zinc is chiefly important today for coating or "galvanising" iron sheet and wire to give protection against rust. Zinc is also used as a roofing material and in the manufacture of casings for dry batteries, fittings for motor cars and plates for printing. Compounds of the element are well known in such diverse fields as medicine, dyeing and paint manufacture.



In addition to producing zinc wire and strip for the electrical industry I.C.I. makes zinc-chrome pigments for paints and zinc compounds for the processing of rubber.

ICI

SARDINE OR WHALE?

It's a matter of taste, of course. From the culinary point of view both have their advocates. For us, in the more specialised field of refrigeration, the big and the small are equally welcome. For 70 years now, we have been producing refrigeration units for every conceivable purpose for trade and industry . . . for big projects such as ice rinks, marine storage, and meeting the more modest requirements of shops and business by way of store cabinets and showcases. We also make it our special concern to ensure that each of our customers, big, medium and small, receives a first-class service in the maintenance of his equipment. Our experience, in other words, is as broad as it is long, and therefore, whether yours is a sardine or a whale of a problem we will be only too glad to help you. Why not write to us today?

These three projects alone are expected to bring about 6,000,000 acres of new land under irrigation by 1957, and to increase electric generating capacity by 708,000 kW. Eight of the River Valley projects are still under investigation. The largest of all is the Kosi Barrage project, which will involve an expenditure of about £50 million, and will irrigate land in both Bihar and Nepal. The preliminary investigations will be completed next year.

Fertilisers and Penicillin

On the industrial side India has two important projects reaching completion—the Sindri fertiliser factory, and the factory for penicillin and sulphonamide near Poona, which will be in operation at the end of next year. Other big industrial schemes in hand are for a machine tool factory, an aircraft-manufacturing project, and the extension of existing iron and steel factories. New schemes not yet begun include a radio equipment and radar factory, an integrated steel plant, and a heavy electrical plant factory. On industry and mining India proposes to spend £135 million.

Ceylon also has an ambitious multi-purpose project—the Gal Oya—which will cost £25 million, irrigate 130,000 acres and provide 21,000 peasant holdings. Again it is a question of damming a river, the new land being leased to small cultivators. The progress on this scheme is good and the main dam will be completed this autumn. Other irrigation schemes are planned; the port of Colombo is to be developed and a hydro-electric project to generate an additional 50,000 kW is already being constructed. A few factories are planned, but none are of outstanding dimensions.

The most important of the Pakistan schemes is the Lower Sind Barrage, with which is connected the Rasul tube-well project. The barrage will cover nearly 3,000,000 acres. The tube-wells will irrigate 712,000 acres and lower the water-table in the Punjab. These and other anti-waterlogging measures, which will cost about £25 million are expected to benefit, eventually, 6,000,000 acres of land. There will be a heavy expenditure on the distribution of improved varieties of seeds and fertilisers and agricultural mechanisation. £51 million are allowed for fuel and power—mainly for the building of hydro-electric stations to generate 200,000 kW. These will supply power for the new pumping and irrigation projects, and for industry. Jute, cotton and the manufacture of paper are to be the main new industries. Six jute mills are proposed to produce 130,000 tons of jute a year; 24 additional cotton mills which will increase the exceedingly low annual consumption of cotton goods from 9 yards to a possible 17 yards per head; and a paper mill capable of producing 30,000 tons. This, the major part of the industrialisation programme, will cost £43 million.

Adequate Training Facilities

Welded into the plan are the arrangements for providing the technical assistance necessary for all these various projects. A technical assistance bureau, with funds amounting to £8,000,000 for three years, has already been set up in Colombo, with the two-way task of providing facilities for Asian trainees to come to the industrialised countries, and to supply experts to help on the spot. The numbers so far dealt with are not very large, but the curious fact is that only a small proportion of the offers made have actually been accepted by the Asian countries. The British Government points out, for example, that it has been asked to provide training facilities for 182 men and has offered places for 140 up till now; but of these only 23 have been accepted. Similarly 48 experts have been requested; 28 offered, and only three were accepted. Britain is, in fact, satisfied that training facilities and expert assistance are available over a very wide field and that a far greater demand for technical skill than has so far been made could be met. It would be a pity if the scientific excellences of the Colombo Plan were marred by administrative weakness.

Paris views Indochina

[FROM OUR PARIS CORRESPONDENT]

THE Indochinese rebellion—it is less a war than a resistance movement—is the one great foreign entanglement in which France has been involved since 1945. At a time when its more successful allies were either taking their ease or beating dignified retreats from imperial positions "according to plan," France had to take the brunt of a virulent Far Eastern nationalism. Extremely weak in war material and morally depleted by their inescapable wartime vassaldom to Japan, the French were faced, in 1945 and 1946, with an almost desperate situation in Indochina. The conference of Fontainebleau, which resulted in a purely formal *modus vivendi* with the nationalist Ho-Chi-Minh, finally proved abortive when the latter resumed hostilities against the French power in December, 1946; so that the French government was forced to choose, at the lowest ebb of its national and international prestige, between evacuation of a long-held territory and a politico-military struggle of which nobody could see the end. With a kind of courage of paralysis the French authorities declined for months and years to take a suitably dramatic view of Indochina and simply stayed put. This, surely the most extraordinary achievement of the much despised domestic *immobilisme*, has resulted five years later in a distinctly strengthened situation of great benefit to the whole anti-Communist world. Owing to the very "other worldliness" of the Indochinese problem in relation to French home politics, and in some measure perhaps to the moral support of the British from Singapore, the French, military and civilian, were able to ward off both the Vietminh on the spot and the Communist opposition in Paris. In the event no amount of abuse about *la sale guerre* managed to subdue latent patriotism regarding France's role in the world, a sentiment which greater "realism" and, strangely enough, a less paralysed government at home might have pushed aside. If, when the game is played out, south-east Asia is not lost to European influence, it will ironically be due largely to the pertinacity of the shadowy France of these post-liberation years.

Change in Political Status

During this time French official thought about Indochina has considerably evolved. Parallel to the growing belief that the war is not lost there has grown the awareness that the country cannot be won from Communism without a transformation of its political status. The agreement of March, 1949, between the President of the Republic and the restored ex-emperor of Annam, Bao-Dai, whereby Vietnam became an *état associé* within the French Union, was followed at the end of 1950 by the conventions of Pau. These agreements, which were negotiated between France, Vietnam, Cambodia and Laos (the last two states being also associated with France), effected the transfer from the French to the Indochinese of control over those countries' essential services. Post and telegraph, immigration, national investment plans, customs, foreign trade, issuing houses, treasury, exchange control, are now all in the hands of the governments of the three associated states, which have themselves determined their own means of joint action with France. The thorniest questions which confronted the Pau conference were the administration of the port of Saigon and of navigation on the river Mekong. By the creation of quadripartite commissions satisfaction was given to the four contracting parties. The presence of Frenchmen remains, of course, technically indispensable in all these bodies owing to the lack of Indochinese experts. Juridically, however, France is simply one of the contracting parties to the inter-state conventions. Its heaviest say is in tariff policy when Indochinese action might affect French or French Union products. Conversely the associated states themselves joined

in a customs union are to be consulted when the French government intends to make tariff changes affecting Indochinese products. The Pau Conference lasted for five months during which hard words were spoken against France. But the final agreement seems to have given the Indochinese the basic juridical guarantees of the independence they desire. In particular the removal of French control from Indochinese customs is a decisive practical step towards the nationhood of the associated states, which was theoretically proclaimed in the Bao-Dai-Auriol agreement of 1949 and in similar agreements with Cambodia and Laos.

The main provision of the 1949 agreement was for the creation of a Vietnamese army. While sceptical of the efficacity of Vietnamese formations the French had come to realise that ultimately the Viet-minh could not be beaten except by native troops. This was not only because the 160,000 French troops available for the Indochinese campaign were to few to crush the guerrillas in action but also because the essential task was the political absorption of dissident elements. As head of state Bao Dai was bound to remain something of a phantom until he had at his disposal the necessary military and civilian services of a modern state. The creation of the army came first in this development. As soon as the Vietnamese army could offer the Viet-Minh both armed opposition and the attraction of a national going concern, desertions from Ho-Chi-Minh would, it was anticipated, grow apace. Unfortunately there are very few senior Vietnamese officers available, for the French army was never one of the European professions which attracted the Indochinese before the war. The shortage of NCO's is equally serious. In the agreement of December, 1950, the target of 50,000 men was established. To date the permanent joint military commission which is building the Vietnamese army has managed to form only 18 battalions, completely equipped. But this is a start and recruiting is going well. The Americans prefer under the Military Aid Programme to equip the Vietnamese army rather than the French expeditionary force. The volume of American aid has hitherto been limited to a few hundred tanks and aeroplanes of fairly ancient date and a valuable ordnance contribution of spare parts. One of the main deficiencies is in helicopters to take away the wounded from rice fields where there are no roads. But the main lack is in trained Vietnamese soldiers. In this connection an anonymous general writing in *Le Monde* has complained that too many rich young Vietnamese are having a good time in Paris while names famous in France are appearing every week on the casualty lists. Is it, he asks, because these young Vietnamese lack confidence in the future to which France is trying to lead their country: or is it that they are of an inferior stamp to their fellow countrymen who are serving with Ho-Chi-Minh? The main reason is possibly *attentisme*, i.e., the disinclination to opt for the still colourless Bao-Dai until he has something to show which is truly Vietnamese.

Improved Morale

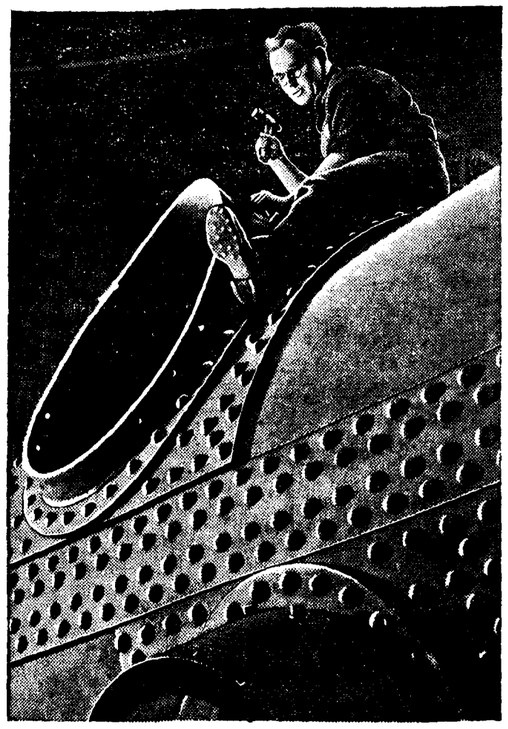
There is no doubt that the arrival in Indochina last December of General de Lattre de Tassigny with the double function of High Commissioner and Commander-in-Chief has enormously revived hopes dashed by the disaster of Cao-Bang in the autumn. All attacks on Hanoi have been beaten off with big losses to the Viet-Minh and all letters from Indochina to France are full of the new *climat* which de Lattre's remarkable personality has instilled. The death in battle of the General's only son has naturally contributed to this feeling of confidence and affection.

In the view of officials in Paris the movement against Ho-Chi-Minh is definitely going well. No quick results can, however, be expected. Against the Communist "abscess" which cannot be eradicated by force (for it cannot be located) the French and the Vietnamese have to build up a new political organism. With all the money in the world this plant could not be "forced" into bud in a few months. The experiment will succeed if Vietnam can be secured against the invasion of Chinese "volunteers." In this connection the Sino-Soviet proposal for a Korean armistice has naturally aroused misgivings in Paris lest the hordes be unleashed upon South-east Asia. The Chinese would only need to pass through Tonkin to Burma and Siam for an end to be put to the Indochinese political experiment; the draught would be much too severe for Bao-Dai.

The Moscow Line on Persia

[BY A CORRESPONDENT]

THE Soviet propaganda machine enjoys several advantages in its exploitation of the Persian dispute. In the first place neither the pro-Communist Tudeh Party nor the Soviet Union itself is directly involved; this enables Moscow to maintain an attitude of lofty objectivity which may well win the ear of many Persians to whom Communism is abhorrent. Secondly, the existence in Teheran of a large number of excited and irresponsible politicians and newspapers makes it hardly necessary for Soviet propagandists to devise their own material. All that Moscow Radio and the Soviet press need do is to choose the most telling points from the flood of anti-British vituperation emitted by the Persians themselves and to give these selections further publicity both in Persia and elsewhere.



A third Soviet asset is the continued activity of the "Azerbaijani Democratic Party" broadcasting station, which has operated from Soviet territory since the withdrawal of the Red Army from Azerbaijan. Far from confining itself to the affairs of Azerbaijan, this station devotes most of its attention to issues affecting the whole of Persia; it also broadcasts in Kurdish, in a tone even more violent than that of its Persian transmissions. On its wavelength Persian listeners hear other Persians telling them that the Soviet Union is "the protector of Persia's independence," that the October Revolution shows Persia the way to free itself from the grip of foreign capital, and that oil experts can easily be obtained from Russia and Eastern Europe.

Sudden Switch in Mid-May

At the beginning of 1951 the ADP station was already engaged in unremitting attacks on the Anglo-Iranian Oil Company, but Moscow broadcasts in Persian were centred on American misdeeds, which were said to include the sending of a hundred ex-Nazis to Persia disguised as technical experts. "American imperialist intrigues" remained Moscow Radio's main thesis even during the Abadan strikes and the passage of the nationalisation law. American efforts to supplant Britain not only in the Persian oilfields but throughout the Middle East remained a staple theme of Soviet propaganda to that area until mid-May, when a sudden switch occurred. Between May 21st and 23rd broadcasts from Warsaw, Vienna and Peking, as well as from Moscow and the ADP station, took up the very different idea of Anglo-American co-operation in exploiting the Middle East, and especially its oil. In one of Moscow Radio's rare commentaries in Persian, Stepanov said, on June 5th, that the United States was not lagging behind Britain in trying to intimidate Persia; this point was illustrated on June 28th by Tass reports linking the arrival of a British cruiser in the Shatt-el-Arab with the despatch of four American destroyers from Singapore for Persian waters.

This pre-occupation with American "machinations" has not, of course, prevented Soviet propagandists from accusing Britain of planning to invade Persia; the Moscow weekly *New Times* has produced "evidence" of a British plot to carve off Khuzistan—the oilfield province—and make it a separate State; and only last week a Moscow broadcast in Persian was devoted to showing that the locusts now ravaging Persia's crops came from "British territories" (including "India and Egypt") and that if necessary the

On the job for 158 years

There is a purposeful ring in the air of a Newton Chambers engineering shop. For here men work with a vigour, a sureness of touch, and a sense of pride which betoken a skilled team. In this same place have worked the fathers and grandfathers of present-day craftsmen, and here, most likely, will work their sons and grandsons. And everything that leaves these workshops carries with it this spirit—this background. *At Newton Chambers every present-day development rests on the sure foundation of 158 years of hard-won experience.*

"imperialists" would drop more locusts on the Middle East "as they had dropped Colorado beetles on Europe."

The Communist propagandists' treatment of Persian leaders is more uncertain than their attitude towards Britain and America. Unity and consistency have been shown on two points; the Shah is "an Anglo-American tool" and the subject of bitter abuse, and the Persian "people" (the word being used in its Marxist-Leninist sense) are not only the innocent victims of the imperialists and their lackeys, but are now fully aware of their enemy's identity and actively struggling to free themselves. Parliament as a whole is treated with contempt as a body of old landlords and merchants who do not represent the broad masses. The charge that it passed the oil nationalisation law only reluctantly under irresistible popular pressure is repeatedly made. Premiers Razmara and Hussein Ala were both steadily reviled during their terms of office; but there have been interesting changes in the Communist attitude towards Dr Mossadegh. No personal abuse has been levelled at the present Premier by Moscow Radio; and although both the "Azerbaijani" station and Warsaw Radio attacked him as an "imperialist agent" at the time when he assumed office, these attacks ceased abruptly at the beginning of May and have not been resumed.

Publicity for the Tudeh

In mid-June the "Azerbaijani" station developed a violent campaign in both Persian and Kurdish against the Mossadegh Government's failure to take over at Abadan and in particular against its entry into negotiations with the AIOC. Kurdish listeners were told that the Persian people "had every right to lose hope in Mossadegh's Government" and to go ahead with "their own plans." Two days later, however, when the negotiations had been broken off, an "Azerbaijani" commentator declared that a Government was now in power which sincerely served the nation; but Mossadegh was warned that he must make use of "progressive elements" and that the masses would accept no excuses for inaction.

While it is difficult to estimate the impact which Communist propaganda is making in Persia, it is clear that the game is being played with great skill. By judicious selection of "news" and comment from other sources and by leaving it to the "Azerbaijani" radio to conduct the more violent forms of agitation, Moscow has contrived to make all its points without committing itself to any definite attitude to the Mossadegh Government, or indeed to the Tudeh Party, whose manifestoes it has publicised without a word of support. At the same time the oil dispute is being fully exploited as a vehicle for arousing hatred of America, Britain and "western imperialism" in general not only in Persia but throughout the Middle East.

Canada's Fight Against Inflation

[FROM OUR OTTAWA CORRESPONDENT]

SOME Canadian businessmen, used to the easy ways of a sellers' market, are beginning to complain about the Government's anti-inflationary measures. Indeed they are beginning an uneasy see-saw, not knowing whether to fear more a continued inflation or a new deflation. This new worry was brought into prominence when the Ford Company of Canada announced a series of lay-offs. The American steel restrictions, which will further reduce the body-stampings supplied to the Canadian motor companies, may be expected to reduce employment. But the immediate crisis was not caused by any material shortages; it resulted from a slump in sales which worried even the British exporters of cars to Canada. Similar reductions in demand hit the makers of stoves and refrigerators and all hard goods. Even the clothing industry felt its effects.

Business has been blaming the Government for all this; and it does indicate that its fiscal measures are having some effect. But of course it is equally true that the buying spree which has been going on for months past was largely anticipatory, and was bound to slacken off sometime. The restrictions which the chartered banks are now applying on new loans undoubtedly bear hardly on many manufacturers and merchants who have been borrowing money to lay in large inventories; and the Government's restrictions on consumer credit, coupled with higher commodity taxes, are certainly having some influence on the reduced consumer demand. But the most that can be expected in overall effect is the re-establishment of a better balance between demand and supply, and a new incentive to the old-fashioned business art of selling, even if this means the almost unheard-of expedient of reducing prices.

If the general economic picture does not justify scare headlines about unemployment, yet such headlines may have a very salutary effect. There are already some signs that the labour unions may be a little more cautious in their demands, and that managements will not be so ready to grant wage increases as they have been in the slap-happy days since the end of the war. If the fiscal policy of Mr Douglas Abbott can bring about this result it will be a great triumph for the conventional fiscal weapons.

American Anxiety Relieved

In the United States there is reported to be a good deal of uneasiness about what Americans regard as "Canada's free economy." Washington officials are apt to be afraid that this country, lacking the complex and formal system of controls which the United States has instituted, may present a danger to their stabilisation programme. But recent talks between Mr C. D. Howe, the Canadian Minister of Trade and Commerce and of Defence Production, and Mr Charles E. Wilson and Mr Eric Johnston have done a great deal to remove this anxiety. Indeed many American officials are even a little envious of Canada's indirect controls.

American officials all insist that the American situation is still basically inflationary. Canada is so susceptible to the influence of every change in the level of American prices and American demand that American trends may be the determining ones here. All the same, Canada's domestic situation is inflationary, and it still would be, even if there were no defence programme. A survey of the investment intentions of business and public authorities at mid-year showed an increase of 5 per cent over the intentions of the beginning of the year and of 20 per cent over last year. Probably just over half the increase is due to the price factor; but this still leaves a substantial increase in physical terms. And without the Government's fiscal deterrents, and without the banks' restrictive loan policy, capital investment would have been very much higher.

The most significant thing about the new survey of capital developments is the change in the direction of investments. Commercial and institutional services, for example, now contemplate less capital investment than they did at the beginning of the year: so do insurance and real estate businesses. But mining and oil wells are much higher. Manufacturing as a whole is far higher; but the increases are in defence supporting industries like iron and steel, chemicals, petroleum, base metals. All these projects are exempt from the deferred depreciation provisions of this year's budget. That is to say, they are allowed the normal depreciation allowance for taxation purposes. Other businesses, which are denied depreciation allowances for a period of four years, show little increase or even a decrease in their capital expenditures compared with the beginning of the year.

The anti-inflationary fiscal weapon may need some adjustment or refinement later in the year; but at present it seems to be achieving its broad purpose satisfactorily.

THE BUSINESS WORLD

Full Circle in Wool

THE commodity markets are watching the possibility of an outbreak of peace in Korea with anxious eyes. If a cease-fire does come, it need not significantly damp down demand for industrial raw materials—provided that rearmament, and the high level of production that it implies, does not slacken, particularly in the United States. But colder war might in any case bring a substantial psychological jolt to the markets, which have already marked prices down well below their peak of four months ago.

How far have such psychological influences been important in the recent past—both in driving prices up in the eight months immediately after Korea and in driving them down since February and March? They have certainly been very potent in the wool market, where prices have described a *full circle*—or *virtually* so—in the past twelve months. Prices quoted at last week's Perth sales were almost back to their pre-Korean level—having in the meantime attained the dizzy rise of over 200 per cent. For this very reason, however, wool is far from being a typical case of commodity market behaviour. Even before the war the wool market was noted for its waywardness. In successive post-war years, when everybody was pointing to the volume of war accumulated stocks hanging over the market and prophesying that a break in prices must come sometime, prices obstinately went on rising. Now, when those stocks are exhausted and available supplies will be less than the current rate of consumption, the break has occurred — though *it is important* to emphasise that prices are still six times their prewar level. That wool should have been the first commodity to show such a dramatic reversal in price is surprising enough, because stocks in both consuming and producing countries are extremely low. But the reversal is all the more surprising since part of the sharp rise in wool prices during the latter half of 1950 could not be directly related to events in Korea; some of it was a reflection of the high rate of consumption that had persisted throughout the year.

Wool prices reached their peak last March, when they were between two and three times their level of June, 1950. Since then they have fallen continuously; indeed, in certain weeks the declines have been the sharpest ever recorded in the history of the wool market. All grades have been affected, though carding wools more than combing wools. Even among combing wools the prices for merino 64s at the end of June were only 11 per cent above those quoted in June, 1950. The lower count combing wools had admittedly held more of their gains; fine crossbreds are still 29 per cent higher than twelve months ago and medium crossbreds 59 per cent higher. But there were special reasons for this. In the first place New Zealand is their principal source of supply, and there have been no sales in New Zealand since February because of the dock strike. In the second place, the prices of these lower count wools had risen more sharply during the earlier phase, because manufacturers switched to them in their search for economies. Despite this rise, and their less dramatic fall since March, fine crossbreds are still cheaper to use than merino.

The best available estimates of world supply and demand for wool are shown in Table I. Total supply during 1950-51 amounted to 2,359 million lb. (clean) while world consumption during the same period was 2,402 million lb.; trade stocks thus seem to have fallen by about 43 million lb. As consumers' stocks are now believed to be down to minimum working levels and as the stocks of wool accumulated during the war are exhausted, this year's consumption will have to be met wholly out of this season's clip. If it is assumed that this clip increases in 1951-52 by the same amount as it did in 1950-51, namely by 3½ per cent—and that was the largest seasonal increase recorded since the war—available supplies will amount to only 2,350 million lb. This would be just about enough to maintain the current rate of consumption, which is now below last year's average level (largely, it seems, because manufacturers

have been using materials other than wool to an increasing extent; it is noticeable that wool consumption has fallen more sharply recently than the output of wool textiles). But this calculation makes no allowance for stockpiling and rearmament requirements. The latter may make it necessary for the consumption of wool for civilian purposes to fall by 10 per cent this year.

If there is any statistical reasoning behind the recent fall in wool prices, therefore, it must lie in an assumption that retail prices for wool textiles, once they reflect the full rise in raw material costs, will induce a decline in purchases of the requisite order of 10 per cent. There could be two explanations of such an expected fall in demand. Either it could be argued that high prices will cause consumers to switch to other sorts of textiles, or it could be argued that high prices will induce the public to buy less textiles as a whole.

Cotton and rayon do compete with wool in the retail trade to some extent, but this competition is not only a matter of price; fashion, taste, and weather, are also important factors. Moreover, supplies of these textiles are not very abundant. The smaller American cotton

crop last year reduced world output from 15,041 million lb. to 13,123 million lb., as Table II shows. World consumption in 1950-51 has been provisionally estimated at 15,000 million lb., so that stocks at the end of the season are likely to be only 6,071 million lb., compared with 7,948 million lb. on August 1, 1950. The price of American cotton has been stationary since February—at the maximum level fixed by the United States Government, or 32 per cent higher than in June, 1950. Egyptian cotton has declined since January but it is still 123 per cent higher than it was twelve months ago. It is true that the prospects for the cotton crop in 1951-52 are good; the American acreage has increased and output is continuing to expand in most other countries. But even if world output reaches its expected level of about 16,000 million lb., stocks will have to be built up above their present levels. If stocks were raised to 8,000 million lb., by no means a high level, supplies available for consumption would be 1,000 million lb. smaller than in 1950-51.

*

World rayon production increased very sharply during 1950. As Table III shows, output of rayon yarn, at 1,938 million lb., was 17 per cent higher than in 1949 and output of staple fibre, at 1,542 million lb., was 45 per cent higher. Productive capacity is still increasing, and by the end of 1951 it is expected to reach an annual rate of 4,500 million lb. (yarn and staple fibre). But the shortage of raw materials, especially of sulphuric acid, is likely to prevent it from being fully utilised. The industry's other raw materials are also by no means plentiful;

although more cotton linters should be available with the new cotton crop, no significant increase can be expected in the supply of woodpulp. It seems unlikely that production this year will increase by more than 10 per cent, which would raise it to about 3,800 million lb. The price of rayon has risen with the price of the other textile fibres during the past twelve months; for viscose staple fibre it is now 38 per cent above the level of June, 1950.

From these figures it would seem that supplies of the three textile fibres available for consumption in 1951-52 might amount to 20,200 million lb., compared with 20,900 million lb. in 1950-51—and defence requirements will have to be met from this smaller total. It may be, of course, that demand for textiles as a whole will fall. The public has admittedly been re-stocking its wardrobes during the past year. Both the value and volume of retail sales of textiles in most countries remained at an extremely high level from August, 1950, until about March, 1951, and part of this buying was no doubt merely an anticipation of apprehended shortages and price-rises. Since March, retail sales have declined, but the real test of the market will come in the autumn, when textiles sales usually increase.

It would be idle to suppose, however, that the recent fall in wool prices has been due to any close reasoning about the likely trend of demand for textiles. Most buyers distrusted the high levels that wool prices reached last March. The general belief was that a rise of 40-50 per cent on closing prices of the previous season could be sustained, but not the rise of 100-200 per cent that March prices represented. That alone induced caution. Maximum prices for raw wool were imposed

by the American Government at the end of January, and this, in conjunction with the fall in retail sales, caused American buyers to withdraw from the wool market at the end of March. The subsequent negotiations on international allocation, raising the possibility of an agreed maximum price, have helped to foster this feeling of uncertainty about the future. In Britain and in certain European countries, wool manufacturers have bought only as much wool as their available credit and liquid resources could cover, without asking the banks for extra accommodation—and they have accepted only those

orders that they could manufacture from these supplies of wool. Most manufacturers could quite easily extend their order books; but in recent months it has been the manufacturer not the wholesale purchaser of textiles who has been unwilling to commit himself for more than a few months ahead.

Wool may be a special case, but it at least emphasises the extent to which a commodity market may be affected by factors that cannot be assessed statistically. From current trends of supply and consumption, wool prices might be expected to be firm. They are not—though wool is still dearer than rayon compared with before the war, though probably no dearer than cotton. The trend of prices at the London sales next week will at least show whether wool buyers consider the recent fall to be merely transitory or whether they feel that a new phase of cheaper wool is dawning.

The Cost of Labour Turnover

WHEN the Minister of Labour assured the Amalgamated Engineering Union last week that he hoped the defence programme would not necessitate a return to direction of labour, he must be presumed to have been reckoning that up to 200,000 persons would voluntarily switch into defence industry as the programme gathers speed. This is the best unofficial guess of the volume of eventually required additional defence workers who will not be obtained merely by switches in their work. It may not be easy to ensure such a movement unless strong financial inducements are given—despite the evidence that the rate of labour turnover in industry is already high. Statistics compiled by the Ministry show that nearly 3 million jobs are changed each year, though it should be noted that the number of individuals involved must be presumed to be much less than this, because about a third of these changes occur after less than four months in any particular firm. Unfortunately, such figures as these throw little light upon the chances of manning the defence industries without either resort to compulsion or to radical changes in financial policy. From this standpoint, the vital question is how far this high rate of turnover indicates any genuine mobility—in the sense of willingness to move from one industry to another, as distinct from movement within individual industries that may merely impose a drag on their efficiency.

As yet there is hardly any indication how much of the job-changing represents a healthy mobility of the first kind. Neither the Ministry of Labour analysis, which covers 56,000 firms and 7,000,000 workers in manufacturing industry, nor the recently concluded two-year survey of the British Institute of Management, gives any clue. Rarely is any record kept of where employees go when they leave; indeed, their destination is often unknown at the time. From the limited evidence available, it may, however, be reasonable to guess that less than a thirtieth of the annual turnover of labour represents a movement of workers from one industry to another.

This accords with the general impression that postwar full employment, in Britain as in the United States, had led to an increase, not in genuine mobility, but in movements from job to like job, especially by voluntary resignation. This cannot be measured statistically, because no comprehensive figures of prewar labour turnover in Britain are available; the only available figures relate to local surveys. A comparison of British and American experience since the war is shown in the accompanying chart, but this has to be qualified because the coverage and basis of assessment are different; the Ministry of Labour figures, which were begun in 1948, may understate turnover by as much as about a tenth. But although the comparisons are uncertain, the statistics of postwar labour turnover deserve scrutiny for the light they throw upon the problem posed for industrial management, and maintenance of labour efficiency, in conditions of full employment. For measurement purposes, labour turnover may be defined as the loss, for any reason, of employees who have sooner or later to be replaced; in the accompanying table and chart, the number leaving in a given period, normally a year, is expressed as a percentage of the average number employed over the period. The annual rate of turnover for men in manufacturing industry has ranged since 1948 from 20 per cent to about 40 per cent and for women from about 35 to nearly 60 per cent; the rate for women is normally about 50 per cent higher than that for men. For both there is a certain seasonal fluctuation, naturally more noticeable in the figures for individual firms or industries than in the national figures.

Inevitably, there are substantial differences in the rates for different industries. To a large extent, these variations seem to reflect differences in the scope for movement within an industry rather than in the nature of the work done. The important factors relate to industrial structure, such as the average size of firms in the industry, the degree of concentration or localisation of the industry—all of which influence the worker's chances of finding convenient alternative openings for employment. Thus the figures for oil refining, explosives or iron and steel works tend to be relatively low because

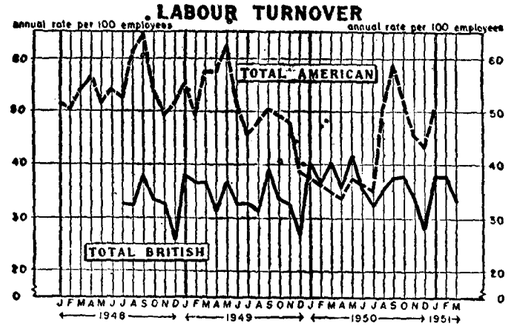
these industries mainly comprise a small number of large employers—although the BIM survey showed that this correlation is not universal. The jute industry, because of the close localisation of a fair number of small or medium-sized firms, has a high turnover; the extreme shortage of labour in this industry is a further stimulus to turnover. Again, many sections of the engineering industry consist of large numbers of medium-sized or small firms with particular concentration in the Midlands, and their turnover tends to be high; here, again, the strong demand for labour plays its part. Generalisation drawn from the experience of broad industrial groups cannot, however, be pushed very far; many internal variations are concealed in an aggregate figure for a whole group of industries, as the figures for textiles shown in the first table plainly suggest. It should be noted, too, that differences between areas result from the extent of alternative employment; thus the south-west area has a low rate and the Midlands or London a high one.

The BIM survey clearly brings out some significant facts not apparent from the Ministry's figures—notably the high proportion of "short-term leavers" and the preponderance of employees leaving at their own request. The BIM sample (a small one, embracing less than 200 establishments and some 250,000 workers) shows that, of the total number of men leaving, an average of nearly a fifth left within one month, nearly two-fifths after less than four months' service and almost three-fifths within the first year. In each case the proportion was larger in 1950 than in 1949. For women the percentages are almost as high. A local survey by Sheffield University and other local investigations show similar results. The experience of individual firms has shown that in a period of prosperity it is difficult to reduce to much under three-fifths the proportion of employees who leave within a year, though there has been some progress in reducing the proportion who leave within three or four months.



Any study of reasons for leaving is subject to the uncertainty inherent in the data: the reasons given may conceal more than they reveal. But the BIM's results give a guide that is largely substantiated by the work done at Sheffield. The BIM survey shows that nearly 45 per cent of the men and 30 per cent of the women left because of "dissatisfaction" with their jobs—principally, according to the BIM survey, because they found scope for "personal betterment." During the two years surveyed, these proportions increased as the proportion of discharges through redundancy decreased. A similar relation between reductions of staff and voluntary resignations has been evident in other studies. Moreover, the American labour figures for 1949 seem to show the same thing. As reductions of staff decrease voluntary leaving usually increases, and vice-versa.

*

From a national point of view, as from that of the individual firm, the serious aspect of labour turnover is that waste is resulting from a high rate of short-term leaving—often for insubstantial reasons. It is naturally almost impossible to make any calculation of the national waste involved in human or financial terms. But such evidence as is available does suggest that, at least in present conditions, this kind of wastage is inherent in over-full employment. For this reason it is not surprising that the problem is attracting research projects, which are springing up throughout the country. It is conceivable in principle that the wastage may be over-emphasised. In the first place, if this is a loss that results from over-full employment, there are certainly some offsetting gains—even in purely materialistic terms. Secondly, a genuine mobility of labour, as distinct from merely frictional movements within industries, is indispensable if the economy is to remain virile.

In any case, there is, of course, always a virtually irreducible amount of change, attributable to illness, accidents, marriage, pregnancy, death and retirement. This minimum might amount to a turnover rate of about 3 per cent for men and 10 to 12 per cent for women. The more nearly an economy approaches one hundred per cent employment, the more clearly does some degree of movement above this minimum become a functional need. If, therefore, the present rate of turnover were by and large resulting in productively purposeful changes, there would be far less cause for concern: but the evidence is otherwise. Much too high a proportion is short-term movement.

This kind of movement involves a wastage for the individual, the business unit and the whole national economy. It is most visible to the business unit. A too

rapid turnover of workers wastes time, labour and materials, and causes a general dislocation. To some extent it can be measured financially. Little has yet been done to investigate these financial costs, but two methods have been suggested. In the simpler, the cost is assessed under a number of heads, as given recently in a pamphlet issued by the Institute of Costs and Works Accountants. Apart from the expense of the employment office and incidental costs of engaging labour, the other main items considered are the training of new employees, the fact that the wage-costs of output by new employees are higher than for fully-trained workers, the overtime caused by delays in filling

vacancies, and the extra scrap, tool breakages, and delays in output. For four units employing altogether between 2,500 and 3,000 people, the cost of the turnover of operatives was assessed at £17,000 a year (including only what the pamphlet refers to as "replacement" costs, since to include also what it calls "preventive" costs, such as the expense of the pension scheme and of the whole of personnel administration, would be to deprive the calculation of meaning). Of this total, £6,000 was the cost of training, and the rest was mainly attributable to the inefficiency of new labour, the cost of the employment department and the loss of output through delay in obtaining new workers. The cost of replacing a worker who left was put at about £100. But in these firms a larger sum than would probably be typical was spent on training, and aggregate turnover was low; expressed in terms of the whole labour force, for example, the cost

Over 5 years		11·0	12·8	12·8

per employee was only about £10 a year. Hence this figure of £100 a replacement, the only one available that is based on costing inside industrial concerns in Britain, is probably unrepresentative; and any national figure of cost that it might be tempting to calculate on such a basis would have no real meaning.

Given the fact that some degree of change in the labour force is not only inevitable but also desirable, it is evident that the optimum figure must vary widely from firm to firm. A unit in an isolated area such as Devon or a Welsh valley, where few alternative occupations offer, may suffer from a high rate of absenteeism instead of high labour loss; absenteeism increased during the war both in the United States and Britain when to leave one's employment was difficult.

In many instances, too, the labour turnover rate, like the rate of productivity, may to some extent be considered an index of managerial efficiency, on the personnel side, but it is one that needs careful reading. Even in conditions of full employment, loss of employees can be limited by good personnel management and recruitment policy; and some firms have been particularly successful in this direction in the last two or three years. Two problems confront management here: first to pick people who will be able to settle down, and, second, to ensure that the atmosphere in the unit where the employee works gives an encouragement to stay. Selection has been studied and tested methods of interviewing and aptitude-testing (not necessarily complicated) are available. Some firms have also tried the payment of workers' bonuses on a group basis, which strengthens the cohesion of the working unit, as well as having other obvious advantages.

Research has its fashions: and labour turnover is now a fashionable subject. The numerous projects of research that are now being undertaken in various universities may yield much that will be helpful to managements. The work of Sheffield University has already led to meetings with representatives of firms that have proved profitable to both sides. Yet there is a danger of over-elaboration of statistical analysis covering industries or localities, and of too little attention to the individual company. What is particularly needed in the way of research—perhaps the BIM may consider initiating it—is a series of published case-studies of the experience and of the financial cost of turnover in individual concerns, not necessarily with disclosure of their identity. The more closely focused the inquiry, the more likely it is to be of value to industry.

Business Notes

Micawber Takes Stock

The Chancellor of the Exchequer on Wednesday last made the release of the quarterly figures of gold and dollar reserves the occasion for a general stock-taking of Britain's economic position as it has developed since the framing of the estimates in this year's Economic Survey. His reckoning of the debits and credits in these trends, and the general tone of his comments, are likely to disquiet all save the closest and most hardened of observers. On the credit side there is the fact that industrial production in the first five months of this year has been running at about the level upon which the Government's budgetary and economic planning was based—at some 5 per cent above the rate for the similar period last year. Given the anxieties about supplies of raw materials, this is a heartening performance—especially as Mr Gaitskell now declares that, although shortages of materials remain an obstacle to further progress, the position is not so menacing as it was a little while ago. This, however, virtually exhausts his list of credit items, and they are appreciably outweighed by the debits. The performance of almost every other major element in the balance sheet has fallen short of the Economic Survey's hopes.

Despite an increase in United Kingdom exports to the dollar area, the gold and dollar surplus of the sterling area as a whole has run down to very small figures in the past quarter, and the deterioration continues. Moreover, as the month by month trade figures had already indicated, Britain's own balance of payments with the rest of the world has worsened much more sharply even than the Survey had envisaged. Almost all the adverse tendencies there set out, the Chancellor declared, "are developing more strongly than we expected"—notably, of course, the worsening of the terms of trade. Though he would not commit himself to any quantitative estimates, he evidently expects the first half-year's figures to show an appreciably bigger overall deficit than could be attributable to any stock-piling purchases. Hence the problem of the overseas balance "is likely to return to the centre of the economic picture." Because of the steepness of the rise in import costs, the volume of exports needs to be raised even further than the Survey assumed, if the threatened return to substantial overseas borrowing is to be averted—and this has to be attempted in the face of fast-rising competitive pressure of defence demands, not to mention the hesitancy of some overseas markets.

If these additional exports are to be achieved, they imply an appreciably bigger cut in home consumption than was officially deemed necessary three months ago; yet consumption in at least the first three or four months of this year was actually running at some 5 per cent above its corresponding 1950 level. Despite this, the Chancellor still does not concede that the budget was insufficiently disinflationary at the time it was framed; he consoles himself with the reflection that the rise in consumption may have been mainly due to non-recurring "forestalling" buying that is now exhausting itself. He admits, however, that tougher measures may be necessary—yet declines to say the form they may take if and when the Government can screw up its courage to take them. In the meantime, it is content to "discuss" with exporting interests the steps needed to raise exports—and is apparently not hopeful that much can be secured from higher export prices. "If," declares Mr Micawber Gaitskell, "industry feels unable to achieve considerable increases" in physical exports, the "situation will begin to look very serious." When will the Government "feel able" to do something about it?

* * * *

Gold Flow Slackens

The deterioration that the Chancellor had to announce in the sterling area's gold and dollar surplus was even greater than most observers had expected. During the second quarter of 1951 this surplus amounted to only $54 million, compared with a surplus of $360 million in the first quarter of 1951 and of $398 million in the fourth quarter of 1950. Receipts under the European Recovery Programme, in respect of allotments made before the end of 1950, amounted to $55 million in the past quarter. The gold and dollar reserve was thus strengthened by $109 million and amounted to $3,867 million on June 30th, compared with $3,758 million on March 31st.

The Chancellor mentioned three factors as mainly responsible for the decline in the dollar surplus in the second quarter. The first was an increase in expenditure on imports from the dollar area by the whole of the sterling area. The second was a decline—partly seasonal—in exports from the overseas sterling area to the dollar area. The third was a reduction in net receipts of gold and dollars from non-dollar

countries—particularly from the European Payments Union whose gold settlements in favour of the United Kingdom last quarter amounted to only $17 million against $76 million in the preceding quarter. The Chancellor added "it is quite likely that these less favourable influences will continue during the next few months." They will be seriously aggravated if the worst befalls in Persia and the products of the Abadan refinery are temporarily lost. In answer to a question, the Chancellor estimated that the gross additional dollar cost to the sterling area of replacing Persian oil would be about $350 million a year.

Buoyant Production

Although the 5 per cent gain in industrial production, by comparison with the first five months of 1950, is slightly better than the 4 per cent increase assumed in the Economic Survey, the Chancellor wisely put his emphasis on the fact that it is much less than the rate of gain in the year 1950 as a whole. The direct dislocating effects of the starting of additional arms production have scarcely begun to make themselves felt; and the effects of shortages of key materials have so far been minimised by drawing upon stocks and by manufacturers' ingenuity. Mr Gaitskell naturally drew some encouragement from the recent output record, but he

emphasised his uncertainty about the adequacy of forthcoming supplies of the two most important materials for the economy, coal and steel. On coal prospects, which are discussed in a later note, the Chancellor added his voice to those calling for the utmost economy in fuel use, and reiterated his desire for a level of coal exports high enough to assist in obtaining iron ore, wood pulp, pyrites and timber from customers on the Continent. Imported iron ore supplies remain the key to 1951 steel production. Although home ore consumption is being increased and the scrap drive is bringing in valuable additional amounts of steel-making material, success or failure in achieving the 16 million tons of ingot steel output aimed at this year depends mainly upon whether the ore already purchased by the steel industry can be shipped to Britain in time. Failing this, any build-up towards full production at the new Margam and Trostre mills is likely to be achieved only by depriving other steel finishing plant of crude steel.

The most important industry in which shortages of raw materials have markedly limited production—essentially shortages of sheet steel and certain zinc die-castings—is the motor industry. Up to the end of May car production was 6 per cent below the 1950 figure, though production of commercial vehicles and chassis was held slightly above last year's, and output of agricultural tractors was 36 per cent higher. Rayon production, affected at the beginning of the year by the sharp cut in sulphur supplies, has since recovered, thanks to the industry's more economical use of raw materials and to its success in obtaining sulphur and acid from outside America. For the moment, there are hopes that the shortages of these basic materials may be eased, or at least not accentuated, during the remainder of the year. Coal supplies may be the determining factor in the level of industrial production as a whole.

* * *

Financial Agreement With Egypt

The Anglo-Egyptian agreement on the release of Egyptian sterling balances, which was initialled last March, was formally signed in Egypt this week. The agreement

provides for the immediate release of £25 million from Egypt's blocked sterling account of £230 million; of this the equivalent of $40 million can be taken in dollars. Thereafter, and for the next ten years, Egypt will be allowed to draw £10 million a year, together with an additional £5,000,000 a year up to a total of £35 million if its current account falls below £45 million. The agreement also provides for the supply of petroleum products worth £11 million annually to Egypt; this will be paid for out of Egypt's current sterling earnings and agreed sterling releases. It will be recalled that, after the agreement was initialled and published in March, it encountered strong political opposition in Britain and that special exception was taken to the petroleum clauses in view of Egypt's continued refusal to allow tankers to proceed to the Haifa refineries through the Suez Canal. Subsequent events in Persia have reinforced these criticisms. Even when the difficulties that stood in the way of the achievement of any agreement at all are comprehended—and nobody who has read the propaganda in the Egyptian press against the agreement will underestimate them—the impression left by this settlement is that the British Government has been willing to give too much away.

* * *

First Quarter's "Above-Line" Surplus

The Exchequer returns for the first quarter of the financial year disclosed an "above-line" surplus of £13.8 million of ordinary revenue, compared with one of just over £41 million in the first quarter of 1950-51 and with a virtual balance for the corresponding period two years ago. This surplus has been achieved despite an increase in ordinary expenditure (including sinking fund) by £105 million, to £832 million. This increase affords the first clear evidence of the effects of defence spending, although it still forms only a modest proportion of the large increase in total above-line expenditure that is envisaged for the full year; including the allowance of £160 million for defence supplementaries, the budget provision for the year is £940 million above the actual expenditure of 1950-51. The fact that a moderate surplus has been achieved in the first three months reflects the buoyancy of "ordinary" revenue, which has risen from £769 million to £846 million—by an amount that is actually more than proportional to the increase of £258 million for which the Chancellor budgeted for the full year. This strength of revenue has not, moreover, been due to any adventitious receipts; revenue from the sale of surplus stores, trading services and from miscellaneous items has in the aggregate declined in almost strict conformity with the budget estimates. More than half the quarter's gain has been attributable to the strength of customs and excise, which in turn is a reflection of rising prices and increased purchases. Customs revenue, up by nearly £27 million, already shows a slightly bigger rise than was expected for the full year, while excise receipts have risen by £15.8 million compared with an expected drop of £4,300,000 for the full year. Income tax, expected to provide an additional £220 million in the year, has so far yielded an additional £29.5 million.

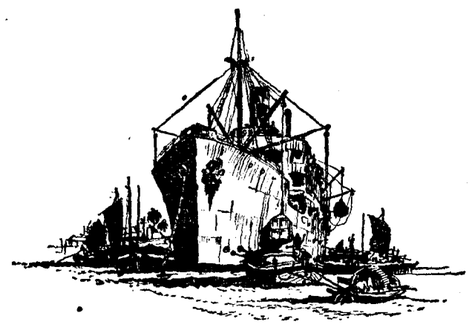
Expenditure below-the-line has been running beyond estimate. After deducting below-line receipts, net expenditure has risen by £12 million to approximately £123 million; the increase expected for the full year was £23 million. This trend is wholly due to the sharp rise in loans to local authorities; over the full year these were expected to decline by £13 million, but have risen by fully £19 million in the first quarter. The upshot is an overall deficit of approximately £109 million, or £40 million more than that for the first quarter of 1950-51.

* * *

The Second Coal Board

Mr Noel-Baker saved up few surprises for his belated appointments to the National Coal Board. Since early this year, Sir Hubert Houldsworth's has been the name most frequently tipped to succeed Lord Hyndley as chairman of the Board. His elevation from the East Midlands to Hobart House may not take place without occasioning some heartburn within various strata of the NCB hierarchy; but the Minister might have taken even longer trying to find an equally acceptable—and willing—chairman from outside nationalised coal. Sir Hubert has been associated with the successful experimental work upon new mining methods and machines carried out in the East Midlands Division in the last three years: and if he should wish to promote the wider application of these experimental techniques more quickly that the Board has hitherto ordered, that may be no bad thing. His recent experience of running a coal business with roughly 100,000 employees, and an output of about 40 million tons worth some £86 million a year, is backed by great experience of the legal side of the industry. And his step upward from the divisional level, which is shared by Mr W. J. Drummond, who becomes one of the two new deputy chairmen, may bring a different viewpoint into the Board's discussions of the proper structure of the industry.

The new appointments almost entirely dispose of the original functional pattern of the Board by which its members were the responsible heads of its major departments. Mr Ebby Edwards and Sir Charles Ellis will presumably retain their special interest in labour relations and in science respectively, but like the other new members they are now described as "non-functional"; Sir Lionel Lowe, who has recently suffered considerable ill-health, has not been reappointed, and the Board will now have no designated finance member. Sir Geoffrey Vickers, who also remains with the Board, has never been a functional member.



Its new members should add considerable strength. Sir Eric Coates, the second new deputy-chairman, is new to the industry, and brings considerable experience of finance and administration. Mr Drummond, on the other hand, has a long experience of controlling coal-mining operations under private and public enterprise. Sir Andrew Bryan, one of the country's most distinguished mining scientists, has an unrivalled and impartial familiarity with the industry's management problems. With the part-time members, all of whom remain, the second Coal Board should be considerably stronger than the first has been, particularly in recent months. It will be judged by its approach to certain fundamental weaknesses that the present Board, pre-occupied with day-to-day routine, has recently tended to shelve.

* * *

—And the Next Coal Winter

Immediate coal prospects, however, are enough to worry the Government. At the miners' conference this week Mr Noel-Baker emphasised that coal consumption is still rising faster than output, and that another crisis this winter is possible. The Minister devoted most of his speech to the need for "desperate efforts" to avoid wasting fuel: he did not specifically suggest that the miners might resume Saturday working in the pits earlier than they now expect to, and Sir William Lawther, in replying, promised his remarks only "the serious consideration they merit." The Minister did, however, say he had decided to set up a committee of unspecified composition to study "the wider aspects of national fuel policy": and, on the subject of manpower, that he contemplated increased recruitment of foreign labour if the miners could not be found at home. For since the middle of April the growth in coal mining manpower that had been so conspicuous in the previous four months seems to have come to an end. The industry's labour force has remained stationary at a little above 700,000, with a slight decline of about a thousand men in the last five weeks. But the number of men at the coal-face is still increasing, as recruits become more skilled: and soon the arrival of Italian workers will swell the figures.

With half the year over, coal budgeting looks more practicable. The Board is not likely to be able to do much more

Where can your goods go?

The world is wide—but economic conditions, currency restrictions and the like exercise a limiting effect . . . It is part of the service of the Westminster Bank to provide the accurate and up-to-date information on trade conditions which must form the background to any discussions of new markets and new business ventures. This facility is included in the wider service which the Bank offers to all importers and exporters and which is described in a booklet called *The Foreign Business Service of the Westminster Bank*. Your nearest branch will be glad to give you a copy.

WESTMINSTER BANK LIMITED

Customers of yours?

The busy streets of any Australian city show a cross-section of Australian people who are engaged in a large variety of occupations and equally as varied and numerous are their requirements as consumers—a situation weighted with possibilities for British business houses . . . But a sound principle when framing any Australian marketing scheme is to precede planning by consultation with the Commonwealth Bank of Australia. For the Commonwealth Bank *knows* Australia. Its intricate network of branches throughout Australia provides a large source of information on any question of Australian life or industry. Its Financial Information Service is at the disposal of all British business houses.

Time for Eastern trade

Ten-fifteen in England and the London, Manchester and Liverpool offices of The Chartered Bank of India, Australia and China have already opened to the public. At New York the day's work has not yet begun. In the East at Colombo it is tea-time and in Hong Kong business is finished for another day. But wherever business men engaged in the Eastern trade may be, they will find at the nearest branch of The Chartered Bank up-to-the-minute information, skilled assistance and efficient banking services.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

Banking with Barclays

New Enterprise?

We have no statistics showing the number of people who have made a success of their business with no help at all from their bank . . . but we are quite sure that it must be extraordinarily small. It's obvious enough, when you think it out—a large part of our purpose in life is to assist the enterprising, even if the help is no more than a word of advice at the beginning of the enterprise. If you are thinking adventurously it will be worth your while to have a talk with one of our managers. He will tell you of the ways in which Barclays can help you.

BARCLAYS BANK LIMITED

BANK OF MONTREAL

than agree with Mr Gaitskell's emphasis upon the importance of coal exports: it should perhaps be said that the possibility of coal imports next winter has not been entirely ruled out. The output side of the balance at present appears to offer roughly 211 million tons of deep-mined coal, 12 million from the opencast sites, and 1,200,000 tons from America; about 224 million tons in all. On the consumption side, inland consumption may well equal the size of deep-mined output, unless material shortages in industry affect the use of fuel more than they have done yet; to this 211 million tons there must be added perhaps 4,000,000 tons for bunkering, and 3-4,000,000 tons to build stocks at the beginning of the winter to a highest-ever level. The NCB may thus be hard put to export the 6,000,000 tons or more that they have tentatively in mind at present, unless stocks are to suffer.

The Board's financial statement for the first quarter of this year shows that it sustained a loss of £3,500,000 on imported coal; some £300,000 was already taken into account in 1950, and about £700,000 remains to be charged against later accounts, making a total loss of perhaps £4,500,000 on American coal during the winter. Exports during the quarter were less than 1,400,000 tons, compared with more than 4,000,000 tons in the first quarter of 1950, which involved the Board in another considerable loss of revenue on higher-priced overseas sales. Rises in wages, operative over most of the period, cost roughly 1s. 1d. a ton, and brought the average earnings of miners, above and below ground, to about £10 a week. The fairly generously estimated rises in inland prices, however, kept the NCB out of the red even in so expensive a period: it showed a surplus for the quarter of £983,100, compared with £693,204 in the last quarter of 1950 and £5,600,011 in the first quarter.

* * *

Repayment of RFC Loan

The loan that the British Government obtained from the Reconstruction Finance Corporation in 1941 will be finally repaid on October 1st next. This loan was originally arranged in order to make it unnecessary for Britain to continue the sale of its direct investments in the United States—sales of which the Courtauld's Viscose operation stands out as such a costly example. The amount negotiated in 1941 was $425 million, but, as Lend-Lease assistance went into its full stride not long after the agreement was signed, only $390 million was ever drawn. With the repayment of the loan, the securities held as collateral will be freed. This collateral consists in part of quoted and marketable securities and in part of direct investments—the latter mainly insurance companies operating in America but owned by United Kingdom interests or American branches of British insurance companies. The whole of these direct investments and a small part of the marketable securities were never vested in the Treasury but were borrowed from the owners and pledged with the RFC. The Chancellor of the Exchequer explained this week that these borrowed securities will be returned to the owners. Most of the marketable securities, however, were bought outright by the Treasury. The Chancellor will be prepared to consider resale of some of these at current market value to former British holders, but only where this will enable substantial former shareholders to resume an active interest in undertakings with which they were previously associated. The rest of the securities will, as a general rule, be retained in Treasury ownership.

According to evidence given before a Senate Banking Committee in Washington some years ago, the market value of the securities that were held as collateral for the RFC loan was $360 million in 1945; it will have increased appreciably since then. Although some of the securities have since been sold and others will be resold to the former owners, a substantial block of them will remain to form the stock-in-trade of an investment trust that will presumably be run by His Majesty's Government—an interesting new field for state enterprise and one that may evoke some criticism in the United States. The dollar income on the collateral pledged against the RFC loan, which has hitherto been earmarked to meet annual interest and capital repayments on the loan, will now feed the dollar balance of payments. Any relief from this source, however, will be more than offset by the payments on the United States and Canadian dollar credits of 1946, repayments of which are due to begin on December 31st next.

* * *

Finance Bill's Third Reading

The Finance Bill duly received its third reading last Tuesday after its laborious passage through the Commons. The tax concessions granted since the introduction of the Bill are likely to cost £4,700,000 in a full year (out of a total tax revenue of £4,015 million). This calculation includes the cost of the concessions in the new schedule of Entertainments Duty (discussed in *The Economist* last week) and the exemption of tooth brushes and certain boot and shoe materials from purchase tax, but it excludes the estimated effects of the concession on initial allowances for shipbuilding and the drawback permitted for oil incorporated in exported goods; the Financial Secretary described the effect of these last two concessions as "difficult to put into figures."

Perhaps the most important achievement of the long debates, however, is that the Treasury has been induced to put on record certain "dispensations" of the blanket powers that the original draft of the Bill proposed to give it over what it chooses to regard as tax evasion. Thus Clause 24 of the Bill has been made slightly less damaging to the British banking system by the provision that overseas recipients of bank interest should have the right to obtain exemption from returning it as taxable income. Clause 29 (which is designed to prevent transactions that might lead to evasion of profits tax) has been improved by certain last minute amendments that will prevent any direction from being made under it if the transactions concerned are cleared in advance by consultation between the company and the inland revenue; in addition, the provisions of this clause will not apply to reductions of dividends or the issue of debentures for cash. The Treasury has made some cautious promises about the circumstances in which its powers (under Clause 33) to prevent the migration of companies overseas will not be used; and the Commissioners of Inland Revenue will be required to specify the circumstances under which their new powers in relation to double taxation (under Clause 34) will be used. After two months of labour the mountain of debates has therefore brought forth a few welcome mice.

* * *

Commodities and Peace Talks

The commodity markets have naturally tended to ease this week as the prospects of a truce in Korea have grown more bright. But, except possibly in wool (which is discussed, together with cotton and rayon, in a separate article on page 38), there has still been nothing remotely resembling a collapse. The markets have generally been content to mark down the prices of those commodities that have risen most dramatically since the Korean war broke out—and this marking-down has been superimposed on the seasonal fall in agricultural prices.

At this juncture it is instructive to compare the relative movements of commodity prices over the whole period of the Korean war. Four or five groupings can be distinguished on this basis. At the bottom of the list are the main cereals and cocoa and coffee, which are less, or little more than, 20 per cent above the prices at which they stood twelve

months ago. Although some of these commodities are now showing seasonal declines, they should not be particularly vulnerable to the psychological effects of an outbreak of peace in Korea. Coffee, in particular, which has shown signs of recovery this week, is likely to remain in inadequate supply; the full effect of German demand has not yet been felt on this market. Zinc and copper make up a second grouping, for they have risen by only 25 to 30 per cent since June, 1950; neither has shown any weakness recently, and demand for them is unlikely to be met during the next year or so. Lead, tin, shellac, flax and sugar fall into a third grouping, since their prices, at the end of June, 1951, were still some 50 per cent or more above those of June, 1950. Except for lead (which is in any case more likely to ease than copper or zinc) the prices of all this group have declined

COMMODITY PRICES AT MONTH-ENDS
(June, 1950=100)

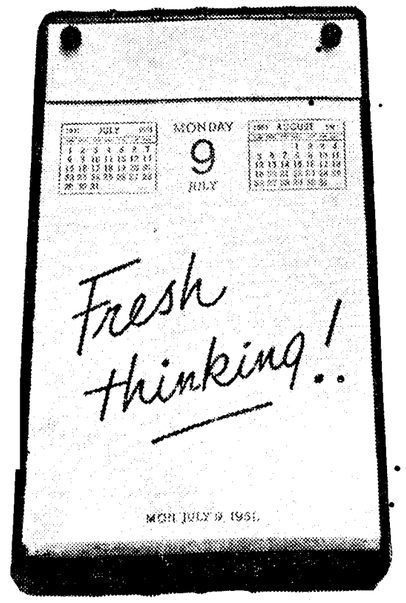
Commodity	1950		1951		
	Sept.	Dec.	Feb.	Mar.	June
Wheat	103	114	115	113	106
Maize	98	116	121	120	112
Sugar, Cuban	136	128	124	128	161
Cocoa, Bahia, spot	132	116	126	128	123
Coffee, Santos, spot	108	106	107	107	104
Jute	93	97	138	161	172
Sisal	146	147	176	187	189
Flax, coutral	104	123	147	161	144
Copper, electro	109	109	109	109	126
Lead, soft foreign pig	139	143	143	143	174
Zinc, g.o.b.	116	118	118	118	126
Tin, London, spot	136	184	236	209	151
Wolfram	188	308	628	433	457
Shellac	137	147	168	160	150
Rubber	190	238	300	262	193
Tallow	243	333	374	303	221

during the week. Until last week the sugar price remained unexpectedly firm, given the large beet crop; it fell to 7 cents per lb. this week. Shellac and tin, like copra and rubber, are particularly sensitive at the present time; tin has fallen over the past week by £45 to £905 a ton, its lowest since February. Higher up the list, the prices of both jute and sisal are still nearly double their pre-Korea level. Jute has fallen heavily this week to £208 per ton. It is hoped that the jute crop in Pakistan—and possibly also in India—will be decidedly larger than last season. As sisal is in part a substitute for jute, both these commodities may now prove weak. Among the commodities that rose most sharply in the year following the outbreak of the Korean war are tallow, which rose by about 100 per cent in the twelve months, and wolfram, which rose by about 300 per cent. The price of tallow fell again this week and supplies are now plentiful. Wolfram, too, which was rising up to the end of June, has now fallen to 542½s. a unit. It has been adversely affected by reports that an agreement on maximum prices has been reached in the International Materials Conference in Washington; this maximum price is expected to be about 20s. a unit below its present price.

* * *

The Future of FCI

The nationalisation of steel has robbed the Finance Corporation for Industry of its favourite child. On March 31st last the corporation's investments and loans outstanding still amounted to £54.5 million (actually £22 million more than a year before). No less than £35 million of this £54.5 million, however, represented advances to the Steel Company of Wales, and another £5,100,000 was accounted for by loans to other undertakings that have fallen under the axe of nationalisation. All this steel money will be repaid in due course, and, when it is, the FCI will be left with a very depleted bag of assets. The total of its loans outside the steel industry at the end of March amounted to only £14.3 million, to which may be added £13.9 million of commitments that have not yet been translated into actual loans. Although this residual portfolio includes some likely "winners" (including the corporation's once criticised loan to Ultramar), it may also contain an appreciable segment of ventures of uncertain profitability. The corporation wrote down its investments in some of these ventures so heavily last year that no net profit was shown—despite a rise in gross investment income from £705,276 to £1,457,504.



It would be unfair to judge FCI's financial prospects from last year's disappointing absence of profit. The corporation has always followed a policy of seeking only a very narrow margin of profit from ventures in the development stage; it has aimed to recoup itself later by securing profitable options over a proportion of any of the equities and preference shares that its foster children may issue when they float themselves off into the ordinary capital market—as at least one of the Corporation's bigger ventures is likely to do quite soon. (Incidentally, the corporation expects to get some compensation from the Government for its loss of this sort of option on some of its steel loans.) But it is difficult to avoid the conclusion that FCI now faces a central dilemma of policy. It was set up originally to make loans to industries whose postwar capital requirements seemed likely to be either too large (as in steel) or too risky—at least on a short view—for the ordinary new issue market to handle. Those of its customers that came to it because their requirements were "too large" are now mostly the monopoly of the state; it may be preponderantly those whose projects seem too uncertain to appeal to ordinary investors that now stand in a lengthening queue at its door.

* * *

Pyrites Supplies

In the United States, in this country and to a less extent in those European countries still using elemental sulphur, sulphuric acid producers are turning to pyrites; in Britain during 1951 and 1952 a number of new or converted plants are expected to be ready to use pyrites. Courtaulds, for example, has announced in its annual report for 1950 not only that it is converting some existing plants to use pyrites, but also that any additional plant for acid production would have to be based on pyrites. The United States is getting some pyrites from Canada, but Britain's main source is Spain. Spanish production fell severely during both the Spanish civil war and the second world war; but even in 1936 the Spanish pyrites industry was in decline, as a result partly of extensions of pyrites mining in other countries, of the cheapness of United States sulphur and of the extraction of sulphur from other sources. At the end of the war, therefore, the industry had over ten years' leeway to make up in rehabilitation of unavoidably neglected plant and machinery, and in the installation of modern equipment; and since 1945 this process has been held up by difficulties in Spain. The Spanish Government controls foreign currency earnings and has delayed the issue of import licences for machinery, which is mostly British; and it is now difficult either to attract new miners or to get back old miners lost in the thirties. Thus pyrites exports only reached a total of between 1,200,000 and 1,300,000 tons during 1950 compared with an average for the years 1928, 1929 and 1930 of 2,650,000 tons; the Rio Tinto mines, the largest Spanish producer, produced about 650,000 tons in 1950, compared with 1,200,000 in 1937.

As the recently published annual reports suggest, both the Rio Tinto Company and the Tharsis Sulphur and Copper Company are more optimistic now about securing the required machinery and increasing output in the next year or two. The Spanish Government is allowing 7½ per cent of the foreign currency from pyrites export for the purchase of new plant (and a further 7½ per cent to repay the use of the companies' foreign currency for previous purchase) under what is called "operation P." Since the latter part of last year procurement of machinery has been easier, although

What is management's greatest asset?

ANYONE who searches deeply into the reasons for business success comes to realise this:

The greatest asset Management has is the ability continually to bring *fresh thinking* to business problems. Because it can best reaffirm past decisions, confirm present policies, or detect a need for a change.

So important is it, that providing fresh thinking about advertising and consumer-sales problems is the greatest responsibility of everyone who works at Young & Rubicam, Limited.

It was just six years ago this month that the first Young & Rubicam-prepared advertisement appeared in the British Press.

During these years, it has been impressed upon our people that they will be judged and rewarded on their ability to produce a steady flow of fresh thinking for our Clients.

Apply such thinking with sound judgment, and you have an approach that Young & Rubicam is using to the advantage of the manufacturers of these fine and varied products:

B. T. THAKUR, General Manager.

installation of machinery is likely to continue for another two or three years. But the shortage of miners has not been eased and is likely to be the ultimate limit on output. The Rio Tinto Company hopes to deliver an extra 50,000 tons in 1951 to make a total of 900,000 tons; and probably another 100,000 tons extra in 1952. Of these deliveries about 200,000 tons will probably be required for internal consumption, leaving in 1951 some 700,000 tons for export. The Tharsis mines should produce about 550,000 tons for export, and smaller producers another 150,000 tons, to make a possible total export in 1951 of about 1,400,000 tons. The small mines might produce more if the price of pyrites were high enough. In 1952 Spain should be exporting at the rate of about 1,600,000 tons a year.

* * *

Britain's Needs

Britain imported about 200,000 tons of pyrites in 1950 and is now importing at the rate of about 400,000 tons a year. The greater part of these imports come from Spain, but Cyprus and Portugal also occasionally supply this country —and Norway could do so. Consumption of pyrites for sulphuric acid production in 1950 was 205,000 tons. Total exports from Cyprus in 1950 were 630,000 tons, which was more than the peak export of prewar years, and some 650,000 tons may be exported during 1951. Portuguese production is running at about 700,000 tons a year and exports may reach 550,000 tons in 1951. The deposits in Portugal and Cyprus are not very large and the present rate of production may not be improved upon substantially. Norway, with a prewar output of 1,000,000 tons, was then second to Spain in European pyrites production; it has the second largest European reserves. Output in 1945, however, was only a quarter of that figure, but in 1950 it was about 750,000 tons, of which about 400,000 tons were exported, mainly to Western Germany and Sweden. Next year further deposits are to be opened up with an initial output of 150,000 tons, and there are other deposits as yet untouched.

The intention of the Norwegian Government, however, is eventually to refine as much as possible of the pyrites in Norway and to export elemental sulphur, if it can be successfully extracted, or sulphuric acid. Thus Norwegian pyrites, subject to the plans of the government, should provide an important supplement to Spanish supplies in coming years. After 1952 it is probable that supplies of pyrites will be plentiful, for the Spanish deposits are huge and the Norwegian deposits very extensive. Between now and the end of 1952 the adequacy of supplies will depend on how quickly new pyrites-using plant is brought into commission; it is conceivable that new capacity may outrun the supplies of the raw material.

* * *

Commercial Atomic Energy

A project to build what may become the first privately owned atomic energy plant has been undertaken in the United States by the Monsanto Chemical Company. With the help of the Union Electric Company of Missouri, the company is to start design studies for a nuclear reactor as soon as formalities with the Atomic Energy Commission have been completed. These studies will show whether it is possible for a commercial enterprise to build and operate such a plant on an economic basis.

Monsanto is the largest producer of elemental phosphorus in the United States. Large quantities of electricity are used in the course of production and the plants are far from any easily accessible source of power. For this reason the prospect of supplying these plants with power from a nuclear reactor is attractive. If the company can also sell to the AEC the plutonium that is produced as a by-product of fission, the comparative cost of the power may not be excessive. Equally, it may be cheaper to produce plutonium in conjunction with the generation of power than in present reactors operated solely for plutonium production.

Although several American companies have carried out projects on behalf of the AEC, this is the first proposal to finance such a project by private capital. The initial studies will be on paper only: if actual building starts, the costs to the company will be extremely high. Calculations of the cost of an atomic power plant are highly conjectural, but American estimates put it as two and a half times that of a coal-fired station. In this country Sir John Cockcroft has put the cost at between two and three times that of a coal-fired station, and has suggested that the construction costs of a small reactor might work out at about £7,500,000 compared with £2,500,000 for a conventional generating station of the same capacity.

The Monsanto project is the first of a number of similar schemes to receive official sanction. In Britain no company has yet approached the atomic energy authorities with a comparable project; conceivably it would be given a favourable hearing, although the fuel and power industries might have their views about it. In the early stages nuclear power may be economically more attractive in isolated territories without established electricity supplies. The method of approach adopted by Monsanto suggests, however, that the economics of the process are likely to be improved if the reactor is taken as the starting point for a number of processes rather than, as at present, simply as a source of heat. Design studies for a nuclear reactor are already being prepared at Harwell and towards the end of the year it should be possible for Sir John Cockcroft to give a detailed report on the feasibility of nuclear power generation. It will then rest with the fuel and power industries, and with private industry, to reach decisions about the course of future development.

Barcelona Traction—the Company Replies

The Barcelona Traction Company has now issued a counterblast to the statements published last week by the Spanish Embassy (quoting the joint Spanish-British governmental minute on the still unpublished report of the Commission of Experts) and by the Prior Lien Bondholders' Committee. The essence of the Joint Governmental Minute was:—

(1) that the Spanish Government was justified in not authorising transfers of foreign currency (required to service the Company's sterling bonds) since the necessary information in support of the applications for exchange had not been supplied, and

(2) that "in the light of the reports submitted by the experts and with the detailed knowledge of the activities of the group of companies furnished by these reports, the decision of the Spanish Government to declare the applications in question ineligible has now been fully justified."

According to the company's statement, the charge that its subsidiary failed to supply the information called for by the Spanish authorities in relation to its applications for transfers of exchange, is without foundation. There is here a patent conflict upon a question of fact, in which the good faith of the British and Canadian Governments seems involved. The company's statement also asserts that the only irregularities of which its board is aware (irregularities implicit in the Joint Governmental Minute and explicit in the Spanish Government's statement) were in connection with certain transfers of funds carried out without the permission of the Spanish Government between 1940 and 1946, the first of such transfers and approximately half of the total having been carried out in conjunction with and at the expressed request of HM Government. The Company further complains that it was denied the right of replying to the charges

made against it, and it also joins issue upon the correct interpretation to be placed upon the report (which has not been published) of the British and Canadian experts, who are distinguished independent accountants.

Where there is such a marked disagreement on vital matters of fact and construction, it is scarcely for the outsider to venture an opinion—at least until the reports of the independent experts have been made public. The Company concludes its statement by calling for the publication of the report of the British and Canadian experts. In view of the seriousness of the allegations and the involvement of the British and Canadian Governments, such publication seems now imperative. It also seems desirable that the report of the Spanish experts should be published as well.

"Tangerine" Gold Certificates

More information has recently become available about the new market in gold certificates in Switzerland and Tangier. These certificates represent gold deposited in Tangier with the Société de Banque Tangero-Suisse, which is an offshoot of a finance house established in Zürich ; they are issued in denominations of gold bars of one-tenth kilo, one-half kilo, one kilo and 12½ kilos—some of them in bearer and some in registered form. Although the certificates are quoted regularly in Switzerland, the market for them is not yet a large one. Since a Swiss citizen is entitled to hold gold in Switzerland (and plenty of gold is available in the convenient form of one-quarter, one-half and one kilo bars—mostly manufactured in France), there seems to be no particular advantage in his acquiring titles to gold deposited in far-off Tangier—except that Tangier would be an even safer repository than Zürich if a European war broke out. The gold markets themselves bear evidence of the fact that fears of war have been receding in the past few days ; the free market price of the metal is now no higher than $39¾-$40 per fine ounce.

Shorter Notes

The Anglo-Iranian Oil Company is paying an interim dividend of 25 per cent on July 31st ; this will make a total dividend for the operating year 1950 of 30 per cent, less tax—the same as for the preceding four years. The company is, however, holding up publication of its accounts and its annual meeting of shareholders until later in the year ; presumably it feels that there is little that is new or profitable that could be told to shareholders at this time, while any figures in its accounts that indicated successful trading experience would be sure to be seized upon by Persian propagandists.

*

The changes in the United Kingdom tariff that result from concessions made at the recent Torquay conference are to be made on September 1, 1951. A full list of changes in rates is published in the *Board of Trade Journal* this week.

*

Lever Brothers and Unilever N.V. and Van den Bergh's N.V. have announced that the procedure to implement the 1948 convention for avoiding double taxation between Britain and the Netherlands has now been agreed by the taxation authorities of both countries. British residents will now be able to claim relief from the 15 per cent Dutch dividend tax on any dividends paid from January 1, 1948 ; details of how to make the necessary claim are given in the companies' circular. The amount of dividend tax recoverable will, however, rank as additional income for the fiscal year in which the dividend was paid and thus give rise to additional liability for British income tax. If the shares have changed hands, dividend tax relief must be claimed by previous owners ; present shareholders can claim relief only on any dividends they have received since they acquired the shares.

Company Notes

Courtaulds.—The peak of Courtaulds' postwar programme of expansion is now well past, and the rate of physical investment in new buildings and plant has been reduced. In consequence profit retentions have enabled the group to increase its holdings of gilt-edged stocks from £14,817,421 to £18,239,790 and of cash from £7,285,454 to £9,809,320 ; these liquid resources compare impressively with outstanding capital commitments of £4,750,000. The completion of this capital programme has borne fruit in all-round increases in productive capacity, in a greater volume of sales and in an astounding advance in trading profits from £10,233,623 to £18,392,835. As was pointed out in *The Economist* of June 14th, however, these figures can create an illusory picture unless the whole question of replacement costs is borne in mind ; it must be remembered too that the tax-collector, who claims £9,049,664 this year, against £3,787,193 last year, pays no heed to this problem in his assessment. The size of the "replacement cost problem" now facing Courtaulds can only be partly gauged by the company's decision to put £4,687,071 (against £2,081,311) to specific reserves against increased costs of materials and of plant and machinery. Another sign of the problem is that the recorded increase in stocks from £12,930,329 to £13,612,608, and in debtors from £3,926,710 to £4,919,589 does not connote any increase in real values ; in fact, stocks are currently at a low level.

In his address to shareholders, Sir John Hanbury-Williams emphasised that the burden of making provision for replacement from undistributed profits could not be borne indefinitely. The directors believe that the time has not yet come for a revaluation of fixed assets, but there is a broad hint in the chairman's statement that fresh capital will have to be raised once further new ventures are planned. Before this can be done, however, the directors consider it necessary to reconstruct the company's capital structure, presumably by means of a bonus issue ; with reserves retained in the business totalling £45,151,369 against an issued capital of £32,000,000 the validity of their case is clear. If Courtaulds were to follow the precedent set by I.C.I. in revaluing fixed assets, then the discrepancy between the real capital worth of the company and its issued capital would, of course, become even more obvious. The chairman also argued that it would be unwise at this stage to increase the dividend beyond 11¼ per cent in view of the uncertain outlook for some raw material supplies and of the Government's wish for continued dividend restraint. Indeed, until the prospect for future raw material supplies and prices is a little clearer, the chairman believes that "it is not only difficult but well-nigh impossible to forecast the immediate part which the rayon trade will play in the textile industry." He added, however, that if the requisite raw materials were obtained at satisfactory prices, then there was no reason why the company should not work its factories at full capacity.

Rolls Royce.—Although Rolls Royce have had a full order-book for some time, rising costs cut into the company's profit margins last year, and trading profits fell from £1,736,406 to £1,575,120. Inflated costs eventually forced the company to raise motor-car prices in October, but this change came too late to have any appreciable effect on the year's figures. In the coming year, defence orders will make necessary a considerable expansion of the company's manufacturing facilities at Glasgow, but the capital expenditure involved will be borne by the Ministry of Supply. Defence orders have often dictated the pattern of production and development in the past, that the company should be better fitted than most to take rearmament in its stride. Nevertheless, costs are rising rapidly,

All in the dark, Mr. Andrews?

When the fuses have blown, when the key-hole can't be found, when the lighter runs out of petrol we turn, almost without thinking, to the sure aid of the match. The match is one example among many hundreds in which chemicals by Albright & Wilson, usually anonymously, but so often importantly, serve the world at large. *Every match made in Britain and countless millions of others besides rely on Albright & Wilson's phosphorus products for the light they give.*

Chemicals for Industry ALBRIGHT & WILSON LTD

49, PARK LANE, LONDON, W.1.

IBW 151

BARCELONA TRACTION, LIGHT & POWER COMPANY, LIMITED

The Board of Barcelona Traction, Light & Power Company, Ltd., have noted with astonishment the terms of the Declaration signed on June 11th by the Spanish Minister of Industry and Commerce and by H.M. Ambassador in Madrid, which has been published in the British press by the Spanish Embassy in London.

The Board draw attention to the following facts as to the procedure adopted, the contents of the Declaration—and what it omits.

The Procedure Adopted

The Declaration accuses the Management of Ebro Irrigation & Power Company, Ltd., the principal operating subsidiary of the Barcelona Traction group, of having failed to supply to the Spanish Government information which had been called for in relation to the Company's applications for transfers of exchange, and it justifies the Spanish Government's refusal of transfers on this ground. It further records that the Spanish Government accuses the Management of the Group of various irregularities—the nature of which is not specified.

The most elementary rules of natural justice require that no man should be condemned without being heard in his own defence. The Board were denied this right. So far from being given an opportunity of replying to any of the charges referred to in the Declaration, they were not even informed what accusations were being made. They do not even now know what are the unspecified irregularities of which, with the implicit assent of H.M. Ambassador, they are alleged to be guilty.

The only irregularities of which the Board are aware were in connection with certain transfers of funds which were carried out between 1940 and 1946 without the permission of the Spanish Government. If these are the irregularities referred to, it was less than candid to state in the Declaration that the British representatives were "informed" of them, since the first of these transfers and approximately half of the total were carried out in conjunction with and at the express request of H.M. Government itself.

The Contents of the Declaration

As respects the only specific allegation made in the Declaration, namely that Ebro failed to supply information which was called for by the Spanish authorities in relation to its applications for transfers of exchange, the Board—now that they know what the charge is—are in a position to state categorically that it is without foundation. At no time up to the end of 1945 did the Spanish authorities even suggest that the failure to permit transfers of exchange by Ebro was due to any lack of information as to the Company's affairs or to any other cause than Spain's own economic situation. Such requests as were made for information in relation to its applications were answered by the Company which offered to supply further details if they were considered necessary. So far from asking for further details the Spanish Government indicated that they were satisfied with the particulars which had already been supplied. The view that Ebro's inability to obtain transfers was due to Spain's own economic situation was expressly confirmed to the Company by the representatives of H.M. Treasury, then in Madrid, who as late as November, 1944, advised Ebro not to press further for remittances at that time as the Spanish Government had not the necessary foreign currency available.

In December, 1946, in connection with their refusal of consent to the Plan of Compromise which had been approved by the Sterling Bondholders and the Supreme Court of Ontario the Spanish Government indicated their wish for a full investigation into various matters including in particular the amount of foreign capital invested by the Barcelona Traction group in Spain. The Company immediately instructed its auditors, Messrs. Turquand, Youngs, McAuliffe & Co., to prepare a report showing in full detail every relevant financial transaction of the Group since the inception of the undertaking 35 years before. This report was in process of completion when the Company was made "bankrupt" in Spain in February, 1948.

The complete file of correspondence which proves these facts is available and would willingly have been supplied to H.M. Government had the Board been given any opportunity of doing so. That the Board was given no such opportunity is the more astonishing in that the joint report of the British and Canadian experts, upon which the Declaration purports to be based, is at pains to point out that the Commission of Experts had not "the means to satisfy itself that such documents and records as may be available to it in relation to any particular matter are complete." For this reason in expressing the view, based upon the only correspondence which they had seen, that Ebro had failed to deal adequately with requests for information from the Exchange Authorities, the Experts add the vital qualification "unless there has been other correspondence or conversations which had made good this apparent deficiency."

Knowing of this qualification on the part of its own expert, aware that the Management of the Group had been given no opportunity of supplying the full correspondence, H.M. Government nevertheless subscribed a declaration which states "that the Experts have *unanimously agreed* that Ebro Irrigation and Power Co., Ltd., the head of the Barcelona Traction group of subsidiary companies in Spain, has not made available the information called for on various occasions to justify the origin, destination and basis of the financial obligations claimed to be the ground of their applications" for transfers of foreign currency.

What the Declaration Omits

The Declaration, although purporting to be based upon "the reports prepared by the Spanish, British and Canadian members of the Commission of Experts appointed to investigate the activities of the Barcelona Traction group,", omits all reference to their findings upon the only matter which they were appointed to investigate. The Spanish Government having early in 1950 sought to justify its failure to grant transfers of exchange on the ground that the Barcelona Traction group was a debtor and not a creditor *vis-a-vis* the Spanish economy, the Commission was appointed, in the words of the Report of the British and Canadian Experts: "to examine the facts and documents relating to the investment of capital in Spain by the Barcelona Traction, Light & Power Co., Ltd., and its subsidiary or associated companies, and also the returns realised on such investment and transferred abroad from time to time, in order to establish the true position of the Barcelona Company, and its subsidiaries *vis-a-vis* the Spanish economy, namely, whether it is a debtor or creditor."

The British and Canadian Experts, distinguished independent accountants, point out in their Report that the Commission "was not and could not be constituted as a judicial authority to deal with allegations concerning the conduct of the proprietors and officials of the Barcelona Company and its undertaking in Spain." Their finding upon the only matter referred to the Commission is that the Barcelona Traction group is and always has been a creditor of the Spanish economy and that the net foreign investment in the enterprise in Spain at December 31st, 1949, was £19,695,522, according to book figures without taking into account the appreciation in value of the physical assets in terms of present monetary values.

This important vindication of Barcelona Traction's case and confutation of the Spanish Government's contention on the very matter which the Commission was appointed to investigate is omitted from the Declaration signed by H.M. Ambassador.

The "Bankruptcy" in Spain

The enterprises of the Barcelona Traction group supply approximately 20 per cent. of the total electric power produced in Spain. The replacement cost of their installations would be not less than 6,000,000,000 pesetas or approximately £55 million. The last Profit and Loss Account of the Company which it was possible to publish before the Spanish "bankruptcy" covered the year 1946 and was as usual audited by Messrs. Turquand, Youngs, McAuliffe & Co. It showed net income of 2,374,945.18 Canadian dollars after deduction of all expenses and of interest on all the Company's sterling and peseta bonds. It is noteworthy that interest on the Company's peseta bonds, although they are an issue junior in ranking to the two sterling bond issues, continued, with the approval of the Canadian Trustees for the senior issues, to be paid until the Company's subsidiaries in Spain were seized in 1948 in this Spanish "bankruptcy." The Company is prosperous even to-day and would have no difficulty in meeting the service of its sterling bonds, but for its inability to obtain transfers of exchange. Its failure to pay interest on its sterling bonds was the ostensible ground upon which three Spanish holders of £11,500 of First Mortgage Bonds which they had acquired a few days before, obtained in two days, without having made any attempt to receive payment of the interest on their bonds and without the Company being notified, a declaration of bankruptcy of Barcelona Traction by the Court of Reus on February 12th, 1948. Barcelona Traction is advised that the bankruptcy is illegal; but even to-day, after nearly three and a half years during which the enterprises of its subsidiary companies which were seized in the bankruptcy have been in Spanish hands, the Company is still prevented even from being heard in any Spanish Court upon its contention that the bankruptcy is illegal. This has been the Company's experience of "the framework of Spanish legislation" within which the Minister assures foreign investors that they "will always find the necessary protection."

Statement of the Prior Lien Bondholders Committee

As regards the statement issued by the Prior Lien Bondholders Committee, which was formed in 1948, it may not be realised that the Bonds which it represents, although previously held principally by British investors, have since 1947 been beneficially owned as to their majority by the Juan March group. Even so it is surprising that the Committee should regard the Declaration as having "done much to clarify the position" without the Report of the investigation, which they state they recommended, being published at all.

The Board, on the other hand, anxious as it always has been that the Company should be placed in the position of being able to reach a just settlement with its creditors, considers that this object could only be advanced if the full facts were made known. They have asked the British and Canadian Governments to publish the complete text of their Experts' Report and have undertaken to defray the cost.

further heavy expenditure on the development of oil engines is inevitable, and the re-imposition of the 66⅔ per cent purchase tax on motor-cars may have its effect on that particular section of the group's activities.

£1 ordinary stock at 125s. yields £4 per cent.

* Includes workers' shares.

The latest year's results reflect, therefore, something of a transitional stage in the development of the group. The way has been prepared in part by the rights issue of 383,333 £1 ordinary shares at £3 15s. in November; the substantial expansion of the company's business clearly justified the introduction of more permanent capital. The board has also recommended that the shareholders' interest in the company's many activities should be established on a more permanent basis by the capitalisation of £1,533,333 from reserves, thus raising the ordinary capital from £1,533,333 to £3,066,666. Rolls Royce's expansionist policy has been made possible in the past by substantial retentions from profits, and the directors feel that the time is ripe for a change in their conservative dividend policy, under which a dividend of 20 per cent has been maintained since 1939, an interim dividend of 10 per cent was paid on the capital of £1,150,000 and a final of 15 per cent on £1,533,333 capital. This decision, taken in a year when profits had fallen, suggest that the directors feel that the company's prospects are sufficiently good to hold out the promise that the prewar level of dividends should be assured for some time to come.

★

Metal Box.—The familiar—but acute—problem of securing adequate finance, both for the replacement of stocks and worn-out equipment and for an expansion of business, stands out clearly in the accounts of Metal Box. The chairman points out that after taxation had taken £1,541,820 from trading profits of £3,132,791—in the previous year taxation had taken £1,063,472 out of profits of £2,423,535—earnings retained by the company were insufficient to provide for bare replacement needs. In addition, money is not at present available "to meet an estimated capital expenditure of £850,000." The company appears therefore to be considering a fresh issue of capital. This news will have taken the gilt off the gingerbread for many shareholders who found good grounds for satisfaction in a record volume of turnover (£28.3 million against £26.2 million), in the substantial improvement in overseas earnings from £421,378 to £934,601, and in an ordinary dividend of 12½ per cent on the present capital of £3,612,770 against last year's dividend of 20 per cent on the original capital of £1,806,385. There was a 100 per scrip bonus in June. Despite the higher dividend disbursement, steps have been taken to tackle the problem of replacement, for the group have retained £243,000 (against £188,750) in stock reserves and £76,750 (against £238,256) in fixed assets reserves.

	Years to March 31 1950	1951

£1 ordinary stock at 52s. 6d. yields £4 15s. 3d. per cent.

The serious shortage of tinplate raises yet another problem for Metal Box. Supplies of containers had to be reduced last year, and the expansion of overseas earnings was only made possible by drawing upon supplies of tinplate in the United States. The chairman emphasised that the supply position would be "bleak indeed" if the Steel Company of Wales were not expected to begin production of tinplate at Trostre at the end of the year; there appears, however, to be every prospect of a world shortage even when all known production plans are in operation. In view of the scarcity of tinplate the company is giving attention to the development of the manufacture and sale of paper cartons and containers. It is also continuing to concentrate heavily on its overseas trade, following the formation of Metal Box Overseas last year.

★

English Sewing Cotton.—The trading experience of English sewing cotton last year is described by the chairman as "very confusing." At the beginning of the year import and currency restrictions—and possibly a return to somewhat more competitive conditions—curtailed the volume of export trade. After the outbreak of the Korean war, however, demand grew to such an extent that reserve stocks were rapidly exhausted and production had to be geared up to meet the new situation. The advance in trading profits from £1,160,842 to £1,352,575 must therefore owe a very great deal to the trading boom in the second half of the year—especially in the United States, where American Thread's net earnings expanded from $1,853,684 to $2,296,807 and dividends paid by this company to English Sewing Cotton rose from £236,057 to £313,523. There is, however, a reverse side to the medal, for the post-Korean boom has brought with it disquieting increases in raw material prices and higher replacement costs; a considerable portion of earnings has therefore to be retained to meet working capital commitments. Moreover, the increases in controlled selling prices at home have not kept pace with the rise in raw material prices, particularly in raw cotton, since devaluation. Despite their recognition of the need to conserve resources, the directors consider that dividends should now reflect in some measure the benefits accruing from the large dollar earning capacity of American Thread; the ordinary dividend has therefore been raised from 7½ to 12½ per cent. At the moment the group's factories are running at full capacity and the chairman is confident that the company will be able to sell this output even when more competitive conditions return.

COMPANY MEETINGS

CADBURY BROTHERS, LIMITED

DE-RATIONING HOPES

COCOA PRICES AND FUTURE SUPPLIES

MR. L. J. CADBURY'S SPEECH

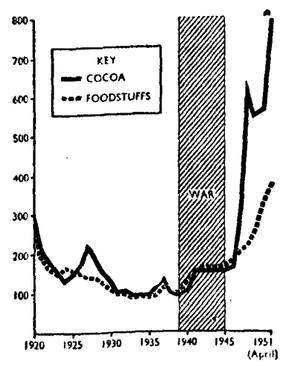
The fifty-second ordinary general meeting of Cadbury Brothers, Limited, was held on July 2nd at Bournville, Birmingham.

Mr L. J. Cadbury, the chairman, in moving the adoption of the report and accounts, said:

Throughout 1950 we had a continuation of consumer rationing and of the chief controls, regulations, and shortages with which we have become so distressingly familiar. Only in one respect did we make a step towards greater freedom: we were once more able to buy our own cocoa last autumn. I have stated our desire to do this year by year at these meetings, and it is satisfactory at last to be able to record some progress.

FREEDOM TO BUY COCOA

As from November 1st open general buying licences were issued for sterling area cocoa. This does not, of course, mean we have reverted to all our prewar practices. Far from it. For one thing, the bulk of our cocoa supplies are purchased from only two sellers, the Gold Coast and Nigerian Marketing Boards. This is likely to be a permanent arrangement. More ephemeral is the scheme we have operated during last winter's cocoa season of setting up a cocoa-buying panel for the industry. Its members are drawn from our own firm and those of Messrs Fry, Rowntree and Nestlé. The panel negotiates for a minimum 75 per cent. of everyone's estimated requirements if they so desire; and although every firm is equally free to buy its own cocoa, the membership of the scheme is practically 100 per cent. The object of the panel system is that all firms should hold cocoa at substantially the same price. This safeguard was regarded as very important by some manufacturers when negotiations were on foot to take over cocoa buying from the Ministry of Food. After so many year of war-time control they felt a lack of cocoa market experience. The scheme has also been of assistance for the Ministry's price-control calculations where a common price for the industry has to be found. Though it has been agreed to continue operating the panel scheme for another year, we do not believe it should be maintained indefinitely.



It is our experience that one big composite buyer finds it very difficult to disguise his market operations, particularly when the great bulk of cocoa destined for the United Kingdom is sold through the one London office of the African Marketing Boards. We believe our interests, and also those of our competitors, will be best served when the London markets, both actual and terminal, are once more in normal operation and when brokers and dealers are again in keen competition with each other for raw cocoa business not only in this country, but in the wider international field.

WORLD COCOA PRICES

World prices of cocoa, which had been falling early in 1950, rose with the development of the Korean hostilities to 360s. per cwt. in September. They declined to 260s. two months later, but have since risen again, and our purchases over the buying season November to March have averaged about 287s. duty paid, ex store. This is about eight times the 1939 figure, and the future course of cocoa prices has been causing us anxiety. We must consider not only the actual price we have to pay, but the price in relation to that of other food raw materials.

I have here a chart showing the cost of cocoa beans and of wholesale foodstuff prices derived from *The Statist*. The year 1938 is taken as 100 and the graphs plot the percentage increases or decreases.

RAW COCOA AND FOODSTUFFS
PRICE INDICES: 1938 = 100

You will note the general trend between the two wars. Cocoa prices rose in 1927 and again slightly in 1937. Otherwise they were low or were actually falling over the period. Raw materials generally followed the same trend, including most of the supplies required for our industry.

We took full advantage of these circumstances. Lower costs of raw materials combined with increasing mechanisation and economies of production allowed us to stage successive price reductions, until we reached our final achievement of 2 oz. for 2d. in milk chocolate. The better value for money that we continued to give, stimulated by our marketing efforts, increased the sales of chocolate and established it definitely as one of the country's foods. The figures for our cocoa imports are striking. The United Kingdom consumption of beans doubled between the two wars, and the chief cause was the reduction in price of cocoa products. Such are the fruits of competition!

LONG-TERM VIEW

Turning to the postwar position, you will see that whereas cocoa has gone up from 100 in 1938 to 800, food generally has increased from 100 to 375. We are naturally concerned about this disparity and do not want cocoa products to become permanently dear in relation to other foods. We do not think this is inevitable, and believe that over the long term it should come more nearly into line with the General Index.

Such expectations depend on the future course of raw cocoa supplies, which have not kept pace with an increasing demand. The latter has risen with the improving living standards of most people in the Western world, while cocoa production has remained relatively stagnant. In 1939 exports of beans from all sources of supply were 740,000 tons; in 1949, 700,000; in 1950, 695,000.

Why has this happened? In the first place, the war discouraged cocoa-growing in West Africa. There was a lack of shipping, particularly in the early years, and this led to the burning of beans that could not be exported. African manpower was also diverted on a large scale to military purposes. Another reason was that the low prewar price of beans did not give sufficient encouragement to increasing world production.

Anything approaching the present price, however, should give great encouragement to increasing supplies both from the traditional sources and from elsewhere, as, for instance, from Malaya, where we have a joint experimental cocoa estate in conjunction with Messrs Harrisons and Crosfield and the Colonial Development Corporation. We are also investigating the practicability of growing cocoa on rubber plantations. This may prove a very useful and important development for us, and for the rubber growers a possible hedge against the competition of the synthetic product.

PRESENT POSITION—IMMEDIATE PROSPECTS

I have so far only dealt with the long-term view. For the immediate future the position is precarious, particularly so because of swollen shoot disease in British West Africa—a subject on which I am glad to say there has been considerable publicity. It is the view of the experts that the only effective remedy is to cut out the diseased trees. This is naturally not popular among the cocoa farmers, but by the end of the year compulsory cutting out had been organised on a systematic basis and was being pursued with diligence. However, in February the new Gold Coast Constitution came into being, and under pressure from his supporters its African leader declared, first, a cutting out holiday, then the complete abandonment of compulsory operations.

With some other representatives of the industry I had an opportunity of meeting Mr Nkrumah when he was recently in this country. I am sure that he appreciates the importance of stamping out swollen shoot. He has also every confidence that while he will not reintroduce compulsion, he can organise cutting out effectively on a voluntary basis. We shall do anything we can to help him, and the progress of the voluntary campaign will be watched with the closest interest, but I fear with some anxiety.

SUGAR AND DERATIONING

The Minister of Food said recently that he believes the de-rationing of chocolate and sweets should take place at the earliest moment and that the industry and the Ministry should not necessarily be inhibited by the failure of the experiment two years ago.

We agree with the Minister and hope it will not be long before our industry returns to the system of the free market. There are certainly signs that, at present prices, the 6 oz. ration is proving sufficient to meet the demands of the average consumer, but it is difficult to prophesy what the demand will be when the coupon is removed. The initial demand, as the experience of two years ago showed us, will certainly be large and it will be necessary to build up stocks to meet it. It is well to remind ourselves and the public that the sugar allocation to our industry for home sales is still only 62½ per cent. of the prewar basic year use. This should be compared with 88 per cent which is the average use for all sugar-using manufacturers and 92 per cent. which is the supply to the domestic consumer. The increased production which has made the 6 oz. ration possible is due, not to additional sugar being allocated

by the Ministry, but to the use which manufacturers have made of other ingredients, and, strange to relate, of composite products consisting mainly of sugar, which they are free to import. A relatively small increase in our sugar supply is all that stands in the way of derationing, a move which we believe is justified by the world sugar position.

NEW ENGLISH FACTORY

Despite the restrictions on home sales of chocolate, the increase in our exports, and the altered pattern of production, due mainly to the shortage of milk, have made it necessary for us to consider an extension of our factory capacity. We naturally should have liked to have made a further increase at our Bourneville factory, which has grown continuously since the original move from the centre of Birmingham in 1879. But the Board of Trade are not willing to agree to such an extension, and, with their approval and encouragement, we have acquired a site at Moreton, Wallasey, on the Wirral Peninsula.

Merseyside is a development area, and we hope the new factory will in due course be useful in providing employment for local labour as well as giving us increased productive capacity.

RESALE PRICE MAINTENANCE

The Government have recently issued a White Paper on Resale Price Maintenance following the Report of the Lloyd Jacob Committee, before which Mr Paul Cadbury gave evidence.

Our industry had no price-maintenance organisation in prewar days, but in conjunction with some of our friends we did endeavour to deal with price-cutting which took the form of using our own and other well-known lines as "loss-leaders."

Such price-cutting was not the result of low-cost distribution, but often arose merely from the desire of a distributor to attract custom to his own shop by cutting the price of a few well-known branded lines. It has always been our policy to give the public goods at the lowest price and to economise wherever possible in the costs both of production and distribution, but we believe there should be reasonable freedom both to the individual manufacturer and for a group of manufacturers to deal with this type of practice.

It is regrettable that on this question the White Paper does not follow the recommendations of the Report, and proposes legislation that will make it illegal for us to take such action ever again in the future. It has come to this decision on the somewhat dubious grounds that what it calls "the present high level of demand" will always be maintained and that we need not fear a return to the prewar buyer's market.

TURNOVER AND FINANCE

The tonnage manufactured by this company in 1950 was almost identical with that of the previous year. The output of our subsidiaries, however, particularly overseas, has gone up, and there has been a general rise in prices. The total sales, therefore, of the group of companies owned by our parent concern, the British Cocoa and Chocolate Company, rose by over £4,000,000 to £41 million.

This has required further working capital and we have also to finance our cocoa purchases. The latter has been a costly business, as we realised it must be when the decision was finally made to take over cocoa buying from the Ministry of Food. To find the necessary funds we added on January 1st this year a further £3,000,000 of Unsecured Notes to our loan capital. For the same reason since that date there has been a substantial increase in our loans and acceptance credits. These will be repaid as we approach the buying season at the end of the year and cocoa stocks are worked off. During the course of the year application was made and has been granted for an official quotation of the British Cocoa and Chocolate Company's 6 per cent. preference shares on the Birmingham Stock Exchange. The dividend on the preference shares is covered 15 times by the net profit being paid into the parent company, and over 60 times by the net profits of the group.

The report and accounts were adopted.

THE BUTTERLEY COMPANY, LIMITED

(Ironmasters and Ironfounders)

STEEL POSITION

COAL COMPENSATION PROBLEMS

MR E. FITZWALTER WRIGHT'S VIEWS

The sixty-fourth annual general meeting of The Butterley Company, Limited, was held at the registered office of the company, Butterley Iron Works, near Derby, on June 29, 1951, Mr E. Fitzwalter Wright (chairman of the Board of Directors) presiding.

The secretary (Mr P. Elliott) read the notice convening the meeting, and the report of the auditors.

The chairman said: Ladies and gentlemen,—A brief note in the directors' report has told you that Mr Hull does not seek re-election to the Board. Our sorrow at his decision is increased by the reason for it. For more than 50 years Mr Hull has been the company's legal adviser, and for 13 years he has been a member of the Board. That sentence epitomises a lifetime of tireless, ungrudging, and invaluable service to the company, for which we should never cease to be grateful. But Mr Hull would, I am sure, tell you that he has enjoyed his work, and that there has continually been throughout all these long years a most happy association between him and our Board, at the beginning as clients, at the end as colleagues. Our thanks and good wishes are his in full measure.

At the end of the year Mr Coote decided to take life a little less strenuously, and though I am glad to say he remains on the Board, he has relinquished his executive duties. We are grateful to him for all he has done for us, as our agent in the North of England, as manager of the wagon works, as London agent, and latterly as estate manager, welfare director, and director in charge of brick sales. The multiplicity of his duties in the various stages of his career with us is some indication of the many-sidedness of his character and abilities, and we are glad to think we still have his clear judgment and long experience of past problems at our disposal.

The balance sheet of the parent company shows the effect of the payment to us last summer of £2,000,000 in Three and a Half per cent. Treasury stock in partial satisfaction of our claim for compensation. This stock was sold and realised £1,996,248. It has therefore been possible to reduce the balance sheet figure of the assets vested in the National Coal Board to £1, and to make a transfer to capital reserve of £363,701. We had hoped that by this time further sums on account of compensation would have been received, and that we should have been able to put before you a scheme for the reduction of our ordinary share capital. A glance at the balance sheet shows how desirable such a reduction is. But for reasons I shall be speaking of later, I cannot, I fear, give you any indication of when it will be possible to do so.

THE YEAR'S PROFIT

Turning now to the consolidated profit and loss account, the profit for the year before taxation amounts to £205,071, compared with £245,170 for 1949. After taking into account profits attributable to prior periods and provisions no longer required, and deducting the proportion of profits attributable to outside shareholders, there is a balance before taxation of £249,018, compared with £299,602 in 1949. Taxation takes £113,627 this year, compared with £151,479 last year, so we are left with £135,391, compared with £148,123.

This year we have thought it prudent to provide £30,000 for the renovation of our houses and buildings, which has lagged behind somewhat owing to shortages of materials and labour and the difficulty of obtaining licences. There remains therefore available for the shareholders from the year's trading £105,391, compared with £148,123. Out of this figure we have paid the dividend on the preference stock for the year, and an interim dividend of 3 per cent. on the ordinary stock, amounting together to £41,388, and now recommend the payment of a final dividend of 5 per cent. on the ordinary stock absorbing a further £47,250, which I trust will meet with your approval.

HEAVY ENGINEERING PRICES

Last year I told you that in our heavy engineering departments competition had become more pronounced, and that we had made certain reductions in the prices of some of our foundry products. While the works are still very fully employed and our order books are if anything fuller than they were a year ago, the profit margin has been smaller. For reasons which seem good to us we have not attempted in all cases to increase our prices to the full extent which increases in wages and materials might have justified. In this way we have made our own modest contribution to the avoidance of inflation. The reductions in profits in these departments have been considerable, but I do not regard them as permanent and they have been offset to quite a large degree by increases in profits in other departments and subsidiaries. The improved results in these departments and subsidiaries are most encouraging.

The Kelvin Construction Company have once again exceeded the previous year's profits and have not only increased their dividend but put a substantial sum to reserve. The extension to the works of Messrs. Hughes and Lancaster are completed so far as the buildings are concerned, and now only await certain items of plant and a proper supply of electricity before they can begin production. In this connection I would mention that last autumn, in company with Mr Newman and Mr Barnett, I visited the United States, and as a result we have concluded an agreement with Air Products, Inc., of Emmaus, Penn., for a licence under which we shall manufacture oxygen generating plants to their design. We have already received orders for three plants from the Air Ministry, and I feel confident

that we have laid the foundation of a prosperous business which will prove capable of great expansion.

GOOD DEMAND FOR BRICKS

During the whole of 1950 demand for bricks was good, and though during the early part of this year the wet weather caused some contraction, I have little doubt that over the year as a whole we shall be able to dispose of all we can make. The new kiln at Blaby was started up early this year and is giving very satisfactory results.

Last year I told you of our anxieties about opencast coal production on our farms. These anxieties have, I am sorry to say, not proved groundless. A further 150 acres have been requisitioned. In order to avoid a serious reduction in the number of pedigree cattle which we have bred over the last few years, we have taken a lease of a 700 acre farm in East Notts, to which most of the young stock will be sent for rearing, leaving substantially only the milking herds here. Every possible step will be taken to see that the opencast land is properly restored, but I fear we must face a big drop in the yields from the opencast areas for many years to come.

STEEL NATIONALISATION

In common with all other concerns engaged in the heavy engineering industry, we have watched with anxiety the transfer of the steel industry to the State. Our most pressing need if we are to continue to compete with our products in world markets is a steady supply of raw materials—of which steel is the chief—at reasonable prices.

The experience we have had with other nationalised industries gives little ground for optimism, and there can be little doubt that steel prices will rise. But more important even than the price, is an assurance that we shall get what we need, when we need it, and if the only way to provide that assurance is a return to some form of licensing or allocation I hope the Government will not hesitate. In this connection I should like to pay a tribute to our buying department, headed by Mr Redfern, for the sterling work they have done over a most difficult period.

COMPENSATION FOR COLLIERY ASSETS

Finally, I come once again to the subject of compensation for our colliery assets. You will have seen that the sums we have already received have enabled us to write down the balance sheet value of those assets to £1, and last year to have paid just over a quarter of a million pounds as a capital profit distribution. But there is more to come.

When I spoke to you last year I had hopes, as I told you, that voluntary arrangements in our two valuation districts would be arrived at by which the complicated procedure of valuation as laid down by the regulations under the Act could be by-passed. Ever since the Act was passed your Board have been active in attempts in this direction. By this time last year we had arrived at the stage in our districts when very large majorities in terms of individual companies, and to a slightly less degree only in terms of tonnage, had signified their willingness to take part in a voluntary arrangement, but many, I think rightly, made it a condition that the arrangement should receive unanimous support. That unanimity we have so far failed to achieve.

NEED FOR UNANIMITY

There are many and pressing reasons why that unanimity should be achieved. May I mention some of them? First, from our own point of view, our capital structure is lopsided, and we can only straighten it out if the money is available for a reduction of our Ordinary capital. Secondly, the value of the pound—ever since vesting date the pound has been decreasing in value, and who at this time can say when it will stop?

Is it not true to say that if our shareholders had been asked five years ago to accept a share of our district allocations 10 per cent. less than they might really have been entitled to, and they had accepted it, they would be better off than they are today? And who can be sure that the same is not true now, if one looks forward another five years? I do not, of course, suggest for one moment that voluntary arrangements necessarily mean unjust valuations, but that is an argument which is often put forward. It is said that shareholders must be protected by the full exercise of their rights under the law. There is an old story of a pedestrian who stood up for his rights and was run over by a lorry. Our lorry is inflation. Thirdly, there is the quite fantastic waste of time, money and ability which the procedure under the Act entails.

NOT A COMPLEX JOB

There has grown up a theory—I might almost call it a religion—that the job of dividing up a certain number of million pounds among a certain number of colliery companies is a task of the utmost complexity on which years of study should be spent. It is nothing of the kind. The Act lays down that the valuations should be on the basis of a willing buyer and a willing seller at the vesting date, as if the Act had not been passed.

You may say that is not a very realistic approach in 1951, but once you have attuned yourself to the slightly Alice in Wonderland atmosphere created by the Act, you find that what you are asked to do is what was done quite frequently and without any fuss by mining engineers and accountants all over the country in the normal course of business. Is it really suggested that when one colliery company was in negotiation with another with a view to purchase, that it took the experts three, four, or five years to make a valuation? On the contrary, it would have been a matter of weeks, let alone months.

AGREEMENT ESSENTIAL

The only way to avoid this waste is for the coalowners to come together and agree to accept the verdict of a tribunal or an individual of their own choosing. It is well known that in Durham and Northumberland such an agreement has been made, and they expect to have their figures in a comparatively few months, and other districts are doing similarly. It is deplorable that the intransigence of only a few coalowners in our districts should block the road to similar progress here.

May I once again offer on your behalf our thanks to our staff and workpeople, who never fail to respond to our calls upon them?

I now have pleasure in moving:—That the directors' report and balance sheet, which carries with it the directors' recommendation of the payment on June 30, 1951, of a final dividend on the Ordinary capital of 5 per cent. less income tax (making 8 per cent., less income tax for the year), which will absorb £47,250 and the carrying forward of the balance of £182,601, be received, approved and adopted. After it has been seconded, any shareholder can ask any questions before the motion is put.

The report and accounts were adopted; the retiring director, Mr H. D. M. Wright, was re-elected; the auditors, Messrs Price, Waterhouse and Company, were reappointed, and the proceedings terminated with a vote of thanks to the chairman.

HIELD BROTHERS

MR DAVID H. HIELD ON DANGEROUS LEVEL OF WOOL PRICES

The twenty-ninth annual general meeting of Hield Brothers, Limited, was held in Bradford on June 29th, Mr David H. Hield (the chairman) presiding.

The following are extracts from the chairman's circulated statement:—

I have pleasure in presenting our balance sheet showing a trading profit of £364,159, as against £317,564 (excluding exchange profit) last year. This increase is due to two factors, increased production and rising wool values.

After providing for the dividends, our net liquid assets are £1,045,470, against £959,054 last year, showing an increase of £86,416. Our stock, approximately the same in volume as last year, at £1,113,687, shows an increase of £279,248. Our profit of £364,159 is, therefore, largely in this increase of stock values, but taxation is based on this inflated result and such taxation makes impossible the accumulation of adequate reserves.

Though there has been a substantial fall in wool values since the end of March, we consider the price today to be still at a dangerous level, and to guard against a further possible fall we are increasing our present reserve of £175,000 by £75,000, making a total reserve of £250,000. The price of wool today is still ten times that of prewar.

We are recommending this year the same dividends as for last year; that is to say, 10 per cent. on the £220,000 preference stock and 25 per cent., or 3d. per 1s. unit, on the £220,000 ordinary stock.

DIVIDEND BONUS

Our trading profit of £364,159 is a record and in addition to the dividend of 25 per cent. we propose paying a bonus of 5 per cent., but I must impress upon you that this exceptional profit is largely due to exceptionally favourable conditions which are not likely to recur; wool has rocketed during the past year and rising prices bring rising profits falling prices the reverse.

I wish, however, once more to point out that the total figure of capital employed in the business is far in excess of the £440,000 issued capital. It amounts to the sum of £1,270,823, and on this sum the dividends declared represent a gross return of under 7 per cent.

The price of wool presents formidable financing difficulties, and these have our urgent and constant attention; present circumstances make it doubly unfortunate that taxation takes so much from our cash resources.

Our borrowing powers today are limited to £440,000, the issued capital of the company. With the price of wool at its present level £440,000 may not be adequate to meet our needs in certain circumstances and we are, therefore, as a precautionary measure, seeking authority to increase these powers to £880,000.

I venture no forecast of the future and while we have a full order book for the coming year, I must point out that the public in every country in the world have not yet felt the effect of the prices ruling today and it remains to be seen how far demand will be maintained for cloth made from wool at its present high price.

We have not speculated in wool; we have only bought as we sold; our commitments of necessity are large but are covered by orders on hand.

Owing to exchange and political difficulties in various parts of the world some of our most important export markets are for the time being closed to us and we see no immediate prospect of their reopening.

I can say with confidence that our goods are held in the highest esteem by our customers. The report was adopted.

JOHN THOMPSON LIMITED

(Steam Power Plant and General Engineers)

INCREASED OUTPUT AND WORK ON HAND

MR EDWARD W. THOMPSON'S REVIEW

The sixteenth ordinary general meeting of John Thompson Limited, was held on July 4th at Wolverhampton.

Mr Edward W. Thompson, M.A., chairman and joint managing director, presiding.

The following is an extract from the chairman's circulated statement:

For the year 1950 our net profits, after paying £570,512 for taxation and providing £186,589 for depreciation, are £402,400 as shown on the consolidated accounts, compared with £312,174 for 1949.

The total output invoiced over the whole group for the year 1950 amounted to £9,460,336 compared with £7,476,498 for the year 1949. The corresponding output for the year 1946 was approximately £4,300,000, which the 1950 figures more than doubled, indicating the great increase in productivity since the war.

All the trading companies included in the previous year's accounts showed a profit, but one small accessory company which was purchased in the middle of 1950 has to record a loss; and in addition our recently opened branch in Brazil, which, for ease of administration in that country, was formed into a company, also is shown as making a loss. In the latter case, however, the "loss" merely reflects the expense of that branch, and is, in effect, the cost of a small part of our export drive.

As will be seen from the consolidated balance sheet at the end of 1950, the total unappropriated profits and reserves of the group have increased to £1,593,855 from £1,292,860 as at the end of 1949—an increase of £300,995. It will be recalled that last year we made a special reserve of £50,000 for depreciation, and your Board have considered it only prudent to repeat this special reserve this year, so that with the normal annual allowance for depreciation we have provided a total sum of £186,589 for depreciation in respect of the year 1950.

We believe that this special reserve is again necessary in view of the continued increase in the cost of replacement of plant and machinery, and building charges.

In the recent Budget the Chancellor proposed to discontinue the initial allowances for taxation purposes of 40 per cent. of new capital expenditure on plant and machinery and 10 per cent. on industrial buildings, to have effect as from April 6, 1952. Whilst, as I pointed out in my statement last year, the effect of the initial allowances in respect of any one year's capital expenditure was to defer the tax liability from the present to future years, we must contemplate a substantial amount of capital expenditure each year in order to keep our various works up-to-date with the best possible machinery for production requirements. The initial allowances only afford a very small relief towards the continually rising costs of replacements generally, and the withdrawal of this small benefit now means that there is no compensation for, or recognition whatsoever of, these increased replacement costs.

In addition to the special depreciation allocation of £50,000 mentioned above we have put a total of £210,000 to general reserve and £20,000 to research and development reserve. This continues our previous policy which has enabled us in recent years to finance the increased output. Including 1950, the amount put to reserve or otherwise retained in the business over the past 13 years is £1,573,309, which is 69 per cent. more than we shall have paid in dividends over the same period.

In 1950 our capital expenditure was £194,193, which as I forecast last year shows a marked reduction. Since the war and including 1950, the total group capital expenditure has been £1,311,722, and our various works are now better equipped than ever before. The policy of your board is to continue their efforts of improvement in the interests of increased production and works efficiency.

I would repeat my statement of previous years that the only means of providing for capital expenditure is out of taxed profits or by further issues of shares for cash as the depreciation allowed against taxation is quite inadequate.

PROFITS AND TAXATION

In spite of the increase of nearly £2,000,000 in our output, our net profits have only increased by £90,226, due largely to the increasingly heavy burden of taxation imposed on British industry. The total taxation charged in the accounts this year is £570,512—an increase of £211,767 over the previous year. It should be appreciated that a large proportion of the profits shown is not in cash or its equivalent but is locked up in stock and work-in-progress. Again the major part of the reserves proposed in the accounts has in fact been expended on fixed assets during the past year. Taxation has, of course, to be found in cash, and the present very heavy burden creates serious problems in financing industry.

The Budget proposal to increase the profits tax on distributed profits from 30 per cent. to 50 per cent., with the increased income-tax, has the effect of bringing our maximum rate of tax payable up to no less than 13s. 3d. in the £ on our profits.

DIVIDENDS

The Chancellor and the F.B.I. envisage "moderate" increases in dividend declarations following on increased profits in industry generally. In view of the excellent results of 1950, your board, after careful consideration, have decided that it is only just to the shareholders to make a moderate increase in the dividend. As your company has 1,400 ordinary shareholders, of whom the great majority hold only small individual amounts of our stock, with the rising cost of living even a small increase in dividend may be of great help to many.

It is therefore proposed to declare a final dividend of 12½ per cent., which will make a total of 22½ per cent. for the year. Compared with last year, we therefore propose to pay out approximately £16,769 more in dividends, which is a small figure even in relation to the increase in net profits.

The greater output and the consequent increase in profits would not have been possible if we had not pursued our re-equipment policy since the war. As an appreciation of the efforts of all employees, both in the offices and works, in contributing to these results, your board have decided to pay all concerned a special bonus of one week's basic pay, amounting to £32,000.

FUTURE PROSPECTS

The amount of work on hand un-invoiced for our group of companies is now over £25 million. Again the increase is, to a large extent, the result of long-term contracts for water tube boilers for power stations at home and abroad, but throughout our various manufacturing companies the work ahead is still rising. During the first three months of 1951 the total output of our companies has exceeded the figures for the corresponding period of 1950.

In this respect the prospects for the present year would look encouraging were it not for the very serious difficulties in obtaining our raw materials, mainly steel plates, sections, tubes, etc. In some cases the steel mills are not, at the moment, in a position even to accept orders, and unless this situation changes very quickly, which appears from general information to be unlikely, I cannot see that the increased production of the first few months of this year can be maintained.

On the other hand, many of the products of our group companies are of an essential nature; for example, we are undertaking an increasing amount of work for the home power stations for the British Electricity Authority, and also power stations abroad. Naturally, a group of our size has undertaken its full share of rearmament contracts, but adequate power supplies are essential to industry for the fulfilment of the rearmament programme both at home and in the Commonwealth. Serious delays will be unavoidable unless the necessary materials are forthcoming to our industry.

EXPORT TRADE

Our export trade continues to increase. We know that, directly and indirectly, nearly 70 per cent. of the present output of our Motor Pressings Company goes abroad. The exports of metal windows from our Beacon Windows Company have expanded, particularly in the dollar area. John Thompson (Wolverhampton), Limited, our main boiler manufacturing works, continue to export a large number of Lancashire and Economic boilers to India and South Africa.

Our Australian companies have increased work on hand, and have recently secured another important order, in this case from the Electricity Commission of New South Wales, for a large power station near Sydney, valued at approximately £1,750,000. Following a visit that I made to Australia in 1950 it was decided to increase our office organisation in Sydney, to deal with contracts in New South Wales and Queensland. Mr G. D. Elliott, one of the directors of our Water Tube Company, has gone to Australia for a period of three to four years, to act as chairman of the Australian companies and to reorganise, as necessary, to deal with our increased business there.

Our companies in India and South Africa continue to progress. We have strengthened the board of our South African company by the appointment of Mr E. G. Gearing, of Rutherfords, Limited, who have been our agents in the Cape Province for some years.

RESEARCH AND DEVELOPMENT

In the ordinary course of our business we are continually carrying out a considerable amount of research and development as applied to our normal products. Quite apart from this special research, investigations are being carried out both in our laboratories and on plant in commission. We have planned to co-ordinate the research activities of our various companies and, as you will see from the consolidated balance sheet, have this year set aside the sum of £20,000, which should meet our immediate needs.

As mentioned earlier in this review, the board have already appreciated, in a tangible form, the efforts of all employees who have contributed towards the excellent results of the past year. On your behalf, as well as on my own, I sincerely thank all concerned, and extend my good wishes to all.

The report and accounts were adopted.

BRITISH TIMKEN LIMITED

SATISFACTORY RESULTS

MR JOHN PASCOE'S REVIEW

Mr John Pascoe, chairman, at the annual general meeting of British Timken Limited said: Last December we suffered a grievous loss in the death of Mr Michael Dewar, who had been chairman of British Timken for 23 years. We shall indeed miss his wise and experienced leadership.

I hold that the first duty of a board of directors is to make profits. The profit motive, or, in other words, the desire for personal gain, has been responsible throughout history for all industrial development; and all else, service to the community, technical invention and development, and good working conditions, depend on the ability of a board of directors to perform its main function of making profits. It is therefore with some satisfaction that we are able to report favourable results for the year 1950.

Our turnover for 1950, three times that for the year 1946, was approximately 17 per cent. higher than in 1949, while the number of employees increased by approximately 7 per cent.

CAPITAL EXPENDITURE

You will observe from the accounts that we had as at December 31, 1950, outstanding commitments of £300,000 in British Timken and £122,000 in subsidiaries (chiefly Fischer Bearings). These capital commitments follow a total capital expenditure of £563,320 in 1950. As this capital expenditure becomes effective we shall have a very considerably increased capacity, but, quite clearly, we are nearing the end of capital expenditure which can be financed from our own resources.

Our raw material position, particularly in alloy steels, is causing us at the moment considerable anxiety. We have lost some output through lack of steel, and we foresee considerable difficulties in keeping our expanding capacity fully occupied, and, indeed, the problem of planning further expansion with the uncertain raw material position is one that needs the most careful consideration.

Our main subsidiary company, Fischer Bearings Company, Limited, has had a satisfactory year, and in general is facing the same problem as the parent organisation in the matter of raw material and the need for increased capacity.

Following the death of our chairman, Mr Michael Dewar, the Timken Roller Bearing Company of Canton, Ohio, exercised its options under agreements going back to 1928 to purchase all his shareholding in British Timken Limited, with the result that the Timken Roller Bearing Company now hold approximately 54 per cent. of our ordinary capital. The Timken Roller Bearing Company have, however, through their board of directors, indicated to your board that they have no intention of proposing any change of management of British Timken, preferring to leave the management of the company in British hands, but naturally, as shareholders, they will not hesitate to exercise their right to ensure that the management shall remain efficient. My appointment as chairman and managing director has met with the express approval of the directors of the Timken Roller Bearing Company.

UNITED STATES SUPREME COURT'S DECISION

The Supreme Court of the United States handed down on June 4th its decision in the action instituted by the United States Government against the Timken Roller Bearing Company of Canton, Ohio, under the so-called anti-trust laws of the United States. The Court has held that the American company may not under American law continue to be a party to the existing business agreements with your company, but has permitted the American company to retain its holdings of shares in your company. The decision cannot fail to have a significant effect upon the nature of the relations between the companies. A considerable time must elapse, however, before the precise course of those relations can be determined.

UNION MINIÈRE DU HAUT-KATANGA

RECORD OUTPUT FIGURES

MR E. SENGIER'S REVIEW

The annual general meeting of Union Minière du Haut-Katanga was held in Brussels on June 28th. It approved the accounts for the year ended December 31, 1950.

Mr Gaston Blaise was in the chair.

Gross profit was 2,780,754,793 francs. Deduction of depreciation, provision for profit tax and other charges left a net profit of 1,838,049,720 francs. The carry-forward from 1949 of 124,387,139 francs gave a balance available for distribution of 1,962,436,859 francs.

After carrying forward 111,804,549 francs and deducting appropriations to the reserve fund, the special reserve and contingencies fund and the special renewals fund, the balance available was 1,181,357,007 francs. A dividend, for 1950, of 750 francs net per share was approved by the meeting. Taking into account the 400 francs already paid in accordance with the resolution of the extraordinary meeting of shareholders held on January 18, 1951, this entailed a balance of dividend amounting to 350 francs, net per share.

MR E. SENGIER'S STATEMENT

Mr E. Sengier, chairman of the executive committee, addressing the meeting, began by calling attention to two facts:

First: The importance attained by this vast industrial complex which plays a dominating part in the activities of Katanga.

Second: The fact that operations were most satisfactory and that favourable factors only were to be recorded.

The report, said Mr Sengier, rightly emphasised their achievement in the field of native labour; all those who attempted to build in the Congo would soon perceive how much that question prevailed over all others and was the condition of lasting success.

Encouraged by the results obtained in the past, they were promoting in every possible way the moral education and the technical training of their native workers.

The accomplishment, within the scheduled time, of the tasks undertaken, said Mr Sengier, constituted an exceptional result when taking into account conditions prevailing in Central Africa. Besides the efficiency and the enthusiasm of the staff, the task required the co-operation of all who had at heart the general interest, i.e., the Government, the Comité Spécial du Katanga and the missions whose help was so valuable to them.

The appreciation given recently by the Governor of Katanga of the perspicacity and perseverence of the mining companies, whose expansion had benefited in such a way the Katangese economy, and the opinions expressed by industrialists who were solving similar problems in North America and in Africa brought to their colonial enterprise based on private undertaking, a very gratifying testimony.

COPPER PRICES

Mr Sengier further made some comments on metal markets. He thought that present copper prices should be considered as abnormally high. The present world price of 27.5 cents compared with the 21.6 cents, average quotation for the year 1950.

Any estimate of supplies and demands, even in the near future, was rendered difficult by the confused situation prevailing.

With a world copper output progressing slowly and a demand steadily increasing, rendered particularly acute just now by reason of the armament programmes and strategic stockpiling, the present price level of copper would probably have been higher had it not been checked by the mining companies who voluntarily maintained their selling prices below what they would have been in a market solely subjected to commercial influences.

The reason was that they considered—and the company fully shared that opinion—that it was contrary to their permanent interest to have prices reaching exaggerated levels. Those prices upset the markets and brought about conditions inconsistent with operating programmes that had to be established long beforehand and carried out with a certain regularity.

Reverting to the results of the past financial year, Mr Sengier wished to confirm his previous hopes to be able to continue to finance by the company's own means the heavy construction expenditures and the vast social programme which had been elaborated in view to consolidating the technical and financial results of the future.

These heavy capital expenditures originated in the increasingly powerful installations and equipment which were needed to reduce operating costs and increase production.

These aims had already largely been reached.

The costs of the company favourably compared with those of its competitors. If the improvements of the financial results were due in part to the above fact, they were also due, it went without saying, to the increased sales prices of products, increases which could very well be temporary. And this eventuality, added Mr Sengier, justified the care with which they drew up their balance sheets, and which should inspire confidence in the management.

ADMINISTRATION

"To end," said Mr Sengier, "I wish particularly to underline the chapter of the report concerning the administration of the company and the changes which occurred on January 1, 1951, in the high management.

"Mr Cousin and myself, closely associated for forty years, that is since Union Minière and its subsidiaries began operating, have thought that the time had come to transfer a substantial part of our responsibilities to our younger associates trained at our sides for many years. It is first of all a tribute we wished to pay to their ability and to the zeal they have displayed. They will continue our work in what I shall call the spirit of the house. These appointments have been unanimously approved by our employees at all levels.

"As mentioned in the report, Mr Cousin accepted to be chairman of the local committee which will control the operations in

Africa in connection with the activities of the subsidiary companies.

"As far as I am concerned, in my capacity of chairman of the executive committee, I will continue to assume the high supervision of the company. That means I am not abandoning ship: Union Minière is a very good ship of which I will remain the pilot. The somewhat rough seas she has crossed seem to have smoothened and I can assure you that the management has passed into excellent hands."

RECORD OUTPUT FIGURES

The report circulated to shareholders shows that in 1950, out of a world copper output estimated at 2,500,000 metric tons, Union Minière produced 175,920 tons, as against 141,399 tons in 1949. This is the highest figure ever reached since the origin of the company. Cobalt and zinc concentrate outputs have also been raised substantially.

Ore mined during the year totalled 4,317,066 metric tons. Nevertheless, copper, cobalt and zinc reserves have notably increased.

Besides copper, 5,148 tons of cobalt were produced, which sets a new record; 51,287 tons of crude and 66,619 tons of roasted zinc concentrates were delivered to the Belgian zinc industry.

As a by-product of the roasting operations, 29,668 kgs. of cadmium were recovered.

Refining of blister copper yielded 138,720 kgs. of silver and 43.3 kgs. of gold.

The uranium-radium ores and concentrates have been exported, and the radium content recovered as usual at the plant of the Société Générale Métallurgique de Hoboken.

The extension and appropriation programme of mines, plants and installations remains generally the same as last year. As a consequence, the electrification of the western group of mines, the sinking of the two shafts at Kambove-West, the development of the Kipushi and Kolwezi concentrators as well as the increase of capacity of the copper and cobalt electrolysis plant and the copper refinery at Jadotville-Shituru have been either pursued or achieved.

The Bia power-plant, built on the Lufira River, and equipped with three 15,600 kVA. groups, went into operation.

The average capacity of both Francqui and Bia power-plants is thus about 500 million kWh. per year.

When the third hydro-electric power-plant (Delcommune power-plant) on the Lualaba River will be commissioned, this average capacity will nearly double and attain one billion kWh. per year.

The rapid social evolution of the native workers has led to a complete re-examination of their labour status. Wage-scales were reconsidered and the more deserving workers receiving in cash the entirety of their wages allowed to live in the public districts.

A special tribute was rendered by Mr Sengier to the European staff of the company in Africa and in Europe and to the members of the religious missions and social workers who collaborated to the social works set up by the company for its native dependants.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

JACKSON THE TAILOR LIMITED

RETAIL DEVELOPMENT IN LONDON

The nineteenth annual general meeting of Jackson the Tailor Limited was held on July 3rd at Newcastle, Mr Lionel Jacobson, chairman and joint managing director, presiding.

The following is an extract from his circulated statement for the year ended January 31, 1951:

During the past five years a policy of steady progress and expansion in selected key positions has been carried out by the retail organisation. At the same time the capacity of the manufacturing division has been progressively and systematically expanded to cope with the anticipated increase in demand. The efforts of the previous years are now producing their effect, as instanced by the figures of the past year. It has been the declared policy of your directors at all times to endeavour to reduce the margin of unit gross profit, and it is a source of some satisfaction to them that these results have been obtained with the margin again reduced, and that in addition the record turnover figures of the previous year were once again surpassed.

Your Board is convinced that we must at all times ensure full employment for the manufacturing division and with this in view we have acquired a number of selected sites in the provinces which should be available for trading within the next few months. In addition the group has acquired one of the principal sites on the south side of Oxford Street, London. When the necessary alterations are completed this store will make a substantial contribution to the turnover and results of the group. We have, furthermore, two sites in the suburbs of London which it is hoped will be open shortly after the central site in Oxford Street. We have a considerable number of customers already in the south of England who travel long distances in order to purchase from one of our branches and with this nucleus of customers already in existence, we have reason to feel that our retail development in London will be as successful as the new branches have been that we have opened during recent years in the larger provincial towns.

PURPOSE OF DECISIONS AND ACQUISITIONS

I would emphasise that the purpose underlying these various decisions and acquisitions has been to ensure that turnover and unit demand should be maintained and, consequently, that the manufacturing division be fully employed even if retail demand should fall away; however, we have also taken the additional precaution of providing for a reasonable expansion in production should demand rise above its present level.

I view with some concern the increases that have taken place in practically every element of our manufacturing costs. Wool, in the form of cloth, is one of the major items in the cost of a suit. The cost of linings and interlinings and the many other items that are necessary has increased considerably.

During the past few years we have created through our subsidiary companies a substantial export trade, particularly with the United States of America and Canada. It was my pleasant duty recently to visit our customers in these countries and I am happy to inform you that our product has been well received.

In the uncertain world political and economic conditions it would be unwise to indulge in any forecast with regard to the future. So far this year we have made further advances and we can face the future with confidence.

The report was adopted.

W. T. HENLEY'S TELEGRAPH WORKS COMPANY, LIMITED

THE SECOND BEST YEAR

The annual general meeting of W. T. Henley's Telegraph Works Company, Limited, was held on June 29th in London, Sir Montague Hughman, the chairman, presiding.

The chairman, in the course of his speech, said: My mind goes back to 27 years ago, when I became a director of this company. Throughout the whole period during which I have been your executive chairman the organisation has shown, year by year, progress and development, culminating in 1949 in a very high record of output from our factories, and which, after 112 years, is something to be proud of. For the one hundred and thirteenth year, which is 1950, we have not reached the high figures of 1949, but I think you can look upon the accounts before you as being the second best in the company's history, and all our subsidiaries paid dividends out of satisfactory profits earned in 1950.

STEEPLY RISING COSTS

We were faced throughout the year with many difficulties; it was a period of steeply rising production costs and frequent price adjustments, and competition during the first half of the year was extremely keen in every department of our business at home and overseas. With the outbreak of war in Korea last June, business showed a rapid change from a buyers' to a sellers' market in a few days. Prices of practically all materials began to rise—delivery times were lengthened—and by the end of the year there was a shortage of practically all materials we require. These conditions have tended to become more acute during the current year. The changes in the Budget by the Chancellor of the Exchequer recently have made the burden of taxation still more onerous.

Woolwich and Birtley Rubber Cable Works: The Combined output was 5 per cent. higher than the previous year. The demand for rubber cables during the first half of 1950 was on a much reduced scale. The autumn demands were so heavy in some of the "bread and butter" types that in a number of cases we were unable to execute orders as promptly as we should have liked.

Gravesend Paper Cable Works: The opening months of the year found us well clear of the end of the postwar rush of business, and this fact, together with the unsettled conditions brought about by the financial crisis and the cut in Government expenditure created an appreciable reduction in the demand for power cables. During the second half of the year, however, there was a considerable improvement.

GREATER DEMAND FOR TYRES

The demand for Henley tyres both at home and overseas has never been greater, but the year has been an extremely difficult one. Notwithstanding the difficulties, the result of the year's work shows a very satisfactory profit.

The balance of our trading account for the year 1950 is £1,486,283. Our overseas business taken as a whole is not quite so good as in 1949, representing a little under 40 per cent. of our total turnover. The results are nevertheless satisfactory.

The report was adopted and a final dividend of 10 per cent., making 15 per cent. for the year, and a cash bonus of 5 per cent. were approved.

HOLYROOD RUBBER LIMITED

INCREASED DIVIDEND

The thirty-eighth annual general meeting of Holyrood Rubber Limited was held on June 29th in London.

Mr Jack Addinsell, the chairman, after expressing appreciation of the courage of the staff under very dangerous and trying conditions, said in the course of his statement: The crop at 1,057,000 lb. fell short of the previous year by 120,000 lb. largely due to unprecedented rains. In the current year absenteeism through intimidation and military operations has resulted in a further fall in output, and for the four months to the end of April 294,500 lbs. were harvested, compared with 332,000 lb. in the corresponding period of last year.

The rise in the price of rubber is reflected in the sum received for the output at £109,253, compared with £53,257 for a larger crop. Estate expenditure was higher by some £8,800 at £46,790, but the effect of increased wages is only partly reflected and we must expect a considerably higher cost for the current year. The greatly increased export duty from January 1st will add substantially to costs.

The profit, before making provision for taxation (£33,160) amounted to £7,314 against £11,786. Your directors propose that £6,000 be transferred to general reserve and £5,000 to replanting reserve. For 1949 the dividend was 6 per cent. An interim 10 per cent. on account of 1950 was paid in March and a final 15 per cent. is recommended.

With regard to our war damage claim, there are indications that we shall soon secure at least a portion of what we have spent, which to the end of the year amounted to £19,004.

RUBBER PLANTATIONS INVESTMENT TRUST, LIMITED

INCREASED REVENUE

The annual general meeting of this company will be held on July 25th in London.

The following is an extract from the circulated address of the chairman, Mr H. J. Welch:—

We began the year with a carry forward of £119,008 and, after making the proposed distribution of 6 per cent. for 1950, as against 5 per cent. for 1949, a balance of £125,789 will be carried into the current year. During 1950 gross revenue receipts were £157,187, equal to earnings of 6.3 per cent. on our issued capital and an increase of approximately 50 per cent. over those of 1949. Net income amounted to £83,595, against £52,688 for the previous year.

The valuation of the investments is given in the directors' report. If to these valuations is added the sum of £713,369, the cost of our holding in Sumatra Tea Estates Limited, it gives an aggregate of £2,571,185, compared with their total net cost, the difference of £534,103 being covered by reserves and surplus totalling £675,789.

As to the immediate future of the Trust, revenue continues to accrue at a satisfactory rate and in the current year we are reaping the benefit of the increased prosperity enjoyed by the rubber industry. But political and economic factors preclude the possibility of making any reliable long-term forecast.

In Eastern countries, where tea and rubber producers principally operate, much unrest and uncertainty prevail. Governments often do not realise the important part played in the past and which could be played in the future by foreign capital and personnel.

RANGALLA CONSOLIDATED

STRONG LIQUID POSITION

The twenty-eighth annual general meeting of Rangalla Consolidated Limited was held on July 2nd in London, Mr Eric Davenport, A.C.A. (the chairman), presiding.

The following is an extract from his circulated statement: The balance of profit and loss, after deduction of London expenses, amounts to £30,003, against £34,090 for 1949. The appropriations made are set out in the report and include the payment of an interim dividend of 15 per cent. for 1950, leaving £5,914 to be carried forward. No further payment is recommended for the year. Our liquid position is strong and it needs to be so, for the rising costs of production require substantially increased figures to meet the monthly requisitions of the estates.

The tea crop at 1,283,173 lb. compares with 1,330,200 lb. in 1949. Out of the 1950 crop 819,423 lb. were delivered under the M.O.F. contract and secured 2s. 8.86d. net. The balance was disposed of locally at a net average of 2s. 5.67d., or an average for the whole crop of 2s. 7.53d., against 2s. 3.69d. in 1949. The crop shortage is mainly due to climatic conditions. The cost of production was 2s. 1.55d., against 1s. 9.21d. in 1949.

As regards the current season, the crop to the end of April is 428,220 lb., against 461,860 lb. in 1950 and 421,744 lb. in 1949. We hope for at least the same crop for May as last year and from then onwards it will depend on the strength of the S.-W. monsoon. The London auctions were resumed in April and on the whole satisfactory prices have been secured.

The report was adopted.

NOTICES

UNIVERSITY OF MELBOURNE, AUSTRALIA

DEPARTMENT OF SOCIAL STUDIES

Applications are invited for the post of DIRECTOR OF A RESEARCH PROJECT ON THE CONDITIONS AND NEEDS OF OLD PEOPLE IN VICTORIA, AUSTRALIA. The successful applicant will be expected to make recommendations as to how these needs can best be met. The project, which is sponsored by the Sidney Myer Trust in conjunction with the Rotary Club of Melbourne, will be carried out under the general supervision of the Department of Social Studies.

Applicants should hold a university degree in one or more of the social sciences and have had experience of social surveys; in addition a Diploma of Social Studies would be an advantage.

Salary up to £1,500 (Australian) per annum, according to qualifications and experience.

Duration of the appointment would be for at least 18 months. A first class return passage to Melbourne will be paid.

Further particulars and information as to method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

The closing date for the receipt of applications is *August*, 20, 1951.

COUNTY BOROUGH OF BLACKBURN EDUCATION COMMITTEE

MUNICIPAL TECHNICAL COLLEGE AND SCHOOL OF ART

DEPARTMENT OF COMMERCE, ADMINISTRATION AND LANGUAGES.

Applications are invited for the appointment of Assistant Lecturer in the Department of Commerce, Administration and Languages, to commence duties on September 1, 1951, or as early as possible.

Salary:—Grade B—£450 x £25 to £725 plus additions for degree training, etc.

Applicants should have good teaching experience. Preference will be given to a man with qualifications and practical experience in Industrial Accounting and/or the Teaching of Management Subjects.

Further particulars and forms of application (which should be returned to me within 14 days of the appearance of this advertisement) can be obtained from this Office.

G. F. HALL, Chief Education Officer.

Education Offices, Library Street, Blackburn.

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE

COLEG PRIFATHROFAOL DEHEUDIR CYMRU A MYNWY

The recently advertised research assistantship in Industrial Relations will not be filled until September. Further applications will be received up till September 10, 1951

July 2, 1951 (Signed) E. R. EVANS, Registrar.
Cathays Park, Cardiff.

THE GLASGOW AND WEST OF SCOTLAND COMMERCIAL COLLEGE

Principal: Dr. Eric THOMPSON, M.A., B.Sc., Econ.

Applications are invited for the post of Lecturer in the Department of Business Administration. Candidates should hold a degree in Commerce. The possession of some business experience would be an advantage. Applications should be submitted as soon as possible. Further particulars may be obtained from the Secretary, The Glasgow and West of Scotland Commercial College, Pitt Street, Glasgow, C.2.

POST VACANCIES IN UNITED NATIONS

The United Nations Economic Commission for Europe in Geneva, Switzerland, is seeking qualified applicants for certain senior posts in the Research and Planning Division. Candidates should possess the highest academic qualifications in applied economics and economic theory, especially in the field of international trade and payments, as well as considerable experience in economic research and analysis. Candidates must be able to give satisfactory evidence of ability to produce finished drafts in a form suitable for publication, to organise and supervise the work of a small professional staff, and to participate effectively in planning the lines of research of the Division. Qualifications must include excellent knowledge of English or French and ability to prepare acceptable drafts in one or the other of these languages; knowledge of other European languages desirable. Applicants should be nationals of member countries of the United Nations.

Letters of application should be addressed to:
Personnel Officer, United Nations, Palais des Nations,
Geneva, Switzerland.

THE Provisional Board of Directors of the National Oil Company of Iran, in connection with the sale of Oil Products, announces to all purchasers of oil from Iran for the purpose of export that they can within one month of this date obtain delivery of the oil products they require against receipt. They must, however, refer to the Board of Directors within one month and effect the payment at standard international rates. The sale prices after expiry of the aforesaid period of one month shall be at standard international rates for quantities which customers of the former Anglo-Iranian Oil Company used to buy during the period January 1, 1948, to March 20, 1951. For any quantities exceeding these, other terms and conditions being equal, the buyers in question have priority of purchase.—Provisional Board of Directors in charge of enforcing the Nationalisation Act of the Oil Industry in Iran at Khorramshahr, Iran.
June 22, 1951.

YOUNG MAN (24), five years' commercial experience, knowledge French/German, seeks position with prospects in manufacturing or distributing organisation. Conscientious worker, adaptable, has just sat for B.Sc. (Econ.) exam.—Box 683.

LAYTONS Wine Merchants, 2a, Duke Street (Manchester Square), W.1, are also party caterers. Welbeck 8808, 1864.

D. HARPER, Manager, 47, Threadneedle Street, E.C.2. July 2, 1951.

LEEDS COLLEGE OF COMMERCE

Principal: E. V. ROBERTS, B.Com., A.C.A.

Required as soon as possible a full-time teacher of Commerce, Economics and Book-keeping. Applicants should have a degree or good professional qualification and preferably have had business experience. Ability to teach Secretarial Practice would be an asset.

Salary will be in accordance with the Burnham Scale for Assistants (Grade B)—Men £150-£725, Women £105-£580—with allowances for degree, training and war service.

Further particulars and form of application to be returned not later than two weeks after the appearance of this advertisement may be obtained by sending stamped and addressed foolscap envelope to the undersigned. GEORGE TAYLOR, Chief Education Officer.
Education Offices, Leeds, 1.

UNIVERSITY OF ABERDEEN

APPOINTMENT OF SECRETARY TO THE UNIVERSITY

The University Court will, in the Autumn, 1951, proceed to the appointment of a Secretary to the University which office will become vacant on September 30, 1952. It is intended that the person appointed should take up duty some months before the present Secretary demits office.

Salary at least £2,000 per annum with F.S.S.U. and Children's Allowance. The University pays a proportion of removal expenses.

Further particulars and form of application may be obtained from the Secretary, with whom applications should be lodged not later than September 30, 1951.

H. J. BUTCHART, Secretary.

The University, Aberdeen.

I.L.O. invites applications from men and women aged between 23 and 35 years on July 31, 1951, for a post of Member of Division in the Non-Metropolitan Territories Division of the International Labour Office, Geneva, Switzerland.

Qualifications required:
1. University degree (preferably in economics or social science) or the equivalent in experience.
2. Familiarity with labour and social problems in Africa.
3. Good knowledge of one of the official languages of the I.L.O. (English and French) and some knowledge of the other.

Preference will be given to candidates of African descent.

On application with stamped, addressed foolscap envelope, further particulars and application forms may be obtained from: The International Labour Office, 38-39, Parliament Street, London, S.W.1.

Completed application forms must be submitted by July 31, 1951.

ASSISTANT to Production Control Manager is required by large mass production factory. Some administrative industrial experience and statistical background are essential and academic qualifications desirable. The age limits are 28-33, and commencing salary will be appropriate to the degree of responsibility. The selected candidate is able to assume immediately. The position offers considerable prospects for the right man.—Apply to Personnel Manager, Harris Lebus, Limited, Finsbury Works, Tottenham, N.17.

BARRISTER, over three years' commercial experience as company secretary with many executive responsibilities, specialist knowledge of taxation and of export trade, seeks permanent appointment. Aged 35.—Write Box 682.

TRANSLATOR-TYPIST to work in Spanish, with Portuguese as secondary language if possible, required by large engineering concern in Midlands, one and a half hours from London. Excellent working conditions in modern offices.—Applications, stating particulars of previous experience, qualifications and salary required, should be made in writing to Box 5026, c/o Charles Barker & Sons, Ltd., 31, Budge Row, London, E.C.4.

AGGREGATE ASSETS at 31st March, 1950 £102,585,433.

Established nearly 90 years

Incorporated with limited liability in New Zealand

Represented at over 280 points in New Zealand and at Melbourne Victoria, Sydney, New South Wales Suva, Fiji; Apia Samoa.

London Office
1, Queen Victoria St., E.C.4
O. M. Samuel Manager

Head Office: WELLINGTON, N.Z.
R. D. Moore, General Manager.

METROPOLITAN BOROUGHS' (ORGANISATION AND METHODS) COMMITTEE

APPOINTMENT OF TEAM LEADER

The above-named Committee, which has been set up by 20 Metropolitan Borough Councils for an initial period of not less than 4 years commencing April 1, 1951, to undertake systematic reviews of their executive machinery and departmental methods, invite applications for the post of Team Leader. Concise particulars should be furnished of education, qualifications, present and past appointments and other information showing the candidate's suitability for the position. The names and addresses of three referees must be given.

Inclusive scale of salary for the post, which will be superannuable and subject to the Scheme of Conditions of Service of the N.J.C. for Local Authorities' Administrative, etc., Services, is £1,200 by annual increments of £100 to £1,500. The appointment may be made at any point within the scale according to qualifications and experience and will be subject to a medical examination and to 3 months' notice on either side.

If the person appointed holds a post in the Civil Service or the Local Government Service, the Committee will be prepared to ask his employing authority to agree to his being seconded during his service with the Committee. A university degree or diploma, or a professional qualification, together with wide administrative experience will be essential; whilst experience in research work will be an advantage. Applications must reach me on or before August 18, 1951, in envelopes endorsed "O. & M. Team Leader."

PARKER MORRIS, Honorary Clerk.
Westminster City Hall, Charing Cross Road, W.C.2.
June, 1951.

DO YOU NEED REPRESENTATION IN BRAZIL ?

Consult J. D. Magalhães—Caixa Postal, 1352—Rio de Janeiro; Member of the: American Chamber of Commerce for Brazil—Associação Comercial do Rio de Janeiro, British Chamber of Commerce in Brazil Inc., Liga do Comercio do Rio de Janeiro, etc.
Purchasing Agent for: Minerals, raw material, sugar, wood, etc.
Selling Agent for: Iron, steel, metals, tools, abrasives, machinery, implements, chemicals, wheat, etc. Agent for: Investments of capital in local enterprises, etc., outright importer.

ARTS GRADUATES.—A food manufacturing company in the Greater London area, marketing its well-known products on a large scale, is able, by reason of planned expansion to offer an opportunity for a non-technical graduate to train for an executive appointment within its production division. The successful candidate will be given an intensive and well-planned course of training (6-9 months duration) to equip him for management responsibilities which he will assume immediately on completion of the course. The company looks for qualities of leadership, decision and readiness to shoulder responsibility and can offer opportunities of promotion to higher management posts to a man of the right calibre. The appointment carries a salary well above the average together with non-contributory pension, life assurance and sickness benefits. Graduates (22-28 years) who are determined on a career which allows scope for initiative within an organisation which recognises individual merit, are invited to write in confidence, sending details of education and career to date, to Box 669.

WE are looking for an efficient and capable young man possessing sound experience in Market, Consumer and Media Research Merchandising and Distribution. He will have the opportunity of expanding a recently created department in a much sought after medium-sized West End Advertising Agency. His salary will keep pace with his performance.—Apply, stating age, experience and initial salary required, Box 681.

HOBBS SAVILL & CO. LTD., announce that on and after July 16, 1951, they are moving to larger and more commodious premises at Plantation House, Mincing Lane, E.C.3. Telephone: Mansion House 7855 remains as formerly.

All departments are being transferred to this address with the exception of the Life and Pensions Dept., who for the time being will continue to operate from Palmerston House, Bishopsgate, E.C.2.

WINE is so easy to enjoy; see if you have a natural ... the wine tasting competition, first prize, a ... among the vines; no charge whatever.—Apply, The Friends of Wine, 1, Vintners Place, London, E.C.4.

COMPANY Executive and Solicitor, under 50, with wide experience in Commercial affairs, business organisation and connections in Britain, Dominions and Overseas, seeks interesting permanent commercial appointment here or abroad. Not afraid of hard work. Write Box 495, Reynells', 44, Chancery Lane, W.C.2

No Through Road

TWO things provide the harsh content of politics in 1951: the threat of Russian aggression and the renewed difficulties in balancing Britain's overseas trade. The formula by which they are dealt with in "One Way Only," the pamphlet written by Mr Aneurin Bevan and his sympathisers, turns out to be disarmingly simple. Assume that these two problems are even now only half the size everyone else thinks they are, and that with a magic touch of real Socialism they would soon disappear altogether. Then it is easy to promise more than Mr Attlee and Mr Gaitskell can; it is even possible, with a hint of (among other things) 50,000 more houses a year of the current size and cost, to rival the Tories with their 100,000 houses to be achieved in part by cheese-paring economies in size and standards.

The formula rests on well-worn precedents, but that does not guarantee its propaganda success. Indeed, Mr Bevan's pamphlet is probably dangerous less because of its direct challenge to the Right-wing leadership of the Labour party than because it betrays the Left wing. Nothing would do more to revitalise British politics than a realistic expression, in relation to the contemporary world, of something of the inspiration that lay behind the old movements of protest. Enough injustice has survived the arrival of the welfare state; enough new injustice, indeed, has crept into the welfare state; enough sloth and bureaucracy and inefficiency have accumulated round it. There is plenty of material for protest, and here is the natural function of a democratic, non-Communist group on the Left of the Labour party. The importance of "One Way Only" is finally to demonstrate that the existing group is incompetent for the task, not only because Mr Bevan is too personally ambitious—which was well known—but also because the group is doctrinally too rigid, because it is as determined to live conservatively in the past as any reactionary. Unfortunately Mr Bevan is just big enough to crowd out the possible competitors in a poor field. It requires no inhuman detachment to see that British politics as a whole is the poorer in consequence.

The Labour party could hardly be more receptive to ideas from a genuine Left wing. It is only too conscious of disillusionment, of a lost dynamic, of the need for new ideas and new men. But it will be hard put to it to get any precise idea of the "one way" along which Mr. Bevan would like to lead it. The pamphlet contrives to tell very little about either the nature or the direction of the road. The most innocent may suspect that the reticence is deliberate—that in fact the paving is uneven from the start and the road soon peters out altogether. But whatever the obscurity of his advice to the Labour party, Mr Bevan's personal road has proved to be the obvious one. Twelve weeks ago he resigned from the Government on the ground that its defence programme was too big to be practicable; however regrettably, it was, according to Mr Bevan in April, "already dead." In fact the walls of Jericho did not fall to the trumpet; Mr Bevan

has not given up the attack but he has had to look round for new weapons. Recognising implicitly, if not explicitly, that his first position was untenable, he now says not so much that a heavy rearmament is impracticable as that it is unnecessary.

The Russians are not, Mr Bevan has discovered, as bad as people suppose ; they are weaker and less bellicose. The pamphlet offers only one pretence of an argument in support of this faith—the fact that in 1948, when the last war was only three years away, the Kremlin did not risk an attack on another Communist state, Tito's Jugoslavia. What that has suddenly come to prove about Russian policy in 1951 is obscure but in any case irrelevant. Mr Bevan does not deny that Russia is liable to indulge in what the pamphlet calls " adventures " and he does not deny (though he blinks at) the obvious fact that the immediate strength of the West is too small to provide an effective guarantee that adventures will be deterred. But if there has to be some rearmament to meet a present danger, then plainly its main point lies in its being as quick as possible and such adjectives as " breakneck " and " hysterical " are so much emotionalism, quite inconsistent with Mr Bevan's own analysis. The real scope for argument is about the eventual scale, not the present speed, of rearmament; and this is a technical question demanding clear-headed judgment. It is not, on his own avowal, a matter for Mr Bevan but for the smaller minds of the despised experts at the Treasury.

> Most of the great decisions in human history are simple. They demand more of courage than of ability. They reach down and tap the inexhaustible reservoirs of spiritual sustenance which are never reached by intellectual ingenuity alone.

Whatever this may mean (and there is a strangely Hitler-like quality in its elevation of intuition against reason), it certainly does not suggest that nicely calculated questions of whether Britain should in three years spend £3.6 billion or £4.7 billion on defence are the real stuff of politics. Nor, of course, is any of the detailed argument—in which Mr Bevan still tries to save himself from open opposition to the Government—really consistent with the very first " principle " that his pamphlet lays down: " War is not inevitable, but will certainly become so if the rearmament race continues unabated." If that is really, as it appears to be, a statement of policy for 1951 and 1952 rather than a pious declaration about 1954, then it is in fact a thorough-going rejection of the foreign policy—the policy of negotiating only from strength—to which Russia has driven the British Government and its allies.

Mr Bevan's alternative seems to be best summed up as " not neutralism, but halfheartedness." Britain should remain a member of the North Atlantic alliance but should devote its main effort not to the purpose of the alliance, which is to deter Russia, but to restraining the supposed aggressiveness of the United States. Whether Mr Bevan really believes that by this policy Britain would for any time exert much influence on the Americans, or anyone else, is open only to speculation. But then he is not consistent even in his anti-Americanism. He is determined at every point to strike an attitude and promise the best of two worlds.

The motives for all this are plain enough. The argument is never really that some undefined slice of the arms programme is unnecessary for effective defence ; the argument is that it gets in the way of something else —more houses or more consumer goods—that everyone would like to have. The object of the exercise is always to offer the Labour party a more comfortable time than the bleak prospect of rising prices and growing scarcities. There is, it is true, one exception: the " world plan for mutual aid." This is the one constructive proposal in the whole of the pamphlet ; it is borrowed, without noticeable further thought, from the Right wing of the Labour party and the official policy of 1950. No one will dispute that Britain and other countries ought to provide capital to improve the living standards of the backward areas—though the practical problems of doing so have not even yet received the attention they deserve. But what Mr Bevan proposes is plainly of secondary importance. The pamphlet makes much of the " world plan " because it is a grander-sounding alternative to guns than just more butter at home. But when it comes to (hypothetical) figures, only one-sixth of the supposed resources that might be freed by cutting armaments is allocated to the scheme. The other five-sixths would provide 25 per cent more new houses in Britain, 5 per cent more social services, 3 per cent more personal consumption, 10 per cent more industrial investment. Halfheartedness characterises Mr Bevan's attitude to the " plan " he champions as well as to the rearmament he distrusts.

*

The real concern of the pamphlet, for which all the rest is designed to provide a cloak or a justification, is to advocate a more " Socialist " domestic policy. Mr Bevan appears as the guardian of the covenant. The party's need is to reaffirm the old faith in which it is faltering because of " concessions to Tory pressure or Tory ways of thought " that are the simple reason for the Government's failures. There should, indeed, be " a fresh series of measures," but when the pamphlet comes down to details all its proposals are alleged to be simply " the implementation of the ideas which the party has already worked out and the policies which it has already accepted." This insistence on orthodoxy has some tactical advantages, but Mr Bevan would plainly have gained far more support within the party by offering it new ideas, if he had any. Is most of the Labour party really so simple-minded, really so lacking in historical sense, as to believe that " a return to the philosophy in which we were born and by which we grew " is the one way to make progress against the problems of the nineteen fifties ? That philosophy was grounded on the industrial supremacy of Britain, on the belief that the problem of production had been solved and that plenty was to be achieved by legislation, on a simple faith in public ownership, on a blunt conviction that profits were wicked and that war was the product of capitalism. Has anyone learned so little from the past six years as to believe that these ideas are relevant now ? Mr Bevan's brand of reactionary orthodoxy cannot rest on anything but poverty of thought.

The fundamental dilemma turns, once more, on the question of economic efficiency. Mr Bevan advocates no more nationalisation than was put into the last election programme—sugar, cement, insurance and a few other oddments. He would leave the main structure of the British economy in private ownership. Yet the rest of " One Way Only " is a straightforward prescription for preventing capitalism and the mechanism of the markets from working. A " general price freeze " (wages

are not mentioned) is to be secured by controls and subsidies ; consumption is to be controlled by prohibiting the manufacture of selected " luxuries " rather than by the influence of financial policy on demand ; dividend increases " above the level of 1947-48 " are either to be prohibited or to be prevented by heavy taxation. Profits are, in other words, relatively respectable if they are the profits that established companies have earned before. What the state will prevent is the enjoyment of profits from new enterprise, from risky investment ; there is to be no incentive for the industrial pioneering, the re-equipment and expansion that the Labour movement professes to urge on reluctant, monopoly-ridden capitalists. Nothing could be further removed from the conception of a progressive economy, socialist or otherwise.

This is the reactionary absurdity to which sheer hidebound prejudice, a blank doctrinal rigidity, has led the professed champions of the Left. There is not even the defence, which the Government has sometimes had, that such measures are a policy for economic siege, desperate devices for clinging on in a storm. In the " one way " the main economic stress has been assumed away by a cut in armaments. Mr Bevan's friends are so muddled that they write about economic policy—" renewing the wartime practice of using physical controls "—as if heavy rearmament were to continue. Yet they began by arguing that it should stop. What is offered is supposed to be a policy for a rising standard of living ; it is in fact an iron prescription for economic stagnation.

Perhaps it would have been unreasonable to expect anything better from Mr Bevan and his sympathisers. Yet that does not make the betrayal of the Left, its commitment to a blind alley, any less tragic. It can only be hoped that the Labour party will find some other source from which to renew its inspiration and reshape its policy.

Patience for Peace

DURING the last ten days something like a peace rush has been seen in the world's capitals. Soviet diplomatists have appeared unexpectedly at American parties ; British Ministers have spent the week-end airing cautious hopes of what may come out of the Kaesong talks ; President Truman has sent to the chairman of the Presidium of the Supreme Soviet a letter expressing the friendship of the American people for the peoples of the Soviet Union, and enclosing a resolution to that effect, passed by both Senate and House of Representatives. It is not surprising that people are asking whether peace is breaking out after all. Are reason and good will calling a halt in this strange thing called cold war ? Shall we be spending the first care-free summer holiday since 1945 ? Unless very firm answers are given to such questions, the peace rush might become like a gold rush, with rumours of great prizes to be won, a helter-skelter movement in directions that are not clearly mapped, with those who have already staked a claim—in this case the Communists—urging on those who have not, and a final result of general disappointment.

The mood could be welcomed without reserve if the evidence to justify it were not so small. It consists at the moment simply of a fair chance that fighting will stop in Korea. From this single probability, deductions about the future are the purest guesswork. It is just as likely—indeed, more likely—that the Soviet price for a settlement in Korea will be some radical and unacceptable revision of the proposed peace treaty with Japan as it is that there will be a chain reaction of peaceful deeds and thoughts throughout the world.

It is now reasonably clear, however, that the position of the West is considerably stronger than it was a year ago. Much the biggest factor contributing to that result has been, of course, the military stand made in Korea. The strength and resolution displayed on the battlefield seem to have made their mark on the cautious realists who control Soviet policy. If there is now a chance of the fighting being stopped, it is because Moscow and Peking think it has ceased to pay. But there have been other factors as well. The gradual building up of strength by the western powers, and the clearer definition of much more to come, have removed a great deal of the fear and defeatism that infected Europe in 1950. Moreover, it can now be seen that the MacArthur incident, and the debate that followed upon it in the United States, have not fulfilled their early promise of disrupting the western alliance, but, on the contrary, have on balance strengthened it. The net effect in the outside world has been to increase confidence in the fundamental moderation and the peaceful objectives of American policy. And the net effect in America has been to rally support for these same policies as against the flamboyant and perilous alternatives.

In short, the result of the past twelve months has been to check over-confidence in the Kremlin and to reduce under-confidence in the free world. Given the new balance created by these facts, and the existence in Korea of a limited, well-defined issue, negotiation between the two camps becomes possible. There could be no clearer illustration of the working of Mr Acheson's policy of creating situations of fact out of which negotiated settlements may emerge ; for if an armistice in Korea should clear the way for more general bargaining about Asian questions, it will be because the mood and opportunity for general negotiation emerged from a particular situation.

Just conceivably, the balance has been tipped too far. As seen from the Kremlin, the spectacle of massive rearmament getting under way in the West, of the alliance of the free nations successfully surviving the strains that are put upon it, and of proposals for preventive war being publicly acclaimed, must certainly be a very impressive one, and possibly a frightening one. It is good that the Kremlin should be impressed and pushed in the direction of caution ; it would be disastrous if the Soviet leaders were frightened into the belief that a general war is inevitable, since in that case they might deem it necessary to begin it at once before the odds lengthen still further and while there are still forfeits to be picked up in Western Europe. It is, therefore, a very good thing that, at this juncture, the leaders of the West should be laying fresh emphasis on the pacific nature of their aims, as Mr Truman and Mr Attlee, in their various ways, have been doing. If western policy is to put a stop to Soviet imperialism without war, it

must consist in equal parts of arms and diplomacy, and every advance in arms should be accompanied by a re-emphasis on diplomacy.

But, though they can be expected to have a good effect on the Kremlin, the danger of these gestures is that they may have a disastrous effect on public opinion in the western countries themselves. For they revive the dangerous delusion that something called a "general settlement" with the Soviet Union is possible. It is doubtful whether the delusion is entertained in the State Department or the Foreign Office; but it is one to which politicians are particularly prone, and quite particularly British Labour politicians—perhaps because so many of them have pacifist antecedents. It is not easy for politicians in any country to preach to their followers principles opposed to those that they have advocated in the past. And it is all the more difficult now because the intensive and ingenious peace campaign is plugging just the kind of slogans that politicians are so tempted to use. The partisans of peace advocate as the cure for all troubles a "five power pact of peace," ignoring all difficulties of interest and detail, and calling warmongers all who point them out. There is, therefore, a danger that relaxation in Korea in the next few weeks will revive the old fond hope that what is called a "general settlement" with the rulers of Russia is possible in a matter of months.

*

It is seldom made clear what is meant by the phrase. Does it mean a friendly, free and confident relationship between the Communist empire and the peoples around it? If so, it must be stated quite bluntly that there is no sign of this coming about; and even if it were promised, there would be no grounds for trusting the promise. The nature of the totalitarian state excludes such a relationship, not only because the whole structure and spirit of the regime would be threatened by the free movement of ideas and persons, but also because the notion of an implacably hostile world outside is part of the myth that justifies the regime's suppression of freedom. The free democracy and the totalitarian state challenge one another at their most vulnerable points. To be fair to Stalin, he has never disguised this difficulty: the most he has claimed as possible is "peaceful co-existence" of the two systems—temporary, not permanent—which means something far closer to cold war than to the brotherhood and free exchanges set out as the aim of American policy in President Truman's letter to Mr Shvernik.

If, then, a general settlement cannot mean—at any rate on present evidence—friendly neighbourliness, what else can it mean? It can mean, perhaps, a settlement of the principal territorial and political problems created by victory in the last war. This means, in fact, confirming and perpetuating not only all the decisions of Yalta and Potsdam but also the Soviet interpretation of them: which in turn means recognising for an indefinite period a Soviet claim to preponderant influence in Europe. It is difficult to see why anything less should be thought acceptable to Moscow. Why should it be assumed that Stalin is ready to discuss a revision of the bulwark that he has built around the frontiers of his country since the collapse of Germany and Japan? Why should a statesman of his experience and record be expected to consider such a settlement unless the Americans, British and French have "concessions" to offer? The advocates of settlement never make it clear what those concessions should be. Whatever may be true in Asia, in Europe it is the Soviet Union that is the conservative power, defending the *ad hoc* settlement of 1945, and the western powers are the revisionists. That is why Soviet statesmen insist again and again on the letter of the Potsdam and Yalta agreements, which gave them a new perimeter of defence.

If a "general settlement" means something more acceptable to the West than a simple confirmation of Potsdam and Yalta, then there has been recent proof that the Russians are not ready for it—in the meeting of Deputies in Paris. Mr Gromyko, once he was convinced that German rearmament was not yet an urgent question, showed little interest in the more general proposals before the conference. Indeed, by insisting that the Atlantic Pact should be put on the agenda for the Foreign Ministers, and by throwing in the offer to put on it as well the Soviet treaties with the satellites, he showed that he was more interested in the propaganda value of the proposed meeting than in possibilities of bargaining. For he must have known that the Western governments were no more likely to negotiate—as distinct from talking—about changes in the Atlantic Pact than Mr Vynshinsky was likely to negotiate changes in his treaties with Poland and Czechoslovakia. The lesson of the Paris meeting is clear; and it is one to be clearly explained by statesmen to the public opinion which demanded the meeting.

To give up hope of a quick general settlement is not by any means to despair of peace. On the contrary, there is good reason for hope in the very remarkable fact that in Korea the strength and caution of both sides have been tested for a year without causing world war. Korea provides encouraging proof that western policy is on the right lines. The essential point that experience of dealing with the Russians is constantly driving home is that the diplomacy of the West will have to work from the particular to the general, not the other way round. The hopes of peace and prosperity should be attached not to broad and generous gestures of friendship, but to the kind of meticulous, hard-fought and piecemeal bargains that are based on political and military facts. Such bargains will not stop the cold war—nothing but the collapse of Stalinism from its own contradictions can do that—but they could limit the risks. From a succession of such bargains there could emerge gradually a pattern of settlement that cannot be predicted now, and would probably be very different from anything that could be proposed now. To talk of bigger plums than these is, by first raising impossible hopes in the free world and then disappointing them, to provide opportunities for Communist propaganda to undo all the good that effort and sacrifice in Korea have done.

The aims of the patient policy are in all conscience big enough: to maintain peace for a decade, by diplomacy and arms, to accept Stalin's challenge to co-existence, and to prove the superior staying power of the free nations is work enough for the patience and statesmanship of the United States and its allies. To go on suggesting that there are easier ways, and shorter cuts—either by fighting or by talking, either by arms alone or by diplomacy alone—is to encourage in the West the impatience and defeatism that increase the risk of war.

Fair Shares in Arms

THE American Congress is now tackling the difficult and contentious task of deciding what aid the free world shall receive in the coming year and what burdens the taxpayer shall shoulder. During the past two weeks Administration witnesses have been testifying before the Foreign Affairs Committee of the House of Representatives on the proposal for $8.5 billion of foreign aid—the Mutual Security Programme—which President Truman has sent to Congress in addition to the United States' own $60 billion defence budget for the year ending June 30, 1952. During this coming twelve months about three-quarters of the total American budget is to go on defence in one form or another—on building up America's own forces, on helping the rest of the free world to build their's, and, as Mr Truman put it, on "our Campaign of Truth." Yet these stupendous figures so numb the senses and blunt the vision of all but those few who are daily at home with them, that it is difficult for plain men to understand them. At the same time if the right confidence, resolution and enthusiasm are to be kindled in the alliance, it is quite as important that this massive American effort should be widely understood as that it should be expertly directed into those channels where it can have the greatest effect. And at present there is room for considerable doubt whether all is now well in either of these respects.

Concern about the methods and principles by which American aid will be distributed has been increased by the fact that the future of ECA (the Economic Co-operation Administration) is now in a state of great uncertainty. In the widespread debate at present taking place in both the United States and Europe some argue that ECA's main usefulness is over, and that when the original four-year span of Marshall aid runs out next June it should be virtually wound up. Others, on the contrary, particularly in Europe, have been glad to see a recent revival of ECA's prestige, and regard it as the best, indeed the only suitable, instrument for transfusing the combination of American military and economic aid into the blood stream of the free world. Instead of some such agency as ECA alone, however, the President's suggestion to Congress was that supreme co-ordination of foreign aid should be carried out by the committee on which ECA and the Defence and State Departments are all represented.

These are no doubt details which are domestic to the political life of Washington. But what everyone concerned in this great flow of aid, both at the receiving and the giving ends, has a right to ask is that, whatever is finally decided, weighty decisions should lie in the hands of a single directing agency as free as possible from sectional interest. Never in the whole expanding field of American foreign assistance has there been more need for great problems to be posed at one central point. Yet, to make the right decisions, a single agency—whether a man or a committee—must be in possession not only of the facts but also of the views of those receiving governments which now compose the wide alliance with the United States. And for this in turn to be undertaken successfully, public opinion on both sides of the Atlantic must be given an understanding of the issues.

The first requirement is that people should appreciate the scale of the proposed aid by simple comparison with other things. President Truman is now asking Congress to devote to the Mutual Security Programme sums of money worth nearly half a prewar American budget even in President Roosevelt's day; that is 15 per cent of the present American defence budget, or two-third's of this year's total British budget. In the President's original message, military aid is scheduled to take roughly $6,250 million, which is considerably more than last year, and strictly economic aid $2,250 million, which is considerably less. Some $7,000 million, or 80 per cent, is to come to Europe, including Western Germany, Austria, Trieste and Jugoslavia. The rest is listed to go to North Africa and the Middle East ($125 million of economic aid and $415 million military), to South East Asia ($375 million economic and $555 million military) and to Latin America ($62 million altogether). In addition, the President has again asked that the lending authority of the Export-Import Bank be increased by $1,000 million. Last year the United States gave away 3,500 tanks, 11,000 trucks, 750 aircraft—the last of 70 Superfortresses on last year's programme was delivered to the RAF in Britain at the end of June—100 ships, 3,000 guns, many smaller arms, and millions of rounds of ammunition. This year's figures will not be settled until Congress has approved the Mutual Security Programme and appropriated funds, probably not before the autumn. But even if a truce in Korea leads Congress to make cuts in the President's programme—and some cuts are probably inevitable—the figures can scarcely fail to be considerably higher than what was spent last year unless there should be a major change in American foreign policy.

*

Those are some of the broad facts, and they naturally raise many issues. For instance, the vast preponderance of American assistance to other countries is now for military rather than economic purposes; yet is it quite certain that this preponderance should be so heavy? And who should really decide—the Americans alone? Or how much say should the receiving country have, once granted that the United States is willing to include it in the aid programme at all? And on what basis should the relative amounts of military and economic aid be settled anyway? Some of these and other questions arose in the early stages of the Marshall plan, but some are new and are inherent in the scale of military aid. There is, for one thing, a real danger that, if non-military aid to the countries of Western Europe is reduced too far, particularly at a time when the terms of trade are turning against them, they will be unnecessarily weakened. No specific provision was ever made for a fourth year of Marshall aid, but the assessment of what was needed to bridge the dollar gap was always based on a four-year programme. Military aid and European rearmament between them do nothing to make that gap any less important than it was before; indeed, it may yet become more important in the fourth year than the third, if the European economy is to carry its own increasing defence burden without letting living standards slide.

At the moment, decisions about dividing the amount of aid to be allotted are in effect made unilaterally by the Americans. As a temporary measure this is no doubt for the best. One of the lessons gained from the first year of the Marshall Plan was that, if aid is to be given primarily on the basis of what a country asks, "it pays to be poor," and this is bad; in the second year, Marshall aid allocation was accordingly done, not exclusively by OEEC, but under the Snoy-Marjolin formula, and in the third year by ECA unilaterally. It would, however, be wrong to accept indefinitely the principle of a purely American, and at present often in effect an ECA, decision for want of thinking out the most effective procedure. What was good for the Marshall Plan is not necessarily good for a combined programme of military and economic aid—as President Truman recognised from the American point of view when he recommended a change from purely ECA control. ECA is virtually having to decide not only how much each country shall receive, but in what proportions of military or economic assistance. For this there are neither generally accepted principles nor common measurements of relative need by which the division of aid may be made. In practice, ever since the Korean war started, ECA has been talking more and more in terms of defence. The organisation's publicity and ideology have shown a probably excessive tendency to re-assess a country's needs almost entirely according to its potential defence contribution. This in turn leads back to the kind of situation in which, militarily today as economically two years ago, "it pays to be weak." There is at present a dangerous premium on lack of effort; the United Kingdom, for instance, with a heavy arms programme of its own is not as good a candidate for American help as Italy.

*

The appointment of a supreme arbiter to divide American aid among its recipients—whether inside ECA or in committee between different departments of the American government—is a matter to be decided in Washington. But those countries which are now gearing their defence programmes to the United States' contribution to their economies ought undoubtedly to have some standing when it comes to determine the considerations on which the supreme arbiter will normally base his decisions. What is wanted, as the arms and subsidies once more flow out from the arsenal of democracy, is a standardised formula by which countries' requirements can be fairly assessed, one against another, and on which they can base their claims. This would also make it possible for the public of the western world to see which country was not doing its stint in the general effort and which was no more than an idle boaster.

A great deal of work has in fact been done on this question in Paris on the new Financial and Economic Board by the experts of ECA, OEEC and Nato. Yet it was originally hoped to draw up—if not to publish—by the end of May a definitive formula for apportioning military aid by means of the Nitze Report. It is now July and still no report has appeared. Moreover, since a primary task for the Financial and Economic Board will be to send out questionnaires under whatever formula is devised, and to collate answers from all the Nato countries, it is depressing that the Board's own terms of reference have not yet been finally agreed.

The fact is that the machinery for handling the growing volume of American aid is at present in urgent need of an overhaul, if it is to do its job properly, without waste and without friction. At the American end, it seems probable that the control panel needs attention—though that is for Washington to settle. At the European receiving end, it is certain that some new element is required to make the existing mechanism more efficient. To determine the precise form which these or any other structural changes may take is difficult and involved. But that in no way detracts from the need for decision and action about them soon. Nor does it mean that it would be anything but a great mistake, at this stage in the halting progress towards union of the western world, to reduce even further the functions of OEEC, by far the most successful organisation for effective international co-operation to be set up in Europe since the war. There is now a great deal to be said for increasing rather than reducing the influence of OEEC. For it constitutes an ideal nucleus for a central organ to which General Eisenhower might turn for decisions in Europe.

Food *versus* Homes?

MANY people have recently expressed concern lest Britain's food supplies should eventually be imperilled by the steady encroachment of urban development upon agricultural land. Before the war this process went on without causing either official alarm or private objections. The maligned "power of the purse" settled all questions about land use. Since the value of land was (and is) almost invariably higher for development than for agriculture, the sale of farmland brought a profit to its owner. Today, however, the position is radically different. In the first place, the operation of the Town and Country Planning Act of 1947 leaves owners with little financial incentive to part with their land. It is not surprising that farmers are up in arms at every proposal to establish a housing estate or new town. There are no pecuniary compensations for losing their present farms, and tenant farmers are hard put to it—because of the security now given to their fellow tenants—to find another farm to which they can move.

In the second place, questions of land use have now to be settled by administrative action in place of the old power of the purse. It is the official duty of the Minister of Local Government and Planning to co-ordinate all forms of land use and to arbitrate between conflicting claims. How this duty will (or should) be interpreted in practice remains very far from clear. But at least it is evident that the Minister will have to determine in general terms how far agricultural land should be protected against those who want to turn it to other uses. His attitude will have an important effect on the development plans that the local planning authorities are now submitting for his approval.

The area of England and Wales is 37 million acres. During the first half of this century, about a million and a quarter acres has passed out of agricultural use. The area left to agriculture and forestry is still about 88 per

cent of the total—or a higher proportion if the whole of Britain is taken. But this land is of very variable quality. A large part consists of "rough grazings," and this part has increased with the decline of hill farming. Its capacity for food production is and must always be small, although it can often yield a good return if diverted to forestry. By contrast, the Land Utilisation Survey recorded only two million acres in England and Wales as "first class" (that is, of very high agricultural value), although 18 million acres were placed in category one ("good").

The land-conservationists fear that good land will be "developed," in one way or another, at a much faster pace during the next half-century than in the past. The Services are, temporarily at least, content with holding about 650,000 acres—a much larger area than before the war. The requirements of mineral undertakings and open-cast mining have also increased. In these cases, however, new statutory provisions require the land to be restored after use, despite the high cost of doing so and the fact that the original fertility of the soil cannot be renewed. The main controversy today is about the standards that should be adopted for residential development. Critics of the present standards, such as Dr Dudley Stamp, suggest that they will eventually deprive the nation of much of its home-grown food. Alarmists have even talked of "building new towns to starve in." Is Britain forced to choose between improved housing and adequate nutrition—between homes and food?

*

In the first place, it is important to remember that the standards of land per dwelling now in use do not represent a luxury fad on the part of planners. They are what most people want. Many town planners, indeed, have an aesthetic aversion to the popular model of "open development"; it is not only conservationists who plead for "building upwards rather than outwards" and who would like to maintain or increase the proportion of flats and terrace housing in the cities, in order to save space and make transport easier. It remains broadly true, however, that the English family's ideal is a house with a garden. The mass exodus of the middle classes from congested cities to open suburbs is evidence enough on this point. It hardly needs the evidence of social surveys to demonstrate that most workers would gladly tread the same road.

Popular demand apart, there are sound social reasons for laying out new urban communities more spaciously than the congested cities of the past. An adequate supply of playing fields for both children and adults would make a valuable contribution to national health, although there sometimes seems to be an unnecessary duplication of the two sets of requirements. A better system of roads and footpaths can help to reduce the loss of life in accidents. Room to cultivate a garden or an allotment is an important source of satisfaction to many people in the machine age. The agricultural value of this last activity is far from negligible. Mr F. S. Osborn has gone so far as to claim that the value of farm produce grown within the area of Welwyn Garden City is greater now that most of it is under bricks and mortar. This argument, if true, rests on the fact that vegetable production in back gardens is much more intensive, with a larger outlay of labour per square yard, than general farming. It is not the optimum use of land from the standpoint of agricultural economics, but it does represent an appreciable contribution to food production.

*

All these points may be conceded without shaking the beliefs of certain agriculturists. Dr Stamp has estimated that land requirements per 1,000 persons at reasonable "open density" standards work out at 55 acres. This figure includes an adequate allowance for playing fields and allotments (but not, strangely, for cemeteries) and assumes a housing density of 12 to the acre—the minimum necessary to provide reasonable gardens. Actual postwar schemes of development have shown rather lower densities than this. The designated areas of new towns allow for around 100 acres to 1,000 persons, but here part of the area will remain as farms and woods.

From such figures it is possible to make a rough guess at the eventual requirements for *Lebensraum* of the urban population. It will be assumed that one-third of the population must be rehoused (roughly, the proportion now living in obsolete dwellings) and that the space they vacate will be devoted to providing, gradually, more spacious living conditions for the other two-thirds. It will also be assumed that rehousing requirements work out at 70 acres per 1,000 persons—a generous enough allowance. The additional amount of land in England and Wales needed for carrying through this social revolution would be about one million acres or 4 per cent of the present area of improved farmland, crops and grass.

There is nothing intrinsically alarming about this prospect. If demand warrants, the lost proportion of

home food production could be made up, probably several times over, by a more intensive cultivation of the land that remains. The calculation allows nothing for the value of produce from gardens and allotments. In addition, this urban development—certainly at the present rate of housing progress—will take a long time to bring about and, once complete, it will not be repeated. Whatever may happen to the population of Britain, there is agreement that it is unlikely to rise much further: nor can the family unit become much smaller. And in so far as the population falls, its demand for food will be correspondingly reduced.

*

The argument is sometimes pitched, however, at a more dramatic level. It is urged that siege conditions, or a complete breakdown of world trade, may force Britain to live almost entirely off its own soil. This argument does indeed have revolutionary implications—but not only for town planning. It would involve a complete reorganisation of agriculture and industry, as well as a drastic fall in standards of living, if indeed the nation could survive at all in such circumstances. The right policy for coping with them is in any case open to debate. A population housed at open densities would be less vulnerable to siege conditions arising from atomic attack than a population crowded in big cities.

These arguments do not imply that local planning authorities should ride roughshod over agricultural interests. But in general they are unlikely to do so; the present tendency is the other way. For the last twenty-five years the large towns have been denied almost any extension of their boundaries, and the future course of development is therefore largely under the control of the county councils. These bodies, and their planning officers, are generally far from indifferent to the welfare of agriculture—as their development plans may be expected to demonstrate.

At the national level, the new obligations on mineral undertakings and injunctions to the local authorities indicate that the conservationists' warnings have been taken seriously. Local authorities have been urged to build on inferior farmland even if this involves them in higher costs. Probably, too much modern building does take place on flat, good farmland, where constructional costs are lowest, and it will be sad if the new age of town planning produces no hill towns. But it is clear that the Government could go too far in imposing additional costs as a very minor, long-term insurance against a food crisis; and it is paradoxical that the one aspect of such a policy that would cost nothing—namely, the elimination of open-cast coal mining—is prevented by the Government's own failure to recruit sufficient labour to the mines.

Dr Dalton will be badly mistaken if he sacrifices the desire for better living and working conditions—a desire which, more than anything else, has secured for his Ministry its present powers—in order to preserve a small margin of agricultural land. There are, of course, other obstacles to better housing, not the least of them being the economic problems involved in decentralising industry. But at least it may be said that agricultural considerations ought not to be allowed to stand in the way of a gradual improvement of residential standards. The long-term saving of farm land through cutting standards would of course be much less than the 4 per cent mentioned in this article—since the needs of the overcrowded could not on any basis be wholly denied. The whole idea of an antithesis between homes and food has been grossly overplayed. The question is whether the nation can afford decent homes for all its members, not whether it has room to build them.

NOTES OF THE WEEK

Camera's at Kaesong

The root of the trouble at Kaesong is that General Ridgway has the substance of victory, having virtually destroyed the North Korean army and crossed the 38th parallel; while General Nam Ie wants the appearance of victory, having lost most of his forces and being committed by his Soviet ally to talk about a cease-fire. The North Korean general appears to have demanded that both armies should withdraw 10 kilometres from the 38th parallel and that all foreign troops should leave Korea. To concede the first demand would mean that the Uno troops would lose valuable positions north of the parallel and with them some of their capacity to control the military situation should political talks after an armistice break down. In the eastern sector Uno troops would have to withdraw over 60 miles with the enemy advancing over 50 miles. This needs at least thinking about. If the second demand were conceded at this stage, General Ridgway would be accepting the proclaimed objectives of Soviet and Chinese policy. His delegates were right to protest against demands that would prejudice a future political settlement.

It is true, of course, that the United Nations, having no territorial or strategic ambitions in Korea, can be less sensitive on these matters than could a national government that knew it had won a victory—although there are Americans who would take a less moderate view in view of the sacrifices they have made. But Uno must retain the power and the right to see that peace in Korea is maintained. No one pretends that the Korean ulcer can be removed, but it needs time to heal.

The predicament of the Communists was shown clearly in the incidents of the first meeting at Kaesong. Communist cameras were able to record the spectacle of an American helicopter surrounded by Communist armed guards, and of American officers being received by Chinese and North Koreans. Their pictures will make most convincing evidence of the version of events that the Communist leaders want their followers to believe: that the "aggressive" westerners came to sue for peace with gallant little North Korea. The lie has to be played out and it will need great skill and firmness on General Ridgway's part to ensure that the cease-fire terms take a palatable form. Perhaps his strongest card is the evidence that the Russians are in a hurry to use the prospect of peace in Korea as a counter with which to press their objections to the peace treaty with Japan, which is being published this week.

Persia and the Court

Dr Mossadegh has now extended to the United Nations his campaign against foreign interference. Upon learning from the International Court of Justice the "interim measures" whereby it proposes that the British and Persians should, in effect, freeze their quarrel while the matter is *sub judice*, he has announced that in Persia's view the Court has no jurisdiction in the matter. Dr Mossadegh likes flying in the face of facts and here he is defying an impressive collection. The Court is an organ of the United Nations and its Statute is part of the Charter; by its Statute it is itself the final arbiter in a case of disputed jurisdiction. By its acceptance of responsibility for issuing interim suggestions, it must think that, *prima facie*, it is competent to handle the matter. Thus Persia, which has rendered good service to Uno—and, during the Azerbaijan dispute of 1946, received good service in return—now does the free world a disservice by rejecting the authority of a useful institution.

The Persian case that the Court has no jurisdiction is, presumably, based on the fact that when in 1930 it signed the famous "Optional Clause" that gave the old pre-war Court, and gives the new Court, compulsory jurisdiction, it restricted compulsory compliance to international "treaties and conventions." It holds that its concession agreement of 1933 with Anglo-Iranian is not international but domestic in scope, and that it has therefore every right to nationalise its oil. The British do not question the right to nationalise; they question only the right to do so in defiance of the undertaking to resort to arbitration given in 1933. They also contest the Persian argument that no international undertaking is infringed. The company, they say, is a British national, which is being denied a promised legal remedy. This denial of justice infringes specific international undertakings given by Persia in 1928 to afford foreigners the same treatment as nationals.

The Court has, of course, no power to enforce a decision. Clearly, however, it should not shirk cases in which its prestige may be impaired because its judgment may be flouted. To do this would be to jettison the sanction of world opinion, and to give in far too easily to the rule of the loud-speaker.

* * *

Double Bluff in Teheran

In the pass that matters have reached in Persia, the news that Dr Mossadegh is ready to "welcome" Mr Averell Harriman as President Truman's personal representative must be regarded as good. It offers just a chance that the present Persian government will discuss its pattern of nationalisation on the basis of President Truman's sensible letter to Dr Mossadegh. This dealt with the seriousness of the breakdown of discussions with the Anglo-Iranian Oil Company and the desirability of considering the *modus vivendi* recommended by the Hague Court. But that chance is slender. Dr Mossadegh's welcome to the visitor is uttered with a familiar reservation: "provided, of course, that our indisputable national rights are respected in accordance with the laws concerning nationalisation of the oil industry." If in this phrase Dr Mossadegh includes the methods by which Persia insists on executing those laws, Mr Harriman will find himself up against the difficulty that has already baffled all British negotiators, as well as the American Ambassador in Teheran, Dr Grady. The context in which the welcome is uttered is not hopeful: it follows a succession of snubs to the American Ambassador and it comes at a time when Dr Mossadegh's hold on political opinion in Teheran seems to be weakening. By accepting the American guest, he has played for time in Teheran. He has also played for it at Abadan, where his lieutenants are now in a position to go on interfering with the remaining British residents while they watch how these will react to the insults.

*

This situation at Abadan, intolerable for the local British residents as well as for the surviving remains of British prestige, demands the invention of a remedy. The key point to remedy is the Persian conviction that British threats to go are all bluff and that Persia will in the end retain the British personnel on its own terms. This conviction is enhanced by an increasing number of discrepancies between British statements—by company officials, by the Embassy in Teheran and by Mr Morrison himself—on whether the intention is to go if need be, or to stay, come what may. The only way in which to dispel the Persian illusion is to continue with a policy which has now—happily—been adopted: to withdraw the British well by well, so forcing the National Iranian Company either to take over or else to lose the local equipment at the hands of pilferers. The Persians have been showing great unwillingness to burn their fingers even at one well. By this policy, some equipment might have to be sacrificed but at least the Persian bluff will have been called long before the main asset, which is the refinery proper, need be abandoned. Mr Morrison's dilemma is very great. It is not improved by the humiliating fact that, as a result of British ineffectiveness, all must now be left to an American negotiator. But the essential now is to help Mr Harriman by proving, step by step, that the Persians really are incompetent to take over.

* *

Egypt and the SS. *Empire Roach*

The Egyptians, too, are now ready to fly in the face of international law. Egypt—as was described in *The Economist* of June 30th—has already been stigmatised by a United Nations authority for "aggressive and hostile action" over the Suez Canal. A report on the subject is tabled with the Security Council. Now a far less defensible action has been committed against a British vessel at sea, the *Empire Roach*. This ship, bound for Akaba (at the north eastern tip of the Red Sea) with arms for Jordan, had been cleared by the Egyptian customs at Suez. While in the international channel that runs through Egyptian territorial waters at the tip of the Sinai peninsula, and of which the Corfu Channel is an exact and unhappy parallel, she was stopped by an Egyptian corvette, searched in unwarrantable circumstances and damaged. There are two possible explanations of this high handed action. One is that the Egyptians on the spot made a mistake as to the ship's identity and thought she was a vessel bound for the Israel port of Elat, which is a few miles from Akaba. The other is that somebody in Cairo, prompted by Persian behaviour, wants to see how much Mr Morrison will take. Their Foreign Minister's first reaction to the incident was to brazen it out. His government is, in international law, entirely in the wrong since it had not given the warning which it is necessary to give to international shipping before declaring a prohibited zone. His case in the Security Council would be stronger if he were to explain the motive right away and take the British protest seriously.

* * *

Autumn Election?

The much-feared *Tribune* pamphlet, "One Way Only," was published on Tuesday. It is precisely what Mr Bevan declares it, in the foreword, not to be—an attempt to state an alternative policy for the Labour party. His acknowledgment that the function of Labour policy-making rests with the annual conference begs the question and deceives no one; the document is unmistakably aimed at directing that policy-making towards the ends that Mr Bevan wants.

At Westminster "One Way Only" has made little impact; the general reaction is that it carries matters no further. Since 1950 the Parliamentary Labour party has come to accept strict discipline as the price of power, and few outside the ranks of the known Bevanites are prepared to risk appearing as dissidents. It is significant that most of the 22 other

Labour Members who had some part in preparing the pamphlet have gone to great pains to keep their participation secret. Few of them in fact had a large part. "One Way Only" is little more than a *Tribune* pamphlet, written by Mr Bevan's regular associates in journalism; he failed to make the additional alliances he hoped for.

The Parliamentary Party is closer to the realities of the foreign situation than is the mass of Labour supporters in the country. There the effect of "One Way Only," as of Mr Bevan's resignation, will certainly be much greater. It is, indeed, a surprisingly ill-prepared pamphlet. It declares (in black type) that Asia will receive this year one cent of economic aid for every $300 the United States spends on armaments, although in fact the proportion works out—on the pamphlet's own figures—at one cent for every $2½. But for its main purpose "One Way Only" is skilful. It provides something for each of the various dissatisfied sections of Labour opinion to bite on; it gives a focus not for discussion (the object avowed by the ex-Ministers in their foreword) but for discontent.

In these circumstances Ministers have every reason for concern about the troubles that wait for them at the party conference at Scarborough in October, particularly now that Mr Bevin will not be there to scatter his critics. Mr Morrison, caught up more and more in the work of the Foreign Office, cannot hope to lead any effective counter-attack on the Bevanites before the conference. Only Mr Attlee and, perhaps, Mr Shinwell have the standing in the party to do this. A series of speeches by the Prime Minister in September might draw some of the wind from Mr Bevan's sails before he reaches Scarborough, but on the whole it seems much more likely that Mr Attlee will have to play the trump card that still rests in his hand. By announcing a date in October or November for the general election he can turn the conference into a rally against the common foe instead of a bitter internal struggle. Mr Attlee is unlikely, indeed, to make such a decision purely on tactical calculations, but he can easily find arguments in the national interest why Labour should not try to govern on a tiny majority through another winter even though it clung to office this spring, when the tide of public opinion was running more clearly against it. Such arguments will be particularly powerful if in September the Government loses the by-election at Droylesden, where the former Labour member had a majority of only 4,136 in a three-cornered fight. The assumption at Westminster is increasingly that there will be an autumn election.

* * *

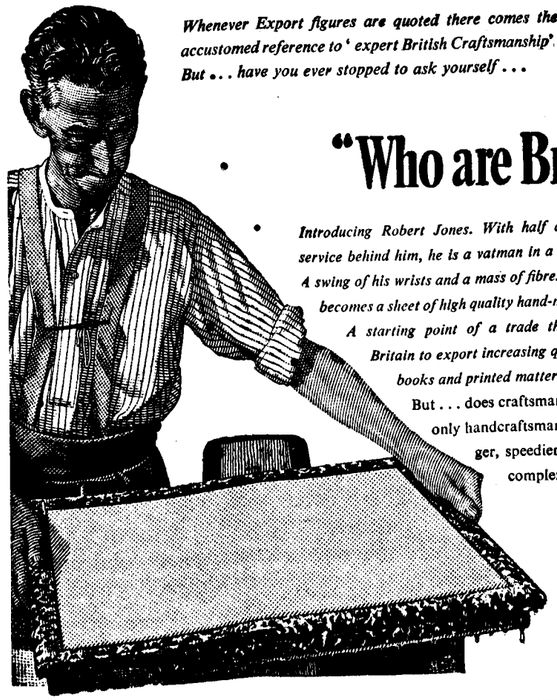
New Rifles for Old

Mr Churchill's request for a debate on the Government's decision to adopt for the British Army a new automatic rifle with the wholly unstandard calibre of .280 inch has been deferred pending consultation "at Ministerial level" with the other members of Nato. It is indeed extraordinary that these consultations were not thought necessary before the decision was reached; until now, it appears, the matter has been dealt with by a joint military working party. This makes one very suspicious that all the old tragic mistakes that make up the history of small arms in the past thirty-five years are about to be committed once again. Mr Shinwell's attitude, when the matter has been raised hitherto, has been that it was one for the experts, whose judgment would hardly be understood, and still less disputed, by the layman. But if one thing emerges clearly from past history, it is that the military expert is incompetent to reach a wise decision on a subject which, when it comes to the point, is one for the industrialist and the production planner.

Between 1915 and 1917 large factories were built in America, on British money, to make Enfield .303 inch rifles. Almost as soon as they were producing, the United States entered the war; the Army Department stopped production of British-type weapons and insisted on a conversion to its own calibre of .300 inch. As a result of this folly, these factories were virtually useless in the first war. But the .300 inch rifles they eventually made were still in existence, unused, when the second war broke out. In fact, in 1940, when rifle production in Britain had to be started up again almost from scratch, these rifles were the only supply immediately available. This time it was the British War Office that missed the opportunity for standardisation by insisting on .303 inch.

It would be difficult to find an area in which the case for standardisation of calibres is stronger than it is in small arms, because of the enormous quantities of ammunition that have to be produced, in many countries, and supplied to armies that may be fighting all over the world and made up of contingents from many nations. The ideal, of course, is that the weapons themselves should be standardised, and that all the Nato armies should be equipped with an automatic rifle of one design. The difficulty here is that the British experts are apparently quite convinced that their new rifle is much better than the American Garand, as it may well be, since it is a much later design; and American military men, more even than those of other nations, are utterly impervious to any suggestion that any other country's design can possibly have any merits; to them, "standardisation" simply means the adoption by other countries of American designs. In these circumstances, it may be right to manufacture a different weapon. Even then, however, one would like to know how many could be produced, in an emergency, from British resources alone; it may easily be a choice between a lot of Garands and very few of the native design. But, in any case, must the calibre be different? Is it not possible to modify the new British weapon to take .300 inch ammunition?

The essential point for the layman to insist upon is that this is a layman's question. In small arms, when supply considerations come up against design considerations, the supply considerations should in nearly every case be dominant. But they are the ones that the military experts always forget. When the matter is argued out "on a Ministerial level," who will advise the Minister? Ten to one it will be a military expert, and history will repeat itself.



* * *

Atomic Crisis

There can no longer be any doubt that state enterprise is floundering in the development of atomic energy as it has done in so many activities. The principal scientific adviser in the Ministry of Supply's atomic energy section has resigned and is going back to private industry; Lord Portal, who has been Controller of Atomic Energy since 1946, is leaving next month. Whether or not these resignations are a direct symptom of the project's troubles, they have brought serious issues to a head.

Last week's debate in the House of Lords established such facts as are exempt from the requirements of secrecy. Lord Cherwell and others made an overwhelming case for taking atomic energy out of the province of the Ministry of Supply and setting up some semi-independent public organisation instead. The case is that neither civil service salaries nor civil service methods are attractive to many of the first-rate scientists that the work requires. Nor do they encourage the type of business administration that so large an industrial undertaking requires. The difficulties, and in particular the sense of frustration within the organisation, are acute at the lower administrative level of control; the staffing problems seem to have reached a point where the day-to-day work of some departments is definitely hampered by shortage of labour.

Many of the difficulties are probably not inherent in the civil service organisation and could have been avoided if they had been noticed in time. That they were in fact allowed to accumulate to the present point is clear evidence

Whenever Export figures are quoted there comes the accustomed reference to 'expert British Craftsmanship'. But . . . have you ever stopped to ask yourself . . .

"Who are Britain's Craftsmen?"

*Introducing Robert Jones. With half a century's service behind him, he is a vatman in a paper mill. A swing of his wrists and a mass of fibres and water becomes a sheet of high quality hand-made paper. A starting point of a trade that enables Britain to export increasing quantities of books and printed matter.**

But . . . does craftsmanship mean only handcraftsmanship? Bigger, speedier and more complex machines are the showmen of the vast paper and printing trades . . . but behind them, away from the limelight, the craftsmen work on as before. And must there not be craftsmanship at every stage if the finished article is to be a masterpiece? Monsanto think so, and they follow this rule in making chemicals for a long list of British industries. Monsanto chemicals for the paper trade are playing an increasingly important part in the production of better paper for Britain and the world.

Monsanto make over 200 chemicals for use in industry. Of widely varying application, they all conform to the highest standards of craftsmanship in chemical manufacture.

Canada

by TCA's "NORTH STAR" Skyliners

A TRIP TO CANADA by one of Trans-Canada Air Lines' giant "North Star" Skyliners means more than speed — there's comfort and convenience aboard. You step inside your Skyliner at London or Prestwick. Then — you're away — relaxing as luxuriously as in your favourite chair. Roomy, pressurised cabins, hot meals, snacks and drinks to order, newspapers and magazines at your elbow — all are yours on this 4-engined 40-passenger "North Star" Skyliner. In less than a day you're in Montreal — *on time.*
Swift Skyliner services link you with every important Canadian and U.S. city.

IT'S ONLY A DAY BY TCA

COST OF LIVING

THERE is no subject more worrying to the Government and everyone else than the cost of living. We are all in the same boat. Crazy world prices and conditions are the source of our hardships and are no more within the control of Britain than storms at sea. Safe navigation, not miracles, is what we have a right to ask of the Government; that, and vigilance to see that we suffer no more than we must.

What is essential for the Government to realise is that the subject cannot be one for sealed lips. It presses too hard upon everyone for that to be possible. The Parliamentary Labour Party and the T.U.C. are doing good work in bringing it into the limelight. They reflect the feelings of the whole country. *However preoccupied Cabinet Ministers are bound to be with the delicate questions of Persia and Korea, the Government should understand that it is time for the fullest and frankest public discussion of the cost of living and what can be done about it.*

Misunderstanding is dangerous. There is expectation that some of the prices we have to pay for supplies from abroad will ease before long; on the other hand, the public has not yet felt the full weight of recent rises and things at home may be worse for a while. *We doubt if most people have any conception of how urgent it is for every single household that we should increase our exports.* The public should have the whole truth made plain to them, even if it is hard.

Once more the need is for leadership and energetic action. *Whatever can be done at home to control the rise in prices must be done without delay.* Attention at the highest level must focus upon this and make its intentions clear.

Reprinted from the editorial column of the Daily Mirror of July 6. The Daily Mirror's net sale—over four and a half million—exceeds that of any other daily newspaper in the world.

of the practical weakness of the organisation and of the need for precisely that sharp jolt which the government's spokesman, Lord Alexander, rejected with nothing better than the adage about horses in mid-stream. No one can imagine, bearing the experience of the nationalised industries in mind, that the public corporation will automatically solve any problems, but it does seem a more hopeful alternative than continued civil service control. The one serious argument for leaving things as they are is that it is the only way to keep the spending of public money under Treasury control. Atomic energy is not a commercial undertaking like the National Coal Board or even to the limited extent of the BBC. There are no precedents, apart from comparatively trifling cases like the University Grants Committee, for removing from Treasury influence the expenditure of large sums out of general revenue. But almost the one complaint that is never heard about the atomic energy programme is that it has been hampered by lack of money at the centre. In other words, Treasury control is not in fact effective; it hardly could be so in a matter at once deeply technical and highly secret. It is no more than a constitutional shadow, to which real administrative improvements ought not to be sacrificed. The Government would be foolish to go on leaving things to the Ministry of Supply.

False Dawn in Germany

The British Government's act in ending the state of war with Germany on July 9th has same practical significance in international law, and considerable symbolic importance for Germans; but in general it does not do more than legalise a situation which has existed for a considerable time past in day-to-day relations with the Federal Republic. The Republic already has the right to appoint diplomatic missions in the countries on the right side of the iron curtain, and its nationals who visit Britain are subject to no more formalities than others. These are recent developments; but it may be as well to recall that for the past six years, western German reconstruction has been aided by the United States, to the extent of $3,250 million. It cannot be denied, therefore, that Germans have enjoyed a substantial amount of the substance of peace-time status.

Nevertheless, the restoration of sovereignty for the Federal Republic is still a long way off. The ending of the state of war is no substitute for a peace treaty and changes none of the conditions of occupation. This is a matter for the so-called "contractual agreements" which are to replace the Occupation Statute. A long examination by experts of the rights which the Allies feel it essential to retain has shown that the agreements will prove extremely complicated. Talks with the representatives of Bonn began in May, and it is highly improbable that they will end until well into 1952.

Looking forward, it is evident that a very difficult period in relations with western Germany is at hand. The views of the Allies on the extra-territorial rights and supreme powers which they intend to retain will certainly clash with the demands made by Dr Adenauer for a simple act restoring full sovereignty to the Federal Republic. Among the public, there will undoubtedly be resentment when it is fully realised that the end of the state of war does not change the status of the occupation powers. One of the main factors with which the Allies must reckon is the rapidly growing impatience of the Germans with continued tutelage. They are fully conscious of the fact that they are needed as allies in defence against a new enemy, and are sure, *horribile dictu*, that the western world owes them a debt of gratitude for having attacked the Soviet Union in 1941. A grudge which will be left unchanged by ending the state of war is that of Germans against the west for having, as they see it, stabbed them in the back during the war and handed so much of their territory to Russia and Poland afterwards. As the years pass it becomes ever harder—particularly for the young men who were children in uniform in September, 1939—to realise that the last war was as unorthodox as its ending, in that one man bore the overwhelming responsibility for its beginning and aftermath.

For A European Army

The question of German rearmament might have been quietly shelved if Moscow had shown willingness at the recent conference in Paris to discuss the "root causes of international tension," rather than those symptoms of it which are disagreeable to the Soviet Union. As it is, the question has now been taken up again. Some of the recent newspaper reports have, however, given an exaggerated idea of developments. The initiative in raising the question again has, indeed, come from Washington, where Mr McCloy has just presented his annual report on the German situation to Congress, but nothing dramatic has occurred. There has been no repetition of the mistake made last September, when the American decision to form German armed contingents was made known to an unprepared public.

Some over-dramatisation of the latest position was inevitable, because the course of events since the Brussels conference of Nato governments last December has been obscured by official secrecy lightened by the usual leakages. The conference instructed the High Commissioners in Germany to explore the practical conditions of a German contribution to defence with military experts appointed by the Bonn Government. It also agreed that the French should talk with other members of Nato and the Germans on forming a European army, with the Pleven Plan as a basis. And the Americans seem to have satisfied their present partners that they would have priority in arms.

The Petersberg talks between western military representatives and Generals Speidel and Heusinger have been going on steadily since Brussels. Mr McCloy was able to take with him to Washington an interim account of their course. It was not by any means an agreed report on joint decisions, but consisted largely of the German proposals, with Allied comment. It has become known that the German generals suggested that an efficient force would consist in the first place of 12 divisions, each of about 10,000 or 12,000 men, supplied with their own, very large tactical air force and light naval units. Provisional opinion on the Allied side, including that of the French, appears to concur with the view that the minimum size of a so-called "regimental combat unit" (or German division) must be more than 6,000 men. The report, however, has not yet been discussed by the North Atlantic Council.

The second set of negotiations—those in Paris on the Pleven Plan—began in a somewhat belated and half-hearted manner during the winter. They came to a temporary end quickly, after the Germans had objected to the French proposal that units should be kept down to 6,000 men, and that the proposed organisation of the army would not grant full equality to the Federal Republic. These talks are now being resumed, with Herr Theodor Blank, the head of Dr Adenauer's defence office, as German representative. It is hoped to produce a report which the Nato deputies can consider with the account of the Petersberg conversations. Dr Adenauer, careful of the need to win over the German public and the Bundestag, stressed some time ago that Generals Speidel and Heusinger could commit the German Government to nothing. Like the Social-Democrats, the Chancellor insists that Germany shall be accorded full equality and sovereignty before any binding decision is taken.

Both in Bonn and Paris men should recall what General Eisenhower said in London last week about "patchwork territorial forces" that "foster localised instead of common interest."

The Oatis Trial

There were no surprises during the trial of Mr William Oatis, the Associated Press correspondent in Czechoslovakia, in Prague. The form and content of these Communist-staged show trials are by now only too well known. Mr Oatis was technically guilty, according to Communist law, of some of the charges against him. He was accused of espionage under a defence law of November 6, 1948, which enables the authorities to find legal grounds for prosecuting a journalist more or less whenever they choose. Mr Oatis tried to get information that the government had not thought fit to publish; but the government publishes so little that Mr Oatis could hardly have earned his salary if he had confined himself to official hand-outs. He would call his efforts to find out, for instance, what happened to Dr Clementis, the normal duty of a journalist; the Communists call it espionage. And it is a tragic irony that his very conscientiousness—which made him try to cross-check his information—made his persecutors' task all the easier.

Mr Oatis's trial made a dramatic climax to the intensive campaign of the Czech authorities to eradicate every sort of western influence and idea. The very heavy sentences imposed on his Czech colleagues serves fresh warning on all Czechs to have nothing to do with foreigners. The implication of western diplomats, particularly Americans, in Mr Oatis's alleged espionage, provides plenty of fresh material for anti-western propaganda. Above all, the trial not only plugged a hole through which a steady stream of factual reporting on Czechoslovakia has been disseminated all over the world; it has also inflicted a defeat on an organisation which, besides being the world's biggest news agency, is a major business concern of the capitalist Americans. For the Czech Communists, this is a not insignificant victory in the cold war.

Before Mr Oatis's arrest, twelve western correspondents had been expelled from Czechoslovakia. His two remaining western colleagues left the country before his trial and they are hardly likely to return. Czechoslovakia will thus fall into line with the other satellites which have already expelled all western correspondents. The quarantine of the mind is as complete as Communist ingenuity can make it.

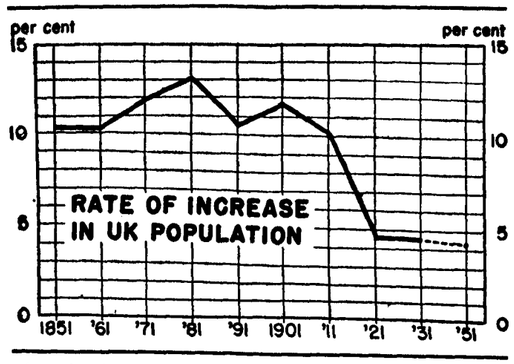
No Change in Broadcasting

The report of the Beveridge Committee on Broadcasting, in spite of its long list of specific recommendations, was a very conservative document. Encouraged by this, a harassed government, with an election in prospect and many other problems on its hands, has heaved a sigh of relief and decided, subject to parliamentary debate, that broadcasting in this country can go on as it is for the time being. The Committee's proposal for a permanent licence is, indeed, rejected in favour of a fifteen-year term; but on the other hand the date of the next inquiry is put off from five years hence, as the Committee proposed, to "about the middle" of the 15-year period. The BBC's monopoly, the prohibition on advertising and the method of finance by receiving licences —of which the BBC is, for the first three years, to receive only 85 per cent—are all confirmed. There is to be no statutory independence for television.



Regional devolution for Scotland, Wales and Northern Ireland is to be secured by a variant of the Committee's proposal. Three Broadcasting Councils are to be set up in these countries "whose primary function would be to control the policy and content of their Home programme." The power of finance is to be reserved to the BBC, though the Councils are to be "responsible for the appointment of staff wholly employed in connection with their Home Service." This is a very odd scheme in any event, but it may be made quite farcical by the provision that the members of the Councils are to be drawn "from the county councils and the major urban local authorities."

* * * *

Fifty Million

Although it gives very little detailed information, the speed with which the preliminary report on the census has been published (HMSO, 5s.) is commendable. For estimates of the total population by age-groups and occupations and for information on the size of houses and how many have a piped water supply, nothing will be available until the sample analysis is published next spring. The main census reports, beginning with a series dealing with each county in turn, will not be out for two or three years.

The present preliminary report gives the numbers of the population by sexes for the country as a whole and for England and Wales by administrative counties, county boroughs and county districts. It confirms the estimate made on the basis of registrations of births and deaths that the population of the United Kingdom of Great Britain and Northern Ireland is now over fifty million. The exact figure

given in the report is 50,210,472, comprising 24,126,549 males and 26,083,923 females. The proportion of females to males declined from 1921 to 1939, and the effect of the second world war was merely to arrest this change, not to reverse it. In 1841 the total population was 20,183,277. Thus there has been an increase of 150 per cent in a hundred and ten years. But, as the accompanying chart shows, the decennial rates of increase have been falling during this century, and the importance of the 1951 census is that it shows the smallest decennial rate of increase on record.

The other interesting fact shown by this report is that, for the first time for more than a century, the rural part of England and Wales has gained population at the expense of the urban. The review of the smaller local government boundaries after the Local Government Act of 1929 resulted in the transfer of nearly a million persons from the rural to the urban category. Thus in 1939 the proportion of the population in urban areas is estimated to have been 82.4 per cent compared with 80 per cent in 1931. In 1951, the proportion had fallen to 80.7 per cent, and the proportion in rural areas had risen correspondingly to 19.3 per cent, compared with 17.6 per cent (estimated) in 1939 and 20 per cent in 1931. The report comments that it is too soon to say whether this represents the beginning of a movement back on to the land or is a temporary phenomenon resulting from the war.

More and Dearer Meat

Mr Webb has been true to his word. The meat ration is to go up both in quantity and in price. In a week's time the public is to get 20 per cent more meat but the ration is to rise by 40 per cent, that is from 10d. to 1s. 2d.; the increase in price is equivalent to an average of 3d. a lb. In the following month the ration will be increased by two further stages to 1s. 7d. a week. At that point it will be equivalent to nearly 1 lb. of meat per adult, compared with the present scale of about 10 oz.

Two things make this larger distribution of meat possible. Home killings begin to increase in August and, secondly, the recent agreement with Argentina has allowed the Ministry of Food to draw heavily on its meat stocks. In May total imports of carcase meat amounted to only 1,500 tons; consumption during the month was 85,000 tons. The Ministry is wasting no time in giving the public the benefit of the increased killings and imports. It seems to have been considerably agitated about whether or not to make the increases in quantity and price simultaneous. Since the causes are the same the arguments for separating the events were political. The Labour Party has been setting some store by the political value of the increased ration, and the higher price no doubt rather spoils the effect. It may equally well be said, however, that the simultaneous increase in quantity enables the price increase to pass off with relatively little damage to the Government's popularity. The Minister of Food has lost nothing by sticking to the economics of the case.

* * *

Disaster Averted in Bihar

It is now almost certain that the disaster of a major famine in Bihar has been avoided. This is the result of American aid, diversions of British shipping, and energetic action on the part both of the central government at Delhi and of the provincial administration in Bihar. Our correspondent in India writes that, during the last six weeks, the situation has greatly improved following the arrival in Bihar of 335,000 tons of food since the beginning of April, compared with only 125,000 tons during the first three months of the year. Almost every means of transport has been used to move the grain, and there is now a month's stock in many deficit areas. Lorries, river steamers, and railways have all played their part, as well as 100,000 bullock carts in those places which no other form of transport can reach.

There can, however, be no end to anxiety until the monsoon is over, and the new crops have been harvested and communications restored. There has been and still is very great hardship. Apart from the battle against sheer starvation, it has been necessary to deal resolutely with prices. The number of government-sponsored "fair price" shops, at which the poor can buy food at one third of the free market price, has been increased from 2,500 in April to 7,500 today; they sell 100,000 tons of food a month to 15 million people. The provincial government is also having to provide work on the railways and in jute-twine making for large numbers of landless people who have exhausted their resources.

In an article on page 97 another aspect of India's population problem is reviewed. From the long-term point of view, the dangers of famine are bound to recur until a more fruitful land is required to support fewer people. The Government of India is to be congratulated for making a start with plans to use for production the counterpart funds being derived from the sale of two million tons of American grain, and for its Five Year Plan announced this week. But the test of these and indeed of all the measures included in the Colombo Plan is in the speed and efficiency with which they are carried out. In India, as elsewhere in Asia, the proof of the pudding is in the eating—not in the elegant phrasing of the recipe.

Banning Australia's Communists

By pressing ahead this week with the Communist Party Dissolution Bill, the Australian Government is tackling something which is of sharp interest to the whole democratic world. Mr Menzies, the Prime Minister, had made it plain that if he was returned to power—as he was in the recent elections—he would proceed with measures to ban the communists. When the Bill was challenged in the High Court before the elections it was declared unconstitutional in time of peace. Now the new move to pass it, along with the Defence Preparations Bill which includes wide powers of economic control is again evoking bitter criticism from the Labour opposition. Mr Menzies is determined and willing to carry both issues to a referendum.

A decision to ban the Communist party in a democratic state involves questions far above mere expediency. As has been stressed in Australia, it is hard to see that there is any moral obligation to give the protection of the constitution to a group of people whose aim is not only to destroy it but who owe allegiance to an outside power that would help them to do so if it could. And on grounds of expediency it is certainly arguable that, if to be a communist is to break the law, it is easier to deal with communists once a law has been passed banning them.

Against this there are two sound reasons for not taking such a step. First, however good the original reasons may have been for denying liberty of expression to a particular group, there is always a danger that the power to deny will be abused, either against individuals or against other groups. There is plenty of experience to show this. Secondly, it is very questionable on grounds of pure expediency whether it is wiser to drive communists underground or to go on watching what they are doing on the surface. Whatever happens, it is certain that communism cannot be stamped out by oppression alone. Mr Menzies, therefore, has a difficult fight on his hands. He has much sympathy in other parts of the Commonwealth where labour conditions and feelings are different; but he will be watched with caution and reserve until it can be seen how far he is justified by events.

* * *

Slow Poison

The use of poisonous chemicals in the growing and processing of food was debated in the House of Lords last week and in the Commons the week before. Lord Douglas's speech sounded like one of those recitations of fearful portents with which Shakespeare built up dramatic tension. DDT had been found in mother's milk; human teeth placed in a glass of cola rapidly dissolved; a cow treated with penicillin yielded milk which would not turn to cheese, and though it was mixed with the milk of 200 other cows still no crumb of cheese resulted. In the House of Commons Dr Stross was rather less horrific. He questioned whether the Government had adequate powers to deal with the use of chemical "additives" in food. At present the Minister of Food has power to prohibit the use of any substance in food manufacture, but he rarely exercises the power. Otherwise, the manufacturer can add what he likes until it is proved harmful—although he would never reject the advice of food inspectors. Dr Stross thought that the burden of proof should be on the manufacturer to show that any chemical which he proposed to add was harmless.

Unfortunately conclusive tests often require prolonged research. Meanwhile the use of chemical fertilisers and insecticides is essential to the expansion of world food supplies; and neither in production nor in processing is there any evidence that they are having a bad effect on general health or that they are a cause of poisoning. Of 2,431 outbreaks in 1949 (the latest year for which complete figures are published) only three were caused by chemical agents, and then there had been mistakes such as storing fruit salad in a zinc bath.

Against this lack of evidence about chemicals, there is ample evidence of the growing danger from infected food. The 1949 figure of 2,428 compares with only 119 outbreaks, including sporadic cases, in 1941. New regulations about notification account for part of the difference, and the rest seems to be the consequence of more communal feeding and a greater reliance on processed meats, which account for over 60 per cent of the cases. The direct cause is usually infected hands and the remedy is education. Several local authorities, led by Guildford, have shown what can be done by a campaign, a code of hygiene and a certificate for the food shops that observe it. This is the important line of attack; additives are a red herring.

* * *

Advertising Advertising

Advertisers are so used to being called economic parasites that they suffer from a strong guilt complex. At the International Advertising Conference this week they have been trying to exorcise it by finding a social purpose in their activities. The speeches were pleasantly characteristic. Lord Beveridge spoke of his reports and arrived at the conclusion that the service of advertising in a free world was to help consumers spend with knowledge—but there were so many restrictions on their choice that he doubted if it could be called a free world. Lady Tweedsmuir thought that besides being a sort of buyer's guide, advertising might do something to improve public taste. Mr Samuel C. Gale recommended the practice, used by advertisers in the United States, of donating space and advertising services to the social purposes appropriate to a Free Dynamic Society. Mr Van den Bergh, of Unilever, Rotterdam, thought that advertising could help to produce larger economic groups on the Benelux model. Mr Francis Elvinger thought that it should explain the free enterprise system. For the economist, at least, the most sophisticated contribution was that of Mr Paul Cadbury. He argued that advertising reconciles mass production and the consumer's freedom. It enables the public to choose what it likes while canalising demand into a limited range of standardised products, so that the advantages of mass production can be enjoyed.

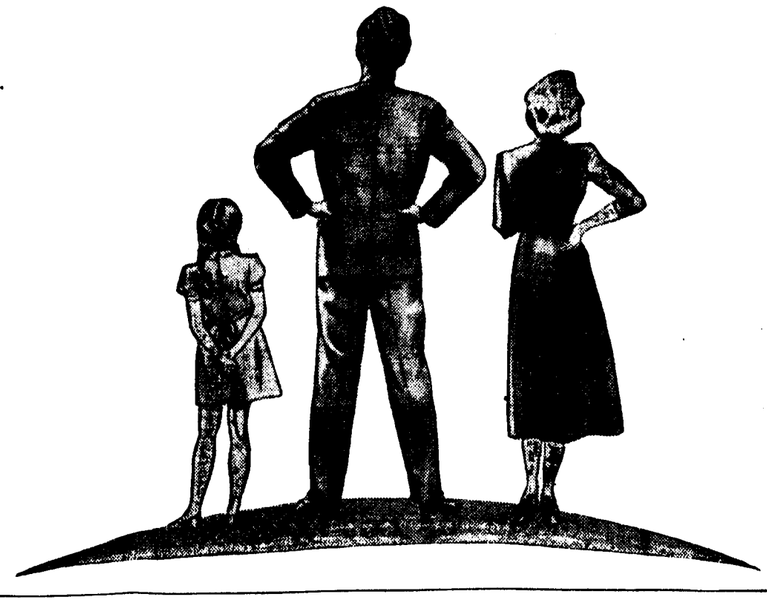
It is characteristic of our time that while nearly everyone is acting from the profit motive, no one can mention the fact. The purpose of advertising—dare it be said?—is to benefit the advertiser. Incidentally it gives an information service to the consumer—a service which he pays for and which is not always reliable. But it is usually amusing when not carried to excess. In this country, as one would expect, it rarely is carried to excess.

* * *

Prepare to Repel Boarders

The executive of the British Federation of Hotel and Boarding House Associations has decided to outlaw Blackpool for price-cutting—a pleasant prelude to the high holiday season. Blackpool thinks a daily minimum charge of 13s. 6d. high enough; the national body insists that "reasonable meals and service" cannot possibly be provided for less than 15s. All, however, share the desire to crush those "seaside spare-room pirates" who turn a possibly tax-evading penny by offering holiday quarters on wholly unregulated terms. Here is a nice *reductio ad absurdum* of price-fixing practice. There is some colour of reason in the minimum price agreement where the combination of depressed trade, high and irreducible overheads, and standardisation of product makes it possible both to assert that "ruinous" competition is against the long-run public interest, and to distinguish it from the normal aggressiveness of the low-cost producers. Nothing could be more remote from the conditions obtaining in the holiday catering trade. What are "reasonable" meals and service? And what should be done with those anti-social holiday makers who would rather pay less for less than more for more? It is possible, as any summer visitor to the high Alps can testify, to have an excellent holiday sleeping on hay and eating black bread and cheese; or under canvas; or in the Spartan surroundings of a youth hostel. It is even possible, however unreasonably, to enjoy the sea air while making one's own bed and dusting one's own room. As for what it is "possible" for the seaside landlady to do, she who attempts the genuinely impossible will soon give it up, while the superwoman who succeeds makes nonsense of the definition.

The association might indeed usefully devise a form of tariff which should ensure that the holiday seeker for room and board knows what he is getting. The family who, attracted by a cheap daily rate, arrive expecting amenities which that rate genuinely cannot cover, are apt to be disgruntled. One party of visitors may be perfectly willing to pitch in and help with the housework, but exacting where food is concerned—not for them the pie "produced" (as in Professor Leacock's "Boarding House Geometry") "any number of times," another may tolerate sketchy catering but insist on undiluted leisure. Where landlady and guests understand one another beforehand, such variations in the holiday spirit are unimportant; while cross-purposes are apt to mean acrimony and a spoiled holiday. There appears, however, little indication that the association is interested in the holiday spirit. One can only wish Blackpool a thoroughly successful season.



Practical Energy

Remove the Crystal Palace? Destroy St. Paul's;—level Westminster Abbey. Public opinion would scarcely be less outraged by the one than the other. The latter are the greatest monuments of the genius of the past, exerted, no doubt, on objects of a more solemn and enduring kind. But, as a specimen of constructive genius, as an evidence of the practical energy of the age, the adaptation of a means to an end, the Crystal Palace stands alone, in this or any other country of the world. To say the least of it, it is one of the greatest and happiest efforts of invention in the most ingenious age the world has seen. Of all the monuments raised to the memory of the greatest statesman of our day, none is so appropriate as the Crystal Palace. But for the policy of Sir Robert Peel, it could not have existed. . . . Nor can any one look upon that monument of fiscal reform without being struck with the folly of impeding the progress of art and industry by such restrictions, as, if continued to this day, would have rendered the conception, had it even entered the mind of Mr Paxton, a barren impossibility. The Crystal Palace is a justification of the policy of the past, and a beacon to that of the future. . . . There are no reasons for its removal. There are thousands why it should be kept. If even the conception of such a building had been well brought before the public, for the many purposes to which it is proposed in the future to apply the Crystal Palace, we have little doubt that public spirit and a conviction of its utility would have secured its successful reception, and that with little difficulty funds would have been found to erect it; but now that it is erected—now that the proposal of a Crystal Palace is no longer a vague theory and speculation, the idea of destroying it after it has performed one single purpose, is revolting at once to the good taste and the good sense of the times in which we live. It requires only to look upon it to feel that such a fate is impossible.

INCREASED TRADE
through British Skill

Industrial development programmes need more than capital and man-power. They require knowledge: the technique of production applied to a wide range of industries. As a result of its long history of industrial achievement, Britain is able to supply this knowledge—and has the manufacturing resources to back it up. The Vickers Group, for instance, can provide capital equipment for land, sea and air transport, factory construction, and primary and secondary industries of many kinds—as well as skilled advisers and technicians to help put the precepts of efficiency into practice. Some idea of what this means in terms of productive capacity is given by an Exhibition now being held at Vickers House, Broadway, S.W.1.

Letters to the Editor

Korean Anniversary

Sir,—Now that Mr Malik's "crumb" has turned out to be a slice of bread, if not the whole loaf, your anniversary Note of June 3rd, which sought to give "an honest answer" on Korea, is especially apposite.

It seems to me that one very important lesson to be drawn from Korea is the following. Given initial Communist aggression in Korea, and the development of a situation without precedents, it yet remains true that there has throughout been much confusion whether events there formed part of the policy of containing Soviet aggression, or whether they were to be regarded as the first example of the use of the United Nations as an instrument for enforcing international order, or as a combination of both.

The two approaches are, however, basically different. "Containment" aims at a settlement with Russia without war. It requires us to make it clear in advance where we will resist aggression, and to avoid military engagements elsewhere. A United Nations policy, on the other hand, calls for intervention whenever and wherever aggression is threatened. I think there are grave dangers for the future if we confuse the limited objectives of containment with a *carte blanche* United Nations policy, for which the United Nations does not yet possess the necessary overwhelming force.

To put it concisely, partly through circumstances *not* within our control, and partly through confused thinking, the United Nations has gone off at half-cock in Korea.—Yours *faithfully*,

L. A. JACKSON

Weybridge, Surrey

The Poor Countries

Sir,—I found your article in your issue of June 2nd so interesting that I had it translated and published. You make a very important point on Point Four that up till now has been totally overlooked: that with the present level of political education in these countries economic progress is very difficult, if not impossible, no matter what help comes from the outside.

Public opinion simply does not understand the relation between capital investment and high productivity, and between this and a high standard of living. The Marxist idea that the entrepreneur exploits the worker is to be found everywhere, in the masses as well as in the higher intellectual levels, in government, and in left and right political circles. Economic principles that seem to be horse sense to the Anglo-Saxon mind are to the Latin (and I suppose to the Asiatic) meaningless. Under these conditions all economic development under private incentive is absolutely impossible, and what little there is is fortuitous or entirely due to the army, or some sort of dictatorship. There can never be the social enthusiasm necessary to economic progress.

Moreover, nothing is being done to correct these conditions. Colombia, for example, has several universities with law and technical faculties, but there is not one worth mentioning for economics and social sciences. Our good neighbours worry about the millions that they probably will have to give us some day, but they do not realise that just one million spent now on this type of education would probably save the others.

Bogotá HERNAN ECHAVARRIA

Next Stage in Soviet Planning

Sir,—In his article published in *The Economist* of June 23rd, your correspondent discusses the enigmatic changes in the staff of the central planning institution—the Gosplan—which have taken place in the Soviet Union since the end of the war and mentions in particular the dismissal of N. A. Voznessensky in March, 1949. Then he goes on to say: "The Gosplan itself, however, was not attacked."

I venture to submit that this statement is inaccurate. The Supreme Soviet of the USSR at its annual session held in June, 1950, approved an "ukaz" or legislative act decreed by its Praesidium in January, 1948, by which the Gosplan had been wound up as a Government Department with the rights and duties of a People's Comissariat, and replaced by three separate Committees attached to the Council of Ministers. One of them was called the Planning Committee, the two others were put in charge respectively of introducing new techniques in Soviet industry and the supply of manpower and raw materials. As a matter of routine the Ukaz was unanimously endorsed by the Supreme Soviet. Not a single tear was shed for the disappearance of the most revolutionary and original institution of the Soviet regime.

As for the prospects of a new Five-Year Plan discussed in the article, I do not think there will be any such plan announced publicly. For that, there must be given some essential targets in round figures, a thing the Soviet rulers have been carefully avoiding since 1946, when they published the aims of the postwar Five-Year Plan. After twenty years' close study of Soviet economics I have come to the conclusion that from now on Soviet industry and agriculture will be run by the Politburo and the Council of Ministers as an army on the field: working out new schemes of gigantic constructions, setting forth new targets, switching on and off manpower and raw materials from one industry to another according to the changing conditions of the world political scene and the necessities of Soviet power politics.—Yours *faithfully*,

T. ZAVALANI

London, W.11

A Decimal Coinage

Sir,—Your correspondent Decimalist might save himself the inelegance of dividing his revalued penny into five slightly devalued quarters by calling the thousandth part of the pound sterling not a farthing but a franc: the French franc at 980 to the £ (controlled rate) is a little nearer to the exact thousandth than the farthing, which stands at present at 960. Such a suggestion, if made with adequate tact in the proper quarters, might have the effect not only of advancing the cause of decimalisation but also of cementing European unity.—Yours faithfully,

J. A. CLARENCE SMITH

Fruits of the Mechanical Brain

The Human Use of Human Beings : Cybernetics and Society. By Norbert Wiener. *Eyre and Spottiswoode. 241 pages. 18s.*

Could a machine—for instance, the new Manchester computor or any foreseeable future refinements of it—ever be said to think? Could it be, as the newspapers already call it, a brain? This question, now far from academic, has been discussed in *Mind*, at special conferences here and abroad, and on the BBC's Third Programme. It opens out into the further question, "How far is it possible to go in constructing mechanical analogues of human behaviour without stripping man of everything that has been thought to be peculiarly his?" Such machines are being constructed, still very primitive affairs, but further progress may be only a matter of technique. Every step in this joint advance of theory and practice will have another important aspect; it is bound to increase understanding, scientifically speaking, of the way the human brain works.

Some scientists have been interested not so much in whether machines which simulate higher human behaviour may be said to reproduce mental processes as in the practical uses to which such machines may be put. Chief among these is Dr Norbert Wiener, the distinguished American mathematician, a pioneer of the subject, to which he has given the name "Cybernetics," or the theory of controls. Dr Wiener has constituted himself the prophet of a robot age for which he finds humanity morally and socially ill-prepared. "The Human Use of Human Beings" is the first of his writings on the subject to be published in England, but he is widely known in the United States. His primary thesis is that the large-scale replacement of human beings in industry by machines of the new computor type is now only a matter of years. If the process goes on at a peacetime rate, he gives it twenty years; if war comes to speed it up, he gives it five years. The completely automatic operation of factories is even now a possibility. Further technical development will make it so economical compared with human labour that the latter, he thinks, will be displaced. Widespread unemployment and social unrest leading to a breakdown of the social order will follow unless industrial society finds a worthy employment for those of its members who are no longer needed for repetitive slave tasks. This Dr Wiener calls the second industrial revolution.

The picture may be technologically correct, but it strikes a sophisticated reader in the circumstances of today as crude, even naïve. So it is with much of this book. It is required reading for anyone who wants to know what is going on, yet a good deal of patient sifting is needed to separate the information—Dr Wiener should appreciate the force of this word—from the irrelevancies. In a book of which the first nine chapters are professedly devoted to "the study of man as a communicative organism," half a chapter is occupied by a discussion of the American patent law. A last very short chapter attempts nothing less than an account of the present state of religion and world politics. A similar lack of proportion is noticeable elsewhere in the book. The exposition of the basic ideas of the subject, in a popular idiom, is well done so far as it goes, but it has to be disentangled from a confusion of political, sociological and historical half truths, or no truths at all. These are views which the author is interested in propagating. They are the views of an old-style American liberal who possesses much native shrewdness but is unversed in modern historical method and in the recent developments of anthropology and psychology. He is also unpractised in political analysis and unaware of the philosophical revolution, which has come so aptly for dealing with the very problems that these new computors raise.

When all this has been said, the book is full of good things. Its very simplicity is ruggedly honest. Its rambling ease of manner both charms the reader and suggests to him fruitful lines of thought. As a populariser of difficult new scientific theories, Dr Wiener can hold his own with the best of his predecessors, but when he enters the arena of politics, philosophy, history, and theology, he must expect to be judged by the standards which centuries of disciplined thinking have established.

Reuter Record

Reuters Century, 1851-1951. By Graham Storey. Foreword by Lord Layton. *Max Parrish. 276 pages. 10s. 6d.*

It was a wonderful emigration that in 1848 brought out of Germany the Eisenhowers to the United States and Julius Reuter first to Paris, then to London. For in Reuter's case it resulted in a German Jew paving the way to three distinctive British achievements: world leadership—until quite recently—in the technique of collecting and transmitting news on a large scale; pioneer work in discovering how an agency can survive without government subsidy; and, finally, an imaginative piece of constitution-making which has made Reuters and its ownership by the British newspapers a model for many other free countries. If the western world's news services are now more confidently immune from government interference than they were before totalitarianism began to spread over Europe, much of the credit goes to Reuters. This, roughly speaking, is the story told in a very readable book, which will make historians' mouths water for a sight of the Reuter files.

The story would have been better told if the balance had been more sternly held between the remoter and the more recent past. The later portion becomes almost ecstatic when it is describing, among other things, the negotiations by which Australian, New Zealand and Indian newspapers became shareholders and full partners in Reuters. If the author had had first-hand contact with newspaper and agency conditions he would probably not have considered the achievement so remarkable. Likewise he would have given a little more attention to the very notable personalities who have served Reuters abroad and to the tricky finances of the work. But there is little other criticism that can be made. The story is told clearly, with a nice choice of detail and has the tang of scholarship, even if here and there one catches a faint trace of the perfume called Unesco.

It is, indeed, an enthralling merchant-adventurer's success story and if one wants to get quickly the essence of the founder's courage, imagination, pertinacity and business skill one need only read the chapter entitled "Reuter Khan," in which he secures from the Shah of Persia what Curzon described as

> the most complete and extraordinary surrender of the entire industrial resources of a kingdom into foreign hands that has probably ever been dreamed of, much less accomplished, in history.

Interesting, too, is the long story of rivalry with Wolff, Havas and Associated Press and the race to instal the cable, telephone and teleprinter. It is to be hoped that Reuters will not be content with this centenary volume but will do what *The Times* has done—produce in more than one volume a full and scholarly record of the rich historical material that must lie in the memories and records of its past.

Spontaneous Generation

The Physical Basis of Life. By J. D. Bernal. *Routledge and Kegan Paul. 80 pages. 6s.*

In this little book, which reproduces in printed form his Guthrie Lecture given before the Physical Society in 1947, Professor Bernal does not so much discuss the physical characteristics of living matter as take them for granted. He examines how they must have originated and evolved. He starts with the evident conviction that living processes grew out of the inanimate gases and liquids of the cooling planet. The end products are separated from them by a long period of chemical evolution, whose contingency on accidental and geophysical factors makes it likely that they are peculiar to our own particular conditions. By comparison, the preconditions are of a much more universal nature, and to this extent he regards the problem of the origin of life as more fundamental than that of its present nature.

Mr Bernal thinks it possible, in the light of modern knowledge, to sketch out a picture—speculative, perhaps, and with many gaps, but still logical and coherent—of the steps by which living processes may have originated and evolved. It relies on no wild hypotheses, which simply conceal ignorance, and much of the research it demands for its elucidation is, according to Mr Bernal, a matter of determining in what way such a process took place, rather than whether it took place at all, which can be taken as self-evident. These are the sort of confident claims that are needed from time to time to stimulate and "brief" research work, and they are laid down here in a plausible and intriguing way.

Mr Bernal likens the physico-chemical evolution of living matter to a play of three acts and prologue. All we have hitherto studied of biology is contained in the closing scene of the last act; but we know a good deal about the stage set (the laws of the physical world) and the first and final groups of actors, and from these we have to infer the intervening play. In the first act, Mr Bernal envisages primitive life forming and developing in isolation, probably on the surface of microscopic clay or sand particles, whose molecular regularity and relatively enormous stable surface would favour the formation of colonies of complex molecules bearing organic relations to each other. The conditions favouring such processes have long ceased to exist—the compositions of sea and atmosphere have radically changed, and a curtain of ozone has cut off the strong ultra-violet light that supplied the energy for the syntheses. Furthermore, such colonies could only survive in the completely sterile conditions of the primitive world; so all-pervasive is life now that they would quickly succumb to the attacks of more highly developed forms. Thus it is plausible to advance spontaneous generation as a hypothesis of the remote origin of life in spite of the persistent failure ever to establish its occurrence under existing conditions.

Much of this book may well be commonplace to the specialists who think and work on these problems; if so, they are to be envied, for it is an exciting book for the layman. In addition to the inherent fascination of its subject, it exhibits a keen and highly informed mind at work on the sorting of an intricate jig-saw puzzle. Those who are aware of Professor Bernal's political convictions will be reassured to find that, though Engels is several times quoted, it is only for the most unexceptionable of scientific statements.

For Freer Trade

World Trade and Investment. The Economics of Interdependence. By Donald Bailey Marsh. *Harcourt, Brace and Company. 594 pages. $6.75.*

One of the more useful by-products of American mass education is the intelligently written, comprehensive, and above all up-to-date textbook for undergraduates. Dr Marsh's work on international economics is an outstanding example of its kind, authoritative and lively, right up-to-1950 in its factual material, its pedagogic purpose unusually well served by the handsome production its publishers have given it.

The focus of the book is on international economic policy, particularly on the major issue of "market process v. control." This issue is posed at the end of Book I, which surveys the facts of international economic relations with the help of a tasteful selection of standard statistics. Book II is a theoretical *tour de force*. Dr Marsh neatly integrates the concepts of the balance of payments with national income accounting, then passes by way of an expert description of the foreign exchange market to an analysis of the mechanism of adjustment through changes in both prices and incomes. This is followed by two chapters on the foreign trade multiplier, unfortunately marred by unnecessary by-play with Keynesian identities and the use of unfamiliar mathematical symbols, and three chapters on the theory of international values, distinguished by the consistent use of the technique of indifference curves and the first appearance in a textbook of the optimum tariff theory.

In Book III Dr Marsh returns to policy problems, and discusses the dollar shortage, the European Recovery Programme, and the Bretton Woods institutions; all of this discussion is penetrating and well-balanced, the four chapters on the problems and possibilities of international investment being perhaps the most useful. Throughout, Dr Marsh leaves no doubt as to his attitude on the central problem of market process *versus* control: the devils of his postwar world are exchange controls and trade barriers. Flexible exchange rate and multilateral free trade are his exorcisms.

The desirability of such a strong political tone in an undergraduate text may well be questioned by the teaching economist; Dr Marsh's transatlantic impatience with the apparatus of controls may equally well irk the European reader. One suspects, too, that the author's advocacy of flexible exchange rates owes something to the limited role of his native country (Canada) in international finance. Nevertheless, strong liberal opinions are the classical privilege of writers on international trade, and they add readability and unity to an excellent textbook.

One Side Only

The United Nations and Power Politics. By John MacLaurin. *Allen and Unwin. 468 pages. 25s.*

Good books about the United Nations are all too few, and it is regrettable that this study, pseudonymously written by "an outstanding educationalist," cannot be included in their number. It is explained in the preface, reasonably enough, that the author, seeing no prospect of his book being read by Soviet citizens, proposes to concentrate his criticism on the Western nations and to discuss Soviet actions only when they "would have to be considered by statesmen pursuing an honest UN policy." In fact, however, Soviet actions are scarcely examined at all, with the natural result that the Western policies which have arisen from them are made to appear arbitrary, intransigent and even brutal. From the account given of the blockade of Berlin one would never realise that the West faced the desperate alternatives of surrendering two million people to Soviet rule or of seeing them starve. In an admittedly brief postscript on Korea the author finds space for several trenchant criticisms of American policy, but none for any suggestion that failure to go to South Korea's aid might have betrayed the whole ideal of collective security. And all the years of Communist intervention in Greece are simply passed over, while the "Truman doctrine," which that intervention helped to forge, is roundly condemned.

By thus ignoring the threats against which the West has had to act, the author demonstrates to his own satisfaction that Russia has in no way prevented the United Nations from working and that this crime should be laid at the doors of America and Britain instead. He appears to hold that to make the United Nations work it is not necessary to strengthen its ability to defend peace; what is required is a conciliatory attitude on the part of the Western nations, and the United States in particular. When he is not engrossed with this main theme the author is able to make some sound points about United Nations' procedures and activities; but even when dealing with relatively uncontroversial subjects he shows a curious lack of balance. It is, for example, surprising to find eighty pages devoted to the largely sterile pro-

Middle East History

History of Syria, including Lebanon and Palestine. By Philip K. Hitti. *Macmillan.* 749 pages. 42s.

Professor Hitti attempts to give a balanced and comprehensive account of the history of Syria from earliest times to the fall of the Ottoman Empire and has produced a readable yet scholarly book. He points out how Syria's geographical position has exposed her to invasion and attack and also to cultural influences from neighbouring civilisations; he examines these influences in some detail. The area over which his study ranges varies in extent at different periods but in most cases reaches beyond the frontiers of present-day Syria, Lebanon and Palestine. He also shows how geographical conditions inside Syria were unfavourable to the development of a strong and self-contained state, and he rightly stresses the almost constant struggle between the nomadic and the settled people.

Mr. Hitti divides the history of Syria into four main epochs, apart from the pre-literary period: the Semitic period in which he describes the settlement of the Amorites, Canaanites, Arameans and Hebrews in Syria; the Greco-Roman period, which he regards as something of an interlude; the Arab-Moslem period, of which, on the whole, he gives a favourable picture; and finally the Ottoman period. The last named is covered in some thirty-six pages with an additional ten pages on "the contemporary scene." The allocation of space to the Ottoman period seems somewhat small in a book of this size, while to maintain that the political structure of Syria was not seriously affected by the Ottoman conquest would seem something of an understatement. The most significant developments of the period were, in Professor Hitti's view, the exposure of Syria to western cultural influences and the emergence of the Lebanon as a separate political entity. As such they merit, perhaps, a somewhat fuller treatment than has been accorded them.

Local History

English Husbandry. By Robert Trow-Smith. *Faber.* 239 pages. 18s.

This is the work of a competent scholar with a passion for agriculture and an elegant command of rural idiom. It tells the whole story, and the two opening chapters, "Prehistoric View" and the "Saxon Scene," are among the best in the book. There is little in the middle part that we do not know already from Maitland, Prothero and Tawney, but when he reaches the "agricultural revolution" the author in a few masterly pages puts Jethro Tull back on the pedestal from which some have tried to dislodge him. He is specially strong on animal husbandry and traces the evolution of horses, cattle, sheep and pigs with expert skill. In modern times, he rightly stresses mechanisation and milk.

Occasionally, perhaps, his enthusiasm for agriculture leads him into exaggeration. "National history, and by that is meant the social development of a people, and not the wars of their kings or the political manœuvres of their leaders, is the sum total of local history." But that is just what, in an island empire founded on commerce, it is not. No aggregation of Victoria County Histories can even begin to tell the national, social tale. And again, "as the eighteenth century grew older society moved forward unconsciously towards the industrial revolution." No serious student of industrial history would endorse this. Indeed, there were so many precursors that some writers seem to abandon the term revolution altogether.

The sketch of agricultural conditions from 1793 to 1846 is much below the level of Prothero. "Peace after Waterloo brought a short relapse." If that is all there was to it, were the statesmen and blue books of the day living in a dream-land? The adjustment to a peace economy after a generation of war was every bit as punishing as the inflow of foreign foodstuffs after 1875. "Co-operation" is not indexed, and this most interesting side of modern marketing and purchase, the agricultural co-operative movement, is conspicuous by its absence.

Sample Auditing

Scientific Method for Auditing. By Lawrence L. Vance. *University of California Press.* (Cambridge University Press.) 103 pages. 19s.

When the balance sheet and profit and loss account, those rather inadequate statistical explanations of an organisation's financial position, are handed to the professional auditor, he faces the job of deciding whether they are correct within the limits set by his terms of reference. Before this decision can be made there is a good deal of routine work to be done. Part of this consists of a careful examination of the more important figures in the records and of "danger areas" particularly vulnerable to fraud. It will seldom be possible, however, even for the organisation's own internal auditors (on whom, if they exist, the professional auditor will to a considerable extent rely), to examine all the transactions of an undertaking of any size. It would be too costly. Auditors usually depend a good deal on test checks, in much the same way that a railway company relies for the control of fraud and error on occasional unexpected ticket inspections.

The auditor will expect the undertaking's own accounting organisation to be so arranged as to reduce the probability of fraud and increase the probability of detection if it occurs. The aim of the test checks will be, first, to ensure that this organisation exists and is properly functioning, and secondly, to ascertain the general quality of the records and their degree of accuracy.

The two types of test may differ. The problem is to decide what parts of the records are to be selected and how many items tested in each; what standards of accuracy are to be set and how they are to be measured; what weight is to be attached to errors of varying kinds and seriousness in different parts of the records.

The standard auditing texts provide meagre guidance for the solution of these problems. Professor Vance does not purport to provide a complete solution. His aim is to show how simple statistical techniques, in particular those of sampling theory, can be used to systematise some of the decisions. It is possible to assess the quality of records by methods similar to those employed in the control of quality in industrial production; the degree of confidence in the result can be expressed in terms of a probability ratio. An auditor using these methods would at least be in a better position than hitherto to maintain a consistent standard of work. Furthermore, his client or employer would be able to weigh the higher money cost of a more extensive audit against a measurable gain in precision.

This, as Professor Vance is aware, will not solve the underlying problems, but his work may well contribute to the development of auditing techniques, even if it contains rather more statistical technicalities than will be palatable to some accountants.

Shorter Notices

Essays in Biography. By J. M. Keynes. *Rupert Hart-Davis.* 354 pages. 12s. 6d.

Essays in Persuasion. By J. M. Keynes. *Rupert Hart-Davis.* 376 pages. 10s. 6d.

These two famous volumes of Maynard Keynes's essays are now re-published. To the biographical essays, three are added. Two of these, however, have appeared in print before, the "Centenary Allocution" on Jevons and the memoir of Mrs Marshall, written with filial affection, that originally appeared in the *Economic Journal.* The third newcomer is a paper on "Newton, The Man" read, after Keynes's death, by his brother at the Newton Tercentenary Celebrations in 1946.

It goes without saying that those who would remember Keynes not simply as the pontifical theorist but as the stylist, the wit, the passionately plausible pamphleteer will want to read and re-read these essays.

The ABC of the Foreign Exchanges. By Norman Crump. *Macmillan.* 403 pages. 12s. 6d.

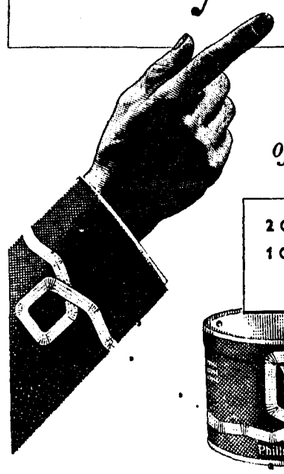
This is the eleventh edition of the book originally written by Mr George Clare in 1892. The substance of the tenth (1936) edition is given in the first twenty-two chapters; the remaining twenty-eight chapters, covering 235 pages, describe war and postwar developments up to September, 1950—largely in the form of an historical commentary. The result can certainly be praised as no mean feat of compression, but its subject lies in a field where compression can only be achieved at the risk of at least some misleading nuances.

History TODAY

The most absorbing monthly magazine in England - 2s. 6d.

AS AN art-historian, *Sir Kenneth Clark,* former Director of the National Gallery, stands pre-eminent. In its July issue HISTORY TODAY presents his critical and biographical portrait of *Leon Battista Alberti,* one of those "all-round" personalities who were a characteristic product of the Renaissance spirit.

Other contributions include *The Persian Crisis; Historical Background,* by Christopher Sykes; *Science in the Dark Ages,* by Jean Lindsay, a study of learning in Europe between the collapse of the classical world and the emergence of the New Learning; *Dressing the Past,* by Quentin Bell, discussion of varying attitudes towards the treatment of historical costume, from Veronese's picture of *The Children of Darius* to such modern films as *Gone with the Wind;* and an essay on *Palmerston,* by A. J. P. Taylor in the current series of *British Prime Ministers.*



In its July issue HISTORY TODAY will also print articles by Michael Rix and Sheldon Van Auken.

AMERICAN SURVEY

Reactions to Korea

Washington, D.C.

MEMBERS of Congress, like everyone else, are never so diligent as when searching out excuses for doing what they want to do. The prospect of a Korean peace and the three months' lull in the inflationary gale provide twin justifications, both very soothing to the conscience, for crippling an already feeble law to control inflation and for economising on defence appropriations.

The hamstringing of the controls legislation is already far advanced. The Senate not only refused to accept all the provisions to strengthen the law requested by the Administration, but in addition forbade all future reductions in ceiling prices of farm products and eliminated the possibility of really effective reductions on anything else. The House is now trying to cancel some past reductions and bleeding the Bill whiter still. The result will be, as intended, to make all price "stabilisation" run in one direction only, upward.

This attack on controls is not, needless to say, the consequence of a deep philosophical antipathy to *dirigisme* on the part of the members of Congress. It is the result, on the one hand, of the agitation by the most powerful pressure groups, particularly the farm lobby, who think that they stand to make a great deal more money if their prices are not held down by ceilings, and, on the other, of the apathy of consumers, who have been so soothed by the levelling off of prices that they have registered scarcely a protesting word.

*

Furthermore, all indications point to the likelihood that the consumer will not be rudely awakened by much higher prices or increasing scarcities for at least three months and quite possibly not until the end of the year. After that, what will happen depends on how far Congress succeeds in its second endeavour, that of cutting the defence budget. And that, in turn, depends entirely on the nation's reaction to the probable peace in Korea.

What that reaction will be no one can possibly say at this time. But some indication of how seriously the Administration views the prospect can be seen from the fact that President Truman and his highest officials, like so many jammed whistles, have done little for the past two weeks but reiterate the truism that peace in Korea in no way changes the need for a defence programme of the size and urgency determined on a year ago. Congress has not attempted to dispute this logic with a frontal attack. It is not necessary. Logic will not prevail against the deep sense of comfort and relief which an armistice in the Far East will induce.

The reaction cannot help but bring about a let-down, and the only question—the all-important one which will control the course of the economy for a year to come—is: how much? If the Korean talks result in a real, though strictly local, settlement, and if the Administration yields to political temptation and hails it as a great peace, there will be no stopping Congress. A cut in the combined domestic military and foreign aid appropriations of $10 to $15 billion below the Administration's request for over $60 billion would not be impossible. Then—and this would be the object of the exercise—the proposed $10 billion Tax Bill, already reduced to $7.2 billion by the House, would be cut by $2 or $3 billion more.

The effect of this could quite easily be a recession. Ironically, the second quarterly report of Mr Charles E. Wilson, Director of Defence Mobilisation, the theme of which was the threat of renewed inflation, also showed very clearly that it is only the anticipation of very heavy defence spending to come that is preventing a downturn here and now.

For three months there have been no serious price rises. Retail prices, which always take time to reflect economic changes, rose to some extent, but wholesale prices dropped slightly and the prices of basic raw materials and primary commodities have fallen off 10 per cent, losing two-fifths of their post-Korean gains. The wage spiral has been checked, the government has been running a fine surplus, inventories are enormous and, even with a full defence programme, production of most durable goods for consumers is scheduled to be maintained at two-thirds of the record pre-Korean levels—still a fabulous volume.

More than the effect of any controls, what all this really reflects is a series of miscalculations by the American public, businessmen and consumers alike. Imagining that the impact of defence outlays would come much sooner and be much heavier than was ever possible, and envisaging shortages of wartime intensity, they stuffed themselves with goods. They not only filled such of the demands of the war years as were still unsatisfied at the time of the Korean outbreak, but many also bought for the needs of a year to come. Meanwhile, during the long period before full-scale military production could follow the placing of contracts, there was relatively little curtailment in civilian output. The lag was even greater than it might have been, for contracts were slow in being awarded and military production is still running at only 80 per cent of schedule. Output of durable goods for civilian use actually increased during the first nine months after Korea and production of soft goods is probably still rising.

Consequently, consumers' inventories are the highest in history, retail inventories are still exceptionally large, and producers' stocks of raw materials and goods in process have grown rather than diminished in the past year. Rumours of peace only furthered the slackening of buying which had already begun, only softened a market already very elastic. Obviously, then, a heavy cut in defence spending below what had been generally anticipated can remove the support from what otherwise would be a much over-extended situation.

*

But equally, and conversely, if the public and Congress are not stampeded by a Korean peace into forgetting the real stakes of the game, then the inflation warnings of Mr Wilson will be amply justified. If the proposed defence budget for this fiscal year is cut by only $3 or $4 billion, the inflation which the huge residual sum will generate must make itself felt some months hence.

About $42 billion worth of defence contracts have been awarded since Korea and only $10 billion worth have been filled. Much of the rest will have to be paid for in the year ahead, and the surplus is already turning into an inflation-begetting deficit. If this spending is accompanied by the further letting of defence contracts at an even higher rate, business, seeing its earlier forecasts of mounting military expenditures confirmed, will proceed with its plans for a record $29 billion expansion of plant and equipment this year. Consumer goods will finally grow more scarce. Under the pressure of a probable increase of $25 billion in personal incomes by a year from now, prices will resume their climb, unhindered by any effective controls. And as prices rise, the present doldrums in wage movements will freshen into a high wind, perhaps a gale.

Mr Wilson has forecast that, as the programme is now planned, an inflationary gap of $10 to $20 billion will develop by mid-1952. If it is objected that this will be diminished by reason of cuts in the proposed military budget, it must also be recognised that there will be an accompanying reduction in the new $10 billion Tax Bill, which is counted upon to fill part of the gap. And will there be enough savings to close the rest of it if prospective savers see the dollar growing less valuable day by day? By continuing a strong defence effort, by strengthening the present controls on inflation, and by imposing a heavy new tax levy, Congress could still chart a middle course between inflation and recession. There is no sign that it will.

A Woman's World?

[FROM A CORRESPONDENT IN NEW YORK]

IN pioneer days women were valued in America because they were scarce. In the last two decades they have been courted because their power as the family purchasing agents (they do 55 per cent of the family buying) could be exploited commercially. During the last war, they were pursued because they constituted the biggest potential pool of free labour. The same thing is happening in the present re-armament period, although as yet there are only about 19 million women in the civilian labour force, compared with 20.5 million at the peak of the war. The need for women as new workers is reflected in "Help Wanted" columns which call for them not only as cooks, teachers and secretaries, but also as engineers and machine operators.

Meanwhile women have for the first time in the nation's history become numerically surplus. The actual figures disclosed by the 1950 count—100 women to every 98 men—produced a spate of supposedly humorous editorial comment, but as yet no serious studies of the implications of the change have appeared.

However, the myth that all women spend their working hours testing soap powders, cake mixes, washing machines and dream kitchens continues to be supported by fantastic expenditures on advertising and to be proclaimed in print and on the air, until women who prefer typewriters to vacuum cleaners hardly dare admit it. The fact beneath the myth is that a third of the feminine population spends its working hours not at home but in factory, office, school room or laboratory. It is only since industry began to take household chores out of the home with one hand and to return expensive gadgets with the other that the working part of the house has been pictured as a paradise, only since women have been employed in large numbers outside the home that the kitchen has become—at least to the advertisers of kitchen equipment—a dream world bathed in a rosy glow of dear desire. Earlier in the century it was a prison from which every ambitious woman yearned to escape as quickly as she could.

*

The change came after 1920 when women won the vote, and more particularly after 1934 when a student of social statistics, eager to speed the advance of women, put forth tentative figures to show that they had much more financial power than was usually credited to them. Those figures were seized on by the women's magazines, eager in turn to justify the sale of their pages at high rates to advertisers still labouring under the belief that it was father who kept the wage packet and paid the bills. The experts in persuasion set up a legend of the financial power of women which, for lack of statistics to the contrary, even the women themselves came to believe. Recently the stockbrokers have joined the chorus. Figures have appeared in the Stock Exchange journal to prove that "Women Own a Lot of Stock!" The accompanying illustration showed pearls spilling out of a safe deposit box.

The facts on which all this fanfare ("Women own 47 per cent of our railroads!" "Women inherit 80 per cent of all life insurance!" "Women control 70 per cent of this nation's private wealth!") is based are scarce. Washington has no figures which show how much wealth women inherit or how much land or how many government bonds they own. Reliable evidence is available only in a few fields.

The Institute of Life Insurance reveals that women owned one-fifth of the life insurance in force in 1949 and received slightly more than half of the death claims paid that year. A writer for the Stock Exchange magazine believes, after studying annual corporation reports, "that women outnumber men stockholders generally." But the significant thing is that in both life insurance and ownership of investments the pioneer pin-money pattern continues. The policies held are, on the average, not large and the individual holdings of shares are small—so small that the American Telephone and Telegraph Company, whose million shareholders are more than half women, recently re-elected an all-man board of directors because the men controlled 67 per cent of the shares.

Income figures support the unpopular thesis that women's economic position is, with flamboyant exceptions, relatively modest. A study made by the Census Bureau in 1950 showed that only a little more than a third of the women in the United States reported any income at all. These 22,725,000 got only 17 per cent of the total income payments made to individuals. Even on the spending side woman's power is less than is commonly pictured. Professors at the universities of Illinois and Florida conducted a joint study which brought out the fact that women do, not 80 per cent of the family spending as alleged, but 55 per cent. None of these studies has made a dent in the golden cloud that surrounds the ladies.

Meanwhile their educational status is steadily improving. There are some two and a half million women in the country with college degrees, and the assumption that bright girls will go to college is as much of a commonplace as it is for bright boys. The political status of women, the cause of so much clamour before 1920, has not advanced as fast as their working value or their voting numbers. The Senate has only one woman among 96 Senators—Mrs Margaret Chase Smith of Maine—and the House only half a dozen out of 435 members. On the executive side things are only a little better. No woman sits in President Truman's Cabinet, though five of them occupy unusual positions on the second level. Mrs Georgia Neese Clark is Treasurer of the United States, Mrs Nellie Taylor Ross is Director of the Mint—two jobs which rank as political plums customarily handed to masculine supporters of the Administration. Mrs Anna Rosenberg is Assistant Secretary of Defence in charge of manpower allocation—a difficult job which is a measure of her extraordinary abilities. Mrs. Eugenia Anderson is Ambassador to Denmark, Mrs Pearl Mesta is Minister to Luxembourg. Women have certainly got feet in a great many doors, but nevertheless the United States is still far from being the women's world that it is popularly supposed to be.

American Notes

Bringing Europe up to Scratch

The House Foreign Affairs Committee is now studying the prospectus of what Mr Harriman has called America's investment in security, the Administration's request for $8.5 billion for foreign aid, more than has been spent for this purpose in any other postwar year. Congress's decision on how much should be put into this Mutual Security Programme will, it is generally agreed, be the "pay-off" on the great MacArthur debate, the test of whether America wants to "go it alone" or with allies.

This year military and economic assistance, in proportions of roughly three to one, are combined in one Bill and

economic aid, at least as far as Europe, which is to get most of it, is concerned, is to be used mainly for purposes that will add to the military potential of the recipients. The Administration's witnesses, while emphasising that the success of the programme depends on the progress made in the next twelve months, did not hide the fact that it would take at least two more annual instalments of similar size to build up the strength of the free world. General Marshall had no doubt that this money would pay better dividends if invested abroad than if put into the rearmament programme at home, but he did suggest that some of the North Atlantic allies were not pursuing their defence preparations as enthusiastically as might have been expected. The members of the Senate Foreign Relations Committee immediately took to the air to investigate this question on the spot in Europe, before opening their hearings in Washington.

Congress has already tried to penalise Europe for failing, in its opinion, to come up to scratch in its restrictions on exports to the Soviet and its satellites. The Kem amendment, which in effect would have stopped all economic aid to America's allies, has been suspended by the National Security Council, but Congressional indignation at this circumvention was such that it became only too likely that a similar embargo, without any escape clause and covering military aid as well, would be included in the mutual security legislation. Representative Battle is, however, coming to the rescue with a sensible alternative, applying to both military and economic assistance, stricter than the Kem amendment but also more workable, conforming more or less with existing conditions. Mr Battle would ban all aid, without exception, to any country exporting arms to the Russian area; while a similar ban would be placed on aid in cases where petroleum or other strategic materials are exported; exceptions would be allowed if the free world would on balance benefit from the goods received in exchange for these exports.

From now on, Americans themselves will have to pay more for anything that they buy from behind the iron curtain, for tariffs on such imports are going up to the Hawley-Smoot levels of twenty years ago, about twice as high as at present. This is the result of the latest version of the Reciprocal Trade Agreements Act, which requires that Russia and its satellites should be denied the benefits of tariff concessions, most favoured nation clauses and so on. The caviare which Senator Kem thought the President was exchanging for American blood when his amendment was suspended will become even more prohibitively expensive. But the volume of trade affected is nowadays very small and includes little that is essential, for of late the United States has received only negligible quantities of such once important commodities as manganese from Russia and tungsten from China.

* * *

Ten Billion Dollar Question

The size of his budget surplus was already showing, to Mr Snyder's embarrassment, when the Secretary of the Treasury appealed to the Senate to add $3 billion to the $7.2 billion Tax Bill passed by the House, thus meeting in full Mr Truman's request. On June 30th the surplus was $3.5 billion, a record some $6 billion better than the $2.7 billion deficit prophesied in January by the President; revenues had increased more rapidly, and defence spending less rapidly, than he had expected. Such a miscalculation increases the Senate's determination not to accept uncritically the estimate that this year's spending will, at $68 billion, outrun revenues, under present tax laws, by $10 billion; Senator George, chairman of the Finance Committee, intends to cut at least $1 billion from the House measure, though, like everyone else, he is in the dark as to what will really be required, as Congress has completed work on no major appropriation measure.

What the Administration's critics overlook is that even the House Bill, if the Senate were to pass it by September 1st, would, because of lagging tax collections, contribute only about $5 billion, or perhaps a little less, to this year's revenues. And beyond yawns the fiscal year 1953, when the Budget Bureau predicts that spending will reach a peacetime total of $80 to $90 billion, something which even Mr Snyder admits cannot be met by present types of taxes. Even after 1954, when, if there is no war, the budget can settle down, it will, in the view of the Bureau, settle no lower than $65 billion a year—a level which would leave no room for reducing taxes below the peacetime peak they reach in the House Bill.

This is an alarming prospect for conservative business groups such as the National Association of Manufacturers and the Committee on Federal Tax Policy, who believe that the House Bill has reached, if not overstepped, the desirable limits on corporate and high individual incomes. It may give a dangerous impetus to the movement, already approved by 22 of the necessary 32 states, to seek a constitutional amendment limiting federal taxes to 25 per cent of any individual income. The House measure, which the Committee on Tax Policy denounces as the worst ever, did not go even as far as the Administration had proposed in increasing taxes in the lower brackets, where the chief danger of inflation lies; votes are to be lost there, and so the lion's share of the load was placed on corporations and on individuals with more than $15,000 a year. The House was equally obstinate about raising excise taxes on wireless and television sets and appliances. The view of the NAM is that the tax base should be broadened by adoption of a federal sales tax, if incentives to produce are not to suffer. But its arguments have met with a frosty reception from the Senate Committee; to the political unpopularity of such a measure, and its regressive character is added the objection that to adopt it would invade a basic source of revenue of 29 of the states.

* * *

Reds on the Run

At a cost of $80,000 in bail, four of the eleven Communist leaders whose conviction was upheld last month by the Supreme Court have purchased their freedom. The remaining seven have begun to serve their sentences. Also on the run are four of the twenty-one "second-string" leaders of the Party, indicted on June 20th on similar charges. The fugitive eight include four members and three alternates of the Party's national committee; if they can elude the Federal Bureau of Investigation, whose face must be as red as its quarry, they can continue to draw the party line, presumably from foreign soil.

The rest of the Party's indicted leaders are not likely to be able to purchase their freedom so cheaply. The government has asked that bail for sixteen of them—the seventeenth is ill—be increased from $177,000 to $876,000, not far short of the $1,000,000 which was asked for the first eleven after their conviction in 1949. This was scaled down by the court, but today's judges may take a different view of what constitutes excessive bail for Communists. The government also asked that the Civil Rights Congress, a left-wing organisation on the Attorney General's "subversive" list, which provided the earlier bail, should not be allowed to find the larger sum. By an odd coincidence, however, the bail requested is almost precisely the total of the Congress's bail fund. Mr Frederick Vanderbilt Field, the millionaire "angel" of Communist causes and descendant of Cornelius Vanderbilt, who is secretary of the Congress, has risked a 90-day jail sentence rather than reveal the names of contributors to the fund. Two other trustees, Mr Dashiell Hammett, the detective-story writer, and Mr Alpheus Hunton, have been sentenced to six months in jail on similar charges.

The Communist Party itself is still legal, though its revolutionary activities are proscribed, but it is a shadow of its former self. Disillusionment on the part of former fellow-travellers is now almost universal, while the revelation of how many agents the FBI had planted in the Party must have sown distrust among its 43,000 members. No restrictions are placed on Communist publications or other above-ground pursuits, but the *Daily Worker* is having a thin time. Its price has gone up from five to ten cents for a copy of eight instead of twelve pages. Ironically, the fact that it keeps afloat at all is probably due to those who buy the paper to see what the enemy is saying.

* * *

Anti-Trust on the Defensive

Although it has not yet approved the details of the scheme, the Department of Justice has in principle promised immunity from prosecution under the anti-trust laws to the nineteen American oil companies which are making voluntary agreements to counter the effects of the Iranian crisis on world supplies of petroleum. These companies, which operate abroad, have formed a foreign petroleum supply committee; their immediate objective is to work out methods of making the best possible use of available transport and refining facilities, in order to provide at least the minimum essential supplies of petroleum products to India and other countries which have depended on Iranian output. As far as can be foreseen at present, the effect of these readjustments on the American consumer should be slight; they may, however, involve renewed attempts to encourage industry to use coal instead of heavy fuel oil wherever possible.

The Department of Justice is apparently not altogether happy about the agreement, for it fears that the arrangements may prove detrimental to the interests of the small independent domestic oil companies. The anti-trust exemption for the pooling scheme was granted under the authority of the Defence Production Act, which similarly exempts the Industry Advisory Committees which are helping the mobilisation and stabilisation authorities. The Department is keeping a wary eye on these committees too, suspecting that the members may be tempted to use their governmental positions to further their private interests. The Department has made it clear that, if business abuses the privileges it has been given under the DPA, there will be no hesitation about bringing anti-trust suits. Furthermore, during the present rearmament programme it is not expected to be so easy as it was during the war to win exemption from anti-trust prosecution on the grounds that defence production will be interfered with.

But at least the government has just signed an armistice in its old war with the steel industry, whose pricing policies have long been under attack. Under the pact, the producers have promised not to plan a common course of action when fixing steel prices, but are permitted to quote delivered prices and absorb freight charges, provided they act independently and in good faith for the purpose of meeting competition. This way out of the so-called basing point controversy was indicated last January by the Supreme Court, when an oil company was permitted to discriminate between its customers by quoting different prices, because it had been genuinely trying to meet, and not to undercut, competition. A Bill to make sure that the Supreme Court will not change its mind has been put before the Senate, but may not be proceeded with now that the Federal Trade Commission has accepted the principle in its agreement with the steel industry.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

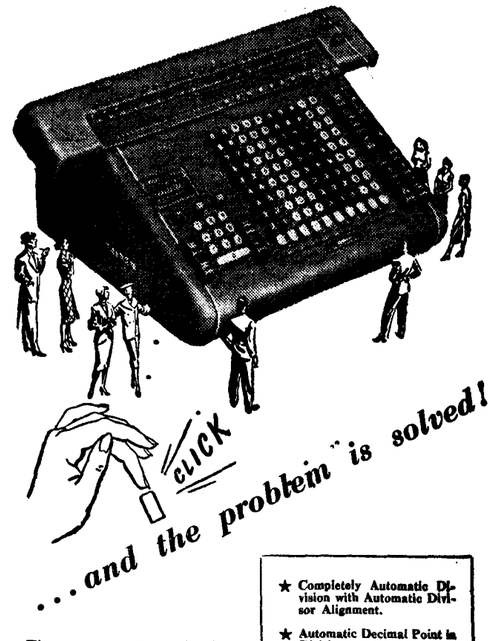
Drawn by A. R. THOMSON, R.A.

A.B. in a paper boat

It takes more than the boy with the bicycle to deliver the morning newspapers which rustle so regularly through your letter-box. Well back in the chain of production you would find Olaf Larsen*—that is, if you knew where to look for him. A likely place would be Bowaters' private docks at Ridham, serving their paper mills at Kemsley and Sittingbourne in Kent.

Larsen is an Able Seaman, a foremast hand in one of the ships which, from May to December, converge on England with decks stacked high with logs of spruce which is paper in the raw. There are many such ships chartered by Bowaters, for each separate paper-making machine needs the trunks of 10,000 trees to keep it going for one week.

Some of the widest paper-making machines in the world are in operation at Kemsley, turning out their eight miles of newsprint every half hour, all round the clock, but even that rare sight fails to tempt Larsen down the gangway. "For the engineers, yes" he explains politely. "But me, I am a sailor." The real reason is he dare not spare the time; he is working for his Second Mate's 'Ticket'. If you told him he was already doing quite a job helping to ensure the constant flow of raw material for the free press of the world he would modestly take your word for it!



The whole wealth of Bowaters craftsmanship, experience and research in the art of making paper—the 'know-how' in short—is freely at your service.

Mexicans for the Farms

Under the threat that Mexico would withdraw all its contract workers from the farms in the south and southwest, where they do much of the hardest work, Congress has now passed a Bill authorising the Department of Labour to recruit farm workers south of the border and providing government guarantees of the wages they are to receive. Under previous agreements, farmers themselves did the recruiting, and not infrequently failed to live up to their bargains. The chief obstacle was not any opposition to the Bill—farmers themselves were critical of the old system—but a conviction on the part of some that it should include severe penalties against farmers who employ, and thus encourage, the flood of illegal migrants, who last year numbered nearly a million. These unlucky creatures, known as "wet-backs" because many of them enter by swimming or wading across the Rio Grande, are glad to accept wages and conditions far below American standards; they thus deprive others of jobs, and are all too frequently a danger to the health of the community. The number of contract workers imported since the war has been only about 75,000 a year. However, with a deadline to meet and the representatives of the farm states in control, the Senate abandoned the Douglas amendment which would have provided jail sentences and fines for offending farmers.

Both of the great labour organisations have asked Mr Truman to veto the Bill on the grounds that it would open the door to a large supply of cheap labour and would injure American workers. The Bill, which puts the Department of Labour into the recruiting business until the end of next year, would lessen some of the exploitation of Mexican workers, but it would only slow up the "wet-back" invasion in so far as it increased the number of legal entrants. More direct methods are being employed by the US Employment Service in the west; it is now threatening, under the terms of the agreement with Mexico, to remove all contract labour from the big farms which employ legal side by side with illegal entrants. In the past this part of the agreement has never been enforced, and the practice of using both contract and "wet-back" labour has been widespread. It is not, strangely enough, a prosecutable offence to harbour an illegal immigrant, though hundreds of thousands were deported last year, some even by air, at the taxpayer's expense. Mr Celler, chairman of the House Judiciary Committee, hopes, by holding an investigation of the "wet-backs," to amend the immigration laws to make it a crime to harbour or give employment to an illegal immigrant.

* * *

Small Business Asks for More

No member of Congress would ever willingly let a small business man with a vote starve into bankruptcy; it therefore seems almost certain that, whatever shape the Defence Production Act finally takes, it will establish a Small Defence Plants Corporation, designed to ensure that as many small business men as possible are invited to dine off defence contracts, and that the rest get enough of the left-overs to keep them alive. At present the distribution of these contracts seems to be much the same as in the last war, when nearly 70 per cent of them were put on the plates of the hundred largest corporations.

There are about 4,000,000 business enterprises in the country and about 90 per cent of them are classified as small, under the official definition which puts any firm with less than 500 employees in that category. Some of these small businesses are, of course, quite big enough to forage for themselves and many of the others are retail and service establishments that make little or no contribution to the country's industrial strength. But if full-scale war breaks out, every bit of manufacturing capacity will be needed; for this reason, and because competition needs encouragement, it can be argued that efforts to save the life of even the smallest company are justified.

One cause of complaint has been that tax concessions, to facilitate industrial expansion for defence, have so far been granted almost exclusively to big firms, a development which, it is alleged, will increase their domination over the national economy. Another is that the growing practice of negotiating defence contracts instead of advertising for bids means that the small firm often gets left out. But the immediate hunger of most small business men arises from lack of metals, such as aluminium and cobalt; prohibitions on their use for certain articles fall especially hard on little firms which may be equipped to make only the forbidden products. The proposed corporation, like its predecessor in the last war, would be expected to ensure that small business men get their fair share of such materials, and of loans for converting to defence production. More important, it would help them to bid for defence contracts and would guarantee their reliability and efficiency to the procurement agencies, who prefer to give contracts to the big firms that they know and trust.

The mobilisation authorities contend that the new corporation is unnecessary and that the small business man is already receiving special consideration. Aluminium cutbacks have been eased in his favour, his interests are the particular concern of a representative in each regional contract office, the pooling and sub-contracting arrangements of the last war are being revived, and the percentage of defence orders going to small firms, which admittedly declined during the first six months of the present rearmament programme, has been rising steadily this year. To this Congressmen reply that the letter of aid for small business men may be there, but the spirit is lacking.

* *

Shorter Notes

Mr Francis P. Matthews, Secretary of the Navy, has been chosen by President Truman to be Ambassador to Ireland. Although he has been offered other diplomatic posts in the past, this is said to be the only one which has ever appealed to him. Mr Matthews has long desired this post, but it is known he left the Navy Department with regret. He is of Irish descent and a prominent layman of the Roman Catholic church, but his main claim to fame is that he is a Democrat from the Republican State of Nebraska.

*

The Charter of the Organisation of American States, which established the first regional grouping within the United Nations at Bogota in 1948, has at last been ratified by the United States. The reason for the three years' delay has been that the United States wished to take a back seat and give other countries a chance to ratify first, as twelve of them have done. Under the charter the organisation was permitted to start work without waiting for ratification.

*

Americans are being forced to realise that the prospect of a truce in Korea will not mean a let-up in the defence effort by the fact that the numbers of young men called up each month under the selective service system are once more rising. And voluntary enlistments which are due to expire during the year have been extended for a further year; however, men whose enlistments were extended by a similar order last year, after the Korean outbreak, will now be allowed to return to civilian life.

*

Housewives are being urged by the laundry trade to dispense with their linen cupboards and to hire their sheets and towels instead. It is cheaper to hire linen than to have it washed although whether the laundries can really make a profit on this basis has yet to be seen. So far the project has been quite a success and the companies are gaining hundreds of new customers each month, but there are still many housewives who are prejudiced against using other people's dirty linen, even though it has been properly washed.

THE WORLD OVERSEAS

The Socialist International

(By a Correspondent Recently in Frankfurt)

IN recent years commentators have so often buried Socialism as a world force that they must find the recent rebirth of the Socialist International slightly improper. The myth that in 1945 Europe was a social democratic continent midway between capitalist America and Communist Russia is mainly responsible for the later legend of a steady decline in Socialist strength. In fact almost one out of every three Europeans regularly votes Socialist—more than ever before. The only serious decline came in France and Italy between 1945 and 1948, and even these parties have rallied in the last few years.

Outside America Socialism is the only serious rival to Communism for the allegiance of the working-class. Recent elections show that progressive Catholicism cannot survive for long outside the main body of the socialist movement. Moreover the very word Socialism has unchallenged prestige as a symbol of utopia. Quite apart from the genuine parties of democratic Socialism, Perón and Vargas in Latin America, Nehru and Thakin Nu in Asia, Herriot and Remer in Western Europe, Nkrumah in West Africa and Communists everywhere, stake some claim to its emotive power.

Socialists have always prided themselves that theirs is an international movement. Now that a Socialist International is once more formally in being, will this vague internationalism be translated into a common programme of action? It is futile to expect anything remotely comparable with the Cominform. Socialist parties are neither spiritually nor politically totalitarian. Few of their members put politics first among their interests, and their policies must be determined by the national climate of opinion in which they work. Previous Socialist Internationals have all collapsed under the first serious strain, leaving chagrin and disillusion as their only legacy.

Indeed, these considerations made the British and Scandinavian Socialist parties most reluctant to recreate the International after the Second World War. In 1945 the Socialist parties were seriously divided on almost every important question of domestic or foreign policy. Apart from the East European Socialists, who were compelled to collaborate with Communists under Russian control, there were powerful sections of the French and Italian parties which made the shibboleth of working-class unity an excuse for continual surrender to Communist initiative at home and abroad. Thus, though most of the continental parties were eager to create an International with mandatory authority over its members, their British and Scandinavian colleagues, now in power at home, shied away from even the moral obligation to submit their policies to collective review.

Nevertheless, the British Labour party recognised its responsibility as the most powerful member of the Socialist community, and on its initiative the parties began a series of informal consultations on almost all problems of common interest. These consultations held largely under the auspices of the so-called "Comisco" (the Committee of the International Socialist Conference), have brought a steady *rapprochement* in attitudes to the developing world situation. By the beginning of 1951 the British Labour party felt sufficiently confident in this broad unity of purpose and in its colleagues' contentment with a purely consultative organisation to propose that the existing machinery be dignified with the name of "The Socialist International."

The Frankfurt Conference revealed how far this unity of purpose has been developed. The Declaration of Aims and Tasks, noted in *The Economist* of last week, was accepted unanimously, though it jettisons nearly all the ideological lumber among which the continental parties still live and move, and which even the Labour party keeps stored away in the attic of its Constitution. In presenting Socialism as the highest form of democracy it rejects completely the Communist claim to any share in the Socialist tradition. The resolution on "Socialist world action in the struggle for peace" commits all parties to support rearmament for collective defence against Communist aggression.

All this is a striking tribute to the value of international consultation in helping Socialist parties to adjust themselves to a new situation: in Europe, at least, the Socialists at last present a common front to the major problems of the modern world. This is a good augury for the new International. But the same Conference showed that it will face its greatest test outside Europe. The Japanese delegation, present for the first time at such a gathering, was clearly unhappy in voting for the Declaration of Aims and Tasks. It abstained on the resolution about world affairs since it favours unarmed neutrality for Japan. The Indian observer, Dr Lohia, expressed similar doubts on both issues. There is a danger that the Asian parties will form an opposition inside the new International.

What kind of Socialism for Asia?

Yet it is Asia, and later Africa, which will offer the International its greatest opportunities. All the developing nationalist movements have settled on Socialism as the slogan for their domestic policy, though they are divided between European and Soviet claims to represent true Socialism. In the existing social democracies of Britain and Scandinavia they see more to admire than to imitate. In many cases, the techniques of Russian and even more, Chinese, Communism, seem more appropriate to under-developed areas than Western methods which demand a high level of civic responsibility and administrative efficiency.

There is a danger that if the European parties overstress their new-found pragmatism the Asian parties will turn to more exciting prophets. On the other hand the prestige of an international organisation is always greatest among its weakest members. The British Labour party lends all the splendour of an imperial tradition to its fraternal parties in the East. If the new International takes a really vigorous initiative in the next few years in Asia it may make a great impact on world politics. But it cannot do so without a greater sacrifice of time and money than its members will spare at present.

It is also important that the Socialist International should work at least in harmony with the International Confederation of Free Trade Unions. The latter has already been active in Africa and Asia, where trade unions often form the best basis for any political organisation. There is little in the Socialist Declaration which need offend the American unionists who play a leading role in the Confederation, but the Confederation's determination to keep the unions out of politics may prevent it from accepting the Socialists' offer of co-operation.

The Ukrainians in Trouble

IT is curious that *Pravda* should have chosen the very time when a "Decade of Ukrainian Art and Literature" was being held in Moscow—usually a friendly affair—to launch an attack on the "nationalistic deviations" in Ukrainian art. At first, it is true, the blows were weak: the writer and chairman of the Ukrainian Parliament, A. Kornieytchuk and his wife—the former Polish writer and politician, Wanda Wasilewska—were reprimanded for failing to portray the Polish nobility and all that it stood for in their libretto on Chmielnicki, a seventeenth century Ukrainian hero. Soon, however, the blows fell thick and fast. Ukrainian painters were accused of ignoring in their canvases the subject of Soviet friendship, while even the choirs were blamed for not including Russian and, say, Georgian songs in their repertoire. Now, in the strongest assault so far made, the Ukrainian party leadership itself has been attacked for lack of vigilance. All this, apparently, because there has been published a Russian translation of a poem "Do love the Ukraine," which was actually written seven years ago by the Ukrainian poet, V. Sosyura.

The heart of the matter, however, lies elsewhere. The poem in question is nationalistic; or, as *Pravda* put it, any Ukrainian nationalist, even on the other side of the fence, would entirely agree with its sentiments. The Soviet leaders are now gathering the harvest from the seeds of nationalism they themselves sowed during or immediately after the war. The rulers in the Kremlin shouted "Long Live Russia" and apparently expected that a cry of "Long Live the Soviet Union" would come ringing back from the other republics. Now, when a cry of "Long Live Armenia" (or Ukraine) comes back they seem genuinely astonished and indignant. Until quite recently the worst sin Soviet writers and artists could commit was cosmopolitanism, since it smacked of connection with and "subservience" to the west. Now that it has been realised that nationalism in its regional form may be a strong disruptive force it, too, is put forward as a major heresy.

Rebuke to the Party

The Ukrainian episode is not unique; it has been preceded by other anti-nationalist attacks. Thus, the Azerbaijani intelligentsia was recently accused of nationalist deviations because of its cult of Shamyl, a local hero in the time of the Crimean War, who not long ago was considered as such in Russia, but now is referred to as an agent of British imperialism. Armenian writers have been accused of taking refuge in and idealising the past, while the Estonians, incorporated not so long ago, have been censured for whitewashing their twentieth-century bourgeois statesmen.

Where the Ukrainian affair differs from precedent is in its scope. In other cases the matter was patched up on the spot through the local party channels. This time the party itself is accused of harbouring the nationalist intelligentsia. The unsigned article in *Pravda* was probably prepared by the Central Committee of the All-Soviet Party, and it was republished the day after in the *Literaturnaya Gazeta*. In the same article the literary monthly *Zviezda* was also strongly criticised for recently publishing the Russian translation of the poem already mentioned. This recalls Zhdanov's attack in 1946 on modernism and cosmopolitanism in Soviet art, for then, too, *Zviezda* was among the first censured.

That the main weight of the offensive was directed at the Ukraine is not surprising, for the latter has always been considered as the main centre of nationalism and resistance to Moscow's decrees. It was there that resistance in the villages against collectivisation was strongest in 1932-33. There, too, the central authorities had most difficulty in re-establishing order after the end of the war. It is rumoured that the additional drive for collectivisation now being carried out in the Soviet Union meets the strongest opposition in the Ukraine; and some observers would attribute to peasant discontent the non-fulfilment by the Ukraine of its planned production figures for certain agricultural products such as eggs, milk, vegetable fats and cotton.

The central government will certainly do everything in its power to prevent discontented peasants from finding allies in a discontented nationalist intelligentsia; and since the party itself has been attacked, the possibility of a purge among the higher officials of the Ukrainian party is not to be excluded. Yet, whatever happens, the Ukrainian and other Soviet writers and artists have been warned to steer between the Scylla of cosmopolitanism and the Charybdis of nationalism.

Birth Control for India

[FROM OUR CORRESPONDENT IN INDIA]

AT the end of last week Mr Nehru, the Prime Minister of India, said that he favoured birth control. "From being the fad of some individuals in India," he is reported as stating, "this has become one of the important issues before the country. It seems clear that the state must encourage family planning." This was not the first time that Mr Nehru had alluded to the subject in public; in April, for instance, he announced that the government was studying methods of curbing the rapid growth of India's population which has risen by 42 million in the last ten years. But he had not before spoken out so strongly and so publicly. And, while the threat of severe famine in Bihar has undoubtedly brought the problem into the forefront of people's minds, the Prime Minister deserves the highest praise for giving such a clear-cut lead.

The lack of outcry at Mr Nehru's statement is significant of the whole change which, in the last few years, has come over the attitude of educated Indians to their country's population problem. Before the war they talked of the country's unlimited resources or, like Mr Nehru himself once, questioned the census figures. Now they realise that in the race between production and babies, it is vital that production which has lagged so far behind should catch up, if their fellow countrymen are to achieve a tolerable level of well-being. In some ways, India is fortunate. The annual rate of increase, 1.3 per cent, is not impossibly large; indeed it is less than that of, say, Germany in the 1890's, and the birth rate has probably dropped by 5 or 6 per 1,000 in the last decade until it may now well be below 30. Moreover, there is in the Hindu religion no such absolute bar to contraception as in many Christian creeds.

There are nevertheless many factors, spiritual and material, which stand in the way of the spread of birth control. Muslims object to it because they have learnt from the Koran that the more Muslims there are, the better, and Hindus because they require a son to perform their rites after their death. Although adoption is usual when there are no male heirs, in a country where infantile mortality is so high a reserve or two is, naturally, felt to be advisable. There is, moreover, the influence of Mahatma Gandhi and his preference for *brahmacharya* (abstinence) over contraception. Mr Nehru, on the other hand, modern in this as in so many other ways, has no such views; he recently said that he would like to see a branch of the Family Planning Association (FPA) in every town and village.

Contraceptive work has indeed begun, although on a very small scale. In 1947, the Family Planning Association, which is affiliated to the All India Women's Conference, opened two free planning clinics in Bombay city; these have been followed by five others and altogether 3,000 women have attended them so far. Work has now begun also in Hyderabad, Poona and Madras. There is clearly still a very long way to go, but an important step forward was recently taken

with the appointment of Lady Rama Rau, the wife of the Governor of the Reserve Bank and the President and creator of the FPA, as representative of her association on the Health Panel of the Planning Commission.

Spreading birth control among the ignorant and the superstitious poor is an ungrateful task. Yet if India is to wait for the example of the urban middle class to permeate the village, it may take a long time. Inevitably, however, it is the townswoman with whom the campaign must begin. She is better informed, easier to reach, less shy, less terrorised by her mother-in-law, less susceptible to the slur of apparent sterility than her sister in the countryside. Besides, children are a far greater nuisance in a town. And going to a clinic is less conspicuous; neither neighbours nor husband need know about it. So far the FPA has concentrated its propaganda on medical students, nurses and doctors, and in certain industrial areas. A favourite method is the instructional film, including the American film "Studies in Human Fertility." The main handicap of the association is the shortage and expense of appliances; so far they have not had much more than one $50,000 consignment from the Watumull Foundation, but even so the duty to be paid practically drained their funds.

For family planning to be effective—and family planning is perhaps India's number one long term priority—it is not enough to rely on the goodwill of a handful of selfless volunteers. The government will have to play its part, not only in the towns but primarily in the countryside. All midwives will need to be trained and equipped in contraception, and schools used as a propaganda medium. Just to show a film or two is mere optimism; if the effort is to be serious, every government servant down to the postman and the private in the army will have to be instructed. Only thus can the village be reached, and the thousand ramifications of the joint family system ensure the effective spreading of the information once it has been made available.

France in Search of a Government

[FROM OUR PARIS CORRESPONDENT]

THE six main groups in the French National Assembly (or five if the Communists be excluded) are now busy about the task of investing a prime minister. It seems likely that President Auriol's first choice will fall on M. Petsche, an Independent; and it is clear that the ability of M. Petsche —and of most other potential prime ministers—to win sufficient votes (314) to be elected, depends on the support of the Socialists who have already made known the price of their participation. Any government in which they take part must undertake, first, to improve immediately the purchasing power of the workers by means of a sliding scale of wages and tax reforms which redistribute the national income; secondly, it must keep its hands off the social security system and the nationalised industries; and thirdly, it must maintain intact the system of lay state schools. The first two items are contentious enough; the third antagonises all other groups except the Radicals and the Communists, and perpetuates the disastrous cross-current that prevents the formation of a genuine French Left. For, through it, the MRP, the only other *parti social* (excluding the UDSR fragment of the Radicals), remains inevitably at loggerheads with the Socialists, to the lasting pleasure of the economic conservatives and, of course, of the Communists.

The solution of the schools question is indeed part of the essential minimum national programme which, as the Gaullists point out, should be above party. In the past legislature a Catholic demand for assistance to their schools was voted down. The MRP now asks that the schools question should again be put to open vote, with the Socialists agreeing, as the MRP previously did, that the matter is "non-governmental." This time, with 120 Gaullists in the House, victory for the Catholics would be certain. It is too simple to represent the schools issue as purely doctrinal, for it contains a real cleavage of practical interest. The anti-clericals know that subsidies to Catholic schools will be the thin end of a wedge that can be driven into the heart of their party-system. The Socialists, for instance, whose popular support south of the Loire is much more from school-teachers than from the workers, would ultimately lose part of their following. The Catholics, on the other hand, fear that if the present economic misery of teachers in the free schools is allowed to persist, they will eventually find difficulty in recruiting priests.

The Gaullists have made the schools question the subject of their first parliamentary draft bill. It lays down that families should be given education-vouchers (*allocation-éducation*) with which they could educate their children as they wished. Family educational committees should then be given official status to supervise the system; on these committees would sit representatives of the family-associations, of the Ministry of Education, of the free schools and of youth organisations. The MRP has proposed that the State should guarantee the gap between the pay received by Catholic teachers from Catholic sources and the state minimum wage for the school-teachers of the various grades. In face of the very conservative character of the new Assembly—it contains more Right deputies than any other since the "sky blue chamber" of 1919—it is possible that the Socialists and MRP will decide that the quarrel is not worth the candle.

Plight of Catholic Teachers

Apart, moreover, from the question of principle involved, the Catholic teachers who before the war could be supported by the contributions of a wealthy provincial bourgeoisie, are in themselves a fairly large depressed economic class, in fact the worst-paid of the liberal professions. Now the state schools are jammed full and the free schools act as teachers continue more strongly than ever. In some places the state schools are jammed full and the free schools act as *de facto* auxiliaries to them: in others, where doctrine decides, the visitor sees a large empty state school while the free school is crammed to overflowing. This state of affairs is typical of what French democracy is almost powerless to alter.

Granted even a solution of the schools question and therewith the solidarity of the non-Communist Left who will be included in the governmental coalition, everything depends upon whether the hundred Independents will opt for General de Gaulle (thereby making an opposition bloc with an absolute majority) or for the centre parties. At the time of writing it appears that de Gaulle is again in the wilderness, for the Independents like neither his high-sounding programme of constitutional reform (presidential republic, etc.) which remains at the head of the RPF's programme, nor the *association-capital-travail* with its profit-sharing features. The RPF therefore risks being left split into its two aspects; a left-centre, rather demagogic republicanism in the towns (where those who despair of "justice" have voted for "order"), and a Catholicism of the Right in the country. The Catholicism of the Left belongs definitely to the MRP, whose ranks have been swollen by the increasing number of new poor who before the war would have been economic conservatives.

As already noted, a sincere social and economic policy is found only among Socialists, MRP, UDSR, and a good number of Gaullists. Were it not for the religious red herring of the schools question the Radicals would be shown up as the economic conservatives that they are. If "Presidential Gaullism" has conclusively mis-fired (and it very much looks like it), the Gaullists may decide to strengthen and penetrate the centre group. But here again there are complications. For the totally impossible feature of centre policy is the Socialist defence to the last ditch of the nationalised industries and the financially ludicrous social security system. But the main critics of these are people like M. Paul Reynaud, who are backwoodsmen when it comes to social policy; and so it goes on round the mulberry bush.

Perhaps the one thing that would really change the political climate would be a practical tax-reform. The Socialists are proposing a super-tax on high incomes, a differential tax on companies' profits according to the modernisation undertaken in the industry, and an increase in the production tax to make up the budget deficit. In October, when the 1951 deficit becomes evident, and at the end of the year, when France has to project the financing of its ten further divisions, taxation will be a fiercely burning issue. At the moment the politicians are faced with the dilemma of whether to tackle financial issues honestly in advance and in so doing risk the collapse of the coalition almost as soon as it is formed; or whether to shelve the whole business until after the holidays when the parties "condemned to live together" will have already agreed on some points of policy.

German Shipbuilding Unshackled

[FROM A CORRESPONDENT]

THE Allied decision to lift all but a few restrictions on German shipbuilding was received with enthusiasm in German shipping circles, in spite of the difficulties attending the rebuilding of a German mercantile fleet.

From a prewar total of 4.2 million gross registered tons the German merchant navy at the end of 1950 had shrunk to 255 ships (including vessels under 500 grt) of just over 500,000 total gross tonnage. With the ceiling of 1,500 grt and 12 knots imposed by the Potsdam agreement, shipowners were forced, in the postwar years, to concentrate on coastal ships. Even when the Washington and Petersberg agreements of 1949 increased permitted tonnage to 7,200 grt the unaltered speed restrictions still made it uneconomic to build overseas liners. Tramp ships and small liners for European trade continued, therefore, to be built, although a few big shipping companies boldly contracted for a few liners for service between Hamburg and North, Central and South America.

Expansion now depends on the capacity of the shipyards and available supplies of materials and capital resources. The present capacity of the German yards is roughly 400,000 grt, i.e. 50 per cent of its prewar capacity. Any extension of that capacity still remains subject to the permission of the Military Security Board.

After all restrictions on shipbuilding for foreign accounts were lifted in September, 1950, important orders were placed, in particular, by Norway, Sweden, Denmark and Holland. These orders were welcomed, but great care was taken not to prejudice German orders, which were known to be imminent in view of the expected lifting of all restrictions. An agreement was accordingly made with German shipowners—the best clients of the yards in normal times—whereby enough slips were reserved for them. Presently the yards were buzzing with activity and output rose from 17,200 gross tons in 1949 to 140,000 gross tons in 1950, for both German and foreign accounts. For 1951 one can reckon with an output of 320,000 gross tons, which will be chiefly for German account. Shipbuilders expect to be able to satisfy both home and foreign orders in the future.

The recent worsening of the situation in the raw material and supplying industries has caused delivery dates to be somewhat postponed. The Federal adviser on raw materials, Dr Friedrich, has, however, recently announced that shipbuilding would be accorded high priority in the allocation of raw materials, and an agreement has been reached between rolling mills and shipbuilders, guaranteeing a steady supply of plates. With capital from the ECA as well as German sources, work has begun on a three-metre plate mill at Hoerde, which will replace the dismantled five-metre armour-plate mill. The most modern of its kind in the world, this plant will produce 18,000 tons a month, and will be in operation in about 18 months.

The most important question is: where will the vast capital required to finance the new shipbuilding programmes be found? To provide an incentive the Federal Government has exempted from tax all non-interest-bearing loans to shipbuilding. This has attracted a limited amount of capital, but only in smaller companies. The big liner companies have hardly benefited at all. This is only too natural since other more profitable investments can easily be found. Moreover the cost of a big liner ranges from DM8-10 million and lenders prepared to grant non-interest-bearing loans to that amount are hard to find.

The second gesture made by the Federal Government to stimulate shipbuilding has been the earmarking in the 1950 budget of DM100 million for loans for shipbuilding. Everyone is eligible who lost a ship after August, 1939, and who, after November, 1949, either contracted with a German yard for a ship to replace it, or acquired a merchant ship abroad. The loan covers up to 40 per cent of building or refitting costs and is only granted if adequate proof is given that further funds are available. Extremely favourable conditions of repayment are attached, making allowances for any losses suffered in the previous year. The immediate result of this decision was that several old companies which had suffered war losses were quickly bought up by new enterprises desirous of qualifying for the loans. But these government loans could only finance a very modest programme, especially as the restrictions were still in force; a so-called "*Anschluss*" programme had to be set afoot later to supplement foreign orders, so as to use the full capacity of the yards and avoid any interruption of production. The pre-financing of both programmes was guaranteed by the *Laender* banks which showed great understanding of the situation.

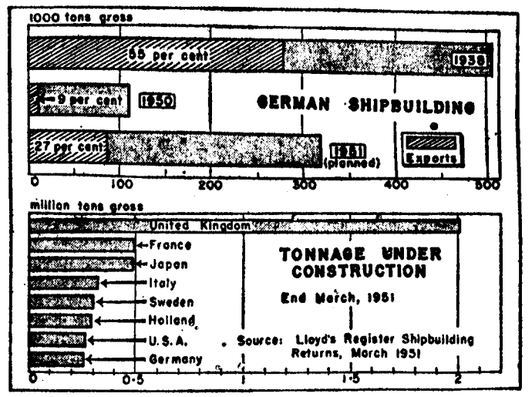
FOR SALE

VANCOUVER, CANADA

INDUSTRIAL PLANT

REINFORCED CONCRETE BUILDING CONTAINING APPROXIMATELY 50,000 SQUARE FEET CENTRALLY LOCATED IN ZONED HEAVY INDUSTRIAL AREA.

Buildings presently occupied by owner, manufacturing heavy machinery who plans moving to larger premises.



Building provides adequate office space, heating plant, outside parking. Suitable for use as sales and service plant manufacturing, warehouse, etc.

PRICE

$275,000 CANADIAN FUNDS.

APPLY BOX 690 THE ECONOMIST

On April 7th the Federal Minister of Finance, Dr Schaeffer, on a visit to Bremen, revealed that he had earmarked another DM100 million in the 1951 budget for shipbuilding loans. As the *Anschluss* programme has already absorbed more than half that amount, a little less than DM50 million is now left for the new programme. But meanwhile the situation has changed radically: the abolition of all speed restrictions now makes it profitable to build fast and efficient ships able to compete everywhere, and particularly in the North Atlantic, with ships of other flags. This means that the remaining 60 per cent of the cost will be easier to find. Moreover, the north German *Laender* which are directly interested in the shipping industry, are now trying to advance considerable sums to shipowners.

The plans so far known of big liner companies like Hapag and Lloyd show that they contemplate the building of an efficient liner fleet totalling about 200,000 grt of cargo vessels. These will have passenger accommodation, and will range from 8,000 to 10,000 grt with a speed of 16 knots. There can be no question yet of passenger ships, and very few tankers have been ordered, since a modern tanker, to be competitive, needs at least 15,000 tons and a speed of 18 knots which are beyond present possibilities. It can safely be forecast that the shipping industry will be content with no less than the complete removal of the last restrictions on shipbuilding and will, in the coming months, press for freedom to increase yard capacity by modernising some of the yards and rebuilding others that were dismantled. The question of dry dock capacity—which in Hamburg sank from 268,000 tons in 1939 to 57,000 tons in 1951—is also bound to be raised. Considered as an extension of yard capacity it still remains under Allied control. Yet the Germans claim that it is essential, not only for German but also for international shipping, that it should be freed from restrictions as soon as possible in order to avoid unnecessary delay in ship repairs.

Finland After the Elections

[FROM A CORRESPONDENT RECENTLY IN FINLAND]

THOUGH the results of the Finnish elections have been described by Moscow as "deeply satisfying," the Finnish Communists do not altogether conceal their disappointment. They had made a really big effort to recapture the position they had held immediately after the war, when they were equal in strength to the Social Democrats and Agrarians. As the total poll fell to 73 per cent from nearly 80 per cent in 1948, and as every other party was weakened through abstentions, a slight increase in votes enabled the Communists to capture five more seats. They and their allies joined in the People's Democratic League, will have 43 out of the 200 seats in Parliament. The Social Democrats retained a comfortable lead, however, with 480,000 votes and 53 seats (54 in 1948). The real losers were the Agrarians, whose representation dropped from 56 to 51 seats. The Conservatives also lost five seats, but all of them were snapped up by the new People's Party, a curious mixture of Liberals, Young Conservatives, and former totalitarians now converted to democracy. The gain of five seats has, of course, added weight to the Communist demand for a share in the Government, from which they have been excluded since the summer of 1948, but so far it has been ignored. In any case the present Government will stay in office until September, and if meanwhile the two Government parties, the Social Democrats and the Agrarians, are able to agree on a joint economic policy, there would be no reason for changing the coalition.

But it is far from certain that the Government parties will succeed in this task. They represent largely opposing economic interests—working-class consumers versus agricultural producers—and their rivalry during the last fifteen months has been one of the main causes of the inflation that today besets Finland in a form even more pernicious than in the immediate postwar period. Paradoxically, the Finnish economy is at present basically sounder than at any time since the beginning of the war. During the first half of this year the index of industrial production rose by ten points to 166, compared with 100 in 1938; exports exceeded imports, and though import prices increased by 12 per cent, unprecedented western demands for timber, pulp, and paper pushed export prices up by as much as 49 per cent. Reparations to the Soviet Union have also ceased to be a burden, and only 8 per cent remain to be paid.

Bids for Workers' Votes

The benefits which should have accrued to the Finnish people from their productive effort and the exceptionally favourable terms of trade have been dissipated by the reckless struggle for power between the three big parties. Inflation in Finland is political in origin. The Agrarian Government has found it necessary to reward its supporters by raising the price of farm produce, while the Social Democrats and the Communists have been outbidding each other in their efforts to buy working-class votes with wage increases. Since the beginning of last year industrial wages have in fact gone up by 55 per cent, and have soared well above prices. An economic "truce" concluded by producers and workers last spring, which freezes both prices and wages until the end of September, has granted the Government a breathing space in which to prepare a long-term stabilisation programme. Meanwhile, however, last year's wage increases as well as the higher prices of imported raw materials are only now making themselves felt in production costs, and industrialists are only waiting for the end of the truce to put their prices up.

Even Social Democratic economists admit that prices should be allowed to catch up with wages to correct the present unbalance, before further automatic wage increases, occurring with every rise in the cost of living index, can make any sense. Before the election, trade union leaders would not hear of such things, but they may be in a more constructive mood now, and, as one leading Finnish politician has put it, at least the psychological conditions for co-operation have been created. In any case, the Social Democrats have made it quite clear that they will in no circumstances join a government with the Communists, even if the present coalition breaks up; and though the Agrarian leaders are not equally firm, an exclusive alliance of farmers and Communists has little chance of survival.

Whatever the composition of the Government, however, the fact remains that the Communists, who in the trade union elections of last April received nearly 90,000 votes out of 200,000, will be able to menace any programme of economic stabilisation by direct action in the industrial field. There is a genuine revolutionary tradition among Finland's working class, and the fact that the Soviet Government has not tried to subjugate Finland by force makes it difficult to convince a radically-minded worker that every additional vote for the Communists may weaken his country's independence.

A New Class on the Cotton Farms

[FROM A CORRESPONDENT LATELY IN THE SUDAN]

THE Sudan is enjoying the most prosperous year of its existence. This is, in the main, due to an abundant cotton crop, but grain and gum arabic are also so plentiful that the Sudan railways have not been able to move the harvests quickly enough. The total weight of all cotton picked to the end of June was 1,995,887 kantars out of a total estimated yield of just over 2,000,000 kantars for the crop year 1950-51. The corresponding figure for 1949-50 was 1,341,955 kantars. While such a yield means a healthy budgetary position for the Government, it also gives rise to some social problems that suggest future difficulties. These arise particularly in the vast area of the Gezira Cotton Board's estates south of Khartoum, where a new class of relatively rich tenant farmers is being created, without any certainty that adequate provision can be made to bolster its new living standards against bad years.

The Gezira Cotton Board farms slightly more than 1,000,000 acres of land irrigated from the Sennar Dam. The current harvest is the first since it was nationalised last year. The profits are divided between the tenants and the Government, each getting 40 per cent; the remaining 20 per cent goes to the Board itself for operating costs and reserves.

The 1950 cotton crop gave a profit of £5,527,000 to the Syndicate. (The tenants had an equal sum divided among them and the Board's share was £2,763,000). The first year of nationalisation is, thanks to the prevailing price of cotton, expected to yield the Government about twice as much as the Syndicate received last year.

There are 25,787 tenancies, each consisting of 40 acres, and each plot gave its tenant about £250 profit last year, in addition to the five acres of *dura* and the five acres of ground nuts or *lubia* (a local bean crop) which can be grown on the ground resting from cotton. From the current harvest, each tenancy should get about £400 from cotton alone—considerable wealth for a simple community. It is hoped that many of the tenants, who remember the black years in the early 'thirties when large numbers of tenants deserted their holdings, will deposit some of this wealth in the banks or even under their earthen floors; but as a large part of the money must find its way into the markets, prices are likely to rise steeply, in spite of everything the Government can do. This may disturb the wage agreements which have been, and are still being, laboriously worked out in the country.

New Social Class

In poverty, these peasants were rooted in the soil and suffering of their environment and history. In prosperity, they now emerge as a new class created by a profit-making social experiment. Their emergence can be remarked in villages where a new brick wall has gone up garishly among the brown clay houses, in the additional gold bracelets on their wives' wrists and their reluctance to send their womenfolk, as formerly, into the fields to pick cotton. A scheme which, particularly since nationalisation, has the stamp of a socialist experiment, is creating another class. If, however, the Gezira plan lies slightly to the right of socialisation, its Board being independent of the Government, the tenants are

Can *figures* make you short-sighted?

Burroughs sees farther

THE EYES of a business are in the office. It will be operating half-blind if delays and bottlenecks in this department interrupt the flow of vital facts and figures. The fault generally lies in obsolete figuring methods—and the price a business pays in rising office-costs can upset its whole planned economy.

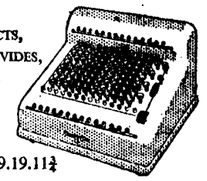
Call Burroughs today, and clear the cobwebs from your calculating. There'll be a Burroughs business machine to fulfil your requirements exactly, giving your business vital facts and figures when they're wanted, and in the way they're wanted.

For a start, enquire about models 51435 and 51455—the British-*made*, key-driven, non-listing adding-calculating machines.

You can count on Burroughs

ADDING • CALCULATING • ACCOUNTING • STATISTICAL MACHINES

The new Burroughs factory at Strathleven, Scotland, is now turning out an ever-increasing supply of business machines for home and overseas markets.



BURROUGHS ADDING MACHINE LTD.,
AVON HOUSE,
356-366 OXFORD STREET, LONDON, W.1

Factories:
Nottingham (Est. 1898); Strathleven, Scotland

ACCUMULATES GROUP TOTALS AND GRAND TOTAL

Where a grand total of individual results is required, the Duplex adding-calculator gives the maximum speed, simplicity and accuracy.

Special features are: positive registration of full key values, a column lock that prevents operating errors, direct subtraction without use of complements.

ADDS, SUBTRACTS, MULTIPLIES, DIVIDES, ACCUMULATES.
13 COLUMNS OF KEYS.
CAPACITY:
£9,999,999,999.19.11¾

BURROUGHS ELECTRIC DUPLEX ADDING-CALCULATOR

subject to a discipline which is nearer to the spirit of collectivisation than the freedom of their village life suggests. They plant ten acres of cotton, five of *dura* and five of ground nuts or beans, leaving twenty acres fallow, but the how, when and where of planting is rigidly laid down for them by the Board's inspectors.

The important fact is that the discipline of their agriculture contrasts with their freedom in other respects. Perhaps the Russians would say they are becoming kulaks. They like money and they like to employ others to work for them, and, as they see how profitable their land can be, they have an increasing attachment to it. It is noticeable this season, for example, that the tenants' families have gone back into the fields themselves because they could not hire enough labour.

It is clear that the emergence of this social pattern in the Gezira is fraught with some dangers. There is the possibility of a cotton slump coming so late that the tenants and their families have become too accustomed to their higher standards of life. The Cotton Board has a tenants' reserve of £900,000 which can rise to £3,000,000, but it is already doubtful whether the full reserve could cushion these people against a slump. There is also the problem of sons who would like to be tenants like their fathers, although as yet there is not enough water to irrigate more land. Finally, there is the problem of machinery. The Board knows that, with the exception of cotton-picking, it can do everything which is done by hand in the Gezira fields by machinery, but that the efficient use of machinery needs a greater area of operation than the 40-acre plot. It can be used with diminished efficiency on the plots, so that the social pattern of the Gezira is preserved; but, were it so used, the inefficiency would hardly be proof against the demands of a bad season which required economy of operation. If, on the other hand, machinery were put to work on larger, economic areas, the *raison d'etre* of the tenant would cease to exist. His attachment to his particular piece of land would be lost, the village unit largely destroyed and, for better or for worse, he would find himself a worker on a collectivised farm stretching over 1,000,000 acres.

Vietminh Looks Ahead

WHILE France, with American assistance, is trying to build up non-Communist governments in Indo-China, which it is hoped will ultimately become strong enough to stand on their own feet, there are as yet no signs of an end to the war carried on by the Vietminh "resistance" against the French and the Vietnamese supporters of Bao Dai. The struggle has recently, however, assumed a new aspect. The victories won by General de Lattre de Tassigny have dashed Vietminh hopes of an early successful outcome to the war; heavy losses were incurred in determined attempts to capture Hanoi and the failure of the effort certainly had a depressing effect on morale. Economic production in the Vietminh-controlled areas also suffered from the mobilisation of large numbers of peasants. As the war had already lasted so long and had imposed such a severe strain on the masses of the people, the Vietminh would probably have begun to go to pieces if it had been nothing but an ordinary nationalist movement. That nothing of the kind has so far happened may have been due in part to the general distrust of French promises and to the loyalty which Ho Chi-minh inspires as an uncompromising and incorruptible national leader. But it has been due even more to the strong organisation and discipline of the Vietnamese Communists, to the fanatical fighting spirit with which their cadres are imbued, and to their ideological outlook which makes their local struggle only a sector of a world conflict far transcending it in importance.

The measures taken to counteract the weakening of the Vietminh after its recent reverses have comprised, first, a sharp differentiation of the Communist party proper, known as the Lao Dong, from the broader Vietminh Front in which it was formerly merged; and secondly, a revision of the political line so as to lay greater stress on the long-term and international aspects of the war in Vietnam. It is admitted that the war has become "more difficult," but it is claimed that the French power is only a part of the "imperialist" camp which is gradually collapsing under the pressure of the "world peace movement"; thus ultimate victory is guaranteed for the Vietminh by its international alliances, provided it preserves its organisation intact and keeps up the fight against the French.

This propaganda of the certainty of ultimate victory explains actions which may seem quite fantastic if their aim is not properly understood. Thus, with active military operations going on in various parts of Vietnam, and among a peasant population with only the vaguest notions of anything outside their own villages, the Vietminh has been organising the collection of signatures in support of the World Peace Council and the appeal for a Five-Power Peace Pact, and its radio proudly announces the numbers of signatures alleged to have been obtained. This is one of the means by which it is intended to make the Vietnamese man in the street (or more often, in the rice field) feel that the Vietminh is solidly united with a world power of boundless strength arrayed against France and America. Similarly the greatest publicity is given to exchanges of greetings between the Vietnam and Korean Peace Committees, to messages to the Chinese Communist party on the occasion of its 30th anniversary celebration, and to the dispatch of a delegation of the Vietnam Youth Federation to the World Youth Festival in Berlin. The Youth Federation, according to the Vietminh radio, has everywhere been holding meetings and study groups to explain to the people the importance of the World Peace Council and its work. It is against such a background that the Vietnamese are being exhorted to stand firm against "the American imperialists and their accomplices."

> The Vietnam revolution which the people support will certainly be victorious. . . . The policy of the puppets and the traitors [Bao Dai and his followers] remains fixed on the plane of mercantilism. What precisely do they want to sell? Simply the bodies of their compatriots to those international traffickers in human flesh, the Americans.

Support for the French

The Communist effort to internationalise the Vietnamese nationalist cause has, however, a counterpart on the other side, for the French have been getting some co-operation from both Vietnam Chinese and Siam on an anti-Communist basis. The Chinese community in Indo-China has been torn by dissensions between the local Communists and Kuomintang organisations, which survive here as elsewhere in South-east Asia; and as France has not recognised the Chinese People's Republic, the French and Bao Dai authorities are able to get substantial co-operation from anti-Communist Chinese. In Bangkok the unsuccessful rising against the government of Marshal Pibul Songgram, in which Communist influence was a factor, has apparently stiffened the Siamese official attitude towards the Vietminh as a carrier of Communism, and the Vietminh delegation has been expelled from Siam.

There is no reason to expect any cessation of pressure on the Indo-China sector of the Asian Communist frontier, whether there is any Chinese armed intervention or not. In the near future the position can only be held by keeping a French army in the field, and hopes of getting it back to Europe are slight indeed, unless it is intended to abandon Indo-China, with all the inevitable consequences to Siam and Malaya as well. In the long run there is no reason why viable non-Communist regimes should not be built up in Vietnam (and in Cambodia and Laos); the first condition, however, is that the Vietminh propaganda of inevitable victory should be deflated, and this depends as much on events elsewhere in the Far East, and in the world at large, as on what happens in Indo-China itself.

Dictaphone TIME-MASTER recording is perfect from beginning to end

YOU WANT absolute accuracy—and you get it when you use a Dictaphone Time-Master for your dictation.

There's no fading or distortion of your words when your secretary transcribes. For Memobelt recording is crystal-clear from beginning to end—far, far more dependable than either notebook-and-pencil systems or any other dictating method.

The reason? Simply—cylindrical recording. Those plastic Memobelts that you can file flat or mail by the dozen in an envelope, are virtually cylinders when they are in the machine.

CONSTANT RECORDING CLARITY

Cylindrical recording means crystal-clear dictation from beginning to end; it means constant recording speed; and it means that back-spacing too is uniform—and therefore simpler.

ONLY THE TIME-MASTER OFFERS ALL THIS

1. Streamlined machine, only 4¼ ins. high, slightly larger than a letterhead. 2. Uniformly clear recording and reproduction. 3. Uniform back-spacing, immediate place finding. 4. Simple automatic operation. 5. Mailable, filable, expendable Memobelts, low-cost plastic medium. 6. Nation-wide service, Dictaphone dependability.

Write for TIME-MASTER literature to Dictaphone Co. Ltd. Dept. O., 107 Kingsway, London, W.C.2.

WHEN IT'S A QUESTION OF TIME . . .

How do your workers find the time?

Do your employees confer anxiously as break and finishing times approach, taking time off to find out the time?
Time searching costs industry far more than it should, especially as workers are apt to believe the fastest clock when it is a question of finishing the day's work.
T.R. Time Control puts an end to this and many other kinds of time loss in industry. The showing, sounding and recording of the correct time all the time is only a small part of what T.R. Time Control can do to make the time you pay for more productive. Spend a profitable moment now to write for full particulars.

Transport and Costs

THE four hundred and forty-six pages of facts and figures in the British Transport Commission's report for 1950 provide a heavy meal, even for expert appetites. The broad story they have to tell had already been made fairly clear in the cases that the Commission had put before the Transport Tribunal for higher charges. Total net revenue rose from £31.3 million to £40 million, but after providing for interest and other charges there remained a deficit for the year of £14.1 million. In purely financial terms, this was a marked improvement on the deficit of £20.8 million in 1949; but by the end of 1950 the Commission had run up a total deficiency of £39.6 million on revenue account, and by the end of the current year there may be another £14 million or so to add to it. The prospect that the Commission may be "in the red" to the tune of £50 million or more by the end of this year is a sufficient illustration of the Commission's financial predicament.

The report reveals that the Commission is in a mood to fight back, to launch some serious criticisms of the various restrictions, statutory and otherwise, that have prevented it from achieving more than a precarious balance at best between its ever-rising costs and its relatively inflexible charges:—

> The Commission's transport system is practically alone among the industrial and commercial organisations of this country in that it has little latitude for increasing its own charges. . . . Any organisation working under these limitations is bound, in times of rising prices or falling traffics, to be chronically in deficit.

The truth of this assertion can hardly be denied, at least in the quite exceptional conditions of the last year or two. The Commission was nearly in balance at the end of last year, thanks to the 16⅔ per cent increase in freight charges that became effective in the middle of May. But the application for that increase had been put to the Minister of Transport on November 9, 1949, and it is reckoned that the delay involved a loss of £11 million of railway and dock revenues. Admittedly, the same emergency procedure was greatly speeded up—without the benefit of public hearings—in order to secure the 10 per cent increase in freight charges last April, following the earlier increase in railway wages. But there has been no change in passenger fares, which are the subject of a charges scheme that is at present before the Transport Tribunal and will not be argued, it seems, before the autumn. As for the charges scheme for rail freight rates that the Commission intends to submit to the Transport Tribunal by August 6th—the present limit of time—it is scarcely conceivable that it could take effect until the beginning of 1953, for it will involve radical changes in classification of goods and in the basis of charging by distance that will affect every trading interest throughout the country. The Commission knows well enough what is in store for it:—

> During 1950, the Commission have been faced with lawsuits, appeals to Consultative Committees, a constant propaganda through various organisations, and a great deal of correspondence, when even quite small changes have been proposed.

The two pending schemes will entail far bigger battles. There will be objections on the score that road haulage rates are not covered in detail—the latest report makes it quite clear that this will be so, though this fact seems difficult to square with Section 76 of the Transport Act. And a careful reading between the lines of the report suggests that the need for a general reserve (presumably to be built up after the present revenue deficiency has been made good) will be an important element in the application for new freight charges. It has yet to be seen whether the public will allow the nationalised industries to build up general reserves. And it is not proper for the Commission to apply for higher charges to meet higher costs unless it can show quite convincingly that its internal efficiency is already at the maximum.

On finance, the Commission makes four demands. It requires adequate financial and physical resources to re-equip and remodel the transport system; it complains of serious arrears of investment and of the fact that it is getting less than a fair share of investment resources compared with other industries that are treated with greater favour; it is patching rather than replacing its assets. It has borrowing powers of £200 million in reserve and although its net current assets fell by £45 million last year, they still amount to £155 million. A more generous share of the nation's investment resources is obviously needed to prevent the transport system from

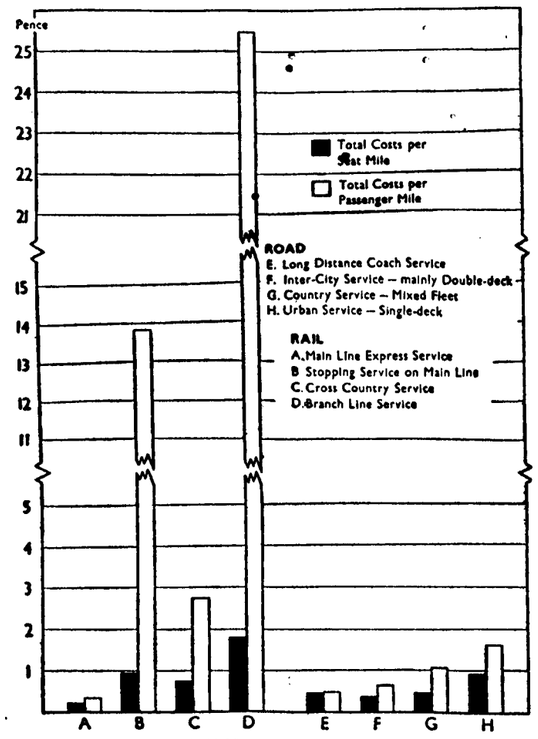
degenerating still further, though such investment could hardly produce a spectacular and immediate benefit.

The second condition is a greater willingness to accept changes "whether in conditions of work or in types of service or in proposals to integrate the Commission's services"; both workers and transport users are exhorted to mend their frustrating and costly opposition. Thirdly, the Commission asks for



> a scheme of public control over the general levels of fares and charges which is both speedy and flexible in operation.

This is a proposition that needs to be studied with great care. It is possible to sympathise with the Commission's complaint that it cannot forever fight a losing battle between rising costs and laggard charges; but it is another matter to deny the value of the Transport Tribunal as the one more or less effective arbiter of public accountability to which any of the nationalised industries has to submit. It is not the fault of the Tribunal—any more than it is the fault of the Commission—that the persistent fall in the value of money makes its procedures so financially embarrassing for the Commission. These are matters that vitally affect the public, and if speed and flexibility were to mean merely that the Commission could quickly obtain all that it asked for without any attempt at public justification, the results would be deplorable. It is here that the Commission seems most convinced of the rightness of its case, and least concerned to concede the principle of safeguards for the public interest.

The fourth argument is also contentious. Transport charges must be recast to recognise the fact that "over a wide field the Commission's services are not a monopoly" and to admit a greater place for competitive principles in fixing charges. This case is at least good to the extent that rates should take greater account of the costs of different types of service and of competition from other forms of transport. Whether the Commission is so little a monopolist as it seems to think is open to argument; but in some important traffics it is undoubtedly a monopolist. Does the new principle mean, for example, that mineral freight, which is cheap to work, should be charged less by reference to cost and more by reference to the fact that only the railways can carry it? It is also unsatisfactory to find that integration between rail and road freight—which can become effective only when the same principles have been applied to road haulage—will still be deferred until after the rail freight charges scheme has been introduced. Integration of public transport remains, it seems, as much a will o' the wisp as ever.

Since the Commission has chosen to put its case for greater freedom to control its revenues and its capital investment with such particular force, it will not resent a number of countercharges on matters of great public importance that find scarcely any mention in its report.

SAMPLE ROAD AND RAIL PASSENGER COSTS

Is it possible, in the first place, that the Commission should have no views at all about the way it is organised and its relations with its Executives? This journal was severely criticised for daring to suggest ten months ago that all was not well with the internal efficiency and organisation of public transport. Since last autumn there have been certain changes in men, but no visible

But later generations dug deeper

When, in 1751, a Swedish mineralogist, Axel Cronstedt, discovered a new metal which he called 'nickel', the Iroquois Indians had been scratching the soil of Ontario for generations. Metallurgy was not of their world, yet beneath them, in the Sudbury District, lay the vast body of nickel-bearing ore which now supplies most of the world's demand for this metal. Today, the total length of underground development in this area is over three times the underground mileage of London's railways. But the need for nickel continually increases throughout industry. To satisfy it, new shafts are being sunk, existing shafts made deeper, new sections opened up, new techniques adopted, the whole world of science brought in to make the greatest use of Axel Cronstedt's discovery.

Capital Security

THE Church of England Building Society now invites investments up to the maximum holding of £5,000. The Society's fully-paid Shares, issued at £25 each, are not subject to Stock Market fluctuations; they are withdrawable on agreed notice being given.

Share interest at the rate of 2½% per annum is received by the investor half-yearly on 31st May and 30th November; the Income Tax on the interest is paid by the Society. Interest is calculated from the date of the investment up to the date of withdrawal.

The Society's substantial assets consist of First Mortgages secured upon carefully valued properties situated in selected districts in many parts of the country. This "spread-over" of mortgages enhances the already solid security enjoyed by our Investing Members.

Since its incorporation in 1882 this old-established Society has never failed to pay the agreed rates of interest at the agreed times, and in spite of wars and crises its stability has remained unshaken. As a medium for the non-speculative investor, who seeks, above all, security of capital, yet desires a reasonable, steady return, it is today an excellent proposition.

ASSETS EXCEED £6,500,000 · RESERVES £330,000

OPEN ACCOUNTS 16,000

We've solved some problems in our time!

In 1927—a Power Station problem. Generators driven by turbines. Turbines dependent on vacuum produced by condensers. Condensers supplied with river water by pumps. Pumps driven by electric motors. And to join the ends of this chain of interdependencies—the motors driven by current from the generators. That circle once broken by stoppage from any cause, the motors had to find power from elsewhere or the turbines could not be re-started.

¶ Obvious answer—a stand-by battery. But batteries idle for long periods are apt to prove work-shy when most needed. We worked out a new system of charging—the continuous feeding of a battery with exactly that fraction of charge which otherwise it must daily lose through standing unused. We called it trickle-charging.

¶ We started something, there. Trickle-charging is universal, now, for stand-by batteries. Our own Keepalite automatic emergency lighting system, using trickle-charged batteries, is in use all over the world.

¶ And the Chloride battery that began it? Dismantled at last after 22 years. Was it worn out? Far from it. Good for many years more service. But the building in which it stood has just been demolished. They're building a new Power Station.

¶ *Our battery research and development organisation, the largest & best equipped in the country—if not in the world—is always at industry's service, ready at any time to tackle another problem.*

improvement in methods. The Railway Executive, which runs three-quarters of the Commission's business, did not enhance its credit either in the way it handled the wage claims earlier this year or in its sudden discovery a few weeks ago that it could not run the summer passenger services that it had promised. The public fears that this debacle is an advance taste of disruption that may be in store next autumn and winter. It has suddenly discovered, in a time of full employment and inflation, when the flow of traffic is abnormal in character and direction, when rearmament adds a further load, when the competing attractions of other jobs are encouraging labour not to join and to transfer from the railway service, that the old fact of too much transport has given place to the new fear of too little transport.

The present mood seems to be that the passenger services are "expendable" in the event of difficulty. It is doubtful whether the panic of a few weeks ago about the summer services was justified; certainly the railways lost much goodwill by it. Already warnings have been given about the difficulties of the coming winter. Are these reckoned to be a spur to the operating divisions to do their best to maintain the winter services? Or is there some other factor behind them? The application for increased fares that is now before the Transport Tribunal will hardly stimulate traffic; the Commission promises to "bear in mind the importance of the lowest practicable level of normal fares" and to reduce fares in carefully selected cases to encourage profitable traffic. A diagram of road and rail passenger costs, based on a sample investigation, suggests that no tolerable increase in fares could make stopping services on main lines and the branch line services as a whole pay their way. The Commission's view is bluntly stated:—

> If the public cannot afford to pay for services of a given quantity and quality at the appropriate level of cost, then the quantity or quality of service offered must be decreased, and the budget must be balanced with higher fares at a slightly lower level of activity.

For certain types of service this may be true; many branch line services are both costly and inconvenient. But it suggests an unwelcome and restrictionist attitude that cannot be allowed to pass unquestioned. If total costs per seat mile and per passenger mile are only a fraction of a penny for the main line express services, why can nothing be done to reduce the costs on other rail services? Their costs will not be improved by driving passengers away; indeed the chart makes it quite plain that improved loading is the only hope for the stopping and cross-country services. To argue that the specialised track, the big power unit, the economy of the long train, and the capacity of the large terminal and marshalling yard justifies a greater degree of specialisation on fast long-distance traffic is perfectly good theory. But what hope is there of slimming the railway system to this scale of operating efficiency? The case for discrimination of charge according to quality of service deserves more consideration than the report suggests.

It is thus an interested, as well as an interesting, case that the Commission has to state—a case in which defects of organisation and policy are tactfully veiled. The Commission seems convinced of the essential rightness of most of the things it is doing, and deplores the wrongness of many of the attitudes of Government, workers and transport users towards its efforts to improve the nation's transport service. Its complaints about charges would be more acceptable if the public were convinced that rising costs were the only factor responsible for the deficit. And its rather remote theoretical approach to some of the crucial problems of railway operations would be more welcome but for the painful fact that the railways are not working well.

Dearer Commercial Credit

THE process of levering up the charges made to commercial borrowers was extended to a further segment of the financial structure at the beginning of this week, following an announcement of an immediate increase in the rates charged by the discount houses and clearing banks for the discount (or re-discount) of bills of exchange—including both bank bills and trade bills. Observers in the City have rightly linked this move with the news, a fortnight earlier, that the clearing banks were embarking upon a roughly simultaneous (though not otherwise specifically concerted) policy of raising their interest charges to borrowers on loans and overdrafts. Rather unexpectedly, City opinion has not, however, jumped to the further conclusion that this quickly following rise in commercial bill rates should be regarded as a sign that the trend towards dearer money will rapidly become still more general, even though some secondary repercussions are bound to develop. That, at least, is the impression conveyed by this week's quite unforeseen strong recovery in the prices of short Government bonds, for these would be vulnerable to any widespread fears of possible disturbance of the basic structure of money market rates—and still more so, of course, to any expectations of change in the long-stabilised Bank rate. On this occasion, the public has achieved a better perspective than usual, or than was to be expected.

For all that, it needs to be emphasised that this further advance in rates, like its predecessor, derives not from any conviction that dearer money may be of itself a necessary and effective means of restraining inflation—or, still less, from any deliberate effort by the monetary authorities to impose it—but solely from the desire of the ultimate lenders to buttress their revenues against the pressure of rising costs. Obviously, these increases in rates, though perhaps not overtly approved by the monetary authorities, have not been forced through in the face of official disapproval; but the authorities, in thus standing aside and allowing the commercial banking system to decide for itself the terms on which it will lend to commercial borrowers, are not really making any new departure in policy. They are merely recognising, in a further sphere, the wisdom of the principle they have followed more or less carefully ever since the collapse of Daltonian monetary objectives—the principle of allowing "natural" forces to decide the level of rates.

Although this principle was applied first in the gilt-

edged market, where it impinged very directly upon the cost of medium and long term borrowings by the Government itself, there is no sign that the authorities are any more disposed to see it extended to the market for their own short term borrowings than they have been at any time in the post-Daltonian phase. Naturally, the clearing banks would be still better pleased with an increase in the return to them from their lendings to the Government on floating debt (provided that this did not compel them to pay more to their depositors) than with the increase they hope to secure from their commercial financing ; but all recent evidence tends to prove that these rates on floating debt will not be raised (not, at least, perceptibly) unless and until the authorities are converted to the view that dearer money in principle, and this kind of dearer money in particular, is a necessary adjunct to their basic economic policy. The case for using this auxiliary weapon of disinflation was recently reasoned at length in these columns ; but there is no reason to suppose that the official mind is noticeably inclining in that direction—yet. Nor does it seem probable that the commercial banks will plead for action on these lines, even if they felt (which they surely ought not to feel) that their own revenue needs would weigh at all heavily with the authorities. Any general increase in the basic structure of money market rates could scarcely leave the banks' deposit allowances immune, and might even revive demands for a resumption of interest payments on current account balances—a change that would certainly not suit the banks' book.

*

Given, therefore, the stabilised structure of floating debt rates, the adjustment of other rates diminishes one set of anomalies merely at the expense of creating or widening other sets. It had been known for some time that the discount houses hoped for a further opportunity to edge up their discount rates for commercial bills; but, in the event, the rate offensive of the clearing banks on a wider front provided both the initiative and the opportunity, with the result that the increase announced last week was much larger than the market could possibly have imposed solely on its own account. In the early postwar phase, the rate at which the discount houses stood ready to lend to commercial borrowers who offered first-class bank acceptances (of three months currency) was less than one thirty-second of 1 per cent above the rate the market earned on British Government Treasury Bills ; its commercial rate was 17/32 per cent per annum, admittedly a quite inadequate return. Over a period of several years, this rate had been laboriously levered up, in several steps, by 5/32 per cent, to 11/16 per cent. Now, at one swoop, it has been increased by twice that amount—by 5/16 per cent, to the round figure of 1 per cent.

These rates are equally applied by the clearing banks to their own direct discount of bills, but the proportion of commercial bills thus secured is not very large ; the greater part of their bills are obtained by re-purchase from the discount market after part of their life has expired. Until then, the bills are carried by the market on call money borrowed from (mainly) the clearing banks on the security of the bills. The rate at which the banks purchase bills from the market was formerly 5/8 per cent ; it will now be 7/8 per cent. Correspondingly, the rate at which the clearing banks lend to the market on the security of bills (Treasury as well as bank) was formerly 1/2 per cent ; for bank bills it will now be 3/4 per cent, with the rate for Treasury bills unchanged at 1/2 per cent. In other words, four-fifths of the additional gross sum that the discount house receives from the commercial seller of the bills (i.e., the commercial borrower) will be passed on to the clearing banks, if those banks continue not only to buy the shorter bills from the market but also to finance them during the early part of their life.

There is, in fact, some possibility that the clearing banks will tend to lose business in both these directions, and especially in the latter ; and to that extent their effort to improve every apparently expandable source of revenue will be frustrated. Many non-clearing banks (and especially the overseas banks operating in London) habitually lend to the discount market on the important short-bond side of its business at rates below those

charged by the clearing banks—mainly at 5/8 per cent, compared with the clearing banks' rate of 3/4 per cent. Now, many of them that are sellers of bills from overseas will prefer to finance these bills themselves rather than sell them at 1 per cent, when the proceeds have to be employed at only 5/8-3/4 per cent ; alternatively, they may deem first-class bills a better security than bonds for loans at 5/8 per cent, thereby offering the discount market a cheaper means of financing its commercial bill portfolios than is now available at the clearing banks. These banks may find that, especially in the matter of their money rate, they have been a shade too greedy.

But, even if the volume of their business in commercial bills (both by loan and purchase) is not thus scaled down, the potential addition to bank revenues from this substantial rise in rates is not large. If the total volume of commercial paper that commands prime rates is put at £200-£250 million, and if it were all to be in three months' bills, the potential additional yield in a full year would be about £625,000-£780,000, of which roughly four-fifths would accrue to the banks and one-fifth to the discount market. In practice, the clearing banks are unlikely to do as well as this, while the market may do better, though not correspondingly so.

In any case, although the discount market gets only a moderate proportion of the increased gross return, the change is of much greater importance for it than for the banks. If it succeeds in maintaining the volume of its commercial bill business, the net return from it would, at a rough estimate, be improved by some 60 per cent—and, if it succeeds in securing any appreciable proportion of bill finance at the 5/8 per cent rate that would undercut the clearing banks, the proportionate gain would be larger still. Even so, the amounts involved are not large. Although the financing of a first-class commercial bill has lately been four times as profitable as that of a Treasury bill, and will now be at least six times (ignoring any reserve that might be deemed necessary for risk on the former), the volume of Treasury bills passing through the market is roughly eight times the volume of fine commercial paper, despite the latter's recent substantial expansion. On the best reckoning, therefore, the market's revenue from commercial bills is still likely to fall short of that from Treasury bills. And although revenue from bill business as a whole is now undoubtedly covering the market's administrative costs (whereas, until a few years ago, this business had been consistently showing a gross loss), the important source of the market's profits is still its business in short bonds. The investment implications of these rate changes, for those interested in bank or discount shares, are not, therefore, of any great moment.

Meanwhile, this further stiffening of bill rates—the extent of which suggests that a further move is improbable unless and until the basic structure shifts—will prevent the rise in loan and overdraft charges now in progress from widening still further the spread between the costs of financing by these two, to some extent competing, methods. For a time, indeed, the spread will probably be somewhat narrowed, and this may help to reinforce recent efforts by the banking system to ensure that so-called "finance" business (which has strongly invaded the discount market in recent years) proceeds by bank advances, while bill credit is more closely confined to genuine self-liquidating finance. At all events, the rise in bill rates will prevent borrowers from using the bill market merely as a possible means of escape from increased charges for overdrafts. But if, in such ways as these, the new adjustments of rates for commercial credit tend to reduce some anomalies, and also to narrow the disparity between these rates and the yields on long-term Government securities, they widen very markedly the margin between the cost of short-term credit to the Government and to the private borrower. The prime commercial bill rate is now virtually twice the rate for Treasury bills—whereas in former times, thanks to the insistence of Continental banks upon "two-name" paper (leading them to refuse the "one-name" bills of the British Government), bank bills regularly commanded a premium over Treasury bills. That, perhaps, was irrational ; but the new pattern is surely even more so.

Business Notes

Gas in the Market

The debut this week of a bulky issue of Gas stock—the Gas Council's first approach to the public for cash—has not provided the occasion for any such light-heartedness among the assembled company as greeted the appearance of compensation stock when the Gas industry was nationalised just over two years ago. The new debutante wore a rather weary air, and was not attired with any particular distinction ; while the sponsors, having apparently watched threatening skies for some time, were evidently anxious to get their protégé through her ordeal before a brief spell of thin sunshine petered out. In other words, the timing of this issue does not suggest that the authorities have any high hopes about the weather that lies ahead. They have seized the first opportunity since hopes of an outbreak of peace lifted gilt-edged prices above their worst levels. In the third week of June prices were standing well below their 1949 lows, with 2½ per cent Consols at 64¼ and yielding over 3⅞ per cent ; by the end of last week a fairly sharp and general recovery had lifted the price of this stock to 65⅞, in a narrow market.

Such was the setting for last Monday's announcement of the new issue—£75 million of British Gas 3½ per cent stock, 1969-71, guaranteed by the Government and offered at 98. At the new level, this was reasonably in line with the market, for the yield of £3 12s. 10d. per cent to the final date was a penny or twopence more than that then obtainable from the 3 per cent Electricity and Transport stocks dated 1968-73. Sixty per cent of the money has to be put up before the end of this month (with no further call until end-October), evidently because £48.6 million is to be used to repay temporary borrowings ; the balance is required for new capital outlays and for working capital. The lists opened and closed on Thursday, but it seems evident that the stock has not aroused any substantial interest among the institutions ; the "departments" have obviously had to do a big job—as they doubtless reckoned to do. The market has apparently assumed that the subsequent marketing process will be carried through with the restraint that has been noticeable in similar operations in the past year or so. At all events, after faltering on the first rumours of the issue, prices have been well maintained, Consols gaining a further ⅛ to 66—at which they yield £3 15s. 10d. per cent flat, or 2s. less than three weeks ago. Over this same period, the final redemption yield on the 1968-73 Electricity stock has dropped by 1s. 8d., to £3 12s. 9d. There is no real confidence, however, that the resistance point that has lately developed in the market's slide will be firmly sustained. The institutions have lately shown some revival of interest, but it has not been large.

Allocating Scarce Materials

The International Materials Conference in Washington is showing results after its three months of deliberations. An emergency allocation of newsprint amounting to 12,550 tons was recently announced ; 3,000 tons went to France and the remainder was shared between India, Pakistan, the Philippines, Malaya, Greece, and Jugoslavia. Last week-end allocations of tungsten and molybdenum were announced for the third quarter of this year. Some 2,800 tons of tungsten was available for distribution ; of this, 1,253 tons has been allocated to the United States, 695 tons to Britain, 290 tons to Germany, 280 tons to France, 210 tons to Sweden and the remainder divided between Canada, Jugoslavia, Australia, and Spain. Most of the 4,400 tons of molybdenum allocated has gone to the United States (3,420 tons) ; Britain is to get 515 tons, France 195 tons, Germany 125 tons and Sweden 100 tons. A reserve of 45 tons is to be held to meet requirements of other countries not yet notified to the Conference.

The two other committees dealing with non-ferrous metals expect to recommend allocations for the fourth quarter of

1950. The allocation for sulphur recommended for the third quarter of this year is 1,400,000 tons; a total of 286,400 tons has been fixed as the export quota, of which the United States will supply 250,000 tons, Norway 18,700 tons and Italy 17,700 tons. Britain's allocation for the quarter is 106,300 tons, of which 105,000 tons will be imported; the balance is to be made up from home production and from a reduction in stocks. Britain is thus getting more than in either of the first two quarters, so that the fear of an immediate sulphur shortage would seem to be allayed. No allocation is expected for cotton, as the United States has already released 2,500,000 bales of cotton and 100,000 bales of cotton linters on the assumption that its new crop will total 16 million bales.

All these arrangements are to some extent makeshift. They are by no means a detailed marketing scheme but depend for their success on the good will of the participating countries in honouring their export and import quotas and in keeping within their total allocation. Such a procedure is expedient at this stage. It should ensure that the immediate shortage is surmounted without the almost interminable negotiations that would be necessary to introduce a more rigid or permanent scheme. But the worries of the IMC are only just beginning. Maximum and minimum prices have been suggested for a number of key materials. Producers are willing to accept these only if the minimum price is guaranteed for a period as long as two or three years, which implies more permanent arrangements than IMC has yet envisaged. Producers are also asking for guarantees that they will be able to buy the manufactured goods that they want at reasonable prices. These problems will occupy much time and argument. It is as well that the commodity committees have restricted themselves in the first instance to the narrower task of apportioning in a practical way such supplies of scarce materials as are available.

* * *

Six Months' Steel

Too many special circumstances have affected steel output in each year since the war for any "normal" seasonal pattern of output to be drawn from the production figures. The weekly average of 313,600 tons of crude steel produced during the first six months of this year, which represents an annual rate of 16,306,000 tons, does not imply that such a total will be produced during the whole year; but no satisfactory correcting factor can be applied to derive from this a clear forecast of 1951 output. Summer holidays fall mainly in the third quarter of the year, though even this factor varies quite considerably in its incidence: upon last year's pattern of output, the production so far would suggest a final total some 300,000 tons lower than last year, or just under 16 million tons. But there is hope in the industry that raw material difficulties may affect output in the second half of the year rather less than they did in the first; and the British Iron and Steel Federation remains confident that its estimate of 16 million tons will be reached.

Success in doing this depends to a large extent upon the industry's drive to recover home scrap, from which the early results were encouraging. The Minister of Supply has passed to the nationalised Iron and Steel Corporation the recent recommendation by the Select Committee on Estimates that a rise in scrap prices would be necessary to bring in the final reserves of capital scrap, though in doing so he neatly prejudged the issue by adding that he was not in favour of a rise in price. This week an expert panel on scrap supplies of the Economic Commission for Europe has again urged countries to adopt "price policies that would encourage maximum collection." Any change in the price of scrap, however, is at present perhaps less urgent than changes in the prices of steel products: most grades of British steel are by far the cheapest in the northern hemisphere and are uneconomically low in price—conceivably by more than £3 a ton. The Minister has not lacked constant reminders of this fact from the private and nationalised central organisations of the industry: and his delay in reaching a decision can only suggest that he prefers to control supplies by hastily improvised priority systems. It is not the first time since the war that physical control of steel supplies has been in operation while prices have been kept artificially low, thus increasing the very demand that makes the control necessary. Complaints have already been heard this week from the cycle industry that one of its largest factories may have to be closed for a week this month unless steel supplies are increased: negotiations between the firm and the Ministry of Supply may give an interesting demonstration of the way in which the need for "Preferential Treatment" priority in civil orders is to be interpreted.

Commodities Still Falling

Few outstanding movements have occurred in commodities during the past week. Most of the commodities, including cocoa, jute, flax, tin, wolfram, shellac and tallow, that were affected by the decline which set in on June 25th have fallen further. There has been a slight recovery in rubber, sugar has remained firm, and lard has risen again. Maize has also made a further advance to 178 cents per bushel, but the market is almost nominal with very little business. Cotton has fallen slightly in New York on the estimate of the cotton acreage planted; this is officially put at 29½ million acres, the largest since the war. The sharp fall in flax during the last three weeks is not primarily attributable to peace talks in Korea. Purchases of flax were so heavy at the end of 1950, and in the first part of this year, that spinners' stocks are as large as they can finance. Moreover,

COMMODITY PRICES

	1950	1951

Tallow (cents per lb.)	4½	18½	14½	13	11⅛	10⅛	9½

(a) Price at June 24th.

big crops are expected in Holland, France and Belgium, where high prices have encouraged a substantial increase in the flax acreage. The truce talks have ensured that buyers of flax will stay out of the market until they calculate that the bottom has been reached.

The fall in jute has been less pronounced than in the previous week; the large Indian and Pakistan crops are late, but supplies later in the year should be good and the price remains basically weak. Sisal has also fallen slightly for the first time since the beginning of June. Tin fell £26 per ton during the week to £879, and is thus still some way above the sterling equivalent (£848) of the price set for American purchases by the Reconstruction Finance Corporation. Wolfram has fallen to £535, and some market judges expect it to fall further.

* * *

The Last Bale

The wool sales that opened in London this week are a memorable occasion, for the last bales of the stock of

10¼ million bales of wool accumulated during the war have been offered by the Joint Organisation. In May, 1945, when the United Kingdom—Dominion Wool Disposals, Ltd., was formed to undertake the task of liquidating this large stock, together with current clips, in an orderly fashion, the operation was expected to take thirteen years. The task has been accomplished in six years, and at no time during this period could it be claimed that wool prices were depressed. On the contrary, prices have risen almost continuously since the first auctions were held in September, 1946; the only major break occurred at the end of last March.

The successful disposal of this wartime stock has been attributable to what seemed to be an almost insatiable demand for wool textiles. But the system of reserve prices protected woolgrowers against the possible depressing effects that the marketing of such a large stock might have had, and it also encouraged them to expand their output. For the five years, 1946-1950, world wool consumption has averaged 2,465 million lb (clean) a year and during this period the annual clip has increased from 2,101 million lb (clean) to 2,270 million lb. This year, world consumption has shown signs of falling and is now around 2,375 million lb; but this is still larger than the annual clip, and the level of stocks throughout the world is low. On April 1st wool stocks in the United States totalled only 175 million lb—say 3½ months' supply—compared with 198 million lb twelve months earlier. British stocks are no larger.

Prices this week in London were a little firmer. They averaged about 20 per cent lower than at the last London sales held in May, but they were fully at par with the slightly higher prices that ruled in the Australian market at the end of last week. No major recovery, however, is likely until American buyers reappear on a large scale, and that is not expected until towards the end of this year. One possible effect of the recent fall in wool is that Australian woolgrowers may become more sympathetic to the new Commonwealth marketing scheme that is to succeed the Joint Organisation. A referendum is to be held early next month, and the Australian Government has announced that it will abide by the woolgrowers' decision. New Zealand sheep farmers who would prefer to rely on the normal mechanism of the market have been given no choice.

Persia's Sterling

Since the outbreak of the Anglo-Iranian dispute little mention has been made of the sterling held in London on Persian account. There are several possible reasons why the British authorities have not announced any official embargo on this sterling, despite the unilateral expropriation of the Anglo-Iranian Oil Company's property in Persia. The first of these is the British desire not to push the Persian authorities to more extreme measures than they have already taken; the second is the fact that an unofficial and undeclared blocking of these balances may already have taken place; and the third is the belief that there is not enough in these accounts to make such a step worthwhile. After the devaluation of sterling it was announced in Parliament that about £10 million had been paid to Persia under the revaluation guarantee on its sterling balance. This suggests that Persia must have held approximately £25 million in its sterling account at the time of devaluation and that the revaluation payment raised the balance some £35 million. A press message from Teheran this week reported that about £16 million remains in Persia's sterling balance and that the Persian authorities are taking steps to withdraw this sum.

Even without an official embargo, the proposed act of withdrawal may present some difficulty. Persian sterling has always been in a somewhat special category. The very substantial sums that were accumulated on Persian account dur-

Martins Bank will be pleased to make arrangements for customers who are travelling or holiday-making in this country to have their cheques encashed during the course of their travels.

RUFFORD OLD HALL
(Property of the National Trust)

Travellers abroad will find it convenient to take Travellers' Cheques issued by the Bank payable on demand by its correspondents throughout the world. Your bank manager will be pleased to explain.

The house near Ormskirk in which Hesketh have lived since the thirteenth century, was originally built round three sides of a quadrangle, but the West Wing has now disappeared. The Great Hall, which forms the South Wing, is the chief apartment of interest in the building and was constructed in the fifteenth or sixteenth century. Lord Hesketh presented the house to the National Trust in 1936.

Spotlight on Australia

In the business world today attention has been focussed on the remarkable industrial development in Australia. The Union Bank of Australia has therefore published two Booklets: "*Industrial Australia*" containing authoritative information on industrial resources, markets, labour and finance, "*Company Formation in Australia*" providing a general guide to Company Law with notes on current taxation and the establishment of a business in the Commonwealth. Anyone contemplating business in Australia, will find in these Booklets the preliminary information they require. Copies of these Booklets will be sent on request.

"WHITE LEAD PAINT" said Washington

The year was 1793. George Washington's estate manager wrote post haste from Mount Vernon, the President's lovely house in Virginia. "*Indeed,*" said he, "*there is a Great deal of painting wanting. The pillars of the Piazza are very naked . . . if Your Excellency Chuses to have them done there is no danger of sending too much White Lead.*" Four days later came Washington's reply: "*I will, by the first Vessel to Alexandria, send oil and paint agreeably to your memorandum . . . I will have both sides and ends painted and sanded, as well as the Pillers.*"

The year is 1951. George Washington's beloved mansion stands as firm today against the searching winds and rain from the Potomac as it did in his lifetime. Its rendered surface looks like stone . . . but it is *wood* . . . wood sound and strong after a hundred and sixty years, through the protective care of coats of White Lead Paint.

The Emidicta
ELECTRONIC DICTATION MACHINE

Makes office work far easier—far more efficient.
Having dictated his correspondence, reports and instructions to the Emidicta, the busy executive can be out all day with the comfortable assurance that the typists' work is not held up—and is completed ready for his return.
The running costs of the EMIDICTA are negligible. It carries a 12 months' guarantee and is backed by one of Britain's finest service organisations.
Let us prove the value of the EMIDICTA to you, without any obligation on your part, by a demonstration in your own office.

The EMIDICTA is a product of the E.M.I. Group (His Master's Voice, Marconiphone, Columbia, etc.) past-masters in recording and sound reproduction.

ing the war—largely as the by-product of payments for oil and of Allied expenditure on the construction of road and rail transport routes to Russia—were protected by a generous gold guarantee. In 1947 this specific gold guarantee seems to have been replaced by the looser revaluation guarantee that was successfully invoked in 1949—and by the promise of conditional convertibility into hard currencies. The exact terms of these provisions have never been published; they are contained in a "Memorandum of Understanding" exchanged between the two central banks. It is understood, however, that this agreement, which was last renewed in 1950 and falls due for further renewal next November, gives Persia permission to convert sterling into hard currencies to pay for goods that are "not obtainable on competitive terms from the soft currency area." The interpretation of any such a loose agreement would give plenty of scope for differences of view. This elasticity may be put to its test if the Persian authorities are now requesting, as the messages from Teheran suggest that they are, the immediate withdrawal of their sterling balance for what are obviously not commercial operations.

* * *

More Women at Work

The employment figures at the end of May reveal that the total working population increased by 20,000 women. The total number in civilian employment increased by 46,000, of which rather more than half seems to have come from a further reduction in the already low numbers of unemployed. The unemployment total of 191,000 in the middle of June was about 25,000 lower than in May, resulting in the phenomenally low rate of unemployment of 0.9 per cent, compared with 1.4 per cent in June, 1950.

The most significant changes in civilian employment during May, apart from large seasonal increases in agriculture and in catering, were declines of 5,000 in the metals, engineering and vehicles group of industries and of 700 on colliery books. This shows that the increase in total numbers employed is not necessarily going to the right jobs to meet the increasing needs of rearmament. Much switching from one industry to another is still likely to be necessary. But the return of women to work—in which the pressure of rising prices may have played some part—should be of valuable assistance.

COMPARISON OF MANPOWER FIGURES IN GREAT BRITAIN
('000)

	End December 1949	End December 1950	End May 1951	Change December 1950 to May 1951	Govt.† Forecast End 1951
Total working population	23,000	23,225	23,287	+ 62	23,350
Men	15,825	15,921	15,937	+ 16	...
Women	7,175	7,304	7,350	+ 46	...
H.M. Forces	725	752	822	+ 70	850
Civilian employment	21,904	22,145	22,256	+ 111	22,200
Registered unemployed	360	328	191*	− 137	300

* At June 18, 1951. † Economic Survey, 1951. *Source:* Ministry of Labour.

The table shows the changes in manpower since the end of 1950. The fall in the unemployed figures has been at a much higher rate than during 1950 and has gone faster than was forecast in the Economic Survey. Unemployment fell by 32,000 during 1950, but in the first five months of this year there has been a fall of no less than 137,000. Some 35,000 women have entered employment during 1951, the May entry being particularly good. There is still a useful reserve of women that might be recruited, though their number must be falling fairly fast. The total number of women at work exceeds the figure for 1943; but the change in the compilation of the figures in 1948 prevents a precise comparison.

Policy for Fuel

Nationalisation, which largely freed the main fuel and power industries from the discipline of the market, both in the sale of their products and the raising of their capital, inevitably placed upon the Ministry a responsibility for co-ordinating their development. This job of super-planning is one from which any practically-minded person might flinch, and in times of abundant fuel the wisest practice might well coincide with the easiest—doing nothing, and allowing the industries to "compete" with each other. Even in theory, this competition is complicated by the duties laid upon these industries' governing boards to care for their consumers as well as their own economic interests. In practice, it is complicated by the fact that two of the three are secondary fuel industries processing the increasingly scarce product of the other.

The composition of Mr Noel-Baker's committee, whose terms of reference would appear to be wide enough to comprehend even the vast complexity of fuel technology, utilisation, and economics, has not yet been announced. It is to be hoped that it will be drawn from independent persons of scientific, engineering, and economic training, and not from the nationalised industries, though it might recruit for special investigations panels of experts from within them. The most likely result from any panel set up on a "representative" basis would be a failure to agree; the second most likely result, and possibly more dangerous, would be an agreed report or set of formulas in which the three monopolists concerned would agree upon their spheres of interest.

The writ, as described to the miners' union and in Parliament, is vague. What questions would the committee need to answer? A first task might be a collation and reassessment of the huge weight of experimental and operational evidence that has been produced upon the various types of fuel comparisons involved; this data is of varying value and in some cases contradictory. The main assignment, obviously, would be the assessment of primary fuel reserves, of new potential sources of energy, and of resources for processing them into secondary fuels; a study of future demands; and as clearly as possible, estimates of real costs, thermal efficiency, and the time within which resources or processing capacity might become available. The task is enormous, and the answers are unlikely to be clear cut. But there are certain immediate problems upon which the committee might be able to deliver interim reports in time to influence short-term policy, and their re-assessment of data might well reveal questions upon which specific research by existing organisations might fairly rapidly provide definitive answers. The work might be lengthy, and expensive, if it is to provide fruitful results. But some such "operational research" may well be necessary to narrow the uncertainties of future investment in the production of different fuels.

Freight Rates Decline

A noticeably easier trend in freight rates has set in, except for a few sections of the tramp market. Sugar and sulphur charterers, for example, appear to have covered their more urgent needs and the latter have secured vessels recently at rates reduced by some 17s. 6d. per ton. Chartering for old crop wheat from the St. Lawrence appears to have subsided, and such vessels as are still being fixed are accepting lower rates. In eastern waters tonnage is easier, and declines of as much as 40s. per ton have occurred for shipments of North China cereals and Indian coal. Even for iron ore, which has been a strong section of the market for some time, freights have declined noticeably from the peak in the North and West African trades. In the Baltic timber trades, however, now at the height of the season, rates remain as firm as ever. This resumption of usual seasonal movement indicates that the worst effects of the winter

panic are diminishing; and it is probable that a cessation of hostilities in Korea would release a further batch of tonnage for general trading. In anticipation of this, shipowners are tending to show more interest in offering their vessels on time charter, while charterers feel that they are now in a better bargaining position. Both parties, however, must take into account the possibility that the departments may once again be caught out of position in the shipping market. An interesting sidelight on the difficulties of Government departments in "working the market" is thrown by the recent incursion of Mr Richard Stokes into the shipping business. When in Washington, at a time when there was a scarcity of tonnage for iron ore imports, he arranged for several cargoes to be lifted from North Africa by American Government vessels, at rates (payable in dollars) rather below current levels, but excluding costs of loading and discharge. By the time these cargoes start moving, it seems likely that spot tonnage will be available, in sterling, at much lower rates.

Meanwhile the chartering of tramp tonnage by the liner companies continues, although at slightly reduced rates. There are considerable arrears of cargo for eastern and southern destinations, and shippers by liner should not expect too early a reduction of the special surcharges introduced to cover the extra costs of chartering additional tonnage. The Australian conference has now spread this surcharge over cargo shipped by all vessels. Whereas a 40 per cent. surcharge was imposed on cargo shipped by extra vessels, this has been altered to a surcharge of 15 per cent on cargo shipped by any vessel. In addition there is a 10 per cent surcharge to compensate for the hold-up of ships in Australian ports.

Defeat on Plasterboard

It appears likely, from Mr Ede's guarded reply in the Commons this week that after annulling, in accordance with the decision of the House, the three price control orders recently imposed upon certain products of the British Plaster Board Group, the Government will probably bring in three similar orders and use its slender majority to secure their acceptance. If only for political reasons—to reverse an unexpected and galling defeat—this was perhaps to be expected: it is still reprehensible.

Mr Brown's lengthy and ingenious defence of his action in controlling by statutory order the prices of plaster, plasterboard and gypsum made by this one firm, and not those of its competitors, failed to convince the House. He argued that the actual price set was fair, and that the computation of allowances for replacement of assets upon the basis of historical costs placed the British Plaster Board group in no worse position than many other firms throughout industry. It is upon these financial details that the Palmer Committee on price control, to which the case was referred by the Minister, may in the meantime have offered some advice.

Upon the question of controlling the price of one producer at a lower level than those allowed to its competitors, Mr Brown claimed that he was attempting not to give the more efficient manufacturer a windfall profit by taking care of the less efficient (adducing in his support views expressed by this journal in an entirely different connection). Such a purpose, upon his own argument, might more logically be achieved by setting a fair price for efficient production and letting such producers as could not meet it go to the wall. This Mr Brown felt "ought not to happen by my action," though he agreed that it might happen in a free market. There may be other cases in which output has to be encouraged by the payment of different prices to bring in new producers: but these orders, discriminating against a named firm, go beyond the procedure hitherto adopted. The British Plaster Board group, the Minister said, produced 75 per cent of the industry's output of plasterboard, and therefore achieved economies of size. It has "its source of materials under its own control," while a smaller competitor had to buy materials from a more expensive source—a commercial advantage he appeared to think somehow unfair. His decision that "I ought to have a differential (price) and make sure they both stayed in business," appears to be based upon a dislike of bigness in business. This is, of course, well outside his sphere and entirely outside the purpose of price control.

Diesels from Rolls-Royce

Lord Hives, chairman of Rolls-Royce Limited, has recently given more details of the company's newly-established Oil Engine Division, to which he referred a fortnight ago in his statement with the company's accounts. This is the first venture of the company into diesel production, and it is hoped to develop a range of "rationalised" diesel engines complementary to the "rationalised" petrol engines that are now in production. By keeping the same bore and stroke throughout, and varying only the number of cylinders, it has been possible to build petrol engines covering a wide power range using common components. The engines themselves have not been in production long enough for the full influence of this development on engineering practice to be assessed, but the War Office, which has specified these standard engines for a range of military vehicles, has given figures showing that the volume of spares needed has already been reduced by 75 per cent. The extension of this principle to diesel design should have the same results over the wide field where diesel engines are used as prime movers.

A new factory has been built at Derby to house the new division. The first engine to go into production there is the 180 horse-power six-cylinder diesel that powers Vickers Armstrong's heavy tractor. A number of "pre-production" models of this tractor are now undergoing site trials, one in Tripoli working in temperatures exceeding 115 deg. F. First commercial deliveries are expected to start in the spring and production will be built up to a rate of 500 tractors a year. The normal working conditions of this tractor, believed to be the largest in the world, have presented Rolls engineers with a number of new problems; its engine will need to be serviced by much less skilled mechanics than usually maintain the company's products. If, in its design, they have been able to make successful allowance for this rough handling, then the tractor will become a direct competitor of the American makes that up till now have been supreme in the field of heavy tractor production.

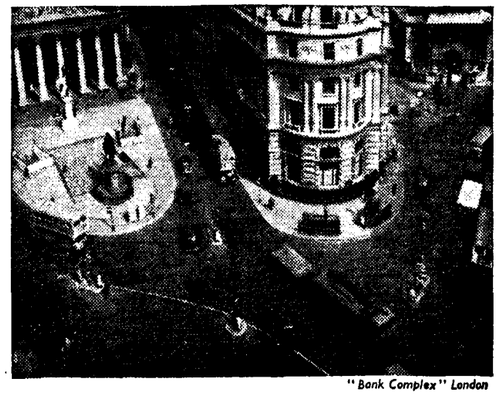
Recovery in Rayon

Rayon output figures for May, published last week, bear witness to the remarkable performance of the industry in a period of raw material shortages. Total output was 32.2 million lb., about three per cent higher than in April and two per cent higher than in May, 1950. Though output in the first quarter of the year was some ten per cent lower than in the last quarter of 1950, it has since recovered considerably; at present it is running rather higher than in the first half of last year, though a little below the higher level of production in the second half. This has been achieved in the face of a 20 per cent cut in supplies of sulphuric acid and carbon bisulphide derived from American sulphur, and shortages of woodpulp and cotton linters.

Assiduity in searching out supplies of sulphuric acid from sources outside America, and drawings upon stocks of raw materials, appear to have enabled the rayon producers to limit the effects of these shortages upon output. The statistics published make no distinction between viscose and acetate yarns, and it is therefore impossible to judge whether the second, which requires less sulphur derivatives in its manufacture, represents a larger proportion of output today than before the shortage. Output of continuous filament



Oil in an incubator helps to hatch eggs. Oil on the bark of an apple-tree can destroy them. Oil serves mankind in more ways than any other mineral. Anglo-Iranian Oil Company produces a complete range of oil products from thirteen refineries in nine countries, transports them in its own shipping fleet, and distributes and markets them through associated companies in four continents.

yarn has been maintained at a steadier level than that of staple fibre, of which deliveries have been supplemented by drawings upon stocks held by producers and spinners. Deliveries of both have suffered even less than has production; in the first quarter total deliveries of yarn and staple

PRODUCTION OF RAYON, 1950-51
(including other synthetic fibres)

Million lb. Per Month	Continuous Filament Yarn Single	Staple Fibre	Total
1950 :—			
1st quarter	16·1	14·1	30·2
2nd "	15·8	14·8	30·6
3rd "	16·2	14·0	30·2
4th "	17·8	15·0	32·8
1951 :—			
1st quarter	17·3	12·4	29·7
January	18·5	13·4	31·9
February	16·3	12·2	28·5
March	17·0	11·7	28·7
April	17·6	13·8	31·4
May	18·4	13·8	32·2

fibre were only 4½ per cent below those in the last quarter of 1950. It has to be borne in mind, however, that capacity for the production of rayon staple had been increasing rapidly up to the end of 1950, and spinners were hoping for a substantial further increase during this year.

The first of the sulphuric acid plants being converted to pyrites-roasting should be in production very shortly, and may further assist the industry to withstand the continued restriction upon American sulphur supplies. It is impossible to find anyone in the industry who is eager to forecast the course of production for the remainder of the year, but there is a feeling that the worst effects of the raw material shortages have now been experienced and that apart from August, when production naturally drops, it might be maintained at something approaching the present rate for the next few months.

* * *

Is Sugar Vulnerable?

The 1950-51 world sugar crop was the largest ever harvested. Yet from January until the Korean truce offer towards the end of June, the price had risen fairly steadily. It has since fallen from 8.05 cents per lb. to 7.00, still about 60 per cent above the price just over a year ago, before the Korean war started. These comparisons suggest that sugar might be vulnerable to the influence of peace moves. The rise in recent months has reflected the fact that even bumper supplies were insufficient to meet normal requirements plus governmental and private purchases for stock in Europe and in the United States. Switzerland in particular has during the past year laid in large stocks of sugar, while in the United States some hundreds of thousand tons are held in domestic larders. Moreover, the increase in production has come largely from the European beet crop, particularly in Germany, France and Poland, the effect of which on the world market is largely limited and indirect. Recent high prices have been caused by a real inadequacy of supplies, which was particularly felt as the season advanced; and although hoarding may not continue if international relations improve, it is unlikely that existing stocks will be unloaded on to the market at all substantially in the near future. In addition, the early estimates of the 1951-52 beet crops envisage a smaller output than last season.

Yet the possibility, remote though it seems at present, of adequate supplies and a sharp fall in sugar prices would certainly revive the arguments for an International Sugar Agreement. Cuba, the major world producer, is now less eager for an international agreement than it was late last year; the impetus comes from the Commonwealth producers. By bilateral agreements with the United States, Canada, and with this country (the last is not yet signed), Cuba has secured an outlet for a larger part of its sugar than it expected last year. On the other hand, both Australia and the West Indies are concerned lest in future years the Cuban agreements with Britain and Canada should make it difficult for the Commonwealth producers to market that part of their output that is not covered by the Commonwealth Agreement. Britain is willing to accept the compromise that the agreement with Cuba, which is for 500,000 tons a year, should last for only three years to 1953, when the new Commonwealth agreement comes into force; other guarantees have been given about taking up surplus supplies. The Canadian agreement is for the same period. But this does not satisfy Commonwealth producers, who are apprehensive about the possibility of a world surplus of sugar, given good crops in the next few years and a lasting relief from international tension. Until the recent fall in sugar prices Commonwealth producers were critical of the price of £32 17s. 6d. a ton, which the agreement lays down for this year. This is the familiar dilemma of all such agreements—to get the highest price and an assured market at the same time.

* * *

Unilever and Distribution Costs

The pastime of blaming the "middleman" for the high cost of living always comes into fashion at times of world price inflation; the fact that the consumer price of mass-produced goods often contains 30 per cent distribution costs and less than 15 per cent factory-processing costs is a useful tag for any platform-speaker's notebook. It is therefore particularly welcome that Sir Geoffrey Heyworth should have devoted his address at Unilever's annual general meeting to outlining his views on what should—and what should not—be done to improve efficiency in distribution. Sir Geoffrey revealed that the distribution cost of Unilever's leading brand of margarine in the main European markets currently averages 23.7 per cent of its consumer price (exclusive of purchase tax); the corresponding average for Unilever's hard soap is 30.7 per cent, for its soap powder 36.9 per cent, for its toilet soaps 47.3 per cent and for toothpaste no less than 62.7 per cent. "Distribution costs," in this sense, includes advertising, selling and transportation costs, as well as wholesalers' and retailers' margins. Advertising alone accounts for 3.2 per cent of the United Kingdom consumer price of Sunlight soap and 6.2 per cent of that of Persil; for new products, of course, advertising expenditure is much higher. Unilever's expenditure on advertising seems to be smaller in Continental than in British markets, but advertising expenditure in America requires a greater share of the proceeds of the product—averaging 12.6 per cent for soap powder. Sir Geoffrey believes, however, that it is partly because greater advertising in America speeds up the rate of stock turnover that retailers there can profitably operate on only a 10.2 per cent margin. On this soap powder, in addition, advertising expenditures "sustain the necessary demand to bring about savings in production costs."

The wide spread of distributive margins on Unilever's various products is a measure of differences in distribution services rendered, in transport costs and in the rates of turnover achieved. Sir Geoffrey had no doubt that "it would be simple to increase efficiency in distribution by reducing the number of selling points so that each point reached a technical optimum of turnover, confining their range of action to the immediate neighbourhood around them, allowing only a limited number of standardised products, replacing the element of selling to the retailer by allocation and abandoning advertising. But this "icy ideal" (which is not so very unlike what was achieved during the war) would abolish freedom of choice, put the housewife at the mercy of her allotted supplier, and stifle technical progress as it stifled competition. Sir Geoffrey recommended, therefore, that Government policy should be limited to ensuring freedom of competition and to increasing efficiency by educative processes and the compilation of more statistics (in which it should be helped by the co-operative effort of retailers). In addition, manufacturers should undertake more market research and consumers should be more alert in exercising their freedom of choice. This liberal policy of competition and publicity was qualified only by a cautious advocacy of the preservation of the right of individual resale price maintenance. In Unilever's trading operations round the world, Sir Geoffrey said, "we have found it necessary to provide that conditions for the sale of our products ensure the active co-operation of as wide a variety of distributors as is necessary adequately to serve the needs of the public. . . . Resale price maintenance is one of the methods we have found effective under certain conditions."

Small Savings Progress

The national savings movement was able to announce last week-end that sales of the new 3 per cent Savings Certificates, which were introduced at the beginning of February, have now topped the £100 million mark. It had also, however, to announce that the net excess of withdrawals over receipts on all national savings media in the preceding week had amounted to £5,914,000—the highest weekly deficit since Christmas. Since the beginning of the financial year the movement's excess of repayments over receipts (excluding accrued interest) has amounted to £27,700,000, or only £1,800,000 less than in the corresponding thirteen weeks of last year. This deficit has been run up despite the fact that sales of the new savings certificates have amounted to £54,700,000 in the thirteen weeks compared with sales of £22,600,000 of the old certificates in the corresponding weeks of 1950; moreover, sales of the new defence bonds have amounted to £12,400,000 in the thirteen weeks, compared with sales of less than £4,600,000 of the old bonds in this period last year.

The best measure of the fall in personal savings since the budget can perhaps be found in the fact that withdrawals from past savings (including interest paid out) totalled £276 million in the first quarter of the financial year—or £50 million more than in the first quarter of 1950-51. This has no doubt been one of the factors that has confounded the estimates in the Economic Survey by hoisting personal consumption to a level 5 per cent above its average in the early months of 1950. Had it not been for the timely rise in interest rates last February, the national savings movement would now almost certainly have been showing a very large rate of weekly deficit; even as it is, the funds that have been attracted to purchases of the new certificates and defence bonds may have been largely drawn from other savings media.

Company Notes

British Associated Picture.—The closing of the Welwyn studios and the concentration of film production at Elstree helped to reduce ABP's production deficit in the latest financial year and contributed "to a considerable extent" to the improvement in group trading profits from £2,205,624 to £2,594,275. The exhibition of films, however, is the mainstay of the group's activities, and makes by far the biggest contribution to earnings. The rise in gross box-office receipts from £18,722,253 to £18,901,114 in a period when cinema attendances continued to decline reflects a half-year's benefit from the increase in cinema seat prices sanctioned by the Treasury under the Eady plan last September. The exhibitors' biggest headache is the entertainments duty, and in the latest year ABP paid in duty £7,009,305, against £6,891,835, from box-office receipts, representing 37.1 per cent. of gross takings. It was this factor, as much as the fear of rising costs and the need to strengthen liquid resources, which influenced the directors in their decision merely to maintain the ordinary dividend at 20 per cent.

	Years to Mar 31 1950	1951
Consolidated Earnings :—	£	£
Trading profit	2,205,624	2,504,275
Total Income	2,210,419	2,507,863
Depreciation	427,803	436,113
Taxation	1,028,035	1,217,464
Group earnings for ordinary stock	*349,564*	*461,053*
Ordinary dividends	220,000	213,750
Ordinary dividends (per cent)	20	20
Retained by subsidiaries	24,519	26,409
Added to general reserve and carry forward	98,045	720,893
Cons. balance sheet analysis :—		
Fixed assets, *less* depreciation	15,155,484	18,657,080
Net current assets	*Dr 100,762*	123,560
Film productions, rights, etc.	618,570	450,599
Cash	462,391	680,862
Reserves	4,671,909	5,326,754
Ordinary capital	2,000,000	2,000,000

5s ordinary stock at 12s. 6d. yields £8 per cent.

Perhaps the most satisfactory aspect of the year's results is the substantial improvement in the group's liquid position. Current assets now exceed current liabilities by £123,560, against a deficiency of £100,762 in the previous year, and "secured indebtedness" has been reduced by £1,045,851 to £3,720,864. In the current year rising costs with the almost certain prospect of a bigger wage-bill will, it is hoped, be offset by the new entertainments duty arrangements made with the Treasury.

★

British Plaster Board.—Rising costs and inadequate paper supplies "coupled with the failure to secure Ministry agreement to adequate selling prices" in the second half of the financial year more than wiped out additional profits earned by British Plaster Board in the earlier months, and finally resulted in an actual fall in trading profits from £1,517,961 to £1,439,522. Faced with this situation, the company did not feel justified in voluntarily agreeing to the request of the Ministry of Works to sell plaster board at prices below those set for its competitors and to reduce its profit margins on building plaster; the company, therefore, withdrew from voluntary agreements covering plaster and plaster board, but not that covering gypsum rock. The Ministry then announced three statutory orders imposing maximum selling prices for gypsum, plaster and plaster board produced by the British Plaster Board group. The Ministry's action was discussed in *The Economist* on May 26th and June 2nd; the Government's defeat on July 5th, when these orders were put to the vote, and the decision to re-introduce orders similar in principle, are discussed on an earlier page.

In negotiations with the company, the Ministry was prepared to make allowance for the replacement of plant and machinery built since the war at postwar values, but not for plant erected before the war. The company seems to have adopted a more consistent approach to present day financial realities than the Ministry in deciding to revalue its assets in the current year. As a first step, £75,000 has been appropriated to a central obsolescence and replacement reserve.

	Years to March 31, 1950	1951
Consolidated earnings :—	£	£
Trading profit	1,517,961	1,439,522
Trading income	1,577,379	1,447,460
Depreciation	285,593	297,649
Taxation	673,607	692,298
Group earnings for ordinary stock	*429,928*	*295,079*
Ordinary dividends	265,918	259,271
Ordinary dividends (per cent)	16½	16½
Retained by subsidiaries	8,023	—
Added to general reserves and carry forward	192,043	13,863
Cons. balance sheet analysis :—		
Fixed assets, *less* depreciation	2,171,493	2,078,396
Net current assets	2,228,281	2,541,818
Stocks	635,663	764,356
Cash	461,420	387,477
Reserves	1,197,529	1,416,695
Ordinary capital	2,900,925	2,900,925

5s. ordinary stock at 15s.xd. yields £5 11s. per cent.

In view of the decline in profits the maintenance of the ordinary dividend at 16½ per cent. was the most that shareholders could expect. Turnover increased substantially during the financial year but there is ample surplus capacity to cope with further demand.

★

W. and T. Avery.—An expansion both in production and orders is reflected in the rise in group trading profits from £1,641,982 to £1,852,283, and stockholders have received their due share in this advance with the raising of the ordinary dividend from 20 to 25 per cent on the old capital before it was increased last month by the hundred per cent. free issue. The directors have taken much of the pleasure out of this operation by issuing a warning that rising costs and expanding business demand more resources, so that equity holders should not anticipate for the current year an increase in the total cash amount distributed.

Some measure of the heavy charge that replacement involves is to be found in the allocation of £72,125 in the two latest financial years to a fixed assets replacement reserve and of £119,775, against £113,325, to a stock reserve. This last appropriation goes more than halfway to match the increase in the book value of stocks from £2,745,066 to £2,940,755. Orders at the present are such as to ensure full production, but the chairman's report does not minimise the difficulties that rearmament is likely to involve in supplies of labour and materials and in the switching of production.

	Years to March 31, 1950	1951
Consolidated earnings :—	£	£
Trading profit	1,641,983	1,852,283

COMPANY MEETINGS

LEVER BROTHERS & UNILEVER LIMITED

FREEDOM OF CHOICE NECESSARY FOR CONSUMER

THE HOUSEWIFE AND RATIONALISATION

IMPORTANCE OF ADVERTISING

SIR GEOFFREY HEYWORTH ON THE PROBLEMS OF DISTRIBUTION

The annual general meeting of the members of Lever Brothers & Unilever Limited was held on July 12th at the Hall of the Chartered Insurance Institute, 20, Aldermanbury, London, E.C.2. Sir Geoffrey Heyworth presided. Addressing the meeting the chairman said:—

My Lords, Ladies and Gentlemen, last year I discussed productivity, a subject important to ourselves and also of public interest because of its effect on national economic problems and on the standard of living. In doing so I was dealing with factors that determine the cost of output of a factory.

DISTRIBUTION

This year I shall discuss distribution, referring particularly to the operations needed to get consumer goods from the producer into the hands of the ultimate users. The costs of these operations are often of even greater consequence to the consumer than the production costs in the factory. The consumer price of some mass-produced articles contains for example 30 per cent. distribution costs as against 10-15 per cent. cost of processing in the factory. It is, therefore, worth while having a closer look at the costs of distribution, especially at a time when housewives everywhere are complaining of the high cost of living. The subject is also important for us producers, as the sum of production and distribution costs determines the price of our products and thus affects the quantities which the public are willing to buy. It is mainly from the view point of the producer of consumer goods that I shall discuss some problems of distribution.

First, I shall try to clear away a few popular misconceptions about distribution, and then consider what can be done to improve efficiency in this field.

COSTS OF PRODUCTION

The idea is fairly widespread that costs of distribution are of an entirely different character from costs of production; that they are less justifiable than the latter and that they are probably too high.

Those who assume that costs of distribution are essentially different from costs of production seem to overlook that there are many operations which producers and distributors have in common. Both have to pay for transport—either of raw materials or of finished products. Both have to cover the costs of keeping and handling stocks, both have to pay for their sites and buildings, and for the cost of heating and lighting. Distribution is therefore only a further phase in the general flow of goods from the original sources to the consumer.

Nor are the costs of distribution always separate and distinct from the costs of production. The line of division between them is often blurred and neither can be considered in isolation. It may for instance be that by incurring heavier distribution costs (in such forms as advertising or frequent deliveries) reductions are effected in the costs of production. Or, on the other hand, there may be economies in distribution which can be attained only by increasing the costs of production. Packaging is a case in point. What matters most is the total of the two costs, not their relative proportions. And, always, of course, the success attained in meeting the consumer's real wishes.

The idea that costs of distribution are less justifiable than costs of production is an odd one. The consumer tends to accept costs within the factory—for materials, plant, wages and management—as right, or at any rate as inevitable, while looking upon the costs of distribution, including shop operations and particularly those of the wholesaler, the bogey "middleman," with suspicion. They even seem to be ethically less worthy. Though why the retailer, the wholesaler, the salesman, or shop assistant should be less deserving of a fair reward than the manufacturer, the farmer and the factory or farm-worker, it is difficult to see. But somehow the one reward is emotionally classified as that of a producer—and therefore legitimate—whereas the other reward is thought of as that of a parasite.

DISTRIBUTORS SERVICES TO CONSUMER

This attitude ignores the real value of the services which distributors render to the consumer. They move the goods from the point of production to a place as close as possible to the consumer, they offer them for sale at hours and in a condition convenient to the consumer, they keep sufficient stocks to offer the consumer a choice between various brands and qualities, and in many cases give expert advice on the use of the product. The housewife would be badly off if the alleged parasites were done away with and the impossible task fell on her of collecting her household requirements personally from factories and farms all over the country.

COSTS OF DISTRIBUTION

If, then, the real function of distributors is acknowledged, what truth is there in the popular belief that the costs of distribution are too high? In a way, it is strange that this assumption is so much more general than that the costs of production are too high. Prima facie there is little reason why there should be less waste in the world's millions of factories and workshops—than in the channels of distribution.

Probably the consumer's readiness to suspect inefficiency in distribution, and to pass over the possibility of inefficiency in production merely reflects the fact that the distribution process is partly within the purview of the public whilst production is usually remote.

FUNCTION OF "MIDDLEMEN"

Another explanation is the existence of "middlemen" in distribution, whose function is not readily apparent. In the field of consumer goods these middlemen are mostly wholesalers. They have a real function in that they collect the goods from various producers and keep them in stock for the retailers to draw on in quantities and assortments and at times which are convenient to them.

Now the wholesaler can survive only if the services he renders are worth the margin he charges. Should he try to overcharge the retailer or the producer, then he will find himself by-passed by one or other of them or replaced by a competitor. Therefore, where he exists it is more likely that he reduces the costs of distribution than that he inflates them.

If the scale of prices fixed by producers, wholesalers and retailers results in the consumer being overcharged for a particular class of articles, that situation, which in our trade is most unlikely to arise, would certainly be short-lived because of competition from the co-operative store, the multiple shop, or other traders to whom manufacturing facilities are available.

EXPLANATION OF HIGH MARGINS

What then is the explanation of the high margins which sometimes lie between the amounts which the producer receives and which the consumer pays?

One answer is that there is no obvious reason why the costs of producing an article should always be higher than the costs of distributing it. In most countries it costs less to catch a fish or to grow a lettuce than to carry it hundreds of miles, pass it on to the right retailer and have it available for the consumer, fresh, nearby and at the right time of the day. And all the time the cost of distribution must cover losses from deterioration or even unsalability.

There is, therefore, no reason to assume that the difference between the amount paid by the consumer and that received by the producer should never exceed a certain percentage. A difference of as much as 100 or 200 per cent. may be quite justified. It all depends on the relative costs of the services rendered by the producer and the distributor to the consumer. This relationship differs widely for various articles.

EFFECT OF RATE OF TURNOVER

Another factor which accounts for difference in "spread" between the production cost and the consumer price of various articles is the rate of turnover at the point of sale. A margin of 34 per cent. on a drug of which one package is sold gives the same gross return as a margin of 17 per cent. on a grocery item of the same price of which two packages are sold in the same time. That is why certain articles have retail "mark-ups" as high as 30 or 40 per cent., whilst others leave a sufficient return at 15 or 20 per cent.

VARIATION IN SELLING METHODS

But even within the range of one article or one group of articles it is not possible to find a standard rate which could be regarded as the right reward for the services of the distributors. That is because there is variation in the quality and the costs of the services they render. The product may be sold in a shop, a market stall, a barrow, or from door to door. If it is a shop, this may be located at a busy town centre or in a residential area. A shop may take orders by telephone or by post, as well as from personal shoppers. Goods may be sold on credit, or only for cash; there may be deliveries at the house or cash and carry only. Shops may be simple affairs as in most villages in temperate climates or provide comfortable shopping places and frost-proof storage of goods in countries with severe winters. They may have a large staff to advise and serve customers or they may make extensive use of self-service and labour-saving equipment

A similar variety exists in the operations of wholesalers and manufacturers, and is reflected in their costs. Some wholesalers have to supply shops many miles apart and poorly served by roads, whereas others have many customers close together in large cities. Some stock and distribute a wide range of articles, others specialise. Some will deal only in unbroken cases but others, for instance in the drug trade, will deliver one-twelfth of a dozen—and may provide a delivery service every day.

The manufacturer also uses various methods in making his contribution to distribution. He may sell direct to the retailer, or through wholesalers, or use both methods. His advertising costs vary, depending on many considerations, for example the price and the frequency of purchase of his product. Services to the trade such as assistance in keeping their stocks at an appropriate level and flowing smoothly, which includes such things as frequent deliveries and helping the retailer to make displays, cost more than simply handing the goods over to a wholesaler.

STANDARD MARGIN IMPOSSIBLE

With all this variety required to meet different conditions for different products, how can there be any one standard margin for distribution? The answer is that there can be no such thing, because there is no hard and fast criterion.

As producers of daily necessities in many parts of the world we have had this lesson brought home to us by our own experience. Whilst we have details about our various products from quite a number of countries, we have found that there are so many factors, working in such different and often contrary ways, that it is necessary to know beforehand far more than the figures themselves will ever tell before it is safe to start making any comparisons. The distribution cost of our leading brand of margarine in our main markets in Western Europe, for example, currently averages 23.7 per cent. of its consumer price, excluding purchase tax. This includes our advertising, selling and transportation, and the wholesaler's and retailer's margins. In soaps the distribution averages, obtained from countries within the same area, work out to 30.7 per cent. on hard soap, 36.9 per cent. on soap powder and 47.3 per cent. on toilet soaps, a considerable variation. The kind of circumstances affecting such figures are illustrated by a still more extreme case, that of toothpaste, which, as everyone will appreciate, is mostly sold by chemists who have to provide elaborate services, and also has a slower rate of turnover. The cost of distribution of toothpaste in our average calculation is 62.7 per cent. of its consumer price, excluding purchase tax.

POSSIBLE ECONOMIES

The impossibility of finding or setting up any standard rates for distribution costs, either in total or by classes of trade, does not mean, however, that there is no scope for improvement in this field. Just as we believe that costs of production can be reduced, so, too, we are confident that we can find economies in distribution through the reduction of waste.

In the field of distribution as contrasted with production, the charge is that there is waste in the whole system rather than in the individual establishment. Critics point to the existence of too many shops with too low an average turnover, to competing deliveries of goods in the same streets by a number of suppliers, to the high cost of advertising, etc.

FREEDOM OF CHOICE OR RIGID PLANNING

What, then, can be done to stimulate the drive for efficiency in this much disputed field? From the outset we should realise that in answering that question we are faced with one of the fundamental problems of society; freedom of choice for the consumer or rigid planning by producers or governments. Under the latter it would be simple to increase efficiency in distribution by reducing the number of selling points so that each point reaches a technical optimum of turnover, confining their range of action to the immediate neighbourhood around them, allowing only a limited number of standardised products, replacing the element of selling to the retailer by allocation and abandoning advertising.

RATIONALISATION

These conditions can be brought about by force and legislation as they have been realised to a large extent behind the Iron Curtain. Few people in our western world would like to go quite so far, but some advocates of rationalisation tend to seek a solution somewhere in that direction. Town planners sometimes suggest that one grocer's shop for every "X" houses, and one fishmonger for "Y" families would be ideal. People with mathematical minds are apt to insist on reduction by legislation of the number of shops in accordance with the number of families to be served, or on zoning of deliveries by bakers, milkmen, and greengrocers, to reduce the amount of labour involved.

There is great attraction in some of these ideas. They would undoubtedly help to reduce the costs of distribution, at least from a short-term point of view. But during the war and the postwar period we had a serious warning of the dangers hidden in all this for the consumer. The restrictions from which we all suffered brought about conditions which were not unlike the rationaliser's idea of efficiency. Products were standardised and varieties were limited, deliveries were greatly reduced or abandoned, consumers often had to choose a retailer merely because of his proximity, the scarcity of labour reduced service to a minimum, advertising was greatly reduced and selling to the retailer often took the form of allocation.

The result was that nobody liked it. The retailer complained about the wholesaler, the wholesaler about the manufacturer, and the housewife was convinced that she was the one who mattered least of all. She felt herself at the mercy of her suppliers and had to accept whatever favours they were willing to bestow upon her.

This situation is not necessarily confined to wartime and the period of postwar scarcities. The danger of it is inherent in all proposals which seek to enforce efficiency in distribution by radical elimination of alternatives. They introduce an element of rigidity in distribution and make the trade—both producer and distributor—insensitive to the consumer's needs. The consumer has either to take great trouble in finding the remaining alternatives or to become disinterested and resigned.

FREEDOM OF CHOICE ESSENTIAL

When discussing efficiency in distribution we should, in my opinion, start from the recognition that freedom of choice for the consumer is essential. The housewife, for example, should have a reasonable variety of products and brands to choose from so as to follow her personal taste. She should have freedom to drop one brand of a product if it no longer satisfies her, and pick another—or for that matter, to drop one shopkeeper in favour of another if the latter suits her better. To be able to choose, she must have at her command the whole variety of suppliers whom I have mentioned, from the barrow boy to the luxury-shop so as to choose the one who suits her purse and her requirements.

If there is waste in this system, and there is bound to be some waste as compared with the icy ideal of the rationalisers, it is the price we pay for one of the elementary freedoms of mankind, not perhaps so fundamental as freedom of thought and freedom of speech, but very important for the day to day satisfaction of those who run our households and whose task is already heavy enough as it is. The rationalisers are mostly men.

PRICE OF TECHNICAL PROGRESS

It is also the price we pay for technical progress. Freedom of choice keeps not only the trade but also the producers on their toes. They have to compete for the acceptance of their products by the consumer and this is a most forceful stimulus for technical improvements. We know this from our own experience. The quality of our products is often changed after we—or our competitors—have discovered a means to give more satisfaction, or we develop entirely new products, sometimes competing with our existing lines.

ROLE OF ADVERTISING

It is in this light that we should see the role of advertising. The rationaliser sees waste in advertising and we do not deny that it can and does exist, but we have to look upon it in relation to the whole process of production and consumption. Advertising makes mass production and the benefits that flow from it possible. Let us look at some examples from our own products:—

Advertising is currently at the rate of 3.2 per cent. of the consumer price of Sunlight soap in the U.K., and 1.6 per cent. in Holland. It is 1.2 per cent. of the consumer price of Blue Band margarine in Holland. Soap powders are somewhat more heavily advertised—the figures being 6.2 per cent. for Persil in the U.K., 5.6 per cent. in France.

These advertising expenditures sustain the necessary demand to bring about savings in production costs which, although they cannot be exactly calculated, are probably greater in amount.

ADVERTISING AND STOCK TURNOVER

But there is another advantage. Advertising also reduces the costs of retailing by speeding up stock turnover. This is demonstrated in the United States, where advertising is much more developed than in Europe and requires a greater share of the proceeds of the product. Our current expenditure on advertising in the U.S.A. for soap powder is at the rate of 12.6 per cent. of the consumer price. But the retailer operates profitably with an average margin of 10.2 per cent., which is lower than in Western Europe, so that the sum of the two in the U.S.A. is in line with the countries of Western Europe.

ADVERTISING AND COST OF NEW PRODUCTS

For new products the costs of advertising are often much higher. Then they are part of the initial costs of a new venture, comparable to costs of research and development. There may be waste in this sort of advertising, as there is undoubtedly waste in research. The number of lines which laboratory workers have pursued and then dropped because they proved to be blind alleys is quite considerable. But nobody thinks of abolishing research for that reason, nor would it be wise to abolish introductory advertising. Every once in a while industry makes a discovery and produces something which will satisfy the demand of customers better than the existing products or which fills a gap in the pattern of production.

Advertising is the way of making this known to consumers, getting them to try it out and making sure that the new product gets a proper chance.

Both freedom of choice and the technical progress it stimulates should be considered vital when discussing distribution. Every attempt at streamlining which threatens these essential values is suspect and likely to do the consumer more harm than good. We see the positive expression of this thought in the Anti-Trust Laws of the U.S., the Monopolies Commission in the U.K., and the legislation against restrictive practices in other countries such as Holland and West Germany.

All this is not to say that nothing should be done about efficiency in distribution. There may be a task for governments, for retailers and wholesalers themselves, for us industrial producers of consumer goods, and, last but not least, for the consumer. I shall deal with these possibilities consecutively.

TASKS FOR GOVERNMENTS

The governments, in my opinion, have a negative and a positive task. The former follows mainly from what I have said about the elementary rights of the consumer. Wherever there is a restrictive arrangement, a closed ring or a monopoly, which prevents the consumer from exercising her rights or new traders and producers from entering the field, there is an indication of danger. It is not always realised that the same danger exists when rationing schemes are maintained too long or introduced too early. Rationing often means hardening of trade relations. Quotas based on past performance, by eliminating competition, dull the incentive to give good service. This generally ends in placing the consumer at the mercy of her suppliers, who in turn are dependent on decisions which have little to do with their efficiency.

RE-SALE PRICE MAINTENANCE

At this juncture it is perhaps pertinent to say something about the announced intention of the British Government to bring in legislation regarding Re-sale Price Maintenance. It would take more time than I have at my disposal adequately to discuss this subject. In any event our own practical experience is limited to certain well-defined classes of consumer goods. A full investigation into this subject so far as the United Kingdom is concerned was made by the Lloyd Jacob Committee, whose report was published in 1949. It arrived at two main conclusions:

(*a*) Collective price maintenance is undesirable and should therefore be prohibited.

(*b*) Individual price maintenance by a particular producer is acceptable and should therefore be allowed.

The Government, however, proposes to make all forms of Re-sale Price Maintenance illegal.

In our own trading operations round the world we have found it necessary at all times to provide that conditions for the sale of our products ensure the active co-operation of as wide a variety of distributors as is necessary adequately to serve the needs of the public for which our products are designed. To achieve this requires constant study, and various methods are used according to the circumstances that exist in different places and at different times.

Re-sale price maintenance is one of the methods we have found effective under certain conditions. We have used it to bring about a uniform price for a given brand; and, in different circumstances, to fix for a given brand differential prices graded according to degree and quality of service rendered.

In both cases we make our arrangements directly with our own distributors and not collectively with other manufacturers.

We have found that such arrangements can bring about as low a re-sale price as the average re-sale price that results from complete freedom and at the same time ensure sales in a greater number of retail outlets. Indeed, only when price maintenance is so arranged to take account of the interests of the consumer as well as of the distributor are the arrangements likely to enjoy any permanence.

If the arrangements provide an excessive margin for the distributor, not only are sales restricted to the disadvantage of the manufacturer and consumer, but the policing of price maintenance by an individual manufacturer becomes impossible.

We believe, then, that the right of an individual producer to make arrangements for re-sale price maintenance should be preserved.

I repeat that these observations on re-sale price maintenance are the results of experience in our own field of household consumer goods and are not necessarily applicable to other types of goods.

RAISING STANDARDS OF FUTURE SHOPOWNERS

The positive task which I see for Governments is to stimulate the creation of opportunities for those entering the wholesale or retail trade to have a good level of education, and a fair knowledge of accounting and general trading conditions. I am impressed by the work which the Dutch Government have done in this direction. The use of a licensing system, as applied in Holland to raise the standards of future shopowners, may be an effective means to this end, although I am sure that it will not suit every nation. But there is danger if this licensing system is used to protect the vested interests of the trade by keeping newcomers out, or to satisfy the rationaliser's desire for an orderly framework, at the expense of the consumer. In Holland, so far, this danger has been avoided.

It is, of course, true that in distribution as in production we can reduce cost by increasing turnover per unit. This is what those who would like to reduce the number of retailers have in mind. We should, however, realise that increase in turnover in industry and all the advantages of large-scale production have not been brought about by legislation or restriction, but by letting the most efficient prove their ability—to the consumer, not to a board or a committee.

COLLECTION AND PUBLICATION OF STATISTICS

A second task for Government is the collection and publication of statistics—of which the Census of Distribution at present being taken in the United Kingdom is one example. Its nearest parallel in Holland is the Census of Industry and Trade. The U.S., Canada, Australia, Italy and the Irish Republic have published similar material. We have found that where such background material has been provided, studies of our own particular problems are more effective, and that where such statistics are available at regular intervals so as to enable changes in pattern to show themselves, they have a still higher value. We think for a country to publish such statistics at intervals of five years is a practical objective. The fact that the U.S. have published such statistics for a longer period than any other country probably explains at least in part their lead in the quantity and quality of more detailed and practical studies.

MAIN CONTRIBUTION FROM THE TRADE

The main contribution to efficiency must, of course, come from the trade itself. For instance, it seems to me that there is room for efficiency studies in retail and wholesale businesses as there is in manufacturing. Distributors, too, have problems of layout and equipment, of material handling, and storage. Besides these, retailing has its special aspects of display of merchandise and—if the business has some size—of the flow of customers through the establishment. Taking orders, making deliveries and keeping up-to-date accounts are also activities which may benefit from new approaches. In big enterprises, department stores, co-operative stores and multiple organisations the employment of the necessary specialists presents no greater difficulty than in manufacturing concerns, and in fact there has been a growing recognition of the necessity for studies of this kind—particularly in the U.S. It may well be possible for independent retailers grouping together, or through their local or national associations, to benefit from similar studies.

The point that is emphasised in all the published studies of efficiency in retail trading is the importance of speed of stock turnover and this factor is one that the manufacturer has most in mind in discussions with distributors as to what represents a suitable margin on his particular type of product. It is difficult for the independent retailer to know what rate of stock turnover is achievable for the different classes of goods that he sells, and so know where to set about eliminating waste. If by co-operative effort figures for recognisable classes of retailers for differing types of goods that they sell could be made available, it would undoubtedly be helpful, and I should like to suggest that groups of retailers collaborate in experiments for this purpose.

TRAINING OF PERSONNEL

Another instance of what the trade can do is the positive training of personnel in the art and science of shopkeeping. This has been the practice of large operators for many years. That the expense is justified by its effectiveness is borne out by a steady expansion in the number and scope of these training schools. In a number of countries facilities are available to the public at large for the training of men and women for retailing either in technical colleges or under arrangements made by associations or institutes of retailers. If the large operator finds vocational training of value it should be equally helpful to the independent family unit.

MANUFACTURER'S CONTRIBUTION TO EFFICIENCY

The manufacturer, too, has a contribution to make to the efficiency of distribution. As I have already said his interest cannot stop at the production stage. It is the price that the consumer has to pay that influences the volume of his production. Just as it is in his interest to find better ways of organising his manufacturing process, so is he concerned with finding better ways of getting his product from the factory into final use. He has therefore to be continually examining the various channels of distribution that are open to him, and must be ready to make changes in established practices. It may be desirable for him to bring more of the selling of his goods under his own control, but almost equally frequently we find that the changes may be in the opposite direction. It was the experience of ourselves and many others that when direct selling was introduced the process was often carried to an uneconomic degree and a subsequent modification making it attractive for the wholesaler to cover the more scattered of the retail outlets proved to be more efficient. The manufacturer therefore has a continuing interest in alternative facilities of distribution being available as a check against the cost of his existing system. This is also in the interests of the public.

The manufacturer also is vitally concerned in reducing to the minimum losses consequent on the falling off in consumer demand for his products, so that he may apply corrective measures quickly. A falling off in demand not only affects the manufacturer himself, but brings losses through the building up of excessive stocks throughout the distributive channel—both losses have to be paid for. Sales statistics are not always a sufficiently sensitive barometer. They only register the producer's sales to the trade and not the movement out of the shop to the consumer, and naturally they show nothing about the sales of competing products. We and other manufacturers have found it desirable to pay for continuous independent investigation of the movement of our products out of the shops and in relation to those of our competitors. We believe that these expenditures are more than justified by the saving of time in diagnosis of the cause of any drop in sales. The cause may be a defect in the quality of the product or the price of the product relative to its competition; change in the channels of distribution; or indeed ineffectiveness of advertising. But whatever it may be, unless it is quickly corrected it will involve waste and must therefore be tackled.

PERIODIC SURVEYS OF SUITABILITY OF PRODUCTS

The manufacturer can also make a contribution to the reduction of waste in distribution by periodic surveys of the suitability of his products by direct approach to the consumer. In particular these techniques have great value when new products involving large expenditure for plant and introductory advertising are being developed.

Last year we spent in different countries over £650,000 on market research. We believe that as techniques improve increasing expenditures of this nature will benefit both industry and the community.

Finally, there is the part that the consumer has to play in the fight against waste in distribution. It is on her alertness in exercising freedom of choice that the whole system depends.

As she plays her part, so will the producer be stimulated to find better types of product and the distributor to provide the kinds of service that are really appropriate to her needs. Waste in distribution can only be minimised if producer, distributor and consumer each maintain the flexibility that makes progress possible. The key is freedom of choice.

The Chairman concluded by moving the adoption of the report and accounts. Sir Herbert Davis, C.B.E., vice-chairman, seconded the motion, and it was carried unanimously.

The proposed dividends of 13½ per cent. on the ordinary stock, and 6 per cent. on the deferred stock payable on July 24, 1951 were approved. The retiring directors were re-appointed, the remuneration of the auditors Messrs Cooper Brothers & Company and Messrs Price Waterhouse & Company, who had been re-appointed under the provisions of the Companies Act, 1948, was fixed, and a special resolution was passed to amend the Articles of Association in regard to the amount which the company may borrow without the sanction of a general meeting.

At a separate general meeting of the ordinary stockholders, held at the conclusion of the annual general meeting, a resolution sanctioning a modification of the terms of the Equalisation Agreement between Lever Brothers and Unilever N.V. and the company was submitted.

A poll was taken, and the chairman announced that the result of the voting would be published in the press on Saturday, July 14th.

LEVER BROTHERS & UNILEVER N.V.

The annual general meeting of the members of Lever Brothers & Unilever N.V. was held on July 12th, at Museumpark, Rotterdam. Mr P. Rykens presided and made a speech in similar terms to that delivered by Sir Geoffrey Heyworth at the annual meeting of Lever Brothers and Unilever Limited, reported above.

The report and accounts for the year 1950 were adopted. The proposed dividend of 12 per cent. (being the equivalent of the dividend for the same year to be paid by Lever Brothers & Unilever Limited to its ordinary stockholders, calculated in accordance with the provisions of the Equalisation Agreement and converted at a rate of exchange of Fl.10.64 to the £ sterling) was approved, the retiring directors were reappointed, and the auditors, Messrs Price Waterhouse and Company and Messrs Cooper Brothers and Company, were re-appointed.

The proposal to modify the terms of the Equalisation Agreement between the company and Lever Brothers and Unilever Limited, was approved by the general meeting and by a subsequent separate general meeting of the ordinary shareholders.

PAYMENT OF INTERIM ORDINARY DIVIDEND

At the annual general meetings of both companies the chairmen announced that the boards of the two companies are considering the resumption, providing circumstances allow, of their prewar practice of paying interim ordinary dividends.

HUDSON'S BAY COMPANY

TWENTY YEARS' PROGRESS

The two hundred and eighty-second annual general court of the Hudson's Bay Company was held on July 6th in London, Sir Patrick Ashley Cooper, the governor, presiding.

The following is an extract from his circulated statement:

It is now 20 years since the reorganisation of the London board took place. The change in fortunes of your company during those years is shown by the following figures. In spite of having to bear a heavy burden of taxation amounting to £10 million we have distributed £3,000,000 (gross) in dividends from trading profits, £1,250,000 from land sales and have ploughed back into trading operations in fixed and current assets £8,500,000. Part of the improvement shown in the balance sheet represents undistributed surpluses of the land department. Our capital, reserves and provision for depreciation and replacement amount to approximately £20 million, but even this figure takes no account of the value of our fur trade posts in remote areas, the value of the residue of the land department, or the great value attaching to your company's name.

The retail stores are the most important operation of your company, and we are happy to report a new sales record. The wholesale department has gradually emerged as one of the largest and most successful wholesale organisations in Canada. Last year this department again broke its own record.

The fur trade department is the one most closely associated in the public mind with the Hudson's Bay Company. In 1931 this department was losing a great deal of money. Today there is a steady and profitable turnover on merchandise each year.

The report was adopted.

THE BRITISH SHAREHOLDERS TRUST LIMITED

HIGHER GROSS REVENUE

MR B. H. BINDER'S SPEECH

The twenty-ninth annual general meeting of The British Shareholders Trust Limited was held on July 11th in London.

Mr B. H. Binder, F.C.A. (the chairman), in the course of his speech, said:

Our gross profit for the year amounted to £88,812, compared with £79,705 last year, and after deduction of all expenses, including taxation (which is £4,762 higher than last year), the net profit is £34,372, namely, £4,000 more than for the year to March 31, 1950.

The directors propose that a final dividend of 4½ per cent., together with a bonus of 2½ per cent., both less income tax, should be paid on the ordinary share capital, making, with the interim dividend of 3 per cent., a total distribution for the year of 10 per cent.

Our subsidiary, the Record Electrical Company Limited, is expanding steadily and continues to make good progress. It has a satisfactory order book and, provided difficulties over raw materials do not arise there is every reason to believe that its business and earnings will continue to develop.

The valuation of our investments at the end of the financial year showed a satisfactory appreciation. The problem of the policy to be pursued with regard to the company's investments is one of growing complexity. A situation has now been reached where a limited number of high-grade equities are showing a lower yield than some undated British Government securities. Fear of serious inflation, coupled with the reduction in the volume of securities available for investment, brought about by the nationalisation of various industries, are no doubt important factors which have given rise to this state of affairs. Considering the tension which exists in international relations, it is surprising that the market is so firm, but it may be that investors have suffered so many shocks without any apparent harm, that they have become inured to the trials and troubles of world affairs.

INEQUITABLE TAXATION

The stepping up of taxation on distributed profits and its application to profits paid to preference shareholders creates a charge on the ordinary shareholders and on the company itself which is inequitable. It increases the prior charge of the preference dividend by 50 per cent., less income tax, so that a 5 per cent. preference dividend, when paid, costs the company about 6¼ per cent. In some instances this means that a regular reasonable dividend on ordinary shares has to be reduced. Even where the margin of profit enables the ordinary dividend to be maintained there is a substantial reduction in the balance of profits which it is desirable to retain in the business to augment the capital required to finance the carrying of normal stocks and the replacement of capital assets at the prevailing heavily increased prices. This may partly explain the increase in "advances from bankers" disclosed in the recently published banks' statistics.

In present world conditions I fear that we cannot for the next two or three years look for any material reduction in our heavy load of taxation whoever may be in charge of the destinies of the nation. In fact, it would appear that we can only expect further additions to our taxation if our necessary defence programme is not met by a continued general increase in production, and that only when we can achieve "Peace through Strength" can we hope to experience some alleviation of our burden of taxation.

The report and accounts were adopted.

THE BURMAH OIL COMPANY, LIMITED

SATISFACTORY RESULTS OF A DIFFICULT YEAR

CONDITIONS IN THE VARIOUS OPERATING FIELDS

SIR KENNETH B. HARPER'S REVIEW

The forty-ninth annual general meeting of the members of The Burmah Oil Company, Limited, was held on Friday, July 6, 1951, in the Merchants' Hall, 30, George Square, Glasgow.

Sir Kenneth B. Harper, chairman and managing director, presided.

The following statement by the chairman was circulated with the directors' report and accounts:

The consolidated profit and loss account discloses a group trading profit for 1950 of £6,837,831 being £1,220,552 higher than that of last year. A number of factors have contributed to this satisfactory result. There was in 1950 some improvement in the general level of petroleum product values over that of the previous twelve months and trade continued to expand in India, Pakistan and Burma. Again, whilst our subsidiaries have maintained their exploration activities during the past year, expenditure in 1950 was below that of 1949 when heavy outlays were incurred on equipment required in connection with these operations.

PROFIT AND DIVIDENDS

To the figure of trading profit of £6,837,831 is added an income from interest and dividends amounting this year to £2,943,989, which, with £1,003 from transfer fees, brings total income from all sources to £9,782,823 from which falls to be deducted directors' emoluments and auditors' fees £36,401, depreciation £855,616 and taxation £5,999,348 leaving £2,891,458. After adding £547,851 brought forward the amount finally available for disposal is £3,439,309. Out of this sum the board has allocated £1,203,332 to general reserve and, if their recommendation of a final dividend of 12½ per cent. and a cash bonus of 6 per cent. is approved, nett Preference and Ordinary dividends and bonus will absorb £1,688,036, leaving £547,941 to be carried forward. While this increased distribution is more than amply covered by earnings, stockholders will notice that it is given in the form not of dividend but of cash bonus, in accordance with prewar practice. It carries no implication that it will be repeated in future years.

I think you will find that the balance sheets of both the company and the group with the accompanying notes set out clearly the financial position, but I would like to add a few general comments.

ADJUSTMENT OF RESERVES

The arrangements between our Burma operating subsidiaries and our friends The Indo-Burma Petroleum Company, Limited, and The British Burmah Petroleum Company, Limited for joint operation of developing, producing and refining crude oil in Burma, with consequent financial adjustment between the parties arising therefrom, enable us this year to delete the now rather unrealistic balance sheet headings of "assets in Burma at date of denial" and "rehabilitation suspense account." Under these arrangements our Burma operating subsidiaries' share of what it has been possible to salvage out of the former, together with the final cost of assets represented by the latter, have been transferred to "concessions, oil wells, buildings, etc." The consequent write-off of the book values of the final assessment of losses in Burma amounted to £1,460,262 and this, as you will observe from the relative note attached to the accounts, has been met out of general reserve. This compares with a book value of £3,400,000, which you will remember was set aside as a provision against this write-off out of available reserves in 1941 but returned to general reserve in 1948. The effect on our general reserve balance, after adding the board's allocation of £1,203,332 out of this year's profits and transferring £256,930 from the parent company's fire and marine insurance reserve now no longer required (because the assets affected are now all held by the operating subsidiaries), is to leave it at £12,850,000, unchanged from last year. In all the circumstances I think you will agree this can be considered satisfactory.

This year, in addition to the reserves which have been built up out of the group's operations, we have a new item under capital reserve arising from the sum received by your company out of the *ex gratia* grant to British interests in Burma by His Majesty's Government to which I referred last year. This amount has meantime been invested in government securities, which you will observe are now held wholly by the parent company, and accounts mainly for the increase this year in the group's holding now standing at £14,532,239. During the year government securities previously held by a subsidiary were transferred to the parent company; this is reflected in the decrease in the parent company's investments in subsidiary companies.

Final adjusting settlement of the back service liability in respect of the staff pension fund was made during the year and the balance of "provisions including contingencies" under current liabilities is correspondingly lower than a year ago.

Under current assets the cost of financing the group's inventories of stores and materials and products, and also debtors, continues to rise under the influence of higher costs and prices.

TRADING

Our trading is conducted partly through the organisations of our own subsidiary companies in Burma, Assam and part of East Pakistan and partly on consignment to Burmah-Shell in the remainder of India and Pakistan. About 28 per cent. of our supplies for sale in 1950 came from our indigenous production, the balance being imported.

In Burma there was some widening of the areas brought under the control of the government but conditions generally continued to be disturbed and trade consequently limited. By means of inland water transport convoys under armed escort we were able to supply Northern Burma with the products of a refinery unit at the oilfields, while Rangoon and markets approachable from there were supplied with imported oil. By the end of the year about one-third of Burma's requirements, in the areas to which we could penetrate, were supplied with indigenous products. We hope to increase this percentage as security and economic conditions permit.

In India rationing was lifted over most of the country during the year and sales showed a marked improvement over 1949. The shortage of transport continued to be a restricting factor.

In Pakistan there would have been a larger increase of trade than in fact there was if there had been access for trading between India and Pakistan. The economic source of supply for more than half East Pakistan is Calcutta, but supplies for the whole of East Pakistan had to come from Chittagong involving in certain cases transport for some 300 miles to markets less than 100 miles from Calcutta. In addition to the waste of freight, this imposed a burden on Chittagong for which our facilities were not designed. Again, the economic route for the Assam Oil Company's products (Assam being a Province of India) is through Pakistan into India by the old railway, but they have had to travel by a new rail link built to avoid Pakistan, a fine bit of engineering but a longer journey by several days. It is to be hoped that these wasteful and expensive procedures will not be imposed upon trading much longer.

INVESTMENTS

Income from our investments quoted on Stock Exchanges contributed just under 25 per cent. of the total gross profit of the group. Apart from our holdings in government stock, our major investment is in Anglo-Iranian ordinary stock and Shell ordinary stock. While it would be improper for me to anticipate in any way the statement which the Anglo-Iranian's chairman will no doubt be making to his stockholders on the present and future situation in Iran, these developments are of direct and particular interest to The Burmah Oil Company stockholders for historic as well as financial reasons. It was The Burmah Oil Company which in 1905 formed the Concessions Syndicate Limited to carry on exploration on the late Mr W. K. D'Arcy's Persian concession when Mr D'Arcy, after four years of work, felt unable to continue, and it was this syndicate which struck oil at Masjid-i-Suleiman on May 26, 1908. In the following year the Anglo-Persian Oil Company, Limited was floated with an initial capital of £1,000,000 in ordinary shares and £1,000,000 in 6 per cent. participating preference shares. The Burmah Oil Company took up 95 per cent. of the ordinary shares and guaranteed the preference dividend for five years. The company also acquired, and in due course made over to the Anglo-Persian Oil Company, Mr D'Arcy's interest in Mesopotamia, out of which arose the important share which the Anglo-Iranian Oil Company now has in the oil development of Iraq.

BURMA

I have referred to the effect on our trading of the disturbed conditions in Burma. Compared with the state of the country in 1949, last year saw a marked improvement in internal communications and in the country's finances. By the end of the year nearly every main town was in government hands, the Irrawaddy was open to river traffic, the railways were partially operating and some road transport was possible, if hazardous.

For your subsidiary operating companies the year 1950 was marked by the necessity for carrying out reductions in their labour forces. In my statement last year I informed you that the questions of the employer's right to discharge surplus employees and the terms governing such discharges had been referred to the Court of Industrial Arbitration in Burma. The resulting award not only forbade us to discharge our surplus employees at Syriam but prescribed a task for the refineries company to carry out while continuing to employ them. On appeal, however, the Supreme Court pronounced that the Industrial Court "have no authority to direct alteration of the ordinary course of the petitioner's business or to decide in what manner they should carry on their business."

The oil companies were then free to discharge surplus labour, though on onerous terms, and the discharges were completed during October. I must add that it was through no fault of ours that these reductions had become necessary; we would much rather they had not. They were due solely to the impossibility of fully restoring our operations in the state of lawlessness prevailing in the country.

While these court cases were proceeding we felt unable to respond to the Burmese Government's inquiries as to our plans for future operations in Burma, but as soon as the cases were disposed of we informed the Government that it was our intention to expand our oilfields and refinery operations as and when internal security conditions permitted. In the state of security existing now and in sight, repair of the main pipeline can still not be contemplated and there is accordingly still no case for completing the rebuilding of Syriam refinery. In order, therefore, to supply petroleum products, in the first place to Upper Burma markets, and in the process to obtain a return on the capital already invested, refining on a small scale is being carried on at the oilfields and it is our intention to develop it up to its maximum economical capacity in the prevailing conditions.

On being informed of this programme the Burmese Prime Minister expressed the desire for a joint venture between the Government and the oil companies in place of the scheme which fell through two years ago owing to the Government's inability to finance their share. Responding to this request, we put before the Government the outline of a scheme for participation by them in a local company. The Government have informed us of their desire and decision to participate, provided they can borrow the money to finance their share. There the matter stands at the moment.

In the meantime it is a matter for satisfaction that the somewhat strained relations which inevitably existed through most of last year have ended and that all our exchanges with the Burma Government are on a basis of friendliness and, I believe, trust on both sides.

INDIA

The crude oil production and refining operations of Assam Oil Company, Limited, continued at the rate at which they have been stabilised for some years past.

In August the Digboi field was shaken by a serious earthquake which had its centre about 100 miles to the north-east in an uninhabited part of the eastern Himalayas. Had this part been populated, the effect would have ranked as a major disaster. As it was, many of our buildings were extensively damaged but fortunately there was no loss of life in Digboi and the wells were undamaged.

PAKISTAN

Development of the field at Chakwal, in the Punjab, is proceeding in close association with the Attock Oil Company, Limited, who have the lease over an adjoining area and at whose refinery at Rawalpindi oil from both areas is processed.

PROSPECTING

Prospecting has continued in India and Pakistan. No resumption was possible in Burma.

In India an outside test well at Barsilla in Upper Assam was completed without finding oil in commercial quantities and preparations have since been made to test another Upper Assam structure at Nichuguard. Although we have so far had no success in these Assam outside tests it is noteworthy that extension drilling at Digboi itself has proved further additions to the productive area of that field.

Preparations were begun for drilling an outside test in Baluchistan (West Pakistan) and another at Patharia in East Pakistan.

Last year in order to conform with the Pakistan Petroleum (Production) Rules 1949 a local rupee company was incorporated in Pakistan to take over our Pakistan Concessions Subsidiary's interests. It is hoped that the necessary formalities to enable this company to commence business will soon be completed.

LABOUR

The discharges of labour in Burma to which I have referred affected some 2,400 men at Chauk Oilfields and 2,700 men at Syriam Refinery. Although it must have been obvious to the men for some time that there had ceased to be work for them, each man no doubt hoped that the axe would not fall on him, and it shows much for their restraint and, I hope we may claim, for their experience of our fair dealing, that the atmosphere remained peaceful before, during and after the discharges and that no serious strike or disturbance took place. The labour now remaining on the payroll at Syriam is employed in connection with receipt and storage of oil.

In both India and Pakistan relations with labour remain good in spite of periodic claims from the unions which are now a feature in these countries, encouraged by the appeasing awards of adjudicators appointed in recent years under the Trade Disputes Act.

TANKERS

Our tanker fleet operated satisfactorily and profitably during 1950 but its long record of immunity from serious accident was marred at the end of January this year when an explosion in our small packed oil tanker S.S. *Beme* resulted in the death of seventeen men, Burmese and Indian, four of whom were company's employees.

Orders have been placed for three more tankers to enable us to carry a greater proportion of our total sales requirements in our own ships and to bring down their average age.

STAFF

Your companies are served by a loyal and efficient staff, who both at home and abroad, ashore and afloat, have continued to maintain their high standards. With your permission I shall convey to them the stockholders' appreciation.

The report and accounts were unanimously adopted.

The final dividend of 12½ per cent. (2s. 6d. per £1 unit) and the cash bonus of 6 per cent. (1s. 2.4d. per £1 unit) on the ordinary stock for the year 1950, recommended by the directors, was approved and declared payable on July 20, 1951.

Mr W. A. Gray and Mr T. T. McCreath, the directors retiring by rotation, were unanimously re-elected.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

PLASTER PRODUCTS (GREENHITHE) LIMITED

MR J. P. EVANS' STATEMENT

The fourteenth annual general meeting of Plaster Products (Greenhithe) Limited, was held in London on July 12th, Mr J. P. Evans (chairman) presiding.

The following is his statement circulated with the report and accounts:

Contrary to the usual practice, I should like to open my remarks by paying a high tribute to the management and staff, not only for their loyalty and co-operation, but also for the determination they have shown in achieving the improved results which are now before you.

Cost of raw materials, labour and distribution has continued to rise throughout the year and selling prices have been increased from time to time after negotiation with the Minister of Works.

With a credit balance on the profit and loss account and adequate cash at our disposal, we have decided to pay all arrears of preference dividend at the date of the balance sheet, and it is our intention to pay the half-yearly dividend which is due on June 30, 1951.

Prophecy is clearly impossible, but we are determined to continue our efforts to improve still further the financial position of the company and the investment of our shareholders. Given normal trading conditions and some betterment in national and international affairs, our efforts should be more adequately rewarded.

The report and accounts were adopted.

BOVRIL LIMITED

RECORD EXPORT SALES

The fifty-fourth annual general meeting of Bovril Limited was held, on July 11th, in London.

The Rt. Hon. the Lord Luke, who presided, in the course of his speech said that trading profits had decreased by £56,722, due to reductions in the profits of three subsidiary companies. The parent company's own profit had been maintained.

The directors recommended the payment of a final dividend on the deferred stock of 10 per cent., making 12½ per cent. for the year.

The cost of production had therefore increased again and the company's margin of profit diminished, since prices had remained constant. It was no easy matter to know whether it was a good thing in the "public interest" to make a good profit and earn more revenue for the Treasury, or make a smaller profit and endanger the stability of the company and the livelihood of its employees and shareholders.

The home sales during the year, in view of the conditions, could be considered satisfactory. During the first half there had been a reduction on the previous year owing to the mildness of the winter, the general shrinkage in spending power of the public, and the fact that wholesalers and retailers had both continued to reduce stocks. During the latter half of the year sales had recovered to normal volume.

Export sales had been the best on record and had made a splendid contribution to the year's figures. Distribution was almost universal except for those countries where shipment was banned—but there was a tendency for markets as a whole to become freer.

The report and accounts were adopted.

BANK OF BRITISH WEST AFRICA, LIMITED

WIDENED SPHERE OF ACTIVITIES

LORD HARLECH'S SURVEY

The fifty-seventh annual general meeting of the Bank of British West Africa, Limited, was held on July 12th in London, the Rt. Hon. Lord Harlech, K.G., G.C.M.G., the chairman, presiding.

The following is an extract from his statement.

Current, deposit and other accounts for the year to March 31, 1951:—

I am glad to submit figures and results which I believe you will examine with satisfaction as they portray an appreciable degree of expansion and a general widening of the bank's activities.

Capital remains unchanged at £1,200,000. A sum of £50,000 has been taken from profits and added to the reserve fund, bringing the total to £1,000,000. A further sum of £50,000 has been placed to contingencies account. Current, deposit and other acounts at £52,710,589 show an increase of £8,081,874 over the previous year.

There has been a substantial increase in the amount outstanding in respect of liabilities on acceptances, confirmed credits and other engagements on behalf of customers, from £5,306,265 to £10,549,839.

ASSETS

Turning to the assets side, cash holdings at £5,223,419 are lower by £2,807,315, but money at call and at short notice is higher at £25,600,000 by £9,175,000. It will be observed that the ratio of liquid assets to deposits stands at approximately 60 per cent. Such position is by no means static, as our resources are continually turning over and a high degree of liquidity is necessary to enable the bank to finance the purchase of West African crops whose value has so markedly increased, and also to meet the heavy demands made by merchant houses covering the dispatch of consumer goods to West Africa.

Investments show little change at £11,400,393. There has been a steady growth of business in loans, advances and overdrafts during the year. An increased total of £9,199,808 appears in the balance-sheet, compared with £7,847,095 a year ago. Premises and furniture stand in the books at £121,715, an increase of £10,876.

In view of the increased profits at our disposal, your directors have given careful consideration to the payment of the dividend this year. An interim dividend of 2½ per cent. was paid in December, 1950, and it is now recommended that a final dividend shall be paid at the rate of 6½ per cent., bringing the total to 9 per cent. for the full year. In making this recommendation, I believe shareholders will appreciate that they are now being compensated to some extent for the lower range of dividends they received during the difficult years preceding and during the war. I might perhaps add that a dividend of 9 per cent. has been paid on several occasions in the history of the bank, while on two occasions the rate was 10 per cent.

INFLATIONARY TROUBLES

Despite precautionary measures, West Africa, in common with other parts of the world, is having inflationary troubles. Steps taken by the Marketing Boards to curb the worst of these have been partially effective, but world demand for tropical crops has been so great that prices have moved steadily upward with the natural consequence that the cost of living in West Africa has become dangerously high. These tendencies have not yet come to an end and, wherever possible, governments will be well advised to counter them by concentrating on the production of domestic food crops to an even greater degree in order that such adverse conditions may be minimised.

Trade with West Africa has flourished throughout the year. African producers are receiving high values for their exportable wealth and are clearly making efforts to take advantage of the present international situation which has created an urgent demand in world markets.

Fortunately, supplies of consumer goods shipped to West Africa have been sufficient to meet demands and, although sales to local African markets by the retail merchant houses have been on a heavy scale, there has been frequent evidence of price resistance against the increased cost of imported manufactured goods. It seems therefore, that there will be future problems to face in connection with merchandise replacements as manufacturing costs are still mounting in every country and retail prices must follow.

NIGERIA

Nigeria experienced no difficulty in selling all it could produce and, while there were welcome slight increases in the output of palm oil and kernels, cotton and timber, the export of rubber was stepped up heavily to 28,000,000 lbs., against 15,000,000 lbs. for the previous year. Unfortunately, the exportable groundnut crop, which was expected to be normal, showed a decrease of 40,000 tons at 188,000 tons.

THE GOLD COAST.—The production and marketing of its extensive annual cocoa crop is still the principal and most lucrative industry of the Gold Coast. Although the existence of swollen shoot disease and uncertain rainfalls frequently affect tonnage output, it is usual to expect that approximately 250,000 tons or more will become available for export each year. Rising world prices have acted as a stimulus and extensive planting of fresh areas has been undertaken which will be of benefit when trees mature five years hence.

VOLTA RIVER SCHEME

Prominent in the colony's ten-year plan is the Volta River hydraulic scheme, an ambitious project. The Volta scheme has grown far beyond its original conception and, in addition to the envisaged hydro-electric generating plant, now embraces an aluminium factory for the processing of local bauxite, the provision of cheaper power for industries, the creation of a new harbour, a new railway and the irrigation of the Accra plains, with the distinct probability of numerous subsidiary industries growing up in the Volta River area.

Mining continues to hold a vital place in the country's economy. The extraction of gold, diamonds, manganese and bauxite proceeds without abatement, bringing valuable revenue to the country as well as creating extensive employment.

My former personal experience of these African territories goes back for many years. Realising their immense potential wealth, I naturally have great faith in their future, which is assured by the valuable agricultural crops and mineral assets they possess. Our bank has grown and progressed in step with these colonies and, having sufficient resources at our disposal, we are well equipped to meet the demands of these expanding countries with equanimity. With prospects such as these, I believe I am justified in looking to the future with confidence.

The report was adopted.

YORKSHIRE FINE WOOLLEN SPINNERS

RECORD RESULTS

SIR FRANK BINNS ON SLUMP IN WOOL VALUES

The third annual general meeting of Yorkshire Fine Woollen Spinners Limited, was held on July 6th in London, Sir Frank Binns, Kt. (chairman and managing director), presiding.

The following is an extract from his statement:

It naturally affords me personal gratification to be able to state that the profits for the year are a record, so far as this group of companies is concerned.

The accounts for the year ended December 31, 1950, show that before charging remuneration of directors and depreciation, the combined profits of the group amount to £253,550 (compared with £215,038 last year).

After deducting depreciation and remuneration of the directors, the profits prior to taxation are £215,116 (£179,117 last year). Taxation on the accounts absorbs £114,950 (£96,800 last year), and the net figure is £100,166 (£82,317 last year).

The investments and current assets amount to £601,120 as against current liabilities and provisions of £315,322.

We have continued to follow the same policy as in the past, in adapting ourselves to the latest types of machinery, and improvements are still being carried out towards the perfection of our plant.

The general working conditions of all our operatives receive our constant attention, thereby ensuring that the work-people's health, morale and efficiency are kept at a high level.

GENERAL

You will be aware that there has been a decided "slump" in the values of wool. The estimate of the fall in prices, I would put, in certain instances, as high as 35 per cent. to 40 per cent. This implied, of course, that wools or tops which were valued as high as 350d. or 360d. per lb. in March this year, are now approximately on the basis of 230d. to 240d. per lb.

I therefore must be cautious, and impart the information to you that although your companies have been extremely busy during the first four months of this year, I do not anticipate that the same margins of profit will be maintained for the remaining eight months of the year ending December 31, 1951.

By this statement I do not wish to make you apprehensive regarding the future, as when the "slump" really began in earnest, your companies were not overloaded with stocks. Your directors anticipate that during 1951, reasonably good profits will be made, sufficient, we think, to be quite adequate to maintain the dividend at 35 per cent., subject, of course, to a completely unprecedented crisis in raw material values not arising.

Your mills are running to full capacity on orders which are showing profits, which we consider to be satisfactory. We feel, however, that although your directors are not gravely concerned about the position at present, nevertheless, as future prices of raw materials are so very uncertain, great care and caution must be observed.

On the ordinary shares an interim dividend of 10 per cent. actual, less income tax, was paid in September, 1950. The directors now recommend a final dividend at the same rate as last year, namely, 25 per cent., less income tax.

The report was adopted.

WIGGINS TEAPE AND COMPANY (1919), LIMITED

(Makers of Gateway Papers)

RECORD OUTPUT AND SALES OF MERCHANTED PAPER

PROGRESS OF THREE NEW PROJECTS

RAW MATERIAL: ABNORMAL PRICE INCREASE

MR L. W. FARROW ON THE UNPRECEDENTED DEMAND

The thirty-second annual general meeting of Wiggins Teape and Company (1919), Limited, was held on July 5th at Winchester House, Old Broad Street, London, E.C.2. Mr L. W. Farrow, C.B.E. (the chairman), presided.

The secretary (Mr W. Barnes) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts:

It is with great regret that I have to inform you that Mr F. D. Pirie passed away in November last. Mr Pirie was a director of this company from 1922 to 1949 and was chairman of our principal subsidiary Alex. Pirie and Sons, Limited, for some 35 years and a director of that company for over 50 years.

The improvement of the trading conditions in the paper trade to which I referred in my last year's statement continued throughout the year 1950. As a result, the output of the mills of the group and the sales volume of merchanted paper provided a record in the history of the group.

The demand for our papers so far outstripped the productive capacity of our mills that we were compelled, in fairness to our customers both at home and abroad, to operate a system of rationing.

PROGRESS OF NEW PROJECTS

I will deal with the progress of the three new projects in this country:

(1) Chartham Mill. The new machine at Chartham is now running satisfactorily. The product is good and profits are being earned.

(2) Glory Mill. Photographic Base paper is being produced on the new machine fully up to standard and the demand for our product exceeds our ability to supply.

(3) Bridgend Mill, South Wales. The machines in this mill have all begun production; it will, however, be some time before they are running to designed capacity. The product is satisfactory and profits are already being earned.

AUSTRALIA: SALES ORGANISATION AUGMENTED

No decision has yet been reached in regard to establishing a mill in Australia. Investigations are still proceeding and our proposed plans have had to be modified in view of the shortage of woodpulp, to which reference is made later in this statement. It is probable that provision will have to be made for the incorporation of a pulping plant to deal with raw materials indigenous to Australia. During the year, we acquired an old established merchanting house in Adelaide to augment our sales organisation in Australia. The house to which I refer is A. E. W. Short Proprietary, Limited, who have been our agents in South Australia for a very long period.

SATISFACTORY S. AFRICAN INVESTMENT

South African Pulp and Paper Industries, Limited, in which your company has a substantial interest, had a record year of trading profit during 1950. The paper machine and auxiliary plant which were sold to that company have been reconditioned and extended in the engineering shops at our Stoneywood mill and were delivered in September last within the specified time. The erection of this machine at Enstra, near Johannesburg, is almost complete and it should be in commercial production before the end of this year. They have ordered a further new machine and it should be delivered by the end of this year. By the provision of these machines the productive capacity of the mill should be doubled. Your directors are very satisfied with this investment and most cordial relations exist between the management of South African Pulp and Paper Industries, Limited, and that of your group.

ENVELOPES AND STATIONERY

I referred last year to the recession in the demand for envelopes and stationery, the manufacture of which is undertaken by our subsidiary, Pirie Appleton and Company, Limited, and its group of companies. I am glad to report that the trend in that industry followed that of the paper trade and a complete recovery took place in the second half of the year.

THE ACCOUNTS

With regard to the accounts, no change occurred in the capital structure during the year. Upon referring to the consolidated balance sheet it will be observed that the funds attributable to debenture and stockholders amount to nearly twelve million pounds. After deducting the amounts of debenture stock, preference and outside share capital, the amount attributable to ordinary capital of Wiggins Teape and Company (1919), Limited, is £7,271,728.

PROVISION OF ADDITIONAL FINANCE

In my statement last year I referred to the fact that paper mills were free to purchase their requirements of woodpulp and esparto. From the beginning of the late war until March 31, 1950, woodpulp and esparto had been purchased by the Board of Trade and the paper mills were not required to pay for these materials until they were used. The cessation of this procedure meant that the mills were once again required to finance their own stocks of these materials. In consequence of this and the need for additional working capital caused by increased business and prices, your company has been called upon to find additional finance of approximately £1,250,000. To do this, your directors arranged a bank loan of £500,000 and acceptance credits which, at December 30, 1950, amounted to £731,739. The other items of liabilities do not call for comment.

The increase in the total of fixed assets represents the payments made during the year on the new projects and on further capital expenditure at our other mills

Current assets show an increase of over £1,800,000 due to the causes to which I have referred. This increase has been financed partly out of profits retained in the business during 1950 and as to the balance, by the bank loan and acceptance credits.

TRADING RESULTS

Upon turning to the consolidated profit and loss account, you will notice that we have also tabled for comparison the trading results for 1948, as those for 1949 were exceptionally low for the reasons I referred to last year. Trading profits of the group amounted to £2,752,914 for 1950, before deducting the expenses enumerated and show an increase of £1,713,497 over 1949 and an increase of £88,855 over 1948, which was a more normal year. The increased profits are due to (a) profits earned by our new projects, (b) increased and more efficient production from our existing mills, (c) improved results of our merchanting companies and overseas branches and (d) increased sales by our converting companies. After allowing for repairs and renewals, pensions, interests on loans, amounts set aside for obsolescence and renewals and increases in specific reserves, the profits before taxation amounted to £1,814,783. After deducting taxation, dividends of subsidiaries applicable to outside shareholders and profits retained in subsidiary companies, etc., the profit of Wiggins Teape and Company (1919), Limited, amounts to £854,330.

It will be seen that your directors are recommending a final dividend of 3¾ per cent., free of tax, making with the interim, a total of 4¾ per cent., free of tax, on the ordinary stock for the year 1950. After transferring the sum of £530,000 to contingencies reserve, the carry forward is slightly increased to £62,263.

It will be observed that the contingencies reserve now amounts to £765,398, and the paper and raw materials stocks reserve amounts to £304,087, a total of £1,069,485. Your directors feel these reserves are necessary in view of the losses which ultimately may be incurred if and when the prices of paper and raw materials fall from their present very high level.

ANALYSIS OF £1 OF TURNOVER

I give below a table showing the relationship of the various items of cost, reserves and dividend to £1 of turnover for 1950:—

	£	s.	d.
1. Raw materials, purchases and stores		11	11½

CURRENT YEAR'S PROSPECTS

With regard to the prospects for the current year, the unprecedented demand for paper continues and the results for 1951 should be satisfactory. The raw material position, however, is giving your directors considerable anxiety. The production of woodpulp throughout the world does not meet the demand, in consequence of which prices are

continuing to rise steeply. For certain grades of woodpulp it has become the custom in this country to fix prices for regular supplies each quarter, and increasing prices for each succeeding quarter's deliveries have been experienced. In some cases prices are being quoted for the second half of this year for bleached pulps which are four times the prices in 1949 and nine and a-half times the prices in 1938. These abnormal rises have reached such a high level that the prices of woodpulps bear little or no relation to the costs of production at the woodpulp mills.

It is my pleasant duty to refer to our employees, both at home and abroad, who have earned our grateful thanks for their loyal and praiseworthy work during the past year.

The report and accounts were adopted.

The retiring directors, Lt.-Col. R. G. Ritson and Comdr. W. B. Pirie, D.S.O., D.L., were re-elected and the remuneration of the auditors having been duly fixed the proceedings terminated.

PURNELL AND SONS LIMITED

(Printers and Bookbinders)

SATISFACTORY RESULTS

FULL PRODUCTION MAINTAINED

The seventeenth ordinary general meeting of Purnell & Sons Limited was held on July 6th at the Waldorf Hotel, Aldwych, London, W.C.2, Mr W. Harvey (chairman and managing director) presiding.

The following is an extract from the chairman's circulated review:

I have pleasure in once again submitting to you the accounts of your company showing results which, I believe you will agree, are satisfactory. The group profit for the year, before providing for taxation, is £561,000, and shows a slight decrease of approximately £10,000 on that of the preceeding year. Out of this profit has to be provided taxation, £362,916, and £4,600 in respect of the minority shareholders' interest in the profits of the subsidiary companies, leaving a balance for the year of £194,284; the corresponding figure for the previous year was £233,594.

HARSH EFFECT OF TAXATION ON INDUSTRY

At the last annual general meeting I referred to the harsh effect of taxation on industry and I feel it is my duty to again draw attention to this ever-increasing burden which is being placed upon the industry of this country. It will be observed that in the accounts now under review a profit which is £10,000 less than the previous year has to bear increased taxation of £28,000. There is left, after providing for taxation, less than 7s. 1d. in the £, to enable the company to maintain its policy of introducing the latest plant and equipment, finance ever-increasing prices of materials and costs, and, at the same time, provide some return to the members who provide the capital and take the risks. Under the provisions of the Finance Bill now before Parliament the proportion of earnings absorbed by taxation will be considerably increased and, one may well ask, for how long can industry carry this ever-increasing burden?

The consolidated balance sheet shows that the current assets exceed the current liabilities by just over £200,000, a similar position to that existing in December, 1949.

The company's works are in full production in spite of the difficulties experienced in obtaining raw materials, but I must say that conditions appear to become more difficult, in every direction, each day. I can, however, assure you that your directors are using every endeavour to maintain production, and I believe I can say, that as far as one can forecast, the present year's results will be satisfactory.

I should like once again to pay tribute to my colleagues on the board, all of whom give their full time to the service of the company, and to express my thanks to the staff and workpeople, without whose wholehearted support the satisfactory results shown by the accounts could not be attained.

The report and accounts were adopted and a final dividend of 32 per cent., making 60 per cent. for the year, was approved.

ASSOCIATED WEAVERS LIMITED

(Manufacturers of Upholstery Fabrics and Carpets; Dyers and Spinners)

RECORD PRODUCTION AND PROFIT

STEADY WORLD-WIDE DEMAND

SIR FRANK NEWNES ON THE OUTLOOK

The fifteenth annual general meeting of Associated Weavers Limited will be held on July 25th at the Savoy Hotel, Strand, London, W.C.

The following is the statement of the Chairman, Sir Frank H. Newnes, Bt., which has been circulated with the report and accounts for the year under review:

The year ended March 31, 1951, has been a record year, both from the point of view of volume of production and profit earned. The consolidated net profit for the year after deducting all expenses, except taxation, amounted to £430,709, against £251,746 last year. Of the profits, 56 per cent., or £240,202, is required for taxation, 12 per cent., or £52,136, is allocated for dividends, and the remainder, 32 per cent., goes to strengthen our reserves and undistributed profits.

You will notice that your Directors recommend on the ordinary stock, as increased by the capital bonus, the same rate of final dividend, viz., 22½ per cent., as that paid for the last four years. It is in addition your Directors' current intention to maintain the interim dividend for 1951-52 at 10 per cent. less tax, thus maintaining the total of 32½ per cent. paid in recent years on the former capital.

SUCCESS OF BOARD'S POLICY

The increased production and profit are largely due, firstly, to the results of constant research and experiment, and secondly, to the Board's policy of capital expenditure wherever sufficiently improved designs of machinery or equipment are available. During the year we spent about £120,000 on capital account, and you will see from a note on the balance sheet that we shall have in due course to pay a further £206,000 in respect of uncompleted contracts for capital expenditure. We anticipate that our cash balances of £160,000, our annual depreciation provisions, and our surplus profits in the future will be sufficient for this purpose.

As a result of the dividend policy followed by the Directors from the inception of the Company, a large proportion of the profits has accumulated in the form of reserves employed in the business, and mainly due to that, the total of our tangible assets, less liabilities at March 31st last, was £1,020,000, exceeding £1,000,000 for the first time.

CURRENT ASSETS

You will notice that our current assets now amount to £1,206,000, against current liabilities amounting to £477,000 (including current taxation and proposed dividends). The largest single item in the current assets is our stock and work in progress. Of this, wool amounts to about two-fifths only. The remainder includes the other textile fibres, cotton, rayon, and jute, together with cotton cloth and raw materials for our subsidiary, Armoride Limited.

I am pleased to report that Armoride Limited continued to improve its position, both in the export and home markets. Its main problem is to obtain sufficient and suitable raw materials.

We have developed the export markets with energy, and the value of our Group exports rose by 25 per cent. during the year. We have established a world-wide organisation, and while one or two markets are of considerable importance to us, there is a steady demand for our productions from nearly every part of the world, except those territories under Russian influence.

MOTHPROOF UPHOLSTERY FABRICS AND CARPETS

For the benefit of new shareholders and those unacquainted with our business, I would state that the Parent Company specialises in the production of mothproofed moquettes for the upholstering of furniture for domestic use, ships, hotels, cinemas, and transport. We are also manufacturers of mothproofed Axminster carpets. Both moquettes and carpets are sold under the same brand name, "Weavercraft," which is well known in the trade. Armoride Limited makes leather cloths and plastic cloths, some of a very specialised type, for a variety of trades, including upholstery, handbags, luggage, shoes, and fancy goods, and the branded names "Armoride" and "Plaxide" are well known. In addition a section of the works is engaged on the rearmament programme.

You will recall that towards the end of 1950 there was distributed to the ordinary shareholders a bonus of one share in five, and it is your Directors' intention towards the end of 1951 to submit to shareholders a resolution providing for a further bonus, this time of one share in six. In addition to the large reserves shown in the balance sheet the current values of our factories and plant are much higher than the book values thus constituting a further reserve, and your Directors wish to see the ordinary capital more nearly representative of the actual capital employed.

BALANCE SHEET ITEMS

There were two small intangible items in our consolidated balance sheet. One is goodwill £15,682, and the other is the excess cost of shares in subsidiary Companies over their net tangible asset value, £881. Your Directors have written off these two items so that there be no entries in the balance sheet except those in respect of tangible assets. The goodwill of your Group is obviously worth very much more than £15,000, but it is not an item we wish to leave indefinitely in our accounts.

So far as the current year is concerned, we have good order books for the export and home trades, and subject to the usual difficulties of raw materials and controls, the outlook remains satisfactory.

Once again, for their contribution to this excellent result, I wish to render thanks to our executive staff, employees, suppliers, and also to the sales secretariat and their agents throughout the world.

LAPORTE CHEMICALS LIMITED

RECORD VOLUME OF SALES

MR L. P. O'BRIEN'S SPEECH

The forty-fourth annual general meeting of Laporte Chemicals, Limited, was held on July 10th in London. Mr L. P. O'Brien, the chairman, presiding.

The following is an extract from his circulated statement:—

Our audited consolidated accounts for the past year show that after deduction of £151,819 for depreciation, there is a credit surplus of £690,137, which is more than was shown at the end of the previous year by £156,493.

Increased earnings were achieved as a result of record sales, both by volume and value.

Last year a surplus, being post-acquisition earnings by one subsidiary for nine months only, was brought in and, therefore, addition of one-third to the figures of that subsidiary to show a twelve-months' average would give an equal period comparison, and on that basis the surplus would be reduced to £143,340.

REPLACEMENT OF ASSETS

The depreciation rates employed would have been satisfactory if the purchasing power of money remained constant from year to year, but that has not been our experience. We have found that the replacement cost of new works built and equipped these last few years is higher than the original cost to an extent greater than the sum provided by our depreciation rates.

Your directors have this subject under consideration in order to arrive at a suitable long-term method of dealing with it.

In the meantime, as we cannot accept that under conditions now prevailing a surplus is a true profit, we are asking you to allocate from the total divisible surplus of the parent company the sum of £100,000, instead of £50,000 as last year, to the credit of obsolescence and replacement of assets reserve, as we now call it, instead of obsolescence reserve as previously, towards providing against the probable undercover which exists in the accounts now before you.

As you know, the Exchequer has not done anything since 1946 towards increasing wear and tear allowances to offset continually increasing costs of replacement. Consequently, this allocation must come out of the surplus remaining after provision for future taxation arising from these accounts.

The total capital and reserves, excluding tax reserves, amount to £2,897,689—an increase of £190,061.

ADDITIONAL PLANT ORDERED

We have an elemental sulphur-burning acid plant at Luton and our two subsidiary companies, John Nicholson and Sons, Limited, and Hunt Brothers (Castleford) Limited, burn quite a lot of sulphur in their Yorkshire plants, and so we have ordered a second pyrites-burning plant to produce 100 tons of strong acid per day to be erected at Castleford, to ensure no permanent interruption to their businesses. Pyrites-burning plants of the type ordered are very expensive and because of the high amortisation amount which it will be necessary to provide, it will be essential to receive higher prices for sulphuric acid made from these plants than from sulphur-burning plants. However, there are acid users who are willing to contract ahead for several years at cost plus for output from these plants.

This country must have adequate supplies of sulphuric acid to survive as an industrial power. Presently there is not enough sulphur to meet demand and soon there will be less still. We have been promised pyrites supplies for several years after our new plants are ready to burn it. Certainly, at that time there will be no plethora of acid production so we deemed it advisable to take steps to provide for the future needs of our customers and ourselves. I regard these new plants as likely to be sound investments.

When the time comes to ask for more capital, I shall go more closely into matters concerning new capital projects. All it seems necessary to add now is that the planned extensions are natural developments of our usual activities.

One might add in this connection that the company has applied for permission to make other extensions necessary to meet stated forward requirements of our customers but, unfortunately, this has been refused for the time being.

Except for National Titanium Pigments, Limited, whose output was reduced in the fourth quarter through shortage of sulphuric acid, the parent company and the subsidiaries have been at full stretch of production in almost every department, and it looks as though it may be like that this year, except possibly in the acid plants.

RESEARCH DEPARTMENT

To ensure continued prosperity in future years, your directors are strengthening the research departments. For example, the company has just completed extensions to existing laboratories at a cost of about £50,000, so that the increasing numbers of the highly qualified scientific staff shall be properly housed and equipped.

Research is not usually a short-term investment; it often takes some years to realise the benefit of patient work, but we have faith in our research departments because we and our customers are benefiting now from work done in past years.

For example, the new hydrogen peroxide plant came into production early in 1950. It has been successful from every point of view. Despite the much heavier amortisation charge to be borne as compared with older plant, the final cost of production is low enough that, so far, helped by the spread of overheads on the greater than expected output, we have absorbed all the higher prices we had to pay for fuel, electricity, wages and everything else, without putting up our selling prices for hydrogen peroxide, which have not been increased for 3½ years. In the circumstances, we feel confident of gainful employment of the extension of the plant now being undertaken and which should start working before the close of this financial year.

We are not going to rely indefinitely on present production methods, good as they may be; for any further extensions and replacements we have still more improvements to introduce, and possibly entirely new ways of manufacture.

Our subsidiary, Malehurst Barytes Company, Limited, has extended its mining operations to Devonshire, having acquired the Bridford Mine, from which barytes are won for use in the barium plants of the parent company. The output from this mine, together with that from our Silverband Mine in Westmorland, leaves the company largely independent of outside supplies.

The report was adopted, the dividends were approved, and Mr P. D. O'Brien was re-elected to the board.

WALKER CAIN LIMITED

CONTINUED DEMAND FOR BOTTLED BEER

The twenty-ninth ordinary annual general meeting of Walker Cain Limited was held on July 11th in London, The Rt. Hon. Lord Brocket (the chairman) presiding.

In the course of his speech, the chairman said: Trade for the year showed a slight recession compared with the previous year due, to a large extent, to the very bad weather experienced last summer. The decrease, however, is very much less than that of the country as a whole, which I regard as a compliment to the excellence of our products. Draught beer tends to fall behind, due, no doubt, to the lack of facilities for obtaining refreshment on the housing estates which have been built since the war. As a consequence, the demand for bottled beer continues to increase. During the year we completed the extension of our bottling stores and chilling plant, and present indications are that we are in a good position to cater for any increased demand that may arise.

The net profit at £523,069 compares with £567,365, showing a decrease of £44,296 after all charges.

The available profit of the group, including the amount brought forward (£523,869) from last year is £1,053,438. We propose that £135,000 be placed to property improvement reserve and £26,000 to general reserves. Dividends to outside shareholders in subsidiary companies absorb £75,036. Parent company preference stock dividends take £88,000, the ordinary stock interim dividend (5 per cent.) £62,425, and the final ordinary dividend (11 per cent.) £131,092. After these allocations the balance carried forward to next year is £535,885, which is £12,016 more than last year.

The report was adopted.

SMITH'S POTATO CRISPS (1929) LIMITED

INSISTENT DEMAND

The twenty-second ordinary general meeting of Smith's Potato Crisps (1929) Limited was held on July 11th in London.

Mr Fermian Le Neve-Foster, the chairman, after paying a tribute to the late Sir Herbert Morgan, said: The net profit shown by the consolidated profit and loss account, after provision for taxation and other items, amounts to £101,633, compared with £97,767 for the previous year.

One factor common to all manufacturing companies for the year under review is the steep increase of costs of all kinds, particularly in the price of materials. We have had to face substantial increases on almost everything we have to buy. That in face of this position we have been able, so far, to refrain from raising our price of our product to the public of 3d. a bag and, at the same time, substantially maintain profits is an achievement of management, the chief credit for which must go to our founder and managing director, Mr Frank Smith.

There can be no doubt that, were we able to supply more crisps of the same quality, our sales could be very greatly increased. One hopes that with increasing world supplies the time may not be too far distant when the limitation and rationing will be removed and we shall be enabled to produce adequate quantities for the whole of the public. The information that is constantly being submitted to us from the trade is strong evidence that if Smith's Crisps were available they are the ones to be supplied. There are no crisps like Smith's.

The report was adopted and the proposed dividend and bonus, making 32½ per cent., less tax, for the year, were approved.

J. LYONS AND COMPANY

PLEA FOR RELAXATION OF AUSTERITY

MR GLUCKSTEIN'S STATEMENT

The 57th annual general meeting of J. Lyons and Company, Limited, was held on July 9 at the Trocadero Restaurant, London, W. Mr Montague Gluckstein (the chairman) presiding.

The following is an extract from his circulated statement:

It is with very deep regret that I have to mention the heavy loss we suffered in the death of Mr Harry Salmon.

In February we had the honour of a visit to Cadby Hall by H.R.H. The Princess Elizabeth. Her visit stirred all hearts, and her gracious acceptance of our welcome, and the lively interest she showed in all she saw, have left with us a proud and happy memory.

Referring first to the company's balance sheet, you will see that, in accordance with the resolution of the extraordinary general meeting held on January 17th, the nominal capital now stands at £10,925,000, an increase of £1,000,000, represented by the creation of further "A" Ordinary shares of £1 each. 660,000 of these new shares have been issued and have now been converted into stock. The price at which they were issued was £4 10s. per share, of which the final instalment of £2 per share was not due until after the close of the financial year on March 31st. The success of the issue was gratifying.

DIVIDENDS MAINTAINED

The net profit for the year is £610,262, which shows an increase of £32,199 over last year's figure of £578,063. Dividends on preference and preferred ordinary stocks for the year have absorbed £269,938. We are recommending the payment of final dividends on the ordinary, "A" ordinary and Proportional Profit capital at the same rates as last year, which, with the interim dividends paid in December last, will take £221,593.

PROBLEM OF RISING COSTS

The year has seen a continued and, in some cases, a steep rise in the cost of all raw materials and equipment. Increases in the cost of transport, both rail and road, have also been heavy. We wonder if those who decide upon these higher charges make sufficient effort to avoid imposing them; they seem to act as if the only way to cover any increases in their costs is to pass them on automatically to those who use the services. Inevitably some at least of the increases must be passed on to the customer; a process which causes us the utmost concern because there is the ever present fear that prices will reach a point beyond his ability to pay them. Our policy has always been to keep the lowest possible price consistent with the maintenance of a high standard of quality, and to realise no more than the smallest margin of profit; often so small that the slightest miscalculation can dissipate it.

The fact that the Government has decided to retain subsidies on certain foodstuffs seems to involve a continuance of austerity, for the quantities made available for consumption at subsidised prices cannot be unlimited. There is however in the case of some foodstuffs, for instance cheese and ham, a "two tier" system, permitting the consumer to purchase additional quantities but at a non-subsidised price. It would seem that the system could well be improved and extended to less expensive commodities after the basic ration has been secured. If anyone prefers to spend extra on food, instead of spending in other ways, there can surely be no serious objection to his being allowed to do so. Relaxation of austerity is desirable, and not only in quantity but in quality also. We welcomed the reopening of the London Tea Market, but it was something of a burlesque to retain retail price control for a commodity which in the market is sold by auction. The effect has been to discourage the sending of finest quality teas to London.

Despite the difficulties, however, I think you will agree that we have reason to be satisfied with the results of our year's work. The achievement of these results would not have been possible without the loyalty and untiring efforts of all our staff. In a company such as this it is not only the board and the senior management who carry home with them their concern for the company's progress and success; there are many that might be termed "middle management" who curtail their leisure and lose some sleep in striving for the successful conduct of the company's business in all its branches. To them, and to the whole staff, I should like, and I am sure you will be with me, to express our warm thanks for their efforts and enthusiasm. It is good to be able to say that we maintain as ever a happy spirit of loyalty and enthusiasm throughout the organisation.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting, the Chairman said: I would like to add a little to the statement that accompanied the accounts.

Reference has been made in it to the great loss which the company sustained by the death, in October last, of Mr Harry Salmon. It is difficult to find adequate words to express the value of his services to the company or to indicate the influence he had on its fortunes. I recognise that I have undertaken a difficult task in following him in the chair, but I hope that the inspiration of his example, and the benefit of my very long association with him, will enable me, with the support of my colleagues, to fulfil it to the benefit of the company.

The country seems to have become so accustomed to austerity, restriction and control that it is in danger of losing resilience. Faced with a Finance Bill which penalises still further the risk-bearing investor by increasing profits tax and places further heavy burdens on industry, the attitude seemed to be "it might have been worse." This country, and this company, were not built up in that spirit. If we are to get back to real achievement and progress, the qualities of enthusiasm, vigour and readiness to take risks—they are still to be found here—should be set free to operate as in the past.

Critics, we are told, should make plain what they want. Very well then we want some relief from the spate of legislation to which we have been subjected for so many years. We want more freedom to buy what we want, where we want, and in the qualities we want. We want freedom to pay high real wages to all who contribute to our effort. Wages are playing a game of leap-frog with the cost of living. Those of half a century ago are often quoted as a shameful past to be lived down. But what could be bought with them is an interesting study. As one of our older employees put it recently: "With sixpence I had a shave, a packet of cigarettes and half a pint of beer." We want freedom to pay high real wages not only to all our staff, but also to those who supply the necessary capital to enable us to build, to equip, to experiment and to progress.

The report and accounts were adopted.

VAB PRODUCTS

The 14th annual general meeting of Vab Products, Limited, was held recently in London.

Mr J. E. Hodgkin, M.I.E.E., M.I.M.E. (the chairman), presided, and, in the course of his speech, said: I think I may say that the company has never stood in a stronger position, and thanks to the very efficient management of our co-directors and managers who are responsible for our subsidiary companies the figures are eminently satisfactory, in spite of the very great difficulties in obtaining raw materials.

The principal change in the company's properties during the year has been the acquisition of the business of Royse Bros., Limited, of Sheffield, which is proving a useful profit-earning member of our group of companies.

Taxation, as you will note, requires more than 70 per cent. of our net profit, which is definitely discouraging to enterprise; but your directors feel that shareholders should participate to a larger extent than hitherto which accounts for the increased dividend recommended in our report.

We have also started a practice of ploughing back into subsidiary companies a substantial amount of their profits as a reserve towards future taxation liability. Therefore the picture is more attractive than shown by the actual figures.

Mr W. G. F. Westbrooke has been appointed managing director during the year, and is very efficiently carrying out the co-ordination of the company's various businesses.

The balance sheet and report were adopted, and a final dividend of 10 per cent., making 20 per cent. for the year, declared.

TELEPHONE MANUFACTURING COMPANY

TAXATION BURDEN ON INDUSTRY

The twenty-first annual general meeting of Telephone Manufacturing Company Limited was held on July 9th in London, Mr Fred T. Jackson, O.B.E., Comp.I.E.E. (chairman and managing director), presiding.

The following is an extract from his circulated statement:

The net profit of the parent company amounted to £192,016; taxation at the new rates takes no less than £105,603. The total dividend of £50,000 subject to income tax has increased by 11 per cent. only since 1939 whereas wages and salaries are more than 100 per cent. higher. This is particularly hard on the 3,000 odd shareholders. Small savings directly or indirectly form a large part of risk capital, which is the lifeblood of industry, and an adequate return is essential if the supply of capital is to be maintained. Heavy taxation and mounting inflation are restricting severely the savings both of industry and of the individual. In the case of your company it is becoming increasingly difficult to retain a sufficient proportion of the profits with which to maintain and provide for a reasonable expansion of the business.

After referring to the progress of the subsidiary companies the statement continued: The parent company's turnover for 1950 showed a small increase. 41.4 per cent. of the output was exported.

The British Post Office is the company's principal customer in the home market. There is no indication as to when it will be possible to recommence the development of the telephone service in this country.

The report and accounts were adopted.

MIDDLE WITWATERSRAND (WESTERN AREAS) LIMITED

REVIEW OF WIDESPREAD INTERESTS

MR S. G. MENELL ON SUCCESS OF PIONEER WORK

The eighteenth annual general meeting of Middle Witwatersrand (Western Areas) Limited was held on June 27th in the Board Room, Anglovaal House, Fox Street, Johannesburg.

The chairman of the company, Mr S. G. Menell, presided, and, in the course of his address, said:

The net profit for the year was £407,767 compared with the previous year's figure of £176,615. Provision for taxation together with expenses in connection with a quotation for the company's shares on the Paris Bourse absorbed £83,118, leaving £324,649 which, added to the balance from the previous year, left £546,257 to be carried forward on appropriation account.

At the date of the balance-sheet the book value of investments was £1,179,453, compared with the previous year's figure of £484,126. The book value of the quoted investments in the company's portfolio was £1,026,962 while the market value of such investments was £1,735,329.

During the year further capital was called up on our holding of Kennecott-Anglovaal Exploration Company, Limited, shares. The item shares in subsidiary companies £41,977, represents the company's holding of 203,597 shares in New Klerksdorp Gold Estates, Limited, and 10,000 shares in S.A. Base Minerals, Limited.

At today's date, the company has over £700,000 cash working capital available to cover the contemplated expenditure on the several operations being conducted by the company.

ORANGE FREE STATE INTERESTS—SAND RIVER AREA

Merriespruit Flotation—Subsequent to my address to shareholders last year, advice was received that the Hon. the Minister of Mines had agreed to grant the company its second mining lease in respect of approximately 5,830 claims immediately to the south of the Virginia and Harmony mines.

Merriespruit (Orange Free State) Gold Mining Company, Limited, was formed to work this second lease area.

Merriespruit Mine.—Progress continues to be made with shaft-sinking and with the other activities necessary to bring a large new mine to production, and full advantage is being taken of the adjacent situation of the Virginia mine for the conjoint opening-up of the two mines.

Progress has been maintained on shaft-sinking, building construction and installation of equipment at Virginia mine. It is pleasing to note that the breaking of world shaft-sinking records at No. 3 shaft during March and April this year has appreciably advanced the date on which development operations will be commenced in the upper levels of the mine.

Other Farms in the Sand River Area.—The farms Zomersveld 395, Gelukspan 394 and portions 2 and 4 of La Riviera 289, totalling 1,227 morgen approximately, adjoining the Virginia and Harmony mines, are the subject of an agreement between the company and New Consolidated Free State Exploration Company, Limited, for the exploration of a joint mining area in which your company will be entitled to participation rights.

In this area, New Consolidated Free State Exploration Company, Limited, have announced encouraging results obtained from Boreholes S.A.P.1, S.A.H.1, SH.D.1 and S.S.D.1 drilled on the farm Saaiplaas No. 690.

Drilling in this area is being continued.

ODENDAALSRUS AREA

The farms Van den Heevers Rust, Klein Begin, Britspan and Stephanus Rust form portion of a block of ground which is the subject of an agreement between the company and General Exploration Orange Free State, Limited, for the exploration of mining areas in the Odendaalsrus district. In the event of it being decided to make an application for a mining lease your company and General Exploration Orange Free State, Limited, will, subject to existing rights, participate in the vendor and subscription rights pro rata to the estimated payable tonnage contributed by each company. The first company formed to take cession of a mining lease in respect of this ground will be under the administration of Anglo-Transvaal Consolidated Investment Company, Limited. Your company will receive a minimum of 25 per cent. of all vendor and subscription rights in such first mining company.

Drilling to date has indicated that the highly payable upper reefs intersected in boreholes K.1, TV.2, VDH.1 and borehole No. 1 on Rosedale 898 extend over a distance of some four miles.

In addition, boreholes V.D.H.5 and V.D.H.6 are being drilled by your company on joint account with General Exploration Orange Free State, Limited, and W.N.5 is being drilled by General Exploration Orange Free State, Limited, on joint account with your company.

PARTICIPATION RIGHTS

The company retains its right (subject to a maximum of £50,000 in respect of any one flotation) to subscribe for 20 per cent. of any working capital for which Lydenburg Estates, Limited, is entitled to subscribe in respect of the turning to account of certain of its properties and interests in the Orange Free State.

STILFONTEIN-HARTEBEESTFONTEIN AREA

In the area south of Stilfontein Gold Mining Company's lease area, known as the Lucas block, drilling has been continued in order to demarcate the extent of the reef-bearing ground. Seven boreholes are at present in progress.

It is anticipated that two mines may eventually be established on the Lucas block and on certain adjoining ground.

Your company retains its interest in the Stilfontein Gold Mining Company, Limited, where good progress has been made during the twelve months under review.

KENNECOTT-ANGLOVAAL EXPLORATION COMPANY, LIMITED

Your company retains its interest in Kennecott-Anglovaal Exploration Company, Limited, which is engaged in prospecting in the Northern Free State and Western and Northern Transvaal. No results of importance have been obtained to date.

NEW KLERKSDORP GOLD ESTATES, LIMITED

The tonnage crushed for the year was 104,450 tons, and the working profit was £28,041. Included in this working profit is the sum of £3,056 received from the sale of gold at enhanced prices.

The payable ore reserve as at December 31, 1950, was estimated to amount to 578,000 tons, having an average value of 2.58 dwts. over a stoping width of 70.1 in.

Progress has been maintained with construction work to increase the capacity of the reduction works to 10,000 tons per month.

KLERKSDORP TOWNLANDS

Since the close of the year your company exercised an option to purchase the mineral rights of the eastern portion of the Klerksdorp Townlands, measuring approximately 4,556 morgen.

It is the present intention that any mine or mines developed on the Klerksdorp Townlands will be developed by New Klerksdorp Gold Estates, Limited.

The report was adopted.

ROYTON TEXTILE CORPORATION LIMITED

GOOD PROGRESS DURING YEAR

The second annual general meeting of the Royton Textile Corporation Limited was held on July 12, 1951, at the offices of the Corporation, Col. J. B. Gartside, D.S.O., M.C., T.D., D.L., J.P., the chairman, presiding.

The secretary read the notice convening the meeting and the report of the auditors. The following is the chairman's statement, which had been circulated with the report and accounts for the year ended March 31, 1951:—

The accounts presented cover the first full year's trading of the Corporation and need little comment from me, being self-explanatory and easily understood. I do feel, however, you would wish me to point out a few of the salient features.

After providing £52,633 depreciation and £208,144 for taxation on the year's profits, the net profit for the year is £173,592, as compared with £107,599 for the nine months ended March 31, 1950.

TAXATION PROVISION

The amount of £83,000 transferred from profit and loss appropriation account calls for some explanation and arises by reason of the normal method adopted of assessing Income Tax Schedule "D" on the preceding year's profits. As a consequence it is necessary in one or other of the first three years' trading of a new company to make provision for the current tax payable on the actual profits earned and also for the future tax which is assessed on those same profits.

The board feel sure that you will agree that in view of the very satisfactory profits earned, full provision should be made as early as possible for all current and future taxation, and this course has been adopted by making the transfer of £83,000. Thus some two-thirds of our gross profit goes to our insatiable friend the Chancellor of the Exchequer.

Turning to the balance sheet, £43,019 has been received on account of the re-equipment grant under the Cotton Spinning (Re-equipment Subsidy) Act, 1948.

Stock reserve £30,000, a very necessary provision. It is to be noted that the cost of raw cotton at 53d. is some 22d. per lb. dearer than a year ago—31d.—and compares with 5d. in 1938.

Of the additions to fixed stock this year, £67,564, some £51,000 will rank for the subsidy grant.

Our commitments for new machinery and ancillary equipment amount to £170,000.

ANALYSIS OF EXPENDITURE

Each £ of Expenditure s.	d.		Per-centage
13	8·85	Cotton	68·687
2	3·85	Wages and Nat. Health Insurance	11·605
	11·50	Maintenance and Trade Expenses.	4·706
2	0·55	Taxation	10·229
	3·49	Dividends	1·455
	7·96	Reserves, Depreciation and Surplus	3·318
20	0·00		100·000%

RE-EQUIPMENT PROGRESS

The re-equipment programmes instigated by the Transferor Companies in 1945-46, and implemented by the Corporation, are materialising; progress cannot be considered as satisfactory as had been anticipated, but when complete our plant will be capable of producing quality cotton yarns under modern practices, conditions and the full utilisation of labour.

Holly Mill is being converted to be capable of producing rayon yarns as and when raw material is available.

The labour position, whilst slightly better than a year ago, still leaves our mills with machines standing idle, and, whilst our production during the past year has increased, we are still below our capacity to produce.

The raw cotton situation gives cause for grave anxiety in the coming year, not only as regards quality, but also as to the availability of the raw material. During the past year, by the kind forbearance of our customers and the ability of our managers and operatives, substitute cottons have been used to a degree never before experienced.

SURVEY OF THE INDUSTRY

Our order book is satisfactory; we have made every effort to keep faith with our customers who supply the utility programme. We are now supplying yarn in larger packages in cop, cone, cheese and beam; and new ring yarn now in production at Vine Mill is giving every satisfaction. By the installation of ancillary machinery we are keeping abreast of the changing conditions which are a feature of the weaving section of the industry. To this end we welcome the suggestion that a survey of the industry should be made in order that the manifold changes which are taking place could be co-ordinated.

During the year our managing director has visited the U.S.A. and Egypt and has had the opportunity to study the various methods of spinning and weaving operative in those countries.

From the foregoing you will gather that whilst we have made progress much remains to be done and teething difficulties to overcome. The present year should, however, see us further on our way to building up an organisation comparable with any in the industry.

I would like on your behalf to express thanks to the management, officials, staff and all employees at the mills, for the loyal and splendid service they have rendered during the year which has resulted in the production of so very satisfactory a result.

Mr F. Brewer and Mr Harold Hasty were re-elected directors.

A final dividend of 10 per cent. (less income tax) was declared making 15 per cent. (less income tax) for the year.

The report and accounts were adopted.

RICHARD COSTAIN LIMITED

SATISFACTORY FINANCIAL POSITION

BALANCED SPREAD OF RESOURCES

MR R. R. COSTAIN ON THE OVERSEAS INTERESTS

The eighteenth annual general meeting of Richard Costain Limited, was held on July 11th at Rodney House, Chichester Street, Dolphin Square, London, S.W.1, Mr R. R. Costain, C.B.E. (chairman and joint managing director) presiding.

The secretary (Mr L. Richards, A.S.A.A.), read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended December 31, 1950:

The accounts for the year ended December 31, 1950, show a small increase in profits, the greater part of which is absorbed by additional taxation. The net profit of the group, after providing for tax, amounts to £82,010, of which 41 per cent. will be absorbed by the dividend on the preference capital and the proposed ordinary dividend, leaving the balance of 59 per cent. to strengthen the reserves of the group. The board recommends a dividend of 10 per cent., less tax, on the ordinary share capital, and, after placing £8,522 to the capital redemption reserve fund and £30,363 to general reserve, the balance on profit and loss account is increased by £3,923.

EFFECT OF RENT RESTRICTION ACTS

The consolidated balance sheet shows a satisfactory position and indicates the balanced spread of the group's resources between freehold and leasehold properties on the one hand and general contracting work on the other. Capital and revenue reserves are shown in the balance sheet at £775,558 as compared with the ordinary capital of £507,985. I should mention that the freehold and leasehold properties are almost entirely included in the balance sheet at pre-war cost, less amortisation, and that the current replacement cost would exceed this by several million pounds. Unfortunately, the operation of the Rent Restriction Acts constitutes an increasing burden on property owners who have to bear the heavily increased cost of repairs and maintenance as well as the service costs associated with flat properties. I am glad to say that practically all the tenants of Dolphin Square have shown an understanding of the position and have co-operated voluntarily in agreeing to a moderate increase in rentals to cover part of the heavier costs of operating and maintaining the property and its essential services.

No account has been taken in the balance sheet of our claim for compensation under the Town and Country Planning Act, 1947.

OVERSEAS DEVELOPMENT POLICY

In my statement last year I referred to the establishment of business in new areas. I am pleased to report that our policy of overseas development has been well justified: we have now overcome the teething troubles inseparable from operations of this nature, and I believe that our overseas interests are now firmly established on a profit-earning basis.

At home we were entrusted with the major part of the work on the Festival of Britain South Bank site and the River Wall, and this work was completed either before or on scheduled dates. On the other side of the river the important block of Government offices in Whitehall is nearing completion.

STEEL SUPPLIES CONCERN

The volume of work on hand is satisfactory and includes several important civil engineering contracts. We are, however, seriously concerned in regard to the supply of steel: the shortage which has arisen so suddenly and acutely is bound to have a marked effect on the progress of our contract work. Even as regards our pre-stressed concrete activities which use a minimum of steel, production has had to be severely curtailed.

We have made a considerable contribution to open-cast coal production during the last few years, but I regret to say that this work over a period of time has not proved economic.

THE OUTLOOK

It is, under present circumstances, impossible to make any statement as to future prospects. I can only say that the group's organisation is in a highly efficient condition, and in the absence of circumstances which we cannot control we should be able to continue the steady progress and strengthening of our reserves which have been maintained for many years.

I am sorry to report that Lord Clwyd, who has been associated with the company for 18 years, has decided not to offer himself for re-election as a director. His advice and support have always been of great value to the company.

Finally, I must express our appreciation of the hard work and loyalty of all members of our organisation at home and abroad which have produced the satisfactory results shown by the accounts.

The report and accounts were adopted and the dividend of 10 per cent. on the ordinary shares was approved.

The retiring director, Brigadier A. G. Bonn, was re-elected and the remuneration of the joint auditors, Messrs James Worley and Sons and Messrs Peat Marwick Mitchell and Company, having been fixed the proceedings terminated.

HAYDEN-NILOS LIMITED

EXPANSION OF HOME AND EXPORT SALES

CAPITALISATION OF £50,000 APPROVED

The fourth ordinary general meeting of Hayden-Nilos Limited, was held on July 11th at the Waldorf Hotel, London W.C.

Commander Robert H. Bristowe, D.S.O. chairman of the company, presided.

The following is his address which has been circulated to shareholders with the report and accounts for the year ended March 31, 1951:

You will notice from the directors' report that Sir Eric Young has joined the board. Sir Eric's coal mining experience of conditions both at home and abroad will be of inestimable value to the company, and it gives me very great pleasure to welcome him to-day.

The consolidated net profit for the year, after taxation and non-recurring items, is £103,933, which together with the amount brought forward of £58,881, less the amount capitalised of £38,117, makes an available balance of £124,697. The first and second interim dividends of 25 per cent. and 30 per cent. respectively have already been paid, absorbing in total £45,375. Your directors do not propose to pay a final dividend. You will be asked at a later meeting to sanction the capitalisation of £50,000, and if this is passed the balance to carry forward on profit and loss account will be £29,322 as against £20,764 last year.

Increasing benefit has been received this year from the works extension and the introduction of the "Mark 15" belt fastening system—to both of which I referred last year. There has been an appreciable expansion in both home and export sales. During the year a director of the company again visited the U.S.A. and Canada. Your directors are confident that in both these countries—where a satisfactory business has already been established—there are good reasons for anticipating continued expansion.

Your management has spent much time in the development of the overseas market, and it will be of interest to shareholders to know that the company has large and increasing markets in 41 countries.

The canteen which opened last December has been well patronised by the company's employees. It is fitted with the most modern appliances, and provides facilities which are obviously much appreciated. I mentioned last year that negotiations for a lease of land close to the works were proceeding, and I can now report that the lease has been obtained. Building will begin as soon as the necessary licence has been obtained.

Congratulations are due to the managing director, Mr Edwin Thompson, and office and works personnel, who have by their industry, enthusiasm and loyalty made such results possible.

The report and accounts were adopted.

At a subsequent extraordinary general meeting a resolution was passed capitalising £50,000 by the issue of 200,000 shares in the proportion of one new share for every three held on July 2, 1951.

FOY MORGAN AND COMPANY, LIMITED

(Timber Agents and Brokers)

SIR GERALD LENANTON'S STATEMENT

The sixteenth annual general meeting of Foy Morgan and Company, Limited, was held on July 11th at the offices of the company, 16, Eastcheap, London, E.C.3. Mr Hurbert Lenanton presided in the absence of the chairman, Sir Gerald Lenanton.

The following is the statement by the Chairman which had been circulated with the report and accounts for the year ended December 31, 1950:—

Experience of trading conditions during 1950 has confirmed the doubts expressed in the penultimate paragraph of my Statement which accompanied last year's Accounts, and the Trading Profit of your Company for the year ended December 31st last, including income from Investments, is £126,335, compared with £149,619 in the previous year. After providing for taxation, the dividends paid on the preference and ordinary shares, and additional remuneration to Directors, it is proposed to transfer £5,000 to the preference Share Redemption Fund and £5,000 to Pensions Account. The Reserve for Contingencies of £10,000 is no longer required.

During the year an unexpected opportunity occurred to sell an overseas asset of the Company. This transaction resulted in a profit over Balance Sheet valuation at cost of £39,000, and your Directors recommend that this exceptional capital profit, less distribution profits tax, be paid to the ordinary shareholders as a capital bonus, leaving a balance to be carried forward of £107,245, compared with £72,148 in 1949.

The trading prospects for the year 1951 are better.

The purchase of Softwood from certain countries has been freed from control, and the Softwood Agents' pooling arrangement has come to an end.

PROGRESS MAINTAINED

Your Directors are satisfied that the steps which I mentioned in the final paragraph of my Statement last year, to meet the changed conditions, have been wisely taken, and that your Company is equipped to obtain at least its previous share of the country's import of Softwood. The Hardwood, Plywood and Wallboard departments continue to maintain the progress shown in the past two years.

The report and accounts were adopted and the dividend distribution was approved.

The retiring directors, Mr R. V. Cooper and Mr N. E. Graydon, were re-elected and the remuneration of the auditors, Messrs Hope Agar and Company, was fixed.

The special resolution amending the Articles of Association was also passed and the proceedings then terminated.

MILFORD STEAM TRAWLING COMPANY

MR J. M. WHITTINGTON'S STATEMENT

The annual general meeting of the Milford Steam Trawling Company, Limited, was held on July 11th, at the Great Western Royal Hotel, Paddington, London, Mr J. M. Whittington (the chairman) presiding.

The following is an extract from his circulated statement:

The fishing industry surely touched bottom in 1950. The distant water interests had to organise a restriction scheme and new ships were tied up on delivery from the builders' yard. In most ports 25 per cent. of the fleet was laid up for a time. Landed weight in England and Wales fell by 13.3 per cent. and the average realised price remained practically unchanged at about 4¼d. per lb.; so much for the exploitation of the housewife. Fortunately for us the average value for hake increased from 92s. to 114s. per cwt., and 3½ months of control are covered by the better figure. We had always contended that the Ministry of Food's price for this fish was unfair and oppressive. According to the Economic Survey for 1951, the consumption per head of fish (with which is aggregated poultry and game) declined by 20 per cent., compared with 1949 and surprisingly was 13.4 per cent. below that for 1938. In passing it may be noted that the decline in consumption of meat between 1938 and 1950 was only about 14 per cent. No doubt most people still believe that vast quantities of fish at extortionate prices were forced down their throats last year, but I hope stockholders who may read these figures will be better informed.

The powers given to the White Fish Authority are wide; it remains to be seen what use is made of them. The Authority itself appears to have no powers to over-ride the Ministry of Food in the important matters of domestic price and foreign imports. So far as I can see, there is nothing to prevent that Minister reimposing the bad old control system or importing unlimited quantities of foreign-caught fish, and the Authority would be powerless to prevent it. This is a fundamental weakness which no well-meant assurances can remove.

CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting the chairman said:

Since my statement was compiled, we have sold to foreign buyers the 10-year-old m.t. Milford Marquis at a profit of some £17,500 over book value. Ships' trading account had benefited little from this ship in recent years, and charges for depreciation and interest will be reduced by some £3,500 a year. From the proceeds all short term debt has been repaid and cash resources replenished.

Provisional accounts for four months to April 30th confirm the impression that profits are now being earned. There was a modest surplus of £2,678 for this period after meeting all charges including depreciation and interest: there should be no liability for taxation for some years. Since April 30th, trade has been maintained at around the same level.

The report was adopted.

NOTICES

A WELL-KNOWN INDUSTRIAL COMPANY, with headquarters in London, invites applications for the post of Deputy to the Director of Personnel with the prospect of succession within a few years. The desirable qualifications are a University Degree, industrial training and experience. Age about 35 years. The duties require a man of broad interests, who would succeed in securing the confidence of highly qualified technical staff. Service experience would be an advantage. The appointment carries a four-figure salary and is pensionable. Please send full details of qualifications and experience in confidence to Box 685.

THE BRITISH INSTITUTE OF MANAGEMENT invites applications for appointment as Information Officer (Financial and Office Management). A keen mind, good working knowledge of Financial and Office Management, experience in either industry or commerce, and ability to write clearly and concisely are essential. Arms in Proportion

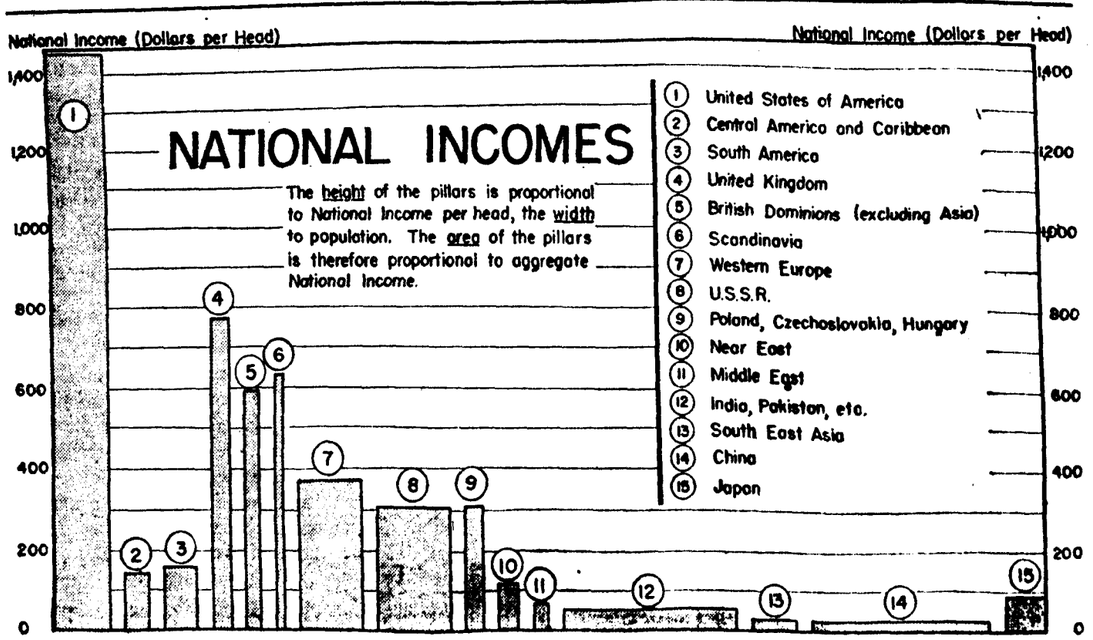
A DANGER known is half overcome. Almost the West's greatest handicap in deciding its policies towards Russia is uncertainty about the amount of force that the Kremlin could effectively bring to bear in support of expansionist policies. It is this uncertainty that has made possible the wishful thinking of MacArthurism and Bevanism, both of which depend for their popular appeal on an assumption that Russia is weaker than most politicians (as well as the experts) believe. General MacArthur concludes that the United Nations could risk being tougher with China and Mr Bevan concludes that Britain should be more conciliatory and not worry too much about arms, but the basis is the same. This assumption will certainly be encouraged if a truce is negotiated in Korea. Public understanding of the necessity and purpose of rearmament for a cold war will then be tested, both here and on the other side of the Atlantic, for the first time. If the test is to be passed the broad facts about the comparative strength of East and West must be widely understood; to explain them clearly and honestly is now almost the first task of Western statesmen.

The Under Secretary for War, Mr Wyatt, last Sunday gave some comparatively detailed estimates of Russia's armed forces. He put the number of Russian divisions at 215, apparently by adding in 40 anti-aircraft and artillery divisions excluded from the recently accepted figure of 175 divisions. There were, he said, over four million men in the Russian armed forces. In addition, the satellites had 60 to 70 mobilised divisions. In Eastern Germany alone there were 22 fully equipped Russian divisions, 18 of them armoured—with more than 5,000 tanks. On Monday, the Under-Secretary for Air followed up these estimates with a reminder that Russia is thought to have about 19,000 aircraft and that the number is growing.



Though these figures must be accepted as the best guesses there are, they can easily be made to seem more frightening than they really are. That is unnecessary. In the Russian army a division is now about 30 per cent smaller than its Western equivalent; but even when every optimistic allowance has been made, it remains true that the 18 to 20 divisions possibly available to Nato in Western Europe are a pitifully inadequate shield against the Red Army giant.

But the greatest deterrent to Russia is, and will remain, the American reserve of industrial power. The facts about the resources available to East and West are illustrated by a diagram on the next page, showing the national incomes of the principal territories concerned. The main points may be summed up as follows. In 1949, according to figures collected and published by the statistical office of the United Nations, the national incomes of the United States and Canada were $228 billion; those of the Western European members of Nato were $87 billion, while the marginal European countries—Western Germany, Greece, Turkey and Jugoslavia—contributed another $21 billion. This makes a total of $336 billion

of resources available to the West even with the southern British Dominions and Latin America left out of account. On the other side, Russian national income in 1949 is put at $60 billion, while the total for the Soviet satellites—for some of which the United Nations could get no figures—may be very roughly estimated at $27 billion; China adds only another $12 billion, making the total for the Communist bloc less than $100 billion. Its resources are, in other words, less than a third of those of the West; and while it is true that even in the direst wartime conditions civilian needs in the West could never be compressed to as small a proportion of total income as totalitarian methods permit, the disparity in the resources left over for potential military use remains enormous. The Communists are unlikely to win a war in the end and there is, therefore, some reason to hope that they will not deliberately start a general war.

This is important, but it is nothing new. It is, at best, a negative relief; it is a hope that Communist policy will not become more aggressive than it has been for the past five years. That policy is to weaken the West by all mischief short of general war. It has so far secured an enormous expansion of Russian power, and it has done so largely by means of, in the phrase of Mr Bevan's pamphlet, "adventures"—in blunter terms, by the suppression of freedom and democratic institutions and the murder of, among others, Socialist politicians. No one believes that the Russians will be deterred from such adventures in the future, any more than in the past, by the West's potential ability to win a general war. All the evidence is still that limited aggression by Russia or its satellites will occur when and where the Kremlin thinks that there is no force adequate to resist it. The only effective deterrent is mobilised force on the spot, not merely the latent ability of American factories to produce a lot of tanks and aircraft in two years' time.

This is the simple lesson of postwar experience. There are, admittedly, more long-standing historical reasons why the principal partners in the North Atlantic Treaty should be tempted to forget it whenever the Russians give them a brief excuse for complacency. Britain and the United States have in this century entered two wars on the strength of their latent rather than of their actual forces and have won in the end. But the victory has come only after two or three years of retreat. In war one may retreat fighting and return fighting. There is no such symmetry in cold war. Retreats may be bloodless, but the only way to return is the method used in Korea. There it has been possible to fight back without directly challenging Russian prestige and so extending the war, but in Europe and the Middle East it would not be possible. If, say, Greece once fell to Communist attack, Soviet totalitarianism could not endure the loss of prestige involved in standing aside when Western armies drove out the foreign "volunteers" who had "helped" the Greek Communists. The Russians would have to choose war. Such a situation is probably the most direct danger; where Western forces are small the Kremlin may miscalculate and undertake—directly or by proxy—an adventure against which the West is compelled to fight. That is what happened in Korea, and the successful resistance will make future Russian policy less adventurous only if the West remains determined never to be so relatively weak anywhere again. The force that may keep all the 215 or so Russian divisions inactive is not the latent force that the West could call on after fighting had begun; it is the mobilised force that can be created now. How great that force needs to be is determined by the size of the Red Army, not the level of Russian national income. The West has to establish an effective equality in the forces that could quickly be brought to bear at any of the points where Russian aggression is possible. Their latent power may make the industrial countries sure of victory in a full war, but for a cold war mobilised divisions are—paradoxically—indispensable; to rely on latent power is to ensure defeats like those of the past five years and to make full war almost certain sooner or later. The paradox is in the nature of cold war,

which should by now be familiar enough to remove the excuses for muddled thinking.

The West can be confident of its ability to win a long war with Russia, but it must be clear about the implications of such confidence. The significance of industrial superiority is not to make the burden of rearmament unnecessary, but to make it more easily supportable. If the policies of the next two years are successful, if war is avoided and the West's armed forces are raised by 1953 to effective equality with the East's, then it should be possible to maintain that equality with relatively little effort. It would be an over-simplification to say that, because the West's total output is three or more times that of the Communist economies, the Western countries will need to devote only one per cent of their national incomes to defence for every three per cent the Russians employ. The West's advantage in productivity is not uniform. There is some reason to suppose that it may be smaller in military matters than in the peaceful activities to which the democracies attach more importance. It is, however, a fair guess at this stage to say that, once the West has caught up with the Russian forces, 10 per cent of national income will be enough to keep it level with any practicable armament effort in the East. The military strategists and planners will no doubt find plausible reasons why they should continue to have more; that is the nature of all specialists, and it is as well to serve notice on them now that by 1953, if all goes well, the politicians' task will be again to challenge their claims, not to give them a free hand; we may all be Bevanists then (though no doubt Mr Bevan will by then have become something else).

*

Mr Bevan is wrong now, not because he emphasises the West's industrial superiority over Russia, but because the moral he draws has no relation to the actual facts of cold war. The real significance of industrial superiority is that armaments need cut into the living standards of the West only during the heave of the next two years. The long pull required for continued security can be made more easily. Unless Mr Bevan and his friends succeed in clamping an entirely static economy on this country, the advance in real incomes can be renewed, with a burst of speed, at the end of 1953. And—what is perhaps even more important to the morale of the West—the heave itself is not, in relation to the magnitude of Western resources, anything that need frighten any reasonable man. It may help to preserve a sense of proportion to repeat a calculation made in these columns before the defence programme was challenged. The difference between peace and war is the difference between the 3 per cent of national income that the British people devoted to defence in the twenties and the 51 per cent reached at the peak of the war. As against this difference of 48 per cent, the rearmament programme involves an additional effort, compared with the thirties, equivalent by 1953 to about 12 per cent of the national income. It is, that is to say, one-quarter war. And after the first heave, it can be reduced to about one-seventh war.

To suggest that such a burden is more than the wealthy West can bear is nonsense. It is, indeed, only too likely to produce the sharpest economic dislocation and inflation when it is imposed on an economy already so fully stretched that the rate of unemployment has fallen to one per cent before armament production has seriously begun. But the reason for the tensions lies in the starting-point, not in the nature of the defence programme. There is no difficulty that cannot be overcome by a realistic economic policy. It is always, of course, open to the West to throw away its advantage in wealth by unrealistic policies, but that does not constitute a case against rearmament.

The essential facts, which it is the task of responsible politicians to make plain, are simple enough: the West is greatly superior to the Communist world in latent strength, but at present greatly inferior in effectively mobilised strength. To deter further Communist aggression, it should be necessary to convert only a small fraction of the latent strength to mobilised strength. Security can, in other words, be gained and retained without crippling economic sacrifices. But the conversion is not any the less essential because it is, proportionately, small.

India and Pakistan

THE danger of war between India and Pakistan is once more becoming acute. The accusation made last week-end by Mr Liaquat Ali Khan, the Pakistani Prime Minister—and since denied by Mr Nehru—that Indian forces are massing aggressively on the frontier in the Punjab was not entirely surprising after the last two months of rapidly mounting tension. Mr Liaquat Ali Khan made a triple appeal: to Mr Nehru in Delhi "to remove the threat," to the Security Council to take notice of the position, and to the people of other countries to apply "their intelligence and good sense" to the problem of relations between India and Pakistan. There can, unhappily, be little hope that his words will lead directly to any change in India's military dispositions. But they do serve to warn the world that it is almost certainly about to face another alarming intensification of the Kashmir dispute. And they also represent a shrewd attempt by Pakistan to seize the initiative in putting its case to the world.

The fact of the matter is that, while Delhi's passive refusal to budge an inch in Kashmir is the direct cause of the present unrest, India itself is most unlikely to make the first overt move; in this respect Mr Nehru spoke no more than the truth. Pakistan therefore runs the risk of finding itself—as it did before—in a position to be branded technically as the aggressor while having a balance of moral justification on its side. The real danger of war over Kashmir now comes from the rising temper of the people of Pakistan. At the same time, they are being goaded by India's continuing and indeed callous rejection of any form of arbitration suggested either by the Security Council or by the Great Powers. There is accordingly little wonder that Mr Liaquat Ali Khan, placed in a tragically difficult situation in relation both to outside opinion and to his political opponents at home, seeks to focus attention on Indian military measures which, although provocative in themselves, no government in Delhi could well avoid taking now in view of the menacing deterioration of the situation.

It takes two to make a quarrel, and in Kashmir both

parties have contributed to the present stalemate. One of the anomalies of the dispute is that, while it was India which first took the issue to the United Nations three years ago, it is India which rejects the jurisdiction of the Security Council today—because the United Nations has failed to settle the dispute in India's favour. In Pakistan, on the other hand, where the problem of Kashmir dominates political life, it is the apparent refusal of the United Nations to intervene as vigorously as it has in Korea that drives opinion inexorably on towards taking the law into its own hands. Certainly the sequence of events in the past year has been favourable to Pakistan. The trouble is that it is not thought to have been favourable enough. And the proof, as anyone in Karachi will say, is that India still sits as before in dogged possession of two-thirds of Kashmir, ingenuously crying peace and urging everyone else to let sleeping dogs lie and bygones be bygones.

*

There have been three leading developments in the Kashmir dispute since the beginning of this year. The first was at the conference of Commonwealth Prime Ministers in London during January, when an attempt was made to negotiate a settlement in private and between friends. The outcome was a failure to reach agreement, but a clear gain in public sympathy for Pakistan. Mr Nehru did not improve his case when, on his return to Delhi, he explained that he had rejected an informal proposal to send a Commonwealth force to Kashmir to ensure order for holding a plebiscite—the objective of United Nations policy—because its arrival would have unfortunate repercussions on Indian opinion. Then, during February and March, the Security Council discussed and passed a resolution, originated by Britain and America, under which Dr Frank Graham, formerly a member of the Senate and before that President of the University of North Carolina, is now in Kashmir as a mediator, in succession to Sir Owen Dixon, in order to do all he can to bring about agreement and demilitarisation. If after three months he has failed—he arrived in Karachi at the end of June—the Security Council, acting on his recommendations, is to call on the two sides to accept arbitration. India, while treating Dr Graham personally with courtesy, rejects the terms on which he was appointed, having held throughout that arbitration can offer no solution. The third development has been the Indian decision, in association with the Kashmiri government of Sheikh Abdulla, to emphasise the permanent nature of the *status quo* by proceeding with steps to convene a constituent assembly for Kashmir, probably in October. When, to this end, an important session of Sheikh Abdulla's National Conference Party was held in Srinagar six weeks ago and Pakistan complained to the Security Council, Sir Gladwyn Jebb, speaking for Britain, secured the adoption—with Russia and India abstaining—of a protest against any Indian action that might prejudice the authority of the United Nations.

The tide in fact has been running hard against Mr Nehru. Unfortunately, however, from the point of view of any hope for a settlement, opinion in Delhi has lately rallied much more to his side. And this has happened at a time when, in Kashmir itself, the military situation on the ground—that is, along the cease-fire line across which the Indian and Pakistani armies have now been facing each other for two and a half years—has materially deteriorated. India, for instance, was undoubtedly justified in complaining to the Security Council at the beginning of this month about an increase in the number of Pakistani violations of the cease-fire agreement; at least fifteen major incidents are reported to have taken place during the last few weeks, in some of which armed raiders have shot up Indian villages, driven off livestock, and flogged the male inhabitants. To this Mr Gurmani, Pakistan's Minister for Kashmir Affairs, speaking in Rawalpindi, retorted that while India had complained of 392 violations since January, 1949, Pakistan complained of 492.

*

This, then, is the background of the grave new period of tension which is beginning. How long may it last? And what can be done to end it without bringing on the appalling disaster of war? It seems unlikely that a conflict will break out before Dr Graham has made his report, since the initiative lies with Karachi, and Pakistan's dissatisfaction will scarcely reach its peak until the Security Council has tried—and is considered in Pakistan to have failed—to put Dr Graham's recommendations into practice. This would carry the dispute over into October. By that time, however, the Kashmir Constituent Assembly may be expected to have met and further inflamed Pakistani opinion. The most likely way for trouble to start would then be a repetition of what happened in 1947: an invasion of Kashmir by the tribes of the North West frontier with Pakistani concurrence. It is a remarkable coincidence that the danger will be at its height at the same time of year as last time, just before the snows fall. If the Constituent Assembly could be deferred for a few weeks, the crisis might be prevented from reaching its peak until early next year.

These grim prospects are at once a menace to millions of innocent Indians and Pakistanis, and a challenge which the nations of the free world can no longer afford to evade. Mr Nehru alone saved the situation in Bengal last year. Now he himself is the prime and obstinate source of trouble. This means that the danger of this latest conflict drifting into open war is greater than at any previous time in the brief history of Pakistan and India. And if war came, the blood-letting which followed would almost certainly rock the stability of the regimes in both Delhi and Karachi. Already a *coup* has been attempted against Mr Liaquat Ali Khan, while in India the extremist Hindu Mahasabha has publicly embarked on a policy of undoing partition, destroying Pakistan and setting up a united greater India, Akhand Hindustan.

A possible truce in Korea and the stalemate in Europe may well lead to a concentration of Soviet effort on Russia's southern flank. In Persia the Communist Tudeh party is waiting for the right moment to try to seize power. In the neighbouring countries of Pakistan and India, with all their resources of industry, manpower, strategic position and Asian prestige, the prize is even greater and the opportunity may soon be scarcely less good. It is a vital interest of the free world that this tragic course of events should be stopped before it is too late. There is much truth in the Pakistani accusation that the United Nations has never put itself out over Kashmir to the same extent as over Korea. If war actually started, a great deal more would be done; the Security Council would be bound, for one thing, to consider the Kashmir dispute under the more critical Chapter VII—action with respect to threats to, and breaches of, the peace. The need is to make this change of heart at once before anything further happens. Even now it would be a help if the Security Council reacted straightaway to the recent pronouncements by Mr Liaquat Ali Khan and Mr Nehru; it could at least send its military observers already in Kashmir down to investigate the military situation in the Punjab. There has always been an understandable unwillingness on the part of the western powers to intervene in the Kashmir dispute for fear of being accused of dictation and imperialism. But unless they now take a bolder and more positive line in both capitals, or unless other powers in Asia, the Middle East or Latin America can prevail on the two governments to bury their differences, the chances of avoiding the ultimate disasters ahead appear to be dwindling dangerously.

Local Government Dilemmas

THE debate on local government in the Commons this week demonstrated the growing alarm with which members of all parties view the steady decline in the powers and the prestige of local authorities. This malaise of local government has no single cause and a variety of symptoms, such as the fall in public interest and participation in the work of local democracy. The chief evidence of decline is the inflated power of control over local administration now wielded by Government departments, powers which sometimes reduce the local council's responsibility for policy-making to farcical dimensions.

Since 1945, the Government has striven to achieve more uniformity, and much higher standards, in local administration. This policy has much to recommend it; but the pace at which it has been pursued, in a period of economic scarcity, has involved the coercion of the more backward local authorities to greater efforts coupled with the denial to progressive authorities of any scope for improvement or experiment. The deadening effect on local initiative and responsibility is unmistakable. At the same time, local government is suffering from financial and structural defects of longer standing. The comparative stability of rate revenues, in face of rapidly rising local expenditure, has over a long period increased the dependence of local authorities on Exchequer aid, and has fastened tighter the controls that go with it. A more general cause of local government weakness lies in the obsolete character of its pattern of areas and division of functions. The removal of certain functions from local government over the last few years has been in part due to these financial and structural inadequacies.

The Commons debate was largely concerned with the evergreen problem of reforming local government areas. It is important to remember that this question is no more than one aspect of what has become a hydra-headed problem. Indeed, the approach to the question of areas and functions depends on what view is taken of the future place of local democracy in British political life. Any system of local government must today strike a compromise between the needs of administration, which suggest comparatively large and uniform areas, and the needs of democracy, which compel respect for the variegated pattern of local communities and for the traditions woven around existing institutions. If it be accepted that the centralising process will continue, reducing local councils to the position of agents of the Government with little or no discretion of their own, then the democratic side of this equation loses much of its force. In such circumstances, a complete rationalisation of local government units, in order to secure the maximum administrative efficiency, has much to be said for it. But if the starting point for reform is a determination to make local institutions more vigorous, as well as more efficient, then a much more delicate balance has to be struck between competing considerations. The reform of areas is then only one step—albeit a necessary one—towards the general rehabilitation of local government.

*

There is general agreement that the English and Welsh system of local government, which was created over sixty years ago, is ill suited to modern conditions. It is also agreed that a general recasting of the system is much preferable to piecemeal tinkering with existing authorities and areas. These points were made by the Local Government Boundary Commission, and the Government has endorsed them. The difficulty is that the only plan of reform available which has any real chance of public acceptance is that put forward by the Commission itself in 1947. The Government, which refused to act on the Commission's reports and wound up its work, has failed to produce an alternative plan of its own despite Mr Bevan's promise that it would do so.

The Government now pins its hope of further progress to reaching agreement on a plan of reform with the various local authority associations. Mr Lindgren made it clear in the debate that, if this cannot be done, then "the Government cannot see the possibility of action being taken within the lifetime of this Parliament." This may be the only realistic attitude for a Government in a precarious position, but it underlines its own failure to take any but the negative step of abolishing the Commission during its five years with a comfortable majority. Do Ministers seriously believe that the various groups of local authorities, all of which have divergent interests and aims and have been amply consulted before, can agree, if at all, on anything but an emaciated compromise which burkes the real issues of reform? Ministers' unwonted anxiety for proceeding by general agreement is a thin disguise for their wish to do nothing. There is no real excuse for continued inaction. If there cannot be comprehensive reform, the stage has been reached when a measure of interim reform, making some piecemeal adjustments in the present system, would be better than further delay—provided this can be done in a way that does not prejudice full reform later.

The most obvious anomaly in local government areas is the way in which many towns have outstripped their administrative boundaries. Since 1926, a county borough has had to obtain a Private Act of Parliament in order to extend its borders. Since 1939, there have

been hardly any extensions of urban boundaries. Many authorities consequently have little or no land within their borders on which to build, and this is highly detrimental to good town planning. To permit a local authority to build houses outside its own area is very far from satisfactory. It arouses local antagonisms and creates a divided responsibility for the provision of services. If, alternatively, other local authorities are made responsible for rehousing the surplus population of a nearby city, then—as Dr Dalton recognised in the debate—they must be given financial incentives to fulfil a task that they are unlikely anyhow to tackle with enthusiasm. In either case, it is a poor transaction for the parent city, which loses population and rateable value without compensating advantages.

Many county boroughs are recognised to have a just case for extending their boundaries. The objection to giving them their way is the effect on the population and rateable value of the administrative counties. The counties have always pleaded that they need the higher rateable values which are often found in the vicinity of large cities to help pay for the provision of services to the poorer rural areas. But the operation of the new Exchequer Equalisation Grant means that any fall in the average rateable value per head of a county will be largely offset by Government aid.

What is important to a local authority now is, as the Boundary Commission pointed out, not so much the quality but the quantity of rateable value—in other words, the size of its population. Many of both the present counties and the county boroughs are too small to provide modern services with full efficiency. But the county boroughs as a whole are worse off than the counties, since their average population is less than half that of the average county. Behind these averages there lie many differences of local conditions and needs. The claim that the extension of a county borough would disrupt the administrative efficiency of some county is no doubt true in certain cases. But there are many instances where it would do nothing of the sort.

It would, of course, be impossible to give full satisfaction to the claims, however legitimate, of existing county boroughs. There is also the problem presented by the claims of many towns seeking county borough status and having, by past standards, an adequate population to justify promotion. Here, however, a different principle is involved. To add to the total number of county boroughs would intensify the struggle for population among the major local authorities, of whom there are already too many. It would clearly be foolish to add to the tally of small county boroughs, though there may be outside the Greater London area, where special considerations apply, one or two towns of over 100,000 population whose wish to enjoy the benefits of county borough status it would be churlish to deny any longer.

The extension of the boundaries of certain county boroughs (unlike the creation of new ones) would not prejudice, as the Boundary Commission recognised, the eventual requirements of local government reform. It is not logical or desirable, under any system, that a town should be compressed within an administrative straitjacket, and precluded from exercising control over its own development. This point has been better recognised in the United States, which is faced with many local government problems of a similar nature. Failure to act on it here will bedevil the planning schemes of a number of large cities. The authority needs to have sufficient control over its immediate environment to plan its growth on a long-term basis, which may involve such measures as the preservation of a green belt and the development of outlying communities. The accusation that such measures will encourage towns to become bigger than is desirable has little basis. In so far as the Government does not take special steps, such as the creation of new towns, to reduce the growth of urban concentrations, they will grow anyhow—in size if not in population ; and it is better that this development should be under unified direction and be carried out at proper standards than that responsibility should be shuffled between a medley of authorities.

To carry out this policy some interim machinery—such as the creation of a new Boundary Commission with a clear mandate and limited powers, or the passage of an Enabling Bill through Parliament—would have to be created. The Minister is mistaken in thinking that minor extensions in one or two cases, obtained (if at all) through the present cumbersome parliamentary procedure, will meet the point. A more generous treatment of county borough claims would not of course solve the general problems of local government reform, which will remain important and pressing. But it would not aggravate their solution, and it would be an interim measure of justice.

The Odious Traffic

The brief notice taken on Monday evening in the House of Commons, of the present condition of the Slave Trade, enables us to congratulate our readers on the sensible diminution of that odious traffic. Mr Hume having called attention to the subject, Lord Palmerston informed the House that on the coast of Africa, north of the Line, the trade might be said to be almost extinguished. The only exceptions were Lagos and Porto Nuevo, and there the presence of British cruisers, spoiling the trade, was inducing the dealers to turn from exporting human beings to exporting palm oil, as a safer and more profitable article to deal in. The people had acquired a taste for European commodities, but had been under the erroneous impression that only slaves would be taken in exchange for them, and had been agreeably disappointed to learn that cotton, which they had begun to cultivate, and other products of industry, were more acceptable than human beings. . . . It is ascertained in Brazil that the employment of slaves is the ruin of agriculture. It has been discovered, too, that the employment of slaves, merely because they cannot be trusted, is more costly than employing free men. . . As the Brazilians and others learn that with slaves there cannot well be a continued division of labour, and little or no improvement in skill, while these two circumstances are the main causes of all improved and cheapened production, they must see that the folly of continuing to import barbarians from Africa is fully equal to its injustice, and they will naturally cease to do that which will continually tend to their own injury and ruin. . . We have shared with others in many doubts as to the utility of maintaining our squadron on the coast of Africa. The results, as explained by Lord Palmerston on Monday, are calculated to put an end to all doubts, and justify a policy that was thought to be more recommended by a visionary philanthropy than sound political expediency.

The Economist

July 19, 1851

The Census of 1951

THE Preliminary Report of the Census of 1951 received brief comment last week ; but the figures contained in it deserve a more extended review. These volumes contain no industrial or occupational breakdown of the figures ; for these and for the answers to the questions about age, size of families and housing, it will be necessary to wait quite a time. But the total figures of population, distinguished simply between men and women and place of residence, have been compiled with exemplary promptness. Some of the more important total figures are summarised below. (Except where otherwise stated, all figures in tables are in thousands.)

The largest aggregate is that of the population of the British Isles as a whole:—

1. Total Population

	1851	1901	1921	1931	1951
England	16,765	30,509	35,230	37,359	41,148
Wales*	1,163	2,019	2,656	2,593	2,597
Scotland	2,889	4,472	4,882	4,843	5,096
Great Britain	**20,816**	**37,000**	**42,769**	**44,795**	**48,841**
Northern Ireland	1,443	1,237	1,258	1,243	1,370
United Kingdom†	**22,259**	**38,237**	**44,027**	**46,038**	**50,210**
Islands‡	143	150	151	143	158
Eire	5,112	3,222	3,096	2,933	2,959
Total, British Isles	**27,514**	**41,609**	**47,274**	**49,114**	**53,327**

* Includes Monmouthshire. † Present boundaries of U.K.
‡ Isle of Man and Channel Islands.

The increase in the twenty years 1931-51 is 9.0 per cent for Great Britain and 9.1 per cent for the United Kingdom. This rate of increase was, however, irregularly distributed among the different regions of the country, as is shown in Table 2.

2. Regional Population

Regions	Total Population		Increase
	1931	1951	%
Northern	3,038	3,140	3·3
East & West Ridings	3,929	4,096	4·2
North Western	6,197	6,445	4·0
North Midland	2,939	3,378	15·0
Midland	3,743	4,422	18·1
Eastern	2,433	3,096	27·2
London & South-Eastern	10,330	10,902	5·5
Southern	2,135	2,648	24·1
South-Western	2,615	3,021	15·5
Total, England	**37,359**	**41,359**	**10·1**
Wales	2,593	2,597	0·1
Scotland	4,843	5,096	5·2
Northern Ireland	1,243	1,370	11·0
United Kingdom	**46,038**	**50,210**	**9·1**

The Eastern and Southern regions, which show the highest rates of increase, were also the leaders in the period 1921-31. It is clear from the figures for the separate counties, however, that the increase in these two regions has been chiefly in the outermost fringes of London: the counties showing the largest rates of increase of the fifteen included in the two regions are Hertfordshire, Buckinghamshire and Bedfordshire. It would seem therefore that the trend of the population towards the south-eastern quarter of the country continues, although it now shows in the outer ring of that area rather than within the metropolitan area itself. The other area where population is collecting is in the Midland and North Midland regions. This seems to be a much more genuinely regional growth, as the increase is very evenly spread among the fourteen counties involved, none showing an increase of less than 10 per cent or more than 25 per cent.

The conclusion that has hit the headlines has been the fact that, for the first time for more than a century, the proportion of the population living in what are defined as rural areas has grown at the expense of the urban areas. These figures need to be interpreted with some care. In the pre-war years, many local government boundaries were altered, mainly in the direction of extending the towns, which would naturally have the effect of increasing the " urban " population without any change in the underlying facts. Since 1939, however, the boundaries between urban and rural areas has been unchanged, and it is in the twelve years since 1939 that the great change has occurred:—

3. Urban and Rural Population
(England and Wales only)

	Urban Areas	Rural Areas
1921—Population (000)	30,035	7,851
Percentage of total population	79·3	20·7
1931—Population (000)	31,952	8,030
Percentage of total population	80·0	20·0
Increase since 1921 (%) :—		
" Self growth "*	4·9	7·8
Balance†	1·5	−5·9
1939—Population (000)	34,183	7,277
Percentage of total population	82·4	17·6
Increase since 1931(%) :—		
" Self growth "*	3·8	3·7
Balance†	3·2	−12·7
1951—Population (000)	35,322	8,423
Percentage of total population	80·7	19·3
Increase since 1939 (%) :—		
" Self growth "*	3·3	15·8
Balance†	...	...

* " Self growth " is increase in population within the boundaries as at the end of the period.
† " Balance " is apparent increase or decrease due solely to alterations of boundaries.

This increase in the population in rural areas is striking ; but it does not connote an increase in the population engaged in rural pursuits. For certainty on this it will be necessary to await the more detailed volumes. But a preliminary judgment, based on inspection of the figures of increases by individual areas, suggests once again that it is the fringe areas—those that are still counted as rural, but have become largely urban, or border on urban areas, that show the big increases. The surprising thing is that this migration to the country proved possible in the twelve years of war and building restrictions.

From 1931 to 1939, Greater London continued to

grow. In the last twelve years there has been a fall, but the total is still above that of 1931:—

4. POPULATION OF LONDON

	1901	1931	1939	1951
County of London	4,536	4,397	4,013	3,348
Outer ring	2,045	3,819	4,715	4,998
Greater London	**6,581**	**8,216**	**8,728**	**8,346**

On the basis of this final figure, the claim is made for London that it is still the largest city in the world, the total population of New York City being 7,835,000 in the census of 1950. But this is not comparing like with like, since Greater London is not, save in police matters, a single administrative unit; it is a conurbation, that is, in the official definition, "a continuous urban area . . . the characteristics of which are mainly those of a single community with a large and continuous interchange of individuals between its several parts." The "metropolitan area" of New York, with a definition roughly corresponding to that of a British conurbation, had a population in 1950 of 12,832,000, or more than half as much again as that of Greater London.

In the order of precedence of the other large cities, Birmingham now takes priority over Glasgow. There is, in total, as can be seen from Table 5, one less city with a population of over a quarter million. The interesting feature of these lists is how very few of the large cities, except those in the Midlands, gained in population in the two decades. Here again, however, the result may be simply due to the narrow definition of a city. An official committee last year defined five "conurbations" in England, of which figures can thus be given for the first time; they are summarised in Table 6.

On the whole, these figures do not substantially alter the picture. Only the West Midlands conurbation shows a sharp increase; the others are fairly static. It seems possible to conclude, tentatively, that whether or not there is a real, as distinct from a statistical, change of trend in favour of rural living, the tide does seem to be setting against the large city. Only those city fathers whose pride is purely arithmetical will regret it.

The ratio of females to males in England and Wales as a whole has declined from 1,088 females to 1,000 males in 1931 to 1,081 in 1951, though it is still higher than at any census before 1921. There are some interesting geographical variations in the ratio. It has fallen quite sharply in rural areas as a whole, where it is now below 1,000, and in the most strongly rural regions, such as the Southern and South-Western. It has risen only in Scotland, in Yorkshire and, very sharply, in Wales. This would seem to suggest that full employment has drawn women out of the agricultural areas, but that some cause (possibly a sharp increase in relative prosperity and improved prospects of alternative local employment) is re-attracting them to the coal-mining areas.

5. CITIES OF OVER 250,000

1931		*1951*	
Glasgow	1,093	Birmingham	1,112
Birmingham	1,003	Glasgow	1,090
Liverpool	856	Liverpool	790

NOTES OF THE WEEK

A Deal with Franco

The emotions of British and European Socialists about Spain must not be allowed to have the same effects on Anglo-American relations as Republican emotions about China. The criticism that has been heard in London about Admiral Sherman's visit to Madrid on behalf of the American Joint Chiefs of Staff shows there is danger of this happening. It can be averted if attention is given strictly to the known facts. They are that the United States is about to conclude a bilateral agreement with Spain, which would give it the use of Spanish naval and air bases in return for American aid; whether this would be military or economic, or both, is not clear. The reasoning behind this policy is in no way sinister or complicated. Because a majority of the members of Nato feel strongly opposed to any direct association of General Franco with their military and economic planning and will not allow the strategic arguments in favour of it to overrule the political sentiment against it, Americans like General Bradley, who do accept the strategic arguments, feel impelled to see what separate deal they can make with Madrid. It is not necessary to see in this matter a hidden plan to defend Europe at the Pyrenees, for General Eisenhower is the last man to base his plans on a defeatist appreciation.

Admirals who want, in case of war, to command the entrance to the Mediterranean and to have access to European ports as far as possible from enemy bomber bases are bound to argue that something should be done to ensure such facilities in advance. Likewise, those who point out that Nato is intended to defend freedom and democracy have good grounds for insisting that General Franco's representatives shall not sit in the North Atlantic Council. It would, therefore, appear reasonable to avoid the difficulty by getting the bases without bringing Spain into Nato; that is precisely what Admiral Sherman is trying to do.

An argument about the right of the Americans to conclude military arrangements for European defence without the approval of Nato will lead nowhere; for Nato is still too young to have or enforce anything like a common foreign policy. It is wiser to concentrate attention on two points. First, it should be asked whether the Spanish people will benefit. If Americans intend to see that any aid given is efficiently and honestly used, then it is probable that some change in the corrupt and tyrannical habits of the Franco regime will follow. Secondly, it should be ascertained that aid to Spain will not reduce the military supplies available to carry out the agreed rearmament plans of Nato members. If it does, those governments have a right to express their concern to Washington. What is questionable is the right of the British Government, whose policy towards Spain goes little further than impotent moral indignation, to criticise the American action without offering any constructive alternative. Does Mr Morrison really believe that the Spanish worker will not welcome American infiltration of the Franco system, or that dictatorship in Spain is in some way more immoral than dictatorship in China or Jugoslavia?

* * *

Peace Treaty for Japan

The draft of the Japanese peace treaty published last week is, as is pointed out in an article from our Washington correspondent on page 156, regarded in America as the final version, not now liable to revision except on minor points of detail. In substance, it represents a triumph for American policy, and in particular for the views of Mr Dulles himself, who has travelled widely and worked indefatigably to get a generally agreed draft. Serious misgivings have been felt in this and other countries about the lack of restrictions on either the trade expansion or the rearmament of Japan, but a strong case can be made for the view of Mr Dulles (with his special past experience of the application of the Treaty of Versailles) that there is no sense in treaties which impose humiliating deprivations of sovereignty on a defeated nation without providing the means or the conditions for their permanent enforcement. In any case, the fact that the United States alone is in a position in the Pacific to afford security either for or against Japan and to sustain Japan's economy with essential dollar aid has meant that the Americans must have the last word on the treaty as far as other western nations are concerned.

Alarm about Japanese rearmament is not well founded, for it is not intended that Japan should again become a major naval power—which it could not afford to become in its weakened economic condition without American backing—and Japan, unlike Germany, cannot be an aggressor without crossing the sea. British fears about renewed Japanese commercial competition, on the other hand, are far from groundless; for American policy might require Japan virtually to cut off trade with Communist China on the grounds that the capital goods which China most wants to buy from Japan are essentially strategic and that dependence of Japanese industry on Chinese supplies would give Peking an economic stranglehold on Japan. Whatever the pros and cons of Japanese trade with China, the restriction of it must divert Japan into other areas in an intensive drive for markets and raw materials, and the effects of this are bound to be felt by Britain.

The way to safeguard British interests against this threat is not, however, to try to subject Japan to formal treaty restrictions on its foreign trade, but to bring about sufficient Anglo-American co-operation on policy towards Japan to ensure that American aid is used to steer Japanese commercial activity into channels not too harmful to the British economy. Since the American Government, as part of its general policy of building up the defences of the free world, wishes to maintain the economic viability of both Britain and Japan, it is in its interest to achieve as far as possible a harmonious adjustment of these two aims. A great deal of thought and skill, and some faith, will be needed.

* * *

Australia and a Pacific Pact

The publication during the past few days of the text of the Japanese peace treaty has been accompanied by news that the United States' defence pact with Australia and New Zealand is nearing completion. The intention is that it should be signed at the same time as the Japanese peace treaty. Indeed, this was virtually one of the conditions on which the Australians and New Zealanders agreed to the present terms of the Japanese treaty at all. This pact is likely to be one of three separate defence agreements made by the United States. The other two are a somewhat similar bilateral accord with the Philippines, and a defence agreement with Japan—outside the treaty—for which the Japanese themselves asked.

In Australia the terms of the Japanese treaty have evoked plenty of last minute doubts, in spite of the American security guarantee which the country is now going to obtain for the first time. There is, however, no realistic alternative to the present arrangements, as the Australian cabinet knows. What is perhaps more likely than the liberal Japanese treaty to worry Australians in the long run is their own commitment to the United States. For their pact is to be a mutual security arrangement. By involving Australia in commitments to help American forces if they are attacked anywhere in the Pacific area, it may have a long-term effect on Australian foreign policy which cannot at present be fully foreseen. If, however, this means that Australia is pushed into taking a more positive role in the nearby territories of South East Asia, this will do no more than fit the facts of its growing stature and responsibilities.

There has been some confusion about the British attitude to the US-Australian-New Zealand pact. The British rightly welcome it, as Mr Morrison tried to say when he mishandled his statement at the time that the agreement was announced. So long as it was a local and regional arrangement there would be no special point in the British joining it themselves, considering the very close ties which now bind them to all the parties in the pact. But what many people in London would doubtless like to see is a Pacific Pact proper, embracing all the countries in the area and of which Britain should be a signatory. This would, however, defeat its own ends so long as anyone—say, Hongkong—was conspicuously left out. It is clear that it is not practical politics to try to bring about such an arrangement.

* * *

Nam Il has the Nerve

The truce talks at Kaesong have made some progress, but they appear to have come up against a serious obstacle in the Communist demand for a withdrawal of all foreign troops from Korea as part of a cease-fire agreement. Moscow radio has declared that "a peaceful settlement of the Korean question is impossible without the withdrawal of foreign troops," but that the Americans are opposing it; and General Nam Il, the North Korean delegate, has stated that foreign troops must be withdrawn as "a guarantee against the resumption of hostilities in Korea." It is clear that the Communists, even though they are now by the verdict of battle the defeated party in Korea, are back at their old game of trying to gain their political objectives as conditions of agreeing to desist from hostilities.

The issue is one on which General Ridgway cannot give way without abandoning the position of strength which his troops have obtained by hard fighting. The object of cease-fire talks is to arrange an armistice while negotiations for a

political settlement proceed. The forces of the United Nations have been sent to Korea to defend South Korea against North Korean aggression and to withdraw them before any political settlement is reached would be simply to give away without military compulsion a cause in which many thousands of American, British and other soldiers have sacrificed their lives.

* * *

Labour Loyalties

The Labour party meets in conference at Scarborough in October, but the struggle for domination of the conference has already begun in the relative privacy of the party's national executive. Mr Morrison has realised that it is not enough to spurn Mr Bevan's arguments ; in order to keep the party from the "One Way Only", the moderates have to sign-post some alternative route. To this end, they have hurried forward a policy statement that Transport House has had in draft for some time. It amounts to little more than last year's "Labour and the New Society," plus a passage or two reaffirming support for the present rearmament programme. Last Monday it came before the policy sub-committee, on which Mr Bevan sits with Mr Morrison and a few other members of the executive. Mr Bevan apparently took a stand against the passage on rearmament and will continue this fight when the draft comes before the full executive this week. There he can count on three supporters, but he is unlikely to win any fresh adherents.

This meeting will be as decisive in shaping party policy as any public clash at Scarborough. Mr Bevan finds himself suddenly faced on the national executive committee with a situation remarkably similar to that which forced him to resign from the Cabinet three months ago. He is confronted with a statement of general policy which has the support of the bulk of his colleagues but against which he has committed himself publicly and in the strongest terms. His prestige is at stake again. To resign again would, however, be a rash tactic. Mr Bevan has already swallowed one rebuff, when the executive in May endorsed the Government's budget policy, and the doctrine of collective responsibility cannot apply to the executive—whose members are elected by the party conference—in the same way as to the Cabinet. There are opposite opinions about whether Mr Bevan would be free at Scarborough to leave the platform and attack an item of executive policy. In 1948 Professor Laski was prevailed on only at the last minute not to step down from the platform to attack Mr Bevin's foreign policy. Mr Bevan's position seems stronger as the rebel within the executive than as a rebel on the floor.

*

There is evidence that Mr Bevan commands much support in the constituency Labour parties, and some ministers are greatly worried about the conference. But Mr Attlee and Mr Morrison appear to be remarkably confident that they can smother the revolt—at any rate for this year—without great difficulty. This confidence is presumably based chiefly on the belief that the main bulk of the trade unions will line up on their side. It is also important that Mr Bevan's supporters seem to be strongest in the constituencies that Labour does not hold in Parliament ; there opinion generally tends to be more extreme—and also less influential.

For these reasons Mr Bevan is unlikely to be able to shake the present control of the party at Scarborough, and he therefore may not try. But this is only half the issue. Without an open conflict, there may still be enough appearance of dissension to make it psychologically difficult for Mr Attlee to stick to power without an autumn election. On the other hand, Labour's defeat at an election would not help Mr Bevan as certainly or easily as his supporters seem to assume. The safer Labour constituencies, whose members can hope to return even if the tide goes strongly against the Government, are for the most part held by older men well to the centre and right of the party ; the ultimate decision as to who shall lead them in Parliament rests in their hands, not those of the annual conference. It is true that in opposition Mr Bevan's powers of invective and denunciation might enable him to go some way towards assuming the role even though he was not elected to it. But on present evidence his chances of leading the party are still much slighter—in opposition as well as in power—than either his friends or some of his enemies believe.

* * *

Money and Trade

In a Parliamentary debate next Thursday the Chancellor of the Exchequer is to speak on the changes in the economic situation and what the Government proposes to do about them. The greatly increased trade deficit that has developed in recent months will not be temporary. At the same time, though there are reports of a new buyers' resistance here and there, the evidence is on the whole increasing that the Chancellor's estimate last April of the internal inflationary gap was too low. Employment is even more "full" than at any other time since the war, and too much money is chasing too few goods in spite of the relief to the home market afforded by an unexpectedly large deficit in the balance of payments. Wages, naturally enough, appear to be rising faster than the Government hoped.

In this situation, it is a pity that the House of Lords did not take the opportunity provided for it by Tuesday's debate on the second reading of the Finance Bill. It is, admittedly, difficult to assess the seriousness of the crisis that may be approaching. Mr Gaitskell, with some knowledge of the way invisible payments have been going, should be able to give a clearer indication. But it is a poor principle that discussion must wait on a Government statement, and some things are clear enough for a useful purpose to have been served by a debate less partisan than can be expected in the House of Commons. In fact, the Lords said almost perfunctorily things that might equally well have been said in April.

After Mr Gaitskell's statement the Commons debate will no doubt be more relevant, but whether it will be more constructive is another matter. Everyone recognises that the state of the parties makes it impossible to think of an autumn budge. The danger is that the Government will take this either as a reason for doing nothing—except, perhaps, to make a fresh attack on profits—or as an encouragement to rely on physical controls (with exhortation), which may possibly slow down the progress of the disease but certainly cannot help to cure it. In fact the planners are not without weapons if the politicians will let them be used. Neither a stiffer monetary policy nor a reduction in many branches of Government spending has to wait on a new budget. It is hard to believe that a diversion of effort from production for the home market to production for export, which is the first immediate need, can take place without such measures.

* * *

The Biennial Crisis

The ominous trade figures for the first half of 1951, and particularly last month's "record" gap between imports and exports, bear an unpleasantly close family resemblance to those heralding the crises of 1947 and 1949. For the British economy, there appears to be ill luck in odd numbers. The crisis now threatening differs in several obvious respects from its predecessors. That of 1947 was unmistakably a crisis of postwar dislocation, staved off by the Washington loan and then precipitated by premature convertibility. That of 1949 was a crisis of inadequate exports, of an over-valued currency in a falling world market. That of 1951, on the contrary, is associated with booming export trade and a world

sellers' market. In every case it has been easy to identify an external cause for which British policy could not be blamed. In 1947 American prices, setting the pace for the rest of the world, were too high ; Mr David Low drew an excellent cartoon showing President Truman riding in full armour to the aid of a distressed Europa but much hampered by the fact that his steed was rising in the air like a balloon. In 1949 American prices were too low ; and Mr Low's pictorial comment showed a diving switchback car, loaded with apprehensive American tycoons, over the caption "Here we go again."

In 1951 American prices are once again too high ; it is true that this time the sterling area, and consequently London's gold and dollar reserves, have benefited, but the effect on the United Kingdom's own balance of payments is as bad as ever. One must wonder whether there exists any happy mean between boom and recession, between an undervalued and an overvalued pound sterling, any relation between internal and external prices, indeed any conceivable world economic climate, in which Britain would be reliably solvent, or whether crises of adverse terms of trade and crises of inadequate foreign demand are to succeed each other like day and night.

The principal moral remains very simple. No adjustment of the sterling exchange rate, upwards or downwards, will make up for a fundamental failure to produce the right things in the right quantities. Britain's improvement in total productivity is highly creditable, but it does not mean much when too little of the product is what is most needed. The real remedy for the biennial crisis is a grim business of producing what the customer wants—notably that uncongenial commodity, coal—and of living on what he pays rather than at the standard prompted by internal inflation.

* * *

Mr Harriman Tests the Ground

Mr Averell Harriman has had, in his first four days of discussion with Persian politicians, experiences familiar to all who know Teheran. He has met with charm, and with expressions of understanding of the individual points he has put, but also with complete unreadiness to see objectively or as a whole the consequences of the plan for executing the nationalisation of oil. He has found no readiness to settle the dispute with Britain except on Persia's "unshakable" terms.

The best that can be said of such a situation is that it is better than one in which Dr Mossadegh might go through the motions of making concessions. At one moment, it seemed possible that he might do so in order to secure the aid with Persia's Seven Year Plan which is now essential to financial stability and which is still on offer from the United States. No such agreement would be of any value unless it were accompanied by some proof of capacity to make a few fundamental changes in Persia's domestic structure—notably, to tax big incomes in order to help pay for social reforms, and to prune an administration which is overloaded to a point of high inefficiency.

It would be tempting to believe that a Harriman failure might be better than a partial Harriman success, were it not for the fact that the hysterical state of mind now prevailing among the Middle Eastern nationalist leaders plays into Russian hands, even though the minds in question hate and fear Russia. Though some of Dr Mossadegh's lieutenants now appear to be taking Russian money, he himself, it should be remembered, introduced the law against foreign oil concessions that resulted in the defeat of the Russo-Persian oil agreement in 1947. Egyptian minds, too, are in the same hysterical state. How is it possible, for instance, to reconcile successive statements by Azzam Pasha, Secretary General of the Arab League? At the end of a visit to Turkey this month he told reporters that he had formed with his Turkish hosts a "spiritual pact" that would be the preliminary to "written pacts." Upon return to the headier atmosphere of Cairo, he has this week proclaimed that the only alternative to a victory for Arab nationalism is that of international Communism.

The Turks, confronted with such inconsequence on their eastern flank, very naturally want to join the more solid and sober ranks of the North Atlantic Treaty Organisation. Their desire to do so and their staunchness as allies have now, happily, been welcomed by Mr Morrison in the House of Commons.

* * *

Italian Government Resigns

It had been hoped that Signor De Gasperi, the Italian Prime Minister, could put off a cabinet reshuffle until the autumn ; but there was little question that it would be necessary fairly soon, since the government coalition had been on a temporary basis for several months. Criticism within the Christian Democrat party of the man who has inherited the mantle of President Einaudi at the Treasury, Signor Pella, has now brought down the government. When Signor Pella resigned on Sunday, the Prime Minister decided, after waiting a day, to clear the decks by bringing to an end his sixth government since 1945.

At present it seems probable—though it is by no means certain—that the President will call on Signor De Gasperi to form another government. This remarkable man still dominates the Christian Democrats, and their moderate loss of popularity in the recent regional elections has done nothing to reduce their position as the biggest group in the central legislature. But there can be little doubt that, if Signor De Gasperi succeeds in forming a new government, he should include some fresh faces in his cabinet. It must be hoped, first, that a new Christian Democrat coalition could now again include Republicans, right-wing Socialists—newly united as the *Partito Socialista*—and perhaps the Liberals who withdrew in January, 1950. Secondly, a new prime minister would be well advised to give more representation to the Christian Democrat left wing.

Signor Pella resigned because he was criticised from both left and right for pursuing a hard money policy. Yet, after several years of violent inflation, his strict defence of the lira was justified both in its timing and conduct. Criticism from the right has naturally come from disgruntled business interests which seek easier terms ; but it has been greatly exceeded by that of ardent younger men on the party's left. They are led by Professor Dossetti—a somewhat sacerdotal Aneurin Bevan—and Signor Fanfani, who believe that the Christian Democrats, if they relapse into the conservatism induced by internal division and inertia, will lose a great deal of ground at the general elections two years hence. Although significant inflationary pressures are bound to be present at a time of rising import costs, anyone now assuming power ought undoubtedly to slacken off a notch or two in the present tight financial policy. Neither Italy nor its allies in Western Europe can afford measures which, by restricting employment, may add needlessly to the excessive and conspicuous contrasts between its rich and poor.

* * *

German Protestants Demonstrate for Unity

The seventy special trains provided by the Soviet German administration for visitors to the German Evangelical rally in Berlin last week were a measure of Russian hopes of the German Protestants. General Chuikov, the head of the Soviet Control Commission, also gave a friendly reception to the president of the rally, Dr von Thadden-Trieglaff, but Soviet smiles in a period of appeasement such as the present are not so useful or unusual as special trains.

General Chuikov must, however, have subsequently wondered whether pastors are worth so many expresses. The huge attendance at the rally certainly demonstrated the attachment to unity which is so particularly evident among Germans in the Soviet Zone and Protestant refugees in the West. But the organisers prevented the Communists from using the occasion to support the Russian-sponsored campaign for their brand of unity and peace. Such political implications as there were in the discussions proved, indeed, to be directed against Communism. Two of the study groups were organised under the headings "To whom do our children belong?" and "Does power corrupt?" Speakers from the Soviet Zone took this rare opportunity of criticising the regime in the Soviet Zone, and an apologist was constantly interrupted by the audience. Moreover, the heads of Government in the Federal Republic and Western Berlin declined to take part in the religious service which President Pieck ostentatiously attended, on the very reasonable grounds that their presence might be misconstrued for political ends. Leading Western German Protestants holding official positions did, however, join in the rally, and the chief organiser himself came from the West.

Though the results doubtless fell far short of Communist hopes, they should not lead the west to feel complacent about the part which the Evangelical Church will play in deciding the fateful question—how and when will German unity be re-established? From the purely political standpoint, it is evident that a strongly nationalistic church, with a tradition of obedience to the head of the state, and its greatest strength in the Soviet Zone (and among refugees from beyond the Oder-Neisse) is likely to prove more amenable to Russian offers than the Catholic Church and the anti-Prussian Rhinelander, Dr Adenauer. It is of great potential value to the common Christian cause of the west that the Federal Chancellor takes Rome and Paris into his immediate purview as well as Berlin, and sees that Western Germany must be firmly linked with Western Europe before the day of reunification arrives. With this in mind, the British and American Governments should show themselves at least as helpful to Dr Adenauer as General Chuikov has been to Dr von Thadden-Trieglaff.

* * *

Storm over Broadcasting

The Government was certainly not looking for trouble when it drafted its White Paper on broadcasting policy. On the contrary, the argument that leaving things pretty much as they are was the easiest course probably weighed as heavily with Ministers as any deeply considered principles. They must therefore be surprised at the storm that has blown up—particularly the unfortunate Mr Gordon-Walker, who was already burdened with the Bamangwato case and on Thursday, as the Minister appointed by the Prime Minister to look after broadcasting and information matters generally, found himself with another hostile debate on his hands.

Two provisions in the White Paper have given widespread offence. One is that national councils are to be appointed for Scotland, Wales and Northern Ireland, with complete powers over the composition of the Home programmes in those regions, and that they are to consist largely of members of county councils. It is this latter provision that has raised the storm. The Governors of the BBC have taken the unusual course of making an open protest against it, and the cry of "no political interference with broadcasting" has been widely echoed. This is, indeed, a valid ground of protest, but concentration on the absurdity of local councillors deciding programmes may divert attention from the more general defects of the proposal to appoint national councils with something more than advisory powers. Any such bodies, however constituted, will inevitably take it as their mandate to foster nationalism in the programmes for which they are responsible. But, politicians and *literati* apart, there is really very little evidence that the great body of listeners want "national" programmes. Indeed, if nationalism meant a decline in the general quality and popular appeal of the programmes, as it very probably would, it would be highly unwelcome. The object lesson is Eire, where the programmes are wholly national—and everyone who can listens to the alien BBC. The case against the BBC's present monopoly of broadcasting has often been argued in *The Economist;* but nationalist atomisation is not the answer. It is not yet clear whether the Government will run before the storm or show once again who is master. In Thursday's debate Mr Gordon-Walker defended the proposal but also confessed that the Government would be very happy to listen to alternative suggestions.

The other proposal in the White Paper to which objection has been taken is the ruling that the BBC is to receive only 85 per cent of the net revenue from wireless licences. It is true, as the White Paper argued, that there is no reason to suppose that the needs of the BBC are exactly met, neither more nor less, by the sum of money that a licence fee of £1, plus a further £1 for television, happens to bring in. It is also true that the BBC might properly borrow for capital purposes. But if the present revenue is too large, the remedy is to reduce the licence fee. To turn the wireless licence into a petty head tax, bringing in a sum of money that is wholly insignificant in relation to the national budget, is merely another example of the small-mindedness with which the Treasury from time to time ruins its own reputation.

Mr Horner's Big Stick

The syndicalist flavour often detectable in the pronouncements of Mr Arthur Horner came out more strongly than usual in his speech to the Northumberland miners' rally at Morpeth last Saturday. A Conservative government putting into effect its declared policy for the coal industry would be met, he said, by a national coal strike. Taken alone, this prediction might be regarded as no more than a legitimate warning—it is the policy, not the hypothetical future government, against which strike action is threatened. But Mr Horner followed this warning with another, considerably more far-reaching. He explained that it was only the miners' loyalty to Labour, their solidarity with fellow Socialists, that had induced them hitherto to refrain from using their bargaining power to the full; no such forbearance, his audience and readers were to understand, would be expected after a change of government. Notice is in fact served on the electorate in general that if it dares exercise its democratic free choice in favour of a party that Mr Horner really dislikes, the National Union of Mineworkers will make it pay for its freedom either in hard cash or in cold hearths and furnaces.

Beside this piece of thinly veiled blackmail, Mr Horner's complaint that the trade unions are not allowed to apply their funds for political purposes at the unlimited discretion of the majority appears almost inoffensive. It is not likely to be met. On the contrary, an unmistakably political coal strike such as Mr Horner envisages would be, given the existence of a Conservative government, the likeliest means of bringing about a recasting of trade union law compared with which the Act of 1927 would appear innocuous. That would be a pity; and the incidental damage to the economy and strength of the country, in which the miners themselves—if not their Communist secretary—may be expected to feel a certain interest, would be a bigger pity still.

More Trouble in Bechuanaland

The Tshekedi case is dragging the Government into increasingly deep water. The debates in Parliament two weeks ago drew forth the concession that a further *kgotla* should be held, with Tshekedi present and an MP from each party as an observer. It was supposed that the question of his return to the Bamangwato reserve could then be openly decided by the tribe. Labour members accepted this arrangement with hesitation; Liberals and Conservatives objected to an issue of this kind being put to what they regarded as a mob decision, and the MPs invited to fly out to Bechuanaland rejected the invitation. Three individuals from outside Parliament have therefore gone instead.

In the meantime, there has been trouble in Bechuanaland. As soon as the news was received that Tshekedi would attend a special *kgotla* several of his friends were assaulted and seized; police reinforcements were sent to Serowe amid rioting and considerable excitement. The Bamangwato tribesmen have now rejected Mr Gordon-Walker's proposal, saying that they have repeatedly decided that Tshekedi could not return and that, in any case, they would not hold a *kgotla* unless their chief Seretse was present. Tshekedi himself immediately expressed willingness to submit the decision to a *kgotla* if he were allowed a month in the country to explain his position first. Now he is claiming that the whole thing is an "unbelievable farce." The story is further confused by the position of Seretse. He has offered to go back to restore order, allowing Tshekedi to return as a private citizen. His offer has been refused by Mr Gordon-Walker.

The Government now has to try to keep its head in face of a mass of local intrigue. Two points, however, stand out clearly. No one has yet explained why both Seretse and Tshekedi were banished in the first place; the reasons which might apply to the one man clearly do not apply to the other. Secondly, Tshekedi has still had no opportunity to answer all the allegations against him to his countrymen on the spot. Through it all he continues to ask for a public inquiry. His willingness to submit to this is surely the strongest argument in his favour. What way out of this unhappy imbroglio is now open, except to consent to the inquiry for which so many people have asked?

The Free Trade Unions

A year and a half ago the International Confederation of Free Trade Unions was formed in London, after a split from the Communist-dominated World Federation of Trade Unions. ICFTU has now just completed its second congress in Milan with an impressive attendance from 47 countries representing a total affiliated membership of over 50 million workers. The presence for the first time of an observer from the Finnish trades unions, which have just broken from the WFTU, was not the least interesting indication of the considerable success which has so far attended the work of the free confederation. Another, more significant, indication was the receipt by the Congress of a request from the WFTU for a joint meeting to discuss "workers' vital interests." This was refused with the challenge:—

> As long as you remain the faithful agents of the Cominform, carrying out the foreign policy of the Kremlin, there can be no joint action. For there can be no unity of action where there is no unity of purpose.

The greatest achievement of the ICFTU has been its promotion of free trade unionism in the underdeveloped areas of the world. To carry this struggle yet further an appeal for £250,000 was launched last February, to which the British unions are contributing about £120,000. But difficulties have now arisen with the Americans. The American Federation of Labour, which has its own regional offices in Asia and Europe, has so far not agreed to contribute to the fund, and—perhaps in support—the second big American organisation, the CIO (which, too, has an office of its own in Europe), also remains uncommitted. The divergence between the Americans and the rest is that the former see the work of the ICFTU too exclusively in terms of the fight against Communism. There is some resentment in Asia against the separate offices of the AFL there, and a general suspicion of these "lone wolf" tactics.

The undercurrent of friction revealed itself in an impassioned debate about a resolution on totalitarianism devised by an American group of delegates. The original resolution had taken eleven paragraphs to denounce the evils of Soviet totalitarianism, but only two sentences to condemn the dictatorships of the right—Spain, Argentina, Portugal, Venezuela and some others. This was quite unacceptable to representatives from Asia and Latin America, and also from some European countries. A revised resolution condemning equally all "agents of totalitarianism under whatever guise they may appear" was eventually adopted. There is obviously some distance to travel before American workers are likely to see eye to eye with their fellow trade unionists in Europe and Asia. There is a risk of the cold war becoming an obsession which will distract attention from constructive work among people who are not ready to take sides against the Soviet Union.

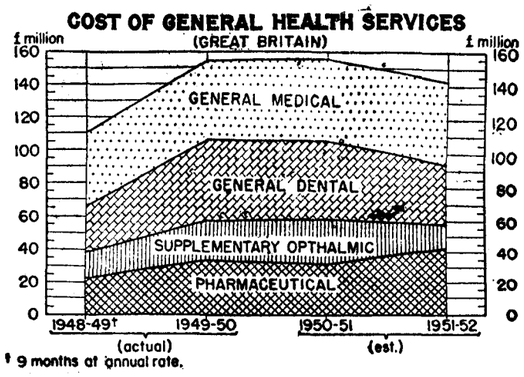
Czech Food Troubles

Last week three Czechoslovak citizens were sentenced to death for forging ration cards; five others were sent to prison for terms ranging from eighteen years to life. (For espionage and treason, the so-called accomplices of Mr Oatis, the AP correspondent, got 16 to 20 years.) These fantastic punishments imposed on offenders against the rationing laws are a measure of the government's anxiety over the country's food supplies. So also was the meeting of the central committee of the Czechoslovak Communist party summoned at the end of June especially to discuss the food shortage. As a result of this meeting the government abandoned its policy of bringing down food prices, for which it has taken much credit, and raised the prices of the scarcest foods, especially meat and fats, on the free market.

The scapegoats that have been found for the present food difficulties range from organised gangs of forgers and lax and irresponsible local officials to "bourgeois ladies of leisure," who have plenty of time to stand in queues. To some extent no doubt all these are to blame; human frailty and bureaucratic inefficiency can play havoc with the best contrived rationing system. But Mr Krajcir, the Minister of Internal Trade, probably touched on the basic trouble when he bluntly told a Cabinet meeting that the bulk buying plans for meat, eggs and fats had failed.

Some of the blame for this failure can be placed on administrative inefficiency, but Mr Krajcir admitted that the main responsibility lay with the village kulaks, who had failed to deliver their quotas of meat and dairy products. In other words, they are reacting in the traditional way to the renewed drive for collectivisation, and as there is more livestock in private hands than on the collective farms, they are in a good position to make their disapproval felt. Opposition to collectivisation was one of the chief reasons for the recent downfall of Otto Sling, Mme. Svermova and their

British Insurance



The annual survey of British Insurance will be published next week. Special articles will appear in *The Economist* while the *Records and Statistics* Supplement will contain comprehensive tables on all aspects of insurance business.

associates. Those who have survived these latest purges, which are described in an article on page 166, are now presumably more than ever committed to carrying out Moscow's demand for further collectivisation.

* * * *

Drugs and Chemists

Last week's debate on payments to chemists coincided with the publication of revised estimates for the cost of the health service in 1951-52. The purpose of the debate was to call attention to the long delay before the Ministry of Health finally settles its accounts with chemists working in the health service. The procedure of payment is, briefly, as follows. At the end of each month the chemists divide the prescriptions they have dispensed into two bundles, those worth over 5s. and those under 5s. They are then sent off to Government pricing offices, where the dearer prescriptions are priced completely and the average of the cheaper prescriptions is calculated from a 20 per cent sample. The arrears of payments have arisen because the Ministry of Health was not fully prepared for the enormous increase in prescribing that followed the introduction of the health service. As a result the pricing offices were swamped ; they are now about a year behind in their work, although, thanks to an increase in the number of pricing clerks, arrears are no longer accumulating.

To meet the hardship that would otherwise have arisen, the Ministry instituted a system of payments on account. Chemists are paid each month 90 per cent of an amount calculated on the latest pricings actually done for each shop ; since prices have risen meanwhile, supplementary payments on account have to be made. The result, it was stated in the debate, is that each chemist is giving the Ministry, on the average, about six weeks' credit, amounting to about £300.

Probably more would be heard about this were it not that most chemists have benefited from the big rise in the cost of the pharmaceutical service. Before the health service was introduced, private and health insurance prescriptions together amounted to 90 million a year. Now more than 200 million prescriptions a year are dispensed. The accompanying diagram shows the effect this has had on the cost of the health service. Of the medical services provided outside the hospitals, the cost of the pharmaceutical service is now 30 per cent of the total, compared with 21 per cent in 1948-49. Thanks to reductions in practitioners' fees, the new charges and a falling off in demand, the cost of the dental and ophthalmic services is declining. But the cost of the pharmaceutical service goes steadily upward. And so long as the pricing system is inefficient, there can be no effective check on excessive prescribing.

The Disappearing Balance

The memorandum to the revised estimates for the health service states that when the original estimates were presented, it was known that charges would be made for certain services, but not exactly which services. The effect of the economies to be achieved by the charges was therefore spread over the three services—dental, ophthalmic and pharmaceutical—where they were likely to be imposed. Since they are to apply only to false teeth and spectacles, the revised estimates make the necessary adjustments, showing a higher estimate for the pharmaceutical service and lower estimates for the dental and ophthalmic services than appeared in the original estimates for 1951-52.

But the revised estimates do more than this. They also provide £200,000 for the cost of treating some tuberculous patients abroad, a provision arising from the new National Health Service Act. They also provide £800,000 to give effect to an arbitration award in favour of Scottish chemists. The result of all these and other adjustments is to increase the total estimate for the health service from £398,083,000 to £399,183,000. The balance available before the limit of £400 million is reached has thus fallen from £2,000,000 to less than £1,000,000. Moreover, in last week's debate on chemists' payments, Mr Marquand, the Minister of Health, said that the estimates do not allow for any repercussions that the arbitration award to Scottish chemists may have on the pharmaceutical service in England and Wales.

Mr Marquand is thus getting perilously near his limit. How would he now propose to find the £2,000,000 which, a month ago, he said was the maximum amount of new money that could be made available to general practitioners —let alone the much higher sum that they themselves are claiming ?

* * *

The Factory School

Opposition to the theory of comprehensive schools seems to be hardening within the London County Council, and it will be interesting to see what happens to the present development plan if at the elections next year the Labour Party loses its very small majority on the council. Four proposals for comprehensive schools came before the LCC this week. All met with opposition ; two were passed by a majority of only nine, and the other two were withdrawn for further consideration.

Even if it is fully agreed that a few large comprehensive schools should be built as an experiment, only one of these four proposals would appear to be at all acceptable. This is for a new mixed school of 2,210 boys and girls at Putney, where the LCC is developing a housing estate and the new population, which will not have loyalties to older local schools, may be able to give the experiment a fair run. There are grave objections to the other proposals. The LCC decided to carry on with the scheme for a comprehensive school, again of 2,210 pupils, at Upper Tulse Hill. It is to be built on the playing fields of an existing school which will in due course be absorbed into the new one. Not only will the playing fields have disappeared, but the size of the new school will necessitate a building of nine storeys. The amenities of an existing school are spoiled and a factory takes its place. Admittedly, sites for school building are scarce, but the LCC only increases its difficulties by insisting on large schools.

The fate of the two other schemes remains undecided. In both cases, the existing schools have playing fields, and it is by building on these that the LCC threatens to increase each school from 500 to 1,350 pupils ; they would thus become comprehensive schools at a cost of £440 per extra place, and by suppressing amenities which had given their pupils something better than the average. It is hard to see how the most wholehearted advocate of comprehensive schools can detect progress in their establishment by these methods.

Enterprise in Aluminium

for Britain's Exports...

RECENTLY two complete train loads of aluminium buildings left the S.M.D.* works at Slough. One hundred and eighty-six transportable buildings, comprising a complete small "prefab town"— bungalows, offices, workshops, canteens and stores — were despatched to Argentina to house an oil survey community. Once again the most modern group in the aluminium industry demonstrates its enterprise and leadership.

Letters to the Editor

New 'Rifles for Old

Sir,—I do not wish to quarrel with the insistence of the Note in your issue of July 14th that supply considerations, and therefore the advantages of standardisation, should weigh very heavily in any final decision on the new rifle—though I think that in some of your comments you carry the argument further than it can be sustained. But your readers will not have gathered from your Note how very strong the "military" advantages of the new rifle are. May I make a quite unofficial attempt to describe some of them?

I think it is common ground that the British Army should be equipped with an automatic rifle. The Russians have one, and in any future war the probability is that the British infantryman will be facing superior numbers. Fire power is all-important, and the new rifle will fire four or five times as many aimed rounds per minute as the present rifle. The real question is whether the British Army should not be equipped with the same automatic rifle as the American Army, or at least with one that can use the same ammunition.

There is no doubt in my mind that the new British rifle is a great deal better in accuracy, speed and ease of aimed fire than the American Garand. But its particular advantage to the British Army lies in the substantially lighter manload of rifle and ammunition. American tactical doctrine has relied very heavily on jeeps, lorries and other transport for the infantry; the British infantryman is expected to be mobile on his feet. It is a technical fact that a small reduction in calibre of bullet allows a substantial reduction in the weight of weapon. Furthermore, with automatic weapons and their high rate of fire, the weight of ammunition becomes of very great importance. A division will be able to carry about a million and a quarter more rounds of the new .280 inch ammunition than they could of .300 inch ammunition for Garands without any additional lorries.

Could this rifle be designed to take .300 inch ammunition? Apart from the dominating question of weight, there are two points to be made here. First, if the new rifle is of .280 inch calibre, the Bren gun can be very easily adapted to take the same ammunition. If the rifle is to be of .300 inch calibre, because of the length of .300 round, all the Brens will have to be almost wholly redesigned—in effect, scrapped. Secondly, there is a very fair chance of the Americans coming round to .280 inch calibre in time. Some, at least, of their experts prefer it to their present .300 inch and think the new British rifle superior to the Garand. The higher command in the United States, however, is naturally unwilling, for production and other reasons, to contemplate any change of calibre now. The British rifle will not be ready for general issue for several years. Meanwhile proper care will, we assume, be taken to ensure a full supply of existing weapons and bullets of which there must be large stocks.

The new .280 inch ammunition is of such a character that American weapons could be easily converted to use it. This will be important when the Americans are ready to take a more favourable view of it than they do today.

I agree with you that production considerations must not be forgotten and that the decision in the last analysis must be a layman's. I agree further that it should long ago have been discussed at ministerial level. But I also think that the layman's decision, when he has all the facts, will be in favour of the change to the new rifle.—Yours faithfully,

ZIVILIAN

Sir,—I agree with the emphasis that your Note of July 14th lays on the value of standardisation and the importance of production considerations in small arms. But one of your comments seems to me to be unfair. After describing the way in which American insistence in 1917 on the calibre of .300 inch prevented the British-financed factories in America from making their intended contribution in the first war, you go on to say that in 1940 "it was the British War Office that missed the opportunity for standardisation by insisting on .303 inch." But all the rifles and ammunition available in Britain in 1940 were of .303 inch calibre, including all the Enfields that had been turned out by the American factories in 1916-17 before their production was interrupted for the change of calibre, and which had never been used (except at Bisley). It would surely have been very foolish to choose that moment to change calibre. This does not, of course, weaken the argument for standardising at an earlier or later date.—Yours faithfully,

London, S.W.1. LAYTON

Targetology

Sir,—A number of us here have for some time amused ourselves by collecting "targets." We should like to thank you for the valuable contributions on page 1421 of your issue of June 16th. In one paragraph it is stated that, but for rearmament, the 1948 targets would be "attained" by 1952-53, that production of some agricultural products is "above the target," while that of others is "within striking distance" and that the output of textiles and sawn softwood has "exceeded" the 1952-53 target.—Yours faithfully, N. W. GOODDEN

Books and Publications

Passage for Asia

Asia and the West. By Maurice Zinkin. *Chatto and Windus* (under the auspices of the International Secretariat, Institute of Pacific Relations). 300 pages. 15s.

In this ambitious but successful book Mr Zinkin sets out to analyse the differences between Asian and western countries and to suggest the road along which the Asian revolution should now be helped to travel. His approach is that of the economist as well as the politician and historian. He takes the map of Asia, unfolds it across his knee, and explains to his reader, with the patient aid of many figures and much research, just how these lands and peoples have come to be what they are and wherein they differ from those of the West. In some ways, therefore, this is a work of reference. It has all the facts and they will undoubtedly stand the test of time. But the book is also a topical, authoritative and readable attempt to discover the truth about the underdeveloped territories of Asia; and as such it deserves to be widely read. For it is not only challenging in tone; Mr Zinkin also expresses here the ideas that he has accumulated over several years of service in the East, first as a member of the Indian Civil Service and now in commerce.

The book is divided into three parts. In the first, the author has developed two main themes—on the one hand, the essentially peasant life of Asia compared with the balance between town and country already maintained in Europe for several hundred years; and, on the other hand, how it is that overpopulation and the impact of the West have made the twentieth century a turning-point in Asian history, by dislocating the old order through bankruptcy and revolution. In the second part, Mr Zinkin drives home his point with the comparison that, after the revelation of American wealth and power in the war, the years since 1945 "have . . . re-enacted in miniature in Europe what has been happening over all the last century in Asia." To the East the shock of the discovery of its own weakness, however, has been greater because the disparity in strength between East and West is even more profound than the difference between Europe and America. This theme is developed by taking in turn the dominant facets of western influence and of population pressure on the history and economy of India, Burma, Java, Manchukuo, Malaya, the Philippines, Siam and Japan.

In part three Mr Zinkin lays down some of the developments that are essential if Asia is to catch up with the West. This can be attempted, he says, either in the liberal way of India or the totalitarian way of China. But the system that is the first to show signs of raising the standard of living will have immense attractions to others. And if it is to be the China of Mao Tse-tung, coming after the harsh but legendary success of Soviet Russia, then the chances of stopping Communism in Asia will be very slender indeed. The essential developments include the application of far more capital to the countryside—if it cannot be supplied at home it must come from outside—and the acquisition of skill. Farming must be "a means of making money as well as a way of life"; there must be "commercialisation of the countryside." In this and in the industrialisation of Asia, the state must inevitably play a major part, as it did in Japan. The role is not, however, an unaccustomed one, since Asia already has a long history of effective and helpful state action. Unfortunately the new start has recently had to be made at a moment of political disillusion in the aftermath of political independence and following a cruel loss of capital equipment in the war. Ceylon is the only country in Asia better off now than in 1939.

Mr Zinkin pays tribute to a large body of helpers in preparing his book, including his virtual co-author, Mr Guy Wint. Everyone in Asia, and who is concerned with Asia, certainly owes them a debt of gratitude, for within these pages are the essential facts, and, however great the task of applying the right remedy, no one can now say that they did not know what the problem was.

Josiah Wedgwood

The Last of the Radicals. By C. V. Wedgwood. *Jonathan Cape.* 252 pages. 16s.

Josiah Wedgwood died in 1943, after a life that is the answer to a biographer's prayer; and if his biography had been bungled in the writing it would have been a tragedy. But, by a rare chance, his niece, who knew him from her childhood, is Miss C. V. Wedgwood, the distinguished historian and writer, and when she undertook his biography she was certain to do it well. She has in fact done it very well. She has drawn a brilliant picture of her uncle—a picture to make old men cry with shame at their wasted lives and to fire young men with a hatred of oppression and a passion for freedom, justice and courage. "The first thing in every political leader," said Wedgwood, "is not brains but courage."

Brought up in an evangelical family which set a high value on education in the home, Wedgwood went to Clifton with a knowledge of history and letters that was probably as rare among schoolboys then as it is today, and he delighted his dying father by winning the school gold medal for history. He never went to a university, but learnt engineering in Armstrong's shipyards. In his adult life he was naval architect, soldier in the Boer War, resident magistrate, MP, historian of Parliament, Zionist and friend of Gandhi, one of the pioneers of armoured warfare in the 1914 war, a gallant leader at Gallipoli and defender of conscientious objectors in England. Though a Fabian and a member of the Labour party, he was also an individualist and a relentless foe of regimentation, an ardent Protestant, a passionate believer in the taxation of land values, and a champion and helper of anyone anywhere whom he knew to be unpopular and believed to be oppressed.

It was his feeling for the underdog that made him join the Labour party, and it was his innate liberalism that irked him when he got there and prevented him from ever getting high office in a Labour government. Wedgwood in the Labour party was rather like Newman in the Catholic Church. "He was," says Miss Wedgwood, "distrusted by many, more especially by the trade unionists, to whom his ideas seemed dangerously liberal." As he hated the planned state and was doubtful even of the desirability of compulsory education, and as he never hid his opinions either from want of courage or from lack of words, the comrades must often have found him queer company. In 1940 he wrote a book "to teach freedom to English children," and in it he said this—

> Dependence on the State ever grows. A new master replaces the old masters. The mountain top is obscured, and those who have no vision tend to become willing clogs in the new bureaucratic machine. This machine, the scaffolding of life, becomes a God whom it is blasphemy to criticise and criminal to obstruct.

If he thought that in 1940, what would he say in 1951?

The Triangle

Communism, Democracy and Catholic Power. By Paul Blanshard. *The Beacon Press,* Boston. 340 pages. $3.50.

This book appropriately comes from America, where the position of the Roman Catholic Church remains a live political issue. In this country attacks on Catholicism, whether Protestant or rationalist, appear to belong to a past age. In the United States a large part of the population is derived by immigration from Catholic countries. Mr Blanshard's book is primarily a criticism of the activities of the Catholic Church in American public life, but he extends his survey to American foreign policy, arguing that the United States should keep clear of all entanglements with political Catholicism in Europe, and particularly with Franco Spain.

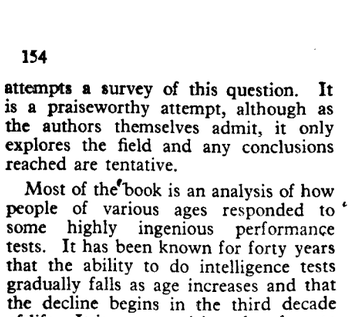
The author develops the theme of a parallelism, in spite of their mortal enmity, between Catholicism and Communism as "two great systems of authoritarian control over men's minds," and he speaks of "the three-way struggle between the Vatican, the Kremlin and democracy." He has chapters on "thought control," "discipline and devotion," "the management of truth," and "the strategy of penetration" as exemplified in the two systems of organisation. He effectively points out some close analogies, and indeed much of the persistent failure in Anglo-Saxon countries to understand the nature and methods of Communism has come from the habit of thinking of it as just another political movement instead of as a *Weltanschauung* affording a complete substitute for dogmatic religion. It is not entirely an accident that Communism has gained its greatest following in countries that are Catholic or Orthodox by traditional faith, and has made least impression where Protestant individualism has been at its strongest; nor is it accidental that ex-Communists so frequently become converts to Catholicism. It is easier for a mind accustomed to authority in matters of belief and conscience to switch from one authoritarian creed to another than to develop a free critical outlook.

Mr Blanshard, however, tends in stressing his analogies to overlook the fundamental difference between Catholicism and Communism in relation to democracy. The aims of Communism can only be achieved through exclusive state power, and a Communist party in a democratic society can have no other function than to work for its violent overthrow. On the other hand, the Catholic distinction between spiritual and temporal powers implies that the essential purposes of the Catholic Church as a religious body can be adequately fulfilled in any society which concedes it genuine religious toleration, even without Catholic control of the state, and there are many Catholics today who consider that in this imperfect world their religion cannot be better off than it is in the great liberal democracies. Among Catholics who take this view there has been much criticism of certain recent policies of the Vatican. Mr Blanshard's book is too much of a direct attack on the Catholic religion as such to have any influence among Catholics, but an analysis confined to the definitely political activities of the hierarchy would disclose considerable differences of opinion about them within the Roman Catholic Church itself.

Elderly Workers

Skill and Age. An Experimental Approach. By A. T. Welford. *Geoffrey Cumberlege. Oxford University Press,* (for the Nuffield Foundation). 161 pages. 8s. 6d.

The emphasis being laid at the present time on the importance of keeping old people at work gives this book particular interest. It is generally agreed that there are two main factors in determining whether elderly people will postpone their retirement: how strong is the financial incentive of continuing at work, and what is the attitude of their employers and fellow-workers. The attitude of employers will be influenced by their opinions and prejudices about the capabilities of their elderly workers. So much is said about the economic burden of an ageing population that it is time that someone tried to find out whether elderly people are a handicap to industry or not.



This book, the fruits of research sponsored by the Nuffield Foundation,

attempts a survey of this question. It is a praiseworthy attempt, although as the authors themselves admit, it only explores the field and any conclusions reached are tentative.

Most of the book is an analysis of how people of various ages responded to some highly ingenious performance tests. It has been known for forty years that the ability to do intelligence tests gradually falls as age increases and that the decline begins in the third decade of life. It is not surprising, therefore, to find that, according to these performance tests, the capacity to acquire fresh skills falls off from the age of thirty onwards. The elderly appear to be slow to learn, but once they have acquired a skill their performance can equal that of younger men. Whenever they come up against a problem needing an effort of comprehension and the organisation of fresh data they tend to fail and to rely more and more upon experience and methods that have served them well in the past.

In visits to a number of factories and workshops, the authors also analysed the kinds of work at which the elderly were employed. Only rarely did they find anyone over fifty employed on jobs where they had to work against time; on the other hand, they found that in jobs needing patience and accuracy the elderly have a positive advantage over younger workers.

This first piece of research should encourage others, particularly large employers of labour, to look into the causes of lack of skill among their ageing workers and examine the types of employment most suitable for them, together with methods of training. It should not be regarded as a welfare service for the old, but rather as a means of making the best use of the whole labour force, for it is clear from this book that elderly workers possess many virtues which younger workers lack.

THE BOOK SOCIETY'S CHOICE

A DRAGON APPARENT

Travels in Indo-China

by NORMAN LEWIS

'Mr. Lewis is a very personal and intelligent writer, ironical and reflective. He is a civilised traveller who travels light but has a head full of excellent impressions. His book looks like being the last we shall get by a real writer — as distinct from a newspaperman — before the curtain falls and the Angkor Vat and the creaking water wheels of Cambodia vanish from the European's itinerary. It is excellent to read a more or less unpolitical book about a country where the politics are hot.'

Magnificently illustrated. 15s. *net*

JONATHAN CAPE

Polar Strife

The Antarctic Problem. An Historical and Political Study. By E. W. Hunter Christie. *Allen and Unwin.* 336 pages. 25s.

Few people are aware to what extent the austere regions of the South Pole have been and are a cause of international dispute. Two decades ago, there was bitter controversy between Denmark and Norway over the sovereignty of East Greenland. The dispute between Great Britain on the one hand and Argentina and Chile on the other over the sovereignty of the Falkland Island Dependencies has been smouldering for a long time. Why cannot Britain and the two South American Republics settle this issue, comparatively minor when compared with those confronting the world today?

This is the problem which Mr Hunter Christie has set out to answer. He is well qualified, as he was on the British Embassy staff in Buenos Aires in 1946 and 1947 and was charged to make a study of the past history of the Falkland Islands and the Dependencies; the present book is largely the result of that study. Fifteen chapters out of nineteen are devoted to a very complete history of the discovery, exploration and exploitation of the disputed areas. The result is a most readable book in which the author has skilfully extracted the meat from earlier accounts. The first chapters are really exciting and the many footnotes are of considerable interest. Nor does he fail to mention former incidents demonstrating South American co-operation.

Anyone who has attempted a book of this kind will know the difficulty of attaining complete accuracy, and there are some minor faults. The book also deserves much better maps. All in all, however, Mr Hunter Christie has done a fine piece of work. He leaves the final judgment on the rights and wrongs of the disputed territories to his readers, with only the reminder that willingness to resort to arms is still the only real guarantee of the territorial integrity of any nation.

Text and Reference Books

Dictionary of Business Terms. Spanish-English and English-Spanish. By L. A. Robb. *Chapman and Hall.* 219 pages. 32s.

Equivalents of business terms in the two languages are given in this dictionary rather than literal translations, which often do not exist. Most important terms have equivalents but where they have none, possibly because of differences in commercial systems, brief definitions are given.

Analysis of Marine and Other Insurance Clauses. By Victor Dover. *H. F. and G. Witherby, Limited.* 618 pages. 25s.

This is a revised edition of a standard reference work last published before the war. It gives a view of the interpretation which may reaonably be placed on the clauses, but not an official interpretation. The "York-Antwerp Rules, 1950," which are to be submitted for approval to the International Law Association, are included in the book.

Methods of Labour Productivity Statistics *International Labour Office Geneva and London.* 136 pages. 4s. 6d.

This report, prepared for the Seventh International Conference of Labour Statisticians at Geneva in the autumn of 1949 (with some subsequent revisions before printing), is concerned with the problems of measurement and interpretation of labour productivity data. Its object is to expose the complexities of the problems rather than to prescribe in any detail. Since there are many different conceptions of labour productivity, stress is laid on the need for any measurement to be clearly defined.

The dangers of using overall figures such as those obtained from the simple division of current production indices by current employment indices are discussed. Because of the many difficulties of adapting the ordinary collection of data, the undertaking of special direct enquiries into productivity is recommended, and methods used in the United States are outlined.

United Nations Statistical Year Book, 1949-50. *HMSO.* 556 pages. £2.

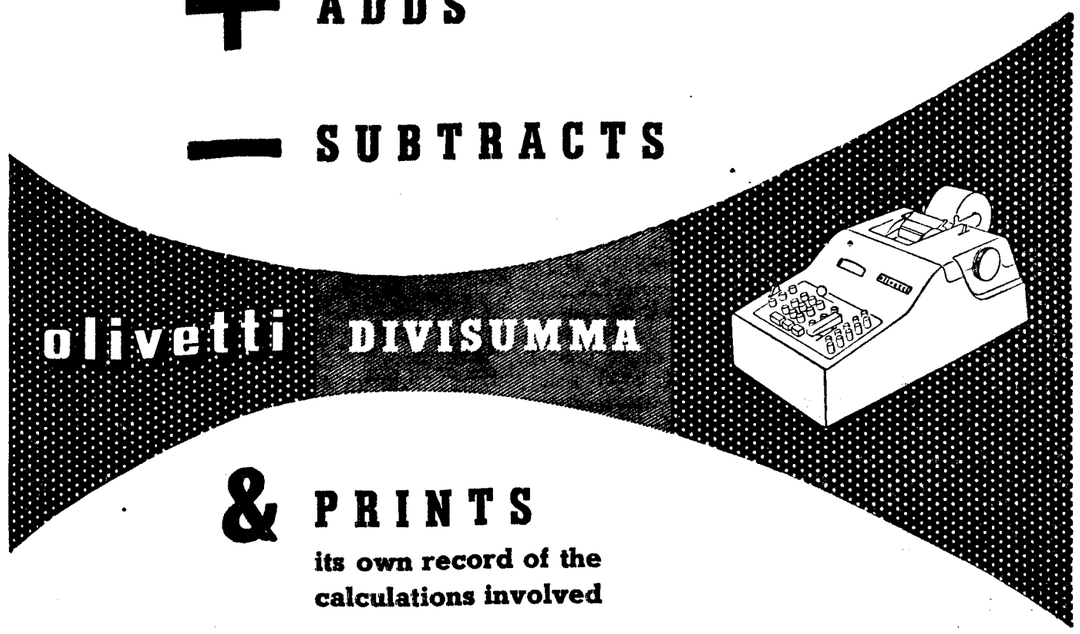
The second annual issue of the United Nations Statistical Yearbook continues all but four of the tables first published last year and in most cases gives annual figures up to 1949. Many of the tables have been expanded. Among the new tables are figures of gross and net reproduction rates, land use, installed electrical capacity, world railway traffic and international shipping freight handled. The national income section includes for the first time a table showing the industrial origin of national income in 22 countries.

In its short life the Statistical Yearbook has established itself as a major source of economic information, and the difficulties of comparing figures from many different countries are minimised by many and clear footnotes.

Secretarial Practice (Sixth Edition) *W. Heffer and Sons, Cambridge* 1010 pages. Cloth 21s. Rexine 25s.

The Manual of the Chartered Institute of Secretaries of Joint Stock Companies and Other Public Bodies was first published in 1912. This edition has been completely revised and includes changes necessitated by the Companies Act, 1948, in addition to new chapters concerned with secretarial practice.

The Mercantile Year Book and Directory of Exporters, 1951. *Lindley-Jones and Brother.* 1324 pages. 26s.



Lists of export merchants, and the classes of goods and markets in which they deal, in London, the provinces and overseas, are published for the sixty-first time. A section listing changes since the last issue is no doubt very helpful to its regular users.

AMERICAN SURVEY

Pacific *Pax Americana*

Washington, D.C.

THE United States, supported somewhat uneasily by Great Britain, unveiled last week its plans for a *Pax Americana* in the Pacific under tre aegis of the United Nations. These plans—the Japanese Peace Treaty, a tripartite defence alliance linking the United States, Australia and New Zealand and a bilateral American-Japanese "security arrangement"—will become formal and more or less final in September. Although it is said that countries still not entirely happy about the terms of the Japanese "treaty of reconciliation" have still a few weeks left in which to suggest changes in the text, it is known that the United States is not prepared to make any substantial changes in the present draft. And the changes that numerous nations would like to make, even though most of them have now given up hope of achieving their wishes, are all substantial.

Early in September, the United States will be host to some 50 other nations at San Francisco for the ceremonial signing of the treaty which restores Japan, minus its empire, to the role of an equal and sovereign member of the free world six years after the island empire was crushed in its brutal and determined effort to conquer Asia and the south-west Pacific. The conference at San Francisco will be limited to speeches and the actual signing of the peace treaty. The alliance between the United States and Australia and New Zealand will probably be signed about the same time—it already has been initialled—but not at San Francisco. It is thought that too direct a linking of a military alliance with the signing of a peace treaty would seem crude at best, rather, as has been said in Washington, like a hostess getting tipsy at her own cocktail party.

The treaty, even when it has been signed, will not, of course, come into force until it has been ratified by the United States Senate and a majority of the 15 nations particularly mentioned in it. As a result of the prolonged squabbling in the Senate over the Administration's policy in the Far East, the Senate probably will not have time to take up the treaty until next January. No difficulty is expected then, however. Despite all the wrangling over Far Eastern policy as a whole, the Japanese treaty has been handled in a skilful and generous bi-partisan fashion by the Administration.

Mr John Foster Dulles, a Republican whom many of the anti-Acheson forces would like to see at the desk of the Secretary of State, has been President Truman's special representative in charge of the treaty negotiations for more than a year. Mr Dulles has been meticulous in avoiding the political booby-traps which are strewn along the path of practically all Administration officials. He has kept Congressional leaders in close and constant touch with the progress of his negotiations. He has not tried to hide from them his difficulties, which on some recent occasions seemed likely to force the United States to "go it alone" if necessary. In addition, Mr Dulles has maintained intimate contact with General MacArthur, even since the latter's controversial removal from Tokyo.

The General, incidentally, poses a ticklish problem for the Administration as it plans the San Francisco conference. In many ways, his role in the treaty, or at least in preparing Japan for such a gentle settlement, is probably equal in importance to that of Mr Dulles. The question that is bothering many officials here is whether the General should be invited to participate in the 50-nation conference to wind up the war he led and inaugurate the era he helped to open in the Pacific. But the thought of General MacArthur appearing on the same platform with Mr Truman, who almost certainly will address the conference, is scarcely calculated to make Administration politicians happy. This is particularly so because no one has yet figured out a way to ask the General to be non-political in his public utterances about the Far East. Nor has any Administration leader dared to hope that the General would mute the aggressive anti-Truman policy which he has been developing since his return to the United States. There seems no prospect of a truce in that battle.

★

Mr Dulles, on the occasion of revealing the text of what is substantially the final draft of the treaty, acknowledged that no one would be 100 per cent satisfied with it. But he did say that "almost everyone should be about 95 per cent satisfied." His optimism was somewhat misplaced, though hardly misguided. In a matter of hours, President Quirino of the Philippines issued a statement emphasising that the treaty "practically sidesteps" his country's demands for reparations and warning the United States that "those who refuse to respect" his country's claims "misread the temper of our people." From Canberra, Mr Casey, the Minister of External Affairs, was reported as saying that Australia is considerably worried about the treaty's calculated omission of any restrictions on Japan's right to rearm. From Paris, French officials complained that no provision had been made for the three associated states of Indo-China to sign the treaty. From London, there were murmurings in Parliament which indicated something more than "five per cent" disagreement, particularly on the lack of economic restrictions in the treaty and the failure to give Communist China an opportunity to participate in the settlement.

But all these misgivings were well known to Mr Dulles. He had argued them in London, Paris, Manila and Canberra, and he had won his way. His technique was simple. It was founded on the arguments that the United States played much the largest part in winning the war against Japan, that since the war the United States had paid out $2 billion to sustain Japan's economy, and that, besides, the United States is the only nation powerful enough to meet aggression in the Pacific. Therefore, he argued, the American views on the treaty must prevail, with or without the support of America's allies. Mr Dulles made some minor concessions along the way, but none of any substance.

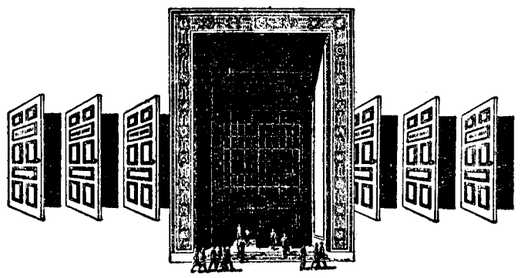
Mr Dulles's approach to the treaty was, as he has said, "unique." As a long-time treaty maker—Mr Dulles helped President Wilson at Versailles—he felt that the traditional punitive type of peace treaty had been proven wrong so many times and with such catastrophic results that a new policy of "reconciliation" was called for. In this he has been supported by Mr Acheson and Mr Truman, who on one or two occasions have overruled the Joint Chiefs of Staff. Even American officials admit there is a certain degree of calculated risk in this policy. But if it does not work, the United States is ready to meet the consequences from the outset.

★

The interlocked questions of Formosa and Chinese participation in the settlement came closer than is generally realised to provoking a major split in Anglo-American policy. And the compromise worked out by Mr Dulles in his talks in London with Mr Attlee and Mr Morrison probably did little more than freeze their fundamental differences in a state of suspended animation. The compromise, which lets Japan decide whether to seek a similar treaty with Communist or Nationalist China, and leaves the future of Formosa open to later discussion, undoubtedly goes further to meet American wishes, if not American interests, than British wishes and interests.

Given this compromise, which was once rejected and later accepted rather resignedly by the British Cabinet, the United States is abundantly confident that Japan will not, at any rate, elect to seek a settlement with Peking. American officials find it "unthinkable" that Japan would do such a thing when it is dependent on the United States and the non-Communist world, not only for its industrial raw materials, but for its security, as long as American armed forces are stationed in and about Japan, as they will be for some time under the bilateral American-Japanese "security arrangement." Yet, some officials and observers in Washington wonder how long Japan will forgo at least an attempt to revive its traditional economic ties with China. Equally, it is sometimes suggested, though usually in whispers, that perhaps General MacArthur was not as successful as is generally made out in converting the Japanese people into a nation of "little Rotarian baseball players." The shrewdest observers are still somewhat sceptical that Japan is now the democracy that it is officially said to be.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.



American Notes

Caesar's Wives

For the unprejudiced, the MacArthur hearings may have exploded the Republican legend that the State Department's policy, particularly its Chinese policy, was controlled by Communist sympathisers. But elsewhere doubts, which the State Department cannot afford, linger on. Senator McCarran is airing charges of a "red slant" in the Voice of America's broadcasts. In the House, considerable support remains for the "get Acheson" amendment, though some Republicans now believe that Mr Acheson is a greater asset to them in office than out, and the party has been taken aback by the realisation that, if funds are withheld from any official who within the past five years has worked for a firm doing business for a foreign government, not only will Mr Acheson be cut off, but 37 other officials as well, some of them Republican and some of the eminence of Mr John Foster Dulles, Mr Walter Gifford, Mr Charles Spofford, and Mr Thomas Cabot. If it were ever put into effect, which is unlikely, the formula would clear the State Department, not of Communist sympathisers, but of its most notable, and most conservative, servants.

But like Caesar's wife, State Department officials must be above suspicion. In a new security check, two high-ranking career diplomats have been suspended until charges against them have been heard. They are both linked with Chinese policy, but, the Department insists, it is not their loyalty but their "security" which is involved—a term covering personal conduct, associations, and indiscretions. A number of unnamed others have also been suspended, as a result of the revival of the severer wartime standards of loyalty announced by the President in April. A "reasonable doubt" now suffices for discharges, while formerly there had to be "reasonable grounds" for believing in an employee's present disloyalty. Doubts, that is, are resolved against the accused and past associations taken into account. Unfortunately, even if a civil servant is cleared, Senator McCarthy, Senator McCarran, or the House Un-American Activities Committee are very likely to revive the charges. And even federal clearance itself need not be final. Under the new loyalty standards, the Loyalty Review Board has reopened 846 borderline cases and instructed department heads to look again at doubtful ones among the eight thousand or so decided since 1947.

This double jeopardy underlines the fact that however fair the new loyalty procedure may be in practice, civil servants are deprived of a number of the safeguards of a court trial, safeguards which judges have been meticulous in assuring even to admitted Communists. Judge Ryan, for example, has refused the government's request for greatly

THROUGH THE CHASE BANK...
NOT ONE DOOR, BUT MANY

Many American doors are open to expanding British export trade. In selecting the most desirable, the Chase National Bank, through its London offices, can prove extremely helpful. Our officers have full, up-to-the-minute information on market, credit and trade situations in all parts of the United States.

THE CHASE NATIONAL BANK
OF THE CITY OF NEW YORK
A United States Corporation with Limited Liability
LONDON—6 Lombard Street
51 Berkeley Square Bush House, Aldwych

increased bail for the 15 Communist leaders who had not forfeited their sureties. The need for the report of the Nimitz Commission on ways in which the national security can be protected without violating individual rights, becomes more and more urgent. But in assigning one aspect of the Commission's task, an investigation of procedures and safeguards in discharges on security grounds, to the National Security Council, the President appears to have abandoned hope that Senator McCarran will relent and let the Commission get to work.

* * *

Bases for Containment

The report that Admiral Sherman has been discussing with General Franco an arrangement which would permit the use of Spanish air and naval bases, in exchange for American arms, is in accordance with the feeling, strongly held both in Congress and the Defence Department, that ideological differences and allied qualms should not stand in the way of developing Spain's military resources for the west. It also is the conviction of the Defence Department that the expanding services and the job they may be called upon to do have far outstripped the available bases. This belief is particularly strong in the Air Force, which is to get more than half of the $6.6 billion for construction which General Marshall is urging Congress to authorise as quickly as possible, and is not altogether content with that. Mr Finletter, the Secretary of the Air Force, told the House Armed Services Committee that the $3.5 billion he was asking for the two year programme would take care of the projected 95-group Air Force on only an "austerity basis."

The number of major Air Force bases is to be increased from 232 to 309 and, although approximately $1 billion of the Air Force's projects are secret, and the maps and charts in the committee room were guarded by members of the Air Force, it is believed that about half of the new 77 are to be built in countries that are members of Nato and in the Far East—where they will most effectively discourage Communist aggression. Construction is already being rushed on the seven air fields in Moroccco made available by the French. The urgency with which the bases are being pressed is explained, at least in part, by the admission wrung from a witness before the committee that there were in readiness only 80 B-36 bombers, the intercontinental aircraft which theoretically can dispense with bases outside the United States. Another 60 are being modernised, but only two or three of these expensive and complex giants are being produced each month. Some of the new air fields will be for tactical purposes, for use with General Eisenhower's army; others will be larger, to accommodate the strategic bombers of the Air Force. Still others, both at home and abroad, will be enlarged to take the bigger jet aircraft now being delivered.

* * *

Because the Joint Chiefs of Staff believe the emergency may last for years, construction is to be of a permanent or semi-permanent nature; the temporary bases constructed during the last war are already proving costly to rehabilitate. Among projects already tentatively approved by the committe are $40 million to be spent in the Philippines and Guam; $346 million for the three services in Alaska; and $128 million for the Army and Air Force in Okinawa. The committee is under great pressure to economise, and indeed claims to have made dramatic savings, but these amount to no more than refusing to authorise projects which will not be put in hand until next year. Even this subterfuge may be abandoned in the case of the Air Force, which is the apple of most Congressmen's eyes

All Change on the Farm

The July crop reports are the most important of the year, for they contain the first estimates for cotton and maize and are made after the wheat harvest has begun. This month they showed a complete and welcome change from the ominous forecasts of last spring. Then the farmers, fearful of possible shortages of labour and equipment, and tired of being urged one year to grow all they could, and the next to grow as little as possible, seemed to be hardening their hearts against the government's exhortations to increase their output of practically all crops. But in the end they have planted more land (371,500,000 acres) than in any year since 1933. The weather, too, was looking brighter, at least until the Kansas floods, and yields promise to be well above recent averages. When the harvest is finally added up the total figure is likely to top all previous records.

Prospects for all the grain crops are good, so there will be plenty of feed for this year's bumper crop of livestock. There are more little pigs than in any year since 1943; there are thought to be more little steers as well, but whether they go to market and how much beef there will be on their ribs depends on the outcome of the Congressional battle between the cattlemen and the price stabilisers. Cotton, such a failure last year, is the most promising crop of all. It is being carried on an acreage nearly 60 per cent larger than last year, and a very high proportion is in the western states where yields are much higher than in the old southern cotton belt—770 pounds an acre on an average in California and Arizona compared with about 220 pounds in Georgia and Alabama.

* * *

This westward movement of cotton is only part of the general post that is taking place amongst American crops. Wheat is coming back to its old home on the eastern seaboard; yields there bear comparison with those of Europe, while those obtained from the dry and often exhausted soil of the great plains do not. Dairy cows are coming south from Wisconsin and Iowa and beef cattle from the mountain grasslands, to fill the gap left by cotton and to restore the fertility of the soil. This has been made possible by the development of new types of forage crops and new breeds of cattle, cows that can sweat and steers that will graze under the hottest sun. New strains of maize are also bringing that crop into the southward trek. Beef, milk and maize production per acre is said to compare favourably with that in the north and west, partly because rainfall is more reliable and partly because southern farmers, trained on cotton and tobacco, give their crops more individual attention and can draw on a plentiful supply of cheap labour.

These changes fit both the short and long-term goals of the Department of Agriculture. Such increased efficiency in the use of land is almost the only way in which any substantial rise in farm output can now be obtained, for there is little or no room left for expansion in the old agricultural pattern. And the changes are also an important advance along the road to sound conservation practices and greater diversification of crops in the future.

* * *

Under the Judicial Robe

In appointing Mr Luther Youngdahl, the Republican Governor of Minnesota, to the US District Court in the capital, President Truman has secured a judge generally agreed to be eminently well qualified—something not always the case in appointments of federal and state judges, in whose selection politics often plays an unabashed part. This has not made the pill any sweeter for Minnesota Republicans, who have lost their best vote-getter, or for Mr Harold Stassen, who counted upon the liberal Mr Youngdahl to see that Republicans of his native state, when they make their choices in Minnesota's first presidential primary next spring, line up behind Mr Stassen and not behind Senator Taft.

Mr Youngdahl, who, after sixteen years as a judge, was induced by Mr Stassen in 1946 to run for Governor, has been twice re-elected; in 1948, though Mr Truman and Mr Hubert Humphrey, the Democratic candidate for the Senate, swept the state, he was returned by a 100,000 majority.

By persuading Mr Youngdahl to exchange the opportunities and risks of a political career for the serenity and life security of a federal judgeship, the President has cleared out of the Democrats' path the man who had been expected to win a fourth term as governor next year, and to knock Mr Humphrey out of the Senate in 1954. Mr Bowles, when Democratic Governor of Connecticut, executed a similar manœuvre when he offered Senator Baldwin, one of the state's leading Republicans, a place on the state bench. Republicans draw what consolation they can from the fact that this did not save Mr Bowles. The practice of eliminating political rivals by elevating them to the bench is, however, comparatively rare. Such plums are usually rewards for the faithful; since the Democrats came into power in 1933, Republicans have received only 19 of 330 lifetime appointments to the federal bench.

Appointments can be withheld, as well as made, for political motives. Thus Senator Douglas, an ardent Fair Dealer, but one who, unlike Senator Humphrey, has incurred a certain Presidential coldness, has not yet been able to obtain Mr Truman's nod for three judicial appointments in his state, which by ancient Senatorial custom he is privileged to control. In New York, it has been noticed that while Judge Medina, who tried the eleven Communist leaders, has been made Judge Hand's successor, and Mr Murphy, who prosecuted Mr Alger Hiss, has secured the federal judgeship he has long coveted, Mr Lloyd Paul Stryker, who defended Mr Hiss, and was expected to receive advancement, has been passed over. The choice of both Judge Medina and Mr Murphy has been endorsed by the local Bar Association. However, Miss Frieda Hennock, a third Presidential choice, has been found by both the American and the New York Bar Associations to be completely unqualified, and the suspicion is that her political activities, rather than her legal gifts, account for her preferment.

But the federal judiciary offers no such spectacle as does Connecticut, where 67 Republican judges appointed by a Republican Governor are trying, so far unsuccessfully, to oust 67 Democrats appointed by his Democratic predecessor. At that, Connecticut is one of only nine states where the supposedly superior method of appointing state judges, rather than electing them, prevails. Only two states, Missouri and California, have adopted the American Bar Association's suggestion of having judges appointed by the governor from a list submitted by an eminent commission.

* * *

Freedom in the Air

It has long been alleged in Washington that the Civil Aeronautics Board, the agency which regulates air transport, is the slave of the country's sixteen major air carriers, the certified airlines which handle the mail and fly on regular schedules between important centres. A valuable piece of evidence in support of this assertion was provided by the board itself last spring, when it reduced the weekly ration of flights allowed to non-scheduled airlines so drastically that it left them little hope of keeping alive; this was the climax of a policy of slow starvation which it had been pursuing towards them by means of its regulations for the last three years. Hundreds of these small lines were started after the war by ex-Army pilots, using surplus government aircraft, ready to carry freight or passengers whenever and wherever they could find a cargo. A great number naturally failed, but the hard core of about fifty that remains is a painful thorn in the flesh of the scheduled airlines.

**After applying certain reserves to write down assets.*

All banks are members of the Federal Deposit Insurance Corporation

A court injunction, however, postponed the CAB's death sentence and the Senate Small Business Committee at once investigated this threat to free enterprise in the air. Its report has not yet been officially released, but it apparently contains a fierce condemnation of the CAB's whole approach to the question of expanding air services. The non-scheduled lines are accused of "skimming the cream off the air travel market," but it seems truer to say that they found a use for the skim milk that no one else wanted. It was they who began the enormous postwar extension of air freight shipment and the cheap flights without frills that have been copied by the major airlines. These "air coach" services brought into the air a whole new class of passengers who would otherwise have stayed at home.

In the opinion of the Senate committee, this mass market still has vast potentialities which may never be tapped if the CAB persists in the restrictive policy under which it approves and subsidises only what is in practice luxury flying. The subsidies, which are not available to the small lines since they are not certified airlines, are intended to make it possible for small communities as well as large to have air services. Before long it should be clear how much the subsidies actually amount to, for at last the payments for carrying air mails are to be treated separately. The CAB is not entirely unjustified in arguing that it ought not to encourage competition which would undermine the financial position of the scheduled airlines and therefore add to the subsidy needed to keep them flying. The board's duty to the public as taxpayers certainly seems to conflict with its duty to them as passengers, and it may well be that the fault lies in the Civil Aeronautics Act of 1938, designed to protect an adolescent industry which has now clearly reached its majority.

Shorter Notes

The House Foreign Affairs Committee has approved the Battle Bill unanimously, and its prospects in the House itself are good. This Bill, designed to replace the unsatisfactory Kem amendment which would have cut America's allies off from Marshall dollars, is also designed to stop the free world sending goods of strategic significance to the countries behind the iron curtain. But the Battle Bill is both more specific and more flexible than its predecessor and should at least be workable. Should peace be concluded in Korea, the Kem amendment will, however, become a dead letter, for it applies only so long as the United States is engaged in hostilities.

*

The cosmetic trade expects to become a billion-dollar industry this year. Sales of "toiletries" last year amounted to nearly $850 million, to men as well as women, for the term includes shaving soap as well as the lipsticks which 99 out of every 100 American women use.

The United States Secret Service is eighty-six years old, but only this week was it finally given permanent status. A department of the Treasury, its official duties are to protect both the currency and the President, the one from counterfeiters, the other from assassins. But, in addition to this odd combination of tasks, it justifies its name by having others, the nature of which is not disclosed.

*

President Truman has signed the Bill, described in *The Economist* last week, which authorises the recruitment of farm workers in Mexico, on the understanding that further legislation to improve the working conditions and living standards of all migratory farm workers will follow. The additional measures that are most urgently needed would deal with illegal immigration from Mexico; as long as this goes on on the present scale, the new law has little meaning. But the President is also hopeful that Congress will implement at least some of the recommendations in the constructive report of his special commission, which suggested various new ways of handling migratory labour.

*

Air taxis will before long be quite common in the United States. The helicopters which have been transporting mail in Los Angeles are now to be allowed to carry passengers as well, and it is proposed to deliver them from the airport practically to their own doors. Similar services are being provided in Chicago between the airport and the city's suburbs.

*

Spare tyres are about to reappear as part of the standard equipment of new cars. Since last April purchasers have had to buy them separately and pay extra for them, but now improved supplies of rubber and reductions in the number of cars being produced have made it possible to remove the ban.

*

The provision of a new bus service between Chinatown and Wall Street suggested to one Wall Street bank that the time had come to open a special Chinese department. This enterprise has been justified by a notable increase in the transactions handled by the bank for the Chinese business community in New York.

*

There were 6,677,000 Americans in the public service in April, nearly as many as in 1945, the wartime peak; of these 2,385,000 were civilian employees of the federal government and the rest were working for state and local governments.

THE WORLD OVERSEAS

Right-Wing Parties in Italy

(From Our Rome Correspondent)

IF Signor De Gasperi is asked to try to form a new Government and is successful, he will have to solve problems of extreme difficulty during the two years which presumably remain before the next general election. Perhaps half the Christian Democratic Party wants to halt agrarian reform at its present stage of merely initial realisation; some would even go back on that. A highly contentious governmental Trade Union Reform Bill now, at last, lies before Parliament. Its application as law would cut profoundly into current trade union routine and would clearly challenge the position of existing trade union leaders. To these specific problems must be added the need for a greater and more convincing skill in combining the exigencies of confidence in the currency and of fuller employment, and in compromising between the need to concentrate rearmament production where it is economically likely to be efficient and the social and political need to place it where it will help in the rehabilitation of depressed and backward regions.

All these are questions which would continue to be pressing even if the Italian political spectrum stopped short at the centre and conservative segments of Christian Democracy. The Chamber, however, includes a good fifty members further to the right, of whom a couple of dozen could be counted as extreme right. It may be exaggeratedly gloomy to recall that the Fascists got into power in 1922 without finding it necessary to have more than 33 members, but certainly the extreme right in Italy has a traditional tendency to serve as a tail wagging a portly and moderate dog. In the municipal elections of this summer, according to the calculations of Togliatti—in this case a fairly detached observer—the Christian Democrats have already lost half a million votes to the MSI, the specifically Fascist party, though the final batch of these elections, including Fascist strongpoints in Rome, Naples, and elsewhere in the south, have still to be held. The recent sufferings of the De Gasperi administration had as their background an undoubted exuberance, in the country, of right extremism.

Youth and Dynamism

The MSI, like early Mussolinian Fascism, offers itself as the final goal of the pilgrim moving rightwards, though, as is the case with Communist leftness, these designations have become partly paradoxical. The comparative "moderates," agrarian Liberals, Monarchists, and the deviationists of Christian Democracy known as the "Wasps"—responsible for recent near-defeats of De Gasperi in the Chamber—have much more of a traditional rightish appearance. The MSI fully perpetuates the Mussolinian mythology of youth and dynamism, and is prepared in its domestic programme to out-socialise Socialism—on paper. An MSI demonstration in a large town will almost always prove to have a nucleus of university students, a far more numerous class than in Britain. This youthfulness, however, by all precedents, means that financing, and probably more than mere financing, comes from outside sources. The immense pageantry and oceanic pamphleteering produced by the MSI this summer in Sicily must have been financed from very imposing sources. From North Italy, it is said locally. In fact the present political struggle behind the scenes doubtless includes fierce tussles between the organisers of the late government and the extreme right for the moneybags of industrialists seeking safety from Communism.

The MSI as it emerged from its feeble showing at the 1948 general elections failed to throw up a political leader of consequence. It is now rumoured, however, that Prince Valerio Borghese, a much decorated naval hero in his forties who followed Mussolini in his last adventures in North Italy, and who was soon amnestied after getting a twelve year sentence for treason in postwar Italy, is meditating in a castle, and preparing himself for the role. The Roman Prince has a magnetic presence, heady and resourceful eloquence, and the strand of foreignness commonly found in very ardent nationalists (he is partly Levantine-Dutch and has a Slav wife). Another last-ditcher old Fascist who openly led the recent MSI campaign in Sicily is ex-Ambassador Anfuse. These names at once bring out the difficulties of the extreme right movement in Italy today and its involvement in historical complications unknown to proto-Fascism. The old Fascist party fell asunder in 1943 when those who followed Mussolini to the north regarded the faction of Ciano and Grandi as traitors. The later faction, in fact, as yet lives only on the margin or outside the MSI but it has money, talents, and experience.

A similar or greater difficulty besets efforts to bring the MSI together with the Monarchists, despite their equally inflamed nationalism. The two regard each other as smirched with the brush of treason in the events of 1943. The Monarchists were stronger than the MSI at the 1948 general elections but appear now to be losing their appeal. There must be mentioned also a third (or fourth) extreme right, lacking a party description but possessing a dynamic leader, Dr Luigi Gedda, the clerical-nationalist, and close friend of the Pope. Dr Gedda has in recent years created and led the "Civic Committees," a financially potent and extremely active anti-Communist propaganda institute which has become progressively detached from the Christian Democrats and especially from Signor De Gasperi. It represents a pole of attraction for Catholic right wingers, and has recently been courted, but in vain, by the MSI whose "pagan" tendencies no clerical can hide from himself. The Monarchists, meanwhile, sometimes revive the tradition of 19th century liberal anti-clericalism.

The complexities of right-wing affiliations have come strongly into the picture in Sicily. The island enjoys an autonomy on similar lines to Northern Ireland, and has just elected a new local Parliament. Of its 90 members one third are Christian Democrats, one third extreme left, a handful are of the left centre and the rest are split between Monarchists and Fascists. The Christian Democrats could form a centre-ish Government with Monarchists and left centre, and this the local Monarchists wished to do, apparently with the approval of ex-King Humbert. But they have been ordered by their Rome headquarters, for higher reasons, to act in combination with the MSI. Some of the leaders have therefore split away; no government has been formed in Sicily six weeks after the elections. The crystallisation needed to give consistency to the mounting forces of the Italian extreme right has thus not yet been realised; but that is a process which, if things began to go really badly in this hotly imaginative country, might happen pretty quickly.

The Return of the Purged

[FROM OUR TOKYO CORRESPONDENT]

KEEN political observers in Japan have recently been intrigued by a 40 per cent increase in the price of *tai*, the succulent Japanese fish which is traditionally eaten at banquets celebrating a joyful occasion such as a marriage or divorce. They attributed this sharp and unexpected price leap to a run on *tai* for the widespread celebrations attending the release of 68,900 top-level "purgees" from the shadow of the Potsdam purge provision. (This stated that "the authority and influence of those who have deceived and misled the people of Japan into embarking on world conquest" should be eliminated for all time.) Whether or not the demand for *tai* was in fact due to these celebrations alone, there is no doubt about Tokyo's present popy-scented mood of exhilaration and rejoicing.

The shriven penitents have been greeted with such unrestrained and universal congratulations, good will and even veneration that one or two newspapers have been constrained diffidently to point out that technically they are not national heroes but paroled rogues. Most of them are returning to public life in urbanity and silence, others with hypocritical gratitude, not a few, alas, in scorn and arrogance. The "depurged" politicians hastily called a conference, formed a sort of unofficial society and gave all indications of striking a medal to be proudly worn after the peace treaty is signed.

Ichiro Hatoyama, titular head of Prime Minister Yoshida's Liberal party, genially allowed it to be known that, having been "depurged," he would be available for Yoshida-san's position, if the party so desired. However he then suffered a mysterious cerebral attack. This does not prevent him from playing "go" (Japanese chess) in his green-roofed Tokyo mansion, but it delays his challenge to his old but ambitious friend Yoshida-san, who is thereby confronted with the suicidal honour of leading the Japanese delegation to the peace conference at San Francisco.

Tanzan Ishibashi, former Treasurer, who was unfairly purged by General Courtney Whitney, MacArthur's closest adviser, returned gaily and immediately to politics and was promptly placed on the government committee now "reviewing," which is to say abolishing or emasculating, such unpopular Occupation "reforms" as those guaranteeing improved working conditions or divorcing banking from government control. Sadao Iguchi, a former career diplomat, who as Counsellor at the Japanese Embassy in Washington was strongly suspected of having played for time until Pearl Harbour was perpetrated, has gone back to the Foreign Office as Vice-Minister and will probably be first Japanese Ambassador to Washington. Joji Matsumoto, former intellectual and the industrial leader of prewar imperialsit policy, as well as vice-president of the South Manchurian Railway, has been appointed chairman of the Public Enterprise Committee, where he has control over the selection of executive staff for government undertakings.

Koichi Kawakami, former president of the Nippon Kogyo Bank, who was purged for his association with the Zaibatsu monopolies, is back as president of the Export Bank and member of the Public Enterprise Committee, where he is evidently marking time before succeeding to the position of Governor of the Bank of Japan. The Mitsui, Mitsubishi and Sumitomo families have all been cleared also—generally in an atmosphere of courageous penury, with hardly a castle to call their own. There has even been an astonishing but confident demand this week for the "depurging" of 3,660 former members of the Japanese Gestapo, the dangerous "thought police" who, it is considered, should now be returned, chastened and reformed, to the new police force.

In retrospect, the "Great Purge" was a great idea doomed to failure. It did not—it could not—operate equitably. It punished some Japanese who, through patriotism or pressure, helped their country once the war began. It passed over others who had plotted for war but removed from Japanese political, industrial, government and public life some of the best brains at a time when they were most urgently needed to help reconstruct the broken nation. For the future, these "depurged" Japanese will re-establish themselves in public life according to merit, industry and other democratic qualities—plus, however, one new, important and unfortunate advantage. The years they have spent in disgrace must, on the evidence of the public welcome for them on their return, ensure them preferment in reward for their patriotic punishment.

Which President for Portugal?

[FROM A CORRESPONDENT RECENTLY IN LISBON]

THE Portugese elections, which take place on Sunday, are far more important than they look on the surface. The three candidates (General Craveiro Lopes representing the Government Nationalist party, Admiral Quintano Meireles of the Republican Opposition, and Dr Ruy Luis Gomez) illustrate the political divisions within the country—on the one hand, the armed forces, and on the other, the permitted Left wing, opposition. There is some feeling within the country that as a general held the presidential post for twenty-five years, it is now an admiral's turn. Few people argue seriously that it is time to put the Left in power.

Dr Salazar's policies are not openly on trial, but unless he is to go (and he has already suggested that he is too tired to continue) the first problem is to elect a man with whom he can work as successfully as he did with General Carmona. The legend of his power has grown so great as to obscure the basis on which it rests. Economic skill he has indeed shown for twenty-five difficult years ; but during that time he had behind him a President who kept political fences mended, held the loyalty of the armed forces, the intellectuals, and the aristocracy, dedicated monuments, and, in short, performed for Portugal most of the functions of a modern king. Relations between the two were deep, subtle and mutually respectful. Before General Carmona came to power in 1926 Portugal had had sixteen years of chaos and disintegration. The twenty-five years which followed saw the rebuilding of the country's structure of government, its physical plant and its economic pattern. The amount of work done is little short of spectacular. The question now is whether the new structures are strongly enough built to stand a change in the head of government. The new constitutional framework is criticised as too rigid ; but it is not at all certain that Portugal is as yet so used to working within it as to make safe a greater degree of flexibility.

The new President must have Dr Salazar's complete confidence. He must perform his honorary and political duties well, and be so content with them that he is not tempted to reach for the power in the hands of the Prime Minister. He must accept the complex corporative state and be determined to continue its functioning without drastic changes—Portugal has too lately regained order, prosperity and self-respect to risk losing them by any new attempt at "reforming" what has been so hardly won. He must be willing to leave economic decisions in Dr Salazar's hands ; since 1928 that ecenomic genius has weathered many storms, and new ones are in the making.

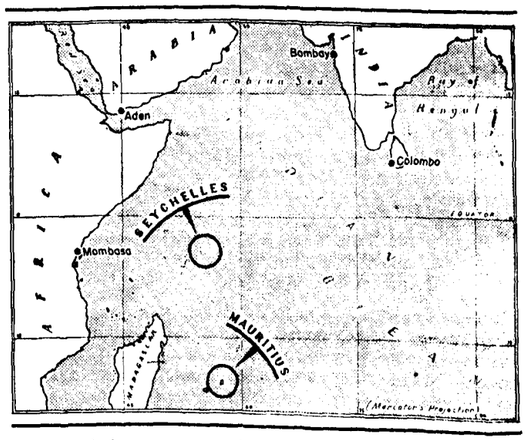
To these strictures, which are difficult enough, must be added a fourth set arising out of Portugal's relations with other nations. Its traditional dependence on England has

latterly been lessened by its cultural affinity for France and by the new financial support which the United States is giving under ECA. Its relations with Spain are nominally good, but actually far from comfortable. Its international position has the lack of ease inevitable in an authoritarian government. It would like to play with the western democracies, but the Soviet Union puts every possible barrier in the way, and it has very little leeway for bargaining. These problems the new President must face, and he must also be prepared for financial difficulties as Portugal begins to feel the pinch of higher prices on the raw materials it needs from the outside.

Relations between the Army and the Navy are, of course, strained by the race, but the struggle between them for power is endemic and hence the candidacy of a general and an admiral presents less danger than one might imagine. The real test will come after the election, as the new man experiments with the straps and braces which General Carmona wore with such apparent ease.

Britain's Island Colonies—I

Mauritius and the Seychelles



FOR Britain's major colonies—in Africa, Asia and the Caribbean—the future, however beset with difficulties, is at least defined. Through economic development they will one day become viable modern states ; through constitutional advance, responsibility will be gradually transferred until they reach independent status as Dominions, it is hoped, within the British Commonwealth. But what of the seven weak and scattered island groups in the Southern Hemisphere, for which Britain continues to hold responsibility, and which can hardly hope to be sufficiently prosperous and populous to stand on their own feet? Even without dreaming of such ultimate goals as independence, how is a reasonable level—on British standards—of administration and social welfare to be assured them? These are not least among the headaches of a paternal Colonial Office which has published a special report* on Mauritius and the Seychelles ; Fiji and the Western Pacific High Commission ; the Falkland Islands, St. Helena and Tristan da Cunha—all unknown islands which the average Englishman, in spite of his ultimate responsibility for them, would scarcely know how to locate on the map.

Mauritius and the ninety-two islands of the Seychelles lie in the middle of the Indian Ocean. The former has a population of 475,000, the latter only 35,000. They were both French colonies until they were ceded to Britain in 1814, and the majority of the European inhabitants have remained French with ideas not notably advanced since pre-French Revolution days. They both depended on slave labour until the Emancipation ; Mauritius then introduced indentured Indians. Today they have a common legacy of conflict between the descendants of white landowners and black slaves (complicated by the energetic Indians of Mauritius) and a further clash of ideas and customs between French settlers long removed from Europe, and modern British administrators. Epidemics, cyclones, bad sanitary and moral habits have induced the most wretched social conditions, and the islands, until recently, have been too poor to pay for a decent education or hospital system, or anything like reasonable housing.

Fortunately, since the war a new era of prosperity has come to these territories, more through good luck than good management. Mauritius is almost entirely dependent on sugar which earns 97 per cent of the value of its exports ; out of 190,000 acres of land under cultivation, 163,000 are under sugar, and all but 48,000 of these are in the hands of big estates. Attempts to produce foodstuffs have not been successful, and milk and meat are scarce and expensive. Copra accounts for 80 per cent of the Seychelles' exports ; cinnamon leaf oil is also exported, but the people again depend largely on imported food. This is a dangerous position and much thought has been given to growing more foodstuffs and developing certain local industries, but its results are not yet impressive.

In the meantime both sugar and copra are booming in price, with markets guaranteed by Britain, and trade and revenue figures are hitting new high levels. Mauritius's imports and exports together increased from £6,750,000 in 1945 to £24,000,000 in 1949 ; its revenue has multiplied threefold since before the war ; so also has that of the Seychelles. In addition Mauritius is receiving an allocation of about £2,000,000 from Colonial Development and Welfare funds for its 10-year development plan, and the Seychelles about £250,800.

With these new resources, education and health schemes are progressing, and a first onslaught is being made on the deplorable housing conditions. Mauritius has done extremely well in eliminating malaria: hospital admissions for malaria were 1,576 in 1948 and only 196 in 1950 ; school meals are now given to combat malnutrition. Town planners have been at work ; sewage and water supplies are being overhauled. The education programme is ambitious, yet the first Government Secondary School for girls was due to open only in

1951, and there are no technical schools at all in Mauritius. Income tax was only due to be introduced in 1951. In the Seychelles a piped water supply is being installed, for the first time, in the capital.

In the meantime, the traditional pattern of constitutional advance is being followed. Mauritius had its first general election under a new constitution in 1948. Under this constitution a Legislative Council with an elected majority was created ; there is also an unofficial majority on the Executive Council, though the Ministerial system has not yet been initiated. The Seychelles are more backward—the elective principle was introduced only in 1948. There is a more restricted electoral roll than in Mauritius ; there is no elected majority on the Legislative Council, and no elected member has yet been appointed to the Executive. Mauritius has also done well in encouraging trade unions and co-operatives, which are still rudimentary in the Seychelles.

All this—on paper—is perhaps as good as might have been hoped for. In practice these isolated islands, ingrown in population and ideas, are toughly resistant to any real advance. White plantation owners fiercely resent the rising tide of coloured political power, jib against taxation, and are not too friendly to organised labour. The Legislative Councils work inefficiently, and politics are riddled with intrigue. Mauritius has been the scene of many labour disturbances over the years, and the new trade unions tend to be irresponsible and a prey to demagogy. Whitehall is half a world away, and hesitates to intervene in a tricky local situation ; Westminster receives too little information to speak with confidence. The policy is to help as far as one can, to build up local responsibility, and to hope for the best.

It is, indeed, difficult to suggest any other policy, but it might well be asked if the present approach is applied with sufficient imagination. New constitutions which give so much in the way of representation, yet fail to introduce a Ministerial system, putting responsibility squarely on the shoulders of elected representatives, have scarcely ever—if ever—been successful, and Mauritius is suffering through being just a halfway house. Economic planning has had a most confused history, again with no clear responsibility attaching to any one person or committee, and with no really purposeful plan round which enthusiasm could be focussed. Trade unions have been encouraged, but then allowed to run wild.

Local government, until recently, has been woefully neglected. Good intentions abound, but to put them forcefully into effect requires a political and administrative system which neither of these islands has yet attained.

(To be continued)

Feuds of Czech Communists

[FROM OUR VIENNA CORRESPONDENT]

IT is at last possible to get a fairly comprehensive picture of the purge which began in Czechoslovakia with the spectacular arrests last winter of such prominent Communists as Marie Svermova, widow of Jan Sverma, a Communist wartime "martyr," and herself a deputy Secretary General of the party, Otto Sling, Secretary of the Brno Communist party and Dr Vlado Clementis, who had "resigned" from the post of Foreign Minister in March, 1950. These three were followed into jail or disgrace by the deputy Minister for Defence, General Reicin ; a number of other high officers of the Army ; General Pavel, head of the Security Police ; Milan Reiman, the head of the Prime Minister's Office ; Artur London, and Vavro Hajdu, leading officials of the Foreign Office ; André Simon and Karel Winter, two leading columnists of *Rude Pravo ;* the editors of *Prace* and *Mlada Frônta ;* the Ambassadors in London, Paris and Washington and many others.

Drastic measures were also taken in the country districts. Twelve chairmen and at least five secretaries of the Communist party organisations in Czechoslovakia's 19 counties have already been purged. Nor was the purge by any means confined to the Upper Ten. It would probably not be too wide off the mark to assume that of the pre-revolution members of the party, two out of every three have been either reduced to the rank of "candidate" or ignominiously expelled. Some of those who have gone fell by the wayside in previous "verifications." But the last—or rather, the latest—verification has been much the most severe so far. Its extent in fact suggests that it was touch and go as to who should purge whom.

The shadow of the scourge to come began to show itself publicly when the Cominform journal published its now famous attack on *Rude Pravo* last December. The Cominform's charges included not simply negative sins like insufficient or misplaced enthusiasm, but also the far more serious one of publishing theoretical inexactitudes. *Rude Pravo,* besides being the official party newspaper, was known to represent the views of the leaders of the party, including President Gottwald. Criticism of *Rude Pravo* in such circumstances was, therefore, tantamount to calling the President himself to order. However, reluctantly, he at once obeyed the whistle from Moscow, even though this involved throwing over a policy which he had at least winked at and friends whom he had at least not tried to restrain.

At the time of their arrest, Dr Clementis and the other so-called ringleaders were as usual accused of being imperialist spies. Dr Clementis himself was said to have been in French pay since before the end of the war—a charge which anyone who knew his relations with the French during the war can only regard as absurd. The charge of spying simply proves that the Government did not care, or dare, to admit that there was a serious split within the Communist party itself and still less that if there had been a free vote among the rank and file the dissentients would almost certainly have had a majority. Indeed, there is plenty of circumstantial evidence that the government itself, and the party bosses, halted for a time between the two opinions.

The exact nature of the differences between the two groups has naturally not been disclosed. It is clear, however, that though there was not actually a Moscow and an anti-Moscow section in the party, there was at least strong support for the view that Russian methods were unsuitable for Czechoslovakia in both agriculture and industry. Many—probably most—perfectly good Czech Communists thought that practical politics made it necessary to go slow on Marxist theory in order to keep up production both in the fields and in the factories. They held that both in agriculture and in industry, the Czechs were more advanced than the Russians and that it would be going backwards rather than forwards to adopt measures and systems which were abhorrent to Czech common sense and experience. Many of them went further and failed to see why, as the popular Czech riddle aptly puts it, their cows should be the longest in the world because they are fed in Czechoslovakia and milked in Moscow. These views were common knowledge, and appear to have been seriously debated in the party, especially in the provincial branches, during most of 1950. They only became heretical when the Cominform intervened and forced the Government's hand.

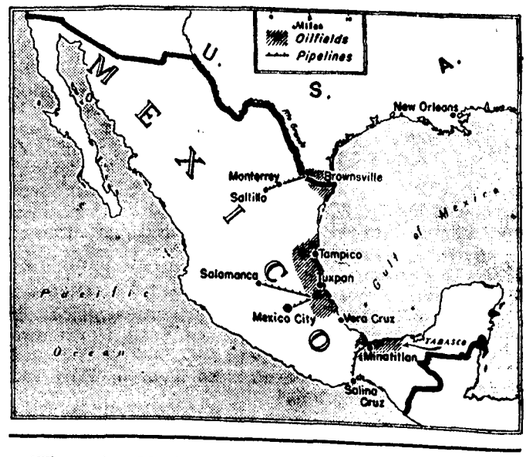
wald finally decided not to be a Tito, the party has been trying to round up and extirpate the heretics. Some 800,000 former party members have been expelled. Nevertheless, the present membership of the party is believed to be about 2,000,000 and the hierarchy has sent out an S.O.S. for more recruits. It certainly needs all the stooges it can get. But whether the newcomers will have the necessary drive and capacity for leadership that Premier Zapotocky says he wants is another question.

Slovakia's Wings Clipped

What has been said hitherto concerns the Czech-speaking provinces. The purge that has been going on in Slovakia is on a rather different basis. Its nature is well illustrated by the fact that there is a Slovak Communist party as well as a Czechoslovak one. The former is considered in Prague to be an anachronism and redundant. This, of course, is a view which the Slovak Communists by no means share. The Slovak Communist party is scarcely less anti-Czech than the war-time Hlinka Guard. The Czechoslovak Communist party is naturally dominated by the more numerous Czechs, and all Slovaks, Communists and otherwise, like far less to be in that position than even the most rabid Englishman disliked being under Eisenhower. Indeed, during the war, Drs Husak and Smidke, two of the leading Slovak Communists (and personal friends of Dr Clementis), urged Moscow on behalf of their party to admit Slovakia to the Soviet Union simply because they wanted to be rid of the Czechs. Their request was turned down but not before it had been duly noted in Prague.

Until the 1948 *Coup*, the existence of a separate Slovak Communist party enabled the Communists to get more than their rightful share of posts in the Czech government. After the *Coup* it helped Slovakia to slow down the tempo of the policies of collectivisation, industrialisation and subjection of the Church. Moves to clip Slovakia's wings were accordingly begun nearly 18 months ago and, by May, 1950, nearly all the prominent Slovak Communists had been ousted from their posts on the Slovak Board of Trustees. At first, they were simply ousted. Later, when the widely held Sling-Svermova creed was adjudged heretical in the Czech provinces, it was considered expedient to lump the two sets of "deviators" together and charge them all with espionage and treason. Dr Clementis seems to have been warned in advance and there is reason to believe that he was caught at Brno while trying to get out of the country.

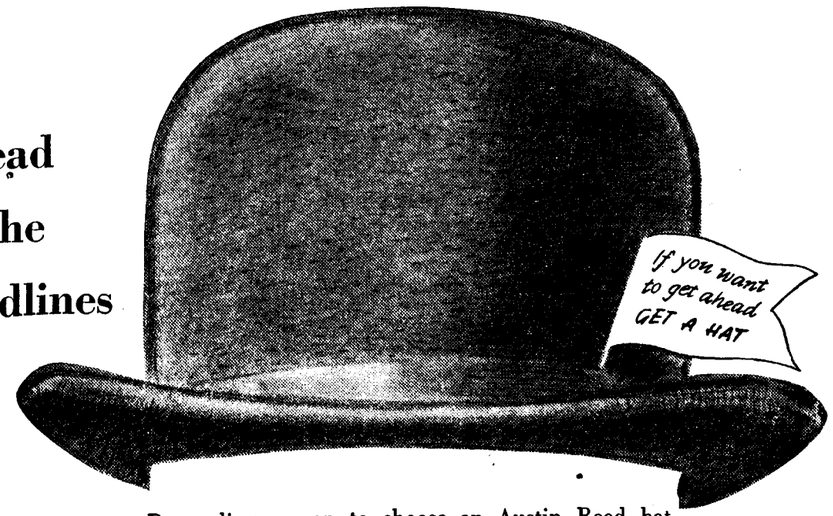


At the time of their arrest it was at least semi-officially stated that the ringleaders of both groups would have to face a public trial. Latterly, this idea seems to have receded. It may still be revived. But the heretics have a very strong following in the country. Publicity, therefore, may be considered inexpedient as it was in the case of Archbishop Beran, especially as there is not the slightest doubt that many Communist leaders who are still members of the government and hierarchy knew perfectly well throughout what was going on and only left the fence when the wind got strong enough to blow them off.

Mexican Petroleum Since Expropriation

[BY A CORRESPONDENT]

IN March, 1938, the Mexican Government expropriated the rich petroleum fields which had been discovered there by foreign geologists and developed with foreign capital. Only the enthusiasm and hard work of a team of Mexican technicians, who had been trained by the foreign companies in Mexico and abroad, averted a breakdown in production after the experienced British and American companies had been expropriated. Today, after thirteen years of effort, the Mexicans admit that their company, Pemex, which was set up by the Government to take over the assets of the foreign companies, is severely handicapped by lack of highly skilled staff. Production since expropriation has been maintained primarily by concentration on the large Poza Rica field which was discovered and developed by the Mexican Eagle Company in the years just before expropriation. Pemex even now is not administered as economically or as efficiently as were the former foreign companies.



Mexican production figures are interesting. From a peak of 193 million barrels of crude oil in 1921 production fell to 38 million barrels in the year of expropriation, 1938. But production had previously dropped as low as 32 million barrels in 1932. The steep decline between 1922 and 1932 was due to some extent to the unexpected presence of salt water in wells. But the main reason for the drop in production was persistent political interference. The Mexican Government appeared deliberately to attempt to throttle the oil companies by restrictive legislation, by heavy taxation and by giving the trade union leaders unrestricted liberty and support in a series of strikes which brought operations almost to a standstill. Under such conditions it was virtually impossible to convince the Mexican people of the benefits the oil companies were bringing to their employees or to the country.

When the Mexican Government took over the properties of the foreign companies and expelled foreign workers it was immediately faced with a series of crises. With a fall in the value of the peso and the rising cost of living the oil field employees were much worse off than they had been under the companies. This gave rise to labour troubles during the early years of the war, when there was a constant threat of a general strike and sabotage occurred in the fields. Pemex publishes no detailed accounts, but it is understood that it has contributed little to the Mexican Exchequer. The then director admitted losing £5,000,000 in 1939 because of unfavourable sales in the United States and the closure of European markets.

During the period immediately after expropriation Mexico was unable to find markets for its oil, despite its proximity to the United States. World stocks at the time were high and fed competitively by American, Venezuelan, Persian and Rumanian oils. Moreover Pemex had great difficulty in its attempts to charter oil tankers because four-fifths of these were owned by the petroleum companies and the remaining fifth were not easy to charter. Fortunately for Pemex these two major problems were solved when Germany invaded Poland in 1939. Since that time Mexico has been able to sell all the oil Pemex could produce. In 1950 it exported crude fuel oil, petrol or gas-oil to eleven countries.

Ahead of the headlines

Persuading a man to choose an Austin Reed hat is all part of the Austin Reed advertising, but persuading young men to wear hats instead of going bareheaded is a matter of vital concern to the Hat Industry as a whole.

The aims of collective publicity differ widely from one industry to another and so do the methods of presenting them. We conduct a number of these campaigns and can speak with knowledge of the strategy to be employed and the advantages that can accrue.

Such campaigns heighten public awareness of the goods or services they promote. They add point and emphasis to the advertising of individual firms in the same field. They stimulate whole industries. By making popular contact through varied channels of publicity, they keep industry ahead of the headlines and provide it with a public platform from which its best interests can be maintained and fostered, in good times or bad.

In these days when new influences, new trends in public taste and usage, are creating new and tougher problems for industry, the possibilities of a collective campaign should be fully investigated. Those interested are invited to discuss the matter with us at no cost to themselves.

TOPICAL TEAPOT TEASER

If you wrapped an imaginary teapot in a hypothetical overcoat of symbolical marbles, would it keep the suppositional tea warm! *NO!* Well, if it wasn't a teapot at all, but a hot-water tank, and the marbles weren't *round* any longer . . . would that do the trick? *YES!* How so? BECAUSE THE VERY BEST INSULATING MATERIAL IN THE WORLD CONSISTS OF PRECISELY THAT— MILLIONS OF FINE GLASS FILAMENTS SPUN FROM GLASS MARBLES.

It keeps heat and cold and noise and electricity in their places. Architects, builders and engineers employ it. It's called:—

FIBREGLASS
TRADE MARK

FIBREGLASS LIMITED,
Ravenhead, St. Helens, Lancs. St. Helens 4224

Whilst production declined in Mexico, it was rising at a most sensational rate in Venezuela, where between 1927 and 1949 output has increased by 720 per cent. In 1921 Mexico supplied one-quarter of the world's oil and in 1937 it supplied only one-fortieth. In the three years after expropriation production was (in thousands of barrels):

1937	46,907
1938	38,506
1939	42,898
1940	44,036

A comparison of petroleum production over two decades gives the following figures:—

•1927	64,121
1937	46,907
•1949	60,736

Mexicans suggest with pride that their production figures since expropriation are satisfactory. They claim that production would be far higher if the disgruntled foreign companies had undertaken more exploratory drilling between 1930 and 1938. Pemex also believes that the foreign companies left the country with full knowledge of the exact location of further large petroleum deposits.

As a result of poor administration and too few high-grade technicians the refineries and other equipment quickly deteriorated; at the same time foreign sales were too low for replacement machinery to be bought and transport renewed. In 1948 Mexico was unsuccessful in raising foreign capital for the purpose of oil field developments, although it did obtain a loan of $150 million from the Export-Import Bank for development projects other than petroleum.

Pemex has succeeded in making trading contracts with various American contractors to undertake further drilling. Their terms do not appear to be attractive as the American contractors assume all hazards and agree to receive no compensation for dry holes. But if they strike oil they hand over operations to Pemex which pays—out of production proceeds—the contractors' expenses plus what in effect amounts to a royalty for 25 years. So far the foreign contractors have not been lucky, though intensive exploratory work continues, encouraged by a recent important discovery in the state of Tabasco which appears to have promising initial prospects. If this discovery is proven it will do something to compensate for the long years of overproduction on the Poza Rica field and will be of invaluable help in maintaining production at its present level.

Pemex has suffered from operating in a country where high mountain ranges, lack of surfaced roads and an obsolete railway system make internal distribution difficult. In order to supply the domestic market on the Pacific coast areas and in some northern districts petroleum is imported from the United States. The directors of Pemex hoped to reduce imports very considerably when the proposed pipe line across the isthmus is completed. Mexican experts have accomplished far more than the world expected of them but the industry still lags badly behind that of all the Middle Eastern countries and Venezuela. Until present legislation is modified to enable petroleum companies with wide experience and adequate "risk-funds" to work there, the future of the petroleum industry in Mexico must remain essentially problematical. There are lessons here for Persia.

Indian Income Tax

[BY A CORRESPONDENT]

WHEN taxation is unavoidably high, as in India today, it is important that reasonable tax payers should be convinced that it is based on fair and sound principles. It is unlikely that the recent Bill to amend the Indian Income Tax Act will produce this conviction, for in a number of important respects the proper desire of the Indian Finance Minister to deal with tax dodgers has led him to introduce clauses which in their present form will hamper legitimate business activity.

The first objection to the Bill is that legislation which involves new charges to tax and extends existing liabilities should not have retrospective effect. There may indeed be exceptional cases where a notorious piece of tax dodging justifies such back dating but, in general, business becomes impossible if individuals incur penalties for actions which when taken were perfectly innocent.

A second ground of criticism of the Bill concerns its definition and treatment of private companies. It is notorious that, in India, such companies have often been devices for the evasion of taxation and it is therefore right that they should be strictly defined and rigidly controlled. It is not right, however, to apply to *bona fide* business concerns a blanket provision compelling distribution of 60 per cent of the profits. Under the difficult financial conditions now prevailing the building up of adequate reserves is of vital importance; moreover, the distribution of excessive dividends must be inflationary in its effect. It would be better if the relevant clause were confined in its operation to what may be described as "phoney" private companies. This was no doubt the intention of the Finance Minister, but as the clause is at present drafted it will hit a *bona fide* subsidiary of a British company. This objection is not academic but is based on the fact that a considerable number of the most important jute, tea and coal companies of Bengal will be compelled by this clause to pay dividends far higher than can be justified by their economic position. Except where tax dodging devices are being utilised, the wise policy would surely be to minimise rather than maximise dividends and it seems strange that the Indian Finance Minister should appear to try in this section to undo the effect of his anti-inflationary policy.

Having it Both Ways

A further criticism of the Bill is that its definition of income actually arising in India is far too wide. As the Bill now stands, a foreign company selling goods directly in India will be liable to Indian tax, not only on the merchanting profit—which would be in accord with general international practice—but also on the whole profit of the sale of the goods, just as though their manufacture and sale had both taken place in India. It seems quite clear that here India is trying to have it both ways. There are two policies which could reasonably be followed. The first would be to follow some logical principle, rather along the lines of Section 42 of the Indian Income Tax Act, of deciding what proportion of the profits of a business operation is reasonably attributable to that part of the operations carried out in India. Another satisfactory alternative in all these international transactions would be to regard the profit as arising in the place of sale only. In its present forms the clause will strike most British business people as being unfair and will not encourage them to specialise in exports to India.

Linked with this criticism is the objection which must arise to a sub-paragraph of Clause 3 of the Bill. Under this sub-paragraph if a British bank or individual, having no connection whatsoever with India, lends money to a sterling company for use in India, the lender will be liable to tax in India on the interest to his loan. Many companies today though perfectly solvent, are finding the problem of liquid finance difficult and a provision of this nature, which must discourage banks and others from lending to companies operating in India will do great disservice to the development of Indian industry. If India were in a state of boom and if foreign capitalists were vying with each other in their endeavours to develop new industry in India, the Government of India could perhaps afford to adopt a high tone with regard to these overseas loans. Under present conditions, however, India is not a very attractive country to foreign capital and its government might find that a more conciliatory policy would be worth while.

THE BUSINESS WORLD

Return to Deficit

THE United Kingdom's balance of payments seems to be going from bad to worse. The overseas trade figures for June reveal an ominous deterioration. The excess of imports over exports reached the all-time record of £151.2 million, compared with £96.8 million in May and £70.3 million in April. The increase in the deficit compared with the two previous months is partly explained by the fact that exports in April were swollen by shipments that had been held up by shipping difficulties earlier in the year, while the export total in May was inflated by abnormally heavy exports of ships. Although these factors may explain last month's deterioration, they do not suggest that the June figures were themselves abnormally and adversely distorted. If these figures provide any indication of what is to come in the second half of the year, a new balance of payments crisis would seem to be well under way.

There are, of course, some mitigating factors. In the first place, the terms of trade must surely soon begin to turn in Britain's favour. Despite the fall in raw material prices, the import price index has so far steadily gone on rising; it was 25 per cent above the average 1950 level in February and 42 per cent above it in May. It may have been on the basis of the latter figure that Lord Pakenham estimated this week that Britain's imports in the next twelve months might cost £950 million more than in 1950 on account of price increases alone. But even though the fall in many raw material prices seems to be taking a long time to work its way through to a fall in British import prices, it seems reasonable to suppose that these prices will now tend to flatten out, relatively to the upward adjustment of British export prices to meet the preceding rise in the cost of imported raw materials; the export price index had risen from only 9 per cent above the average 1950 level in February to 18 per cent above it in May. In the second place, it will be disappointing if the volume of exports does not rise relatively to the volume of imports in the second half of this year. Between January and May, the volume of imports was 9 per cent above the average 1950 level and the volume of exports was only 4 per cent above it. This disturbing outturn may have been partly due to the pre-emption of potential exports and the increased demand for imports generated by the 5 per cent rise in domestic consumption to which Mr Gaitskell alluded a fortnight ago. Britain seems to have been experiencing a boom in "anticipatory" buying by consumers at the very moment when consumers in other countries, who stepped up their purchases immediately after war started in Korea, are going slow. Britain's balance of payments deficit now is thus, to some extent, the counterpart of its exceptional balance of payments surplus last autumn. The Government is now sounding the bell for a new export drive, which will involve setting new targets for exports of textiles and other consumer goods. This drive may have real difficulty in forcing its way through consumer resistance abroad—sales of domestic consumer goods in the United States and some Continental countries are still surprisingly low—but it may possibly tend to meet progressively less competition from consumer pre-emption at home.

Whatever the prospects for the second half of the year, however, the trend shown by the figures for the first half remains disquieting. The excess of imports over exports in this period amounted to £554.7 million, compared with £219.7 million in the first half of 1950 and only £347.9 million in the whole of last year. If the c.i.f. import total shown in the trade returns is adjusted to an f.o.b. basis by the customary deduction of 11 per cent (representing insurance and freight almost exclusively paid to British companies) the visible trade gap for the first half of the year can be estimated at just over £350 million. If invisible earnings in the first half of the year were equal to those that accrued in the second half of 1950 (£219 million), this would leave an overall deficit of £131 million for the first half of this year—that is, an annual rate of deficit of rather over £260 million, compared with a favourable balance of £229 million in 1950.

The performance of the past six months may not, however, have in fact been quite so depressing as this arithmetic might suggest. Invisible receipts will have gained the full benefit of high profit remittances from overseas commodity producers, and of a still expanding overseas trade in sterling oil. Even so, it now seems that Mr Gaitskell's recent estimate that "there was little doubt that the overall balance of payments would show a deficit for the first half of 1951 when imports for stockpiling were taken into account" was probably an understatement. Moreover, even if there is some slow relief—as compared with the present position—in the second half of the year, it must be remembered that that recovery will have to begin from the very low ebb revealed in the June figures. In addition an allowance will have to be made for the as yet incalculable effects on invisible receipts of the Anglo-Iranian oil stoppage. Taking these factors into consideration, there seems to be no doubt that the Economic Survey estimates of the balance of payments for 1951 will prove to have been much too optimistic.

*

It is not only the "overall" balance of payments that has deteriorated: a steady contraction is proceeding in the surplus on the sterling area's dollar account. In the second quarter of this year, as reported in *The Economist* of July 7th, this surplus amounted to $54 million compared with $360 million in the previous quarter and $398 million in the fourth quarter of 1950. This week news has come of the result of the European Payments Union "compensations" for June. These not only add to the depressing testimony of the gold and dollar figures for the second quarter; they also suggest that the position has been progressively and seriously deteriorating. In April this year the United Kingdom still succeeded in achieving a surplus of $52 million in its payments with other EPU members. In May, this was converted into a deficit of $27.2 million, and in June the deficit grew to $51.8 million.

Although the United Kingdom appears in the EPU returns as the member incurring this deficit, the transaction that have led to it are in fact those between EPU countries and the whole sterling area. One reason for the sudden emergence of the United Kingdom as a debtor in the EPU compensations lies in reduced sales of sterling area commodities to Europe; these reduced sales are partly due to lower prices and are partly a seasonal phenomenon. But the United Kingdom's relapse to debtor status also reflects the emergence of Germany as a creditor in intra-European trade. Germany's recent performance within EPU has shown a remarkable response to the measures introduced earlier this year to arrest its seemingly chronic deficit. Germany has been a creditor in each of the monthly EPU compensations since March and it has already been able to repay the whole of the exceptional credit of $120 million put at its disposal by EPU; it has also recovered some of the gold lost to the Union as a result of the substantial deficits incurred in the second half of 1950 and the first two months of 1951. Germany is becoming an increasingly active competitor in a number of Continental markets and succeeded some time ago in ousting British car manufacturers from first place in such export markets as Switzerland.

As a result of the $51.8 million deficit incurred with other EPU countries in June, Britain has had to repay $25.9 million of gold and has had another $25.9 million deducted from its credit balance with EPU. The loss of gold, though incurred in respect of June transactions, did not become effective until July and was not, therefore, reflected in the gold and dollar figures for June 30th; it is a loss that will be accounted in the current quarter and will affect the total to be announced early in October. On balance, the United Kingdom is still a substantial creditor with EPU, which began its operations on July 1, 1950. Twelve months' payments have now been cleared through this machinery. In this period the United Kingdom, acting for its own account and as banker for the sterling area, accumulated a net surplus equivalent to $604.1 million with other EPU countries. Of this, the equivalent of $150 million was set off against the "initial debit position" with which the United Kingdom was saddled at the outset. A further $85.7 million was financed by the debtor countries by drafts on their existing sterling balances. Of the remainder, $292 million was accumulated as a credit balance with EPU and, in accordance with EPU rules, the residual of about $80 million has been paid to Britain in gold. On balance, therefore, the United Kingdom remains a substantial beneficiary from the first year of operation of EPU though, at the rate at which deficits are now being incurred, the gold derived from that source is fast flowing back to the Union.

*

In spite of the recent evidence of the deterioration in the gold and dollar balance of the whole sterling area, the gathering difficulties of the United Kingdom on its balance of payments constitute a sterling rather than a dollar problem. When the White Paper on the balance of payments for the first half of 1951 is published, it seems certain to reveal a growth in Britain's sterling liabilities—mainly to the rest of the sterling area—considerably in excess of the concurrent increase in gold and dollar reserves. The banker of the sterling area has again been failing in his job of striking even a bare balance between the growth of his assets and that of his liabilities. This is another way of saying that for the first half of the year the United Kingdom will have run a substantial "overall" deficit, though—unlike the experience of previous periods of heavy deficit in the postwar years—the critical problem will be that of Britain's payments *vis-à-vis* the overseas sterling area and not those *vis-à-vis* the dollar area.

There need be no balance of payments crisis on this score—provided that the overseas sterling area countries are willing to play the sterling area game and to allow their sterling balances to go on mounting. No fear need be entertained that they will fail in this respect in the near future. Many of the largest accumulators are colonial territories whose policy in this matter is determined in London. Others, such as the Australasian dominions, can be relied upon not to rock the boat unduly, though it should be added that, ever since Australia became a net dollar earner, it has shown increasing signs of appetite for dollar goods and for some widening in the mesh of "essentiality" through which import licensing for such goods must pass. It would, however, be dangerous in the extreme for Britain to continue living in this way on banking traditions and on goodwill built up in past decades. To do so will provide a sure way of undermining the strength and cohesion of the sterling area system. For this reason the dangers inherent in

present trends in the balance of payments are perhaps greater than those in periods when the dollar gap yawned wider. In these earlier crises immediate remedial action was called for; and through such desperate means or expedients as import cuts, the suspension of convertibility and devaluation—buttressed by a moderate exercise in disinflation — the call was answered. On this occasion there is still a chance to postpone the harsh decisions. The momentum of past habits will still make it possible for the welfare state and cosseted economy of Britain to be maintained on the backs of other, and in many cases poorer, countries. The damage that will be done if the period of grace is so used will, however, be just as great as that which would have been caused by inaction when the gold and dollar reserve was ebbing away in the bleak summers of 1947 and 1949.

Oil in Emergency

IN normal times, no industry is more adept in meeting the infinitely variable needs of consumers throughout the world than the oil industry. Planning, as that word is ordinarily understood in this country, does not come naturally to it. But the Persian crisis has forced upon the industry an exercise in co-operative action that holds out the one chance of mitigating its worst effects.

The effects of the cutting off of Persian oil have been measured. It is believed that a plan of action has been proposed by the American oil companies and submitted to the Petroleum Administration for Defence for approval by the appropriate American authorities, including the Department of Justice.

Nothing is more calculated to frighten the American oil industry in normal circumstances than the mere suggestion of co-operative action. Its sensitiveness is natural, for it has suffered more than most from the penalties of American anti-trust legislation. Even when war itself demanded the pooling of supplies and transport and the arbitrary division of markets, the industry was always conscious that the Department of Justice was looking over its shoulder. It is able to approach the Department in the present circumstances of cold war only by virtue of the Defence Production Act of last year; its recommendations are intended to mitigate the shortages of oil supplies to friendly foreign nations whose defence measures would otherwise be jeopardised. The Foreign Petroleum Supply Committee, which consists of representatives of the American oil companies engaged in operations overseas, is appointed by the Petroleum Administrator for Defence and assists him by making recommendations; it is the first plan of the FPSC, to meet the stoppage of Persian supplies, that is now under consideration in Washington.

The details of the plan have not been disclosed, but its broad drift can be gauged from the problems that it has to meet. It is no secret that the plan owes much to a study of the oil situation carried out by the British Overseas Petroleum Supply Committee which comprises representatives from the Shell, Anglo-Iranian and Trinidad Leaseholds companies. This committee, formed at the request of the British Government, and free of the inhibitions to informal discussions that affected American companies, had a correspondingly good start in measuring the effects of the Persian oil crisis on consumers in Europe, the Indian Ocean and the Far East. The fact that its work was of immediate service to the American FPSC does not mean that a "British" plan has been under discussion in Washington or that "British" demands are being made on the American oil industry or American oil consumers. It reflects the fact, rather, that problems of petroleum supplies are of world-wide importance, and that their successful solution can best come about from the widest area of discussion and agreement.

*

The loss of Persian oil has produced a critical situation, but it is a crisis which varies in intensity in different products and different markets. As an article in *The Economist* of May 26th showed, the loss of Persian crude oil is of less moment than the loss of refined products from Abadan. According to American reports of the British presentation of the facts to the FPSC, the western world has lost about 150,000 barrels a day of crude oil as a result of the cessation of exports from Persia, but the loss of refined products, ranging from aviation gasoline to heavy fuel oil, amounts to the equivalent of no less than 485,000 barrels of crude a day. (The barrel equals 35 Imperial gallons or 42 American gallons, and about 7½ barrels of Persian crude weigh a ton.) The whole of the Persian crude oil shipped as such could be made good from Kuwait and Saudi Arabia, apart, perhaps, from 20,000 barrels a day. It is thought that spare refining capacity controlled by British oil companies in Europe is of the order of 115,000 barrels a day, for which further supplies of crude would be needed. All told, about 135,000 barrels of crude have to be found—and more as further refinery capacity can be found from new plants or by running existing plants more intensively. The provision of this extra crude oil can, it seems, best be found by retaining in the Eastern Hemisphere shipments from the Persian Gulf and other Middle East sources which in normal times move to the United States and Canada. These are running at present at nearly 270,000 barrels a day—twice the volume that is needed by Western Europe. The obvious source for replacing this Middle East crude, if it were diverted from the Western Hemisphere to Europe, would be from Texas, where an increase in output is technically easy.

The loss of refined products from Abadan is equal to 485,000 barrels a day in terms of crude, or by an odd symmetry in the figures, 458,000 barrels of refined products. To replace these refined products, perhaps 100,000 to 150,000 barrels a day could be obtained from European refineries; to find the rest would involve a more complicated operation. For example, about 280,000 barrels of refined products are being exported by American companies from the Persian Gulf, of which perhaps half is shipped from Ras Tanura and Bahrein to consumers outside the Indian Ocean area. Unless a fairly high proportion of these products that now go to destinations west of Suez and in the Far East can be retained in the Indian Ocean area, it will be impossible to meet the needs of consumers in this area—and it would seem that both London and Washington attach importance to meeting them as far as possible. It would follow, even so, that some 250,000 barrels of refined products would be needed to close the gap, and there is little prospect of filling it, at least in the short run, except from the United States.

Whether these figures and the diversions that they appear to entail have been adopted in the American oil companies' plan is not known. They are an exercise in what might be done, and not necessarily a forecast of what will be done. But the analysis seems realistic; the American companies have a commercial interest in keeping open their established markets; it happens that stocks of oil products in the United States are at a high level and are still increasing; and the highest interests of western economic co-operation and preparedness in defence are involved. That is not to say that the process of rearranging cargoes will be simple, or that each market will get oil in the quantities and qualities to which it has been accustomed. The most deft rearrangement of crude oil shipments to avoid cross hauls will not get rid of the brute fact that the closing of the Abadan refinery means an extreme shortage of heavy fuel oil, which formed half of its output and is of profound importance for ships' bunkers in Indian and Eastern waters. It will be impossible to replace immediately the output of aviation gasolene hitherto produced by the Abadan refinery at the rate of 18,000 barrels a day, for there is no other source in the Middle East.

Something depends, too, on the outcome of the negotiations for a truce in Korea. The Korean war has involved demands on aviation and heavy fuels that are large enough in absolute terms, but would go only a modest distance in making good the losses from Abadan. In general terms, therefore, the prospect is for a distinctly awkward shortage of certain fuels, but of a bare sufficiency of oil products as a whole provided that American production remains high and therefore capable of filling most, if not the whole, of the remaining deficit after taking into account what the British companies can do for themselves. So far as this country is concerned, it will involve a heavy dollar expenditure, estimated by the Chancellor of the Exchequer at $350 million a year, and it would not be surprising if dollar expenditure had not already been incurred in buying cargoes for near delivery. This dollar expenditure is only part of the cost of the loss of Abadan to the British balance of payments, for the refinery was both a dollar saver and a sterling earner. The present British preoccupation with a new balance of payments problem is thus seriously complicated by the loss of Persian oil. It is bound to lead to a re-examination of all the devices dear to the Treasury mind which depend on the drawing of arbitrary distinctions between dollar and sterling oil.

It is indeed fortunate in these circumstances that such good progress has been made with the major new refineries in this country. The second distillation unit at the new Shell refinery at Stanlow came into operation at the end of last month, trebling the capacity of the plant to 3,000,000 tons, with a catalytic cracker approaching completion. The completion of the project early next year will raise Shell's refinery capacity in this country (including Shell Haven and Heysham) to 8,000,000 tons a year. At Fawley, the first distillation unit of the new Esso refinery is about to come "on stream," only two years after the project was started. Work is well advanced on the other units of the plant, including a "cat cracker" from which further supplies of petrol can be obtained by processing the gas oil produced from the distillation units. The total volume of products will amount to about 6,000,000 tons a year. By the end of next year, when the new refinery at the Isle of Grain is working, Anglo-Iranian's refinery capacity in this country will reach 8.8 million tons. The importance of obtaining crude oil to feed this new refinery capacity is obvious, and fortunately it should present no special difficulty. These plants and others were intended essentially for meeting domestic requirements, and not for supplying export markets on any important scale, but they will make a real contribution towards the solution of present difficulties. The problems of consuming centres in the Indian Ocean and farther east are clearly more critical and will be more difficult to solve. The fact that the world oil industry has been capable of such prodigious expansion in recent years to meet a cumulative increase of 10 per cent annually in demand is an encouragement. It should mean that the present crisis can be solved by ingenuity and resource. The western world is not faced with a disaster in oil, but rather with a temporary spell of difficulty and contrivance.

Business Notes

Abbey Works in Production

The official opening of the hot strip mill at the Abbey Works by the Chancellor of the Exchequer last Tuesday marks a decisive stage—but still only a stage—in the progress of the immense project that the Steel Company of Wales set on foot four years ago. Those who have been privileged to watch the growth of this enterprise from the first surveys of marsh and sand dune to the near-completion of an integrated works extending over 4½ miles have learned something of the problems that have been so skilfully solved by engineers, contractors and workmen on the site. To the lay observer, perhaps, the completion of the hot strip mill is something of an anti-climax as well as an engineering triumph; this plant was intended and now it is running. This impression is perhaps the greatest compliment that could be paid to the engineering skills that have gone into its construction, and to the resource that has given a disarming appearance of simplicity to one of the biggest undertakings in the history of the British steel industry.

The new Abbey Works adjoin and totally dwarf an old steel works at Port Talbot. Every section of the plant is new, or recreated. The iron works has two, and will presently have three, new blast furnaces, together capable of producing 19,000 tons of pig-iron each week. The total capacity of the new open hearth steel furnaces, when completed, will be 29,000 tons a week—a total addition of not much less than 10 per cent to the ingot-producing capacity of the whole British steel industry. The bulk of the ingots will be rolled in the continuous strip mill, which is capable of rolling hot strip to a width of 72 inches—the widest in this country. From the continuous strip mill, the coils will be taken to the finishing plants, of which there are two—a cold reduction mill at the Abbey Works itself, which is nearing completion and from which finished sheet for motor bodies, steel furni-

ture, refrigerators and the like will be produced, and a modern tinplate works at Trostre, about 25 miles from Port Talbot, where the most efficient methods of electrolytic tinning will be in operation. This second plant, too, has yet to be completed, and for the time being hot strip is being rolled at the Abbey Works for shipment to other finishing plants in South Wales.

Within a few months, therefore, the completed project should be showing its paces. It comes into operation at a time of anxiety about raw materials for steel making, but with the clear advantage that no other plant in the country will be able to match its efficiency in converting materials into finished products that are scarcer than any others that the steel industry produces. There are many matters for congratulation in the conception and execution of the project—not least for the architectural distinction of the works and for the contribution of American machinery and knowledge for some vital parts of the plant. It might also be noted that the Steel Company of Wales has kept the promises that appeared in its prospectus in July, 1947. The plant will in fact "be run in and in production within five years" with a margin of many months. The profits estimate of £5,000,000 a year from the new plant when it is in full production and from existing old-style plants is likely to be comfortably assured. And the company is not to be blamed for the fact that its cost has exceeded the original estimate of £60 million for the plant now nearing completion and a third cold reduction plant that was then in mind. If it has kept within 25 per cent of this figure it will have done well in view of the rapid rise in construction costs during the past four years.

Agreeing to Agree

The joint statement that last week recorded a measure of agreement between the Iron and Steel Corporation of Great Britain and the British Iron and Steel Federation upon the control of the industry's common services said, with grim correctitude and clumsy phraseology, about as little as can easily be conveyed in two hundred and fifty words. This is in the nature of joint statements after protracted and bitter negotiation, but it leaves the public entirely in the dark about the real extent of co-operation between private and state steel set down in the unpublished memorandum agreed upon by the two bodies.

The fact, however unexplained, is welcome. So is the retention—"pending the setting up of the long-term organisation"—of the industry's common services without division or duplication, in particular of the British Iron and Steel Corporation, Ltd., and its subsidiaries, which handle the import of ore, scrap and semi-finished steel for the whole industry. Mr Hardie's share of control of these services will probably be formally limited to representation upon the committees that control them, and the presence of certain of his officers within their organisation. His point that he is ultimately responsible for the provision of these services to the publicly-owned majority of the steel producers has been conceded, and it will presumably give his views due weight in such councils. But the anxiety of Sir Andrew Duncan and Sir Ellis Hunter that in this interim period while the industry's future is shadowed by political uncertainty no radical change should be made in the organisation that still really manages the industry has also been satisfied. Whether this justifies the hopes, held in those quarters of the industry that favour amicable co-operation between the two bodies, that the statement presages a progressive rapprochement between corporation and federation, is hard to judge. It is perhaps not altogether easy to envisage the powerful personalities involved in any very close comradeship. But something has been achieved in giving the state corporation at least some opportunity to share the responsibilities placed upon it by legislation, without disrupting the steel industry's existing structure: time, and political developments, must be allowed to find the final formula.

Who Uses Steel?

One common service of particular value to the industry is the federation's statistical department—not only for the comprehensive series of data it publishes monthly on current steel activity, but also for the special studies it makes from time to time. An example in the current issue of the federation's statistical bulletin is an assessment of the concentration of steel consumption—a subject of considerable importance in relation to the steel allocation scheme that is expected towards the end of this year.

Probably 150,000 or more firms in Britain, the bulletin estimates, buy steel; but most of them buy very little. Counting about 50,000 establishments of any size in the engineering and shipbuilding industries, about 30,000 concerned with the manufacture of vehicles and aircraft, and perhaps 15,000 that manufacture other metal products, there may be about

SIZE DISTRIBUTION OF UK STEEL CONSUMERS*
(FOURTH QUARTER, 1950)

Consumer Group	Number of Users		Steel Consumption			
			'000 Tons		% of Total	
	Actual	Cumulative	Actual	Cumulative	Actual	Cumulative
Public organisations	7	7	310	310	11	11
Private firms using :—						
Over 2,000 tons.....	179	186	853	1,164	31	42
1,001-2,000 tons	188	374	262	1,426	9	51
501-1,000 tons	304	678	214	1,640	8	59
101- 500 tons	1,304	1,982	298	1,937	11	70
26- 100 tons	1,605	3,587	90	2,027	3	73
Firms using under 26 tons and firms not covered by the analysis	...	150,000†	...	2,770‡	...	100

* Excludes tinplate. † Estimated. ‡ Partly estimated.

100,000 metal processing firms. To these the bulletin adds perhaps half of the 100,000 building and contracting firms as users of some finished steel. But the table shows how heavily, within these totals, consumption is concentrated. Public organisations use 11 per cent of steel (and this under-estimates their importance, since steel for a BEA generator, for example, is counted in the consumption of the plant manufacturer); and 179 private firms use another 31 per cent of total consumption. A modest total of 2,000 firms are responsible for more than 70 per cent of the total use of steel in this country. Since 12 per cent of the total tonnage is sheet steel, which is already controlled, and the work of the building and contracting industries is subject to Government licence, while the Government has direct control over the investment programmes of public enterprises, the Government already possesses a considerable influence over the level of steel consumption in the country. Whether it is exerting this influence properly, in the interim period before steel allocation, is another question.

Record Rise in Bank Advances

Some surprise has been caused this week at the very marked steepening in the rise in bank advances disclosed by the clearing banks' aggregate statement for June 30th last. For some months past, the rise in primary commodity prices and the more general sources of pressure upon industry's working capital have been impelling bank advances rapidly upwards, but the City was scarcely prepared to see them leap by £89 million in the space of six weeks. This is by far the biggest monthly movement ever recorded; it carries the total to £1,882 million, or £238 million above its level at end-1950, and £234 million above the total recorded six months before that. The half-yearly movement also breaks new ground: it compares with an increase of £125 million in the first half of 1950 and one of £70 million in the first half of 1949. On both these occasions, however, the growth

was being restrained by the substantial repayments that were being made out of the proceeds of Electricity and Gas issues.

It should be emphasised that this acceleration of the rise in advances in recent months is not attributable to any change of policy pursued by the banks; on the contrary, they not only appear to be loyally observing the spirit of the official directives but have also been tightening up their own requirements. These qualitative methods of restraint will now tend to be reinforced by the modest rise in interest rates that the banks are now in process of imposing upon their customers; but the momentum behind the pattern of public demand suggests that the whole movement will never be kept within reasonable bounds unless the authorities themselves are prepared to revive the use of orthodox techniques of monetary policy. Meanwhile, there is perhaps some reason to hope that advances totals will rise less sharply in the second half of this year than they did in the first half. In the second half of 1950, it will be recalled, the large repayments made out of the proceeds of new capital issues actually led to a small net decline in outstanding advances. It is too soon to guess whether any comparable boom in capital issues is likely to be experienced this year, but the banking figures for July and August will reflect the repayments of loans out of the proceeds of the recent Gas issue —repayments, however, that will have been substantially financed by increased Governmental borrowings from the banks to finance the "Departments" large participation in the new stock.

The rise in advances, it should be noted, has not involved any corresponding increase in net bank deposits. During the six weeks to end-June, these rose by £72 million, or by £19 million less than in the corresponding period last year, while in the first half of this year they declined by £180 million, compared with a decline of £224 million in the first half of 1950. In other words, during this period in which the external balance of payments has been relapsing into deficit (and in which, therefore, the central Government has been relieved from the strain of providing the sterling required to finance an overall external surplus) repayments of Governmental indebtedness to the banking system have much exceeded the banks' new lendings to industry—including, of course, nationalised industry. It is noteworthy, however, that official policy in these past six months has fallen far short of what would have been needed to redress the credit expansion caused by the heavy Governmental borrowings of the previous six months. Over the whole twelve-month period, net bank deposits have risen by £180 million—though this is fully £100 million short of the simultaneous rise in bank advances and investments combined.

* * *

Peace with Japan

It is not surprising that the draft Treaty of Peace with Japan, which has been circulated to interested countries by the United States, has encouraged a boom in Japanese bonds on the stock markets. Under the draft treaty, Japan affirms its liability for the prewar external debts of the Japanese state and for debts of corporate bodies subsequently declared to be liabilities of the state; it therefore undertakes to negotiate at an early date with its creditors for a resumption of payments on those debts. In view of the comparatively modest size of Japan's external debt and of the rapidity with which Japanese export trade is reviving, there seems to be no reason why resumption of payment should be made at other than the contractual rates. The capacity to meet external debt payments should be enhanced by the Allies' recognition that the imposition of reparations would cripple the Japanese economy. It is true that the draft treaty records "in principle" that Japan should repair damage and suffering caused by it during the war, but it adds that in order to protect the country against undue foreign exchange burdens resulting from such compensation, the Allied powers are to supply raw materials, presumably free of payment, for such reparations work.

Under the commercial policy clauses of the proposed treaty, Japan agrees to enter into stable and friendly trading and maritime relations with all signatories for the first four years of the new state of peace. It will also give most favoured nation treatment to all signatories that grant it reciprocity. Unfortunately, Japan may not receive such reciprocity in the markets of Britain and Colonial territories. This was the unmistakable implication of a statement made by the President of the Board of Trade last week. Sir Hartley Shawcross, after some unexceptionable remarks on the similarity of Japan's economic circumstances with those of the United Kingdom, notably Japan's complete dependence on exports, recalled that "bearing in mind the prewar record of Japanese competition, especially in the textile trade, we have decided not to accord most favoured nation rights to Japan because we feel that we must for the present retain our freedom to protect our economy, if necessary, against abnormal and injurious competition." The President of the Board of Trade went on to hope that as a result of consultation between the industries principally concerned in the two countries "policies and practices may develop which will make it possible for Japan and all other countries participating in world trade, to develop their economic activities on the basis of live-and-let-live." This seems to be a euphemistic way of saying that the Board of Trade, which recently sounded a resounding blast against restrictive practices in the British market, is now openly advocating restrictive practices in world trade. Sir Hartley in effect adjured British industry, and notably the textile industry, to combine with Japanese and other competitors in order to make the export markets of the world, especially those of the Colonial territories, safe for relatively high cost and inefficient producers. That is as good a formula as could be devised for undermining and losing what is left of the Commonwealth.

* * *

Germany's External Debts

The preliminary consultations that were held in London on the question of Germany's external debts ended last Wednesday. The discussions were attended by the Tripartite Commission on German debts that represents the British, United States and French Governments, a delegation of the German Federal Republic and representatives of creditors and debtors, together with observers from other countries with substantial creditor interests. The main purpose of the discussions was exploratory: the culling of full information on the debts involved, discussion of Germany's capacity to bear the weight of an external debt burden and, finally, clarification of the views held by the various parties concerned on the general lines that a solution of this problem should follow. On most of these counts the discussions appear to have been eminently successful. The various classes of creditors certainly learnt a very great deal more about one another's views than they knew before. The German delegation brought considerable new material bearing upon the dimensions of the problem. It was found possible at the end of the consultations to issue and approve a number of written reports setting out the matters on which a large measure of agreement was found to exist. These documents will now be used as basic material for an autumn meeting, also to be held in London, at which it is hoped that a definitive settlement of the German external debt problem can be reached. The head of the German delegation, Herr H. J. Abs, pointed out at the end of the discussion that the German Government will do its best to solve the debt problem "in a manner satisfactory to every side involved and in accordance with our ability."

Courtaulds Re-enter America

Formation of Courtaulds Incorporated, a new wholly owned American subsidiary to produce viscose rayon staple in the United States, is a step of great significance for the British parent company, Courtaulds Ltd. It is just over ten years since the company was forced to surrender its 96 per cent shareholding in American Viscose Corporation to the Treasury, in order to raise dollars to pay for war purchases from America: the hasty transaction raised only £13,611,000 worth of dollars, though after arbitration Courtaulds was awarded £27,125,000 for its shares. Nobody in Britain can look back to that piece of one-sided bargaining with any pleasure. But the re-entry of Courtaulds into the American market is eminently satisfying.

Courtaulds Incorporated is to erect a factory—which, according to American reports, will be at Huntsville, Alabama—to produce initially 50 million lb. of viscose rayon staple fibre a year. This may be compared with a total American staple fibre output of 306 million lb. last year, of which about 189 million lb. was viscose fibre, produced by eight American plants. United States consumption of staple fibre has expanded considerably in recent years; last year staple imports reached 91 million lb., six times those in 1949 and more than twice as large as imports in the more prosperous year of 1948. American producers' viscose staple capacity, now about 200 million lb., was recently estimated as likely to rise to 265 million lb. by the end of 1952: the initial rating of Courtaulds' new American plant will thus represent a sizeable share of total capacity.

In his statement with the parent company's accounts at the beginning of July, Sir John Hanbury-Williams referred to the possibility of large sums being invested in new ventures in Britain and overseas. No figure has been quoted for the American investment, though an American estimate puts it at $10 million. On the question of raising additional capital, he added:

> It is not yet possible to assess with any degree of accuracy the requirements or the timing of such an operation, but the burden of providing for the purposes mentioned above entirely out of the company's undistributed profits and other reserves cannot be borne indefinitely.

Sir John mentioned also the share capital reconstruction of the company, which he said might have to be dealt with before, or simultaneously with, the raising of new capital. He is likely to make a further statement concerning the new American venture at the annual meeting next week: this week's announcement may well mean that the date of both impending capital operations may be brought forward.

Freer Dollars for Films?

"Freer" rather than full convertibility into dollars of the sterling earned by exhibition of American films in Britain is the practical aim of the delegation from Hollywood that began discussions in Whitehall this week with representatives of the Board of Trade, the Treasury and the Bank of England. The present Anglo-American agreement on films expires on September 29th, and the American industry's negotiators—whose talks in Britain are among a number of similar negotiations with other European countries showing American films—have the task of working out another to follow it. Earlier this year some circles in Hollywood expressed optimism about obtaining full convertibility of these foreign revenues. Owing to stronger competition at home from television, these revenues are assuming a greater weight in th American industry's accounts. Since that time the change in Britain's dollar prospects has apparently convinced Mr McCarthy, leader of the American delegation, that to press for full convertibility would be a waste of time.

Under the present agreement, the American industry can repatriate $17 million of its earnings, plus up to $4,000,000 on account of its production of films in Britain and its purchases of Western Hemisphere rights of British films. The remainder of its earnings—on the current year's operations, perhaps £14 million—remain frozen within the sterling area, but may be invested in a variety of agreed ways. These include the financing of the companies' large branch organisations in London and other British cities, the purchase of "export prints" of American films processed here, and investment in film production on the Continent; some of the other permitted transactions, in effect, enable the transfer of further earnings out of the sterling area. In the current year, it may be that a comparatively small sum of sterling has in fact remained uninvested. But the American companies, who expect larger revenue next year on the assumption that British films will decline in number, are pressing for an increase in the basic limit above $17 million, and an extension of the uses to which the sterling retained can be put. The British Government may seek to make any increase conditional upon an American undertaking to continue financing production in British studios; though the Hollywood negotiators say this will certainly continue, they are unwilling to be tied to any stated level of investment.

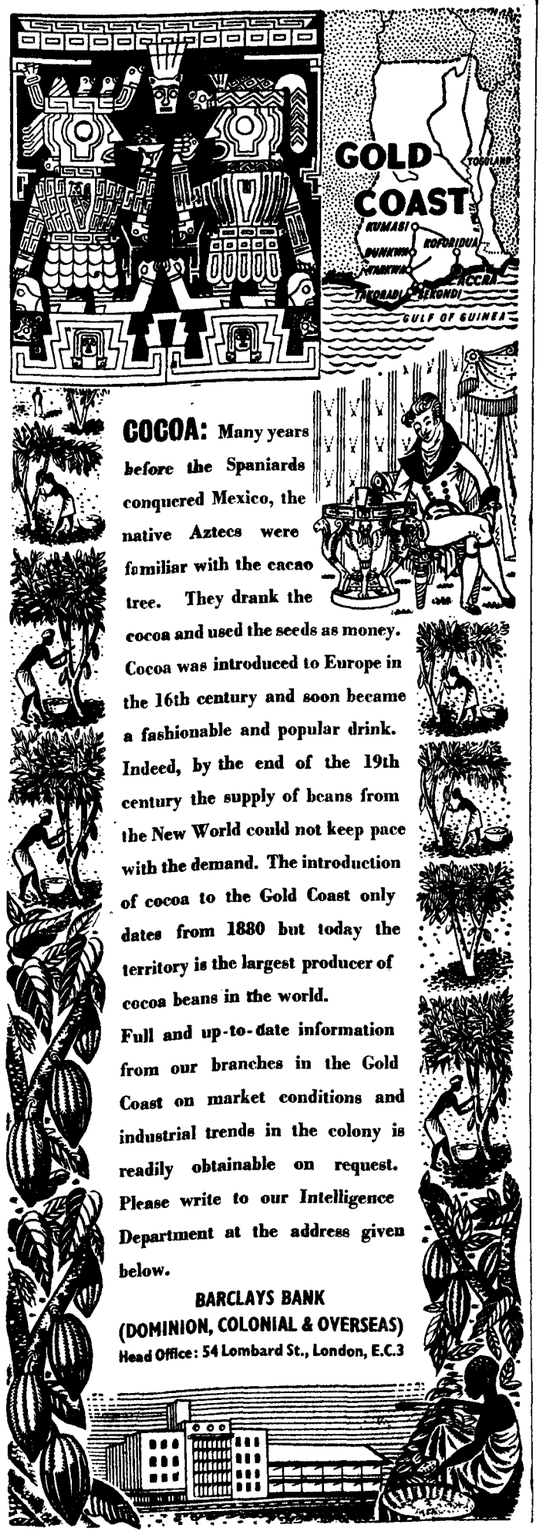
Control of Tungsten



The Ministry of Materials is to become the sole importer and distributor of tungsten ores and concentrates after July 30th. This reimposition of government control of tungsten ores is the natural consequence of the allocation of tungsten ore by the International Materials Conference, which asked member governments both to exercise control of imports and exports of tungsten and to render returns to it. Tungsten is not as easy to control as molybdenum or sulphur, for more than 90 per cent of these commodities comes from the United States. Brazil and Portugal are the largest exporters of tungsten ore at the present time, but together they provide little more than half of world supplies. Spain, Australia, Brazil and a large number of other countries produce the balance. Thus the success of any international allocation of tungsten ore is largely dependent on the full co-operation of producers and consumers with the IMC; it remains to be seen how complete such co-operation will be.

Control in this country is to be exercised through the agency of a few leading firms of merchant importers, who will act according to the Ministry's instructions. It would probably be impossible at the present time to attract experienced men into the civil service as was done during the war in order to exert closer supervision. But apart from that the smaller the interference with the market the easier it should be to return to more normal arrangements if the present strain on supplies should be eased. Meanwhile the market is largely biding time. The price has fallen further during the week to 530s. a unit: buyers are probably holding back until the end of the month to find out what the Ministry's policy on prices will be. The Ministry, however, is unlikely to fix any domestic price since the principal consumer is the partly-nationalised steel industry. The present market price is about equivalent to the maximum price of $65 a short ton (f.o.b.), to which the main exporting countries, except Brazil, have agreed. The 695 metric tons (metal content) of ore that have been allocated to Britain should cover the country's basic needs during the third quarter. The quantity represents about the same rate of imports as during the first five months of the year, though it is about a fifth below the rate of imports of tungsten in 1950.

* * *

Downtrend in Prices

The feature among commodities in the past week was the continued drop in tin, to £848½ per ton, so that it was on

COCOA: Many years before the Spaniards conquered Mexico, the native Aztecs were familiar with the cacao tree. They drank the cocoa and used the seeds as money. Cocoa was introduced to Europe in the 16th century and soon became a fashionable and popular drink. Indeed, by the end of the 19th century the supply of beans from the New World could not keep pace with the demand. The introduction of cocoa to the Gold Coast only dates from 1880 but today the territory is the largest producer of cocoa beans in the world.

Full and up-to-date information from our branches in the Gold Coast on market conditions and industrial trends in the colony is readily obtainable on request. Please write to our Intelligence Department at the address given below.

THE TEST OF TWO CENTURIES

In the two hundred years since Glyn, Mills & Co. became a name in Lombard Street, great changes have shaped the course of history. In those changes this now famous bank has preserved unaltered its tradition of a private Banking House offering the most comprehensive financial facilities.
To-day, as in 1753, Glyn, Mills & Co. provides a banking service to meet the special requirements both of the large public corporation and of the private customer.

Ambassadors at large

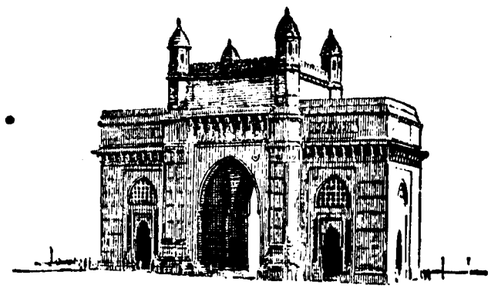
WE MAKE NO CLAIM to shape the destiny of world affairs. What we do like to feel is that we help the world's way of living and working to be more efficient, more productive, altogether much more comfortable. If you walk through the tea plantations of Ceylon, India or British East Africa, or watch irrigation work in Australia, or for that matter travel through any of the extensive areas under cultivation throughout the British Empire then you will see what we mean. You will be seeing products of the Marshall Organisation at work. In 39 different countries you will find Marshall or Fowler equipment — supplying power and heating, rolling out endless ribbons of new road, cultivating new land, beginning vast housing projects — even contributing to your cup of tea!

Each of these products carries and upholds the well-earned reputation of Britain's craftsmen. Each one is an ambassador for Britain whose credentials are respected everywhere.

THE MARSHALL ORGANISATION

MARSHALLS OF GAINSBOROUGH — *Wheel Tractors · Road Rollers · Boilers · Tea Machinery · Threshing Machines · Combine Harvesters*

FOWLERS OF LEEDS — *Diesel Locomotives · Crawler Tractors*



A Clerk in Adelaide goes on Holiday

and it may be important for a British manufacturer to know what goods he buys, both before and during his holiday, and what he usually pays. For it may well be there is an opening in the Australian market for this manufacturer's line of goods. Faced with difficult research points of this nature, the shrewd business man consults the Bank of Australasia, for the information he requires must be accurate and up-to-date. The Bank of Australasia is in constant touch with all aspects of the Australian and New Zealand way of life and commerce. It gladly places this fund of knowledge, together with a complete banking service, at the disposal of all British export houses.

NATIONAL BANK OF INDIA
LIMITED

Head Office : 26 Bishopsgate, London, E.C.2.

Tuesday selling for the equivalent of the American Reconstruction Finance Corporation's price of 106 cents per lb. It recovered on Wednesday to £862½, but on Thursday the price was £857½. Offers of Belgian and Dutch tin are expected soon on the London market following the RFC's notification to Belgian, Dutch and Indonesian producers that, in accordance with the escape clause of its agreements, it will not pay more than 103 cents per lb. The possibility of these new supplies found its reflection in the London price early in the week, and another fall is likely if Belgian and Dutch tin is in fact offered. The question is now being raised whether the RFC will lower its selling price for tin in America to 103 cents, which would logically be its next step. The continued decline in jute had been expected because of the prospects of good Indian and Pakistan crops. The signs of increasing tension again between the two Dominions may, however, affect future supplies. Optimistic American crop estimates also explain the further falls in American cotton. The recovery in rubber on Tuesday proved to be temporary. The price fell to 48d. per lb. at the close on Wednesday ; and on Thursday it was 48½d. The

(a) Price at June 24th. This and following quotations are for new crop.

recovery resulted from a drop in shipments from Malaya because of bad weather conditions and also because of labour difficulties on the estates. Natural rubber supplies in the coming months are likely to be good because estimates of world production in 1951 are decidedly higher than in 1950. World production of natural rubber in May was 152,500 long tons. The Rubber Study Group's estimate for the year is 1,870,000 tons, but private estimates have been higher. A surplus of some 300,000 tons is expected. Synthetic production is also up.

British prices of zinc and soft lead were raised by the Ministry of Materials at the end of last week to conform with higher prices of imported supplies. The standard price of zinc is increased from £160 to £190 per ton and of imported lead from £160 to £180 per ton. Continental prices of zinc and lead have for some time been appreciably higher than British or American controlled prices. There has been some discussion in the United States of the adverse effect on supplies of lead that is resulting from price control ; this has produced a large difference between the controlled domestic price and free market prices. It is possible that some attempt may be made to bring domestic lead and zinc prices into closer accord with world prices.

Dearer Wheat without Agreement?

The Canadian Wheat Board proposed at the end of June to add a 6 cents carrying charge to the price of wheat sold under the International Wheat Agreement during the 1951-52 season. Now the United States Department of Agriculture has followed suit and the Australian Government also intends to add a carrying charge. A similar charge was made under the Anglo-Canadian Wheat Agreement, which lapsed in 1949 upon conclusion of the international agreement, and was imposed by both Australia and Canada during part of the first year of the IWA. The agreement allows this under Article VI: "The basic minimum and maximum prices . . . shall exclude such carrying charges and marketing costs as may be agreed between the buyer and the seller." The Canadian proposal has been noted by the Council of the IWA ; protests have been made by importing countries, but some Canadian wheat with the carrying charge has already been sold.

For the past year wheat farmers in Canada have been chafing at the price they receive for their wheat. American wheat-growers sell their wheat at prices subsidised by the United States Government, but the United States alone pursues this policy. The world price outside the agreement rose as high as $2.58 in February and is now $2.35⅝ ; this is still about 30 per cent above the IWA standard maximum price of $1.80. As a result there has been pressure from producing countries on the International Wheat Council to raise the agreement price ; but at the present time this seems unlikely.

There is a case for the carrying charge apart from any consideration of world prices, if only because under the wheat agreement wheat is shipped more evenly during the year than used to be the case. As a result the cost of storage and of inspection for damage have to be met by the exporters instead of the importers. Further, insurance and loss of interest come into the reckoning. Yet to importing countries it appears like an attempt to obtain a higher price without getting the required agreement of a two-thirds majority, which has to be secured separately by both importers and exporters on the council. The power of the importing countries to oppose the change would depend on world supply and demand. Both the Canadian and the American spring crops promise to be good and free market prices have weakened a little. But it is too soon yet to be sure of what total world supplies will be available during the season ; Canada before now has suffered frost in August and the Kansas floods have affected the crop in that area of the United States.

* * *

Consumers and Coal

The annual report of the Industrial Coal Consumers' Council, published with that of the Domestic Consumers' Council this week, begins by informing the Minister of Fuel and Power that there was a serious coal shortage during last winter, that the National Coal Board has produced a long-term plan for the mines, and that next winter may see another coal crisis, too. The remainder of the report is scarcely more revealing. The Council appears still to conceive its function to be that of explaining the National Coal Board's behaviour and difficulties to the industries using coal ; it suggests that particular questions regarding price and quality can be most usefully dealt with directly between industrial organisations and the NCB, leaving to itself "general consideration of the commercial arrangements and activities of the Board."

This perhaps leaves less undone than might appear. As the Council says, most of the coal consuming industries are well organised to negotiate directly with the NCB. In very general terms, the Council does offer certain guarded opinions on behalf of industry ; it suggests, for example, that any extension to industrial fuel supplies of the principles of the new domestic price structure (which within large areas equalises the costs of transport for coal of specific grades) should be considered with great caution. Its comment that

the advantages enjoyed by industrialists who sited their works near coal might thus be nullified is sound enough. And its table showing the increase in the amount of dirty coal due to the exploitation of dirty seams is informative, if doleful. Even here, however, the emphasis seems mainly to explain the Board's difficulties or deficiencies to industry. It is difficult to believe that the Council represents the best possible contact between the industrial coal consumer and the coal industry. Would any industrial consumer notice if it were abolished?

The Domestic Consumers' Council report, which is written in a rather more sprightly fashion, preserves the form at any rate of a body representing the consumer's interest. It argues that larger supplies of domestic house coal and boiler fuel might relieve much of the pressure upon gas and electricity and would impose less strain on coal supplies than is sometimes assumed. It asks for improvements in the quality of coal—"it cannot be too strongly emphasised that consumers who receive ill-prepared coal have a genuine grievance." It believes that in the summer when coal prices are reduced, domestic consumers should be allowed to buy up their whole annual ration; and it calls for improvement in the distribution of boiler fuels. It concludes, incidentally, that "the scarcity of solid fuel will continue for years." The report is moderate enough, in all conscience, and few of the Council's recommendations appear to have been fully implemented; but it does appear to be attempting to do the job for which it was appointed.

New Anthracite Mine

Development of the new anthracite colliery in the Gwyndraeth valley of South Wales, near Llanelly, will not need to await the sinking of the two new shafts that form part of the project. One existing shaft of Great Mountain No. 3 Pit, the nearest mine, will be incorporated and used to augment ventilation; while the two main shafts are being sunk, horizon development will begin from this pit.

The mine is situated in a district where an exceptionally rich new anthracite seam was recently reported at 2,550 ft. depth: reserves in the colliery area lie in seven seams and are estimated at more than 100 million tons of workable anthracite. Output from the Gwendraeth colliery is expected to begin in 1956; when it comes into full production in 1962 it will raise a million tons of saleable coal a year.

The Board is spending £7,500,000 on this new project, which will be the first of four mines planned for the South Wales anthracite area. Modernisation here is imperative but will be costly. Most of the anthracite pits are old and dilapidated: labour relations since nationalisation have continued to be worse than in most other areas; and mining costs are the highest in the industry. During the 15-year plan it is proposed to spend £27 million in the area, which should improve its poor technical standards, though costs are expected to remain high. The new mine will offer employment for the men in six surrounding collieries that are nearing exhaustion. Unless it appears to be encouraging better labour relations in the area, this may be one of the development programmes with which the NCB is not certain to continue further.

Facing the Tail?

Certain recommendations of the Court of Investigation that has just reported on the crash last October of a British European Airways Dakota, revive interest in the bearing of airline seating arrangements on casualties. In this disaster, when all but one of the 29 people on board were killed, all the seats were torn away from the floor by the impact of the crash and piled up in the fore-end of the compartment. In a crash in March, 1950, where 80 people were killed, much the same thing occurred. In the report on the Dakota crash, the Court makes a strong recommendation for the introduction of backward-facing seats, so adding its authority to the growing body of opinion in favour of this kind of seating arrangement, which is already standard practice in RAF transport aircraft.

The Air Registration Board, the body in this country responsible for issuing certificates of airworthiness for aircraft, has accumulated about five years' evidence suggesting that backward seating is safer. Airline operators, however, regard it without enthusiasm, the strongest opposition coming from America. Reversing the seating may also impose a weight penalty on the operator that he can ill afford, and although the unfavourable reaction of passengers has probably been exaggerated, it is still a factor that commercial operators feel compelled to take into account. The Air Registration Board has not, as was widely reported, recommended the universal introduction of backward-facing seats; but it has proposed to the International Civil Aviation Organisation's committee on airworthiness that cabin arrangements in general should be studied and that in aircraft where the seats are close-packed—the "coach type" seating that goes with reduced fares—the seats should without exception face backwards. This suggestion has been rejected, not for technical reasons but on the grounds that it was "not timely." But now the Australian licensing authorities are sending out preliminary notifications that eventually all aircraft built or operated in Australia must, without exception, have backward-facing seats. Such unilateral action could create difficulties.

The Ministry of Supply is now to study the technical considerations involved in applying such a change to existing and future aircraft. Operators and manufacturers contend that it may not be possible to reverse the seats of aircraft now in operation. It would be possible, but not easy, for an aircraft manufacturer to modify the drawings of an existing aircraft if his customer insisted on it being delivered with backward-facing seats. But only when aircraft are designed from the start for this kind of seating arrangement will all the technical difficulties of the change be avoided. It is of great importance to the aircraft industry, therefore, that manufacturers should be given a clear lead in this question by international agreement.

Plasterboard as Before

The Minister of Works has made no concessions in the new price control orders for plasterboard that he laid before the House last week. These orders still refer to the products of the British Plaster Board group of companies alone, and the only practical result of the Government's defeat on the original orders appears to have been to halve the effective margin which the Ministry proposes to allow the group. Originally this margin seems to have been ½d. a square yard whereas producers who remained within the voluntary agreement (from which British Plaster Board broke away) will obtain an increase in their margin of between 1d. and 1½d. Plasterboard makers are now having to pay considerably more for the paper that they use—the increase is equivalent to nearly 3½d. per square yard on the price of the finished product. The Ministry has allowed all producers a price increase of only 3d. per square yard to cover these higher paper prices. Under the new order, the price of plasterboard made by the British Plaster Board group will be increased by 3½d. a square yard in place of the original increase of ½d., but its net effective increase may be now nearer a farthing a square yard.

The new Minister has missed an opportunity to undo an unhappy piece of discriminatory regulation. The Government's defeat in the House of Commons suggested the

PHOSPHORUS

PHOSPHORUS is an element essential to life, whether animal or vegetable. Though it occurs abundantly in the form of natural phosphates, these can be absorbed by plants only with difficulty. They must first be converted into soluble fertilisers such as superphosphate, which are then absorbed easily. This conversion is one of chemistry's greatest contributions to agriculture. Phosphorus, which is never found free in nature, is obtained mainly from the mineral apatite—a compound of phosphorus and calcium that is found in many countries, but principally in the U.S.A., Russia and North Africa. Other valuable sources are animal bones and basic slag—a by-product of steel making. The element exists in several forms, the two most important being "yellow" phosphorus, a white, wax-like poisonous solid that catches fire when exposed to air, and "red" phosphorus, a non-poisonous powder used in the striking compound on safety-match boxes. Compounds of phosphorus are used in medicine and for purposes as different as water softening and the rust-proofing of steel.

In addition to using small quantities of the element in making phosphor bronze, an important heavy-duty alloy, I.C.I. uses more than 70,000 tons of phosphate rock every year in producing "Concentrated Complete Fertilizers" for agriculture.

L1629Q

disquiet that was raised by control orders directed against a single producer. Whether or not, in the six months' discussions before the orders were first made, there had been some clash of personalities, the advent of a Minister new to the dispute might have been expected to promote a voluntary settlement. There is, on practical grounds, some reason to doubt whether the orders will have the desired effect of allowing "high cost" producers to stay in business while preventing the "low cost" producer from making over-large profits. There is probably more capacity to produce plasterboard in the country than is necessary to meet demand. The recent scarcity has been entirely due to paper shortage: supplies are now improving, and board output may be expected to expand again. It would not be surprising if, when deliveries improve, consumers show a preference for the cheaper rather than the dearer board.

The problems raised by existence side by side of high and low cost producers in the same industry are not new to the Ministry. The situation is common to both brick and cement. It is hard to believe that in such circumstances it is desirable to experiment in differential price control to the disadvantage of one producer without pursuing the logic of the Minister's argument to every case with which he is concerned. He may, as he suggested in the recent debate, find grounds in the Palmer Committee's advice for thinking again.

* * *

Science in Brick Production

The London Brick Company has recently opened a new block of laboratory buildings at its brickyard in Bedfordshire. This Stewartby laboratory will serve the company's thirty or more brickworks, which between them have an average output of 30 million bricks a week. It houses long-term research into raw materials, plant design, and the development of clay products, but its facilities are also linked to the day-to-day operation of the kilns. By carrying out continual analysis of clay samples, which can vary widely in composition within a small area, kiln temperatures can be adjusted to allow for these variations and to produce a brick of standard quality. Analysis of this kind, which also covers the gas content of the clay, has assisted the company in reducing its fuel consumption to only one cwt. of coal per ton of bricks, and it may eventually be possible largely to dispense with coal and make the firing process virtually self-sustaining upon the combustible content of the raw clay.

Such scientific control is new in this country and elsewhere. The company probably produces a fifth of all the bricks made in this country, and in a completely free market it is difficult to see how some small yards could for long continue to compete with it. The arguments in favour of the small local brickyard have faded with the growing efficiency of the large works and the relatively lower incidence of transport costs. Today, however, production still needs to be expanded: in December the Minister of Works asked the industry to raise its rate of output from about 6,500 million bricks in 1950 to between 7,000 and 8,000 million this year.

Since he made his appeal the rate of production has been rising, but the improvement is largely seasonal. In May this year 527 million bricks were produced, compared with 517 million twelve months earlier, and stocks, which had improved slightly during the bad weather in February and March, had fallen by May to the uncomfortably low figure of 178 million. The industry is no longer expected to reach the Ministry's target this year, largely through the difficulty experienced by the small brickyards in recruiting labour. One of the rewards for the amount of money that the London Brick Company has spent on research since it first opened a laboratory in 1928 has been the complete mechanisation of Fletton brick production, culminating in the elimination of manual loading and unloading of the kilns. For lack of outside interest, brickyards are driven to design their own machinery, and the unmechanised yards are finding that however high the wages, men will no longer undertake the great physical effort required in brickyard work.

* * *

United Dominions Trust's Record Year

The United Dominions Trust has had another record year, both in volume of business transacted and in profits earned. Its consolidated balance sheet total rose from £16.5 million to £20.4 million in the year to March 31st; within this total its loans and acceptances rose from just over £9,600,000 to just over £12.4 million. These figures include loans made by the specialist finance houses that are wholly owned subsidiaries of the group, such as British Medical Finance, Credit for Industry, Engineering Finance and the recently purchased London Produce Clearing House; they do not, however, include the operations of Ryders Discount Company, which is also a UDT subsidiary but which is separately managed.

The company's gross profits rose from £526,248 to £634,671 last year, and although taxation has absorbed £341,822, compared with £249,471, the directors have decided to step up the year's dividend from 15 per cent to the prewar rate of 17½ per cent; in addition they are recommending a special bonus of 2½ per cent, as a token payment against the dividends that were unpaid in some of the war years. Many of the group's stockholders, the chairman pointed out, are insurance and trust companies that rely on their investment earnings "for the essential and proper purposes of their own companies." The company could have increased its business last year even more markedly than it actually did had it not followed a particularly cautious and selective lending policy. In view of the increased demand for its services, UDT hopes to increase its capital shortly; an application for such an increase is now apparently before the Capital Issues Committee and Mr Gibson Jarvie hopes to announce the results of discussions on this question at the full meeting of stockholders on August 14th.

Experiments in Self-Service

There are perhaps 900 self-service shops or sections of department stores in this country. "In four years," a representative of the Express Dairy Company was ready to predict in a recent public discussion on the subject, "there may well be ten times that number." There are certainly signs that after some years of rather slow progress—except in the co-operative movement—this form of retailing began to spread more rapidly in 1950, and is now the subject at least of experiment by most of the large multiple grocers.

So far, the movement towards self-service shops in Britain has been largely confined to groceries, though the largest

multiple chemist is trying out one such unit and a hardware store is experimenting with another. The retail co-operative societies own about 700 self-service shops, though certain societies are still doubtful of their value and the co-operative movement has recently started a large-scale analysis of its operating experience with self-service. Despite the almost complete conversion of popular catering to self-service, the few large firms that make self-service equipment have found that most assiduous promotion has been needed to sell the idea to even a few British traders. But statistically impressive reports of increased sales by the major firms that have tried out self-service are now attracting considerable interest in the grocery trade; and the small number of independent grocers who have converted their shops appear in most cases to consider it a success.

Most self-service retailers have obtained increased sales with the same number of assistants rather than a constant volume with fewer staff; this fact has at length won guarded approval for the system from the Union of Shop, Distributive and Allied Workers. Many independent grocers still argue that self-service does away with the "personal touch" that is a non-measurable element in their service and turnover. Enthusiasts for self-service argue that the personal touch is often reduced in practice to bestowing encouraging nods upon a queue, and that in the self-service unit most customers can go through at their own pace without congestion while the fussy shopper can receive all the attention she needs from the manager. Housewives, so far as they have been questioned, tend to welcome the new system, though some remark that they find themselves buying more. This is the famous "impulse buying," which according to American marketing consultants follows from the fact that all the goods sold are on display, while three parts of an ordinary grocer's stock may be out of sight or reach.

Since wage costs per sale are considerably lower, and capital charges only slightly higher, self-service should cut the retailer's costs, and probably increase his net rate of profit. The spread of this new method may therefore be hastened, in coming years, by public concern with reduction of distributive costs. So far, self-service operators generally express the same suspicion of measures to abolish resale price maintenance as other grocers. But upon their own evidence, they might be better placed to benefit from increased competition in retailing than conventional shops; and their attraction to the customer cannot for ever be based only upon novelty, speed, and convenience of choice.

Shorter Notes

Lord Alexander's figures of defence contracts already placed, given in the House of Lords this week, were slightly confusing. He said that by now some £900 million worth of orders had been placed with British and foreign industry, and added "This is very nearly 50 per cent of the three-year production programme: it may be more than 50 per cent because the contracts do not include orders given on the naval side." Official statements up to now have usually estimated the three-year expenditure on "production, research and development, and works" at £2,800 million, of which these orders would represent about a third. Whether Lord Alexander was comparing them with some other subdivision of the total expenditure—conceivably the £1,700 million odd to be spent with the metal-using industries?—is uncertain: he once before quoted a figure of "about £2,000 million" for "conversion, refitting, equipment and stores." His latest statement may be recorded as adding one more to the array of figures calculated on a variety of bases and definitions that obscures the real dimensions of the defence programme.

★

F. Perkins Ltd., Diesel engine manufacturers, are making a public offer of £1,500,000 4½ per cent first mortgage debenture stock at par. The proceeds will be used to repay £1,450,000 of indebtedness to the Finance Corporation for Industry, which has largely financed the great expansion of the company in the last few years. In order to finance a further extension to the Peterborough factory, £1,528,732 10s. ordinary shares are being placed, without Stock Exchange quotation, among institutional investors.

★

The International Nickel Company has announced that it is now producing refined nickel at the rate of 21 million lb. a month. This is an increase of about 5 per cent on last year's rate of production. In his annual report in April the chairman of the company suggested that this increase might be achieved by the end of the year. The increase is an early result of the large-scale programme of expansion which the company is undertaking.

★

The phenomenal rise in raw material prices and in overhead expenses since Hulton Press became a public company in February, 1948, has made it essential that reserves and liquid resources should be built up "to meet the difficult trading conditions lying ahead." In these circumstances, in order "to minimise the possibility of a reduction of the rate of dividend," which hitherto has been maintained at 75 per cent, Mr Edward Hulton, who owns 1,071,728 of the two million 2s. 6d. ordinary shares, proposes to convert 750,000 of his shares into deferred shares, on which the dividend will be limited to 5 per cent. Voting rights will not be changed and Mr Hulton reserves the right to reconvert the deferred shares.

Company Notes

Renold and Coventry Chain.—Production by Renold and Coventry Chain rose by 11 per cent in the year to April 1st through the use of additional capacity at Manchester and a general increase in productivity; this growth might well have been greater if supplies of steel and fuel had been more plentiful. Greater production was matched by record sales both in volume and value, so that group trading profits rose from £914,080 to £1,030,686. Some part of this prosperity was passed on to ordinary shareholders, who are to receive a dividend of 17½ per cent, against 15 per cent. The year, however, has not been without difficulties. Demand rose so sharply after the outbreak of the Korean war as to tax production capacity "to the utmost." Higher costs meant that in some cases prices had to be raised. It is a welcome sign, therefore, that the parent company by strict stock control have been able to reduce stocks by £58,951 to £1,191,201 despite a cost increase of some £40,000.

	Years ended April 2, 1950	April 1, 1951

£1 ordinary stock at 77s. 6d. yields £4 10s. per cent.

The company have gone one step further than most organisations to meet the problem of replacement. An investigation has shown that the average expectation of life of the company's plant is 25 years and not 16 years which had been previously used in depreciation calculation. Depreciation charges will therefore be adjusted to lower levels in order to reflect current experience more accurately. Full recognition is also given to the effect of inflation upon replacement costs, and the company intend to appropriate such sums to "re-equipment reserves" as with cumulative depreciation will fully cover the cost of replacement; these sums will be set aside before stating the amount freely available for distribution. After applying the new rates of depreciation it was estimated that on April 2, 1950, re-equipment reserves should total £773,000, against an actual book value of £175,000. To make good this shortfall £447,788 has been transferred from general reserves and the balance of £150,212 has been made up by depreciation adjustments. Given adequate steel supplies, further technical developments should ensure a further growth in output this year, but a more substantial increase can only be expected when the company's plans to secure additional capacity have matured.

★

W. H. Smith.—The accounts of W. H. Smith should attract wide interest, for the company's achievements can be taken to be representative of the experience of retail and wholesale book and stationery trade as a whole. A general rise in prices and a greater number of customers combined to produce a substantial increase in sales, and although costs, particularly wages, have been rising, gross profit margins were maintained. Group

* In respect of the period from September 1, 1949, to April 1, 1950; this rate is equivalent to 12 per cent. per annum.

£1 "A" ordinary shares at 48s. 0d. yields £5 per cent.

trading profits have risen from £1,570,530 to £1,629,094, and a dividend of 12 per cent has been declared. Certain expenses are, of course, outside the company's control, and the increases in transport costs, in particular, have given rise to some anxiety.

In view of the difficulties created by rising prices, it is reassuring to note that the company's stocks are described as being "in a healthy condition" and that negotiations for the renewal of bookstall contracts are "proceeding in a friendly atmosphere" with the Railway Executive and London Transport Executive. The chairman is hesitant in forecasting what effect the rise in newspaper prices will have upon profits, especially in conjunction with wage increases granted under a recent award. Whatever difficulties the book trade may encounter, it would be hard to deny a sound future for a business with the traditions and experience of W. H. Smith and Son.

★

Lewis Berger.—The first months of the financial year ending last March are described by the chairman as "a period of intense competition," yet for the year as a whole the Berger group achieved new production and sales records. The most acute problem appears to have been growing raw material shortages and rising costs rather than the transient reappearance of a buyers' market in the paint industry. The group recovered from the 1949-50 setback in earnings, and trading profits advanced from £801,450 to £905,766. This, however, is only half the

	Years to March 31, 1950	1951

4s. ordinary stock at 20s. 9d. yields £4 7s. per cent.

story for increased depreciation charges, following the installation of new machinery and plant at a high level of prices, the servicing of the £1,000,000 loan stock and the higher provision for taxation have all contributed to a fall in group net profits from £423,509 to £362,316. Now that the capital development programme, which was partly financed from retained profits in the past, is beginning to bear its first fruits, equity shareholders were entitled to expect a measure of reward. In the previous year a dividend of 33 per cent was paid on the original capital of £527,275; now ordinary shareholders are to receive the equivalent of 22½ per cent on £1,054,550 capital as doubled by the 100 per cent scrip bonus.

The company's capital projects made heavy calls upon liquid resources, but the stringency of liquid funds has now been relieved by the proceeds of the 1950 loan stock issue. Cash has risen from £189,094 to £471,293 and a bank overdraft of £94,506 has been paid off. The successful completion of the loan issue has also enabled the company to make further progress in its capital extension and development programme. Delays in plant deliveries have prevented the new Chadwell Heath factory from coming into full operation. Whether raw material shortages this year will prevent the full utilisation of this new capacity has yet to be seen; and shareholders will also recognise that the provision of adequate working capital is no easy task when "costs of raw materials, overhead expenses and taxation continue their upward spiral."

★

Amalgamated Metal.—The trading fortunes of Amalgamated Metal are in large degree at the mercy of price fluctuations in world commodity markets. The chairman admits that abnormal price fluctuations, particularly in tin and rubber, after the beginning of the Korean war "made trading very difficult." The fall in group trading profits from £578,198 to £403,509 was due to a loss incurred by the subsidiary, Henry Gardner, through the incidence of commodity contracts maturing in 1950; the other subsidiaries earned in the aggregate increased profits for the year. This setback, however, should be only temporary, for commodity contracts maturing in 1951 are expected to show a profit that will more than make good the 1950 loss. Such indeed is the directors' confidence that despite smaller profits the ordinary dividend has been raised from 6 to 7 per cent.

The rise in stocks from £1,384,099 to £1,821,568 is both a reflection of greater activity and more particularly of higher commodity prices; but a large part of merchandise stocks are not a market risk, since they have been sold forward. Much heavier investment in stocks and debtors, which have risen from £2,648,131 to £4,019,329, as well as the expansion of the company's interests in mining and metal enterprises in the Commonwealth, has made some inroads into liquid resources; cash balances have fallen from £1,232,184 to £760,795 and loans and bank overdrafts have risen from £590,952 to £1,107,740. The yield of nearly 6¾ per cent at the current price of 22s. is a reflection of the risks that almost inevitably accompany trading in commodity markets at the present time.

Statistical Summary

EXCHEQUER RETURNS

For the week ended July 14, 1951, total ordinary revenue was £36,231,000, against ordinary expenditure of £62,049,000 and issues to sinking funds £50,000. This, including sinking fund allocations of £3,568,000 the surplus accrued since April 1, 1951, is £15,791,000 compared with a surplus of £40,559,000 for the corresponding period of the previous year.

COMPANY MEETINGS

GOODLASS WALL AND LEAD INDUSTRIES

ACTIVITY IN ALL DEPARTMENTS

MR J. L. McCONNELL ON THE FINANCIAL POLICY

The twentieth annual general meeting of Goodlass Wall and Lead Industries, Limited, was held on July 17th in London.

Mr J. L. McConnell, chairman and managing director, presided.

The following is an extract from his circulated statement:—

The group profits at £1,230,831, after taxation, show an increase of £146,764 over those for 1949, itself a good year, and the balance sheet discloses once again a position of great strength.

In order that stockholders may be able to view the results in proper perspective, I should explain that of our total profit rather more than 80 per cent. arises from operations conducted within the United Kingdom.

In the United Kingdom the major portion of our earnings comes from the metal side of our business. Two years ago the majority of our old-established lead manufacturing companies were grouped under the name of Associated Lead Manufacturers, Limited, and this company is now looked upon in the non-ferrous metals industry as the pre-eminent manufacturer of lead and antimony products in this country. It has had a successful year's trading. The year began quietly, and in the early months' trading, although very satisfactory, showed some reduction from previous levels. The outbreak of the trouble in Korea reversed the trend in markets, and thereafter all departments became active, and at the end of the year were working at high pressure. The year was one of rising prices and further general inflation, and these factors had some bearing upon the improvement in our earnings. There was particular activity in lead oxides, and the antimony department had a very good year, reaping the benefit of the substantial expenditure on plant in recent years. Our smelting plants were able once again to play a part of national importance in bringing forward for use a substantial tonnage of secondary lead, tin and antimony. Our export deliveries were highly satisfactory, and I am glad to report the disposal of a sizeable tonnage in hard currency markets. The Fry's Metal Foundries Group also had a successful year, and some of their new developments have shown promising expansion. We took the opportunity of disposing during the period of Thomas B. Campbell and Sons, Limited, a merchant business in Glasgow, which we felt was somewhat outside the scope of our normal activities.

Our main paint company at home, Goodlass Wall and Company, Limited, Liverpool, had a good year, carrying out a further measure of concentration in its new factory at Speke. Our other paint companies in the home market improved their position.

OVERSEAS COMPANIES

Lead.—Our lead and zinc companies in India had excellent results, and measures are in hand for increasing their productive capacity. Our new lead manufacturing subsidiary in Durban started production in the spring of 1950. The major problem confronting our companies in these countries is that of obtaining adequate supplies of metal.

Paint.—Our companies in Australia, Eire, India and South Africa again did well, and all of them are extending plant capacity. The results of our Argentine company were also satisfactory, but once again have not been included in our consolidated accounts because, in our opinion, exchange restrictions would make this misleading. I am pleased to say, however, that within the past few weeks they have found it possible to remit to us a dividend declared two years ago.

Trade Investments.—British Titan Products Company, Limited, has more than fulfilled expectations, and the substantial increase in capacity at Grimsby now in train will involve, in early 1952, an addition for us to our already large investment in that company. British Australian Lead Manufacturers Pty., Limited, Australia, in which we have a substantial holding, continues to prosper, and our associated company in Johannesburg, Enthoven Fry, Limited, has again made good progress.

Development.—Our research activities have been fully maintained, and arising from them we have commenced the production of a number of special chemical compounds. Some of these are promising, but it is too early to assess their importance. Good progress has been made with the installation of plant at Newcastle-upon-Tyne for the manufacture of a range of zirconium products under licence from the U.S.A. This plant should be in active operation in the autumn of this year.

Fixed Assets.—As you will observe from the group accounts, the net additions to buildings and plant during the year amount to £467,767.

Depreciation has been provided at our usual rates and we have transferred £200,000 to reserve for replacement of fixed assets, bringing the total of that account to £800,000. This allocation is about the equivalent of doubling our normal charge for depreciation.

RAW MATERIAL SUPPLIES

The volume of our business depends largely upon our ability to obtain adequate supplies of lead, our most important raw material, and the two sources open to us are virgin lead from abroad and metal which we produce from secondary material arising at home. As regards the latter, we are free to exercise our skill in obtaining a reasonable share of what is available, and whilst we shall normally be able to count upon a substantial tonnage in this way from current supplies, the substantial stocks left over after the war have largely been absorbed. Virgin lead remains in the hands of the Ministry of Supply, who control price and distribution. Supplies were fairly free in the early part of the year, but with the outbreak of the Korean trouble and the consequent expansion of U.S.A. demand, the position gradually changed, and in February, 1951, a measure of rationing was introduced by the Ministry. This has severely curtailed our export activities for the time being, but we are still able, I am glad to say, to continue our home trade at a reasonable level. The price of lead rose during the year from £97 a ton to £136 a ton and is now £160 a ton. It will be a relief when circumstances permit the reopening of the London Metal Exchange for lead trading and its facilities again become available for hedging purposes with consequent avoidance of market risk.

FINANCIAL POLICY

Over the short period of two years to December 31st last the amount required to finance our stocks and debtors has gone up by about £1,500,000, the dominant factor being the rise in price of metals: lead on the one hand and antimony and tin on the other, at the end of 1950 were respectively nine times and five times the prewar prices. There is also the oppressive burden of taxation, which last year required the provision by us of no less a sum than £1,525,956. The increase imposed by the recent Budget in the rates of income tax and profits tax on distributed profits and the abolition of initial allowances next year will make it more difficult than ever for a company such as yours to continue as it has done for so many years to meet from its own resources all the demands upon it.

With the above in mind, your board are compelled to exercise restraint in dividend policy, but at the same time they no longer feel under obligation to limit dividends rigidly to a rate paid in an earlier year. The capital employed by the company has substantially increased in recent years and it would be unreasonable that shareholders should be asked to accept a steadily reducing rate of return upon it. Your directors have, therefore, decided to recommend that a final dividend upon the ordinary stock of 12½ per cent., less tax, be declared, making a total of 20 per cent., less tax, for the year, as compared with 15 per cent., less tax, for the previous year.

The capital employed in the business is now quite out of line with the issued capital, and your directors consider that now is an appropriate time to get these into a more rational relationship. Application has, therefore, been made to the Capital Issues Committee for permission to capitalise reserves to the extent necessary to allot to our ordinary stockholders one fully paid share of 10s. for every stock unit held, bringing the total issued ordinary capital up to £2,409,355.

Prospects.—So far this year we have been busy and I anticipate a steady demand for all of our products in 1951.

The report and accounts were adopted.

FORSTER'S GLASS COMPANY, LIMITED

DEMAND AT HIGH LEVEL

The thirty-second annual general meeting of Forster's Glass Company, Limited, was held on July 13th in London, Col. Charles E. Ponsonby, T.D., D.L., the chairman, presiding.

The following is an extract from the chairman's circulated statement:—

The profit for the year, before charging taxation, amounts to £80,521, an increase of £7,549 over last year after charging £33,459 for depreciation, against £32,054 last year. The recent increases in the rates of distributed profits tax and income tax call for increased provisions, and the estimated amounts charged in the accounts—£32,569, against £24,958 last year—offset the increase in profits. After deducting the preference dividend, the net profit is £34,827. Out of this the directors recommend a dividend of 16¼ per cent. on the ordinary shares. In the opinion of your directors the trading results can be considered satisfactory, having regard to the difficulties encountered.

The demand for your company's products during the year has been very heavy and we regret that we have found it impossible to meet all requirements.

I referred last year to the heavy burden of taxation, which makes it more and more difficult to retain sufficient liquid resources for the replacement and modernisation of plant and equipment. The recent increase in the tax on distributed profits from 30 per cent. to 50 per cent. has had a further penalising effect.

As far as the present year is concerned the demand for your company's products still continues at a very high level.

The report was adopted.

NU-SWIFT LIMITED

WORLD-WIDE RECOGNITION OF PRESSURE-OPERATED FIRE EXTINGUISHERS

NECESSITY FOR UP-TO-DATE FIRE PROTECTION

The eighteenth general meeting of Nu-Swift Limited, was held on June 29, 1951, at the Nu-Swift Factory, Elland, Yorkshire. Mr A. Harland, the chairman, who presided said:—

Never in the history of the company have so many fires been put out by Nu-Swift pressure-operated extinguishers as during the last year. Output, sales, and profits all reached fresh high levels. We rejoice at the signal honour graciously conferred by His Majesty the King upon our contracts and factory manager, Mr E. E. C. Cawood.

The merits of our products were strikingly acknowledged during the year by the decision of the Royal Swedish Navy to standardise Nu-Swift pressure-operated extinguishers in the same way as our extinguishers are already on guard in "Every Ship of the Royal Navy." The Swedish Navy is the 11th navy to standardise Nu-Swift.

LARGE INCREASE IN EXPORT SALES

Thanks to our policy of pressing on with research and development, Nu-Swift extinguishers continue to find a large and growing market abroad. Our standard products are specified and operate with efficiency all over the world. Under arctic conditions they are used in the Spitzbergen collieries near the North Pole. In tropical countries Nu-Swift is giving equal satisfaction in Africa, Asia, America and Australia under trying and exacting climatic conditions. The name of Nu-Swift is now registered as our trade mark in 62 countries. Export sales last year exceeded the total of our home sales in the last prewar year by 33.2 per cent.

"FIRE! WHERE'S YOUR NU-SWIFT?"

To the civilian user in the home market we continue to give the closest attention. Through our extensive advertising campaign in 146 papers and trade publications in Britain, we ask the simple question: "Fire! Where's your Nu-Swift?" More and more people have come to realise the immense advantages of standardising for every risk, pressure-operated extinguishers, all operated in the common-sense upright position.

We are the only manufacturers able to offer this up-to-date method of operation for every type of risk.

Among our users are many of the leading industrial concerns, shipowners, transport undertakings, progressive farmers, a large number of municipalities and many shopkeepers and private individuals, apart from the nationalised industries, chief among which is the National Coal Board with its peculiar fire problems for which Nu-Swift extinguishers are particularly suitable.

WHY WAIT FOR FIRE BRIGADE TO BRING ALONG NU-SWIFT?

Last, but not least, a number of progressive Fire Brigades carry Nu-Swift on their engines. But why wait for the Fire Brigade to bring along Nu-Swift? Everybody has a fire risk. For the first five minutes any man's fire is his own, and the cost of providing pressure-operated Nu-Swift extinguishers is small compared with the prospective loss of life and property through fire.

Production has been maintained at a high level and the shortage of raw materials has not hampered us unduly, thanks to the collaboration of our many suppliers and the Government Departments involved, all of whom recognise the essential nature of our products. Most of our models can still be delivered promptly and we plan to increase production still further. Should the international situation deteriorate, it may be difficult for us to cope with all demands. It behoves, therefore, everybody to check or have checked whether his or her fire-fighting equipment is up-to-date and adequate in number. War or peace, the risk of fire will always be with us.

On the proposal of the managing director, Mr F. Graucob, the retiring director, Mr A. Harland, was re-elected and the report was adopted.

CENTRAL AND DISTRICT PROPERTIES LIMITED

The seventeenth ordinary general meeting of Central and District Properties Limited, was held on July 16th in London.

Mr Albert William Bourner, the chairman, presided, and in the course of his speech said:—

The net profit of the group for the year to March 31, 1951, before taxation and reserves for amortisation and deferred repairs, amounts to £61,123, which shows an increase of £7,284 over that of the previous year. Although the new increase in the rate of profits tax is not chargeable for the whole year, taxation falls on us very heavily and provision for this item has been made amounting to £33,539. Of the total rents we collected last year, 31 per cent. was paid, either to the local rate collector or the Inland Revenue collector of taxes.

Last year we transferred for deferred repairs £10,000 to reserve account and a further £2,000 is being transferred this year. A certain amount of deferred repairs has been undertaken during the year and it is the intention to continue to carry out these repairs as and when licences are procurable and it is otherwise expedient to do so.

DIVIDEND OF 17½ PER CENT.

As a result of the increased income which your company is receiving, your directors considered that an increased dividend could be paid for the year and they therefore increased the interim dividend from 5 per cent. to 7½ per cent., anticipating that a corresponding increase could be made in the final dividend. The increase in the profits tax which was announced in this year's Budget has made this impossible and your directors are therefore recommending payment of a similar final dividend to the previous year—namely, 10 per cent., making 17½ per cent. for the year.

The property which was purchased during the year will show a very satisfactory return on its cost to the company. We have now no large war damage repairs to be completed, with the exception of the property at Angel Hill Parade, which was totally destroyed. Once again, I regret to report that in spite of our efforts we have not been able to obtain permission to rebuild this property which would provide living accommodation and shops in an area in which they are urgently required.

I am satisfied the position of your company continues to be sound and that we can continue to look forward to the future with confidence, provided no unforeseen circumstances arise.

The report was adopted.

AMALGAMATED METAL CORPORATION, LIMITED

MR WALTER GARDNER'S STATEMENT

The annual general meeting of this company will be held in London on August 8th.

The following are extracts from the statement of the chairman, Mr Walter Gardner, circulated with the report and accounts for the year 1950:—

We mourn the loss of Mr R. C. Stanley, who had been a director of the Amalgamated Metal Corporation since its inception, and was one of the most outstanding figures in the metal industry. We are greatly pleased to propose the election of Dr John F. Thompson (chairman and president of the International Nickel Company of Canada) as a member of our board.

The outbreak of hostilities in Korea had its impact on commodities, and brought about abnormal market fluctuations which made trading very difficult. Tin, the only metal in which we have a free market, was, of course, so influenced, and has since been greatly affected by the action or inaction of those responsible for stockpiling in the United States.

The same is true of rubber, which stood at 15d. per lb. at the end of 1949. Since then it has touched 74d. and, latterly, has been almost halved in price. The rise, which in its early stages was due to expanding US civilian demand for cars and trucks, became accentuated with the outbreak of the Korean war. Stockpiling by US and other countries forced the price to unexpectedly high levels. Recently the market has returned to a more reasonable level.

WIDESPREAD ACTIVITIES

Our associated company in Australia has recently expanded its activities by opening an office in Melbourne, and, in conjunction with our friends the Wolverhampton Metal Company, has recently formed a company to take a share in the expanding scrap and secondary metal business of that country.

The British Metal Corporation has, since the end of our last financial year, sold the entire share capital of Huntington, Heberlein and Company to Simon-Carves. The terms of sale provide for co-operation between the British Metal Corporation and Simon-Carves over matters of mutual interest.

During the latter part of 1950 the British Metal Corporation, in conjunction with a well-known mining concern, exercised an option for the purchase of an Asbestos property in Southern Rhodesia. The preparation of this property for regular production has been proceeding since its acquisition, and it is expected that production on a limited scale will begin shortly.

In conjunction with the Messina (Transvaal) Development Company and another well-known mining concern, the British Metal Corporation has taken an investment in the capital of Rhodesia Copper Ventures. The combined investment of the three concerns constitutes a controlling interest in the company. Rhodesia Copper Ventures are the owners of various exclusive prospecting rights in the neighbourhood of Sinoia, in Southern Rhodesia. The results to date show promise of developing sufficient tonnage to justify operation on a commercial scale.

Since the conclusion of our last financial year, the British Metal Corporation and Henry Gardner & Company have decided to open a joint office in Karachi under the style of the British Metal Corporation (Pakistan) to handle metals, ores and general merchandise. It is hoped that this move will enable our group to take its share in the expanding industrial and other activities of this member of the Commonwealth.

WALSALL CONDUITS LIMITED

FULL ORDER BOOK

MR A. E. READ ON RE-ORGANISATION BENEFITS

The fifteenth annual general meeting of Walsall Conduits Limited was held on July 19th in Birmingham, Mr A. E. Read (the chairman) presiding.

The following is his statement which has been circulated with the report and accounts:

The total net profits of the company and its subsidiaries, before provision for taxation, amounted to £396,004 as compared with £313,590 for the previous year. After deducting taxation on the basis of the legal liability to December 31st the net profit amounts to £219,021 as compared with £147,581 for the year 1949. Notwithstanding expenditure during the year of more than £70,000 on additions to fixed assets, the liquid position as shown in the consolidated balance-sheet has further improved as the surplus of current assets at December 31, 1950, amounted to £772,112 compared with £667,501 at the end of the previous financial year.

The installation of a new pickling plant which I referred to last year has been completed and is now in production with highly satisfactory results.

I am pleased to be able to state that the new steel manipulating department is nearing completion and it is hoped that it will be in full production before the end of the present year. Providing adequate supplies of steel are available the output of this section of the works, which has hitherto been greatly overburdened, should be considerably increased.

The scheme of re-equipment and reorganisation which has been proceeding steadily during the past three years is now bearing fruit as is clearly evidenced in the accounts for the year.

RAW MATERIAL DIFFICULTIES

While I am happy to say that the company has up to the present been able to keep the whole of its employees fully employed, your directors are gravely concerned at the increasing difficulty which they and most other concerns in the trade are experiencing in obtaining supplies of raw materials, particularly pig-iron, steel, and non-ferrous metals.

Our order book is full, and notwithstanding the greatly increased output the directors appreciate that the deliveries we are able to make are still unsatisfactory. The board ask for the indulgence of customers and desire me to assure them that no effort will be spared to overcome the many unforeseeable difficulties which are constantly arising owing to the abnormal world conditions. Heavy taxation is also crippling industry by diverting liquid resources, which would in former times have been available for and normally used for trade expansion, into other channels.

I regret to say that anticipated improvements in our subsidiary ceramic factory did not materialise. The trade as a whole has now, however, made price adjustments which will bring selling prices more into line with the increased cost of materials and labour; the factory is now working to full capacity and the figures for the first five months of the current financial year are satisfactory.

During the year two new service depôts have been established, bringing the total number to 33, thus furthering the expansion of the company's sales policy, which is to make "Walsall" goods readily available wherever and whenever required.

The directors desire me to thank the management, staff, and all employees both of the works and depôts for the loyal support which has been cheerfully given throughout the year.

The report and accounts were adopted.

THE CLAN LINE STEAMERS, LIMITED

LORD ROTHERWICK ON TAXATION AND PROFITS

The sixty-first annual general meeting of The Clan Line Steamers, Limited, was held on July 12th in London.

The Rt. Hon. Lord Rotherwick (the Chairman), in the course of his speech, said: The accounts do not reflect the effect of the scheme of reconstruction and amalgamation which was approved by stockholders on March 28th. So far as this company is concerned the principal effect of the change should be an improvement in the earnings position of the Group, although we are fully aware of the difficulty in making even the recently negotiated adjustments in freight rates meet the increased costs of ship operation.

DELAYS IN PORT

With shipbuilding costs at their present high level it is a tragedy that, owing to delays in port, additional vessels are required merely to maintain a service.

Just as delays in port contribute to increased cost of transport, so does excessive taxation. This has been further increased by the latest Budget, for not only have the rates of tax been increased but notice has been given that the initial allowance on capital expenditure is to be withdrawn. Representations were made by the shipping industry for a retention of initial allowances on new vessels so that this industry, vital as it is to the well-being of the nation both in peace and war, might be given a reasonable opportunity of maintaining a high standard of efficiency.

Almost daily in certain papers one sees criticism of the profits earned by industry. Let there be no mistake; the profits in a period of inflation as disclosed by a company's accounts are only paper profits. Presumably those who criticise profits wish to see the end of private enterprise. Nationalised industries, instead of contributing to the revenue as when under private enterprise, are now making heavy losses which fall on the shoulders of the unfortunate British taxpayers. Private enterprise now has the dual responsibility of keeping this country on its feet and also bolstering up nationalised industries.

DIVIDENDS

The dividend this year has been increased to 30 per cent. So far as cash is concerned the net outlay is little in excess of the payment for the previous year which included a 5 per cent. distribution from profit on realisation of investments. In addition to the dividend you have been advised of the proposal to distribute shares in The Scottish Lion Insurance Company Limited, and Sea Lion Investments Limited, subject to the approval of the extraordinary general meeting. It was felt that the policy of retaining the profits of subsidiary undertakings in Clan Line and distributing them to stockholders by means of a variation in the rate of the ordinary dividend had certain weaknesses and that it would be better to give the stockholders a direct interest in subsidiary companies.

During the last four months a considerable reorganisation of the finances of the company has taken place and your directors are confident that the results will be beneficial to the company.

The report and accounts were adopted and at a subsequent extraordinary general meeting the proposed distribution of the subsidiary companies shares was approved.

The chairman informed the meeting that the directors proposed to make application to the Stock Exchange for permission to deal in the shares of The Scottish Lion Insurance Company Limited.

RALLI BROTHERS LIMITED

EFFECTS OF DEVALUATION

MR J. VLASTO ON WORLD CONDITIONS

The twenty-first annual general meeting of Ralli Brothers Limited was held on July 17th at Winchester House, Old Broad Street, London, E.C., Mr Jack Vlasto, the president, being in the chair.

The following is his statement circulated with the report and accounts for the year to August 31, 1950:

It is with much sorrow that I must refer to the death last August of my colleague on the Board, Mr Henry Pfister. He served Ralli Brothers for 55 years with the utmost devotion. His experience and counsel were always of the greatest value and all of us have sadly missed his delightful personality. The remarkable number of letters of sympathy received by the company testified to the esteem and affection in which he was held on the Baltic Exchange and in the produce world.

The directors' report with the company's balance-sheet and the consolidated accounts of the group are before you and will, I trust, be found fully informative. I must apologise for the long delay in their preparation. We are taking steps which, we hope, will lead to the earlier presentation of next year's accounts.

The devaluation of sterling in September, 1949, gave rise to some unpredictable developments in Indian and Pakistani trade which caused a number of then outstanding contracts to prove very costly. Business became brisk, however, in the early part of 1950 and a steady flow of good results brought the ultimate profit for 1949-50 to a satisfactory figure.

INTERNATIONAL SITUATION

The current year's trading began exceedingly well for us. World demand for the commodities in which we deal became even stronger and our monetary turnover, with the added effect of higher prices, was, for a time, running at almost double that of the previous year. To finance this trade, we were compelled to seek financial facilities on a much larger scale than ever before, especially over the peak period of January-March. Although the last few months have seen an appreciable slackening in activity, our turnover—excluding subsidiary companies—is likely to exceed £50 million for the year and, unless we suffer some unexpected setback, our gross profits should be well in excess of anything yet achieved by the company.

The uncertain international situation, the growing complexity of taxation problems and the huge proportion of profits which is taxed away, are the unfavourable factors. To these must be added the tendency in certain overseas countries from which we export to insist on repatriation of gross sale proceeds. In this way our earnings on such transactions may not be transferable.

INDIA

An improving tendency in the Indian Stock Markets encouraged us to come forward in April with the long postponed offer for sale to the Indian public of 60 per cent. of the share capital of Rallis India, Limited, of which details are referred to in the report of the directors. The Ordinaries were heavily oversubscribed for at the premium asked, but we were left with about half the Six Per Cent. Cumulative Preference shares, although offered at par, because a slightly higher yield than 6 per cent. was obtainable at that time

from comparable Indian securities. Our main objective was, however, achieved by the sale of 51 per cent. of the Ordinary shares and the general result was quite up to our expectations.

Our thanks are due especially to Mr G. Euthymopulo, the managing director of Rallis India Limited, and Mr F. Fielding, the secretary, for the efficient manner in which, acting on our behalf, they and others have tackled the local difficulties of this problem and brought the offer for sale to a satisfactory conclusion. While I am gratified at the completion of our plan to transfer control to Indian hands, there must inevitably be regret at the severance of our Indian organisation, founded by our predecessors over 100 years ago. We look forward, nevertheless, to many years of continued trading with Rallis India Limited.

RALLI ESTATES

The year which has seen the disappearance of one subsidiary company has also seen the creation of a new one—Ralli Estates Limited—a Tanganyika company, formed to own and manage the two adjoining sisal properties which were offered to us on 99-year terms by the Government of Tanganyika when disposing of former enemy sisal estates as from January 1, 1951. We have subscribed the whole £250,000 issued capital of Ralli Estates Limited, which has Mr M. A. Carson, O.B.E., our manager in East Africa, as its chairman supported by a Board which includes long planter experience. The present production is about 3,500 tons of sisal fibre per annum and there is adequate space for further development.

In January and February last, I visited our Karachi office and several of our offices and jute baling stations in the interior markets of East Pakistan. The visit was rendered a real pleasure by the evidence of efficiency and hard work which I saw everywhere and by the demonstration of unity and loyalty to the company expressed in the warmth of welcome extended to me by everyone down to our humblest employee. The company is, indeed, fortunate in the quality and devotion of its staff all over the world and our sincere thanks are due to them for another year's fine work.

The report and accounts were adopted.

The proceedings terminated with a cordial vote of thanks to the President on the proposition of Mr M. A. Carson, O.B.E.

KEPONG (MALAY) RUBBER ESTATES LIMITED

DIVIDEND OF 35 PER CENT.

The forty-sixth annual general meeting of the Kepong (Malay) Rubber Estates Limited was held on July 18th in London, Mr T. J. Cumming, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for 1950:—

Although the crop harvested did not reach the estimated figure, the results cannot be regarded as other than satisfactory, and when we consider the difficult conditions under which work on the estates is carried out, we can only be thankful that the shortage in crop was not worse. The net average sale price for all grades was 22.34d., compared with 10.61d. for 1949. This increase covers by a large margin the increase in estate expenditure.

The profit for the year prior to taxation was £505,540, and it is proposed to pay a final dividend of 15 per cent., less tax, which will absorb £58,555, making 35 per cent. for the year, to transfer £50,000 to general reserve and £50,000 to provision on account of the rehabilitation expenditure, leaving £58,003 to be carried forward. After considering the position to date, the board decided to pay an interim dividend of 10 per cent., less tax, in respect of the current financial year.

Due to emergency difficulties, labour shortages and frequent bad weather interruptions, the crop harvested was below the estimate. The actual figure for all grades was 12,904,000 lb., which is 1,378,000 lb. below the previous year's figure. A large portion of the crop has been marketed in the form of Licentex, the production of which has proceeded satisfactorily.

The report was adopted.

PYE LIMITED

G.P.O.—NEED FOR CHANGE OF OUTLOOK

The twenty-second annual general meeting of Pye, Limited, was held on July 18th in London.

Mr C. O. Stanley, C.B.E. (the chairman), in the course of his speech said:

The efficiency of industry and, in fact, of the nation as a whole, is dependent on the speed of our communications. It is in the field of radio that we have the really big opportunity of improving our communications, but unless something is done quickly to change the outlook of the G.P.O.—which has absolute control over this phase of our national life—we shall find ourselves a long way behind other countries.

It is common knowledge that for the last 30 years there has been considerable foreign influence on the outlook and standards of the G.P.O.; in fact, a great deal of British telephone work has been copied from other countries. The G.P.O. is a monopoly, and in its dealings with its suppliers it uses the most objectionably monopolistic methods.

We question whether the G.P.O. are serving the best interests of the nation in all the actions they are taking with regard to radio communications, and it is now clear that either your company or some other company must challenge these actions if we are to accept the principle that competition and free enterprise in communications are essential for the future of this country. For our part we do not imagine that we shall add to our order book by honestly stating our beliefs on this important subject, but we do believe that we have a duty to our workpeople in ventilating what we consider to be one of the very weakest spots in British administration.

In considering the accounts there is one matter I would like to refer to, and that is the continued demand for an extension of the capital employed in the business. Despite the fact that there has been a pronounced increase in profits, the money is not available to pay anything like the increase in dividend which these profits justify. There is also the point that the profit-sharing to our workers has increased, and surely if we increase it for one side of the partnership we should do it for the other.

Trading profits are over one-third more than last year, but taxation is greater by approximately one-half. This emphasises the very heavy burden which industry now has to bear under the present taxation system. The scheme for initial allowances helps industry to find the money necessary to replace worn-out or obsolete plant which in these days is extremely important, and the Government's decision to withdraw the scheme next year is very much to be deplored.

The report was adopted.

HENRY HOPE AND SONS LIMITED

RECORD SALES

The fifty-third annual general meeting of Henry Hope and Sons, Limited, was held on July 18th at Smethwick, Mr H. D. Hope (chairman of the company) presiding.

The chairman in the course of his speech said: This is our fifty-third annual general meeting, and it marks the largest volume of sales in the history of the company, both at home and abroad.

You will have observed the notice which we sent to the Stock Exchange, stating the result of our year's trading, and disclosing a fall of over £50,000 in the Home trading profits of the company for the year, as compared with the previous year. While this setback at home is offset by larger profits from our subsidiaries abroad this fall in profits on a larger turnover is disturbing. It arises simply and solely from the advance in cost of materials, wages and services without corresponding increase in selling prices. A few examples will suffice to tell you what has happened during the year:—

Lead increased from £84 per ton to £160 per ton.

Zinc increased from £89 10s. per ton to £160 per ton.

Brass rodding from 1s. 1½d. per lb. to 2s. 3d. per lb.

Aluminium from 1s. 10½d. per lb. to 2s. 0½d. per lb.

Transport: Rail rates have been increased 26 per cent., and Road rates have been increased 18 per cent.

During this period the selling prices of a large part of our output have been pegged by Government control; indeed there has been a strong disinclination in the trade to raise prices, in the belief that these increased costs could be met by increased volume. For several reasons this has turned out to be a delusion, and in my opinion it will not be possible to avoid further increases in price if good design and high quality are to be maintained.

You have no doubt seen some comments in the Press on our decision to recommend the same ordinary dividend as last year. While the profit we have earned will appear to be ample to justify a higher dividend, your directors are satisfied that under present circumstances it is the correct policy to plough back profits into the business.

The report was adopted.

NOTICES

QUALIFIED Accountant, age 25 to 35, required for post with petroleum company in Accra, Gold Coast. Must have good knowledge of French language and be single. Apply in writing to Personnel Supervisor, United Overseas Petroleum Company, Limited, West Hall, Byfleet, Surrey.

E. O. CUTTER, Borough Education Officer.

Education Office, 63-69, Guildford Street, Luton, Beds.

AMENDED

SENIOR SCIENTIFIC OFFICERS; SCIENTIFIC OFFICERS: The Civil Service Commissioners invite applications for permanent appointments to be filled by competitive interview during 1951. Interviews began in January and will continue throughout the year, but a closing date for the receipt of applications earlier than December, 1951, may eventually be announced. Successful candidates may be appointed immediately. The posts are in various Government Departments and cover a wide range of scientific research and development in most of the major fields of fundamental and applied science. Candidates must have obtained a university degree with first or second class honours in a scientific subject (including engineering) or in Mathematics, or an equivalent qualification, or possess high professional attainments. Candidates for Senior Scientific Officer posts must in addition have had at least three years' post-graduate or other approved experience. Candidates for Scientific Officer posts taking their degrees in 1951 may be admitted to compete before the result of their degree examination is known.

Age Limits: For Senior Scientific Officers, at least 21 and under 28 on August 1, 1951; for Scientific Officers, at least 26 and under 31 (or under 31 for established civil servants of the Experimental Officer class) on August 1, 1951. London salary scales: Senior Scientific Officers (men), £750-£950; (women), £625-£850; Scientific Officers (men), £400-£650; (women), £400-£525. Somewhat lower rates in provinces.

Further particulars from the Secretary, Civil Service Commission, Scientific Branch, Trinidad House, Old Burlington Street, London, W.1, quoting No. 3399.

FACTORY, centrally situated in Edinburgh, one of the lowest rated cities in Great Britain, presently use as a printing works, approximately 21,000 square feet, existing use light industrial purposes, assessed rent £235, derated to £58. No ground burdens, electric lift, two loading banks, all in modern condition, approximate entry December. Permission to view from and offers to Shepherd and Wedderburn, 16, Charlotte Square, Edinburgh.

ABLE Cambridge Graduate (1st class Hons.) with considerable capital seeks business appointment or opportunity. Remuneration secondary to scope for initiative.—Box 707.

PUBLIC RELATIONS. American woman expert, now in London, available for discussion, view handling of assignments on special phases of promotion, market research and contact on return to U.S.A. Goldsmith, 16, Welbeck Street, W.1.

Change necessitated by private reasons which are regretfully accepted by present employers who will gladly furnish a reference and answer questions. Write Box 692.

YORKSHIREMAN (53) trustworthy and diligent seeks post where general knowledge, organizing ability, and administrative experience are required. Box 695.

191

CROWN AGENTS FOR THE COLONIES

Economic and Marketing Officer required by the Government of Uganda for one tour of 2½-3 years with prospect of permanency. Salary according to age and experience in the scale £632 rising to £1,290 a year (including allowances). Free passages for officer and wife and assistance towards cost of children's passages. Liberal leave on full salary. Candidates, under 35 years of age should be of good education and preferably have a knowledge of commercial practice and/or agricultural marketing. A University Degree would be an advantage. Apply at once by letter, stating age, full names in block letters and full particulars of qualifications and experience and mentioning this paper to the Crown Agents for the Colonies, 4, Millbank, London, S.W.1, quoting M.28712.C on both letter and envelope. The Crown Agents cannot undertake to acknowledge all applications and will communicate only with applicants selected for further consideration.

EAST AND CENTRAL AFRICA

Applications are invited for an appointment to carry out an economic research inquiry into, and report upon, the organisation and costs of the distribution of retail goods in Tanganyika, The Nyasaland Protectorate and Zanzibar. The inquiry, which will be administered by the Government of Tanganyika, is expected to take up to eighteen months to complete, of which about fifteen months will be spent in Africa. Salary between £700 and £1,000 a year according to qualifications plus Overseas Research Allowance of between £175 and £240 a year and Cost of Living Allowance of 15 per cent of salary. Income tax at the local rate which is substantially below the United Kingdom rate. Outfit allowance £30. Existing F.S.S.U. policy will be maintained, where possible, on the usual basis. Free return passage to and from East Africa and local travel for the selected candidate, who may be required to travel by air. Provision is made for clerical and statistical assistance. Experience in market research will be considered an advantage in applicants. Further particulars and application forms may be obtained from the Under Secretary of State, Colonial Office (Research Department), Sanctuary Buildings, Great Smith Street, London, S.W.1, quoting Reference No. 97402/66/51.

A DIRECTOR of Research is required to become head of the Research Organisation of a leading Group of Plantation Companies in Malaya. This key post calls for a Scientist with a general training, of which the emphasis is towards Chemistry, Soils, and Plant Physiology. It offers exceptional scope for personal direction and initiation of research of the first importance to industries which are vital to the economy of the sterling area. It will, accordingly, be highly remunerated. Suitably qualified candidates are requested to write in confidence with full details of career and qualifications to Box 110, Dorland Advertising, 18-20, Regent Street, S.W.1.

EXPERIENCED Man for Statistical Department stockbrokers office, with wide knowledge of industry and ability to produce ideas. Good appearance and address. Lunch vouchers and bonuses good prospects for right man also junior for same department. Apply Box 688.

AN international Company (8 factories in the United States, also 4 factories in Canada and England) is prepared to consider the marketing of new Fancy goods or other lines. Sales ramifications include intensive coverage of the three countries mentioned, with the main Export markets of the world, in which the Company has its own (39) direct Selling Agents. By reason of its size and reputation, sales of any new lines marketed by the Company will be substantial. New manufacturing propositions would also be considered: large financial resources available. Products must have mass appeal. Box 698.

AN excellent opportunity arises for a thoroughly experienced man to develop the export and import department of a live organisation dealing mainly in building materials and steel. Live connections with home and continental suppliers and overseas buyers essential. Knowledge of French and German desirable. The appointment is in London and carries a four figure salary, plus commission.—Write in the first instance giving fullest particulars to Box 703.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 16, George Street, Mansion House, E.C.4.

FACTORY Space. New factory suitable light industry, 15,000 square feet, standing in own grounds near small Monmouthshire town. Brick built (1949), excellent working space well lit by day and night, modern offices, canteen, mains electricity, all services. Road access, rail adjoining. Available in one month on long lease. Reply giving approximate information type of industry to be housed to Box 689.

GENERAL MANAGER of Hong Kong Import-Export firm on leave, and owing to the political interference with Hong Kong's economic position not desirous of returning there, requires new position from September—Continent or Overseas preferred. Advertiser will be in London about August 1st.—Write Box 6020, Frost-Smith Advertising, 64, Finsbury Pavement, London, E.C.2.

A UNIVERSITY GRADUATE, age 23/24, required for a progressive appointment in the London Head Office of a well-known Eastern Merchant Firm. Knowledge of languages an advantage.—Write Box No. 627/1, c/o Foster Turner & Everetts Ltd., 11, Old Jewry, London, E.C.2.

DEVELOPMENT MANAGER of considerable ability (preferably University graduate) required to co-ordinate and promote projects in the field of textile manufactures. Economist with experience of textile technology or mechanical engineering would be desirable. Languages an advantage. Age preferably over 30 years. Please apply in handwriting to Box 696.

Three Months to Go

THE debate on the economic situation was still in progress in the House of Commons when this issue of *The Economist* went to press, and detailed comment must therefore be postponed. Mr Gaitskell's analysis of the problems now facing Britain contained, indeed, nothing unexpected. The essentials are simple. The commodity boom of last autumn and winter has raised the cost of the things that this country imports by 43 per cent, while exports have expanded correspondingly neither in price nor in volume. At the same time, the primary producers of the sterling area have ceased to earn a substantial dollar surplus. Britain is temporarily getting the worst of two worlds. Thanks in part to the rigidities of bulk buying, this country is still paying dearly for its imports while dollar earnings, responding more quickly to the fall in commodity prices since the spring, have been reduced. The deficit in Britain's general balance of payments is being financed by incurring, faster than ever, fresh short-term debts to the other members of the sterling area; and these additional sterling balances are not being matched, as they were in the previous eighteen months, by extra assets in the form of larger gold and dollar reserves.

Here are all the ingredients for another period of economic stress. One relief can be expected. The terms on which imports are exchanged for exports should become, temporarily at least, less unfavourable to Britain as import prices belatedly reflect the recent recession in commodity markets while export prices continue to creep up, in response to past increases in the cost of both raw materials and labour. But this change alone can hardly be big enough to close the payments gap, and there is likely to be little to help it. The signs are that at home inflationary pressures will mount sharply in the autumn and will suck more goods into the home market just when the growth of German and Japanese competition is making the export markets in any case more difficult for British manufacturers. There seems at present to be only a slight chance of securing that large increase in exports of consumer goods, such as textiles and china, on which a future balance in overseas payments depends; there is no chance at all of securing the coal exports that would be most valuable. The probability, indeed, is that all the other difficulties will be accentuated by an acute shortage of British coal this winter.

Even if all these matters turn out more favourably than it would be prudent to expect, the British economy will continue to depend on the willingness of some other countries not merely to leave their existing large balances in sterling unspent but to continue to extend fresh credit to this country. This willingness is not inexhaustible. No one can tell when the breaking-point—the point when creditors demand either British goods or American dollars in payment—may come. But it has certainly been brought nearer by the large accumulations of sterling during this year. Within the next six or twelve months the economy can drift only too easily, if nothing i

done, into a sterling crisis that would not merely disorganise Britain's foreign trade but threaten the jobs and welfare of large sections of the British people.

To prevent such a catastrophe there has to be a vigorous new export effort; and no one seriously supposes that it can be secured primarily by the negative measures—the mixture of exhortation and threats, of physical controls and penalties on enterprise—that the Chancellor of the Exchequer suggested on Thursday. Those proposals, and particularly the introduction of statutory control of dividends in the autumn, are an electioneering programme. At best, they are designed to give an appearance of softening—though certainly not to remove—the impact of adverse circumstances on the British people. And they are therefore bound to make the external deficit worse, not better. That deficit has arisen precisely because unrealistic Government policies have already enabled the British people temporarily to defy economic circumstances. In the first quarter of 1951, they enjoyed a standard of living 5 per cent higher than in 1950 although both the requirements of defence and the adverse movement in the terms of trade were reducing the real resources available for British consumption. It is, fundamentally, this buying spree, out of step with the underlying economic trends, that is now reflected in Britain's renewed inability to pay its way abroad.

The way to correct this failure in economic planning is plain enough. It is to remove the surplus purchasing power that made the buying spree possible. The weapons for such an attack are well known. They are higher interest rates and a larger Budget surplus. There are, admittedly, enormous practical obstacles to the use of such weapons, and no one—the Opposition least of all—has yet got down to the details of an effective policy. But the obstacles are political, not economic. The weakness lies, primarily, not in the weapons of economic planning but in the will to use them. A Labour Government is not necessarily in this respect weaker than a Conservative Government would be. But no government can set out deliberately to reduce the country's standard of living when it exists on a trifling majority in Parliament and has already lost much support in the country. A Labour Chancellor, in particular, can adopt a firm financial policy only if his government is strong enough to defy many of its own supporters.

No responsible leader of the Labour Party can suppose that the Government is at present capable of executing such a policy as is needed. The record of the last four months must complete, if that is necessary, the disillusionment. The one fruit of staying in office has been the Budget, and the Parliamentary session ends with just such an economic crisis as the Budget was intended to prevent. It was, indeed, as sound a Budget as the political conditions of last April entitled one to expect. It was also—chiefly because public opinion did not appreciate its dependence on rising prices—a fairly popular Budget; during the summer, Labour has regained some lost support. But in being popular the Budget has proved also to be weak. The policies it embodied are failing to prevent inflation and to secure a balance in external payments. In the atmosphere of uncertainty and crisis that must now follow, the Government may expect to lose again the support that it has gained, with no advantage to itself, since the spring.

The only adequate remedy is a fresh Budget in the autumn. But to bring a severe Budget before the present Parliament is plainly impossible. It is now beyond question that Mr Attlee can avoid an autumn election only if he also avoids throughout the winter the pressing problems of the British economy.

It is possible to recognise the sincerity of the reasons that have made Mr Attlee decide against an election so far. It is impossible to recognise that they now have any validity whatever. In effect, Mr Attlee assumed that the Government could carry on because it would have to deal with few serious problems except in foreign policy and defence, on which the parties were substantially agreed, and the smallness of Labour's majority therefore did not matter. The assumption had some basis last year, when British policy seemed at last to have gained some mastery over economic life in the postwar world. The appearance was deceptive. All that had really happened was that circumstances had become temporarily favourable to Britain. It was the environment, not the control, that had improved. This country is now caught up in a new period of greater economic stringency. It will drift before a gathering storm unless the firm policies possible only for a strong government, whatever its party composition, are adopted soon. The duty as well as the interest of the Labour Party is, more plainly even than before, to appeal to the electorate in October.

Towards Europe's Army

WITH long labour and no little skill another European plan of French conception has been brought to birth. It is true that the Pleven plan for a European army still consists largely of principles and hardly at all of facts; but the interim report that was approved in Paris on Tuesday by representatives of France, Germany, Italy, Belgium and Luxemburg represents an impressive measure of agreement on quite revolutionary proposals for an integrated defence organisation. Allied statesmen have now to see how it can be reconciled with the proposals for a German contribution to General Eisenhower's integrated force of national contingents that have been worked out by the Allied High Commissioners and German military experts at the Petersberg. If they try hard enough they may yet succeed in creating what is called a "common supranational political and military authority," under which will serve the armed forces that members set aside for European defence; but it would be foolish to pretend either that the plan is near realisation or that it would not take a long time to realise it. It is in fact less advanced than the Schuman Plan for iron, coal and steel; and neither plan can come to anything until several further decisive steps have been taken in Germany's relations with France and the rest of Europe.

There is hard-headedness as well as idealism behind this plan for a European army and defence organisation. Many Frenchmen see in it the one way of controlling German rearmament; others see it as an essential part of the united Europe they are trying to build, with the proposals for a Minister of Defence, a Council of Ministers and an Assembly as the crucial features. Some Germans see in it a way of getting their own rearmament cheaply and quickly; many more see in it another means of bargaining their way back to independence and equality in Europe and eventually in the North Atlantic Treaty Organisation. American political and military opinion, which last September was sceptical and impatient of this French attempt to delay and control German rearmament, has now come round to the view that there may be something in it after all: here may be a genuine effort towards that integration which General Eisenhower and Mr Churchill have lately demanded so eloquently. The British Government, quite rightly sceptical of anything that detracts from the main effort of providing Europe with adequate forces, but quite wrongly sceptical of the whole drive towards European integration, has watched the negotiations with cold aloofness and declared its intention to take no part. It prefers the idea of German national contingents to be brought under General Eisenhower's direct command.

*

In short, the Pleven Plan proceedings have reached the stage at which no real progress is possible unless firm decisions are taken about what can and what cannot be done about German rearmament and the French attitude towards it. The two basic facts in the argument are still these: first, that General Eisenhower needs some fifty divisions for the defence of Western Europe, and has discovered no way of making up that number save by getting ten to twelve divisions of German soldiers with an adequate tactical air force; secondly, that the vast majority of Germans do not want, as yet, to make either this or any other contribution to the common defence until there are sufficient non-German forces on their territory to resist successfully any Russian threat to their security. In other words, Western Europe cannot be defended until the Germans rearm; and the Germans will not rearm until their country is defended. This is to state the dilemma very baldly, for there are other motives at work in Bonn; and the question of what the Federal Republic will do for defence has become inextricably linked up with the question of what the occupying powers will do to meet its political claims. If it was believed last September that Germans would jump at the chance of bearing arms again, it is now realised that their co-operation must be bought by political concessions. The questions to be settled now, therefore, are two: how urgent is Europe's need of these German divisions? And how high a price it is worth paying for them?

For most Americans concerned with the question the answer has so far seemed clear. Western Europe must have troops on the ground quickly; and when the United States, Britain and France have stretched their resources to the utmost they fall far short, for two or three years to come, of the number that the generals believe adequate for western security in the cold war. The gap can and should be filled by Germans, because their quality is known, their interest in resisting Communism and Soviet expansion is obvious, and their dependence on American economic aid is notorious. Moreover, if there are to be German divisions trained and equipped by 1953—and General Eisenhower can hardly expect anything earlier than that—a start should be made now with recruitment and organisation

For the French the answer is much more complicated. Many of them fear the German strength of the future more than they fear the Soviet power of the present. They admit the inevitability, if not the need, of some German rearmament; but they want the Germans to accept, while still weak, such obligations and restrictions as will give Europe security against the hegemony of a nationalistic Germany. Both deep distrust of the Germans and sincere hopes of finding a new relationship with them are expressed in their determination to create for Western Europe political, economic and military institutions in which Germans will accept a partnership that both liberates them and engages them. For the French the Pleven Plan, the Schuman Plan and the Council of Europe are all interlinked. The French, like the Germans, want to set a price and strike a bargain. They, as an occupying power, will agree to ending the Occupation Statute and giving Germany a more equal status in Europe provided that the Germans accept in advance the defined obligations of European partnership and prove that they will work. And these include acceptance of a European defence minister or commissioner to control the generals and their staffs, and to influence decisions for or against war; the integration of German units—the French Assembly insists that they shall not be called "divisions"—in European army corps; and the integration of German staff officers with their European colleagues. There must be—say the French—no new German Staff with its own plans to "get back the German east" beyond the Oder-Neisse line.

The British Government, determined to have nothing to do with the European army, has followed a wobbling middle line. It disapproves of American haste to get German divisions; and it is sceptical of French efforts to bind the German Samson; but it also doubts, rightly, whether Federal Germany is capable of becoming the Samson that the French fear. For there is at present no intention of reviving the German armaments industries or of asking the Germans to contribute industrially anything that cannot be made in the course of peaceful production. Indeed, the Germans themselves are obviously determined, for the time being at any rate, to get all the equipment and arms they need at other people's expense. As the volume of that equipment available is still insufficient to meet the full needs of Nato, and as the Americans agreed last December with their allies that the Germans should come last in the queue for such aid, the tendency in London is to mediate and murmur *festina lente*.

*

If the Americans are now a good deal closer to the French than they were a year ago it is partly because General Eisenhower now reads the European situation more accurately than did the Pentagon last year, partly because the Germans have overplayed their hand. Both in Bonn and outside—notably in Social Democrat opposition led by Dr Shumacher—it seems to have been believed that the Supreme Commander's search for ground troops was so desperate and American weakness so aggravated by the Korean war that almost any price could be extorted for a German contribution to European defence. Politicians and party leaders used the recent State elections to make their task of persuading the apathetic and defeatist Germans to do something

for their own defence even more difficult than it already is. Full equality of rights with Europe (*Gleichberechtigung*) was demanded as the condition of rearmament. Blackmail is not too strong a word for the tatics that have been pursued, and it is only quite recently that the Germans seem to have realised that the Supreme Commander really meant what he said in declaring that he wanted no unwilling soldiers, and that the condition of accepting German units must be a political understanding "that will contemplate an eventual and *earned* equality." It is, perhaps, because the meaning of his words has begun to sink in that the Germans have now agreed to the interim report on a European army and that they have shown themselves not unreasonable in the technical discussion between their military experts and the Allied High Commissioners at the Petersberg, where the talk was at first of an army of 250,000 men, a very large tactical air force, and an independent German general staff.

To make haste with German rearmament along the lines that were laid down last September will lead nowhere; and it is a pity that the American High Commissioner, Mr McCloy, felt it necessary to give recently in Washington a picture of the Germans' readiness to defend themselves that was rosier than the evidence justifies. It is in the political, rather than the military, sphere that haste might bring results. For unless Dr Adenauer can show the *Bundestag* and the German people definite evidence that they will be treated in the new western institutions as free and equal partners, he will be unable to make good the pledges that have been given in the Pleven Plan. It is almost certain, for example, that German divisions will have to be raised by conscription. To do that it will be necessary to amend the constitution and to hold a general election to approve the act. If such an election were held now, Dr Adenauer, the good European, would almost certainly lose and Dr Schumacher, the rabid nationalist, would come into power. In other words, the Americans, British and French have to work out in the months ahead such a revision of the Occupation Statute and such concessions to Germany's political claims as will enable the Chancellor to show his people that it pays to be European. If this demonstration cannot be made, then it is most unlikely that anything will come either of the Schuman Plan or of the Pleven Plan. German rearmament will not come about and French policy in Western Europe will face utter failure.

No British Government can stand by at such a juncture with its arms crossed and just tell Europe to get on with it. For it is no exaggeration to say that both the defence and the unity of Europe depend on the prompt and magnanimous handling of the German problem. The Germans in their present mood will not make it easy; but their Government's adhesion to the first sketch of the Pleven Plan is an act of courage which should strengthen confidence in its good faith.

Statesmanship on the Cheap

AT the next general election a number of members of Parliament are going to lose their seats principally because of dissatisfaction with the rising cost of living. This will be fate at its bitterest, for the average MP has probably suffered more from rising prices than the average member of the community as a whole. He still gets the £1,000 a year he awarded himself in 1946; prices have risen by more than 30 per cent since then, and his expenses, which he must meet out of his salary, have risen accordingly.

The largest item is secretarial assistance. The size of the MP's mail varies a good deal; broadly speaking, the more active he is in his constituency the more letters he receives, and the more letters he writes the more he has to write. An average figure would perhaps be fifteen letters a day. Some members are to be seen in the House every morning laboriously answering them by hand. But this hardly seems the best use of an able or busy man's time, and the majority either have a full-time secretary or share one—one girl to two or three members. Some have experienced secretaries who will answer most of the letters on their own initiative, and who keep card indexes of the MP's "cases," so that when he visits the constituency he can take a bunch of cards and show an astounding degree of personal interest on the doorstep. Secretarial assistance, if he uses it at all, will thus cost the MP anything between £120 and £400 a year. Postage, at twenty letters a day, will cost £65 and telephone and telegrams may also be a substantial item. Constituents who call at the House must be entertained and rounds of drinks have to be bought in the constituency. Moreover, many MPs have to undertake, when they are adopted as candidates, to pay a fixed sum each year into the funds of their constituency party. Trade union nominees pay nothing, and since the Maxwell Fyfe reforms Conservatives may not contribute more than £50 a year; but many a Labour member is paying as much as £100 a year out of his own pocket.

It is true that all these expenses, except entertaining, count for income tax relief. The member gets £100 tax free and as much in addition as he can justify. Paradoxically, the poorer an MP is the less he is able to claim as expenses in his tax return. For if he has no income other than his parliamentary salary he will hardly be believed if he claims to have nothing left after paying his expenses; the MP with other sources of income can make such a claim, and a few do indeed get almost the full £1,000 tax free. With the exception of London members whose homes are in their own constituencies, MPs may claim relief on the cost of running a second home. The cost of running a car qualifies as an expense only within the bounds of the constituency, but MPs have benefited from the initial allowance of 40 per cent on the cost of buying a new car. Many who have bought and sold a car every year or two will be sadly out of pocket when the initial allowance system comes to an end in April.

Though accurate generalisation is very difficult, it is probably not far wrong to say that, outside the group who write their own letters, the expenses actually incurred by an MP in the course of his business as a politician can hardly be less than £300 a year. The average—for which the appropriate measurement is the

median rather than the arithmetic mean—seems to be nearer £400 a year. The MP is therefore left with £600 to £700 gross—a sum that obviously must be supplemented by other sources of income if the political life is to allow its practitioners anything near the standard of living that most of them could obtain in other occupations. There are perhaps fifty to a hundred members living on the £1,000 only, but many of these are elderly trade unionists, bachelors or without dependent children; some of them are over the retiring age for other occupations, so that they are probably not, on balance, the worst cases of hardship. A group which is better off is the small number of union members who are paid an income by their unions. At the opposite end of the economic scale, there are those who are earning very substantial incomes and find it an asset to be an MP. Most of them are lawyers, successful journalists, and company directors—three occupations which can be combined better than most with parliamentary work. Even they, however, are finding life rather more difficult. The journalist is up against the shortage of newsprint and the barrister, in the present state of the parties, cannot accept briefs that would make him miss divisions in the House.

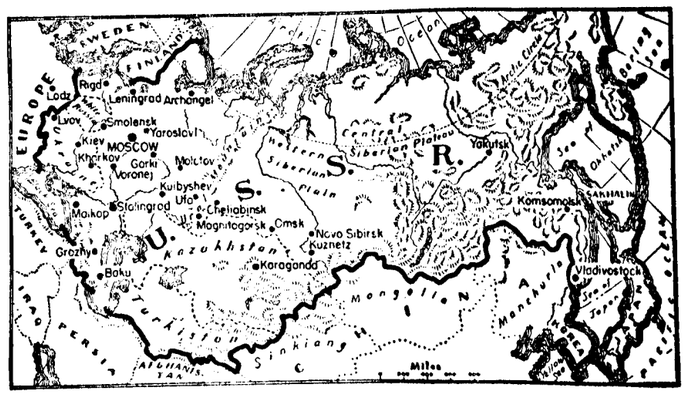
*

The MPs for whom the present level of parliamentary salaries involves the greatest financial sacrifice are a middle group of about a hundred to a hundred and fifty members who have no private means and no incomes from nominal occupations, but who earn, in addition to their salaries, small sums adding up to a few hundred pounds a year. To get this additional income they are eagerly on the look out for opportunities to broadcast, to write an article, to be televised. It is true that the same piece of research will do for the speech in the House, the constituency speech at the week-end and the article in the press—which is paid for at a higher rate because the author is an MP. But the opportunities, except for the established journalist, are few. Moreover, the time in which to earn money is very limited. With the extension of the sphere of government the business of legislation becomes steadily heavier and more complicated. At the same time, the burden of constituency work has been greatly increased by the growth of literacy and the accessibility that the MP is expected to display in the age of the common man. The MP, like the civil servant, is harassed by people's efforts to get themselves higher on the waiting list for houses or to secure a higher war pension. Unless he is lucky enough to have a job that dovetails easily into his parliamentary work or involves only nominal duties, he finds himself in a dilemma. If he is very active as an MP he may gain in reputation and in constituency support, but his income will suffer. If he tries by his outside work to support a family comfortably and to build up resources against old age, or merely against failure in another election, he has to scamp his work as an MP—as far as his party whips will allow. He may write the necessary letters and make the occasional speech, but his study of complex legislation is likely to be perfunctory; and he will never, if he can help it, be available for committee work.

More important still, he has not time to think politically. The present poverty of political thought, the fact that it is the managerial and technical type of speech which is admired rather than one which raises more general principles, reflects this pressure on the MP's time. It is better that the majority of MPs should have outside work than that we should be governed by professional politicians; but the salary paid should not be such that many MPs are very hard up, or having to work desperately long hours in order to avoid being hard up. It should even be enough to enable a few devoted members—not just the elderly, the single and the unemployable—to give all their time to parliamentary work. No one wants people to put up for election for the sake of the money; it is better that most men should have to make some financial sacrifice by becoming MPs. But the sacrifice should not be such that able people consider it prohibitive. And that is the point which seems to be quickly approaching.

*

In theory the present balance of the parties makes this a good time to secure an all-party agreement to raise members' salaries. In practice, however, the Labour Party would fear the loss of votes involved, and the Conservatives would be unwilling to surrender the chance to attack them. "MPs Give Themselves A Rise" would look bad in the headlines, particularly when moderation in wage claims is urged on the rest of the community. Would it be possible, then, to give some relief in kind? Free postage would help, though not greatly, and it would have its disadvantages. It would enable the sitting member to be steadily electioneering at public expense from the moment he is elected. A greater benefit, and one less likely to be abused, would be to supply part-time secretarial assistance free. There is an unanswerable case, when a man has been elected to Parliament, for providing him with the facilities he needs in order to do his work. No other democracy treats its politicians in such niggardly fashion as does Britain. To provide secretarial help would, it is true, mean building a new block of offices. Moreover, the pool typist would not be as useful as the personal secretary; and the MP whose work, whether private or parliamentary, is now handled by his own secretary, would not benefit. An alternative, which would cater more flexibly for the differing needs of MPs, would be to give them a fixed grant of, say, £250 towards secretarial assistance. The country might not be too unsympathetic if this were done "in view of the increasing burden of parliamentary work," and if the legislation were backed by a determined, all-party effort to bring home to people the fact, so often forgotten, that the MP's £20 a week is not at present what he has to spend on himself and his family. Even so, a cash provision would probably be less acceptable in the country than a provision in kind. And, in either case, it would be a great pity if help with secretarial expenses encouraged the MP's constituents to write to him more often.



Pensions are another matter in which the present provision is unduly niggardly. If MPs can hardly maintain themselves, they can certainly not make provision for retirement. Moreover, on top of all the usual humanitarian arguments for pensions, there is a special reason why pensions should be provided for MPs: they would then be far less terrified of the prospect of a dissolution and better able to face the party whips with independence. It was a great strength of the parliamentary

system in the old days that MPs were ready to retire to their estates rather than violate their principles and the knowledge that an adequate pension was available would provide some latter-day shadow of the estate. It would do so, of course, only if the arrangements were unorthodox in the sense that the amount of the pension did not rise with length of service. There would have to be some minimum qualification—to have been re-elected once or twice rather than to have been elected once. The cost to the Exchequer could be kept to fairly small proportions if the pension were given only when the ex-MP's income would otherwise be less than £1,000 a year.

There are difficulties in all such proposals, but they should not make the country lose sight of the fact that the whole democratic system of government depends on the quality of the men it puts in office. It is a great mistake to try to get statesmanship on the cheap.

Houses for Russians

As argument goes on in the western world about the adjustment of domestic policies to defence requirements, it is often forgotten that the Soviet Union, for two periods of the last twenty years, has had to deal with just these difficulties. Before the war there was the period of preparation against the armies of Hitler; after it there was the period of maintaining a high level of armaments—but not a full war economy—with which to maintain and exploit the international situation created by the defeat of Germany and Japan, the weakness of Europe, and the disarmament of the United States and Britain. To the planner in Moscow, therefore, the idea of semi-war economy, whether it be three-quarters peace or three-quarters war, is familiar; and much that has been done and said in the Soviet Union throws light on his handling of the problems. Detailed judgments are, of course, impossible, owing to the care with which only limited economic information is released; but it is possible both to detect symptoms and to pin down facts from some sectors of the Soviet economy. Information is seldom easily obtained about those economic activities that are going badly; that is to say, obviously falling short of the expectations either of the planners or of the Russian consumer. But it becomes necessary from time to time to put the whole weight of the Communist party behind a campaign of production, or to give some airing to complaints and criticisms that are known to be justified and widespread. Only then is it clearly revealed how the planners of the Soviet Union deal with conflicting priorities and how the consumer in the Soviet Union has seen—and still sees—his hopes and claims giving place to the demands of heavy industry, raw material production and investment in transport, and what are called "Great Construction Projects."

Such a piecemeal revelation has occurred in recent months in the case of housing, a sector of the economy in which the needs of the consumer in their most primitive form and the demands of heavy industry are most clearly in conflict. Shortage of houses is, of course, a seamy side of rapid industrialisation that is inevitable even in a world at peace, and in the Soviet Union it has been a permanent headache to planners. There are signs that the shortage has now become particularly acute; that is to say, more publicity has been given to it in the Soviet press than is usual with defects in the Soviet economy. First it was learnt that in the last five years rural housing had been sacrificed for the sake of urban building and, therefore, failed to reach the planned figure. Now it is known that urban building, too, had to be curtailed and in the first quarter of this year fell short of the planned amount. There are many reports in the Soviet press of "squatters," and numerous attacks on the town planners, accusing them of constructing small houses in the suburbs instead of big buildings in the centre. A recent issue of *Pravda* said that in Stalingrad, a city that gets particular attention, "industrial establishments have been entirely rebuilt, while house building is on a large scale." To the initiated this reads: "factories are working again at full pressure, but housing conditions are gravely disturbing."

The task which faced the Soviet building industry after the war was indeed, tremendous. Even without the destruction caused by the war, it was extremely difficult to keep pace with the growth of the urban population caused by industrial development. From 1926 to 1939 the town population grew from 26 million to nearly 56 million, and from less than 18 to nearly 33 per cent of the total. The pace slackened during the war, but it has picked up somewhat since then, and the urban population now greatly exceeds 70 million and accounts for much more than one-third of the total. Thus, in the last quarter of a century, room had to be found for nearly 50 million new town-dwellers. New towns were built always with the same order of priority; first, workers living in barracks erected factories, and only then did they build houses to live in.

In this way there sprang up Magnitogorsk in the Urals, Komsomolsk in the Far East and Karaganda in Kazakhstan—towns which were not yet on the map before the Revolution. In addition to the bigger towns, smaller

workers' settlements were erected consisting of a thousand or more wooden houses, and these are so far more numerous than the towns proper. The older towns, too, grew up in great strides. In Moscow, for instance, the population rose from 2,029,000 in 1926 to 4,137,000 in 1939 and 5,050,000 in 1950. In the same period the population of Baku was almost doubled, rising from 453,000 in 1926 to 850,000 in 1950; and the inhabitants of Kuibyshev increased from 175,000 to 600,000.

Such pressure of population would have been a nightmare for any town planners, especially as they had to compete for scarce resources with equally harassed planners in other branches of the economy. Yet, in 1945, they had in addition the equally gigantic task of reconstruction in the western regions ravaged by the war. The residential districts of Stalingrad, Smolensk, Voronej and other towns had been completely destroyed, those of Leningrad, Kiev or Kharkov scarcely less so. According to Soviet statistics 1,700 towns and workers' settlements had been reduced to ruins. Out of the 100 million square metres of floor space which were to be restored or built in the towns during the Five Year Plan (1946-50), some 60 per cent were needed to rehouse the victims of the war in the west. The plan, it is claimed, has been somewhat overfulfilled; but even so it does not leave more than 4 square yards—that is, six feet by six feet—per head of new town-dweller, which is certainly very little indeed. (In Britain, 900 square feet is allowed for a standard one-family subsidised house.) Yet even this was achieved only by the sacrifice of rural building. When, in 1949, in view of the tense international situation, the Soviet rulers decided to step up the production plan for heavy industry, it was clear that consumers' goods industries and housing would be the chief sufferers; and it was housing in the rural areas that first felt the axe. By the end of the plan period only 2,700,000 rural dwellings had been built or restored, or one-fifth less than the 3,400,000 dwellings which were to have been erected by 1950.

*

Towns were given priority over the countryside because it was necessary to house the industrial workers. Now, with the inexorable logic of scarcity, the planned dormitory areas of towns are being sacrificed for the sake of factory building, and urban housing is falling short of the already inadequate figures of the plan. This must create much discontent among town workers, and the Soviet rulers, to anticipate further trouble, seem to have decided to bring the matter into the open and put a great part of the blame on incompetence. The Ministry of the Building Materials Industry and its head, M. Yudin, were chosen as scapegoats. Not only is his Ministry being rendered responsible for all the usual defects of hasty construction, but it is also strongly attacked for supplying in the first quarter of this year only one-third of the building materials for housing which it was to provide under the plan. Such a failure can hardly be wholly the result of incompetence; it must form part of a general policy of putting factories before houses.

Thus the second line of attack, directed at town planners, seems more logical. Since resources are and will remain scarce, they must be used in the most economical ways: big blocks of flats should be built, and they should be erected in the centre of towns so as to shorten the range of roads and sewage mains required. The recently constituted all-Soviet Housing Committee points out accusingly that in most towns the opposite policy has been followed. Thus, to quote but a few examples, in Kuibyshev and in the centre of the car industry at Gorki, small houses accounted for over 95 per cent of the buildings erected during the last three years. In the tractor-producing Cheliabinsk in the Urals, and in the oil-refining town of Jaroslavl, nearly all the houses were built in the suburbs. Both planners and inhabitants are equally to blame, it is argued, and the whole policy must be quickly reversed. It probably will be. Even so, however, and despite the apparent achievements in building techniques and in mass production of standard parts to be assembled on the site, the housing position is likely to remain painful and even to deteriorate as long as the Soviet view of the international situation is such that heavy industry must have first call on the resources of the country.

The present housing situation is certainly bad, even appalling by western standards. The Soviet Press admits that in new houses small rooms are allocated grudgingly according to a metric quota of floor space. Bureaucrats and privileged shock-workers are given priority. In the older houses with five-room flats, five families in a flat is the rule rather than the exception. Western standards, however, should not be rigidly applied, for living conditions in Eastern Europe were never comparable with those of Western Europe, let alone of England. Electric light and a good water and sewage system were often luxuries even in towns like Lodz, the Manchester of Poland. At least all the towns in the Soviet Union now have electricity and this is, indeed, something for a Russian *mujik* turned town-dweller. Yet, even this patient new townsman, who may in his youth have experienced the squalor of housing in the Russian countryside, is capable of becoming restless in the long run. This is probably the reason why the Soviet headquarters has now sounded the alarm on the housing front. It is, however, unlikely to throw any new forces into the battle. The five housewives sharing a kitchen stove may well ponder on the fact that, paradoxically enough, this overcrowding is one of the penalties the Russians are paying for belonging to a nation that is a great international power. How great the penalties are likely to remain cannot be judged until more is known of the objectives of Soviet planners for the future; at the moment no plan for 1951 has been published and there is no sign of the next five-year plan. It may well be that the decision to move closer to a state of full war economy has not yet been taken and that Moscow is content for the time being with a state of affairs in which defence expenditure is about half-way between the level of the peaceful early thirties and that of full preparation for war with Germany.

NOTES OF THE WEEK

Mr Acheson and the Cooing Bear

It is premature to start talking already of a Soviet peace offensive, for so much of it consists so far of mere affability—and affability costs nothing and commits nobody. Mr Malik's suggestion for a cease-fire in Korea was something that could be bitten on; and if it leads even to the beginnings of a settlement in Korea, the Soviet leaders will be given full credit for helping the Chinese and North Koreans out of a nasty situation. But the appearance of an article by Mr Morrison in *Pravda*, the publication in Moscow of a new English-language magazine with copious references to the historical friendship of Russians, Americans and British, and the symptoms of cordiality in Soviet diplomatists that are being reported from all over the world—these amount to little more than a pleasant and cooling water ice. If they are the prelude to acts of friendship and co-operation, well and good; if they are not, they will have to be reckoned as part of the plan that is now getting public men from the free world to visit Moscow and discuss all manner of topics under the auspices of the subversive peace campaign.

Mr Acheson struck the right note when he spoke in Detroit on Tuesday; indeed, Mr Acheson has for some time been formulating western policy more clearly and consistently than any other western statesman. He insisted that the situation remains dangerous so long as Soviet power "is of threatening proportions" and so long as Moscow "does not show willingness to work for a stable and peaceful world." The object was to block Soviet expansionism without war by building an effective system of collective security. While that was being done, danger would remain; to relax the effort would be as dangerous as it is "to fall asleep in a blizzard."

It may sound callous and stubborn of Mr Acheson to say that the free world's task "remains the same whether our adversaries are cooing like doves or growling like bears"; but the Soviet leaders would probably say exactly the same of their task. In Warsaw on Sunday Mr Molotov, who is in charge of Soviet foreign policy, found it impossible to do anything but growl warnings to possible Titoists in Poland and warmongers in the West. If he had given any hint, before a picked Communist audience, of a desire to negotiate at the great points of tension in Germany and Austria it would have been something to treat with attention and respect, and the growls could have been ignored. But he seemed much more concerned to rally the satellites around him by emphasising the solidarity of the Communist bloc—including 18 million Germans—against the world of the Atlantic Pact. It is possible, of course, that the Kremlin is seriously frightened of the rearmament that its policy has provoked in Europe and the United States; but it will not make concessions to that growing power until it is convinced by trial and error that it cannot divide peoples and governments by helping the Bevanites of the western world. Those who let themselves be lulled by the cooing will help to put off the day when serious negotiation becomes possible.

* * *

Persia Thinks Again

Mr Averell Harriman has won a round by revealing that some Persian minds are still half-open to reasoning. He has extracted from Dr Mossadegh's government suggestions for a possible resumption of oil negotiations which concede at least one point not previously conceded: readiness to negotiate with the British Government. Previously it had contended that its quarrel was purely domestic, between itself and its concessionaire. The "suggestions" are ambiguously worded, but give grounds for hope that the Persians will also concede a second important point: that discussion could take place on the basis of the nationalisation law of March 15th, which merely established the principle of nationalisation, instead of on that of May 1st, which dictated the conditions in which the employee of the Anglo-Iranian Company was to be converted into a Persian government servant.

Several factors seem to have combined to produce this slackening of tension. One is Mr Harriman's personality: he not only impressed the Persians he met, but spurred them to be unusually thoughtful and reticent about their talks with him. Another was the overwhelming knowledge of the conditions of trade in the world's oil displayed by his accompanying adviser, Mr Walter Levy. A third was the discovery that the advertisements of Persian oil for sale, that have been appearing in the world press, do not immediately bring a queue of customers, particularly when they carry the footnote that buyers must bring their own tankers. A fourth—and one which may bring dissension inside Persia—is the realisation by some Persians of the triumph they are scoring for Soviet policy. Attention was drawn in *The Economist* of June 9th to the skill with which the Russians had refrained from frightening the Persians by displaying their satisfaction over the plight of Britain. In recent weeks their delight, and the hand they are now taking in events, have been less well-concealed, and some Persians have noticed them.

But the British are not yet past the peak of their difficulties on account of the situation at Abadan. Trouble between company and government has always been exacerbated by the sheer distance of the oilfields from Teheran, by the difference in atmosphere between a high-plateau capital and a coastal desert, and by resultant lack of co-ordination between events and tempers—British as well as Persian—in the two places. Exasperating nuisance tactics are still being followed by the Persian government representatives in the south. Some of these are poor men and they have gazed on the rich loot which would fall into their hands if they were to be able to smoke the British out. The British personnel on the spot cannot indefinitely be subjected to their insults. Yet it is doubtful whether Dr Mossadegh has the power to call them off at long range. The immediate problem for the British Government is at Abadan, not in Teheran.

* * *

Jordan Without a King

King Abdullah's death sent half Jordan into deep mourning. But in the other half of his kingdom—on the west bank of Jordan that was Palestine till 1949—few tears are being shed; the same can be said of the refugee camps on either bank. Some ex-Palestinians—responsible men who see the dangers of quarrelling within the Arab world—have been ready to work with him. But there is no love lost between the thousands of indigent people who regarded his annexation of Arab Palestine as traitorous acceptance of the line that denies them their former homes, and the desert peoples of the east bank of the Jordan over whom he had ruled since 1921. The rift may well widen because he was shot on the west bank, in Jerusalem. In Cairo, a denial of complicity in the murder has been issued by his enemies of the "Gaza Government" that owes allegiance to the ex-Mufti of Jerusalem, Haj Amin al Husseini. But the murderer's motive was clearly the same as Haj Amin's: vengeance on a man who admitted the realities of life and the existence of Israel.

Jordan without Abdullah therefore threatens to become a prey to internal quarrels. These could be the more serious because the position about the succession is not clear. King Abdullah (a personal memoir on whom appears on page 221) must be rated as an unsuccessful parent, for all his virtues. He was autocratic and over-repressive of his sons' activities, and his elder son, the Emir Talal, has become a prey to melancholia and fits of violence. If he were never to be well enough to rule, the heir is his son Hussein, a boy of 14. Meantime Abdullah's second son, the Emir Naif, has been declared regent.

These internal difficulties play into the hands of all who want change. Among those who wish it must be numbered the Mufti, who wants a territory; the refugees, who want their old homes and jobs again; the Russians, who want trouble for the west, and the "Greater Syria" aspirants of various nationalities who would like an excuse to annex part or all of Jordan. Last on the list is the Herut, or expansionist party, in Israel, the waning fortunes of which are described on page 222. With so many pressure groups weighing upon it, the new government of Jordan, the Prime Minister of which is Tewfik Pasha Abulhuda, must work hard for strength at the centre if it wants to preserve stability and independence.

* * *

An Election Policy

Attempts to estimate the likelihood of an autumn election lose none of their fascination at Westminster although by now most of the considerations that Mr Attlee can possibly take into account—and many that he cannot—have been discussed to fine extremes of subtlety. The slightest winds seem to convince many members of the House of Commons alternately that an election in October or November is certain and that Mr Attlee and Mr Morrison are determined to hang on until the spring. On balance, however, the belief that there will be an autumn election seems to have hardened in the past few days. And Labour members can now face the holidays with the consolation that at least an election programme is written.

This is the statement, drafted primarily to the tastes of Mr Morrison, that the party's national executive committee approved on Wednesday. It is, primarily, the moderated version of the last election programme that Mr Morrison would have preferred in 1950; in domestic policy there has this time been very little serious opposition to the principles of "consolidation" and "digestion." The disagreement from the Left was concentrated on the statement's support of the rearmament programme. On Wednesday Mr Bevan and his three supporters on the executive committee made as much trouble as they could at every stage of this argument, but in the end they accepted the majority decision. The rumours that they would feel obliged to resign proved to be unfounded—which had, indeed, always seemed likely to be the case.

This statement of Labour policy is now being sent to the constituencies for discussion before it is submitted to the Scarborough conference in October. The resolutions submitted for the conference by the constituency parties and trade unions were published this week; both Mr Bevan and Conservative commentators have made the most of the fact that an overwhelming majority of the resolutions imply agreement with Mr Bevan and criticism of the Government. It is, however, quite wrong to take this as a guide from the constituencies as to the state of feeling in the party. The Left wing is always most vocal at these times, and many of the resolutions are similar enough to make it plain that they have been engineered by a small group of authors. There is no reason to doubt that, however Mr Bevan chooses to develop his campaign during the month before the conference, the executive's statement of policy will command a clear majority of votes at Scarborough. How many votes it will command in the country, as an election programme, is another question.

Another Divided Team?

In the last Parliament speeches on foreign affairs from the Labour backbenches were closely watched for signs of revolt against Mr Bevin. It was the Tories' turn to receive similar scrutiny during Wednesday's debate on foreign affairs. The leaders of both parties were looking, eagerly or anxiously, for evidence of the rumoured divisions of opinion within the Conservative ranks; in particular, it had been suggested that the more hotheaded Tory members were becoming restive under the moderating leadership of Mr Churchill and Mr Eden.

The signs of disagreement were in fact few. This was partly because discussion of the Middle East, the region in which the Tories are most impatient about the Government's policy, had been postponed until next Monday. But the more important reason is that there is no real, coherent challenge to Mr Churchill's views on the world situation. There is some chafing at his demand for restraint during the Persian negotiations, and there are some calls for more drastic action towards Egypt and in the defence of British interests in the South Atlantic. But Labour speakers and publicists are misleading themselves if they regard this as a significant revolt against Mr Churchill's or Mr Eden's leadership. Mr Churchill has had ample experience at curbing or guiding pressure for drastic action—as in the two years of demands for a second front—and he has never shown himself afraid of the more rigidly Tory elements in the party which, late in life, he came to command. He has never set the Left wing slogan on its head and cried *pas d'ennemis à droit*. There was a period, it is true, when in the Commons Mr Churchill appeared to be speaking with a much softer voice than Lord Salisbury adopted in the Lords, but on Monday he put himself into step with a gibe at Mr Morrison's "butter fingers"; the reports of a radical disagreement are baseless.

The truth is that, in foreign affairs as in home policy, the differing streams of opinion within the Tory Party are likely to remain below the surface so long as the party is in opposition. Nor is there much profit for the Tories' opponents in attempts to play off personal differences, such as those supposed to exist between Mr Churchill and Mr Eden. Mr Eden would be less than human (and much less than a politician) if he did not at times find that the role of heir apparent has its disadvantages. One acute Tory backbencher has described the relationship between the two men as akin to that between Queen Victoria and the future Edward VII in the later stages of the Great Queen's reign. But Mr Eden's loyalty to his leader cannot in any way be questioned, and there is in any case no reason to think that his views on present policy differ appreciably from those of either Mr Churchill or Lord Salisbury.

* * *

Up or Down?

Hopeful Labour backbenchers have lately been pressing the President of the Board of Trade and the junior Ministers of his department about the possibility of lower textile prices now that the raw material boom is receding. This impatience contrasts strikingly with the reluctance of Labour opinion to accept the consequences, in terms of retail prices, of the raw material situation at its tightest; the questioners seem to be unaware of the lags from which British consumers have benefited on the rise but may suffer on the fall. The price increases that have horrified shoppers in the last twelve months have accompanied the commodity boom set off by rearmament, but have not been primarily caused by it; until recently the influence behind them has been the earlier increase in sterling prices due to devaluation. The peak in raw material prices reached last spring has as yet made only a minor impact on the final purchaser's pocket, and its passing (assuming that to be more than a temporary phase) can afford a correspondingly small relief. Any rejoicing should be rather at the withdrawal of a threat of further increase than at the promise of a rapid future reduction.

Last week Mr Bottomley justifiably dodged the point-blank supplementary question in which Mrs Mann inquired whether he would advise his wife to put off buying blankets till the autumn. But to expect any perceptible fall by the autumn, which is just when some of the goods made from the very dearest wool will be reaching the shops, is to put a quite uncharacteristic faith in the beneficent capacity of private enterprise to damp down the impact of particular scarcities. Looking further ahead, the prospects may be brighter—and play their part in Labour's electoral calculations. The hope of lower prices is hardly relevant, however, outside that range of goods in which raw material costs form a particularly large proportion of the final price. In the world commodity markets, what goes up may come down; it is otherwise with the round of wage increases by which inflation is now being immovably built into the cost structure. There may be a brief, electorally propitious moment when, for many consumer goods, the effect of the decline in raw material prices will outweigh that of the rise in other costs. To identify this moment in advance would, however, be a feat of successful speculation with which none of the historic "killings" on the world's commodity markets would stand comparison; the Government would hardly be judging itself on past form if it pinned its hopes to such a feat.

Candour Begins at Home

On two occasions in the last week M. Spaak, as the outstanding personality of the Council of Europe, has shown before British audiences a generous understanding of British difficulties in co-operating with the movement for European unity. Indeed, he has stated their government's objections to full participation so fully as to come under suspicion of drawing a caricature. But there is one feature of his advocacy—and, indeed, of Mr Churchill's advocacy—that arouses even more suspicion. It is the refusal ever to state in specific, easily understood form the kind of detailed difficulties that have to be overcome. Two years ago this vagueness was pardonable, as there was little evidence of what these difficulties might be; now it is no longer pardonable, for the negotiations over the Schuman Plan, the working of OEEC and EPU, and the proceedings of the Council of Europe have supplied countless illustrations. In some cases the difficulties have been overcome; in others they remain; in most cases the soundness of the British Government's insistence on the functional approach, uninspired though it sounds, has been proved.

There is a danger that a pretence which was convenient and fair enough at the first session of the European Assembly may become a habit; and the result can only be, sooner or later, that some carefully worked out plan for political, economic, or military integration suddenly becomes unworkable when the voters in the countries affected realise what sacrifices are asked of them. There is a danger of this happening in Germany as the trade unions examine the Schuman Plan. It happened two years ago when the French wine-grower and horticulturist realised what was implied by the Franco-Italian customs union. It has caused difficulties for Benelux. The British will take more earnestly to heart the reproach that they have not done enough for European unity if they can read of European statesmen explaining to voters a little of what will happen when plans for integration make their impact on the individual miner, farmer and factory worker.

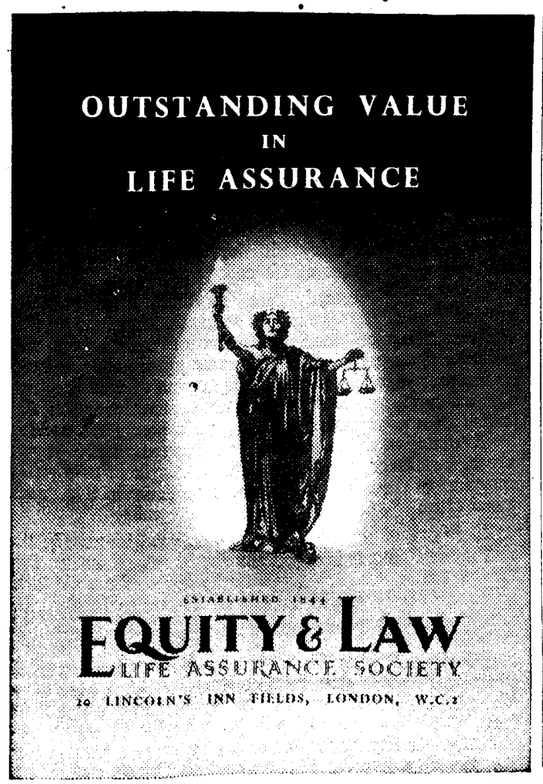
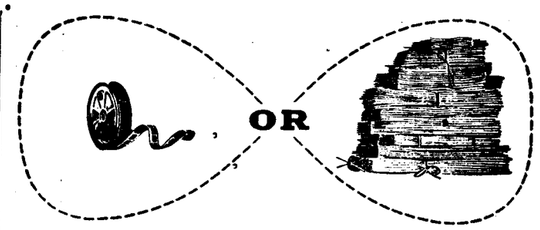
Progress at Kaesong



The latest reports from Korea indicate that the Communists, after an interval to observe reactions in the free world, have decided to climb down from their preposterous demand that an armistice should be made conditional on agreement to withdraw all foreign troops from Korea in advance of a political settlement. This is encouraging news. General Marshall on July 24th made it quite clear in a prepared statement that the American Government refused absolutely to withdraw its forces before a settlement had been reached, and further that for an armistice to be concluded there must be agreement on "a military line which would be defensible in the event of any renewal of hostilities" and a system of mutual inspection to guard against a sudden surprise attack. The United Nations army cannot afford to take any chances in dealing with an enemy which, as experience has shown, will justify any *Blitzkrieg* simply by asserting in the teeth of the evidence that the other side attacked first.



It seems likely that much patience combined with firm resolution will be required before an armistice is obtained. Meanwhile, however, the fighting has in any case died down. The United Nations' objective of driving the invaders out of South Korea has been approximately reached, and the aim now must be to make sure that they do not come back.

Rearmament Through Peace Committees

One wonders whether the genuine peace-lovers who attend the meetings and sign the petitions organised by the "British Peace Committee" and its local affiliates fully understand the nature of the international movement to which they are thereby lending their support. Some information about the present activities of the Chinese Peace Committee, which has the closest links with its British sister through the World Peace Council, may help to enlighten them. The

Who *can save up to 99% of your records space?*

Kodak are already doing this for many of Britain's best known businesses by making 16 mm. microfilm recording into a simple office routine. Kodak supply the high speed automatic machines to the user and all film is processed under scientific control in Kodak's own laboratories.

This service was pioneered by Kodak nearly twenty years ago and has been constantly improved, both in quality and speed. Every 24 hours over two million copies of records pass through Kodak's hands, most of them being processed overnight so that one day's records are available next day.

Find out if this service can help you. Talk it over with a Kodak representative.

ASSEMBLY

The TI Companies have been brought up on assembly problems. They make not only finished articles but component parts, great quantities of which are assembled in TI's own factories in Britain. Whatever they make, TI make it as if it were literally intended for their own use. This applies equally to precision steel tubes, electrical accessories, wrought aluminium sheet products, cycle parts, and a wide range of other components for most branches of industry.

TI's FORTY-NINE FACTORIES SERVE THE WORLD

TUBE INVESTMENTS LIMITED, THE ADELPHI, LONDON, W.C.2. (TRAFALGAR 5633)

Chinese Peace Committee (which is also known as the Committee to Resist America and Aid Korea) has in recent months come to play a central part in the expansion of China's armed forces. Since early June it has devoted its nation-wide propagandist network and its considerable powers of suasion to securing contributions for the purchase of arms; the latest figures to be proudly announced by Peking radio show that over 2,000 aircraft and 200 tanks and artillery guns can already be purchased with these contributions.

This is not, of course, the Peace Committee's only function. It is also campaigning for greater support for the Chinese "volunteer units" at the Korean front; for the signing by individuals and groups of "patriotic pacts" pledging herculean efforts in field, factory and school to keep the national armed forces supplied and to root out all opposition to the government; and for the recruiting of a quarter of a million 16-year-old boys and girls to enter military cadet schools. The Chinese Communist press and radio are giving the fullest publicity to these campaigns, adding much human interest in the form of such stories as that of a mechanic who postponed his wedding in order to work on Sunday as part of the arms fund drive.

* * *

Fraud and Identity

The correspondence, published last week, between Mr Clement Davies and Mr Attlee on the subject of identity cards leaves the impression that, while Mr Davies may have won a victory on points, he secured no effective verdict; Mr Attlee's last letter merely broke off the engagement. What is more disquieting is that the Government still seems determined not to face the issue on its merits. Twelve years ago the identity card started on its career as a security measure. The country is now asked to believe that it is necessary for administrative reasons. Like Mr Willcock, the citizen is entitled to ask "Why?", and it is to that question that, so far, no serious answer has been given.

Until Mr Willcock's stand (discussed in *The Economist* of June 30th, page 1550), the card was used for three main purposes: by the police, to provide a cross check on motorists' driving licences; by the Food Ministry, in connection with the issue of ration books; and by the Post Office to prevent (or hinder) fraudulent withdrawals from the Post Office Savings Bank. Mr Willcock has, effectively, wrecked the police card index of convicted motorists' identity card numbers. Can the departments substantiate their claims for its retention? The Ministry of Food already claims to work on the principle that no new ration book is issued in renewal unless the earlier book is surrendered. How can it be suggested that the production of an identity card as well lends any additional safety to the whole operation? So far as the Post Office is concerned, a depositor, to obtain any money from his account on demand, must produce his savings bank book, which contains his signature, and sign a form, thus providing for a comparison of the handwritings. All his identity card contains is another version of his signature, which would seem to add little to the security of the procedure. To cheat the Post Office a man must falsify his own book, or steal someone else's book, or forge a complete new book. If he falsifies his own book, the identity card is no protection at all to the Post Office. If he can turn out false savings bank books he could, presumably, turn out false identity cards equally easily; in fact, that would seem to be the simpler task. The Government's answer to Lord Reading's motion on identity cards in the House of Lords this week was not known at the time of going to press. But the impression left from the discussions of recent weeks is that the departments wish to retain the identity card because they cherish the belief that the criminal can be deterred from crime by increasing the trouble he has to take to succeed. One wishes there were some evidence to support that pleasant theory.

The Highest Civil Service

The resignation of another civil servant of the highest rank in order to take up an industrial post ought to act as a danger signal. Nobody who knows Sir John Woods, the Secretary of the Board of Trade, will wish to cast any reproaches upon him. He was seriously wounded in the first world war and for many years only great gallantry in the face of suffering has enabled him to go on bearing the crushing burden of work and anxiety that falls to the permanent head of one of the largest and most varied departments of state. He is one of the most popular figures in Whitehall and will carry with him into his new post the unalloyed good wishes of his colleagues.

The incident serves, however, to direct attention to the present state of the higher civil service. There are roughly thirty-five men of Permanent Secretary rank in the civil service; of these all but four are now 55 or over; and one of the four exceptions is resigning at the end of the year. There is nothing absolute about the retirement age of 60; but all these men have, for a dozen years past, been working far harder than the public can well imagine; and many of the best of them are in poor health. It is safe to say that very few of them will still be at their desks in five or six years' time.

There are, of course, plenty of able younger men in the civil service. But it is significant that though there are four men of Permanent Secretary rank below 50, there are none between 50 and 55, and the gap of the lost generation presumably exists in the second and third ranks also. The task of finding thirty men capable of filling the post of Permanent Secretary or Deputy Secretary of a department—in addition to the various posts in the nationalised boards and elsewhere which in practice have to be filled from the highest ranks of the civil service—will be one of quite exceptional difficulty. It falls to the lot of the Permanent Secretary to the Treasury, but Sir Edward Bridges himself reaches his 59th birthday next week and is beginning to pay the penalty of never having spared himself.

The efficient functioning of the immensely complicated apparatus of state, which is one of modern Britain's outstanding achievements—but which the politicians and the public are apt to take for granted—depends entirely upon the quality of the very highest civil servants. It is not going too far to say that the civil service has managed to meet the demands hitherto put upon it only at a cost to individuals far greater than any employer ought to ask of his servants, and that it may well crack under the burden if so many of its most experienced members depart in such short order. There is very little possibility of providing reinforcements. The service might have been less cavalier at the end of the war in its attitude towards the higher ranks of the temporary civil servants, more of whom would have stayed if it had not been made so clear to them that their prospects would be much worse than in other employments (only two of the present thirty came into the service as temporaries during the war). But that mistake can hardly be reversed now; and in any case, though there are brilliant exceptions, it takes many years to train a Permanent Secretary. The only real answer is drastically to reduce the activities of the state. This will not be easy. But it may become compulsory.

* * *

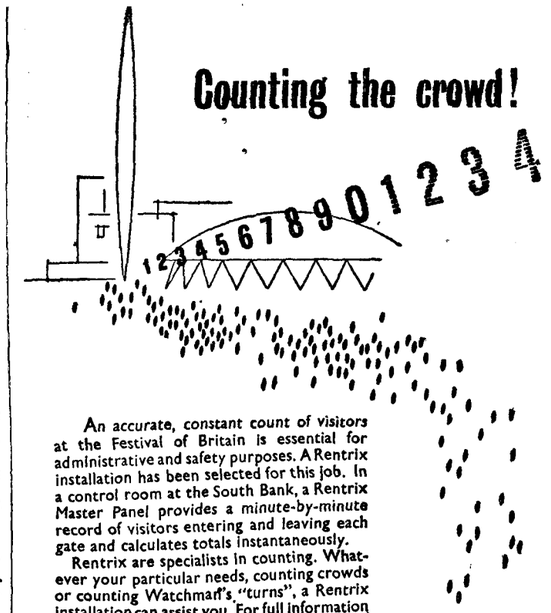
Education Without Work

It is refreshing that a debate on education should be concerned with the content of education as well as with the details of administration. On this score, Tuesday's debate in the House of Commons was well above average. The Parliamentary Secretary for Education seems to be among those who are chiefly interested in the primary school and who still cling to the idea that as long as school work is brighter it must inevitably be better. Mr Hardman said that

DEMOCRATIC ELECTION

MR. ARTHUR HORNER, general secretary of the National Union of Mineworkers, has given an unfortunate impression by his speech foreseeing industrial unrest in the event of a Conservative government. He need not have intended more than to emphasise the truth as he sees it when he warned that any attempt to reverse the trend of progressive reforms would bring about "the greatest crisis in history." But he caused a sensation by declaring that if a Tory government were returned it was certain that there would be a national strike of miners, in view of Tory proposals for the industry.

Whether he meant it or not, Mr. Horner has only himself to blame if people read a threat that the power of a trade union might be pitted against a democratically elected government. And the idea that any trade union should dispute with any government the question of who rules Britain is one that no supporter of democracy can tolerate.



Workers Will Decide

Mr. Horner and everyone else should understand that the workers of Britain WILL decide the next government. They will choose it without resort to strikes, at the polls. No one can override them; they are by far the biggest group in the community. The party elected will then govern by the majority will of the nation, which is the foundation of law. Whoever they are, they will have to pay attention to the opinion of the miners in running the coal industry. But their responsibility will be towards the community as a whole.

If miners and other workers fear that a Tory government would be bad for them and for the country, they should fling their whole weight against the Tories at the polls. But when the election is over, all sides must accept the verdict. Votes are democratic weapons; political strikes are not. The ballot box, and not any orator's tub, will reveal the will of the people.

what matters most at fifteen "is a child's excitement and curiosity about life" and that if it has "exuberant vitality, a sense of humour and a sense of service" it can go a long way in adult life. All these are undoubtedly great assets, but a certain competence in the three Rs is an advantage that at present it is unfashionable to remember. It was all to the good that Miss Horsbrugh and others emphasised the importance of these things. The grammar schools are complaining bitterly that their entrants, drilled only in the expertise of intelligence tests and accustomed only to "activity methods," cannot write the simplest essay.

The other main subject of debate on Tuesday was the comprehensive school. Several speakers tried to obtain a definition of the Ministry's policy. In fairness to Mr Tomlinson, it should be said that his department has done nothing whatever to press for this type of school; indeed, it has done a good deal to curb some of the more extreme ideas of local authorities and to point out the difficulties. The authorities that have gone ahead with comprehensive schools have done so on their own initiative, and Mr Tomlinson has very properly remained neutral unless a scheme appeared to be impracticable; Mr Hardman said that the Ministry was prepared to see experiments tried out by different authorities. But the question about the LCC's proposals, which have attracted most attention, is whether the scale of their plans amounts to an experiment, or whether it is a steam roller. On this the Government's views remained undefined.

* * *

The Case of the Polish Tankers

Mr Attlee had some difficulty in answering the questions asked last Monday in the House of Commons about the Government's seizure of two tankers which have been built in this country for Poland. It would, indeed, be hypocrisy to pretend that this action is not a breach of contract. It is incontestable that the Polish Government secured the insertion of a clause in the Anglo-Polish Trade Treaty of January, 1949 which expressly provided against just such actions. Let it be acknowledged with regret that the cold war has driven one more nail into the coffin of international and private agreements.

The Government has justified its action under the emergency defence powers which it still holds. It is certainly not for Poland or any other totalitarian state to object in principle to the exercise of such rights; and the Polish Government itself has defaulted in its undertaking to compensate the owners of nationalised property in Poland. British history even in recent years has provided instances of emergency actions such as the seizure of the battleship which was just ready for delivery to Turkey shortly before the outbreak of the 1914-18 war. It is apparent that the present action against Poland rests on the same assumption that a state of emergency exists and indicates that the Government may have decided to follow a much more drastic policy than hitherto in its trade with the Soviet sphere.

However severe British practice becomes, it is not likely to satisfy the American extremists who sponsored the Kem amendment, forbidding economic aid to any country selling goods of potential military value to Communists, or the framers of the more limited but specific Battle bill, covering military as well as economic aid. A stricter British policy will, however, make it easier to co-ordinate the controls which all countries receiving American aid are imposing. Hitherto it has been a difficulty that the Germans could accuse Britain of applying fewer restrictions on exports eastwards than they were instructed to impose. Britain and Germany both present exceptional problems within the whole tangled complex of east-west trade, owing to the volume of British business and the loopholes offered by the artificial division of Germany. Perhaps the Ruhr industrialists who constantly assert that the British accept contracts which they are forced to reject will be impressed by the seizure of the Polish tankers.

Marshall Aid and the Colonies

When Marshall Aid to Britain ceased last January, it was announced that free grants from ECA for colonial development would continue. This was welcome but stirred no great enthusiasm, because the total aid so far given to British colonies through ECA was only £4,000,000, apart from a certain amount of technical assistance, and special loans for expanding the production of strategic materials. The grants were so hedged about with restrictions, that the Colonial Office was not strongly tempted to put in applications A grant could be made only for specific projects, and was given in the form of essential dollar equipment, to be bought in the United States. As most of the projects were for road development, a major beneficiary under the scheme was the Caterpillar Tractor Company, whose products were in great demand.

Experience soon showed that the part of any project that needed to be paid for in dollars was small, perhaps only between 5 and 10 per cent of the total cost. So as more and more equipment became available in Europe, this form of help became almost meaningless. The Colonial Office contended that it should take the form of supplying dollar consumption goods needed in the colonies, thus releasing British productive power to supply the capital equipment. It was not until November, 1950, that the Americans, stimulated by the general recognition that more must be done to help the overseas territories, agreed to a radical change in the procedure.

Under the new arrangements, grants need not take the form of dollar equipment. Up to 50 per cent of the cost of a project can be met by the United States supplying consumption goods—tobacco and flour—to other colonies previously agreed upon by Britain and the United States. According to this procedure free grants of £2,750,000 have now been made in connection with eight colonial projects —road schemes in Sierra Leone, Tanganyika, Nigeria and Northern Rhodesia; a rail link in the Gold Coast; the construction of wharves in North Borneo; draining and irrigation for rice production in British Guiana; and the expansion of the Enugu Collieries in Nigeria. Assistance in this form has been much appreciated; more is the pity that such a satisfactory procedure having at last been established, the whole programme lapsed on June 30th. It is thought that free grants for general development will now be replaced by loans but there is great pressure among certain sections of American opinion for some flesh to be put, at long last, on the bones of all programmes generally known as "Point Four." It is to be hoped that the "general development" part of ECA aid, small as it is, will not be a victim of the many other rival demands.

No More Clerks?

The development of electronic calculating machines, using electrical impulses instead of mechanical counters, has been going on for some years both in the United States and in this country. Hitherto they have been regarded solely as a tool—a large and intricate tool—for the research worker. The latest model, recently installed in Manchester University, is the first—in this country at least—to be factory-produced. It, and others like it, are looked upon as general-purpose machines. They can carry out ordinary arithmetical calculations at lightning speed compared with the quickest of desk machines. They can be set to perform special complicated calculations and they can store information. These qualities have given rise to the popular conception of an "electronic brain." But this is a misnomer. The machine must be fed with carefully worked out instructions which it will follow literally. And its powers of choice are only such that, according to the result of a test at some point in the calculation, it can select from alternative courses the correct one for the subsequent calculation.

The designers of these latest machines envisage a world in which general statistics, commercial accounting and the tediousness of PAYE are reduced to the speed of electronic circuits. It is not easy to follow the designers into this new world where clerks would be comparatively few—but where, it is apparent, there would have to be a host of highly skilled machine instructors and technicians. The present computors seem most suited to perform intricate mathematical analysis on a fairly small import of data, whereas for most commercial uses, the reverse is required—relatively simple calculations on a considerable import of data. In much of the national census work, the time of actual computation is small compared with that required to collect and assemble the raw data and to present them in their final form. It is by no means certain that electronic computing can make any drastic inroad on the time taken in the preliminary stages. If used in accounting, the legality of keeping the information in the form required for the machine might well be questionable.

But experiments in the commercial field are being made. One of the largest firms of caterers in this country is having an electronic calculator built. This is to be subjected to tests for commercial use, but it is far too early to say whether it will be found at all practicable. Apart from anything else, at the present price of about £55,000 for the latest model, the electronic computing age hardly seems to be just around the corner.

Five Years' Fun

In spite of untimely power cuts on the Big Dipper and the accident on the Emett railway, cheers greeted Mr Stokes's announcement last Tuesday that the Government will ask Parliament to keep the Festival Gardens open for five years. Not only visitors but also Londoners—except, perhaps, the inhabitants of Cheyne Walk—may be expected to welcome a prolonged fun fair. The Gardens opened late, and it is fair neither to the taxpayer nor to the designers to expect the undertaking to exhaust its value in so short a period as four months. If, as Mr Stokes claimed, continued opening will in fact ensure a larger return on the capital soaked up by mud and strikes, Parliamentary cheers are justified.

Before the suggestion is approved, however, Mr. Stokes should provide convincing evidence that no more capital will be needed. The new lease must not be made a cover for the failure of the gardens to yield the estimated return; and if their life is prolonged, some points of organisation will need reconsideration. The income of the gardens has been restricted not only by Sabbatarianism but also by failures in the imagination of the organisers. If they are to continue, there could well be more flexibility in such matters as later closing on certain days of the year. But if Chelsea agrees, the contractors accept, and guarantees are given that no more capital will be asked for at the last moment, few people will oppose Mr Stokes's suggestion. It is to be hoped that the Government is also considering the future of the South Bank, whose café front has provided new evening entertainment for Londoners, and whose profits are perhaps as far behind the estimates as those of the fun fair.

Shorter Notes

The debate on broadcasting policy on Thursday of last week was very largely, as expected, taken up with the Government's proposal for national councils drawn from the local authorities. Apart from this, not much that was new emerged. It is, however, worth placing on record that none of the Conservative speeches expressed any support for the principle of monopoly and all but one attacked it. This would not have been possible a few years ago; it is evident that public opinion is moving.

*

The Iraqi Government has withdrawn from the High Court in London an action concerning its dispute with the Iraq Petroleum Company about the basis on which its royalties are paid. It had contended, and the company had denied, that by the terms of their mutual agreement the rate in gold shillings per ton was payable at the free market rate for gold. The case is adjourned *sine die*. This initiative taken by the Iraqis during the present period of Middle Eastern ferment about oil is yet one more proof of their commonsense attitude to world affairs. It may also be a sign of their belief that the current Baghdad negotiations for a new agreement on an overall rate of payment per ton of oil extracted are progressing favourably. The rate of payment need not necessarily be related to gold.

Arms for Peace

The annual meeting of the friends of Peace took place this week in Exeter Hall. They seem to be gaining ground in public estimation, and were honoured on this occasion by having . . . an eminent man of science for their chairman. Free Trade and they are close allies, and would bind all nations in bonds of amity. Without peace, the law that permits unrestrained intercourse would be a dead letter—without Free Trade, peace would have none of the intercourse of friendship. As Free Traders, therefore, we share the hopes of the members of the Peace Congress, and strive ardently for objects similar to those which attract them together. A survey of society somewhat different from theirs, leads indeed to a conclusion not quite in accordance with a resolution they have adopted. Since 1815 the several Governments of Europe, notwithstanding the "standing armaments with which they menace each other," have remained at peace. . . . In that time, too, very stirring events have occurred, quite sufficient, according to what took place in 1792-93, without prudent management, to have plunged all Europe into another revolutionary war. It cannot be forgotten that the war then begun was incited by the supposed defenceless state of France. The Sovereigns of Europe and the Minister of England shared the delusion—mistook the dismantled fortresses of an old tyranny for the ruins of a destroyed nation. They supposed that the overthrow of the Government had cut the sinews of the national power. They expected an easy conquest. . . . From that example, and from the peace that has been so continuously preserved since 1815, with mighty armaments on all sides, we cannot but suppose that the state of preparedness for war had something to do with making nations respect each other and with keeping them at peace. . . . Though the mutual and friendly relations established by Free Trade may make [mighty armaments] unnecessary, that has not hitherto been the case. Till people generally be more friendly towards each other, and till their Governments be altered and improved, we are afraid that the armaments will be useful in making the Governments respect each other, and in preserving peace.

Letters to the Editor

A Deal with Franco

Sir,—Your note in your issue of July 21st treats a serious matter far too lightly and superficially. Economic aid to Franco will strengthen his regime and I cannot understand how any liberally minded person can see in this any prospective benefit for the Spanish people. Furthermore, I believe that moral indignation, however impotent, and I do not believe that it is, will at least preserve us our friends in Europe, who will stand, or fall, with our liberal sanity. On the basest calculation, surrender of the right of moral indignation would be an unwise and unremunerative sacrifice.

To expect a reformation of the Franco regime is, at best, pathetic, and, more truly, is criminally myopic. I feel sure that few Spaniards, and even fewer Europeans, see the American action as "infiltration" designed to purify, which, I take it, is your argument.

It is unreal to assume that America can act bilaterally in Europe. Military (and economic) arrangements agreed upon between Spain and the United States will inevitably affect Nato's outlook and policy; these modifications may be little to our liking and will certainly be damaging to our reputation. Nor is Communist propaganda so ineffective as to neglect to use this weapon against us.

Finally, your last sentence seems to me to develop your confusion still further. We know that it is impossible to live in the same world as Fascism, but we have yet to come to a similar decision about Communism, and until we do, it is wrong to confuse Spanish dictatorship on the one hand with Chinese, Jugoslavian—or Russian—on the other.—Yours faithfully,

London, E.11 J. H.

A Higher Pound?

Sir,—In his letter in your issue of June 30th "Financier" has raised a matter of considerable importance for the cohesion of the sterling area. Both in England and in Australia I have felt that such policy decisions as exchange-rate variations have not been sufficiently discussed, publicly at least, in the light of their effects on other sterling countries.

This is especially true in the case of policies regarding the drawing-down of the sterling balances which are at present accumulating in London in the accounts of other sterling countries. You drew attention in your issue of June 2nd to the need to ensure that the drawings do not occur in such a way as to add further strain to the economy of the United Kingdom. At the same time, the possibility of drawing on these balances in bad times is the overseas countries' main incentive to build them up. You appeared to have in mind a decline in demand for individual primary exports at a time of general full employment, for any general decline would surely betoken such a fall in world trade and employment that the United Kingdom would be glad of continued purchases of its exports by overseas countries. Certainly the "public works programmes" overseas which you mention (and the resulting foreign trade deficits) should have their merits weighed against those of similar schemes contemplated to maintain employment in the United Kingdom.

Finally, in elucidation of a point "Financier" makes, it should be pointed out that revaluation of the pound by the United Kingdom would be followed by many other sterling countries, which would thereby avoid the adverse effects on their terms of trade; in certain cases the prior revaluation by the United Kingdom might make a desirable change in an overseas country more politically practicable. Where such a change would be likely to affect dollar earnings by overseas sterling countries we can be sure that these repercussions would be carefully considered by the United Kingdom as custodian of the area's reserves.—Yours faithfully,

J. O. N. PERKINS

The University, Melbourne

Dearer Commercial Credit

Sir,—In your issue of July 14th you say, and it can be granted, that the ultimate lenders desire to buttress their revenues, against rising costs. On the other hand, the earning assets of the banking system have been vastly increased as a result of two world wars, while their paid-up capital has not gone up in proportion.

The public has no means of ascertaining what are the real profits of the banks, for they do not (so far as I know) publish their gross profits or show what sums are paid in taxation.

The banking system covers up its inner reserves, and its contingency accounts under the heading "deposits and other accounts." Is there any real reason for the new higher charges? If so the banks should substantiate their demands.—Yours faithfully, GEORGE WILSON

Virginia, Ireland

Birth Control for India

Sir,—I doubt whether your correspondent in India is right in saying that "there is in the Hindu religion [*sic*] no such absolute bar to contraception as in many Christian creeds."

Nearly 25 years ago the Bombay Board of Film Censors, of which I was a member, viewed an Indian film advocating birth control. At the end a Hindu colleague said to me "It is useless to preach birth control to Hindus. We believe in the sacredness of life, and that is why we marry our children before they attain puberty. Otherwise our daughters might be deprived of the opportunity for conceiving as soon as this were physically possible, and we fathers would then be guilty of potential murder."

Has India changed so fast since then that birth control propaganda will have any appreciable effect? I should like to believe it, but I wonder.—Yours faithfully, ALAN GREEN

Berkhamsted

*

Sir,—There are many people who regard the development of contraception as one of the greatest tragedies that has fallen on the human race. To such, the article in your issue of July 14th must have caused a good deal of pain. To give a factual account of what is happening is one thing; to approve it, as the article appears to do, without any concession to the principles of (presumably) many readers, is another. And in the towns "going to a clinic is less conspicuous; neither neighbours nor husband need know about it." Is this remark worthy of a responsible weekly in a Christian country?—Yours faithfully, BROOKE CRUTCHLEY

Cambridge

A Six-Day Week?

Sir,—I have been reading in your issue of July 7th a prophetic report from "Hansard," July 1, 1967, in which is painted a delightful picture of the welfare state of those days.

But has it occured to you, that July 1, 1967 is a Saturday? Does this mean the Parliament of the future will work a six-day week, when the present tendency for all civilised beings seems to be to do less work for more money?—Yours faithfully, G. W. K. ANDERSON

Bristol

The Week-end (Abolition) (Emergency Provisions) Act was passed in 1951.—EDITOR.]

Inquest on Farming

Sir,—Thank you for publishing Mr Oliver Smedley's letter. He is absolutely right. If we wish to stop inflation, remove the bottlenecks in production and prevent the encroachment of tyranny in our midst; we must return to a free economy.

I write as a farmer and a member of the National Farmers' Union, and I can say that many farmers appreciate that government promises of "fair" prices must prove completely hollow and that all that remains are the conditions attached to the promises—conditions which embody undemocratic legislation.—Yours faithfully,

ANTONY FISHER

Framfield, Sussex

Return to Deficit

Sir,—"This disturbing outturn (we learn from your issue of July 21st) may have been partly due to the pre-emption of potential exports . . . ."

Could it not also be at least partly due to an inflationary disequilibrium of our vocabulary?—Yours faithfully,

P. H. A. KENYON

Books and Publications

Man and the Land

A Natural History of Man in Britain. By H. J. Fleure. *Collins.* 350 pages. 21s.
A Land. By Jacquetta Hawkes. *Cresset Press.* 250 pages. 21s.
The Earth's Crust. By L. Dudley Stamp. *Harrap.* 120 pages. 18s.

The difference between the first two of these books is epitomised in their illustrations. Professor Fleure uses splendid photographs, many of them coloured, as well as copious and explicit line drawings and plans to document his comprehensive study. Mrs Hawkes has skilfully chosen black and white photographs to complement and amplify the drawings of Henry Moore and Ben Nicholson which interpret and are interpreted by her theme.

The first book is prefaced by an editorial credo:

> We believe that the study of the natural history of man in Britain can contribute to the view that he must be regarded as one with nature. We believe that the search for a true relationship of man and his environment can alone save our beautiful islands from wrongful changes, from the degradation and destruction which may result equally from unplanned development as from wrongfully conceived physical planning.

The author puts the matter more succinctly when he pleads for planning "on the basis of function rather than façade."

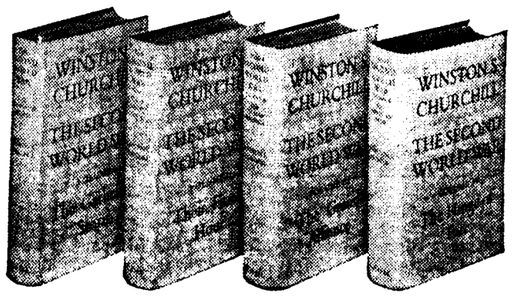
Professor Fleure examines the main lines of evolutionary response to environment from the combined viewpoints of historian, anthropologist, geographer and naturalist, disarmingly admitting that "no hard and fast line can be drawn, so what is included or excluded is the result of decisions that are submitted to the tolerant judgment of the reader." The reader will also need considerable powers of assimilation to benefit from the mass of information which is embedded in the agglomeration of this story of our forebears from the emergence of hominid forms during the eleven advances and retreats of pleistocene ice sheets to the pressure of population on subsistence which conditions survival today. The necessary telescoping of early millenia prescribes a catalogue style, the clarity of which is reduced by the author's meticulous balancing of pro with con, of exception with rule, in his anxiety to guard against schematic rigidity. But as the theme broadens, he allows himself greater amplitude, and gives signs of a pawky humour—as in the deliniation of the modern town, from "dormitory-village" to "night dead-heart" as indicative of social evolution.

From the fugitive evidence of continuity of physical characteristics over thousands of years, Professor Fleure deduces that a particular group tends to show a general pattern of choice which has conditioned social tradition in the past and will probably shape future development. The main threads which appear in this complicated web of evolution are unity, initiative and tolerance, and the author stresses the value of diversity, whether in religion, climate, physical type or mental outlook, in promoting that inherent cohesion based on compromise which accepts unorthdoxy. Here he shows some inconsistency, on the one hand regarding it as a matter for congratulation that as a result of diversity between barons and king, king and church, king and parliament, centralisation has been fended off until the present generation, and on the other suggesting that the contemporary effort to create the social-service state is a manifestation of old deep-rooted tendencies towards communal life which were disrupted by the Reformation, the enclosures and the Industrial Revolution.

Much of the charm of this book lies in glimpses from unaccustomed angles: that we owe the great church and many old inns and places of amusement at Southwark to the dilatoriness of local authorities in repairing London Bridge, thus necessitating the unloading of wagons and a consequent caravanseral; that the medieval worship of the Virgin resulted in the improvement in design and beauty of women's clothes; that the aristocratic garb of one generation tends to become a service garb of later times; and the endearing revelation that "one frequently finds pins near female skeletons."

Mrs Hawkes has chosen an almost identical theme in *A Land*, but to the evidence of geologists and archæologists she adds that of psychologists and the intuitive contributions of poets and artists, as well as her own sensitive awareness of "the unity of past and present, of mind and matter, of man and man's origin." In place of the wise planning which Professor Fleure thinks will rescue us from our present misuse of our heritage, she urges a change of heart brought about by an awakened sensitiveness. Professor Fleure would have us constantly remind ourselves of our past through the opportunity and proper use of museums; Mrs Hawkes would have us feel it in our bones. She is concerned with the qualities of the stone which makes the land; and stone, in all its variety and vagary, its manifestation in buildings and its intimate relationship with the character and social evolution of its people, is as familiar and dear to her as are flowers and plants to a gardener. All who would appreciate architecture with an extra sense, who would approach the sculpture of Henry Moore with new comfort, and who recognise the difference between a standard of living and a standard of values, should read this book. They will read it again.

The illustrations of the third book are the pillars of its argument, and fascinating they are. Dr Stamp has constructed some thirty three-dimensional models of different rock formations, glacial valleys, volcanic hills, deltas and the scenery and structure typical of various geological formations; these have been photographed in colour and amplified by captions and diagrams. These, together with a brief text, serve to explain the more usual features of physical geography and geology. The result is a most captivating book.



This new approach to these subjects would be entrancing in the schoolroom. But the book is not specially intended for children. Most adults who have ever puzzled over the formation of mountains or of cliffs will find this book both interesting and informative. But it is more than that. It is exciting. With a picture or diagram a page it is truly "geology without tears." The riddles of the earth's surface are answered before our eyes.

Travels in Indo-China

A Dragon Apparent. By Norman Lewis. *Jonathan Cape.* 317 pages. 15s.

This is a fascinating travel book about Indo-China. Mr Lewis went there in 1949 and appears to have left early in 1950. During that time he moved about in the country as much as he could, approaching the problem of doing so not as a political observer or journalist but as what he clearly proves himself to be—a writer of great distinction and a brave man who is not to be deterred by the incidental perils of a land at war. The result is a book which should take its place in the permanent literature of the Far East. It should certainly be of general interest to all, whether they know the Orient or not, who are concerned with the study of ancient civilisations, with the problems of backward peoples and colonialism, and with the Communist struggle of our own time. The book is beautifully illustrated with 28 photographs including a brilliant, coloured frontispiece; the coloured photography used for the jacket is quite exceptional.

Mr Lewis based his travels on Saigon and made four round trips—up into the territory of the Mois north of Dalat, round the delta with the French army, through Cambodia up to Angkor, and finally to Luang Prabang in northern Laos. If any criticism is to be made of such an intrepid traveller, it is that he saw relatively little of the Vietnamese, who, after all, are the most numerous people in Indo-China, and he never visited Hanoi or the Red River valley. But, as he makes clear, he did not go to study the war. Indeed, this relative detachment from politics gives his observations about current problems a special poignancy. Politics, of course, cropped up at every turn—Mr Lewis managed to visit a Viet Minh command post in the *Plaine des Joncs*—and the gloomy verdict to which he was driven seeps through much of his writing, however much he obviously admired individual Frenchmen. Since Mr Lewis left Indo-China, General de Lattre has transformed the military situation in the north. Yet it is

hard to see how even a full-scale victory could sweeten the atmosphere of sullen resentment at the mere presence of the French which at times impressed itself on Mr Lewis. The future alone can prove how far he is right.

Leblanc Widnes

A History of the Chemical Industry in Widnes. By D. W. F. Hardie. *Imperial Chemical Industries.* 250 pages. 21s.

The rock-tipped promontory of Widnes in Lancashire, jutting out into the Mersey estuary to form the Runcorn Gap, is one of the classical sites of the British heavy chemicals industry. Dr Hardie's history, commissioned last year when the town celebrated the centenary of its basic industry, traces its development mainly through the lives of the founders and personalities of "Leblanc Widnes."

The tale of Nicolas Leblanc, the French surgeon who in 1790 won a prize of 100,000 francs from the Duke of Orleans for inventing a practical process to produce soda from salt, but who lost prize, patron and factory in the Revolution, is well known. His process, introduced into England soon after, was not firmly established there until the eighteen-twenties; it coincided with the repeal of the salt tax—but did not, Dr Hardie emphasises, follow upon it. It required the import of American sulphur and of Spanish pyrites for the development of the process. First established in Liverpool, it was driven from there by complaints about the noxious fumes it poured into the atmosphere around the alkali factories. St. Helens, and pre-eminently Widnes, became its new homes. These two places offered proximity to the Cheshire saltfield and Lancashire coal; railway and canal facilities, as well as a position on the estuary favourable for the import of raw material and the export of alkali; ready access to customers such as St. Helens glassmakers, the soap and metal industries of Warrington, and the Lancashire manufacturers of cotton. And at that time there were few residents to complain about the fumes.

For some thirty years—between 1847 and the mid-seventies—the Leblanc process and Widnes were supreme. Then came the introduction into Britain by Ludwig Mond of the Solvay ammonia-soda process which was more efficient. By 1890 depression had set in for the alkali trade. The Widnes manufacturers combined into the United Alkali Company, and searched assiduously for technical improvements to regain Leblanc leadership; but in vain. As a method of alkali manufacture, it was finally discontinued in the 1920s. But the making of sulphuric acid—as hardly needs emphasis in 1951—has become an important industry in its own right, and hydrochloric acid, the main constituent of the Leblanc fumes, is now made by essentially the same process. Today, housing the General Chemicals Division of Imperial Chemical Industries, Widnes produces more than a hundred varieties of inorganic and organic chemicals.

Dr Hardie's style, which punctuates personalities with technical, local and occasionally economic detail, is uneven, but his subject matter is intrinsically attractive. A town with a history only a hundred years long, with many of the original families still connected with its industry, and with so cohesive an industrial purpose, is the researcher's dream; and Dr Hardie has had access to descendants, family records and diaries, and the archives of the Leblanc industrialists whose businesses were gathered first into United Alkali and later—with Mond, their old adversary—into ICI.

The Born Servant

Huskisson and his Age. By C. R. Fay. *Longmans.* 398 pages. 30s.

Readers of Mr Fay's earlier books have admired the way in which he hops over the hedges of the main thoroughfares of economic history to cull some curious fact or some illuminating coincidence, leaving his pedestrian colleagues to continue down the hard high road of trends and policies. But in his latest volume what was an amiable eccentricity has become a cause of bewilderment. His publishers call the method "impressionist"; his readers might have another name for it. He has so obviously enjoyed writing the book that he seems to have forgotten everyone else. What he has provided is the raw material for a full-length biography of a very important, if colourless, figure in the fiscal and economic history of this country. Even then, it is the age rather than the man which is illustrated by this collection of records.

We begin with the documents about Huskisson's death, an event strangely out of character with the rest of his undramatic career. On page 297 we learn about his family and education. He was Member of Parliament for Chichester and Liverpool, and his family came from Staffordshire—a sufficient excuse for a wealth of detail about Sussex, Merseyside and the Midlands generally. Mr Fay has the scholar's zest for such excursions, but sometimes we wish we could see the wood instead of the trees.

Commissioner for Woods and Forests, Under-Secretary for War, Agent for Ceylon and the Cape—such is the Huskisson of this volume. A second volume is promised to deal with "the Great Partnership" with Canning which began when Huskisson became President of the Board of Trade in 1823. Then only did he emerge from obscurity "to practise those commercial improvements to which he owes all his glory." So wrote Greville, in one of those cool appraisals by way of obituary notices with which the Diary is studded; Mr Fay, however, calls it "a contemptible mis-appreciation." At least they both agree that "Huskisson was a born servant, and could never have held with success the highest office." The best assessment of Huskisson's real importance is still Professor Brady's, published twenty years ago. For the earlier period the indefatigable industry displayed in this volume reveals much that is interesting about the man, his friends and his times—provided the reader is painstaking enough to dig it out for himself.

The Soviet View

Soviet Documents on Foreign Policy. Vol. I, 1917-1924. Selected and edited by Jane Degras. *Geoffrey Cumberlege. Oxford University Press.* 501 pages. 42s.

This is the first of three volumes of Soviet official documents on foreign policy, edited for the Royal Institute of International Affairs by Mrs Degras. The present volume covers the infancy of the Bolshevik state. The official statements, speeches and notes here collected deal mainly with the Bolsheviks' relations with the governments of neighbouring states in Europe and Asia. There is a great deal about Bessarabia and about Russo-Polish problems, and some correspondence with the French and Polish governments about the 1922 Rappallo treaty with Germany. Among the curiosities is the abortive treaty with the "Finnish Socialist Workers' Republic" of March 1, 1918. The appeals to the workers and peasants of Turkey (p. 164) and Persia (p. 161) are examples of the revolutionary rhetoric on which the Soviet leaders at first relied. They may be compared with the formal treaties with Turkey (p. 237) and Afghanistan (p. 233). Of considerable interest also are a letter from Chicherin to Sun Yat-Sen, and a joint statement by Joffe and Sun Yat-Sen on Russo-Chinese relations (p. 370). The volume ends with the "Zinoviev letter" incident in Anglo-Soviet relations.

This random list of examples should at least give some impression of the scope of the collection. It will be an invaluable reference work for students of Soviet affairs. The presentation of the material in chronological order rather than by subjects is convenient to the historian, though it may discourage the superficial reader. All readers should of course use this book together with works by non-Soviet writers. If not, they may fall a prey to the crude but not unskilful revolutionary propaganda contained in almost every document. The policy of the Soviet Union in these years was far from being as nobly unselfish as the words of Soviet spokesmen suggest.

The Royal Institute and Mrs Degras have earned the gratitude of the public by this effort. Perhaps they will consider a suggestion for a further enterprise. The editor states in the preface that Comintern documents have not been included, as they would "extend the field too widely and make selection even more difficult." For the purposes of this series this decision was no doubt right. But could not a separate series of Comintern documents be produced? Such a series might include the main reports and speeches at Comintern congresses and at some of the more important congresses of national Communist parties—for instance the German, Chinese, French, Polish and Bulgarian—and of the socialist congresses at which affiliation with the Comintern was discussed—for instance Halle 1920 or Livorno 1921. The collection of such material should not be impossible. Especially for the years 1919-23, it would be of great value.

Good for One Shilling

Getting to Know English Literature. By T. G. Williams. 123 pages.

Finding Out about Atomic Energy. By Dr. J. L. Michiels. 122 pages.

A Short History of Our Own Times (1919-1950). By Esmond Wright. 126 pages.

A Signpost to Mathematics. By A. H. Read. 123 pages.

Thrift Books. *Watts.* 1s. each.

The "Thrift Books" are described by their publisher as "a companion series to the Thinker's Library." The first eight titles indicate that they are intended to be strictly educational and informative, elementary introductions for adults. It will no doubt now be easier to restrict the parent series to "the classic works in which the masters of modern thought embodied, for the general reader, their views."

At one shilling, the new series is attractive. The style is popular—though not so much so as the titles and chapter headings sometimes suggest—but the standards are academic. Dr Michiel's little introduction to nuclear physics is a model of its kind. Dr Read finds several new and suggestive ways of introducing some primary topics of modern mathematics, but he does not waste time on the illusion that the subject can be made easy to those who have no bent for it. In his "History Of Our Own Times" Mr Wright manages to pack a great deal of information into his short narrative. He writes modestly, without that tendency to treat current history as a series of problems-to-be-solved which afflicts so many writers of text books on international affairs. Literature is in its nature less amenable to this kind of treatment, and English literature is a large order. Mr Williams has concerned himself as much with questions of general aesthetics as with a mere chronicle of books and authors. Collectively, these books show sound editorial judgment.

Shorter Notices

Introduction to Economics. By Henry William Spiegel. *Blakiston.* 589 pages. $5.

Readers of Professor Spiegel's excellent "Current Economic Problems" will be naturally predisposed to find in his "Introduction to Economics" the same qualities of clear thought and realistic judgment as distinguished the earlier work. They are, indeed, not lacking. The layout of "Introduction to Economics" shows a novel and ingenious balance and juxtaposition of particular equilibrium theory and the study of aggregates; the relevance of theory to concrete problems is made clear; and the style is commendably free of that gobbledigook to which economists in general and American economists in particular are—with some shining exceptions—so painfully prone.

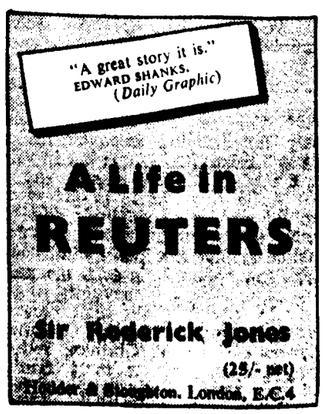
Nevertheless, "Introduction to Economics" is a disappointing book. It is, according to the author's preface, intended to cover the ground of "an intensive one-semester course or a less intensive two-semester course,"; it is thus meant for readers starting from scratch and not, presumably, hand-picked in advance. The picture of such readers using their newly acquired and unpractised technique, only half-way through the course, on the "cob-web theorem" or on an introduction to the Theory of Games, is frankly depressing; while if one assumes more advanced standing at the start, the level of the questions proposed for discussion at the end of each chapter, and the corresponding bibliographies, are surprisingly elementary. "Introduction to Economics" is probably best regarded as a book for teachers, who will certainly find it stimulating and valuable. It is hard to think of any group of students who would not be better served by any one out of a number of its competitors.

Readings in Rural Problems. By V. V. Sayana. *S. Chand and Company, Delhi.* 184 pages. Rs. 5.

This is a slight book, composed mainly of papers Dr Sayana has read on various occasions to learned societies. Such of his figures as are based on his own original research are of great interest. They show, for instance, the enormous rise in the price of land in the last few years, and demonstrate that the Indian peasantry has not so much paid off its debt—though the total is undoubtedly somewhat lower than before the war—as failed to increase it at a time when steadily increasing prices have been annually lightening its real weight. Obviously recent tenancy and moneylender legislation have had considerable success in improving the peasant's position.

More important than any of Dr Sayana's conclusions, however, are his attitudes. He still holds to the Indian economist's traditional belief in such notions as co-operative farming and reducing the middle man's commission; but he is obviously beginning to have his doubts. He has, for example, an uncomfortable feeling that the middle man, after all, does perform a function, that in a peasant society where goods come to the market in small and marginal amounts, somebody must collect them, grade them, pack them and despatch them to the towns. To know that the middleman charges too much for what he does is only the beginning of wisdom; a solution requires an alternative which is equally effective as well as cheaper. That Mr Sayana has not yet got; but he at least knows that it is what he should be looking for.

The Place of Reason in Ethics. By Stephen Toulmin. *Cambridge University Press.* 228 pages. 16s.



Books about ethics tend to be either too heavy and technical for the layman or too emotive and woolly for the specialist. Mr Toulmin, however, has achieved the rare distinction of writing a book which is both readable and technically competent. Mr Toulmin's book has the additional interest of approaching the subject in a more positive way than has been fashionable. He is concerned to show, firstly, not only where previous moral philosophers have gone wrong, but also what their positive contribution has been to the logic of moral statements. Secondly, Mr Toulmin has a theory of his own about reason in ethics which he equates with "giving reasons" for moral judgments.

The Edison Group. Published by the Edison Company, Milan. 186 pages.

The ten hydro-electric power generating companies of the Edison group in northern Italy have just produced a fascinating and beautifully illustrated guide to their operations, written in American. The original company was established in 1882, and from an output of 75 million kwh in 1900, the figure for the whole group has now risen to 6,100 million. To anyone interested in either electricity or the development of Italy, the guide gives a vivid picture of the elaborate dams, tunnels, generating stations and distribution lines that are behind these dry statistics.

The International Economy. By P. T. Ellsworth. *Macmillan.* 922 pages. 42s.

Foreign trade is the section of economics in which theory and history can most readily be taught together, and in this style Professor Ellsworth has written a useful textbook of the weighty American variety. In part it is based on the author's prewar "International Economics," but in addition to extensive changes in method and scope there is a long section of 220 pages devoted to postwar problems.

AMERICAN SURVEY

Dilemmas of Leadership

Washington, D.C.

"We have got to earn the right to the leadership that has been granted us, by demonstrating wisdom and humility," Mr Paul Hoffman told a Congressional committee last week. Being in a position to aid its friends, he went on, does not give a country "the right to impose its conditions on other nations" or "to dictate inflexible terms to them." The United States Congress certainly needs to be reminded regularly of the need to develop a degree of tact which it has seldom shown; and Mr Hoffman, who was triumphantly successful in a job where it would have been fatally easy to be accused of dictation, is the right man to remind it. But the Administration, with most of the world on its shoulders, is probably thinking that his advice is easier to give than to take.

The United States has become the most powerful country in the civilised world at a moment when the responsibilities of the position are greater than ever before and the limits within which this power can be exercised more restricted. It is true that, by their outraged cries of "Imperialism" in the days when Britain was struggling with the responsibilities of world power, the American people and their governments did much to promote the imposition of the restrictions from which they now suffer. But they were only hastening a change which would have been inevitable in any case and, with the exception of a few individuals, they still, despite the difficulties involved, approve the change. The State Department and the Department of Defence however, the two departments permanently and increasingly concerned with negotiations with foreign powers, have learned over the postwar years how difficult and frustrating it can be to demonstrate humility while at the same time providing most of the materials of western strength. And any attempt to consider the opinions and feelings of other countries, they have discovered to their cost, brings from Congress not praise for their forbearance but accusations of being satellites of Whitehall.

American public opinion, and opinion in Congress which reproduces it two or three times life-size, cannot be expected, when there is a fundamental disagreement over policy with other allies, to forget altogether that it is paying the piper. And, convinced of the righteousness of its own choice of tune, it likes to hear other countries sing it for their supper. But again and again in the last few years the Administration has compromised when it would have been more popular at home if it had dictated inflexible terms. Two recent examples illustrated how careful it tries to be—the Japanese Peace Treaty and Spain. Had Mr Dulles insisted that the Chinese Nationalists should sign the Treaty, he would have been acclaimed in Congress; had General Bradley used the threat of withholding military aid from the other members of Nato in order to force the admission of Spain, he would have had the great bulk of American opinion behind him. Mr Dulles chose instead to seek a solution which would not offend the countries of the Commonwealth, and General Bradley found one which deserved something more than Mr Morrison's first peevish protest.

The United States has had, since 1945, a harder task than any previous world power. Apart from the obvious dangers of taking a wrong step in an age when technology has made any step potentially fatal, it has the problem of trying to accommodate the United Nations at every stage. Having accepted the proposition that all national units are equal (just as the membership of the Senate is an acceptance of the proposition that all states are equal), and therefore that the views of each individual Nicaraguan are worth about forty times the views of each individual American, it faces the possibility every day that a block of small powers, who could not raise a division of troops or a hundred million dollars between them, may inhibit vital action. In an ideal world where small powers were as disinterested in reaching decisions as the sentimentalists like to believe, this might cause no great harm. In fact, the United States has found that, unless it "persuades" many of them to support its policies, they will be "persuaded" by somebody else.

*

An analysis of the behaviour of the State and Defence Departments since the war would show that, unlike Congress, they have become progressively more careful about imposing their will on other nations. The Economic Co-operation Administration's record has been, except for one short period, above reproach. That of the Treasury, on the contrary, has been consistently bad, particularly in its relations with international organisations. Last year an intrigue to replace M. Camille Gutt, as Manager of the International Monetary Fund, by an American—contrary to the understanding that the President of the International Bank should come from the United States and the Manager of the Fund from elsewhere—was only frustrated by a personal appeal to the President from M. Gutt himself. Recently Mr John Snyder, the Secretary of the Treasury, called a press conference to give his opinion of the recommendations on European exchange rates in the report of the Economic Commission for Europe—an opinion which was delivered, most unsuitably, in the manner of an Appeal Court handing down a final decision.

The failure of a few individuals and a few groups of individuals to display the wisdom and humility for which Mr Hoffman is calling can be traced to three causes—a prevalence of dogma among American economists, a lack of training in international civil service methods

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

and, another aspect of the same characteristic, a different conception of the meaning of the word "Chairman." The President of the Senate and the Speaker of the House of Representatives are not neutrals, doing their best to be above party. They are men whose duty it is to use their positions for the furtherance of their party's aims. And, in the case of those officials scattered through international financial organisations by the United States Treasury, the aim to be furthered is the achievement of the perfect economic world of non-discrimination *à l'Américaine*. It is a pity that a record which, on the Administration's side, has been marred only occasionally by impatience or by the dictates of domestic politics, as far as the State and Defence Departments are concerned, should contain such examples of unnecessary interference, for they must have a disquieting influence on other countries out of all proportion to their real significance.

The behaviour of Congress is quite another matter and one which will only be changed by time—probably a long time—and the slow evolution of some method by which the legislature can be given a larger share in positive decisions to add to its present powers of complaint, investigation and veto. The American Constitution was not designed for the operations of a government with the international responsibilities which the United States is now carrying; therefore it adds to the difficulties of an Administration trying to provide the leadership which no other country can at present offer. That there is much uneasy recognition of this is proved by the number of suggestions for the reform of the Constitution now being published, most of which take the form of changing the American system to bring it closer to a parliamentary one. Many of these solutions are ingenious and admirable, but they are doomed to remain untried because they would inevitably hurt entrenched political interests. More immediately effective might be the establishment of some non-political—or neutral—commission which would publish, at regular intervals, reports on examples of imperialist dictation, by either the Administration or the legislature. Such reports would have a healthy effect, by helping those who are doing their best to act with wisdom and humility. But it is unlikely that Congress would be inclined to provide money for such a venture. There is an opening for some private organisation—perhaps Mr Hoffman's own Ford Foundation.

No Conjuring in the Air

[FROM A CORRESPONDENT IN NEW YORK]

AMONG the 2,045,000 words of testimony poured out during the MacArthur hearings, perhaps the most chilling to the hearts of Congressmen were uttered by General Hoyt Vandenberg, chief of staff of the Air Force. The words were "a shoe-string air force" and the General used them to describe the air arm of the United States. How many aircraft would be needed to carry out General MacArthur's plan for destroying the industrial centres of Manchuria? "I would say roughly double the strategic airpower that the United States has today," replied General Vandenberg.

To a Congress which appropriated $13 billion during the fiscal year 1951 for military aircraft, General Vandenberg's answer was horrifying; it seemed to set the nation on a rocky road leading over the hill to the poorhouse. To those Senators who had built their hopes for world peace on an abiding faith in the ability of America to deliver swift devastation by air to any enemy, the reply amounted to heresy. Where is the air power which will save America?

Why, after a year at war, isn't the Air Force ready? The answer, according to one of America's leading aircraft manufacturers, Mr James Kindelberger, chairman of the North American Aviation company, is that no rabbit is ever pulled out of a hat, unless it has been carefully placed there in advance.

Mr Kindelberger means that a modern air force will not roar into the air tomorrow simply because Congress has appropriated money today. Although the speed of aircraft has been pushed beyond the sonic range, their development is still measured in decades. A good example is the four-engined Lockheed "Constellation" air transport. Ready to go into commercial service in 1939, the "Connie" was diverted to war service, but only 20 were delivered to the Air Force before the war ended. Today, at the peak of its popularity, used by 17 world airlines, the Constellation is 15 years old; the basic design has about run its course. This month, the Lockheed Aircraft Corporation got an Air Force contract to develop a new design for a fast cargo transport powered with four Allison turbo-prop engines. Already on the drawing boards for 18 months, the first prototype of the new model will not get into the air for another year.

Even when a model has been chosen by the armed services, there usually intervenes a yawning gap known as "lead time" which is taken up with the dreary business of distributing contracts, buying machine tools and training shop assistants to be spot welders. A frightened and angry Congress set this chain reaction in motion over a year ago, when it voted extra military appropriations after the invasion of South Korea. But the appropriations will not bear fruit until the end of 1951, and the pickings will be slim even then. Despite the winds which whistle through the Capitol, sighing of a 150-group Air Force, actual production at the end of 1951 will be at the rate of only 6,000 aircraft a year, compared to 96,318 at the peak of the last war.

*

The aircraft industry is scheduled to have a full head of steam built up by mid-1953, but it probably will not be allowed to run wide open. Mr Charles E. Wilson, the director of defence mobilisation, has set a goal of 196,000 jet engines and 50,000 aircraft a year, but this goal is stated in terms of capacity rather than production. A devout Baptist with a mystical faith in the American civilian economy, Mr Wilson wants to build up a defence industry which will supplement civilian production instead of supplanting it. To get all-out production now, Mr Wilson could order the aircraft companies on to a round-the-clock schedule, but he would then have to deny civilians those automobiles, refrigerators and washing machines which most Americans accept as the normal measure of a decent standard of living. Instead, the aircraft companies are laying out new production lines, but are running them at one shift a day. If war comes, they can switch to three shifts, using their *cadre* of skilled foremen and leading mechanics to train the army of new workers.

Mr Wilson is also anxious that aircraft companies should sub-contract much of their work to smaller firms, instead of attempting to do all the work themselves. This has made him popular with Congress which reveres the American small businessman only slightly less than the American Mother. Mr Wilson believes that "farming out" the manufacture of carburettors, fuselage parts, control cables, and so on, will spread the defence work evenly throughout the economy and will make it easier to expand production quickly in an emergency.

But the facts of business life deny the small machine shop a dominant role in sub-contracting. As in the late war, the heavy burden falls on the automobile companies. With their assistance, manufacturing floor space in the aviation industry has more than doubled in the past year, jumping from 60 million square feet to 127 million. This has not, however, meant, as it did during the last war, that a great deal of automotive manufacturing space has been sacrificed to make room for aircraft. The companies are filling most of their orders by reopening government plants which have been closed since 1945. The pinch now being felt in Detroit (production of cars will be cut back 37 per cent in the third quarter) has been imposed by a lack of steel, not by a rush of aeroplane orders; when the planned expansion of steel capacity is complete, even this pinch may ease.

*

Thus, when America is fully tooled up for defence production, and fully armed to resist aggression in mid-1953, theoretically two reservoirs of production will remain to be tapped in case of war: the big areas of civilian industry which will have been untouched by defence work, and the second and third shifts on the plants now working only one shift a day. Actually this assumption ignores an important factor, the tight labour market. With 61.8 million people employed in June, less than two million were out of jobs, and many of these are unemployable. In Los Angeles, the centre of the aircraft industry, the Douglas Aircraft Company is luring workers on to its payroll by showing them on television the fine working conditions within the plant.

But serious manpower bottlenecks are still a cause for future, rather than present, worry for the aviation industry. Almost the only industry really choked by a rush of orders too big for it to swallow is the machine tool trade, which, however, is at the beginning of the line in any all-out defence effort. These are the machines which turn out the knife-sharp turbine blades, polished crank-shafts and jewel-like piston parts which make up the modern aircraft engine. Some of them are so complex they take from three months to a year to build, and without them a defence programme is nothing more than an oratorical blue-print. The machine tool industry is delivering goods at only one-quarter the rate attained in the last war and some manufacturers will promise no deliveries before late 1953.

Unless this bottleneck is widened soon, the defence programme may be thrown off balance, and industrial and military preparedness may not be achieved by the middle of 1953. Already, deliveries of aircraft and other military equipment have fallen 20 per cent behind schedule, and Mr Wilson is afraid that the truce in Korea may bring on another slow-down. Much of the pressure for delay will come, inevitably, from economy-minded Congressmen, but some may develop within the Department of Defence itself. The armed services have 3,000 procurement officers who have authority to sign contracts. Like other citizens, these officers read newspapers every day and, if they become convinced that peace is about to break out, they may keep a new jet engine on the drawing board for a few extra months, in the interests of perfection, thus delaying the signing of a firm contract for production. It is Mr Wilson's hard task to convince both his critics in Congress and his friends in the Defence Department that the size of the Air Force in 1953 depends on today's decisions, and that the time to put that rabbit in the hat is now.

American Notes

Manœuvres on Controls

The new Defence Production Bill, when it at last emerged from the House early on Saturday morning, was much better than had seemed possible a few hours before and rather better than the Senate version, but this does not mean that the House Bill is good in itself. It does not actually guarantee inflation, but it would not do much to prevent it. There is, however, at least a possibility that the Senate and House conferees, who must reconcile the two versions before the end of the week, will produce a final Bill more satisfactory than either of them; in the hope of this Administration spokesmen are making one more effort to arouse public opinion and to bring pressure to bear upon the conferees from consumers. Previous efforts have been unusually unsuccessful; the apathy of housewives, apparently unable to see beyond today's falling prices and prospects of peace, helped the producers' lobbyists in the House to cut the Defence Production Bill according to their special interests with a boldness that had seldom been equalled.

The coalition of Republicans and conservative Democrats from farm districts, which dominated the proceedings until the last hours of the debate, led the House by the nose with the argument that, since the President had made only slow and ineffective use of the powers he was given in last year's Act, he could only want additional powers this year, when economic conditions no longer seem to make them so necessary, in order to "socialise" the country. When the time came for the final votes, which were recorded individually, as the earlier ones had not been, members of the House from urban districts, hardly aware until then where they were going, found themselves facing disaster. For votes cast against effective controls at this stage would certainly rise up to haunt them at next year's election, should the cost of living go up again as the Administration insists it will without controls. The House safeguarded itself, as the Senate had already done, by ensuring that the new Act would expire next summer, so that there would be an opportunity for reconsideration, before the election and after there had been time to see which way the economy jumps. But, even so, the anti-control coalition was replaced at the last minute by one of Representatives from cities and towns which managed to defeat some of the most dangerous amendments.

The worst of these, apart from one which would have frozen all prices and wages for four months, dealt with price ceilings, one forbidding any reduction in them at all, another putting them on a "cost-plus" basis that would have made them into a "profit pyramid." However, traces of this cost-plus pricing system remain in both Bills, and it is one of the provisions that the Administration is most anxious should be obliterated in the final version. There is no prospect of permission being given for any further reductions in the price ceilings on beef, or for the system of setting quotas for beef slaughterers, which the Administration considers essential for the prevention of black markets in meat. But the House Bill does allow reductions in other ceiling prices, which the Senate Bill did not. Both Bills are unsatisfactory on instalment credit and rent controls, but the House version grants the Administration's request for subsidies to encourage industrial production.

* * *

Crying Inflation

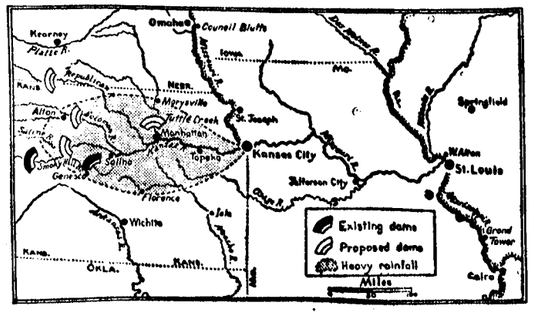
Congress, within the next few weeks, must pass upon military appropriations, foreign aid, and taxes; before the month is out it will have determined the extent of controls over the economy. The President's mid-year economic report was drawn up to discourage Congress from letting down its military guard on good news from Korea, and its economic guard on prophecies of recession at home. Ameri-

can economic tasks, the President emphasised, are heavy because of the weight of world responsibility; like Mr Acheson at Detroit, he insisted that, whatever happens in Korea, the job of building defences against Soviet imperialism remains as urgent as ever. And if the defence programme is not to be slowed down—and Mr Truman hinted that some goals, instead, might need to be raised—the President and his economic advisers remain convinced that inflation, and not deflation, is the danger, whatever the present woes of retailers staggering under heavy inventories.

The present economic lull, in the President's view, is the reward for credit and price controls, for taxation which has exceeded the actual increase in defence spending, and for a remarkable 10 per cent increase in production over the past year. Output rose more rapidly than in any other postwar year, while unemployment fell by 1,800,000 to the lowest level since 1945. But the Council of Economic Advisers does not expect production to increase more than 5 per cent in the next twelve months, while spending on the security programme, which includes foreign aid as well as domestic spending, will nearly double, reaching an annual rate of $65 billion in mid-1952, from the present rate of $35 billion a year.

Lest Congress should take fright at such a figure, the President put it in perspective: at its peak, the defence programme should not take more than one-fifth of total output, compared with one-half in 1944. Lest Congress attempt to economise at the expense of America's allies, he pointed out that the great economic, moral, and military advantages of sustaining the free world could be purchased for 2 per cent of America's total estimated output, and that if the other members of Nato could not expand their military programmes as rapidly as the United States, this was because their total output, related to population, is less than a third of the American level.

The heart of his argument, however, was the estimate of the CEA that, with a $30 billion increase in defence spending and reinforced by capital goods expenditures which are running at an all-time high, personal incomes next year will be raised, before taxes, to an annual rate $15-$20 billion greater than at present. Supplies of civilian goods then will not be higher, and may well be lower, than they are now. To keep this wolf of inflation from the door, he advanced the old prescription: a $10 billion tax increase, price, wage and rent controls, credit controls, particularly the selective ones Congress is anxious to ease, and voluntary savings. Congress, however, like the friends of the boy who cried wolf, may decide the President has cried inflation once too often.



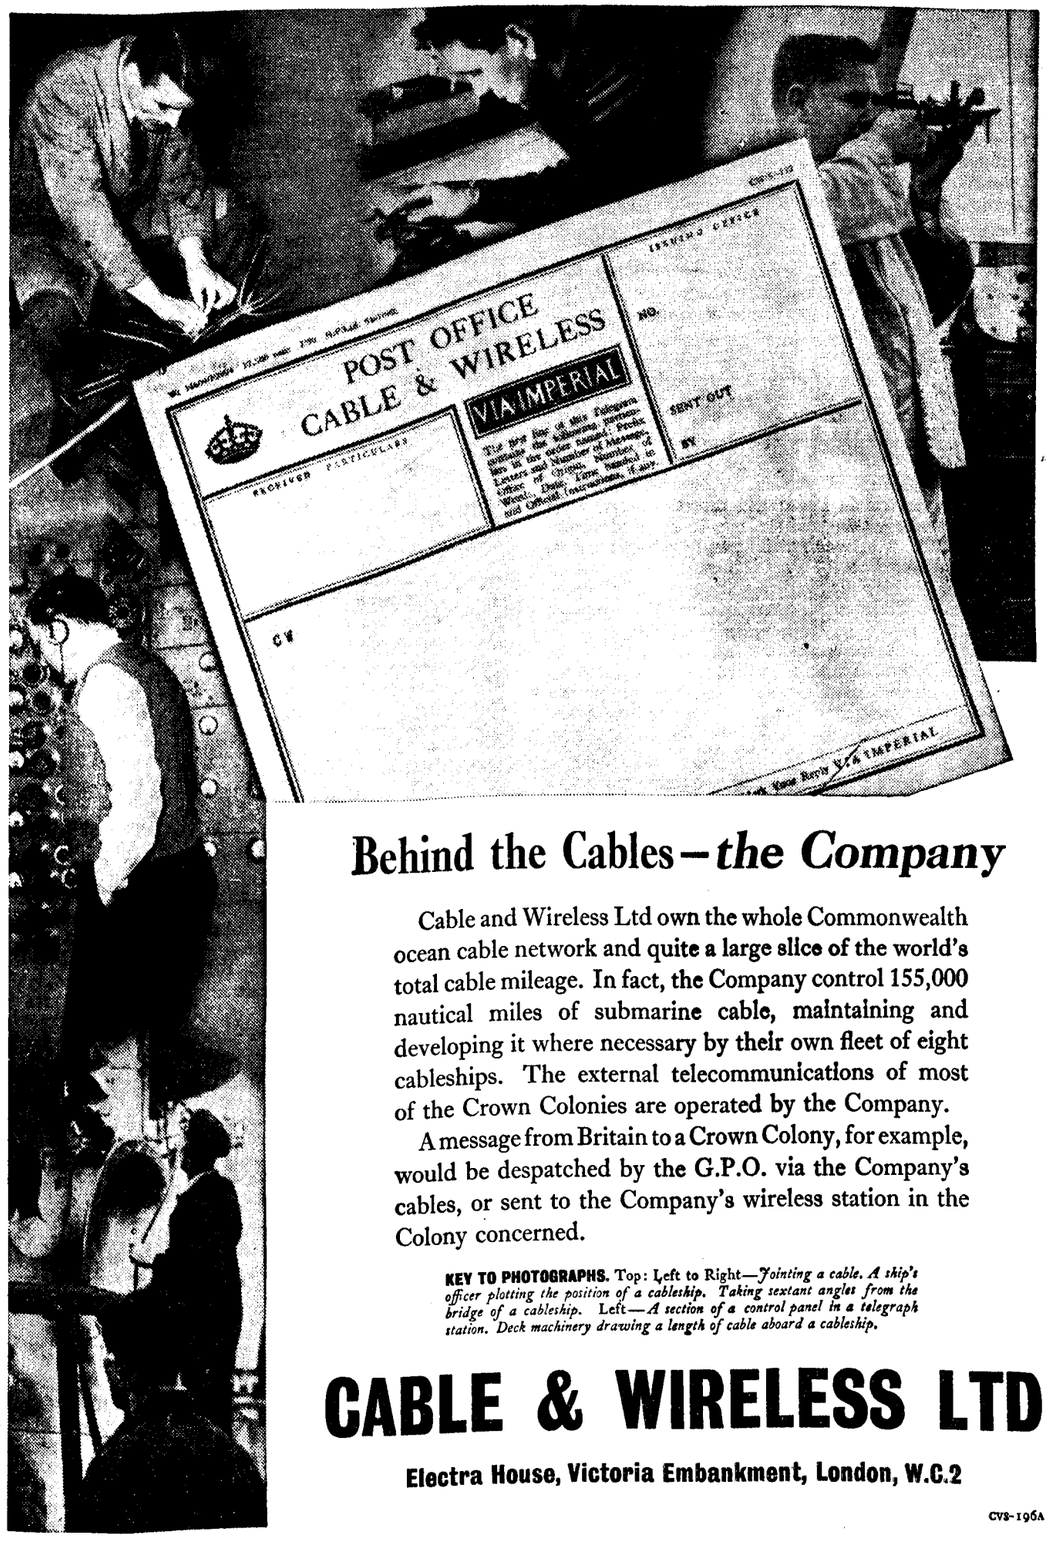
* * *

Billion Dollar Flood

Kansas City is emerging from its ordeal by flood and fire and the crest of the water has passed beyond St Louis to the lower stretches of the Mississippi River; there flood control works are effective enough nowadays to deal with a volume of water that has not been equalled since 1844. The disaster was caused by an abnormally wet June in Kansas, followed by a series of cloudbursts in what should have been a hot and dry July; the soaked soil could absorb no more and all the water poured down the Kansas River into the already swollen Missouri River at Kansas City.

This unusual readiness of the clouds to drop their moisture over Kansas, instead of carrying it on to the north-east—New York City is again in danger of a water shortage as a result—is being blamed by some, not on Providence, but on Dr Irving Krick and the cloud-seeding operations by which he brings rain to the parched west. The damage caused by the floods is being blamed, much more convincingly, on the Congressmen who, in the interests of reducing the budget deficit, and sometimes also in those of influential friends, have failed to appropriate the money needed to build the Tuttle Creek and other dams, authorised years ago, on the tributaries of the Kansas River. These and other flood control works in the area, which would make Kansas City permanently safe, would cost $300 million, compared with the flood's $1 billion worth of direct damage to life, crops, industry, transport and buildings, and the indirect and incalculable loss to the national economy arising from the complete disruption of such a major railway and agricultural centre as Kansas City.

The Administration is hoping that this year all its requests for funds for flood control will be saved from the Congressional axe, now that the false economy of cuts in such



appropriations has been demonstrated in Kansas. Funds to start the three projected dams there ought at least to be forthcoming, but Congress will not necessarily extend its generosity to other branches of the Pick-Sloan plan. Under this scheme, drawn up in 1944, the Army Engineers and the Bureau of Reclamation deal jointly, but not always co-operatively, with flood control and hydro-electric development for the whole Missouri Basin, stretching right up into Montana. The advocates of an independent and more comprehensive Missouri Valley Authority are also trying to make capital out of the recent floods, as are those who find a remedy for most of the earth's problems in improved soil conservation practices. Good as both cases may be in theory, it is doubtful whether either would have been an effective answer to the peculiar weather conditions which prevailed in Kansas this summer.

* * *

Paying the Natural Gas Bill

A little over a year ago Mr Truman was applauded for a difficult veto. On the ground that competition could not be relied upon to keep down the price of natural gas, which consumers in most major cities will soon use, he vetoed the Kerr Bill, though he had been expected to pass it as a token of gratitude for past and anticipated contributions of the oil companies to the party funds. The Bill would have exempted from federal regulation the independent producers of natural gas; the chief beneficiaries would have been the big oil companies which control half the proven supplies of natural gas, but which are independent in the sense that they are not affiliated with pipe-line firms.

What Mr Truman took away with one hand, however, his old friend, Mr Mon Wallgren, whom he made chairman of the Federal Power Commission, has returned with the other. With a speed which is unprecedented, the FPC has ruled that the Phillips Petroleum Company, largest of the independents, is not subject to its jurisdiction. The company had argued that, although it sold gas to five or six pipeline systems for interstate transportation and sale, its own operations were entirely intrastate and hence exempt from federal control. The decision may be appealed by some of the state or city regulatory agencies, but for the moment the oil companies are celebrating, not only the escape of natural gas, but the allaying of their fears that federal control of oil at the wells might follow that of gas. Staunch Administration Democrats from the south-west, including Senator

Behind the Cables—*the Company*

Cable and Wireless Ltd own the whole Commonwealth ocean cable network and quite a large slice of the world's total cable mileage. In fact, the Company control 155,000 nautical miles of submarine cable, maintaining and developing it where necessary by their own fleet of eight cableships. The external telecommunications of most of the Crown Colonies are operated by the Company.

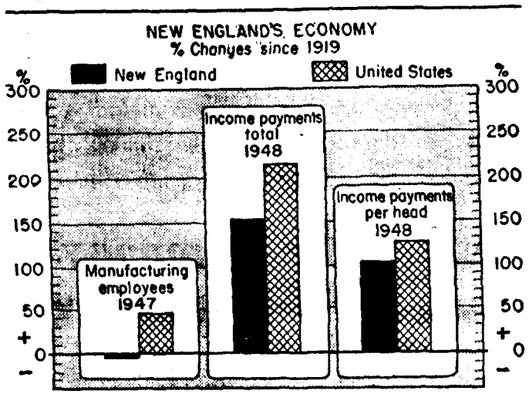
A message from Britain to a Crown Colony, for example, would be despatched by the G.P.O. via the Company's cables, or sent to the Company's wireless station in the Colony concerned.

KEY TO PHOTOGRAPHS. Top: Left to Right—*Jointing a cable. A ship's officer plotting the position of a cableship. Taking sextant angles from the bridge of a cableship.* Left—*A section of a control panel in a telegraph station. Deck machinery drawing a length of cable aboard a cableship.*

CABLE & WIRELESS LTD

Electra House, Victoria Embankment, London, W.C.2

CVS-196A



Connally and Mr Rayburn, the Speaker of the House, must now be regretting the hard things they said about Mr Truman's veto.

The oil companies contend that the removal of federal regulation will release great quantities of natural gas, which have been held back from the market. Whether, in fact, supplies will rise and prices fall, as they allege, probably will not be known until after the next election. There is such a shortage of steel for new pipelines that Mr Chapman, the Secretary of the Interior and head of the Petroleum Administration, proposes to issue an order limiting the number of new natural gas customers whom distributors may take on. The steel allotted for pipelines in the third quarter is only half that needed for the "most essential" projects.

* * *

New England's Second Chance

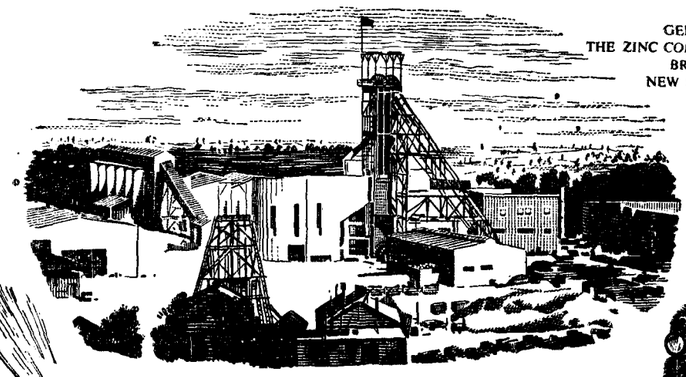
When the high tide of postwar prosperity started to recede in late 1948, New England was left higher and drier than any other area—a sign that good times had only concealed, and had not cured, any of its troubles of industrial old age. But the survey of New England's ailments, set in train by the Council of Economic Advisers, was hardly begun before the war in Korea and the rearmament programme refloated New England and offered a second chance to make its economy seaworthy. The authors of the report, which was submitted to the President at the end of June, believe that both New Englanders and the federal government should seize this opportunity to make adjustments which will enable the 9,000,000 people who live in the six states in the tiny north-eastern corner of the country to earn a good living.

New England is hardly a "distressed area" in British terms, though it is poor in raw materials and its geographical position has lost many of its advantages. Its income a head is still greater than the American average, though the difference is declining; its economy is still growing, though more slowly than that of other regions. The greatest single source of weakness has been its dependence on two industries—shoes and textiles—and the competition from new plants in the south and west. From 1919 to 1947, 156,000 jobs disappeared in textiles alone, but the drop in total manufacturing employment was held to 30,000 because of an expansion in durable goods—a trend which the report believes should be accelerated, though it helped to make New England more vulnerable to the recession in 1949. The real trouble, however, was New England's large proportion of high-cost marginal producers and antiquated plants; when one of these is a town's sole support any recession can be devastating. High wages have ceased to be a handicap; in the new heavy industries New England's rates are actually lower than those in the west and even in textiles the differential is disappearing.

Modernisation, diversification, and the encouragement of venture capital are old specifics for Yankee ailments; the report is critical of the decline in risk-taking and managerial ability, particularly in third and fourth generation family concerns, and the resistance to new ideas on the part of trade unions and management alike. But what will be hardest for many rock-ribbed New Englanders to swallow is the suggestion that instead of vainly crying out against federal "extravagance," they should seek their fair share of federal spending. New England has no federal hydro-electric developments; though it contributed 9 per cent of war production, it received only 4.5 per cent of the new government plants built during the war. The same pattern seems to be repeating itself in the defence effort; if the New England steel mill, which the report endorses, is not built, New England's share of federally financed new plant may be even smaller this time. In 1948 the federal government was taking $1 billion more out of New England in taxes than it spent there. Today's Connecticut Yankee, it seems, should swallow his pride and make his way to President Truman's court.

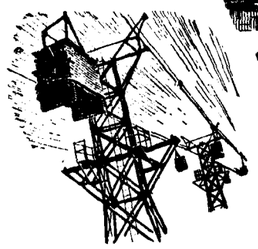
Shorter Notes

President Truman has sent the Senate his nominations for the three vacancies on the Federal Bench in Illinois and in two out of the three cases he has, contrary to custom, ignored the recommendations of Mr Paul Douglas, the Democratic Senator from Illinois. Mr Douglas has taken the unusual step of asking the local Bar Associations to conduct a poll amongst their members as to whether his or the President's nominees would make the better judges. Should the result be in his favour, he is likely to exercise his Senatorial privilege and block the confirmation of the nominations.



*

The door-to-door salesman now travels in a truck fitted out with a large selection of goods, in fact in a "mobile shop." This method of selling has increased enormously in the last few years, and its appeal for housewives who cannot get away from kitchen and children is obvious. But it appeals also to tradesmen who are tied to their businesses. It is not only magazines, clothes, washing machines and pianos that are sold by this means, but also printing presses, automobile accessories and tools for aircraft repairs.



*

The union of Blacksmiths and Drop Forgers has merged with that of the Boilermakers and Iron Ship Builders, because there are no longer enough blacksmiths to justify a separate organisation for them. The advance of technology is to blame; not only is the art of shoeing horses almost unknown today in the United States, except at race tracks, but there is also now little work for blacksmiths on even the iron horses, for railway engines seem to need much less maintenance than they used to do. Such blacksmiths as survive have, however, far more complicated repairs to do than their predecessors, for they deal with anything from surgical instruments to heavy machinery.

With the success of oil drilling operations in north-eastern Montana, only three months after oil was found near Williston, North Dakota, there can be little doubt that an important new petroleum producing area has been discovered in the northern United States, stretching probably into Saskatchewan and Manitoba. The chief difficulty is that most of this oil lies two miles or more underground and it will be a slow and expensive process to prove the new fields.

THE WORLD OVERSEAS

Peking Claims the Lead in Asia

ON July 1st the Chinese Communists celebrated the thirtieth anniversary of the founding of their party. The speeches made and articles contributed to the press on this occasion by Chinese Communist leaders throw some light on their opinion of themselves and their conception of the special part they are destined to play in the world revolution.

All the declarations lay the greatest emphasis on the Marxist-Leninist foundation of Chinese Communism. Marxism-Leninism is held to be "a universal truth which is applicable anywhere" and the Chinese Communist party (the CCP) is said to be "armed" with it. According to Peng Chen, a member of the CCP Politburo:

> The practical experiences of the Chinese people have taught us that Marxism-Leninism is an omnipotent scientific weapon. . . . It enables us rapidly and thoroughly to expose the real nature of the varied kinds of swindlers and traitors who put on a revolutionary mask but who actually serve as the tools of our enemies. . . . It transforms the spontaneous struggles of the Chinese people into a conscious revolutionary struggle guided with scientific foresight. It enables the Chinese working class . . . to establish a broad united front so that our enemies are completely isolated and can be defeated one by one.

The tributes paid to Marxism-Leninism and to "the principles of party construction of Lenin and Stalin" are not, however, intended to imply that China has merely taken over a European doctrine and adapted it to local traditions. The theories of Mao Tse-tung—who now receives in China the kind of adulation elsewhere reserved for Stalin—are also glorified, and China's achievement is placed on an equality with that of the Soviet Union in a division of labour which, broadly speaking, implies that Russia should lead the West while China leads the East. This view is not presented as an innovation, but is supported by lengthy quotations from Lenin and Stalin on the difference between a revolution in an imperialist country, where there is no foreign oppression, and a revolution in a colonial or semi-colonial country, where there is a nationalist revolutionary struggle. But the way the Chinese have developed this idea cannot be entirely to the liking of Moscow, for the conclusion is drawn that Chinese experience is more relevant than Russian for the world of backward and dependent peoples. In the words of Lu Ting-yi:

> In the course of the century-old, worldwide Marxist movement, classic examples have come into existence. Up to now two of them are of the greatest importance—the October Revolution in Russia and the People's Democratic Reovlution in China. . . . The classic type of the revolutions in imperialist countries is the October Revolution. The classic type of the revolutions in colonial and semi-colonial countries is the Chinese Revolution. . . . It is clear that this is a further development and enrichment of Marxism-Leninism and a contribution of universal significance to the world Communist movement.

In the editorial comment of the Cominform journal on the anniversary this language is discreetly toned down, though a warm tribute is paid to the Chinese achievement:

> The victory of the Chinese revolution with the establishment of the Chinese People's Republic is the greatest event in history, following the October Socialist Revolution. It tremendously changed the international situation: the camp of peace, democracy and Socialism acquired added strength while the imperialist camp has been further weakened. The experience of the Chinese revolution is of inestimable significance for the peoples of the colonial countries, fighting for freedom and independence.

The Russians are evidently unwilling to admit the theory of the co-equal "classic" types dividing the world into respective spheres of influence, though they are ready to allow that the Chinese experience may be of "inestimable significance" for the colonial and semi-colonial peoples. Moscow is probably willing to concede to Communist China a sphere of national hegemony in South East Asia—a region where Russia has never had any direct interest—but it would be quite a different matter to agree that China should be the special guide and mentor for all colonial and semi-colonial countries irrespective of their location. If Peking continues to assert such claims as a matter of policy, it could lead to considerable friction with the Soviet Union.

India still to be "Liberated"

It is hardly, however, a difference of a kind which can afford much satisfaction to those western statesmen and diplomats who nourish hopes of detaching China from Russia. For if there is any distinction to be drawn between the publicly declared programmes of the two Communist powers for backward countries, China is the more militant in its incitement to armed revolt. Thus Lu Ting-yi declares that "the peoples of Vietnam, Burma, Indonesia, Malaya and the Philippines have been carrying on their national liberation wars against imperialism, while the national liberation movement is growing in India, Japan and other countries." Thus a line is drawn between countries where Communist armies or guerrilla bands are actually carrying on military operations against the established governments and those in which Communist parties exist but are not yet engaged in armed insurrection. In any case none of the countries mentioned are admitted to have attained "national liberation," and it must be a little hard for the Indian and Burmese Governments which have exchanged ambassadors with the Chinese People's Republic to be informed that their nations are not yet independent. The Chinese Communists, however, have laid it down that only the working class led by a Communist party can carry out a "genuine" revolution against imperialism, and therefore Asian countries are just as much in need of "national liberation" against Mr Nehru, Mr Thakin Nu or Mr Sukarno as against Mr Malcolm Macdonald or General de Lattre de Tassigny. The Chinese Communist leaders express supreme contempt for all Asian non-Communist national movements. As Lu Ting-yi puts it:

> China will take a path different from that of Japan which, after the Meiji Restoration, became an imperialist country and later on actually became a colony of US imperialism. China will also take a path different from that of Turkey, which since the Kemal revolution has become a satellite and henchman of the imperialist aggressive bloc. In the light of the great victory of the people's democratic revolution in China guided by Marxism-Leninism and Mao Tse-tung's theory of the Chinese revolution, all the bourgeois democratic movements of the old type in the history of Asia—such as the Meiji restoration in Japan, the Kemal revolution in Turkey, the Gandhiist movement in India, etc.—become pale and colourless.

It appears therefore that the extremely benevolent attitude of India and Burma towards the Chinese People's Republic does not bring any correspondingly favourable attitude of the Chinese Communists towards them, but that India, which declined to join in the United Nations' condemnation of China as an aggressor in Korea, and Turkey, which sent an expeditionary force to fight in Korea, are both alike included in the category of "pale and colourless" regimes destined to extinction at the hands of "national liberation movements."

On the other hand, there can be no doubt but that the Chinese Communist revolution has had a great effect in Asia just because it has happened in an Asian country and has grappled with conditions which are more or less typical of Asian countries; thus it seems to come nearer to popular Asian aspirations and needs than the political practice of the West or even of Russia. Another asset of the Chinese is that they can claim to have shown, far more than the Russian Bolsheviks, how power can be captured by what may be called gradual violence. The Bolsheviks started with a swift seizure of power in the capital of Russia and during the whole period of the civil wars they were in possession of the territorial core of the old Russian empire; the Chinese Communists, on the other hand, were for years rebels holding on precariously in a remote part of China, and only after a long process of infiltration and expansion did they finally conquer the great cities of the country.

Cadres for a Peasant Army

The Chinese example is thus by far the more relevant for a local Communist party in Asia which cannot seize power immediately in urban centres but has a chance of waging guerrilla warfare from jungle or mountain strongholds. The Communists in Malaya at the outset hoped to gain control of an area which would provide a Malayan "Yenan"; in Vietnam and the Philippines a measure of success has been obtained in setting up organs of administrative control in "liberated areas" to support ceaseless warfare against the established government. The Chinese Communist party anniversary statements lay great stress on the long duration of the armed struggle in China, which was carried on by the Communist forces for over two decades—civil war 1927-36, anti-Japanese war 1937-45, and renewed civil war 1945-49. Patience and persistence are thus represented as the keys to ultimate victory, and it is emphasised that prolonged fighting is the best way of producing real revolutionary cadres. In repudiating the charge that Chinese Communism had been essentially a peasant movement, Peng Chen points out that peasants leaving their villages to join the Communist forces lived for a long period in "a revolutionary military organisation," so that their "peasant origin" became irrelevant.

The professional revolutionary, the "cadre," political or military, is indeed the key figure in the new regime in China and it is vitally necessary to keep up the revolutionary *élan* and hatred now that victory within China has been won. Imperialism, however, meets the need for a permanent enemy, and it is notable that in the anniversary retrospect the greatest sin of the Kuomintang is represented as having been its subservience to America; indeed, it is even suggested that the renewal of the civil war in China in 1945 was the work, not of the Kuomintang itself, but of America, which "having replaced Fascist Germany, Italy and Japan, has been frantically pushing forward with its plans for enslaving the world." These plans, however, were frustrated, first in China itself and then in Korea. Chu Teh, the Commander-in-Chief of the People's Liberation Army, also hints that the fight in future must be extended to Japan:

> The Chinese people . . . certainly will not tolerate the American imperialist invasion of Formosa and Korea or the schemes for signing a separate peace with Japan and the military occupation and rearming of Japan. At this moment the American imperialists should especially review the history of how Chiang Kai-shek, whom they armed and commanded, was thoroughly defeated by the Chinese people and the People's Liberation Army.

King Abdullah

KING ABDULLAH—born in 1882 and murdered in 1951—liked to think, as he looked back from his sixties, that one of the most remarkable things about his life was the change that it spanned. He spent his childhood in and around Mecca in a world bounded by the range of stud camels, fast mules and pedigree horses. He was in his thirties a spirited member of the Ottoman House of Parliament in Constantinople. He lived to visit a friendly Turkish republic by air, to watch his army tear across the Syrian desert in fast armoured cars, and to experience the buffets of world economics and politics dealt by Hitler and Stalin.

He was a man who knew his mind and liked his way. Yet he appreciated the same trait in others. Mr Churchill, therefore, was greatly to his taste, and he was often displeased with irresolute Arab friends. Some of his quarrels with the Arab League were due as much to this characteristic as to his personal ambitions for Jordan.

In Britain he will be remembered chiefly for the staunchness of his friendship. He never forgot a good turn and, when he could, repaid it. The warmest spot in British hearts should be reserved for what he did in 1941. When the world war broke out many Arabs, highly appreciative of Hitler's anti-Jewish policy and of his success in annexing territory, reckoned that a German victory would have points. Abdullah was from the start of the war wholly pro-British; even his antipathy for the French (who had turned his brother Feisul out of Damascus) did not shake his conviction. Among the many crises of the war years, Britain's lowest ebb was the month in 1941 in which Crete fell, German aeroplanes took off for Syria and Rashid Ali revolted in Baghdad. At this grave moment King Abdullah permitted the use of his army for a foreign campaign on Britain's behalf. The Arab Legion campaigned in Iraq.

His personal friends in Britain share recollections of many endearing characteristics. He was accessible to his whole people; any early morning caller, however humble, might come in. He liked nature—flowers and animals—and enjoyed comment on their little ways. He had a great taste for poetry. He liked using his eye for a horse to bring him winnings at the races. He was invariably dapper in his striped silk robes and white headscarf; he expected the same of European guests on formal occasions. "Have you noticed," he once remarked to a British friend, "that X never creases his trousers?" He loved observing mankind and would spend happy afternoons in a green velvet armchair on the palace steps of Amman watching the passers-by.

Flutters Among the Tribes

Yet he had his weaknesses. He relished a little trouble between tribe and tribe—a scene to which he could bustle off in a car and during which he could lay down the law, perhaps distribute some largesse, and settle the hash. This was all very well when the tribes lived within his frontiers but awkward when their homelands lay beyond them. His flutters among the tribal leaders in Syria—usually put down to "British machinations"—were for years a sore point with the French.

His mind often toyed with territorial aspirations of nineteenth-century pattern, of a type dating from the days when it was a good thing to have a bigger kingdom no matter what the contents. Alone among Arabs, he was in favour of the partition of Palestine when it was first proposed in 1937. He recognised partition in 1949 and met his death two years later because he had done so. He had weighed the risks. To him, they were worth it. Perhaps he was something of an anachronism. Yet anyone who watched his upright figure as he stood to the salute for 2½ hours at the annual parade of his Legion in April knew that here was someone who had enjoyed life, and, particularly, every minute of being a king.

Israel's Second Elections

In Jerusalem, one half of the city is blacked out in mourning for King Abdullah, but the other is a blaze of light. For Israel is in the last week of its election campaign. Loudspeaker vans are hard at work. Posters, and the letters of the alphabet which stand for the parties and which enable newcomers who do not yet know Hebrew to make their mark for a party list, fill every available blank space. Voting takes place on Monday.

In the past, election results have been easily predictable. In 40 years of polling first for the Council which represented the Jewish community under the Mandate, and, in 1949, for the first national Parliament (*Knesset*), the proportions in which the parties have been returned have varied curiously little. They have been unchanging because of the custom whereby party membership affords privileges that have turned political parties into quasi-benefit societies; membership of them can produce jobs, credit facilities and even accommodation. Even the schooling of children is by law organised on the basis of the major party trends. For years, therefore, the balance between this group and that—between Labour and Liberal, or orthodox and non-religious—has tended to be static. This time it may change, for no one can tell what considerations will sway the high proportion of new voters. The number of eligible voters has doubled in the last 2½ years.

In the *Knesset* that is now in process of dissolution the principal parties, reading from left to right, were:—

Communists	3
Mapam (pro-Soviet except where this policy conflicts with Zionism)	19
Mapai (Labour)	46
United Religious Front (orthodox)	16
Progressives	5
General Zionists (for free enterprise)	7
Herut (expansionist)	14
Seven other groups	13

Only Mapai would like to drop the system of proportional representation that inevitably produces a large number of small parties and drives these eternally to form coalitions. Last time, Mr Ben Gurion's Mapai was faced with the necessity of joining either with Mapam or with the Religious Bloc to obtain a majority. It chose the latter, worked with it for nearly two years, but finally broke with it on the issue of whether there should be secular education only, or religious education as well, in the immigrant camps. The quarrel brought to a head one of the fundamental problems that exercises thoughtful Israelis, to wit: Is their new state to be founded on recognition of the moral and spiritual basis that held Jewry together through the centuries, and, if so, need this necessarily take the form of outward observance of all the practices that are thought imperative by orthodox Jewry?

What Kind of Coalition?

There are a few pointers to the way in which the voting will go. For instance, in rural areas it can be predicted even among new voters because the trends and parties, through their recruiting stations in the immigrant camps, attract newcomers to settlements which they themselves organise and in which all vote one way. It is in the towns that forecasts are harder to make. In the municipal elections of last November, a swing to the right took place in Tel Aviv and in the older towns; here the General Zionists seemed to attract a lower middle class vote which had become dissatisfied with Mapai, less because of queues and controls (which most sober Israelis know are unavoidable in the country's parlous financial state) than because of pressure allegedly exercised on the small man by the organisations run by Mapai's adjunct, the Histadruth (Jewish Federation of Labour).

The Histadruth exercises—in the view of its opponents, misuses—considerable powers through, for instance, its powerful co-operatives, through its admirable workmen's housing organisations or through equally efficient sickness benefit arrangements; 17 per cent of the population is said to work for Solel Boneh, which is its contracting organisation for industrial and constructional jobs. But against this evidence that a swing away from Labour might take place must be set the fact that in the municipal elections, such areas as can be said to consist almost entirely of new immigrants—such as Jaffa and Ramle—voted left. The proportions here showed Mapai roughly twice as strong as Mapam and Mapam twice as strong as the Communists. The Arab franchise, which in 1949 numbered only 32,000, is expected to amount to about half of the Arab population of 175,000. The Arab parties are all left wing. The only non-Arab party to run Arab candidates at or near the top of its list is the Communist party.

Groups that are expected to lose ground are the Religious Bloc, which has split into its four component parties, the Progressives (whose programme is almost indistinguishable from that of the General Zionists) and Herut, the party that hopes for the expansion of Israel. This lives on several slogans that are widely regarded as out of date and it has lately been short of funds. It might get a fillip if there were trouble in Jordan.

Mapai is likely therefore once more to lead the poll, and Mr Ben Gurion to remain Prime Minister. If he is returned, what kind of a coalition will he seek? Mapam, which has become, on this year's party showing, a little redder than it was before, would make a strange partner. The likelihood is that he will seek alliance with the General Zionists. Their demands are for modified controls; for measures to break Histadruth-controlled monopolies over some public utilities and industries; for nationalisation of education, insurance, labour exchanges and public building; and for the introduction of the merit system in the army and civil service. Some of these demands attack Mapai's vested interests at the root, which the demands of the Religious Bloc do not. But, faced with a choice between the two, Mapai's more thoughtful members seem to find the General Zionists' price the less irrational one to pay.

No Change in Madrid

[BY A CORRESPONDENT]

The publicity accorded the recent Spanish Cabinet changes in the British press probably reflects the general anxiety in this country to see a more liberal regime in Spain. It would be a mistake, however, to allow wishful thinking to blind one to the facts. One swallow does not make a summer, and the departure at long last of the much-criticised Sr Suances, Minister of Industry and Commerce, as a sop to the United States, loses much of its importance in the light of the composition of the new Cabinet. Sr Suances came under fire for his policy of indiscriminate industrialisation, for centralising all business transactions in Madrid, for promoting the state-run *Instituto Nacional de Industria* (INI)—whose tentacles have been rapidly spreading into every branch of industry—and for his almost completely rigid adherence to the law restricting to 25 per cent foreign capital invested in Spanish concerns. Sr Suances' ministry is now split into two, a Ministry of Industry under Sr Joaquin Planell and a Ministry of Commerce under Sr Manuel Arburua. In two such closely related departments—and there has so far been little indication of their respective spheres—much will depend on the personalities of their chiefs. Sr Planell was second in command of INI and can therefore be relied on to continue the policies of his former chief. Sr Arburua was general manager of the Spanish Bank for Foreign Credits and has held office under a former Minister of Commerce, Sr Carceller. He is known to favour

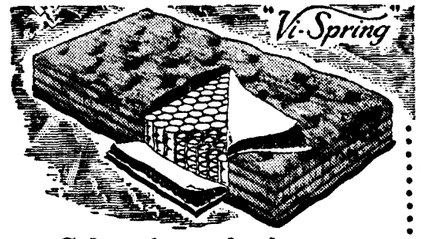
a more liberal policy in trade but whether he will be able to achieve it in spite of his colleague's opposition remains to be seen.

At the new Ministry of Press and Information, the Minister, Sr Gabriel Salgado, has already had charge, not only of propaganda, but of the censorship of the press. His heyday in this capacity was during the war, at a time when German influence was strong in Spain. His appointment bodes little good, despite talk of a new and more liberal press law. The appointment of Franco's right-hand man, Sr Carrero Blanco, as Minister without Portfolio, gives promotion to a man known to hate England and France. Under the pseudonyms of "Hispanicus" in the press and "Juan de la Cosa" on the wireless, he has at times conducted venomous campaigns against Britain and France; nor has the United States been entirely exempt in the past. Any institution that savours of "liberalism" is anathema to him.

Some Routine Promotions

Sr Joaquin Ruiz Jiminez, formerly Spanish Ambassador to the Vatican, owes his appointment as Minister of Education rather to strong intervention by influential elements in the Church than to any wish on the part of Franco to please the United States by withdrawing his own choice of Sr Sastiella. The latter was joint author of a book claiming Gibraltar for Spain and the man whom Franco would have sent as Ambassador to London if the British Government had not refused to have him. Nor can the appointment of General Augustin Munoz Grandes as Minister for War be regarded as a conciliatory gesture, since he was head of the Blue Division which fought against Russia. The new Minister of Justice, Sr Antonio Iturmendi, has held office as Under-Secretary in the Ministry of the Interior which controls the machinery of the State police. Four members of the outgoing Cabinet, including the Foreign Minister, Sr Artajo, retain their present posts. The remaining portfolios are routine promotions. An official of the Finance Ministry, Sr Francesco Gomez Llanos, is the new Finance Minister; the Minister for Agriculture, Sr Rafael Cavestany, was a member of the Agricultural Research Institute, while the Minister for the Navy, Admiral Salvador Moreno, is a former Minister of Marine who has been commanding the naval base at El Ferrol.

Although a number of the new Cabinet have been described as monarchist, it would be a mistake to imagine that this heralds the return of the Pretender, Don Juan, to the throne. Spain abounds in "passive" monarchists who would welcome a return of the monarchy, but are not prepared to take action to bring it about, and meanwhile enjoy such fruits of the Franco regime as are available to them. Moreover, the Don Juan monarchists are hopelessly divided among themselves, and there are in addition other monarchists who support the Carlist line, such as Sr Iturmendi, the Minister of Justice. Count Vallelano, the new Minister of Public Works, who was Mayor of Madrid under Primo de Rivera, is a monarchist by repute, but were he a true supporter of Don Juan he would not hold office under Franco. Franco's policy is at present directed towards persuading Don Juan to abdicate in favour of his eldest son, now at school with his brother in Madrid. Don Juan himself is unacceptable to Franco because he is tainted with liberalism from his contacts with Republican Socialists in exile. So far, Don Juan has shown no signs of complying with Franco's wishes, nor would there seem much point in his doing so, since the Prince of Asturias is now only twelve and may not succeed to the throne, under Franco's Succession Law, until he is 30, by which time Franco would be nearing 80.



The fact is that, with the possible exception of the Minister of Commerce, Franco has done nothing to introduce more liberal elements into his Cabinet. Moreover, his hand has recently been strengthened by prospects of a good harvest and better water supplies to generate electrical power for industry. The cancerous state of the economy remains, as the recent outburst of strikes bears witness, but the United States' need for bases is Franco's opportunity. Past experience shows that he is unlikely to waste it and his terms will almost certainly be stiff. Extensive United States help is at present Spain's only hope of recovery; but it will go to a totalitarian and illiberal regime, and it will not be surprising if only a small proportion of it reaches the people for whom it is intended.

Class War in Western Germany

The air of Federal Germany resounds with threats of class war. From the headquarters of the *Deutsche Gewerkschaftsbund* (the German TUC) come statements framed in terms such as "challenge to battle," "the employers' front" and "strong-points" which fall so naturally from German lips. The Federation of German industry is less militant in tone, but equally formidable in strength. The employers' union may even be stronger than the DGB. True, the German trade union movement is no longer split into Catholic and Social organisations, but it is not a monolithic, centralised body. Owing to the insistence of the British in the early days of Military Government, the trade unions were reorganised on the democratic lines of the TUC. The headquarters in Duesseldorf have therefore no direct authority on wage issues. In any case, only about 5,500,000 out of the working population of 14,250,000 are union members.

The present tension between the employers' and trade union organisations is not the fault of Dr Adenauer. At the end of last year the Chancellor made an effort to secure labour peace by two measures. He established a joint com-

Bravo Monsieur! . . . mais
c'est impossible that you arrive today!

Yet there it was . . . before his eyes. The Crossley car that had set out from London on the twenty-third of March 1907 arrived in Monte Carlo the very next day — only thirty-five hours later. An event which increased more than ever the insistent demand for Crossley cars; was recorded in Automobile history; and filled its makers with a glowing sense of triumph.

This pride of achievement, springing from a steadfast belief in constant and absolute perfection in engineering quality, has been a guiding principle at Crossley Motors from the very first: and through the years this official policy, with its ideal of perfection, has never made concessions or compromises of any sort.

When it became clear during the 1920's that the industry as a whole had accepted mass-production methods, the bold decision was reached to maintain the criterion the Company had set itself by changing over to the commercial vehicle market: and today, in its new field, the prestige attached to the name of Crossley stands as a tribute to the individual courage of a company that has never sacrificed its ideals.

CROSSLEY

FOUNDED IN THE TRUE TRADITION OF BRITISH CRAFTSMANSHIP

Crossley Motors Ltd., Errwood Park, Stockport, is a member of the Group of Companies controlled by Associated Commercial Vehicles Ltd. of which the selling organisation is

A.C.V. SALES LTD. 49 BERKELEY SQUARE, LONDON W.1

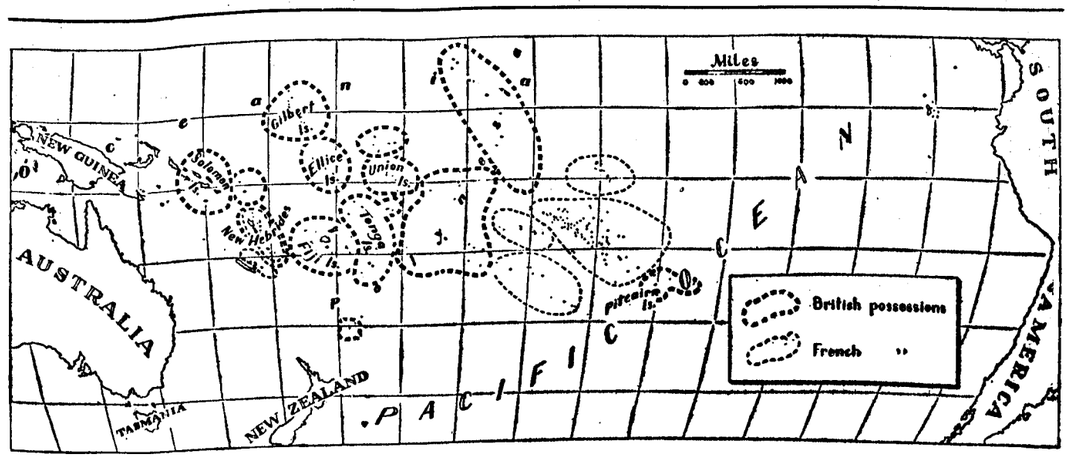
mittee to deal with the problem of stabilising wages and prices, and he pressed through the Co-determination Law. This latter measure—a big step towards syndicalism—gave labour the right to an equal share in the boards of directors and management of the heavy industrial concerns of the Ruhr, once they have been reorganised under the Allied Law 27. It is bitterly opposed by the employers' federation, because the labour representatives will tend to be spokesmen of the trade union headquarters. The DGB is as determined to extend co-determination to every important branch of industry as the employers' organisation is to prevent any further breaches in the rights of capital. The latest round has gone to the employers—in this case the State itself; the *Bundestag* has rejected a demand that the Federal Railways Board should give equal representation to labour. The railway union leader thereupon issued a flaming declaration about struggle to the last.

No More Concessions

In the field of wages it also seems that the period of concession by both sides is at an end. Conflicting statistics come from the two rival organisations; but it appears fairly certain that wages have gone up over the past year to roughly the same extent as prices. The unions are probably right in claiming that the German worker has still a smaller share of the national income than before the war, while any observer of the German economy can see that he works extraordinarily hard to secure as much as he does. To minimise inflationary conditions and set the mismanaged public finances in order, the German worker should probably not receive much more, but taxation should leave trades and industrialists with less. Something in that direction has been attempted in the new Federal income tax regulations, but in general Dr Schaeffer, the Bonn Minister of Finance, still remains helpless in the face of competing pressure groups.

Various employers' associations have now declared they will not grant further wage demands. The new chairman of the DGB, Christian Fette, has retorted that in view of the "great unrest among the workers," and the failure to keep prices down, "it is time to change the present economic system." On July 24th the DGB executive recommended withdrawal from all co-operation with the Government. Over a hundred wage agreements have been ended by individual unions and some leaders inside the Metalworkers Union have decided to "break the industrialists' front from below" by instructing individual factories to take their own steps to secure benefits which have not been accorded by negotiation. The struggle in this branch of industry will have wide political repercussions. The employers will certainly oppose any further wage increases all the more resolutely in view of the Schuman Plan. They will wish to retain the position of the Ruhr as the cheapest steel producer in order to justify the investment of all available American capital in Germany.

The Trade Union Federation, in contrast to the Social-Democrat Party, has conditionally approved the Schuman Plan, since its economists believe that the Plan offers the Ruhr a big chance of leadership, and co-determination ensures power for the Federation in the Ruhr. It has, however, reacted strongly against the latest concessions made to private owners by the Allies in connection with the reorganisation of the Ruhr, and maintains that the new unit companies must be publicly owned. Here they are at one with the Social-Democrats.



Another indication of the trade union leaders' intention to enter the home political field came on the occasion of the election of Herr Fette last month. The new chairman announced that the unions would themselves take action against any neo-Nazi activities, should the authorities fail to do so.

From the Soviet Zone, an almost desperate effort has again been made to use these tendencies for Moscow's purposes. Herr Ulbricht and the Communist trade union federation have issued appeals to the Western Germans to link wage claims with action against defence production and the Schuman Plan. The West German Communists have again been reprimanded for their failure to secure working class unity. The Communists have indeed failed in Western Germany. They have been progressively ousted from all but a few positions in works councils and trade union branches; only recently the Communist leader, Agartz, tried to instigate a strike in the mining industry, but only succeeded in getting himself expelled from the central organ of the powerful mining union. The main concern of the average workman is to retain his job and build up the enterprise of which he is a part. Industrial workers are already afraid that shortage of raw materials will cause short time or unemployment and are anxious not to make the risk worse by strikes. The employers are therefore in a strong position, which they will undoubtedly be tempted to abuse.

Britain's Island Colonies—II

Fiji and the West Pacific

FOR the first time for many years a British Minister from the Colonial Office, Mr John Dugdale, is now on a visit to the Western Pacific. He will enter there the least known, but in many ways the most fascinating, area in the British

Empire—interminable reaches of ocean, studded with small islands, whose scattered and primitive populations (Polynesian, Melanesian and Micronesian) have long provided the anthropologist's paradise. But for the administrator, who must carry out ten-year development plans, inaugurate trade unions and co-operative societies, build up local institutions, and make that "advance to self-government" which is the essence of British colonial policy, this Garden of Eden does not lack its cares and problems.

The focal point of this area is the island of Fiji, with a population of nearly 300,000. There are then three groups of islands—the Solomons, the Gilbert and Ellice Islands and the New Hebrides (the latter under a condominium with France) whose populations amount in all to less than 200,000. The separate island of Tonga has 46,000 people, with a kingdom proclaimed in 1845—and based on the British constitution—today ruled by Queen Salote. And finally, 120 souls, mainly of British descent, inhabit the lonely island of Pitcairn in the extreme east. All these islands were brought under British protection towards the end of the nineteenth century. The Solomons and the Gilbert and Ellice group were occupied by the Japanese during the war, and suffered severe damage and disruption.

Traders Replaced by State Schemes

In this extraordinary dominion colonial officials pursue day-to-day policies which are surprisingly similar to those laid down in all the varying circumstances of Equatorial Africa or the West Indies. Obviously there must be an ordered economic framework—this means proper trading arrangements, fair prices to the producers, balanced budgets, income tax and the rest. It is no easy task, yet in this field great progress has been made since the war, partly owing to the high prices that have prevailed for the main products of the area—sugar, copra and gold from Fiji; copra and phosphates from the Gilbert and Ellice Islands; and almost entirely copra from Tonga, the New Hebrides and the Solomons. Pitcairn has one main source of revenue—postage stamps.

But, as in other colonies in these days, prices are no longer left to chance. The British Ministry of Food buys the whole of the copra, under bulk-buying contracts, through statutory Copra Boards which are non-profit-making organisations. The sale of sugar in Fiji has also been guaranteed by Britain at fixed prices. In the Solomons and the Gilbert and Ellice Islands the commercial firms which operated before the war have not returned. Their place has been taken by government trade schemes, in some cases working on co-operative principles, which retain all the profits for local development and welfare. Co-operatives, government trading and other measures of self-help have developed successfully in recent years, and the trade and revenue figures for the whole area look extremely healthy, showing threefold or fourfold increases over ten years:—

Revenue	1,010	...	5,296
Expenditure	1,189	...	4,702

*Approximate

In Fiji a Development Fund Bill, sponsored by a distinguished Fijian, has just passed its third reading in the Legislative Council. Its purpose is to channel off the heavy tax which will be levied on all Fijian copra growers from the proceeds of their sale of copra to the Copra Board. These moneys will be paid into the Fund and credited to the growers, or co-operative societies, who have paid the tax. They will then be able to withdraw their credits plus interest, for special improvement schemes approved by the Board of the Fund. (This may be compared with the arrangements in the marketing of West African cocoa, which have caused so much controversy.) All copra must be marketed through the Copra Board, so that the open market on which European and Chinese traders have long been established is upset. The Fijians, who themselves initiated this Bill, have taken things into their own hands. This, said the Governor in the Legislative Council, "is a bold experiment for which it would be difficult to find a close precedent."

In the Gilbert and Ellice Islands there has been another bold experiment. The Government Trade Scheme has become a co-operative wholesale society. It imports trade goods, distributes them to the island co-operatives, and collects and ships copra. The latest figures available show a profit of £36,000 on merchandise trading in 1949, and a profit of £70,000 on copra trading. £48,000 was placed in a special Development and Welfare Fund, for loans to the island societies for development work, and to repay the cost of the ships which the society is now wealthy enough to buy. It is a remarkable record for this one group of scattered islands with a population of only 37,000. Moreover, there are 22 trade unions in Fiji, and the official report says that "collective bargaining has become a normal feature of the industrial set-up."

This good balance sheet on the economic front has meant a variety of social services. It is remarkable that Fiji has a Central Medical School, founded in 1884, at which four-year courses in medicine were attended, in 1950, by 80 students from the whole area. But the record of political advance is quite different. Whereas almost every other British territory has undergone fairly dramatic constitutional changes—or even a series of changes—in the last decade, nothing of this sort has happened in the Pacific except in Fiji. All the island groups come under the jurisdiction of the High Commissioner for the Western Pacific; none has a Legislative Council; they are administered by officials with varying titles. Fiji has Legislative and Executive Councils which have been revised recently. The Legislative Council has 16 official members and 15 unofficial, apportioned on the basis of strict racial equality irrespective of the size of the community—5 Fijian, 5 Indian and 5 European—a neat way of solving racial problems at the centre.

Uneasy Undercurrents

It would be easy to look at this total picture complacently, but beneath the surface there is a simmering of malaise, springing from the impact of European civilisation on isolated and backward peoples. This uneasiness bursts out sporadically in mysterious native cults—the Vailala Madness, the Fijian "Cargo Myth" (under which it was believed that deceased ancestors would return in a steamer as white men and distribute free vast quantities of trade goods to those who had followed the cult) and, in the Solomons since the war, the Marching Rule movement. Marching Rule sprang directly from the impression made by the wealth of American soldiers during the war, and was somehow connected with the Cargo Myth. It was extremely well organised and took the form of an anti-British campaign on the basis of non-co-operation with the authorities. It grew to such proportions that in 1947 it had to be forcibly suppressed by the arrest of all the leaders. Today the leaders have been released and are mostly working with the Administration.

In the early days of European contacts in the South Seas infinite harm was done to the Islanders through the unbridled pursuit of trading profits. Today that era has largely passed; under an ordered and benevolent administration, attuned to the ideals of the welfare state, social and economic advance has gained momentum. What this will finally mean in human happiness remains obscure; nor can one draft any confident blue-print for the political future of the Pacific Islands. But what, in terms of the twentieth century, can possibly be the alternative?

(To be concluded)

SIMON ENGINEERING GROUP

Aspects of enterprise

No. 6

In Canada two large and complete new Simon flour milling plants were recently built for the same firm. The first was completed in 1948 and the second in 1950. Both were designed, manufactured, shipped, installed and set to work in nine months. Of the first mill the client wrote: "It incorporates the last word in milling equipment and facilities to be found in any Canadian plant." And of the second: "The most modern flour mill ever erected in Canada or the United States."

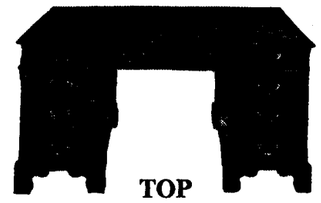
A word about deeds

"DEEDS NOT WORDS" is a good motto for business. Yet some words have great power to influence deeds.



The name of Laing stands for many fine structures—factories, power stations, steelworks, cement works, aerodromes and schools—completed efficiently and on time, and for a century-old tradition of team work and craftsmanship. The name sets a standard which the firm's employees are ambitious to live up to, and so it is a great begetter of deeds.

Furthermore it guarantees that same high standard of work for those who entrust their construction to John Laing and Son Ltd.

When economic health comes by the gallon!

Healthy industries make healthy nations. For example, petroleum is a *basic* industry that must maintain and increase its production. When it does, a multitude of other industries prosper with it.

Rugged International Diesel tractors, power units and related equipment serve the petroleum industry well. They handle *every* power job; they clear and level land for drill rigs, man the pumps and lay pipe a hundred miles or more.

Consider the *basic industries* that make up the *physical and economic security* of your nation. International Harvester contributes strength to these industries by providing the necessary tools for transport, agriculture and all phases of earthmoving and construction. THE BUSINESS WORLD

Dividends under Control

SCAPEGOATS are easier to find than cures. One cannot expect Labour Party supporters to miss the opportunity of holding profits and dividends to blame for the present ills of inflation and rising prices. What is more perplexing is the rapid change in the Chancellor of the Exchequer's thinking on these matters. In his Budget speech, he recognised the function of profit as an incentive in an economy "three-quarters of which is run by private enterprise." His arguments led him to raise the rate of profits tax on distributed profits from 30 per cent to 50 per cent, in the hope of providing "a powerful incentive to companies to put profits to reserve rather than to increase dividends." He preferred this course to statutory control of dividends, which he rejected on the understandable grounds that it would not be wholly practicable and would involve additional administrative work. Now he has changed his mind completely. Dividend limitation—if the Government has its way—is to be fastened on the British economy for three years from yesterday.

The reasons for the Chancellor's decision are worth setting down. They depend on his estimate of the public's attitude towards dividends, not on any measure of their economic effects:—

> It is no exaggeration to say that practically every morning there is news of a company increasing its dividend in a pretty substantial way, and on a scale far greater than the general increase in money incomes which has recently been taking place. This kind of thing inevitably acts as a continual irritant on the great majority of the population who are not equity shareholders. . . . The psychological consequences of sharp increases in dividends are far greater than their direct monetary effect. . . . I have now come to the conclusion that these further steps are necessary if we are not to be continually frustrated in our efforts to check inflation and the increase in the cost of living.

This amounts to an assertion that the rise in dividends has been a material factor in raising the cost of living, which is absurd. The rise in dividends has absorbed a small part of the rise in profits, the great bulk of which has been paid over in taxation and set aside to company reserves, thus fulfilling the precepts of the Economic Survey of helping to restrain the increase in inflationary pressure.

The "further steps" that the Chancellor proposes are certainly drastic. They will rock the equity share market, which until recently has responded vigorously to the prospect of higher dividends, and the Chancellor's intention to contrive a deflation of equity share values will certainly be satisfied. So far, only the principles of dividend control have been announced, but these—and the Bill that the Government intends to present in the autumn—will need the closest study. A limit will be imposed on the gross amount of equity dividends distributed by public or private companies during a period covering three accounting years from July 27th. The limit for the majority of companies will be the *average* amount distributed or declared in respect of the last two accounting years up to July 26th—in other words, the virtuous ones that have observed dividend limitation suffer, while the naughty are permitted to average their sin. Some companies that have paid no dividends in the past two years will be caught by the penal capital standard of 5 per cent on their issued capital and new companies will be limited in effect to a 7 per cent distribution; the control will not apply to companies distributing less than £10,000 gross. The form of control implies that companies that wish to reconstruct their capital will have to seek consent from the Treasury—an extension of the disagreeable principle that it is entitled to act as arbiter in its own cause.

Clearly, dividend control on this pattern will imply a reduction in dividends, in many cases, below the level of the latest year, and an even greater fall below expectations for the coming year. This is the ceiling without floor—a variant of the end-result of EPT without any of the compelling circumstances of war itself. To suppose that, if these proposals go through, they will be limited to three years is asking those members of the public who are equity shareholders (not so negligible a section of the public as the Chancellor seems to think) to believe too much. They mean—if they are passed and kept on the Statute Book in anything resembling their present form—the end of free enterprise in industry, the death of the adventuring of new capital in new processes, the rigid mould of control over what is and the removal of incentive from new savers and new investors to finance something better. This is the latest and worst example of tilting at windmills and attacking symptoms. If the amateur psychologists of the Treasury bench had any political courage and any economic realism they would shrink from proposals that would damage for all time the prospects of a free, healthy and progressive industrial economy in this country.

Dismay at the rapid rise in the cost of living has thus led to sweeping attacks that wholly fail to distinguish between the significance of profits and dividends or to measure their relative weight. Once again, therefore, the facts that emerge from published accounts are submitted for examination. The Chancellor presented his Budget on April 10th; thus the results of the companies whose accounts were published in the second quarter of this year were largely drawn up to give effect to his tax proposals. They did not, it seems, satisfy his wishes about dividends; but it is difficult to discover how their dividend decisions could have added any appreciable force to what Mr Jay called "the inflationary pressure on living costs." In fact the 877 companies whose reports were received in this very active quarter increased their dividend payments by little more than £10 million, from £52.1 million to £62.6 million, both figures being calculated after deducting tax. Ten million pounds may sound a lot, but it is tiny compared with the "inflationary pressure on living costs" that is already being caused by higher import prices and by wage increases this year. The former have run into

a hundred million pounds; the latter are officially estimated at £2,750,000 a week. The rise in dividends represents perhaps one part in fifteen hundred of the nation's total expenditure. To pretend that it is a prime cause of inflation is politics, not economics.

Nor indeed is the rise in trading profits a cause of inflation; it is certainly a consequence of inflation and it admittedly owes much to the comfortable economic climate to which Mr Gaitskell referred in his Budget speech. It is not a healthy state of affairs that 877 companies can in a single year increase their trading profits by 27½ per cent, from £482.3 million to £614.0 million. This is the end-product of inflation and rising prices, not the particular mark of enterprise, though that has not been absent. Times without number it has been demonstrated in these columns that the bulk of any increase in "profits" attributable to a period of rapidly rising prices is not "profit" at all, but capital dressed up to look like profit. Of all the components of the national income, profits make the quickest response to inflation. The tax authorities know this; and so do company directors. The total income of these 877 companies, after deducting depreciation, rose during the past year from £454.6 million to £567.7 million; their total liability for income tax and profits tax rose from £207.2 million to £278.4 million. Of an increase of roughly £113 million in profits, the tax collector claimed over £70 million. Of the balance, roughly £14 million has been set aside for contingencies and other provisions, £5,500,000 million retained as reserves by subsidiary companies and the same amount retained by parent companies together with an increase of about £9,000,000 in their balance on profit and loss account. The ordinary shareholder has received less than a tenth of the increase. The average rate of ordinary dividend (before tax) on the issued ordinary capital of these companies is 16.2 per cent in the latest year, compared with 13.3 per cent in the preceding year; in terms of the "net worth" that the legal capital truly represents, the average rate of dividend return amounts to 5.5 per cent, compared with 5.1 per cent, and the average return in earnings (taking account of profits tax) expressed in terms of net worth has fallen from 13.7 per cent to 12.9 per cent.

Details of these calculations of profits and dividends and of the financial position of the companies are given in the tables that accompany this article. (The fuller classification by industrial groups will appear in next week's issue of *Records and Statistics*.) Without doubt, the high profits figures of these companies in the latest year have brought an appreciable strengthening of their current financial position if one is to judge solely by the balance sheet figures themselves. The net current assets of the 877 companies have increased from £99 million to £304 million. There has been no appreciable difficulty in financing nearly £150 million of additional stock values, and cash and securities have actually increased. There has, of course, been some increase in permanent capital—notably £56 million of new debenture and loan finance and smaller amounts of preference and ordinary capital. But the broad conclusion is that "profits," as the accountant understands them, have been rising fast enough in the past year to meet the additional strains that have been put on industry by rising prices—including in particular the replacement of stocks and fixed assets at current prices.

The fact remains, however, that the book-keeping is

deceptive, in the sense that it does not begin to measure the erosion of capital that has been caused by the persistent rise in prices and taxation over two decades. It must be remembered that the second-quarter sample of companies includes the majority of the industrial giants who are more ready and more able than the average run of companies to take what corrective measures are open to them towards preserving their capital substance. This is not nearly so true of the smaller public company, and even less true of private companies. The memorandum that the British Bankers' Association has submitted to the Royal Commission on Taxation throws most valuable light on the financial situation of private companies in an analysis of the balance sheets of more than 1,500

private companies that compares their position in 1946 with that of 1949-50. These companies show a 10 per cent fall in cash holdings, and an increase of 118 per cent in bank overdrafts. Their stocks have increased in value by just over 100 per cent, and despite the fact that "genuine and spurious profits have borne heavy taxation" they have managed to finance three-quarters of the increase in stocks from reserves from taxed profits and by finding new capital. The results of the inquiry can be summarised in a *pro forma* balance sheet. From these figures the memorandum reaches the valid conclusion that they amply confirm the general impression that in postwar years the increase in capital resources has not kept pace with the rise in the financial requirements of business undertakings.

The Financial Secretary, in the closing stages of the debate on the Finance Bill, admitted what had been clear from the general drift of the Budget—that "the main extra revenue required for rearmament must come from increased taxation on profits." The full effects of the increase in profits tax and of the withdrawal of the initial allowances will not become apparent until a couple of years have elapsed. To pretend in these circumstances that it is only increases in dividends that are offensive is disingenuous. Policy is being aimed deliberately at the income that industry needs to sustain itself; warnings that this course is using up the real substance of industry go unheeded; the arguments of the Tucker Committee that "true profits" are what conventional accounting principles say they are have been eagerly prayed in aid—despite the spirited criticism that they have attracted, to which the British Bankers' Association have added their authority. Eventually, perhaps, there will be a greater public understanding of the nature and role of profits in the British economy; politics have given "profits" a bad name, and even those who understand what they are often seem capable only of shamefaced apologetics when they talk about them. It is to be hoped that industry, the City, the professions and the economists are preparing to put their case effectively and factually before the Royal Commission.

Aero Engines

MILITARY aircraft construction is strategically the most important single item in the rearmament programme as well as the most costly: and it seems likely to prove the most problematic. Its two sides, airframe and aero-engine production, are separate in nature and technique: and the Select Committee on Estimates, which took evidence from the aircraft industry before full details of the programme were available, and published its findings at the end of May, could even then detect signs that the production of engines might not long remain "in phase" with the production of airframes. Fuller consideration of the aircraft programme supports its conclusion that quantity production of gas turbines for aircraft presents certain special problems beyond those common to defence contractors generally.

The outline of the programme is well known. Apart from outstanding orders, largely placed before the present programme began, for Rolls-Royce Derwent and Nene and de Havilland Goblin engines for Meteor, Attacker and Vampire fighters, large orders have been placed with the de Havilland Engine Company for the Ghost engine of the Venom fighter. Much larger orders have been placed for the Rolls-Royce Avon engine that already powers the twin-engined Canberra and the four-engined Valiant bomber and is expected to be used in a number of new fighters. This engine will in time become the standard power unit for the RAF. Smaller orders have been placed for the Armstrong-Siddeley Sapphire engine that is considered as an alternative to the Avon. Armstrong-Siddeley turbo-prop engines for special naval aircraft, and piston engines for trainer and transport aircraft and for helicopters, have been ordered in relatively small quantities.

The de Havilland Engine Company had begun to expand its capacity before the rearmament programme was on foot and therefore has space at its disposal to fulfil the orders that have been placed with it. Rolls-Royce Ltd. has several factories already working on Avon production. A further factory in Glasgow is being converted from piston engines to Avons, and the company is about to build a completely new factory in Scotland. Other companies that will be building the Avon engine—Bristol and Napier—have the necessary factory space for the orders so far received, but will be tooling up without any experience of jet-engine production other than what can be gained from prototype development; and if it should eventually undertake Avon production, the Standard Motor Company may need to build a new factory. The Sapphire orders can be handled within the Hawker Siddeley Group, the Hawksley Company providing factory space to supplement Armstrong-Siddeley's facilities.

A major contractor in the aero-engine programme might be expected at the peak of its output to be able to produce 200 to 300 engines a month; the smaller contractors might turn out between 50 and 100. Each of the newer engines requires roughly three times the machine tools and man-power needed for a piston engine, but is a unit of much higher power. The aircraft industry as a whole is employing about 158,000 men and women; this labour force will have to be greatly increased, although no accurate calculation is possible. Possibly half the additional workers may be needed in the engine factories. The work done in many engine factories is limited to the machining of bought-out rough forgings and castings and to their assembly with other components bought from outside. All these sub-contractors will need to expand output—and probably their labour force—in proportion.

*

At present, the production of the latest types of jet engines is modest. Tooling up the new lines will take at least twelve months and some time after a year the lines will reach their full rate of output. Construction work for new factories that are being built will take at least a year; and it will be more than two years before their engine production reaches a peak. Within the industry Rolls-Royce and de Havilland, the two companies with jet engines in production before rearmament started, have a lead over other manufacturers. Both companies received big orders last summer and their long-term contracts with suppliers of materials give them a further advantage. In the same way, these two companies were able to take some chances and place orders for machine tools orders, both at home and abroad, well in advance.

There is no reason to suppose the aircraft programme in any way exaggerates military requirements. But it is still necessary to ask whether it is practicable, one that can reasonably be expected to be fulfilled. Production methods for British jet engines have so far consisted of adapting known machining techniques to finish rough components to the accuracy required by gas-turbine engineering (up to limits of one ten-thousandth of an inch on some components). Such techniques are quite suitable for limited commercial production where the scale of output does not justify the designing of special tools to carry one operation through from start to finish; but they may prove both clumsy and wasteful of tools and man-power when applied to quantity production. Yet it is by these means that the greater part of the engine programme seems destined to be carried out. The methods have been tested and are known to work with reasonable accuracy. Experience will undoubtedly suggest improvements (de Havilland has recently reduced compressor machining time to between a quarter and a third of the former figure) and, given sufficient tools, these methods should not prevent the engine programme from being fulfilled.

Both the Ministry and the industry are reasonably confident that the tools will arrive; but tools without labour are useless and the engine factories are, at this moment, concerned more about the supply of labour than about any other single factor. A cut in engineering production for civilian purposes might release some workers, but the aircraft industry does not expect to get many by such means. It prefers to believe that housing is the key to labour supply and is apprehensive lest delays to house building in certain important areas might mean that the new machine tools reach the factories before the workers.

Labour, material contracts and tools are all factors that might hold up the start of production. There is another feature of engine production that could put the deliveries of certain components "out of phase," in the same way that the deliveries of engines may become "out of phase" with the supply of airframes. The de Havilland Ghost may be the last British jet engine to go into production with a centrifugal compressor. This is a large disc with vanes along its face, and it can be produced two at a time on automatic profilers with about 130 hours machining. The axial compressors used in all other new engines are built out of alternate stationary and rotating rows of about 100 small blades. The production of the rotating blades—about 1,500 to 2,000 to each engine—may prove the worst bottleneck in the whole rearmament programme. Rolls-Royce and several American manufacturers still use a light alloy for these blades; but the majority of other manufacturers either use, or are being encouraged to change to, stainless steel. An engine production line of 100 engines a month would call for about 200,000 blades for its compressors and turbines. It is not difficult to imagine British blade requirements reaching and exceeding one million a month; in the United States present requirements have been put at 500,000 blades a week and may rise to several millions a week as American engine production builds up.

*

The blades have a complicated aerofoil shape that must be reproduced with extreme accuracy if engine performance is not to be impaired. The light alloy blades can be die-stamped at high speed but the life of each set of dies is limited to only 1,500 to 1,800 blades—one set of dies is needed for every engine. Die-making is a slow process entailing hours of hand filing in its final stages. Although the number of blades per set of dies might be increased, it seems inconceivable that die production by present methods can ever keep pace with the production of compressor blades at the rate that may be required. It is possible to re-face dies several times, but even the process of refacing may take more than half the time needed to make a new die. Thus, although die-stamping speeds up the production of blades in the factory, it throws back an intolerable burden on the tool-room, and this can be lifted, it would seem, by nothing short of a revolution in die-making technique.

The production of stainless steel blades is even more difficult. Many engineers can get no more than 300 stainless steel blades from a set of dies, and the industry has devoted much ingenuity to designing, so far without success, machines for producing these blades in quantity. A turbine blade, made from materials of slightly greater hardness than stainless steel, needs one and a half to two hours of machining to reduce the rough forging to its required dimensions, and a steel compressor blade probably rather less time. These facts give some indication of the tools, time and labour that are needed to produce 1,500 or more steel blades for a single engine. Wide use of one high-speed tool known to have been developed for machining the rough forgings is held up by the reluctance of the designer to part with it on the terms offered by the Ministry of Supply, but the same machines will be tried out in quantity production in the United States next spring. It should then be possible to see whether they do, in fact, offer an opportunity to circumvent at least part of the difficulty caused by the preference of engine designers for blades of this intractable material.

*

It is difficult in these circumstances to share the apparent optimism of the industry and the Ministry that compressor blade deliveries constitute no threat to the engine programme. The attitude of the engine companies is partly explained by the fact that each undertakes to produce as many blades as its own factories can handle but relies on sub-contractors for the balance. These specialised blade producers, whose difficulties receive considerably less attention than those of the engine makers, are already swamped by the recent flood of orders. Probably the only concern with a real prospect of receiving blade deliveries on time is Rolls-Royce, simply because that company was able to place its orders ahead of the others. New factories can and will be built for blade production, and in time a new sub-industry may be created with factories capable of turning out as many as half a million blades a month. But a decision to build new factories does not solve the difficulties of providing sufficient dies for stamping light alloys or with machines for turning out steel blades.

Each of the many experimental techniques tried in this country and in the United States has had some unsatisfactory feature that has prevented the development of a new mass production method for making blades. Some engineers hold that the best solution would be to devise a method of mass-producing dies; but this is still a long way from practical possibility. War itself might compel a solution by permitting greater tolerances on the blades; this would speed production at the expense of engine performance.

But this is an industry in which expert views can differ widely, and the belief that such down-grading could be taken under the dictates of emergency does not absolve the authorities, both at the Ministry of Supply and at the Air Ministry, from criticisms of complacency on this point. Some sections of the industry view with disquiet the abandonment of nearly all officially sponsored development work on centrifugal compressors, which are relatively simple to produce. Even if this decision proves to be correct on technical grounds, it is no use letting engine designers forge ahead on axial compressor engines without keeping in mind the present limitations of techniques in producing blades for them. Compressor design holds the key to engine efficiency, and particularly to fuel consumption; but if engines are to be produced in quantity, some concessions may have to be made to the requirements of quantity production, and these might entail, for example, a revision of some blade designs. Meanwhile, the authorities seem content to order more and more engines although the sub-contractors, on whom the responsibility of producing the extra blades eventually falls, have repeatedly protested that they can see no hope of delivery by the dates specified. It is, surely, desirable that there should be closer co-operation between the services, the engine designers and the blade-production specialists to see whether standards and quantities have been set too high or whether the aircraft programme can still be realised by technical collaboration at all levels.

Business Notes

Tampering with the Barometer

Mr Gaitskell's statement on Thursday, made just as this issue of *The Economist* was going to press, revealed more clearly than any governmental pronouncement for many months how completely political objectives now block every sane approach to economic policy. Confronted yet again with the menace of inflation, with an ominous disequilibrium in the balance of payments, and with an excessive level of domestic consumption, the Government has produced three measures that scarcely merit even to be called expedients. The first of these, the legal restraint of dividends, which is discussed in the article on page 229, is nothing more than a party-political sop; any direct relief that it may afford, by way of curtailing consumption, will be virtually negligible. The second measure, the extension and intensification of price control, does not make even this pretence of tackling the real problem. In effect, the Government proposes to tamper with the barometer of inflation—or, rather, with what the public regards as the barometer, the level of prices—in the hope that, if its faking of the readings succeeds, people will believe that the pressure has relaxed. The third measure, tighter control of bank advances, is in principle more defensible; but in practice the wisdom of this step rests upon the assumption that existing methods of broad "priority" directives to the banks are more likely to achieve the requisite restraint of demand than orthodox quantitative methods—supported, as necessary, by rising interest rates.

Past experience does not justify this assumption—even if it does not demonstrably rebut it. The directives to the banks, broadly phrased though they are, have been quite clear in their general intent, and there is every reason to believe that the banks have tried conscientiously to lend only for purposes that the authorities, in their planners' wisdom, would themselves have approved as "essential." Yet bank advances have expanded fast. It is curious, indeed, that it should have been Chancellor Gaitskell who has taken these steps—for he has shown in the past a clearer understanding of the basic economic principles, and a better grip upon realities, than any of his recent predecessors and most, if not all, of his present colleagues. Even now, he concedes the potency of rising interest rates—provided these are restricted to commercial banking business. To argue, as he did on Thursday, that no useful purpose could be served by raising Treasury bill rates, is to miss the vital point—which is that a policy of restricting the general volume of credit (a policy that could be widely pervasive in its effects) would incidentally involve some increase in these rates. As recent articles in these columns have demonstrated, this particular rise would be an incidental consequence, not a specific objective, of the policy that is needed.

Annual Insurance Survey
Page 245

Prices and Logic

Mr Gaitskell's attitude towards price control is even more astonishing—because it is a complete *volte-face* from the basic principle of his Budget. All his reckoning was then based on the thesis that the rise in domestic prices caused by the leap in import costs would do the job that otherwise would have called for still heavier taxation (or, what he did not admit, for honest retrenchment). Now, in effect, the Chancellor is hoping to ensure by extended price control that prices will not do that job. Each rise is to be deferred as long as possible, thereby providing consumers with a positive inducement to expand their purchases, increasing their effective purchasing power, and simultaneously depleting the pool of savings that accumulates in company profits—and, of course, also eating still further into the real capital of industry by preventing manufacturers from relating their prices to replacement costs. Worse still, the techniques to be employed are the obnoxious methods of differential pricing and cost-plus that the authorities have been steadily and wisely relinquishing in the past four years. Mr Gaitskell puts back the clock and rewards the inefficient.

All this, it is scarcely necessary to add, results from political fear and party doctrine. There must be no retrenchment (because it is "impossible"). There must be no honest monetary policy (because Labour still regards it as a vicious instrument of "capitalism"). And there must be no admission of the truth that real incomes cannot rise in present circumstances, and may, in fact, be reduced willy-nilly.

* * *

Anxiety about Coal

If anxiety were the measure of Ministers of Fuel and Power, Mr Noel-Baker this year might be shaping as the best of the succession. Accusations in the House this week that he might be forgetting the lesson of last winter's coal shortage would seem to be quite misplaced: the Minister lets no week go by without a dire warning or a doleful appeal. But anxiety is something less than vigilance; and there has been little in his public utterances to suggest that his control of fuel difficulties in any way matches his painful awareness of them. The enforced cuts in domestic consumption that the Chancellor announced this week constitute the usual surrender to circumstances, not a policy. Possibly the most disturbing factor in the coal industry today is the profound lack of confidence at the top of the industry and the National Coal Board that anything can really be done—in the short run—about production.

Efficiency in consumption is always desirable; but it cannot be put forward as the only remedy for a failure of output to fulfil demand. Considerable savings in coal might be brought about by new fuel installations in industry or by the wider and more efficient use of solid fuel for space-heating. Both objects might be promoted by more realistic pricing of different fuels; and such economic comparisons, and not the mere promotion of various fuel-saving devices for which adequate backing already exists, should be the central task of the Minister's new fuel economy committee. But such measures must be complemented by purposive action on the other side of the equation—by getting more coal.

A final decision whether or not to import American coal again this winter will not be easy to take: but it cannot be long delayed. Even if most districts of the coal industry allow Saturday working to be resumed before September (as the miners' executive still appears to hope) it will not be easy to decide in good time whether the famous "autumn spurt" that disappointed last year's hopes will materialise this year. Last winter pointed the lesson that arrangements for shipping should be made well in advance. The coal industry is just holding its labour force at the coal face: but for three months past total manpower has been slowly declining. Between now and the beginning of the coal winter in November it is hoped to add more than 4,500,000 tons to distributed coal stocks, raising them to 18 million tons. This seems to be a rather generous figure, though perhaps not an excessive one, given the present rate of consumption. An estimate based upon applying current rates of output and consumption to last year's figures, and assuming that the modest export and bunkering programmes are fulfilled, suggests that the industry might fall slightly short of this figure, whatever the effect of official measures to cut domestic coal consumption.

* * *

American Coal for Europe

Other European countries, at any rate, have no doubt that they must go on importing American coal this winter. For the third quarter of this year Europe's total coal deficit, according to estimates of the Economic Commission for Europe, will be 9,000,000 tons of coal and 2,000,000 tons of coke. America's port capacity to move coal to Europe is generally put at some 7,000,000 tons a quarter, and though the limit might be stretched, it is doubtful whether the whole 9,000,000 tons could be supplied. Apart from this total, moreover, Germany is now making a claim to be allowed to import 3,000,000 tons of American coal. The United States does not export coke; and coke will present the most difficult shortage in the European fuel economy. It has inevitably brought up again the constant argument between the consumers of metallurgical and domestic coke: the steel-making countries want priority for their needs, while countries such as the Scandinavian group, for example, argue that their domestic heating is based upon coke and they can no more afford to be deprived of coke than can the steel industries. Given these gaps between requirements and supplies, it is not surprising that for the first time since the war the delegations to ECE have failed to reach agreement about allocation of the available supplies; further meetings are planned, but there is no sign that the disagreement will be resolved.

Much of the dispute concerns the sharing of German coal exports. Until August last year this sharing was based on a formula set by the coal committee of the Economic Commission for Europe; since that time Germany has been free to include coal in the trade agreements it has made with other European countries, notably Italy. Certain of the other importing nations that partly depend upon coal from Germany—they include Norway, Denmark, Yugoslavia and Austria—have been seriously hit by the pre-emption of German supplies for these favoured customers. Part of the attraction of German coal is its low price; and the German Government's proposal to increase export prices by some 25s. a ton (bringing them slightly above British export prices) may have some effect upon importing countries' claims.

Marshall Aid is now being granted for the purchase of American coal, and the United States is providing ships from its reserve fleet. Since the spring an attempt has been made to co-ordinate shipping requirements of European countries, in order to disturb the freight market as little as possible in coming months: and European importers are now reporting that tonnage is at present not difficult to obtain. A further suggestion on these lines is that countries well suited to import American coal, such as those on the western seaboard, might take more of their requirements in this way, giving up claims to the export pool of European suppliers. Such a scheme might benefit the Continent as a whole by reducing transport costs to a minimum; but in view of the sharp difference in price between American and European coal it could not be arranged without some sort of financial compensation.

STABILITY IN
CHANGING CONDITIONS

A customer of the Three Banks Group has the comforting knowledge that however rapidly trade conditions may change either at home or overseas, he has at his disposal the combined skill and wide experience of a Group in touch with financial and business interest in all parts of the world, and the benefits of a Banking Service that is adaptable, individual and complete in every detail.

ROYAL BANK OF SCOTLAND
Founded 1727 Edinburgh, London & Branches

GLYN, MILLS & CO.
Founded 1753 London

WILLIAMS DEACON'S BANK LTD.
Founded 1771 Manchester, London & Branches

INDUSTRIAL AND COMMERCIAL
I. C. F. C.
FINANCE CORPORATION LTD.

Finance for the Private Company

Rising costs of plant, stocks, and work in progress have combined with taxation to set new problems for the Private Company in raising additional capital or long-term funds. To assist sound enterprises in solving such problems within the limits of today's priorities is one of the functions of I.C.F.C.

I.C.F.C. operates on commercial principles and offers despatch, economy and flexibility in method.

Full particulars of the facilities offered may be obtained from

Recap on Rearmament

Detailed criticism in Parliament of the progress of rearmament is, in principle, indispensable: in practice, it can seldom be effective. The Select Committee on Estimates, whose first report on rearmament was debated in the House of Commons this week, heard its last evidence in mid-March and presented its conclusions at the beginning of May. In so far as those were of urgent value to the programme, they should have taken effect upon the civil servants organising it well before now (though belated organisation of the advisory council for the radio industry, discussed below, does not suggest any frantic haste). In so far as the conclusions were general in nature, the circumstances upon which some of them were based have changed fairly radically since. Provision of machine tools, for example, upon which the Committee's and other criticisms fastened early this year, would since appear to have been satisfactorily handled—so far as placing orders goes—by the Ministry, who in particular justified its policy of obtaining many of the tools from America by obtaining from the United States Government priorities and many of the dollars too. The Committee's recommendations about allocation of scarce materials have in the meantime largely been covered by parallel action. Such instances re-emphasise the value of the Select Committee's report; but they make it no easier for the Commons to discuss very profitably nearly three months after.

Mr Strauss's statement that 51,000 defence contracts have so far been placed was one of the few scraps of new information the debate provided: and his assurance that "by and large, we shall carry out the (1951-52) defence programme, with some variations between items, to the extent that it was included in the defence estimates and forms part of the budget" is interesting if conveniently evasive. From the circular argument about double-shifting at arms factories in which he and Mr Hudson involved it continued to be apparent that the Government would like half a million workers to turn to defence production but that it has still no idea how to induce those who would need to change jobs to do so. Upon one of the technical recommendations of the Select Committee, concerning the price of steel scrap, the Minister still seemed to prejudge the issue he had handed over to his Iron and Steel Corporation; in rejecting suggestions that full lists of reserve machine tools should be sent to all defence contractors and that another census of machine tools in the country should be carried out, he appeared to be on firmer ground.

* * * *

Inadequate Exports

Details of the United Kingdom's trade in June have not improved the disappointing impression given by the provisional figures. Exports of almost all categories were down on the figures for May. Pottery was significant among the few exceptions, since it is one of the consumer goods industries on which the Government is now relying for increased exports. Exports were £2,237,000 compared with exports in May of £2,123,000, an increase that is hardly enough to be gratifying. Total exports of vehicles in June by value were lower than the average of the first six months; the number of private cars exported was well below last year's rate. Exports of machinery and metal goods also fell in June. Textile exports in June were valued at £42.5 million, which was decidedly lower than in the previous two months and only a little more than the average for the first quarter. Because of the high April and May figures, the total for the second quarter was 13 per cent higher than in the first. Textile exports, however, have increased in price by some 37 per cent over 1950, which is far more than other manufactures; the volume of textile exports in the first six months of the year has been only a little higher than the average rate of 1950. Imports were seasonally high in the second quarter. In June the increase in value resulted from the import of larger supplies of cotton, as well as of timber and woolpulp. Imports for the half-year have been about 10 per cent by volume above the 1950 rate.

The only news that is at all reassuring is that the terms of trade moved slightly in Britain's favour from May to June. This might well be the beginning of a trend in this country's favour. Raw material imports cost no more in June than in May, whereas the price index for exported manufactures continued to rise. The effect of the fall in commodity prices since February and March is at last being reflected in import prices, and it seems likely that the import prices index will fall in coming months.

The problem that faces the Government unless imports are to be limited is how to increase exports that are already about 70 per cent above the prewar volume. Targets are being prepared for 1952, but it is clearly too late to announce any for the current year. In any event, targets will not produce exports. With the full impact of rearmament still to be felt on exports of machinery, metal goods and vehicles the main onus of any expansion must clearly be on exports of consumer goods, of which textiles provide the major part. Raw materials for the wool and rayon industries may be limited, whereas cotton supplies are likely to be good. Moreover, cotton exports are only two-thirds of the 1938 total. The limitation in cotton has been the shortage of labour since the war and the refusal of the unions to agree to double shifts. An alternative to increasing output, however, is to limit home consumption. The high retail sales of most consumer goods at the beginning of the year are partly responsible for the failure of exports to reach the levels hoped for. It remains to be seen whether recent pointers in the retail trade mean that higher clothing and other prices are beginning to have some effect in curtailing home consumption.

* * *

Less Meat from Argentina?

Conflicting reports are coming out of Argentina about the prospective flow of Argentine meat exports to Britain. It will be remembered that the protocol signed after long haggling last April laid down that Argentine shipments to Britain in the present contract year would be at least 200,000 tons of carcase meat and 30,000 tons of corned beef. Immediately after the signing of the protocol, there was a welcome increase in activity at Argentine ports. Shipments of beef to all destinations from these ports in May have been estimated at 364,000 quarters, compared with a monthly average of less than 120,000 quarters in the previous three months; shipments of mutton and lamb in May have been estimated at 18,500 and 185,000 carcases respectively, compared with previous monthly averages of only about 2,000 and 1,000 carcases respectively. About two-thirds of the beef shipments in May, and nearly all the mutton and lamb shipments, were destined for Britain. As a result, about 30,000 tons of meat of all types arrived in British ports from Argentina in June—arrivals that were considerably above the monthly average postulated by Argentina's yearly commitment of 230,000 tons.

At this stage, however, difficulties began to crop up. First, unofficial reports indicate that activity at Argentine ports was much reduced in June—which suggests that the large shipments in May may have come from accumulated stocks. Then, the Argentine Livestock Institute—a Government controlled body presided over by the Minister of Economic Affairs—announced that exports of frozen beef to all destinations in the four months from July to October would be limited to rather less than 9,500 long tons a month and that exports of canned and preserved beef would be limited to 20 per cent of their previous monthly average. It has been suggested that Britain may secure only about 55 per cent of these reduced exports. Although exports from Argentina usually do decline at this period of Argentine winter, this year's decline seems to be greater than had been expected. In part, the decline is due to losses of cattle in the 1949-50 drought; some local observers believe that this has brought total Argentine cattle herds down to 35 million from the total of 45 million assessed in the 1947 census. In part, however, the decline in available supplies for export must also be due to the ill-judged increase in selling prices of small cattle (of the sort preferred in the domestic market) during last year's trade deadlock; this increase encouraged producers to send young cattle to market instead of fattening them for this year's export sales. The indications are, in short, that although the long trade deadlock last year did not cause other countries to supplant Britain as customers for Argentine meat—as some people feared it would do—it did result in a disastrous fall in Argentina's total export potential. The implications of this for Argentina's foreign exchange position are as obvious as they are disquieting. So are the implications for the negotiations for opening the Argentine market to "inessential" imports from Britain and for future sterling remittances. The negotiations about "inessential" imports now seem to be relapsing into deadlock, while arrears of remittances have still been cleared only up to August, 1950, approximately; those that accrued in the fourteen months before that have been remitted only at a penal "free" exchange rate.

* * *

Expanding Cement Output

Although cement stocks are showing their usual seasonal decline, there should be no recurrence of last summer's cement "famine"—assuming always that sufficient transport can be found to carry the cement to the more remote districts. This year the industry expects to bring 640,000 tons of new capacity into operation. The largest single plant to be put up since the war, the Associated Portland Cement Company's plant at Shoreham, built at a cost of £2,500,000, came into operation just after Christmas and is now working to its full capacity of 350,000 tons a year. During 1951, the Shoreham plant, together with extensions to be completed within the year, should produce about 400,000 tons, bringing the industry's estimated output to about 10 million tons.

The Ministry of Works calculated that home consumption this year would exceed 9,000,000 tons. Exports of cement have been kept down during the past two years to 1,800,000 tons in order to maintain deliveries to the home market. Since it is generally agreed that it would be impolitic to reduce exports below this figure, the industry made provision for meeting the Ministry's high estimate of home consumption by arranging to import larger quantities of cement from Europe. Imports during the first half of this year amounted to more than 185,000 tons. The average price per ton for these imports works out at more than £6 13s. compared with a domestic selling price of 84s. in the London area and an average export price of about £5 2s. a ton.

The difference between import prices and the ruling home price at which the imported cement is sold is made good by a levy of 4s. a ton on home-produced cement. If the industry could dispense with imports, a marked reduction in prices would thus become possible. Although it is now obvious that home consumption will be well below the Ministry's estimate, the industry does not think that it is desirable on that account alone to cancel its import orders; it will instead use the extra cement to increase exports this year to about 2,000,000 tons. A further 500,000 to 600,000 tons of new capacity, including plant to be built in connection with the new anhydrite plants for sulphuric acid, has yet to be completed. Some time next year the industry may feel that there is sufficient capacity to dispense with imports without thereby running the risk of losing its export markets to European competitors. A price reduction should then follow. The buyer can secure a reduction in price now by dispensing with bags and accepting delivery of cement in bulk. Consumers are being offered a rebate of about 18s. a ton—equal to the value of the bags—for bulk supplies, but the response so far has not been active.

Plush dogs don't bark

To a baby a woolly toy may be indistinguishable from a living animal—but a dog-lover knows the difference! Baby's plaything won't beg for bones or run after sticks, however loudly you shout 'Fetch it, Rover'!

There are substitutes for wood, too, and to the ordinary person they may look just as good. But the expert knows the truth of the saying 'There's nothing like wood'. Wood is alive: wood has character: wood is something you *grow fond of.*

All very true, you may say, but can we *get* wood if we specify it? Well, there is a shortage of some traditional timbers—but on the other hand many new timbers are coming into the country. The Timber Development Association will be glad to put you into the picture on the supply situation. Why not drop them a line about *your* particular problem?

***There's nothing like* WOOD**

"South African Sherry for me every time

So I've converted you, too, then?
You certainly have! Do you remember you told me to look specially for the fine *South African sherries. Since then I've found some which are just exactly to my taste.*
And don't you find them easy on the pocket, too? That means something these days!
Yes, how is it they can send us such remarkably good wines at such a reasonable price?
Well, there are two reasons: that amazing climate of theirs at the Cape, and then the Preferential Duty.
No wonder South African Sherry is becoming so popular, then.
It deserves to be. Do you know they've been making wine in South Africa for nearly 300 years. With all that experience behind them and the splendid organization they have now built up, they're able to produce the very highest quality. Their really fine wines are matured for many years before they're shipped to this country.
I suppose we can now say, then, that South Africa is one of the leading wine producing countries?
Well, wouldn't you say it was, from the taste of this sherry? **Let me fill your glass!"**

THE GLASGOW SCHOOL OF MANAGEMENT STUDIES

THE ROYAL TECHNICAL COLLEGE
and
The Glasgow and West of Scotland
COMMERCIAL COLLEGE
announce the following courses
for the
Session 1951-52
(October, 1951 to June, 1952)

For individual students
One-session full-time courses in the following subjects :
WORKS MANAGEMENT
PERSONNEL MANAGEMENT
BUSINESS ADMINISTRATION

For students sponsored by employers :
Full-time courses, each of 9 weeks' duration on
WORKS MANAGEMENT and LABOUR RELATIONS
Commencing on
October 1st, 1951, January 14th, 1952, April 16th, 1952

Enquiries for further details should be addressed to :
The Royal Technical College,
Department of Industrial Administration,
George Street, Glasgow, C.1.
or
The Glasgow and West of Scotland Commercial College,
Department of Business Administration,
Pitt Street, GLASGOW, C.2.

Courtaulds' Plans in America

Sir John Hanbury-Williams, at Courtaulds' annual meeting this week, added a few touches of detail to the recent announcement that the company is to establish a viscose rayon plant once again in the United States. He was able to announce that Treasury permission to acquire dollars for the project had already been granted; and though he made no estimate of the total cost, he did say it would be well in excess of the $10 million suggested last week in America.

Ever since it was forced to surrender its interest in American Viscose during the war, Sir John recalled, it had been the ambition of the company to re-establish its participation in rayon manufacture in the United States, and "all possible methods of achieving this objective had therefore been carefully considered." He was confident that the plant would one day be a good dollar earner as well as a satisfactory investment: and, as expected, he added that the possibility of extending the scope of the American venture to cover other products in addition to the initial 50 million lb a year of viscose rayon staple would always be in the minds of the Board.

Financial Agreement with Pakistan

A new six-year financial agreement between the United Kingdom and Pakistan is to be signed in the near future. In recent discussions in London Mr Gaitskell and the Finance Minister of Pakistan reviewed the whole field of Anglo-Pakistan financial relations and made a number of arrangements about the future of Pakistan's sterling balances. They agreed, in the first place, that £30 million should be transferred at once from Pakistan's No. 2 (or blocked) account, to its No. 1 (or current) account. This is a once-for-all transfer. The £30 million concerned will be regarded as a minimum currency reserve, and the Pakistan Government has no intention—at present—of drawing on it. Pakistan has given an assurance that, should it ever become "necessary" to make such drawings, this would not be done without first consulting the British Government. The British Government has also arranged for annual releases of £4,000,000 from the No. 2 to the No. 1 account to help to finance Pakistan's development programme during the six years of the Colombo Plan. If during this period Pakistan's "essential requirements" call for larger releases, the two governments will consult together with a view to arranging any "necessary acceleration."

These provisions for the release of Pakistan's sterling might become important—and their apparent vagueness might become dangerous—if the Dominion's trading position deteriorated. For the moment Pakistan is abundantly supplied with sterling in its current account as a result of its favourable balance of payments, not only with the sterling area but with the dollar world; there is a tendency in Pakistan, however, to regard the formal immobilisation of part of its sterling as something of a stigma so that the new agreement will carry some prestige significance. A more immediately interesting feature of the new agreement is that the British Government is to sell £4,000,000 worth of gold to Pakistan as an addition to the independent reserves that its State Bank holds as part of the backing for the note issue. This follows the precedent set in the last agreement with Ceylon. It reflects the growing tendency among the dollar earners in the sterling area not to leave the whole of their hard currency earnings in sterling balances in London.

South Africa's Reserves—and Imports

Three years ago, when South Africa's external finances were gravely threatened by the sudden cessation of the inflow of foreign capital and by the extravagant boom in imports, its government showed great reluctance to check these imports by physical controls. Now that the tide has turned, it is showing an equal reluctance to relax these defensive measures. In his annual survey as governor of the South African Reserve Bank, Dr de Kock remarked that the inflow of capital has far exceeded all expectations, and yet comprised investment funds as distinct from the hot money that played so large a part in the earlier movement. During 1950, there was a net inflow of £78 million, and the balance of payments—apparently including capital movements—showed a final surplus of £71 million, in contrast with a deficiency of £63 million in 1949. The gold and foreign reserve mounted to the very high level of £172 million by the end of the financial year (March 31st) though it has since declined to around £150 million, or not much above the figure shown at this time last year. Exports, excluding gold, rose in 1950 by £65 million, while imports declined by £9,000,000. This relatively moderate net decline in imports conceals, however, the very sharp fall that occurred in those from hard currency countries; these were reduced by no less than £46 million, while there was also a fall of £5,000,000 in those from Britain. It is noteworthy that purchases from Germany, Japan and Italy contributed £20 million of the increase of £42 million in imports from other countries.

Sales of gold at premium prices, of great importance to the mines themselves, are now beginning to play a significant part in the Union's balance of payments. They amounted to £51½ million, or to more than one-third of the industry's total sales, and the net premium produced was £3.6 million (equivalent to about 7½ per cent on the monetary gold price). Of the sales made by the Bank itself, 91 per cent, or £74 million, was made to Britain, and, of this, £68½ million was sold under the terms of the financial agreement between the two countries. Hence the proportion (47 per cent) of the Union's total gold output that was secured by Britain under this agreement proved to be appreciably above the minimum that it laid down. Despite the present strength of South Africa's reserves, Dr de Kock emphasises that the pressure upon the Union's terms of trade, and the possibility that the inflow of funds may slacken makes it desirable for a developing economy to walk warily—hence his conclusion that the present mechanism of import control should be retained for the time being.

FCI's Problems Reviewed

In his annual address to stockholders of the Finance Corporation for Industry Lord Bruce explained in some detail why the Corporation considered it prudent to apply last year's available balance of income to writing down its investments—thus showing neither profit nor loss. As noted in *The Economist* of July 7th, the FCI has always followed a policy of making advances at very low rates of interest to projects that are still in the development stage; in return, however, it takes conversion options in the equity of such ventures, so that it receives an adequate return for its risk-bearing if and when its customers reach the stage of full and profitable production. One case in which this method of operation has proved highly successful is that of F. Perkins, the diesel engine manufacturers, which has now matured sufficiently to approach the public capital market for finance; as a result of the new issue, announced last week, the advances made by FCI to this company will be repaid, and a substantial profit should accrue to FCI through its holdings in the equity. Unfortunately, however, some other borrowers from FCI have run into the common bugbear of finding that development is a much more expensive business in inflationary conditions than they originally budgeted for. The outstanding example among FCI's bigger customers is Petrochemicals Ltd.; the primary plant of this venture should have reached the stage of full operation by the end of this year, but Lord Bruce countered that "it has still to be demon-

strated whether the basic products can be produced at a profitable and competitive price, not only under present conditions but in face of a recession." Lord Bruce drew comfort, however, from the fact that the gloomy predictions now made by some people about Petrochemicals' future are reminiscent of those made at this time last year about the Ultramar oil project in Venezuela; Ultramar, whose equity FCI can claim to have saved for Britain, has now repaid all but £1,100,000 of its advances from FCI.

Lord Bruce made little direct reference to the reduction of investment outlets that FCI has suffered through the nationalisation of steel. He did indicate, however, that the Corporation expects to get a "substantial amount of compensation" as a result of the waiving of the equity conversion rights that were attached to its £40 million of pre-nationalisation steel advances. This compensation money, together with the profit that FCI expects from the transfer to the market of its advances to F. Perkins, will provide a buffer against any losses that may arise from FCI's other existing commitments.

Belgian Congo Central Bank

A new central bank and bank of issue is to be established within the next few weeks in the Belgian Congo. The new bank will have a capital of Frs. (Congo) 150 million, of which one half will be subscribed by the Governments of the Congo and of Ruanda Urundi, 25 per cent by the National Bank of Belgium, and the other 25 per cent by Belgian private interests; its ultimate headquarters will be at Leopoldville. Hitherto the functions of a central bank have been performed in this territory by a mixed central-commercial bank, the Banque du Congo Belge. This bank, which is owned by the Société Generale de Belgique, will henceforth concentrate on its commercial business. At present much of this business is handled by its subsidiary, the Banque Commerciale du Congo, which was set up in 1911. Now that the parent bank's central banking functions are to lapse, it will not be debarred in any way from commercial operations and there would seem to be little justification for maintaining two separate institutions.

New Machinery for Radio Orders

The Minister of Supply's announcement in the House on Monday of the impending establishment of a Radio Advisory Council and the appointment of a Director-General of Radio Production has been welcomed by the industry. The need for a step of this kind has been apparent for some time. Although the Radio Industry Council, the manufacturers' organisation, has had its own rearmament committee, there has been no opposite number inside the Ministry with which common problems could be discussed. Responsibility for placing orders for radio equipment was divided between those sections of the Ministry acting for the Air Ministry and those acting for the Army, and was a comparatively minor aspect of each section's work. Members of the industry have complained, on occasions with considerable vehemence, that there was no one of authority within the Ministry with whom they could deal and that they suffered accordingly in negotiating contracts.

Some of the consequences of this lack of central responsibility were brought to light in the industry's evidence to the Select Committee on Estimates last February. They ranged from apparent ignorance of impending material shortages to cuts in material allocations made without prior consultation with the industry, and lack of any guidance to producers in deciding between conflicting home and export demands. The Select Committee asked in May for urgent action to improve the "present system of negotiation between the Ministry of Supply and the radio industry."

Neither the name of the new Director-General nor of the members of the Council had been announced at the time *The Economist* went to press, but the Council is expected to consist of about eight industry representatives and one or two members of the Director-General's staff. The centralisation of responsibility implied in the creation of this new post should go a long way to meet the industry's complaints on that score, but the work of the committee may prove to be even more important. The timing of radio orders needs great care, for the industry's products include key components for most major items of military equipment. The Government's plan for the radio industry requires a smooth transition from civilian to military production; and it may involve maintaining civilian production at a high level until military equipment can replace domestic sets on the assembly lines. This may not come about for at least eighteen months; and it will need the closest co-operation between the Ministry and the industry to see that there is no serious interruption to output—and possible loss of labour—before then.

Surplus Tin?

On Tuesday, Mr Symington, the chairman of the Reconstruction Finance Corporation, announced that agreement had been reached to pay Bolivian tin producers $1.12 a pound. This price is 6 cents above the level of $1.06 at which the RFC has kept its selling price since the middle of June. Mr Symington mentioned that the new Bolivian price of $1.12 is equivalent to a Singapore price of $1.08 a pound or £864 a ton. The RFC informed Dutch and Belgian producers only last week that it would not pay more than $1.03 for their tin. Thus the object of the RFC's policy seems not merely to reduce the price it has been paying for tin but also to offer differential prices to different suppliers. Indonesia and the Belgian Congo have agreed to supply the United States with tin concentrates instead of metal under their contracts; as a result, the supplies of Belgian and Dutch tin that the London market had expected will not arrive. Additional supplies of concentrates from Belgium and Indonesia will enable the United States Texas smelter to increase its output from about 37,000 long tons a year, the rate at which it has been operating in recent months, to some 55,000 tons; this would still be below the theoretical annual capacity of the smelter.

Since supplies of concentrates are assured from Bolivia, the Belgian Congo and Indonesia, the United States could easily postpone all purchases of tin metal for as long as twelve months if it wished. Consumption in the United States has been running at about 70,000 tons, but is likely to be reduced by at least a tenth as a result of the restrictions imposed on the use of tin. The RFC's stocks were published as 31,000 tons at the end of last year. Since then, stocks have been depleted by some 8,000 to 9,000 tons, leaving about 22,000 or 23,000 tons, apart from tin held in the stockpile. Moreover, at the beginning of this year the American Government restricted the amount of tin that could be held by producers of tinplate to three months' supply, and by other users to two months' supply; as a result some 10,000 to 15,000 tons of additional stocks are probably held by large consumers in addition to the stocks officially allowed. Since the RFC will under-deliver by this amount, this tonnage is equivalent to a further reserve. Thus, with RFC stocks of 23,000 tons, smelter output of 55,000 tons and consumers' additional stocks of 10,000-15,000 tons, American supplies of tin available in the next twelve months could total 88,000 to 93,000 tons. These supplies would meet consumption and leave a surplus, without touching the large strategic reserve.

If America should hold aloof from the world market, except for the purchase of concentrates under existing agreements, a serious surplus of tin would result. World output of tin metal is currently at the rate of 165,000 to 170,000 tons a year. Excluding the United States, the amount available for the rest of the world would be about 110,000 tons. This calculation assumes that the additional concentrates to be supplied to the American smelter would result in a corresponding reduction of Dutch and Belgian smelter output. World consumption, again excluding America, is at the rate of 75,000 to 80,000 tons. Thus a surplus of 30,000 tons or more might be in prospect in the coming year, and the surplus would be even larger if some countries decided to buy no more than enough to meet current consumption. On Thursday tin had risen to £895 a ton compared with £862½ a ton a week ago. The rise has followed the announcement of the price fixed under the Bolivian agreement. The Straits price has also risen. The present price is clearly vulnerable.

Increase in Shipbuilding

Merchant ships under construction in the world increased by nearly 250,000 tons gross in the second quarter of this year, according to Lloyd's Register of Shipping, whose returns for the end of June record a world total of 5,331,214 tons. Nearly 40 per cent of this tonnage is under construction in Great Britain and Northern Ireland, where the total is 2,114,319 tons, an increase of 41,596 tons. Shipbuilding in Japan increased during the quarter by a similiar amount; Japan now has 520,665 tons under construction, and is the second largest shipbuilding country in the world, displacing France, whose total of 439,363 tons is some 46,000 tons less than in March. The largest increase in shipbuilding activity during the quarter, however, was in Germany, where tonnage building increased by 126,568 tons to a total of 387,853 tons. Germany now ranks fourth in the world. Returns are not available for China, Poland or Russia.

Of the tonnage under construction in Great Britain, 34.5 per cent is for export. The export total is 729,313 tons, of

NATIONAL TRUST COMPANY LIMITED

BARCELONA TRACTION LIGHT & POWER COMPANY LIMITED

NATIONAL TRUST COMPANY LIMITED of Toronto, Canada, announces that as holder of all the shares of Ebro Irrigation & Power Company Limited and Catalonian Land Company Limited, both of which are Canadian Companies incorporated under the Dominion Companies Act, it has delivered protests to the persons in Spain purporting to act as Directors of these two companies, protesting against the notice which has been advertised in Spain by these persons stating that new shares must be applied for to them within thirty days of the notice, after which the present outstanding shares of these companies will become valueless.

National Trust Company Limited states in these protests that it does not recognise the validity of any such exchange of shares as is called for by the notice and points out that the legality of the appointment of the persons at present purporting to act as Directors of these companies and the validity of all their actions has been challenged in the Spanish Courts where the relevant issues have not yet been heard.

National Trust Company Limited has sent similar protests to the persons purporting to act as Directors of two Spanish Companies, namely Union Electrica de Cataluna S.A. and La Electricista Catalana S.A., of whose capital National Trust Company Limited is also a shareholder.

National Trust Company Limited also points out in these protests that the shares in question of the two Canadian and two Spanish Companies are held by it under the Trust Mortgages securing the sterling bonds of Barcelona Traction Light & Power Co. Ltd., as security for these bonds and that it holds the certificates for these shares at its Head Office in Toronto.

BARCELONA TRACTION, LIGHT & POWER COMPANY, LIMITED

A statement issued to-day by the National Trust Company Limited of Toronto draws attention to the most recent development in the Spanish "bankruptcy" of Barcelona Traction—namely, the announcements in the Spanish press of the proposed issue in Spain of fresh share certificates of Ebro Irrigation and Power Company Limited and other companies of the Barcelona Traction Group, and the purported invalidation of the existing share certificates.

The Board of Barcelona Traction desire to make it clear that these announcements and the issue of fresh share certificates which they threaten are wholly unauthorised. The shares and bonds of Ebro, the chief operating company of the Group, and shares of the other companies form directly or indirectly the principal security for Barcelona Traction's issues of Prior Lien and First Mortgage Bonds. The bonds and certificates for shares of Ebro and with minor exceptions the certificates for shares of the other companies, are in the physical custody in Canada of National Trust Company Limited or of the Receiver and Manager appointed by the Supreme Court of Ontario.

Puppet Boards of Ebro and the other companies, set up in Spain, are now proposing to issue pieces of paper described as "shares" to supplant the real shares held in Canada. The manoeuvre is all the more transparent in that the Spanish announcements do not state that in order to obtain the new shares the old shares must be presented for exchange. It is to be inferred that the new share certificates will be issued to three Spaniards (who are acting as *sindicos* in the "bankruptcy" of Barcelona Traction), without regard to the rights of the trustee for the Prior Lien and First Mortgage Bonds, let alone those of Barcelona Traction itself.

If this threatened manoeuvre were successful it would render ineffective the security to which the holders of Barcelona Traction's sterling bonds are entitled under English and Canadian law and enable the Company's assets to be disposed of in Spain without any remedy. As is well known, the Barcelona group of companies is earning large revenues in Spain and owns immensely valuable physical assets. It is significant that the threatened manoeuvre follows hot foot upon the publication of the Joint Declaration of 11th June, 1951, to which the United Kingdom and Canadian Governments were parties and which is claimed by the Spanish Government to be a complete justification of the treatment accorded to foreign investors in Spain.

In commenting upon the Joint Declaration, the Board of Barcelona Traction, in addition to other criticisms, pointed out that it appeared to be irreconcilable with the Report of the independent British and Canadian experts upon which, *inter alia*, it purported to be based. The Board accordingly invited the British and Canadian Governments to publish the Report.

So far the Governments despite the obvious urgency of the situation have not agreed to do so. The Board of Barcelona Traction considers that the immediate publication of the Report is essential not only in justice to the management of the Group which has been traduced by the Joint Declaration but also for the protection of the shareholders and the independent bondholders of the Company whose only safeguard against yet further illegal action in Spain is that the truth, and the whole truth, should be known.

which 344,938 tons are for Norway, 62,690 tons for Panama and £58,910 tons for Liberia; the largest part of this export tonnage consists of tankers. Tonnage being built in all countries for export amounts to 1,510,710 tons, of which 48.3 per cent is being built in Britain; the largest importers are Norway, Brazil, Panama and France. The largest additions to merchant fleets are being made by Great Britain (1,385,006 tons), Norway (645,492 tons), France (542,829 tons) and Japan (490,895 tons).

A table introduced for the first time into these Lloyd's Register returns gives an analysis of ships under construction in Great Britain by types. It shows that more than half of the total under construction is tanker tonnage, amounting to 103 vessels of 1,181,755 tons gross. There are also 69 cargo liners (491,350 tons), and 20 passenger ships (220,900 tons). Dry-cargo tramps account for 23 vessels (141,300 tons); there are 7 colliers (13,770 tons), 39 coasters (30,415 tons) and 86 miscellaneous craft totalling 34,829 tons, making a total of 345 vessels. In addition there are 255 vessels, totalling 1,840,851 tons gross, for which plans have been approved or material ordered. In this category the proportion of tankers is even larger (1,247,020 tons, or 67.7 per cent) but there are only 8 passenger ships, totalling 95,100 tons. Thus, of 600 vessels totalling nearly 4,000,000 tons that are under construction or in preparation, over 2,400,000 tons consist of tankers, which make heavier demands on steel per ton gross than almost any other type of vessel. The British shipbuilding programme is thus heavily weighted by tanker orders, the proportion of tankers at present under construction being 55.9 per cent in Britain and only 26.9 per cent in shipyards abroad.

* * *

Plentiful Timber

Agreement has at last been reached with Russia upon the supply of 128,600 standards of softwoods, with an option until September 1st for an additional 64,000 standards. Some 22,000 standards are to come from the Kara Sea and the balance from the White Sea. Original Russian stipulations concerning transport of the timber and the timing of the cargo ships' arrival at Archangel have not been met; but Britain's Timber Control conceded that payment should be in convertible sterling. Prices in the agreement are as originally proposed. The landed price of White Sea timber will be about £95 or £96 a standard, slightly lower than the landed price (about £100 a standard) of timber from British Columbia. A new Jugoslav contract has also been made for the supply of some 60,000 standards before June, 1952; but there have been no shipments yet. The Russian agreement has now ensured that softwood supplies should be plentiful, compared with the present rate of consumption, in the latter part of this year. Some 231,000 standards were imported in the first six months; but something nearer 1,500,000 standards, including the Russian supplies, should be shipped in the remainder of this year. This compares with 796,000 standards in 1950 and 1,072,000 in 1949. This country's prospects of adequate supplies from elsewhere, together with the knowledge that some 260,000 standards are still to be sold in Sweden and Finland, made it possible for the Timber Control to resist most of the Russian demands. Britain is the most likely purchaser of the Baltic timber outstanding. There is likely to be some difficulty in the dock handling of the large quantities of timber expected in coming months. A shortage of lighters and barges in June caused delays in the unloading of timber at the Surrey Docks, and many of the quays are too weak to have large quantities of timber unloaded on to them.

The trade is anxious lest a surplus should accumulate. It is urging a more liberal grant of licences for the use of timber and an increase in the housing programme. The surplus will depend on how large the Government's stockpile is to be: at the present rate of consumption, however, it might amount to one or two hundred standards. Additional uses for timber may be found to relieve pressure on steel supplies, and the export packing trade will need more if its shortage of labour can be eased. Apart from these essential outlets there may be a case for a change in Government policy, but it would be wise to ensure that all promised supplies arrive first.

The new demands on shipping resulting from the Russian contract have postponed a fall in Baltic freight prices, which recently showed a tendency to weaken. Present rates are about £17 a standard for Middle Gulf ports. Pacific Coast rates have also eased from £45 to £35 a standard, but a recovery is expected if the Government imports more American coal. There has been little change on the liner rates from South America or Africa.

Shorter Notes

After a meeting of the International Wheat Council it was announced on Tuesday that the United Kingdom is to purchase under the International Wheat Agreement 95 million bushels of wheat and 350,000 tons of flour (equivalent to some 18 million bushels of wheat). At the end of September the two countries will consider a transaction outside the agreement for a further 9,000,000 bushels of wheat. No settlement has yet been reached whether Britain is to pay the 6 cents carrying charge which Canada wishes to impose on all wheat exports.

*

From the end of this month the special 50 per cent strike surcharge on freights to New Zealand is to be withdrawn: lines serving New Zealand are now confident that they will soon be able to maintain at least as many regular services—fortnightly to ports in the north island, and three-weekly to the south—as before the New Zealand dock strike. Their confidence reflects the greater success now attending the New Zealand Government's handling of the strike: and also the effectiveness of recent emergency docking arrangements by which ships arriving have discharged all their cargo through one port, instead of moving consignments to the port most convenient to New Zealand importers. Special rates set for several ships that the lines have recently been obliged to charter will not, however, be altered.

Company Notes

Patons and Baldwins.—The key to the report of Patons and Baldwins for the year to April 28th is to be found in the rise in wool prices until March this year and the subsequent fall. Excluding the trading results of the Shanghai branch and after reducing the valuation of stocks held in Britain by £417,115, the company's trading surplus has risen by £1,370,902 to £3,826,061. This surplus, however, cannot "be looked upon as a normal trading profit," for, as the chairman points out, it is greatly influenced by sales in a rising market of stocks previously purchased at lower prices. These stocks have then had to be replaced at the new higher values.

There could be no clearer illustration than these accounts of the inroads of the so-called income tax into the real capital of industry during a period of rising prices. Higher prices for wool largely account for the rise in the book value of stocks. At the end of April last year, stocks held in Britain by the company were valued at £10,401,527; in the latest year, the total value of stocks, including those held in Shanghai, is £13,992,606, "after writing off £557,290 to reduce to market values at 28th April and a further £417,115 to write U.K. wool and tops stocks down to market values at June 11, 1951."

Rising costs have stretched liquid resources to the limit. Bank overdrafts and acceptance credits have only been slightly reduced from £2,536,571 to £2,353,334 and cash has fallen from £605,803 to £199,143, despite the issue of £3,000,000 debenture stock, replacing the original £500,000 issue. It is not, therefore, surprising that the ordinary dividend has been merely maintained at 20 per cent. Nor is it surprising in view of the present downward trend in wool prices that £804,648, against £750,000, has been transferred to a contingencies reserve.

The fall in wool prices has coincided with widespread consumers' resistance to high prices. Evidently the current year is likely to be a difficult one, but the chairman welcomes the fall in wool prices and expects that "it will result in a healthier basis for trade throughout the industry." Consumers may already have benefited from the fall in price, for at the beginning of June several of the leading manufacturers of knitting wool, including Patons and Baldwins, the largest

£1 ordinary stock at 69s. 6d. xd. yields £5 15s. per cent.

single producer, reduced prices by 3d. or 4d. below the ceiling price of 3s. 1d. an ounce which became effective in March.

Since the end of April constructional work at the new Darlington factory has been completed. The combing and finishing sections are now fully equipped, but some £350,000 worth of machinery for the spinning section has yet to be delivered. In the latest financial year the net book value of the Darlington factory and plant has increased by £1,098,634 to £6,666,033.

*

Bleachers Association.—The years between 1931 and 1947 were barren ones for holders of Bleachers ordinary stock, but since 1947, when a dividend of 3 per cent was paid, the ordinary dividend has gradually been increased as profits have improved. In the latest year the dividend has been raised from 7½ per cent (including a 2½ per cent jubilee bonus) to 8 per cent. This decision, however, came as a sharp disappointment to many stockholders and the 10s. units fell 1s. 9d. to 11s. 3d. and later to 10s. 9d. The further fall reflects the general weakness in textile shares brought about by fears of Japanese competition. In a year of rising prices and of greater output in the textile industry, the increase in Bleachers' group trading profits from £1,073,290 to £1,244,211 is satisfactory rather than outstanding, though these figures are after charging repairs and maintenance of £485,964 in the latest year, against £440,398.

	Years to March 31, 1950	Years to March 31, 1951
Consolidated earnings:—	£	£

Cash	192,459	338,574
Reserves	1,545,838	1,850,549
Ordinary capital	1,909,368	1,909,368

10s. ordinary stock at 10s. 9d. xd. yields £7 9s. per cent.

An appropriation of £100,000 to a fixed assets replacement reserves and in the rise in stocks from £1,170,384 to £1,374,206 both mark the year's rise in prices. Allocations to reserves have led to some improvement in the group's liquid position and cash has risen from £192,459 to £338,574. Attention at the moment is concentrated on the ultimate revival of Japanese competition. Exports from Lancashire, however, have been well maintained and Bleachers in recent years has extended its activities to the finishing of artificial silk and to the preparation of cotton cellulose. These interests should stand the company in good stead if and when the industry has to face Japanese competition in a more vigorous form than is the case today.

*

Distillers.—Large industrial undertakings scarcely without exception have reported peak profits this year; Distillers' group trading profits have soared from £12,837,691 to £17,934,520. But record levels of profits have sometimes encouraged investors to assess the prospects of bigger ordinary dividends more optimistically than seems justifiable to certain boards of directors. Distillers is a case in point. The widespread view was that Distillers' ordinary dividend would be stepped up from 20 to 25 per cent; these sanguine hopes have only partially been satisfied by the announcement of a 22½ per cent dividend.

At first sight, with trading profits of nearly £18 million and group earnings of the order of £6.8 million, this decision might be criticised as ultra-conservative. To do so, however, would be to ignore many of the lessons that this year of record profits has made clear. Before making any appropriations to reserves, Distillers have to provide more than half of the trading profits to meet taxation, which absorbs the staggering sum of £9,515,576, against £6,421,948. After this burden has been met, reserves have to be built up to meet the inflated replacement costs of fixed and working capital.

In Distillers' case the necessary sums are retained by subsidiaries or held in general reserves, in contrast to the practice in certain other cases of strengthening specific reserves. In addition, the group has been rapidly expanding its interests in industrial spheres other than distilling; these developments in

4s. ordinary stock at 23s. 0d. yields £3 18s. per cent.

themselves require the careful conservation of resources. The borrowing of £10 million last year by the issue of unsecured loan stock in order to finance the extension and modernisation of distilling plant underlines the importance and capital cost of these new activities.

Rising prices in the latest year may well have given an extra lift of profits, but it is too often forgotten that working capital has then to be replaced at the higher price levels. In a year when British output of potable spirits showed little change, White Horse and John Dewar, both Distillers' subsidiaries, earned higher profits. This advance in profits may owe a good deal to the adjustment in export prices of whisky after devaluation. At the same time, costs have risen and it would not be surprising if the remarkable jump in group profits was largely connected with the company's other industrial activities. If, therefore, Distillers' dividend policy can be called conservative, the latest profits provide good evidence of the success of the company's policy of branching out into chemicals, drugs, and industrial raw materials.

Statistical Summary

EXCHEQUER RETURNS

For the week ended July 21, 1951, total ordinary revenue was £92,411,000, against ordinary expenditure of £75,365,000 and issues to sinking funds £350,000. Thus, including sinking fund allocations of £3,918,000 the surplus accrued since April 1, 1951, is £30,487,000 compared with a surplus of £39,393,000 for the corresponding period of the previous year.

On July 20th applications for 91 day bills to be paid from July 23 to July 28, 1951, were accepted dated Monday to Saturday as to about 60 per cent at £99 17s. 5d., and applications at higher prices were accepted in full. Treasury Bills to a maximum of £230 million are being offered for July 27th. For the week ending July 28th the banks were not asked for Treasury deposits.

BRITISH INSURANCE

THIS year's Survey of British Insurance is again divided between *The Economist* and the *Records and Statistics* Supplement. Three articles follow on topics of particular interest to the insurance offices and their customers. *Records and Statistics* contains detailed analyses of every branch of insurance business.

Freedom and Facts

PARLIAMENT has always allowed the insurance industry very wide freedom of action. It has been wise to do so, and the industry has not abused the trust reposed in it. Insurance depends upon the unquestioning faith of the insured in the skill and financial strength of the insurer. The fact that the British public allows insurers a degree of freedom from state regulation far greater than that permitted in many other countries is a tribute to the public's good sense and to the integrity of British insurers. In large measure the Assurance Companies Act, 1909, still regulates the business and subsequent legislation affecting insurance (apart from industrial life assurance) has been concerned with such matters as Board of Trade powers of investigation and winding up and bringing of motor, marine and aviation insurance within the ambit of the 1909 Act.

Perhaps the greatest freedom enjoyed by insurance companies in this country is the unfettered power to invest their assets as and, subject to Exchange Control regulations, where they please. In sharp contrast, life insurance companies in the United States have until recently been compelled to invest substantially the whole of their assets in Government and other bonds, or in mortgages and real estate. They are now permitted in most, but not all, states to purchase equities up to a small proportion (about 3 per cent) of their total assets. On the other hand, assets relating to other classes of insurance may be invested in the United States without restriction, and some insurance companies hold equities representing up to 40 per cent of their total assets. Life assurance contracts are long-term, but fire, accident and marine liabilities are short-term and should, on broad grounds, be covered by easily realisable or "near-cash" assets to meet sudden claims. The distribution of the investments of American insurers is exactly the reverse of that which is—at any rate to British eyes—logical; though it should be added at once that no British life assurance company holds as much as 40 per cent of its assets in ordinary shares.

Although the Act of 1909 works well enough, there can be no harm in taking a quick look at some of its provisions and in inquiring whether it could not be strengthened. This is not to be construed as a suggestion that new legislation is urgently needed or that legislation in the spirit of the Labour Party's earlier proposals would be other than a disaster. It is rather an exercise to see whether anything could or should be done to improve a piece of machinery that has stood the test of more than forty years and two wars.

Statutory requirements regarding the form of the revenue accounts and balance sheets, which must be deposited annually with the Board of Trade, are far from onerous. Assets may be valued in any manner that may be thought fit, so long as the certificate to the balance sheet states "how the values of the Stock Exchange securities are arrived at." But those signing the accounts must certify that "in their belief the assets set forth in the balance sheet are in the aggregate fully of the value stated therein less any investment reserve fund taken into account." As the certificate is required in respect of life assurance business only when an actuarial valuation is made (which may be at intervals of up to five years) significant fluctuations in the value of the assets representing the life and annuity funds (which account for about three-quarters of the total liabilities of British insurance companies) may occur in the intervening years. Such fluctuations would in practice no doubt be covered by hidden and disclosed reserves, but the absence of the certificate in non-valuation years removes the proof that this is so: at the end of 1949, when the insurance companies had experienced a considerable depreciation on their Stock Exchange securities, some companies thought it proper to state in the directors' statement or chairman's speech that the depreciation was in fact so covered. The certificate about investment values is intended to mean, and is undoubtedly taken by the public to mean, that on the basis of market values for quoted Stock Exchange securities together with up-to-date valuations of other assets, the aggregate value of the assets at the date of the balance sheet was not less than the balance sheet total less any disclosed investment reserves. If there were a shortfall between the current value of the assets and the balance sheet total less investment reserves, would the certificate be improperly given provided that, in the honest opinion of those giving it, the intrinsic value—as distinct from the present value—of the assets as a whole was greater than the current value by at least the amount of the shortfall? The basis of the valuation of all categories of assets might with advantage be clearly set out and certified.

Because confidence is the essence of the business, insurance companies, like the banks, are not under obligation to disclose the amount of their hidden reserves and the Companies Act, 1948, maintains this principle. That there should be secrecy about the extent of inner

reserves is unquestionably right, but this principle has to be interpreted in circumstances that differ from any that could have been foreseen or intended in 1909. Because of the worldwide spread of British insurance and the exchange control restrictions in force today in so many countries, it is the practice, dictated by prudence if not by local legislation, to cover liabilities in foreign currencies as far as possible with local investments in the same currency. It follows, therefore, that provisions which were perfectly adequate when one currency could be freely exchanged into another might not be wholly applicable today. The omnibus sterling figures shown in insurance company balance sheets in fact represent the sterling equivalent of assets held in a wide variety of currencies, some of which may be virtually blocked. Again, a change in the exchange value of a given currency against sterling (such as that of United States and Canadian dollars in 1949) may substantially increase the sterling value of those assets held in that currency, although they may be wholly, and certainly are substantially, hypothecated against liabilities in that currency. As the present certificate covers total assets, it would be possible to count such appreciation in sterling terms against any depreciation in other securities. On these grounds, the form of certificate might be worth re-examination. The point that should be made clear is that assets held in a given country are of sufficient value to meet the liabilities in that currency, or, if this is not so, that adequate free reserves are held in some other currency which can be freely changed into the currency in which there is a deficiency.

The Assurance Companies Acts 1909 to 1946 require that the liabilities under various types of insurance must be shown under separate funds, but there is no obligation to separate the assets. Whatever may have been the justification for this in the past, it is widely accepted today that life and annuity assets and those covering the liabilities under all other classes of insurance should be separate and distinct. This, at any rate, is common practice though it is not the law. Some companies have carried this division into effect in their accounts but, whilst most others publish separate balance sheets for life and annuity business, many merely apportion common investments between the life and annuity and other funds. In view of the very large amounts invested by the insurance companies on behalf of their lives assured and annuitants (at the end of 1949 the life and annuity funds of the companies established within Great Britain making returns to the Board of Trade under the Assurance Companies Acts aggregated £2,244 million) it may be worth asking whether the doctrine against the segregation of assets does not require consideration afresh.

Companies transacting life assurance business must publish annually details of new life assurance policies issued, but there is no obligation to give information regarding new annuity contracts. In 1909, annuity business was relatively unimportant, but in recent years, and in particular within the last five years, deferred annuity contracts issued in connection with staff pension schemes have become of growing importance, and now form a large part of the total life and annuity business of some companies. Many of the offices in fact give quite full information of their new annuity business each year and differentiate between that effected under staff pension schemes and individual contracts. But because of the lack of an official form of return, this information is not always given nor, if given, is there always sufficient detail. Staff pension schemes now cover pension rights for a large number of people and are thus of substantial importance to the insurance industry and to the public. A statutory form of return of new business of this type transacted each year and the separation of details relating to it from other annuity business in the valuation returns would seem desirable. Group life assurance, commonly effected in conjunction with pension schemes, should also be stated separately from individual life assurance business.

Upwards of 70 per cent of fire, accident and marine insurance is transacted abroad or written in London for overseas account. At present it is necessary in the revenue accounts to differentiate between home and overseas business only as regards life assurance, and although over 10 per cent of the total life premium income comes from outside the United Kingdom, overseas business is relatively of minor importance. The aggregation of home and overseas business in the fire, accident and marine departments which is permitted under the 1909 Act is wise. Insurance depends for its success on the operation of the law of averages both over a period of time and through the geographical spreading of risks. It often happens that in one year a run of losses in a given area is offset by better than average profits elsewhere, whilst in the other years the position is reversed. With the growing sense of nationalism throughout the world and increasing discrimination against foreign insurers, it would be unwise to disclose the experience in different classes of business in different countries abroad. From the point of view of the public relations of the insurance industry in the United Kingdom, however, the inability to publish details of the home experience alone in individual classes of insurance is sometimes unfortunate. There has, for instance, been criticism of the recent 12½ per cent increase in motor insurance premiums. This increase was in fact fully justified by motor insurance experience in the United Kingdom, but that fact could not be demonstrably proved from published facts and figures.

It is hardly to be expected that, after its experiences of the past two years, the insurance industry would regard with enthusiasm any proposal by a Labour Government to introduce fresh legislation concerning its business. Yet it may still be true, politics quite apart, that the Assurance Companies Act, 1909, could with advantage be brought up to date in certain respects and consolidated with the other legislation affecting the insurance industry. The freedom of the industry to conduct its affairs with the minimum of statutory interference, under which it has prospered so much, should be preserved. The price of that freedom is not high—it is the protection of the insuring public by the provision of information in accord with modern requirements. A draft Bill, the Insurance Undertakings Bill, was brought out between the wars by a Departmental Committee upon which the insurance offices were represented; this contained, amongst other matters, provisions for the segregation of life and non-life assets. Is there any good reason why a new committee should not reconsider the detailed application of the Assurance Companies Acts? Or, better still, might not the industry itself be able to bring forward an agreed measure for consideration by Parliament? It would have nothing to lose, and conceivably much to gain.

From the ashes...

On the night of the 2nd September, 1666, a small fire started in Pudding Lane. In three days it devastated all but 75 of London's 373 acres, destroyed 13,200 houses, 89 parish churches and old St. Paul's Cathedral. But despite the tragic loss of life and property, the fire was a blessing to London. It destroyed a vermin-infested, plague-ridden, unsanitary and badly planned city and allowed Christopher Wren to replan its streets and redesign its churches.

As a result of this and similar fires the Sun Fire Office was established in 1710—laying the foundation of the great reputation which the "SUN" holds to-day for insurance service of all kinds.

The Growth of Pension Schemes

DURING the last two decades, pensions schemes have been established in increasing numbers, and the rate of growth has been greatly accelerated since the war. No up-to-date statistics are available to measure the relative popularity of privately administered pension funds on the one hand and pension schemes arranged with life offices on the other hand. An investigation by the Ministry of Labour in 1936 showed that out of some 6,500 employers (excluding government departments and local authorities) who had by then established employees' pension schemes, one-half had done so by insurance through a life office. At that time private pension funds covered 1,362,000 employees and life office schemes no more than 255,000 employees. To-day the number of employees under the two types of scheme is probably much more nearly equal, and the employees covered numbered several million.

There are no official statistics of the amount of staff pension scheme business undertaken each year by the life offices, or of the total amount of such policies in force. The following table, extracted from a paper recently read by Mr G. W. Pingstone to the Institute of Actuaries, relates to five of the principal offices transacting group life and pension business. They should be an accurate guide to the trend, for the five offices underwrite a good proportion of total staff pension business; indeed, the entry of other offices into staff pension business suggests that the actual rate of growth may have been more rapid than the table indicates:—

GROUP PENSION BUSINESS—5 OFFICES

Year Ended December 31st	Total Net Group Business in Force in Great Britain			
	Number of Lives Assured	Amount of Group Life Assurance	Annual Premium Income	
			Life Assurance	Pensions
		£	£	£
1934	120,300	17,060,000	197,000	1,083,000
1939	366,000	57,310,000	661,000	4,395,000
1944	500,100	93,680,000	1,234,000	7,846,000
1949	709,200	216,860,000	2,702,000	18,818,000

The annual premium income from group life and pension schemes of these five offices alone represented some 13 per cent of the total ordinary life home premium income and consideration for annuities of all British life offices in 1949. In addition, a substantial number of staff pension schemes are arranged with life offices under endowment assurance policies carrying a guaranteed annuity option, of which the magnitude is not known.

The rapid spread of staff pension schemes amongst industrial employers marks a growing sense of social responsibility towards employees. But without the taxation concessions granted for approved schemes the growth would have been far slower. The net cost of a superannuation scheme to an employer is very substantially reduced by his ability to secure, in normal circumstances, relief from profits tax and income tax to the extent of his contributions. The employee can obtain relief from tax in respect of his contributions, up to certain limits of contribution. Pension schemes are sometimes criticised on the ground that they may tend to restrict mobility of labour, already curtailed by the housing shortage and other factors. Pension schemes would not have this effect, if they provided for the transfer of an employee's accrued pension rights from the old to a new employer's pension fund. A statutory scheme of transfer values already exists within government, local government and public board superannuation schemes, and a growing number of privately administered pension funds now include transfer rules in their trust deeds. A recent sample taken by the Association of Superannuation and Pension Funds showed that one-third of the privately administered funds provided for transfer values. An employee withdrawing from a life office scheme usually has the option (which is seldom exercised) of taking a fully paid-up pension or other benefit for a reduced amount on leaving the service or alternatively of accepting, as he usually does, the actuarially less valuable cash surrender value.

What are the relative attractions of privately administered funds and staff pension schemes arranged with life offices? The life offices offer virtually absolute security, expertise in investment and—an attraction to many employers—the assumption of all the work involved in launching and administering the scheme. On the other hand, life office pension schemes tend to be more rigid than privately administered funds and, provided that such funds are skilfully managed, may also be more expensive. Because the contributions paid on behalf of a given employee and the benefits to which he is entitled must be closely related in a life assurance scheme, any subsequent modification of benefits is a difficult matter. For instance, early retirement can be provided for in a private scheme and the contributions throughout calculated accordingly, whereas under a life office scheme only such reduced pension can be paid in these circumstances as the contributions standing to the employee's credit will permit. A life office must allow a safety margin in calculating the contributions and, if the actual experience turns out to be more favourable than that expected, will retain this margin as profit, together with any investment profits. Further, it is the practice of life offices never to pay over the full reserve held against a contract if it should be prematurely terminated by the assured. This is a matter of importance if there is a marked turnover of staff; employees' contributions will usually be returned in full but employers receive back less than they have paid in. Should a substantial death benefit be required a life office scheme is normally necessary.

Many employers prefer to insure their pension scheme with a life office and thus avoid the not inconsiderable responsibility of organising and running a private scheme. A privately administered scheme can succeed only if the number of employees is sufficiently large to give a statistical probability of normal experience for the fund. It also needs the technical services of an actuary and an investment consultant. Although the life offices undertake the largest pension schemes, their services are indispensable to the smaller concerns.

Staff pension schemes can be arranged in a wide variety of ways to suit the needs of employers and employees. They may be contributory or non-contributory on the part of the employees; the large

majority are contributory, but the difference between the two types is psychological rather than real. Life office group pension schemes usually provide for the purchase during each year of service of a given pension dependent upon the current salary of the employee. The employee's contribution is a fixed amount per week or month, the balance of the cost of each year's pension (the unit cost increases with age) being met by the employer. In addition there is usually a group life assurance benefit of approximately one year's salary. Recent life office developments include group family income benefits under which an annual payment (by monthly instalments) of the order of one-fifth of his salary is made from the date of death until the employee would have attained a given age, say, sixty-five. Many life office pension schemes are based upon endowment assurances. This arrangement has the advantage that the benefit payable upon premature death is much larger than under a group scheme (when it is normally limited to the group life benefit together with a refund of the employee's contributions) and there is the additional attractive option of receiving a capital sum at maturity instead of a pension, the amount of which is, however, limited to 25 per cent of the total benefit by the Finance Act, 1947. Under group pension schemes, whereby the pension is secured by a deferred annuity, there is normally no cash option at the retiring age in lieu of a pension.

*

Apart from schemes secured by endowment assurances applicable to all eligible employees, in recent years a substantial number of supplementary pension schemes for directors and higher paid executives have been arranged by the life offices by means of endowment assurance policies. Such schemes are known as "top hat" pension schemes in that they are commonly superimposed on a group scheme applicable to all personnel. The Inland Revenue will permit no more than 25 per cent of the total pension benefits of an employee under all superannuation schemes to be taken in the form of a capital sum at retiring age, and "top hat" schemes are, therefore, arranged to secure this result. As it is possible to arrange such an additional pension scheme so that the employer pays the whole of the contribution, and secures relief from taxation on it, whilst such contribution is not assessed on the employee for income tax or surtax, the attraction of such an arrangement is obvious. Because no separate new business figures of these special endowment assurance pension schemes are published the total number in force cannot be ascertained; from the new business figures of certain offices known to specialise in them, however, it would seem that a substantial volume of this business is being transacted.

An interesting development in life office group pension schemes has recently been announced by the Prudential. This office will now undertake such schemes on a participating basis (which will not, however, be extended to group life assurance benefits). The contributions will be rather higher than those charged under normal fixed benefit schemes, in the same way that the premiums under individual with-profit policies are higher than those charged under non-participating contracts securing the same initial benefit. Any profits accruing from the business taken as a whole will be distributed as annual additions to the accrued pensions together with a special final bonus addition to the pension when it commences. It remains to be seen how far the experiment will prove popular. A participating scheme offers a smaller guaranteed initial pension than a fixed benefit scheme, for the same contribution; on the other hand, a participating life assurance policy is almost invariably more profitable than a non-participating contract.

The taxation concessions for superannuation schemes are particularly attractive today; they have been grafted piecemeal on to a code of taxation which was conceived before taxation of the present severity or the widespread adoption of staff pension schemes were contemplated. But they are also extremely complicated. Three separate enactments—the Income Tax Act, 1918, the Finance Act, 1921, and the Finance Act, 1947—have a major effect on pension schemes. To obtain income tax concessions, a scheme must be approved by the Commissioners of Inland Revenue under the Finance Act, 1947, and must also either conform with Section 32 of the Income Tax Act, 1918, as subsequently amended, or comply with the requirements of, and be approved by the Commissioners of Inland Revenue, under the Finance Act, 1921; thus it is hardly surprising that there are numerous anomalies and inequities (some of which were discussed in an article on Retirement and Taxation in the issue of *The Economist* of August 19, 1950). Very broadly, under the Income Tax Act, 1918, the employee's contribution qualifies for life assurance premium relief, the employer's contributions are relieved of profits and income tax, and, whilst pensions are taxed, capital payments and refunds to employees leaving the service are not. Schemes approved under the Finance Act, 1921, on the other hand, secure full abatement of taxation on both the employee's and the employer's contribution, the interest income of the fund is tax free (in a privately administered fund) and pensions are taxed. In addition tax at one-quarter of the standard rate is levied on the net amount of any refund of contributions to employees leaving the service. The Finance Act, 1947, is restrictive as regards pension schemes: in particular it provides that at least three-quarters of the benefits must take the form of a non-commutable non-assignable life annuity. Because of the income tax position, it is usually best to arrange a life office scheme under the Income Tax Act, 1918, where the employees are comparatively low paid or where there is a high rate of labour turnover; for a more highly paid and stable staff the benefits obtainable under the Finance Act, 1921, tend to be greater.

A committee was set up last August under the chairmanship of Mr. J. Millard Tucker, K.C., to review the treatment for income tax of superannuation and pension fund schemes. Its terms of reference extend to the consideration of whether tax relief should be given for payments made by individuals for retirement or for their dependants after death. The report of the Tucker Committee should in due course lead to the establishment of uniform principles for all superannuation schemes; certainly the complications and inequities of the present law require remedy. Individuals can at present provide for their old age only out of taxed income which is virtually impossible. Similarly, those who own directly or indirectly more than 5 per cent of the ordinary capital of a director-controlled company are debarred by the Finance Act, 1947, from benefit under an approved pension scheme. Equity demands that some way should be found of repairing the anomalies that at present exist in the tax law as it affects pensions schemes.

Insurers as Investors

FOLLOWING the sharp setback in Stock Exchange securities in the closing months of 1949 there was a modest recovery last year. By the end of 1950, the aggregate market value of the British Stock Exchange securities of the insurance companies had risen by an amount equivalent to about 2 per cent of the total assets whereas during 1949 there was a fall equivalent to approximately 7 per cent of the total assets. These estimates are based on the average distribution of insurance assets and the movements of the Actuaries Investment Index during 1950. This estimate of last year's investment experience of the offices takes into account the movement in British marketable securities only, and the composite offices, which have substantial overseas investments have fared differently. The life and annuity funds, which account for about three-quarters of the total assets of the British insurance companies are, however very largely invested in this country, so that there is no reason to suppose that the average appreciation differed markedly from 2 per cent. Those offices with a higher concentration of ordinary stocks in their assets must have done better than the majority.

Unfortunately the whole of the welcome replenishment of hidden reserves which took place last year was dissipated during the first six months of 1951, the average depreciation of United Kingdom Stock Exchange securities over the first half of this year being about the same as the appreciation in 1950. Those offices holding about the average proportion of equities (which appreciated, according to the Actuaries Investment Index, by 14.1 per cent compared with an average depreciation in fixed interest securities of about 5 per cent), comfortably held their own, but those with a smaller proportion of their assets in ordinary shares can hardly have avoided some depreciation this year. Margins between balance sheet and market values cannot now, on the whole, be too comfortable, particularly where life and annuity funds have expanded substantially since the end of the war, involving a correspondingly heavy investment programme during the cheap money period.

The distribution of insurance assets between the various categories requires careful interpretation. Only one office, the National Mutual Life, revalues its assets each year at market values; thus if all the other offices have varying margins between market and book values for each category of investments, the distribution between categories is to that extent affected. Secondly, the distribution of investments in British Government and Government guaranteed securities between short-, medium- and long-dated stocks is unknown, save that the guaranteed stocks are all long-dated. Last year there was a marked rise in the holdings of guaranteed stocks and a fall in British Government direct obligations which may indicate a general lengthening of maturity dates. The ordinary shares held by some life offices against sterling liabilities include United States and Canadian equities.

In previous years, this survey has presented an analysis of the holdings of the total funds of each office; thus the figures for the composite offices have represented both the life and annuity funds and also the fire, accident and marine funds. Life and annuity contracts are essentially long-term liabilities, whereas other types of insurance provide an essentially short-term cover, with the ever-present hazard that catastrophe may involve very heavy claims. Non-life funds, therefore, tend to be held in much more liquid form than life and annuity fund investments, with a higher proportion of short-dated securities and cash. In this year's survey, the assets pertaining to the two classes of fund have been separately analysed; table IIa shows the distribution of life and annuity funds and table IIb the distribution of fire, accident, marine and capital redemption funds of certain leading composite offices. The book values of total assets, together with those for 1949, appear in the current issue of *Records and Statistics*.

About 70 per cent of non-life insurance business is transacted overseas, predominantly in North America. Because of exchange control restrictions in many countries, uncertainty as to the future value of currencies and local legislation in many countries, it is the usual practice of insurance companies to cover liabilities in a given currency as far as possible with assets in that currency. Table IIb shows the effect of this factor in the sterling equivalent of investments in foreign currencies, largely in foreign Government and especially of United States Government bonds. Particularly high percentages are shown for Employers' Liability, Liverpool and London and Globe and Royal. Gilt-edged holdings vary in importance, but tend to be a good deal lower relatively than life-fund holdings, whereas cash holdings vary from 16 per cent to nearly 40 per cent. In no case does the cash holding of any of the 41 life funds exceed 6 per cent.

The reduction in the importance of gilt-edged portfolios which commenced in 1949 gathered pace last year. The percentage of total assets invested in gilt-edged fell from 37.7 per cent in 1949 to 35.1 per cent last year and, even more significantly, the absolute amount fell by £4.3 million to £991 million, thus reversing the trend of many years. The whole of the increment of £184.3 million during last year in the assets of the offices included in Table I was, therefore, invested outside the gilt-edged market. By far the largest rise was in debentures and mortgages; the former rose by £54.6 million to 10.4 per cent of total assets (9.1 per cent in 1949) whilst mortgages increased by £34.7 million to 10.2 per cent of total assets (9.6 per cent in 1949). The rise of £26.0 million in ordinary shares to 10.3 per cent of total assets compared with 10.1 per cent in 1949 was perhaps rather less than might have been expected; but there are grounds for believing that the life offices have increased their equity investments further this year.

Table III shows a further small rise in the average net yield on the life and annuity funds of the leading offices. Although new money could be invested advantageously last year the annual increment in the funds is small compared with the total assets, and the improvement in average yield modest. Experience so far this year suggests that the slowly rising trend of net yields may be expected to continue. It will be noted that some offices show net yields differing materially from the average.

LORD BRUCE ON NEED FOR GOOD SENSE

The sixth annual general meeting of members of Finance Corporation for Industry Limited was held on July 25th in the Conference Hall of The Chartered Insurance Institute, 20, Aldermanbury, London, E.C., the Rt. Hon. Viscount Bruce of Melbourne, P.C., C.H., F.R.S. (the chairman), presiding.

The chairman said:—Gentlemen, the notices which we sent out were signed by Mr A. E. Owen, the secretary of the company. Unhappily, Mr Owen died on July 14th. He had been secretary for some three years, he rendered very great service to the corporation, and his death is a very deep loss to all of us.

You will have observed that during the year there have been a number of changes in the board.

In December last Sir Thomas Frazer, having retired from his position as general manager of the North British and Mercantile Insurance Company and proposing to live in the country, intimated that he felt he could no longer continue his active association with the corporation. About the same time, Mr Ivan Spens, owing to increasing responsibilities in other directions, indicated that he felt he could no longer devote the time he felt desirable to the corporation's affairs. More recently Lord Westwood informed me that he was desirous of lightening the burden he was carrying and did not wish his name to be submitted for re-election to the board.

These resignations your board has accepted with deep regret. Sir Thomas Frazer, Mr Ivan Spens and Lord Westwood were all original directors when the corporation was formed. I am sure it would be your wish that I should convey to them your deep appreciation of the valuable services they have rendered to the corporation during the early and formative years of its existence. To this appreciation I desire to add my thanks and deep gratitude for the help and encouragement they have so generously extended to me during the years since I became chairman.

Against these losses, we can set off the return to our ranks of Sir Robert Sinclair, after his highly successful term of duty as President of the Federation of British Industries and the acceptance of seats on the board by Sir Archibald Forbes and Mr Pollen. To them on your behalf I extend a very warm welcome.

ADVANCES AND COMMITMENTS

From the balance sheet you will see that the investments by way of loans and participations at cost less amounts written off totalled £54,506,992. You will also have observed from the first note that at March 31st the company had undertaken to make further loans amounting to £13,945,000. The actual advances and commitments at that date therefore totalled £68,451,992.

The comparable figures twelve months before were investments £32,702,386, commitments £34,160,255, total £66,862,641.

These figures, however, require a little explanation. The 1950 figures included the full amount of advances and commitments to the iron and steel companies, amounting to £53 million. The 1951 figures include only the actual advances of £40,175,000. The £13 million of commitments in respect to which advances had not been made have been eliminated, owing to the fact that these commitments were cancelled after February 15, 1951, when the iron and steel companies were vested in the British Iron and Steel Corporation, as a result of nationalisation.

The actual figure of advances (less amounts written off) and commitments at the date of the balance sheet, apart from the £40,175,000 which is repayable in cash by the Iron and Steel Corporation, was £28,276,992, against a comparable figure of £13,812,641 last year.

I do not think there is anything else in the balance sheet calling for comment.

In the profit and loss account, you will see that the result of the year's operation is that we have shown neither a profit nor a loss. The reason for this somewhat remarkable result is to be found in Note 4 on the balance sheet. From the directors' report you will see that the available balance of income has been applied in writing down our investments. Whether or not losses will be incurred up to or beyond the amounts written off it is not possible to estimate at present.

That briefly is the position on the profit and loss account and it arises from the nature of the business which your corporation conducts, combined with the necessity to prepare accounts for the relatively short period of one year. However, taken with Note 4 on the balance sheet and the statement in the auditors' certificate that "investments by way of loans and participations include interests in companies in the development stage, upon the value of which we are unable to express an opinion" it may have caused a certain feeling of concern.

It is desirable that I should give some explanation of the position to the shareholders, while at the same time drawing attention to Note 3 on the balance sheet, which from my later remarks will be seen to be of considerable importance in relation to Note 4.

BOARD'S POLICY

Twelve months ago, in my address at our annual meeting, after giving figures with regard to the advances made and our commitments I suggested that, from the facts I had given, shareholders would appreciate that our affairs cannot be considered on an annual basis—as is customary in respect to most financial concerns—but must be judged over a period of years. The reason why this has to be done is that the corporation's advances are in most cases financing either the expansion programmes of existing businesses or the development of entirely new activities in the U.K. economy. In respect to such projects—which take a period to materialise—it is impossible to assess the results until they are in production on a commercial basis. In these circumstances it is extremely difficult to determine, save over a period of years, how successful or unsuccessful the operations of the corporation may have been. Accordingly we consider that the proper policy for the time being is to apply any net surplus of income in the writing down of such holdings.

I can, however, give you certain facts with regard to the present state of the corporation's affairs which will enable shareholders to form their own judgment.

At a previous meeting I pointed out to you that our policy was to make advances to projects for expansion or new development, at as low a rate of interest as was possible during the period of construction and equipment. I pointed out that when we made these advances it was our practice to take conversion options in the equity of the ventures, so that if our pioneering efforts should prove successful we would receive an adequate reward for the risks we had to take.

I would now like to give you some examples of how this has worked out in practice.

All of you will have observed during the last few days that F. Perkins Limited of Peterborough, the diesel engine manufacturers, is now approaching the market for the provision of the finance required for this extremely progressive and successful business. As a result of the provision of this permanent finance through the market, the advances made by F.C.I. to F. Perkins Limited will be liquidated and a substantial profit should accrue to F.C.I. through its holding in the equity of the company, acquired partly by conversion rights and partly by cash subscription. I suggest that the amount of financial assistance we have accorded to this business, supported by an equity of only some £100,000, could not have been provided by any organisation in the City other than F.C.I. The great business, particularly in the export trade, that F. Perkins Limited is now transacting, and which I am confident will continue to expand, is of great benefit to the whole U.K. economy and more than justifies the action of your board.

IRON AND STEEL INDUSTRY

I now turn to the position with regard to the advances we have made to the iron and steel industry.

Our policy there was also to provide loans at the lowest possible rate of interest during construction and equipment, with conversion rights in the equity should the venture prove successful. The advances to iron and steel companies to which we were committed, as I indicated earlier totalled no less than £53 million and in fact £40 million had been advanced when vesting day arrived. Attached to these advances were valuable conversion rights in the equity of the companies concerned.

In the case of the Steel Company of Wales alone, these conversion rights are up to £10 million in the equity of the company.

We are at the moment negotiating with the Iron and Steel Corporation to determine the compensation payable to us under the Iron and Steel Act in respect of the conversion rights of which nationalisation has deprived us. These negotiations are being actively pursued and we anticipate that the result will be the payment to F.C.I. of a substantial amount for compensation.

The amounts accruing to F.C.I. in respect to our equity conversion rights in the iron and steel companies and the profits we will derive from the transfer to the market of our advances to F. Perkins Limited, will constitute a buffer against any loss that may arise in respect to our existing commitments —to which I will refer later—and should such losses not materialise will constitute a valuable reserve against our future operations.

PETROCHEMICALS LIMITED

I will now deal with our other investments and commments.

In the directors' report we indicate that the ultimate value of some of our investments in the companies in the development stage cannot yet be measured. The outstanding example is Petrochemicals Limited, to which the corporation has made large advances. This company was formed to operate the catarole process and to develop the production of a wide variety of chemical products from petroleum. The advice which your board received was that this was a field with great possibilities which the U.S.A. was already developing and in which it was of national importance that Britain should participate.

After obtaining the best possible scientific advice as to the soundness of the proposals, your directors agreed to participate in the finance.

In its conception the project was divided into two parts—a primary plant to produce certain basic chemicals and subsidiary plants to produce what are generally known as "end products." The primary plant was not expected to do much more than earn depreciation and interest on the capital employed. The subsidiary plants were to produce chemicals of high commercial value which could be marketed on a most remunerative basis.

A predominant part of the loan finance for the plant has been provided by F.C.I. The ordinary capital, amounting to approximately £2750,000, has been found from other sources, with a limited participation by F.C.I.

Like most large-scale new projects in these days—and particularly in the extremely complex chemical industry—the cost has far exceeded the original estimates. Your directors are providing the finance necessary to bring the primary project through to the full operational stage. That stage has not yet been attained but will it is hoped be reached by the end of the year. In the meantime we believe that the company is justified in claiming that the scientific soundness of the basis on which the plant has been conceived is now established. What has still to be demonstrated is whether the basic products can be produced at a profitable and competitive price, not only under present conditions but in face of a recession. By this time next year we should have a clearer picture of the operational efficiency of the plant and its commercial possibilities.

No project of this magnitude in a new scientific field can be financed without risk and therefore some anxiety and concern to those responsible. I am not going to indulge in prophecy today. Nevertheless, although there is no direct comparison, since there are major differences in character, it is not wholly irrelevant to refer in this context to what I heard eighteen months ago with regard to the investment that F.C.I. had made in Ultramar.

THE ULTRAMAR INVESTMENT

The same gloomy predictions were made and many of our shareholders had great anxiety with regard to the Ultramar investment. Today the position is that the greater part of our advances have been repaid, reducing the amount outstanding to £1,100,000. I am certain that this balance will be repaid, together with all the accrued interest which we agreed to postpone.

I believe that the action of F.C.I. in assisting in the financing of Ultramar at a critical moment saved the equity in this great Venezuelan project for Britain. Equally I believe that the investment in Petrochemicals Limited was the carrying out by F.C.I. of the task it was set to perform.

Having dealt with what I would describe as the "domestic affairs" of F.C.I., I now turn to wider questions which must affect our operations in the future. Before doing so I must make it clear—as I have had to do on previous occasions—that I and I alone take the full responsibility for what I am about to say.

Our activities cannot be separated from the financial and economic conditions prevailing in the country.

EFFECT OF REARMAMENT PROGRAMME

Since our last meeting, the Government has announced its rearmament programme of £4,700 million over the next three years.

Apart from the financial burden involved, this places a tremendous strain on industry. To meet it, vast problems of manpower, raw materials and capital investment have to be faced and solved if the rearmament programme is to be carried through side by side with the maintenance of the necessary flow of exports upon which our whole economy depends.

All these difficult questions are receiving the consideration not only of the Government but also of the Federation of British Industries, the Council of the T.U.C., and many other bodies associated both with management and employment in industry.

I do not desire to detract from all these earnest and I believe devoted efforts. Neither do I propose to attempt to deal with the multitudinous issues involved. I desire solely to address myself to the one point on which in my view all the others depend.

NEEDS OF THE NEW WORLD

Without an efficient, generally accepted and smoothly working industrial machine, our task is an impossible one. Unhappily at the moment that is just what we do not possess. At this time, when we are facing the greatest economic crisis in our history, we are hopelessly divided as to whether the basis on which that machine should operate should be government ownership or private enterprise. This question has become a political issue and unquestionably will play a major part when an election comes. This is wrong, and would not be tolerated if the people really understood the facts.

The first one is that we are living in a new world, requiring clear and constructive thinking. Accepted theories and current shibboleths have to be critically examined and where necessary ruthlessly discarded. The reason for this is that two world wars have completely destroyed the equilibrium of the financial and economic systems which had been built up prior to those wars. As a result, nations have been forced to adopt national economic policies for which the governments of individual countries are responsible and of which governments have to ensure the implementation.

This necessity has been recognised and acted upon by all countries, irrespective of whether their internal economies are based on the theory of government ownership or private enterprise. In face of this, the activities of private enterprise have to be conducted within the overall national economic policy.

Nowhere is this more clearly marked than in the United States, where in respect to agriculture control and direction is as rigid, if not more so, than in any country outside the Iron Curtain.

In this new world, with all the changes that have come about, are we not being extraordinarily stupid in allowing this question of nationalisation versus private enterprise to become a great political issue? Can we not exercise our traditional British commonsense and political instinct and recognise that neither one nor the other is the answer to our difficulties and that each has its part to play?

For certain great utilities, public ownership is probably the right answer. Production, particularly of consumer goods and goods entering into international trade, is clearly a field for private enterprise.

I again remind you that under modern conditions the activities of private enterprise must be integrated into the overall national economic policy. Here once more I feel we are not living up to our reputation for good sense.

I suggest the answer has been found of how, while retaining the experience, initiative and vision of private enterprise, to integrate it into the overall economic policy and to achieve in a whole industry the co-operation of the government, management, trade unions and employees.

THE MARGAM PROJECT

I refer to the iron and steel industry. Last week I was privileged—as probably were many of you—to attend the inaugural ceremony of the Steel Company of Wales at Margam. All who did so must have been deeply impressed by what has been achieved.

In May, 1945, Mr Churchill invited the Iron and Steel Federation to prepare a plan to meet Britain's needs for iron and steel over the next five years. In response to that invitation, the Iron and Steel Federation—a body composed of all the great iron and steel companies—prepared a plan of modernisation and expansion, providing for a capital expenditure of £160 million, which has since been increased to £240 million. This plan, with certain modifications, was approved by the Iron and Steel Board which had been set up, composed of representatives of the Government, private enterprise, trade unions and consumers, under the chairmanship of Sir Archibald Forbes. Embraced in this scheme was the £60 million project for the Steel Company of Wales, sponsored by four of the great steel companies. The public, through the great issuing houses of the City, contributed £15 million and F.C.I. no less than £35 million towards the required finance.

I regret that the speeches which were broadcast to the nation at the inaugural ceremony paid no tribute to the initiative and vision of private enterprise and private finance, which was responsible for this valuable development. I am confident that this great industrial plant will provide an ever increasing source of production, employment and profit. I trust that when it does politicians will not forget and will in fact admit that its success is founded on private enterprise and private finance and will not be tempted to claim it as evidence of the success of nationalisation.

The achievement at Margam should be an inspiration to British industry. I go further and say that the organisation and co-operation which was achieved in the iron and steel industry should be the model for other industries. On such a foundation I believe we can build the industrial machine—to which I referred earlier as being essential if we are to reconcile the needs of rearmament and the export trade and overcome the tremendous financial and economic problems that face us.

The report and accounts were adopted.

The retiring directors (Sir John Morison, C.A., Sir Archibald F. Forbes, Mr J. A. Pollen and Sir Robert J. Sinclair, K.C.B., K.B.E.) were re-elected, and the fee of the auditors (Messrs Deloitte, Plender, Griffiths and Company) having been duly fixed, the proceedings terminated with a vote of thanks to the chairman, directors and staff.

THE AUSTRALIAN ESTATES COMPANY

INCREASED PROFITS DUE TO HIGH WOOL VALUES

THREAT OF COMPETITION FROM NEW SYNTHETIC PRODUCTS

The annual general meeting of The Australian Estates Company, Limited, was held on July 12th at 96, Leadenhall Street, London, E.C.3.

In the course of his review the Chairman said:

The net profit for the year 1950 is £353,855 as compared with £247,156 for 1949, and, after adding £144,237 brought forward from last year, there is an amount of £498,092 available for appropriation.

In view of the good results, the board recommends a dividend of 9 per cent. and a special bonus of 3 per cent. on the ordinary stock. After paying dividends and making the appropriations set out in the profit and loss account, including the transfer of £60,000 to general reserve, the amount to be carried forward to 1951 is £181,782.

The increase in profits is due mainly to the extraordinarily high wool values which ruled during the year, bringing high returns to our sheep properties, and also good earnings from our agency department consequent upon the high prices for wool and stock.

Expenses again rose and a very high sum for taxation has had to be provided from the year's profit. This substantial rise in expenses (including in particular wages and salaries) is a disturbing feature as, should the prices which we receive for our primary products fall later on, it will be very difficult to secure a corresponding reduction in our overall expenses.

A further disturbing feature is that the extremely high level to which wool prices have risen is bound to accentuate the production of substitutes; and there is every indication that new synthetic products, in particular those emanating from the United States of America, may be serious competitors during the course of a few years.

PASTORAL

Exceptionally heavy rains fell throughout the greater part of the year in nearly all areas of New South Wales, which resulted in floods and unhealthy conditions for sheep. Heavy loses were caused by blowflies, and wet weather interfered with the destruction of rabbits.

Queensland also experienced continuous wet weather, resulting in a rank growth of grass on which stock did not do as well as usual. Blowflies were responsible for some loss of sheep in this State.

The company's total wool clip from all stations was 9,083 bales, as compared with 9,328 bales in 1949. The cut per head was almost the same as for 1949 and the reduction is due partly to the disposal of sheep from areas resumed, and partly to losses through blowfly.

The average price realised for the wool clip was more than double that for 1949.

The total number of sheep owned by the company shows a reduction on the previous year. Lambing has again been disappointing this year; and it will be necessary to take energetic steps to try and restore our flocks to the previous level. The average price realised for sale sheep was higher than in 1949.

RESEARCH

The company's research organisation continues to give valuable service to our sugar mills, and assists in our agricultural experiments at our stations in the South-West and North-West of Queensland. With the aid of research, our aim is to increase the number of sheep and cattle carried in those districts and to minimise the effects of severe drought. Scientific assistance is becoming increasingly important in the management of pastures, and problems of animal husbandry. Our research staff also works continuously on problems arising from the milling of sugar cane.

SUGAR

The sugar districts of Queensland experienced one of the wettest years on record, which caused many stoppages at the mills, and the season was prolonged into the beginning of 1951. Although every effort was made to harvest all the available cane, a considerable quantity had to be left standing, and it is estimated that at least half a million tons in Queensland could not be harvested, despite higher crushing rates than usual at the mills and special efforts by farmers.

The total sugar production in Queensland during 1950 was 889,000 tons, as compared with over 896,000 tons in 1949.

Planting and cultivation operations were made unusually difficult owing to continuous rain and it is expected that the 1951 crop will be lighter.

AGENCY

All branches of our agency section—wool-broking, produce stock and station, merchandise and insurance—as well as the sub-branches in Victoria and Queensland, again enjoyed a large turnover. The company's Victorian produce business, comprising the auctioning of furred skins, hides, tallow and sheepskins, had an exceptionally good year.

During 1950, new branches were opened at Longreach in Queensland, and at Mansfield, Yea and Kyneton in Victoria.

We also acquired the whole of the shares in John McNamara and Co. Pty., Ltd., the largest stock-selling agents in Melbourne. This old-established and well-known business will continue under the capable direction of Mr Maurice McNamara, who is favourably known in all Eastern Australian States. He is being ably assisted by his son, Mr Keiran McNamara.

The company's agency connections in Victoria and Queensland are now widespread, and the services rendered are of great value to clients.

WOOL

The total Australian wool clip for the season July 1950-June 1951, was estimated to reach 3,560,000 bales, which will slightly exceed the previous year's clip.

At the end of May 3,353,102 bales had been sold, which realised £616,238,187 at an average price of 148.63d. per pound. It is likely that the Australian wool cheque will exceed £640,000,000 for the 1950-51 selling season, as compared with £286,919,294 for 1949-50.

In 1938-39, the last prewar year, the clip averaged 10.58d. per pound, and realised £39,123,031.

All wool-using countries competed throughout the season, Great Britain being the largest purchaser, and substantial quantities being taken by France, United States and Belgium.

It is believed that the United States operations had a very considerable influence on the market during the season, although their purchases were not as heavy as expected.

A suggestion to allot a certain portion of the Australian clip for defence purposes was considered at a conference in Australia during November, but no workable arrangement could be agreed upon.

At December 31, 1950, Joint Organisation stocks totalled 172,664 bales. These were to be offered in the six months January-June, 1951, and have now nearly all been sold. It is interesting to recall that, at July 31, 1945, Joint Organisation holdings were 10,407,000 bales, of which 6,796,000 bales comprised Australian wool. That this volume of wool, in addition to the yearly production of the various growing countries, has been so readily absorbed at record prices indicates the sound statistical position of the industry today, and would seem to point to a further period of satisfactory prices, subject to the question of substitutes to which I have already referred.

OUTLOOK

New South Wales has had very little rain since the beginning of 1951, and pastoralists were becoming concerned at the dry conditions until relieved by falls at the end of May; should these be followed up during the winter, the 1951 season should be satisfactory.

Early in 1951, in order to deal with the rabbit menace, a disease known as Myxomatosis was deliberately spread among rabbits in some districts in Victoria and New South Wales. This was carried by mosquitoes, and the highest mortality among rabbits was in areas adjacent to water. On our "Buckiinguy" station, large numbers died from the disease and that property is now comparatively free from rabbits; it did not spread on our other properties. The disease has diminished with cold weather and the drying up of water courses, but may recur later. This method of dealing with the problem was the result of many years of investigation by the Commonwealth Scientific and Industrial Research Organisation which will continue the work when conditions again become favourable.

Dry conditions exist in Queensland in both sheep and cattle districts, and it is likely that it will not be a good year in that State.

We expect, however, to have a good wool clip, and to dispose of about the same number of cattle as last year, although possibly their condition will not be so good.

The prospects in the sugar industry are for a reduced crushing, due to a long interval of dry weather at a time when rain was specially needed.

STAFF

The company is fortunate in its staff in all departments, and their energy and ability have contributed materially to the good results. We pay special attention to staff welfare; have a good provident fund; and a sickness fund which bears the major portion of hospital or medical expenses incurred by officers or their families. These funds are available, not only to the permanent staff but to all the company's employees at stations, mills and stores, with whom good relations exist.

The company is again greatly indebted to Mr Colman for his very able and inspiring leadership. The fine results achieved during the last twelve months are the result not only of his hard work during that period, but also the excellent foundations which he has laid over a long period of years. The board commends his services and those of his managers and colleagues most warmly to the shareholders.

The report and accounts were unanimously adopted and the other formal business having been duly transacted the proceedings terminated with a cordial vote of thanks to the chairman, directors and staff.

ROLLS-ROYCE LIMITED

INCREASED DEMAND FOR PRODUCTS

ADJUSTMENT OF CAPITAL STRUCTURE

LORD HIVES' SURVEY OF ACTIVITIES

The forty-fourth annual general meeting of Rolls-Royce Limited was held on July 24th at the Midland Hotel, Derby, the Rt. Hon. Lord Hives, C.H., M.B.E., D.Sc., the chairman, presided.

The following is an extract from the statement by the chairman which had been circulated with the report and accounts:

The operations of the company's various divisions during the past year have been carried on against a very unsettled background. Whereas in the early part of 1950 we were actively planning to widen our interests in commercial markets generally, we finished the year with the emphasis once again on military work.

REARMAMENT

It could be anticipated that in the rearmament programme any expansion on aircraft engines would mean that Rolls-Royce products would be in great demand.

The major expansion plan for aero engines in this country is based on the Rolls-Royce "Avon." The Ministry of Supply is arranging to place direct contracts with the Bristol Aeroplane Company, Limited, D. Napier and Son, Limited, and possibly with the Standard Motor Company, Limited, to manufacture these engines. On our side, we are handing over unreservedly not only our designs but also our manufacturing technique and experience for the use of the nation. We have very friendly relations with all of these companies whereby we pool our manufacturing knowledge.

In the War Office rearmament programme the Rolls-Royce range of engines has been chosen for a large number of vehicles. Direct contracts have been placed on the Austin Motor Company, Limited, to manufacture additional engines. Here, again, all our designs and manufacturing technique and experience have been made available to the nation.

In addition to the increased demands for our products in this country, expansion is also planned in countries where engines are built under licence. In the U.S.A. it has been announced that the Chrysler Corporation will work with Pratt and Whitney to manufacture the J.48, which is a licensed engine. Increased demands are also being made on our licensees in Australia, Belgium and France.

This year marks the tenth anniversary of the first flight made by a plane powered by a gas turbine engine—the first Whittle engine.

The energy which your company has put into the subsequent development of the gas turbine engine has permitted, during the last year, at least one of Sir Frank Whittle's dreams to be realised, namely, the non-stop transatlantic crossing made by the "Canberra" aircraft at an average speed of 450 miles per hour. Many of you will be aware that this aircraft is a product of the English Electric Company, Limited, and is powered by our "Avon" engine.

In addition to the many military applications for the "Avon" engine there is every prospect that it will, in due course, find its place in future civil air liners. The Ministry of Supply is planning for a "Comet" to be fitted with "Avon" engines for development flight.

It has fallen to your company's "Dart" engine to be the first propeller gas turbine engine which will make its appearance in scheduled airline use. The "Dart" is fitted in the Vickers "Viscount," a number of which have been ordered by British European Airways, who anticipate that the aircraft will be coming into use during 1953.

The motor-car division has continued to operate under conditions which are both difficult and largely unpredictable. The reduction in purchase tax from 66⅔ per cent. in April, 1949, resulted in a substantial and necessary improvement in the order book, but economic restrictions, and more latterly, those arising from the general material supply position, have limited production. It is too early to forecast the full impact of the recent budget which has reimposed the higher rate of purchase tax, but sooner or later the effect is bound to be serious, and it is hoped that the matter will be reviewed early enough to ensure that no permanent damage is done to us and other similarly placed manufacturers. In the meantime we are operating under worsening conditions of material supply and ever-increasing costs.

During the past few years your company has been developing a series of medium-powered oil engines for industrial service.

Good progress has been made in this new branch of the company's activities in developing a range of rationalised engines, with the maximum number of common parts, which are readily adaptable to a wide variety of applications.

CAPITAL STRUCTURE

The past year has seen two important events in connection with the capital structure of the company. The first was the issue of new capital by way of a Rights Issue to existing stockholders. It had been apparent for some time that the introduction of more permanent capital was fully justified by the very substantial increase in the scope of the company's activities compared with the years before the war.

The second event was the recent announcement that the board is recommending the issue of a scrip bonus which is designed to bring the nominal capital of the company more nearly in line with the capital employed. This step is also overdue.

The volume of turnover was practically the same as in the previous year, but much of it returned lower margins of profit. This was largely the result of rising costs, not only in respect of raw materials but also in the provision of practically all essential services and supplies. We deferred as long as possible making any alteration in the selling price of our motor-cars, but during the latter part of the year this became inevitable, and increased prices were effective from October.

DIVIDEND

Your directors have given a great deal of thought to the dividend which they should recommend, having regard to the earnings record of the past, the problems of the present, and the possibilities of the future. The directors feel that the time has come when the stockholders' contribution to this state of affairs should be recognised by a modest increase in the dividend. Your board therefore recommends a final dividend of 15 per cent. which, together with the 10 per cent. paid last December, will restore the rate of distribution to the 1938 level.

The report and accounts were adopted.

At the subsequent extra-ordinary general meeting the proposed increase of capital and scrip bonus was approved.

ALLIED IRONFOUNDERS

RECORD TRADING RESULTS

The twenty-second annual general meeting of Allied Ironfounders, Limited, was held on July 19th at Caxton Hall, Westminster, S.W., Mr James Shaw (chairman and managing director) presiding.

The following is an extract from the chairman's circulated statement.

The trading profits of the group are given in the consolidated profit and loss account at £1,926,276 (last year £1,714,598).

For some years now your directors have felt it incumbent upon them in the interests of the national economy to refrain from recommending any increase in the ordinary dividend, but they feel justified this year in recommending to you a final dividend of 11½ per cent., making 17½ per cent. for the year. Since our revenue reserves now exceed in total the amount of the issued ordinary capital, on balance sheet values this dividend is slightly less than 8¾ per cent. on capital employed. If the total capital employed were computed at today's money values the yield would be substantially less.

It is quite clear that the present penal taxation cannot fail to enforce restraint in future dividend payments and must inevitably discourage investment in risk capital.

The financial strength of the group is apparent when you compare the total current assets of £5,233,604 with our current liabilities of £1,315,735 and our liability for income tax in January of next year of £701,528.

With reserves at more than £2,500,000, the shareholders' interest in the group now exceeds £6,000,000. If our fixed assets were re-valued this figure of £6,000,000 would, of course, be correspondingly increased.

REVIEW OF THE YEAR

The results reflect a successful year's trading and are a record for the company both in volume of output and profit earning. This performance, over a period of labour and material shortages, coupled with rising costs without a proportionate advance in selling prices, is evidence of steadily increasing efficiency and productivity throughout the organisation.

All our units have been profitably employed during the year and harmonious working through all grades of our personnel has contributed to the advancement of those plans for development of which I have advised you in my previous annual reports.

Our shipments abroad for the period created a record for the company, a considerable share of the trade being with dollar areas.

Special visits have been made to Commonwealth and other countries which have led to a reorganisation in some of our representation. We see good prospects of a further expansion of this trade.

We ended last year fully employed in all our works and present orders will keep us busy for a long time ahead.

There is a shortage of some essential materials and although our output has not so far been seriously affected any further deterioration in the position would give cause for concern.

So long as the housing policy of the present Government is maintained our goods will be required and the means to make them ought to be available.

The company is well equipped with resources which, in normal times, would ensure its success, and your directors plan to employ these assets energetically. We shall pursue programmes for improvement and development while sharing with you the hope that the company will continue to be fully employed in peace-time activities.

The report was adopted.

THE A.P.V. COMPANY

GREAT DEMAND FOR PRODUCTS

The forty-first ordinary general meeting of the A.P.V. Company, Limited, was held on July 25th in London, Dr. Richard J. S. Seligman, Ph.nat.D., F.C.G.I., F.Inst.Met., F.I.M. (the chairman), presiding.

The following is an extract from his circulated statement:

Once again I am privileged to present a very satisfactory report. The parent company earned a trading profit of £484,700 and the trading profit of the group amounted to £551,013. The contribution of your subsidiary companies amounted to £66,313.

The balance sheet of your parent company discloses a strong financial position. Current assets amount to £2,829,495, against current liabilities of £1,385,606. The consolidated balance sheet shows that current assets exceed current liabilities by £1,495,651. This satisfactory liquid position will not be maintained in the future by reason of the fact that the additional capital raised last year was specifically for the erection and equipment of the new factory at Crawley, in respect of which no expenditure had been incurred at the date of the balance sheet.

Last year I drew attention to the strains put upon your factories by the great demand for the company's products. This difficulty has persisted and despite the appreciable increase in our turnover as compared with 1949, the orders on the company's books at January 1, 1951, were over 12½ per cent. higher than in 1950 and have increased appreciably since then. Your company's efforts to meet the national need for exports continued unabated. Despite competition the orders received from abroad amounted to over £1,250,000 and the export orders executed during the period have exceeded 37 per cent. of the total sales invoiced.

Having dealt at length with the activities of the associated and subsidiary companies the statement continued:

FUTURE PROSPECTS

So far the facts and figures I have given you have, in the main, been favourable. Now I must bring matters to your notice which carry a serious threat to the development and even the well-being of your company. I refer to the shortage of raw materials. As you will appreciate the raw materials used by your company are, for the most part, also the raw materials required for rearmament and it so happens that some of those most valuable to us are also those in shortest supply. This applies to some of your subsidiaries and notably to Paramount Alloys Limited, as well as to your main factory.

Your board has of course kept before it the part which your company should play in the rearmament programme itself and close contact has been maintained with the Government departments concerned.

The present output of your company is being achieved in the face of excessive difficulties arising from congestion and lack of space while the increased production necessary to enable us to give better deliveries is impossible. Your directors decided that it would be desirable to concentrate the whole of its manufacturing activities in the new town being constructed at Crawley in Sussex and contracts have been entered into with the Crawley Development Corporation for the lease of 17 acres of ground on which our factory is to be installed.

Building and the subsequent transfer of our work to the new premises is to be done in stages. Contracts have been let for the first stage of building and despite the interference of abnormally bad weather building is going on apace.

The report was adopted and the ordinary dividend of 15d. per share was approved.

LONSDALE INVESTMENT TRUST LIMITED

INCREASED REVENUE AND PROFIT

MR T. L. McC. LONSDALE'S STATEMENT

The fourth annual general meeting of Lonsdale Investment Trust Limited was held on July 25th at 22, Old Broad Street, London, E.C., Mr T. L. McC. Lonsdale, the chairman, presiding.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended February 28, 1951:

There has been during the year a substantial improvement in the valuation of the Trust's securities and in its revenue. The gross revenue of the Trust amounted to £176,003 against £158,020 last year, an increase of £17,983. The net profit, after payment of expenses, debenture interest and taxation, amounted to £86,668 compared with £78,427 a year ago. After adding £3,822 representing refunds of taxation in respect of previous years arising from reciprocal tax agreements, and £1,500 received from a subsidiary company in respect of a previous year, and after paying the preference dividend and the dividend of 10 per cent. on the ordinary stock, the revenue balance carried forward is increased by £17,196.

The revenue of the Trust included a dividend of 7½ per cent. received from Robert Benson, Lonsdale & Co. Limited, the same as last year. After payment of this dividend the unappropriated revenue balance carried forward in Robert Benson, Lonsdale & Co. Limited is increased by £26,483. The combined revenue balances of the Trust and Robert Benson, Lonsdale & Co. Limited have therefore been augmented this year by £43,679 after allowing for taxation.

Since the close of the year the ordinary stock units of Manchester Oil Refinery Limited, with which the Group has been closely identified since that company was formed, have been introduced on the Stock Exchange. In order to facilitate that operation the Group has disposed of part of its substantial interest in the company. Manchester Oil Refinery Limited, which in its inception represented a pioneer development, now fulfils an important function in its particular industry.

PETROCHEMICALS LIMITED

Another large development interest of the Group, Petrochemicals Limited, has been undergoing teething troubles inseparable from setting up a complicated chemical unit and aggravated by the effect of inflation on the cost of construction. We are given to understand, however, that although there are still running-in problems, the operation of the plant is showing gradual improvement and its products are finding a ready market. There is no doubt of the importance of the future development of the petroleum-chemical industry, and we are confident that Petrochemicals Limited will ultimately prove itself to be a successful enterprise of national importance. It may be of interest to say that the Group's investment in Petrochemicals Limited (included among unquoted securities) has been valued in our accounts as at February 28th at a low figure. This was done both as a matter of prudence and on account of the long-term nature of the project, but should not be taken as indicating any lack of confidence in the ultimate future of the company.

According to present estimates it appears likely that the revenue from the Trust's general investments during the current year will show an increase on last year's figures.

SUCCESSFUL ISSUES

Robert Benson, Lonsdale & Co. Limited has had a busy year and has again sponsored a number of successful issues in widely varying fields of industry and commerce. This activity is being well maintained during the current year. Much has already been said in reports of industrial and other companies about the depreciation on fixed assets being based for taxation purposes on historical costs rather than on replacement values. This factor together with the incidence of high taxation and inflation is forcing industrial companies more and more to seek fresh capital, not merely for developing their businesses but also for maintaining them at their present level. Up to date the capital market has been able to meet the demands of industry. If, however, the factors referred to above continue to operate, the time will inevitably arrive when the demand for new capital will exceed the supply, with the result that industrial activity may be restricted.

The report and accounts were unanimously adopted.

ELLAMS DUPLICATOR COMPANY, LIMITED

LARGER TURNOVER

The annual general meeting of Ellams Duplicator Company, Limited, was held on July 23rd in London, Mr Frederick Ellam, the chairman, presiding.

The following is an extract from his circulated statement for the year ending December 31, 1950:

Since the last annual meeting both turnover and net profits have shown improvement, but in view of the uncertainties affecting both supplies and customers' demands, it is difficult to make any forecast of future results, except to state that the improved trend of sales which commenced in about the middle of 1950 is continuing.

The ever-rising cost of raw materials is a serious factor, but equally serious is the difficulty of obtaining adequate supplies. We are fortunate in having a keen purchasing department which, together with an extensive and well-equipped laboratory and research section, has enabled us to overcome most of our difficulties and, at the same time, maintain production and the high standard of quality with which the products of your company have always been associated.

We have again considered it advisable to increase our stock reserve by £10,000 and the general reserve by a similar amount, bringing it up to £125,000. Your directors have decided to recommend an increase in the final dividend, making 33⅓ per cent. for the year.

As you will gather from the foregoing, our difficulties have not eased during the past 12 months, and I particularly wish to record our obligation to our staff in all grades, who have continued to serve the organisation with unfailing zest and loyalty and in thanking them on your behalf for their efforts, it is proposed to allocate the sum of £3,000 to the staff fund.

The report was adopted.

RHODESIA BROKEN HILL DEVELOPMENT COMPANY, LIMITED

RECORD SALES AND PROFITS

The forty-first annual general meeting of this company will be held in Northern Rhodesia on August 8th.

The following is an extract from the statement of the chairman, Sir Ernest Oppenheimer, circulated with the report and accounts for the year to December 31, 1950:—

The year under review was again a very successful one; in fact, the sales proceeds and the resulting profits earned by your company both constitute a record. The demand for your company's products, particularly zinc, continues to be very strong.

TRANSFER OF CONTROL

There are two principal reasons for transferring the seat of control from the United Kingdom. In the first place it was evident that an increase in administrative efficiency could be effected, and in the second it was possible to make a very substantial saving in taxation by obviating the amount payable in the United Kingdom by way of income tax and profits tax. Since virtually the whole of the company's profits are made in Northern Rhodesia and an important part of the capital of the company is held outside the United Kingdom, this move was considered entirely justifiable.

The dividend payable in respect of the year under review will be regarded as a free of tax dividend by the United Kingdom revenue authorities. Thus, although the declared rate of dividend for 1950 is 45 per cent., against 40 per cent. for 1949, it is necessary, in order to obtain a true comparison of the two dividends, to express the dividend for the earlier year in similar terms, and on this basis it would have amounted to 22 per cent. This is a non-recurring feature arising from the change of control and briefly is due to the fact that the dividend is payable in respect of the final year during which the company was assessable to United Kingdom taxation (although by reference to the results of earlier years) and is therefore deemed to be a distribution of taxed profits.

TAXATION BENEFITS

The measure of the taxation benefits arising from the change of control is given by a comparison of the proportion of profits absorbed by tax in the two years 1949 and 1950; the accounts show these figures to be approximately 54 per cent. and 36.5 per cent. This saving is due partly to the lower rate of income tax payable by the company and, to a greater extent, to the fact that it is no longer liable for the payment of profits tax which, incidentally, in terms of the United Kingdom 1951 Finance Bill, is due to be increased still further to 50 per cent. on distributed profits.

The production of fused vanadic oxide recommenced in April of this year. As a result of the serious world shortage of sulphur consideration is at present being given to extending the activities of the Iron Duke mine with a view to supplying pyrites, hitherto used only in the company's own works and on the copperbelt, to large scale users in the Union of South Africa. Metallurgical investigations are proceeding with a view to determining whether your company should undertake the production of refined cadmium. The profits for this year show a substantial improvement on those for the corresponding period of last year and there is every indication that this improvement will continue.

NCHANGA CONSOLIDATED COPPER MINES LIMITED

INCREASED PRODUCTION

The fourteenth annual general meeting of this company will be held in Northern Rhodesia on August 8th.

The following is an extract from the statement by the chairman, Sir Ernest Oppenheimer, circulated with the report and accounts for the year to March 31, 1951:—

The transfer of this company's control from the United Kingdom was effected with a view to bringing the seat of management and control to the territory where the mining operations are carried on, so as to secure increased administrative efficiency; a further benefit resulting from the move was the avoidance of the very heavy burden of United Kingdom income tax and profits tax.

The dividend rate of 37½ per cent. is not strictly comparable with that of 20 per cent. for the previous year, which would have been expressed at a considerably lower rate had it been paid under the same special circumstances as apply to this year's dividend.

During the latter part of the year under review, production of copper was running at the increased rate envisaged in the 1947 extensions programme. Sales were increased and profits were further augmented by the rises which occurred during the year in the price of copper. The increased rate of production has also enabled unit costs to be kept down in a period of rising price levels.

In order to maintain this increased rate of production, adequate coal supplies must be available. On the basis of foreseeable coal supplies it may be difficult to maintain the overall production of copper for the remainder of the year.

EXPANSION PLANS

Members will recollect that Mr S. S. Taylor, in his speech at the last annual general meeting, gave details of the proposals for further increasing the company's production from 64,000 long tons per year, provided by the 1947 extensions, to 108,000 long tons. Construction work on these further extensions, known as the third stage extensions, was commenced during the year under review and will, it is hoped, be completed towards the end of 1952, although, owing to increased supply and transport difficulties, it is possible this date may prove to be unattainable.

The estimated total cost of these extensions was stated last year to be £5,700,000. Since that time a new forecast has been made of the future milling grade of ore, and in consequence it has been decided that the fourth unit of the Leach and Electrolytic plant will not now be required though it will be necessary to install additional washing and flotation plant in the concentrator. The revision of requirements for the third stage extensions programme is expected to reduce the cost substantially.

It is the intention to finance this and other capital expenditure commitments in part out of profits but mainly by raising fresh capital, and consideration is now being given to the form the additional finance should take. As a first step in providing finance out of profits £700,000 has been transferred to general reserve during the year under review.

It will be noted from the consulting engineers' report that the ore reserves at March 31, 1951, were estimated to be approximately 137,000,000 tons, averaging 4.65 per cent. copper, including approximately 43,000,000 tons in respect of the Nchanga West ore-body. The latter figure is based on a reserve calculated in 1931, and includes only part of the known ore contained in the Nchanga West ore-body, the balance being excluded because insufficient drilling had been done to justify an attempt to calculate the tonnage and grade with accuracy.

THE TRUSTEES CORPORATION, LIMITED

A SUCCESSFUL YEAR

The sixty-third annual general meeting was held on July 25th in London. Mr L. A. Stride, the chairman, in the course of his speech said:—

The accounts in themselves are entirely satisfactory.

Total revenue for the year amounted to £368,173, compared with £313,262 for the previous year, an increase of £54,911. Taxation takes £138,416, as compared with £111,366 a year ago. We recommend a final dividend of 7 per cent. with a bonus of 2 per cent., both less income tax, on the ordinary stock (making a total of 16 per cent.).

Reserves and the carry-forward now aggregate more than £836,401, against the corporation's total capital of £1,750,000—eloquent testimony to a sound past policy and present strong position.

The Chancellor of the Exchequer has recently announced that by next October this country will have repaid in full the $425 million American Reconstruction Finance Corporation Loan of 1941. He added that as a general rule such American securities as are vested in the Treasury and will then become released are to be retained in Treasury ownership, but in a few certain cases he may be prepared to consider resale to former British holders at current market prices. I would urge very strongly that in the interests both of the original holders, the taxpayers and the country, the Treasury should divest itself as quickly as possible of all such securities when October arrives.

The formal business was transacted and the proceedings ended with a unanimous vote of thanks to the chairman, directors and staff.

BRITISH BORNEO TIMBER COMPANY, LIMITED

SATISFACTORY RESULTS

The thirty-first annual general meeting of The British Borneo Timber Company, Limited, was held on July 26th in London, Mr H. W. Hörner (the chairman) presiding.

The following is an extract from his circulated address:

The results for the past year may be considered satisfactory. The indications that prospects as regards disposal and prices were good, to which I referred almost a year ago, have proved to be correct. Prices have advanced in all markets and the upward tendency continues, but, regrettably, largely for reasons connected with the international situation and the war in Korea in particular. Markets continue to be governed by the world shortage of timber for urgent peacetime uses and would be better without the added stimulus of the threat of war, which brings with it countervailing shortages and dislocations of costs of production, coupled with general uncertainty and lack of confidence.

The net profit for the year is £62,625. The amount available for appropriation is £85,412. We have ahead of us an extensive programme for building up facilities for increased production, involving heavy expenditure, and it is necessary to continue to conserve our financial resources. The board have transferred £50,000 to general reserve and recommend a dividend of 20 per cent. This will leave a sum of £16,242 to be carried forward.

The company is going ahead steadily with its programme of re-equipment.

The balance sheet reflects improved financial strength, but no greater than is necessary in present circumstances.

The report was adopted.

TOERANGIE (SUMATRA) RUBBER AND PRODUCE

MR A. L. MATHEWSON ON INDONESIAN PROBLEMS

The thirty-ninth annual meeting of Toerangie (Sumatra) Rubber and Produce Estates, Limited, was held on July 26th in London.

Mr A. L. Mathewson, O.B.E., the chairman, who presided, after dealing with domestic affairs and referring to the possibilities of a distribution by way of an interim and only dividend for 1949-50, went on to say: Latex stealing by our own workers has reached staggering proportions. The loss of crop is not limited to that stolen by the labourers, as we are informed that people from the neighbouring villages are illicitly tapping the rubber trees in our uncleared areas. The loss thus incurred cannot be estimated, but we do know that serious damage is being done to the trees by these intruders. The facts are constantly being reported to the local authorities, who seem powerless to take effective counter measures.

Another serious problem is the large-scale illegal occupation of estate lands in East Sumatra. This infiltration of squatters has grown apace and so far the authorities have not taken effective action to stem the tide or to give the leaseholders like ourselves the protection to which they are entitled.

A CRITICAL PERIOD

As was to be foreseen, the early years of Indonesia's independence are proving difficult and indeed critical. There is, however, no doubt that patriotic and intelligent Indonesian leaders are under no illusion as to the very formidable political and economic difficulties to be surmounted if the new Republic is to avoid chaos and is to succeed in utilising its rich natural resources progressively and adequately for the needs of its great and rapidly growing population.

So far as Sumatra is concerned, perhaps the misuse of the trade unions by communistic elements and the wholesale theft of estate crops are the problems which by reason of their immediate and grave threat to economic stability may be signalised as most urgently requiring prompt and effective action by the new Government.

SUBVERSIVE PROPAGANDA

Subversive propagandists make great play of alleged "enormous" profits made by estate employers; they keep dinning into the ears of estate workers—that they are underpaid and overworked and that they have been and are still exploited by foreign capital. This company, which cannot be regarded as unrepresentative of scores of others in the same field, has now worked its plantations in Sumatra for thirty-nine years and the net dividend paid during that period is no more than 3¼ per cent. in average.

Needless to say, these unscrupulous agitators do not publicise to estate workers the fact that about half the value of all estate produce (except what is stolen from estates and smuggled) goes in one form or another not to the owners but to the Indonesian Government, leaving the former to meet the entire cost of production, including all labour remuneration, as also home taxation, out of the other half. Nor are workers reminded that despite such a penal governmental levy on estate enterprise it is not their Government, but estate employers who provide them over and above their pay with free or heavily subsidised food and textiles, free housing, free medical care, besides other benefits and amenities.

ATTITUDE OF GOVERNMENT

Undoubtedly the new Indonesian Government is aware of the prospect of tea producers, unable to meet enormously increased labour and other costs, being compelled, in the absence of prompt remedial measures, to suspend production; and it cannot but be mindful of the precarious situation which a continuation of rising costs and falling world prices for other estate products would create for the country. Desirous as the Indonesian authorities are of attracting investment from overseas they cannot fail to note and appreciate that capital which is now denied essential security and the prospect of fair reward in Indonesia is seen to be finding ad providing employment in other countries.

The report and accounts were adopted.

SPEAR AND JACKSON, LIMITED

(Saw and Tool Makers)

ANOTHER SUCCESSFUL YEAR

CONTINUED DEMAND FOR PRODUCTS

MR A. K. WILSON'S REVIEW OF ACTIVITIES

The forty-sixth annual general meeting of Spear and Jackson, Limited, was held on July 20th at Sheffield, Mr A. K. Wilson (chairman and managing director) presiding.

The following is an extract from his circulated statement.

The year 1950 has again been a successful one, both as regards sales and profits. The turnover for the group has again exceeded £1,000,000. Our Canadian and American subsidiaries have both enjoyed a good year.

Our registered office is once again at Aetna Works, Savile Street, and accommodates the whole of our staff. The move from "The Towers," Sandygate Road, Sheffield 10, took place in December.

Considerable reorganisation has been made in the various manufacturing departments enabling the flow of work to be improved.

Towards the middle of the year under review there was a shortage of steel, giving rise to difficulties in processing it into billets, bars and sheets. These shortages, and delays in cogging and rolling grew greater and greater as the year progressed and have caused all concerned great anxiety.

Costs of manufacture continue to increase; coal and coke have risen to alarming proportions, and in their wake follow gas, electricity, oil, rail and haulage rates and materials of all descriptions.

The accounts have been prepared on similar lines to those of last year. Certain modifications in wording and in layout which it is thought will make the accounts more easily understood have been introduced.

PROFIT AND LOSS ACCOUNTS

Consolidated Account of the Group.—My opening remarks are reflected in the figures in this account. The trading profit of the group (after allowing for the small trading loss of a new subsidiary from the date on which it became a subsidiary) is £278,770 compared with £210,649. The net profit after meeting all charges and providing for inter-company profits on unsold stocks, £5,000, and for the estimated taxation liabilities on the profits of the year is £104,173 compared with £105,427.

The balance carried to the appropriation account of Spear and Jackson, Limited, is £72,172 compared with £99,238, the reduction being due to the heavier debit for taxation and an initial contribution to the pensions scheme, inaugurated during the year, by way of a lump sum payment in respect of past service pensions.

Appropriation Account of Spear and Jackson, Limited.—After bringing forward from last year, £26,153, and adding Spear and Jackson's own profit, £69,142, and the net dividends from subsidiaries, £6,572, the amount available is £101,867 compared with £126,965 last year.

The appropriations and recommendations of the directors are set out in the directors' report. It has been thought fit this year to make an initial appropriation of £15,000 to a reserve to be used for the purpose of keeping our plant and buildings up to date on the most modern lines.

DIVIDENDS

The dividend on the preference shares for the year has been paid, which required a net sum of £2,150.

The directors recommend a dividend on the ordinary shares [illegible] per cent. requiring a net sum of [illegible], against 15 per cent. requiring a net sum of £13,612 for last year.

After giving effect to these appropriations and recommendations the balance to be carried forward to next year is £30,808, compared with £26,153 last year

BALANCE SHEETS

The form of these balance sheets is similar to that of last year and little comment is therefore necessary.

Taxation liabilities on the profits of the year have been provided for and adequate reserves made in respect of outstanding matters affecting excess profits tax liabilities.

The liquid position of the company and of the group is again very satisfactory, as is the position as a whole shown by the two balance sheets.

PENSION SCHEME

I referred to this in my last year's statement. The resolution, which I proposed at the annual general meeting, was unanimously approved and the scheme is now operating.

GENERAL

The difficulties encountered in the export trade, to which I made reference twelve months ago, have not diminished. Nevertheless, a high figure has been reached. The demand for our products remains as great as ever and production is not able to meet the demand. Many offers of new business have had to be turned down, our main aim being to try and satisfy our regular customers by sending them as much as possible.

There is still a scarcity of labour in all sections of our works and every effort is being made to encourage new entrants.

FUTURE PROSPECTS

It is difficult and dangerous to forecast far ahead under conditions as they exist to-day. However, for the first five months of 1951 the turnover has been maintained, and, unless something unforeseen occurs, the current year's prospects appear satisfactory.

Finally, I would express to the company's management, staff and employees, the board's appreciation for the high standard of workmanship maintained and the output obtained.

The report and accounts were adopted.

HICK, HARGREAVES AND COMPANY, LIMITED

RESULTS AGAIN SATISFACTORY

WORKS IN FULL PRODUCTION

MR W. D'ARCY MADDEN ON THE HEAVY ORDER BOOK

The sixtieth annual ordinary general meeting of Hick, Hargreaves and Company, Limited, was held on July 25, 1951, at Bolton.

Mr W. D'Arcy Madden, chairman and managing director, who presided, said:—

I am pleased to report that the results for the past year are again most satisfactory. The final profit, after taxation and all charges, is £140,050, a moderate increase of 8 per cent. over the previous very good year.

In my speech a year ago I referred to the large undistributed profits accumulated in the reserve fund. At an extraordinary general meeting, held on March 28th last, it was decided to distribute a part of these profits and to issue one bonus share in respect of every five shares held, thereby increasing the capital of the company to £288,000 and reducing the reserve fund by £48,000.

DIVIDEND POLICY

Your directors have given very considerable thought to the question of dividend for the past year and they have decided to recommend to you the payment of a final dividend of 13 per cent. (less tax) on the company's increased capital. This will give a total distribution for the year of approximately 4 per cent. (gross) on the capital actually employed in the business during the year, which cannot be regarded as in any way excessive, and it is felt that the increase now proposed is, in all the circumstances, fully justified.

Your directors have under consideration the more equal distribution of the interim and final dividends. It may, therefore, be decided, in the future, to distribute a somewhat greater proportion of the total dividend as interim.

SUBSTANTIAL TRANSFERS TO RESERVE

As you see from the accounts, the transfers to the reserve funds are again substantial. £50,000 is added to the general reserve and another £50,000 is allocated to a new plant extension reserve fund, which we propose to build up to meet the cost of certain extensions to the works which are now under consideration. It is not thought necessary to increase further the stock reserve, which now stands at £10,000. The stocks of raw material and finished parts which we carry are turned over at comparatively short intervals, and the amount reserved should, therefore, be sufficient to cover any unexpected depreciation in values.

In consideration of the larger profit which has been earned, the employees' bonus is this year increased to £14,000; thus, in accordance with our policy of profit-sharing, all the company's employees benefit from the higher profits. In addition, a grant of £5,000 is again made to the benevolent and welfare trust fund. The capital of this fund has now been built up to £30,000.

IMPORTANT CONTRACTS

The works have been in full production throughout the year and a heavy order book includes important power station contracts for the British Electricity Authority covering condensing plant and feed-heating equipments required for commissioning at intervals from the present year to the end of 1956. We have also important contracts for the Admiralty and for the Ministry of Supply in connection with the rearmament programme. We are fortunate to be engaged on work of national importance and, consequently, of high priority, but even so our production is ever more dependent on adequate supplies of raw materials and on the deliveries of subsidiary parts and equipments from our suppliers and sub-contractors.

The load on the engineering industry of the country is today enormous. There is no surplus of labour to draw upon, and the demand far exceeds the supply. With these limitations of both materials and labour it appears essential that some policy must be adopted nationally to ensure that both be utilised to the best advantage if essential production is to be maintained.

COMPANY'S PREMIER POSITION

The works and plant have been fully maintained during the year. Your directors are now seeking authority to build and equip an additional heavy bay to the main engineers' shop. This will enable us to deal with the larger power station equipment now contemplated and will ensure the company maintaining its present premier position in the manufacture of condensing plant and other equipment of the most up-to-date design and construction.

In conclusion, I am sure you will wish me to express your thanks to all our staff and workpeople for their loyal and efficient service which has contributed so much to the excellent results of the past year.

The report and accounts were adopted.

TIMOTHY WHITES AND TAYLORS

The twenty-second ordinary annual general meeting of Timothy Whites and Taylors, Limited, was held on July 19th in London. In the absence of the chairman, Mr Louis Nicholas, J.P., F.C.A., owing to indisposition, Mr G. I. Rushton (vice-chairman and managing director) presided.

The following is an extract from the chairman's circulated statement:

The retail sales for the year exceeded those of the previous year and were the highest in the history of the companies.

No decision has yet been given by the Whitley Council on the appeal by the chemists against the arbitrary reduction in May, 1950, from 33⅓ to 16⅔ in the "on-cost" allowed to be charged on goods supplied under the National Health Service and, of course, this reduction adversely affected the group's profits for the year.

The trading profit and sundry income of the group for the year amounted to £1,135,360 as compared with £1,153,711 for the previous year. The net profit for the year was £336,467 as compared with £335,668.

The dividend on the ordinary shares has been maintained at 32½ per cent. while the balance carried forward is £136,997.

During the year several new businesses have been acquired and the fixtures in many shops modernised.

The negotiations with the War Damage Commission on the claim for loss of the company's warehouses and offices in Portsmouth were finalised during the year and the claim agreed at £250,288 which has been received by the Company.

With regard to the current year I am pleased to say that up to the present sales are in excess of those of the corresponding period last year.

The report was adopted.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

The Reporting Manager,
The Economist,
22 Ryder Street, S.W.1

AMALGAMATED DENTAL

The forty-sixth annual general meeting of this company was held on July 27th in London, Mr C. Clifford Reeves, the chairman, presiding.

The following is an extract from his circulated statement for 1950:—

I am able to report a satisfactory year's trading over the widespread sphere of the company's operations. Notable progress has been made in the overseas territories, with consequent benefit to the export business.

The net profits for the year, before charging taxation and after placing £5,550 to freehold property reserve, are £510,315 (against £589,274). Provision for taxation requires £282,005 (against £316,404), leaving net profit £228,310 (against £272,870), from which the directors have placed £100,000 to general revenue reserve.

In Great Britain the effect of the impact of the National Health Act, has in a degree subsided and we now approach a state of affairs which will enable us more accurately to assess the demand as reflected by the call for dental professional services. The directors are confident that unless our efforts are hampered by shortage of raw materials or rising costs, over which we have no control, the company may reasonably look forward to a period of successful trading.

The year under review saw the issue of the report of the Monopolies Commission. In addition to an Order laid before Parliament, the effect of which would be to prevent exclusive dealing and collective boycott, the Government has issued a White Paper with proposals of general application. These proposals would not only deal with the same matters but also would prevent your company, by direct contract, maintaining the normal end price fixed for its products.

The report was adopted.

WILLIAM HANCOCK AND COMPANY

EFFECT OF PROFITS TAX

The sixty-fourth annual general meeting of William Hancock and Company Limited, was held on July 26th at Cardiff, Col. J. G. Gaskell, T.D., D.L. (chairman and managing director), presiding.

The following are extracts from the chairman's circulated statement.

The year's trading has resulted in a net profit of £71,977, compared with £78,474. The increase in profits tax on distributed profits imposed in the last two Budgets is mainly responsible for the reduced net profit. The trading profit is actually higher than last year at £253,379.

The increased profit referred to is not due to increased beer sales—this latter shows a slight decrease—but is due to improved trade in other branches of our business, such as the wine and spirit department and the hotels and managed houses departments.

The directors recommend a dividend of 14 per cent. against 16 per cent. last year.

This has been a difficult year and so, I am afraid, will be the next. In this area and actually in almost all other areas, the price of beer has been increased by one penny per pint, and the profit derived by this advance in price will be shared between the wholesaler and retailer and the general public, the latter in the form of a slightly increased gravity. I do not think this is likely to result in any increase in sales, on the contrary, the higher cost may mean a reduction, but it does allow for a margin to meet the further costs in production which seem to be inevitable as a result of the Government's failure to reduce their own expenditure which obviously requires high taxation.

The report was adopted.

CITY OF BIRMINGHAM EDUCATION COMMITTEE

COLLEGE OF TECHNOLOGY, BIRMINGHAM

Department of Industrial Administration

Applications are invited for the post of full-time Lecturer (man) in English, in the Department of Industrial Administration.

Applicants should be over 30 years of age, and preferably possess an Honours degree in English. Experience in industry, or in teaching English to students engaged in industry, is essential.

The students concerned range from 18 years of age, studying engineering, etc., to adults with considerable industrial experience and responsibility.

Salary in accordance with the Burnham (Further Education) scale for lecturers (men), £900 by £25 to £1,000.

The applicant selected will be required to take up duty as soon as possible.

Further details and form of application may be obtained from the Registrar, College of Technology, Suffolk Street, Birmingham, on receipt of a stamped addressed foolscap envelope, and should be returned not later than 14 days after the appearance of this advertisement.

C. McCAW, Clerk to the Governing Body.

THE Philips Group of Companies has a vacancy in the Central Personnel Department at their head office in London for a man whose primary responsibility will be to foster within the framework of the established general personnel policy, the personnel relations with administration and other office staff in various establishments in this country. The function will include the development of schemes for training, merit rating, promotion, group incentives and other arrangements to promote the enthusiasm and team spirit of the staff. It will be interesting and offer scope for a man with initiative and ambition. Candidates should preferably be between 25 and 40 years of age, have a degree and experience of personnel management practice. Starting salary according to experience and qualifications, but in all probability not less than £700 will be paid to a suitable person. Applications should be sent to the Chief Personnel Officer, Philips Electrical Industries Ltd., Century House, Shaftesbury Avenue, London, W.C.2.

PERFECT German, good negotiating ability required for position open with London company in their Continental department.—Applicants should send details of past experience and age to Box 709.

FINALS student Institute of Actuaries, 28, seeks post in statistical department stockbrokers; or in Commercial-Industrial Co., with management prospects. Public School, wide general education, plenty of initiative. Minimum £600 p.a.—Box 706.

LAYTONS Wine Merchants, 2a, Duke Street (Manchester Square), W.1. are also party caterers. Welbeck 8808, 1864.

MONEY isn't everything, even in advertising. Ideas, drive and organisation are the first essentials. For sound guidance through every stage of an advertising campaign, consult SAMSON CLARK & CO. LTD., 67/61, Mortimer Street, London, W.1. MUSeum 5060.

TOP-LEVEL Commercial Executive—background light mech./elect. engineering—mass/special prodn. 6,000 employee class, seeks app. as G.M. or M.D. Effort has been 50/50 factory & commercial. Preference for active, flexible co. as against slow-moving big one.—Box 711.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical, research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1884): fees are reasonable, and may be paid by instalments if desired.

Prospectus from the Director of Studies, Department P17 **WOLSEY HALL, OXFORD**

SIR JAMES MARSHALL-CORNWALL & PARTNERS, LIMITED, 5 St. James's Place, London, S.W.1, require an intelligent man or woman, capable of drafting and handling credits, shipping documents, invoices and the drafting of contracts. Salary will be in accordance with experience and will be above scale for the right person.—Apply in the first instance to the above address by postcard only for application form.

CITY OF LONDON COLLEGE, MOORGATE, E.C.2

Part-time evening lecturers in *Economics* are required for the session beginning September, 1951. Further particulars can be obtained from the Secretary.

THE UNIVERSITY OF LIVERPOOL

Applications are invited for the post of Assistant Lecturer in Economic History in the Department of Economic Science, at an initial salary of £450 per annum, with allowance for age, experience and qualifications.

Applications stating age, academic qualifications and experience, together with the names of three referees, should be received not later than August 4, 1951, by the undersigned from whom further particulars of the conditions of appointment may be obtained.

June, 1951 STANLEY DUMBELL, Registrar.

THE POLYTECHNIC, 309 REGENT STREET, W.1

DEPARTMENT OF MANAGEMENT STUDIES

FULL-TIME DAY COURSES:

1. A one-year course for the Intermediate Certificate in Management Studies, leading to the Final examinations of all the professional Management bodies.
2. One-month courses on **Industrial Relations and Productivity.** Session 1951-52 commences on **Tuesday, September 18th.**

PART-TIME DAY COURSES:

1. Courses for **Office Supervisors,** on one half day a week.
2. Courses for **Foremen and Supervisors,** on one half day a fortnight.
3. Courses on **Work Simplification in the Office,** on one half day a fortnight.
4. Courses on Report Writing, on one half day a fortnight.

The above courses extend over a session of three terms. New courses begin each term.

Session 1951-52 commences on *Monday,* September 24th.

EVENING COURSES:

1. The Intermediate Certificate in Management Studies. There is also a shortened part-time day and evening course.
2. The Diploma in Management Studies, and the Final examinations of the Institute of Industrial Administration, the Institution of Works Managers, the Institute of Personnel Management, the Office Management Association, the Purchasing Officers' Association.

Session 1951-52 commences on **Monday,** September 24th. New evening students will be enrolled on **September 17th, 5.0-8.0 p.m.**

Prospectuses may be obtained on application to the undersigned.

J. C. JONES, Director of Education.

TRAINEE PERSONNEL OFFICERS (female) required by well-known Fashion House. Applicants should be aged 23-30, and must be prepared to take one year training at recognised Institute of Personnel Management Course. After training applicants must be willing to work anywhere in Britain. Good salary while training. Apply in writing to Box 708.

FACTORY, centrally situated in Edinburgh, one of the lowest rated cities in Great Britain, presently use as a printing works, approximately 21,000 square feet, existing use light industrial purposes, assessed rent £235, derated to £58. No ground burdens, electric lift, two loading banks, all in modern condition, approximate entry December. Permission to view from and offers to Shepherd and Wedderburn, 16, Charlotte Square, Edinburgh.

WINE is so easy to enjoy; see if you have a natural palate; enter the Wine-Tasting Competition. First prize, a week among the vines. No charge whatever. Closing date for 1st Round is August 30th! Don't delay!—Apply The Friends of Wine, 1, Vintners Place, London, E.C.4.

STATISTICIAN required for Personnel Department of large factory. Applicants should be interested in personnel problems. Academic qualifications desirable. Write giving full details to Personnel Department, Osram-G.E.C., Brook Green, Hammersmith, W.6.

WORKS Accountant, A.C.W.A. (45), executive experience process and engineering industries; especially in team research into cost reduction and control; seeks post here or abroad with scope for original and constructive work.—Box 701.

OFFICE Management Association requires Secretary. Good educational and literary standards. Particulars (age, education, experience, qualifications and salary required) to the Chairman, Office Management Association, Management House, 8, Hill Street, London, W.1.

Cold Class War

THE statement that the Chancellor of the Exchequer made to Parliament on Thursday of last week purported to be one of economic policy. Mr Gaitskell's lecture in economic analysis was, as always, lucid, though incomplete; but his proposals for action contained very little that is likely to affect the economic situation of the country. The difficulties in which the British economy finds itself are, in their main outline, neither very difficult to identify nor open to much dispute. The direction in which economic policy should point is also apparent and agreed. As soon as the terms of trade turned so sharply against this country after the Communist aggression in Korea and the necessity for rearmament was generally accepted, it was obvious that the aggregate of expenditure on things other than defence would have to be reduced, either deliberately by economic policy or blindly and unjustly by inflation. What categories of expenditure are to be cut? And by what means? Virtually the whole of economic policy in the past twelve months has revolved round these two questions. The alarms of the last few weeks have arisen because the Budget in April was insufficiently clear and effective in the answers it gave. Mr Gaitskell did not then say emphatically enough that the standard of living was his choice for the cut; and in any case consumption, instead of falling, has risen. His new statement, if it was to make any contact at all with economic policy, should have defined more clearly what sort of expenditure was to be reduced, and proposed effective means for reducing it.

When this very simple test is applied, Mr Gaitskell's statement is left without any substance at all. Tighter price control will not reduce expenditure, but will simply divert it. The restriction of bank credit by verbal pressure has been supposed to be in force for some time past; it is unlikely to be any more effective henceforward. The same can be said for export exhortation. The amount of expenditure that can possibly be stopped by dividend limitation is negligibly tiny. And the "reasonable restraint" which is all that is asked of the unions is unlikely to extend beyond speech-making.

In short, the Chancellor's statement hardly impinged on the economic problem at all. Why then was it made? One can only suppose that the impulse behind it was political, and it deserves analysis more for the light that it sheds on party politics than for any perceptible effect that it is likely to have on the course of economic events. Ministers are evidently much more concerned at the effect that the Bevanite defection is having within the ranks of their party than they have hitherto been willing to admit. As the real burdens of rearmament begin to show themselves in a steadily mounting cost of living, many members of the Labour party are feeling the temptation to escape into wishful thinking. It has become necessary for Ministers to do something to restore their popularity in the party. This explains both the negative and the positive side of last week's statement. If it was designed to court popularity in the party, it could not contain

any real measures of policy, because real policy at the moment would consist precisely in making the burdens of rearmament more precise and defining their incidence. On the other hand, dividend limitation, though negligible in effect and indefensible in equity so long as wages are not equally frozen, could be relied upon to raise a cheer in the party. But the trade unions had to be handled with kid gloves, since it is on their block votes that Mr Gaitskell will rely at Scarborough.

But what a dreadful light this sheds on the motives by which Ministers are inspired. It is quite enough to bring the Gaitskell boom to an abrupt end. There was a moment, at the time of the Budget, when the Chancellor surprised even his friends by his readiness to stand up for what his intelligence told him was right. His actions, it is true, were nothing sensational ; indeed, it is now clear that they were far below the needs of the situation. But it was refreshing to see anyone making a stand, and it brought him some of the respect that, in his time, Sir Stafford Cripps used to inspire in independent public opinion. But it is now apparent that the Chancellor's stock of moral courage was exhausted by the one effort. It is now clear that, faced with the ultimate horror of unpopularity in the party, he is as ready as any hack to do what he must know to be intellectually untrue and morally unjust. It is not perhaps so much for itself but as a symbol of Labour thinking that dividend limitation is most calculated to infuriate ; the harm it does to shareholders as a class, whom it deprives of all chance of defending themselves against inflation, is compensated by no comparable good to the national economy as a whole.

It is not only individuals, but parties, whose characters are revealed when they are under pressure. Once again the Labour party has given a demonstration that when it is in a fix it turns nasty. When Labour Ministers are faced with a situation in which they do not know what to do, they seem always to conclude that at least it must be safe to take another crack at profits. Mr Gaitskell must know perfectly well that his party's long list of penal measures against profits, and particularly against the equity profits of enterprise, are damaging to the country ; he as good as admitted it in his Budget speech, when he explained that profits are, and would remain, the mainspring of three-fourths of the national economy. He knows how much damage would be done to the country by open hostility between the classes ; but he still lends himself to the cold class war. His defence is that attacks on profits are necessary to secure a mood of moderation in the unions. But if it is really true that the unions demand that injustice be done to others before they will do their own duty, it should be the part of statesmanship to resist the demand, not to pander to it.

But the fact that the leaders of the party so easily allow their hearts to rule their heads is less alarming than the repeated revelation of what there is in their hearts. All the generous idealism on which the Labour party grew up—the promise that service and comradeship would replace jealousy and selfishness, that intelligence should direct the economic destinies of the people—has gone, and the only continuing element in the party faith, it appears, is hatred of the capitalist. Is that too severe a verdict ? Let those who think so ask themselves what else remains. The public ownership of industry is an almost openly-avowed failure. The planning of the economy has been abandoned to such a point that Ministers, faced with a perfectly simple economic dilemma, dare not explain it to their followers. The trade unions, so far from becoming a responsible estate of the realm, have, on Ministers' own showing, to be cozened into doing their duty. The only thing that can still be relied upon to arouse enthusiasm in the ranks of the party is to take somebody's property away or to devise a new penalty for material success or good fortune. The Tories in their heyday may have been indifferent to the miseries of their countrymen. At their worst they never took open pleasure in deliberately penalising their opponents.

The tragedy is that there is almost certainly a large majority of the British people waiting to vote for a party that will really set out to do what Labour once promised to do, to reconstruct society on a kindly and intelligent plan, appealing to the generous instincts of man and using the highest ranges of his intellect. Every time a Labour leader reacts to a difficult situation, as Mr Gaitskell did last week, with weakness and malice, he convinces a few more of the inherently left-minded people of the country that they have nothing to hope from Labour. The Cheshire cat faded until there was nothing left but the smile. Has Labour socialism faded until there is nothing left but the spite ?

Middle Eastern Quandary

WHEN the House of Commons earmarks a day for a debate on the Middle East, its constituents are entitled to expect that it will have something new to say. Last Monday, they were disappointed. Speeches were cantankerous and sterile. No one offered suggestions that could help Mr Morrison with the Middle Eastern problems that beset him in Persia, Egypt and Washington. Mr Churchill, who came closest to doing so in his plea for joint Anglo-American effort, spoilt his argument by his usual faulty assumption that the Middle Eastern peoples, having been "saved" by Allied arms in the war, are grateful to their saviours. Indeed, the debate was a failure chiefly because no one was realist enough to broach the fact that—except in the semi-European units of Turkey and Israel—there are at present among the Middle Eastern peoples no elements that favour the west. Individuals possess western friends. Despots like King Ibn Saud or the late King Abdullah sign agreements with western allies. But among the peoples as a whole the term "pro-British" is one of opprobrium, and "pro-American" runs it close in all the countries which take the Palestine settlement to heart.

This xenophobia is not new. It has been the spice of Middle Eastern life for more than a generation. Since the second world war, however, it has taken on a new and far more anti-western tone, because it has been hitched to another forcible emotion—that of social discontent. The western diplomat who deals chiefly with the rich, and the western business man who lives in the best part of the town, have naturally come to be regarded as the champions of the pasha and his way of life. A v spread sense of resentment against the west has the

arisen. Anomalously, the rich pasha and landlord-politician supports it. He would, if he were logical, throw in his lot with the West in order to barricade himself against Communism. Instead, he points at it as the source of all local evils, so identifying himself with a popular outcry and deflecting attention from his own shortcomings as a manager of his country's social affairs.

Naturally the British, who have played a larger part than any other western power in the politics of the countries which used to belong to the Ottoman Empire, are more widely blamed than the Americans for this state of society. But the Americans, who until a few years ago could sit smugly by because they were known only as educationists and as organisers of excellent agricultural and medical missions, are now likewise saddled with the burdens of overseas statesmanship and of the exploitation of natural resources. They are held at least as responsible as the British for the ills of the Arab states on account of their share in producing the Palestine settlement and the foundation of Israel.

*

There is no doubt that an immense show of might—either British or American or both—could cause a change in this anti-western attitude. For centuries the average Middle Easterner has inclined to the strong and has shifted his allegiance, with common sense and without false shame, to the side that he thinks will win. But for at least another eighteen months, great parades of British and American armament are not feasible. The temptation, therefore, is to leave a carping section of the world to its own devices, so that it may learn that its misfortunes are not—as its peoples delude themselves into thinking—the fault of a local western embassy or oil company. Yet for reasons that have long been accepted by the British public, and are now accepted also by the State Department (though hardly yet by Congress or American public opinion), it is simply not possible for the western countries to leave the Middle East to stew, even temporarily, in its own juice. These reasons are succinctly set forth by the State Department in the Mutual Security Programme for 1952 which it has now laid before Congress:

> The near eastern area is important to the security of the United States and of the free world. It lies athwart the principal lines of sea and air communication in the eastern Hemisphere. It is a land bridge between Asia and Africa, Soviet control of which would expose the African continent. It is a source of a prime strategic material, oil, the continuing supply of which is essential to friendly nations in Europe and Asia. It supplies three-fourths of the petroleum requirements of western Europe.

The official document does not add what a newspaper can add with impunity: that if Soviet expansion is to be arrested, the Middle East is also important, because it is the site of bases—British in Egypt, Jordan and Iraq, American in Saudi Arabia—which cause the Soviet Union to reflect that the Caucasus is its soft underbelly.

In a situation in which to stay is unpleasant, but to go is impossible, British and American minds have to conceive some way of mitigating the unpleasantness. So far, they have proffered three methods. The first—which is openly advocated only by the left wing of the Labour Party, but to which the official policy of the Labour Government comes dangerously close in practice—is to scuttle in slow motion, not to go willingly, but to put up no effective resistance to acts of ejection. This was Labour's conception of the right course to take in Egypt in 1946, and again at Abadan in 1951 ; on both occasions, "reasonableness" was based on the hope of being invited to stay when withdrawal began to cause the local peoples to see their own shortcomings. The second suggestion—also British, but coming from the right—is the remedy known in the last century as a whiff of grapeshot. The third, advocated by many Americans, is to pour from a bountiful cornucopia the blessings of development and technical aid.

*

The ineffectiveness of the first two policies has often been thrashed out ; that the third can be equally ineffective is less obvious and less well known. The policy of scuttle is impolitic because it exposes the western powers to the risk that a birdwitted Middle East would, in a frenzy of anti-western triumph, remain blind to the dangers of Russian imperialism, take the west at its word and let it go. It is most unlikely that there will ever be an invitation to return, and withdrawal, therefore, opens the way to a vacuum which the Middle Eastern peoples have not yet the capacity to fill and into which Soviet expansionists would immediately flow. If practised at Abadan, it would also establish a precedent that would, among all the less scrupulous peoples of the world, vastly encourage disrespect of foreign rights and property. The drawback of the grapeshot policy is that it has always divided even British opinion, and that it would cause an even wider rift between American and British opinion. It would also create golden opportunities for indicting a western power before the United Nations, and so play into the hands of Soviet propagandists. Finally, it would do nothing to mitigate the social unrest which underlies the captious behaviour of the Middle Eastern states.

From this last standpoint the American recipe—that of providing money and "know-how"—is far more attractive. But, before it can be really effective, it will have to surmount three separate ranges of obstacles. First, some Middle Eastern states flatly refuse to accept American aid, because of the taint it carries of affiliation with the friends of Israel. Syria, for instance, in June refused technical assistance offered by the United States, even though the schemes are urgent and can hardly proceed, certainly not in full, without external aid. Rancour on the score of Palestine, which is not dying down, has so far prevented any integrated organisation of settlement of the Arab refugees, with the result that the mood of these people now represents the biggest cancer in the whole of the Middle East.

Secondly, even where the willingness to receive aid exists, it is not likely to be applied effectively. Some states will take the assistance offered, fail to use it as it could be used, and then blame the west for the failure, as happened when the American group of engineering firms called Overseas Consultants Inc. was engaged, and after months of frustrated effort dismissed, by the Persian Government. Other governments will accept assistance only on the condition that there are no strings attached and no western supervision, which means that the accustomed large percentage of benefits can flow into the pockets of pashas and that not too much will be done to disturb the social order that provides their privileges. Very few Point Four projects, applied as they must be through the governments of these sovereign states, can hope to reach the point of effective fruition.

But, thirdly, even if they did, even if the standard of living of the Middle East were perceptibly raised by foreign bounty or foreign investment, there is no evidence to support the belief that this result would make the

Middle Easterners more friendly to western foreigners or the Middle Eastern states more ready to play the part that has been written for them—and quite a lot of evidence to the contrary. It would, perhaps, be too pessimistic to conclude that the "American" formula will do no good. But the ratio of achievement to effort put in will be small; and the process will be very slow. Taken by itself as a policy for the Middle East in the present world crisis, it is as useless as either of the British alternatives.

★

The position, then, seems to be that the west desperately needs a policy for the Middle East, but has no idea where to find one that will work quickly. Immense thought has been given in recent years to the problems of Europe and of the Far East. The Middle East is hardly, if at all, less vital, yet it has not received a fraction of the attention it deserves in London; in America, where thinking about "aid" is vigorous, too little attention has been paid to the practical difficulties. With the progress that has been made in Europe and in the Far East, the Middle East ought now to go to the top of the list for deep thought and close attention on the part of the ultimate policy-makers. The point that they have to decide is how, at short notice, to reveal to discontented masses not only that the western countries have a recipe for social discontent, but that they are capable of putting this recipe to use. The task, though it is not easy, is not hopeless, because the Middle Eastern peoples are none of them pro-Russian. They merely want to be left to themselves in order to decide—as Turkey was free to decide—how much help they need and where to go for it. The problem is to stir them into doing this quickly.

It can be done only in close partnership between Britain and America, not forgetting France, which still has large Levantine interests. To succumb to the old preference for acting separately merely causes delay, for it allows the pasha to fall back upon his practice of playing one interested power against the other. But to attain this co-operation, several prejudices have to be battened down. One is the British tendency to regard the Middle East as a preserve in which the Americans are overconfident interlopers. Another is the American conception that the British overrate the difficulties, suffer from hardened arteries and will try nothing new. So far, there has been a steady tendency, particularly on the part of the Middle Eastern "experts" of both countries, to think such thoughts. A real effort by the heads of the two governments could clear these obstacles away, since there is no real clash of interest; but nothing less is likely to avail.

Fortunately, the ground is being laid for a co-ordinated joint policy, and as elsewhere it is strategic necessity that is pointing the way. The problem of the Mediterranean command is at last settled. American approval seems to have been won, for the first time, for the principle of a full-fledged defence scheme for the whole of the Middle East. The idea that is being canvassed is that a body should be set up, consisting at the start only of those members of Nato with Middle Eastern interests—specifically, of the United States, Britain, France and Turkey. It would, however, at a later stage be open to the membership not only of other Middle Eastern states, but also of more distant countries, such as some of the nations of the Commonwealth, which would have a role to play in the Middle East if war came.

But neither strategic arrangements nor welfare planning will get very far unless they are based on a clear, coherent and agreed policy. What, in the broadest terms, do the western countries want from the Middle East? And what methods do they propose to follow to get it? These are the questions to which answers are needed. If it is within the power of the British Government to persuade Washington to join in an exploration of these matters at the highest level, no considerations of pride or of exclusive prestige should stand in the way. The Americans, in their turn, if they can once rid themselves of the suspicion that British aims are ignoble or British methods antiquated, will find that this is at least one part of the world where they will not be asked to bear more than their fair share of the burdens of responsibility.

China and Japan

WITH the San Francisco Conference only five weeks away, Communist China at last faces the prospect of its traditional enemy, Japan, recovering its independence and sovereignty under a very liberal peace treaty; a treaty, moreover, in which neither the Soviet Union nor China itself has any part. It is not surprising that the violence of Peking's propaganda against the Japanese treaty has in recent weeks reached a new height, with Chu Teh, the Commander-in-Chief, declaring that China will not tolerate the treaty and the Communist radio telling the Chinese that they must "fight to the finish" against it. This rattling of sabres makes it difficult to detect China's real intentions towards Japan; but there are permanent and well-known factors in relations between the two countries which show what the alternatives are.

Fourteen years of invasion and occupation have undoubtedly left a very real fear and hatred of the effectively exploited in Peking's current internal propaganda. One result is that over 339 million Chinese are reported to have "voted" against the proposed peace treaty long before its terms were made known. But it cannot be believed that Mao Tse-tung and his colleagues themselves accept the basic premise of this campaign, which is that the treaty's one aim is to rearm Japan for an attack on "China and Asia." The Chinese Communist leaders are fully aware both of their own great and growing military strength and of Japan's present enfeebled state. They must know that the danger of another Japanese invasion, against which they are ostensibly building up their defences, is a myth. If, in spite of this knowledge, they were tempted to contemplate taking "preventive" military action against Japan, it would not take them long to realise that China alone could hope for no success in this direction as long as Japan was protected by American air and sea power.

While the possibility of Chinese armed action against Japan may thus be ruled out at the start, the possibility of action by the Soviet Union remains. Japan may be an island nation, but the USSR is a naval power, and its new bases in Karafuto and the Habomai Islands are so near that the Japanese can see some of them across the water. It is not difficult to imagine a situation in which the Russians might declare themselves forced to occupy Hokkaido, the northernmost of the main Japanese islands, to forestall some alleged threat to the Soviet Far East or even to save a Japanese "liberation movement" from repression by the Tokyo authorities; some of the 300,000 Japanese prisoners of war still unaccounted for in Siberia might well reappear as the spearhead of such a move.

But Mao, however tempting the circumstances, is not likely to ask the Russians to help him carry out his threats. The new China can be no more anxious to see a Russian domination of Japan than was the old Japan to see a Russian domination of China. Moreover, Peking has now asserted that colonial and "semi-colonial" peoples should look to it rather than to Moscow for guidance in their struggles for freedom; and in Peking's terminology Japan is classed as a "fully-fledged" American colony both now and after the signing of the peace treaty. Lastly, the Russians are thought of in Asia as Europeans, and it would hardly improve Communist China's chances of mobilising Asian nationalism against the white man if Mao were to connive at any attack on Japan by a white nation.

★

The beating of drums and gongs which the approach of the Japanese treaty has evoked throughout China can therefore be taken less as a sign of intended violence than as a routine exploitation of the issue for the strengthening of internal and international solidarity. This does not imply, of course, that once the ink is dry at San Francisco the Chinese will let bygones be bygones. Peking and Moscow may have given up all hope of deflecting the United States from concluding a treaty on the lines of Mr Dulles's draft—although even that is uncertain—but the Communist objections to the proposed treaty are very strong and cogent ones. Instead of a disarmed and defenceless Japan, stripped of its experienced political leaders and thus an easy prey to fomented disorder, and irrevocably bound to the neighbouring mainland by economic necessity, the San Francisco treaty and the American guarantees which go with it seek to create, behind a screen of American armed might, a Japan capable of preserving internal order and of plotting an economic course uninfluenced by pressure from its Communist neighbours. Such a structure will not make easy the task of winning Japan for the Communist world by political methods. On the contrary, it may yet make possible the emergence of a Japan which, although unable to match China in terms of military power, will challenge Peking's claims to political and economic leadership in the Far East. So, even if Peking and Moscow abandon for the moment all hopes of securing a Communist Japan, their future policy must be aimed at weakening the only country which can make such a challenge. In the execution of that policy Peking must play the leading role, not only for its own satisfaction, but because it alone holds certain cards.

The most obvious political line of attack for the Communist powers is to foster the growth within Japan of some form of popular front based on the small Japanese Communist Party. Peking has always had close links with this party, several of whose leaders were trained at Yenan; Yenan-trained Koreans living in Japan have also proved a useful instrument. But the Japanese Communists are divided among themselves and are so far making little headway among workers to whom American occupation has introduced the idea of free trade unionism and democratic social security. The Japanese Socialists might be thought to offer possibilities—they have long pressed for Soviet and Chinese participation in the peace treaty—but since they combine this attitude with such demands as the return of Karafuto by the Soviet Union, Peking must suspect that where the Socialists agree with Communist policies they are simply stealing Communist votes. As for the Communist-sponsored peace movement, this has made some progress in Japan, especially among intellectuals; but in a country where everybody speaks in terms of peace no one dove can hope to achieve a striking effect.

More promising opportunities appear in the economic field, where Communist China can exert considerable leverage on Japan. Japanese business men are painfully anxious to resume their former trade with China, not merely on the modest scale which was current before the United Nations embargo, but on the much higher level of prewar days (in 1929 a quarter of all Japan's exports went to China). The loss which the breakdown of this trade has caused to Japan can be clearly seen in the extinction of countless firms in Kansai (industrial western Japan), the area principally concerned in trading with China. Since the negotiations for a cease-fire in Korea began, Tokyo officials have found it necessary to point out to Japanese exporters that by clamouring for trade with China on almost any terms they will only strengthen Peking's bargaining power if the barriers are removed. Warnings have also been given that Mao's China, with its new state-controlled economy, could all too easily apply political pressure to a Japan which had tied itself closely to Chinese markets and materials. The present political leaders of Japan are fully aware of these dangers, but their caution in regard to trade with China may yet be swept aside by pressure from the business circles on whose support they rely. There are, moreover, certain supplies for which Japan must turn to China if it is to avoid paying high prices for them in dollars; the most important is coking coal, without which the steel industry, and therefore the whole Japanese industrial nexus, cannot survive, and of which China is the only source outside the dollar area and within easy reach.

If, however, Japan cannot be won over by direct economic pressure, Peking can still hope to fetter the country's economy at a low level by preventing the full resumption of Japan's trade with other Asian countries. A great deal of Communist propaganda is being devoted to instilling in the peoples of south-east Asia and India a fear both of Japanese military revival and of Japanese economic exploitation. This field is fertile; the existence of much real fear of a resurgent Japan has been shown by the objections raised by India, Burma, Indonesia and the Philippines regarding the proposed peace treaty. On present indications Peking cannot hope to line up all the Asian governments against the treaty in such a way as to make it a purely "white" affair; but Liu Ning-yi's report to the World Federation of Trade Unions in July showed that the Chinese hope to arouse enough anti-Japanese feeling among Asian workers to impede Japan's efforts to re-establish itself in the southern

markets. In such a campaign there will be an important role for the millions of Chinese living in south-east Asia, who are coming over to the Communist flag in increasing numbers. And by obstructing economic co-operation between Japan and the south, Peking will also be delaying reconstruction in the southern countries themselves and thereby improving the chances for their own Communists.

These tactics can only be countered if America and Britain recognise each other's different approaches to the problem of Japan and follow a common policy. Britain must accept the fact that to give Japan a major role in the development of south-east Asia is the only alternative to its either remaining an intolerable burden on America's shoulders or drifting into the Communist camp. The United States must in turn appreciate the very real fears which the return of Japan as a sovereign trading nation is awakening in south-east Asia. These fears can only be laid at rest, to the mutual benefit of both areas, if America and Britain take pains to ensure that "development" under the Point Four and Colombo plans is genuine development in the interests of the Asian countries themselves, and not veiled exploitation on behalf of Japanese industry.

Haute Couture in London

IN these days when the scions of ancient houses are conducting parties of tourists round their country seats, when family heirlooms are sold to pay death duties, when the statistics of the Inland Revenue show that there are hardly any rich people, it is surprising how the luxury trades flourish. The British *haute couture* is one such example. Most of the "Big Ten" London *couturiers* had an excellent summer season and the indications are that their autumn collections, which they showed last week, will also be a success. Many of their old clients buy less than they used to do, but their defection is more than offset by the appearance of new customers and new money.

For a number of reasons, however, the prospects for the future are somewhat uncertain. What would strongly affect the prospects of the *couturiers* is the return of French competition. The British fashion trade has benefited greatly from the exchange restrictions which have prevented customers from buying in Paris. This is not to suggest that it is a mere substitute for French *couture*. It was already established in the nineteenth century when Worth of Paris established himself in London. But apart from suits, in which Britain has always led the field, it was for a long time only a pale shadow of its French counterpart. The challenge to the Paris houses began between the wars and a milestone was passed when Norman Hartnell won the custom of the Royal Family. Since then the reputation of British *couture* has grown very considerably. Its growth is analogous to that of the British ballet. This was never taken seriously while the Diaghilev ballet was in existence, but it was all the time developing steadily and was able, when its main competitor disappeared, to rise grandly to the occasion. In both ballet and *haute couture* a great reputation was the monopoly of another country, and the struggling artists in London had to live down the initial "stigma" of being British.

By now London's fashion trade is mature and its reputation is established; so much so that, through the medium of the Incorporated Society of London Fashion Designers, it is actively supported by the British textile organisations as a shop-window for their fabrics. It cannot—it never will—boast an international reputation comparable to that of Paris. Its output is on nothing like the same scale. Whereas a Paris house will employ perhaps 500 to 850 workers, the largest London house has not more than 250, and the average is probably nearer 100 workers. A Paris house shows perhaps 150 models twice a year, in January and July, with small mid-season collections in April and October. A large London house will show perhaps 30 in January and July, and has no mid-season collection. Perhaps 20 models out of a Paris collection will be of extreme design aimed simply at the headlines. As it costs about £200 in materials and dressmaking simply to put a model on the floor, British *couturiers* cannot afford to design purely for publicity. A Paris house can repeat an idea several times over in different models, until its impact on the fashion reporter is certain. A London collection is not big enough to do this. A Paris collection is launched, with champagne, at a cost of anything up to £10,000. A London house spends perhaps £2,000 to £3,000—a large sum in relation to its capital, which is usually small, and to its overheads, which are higher than the French. A fully-trained seamstress in Paris will earn perhaps £5 a week; in London she is paid £8 or £9 a week. A head fitter or tailor will get perhaps £750 a year in Paris, but probably at least £1,000 in London. Paris, with its tradition of *couture*, is rich in trained and experienced people; in London they have a scarcity value. The London house, moreover, has to pay purchase tax at the rate of 22½ per cent on each quarter's sales. With such overheads and with a much smaller output, London's fashion trade must build its reputation slowly by solid worth, without the aid of high-powered publicity.

In spite of these disadvantages, the London houses are in better shape than the majority of the Paris houses. But what would happen if the shackles were removed from the French industry? A complete removal of the restrictions on spending money in France is unlikely, although they may be still further relaxed. This will certainly cost the London houses some of their trade; but some of them, at least, are by now well enough established to stand it. There are two pointers to what might happen. Two seasons ago the dates fixed for the London shows clashed with those subsequently fixed by Paris; in London they hardly expected to see a single overseas buyer. As it turned out, buyers were prepared to forgo a part of the Paris shows in order to see the London collections. The London *couturiers* have the advantage of better fitting the length of modern purses. An evening dress from Paris might cost £300; a comparable one from a London house might cost £125, plus 22½ per cent tax for the home market. If the London houses retain this advantage it should go far to offset the lure of Paris.

The London *couturier* would probably admit that he still looks to Paris for inspiration. But his designs are his own and he does not in any sense copy Paris. The movement of ideas in fashion makes an interesting study, for although each designer is working on his own, clearly discernible trends in fashion emerge. This is because each new fashion evolves from its predecessor or is a reaction to it. Thus, the lavish "New Look" was a natural reaction to the austere fashions that had preceded it, and although it is attributed particularly to Dior, the other designers were not at variance with it. London designers, while interpreting the current international trend of fashion to suit the British taste and British purses, now have a reputation in their own right.

Short purses, though they keep French competition at bay, could of course be very damaging to the *couturiers'* interests. As purchasing power is reduced they have to reckon with the competition of what is called, by a strange contradiction in terms, "wholesale *couture*." This is the high quality end of the ready-made clothing trade, and its growth since prewar years has been as remarkable as that of the *couturiers*, especially since it was strengthened by immigrants from Berlin and Vienna, which had a very flourishing trade in good quality ready-mades. There are thirteen such firms who collectively call themselves the London Model House Group, and some of these are now producing clothes of distinguished design and excellent material. The wholesale model makes no claim to be exclusive. The woman who buys a dress from the *couturier* knows that perhaps fifty of that model will be made in all, and it is for the saleswoman to tell her if anyone she is likely to meet has bought the same dress. The wholesale *couturier* buys enough material to make several hundred of each model. Each dress, however, is cut and made separately, and the number actually made depends on the orders received from the buyers to whom the models are shown. The wholesale *couturier* preserves a measure of "exclusiveness" by limiting sales to high-class department stores and small shops of what is called the "madame type"—and often to only one in each shopping area.

One advantage which nothing can take from the *couturier* is that of personal fitting. British women constantly complain that the range of sizes in ready-made clothes is too limited; and the *couturiers* have a hard core of custom among well-to-do women who have failed to conform to the standard measurements. (In the United States they would have no difficulty, for there are sizes in plenty to suit all types of figure.) On the other hand, what has driven at least some people to the shop selling wholesale clothes is the inability of some of the smaller fashion houses to give credit. Undercapitalised as, on the whole, they are, they would be unable to pay the purchase tax due every three months if they did not insist that their customers paid promptly. One of the newer *couturiers*, Hardy Amies, is forearmed against the ready-made trade. Following Dior's example, he runs side by side with his *couture* business a *boutique* where ready-made clothes are sold. This experiment is proving very successful.

The *haute couture* of London has achieved a success which at one time no one would have thought possible. It is still a precarious profession. Abrupt disappearances from its ranks are not uncommon, and new entrants are slow to come forward. But in this country it is so far more than holding its own against the tide of mass production and standardisation. Today, that is a rare achievement.

NOTES OF THE WEEK

All Set for Scarborough

Mr Attlee has been able to go off to Norway, Mr Morrison to settle down to the work of the Foreign Office, and other members of Parliament to disperse for their holidays, with the knowledge that the stage is now fully set for the Labour Party's conference at Scarborough in October. Mr Gaitskell last week put into position the hitherto hidden element on the scene—the positive part of Mr Attlee's and Mr Morrison's answer to Mr Bevan.

The arguments in the party's national executive committee had already made it plain that the Labour leaders were firm in rejecting outright Mr Bevan's arguments against the level of rearmament. The other part of their reply is to outbid Mr Bevan with a "Soak the Rich" policy at home. The new draft policy, approved by the national executive ten days ago, is couched in those generalisations dear to the hearts of Labour pamphleteers. But it is a great deal more drastic on domestic policy than had been expected. The exact contents are still a matter of speculation. The idea of a capital gains tax seems to have been dropped, but many Labour members are certainly expecting a limited capital levy—on the lines of Sir Stafford Cripps's "once-for-all" special contribution, though at steeper rates. If it is judged solely within the context of the Labour Party's internal struggles, dividend control alone is a shrewd—perhaps even a deadly—counter blow to Mr Bevan. It is difficult now to see that he can hold the initiative in the debates at Scarborough; and in his position as a member (albeit a dissident member) of the executive, his chances of effective counter attack are small. By choosing to steer to the Left himself, Mr Attlee has made Mr Bevan's resignation look unnecessary even by the standards of the dissidents.

This setting of the stage for the conference must look much more comfortable for the Labour party's leaders than many of them had expected. That comparative comfort has been bought at a price, in economic unrealism and political irresponsibility, that must give the more reflective of them bad dreams. If Mr Bevan recognises that he has been out-manoeuvred, he may console himself with the thought that "shrewd" politicians are often short-sighted travellers from expedient to expedient to defeat.

* * *

Inflation Despite Imports

The Chancellor of the Exchequer was in an awkward position last week. He had to make a case for measures almost entirely irrelevant to Britain's real economic problem. And therefore the analysis of that problem—which is a Chancellor's essential task in a debate of last Thursday's kind—had to be blurred. Mr Gaitskell talked about the external deficit and referred to inflation at home; but for once he rivalled Dr Dalton in unwillingness plainly to recognise the relation between the two.

The essential point could have been put very simply. Last year the British balance of payments showed a surplus of £229 million; now a deficit is being incurred at the rate of more than £300 million a year. This change is, taken by

itself, a sharp deflationary push to the economy; it increases the value of goods available in Britain by roughly £500 million without increasing the incomes chasing those goods. Mr Gaitskell's Budget was designed to prevent inflation without such large help from an external deficit. As the standard for preventing inflation, he looked back to the middle of 1950, when the Economic Survey detected "a fairly satisfactory balance between total demand and total supply." Unemployment was then 1.4 per cent of the working population; now it has been squeezed down to 0.9 per cent. This means that, by the Government's own standards of judgment, the economy has plainly moved into an inflationary condition, with demand outrunning supply in spite of the external deficit. If the balance of payments had worked out as the Government "planned," the inflationary gap at home would have proved to be quite three times as big as the £150 million that the Budget was intended to close.

This is the basic point that Mr Gaitskell and other Labour speakers dodged. He has little reason to be ashamed of the miscalculation in April; he had to guess about many uncertainties. What cannot be forgiven is the refusal now to recognise plain facts. The external deficit, accompanying a record low level of unemployment, is unmistakable evidence that the Budget has proved to be too weak, and that a new fiscal and financial policy, not tinkering with dividends and controls, is now the pressing necessity—according to the tests of economic realism that Mr Gaitskell used to employ, before he bowed to the pressures of the Labour Party's internal politics.

* * *

Tory Manners and Labour Morals

The debate on the Middle East last Monday had one feature in common with many recent discussions of foreign affairs in the House of Commons: the bad manners shown by a group of Conservative members in their reception of the Foreign Secretary. A verbal slip and some unorthodoxy in the pronunciation of two foreign names were thought to be great jokes. It should be said that—as has been pointed out in these columns—Mr Morrison's provocatively partisan manner has several times encouraged the Opposition to score cheap points in reply. But in both the recent debates, he has obviously made a genuine effort to mend his ways. He has spoken in Parliament with the dignity of attitude appropriate to a Foreign Secretary, and it is a great pity that the Tories on Monday failed to encourage him by responding in kind. As Mr Churchill said, his speech was at least "an able and agreeable parade of bland truisms and platitudes." That is not altogether untraditional; and five days before Mr Butler had—quite fairly—detected qualities of statesmanship in Mr Morrison's speech during the general debate on foreign affairs.

But if the Foreign Secretary's performance in the House of Commons has improved, while that of the Tory backbenchers has deteriorated in taste, it must be said that Mr Morrison's recent speech outside the House—to the Durham miners—entirely deserved Mr Churchill's condemnation of it as "one of the most lamentable utterances" ever made by the Foreign Secretary of a major power. Mr Morrison had declared that if the Tory backbenchers had had their way, "we should have been involved in two wars in the last ten days." To put the matter at its highest, this charge is meaningless. It is also the kind of attempt to stir up party passions, dividing the country on matters of national policy, that every responsible statesman always avoids at all costs. The example of the United States should demonstrate—to the Labour Party most of all—the perils that beset a democracy if foreign affairs are exploited as the material for unscrupulous party conflict. For members of the Government to raise the cry that the Tories are "warmongers" would do incalculable harm (except to Mr Bevan) by confusing the public will in matters of defence; it would also be of very questionable electoral advantage to Labour. If the next election is to be as much a mud-slinging match as all that, the Tories can find plenty of mud with more adhesive qualities.

* * *

Mr Morrison and *Pravda*

The exchanges between the editors of *Pravda* and Mr Morrison have, on balance, been worth while. It is preferable that His Majesty's Ministers should not make a habit of this new kind of public diplomacy, but once the Foreign Secretary had made his challenge *Pravda* had to take it up and the British case had to be stated. It could have been done with more skill; figures and facts about comparative standards of living would have made more impact on the Russian reader and would have created greater difficulties for the *Pravda* writers than the more general points that Mr Morrison made. And it should never be forgotten that the key words of contemporary polemics—peace, justice, freedom, law—do not mean to Russians under 45 what they mean to the English-speaking world. But what was done had two valuable results.

First, it created a precedent. One can recall no previous occasion on which a foreign point of view has been presented at such length to the Russian people unedited but under official auspices. The mere event may have sown some seed of interest and doubt. Second, *Pravda* was obliged to do something that is very rarely—if ever—done in the Soviet Union: defend the exclusive and privileged position of the Communist Party in Russian society. Arguments had to be presented to justify a position that had been treated as above argument. The Soviet reply raises no new hopes of understanding; two diametrically opposed versions of events since 1945 remain confronted and there is little reason to suppose that either will be substantially amended so long as there can be no agreement about what constitutes a fact. To take a striking example: *Pravda* denies western complaints about Soviet armed strength with the statement that "its army is at present approximately the size it was in peace time before the Second World War." That very general statement, which might refer to any year between 1933 and 1940 is not at all reassuring; for Stalin in 1946 emphasised how long and carefully he had prepared for the war with Germany:

> It would be a mistake to think that one could win such an historic victory without preparing the whole country beforehand for active defence. It would be no less erroneous to assume that this preparation could be carried out in a short time—three or four years. . . . It is necessary to have a completely modern army, with sufficient quantities of well-organised supplies.

The types and numbers of Soviet tanks, aircraft and guns suggest that since 1946 preparations no less careful have been made, even if the full mobilisation and industrial effort of wartime have been scaled down.

* * *

An Un-American Bill

One would like to believe that there exists somewhere the man who could decide quickly and fairly whether the exchange of light rails made in Britain for coarse grains produced in Russia is on balance beneficial or harmful to the western alliance. If he could be found and placed in a Washington office he might even then find it difficult to decide, in a manner that would satisfy Congress, such further questions as whether Norway should send aluminium to Poland in exchange for Polish coal—that Britain is unable to supply—or whether Western Germans should exchange engineering goods for the food of Eastern Germany. One can imagine him deciding in despair to toss a coin; if he did so he could hardly follow a policy of economic warfare more incalculable and arbitrary than that which is likely to result from the Battle Bill recently approved by the House Foreign Affairs Committee in Washington.

This measure would forbid, first, all military, economic and financial aid—without any escape clauses—to governments which exported arms or munitions to the Communist sphere; secondly, it would apply the same sanctions to any government exporting to those countries petroleum, transport equipment of high strategic value and items of "primary strategic importance" used in producing war materials and arms. No one can quarrel with the first requirement, although it is fair to ask what evidence there is that any recipient of American aid has failed to meet it. But the second requirement is entirely unacceptable. It would place in the hands of one American office powers of veto over the trade policies of a score of countries; it would raise countless questions of classification, to be decided unilaterally in Washington; every trade treaty between a country of free Europe and a country behind the iron curtain would be affected.

That is the practical objection, and it is, in all conscience, strong enough. But there is an even stronger political and moral objection. Such an arrangement is incompatible with the free and equal partnership between the United States and its allies which has been created and maintained so admirably by Washington's representatives abroad. What the Battle Bill wants to be done unilaterally has been done for many months in confidential and friendly discussion between the experts of the body known as the Paris Committee. If it is argued that this committee has failed in its task, the evidence should be produced. There is more than one government in Nato that would rather refuse all aid than accept it on the terms of this un-American Bill; for Europeans are still just as proud of their independence and jealous of their rights as Americans.

* * *

New Talks in Teheran

Inch by inch, Mr Harriman seems to be edging both the British and the Persians towards fresh negotiations. The former are wisely sticking to two conditions for opening inter-governmental talks: the first, no more baiting of oil company staff at Abadan by Persian officials; the second, discussion on the basis of the principle of nationalisation and not on that of executing the enforcement law which the Majlis passed in May. Subject to these conditions, a British mission headed by the Lord Privy Seal, Mr Richard Stokes, is leaving for Teheran. Meantime, the oil storage tanks at Abadan are full to capacity and the refinery has ceased to function. All its Persian employees, whether idle or occupied, are still being paid their wages by the company, and a British staff remains in charge of it on a care and maintenance basis. During the pause which must ensue while talks take place in Teheran, the position of these engineers is greatly improved by the presence at several anchorages in the northern Persian Gulf of a naval force that now consists of 1 cruiser, 4 destroyers, 2 frigates and 2 tank landing ships. Without succumbing to fire-eating Tory tactics, Mr Attlee has unobtrusively accumulated in the area enough force to ensure the safety of British life and limb. He is to be congratulated on his technique in doing so.

The reception which Dr Mossadegh will accord to the British mission remains a matter for conjecture. He is being pushed this way and that—at one moment by his extremist lieutenants, who are still reaffirming on Teheran radio that the oil nationalisation law is "unchangeable," and at another, by counsellors of moderation. The Russians are now openly supporting the former, for Soviet-controlled broadcasts which used to praise Dr Mossadegh's nationalist courage, are now warning him that he is losing the support of "the freedom loving peoples":

> If the Government should neglect the task of taking over the former oil company, the people will assume direct responsibility for carrying out oil nationalisation.

Here is direct incitement to revolution. Mr Stokes, if he finds the Persian negotiators capricious, must remember that they are working under pressure from a variety of sources. Persia is a country that has for 150 years maintained its independence through good judgment as to when to display caprice, and when not.

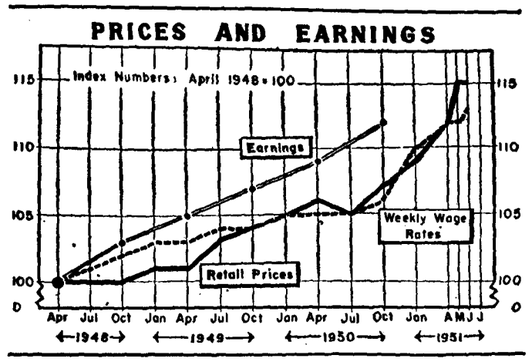
* * *

Privilege

Everyone concerned to preserve the dignity and prestige of Parliament will welcome the reaffirmation, made by the Committee of Privileges in a report this week, that "the privileges of the House of Commons apply to individual members only in so far as they are necessary in order that the House may freely perform its functions. Such privileges do not exalt the member above the ordinary restraints of law which apply to his fellow citizens." Mr John Lewis, the Labour member for Bolton West, complained that he had been obstructed by the police in his passage to the House, and that the service of summonses on him by the police, after he had tabled a motion on the matter in the Commons, represented a breach of privilege. The committee found that there had been no obstruction by the police, and that no breach of privilege was involved in the issue of the summonses.

What is remarkable about the cases of privilege raised in this Parliament is not that they have been numerous but that so many of them either have been rejected by the Committee and the House or have been regarded as purely technical breaches unworthy of further action. Parliament as a whole has neither claimed, nor exercised, any extension of its privileges. But there has been a spate of complaints—from members on one side of the House—about possible breaches of privilege, and in the consequent debates many members have pointed out that the complaints sometimes suggested too great an eagerness to use the formidable weapon of privilege in incidents of slight importance, rather than in defence of Parliament as an institution.

The experience and judgment of the members of the Committee of Privileges, and the collective wisdom of the House, have dealt with these cases effectively and sensibly. They have made it plain that the dignity of Parliament does not consist in the existence of one law for the ruled and another for the ruler. They have shown clearly that privilege should not be invoked as a protection either against the normal buffetings of public life or against the discharge by any member of, in the committee's words, "obligations to society which apply to him as much, and perhaps more closely in that capacity, as they apply to other subjects of the Crown."



* * *

Unions at their Last

The trade unions seem to have decided that, for the time being, any connection there may be between rearmament and the rising cost of living is none of their business. They may, of course, decide otherwise when they meet for the annual congress at Blackpool on September 3rd; but for the present their main concern, as the congress agenda shows, is the cost of living itself. Only one union, the Scottish Painters' Society, has expressed the views of Mr Bevan and his associates in a draft motion suggesting that the TUC should be seriously concerned about "the Government's rearmament programme, despite the desire of the people for peace and national recovery." At least 15 other unions, most of them more eminent than the Scottish Painters, will simply adjure the congress to protest against rising prices and excessive profits. The Electrical Trades Union, which last year led the revolt against wage restraint, has advanced a stage further. Its

draft motion says that "further wage increases are essential for all sections of the workers" and suggests "that the standard of living of the people must be improved at the expense of profits." But the motion does not suggest that this can, or should, be achieved by reducing the national expenditure on guns.

The accompanying chart, showing the movement of prices, wages and earnings since the wage restraint policy was introduced in the spring of 1948, does not suggest that the pressure of the rising cost of living is really as acute—for wage-earners as a whole—as union resolutions generally suggest. There is no reason to think that, in the interval since the last published figures, actual earnings have failed to keep ahead of wage-rates. In putting forward the present round of wage claims the unions no doubt feel, however, that the delays in negotiation and arbitration make it necessary to move in advance of the future price increases

that they expect. At the same time, the unions clearly believe that the cost of living could be stabilised or reduced by the limitation of profits and dividends. They are not prepared themselves to suggest how the Government should tackle such a complicated problem. Mr Gaitskell's proposals fit in with their aspirations, but the unions will want to be shown how the limitation of dividends is going in practice to make their wages last a little longer. The concern of most of the resolutions for the TUC is simply to state the problem as the wage-earner sees it. In this, they show, once again, that a British trade union's first concern is the welfare of its members. Collective selfishness is a legitimate motive for the TUC; selfishness combined with scepticism might even help to transform the airier notions of Chancellors and ex-Ministers of Labour into practical common sense.

* * * *

Educating the Backbencher

Listening to his own backbench supporters in the House of Commons, Mr Gaitskell must often feelingly recall the Duke of Wellington's remark that he did not know how his troops looked to the enemy, but they frightened him. The amount of sheer bone-headed misunderstanding and mental confusion displayed both in the question time preceding last week's major economic debate, and in the debate itself, by a succession of Labour speakers would be painful to any instructed auditor; to a one-time professional economist it can only be agonising. One supplementary question disclosed the opinion that no manufacturer should be allowed to make a profit on utility goods if he is simultaneously making more than the standard utility margin on other lines; another displayed a massive indignation against two Lancashire firms whose profits had increased tenfold since, of all dates, 1936; another member interjected that "the consumer pays" profits made out of the export trade.

Sir Hartley Shawcross dealt faithfully with these and other exhibitions; Mr Gaitskell's own speech had, when considered from the point of view of the deep lunatic fringe, notable educational value; and for the Conservatives, Sir Peter Bennett offered a quiet analysis of what "profits" had to cover, especially in a period of rising prices, which the Chancellor must have wished it had been politic for him to give himself. The Bourbon quality of the backbench Labour mind, however, was classically demonstrated next day by Mrs Castle's speech on the adjournment, arguing against recent increases in maximum permitted prices on the ground that firms had, "thanks to the laxity of Board of Trade control," passed on to the consumer the mark-up on their stock. Any question concerning the possibility of replacing stocks, whose constituent costs had meanwhile risen sharply, out of the proceeds of sales made at unchanged prices, had evidently glanced off the backbenchers' mental armour-plating without leaving a scratch. Any statistical evidence concerning the relative magnitude of dividend and wage increases can be expected to do the same. The fact is that the terms "profits" and "prices" do not, to the average Labour member, denote economic quantities registering and motivating economic activities; they are moral emblems, trigger words setting off a predictable but irrelevant charge of righteous emotion. To reconcile the need to propitiate this type of prejudice with the claims of intellectual integrity and realism is an unenviable task.

Drawing the Line in Korea

For the past week the Kaesong armistice talks have been brought to deadlock by the Communist demand that the United Nations forces should withdraw behind the thirty-eighth parallel. If he accepted this demand General Ridgway would have to give up over 2,000 square miles of hard-won ground and exchange a formidable defensive position for the doubtful protection of an imaginary line which neither the United Nations nor the Communists have ever succeeded in defending. He would also be giving his opponents a propaganda weapon which would help to substantiate their claim that not they but the United Nations are in sore need of peace. No argument whatever can be advanced in favour of withdrawing to the parallel, unless in return some really significant step towards settlement were offered from the Communist side.

The Communists presumably hope to uncover some signs of weakening or disunity among their antagonists by prolonging the deadlock and uttering vague threats about a complete breakdown, such as those made by General Peng Teh-huai on Wednesday. It will be surprising if they succeed this time. Memories are not so short that it is already forgotten that at the first Kaesong meeting on July 10th the Communist delegates put forward as their two main demands the removal of all foreign troops in advance of a political settlement and the fixing of the cease-fire lines along the thirty-eighth parallel. After fifteen days of maintaining the first demand they quietly withdrew it, only to take up an equally stubborn attitude on the second. If within the next week Nam Il again asks for a recess to consult his masters and again climbs down, it is all too likely that a third impossible demand will be put forward from the Communist side. By then, however, the United Nations negotiators will have become inured to these repeated cries of "wolf."

* * *

How many Divisions for Nato?

American military men in Germany are said to be elated at the prospect that by the end of this year the Russians will have lost their local superiority in numbers and will be quite incapable of breaking through swiftly to the Atlantic coast. It is, indeed, forecast that the New Year will see 17

Nato divisions in Germany facing only 22 of the smaller Soviet divisions. If this build-up proceeds according to plan—and that is by no means assured, especially as regards the French contribution—it will undoubtedly improve the local position of the western allies.

It would be gross self-deception, however, to see in this anything more than one of the first steps towards a real balance of force. Even by the New Year the Nato allies are only to have five armoured divisions in Germany, while the Russians, according to Mr Shinwell, already have 18 there. Moreover, the Soviet armies in Germany are only the spearhead of a force twelve times as great, the bulk of which lies at no great distance.

The East European satellites alone are said to have over a million men under arms, and a large proportion of the 215 Soviet divisions are stationed either on satellite soil or along Russia's western frontier—which today is no further east than Koenigsberg. The Nato allies will not begin to match this concentration of force until the end of 1952, when, if Mr Marshall's forecast of last week is fulfilled, they will have some 2,800,000 men in Germany and western Europe.

Even this forecast seems optimistic. Mr Marshall hopes that by the end of 1952 the European members of Nato will be contributing 2,500,000 soldiers to General Eisenhower's command. But the five nations taking part in the Pleven Plan for a European army are only proposing to provide Nato with 20 divisions or 600,000 men by that date; and this figure is based on the assumption that final agreement on a German contribution can be reached in time for at least the first German units to be raised in 1952. British, Dutch and Scandinavian forces for Nato must, of course, be added to those provided by the Pleven group; but from the available evidence it would be rash to assume that even by the end of next year Nato will have enough divisions for its task.

* * *

Kashmir Again

The new tension between India and Pakistan over Kashmir has led not only to fresh alarms over the possibility of actual war between two members of the Commonwealth, but also to some expressions of resentment in India at what is regarded there as a pro-Pakistan trend of British public opinion. It is very regrettable that the prevalent British attitude on this matter should be so widely misunderstood in India. British opinion, with rare exceptions, is neither pro-India nor pro-Pakistan, nor is there any direct British interest in what happens in Kashmir. There is certainly no desire in this country to make mischief between India and Pakistan; on the contrary, there is the strongest desire that this dangerous dispute should be settled, so that there should be not only an end to such a deplorable conflict between two members of the Commonwealth, but also a reconciliation which would ensure the strategic security and international strength of both countries in the present crisis of world affairs.

What has made British opinion critical of India over the Kashmir dispute is India's attitude to the proposals for United Nations supervision of a plebiscite in Kashmir, which to the people of this country appear to offer the means for a fair and just settlement of the whole affair. Mr Nehru agrees that the people of Kashmir have the right to decide whether they will join India or Pakistan; in his reply to the last message from the Prime Minister of Pakistan he says:

> It is not for India or Pakistan, whatever our wishes, to decide the future of Kashmir. Kashmir and the people of Kashmir are not commodities for barter or for a bargain. It is their inherent right to determine their own future.

The United Nations proposals were designed to enable the people of Kashmir to exercise the right under the supervision of an impartial, neutral authority, so that neither side could say that the elections were faked or conducted under pressure. But now a Constituent Assembly is to be elected in that part of Kashmir (comprising the bulk of the population) held by Sheikh Abdulla, and the recent excitement in Pakistan has been due to the anticipation that the result is going to be claimed by India as Kashmir's self-determination, rendering any plebiscite superfluous. Pakistan cannot be expected to accept as valid elections controlled by Abdulla's police any more than India can be expected to accept elections controlled by the Azad police; the whole point of the United Nations scheme was to ensure fairness of electoral procedure in both the two zones of Kashmir. If British opinion is critical of India's refusal of the United Nations plebiscite solution, it is not because of any anti-Indian bias, but because on this particular issue India's attitude appears unreasonable.

* * *

The Administrator's Convenience

The fight against identity cards was continued last week when a motion to abolish them was carried against the Government in the House of Lords. Two main points were made by those who spoke in favour of the motion. The first was the extent to which administrative convenience, however small, is today given precedence over the wishes of the ordinary citizen. In the debate, the abolitionists showed what very little use the identity card in fact is in preventing fraud on the food offices or the Post Office savings bank. It is administratively easier to compare a name in a bank book with a name on an identity card, but, as Lord Goddard pointed out, fraud is detected only when the signature on the withdrawal form is compared with the signature in the book.

For the Government, Lord Shepherd tried to put this question of administrative convenience on a wider basis. It was not the identity card as such that he considered important but the national register from which it derives. The national register, which forms a running census of the population, is used, among other things, to check the call up of conscripts and, in the health service, to prevent people from being on the list of more than one doctor at the same time. But if the national register is needed for these permanent purposes, the Government should introduce a new Bill to make it permanent. This was the second point on which the abolitionists, particularly Lord Goddard, concentrated. The National Registration Act, he said, was passed as a security Act and as a temporary Act. If the departments now wish to use it for general administrative purposes and to retain it permanently, then the Ministers concerned should ask Parliament for power to do so.

* * *

Policy for Forests

A satisfactory policy for British forestry has to cope with two distinct and dissimilar problems, which are often confused in public debate. There is the need to conserve existing stocks of standing timber, which are dangerously inadequate, against the danger of another war. There is also the case for restocking depleted woodlands and for planting a large area of new land. But this is a distant objective, since the new timber will take forty to a hundred years to mature and can make no contribution to foreseeable contingencies. Different policies are called for in the two cases.

The new Forestry Act is concerned with both questions. It arms the Forestry Commission with comprehensive powers to regulate the felling of private woodlands. Control over felling was previously carried on under defence regulations, and the volume of permitted felling has been reduced in each of the last three years. The Commission's new powers are stronger but also less arbitrary, since owners' grievances must be referred to a separate committee (final decision resting as a rule with the Minister) and also because

PROGRESS *in* ELECTRONICS

THE HEART of every electronic device is the electron tube. Without it there would be no radio, no television, no telecommunications, no nucleonics, no radar.

The development of electron tubes is a major activity of the Mullard organisation. In extensive research laboratories, Mullard scientists are continuously at work increasing the efficiency of existing techniques and designing new ones to meet the ever-changing needs of industry, communications and medicine.

Bringing the benefits of this research to industry and the community is the other function of the Mullard organisation. Every year, in great factories in Lancashire and Surrey, millions of valves, electron tubes and components are produced for Britain's electronics industry. In other plants electronic equipments are manufactured for specialised purposes. Behind the name Mullard, therefore, is a store of experience in electronics that may well prove of immense importance to your own organisation.

compensation is available where control causes financial loss. This is at any rate a more satisfactory method than the use of defence regulations.

The long-term issues of forestry are more complex. The Commission's planting of 150,000 new acres in the last five years, which has involved the construction of a considerable number of roads and houses in remote places, seems a bigger investment for the remote future than can really be afforded. At the same time, very little has been done to restock the million or more acres of devastated woodlands in private ownership which are mostly accessible and suited to forestry. The new Forestry Act enables the Commission to require that in future felled woodlands shall be restocked, but this does not solve the main problem. The Commission, in its last annual report,* gave another warning that it may use its compulsory powers to acquire unproductive woodlands, and this course of action should be seriously considered as an alternative, rather than an addition, to some of the Commission's own schemes.

Tied Politics

Politics more than reformative zeal must account for Dr Dalton's proposal, launched in a week-end speech in Cambridgeshire, to abolish the cottage certificate system. As an election issue—to judge by the reception already given to his speech—it could cause quite a stir. But it will effect very little as a practical measure to deal with the general question whether the tenancy of a particular house should be tied to the performance of a particular job (which may be a schoolmaster's, policeman's, railwayman's or miner's, as well as a farm worker's).

The particular manifestation of the tied cottage now under attack arises from the provisions of the Rent and Mortgage Interest Restriction (Amendment) Act 1933. Under this Act a farmer can buy an occupied house outside his own land; apply to the county agricultural committee for a certificate that he needs the cottage to house a farm worker of his own; and then armed with the certificate go to the county court for an eviction order without being under any obligation to offer the evicted tenant alternative accommodation. It is the exemption from this obligation which is the main objection to the 1933 Act and which differentiates it from the Rent Restriction Acts, under which the landlord is bound to offer other accommodation. The Minister stated that large numbers of new tied cottages were being created every year, and that this creation of tied from what had previously been free houses meant that unsuspecting tenants could be turned out through no fault of their own.

The figures do not appear to support Dr Dalton's statement. Since 1945 about 1,000 houses a year have become tied in this way, and the county agricultural committees have been granting certificates in about half of the cases referred to them. All that Dr Dalton can claim for his proposal is that it would stop a very gradual increase in the total number of tied cottages. It is easy to find arguments both for and against his proposal. There is much to be said against the piecemeal extension of a system that is alleged to be greatly disliked; the argument is particularly strong when the sitting tenant, who may be living in a village several miles from the farm concerned, can have no foreknowledge of his fate. On the other hand, the county agricultural committees are permitted by the Ministry of Agriculture to grant certificates only if the sitting tenant is not engaged on agricultural work. In many agricultural communities there is little house-room to spare for people who work outside, and the new measure, if it is presented in the autumn, will certainly make the farmer's problems more difficult; but in the rural community as a whole it may well win more votes than it loses.

* HMSO, 2s. 6d.

German Generals Name Their Price

The reunion of former German parachute troops, including some from the Soviet Zone, at their old garrison town of Brunswick on July 29th, sharply revealed the dangers which must be faced in reviving a German Wehrmacht. Far-reaching hysteria, hero-worship, intense *esprit de corps*, contempt for democracies—all these were epitomised in the gathering. A newspaper of the moderate Right, the *Frankfurter Allgemeine Zeitung*, gives this account of the rally, which became a personal triumph for General Ramcke, Hitler's defender of the Brest "strongpoint," who was recently released from a French prison:

> When Papa Ramcke, borne shoulder-high through a crowd numbering thousands, appeared at the reunion, the peaceful "Green Devils" were transformed into madmen. The heat, the joy, the crush, the feeling of being still alive after all, formed an extraordinary combination with the visual impressions—with the chain-reaction of flashlights and the wavering mass; it led to an explosion when, under the gigantic swooping eagle with the silver laurel leaves, Ramcke, with tears in his eyes, called for the song of the parachute *Jaeger*. If Ramcke has a feeling for politics, the recollection of this moment will make him realise the whole responsibility which he personally bears at the moment.

In his speech, Ramcke declared: "We are ready to step in, weapon in hand, to defend European peace, in so far as it is really threatened. But if we do so it is only if certain irrevocable basic demands are fulfilled." He went on to claim political and military equality, pointing out that Germans were not ready to offer their lives for "a nebulous Europe." They must know what political and social structure this Europe would have, and what Germany's place in it would be. As for military equality, said General Ramcke:

> As old soldiers we are not afraid of death, but we are not ready to sacrifice ourselves senselessly and bleed to death in a non-man's-land as the penal battalion of antiquated democracies.

The General proceeded to demand an immediate end to, and revocation of, "defamation and discrimination against the German people, in particular those strata who engaged their lives for the Fatherland and its security—that is to say, the former soldiers of all sections of the Wehrmacht, including the *Waffen SS* and the police." Specifically, Ramcke insisted that all the "so-called war criminals" should be immediately released. Continued trials "were not compatible with the European feeling for justice." After saying he "did not know how many men of honour still populate the dungeons of Europe," Ramcke pointed to an empty chair on his right, declaring "Here our revered Field Marshal Kesselring should sit." He finally asked that the seven Nazi leaders in Spandau should not be forgotten, mentioning by name Baron von Neurath and Admirals Raeder and Doenitz. Since the men sentenced at Nuremberg are guarded by the Russians as well as the western powers, Ramcke cannot believe that they will be released as the price of German divisions for Atlantic forces. The British, who hold Marshal Kesselring and others at Werl gaol are, on the other hand, faced with a very difficult decision.

General Ramcke is an outstanding spokesman for German demands, but he is by no means the only one. More will be heard from the thirty generals and admirals who met last week-end to unite all organisations of ex-soldiers into one federal body, which will not only look after matters of welfare, but pronounce on policy regarding a German contribution to defence. The price they ask is hardly likely to be lower than Ramcke's.

* * *

Iron Curtain Harvest

In Eastern Europe the harvest is well under way and from all accounts it should be a good one. But in most countries the Communist authorities are very concerned lest

they should fail to extract from the peasants enough grain to satisfy both Soviet demands and the needs of their own industrial workers. The mixture of exhortations, bribes, threats and penalties with which farmers everywhere are being bombarded makes this quite clear.

"Enlightenment" work among the peasants is considered of great importance. In Roumania, for instance, mobile teams of journalists and printers are producing special editions containing progress reports and accounts of the prowess of individual peasants. At the other end of the scale, Czech kulaks are being sentenced to fines and imprisonment for failure to deliver their quotas; and the Communist newspaper, *Rude Pravo*, admits that morale inside the co-operatives is often low, a failing that is ascribed to kulak machinations. In Hungary, where in fifty districts the farmers are said to have failed to fulfil their deliveries, increased quotas are to be imposed on the delinquents and they are to be prevented from selling on the free market until they have fulfilled them.

The carrot as well as the whip is being applied to the farmers of Eastern Europe. In Hungary, for instance, industrial goods have been specially set aside for purchase by peasants who fulfil more than their delivery quotas. It is said that farmers both outside and inside the collectives will benefit; but, since individual farmers have been set relatively very much higher delivery quotas than the co-operatives or state farms, it is obvious who will benefit most. The scheme, indeed, fulfils a second purpose of emphasising the advantages to be gained from joining a co-operative farm. In the same way, the new Polish system for grain purchases by the state is clearly designed not only to get hold of more grain, but to increase the disadvantages under which the richer peasants work; for the "norm per hectare" to be handed over by the kulaks is to be "several times greater" than that of the smaller peasants. It does not, in fact, look as if the Communists are willing or able to follow the common-sense course of seriously relaxing the pressure to join collectives until the harvest is safely over. It is perhaps significant that in Hungary the temporary ban on forming new collectives instituted last March has just been lifted.

* * *

Moscow on Bevanism

The Kremlin, it seems, likes Mr Bevan about as much, or as little, as Senator McCarthy likes Marshal Tito. Indeed, it regards Bevanism as the Titoism of the Anglo-American camp, useful as a means of splitting the opponent's ranks, but extremely dangerous to the Russian side nevertheless. A good Tory never forgets that Marshal Tito is a Communist, and the Soviet Agitation and Propaganda Department never forgets that Mr Bevan is a Labour party man. If it ever had any doubts, Mr Bevan's present trip to visit Marshal Tito would have removed them.

The attitude of Soviet propaganda towards the appearance of a deviationist in the London-Washington bloc was determined in advance by the immutable principles of Marxism-Leninism-Stalinism and the tactics laid down by Lenin. These teach Communists that the greatest danger to the revolution comes from the reformist Socialists, and that leadership of any development in the working classes must never be allowed to slip from the hands of the Communist Party into those of their closest rivals, the Socialist Party politicians. Soviet propaganda has for this reason consistently denounced Dr Schumacher in Germany as a secret ally of Dr Adenauer, despite the Socialist leader's opposition to rearmament. In the same way it has "exposed" Mr Bevan. According to Moscow, Mr Attlee and Mr Bevan, worried by the discontent in the rank and file of the Labour party over British subservience to America, decided to fake a split in the hierarchy. This was intended to delude the rank and file into believing that a new group had arisen whose policies were in accordance with their wishes. But really, says Moscow, Mr Bevan is as much a renegade as Mr Attlee, and Labour and Conservatives are both imperialist parties. Mr Bevan's "hostility" towards Russia is said to be an attempt to deflect the wrath of the people from America. The Soviet Communist party leaders cannot be content with the fact that Mr Bevan criticises the Anglo-American rearmament policy of the Government; to satisfy Stalin's definition of an internationalist and peace-lover he would have to be positively *for* the Soviet Union.

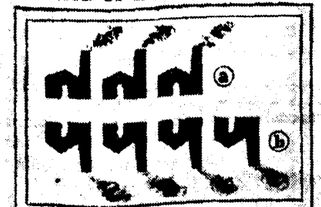
Despite its attitude to Bevanism, Moscow is developing a very intensive propaganda campaign to prove not only that the British Labour ranks are in revolt, but that the Anglo-American alliance is ruptured over China, Persia and various other issues. One of the main points of Mr Molotov's recent address to the satellites in Warsaw was that the "ruling cliques" in the Western camp were falling out; the Soviet bloc had only to stand firm and it would win bloodless victory by the collapse of the Western alliance.

* * *

Intestate Succession

An admirable report has been published by the Lord Chancellor's committee to consider, under the chairmanship of Lord Morton of Henryton, the present laws of intestate succession, and the provisions of the Inheritance Act, 1938, in relation to them. The present rules governing intestate succession in England and Wales date from the Administration of Estates Act of 1925. The interest of the surviving spouse was necessarily defined in terms of money, and any legislation on this subject must therefore be revised from time to time if its original intentions are to remain effective. Under the 1925 Act, a surviving widow takes the personal chattels and the first £1,000 of the estate; her interest in the rest of the estate depends on what other relatives the deceased man left. The Morton Committee would increase the £1,000 to £5,000, give it to the surviving spouse with the right to the personal chattels and also give him or her the right to buy the "matrimonial home" at a price equal to its value as agreed for probate court purposes with the Commissioners of Inland Revenue.

As for the rest of the estate, where there are surviving children, the committee suggests only one change. At the moment, subject to the widow's interest for life in half the rest of the estate, the children take all. The committee would give the surviving spouse the right to take the capital value of the life interest in the half straight away. Where there is no child, but either parents or brother and sister surviving as well as a surviving spouse, the committee recommends that the surviving spouse should take the first £20,000 and half the rest, the parents (or brothers and sisters if no parents) the remainder. If there are no surviving parents, or brothers and sisters, the recommendation is that the surviving spouse should take the whole estate. The major changes here are, first, the suggestion to give the surviving spouse the first £20,000 of the estate, and, secondly, the elimination from the "family," for inheritance purposes, of all the more remote relatives, such as grandparents and uncles and aunts, who now, in those circumstances, would have a claim to share. The committee is also opposed to giving what is tactfully called any member of an "extra-marital" family of the deceased any claim to share in the estate.



In dealing with the relation of the Inheritance Act, 1938, to the law of succession of an intestacy, the committee makes two suggestions. The Inheritance Act gives any dependant of the deceased the right to apply to the court if "reasonable provision" has not been made for him, or her, under a will. There, the committee suggests that it

SCHWEPPERVESCENCE LASTS THE WHOLE DRINK THROUGH

should be made clear that the 1938 Act applies even though the will in question does not dispose of all the property in the estate. It goes further; it also suggests that the machinery and rights created by the 1938 Act should be available for any dependant of a person who dies without leaving a will at all. The argument in favour is that general rules for intestate succession can only be general rules. There can be cases in which a court could do greater justice if it had the power. That argument seems very strong; if Parliament has already given the courts power to change the declared intentions of a testator (and there has been no complaint that the power has been abused), then they should have power to amend what is, after all, an arbitrary rule to meet the exceptional case.

* * *

Discipline and Punishment

The Home Secretary's statement last week on the report of the committee which reviewed punishments in prisons and borstals was not very satisfactory. He did not mention one of the committee's most constructive recommendations—that the earnings of the average prisoner should be increased to 2s. 6d. a week, in order to put an end to the tobacco racketeering which is responsible for so much indiscipline, and even crime, in prisons. It is to be hoped that silence does not mean that this recommendation will be passed over. Mr Ede has accepted, in principle, the proposal that a special prison should be established for prisoners who persistently defy authority. Unfortunately, lack of accommodation will prevent this being done in the near future, as well as another constructive proposal that a special establishment should be provided for prisoners who are mentally unstable. A special institution for particularly difficult borstal inmates has, however, already been established.

Mr Ede has also accepted two of the committee's more questionable recommendations. One of them, which is discussed further in a letter on the next page, denies the right of a prisoner to be represented when he is charged with a serious offence before the visiting committee. This means that an inarticulate prisoner may be sentenced to a flogging—a punishment which cannot be imposed by a court of law—without a word being put in on his behalf. The other dubious recommendation accepted by Mr Ede concerns absconding from borstals. At present, absconding is dealt with and punished by the governor except in serious and persistent cases. Because it has increased considerably since the war, the committee recommended that absconding should always be dealt with by the board of visitors. The committee is probably right in recommending that until the borstal system is properly re-established after its breakdown in the war, absconders should be treated more severely. But the borstal inmate is so precariously balanced that some absconding is inevitable. From an appendix to the committee's report giving punishment records for some borstals, one learns that absconding may take place because of a dying father, a sick mother or, by one "intelligent first offender," because of a sense of unfairness at his borstal sentence. It would seem unwise to abolish the governor's discretion to deal with this sort of case as he, who must know the offender better than visitors can, thinks best.

* * *

Slow-Footed Messenger

There have been many complaints about the difficulty of getting international publications, particularly those of the United Nations agencies, through "the proper channels," which in this case are His Majesty's Stationery Office. Difficulties are bound to arise in any system of distribution when the publishers are as distant as New York, Geneva or Paris, and something less than the normal speed of communication would be expected. What is inexcusable is the Stationery Office's apparent ignorance of the news value or importance of the material it handles and its inability to assess the likely demand for even important publications. For example, it appears to take three times as long for the Stationery Office to get a report from Geneva as it would take a private person, yet orders are placed in such tiny quantities that customers have regularly to be told that no copies are available until the next order is delivered several weeks later. The fear of having any stock left unsold induces so much caution in ordering that on several occasions two months have elapsed between the arrival of a report by personal post and its delivery by the Stationery Office.

Delay in the supply of foreign publications would be accepted more readily if the Stationery Office were more efficient in its handling of British publications. But even here librarians report not only the incorrect delivery of orders, but a complete inability to give any advance information about delivery dates; there are also various minor irritations arising from the vast and varied business which the Stationery Office handles. But this excuse cannot be accepted. The Stationery Office is a huge and growing monopoly. It can only be judged by the service it gives the public, and if it cannot handle its vast business well it should rid itself of some of it.

Oppression Abroad

Mr Gladstone's letters to Lord Aberdeen have re-awakened popular feeling on a subject on which it should never be suffered to slumber. He spent a portion of last winter and spring in Italy, and was an eye- and ear-witness to many of the transactions of the Courts of Rome and Naples: what he there saw appeared to him so heinous, that he tried the effect of personal and private remonstrance through the medium of his friend Lord Aberdeen. His representations met with no attention; and he now, deliberately and reluctantly—all his sympathies as a Conservative overpowered and neutralised by his wider and nobler sympathies as man—comes forward to state to the English public . . . the shameless oppressions, the hideous cruelties, all the black atrocities committed in his sight by those barbarous and stupid Courts. . . . We respect Mr Gladstone and are grateful to him for having raised his voice and borne his testimony against these regal crimes. We hold, with him, that we are not called upon to be passive and cold spectators of these and similar enormities, merely because the scene of them is a country separated from us by mountains or by seas, and the victims of them are men speaking a different language, and trained under different institutions from our own. . . . We are not of those who hold that our sympathy should be confined to the suffering—ample enough, God knows—which lies within the four seas of Britain. We require no other justification for this wider sympathy we feel, than that it is natural we should feel it—that we are so made that we do feel it. It has always been the proud distinction of Englishmen that they have felt it. It has been their misfortune, and to a certain extent their reproach, that their ready sympathy and restless benevolence has not always been directed by the clearest knowledge, or guided by the soundest judgment. But wherever oppression has been exercised, wherever suffering or wrong has been heard of, their feelings of sympathy with the oppressed, and of indignation against the oppressor, have never been languid or tardy.

Letters to the Editor

Dividends Under Control

Sir,—Your jeremiad on the results of statutory limitation of dividends must surely have been composed without consideration of the nature of joint stock companies today. Whatever the economic arguments for the retention of company profits for the maintenance and extension of industrial capital, there can be none in support of a return for investors which exceeds the gilt-edged return by much more than the risk involved.

It certainly cannot be argued that, in the 13,000-odd public companies which are responsible for at least half of the economic activity of the country, dividends are an incentive to enterprise or efficiency. For, in these companies, the majority of the shareholders play no part in their policy or management and they are the ones mainly affected by the Chancellor's proposals.

The exemption from control of companies distributing less than £10,000 will cover most of the private, owner-managed companies. In so far as they are responsible for new products and new processes they will continue to receive a commensurate incentive reward.

When the large public companies need new capital for similar purposes, they should find no difficulty in raising it on terms which allow only a limited return. Most of the money raised by these companies during the last few years has been on such terms and an examination of the rate of compulsory liquidation or dividend failure over the last ten years suggests that 5 per cent is ample to cover all risks except those arising from a major slump. Dividend limitation is unlikely to affect the rate of saving and investors will still, presumably, be willing to invest in shares paying appreciably above the gilt-edged rate.

The truth is that the bureaucratically managed public company is subject to quite different motivations from those of the owner-managed private company. Is it not time for those who comment on Government policy as it affects industry to recognise the great differences, qualitative as well as quantitative, that distinguish the institutions of which industry is composed?—Yours faithfully,

AUSTEN ALBU

House of Commons

[This letter is referred to in an article on page 297.—EDITOR.]

Local Government Dilemmas

Sir,—The article in your issue of July 21st is a further reminder of the urgency of the problems of local government structure and functions which have been growing more acute in recent years.

We should beware of making too much of an excuse for the decline of local initiative and responsibility out of the increased control over local authorities now exercised by the central government. Whilst I should hesitate to belittle the part played by increased governmental control, local authorities still have an enormous scope for initiative within their existing permissive powers. Though financial difficulties may play a part in preventing local authorities from breaking new ground, the action of one county council in establishing a rehabilitation scheme for tuberculous persons in 1938 under the general powers of the Public Health Acts will illustrate my point here.

Too much can be made of population figures as an index to what an area's status ought to be. If one takes existing authorities of the same population within any given class, one will find enormous variations in those factors which affect the demand for services and ability to pay. It is factors such as birth and death rates, number of children per thousand of population, rateable value and rate income per head, rather than total population, which determine the efficacy or otherwise of any particular administrative unit. There is, of course, a minimum population below which efficient administration is impossible.

Finally, in all the proposals for local government reform which have been brought forward in the last decade, little prominence has been given to the work of the geographers. More official attention needs to be given to the endeavours of Smailes, Dickinson, Gilbert, and others, to relate administrative areas to the facts of social structure by the use of a variety of indices for the measurement and delimitation of "areas of consciousness."—Yours faithfully,

W. THORNHILL

The University, Sheffield

*

Sir,—The most unsatisfactory feature of the local government structure is not the fact that towns have outgrown their administrative boundaries. An interim reform which would not impede a general solution might be as follows:

1. Leave the Welsh structure until the Welsh Secretary of State is appointed.

2. Unite the five English counties of less than 100,000 population with neighbouring areas.

3. Create a new type of unit with the civic dignity of a borough and the functions of a parish.

4. Require county review orders to be made securing the disappearance as county districts of the four hundred English boroughs and districts with populations of less than 10,000.—Yours faithfully, H. THORNTON

Bradford

Punishments in Prison

Sir,—The Home Secretary has accepted the recommendation of the White Paper on punishments in prisons which appears to make it impossible for prisoners accused of offences against prison regulations to have, not a proper defence by a lawyer, but merely their case stated for them, if they so wish, by a "prisoners' friend."

As everyone who has been in one of the armed services knows, there is a not unnatural propensity to uphold authority by taking, in case of doubt, the word of the superior officer during the hearing of discipline cases. Since prisoners are often tough and anti-social individuals, it is understandable that in some respects the authority and power of the prison staff over the inmates is greater than that wielded by a superior officer over his inferior in the armed services. Under the circumstances, a "prisoners' friend," if he is to work in amity with the prison staff, must clearly proceed with tact and moderation. But in a milieu which is not altogether comparable to the dispassionate atmosphere of a court of law, is it not all the more important to guard against injustice, even at the cost of administrative inconvenience? It is hard to believe that Mr. Chuter Ede feels happy in withholding even this most elementary safeguard of the rights of the less articulate accused.—Yours faithfully,

HUGH J. KLARE, Secretary
Howard League for Penal Reform

Storm Over Broadcasting

Sir,—There are certain aspects of the proposals to institute national programmes which are not mentioned in your Notes of the Week on July 21st that deserve emphasis.

As regards Eire, you say that "everyone who can listens to the alien BBC." Are you sure? Or is your claim too sweeping? My information is that it is only the entertainment hours that are popular in the South of Ireland; the Eire news service is used universally. Surely there is an obvious and important distinction here.

Similarly, many Scots want a national programme for just this reason. They have no wish to interfere with the drama, the concerts, the dance music or variety, but control of our own news service and talks is essential if we are to resume our place amongst the nations in Europe. Our radio news and our talks are filtered to us at present through London, thus preventing our being in touch with the wider outlook which could so easily be ours. We want to select our own news, and so to get the news and views of the Commonwealth, of the United States (where Scotland has so many understanding friends) and of the European countries (with which we have lost our traditional contact).

In short, many Scots assert their right to select their own news and to reduce the insularity of outlook which London control imposes.—Yours faithfully,

H. A. BARR

Books and Publications

The Tide Turns

The Hinge of Fate. The Second World War, Vol. IV. By Winston Churchill. *Cassell.* 917 pages. 25s.

Mr Churchill's third volume brought his history of the Second World War down to the end of 1941, to the formation of the Grand Alliance. The new aggressions of Germany and Japan in 1941 had indeed forced that alliance; but Britain, by its central position and long resistance, was inevitably the nucleus of it, and Mr Churchill, by his undisputed position, its controlling genius. His new volume now shows him exercising that control, at first through the blackest period of the war, then through the great changes of fortune in the summer and autumn of 1942 to the planned conquest of Italy in the summer of 1943.

The change of fortune in those eighteen months was indeed remarkable. They began with "a cataract of disasters": the fall of Singapore in February, 1942—"the greatest scandal that could possibly be exposed" as Mr Churchill minuted at the time—followed by the Japanese conquest of the whole of South East Asia from Rangoon to New Guinea; the fall of Tobruk in June, "unexplained and, it seemed, inexplicable," with 33,000 men and "gigantic booty," followed by Rommel's triumphant invasion of Egypt; the spectacular, if unimportant, escape of the German battleships from Brest in February; Malta and control of the Mediterranean almost lost in May; the U-boats triumphant as never before in the Atlantic; the disaster to the Arctic convoy in July; and in Russia, the German advance towards the Caucasus. July, 1942, was indeed the nadir of the war. It was the only time in the whole war when Mr Churchill's leadership was openly and frontally challenged. On July 1st Sir John Wardlaw Milne moved his vote of censure, "that this House . . . has no confidence in the central direction of the War." And yet, in fact, the challenge was never a threat. Defeated by 475 votes to 25 it was even rendered ridiculous; and thereafter it was never to be repeated. How could it have been? Already in the Pacific, with the great American naval victories of the Coral Sea and Midway in May and June, the tide had begun to turn. In August Mr Churchill visited Cairo and reorganised the whole Middle Eastern command. In November came the twin victories of Stalingrad and El Alamein. "It may almost be said, before Alamein we never had a victory; after Alamein we never had a defeat." Thereafter came the landing in North Africa, the delayed victory in Tunisia, the Casablanca conference, the pronouncement of "unconditional surrender," and, with the planning of the Italian campaign, the first stage in its implementation. Well may Mr Churchill entitle this volume "The Hinge of Fate."

How did Mr Churchill retain, in that crucial year, his astonishing mastery of an ever-widening war? This book, selective and personal, as it must be, but documented beyond the reach of reasonable criticism, is the answer. Here we see the same extraordinary vigilance, the same minute attention to detail, the same incessant pertinent **questioning**, extended, with undiminished vitality, to ever new corners of the globe: extended often by indefatigable personal journeys—to Washington, to Cairo, to Turkey, to Moscow—and indefatigable personal diplomacy. Some of the most revealing passages in the book deal with this diplomacy, in which Mr Churchill always showed the same qualities of blunt clarity about facts and olympian generosity to persons: one sees his handling of the nervous and mutinous Mr Curtin; of the futile Giraud and wellnigh intolerable de Gaulle; of the "rough and surly" Stalin, whose granitic character and "wicked system" arouse in him a kind of sympathetic implacability; and finally, even of that great friend and ally, President Roosevelt, whose naivety on such subjects as India and China is sometimes touched by a few infinitely gentle shafts.

Of course, in this vast field, Mr Churchill has his preferences—and his gaps. His preference for the Middle East and the Mediterranean is obvious. His references to Gandhi, Nehru, and the Indian Congress Party are seldom sympathetic; and the defenders of General Auchinleck will feel about this volume as the defenders of Lord Wavell about the last. A notable gap is Mr Churchill's reluctance to discuss the very serious controversy about tank design which gave substance to Parliamentary doubts.

Nevertheless, the omissions in this book, which shows undiminished control of its vast matter and undiminished vitality in the expression of it, are far outweighed—even after the publication of the Hopkins Papers and so much other relevant matter—by its contributions to our knowledge of the war. Perhaps it should be said: especially after some of these publications. In a valuable account of the origin of "Unconditional Surrender," Mr Churchill (who incidentally corrects his own earlier utterance) has some particularly dry comments on the "rubbish" published by Mr Elliott Roosevelt on that subject. Altogether this volume, like its predecessors, must be pronounced a heroic work. The authority of its author gives it substantive value: its documentation preserves it from the imputation of retrospective self-justification; and those documents, being so often by the same pen, are effectively insured against official dust. Pliny judged most happy those to whom the Gods had granted *aut facere scribenda aut scribere legenda.* Mr Churchill, thanks to the changing fortunes of politics, has achieved both felicities. What is more, he has done it twice in one lifetime.

The Springs of Economic Action

Psychological Analysis of Economic Behaviour. By George Katona. *McGraw-Hill.* 347 pages. $5.00.

There can be few readers on whom the title of Professor Katona's book will not have a rather forbidding effect. Those to whom economic concepts and language are familiar tools may well baulk at the prospect of grappling with "behavioral environment," "conceptual fields," "the we situation" and other legitimate but, to the layman, repulsive pieces of professional jargon; and the psychologist may equally understandably be repelled by the notions of marginalism or of macroeconomic time series. In fact, this is a readable, though necessarily solid, and stimulating book which casts a considerable light on the limitations and possibilities of economic analysis as a means of understanding real-life situations and whose conclusions have a significant bearing on policy.

It is a little too ambitiously named. The kinds of economic behaviour on which Professor Katona trains the psychological searchlight include the consumers' response to particular price movements, the decision (whether habitual or specifically thought out) to save or to spend in given circumstances of income, the businessman's pursuit of profits and particularly his price and output policy, and the contagious buying and selling waves which are part of the trade-cycle picture. He consciously omits other matters to which psychological considerations appear even more relevant; such as wage negotiation, economic mobility (both between places and between occupations) and the power-politics of business as analysed in Messrs Morgenstein and Neumann's "Theory of Games" and described in Mr Thurman Arnold's "Folklore of Capitalism." Over the field which he does cover, however, he is sensible and enlightening.

The psychology which he applies is, as he describes it, "most strongly influenced by Max Wertheimer, who has been rightly called the father of gestalt psychology." The reader need not, therefore, expect a monstrous hybrid of Freudian symbolism and indifference curves. "In a certain sense," says Professor Katona, "this book constitutes a test . . . it would represent additional evidence for the validity of the psychological principles here presented if they proved useful and fruitful in the task of analysing economic behaviour." Looked at from this point of view, the test may be said to yield a positive result, if not a very large one. Examining the evidence of successive wartime and postwar social surveys in the light of psychological hypotheses, Professor Katona does reach conclusions which harmonise with the recorded facts. He has a proper scientific caution about the use of such techniques for actual prediction; but even where one cannot predict with any useful degree of certainty, one can nevertheless diagnose. There is room for much more of this collaboration between allied disciplines.

Labour Control

Antecedents of the International Labour Organisation. By John W. Follows. *The Clarendon Press, Oxford.* 234 pages. 18s.

The establishment of the International Labour Organisation in 1919 was the climax of almost a century's discussion and agitation. It was natural that the idea of international labour legislation should arise at a time when states were becoming increasingly concerned with the regulation of factory conditions on a national scale. It was sometimes argued that such national regulation was necessary to protect the good employer, who reduced the working day of his employees, from the competition of the bad employer, who attempted no such limitation. The same argument could be and was applied to the industrial relationships between states. Thus the idea of international labour legislation developed in England, France, and Belgium in the first half of the nineteenth century.

The idea, as Mr Follows shows, cannot be ascribed to Robert Owen, though some have regarded him as a pioneer in that as in so many other fields. It emerged, however, in the 1830s when Charles Hindley, a Lancashire manufacturer and factory reformer, advocated international labour legislation by treaty. On the continent somewhat similar ideas were expressed by Villermé, J.A. Blanqui, and Legrand. During the second half of the century movements for the international protection of labour were to be found in Germany, France and Switzerland. These movements culminated in the Berlin Conference of 1890, which was chiefly notable as "the first official international meeting to discuss labour problems." After 1890 the initiative passed to Switzerland, where ten years later the first International Association for Labour Legislation was established. This unofficial body prepared the ground for the official International Labour Organisation of 1919.

Mr Follows gives a full and clear account of these developments. His book is based on extensive British and continental sources, of which there is a useful bibliography. It does not, however, include M. W. Thomas's recent work on factory legislation or Stekloff's study of the First International. The documentary appendices are valuable, as are the extensive quotations from contemporary sources in the text. In all, this is a scholarly work for those interested in the economic problems of the nineteenth century and in the historical background of the ILO.

Stating the Obvious

Social Anthropology. By E. E. Evans-Pritchard. *Cohen and West.* 134 pages. 8s. 6d. net.

This short book reprints six lectures given by the author on the BBC's Third Programme. The prose is felicitous; the matter disappointingly academic, sometimes even trivial. The author states that among the minimum and essential topics of social anthropology are comparative political institutions and comparative law. But the lay reader will look in vain in these lectures for an account of what anthropologists have made of these or any other topics. The main theme seems to be a private squabble among anthropologists. Some, described by the author as "functionalists," are said to think that "social systems are natural systems which can be reduced [*sic*] to sociological laws." Professor Evans-Pritchard claims to speak for the opposing camp which denies that "natural laws of society" can be discovered by methods like those of the natural sciences. He regards his subject as a kind of historiography. At the same time he appears to be blissfully ignorant of the literature on this subject written by specialists in the other social sciences. His own discussion of it is muddled and leads to the conclusion that he belongs to both camps.

Professor Evans-Pritchard asserts that social anthropology studies societies as wholes and claims, rather incongruously in view of his general standpoint, that it has a body of general theory which history lacks. He regards it as the study of societies rather than of cultures, emphasising that this is a distinction between different kinds of abstractions. He then gives a brilliant if biased outline of the ideas of the eighteenth and nineteenth century as precursors of modern anthropology, accusing them of having been confused because of the assumption taken over from the "Enlightenment" that societies are natural systems. His account of recent theoretical developments is sketchy and mainly taken up with an attack on the scientific pretensions of the "functionalists." Discussing field work, he states that the final aim is "structural analysis" which requires theory but also the "imaginative insight of the artist." He illustrates this by summarising some well-known tribal studies. His final chapter on applied anthropology ends with the remark "What I am saying is fairly obvious," and this sums it up well. He says also that he gained some understanding of communist Russia by studying witchcraft in an African tribe, but to what this understanding led him he omits to tell. There are many such remarks, to which the layman's automatic reaction is "Nonsense."

Underestimate of Change

Cabinet Government. By Sir Ivor Jennings. Second Edition. *Cambridge University Press.* 578 pages. 30s.

Sir Ivor Jennings's analysis of the modern system of British government is too well known to need either description or praise. It has certainly not been invalidated by such changes as have occurred in the fifteen years since "Cabinet Government" was first published. A revised edition, taking account of wartime and postwar developments, is none the less welcome. The framework of the book is, sensibly, unchanged, except that the chapter on defence has been expanded and what was a section on the Economic Advisory Council has become a chapter on economic policy—but an unsatisfactorily sketchy chapter of only nine pages. Sir Ivor seems, unfortunately, to have had too little time to make his revision as thorough as the new material requires. He assumes too readily that the newer problems of government for the welfare state and the planned economy are mere extensions of old problems. He misses the point rather widely in such statements as, for example, "There has been a considerable improvement in inter-departmental relations." It is certainly true that contacts between the departments are more intimate, and probably true that open, head-on conflicts are fewer—at any rate in proportion to the volume of business—than they were in the 'twenties. But this constitutes better relations in only the most trivial sense. Perhaps the chief reason for it is that the departments have grown so much, their policies are now so numerous and so confused, that conflicts of policy between the departments very often remain almost unknown, and if they are known are taken for granted in all but the most important matters. Inter-departmental relations have certainly not improved in a sense that has anything to do with the efficiency of government.

Such criticism is, however, merely to suggest that even Sir Ivor Jennings has difficulty in observing British government closely from as far away as Ceylon. "Cabinet Government" remains the second most essential aid to an understanding of British politics. (The first essential is still Bagehot's "English Constitution," and the third is Sir Ivor Jennings's own "Parliament.")

Unpremeditated Measurement

Cyclical Movements in the Balance of Payments. By Tse Chun Chang. *Cambridge University Press.* 224 pages. 18s.

This book, which incorporates much material previously published in articles, is a comparative statistical study of the cyclical behaviour of the balances of pay-

The Scope Year Book

Essential 650 page guide to British industry, trade and finance. Many graphs, tables and features never before assembled in handy volume form. Contains unique analysis of the British economy; a compendium of world-wide marketing data; valuable statistical reference on production and trade.

Severely limited edition. Post free 45/-

SCOPE BOOKS, LTD
1, New Bond Street, London, W.1.

ments of a number of countries during the period 1924-38. Part I begins with a theoretical explanation of why some countries develop surpluses and others deficits at the same stage of the international trade cycle. It then presents, for a large number of countries, statistical estimates of the average and marginal propensities to import; the income and price elasticities of national demands for imports and of world demands for exports; the price-elasticity of substitution between the exports of various countries in world and national markets; and the export multiplier. Part II analyses the British demand for imports, and the cyclical behaviour of the United Kingdom's balance of payments. Part III contains an analysis of the balances of payments of the United States, Sweden, Australia, and Chile. While Dr Chang assumes throughout that these countries can each be regarded as representative of other countries of the same "type," this assumption is almost certainly unjustified in the case of Britain and the United States, and its limitations as applied to the others are evident in the inclusion, "because of its special features," of a final chapter on the Canadian balance of payments.

Dr Chang's statistical results are very suggestive, and obviously represent a great deal of arduous labour. Nevertheless, they can be accepted only with reservations, even as a description of the period to which they relate, and certainly cannot be taken as estimates applicable to subsequent periods. The "elasticities" which he purports to measure are aggregates, which may be altered in all sorts of unsuspected ways by changes in their constituents; the shortage of suitable statistics leads him into many dubious substitutions, such as the use of employment figures and bank clearings to represent the British national income; and the fitting of single equations to short time-series by multiple correlation is a statistically suspect method of estimation.

Altogether, this book would have been much more useful if Dr Chang had given more attention to his theoretical structure, and to the limitations of his statistical sources and methods, before sitting down to his monumental calculations. Potential readers should perhaps be warned that the standard of proof-reading is shockingly below what one expects of the Cambridge University Press.

Social Security for India

Social Insurance for Industrial Workers in India. By S. D. Punekar. *Oxford University Press.* 228 pages. 17s. 6d.

Before 1939 it would have appeared quite utopian to propose a scheme of social insurance, let alone one of social security, for India. During and since the war, matters have moved fast. In 1943 Professor Adarkar was appointed to draft a health insurance scheme for industrial workers; thereafter by various means factual data bearing upon social insurance were collected; in 1948 the Employee's State Insurance Act was passed (providing benefit for factory workers in the event of sickness, maternity, and injury at work); and, finally, the new Indian constitution adopted the ideal of social security by laying down that the state shall make "provision for securing the right to work, to education, and public assistance in case of unemployment, old age, sickness, disablement, and other cases of undeserved want."

Mr Punekar, who since 1944 has taken part in the preliminary enquiries for a social insurance scheme in India, has now written an admirable introduction to the whole subject, in which he first surveys concisely the standards of social security in other countries and measures for putting them into effect, and then considers how these ideas and policies can best be adapted to the special problems and conditions of India.

"The evolution from social insurance to social security," he says, "consists in extending its protection to an even larger circle of the population, in widening the range of the risks it covers, and as regards the quality and quantity of its benefits, caring more for social adequacy than for actuarial equity." The various steps that must be taken to transform the elementary forms of social services at present in existence in India into a comprehensive plan of social security include therefore the extension of cover to all citizens (with special provision for peasants), and to all risks; the provision of medical services for all; the provision of adequate cash benefits; and administrative arrangements.

Mr Punekar analyses the various problems encountered and supports his arguments with statistical data. In doing so he succeeds in presenting a clear picture both of what is needed and how such needs can be met.

Text and Reference Books

Statistical Digest of the War. Prepared in the Central Statistical Office. *HMSO.* 247 pages. 32s. 6d.

Compiled as one of the introductory volumes in the official civil histories of the second world war, this book presents the main statistical facts about the war effort of the United Kingdom. Many of the general series have been published elsewhere, such as those on population, social conditions, agriculture, external trade and wages and prices. But a great deal of new material is released by this publication. To mention only some, there are tables giving numbers employed in the manufacture of equipment and supplies for the Forces divided by industry; losses of foodstuffs and raw materials at sea; details of supplies and consumption of different oil products; naval and merchant shipbuilding and repairs; and production and overseas supplies of munitions and aircraft. One of the most informative tables shows the Ministry of Supply munitions production arrranged as an index for each main category on the basis of 100 in the first four months of the war—but without any attempt at a comprehensive index.

Some of the series are given monthly or quarterly, others only yearly. All the tables are laid out very clearly with definitions and explanatory notes gathered together at the end of the book. This volume is in every way a model in statistical presentation.

Industrial Negotiation and Arbitration. By M. W. Turner-Samuels and D. J. Turner-Samuels. *Solicitors' Law Stationery Society.* 532 pages. 75s.

This clear and detailed guide to the machinery and practice of formal collective bargaining in industry deliberately excludes any consideration of the historical, economic or social aspects of the organisations in question. Designed for the adviser or representative of the groups concerned, it covers the whole field of statutory and non-statutory negotiating bodies in private and public industrial activity, the operations of joint consultation within specific industries and individual enterprises, and the working of voluntary and compulsory arbitration machinery. It contains tables of relevant cases and statutes, and 29 appendices ranging from an outline of the provisions usefully covered in a collective agreement to a table detailing the paid holidays granted in a wide variety of industries.

Budgetary Structure and Classification of Government Accounts. United Nations. *HMSO.* 100 pages. 5s.

This publication suggests certain basic requirements in the structure of central government budget accounts if these are to be of real use. The basis for separating capital and current transactions is discussed and a general framework drawn up for both types of accounts. A brief summary is given of the budget systems of Italy, Sweden, the United States and Russia.

Capital Development in Steel

A Study of the United Steel Companies Ltd.

P. W. S. ANDREWS & ELIZABETH BRUNNER

Roy. 8vo. 384 *pp.* *Illustrated* 30*s. net*

A unique case-study which provides a more detailed account of policies, capital expenditure and profitability than has so far been made publicly available for any British business.

Business men will be particularly interested in the detailed description of the system of management and the method of controlling capital expenditure, and Economists in the indication of ways in which the existing theory of investment decisions needs revision. The general reader will now be able to form a judgment on the charges commonly levelled at the industry.

BASIL BLACKWELL OXFORD

AMERICAN SURVEY

Approach to Foreign Aid

Washington, D.C.

THE fact that people living in other countries do not vote in United States Congressional elections is not remarkable, but it is important. It means that any piece of legislation proposing financial assistance for non-Americans is Congress's favourite economy. The pending Bill for the $8.5 billion Mutual Security Programme will be no exception. An extremely small, if noisy, group of isolationist Democrats and Republicans would like to throw out the legislation altogether; fortunately, however, the question of whether the United States "goes it alone" against the Russian menace is no longer seriously debatable. Accordingly, the discussion will not turn on whether or not there should be a very large foreign assistance programme this year, but only on how very large it should be.

Even though the Foreign Affairs Committee of the House of Representatives has been considering the Bill for more than a month, it is far too early to guess precisely how much will be cut from it. The Senate Foreign Relations Committee has just begun its study of the measure. Debates on the floor of both chambers are still several weeks in the future, and after that the whole process has to be gone through again before money will be appropriated. Not until autumn will the final amount be known.

Those who listen in the right places—the extreme Right places—can hear the prediction that some $3 billion will eventually be hacked off the Bill but, at the moment, this estimate seems far-fetched. Fears that a tidy Korean armistice would start an orgy of complacency have lately diminished. Furthermore, recent trips to Europe by a number of legislators have borne excellent fruit. They returned much more impressed than before with European progress, much more aware of the magnitude of the job to be done and much more conscious of the nearness and intensity of the threat on the other side of the Iron Curtain. For the present, at least, even the hardest-shelled Republicans among them have ceased to demand drastic reductions in foreign aid funds. But despite this change of mood, and despite the slogan that "this is for the stuff that General Ike has to have," some substantial surgery is certain. If Congress ultimately cuts about $1 billion from the $6.3 billion requested mainly for military aid in the Bill, and about $300 million from the $2.2 billion for economic assistance, the Administration will count itself lucky.

*

Besides the fight over the amount of money, the other big issue is how the Mutual Security Programme is to be run. Officially, and for public consumption, the Administration favours the present set of arrangements, but even the Secretary of State indicated that he did not feel strongly on the matter. Privately, in the Economic Co-operation Administration and, according to returning Senators, in General Eisenhower's headquarters, there is vigorous agitation for a change. Almost the only individuals with a vested interest in favour of the *status quo* are the staff of Mr Thomas Cabot, the State Department's Director of International Security Affairs, who is top man in the present heap, and the inept Mr James Webb, the Under-Secretary of State, who is, if not the architect, at least the curator, of the Department's malorganisation. Even they concede that the present system is monstrous on paper, but assert that it works out pretty well in practice. This latter statement should be discounted—and is.

As near as it can be figured out, a top committee under Mr Cabot in the State Department, the International Security Affairs Committee, runs foreign aid today. As chairman of ISAC, Mr Cabot represents the State Department; other members are the representatives of the Department of Defence and the ECA. Considering all appropriations for ECA and for military assistance, they jointly determine how the funds are to be divided, on a regional and national basis, and whether they are to take the form of finished military "hardware" or of dollars to further additional military production or to aid economic recovery, within the recipient countries. Decisions on the type and amounts of the military "end-items" are made by the Department of Defence, which is also in charge of their procurement and distribution abroad. ECA administers the economic, or dollar, component of the military aid funds and the sums available to it in straight economic appropriations (combined in the pending Bill).

It is almost certain that Congress will change this arrangement. It seems determined, whether logically or not, to create a new agency, replacing ECA but built around its organisation and staff, to conduct part or all of the foreign aid task. But this is the point of departure for the main controversy, lively although technical.

*

On the one hand are those who support the recommendations of two Presidential commissions, headed by Mr Gordon Gray and Mr Nelson Rockefeller. They would have the new agency conduct all the work now done by ECA, take over the State Department's operation of the Point Four programme for under-developed areas, guide the lending policies of the Export-Import Bank, and operate, or at least control, the foreign economic activities conducted by a score of other federal agencies. But the new agency would not have power over the military equipment furnished as part of foreign aid.

Supporters of the plan point to the advantage of a single agency co-ordinating most of the nation's foreign economic activity, but they insist that its authority cannot be absolute. For, they say, foreign policy in general must remain under

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

the direction of the State Department, which must have a controlling voice on broad questions of economic policy where they impinge on foreign policy as a whole. Similarly, the actual operations of military aid are technical matters that cannot help but be the Pentagon's task.

On such an analysis, a committee like ISAC is inescapable; there would still have to be a three-agency group, centred in the State Department, co-ordinating the Mutual Security Programme. About the only difference would be that ECA's successor would be bigger, with wider powers, and perhaps with the role of expediter and principal wielder of carrots and whips. Abroad, the administration would be much the same as now: the Ambassador in each country would be head of the team; under him would be the neo-ECA mission chief working on economic aid, and a military assistance group dealing with military hardware.

On the other hand are those who propose that ECA's successor be in charge of all foreign assistance, military as well as economic. Since the Pentagon would still have to conduct the technical operations of selecting and supplying military end-items, and since the State Department would still be in charge of foreign policy, a three-agency co-ordinating committee like ISAC would still be necessary. But in this case the chairman would be the head of the new agency, not a State Department man. More important, he, not the State Department, would control the purse strings. He would have Cabinet status and full responsibility for the whole programme, including the prime goal of foreign rearmament. Abroad, the neo-ECA country mission chief would work with, but not under, the Ambassador. He would have a military mission subordinate to him and would answer only to Washington.

The arguments for this plan are the same as those used three years ago to justify the independent status of ECA. It is contended that there should be a single unattached operating agency, working on a businesslike basis, where responsibility is centred, unified and undiffused at home and equally clear and monolithic abroad. The State Department, concerned with policy or "diplomacy," cannot and should not attempt to execute what are essentially enterprises "of business administration of great magnitude and complexity."

It is much too early to see how this controversy will be resolved. But if a forecast has to be made, perhaps the best basis, if an illogical one, for a guess is the fact that never has the State Department or its head been in lower esteem with the Congress. To take ISAC's functions away from it and give them to a new agency is for many reasons, including the political ones, an attractive course of action.

Television Round the Clock

Washington, D.C.

AMERICAN visitors to Britain are often aghast to discover that the BBC permits several hours of the day and evening to pass during which nothing is to be seen on any television screen because nothing is being sent out. In the United States, the notion that television should not begin at all until three o'clock in the afternoon and that when it has started, it should sign off, sign on, and finally retire for the night, like an elderly lady, at a little after ten, suggests an apathy verging on coma. This view would be taken, not only in New York or Los Angeles, each of which has seven different television stations competing for attention most of the livelong day and all the livelong night until after midnight, or in Washington and Chicago (four stations each) or in Philadelphia, Baltimore, Cleveland, Columbus, Detroit, and San Francisco (three stations each), but also in the numerous other towns which have only one or two stations.

Nevertheless, there would be a good deal of sympathy in America for a deliberate policy of assigning a higher priority to silence than to mediocrity, if this, rather than financial anaemia, were the real cause of British restraint. The results of the diametrically opposite policy are not always happy. The present era in American television, which prefers anything to a blank screen, is an outcome of the industry's fantastically rapid rate of growth. This, in turn, is largely explained by abundant venture capital, intensive and successful technology, the unfailing readiness of Americans in a period of prosperity to buy something new and promising and an absence (up to very recently) of materials shortages. Yet a pattern which has been discernible often enough in other contexts has made a conspicuous reappearance. The equipment enabling the millions to see and hear television programmes in their homes has been created swiftly and efficiently. But there are not enough television programmes that are worth seeing and hearing. There are nowhere near enough; and since the whole system, being geared to the effort of advertisers to secure and to divide among themselves the continuous and unflagging attention of their audiences, counts silence as the ultimate horror, the door to mediocrity is wide open.

*

Lively dinner-table arguments can be started almost anywhere in America with a brief introductory sentence or two on the worst television programme one has ever experienced. Almost everyone present will claim to have seen one worse. It is no pleasure to report that numbers of aged and infirm British films, exhumed from heaven knows what vaults and bought cheaply for dollars, often figure in these grim reminiscences, thus hurting the chances of new British offerings.

Television stations in America use these films, and comparable vintage material of Hollywood origin, because they have not so far been able to come to terms with the American film industry. One of the unresolved questions is whether the revenues Hollywood would receive, if it sold or rented newer films to the television stations, would come within a mile of compensating it for the further ruin that would be visited upon the nation's cinemas whose average attendances have declined by 25 per cent or more where television has got into its swing. Another is whether a way can be found of satisfying the insistence of Mr James Caesar Petrillo and his musicians' union on sharing the money made out of the televising of all films carrying sound tracks.

The impasse seems unlikely to last indefinitely. One possible way around it has already appeared. In Chicago earlier this year, by permission of the Federal Communications Commission and on the initiative of the Zenith Radio Corporation, a new system called phonevision, or PV, was tried out with what appear to have been highly successful results. Nine moving picture companies furnished ninety respectable films which were telecast in a scrambled form. Three hundred Chicago families with television sets in their homes were invited, for a period of three months, to dial the telephone company and request from it a signal, supplied over the normal telephone wire, which unscrambled the

telecast at a cost of $1 a film. The quality of the reception was reported to be excellent, and the indications were that if the revenue received during the test were projected over 10 million families (a conservative estimate of the number with television sets) each worth-while film would bring in something like $2,500,000. The prospect is that a good deal more will be heard of PV. Not the least of its advantages is that it can function without interruptions for advertising.

A flow of entertaining films would go some of the way to mitigate the worst aspects of the present in television. It would help to remove some of the hastily thrown together, under-rehearsed, variety programmes, the terribly bright hostesses interviewing the terribly dull visitors, the more laboured serial stories, the more painful programmes in which children are required or permitted to sing and dance, and the slipshod murder mysteries. It might even reduce the number of hours now devoted to all-in wrestling—a sport, if that is the word, to which television in America has given a new lease of life.

Mediocrity is made inevitable by a system which has too quickly produced too many television stations broadcasting for too many hours a day. And mediocrity is most unlikely to be banished (if the Hays Office and its successors in Hollywood are to be taken as a guide to what is to come) by the new movement to establish a "TV Code of Decency." It is no doubt desirable that what spokesmen call "excessive nudity" should not be allowed to intrude by way of the television screen into the American home, and that other manifest abuses of the new industry should be curbed. The trouble is that one taboo breeds another, and the accumulation of taboos is apt, after a time, to produce for characters on the screen rules of behaviour which bear less and less relation to life as it is lived by characters off the screen.

*

Nevertheless, when all of this has been said, it remains true that, for anyone who is prepared to sift and select, there is great talent, originality, charm and inventiveness to be discovered in American television programmes. There are first-rate, well-rehearsed variety programmes (such as "Garroway At Large" from Chicago); there are sprightly and entertaining interviews (such as "Meet the Press" and most of Miss Faye Emerson's programmes); there are subtly-conceived serial stories full of character (such as "I Remember Mama"); there are good children's programmes (such as the best Howdy-Doody and Hopalong Cassidy instalments); and there are first-rate murder mysteries (such as most of the stories in the "Suspense" series). What television in America does best will always be a matter of opinion. For one viewer it will be the baseball games or the boxing; for another it will be the plays or, rather, the best of the plays.

New kinds of programmes also are being evolved. Mass was televised in Boston a few weeks ago, and the new cathedral at Newark, New Jersey, is being equipped with lighting for television. The Department of Defence in Washington has a weekly programme which appears to have taken into consideration the recruiting possibilities of television. The Metropolitan Opera organisation in New York is to televise special studio productions. The result of an appeal by education authorities for a generous allocation of channels for "educational programmes" (the nature of which has not so far been very clearly defined) is now awaited. The televising of the Kefauver Crime Investigating Committee's hearings, immensely popular though it was, has raised some awkward doubts whether the technique is one that serves the end of justice; but it will be surprising if there are not more experiments of this kind. And whether or not Congress is ever televised (as the State Legislature in Oklahoma has been), it is not inconceivable that the questioning of Members of the Cabinet before the television camera either by members of Congress or newspapermen, which is now a fairly frequent occurrence, will develop into a more regular and more formal event.

American Notes

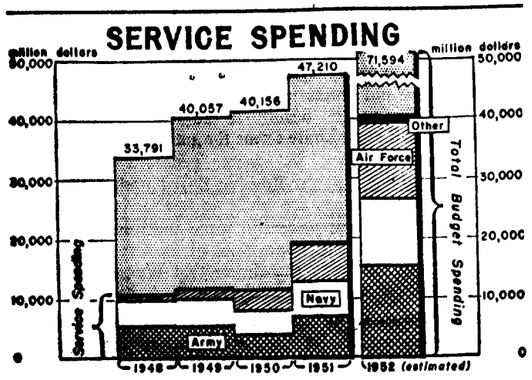
Controls Roll Forward

It was always wishful thinking to hope that the Senate and House conferees on the amendments to the Defence Production Act would cook up a mixture more to the Administration's taste than either of the two versions they were given to work with. The dish they brought out of the committee room at the end of last week, and which was quickly approved by both houses, was the compromise that might have been expected. President Truman had no choice but to swallow it, for the alternative was to do without a Defence Production Act entirely and to allow to lapse the system of priorities and allocations through which manufacturers are being guaranteed the supplies they need for the rearmament programme.

These powers are left undisturbed in the amended Act and it also contains rent controls, although it does not strengthen them as the President had requested. Restrictions on mortgages and instalment credit are continued but, to ease the difficulties of dealers in durable goods, the Act stipulates that hire purchase terms for automobiles and household equipment may be more generous than those established by the Federal Reserve Board under last year's Act. Other concessions are made to special interests, such as the exemption from price and wage controls of bars and "beauticians" and the imposition of import controls on dairy products, including the cheese that Wisconsin farmers can make neither so cheaply nor so tastily as can Europeans.

But it was for the sake of the cattlemen and meat packers that Congress struck its sharpest blow at the American consumer. It abolished the slaughtering quotas for livestock, which from the experience of the last war are considered essential if price controls on meat are to be enforced. This may perhaps be reconsidered, but Congress definitely forbade the further reductions in the ceiling prices on beef, which had been planned during the next few months and which would have affected butcher's shops as well as packing plants. The Act does in theory permit "roll backs" on the ceiling prices of non-farm products and services, but in practice it ensures that these will be "rolled forward." For it requires that, when the heights of these ceilings are fixed, allowance must be made for all increases in costs between the Korean outbreak and the present time and that wholesalers and retailers must be permitted their customary percentages of profit. In most cases, the present price ceilings are based on costs last January, and the stabilisation authorities have hitherto tried to limit profits to a "dollars and cents," instead of a percentage, margin over costs.

*



The exact effect of the new Act on the present price ceilings is not yet clear and, since by no means all prices are pressing against the ceilings at the moment, it will not necessarily mean an immediate rise in the cost of living. But if the Administration's forecasts of renewed inflationary pressures are fulfilled, and it is difficult to see how they can fail to be, then the "grave deficiencies" which Mr Truman

condemned when signing the Bill will become only too apparent. When they do, Congress will probably rush to repair them—in any case the new Act expires next June—but whether it will be able to do so quickly enough to protect consumers from the damage that lies in wait for them is another matter.

* * *

Air Force Supremacy

The death of Admiral Sherman has come, to the dismay of the Navy, at a moment when the Air Force is once more spreading its wings. Admiral Sherman had rebuilt the confidence and prestige of the Navy after the fiasco of the Congressional hearings on the B-36 bomber. His brilliance and broad-minded approach—he was a strong supporter of service unification—will also be greatly missed in the Joint Chiefs of Staff, who, in drawing up this autumn the military budget for fiscal 1953, must reckon with a new Air Force demand for expansion. The recent truce among the services has owed a great deal to the concept of "balanced forces," which in effect has meant that the available funds were shared out more or less equally among the three, whether or not this was the ideal division. In a recent press conference, however, General Marshall conceded that the concept could no longer apply to the Air Force, with its special responsibilities for the defence of Europe.

Under General Marshall, the outright inter-service hostilities of two years ago are unlikely to break out again, but the truce is becoming an uneasy one. The Air Force, which now has 87 air groups (varying in size from 18 heavy bombers to 75 fighters) is scheduled, if the schedules, which are now more than 20 per cent in arrears, can be met, to reach 95 groups by next June. It is now urging that the target be raised to 138, and suggesting that the funds to make a start can be found by increasing defence requests to $70 billion for the fiscal year 1953 and allotting the lion's share, some $40 billion, to the Air Force. As the table shows, the Army and Navy would have to be content with

NEW DEFENCE BUDGET AUTHORISATIONS
($ Billion)

	1950	1951	1952*
Army	4·3	19·5	20·7
Navy	4·3	12·4	15·1
Air Force	5·4	15·2	19·8
Defence Department	0·2	0·5	0·5
Public Works	...	...	4·5
TOTAL	14·0	47·6	60·7

* Requested.

—or resigned to—much less than they are now asking for 1952; they would be limited, if not reduced, in size.

The Air Force, and its friends, such as Senator Lodge, who have raised the issue inside and outside Congress, argue that Russian development of long-range bombers demands more fighters for American defence, while the great predominance of Russia in the air over Europe means that it is useless to raise land forces unless they are guaranteed adequate tactical air support. Aircraft for such operations, which proved their value overwhelmingly in Korea, are what the Air Force is weakest in; in the years when economy made a choice necessary, the money went on strategic bombers.

Such an expansion of the Air Force, everyone agrees, could not materialise for several years, even if everything were concentrated on it, at the cost of higher taxes, tighter controls and starvation for other projects. Even then such a force might be obsolete before it was needed. General Vandenberg may visualise a great new air armada keeping the peace as the British Navy once did, but others fear it might leave the Air Force "all dressed up, with nowhere to go," thus encouraging advocates of a preventive war. The mere maintenance of a 150-group Air Force, Senator Lodge's target, would cost about $40 billion a year.

The real danger, however, is of the revival of the Air Force's old belief that air power, alone, can win any war and of the political appeal of a "cheap war." Mr Truman hopes to keep the squabble inside the service family this time, but even with the best intentions of the service chiefs and some satisfaction of Air Force demands, this may be impossible. Senator Taft has just this week revived his old contention that air and sea supremacy can make the raising of large land armies unnecessary; Congress is already vexed and alarmed to discover that the six divisions it approved for Europe last winter are likely, with supporting troops and airmen, to be nearer 350,000 men than the 200,000 it believed it was accepting then. "The sky's the limit" for the Air Force could not be represented, even on the Republican platform, as a cheap plank, but it might be presented as a substitute for conscription, universal military service and other disagreeable necessities.

* * *

Misfire in the House

Congress hopes to have cleared its decks of three "musts" before October 1st; if by then it can dispose of appropriations, foreign aid, and the tax Bill, it can adjourn with the President's promise that, barring an emergency, he will not call an autumn session. But appropriations are woefully behind; because not a single money bill has been sent to the White House, though the fiscal year is already a month old, another stop-gap has had to be passed, extending until August 31st the right of government departments to continue meeting their pay-rolls and other expenses. One thing which is making the going disgracefully slow this year—and it is never speedy—is the determination of Congress to enforce savings all down the line, with the hope of justifying a smaller tax increase than the President asked for.

If Congress possessed the joint budget unit which the Expenditures Committee recommended last week, Congressional budget-paring might be both speedier and more effective. But as things are, the temptation is to adopt such monstrosities as the Jensen amendment, added by the House to all money Bills, which requires each department to fill only three-quarters of its staff vacancies. There is something to be said for Senator Douglas's move to reduce holidays with pay in the civil service from 26 days (five and a half weeks) to 20; salaried staff in private industry are lucky if they get three weeks' paid holiday. But the Jensen amendment lumps in the under-staffed with the over-staffed department, assuming that because the number of federal employees has risen by over 500,000 in the past year (for obvious reasons) a cut all round is in order. The Senate has taken its stand on the Ferguson amendment, which reduces all personnel funds by 10 per cent, but even this is proving unacceptable to the House, particularly to its Republican members, and is holding up the few money bills which have been otherwise agreed.

Where the State Department appropriation was concerned, however, it was a rifle and not a shot-gun which the House Republicans favoured. The bead was drawn directly on Mr Acheson, by prohibiting payment of salary to a department head who, within the past five years, had been associated with any firm representing a foreign government. When the moment came, however, few Republicans and hardly any Democrats could be found willing to pull the trigger; the amendment was defeated by 171-81. No vote of confidence in the Secretary of State was implied; it was disgust rather, with an approach which was clearly an invasion of the powers of the President and amounted to an unconstitutional bill of attainder.

* * *

Tin—Test Case

Mr Stuart Symington, the Reconstruction Finance Corporation's new broom, reported last week that at least one corner of the commodity markets had been swept clean of international cartels. He told the Senate subcommittee which in March had accused its country's allies of "gouging" the American taxpayer, by pushing up the prices of strategic materials, that tin had been made a test case and had come through with shining success, proving that the United States could force prices down to fair levels. This was the metal about which the sub-committee had been especially concerned and on its recommendation the RFC was made the sole importer of tin for commercial purposes. Both the corporation and the buyers for the government stockpile at once ceased to purchase tin and the RFC began to undercut the world market by selling its stocks to American consumers at less than Singapore prices. By the middle of June New York prices had dropped to $1.06 a pound from $1.80 in March, and world prices had fallen similarly. At this point Mr Symington intimated that the "reasonable" price level at which he was prepared to resume buying abroad had almost been reached; it was understood to be $1.03, at which the RFC has just begun to sell.

Bolivia, which supplies tin for the RFC's smelter in Texas and relies on its sales of the metal for its dollar exchange and such prosperity as it has, was the first tin-producing country on which Mr Symington smiled—unexpectedly warmly, for its new contract with the RFC provides for a price of $1.12 a pound. But this, it is said, has nothing to do with the uncertain political situation and the strong Communist influence in that country. Mr Symington hastened to explain that the price was entirely accounted for by Bolivia's exceptionally high costs, and that other sellers were not to expect similar generosity. He has always insisted that the RFC should not pay unjustifiably high prices in order to further the State Department's foreign policy or to supplement aid to under-developed areas.

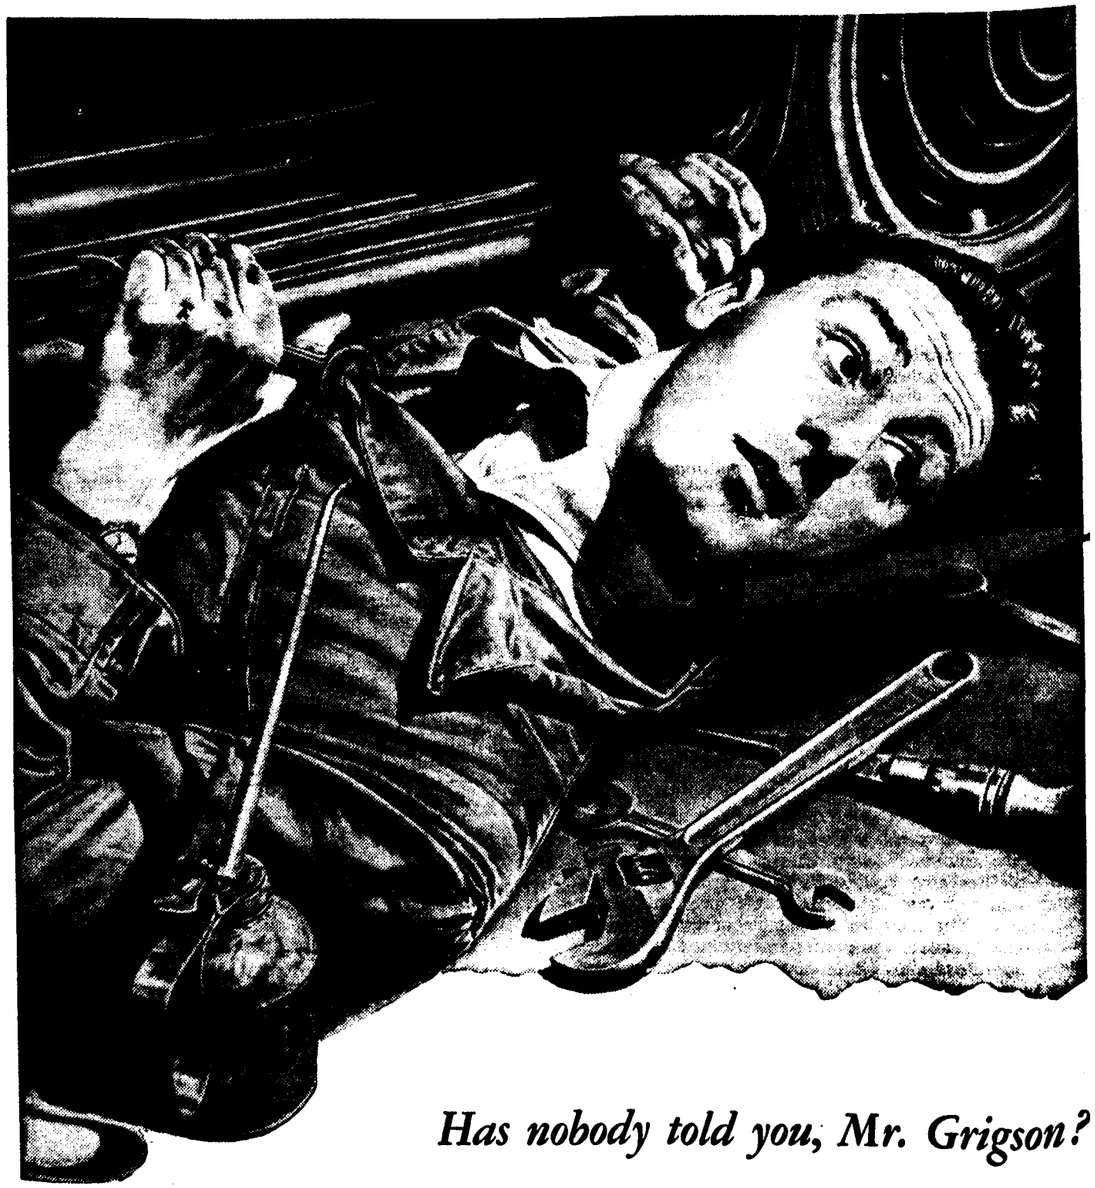
Mr Symington, using the methods of the propaganda war as well as of the price war, also took care to dash the hopes of those who argue that, even with its present controls on consumption, the United States, which must import all its tin, cannot live on its fat for ever. He gave figures showing that there would be a world surplus of tin next year and declared that the United States still had enough tin to be able to withdraw from the market at any time if world prices should rise again. Furthermore, it has become possible to reduce purchases for the stockpile from the Belgian Congo to merely token amounts, on the excuse of high prices, as the result of the cut of over 30 per cent in the total quantity estimated to be necessary for a wartime reserve. This, it is suggested, means that new methods of economising in the use of tin have been found; in particular it is possible that before long aluminium may be produced cheaply enough to be used as a substitute for tin in preserving food.

Shorter Notes

The St Lawrence Seaway and Power project, which was launched on Congress this year for the fourth time with a real chance of reaching port at last, has foundered on the first reef it met, the House Public Works Committee, where it was unexpectedly defeated by three votes. It is possible, however, that it may be refloated if Canada decides to build a seaway entirely on its side of the river, as the government of Ontario is urging.

*

In the last six years it has cost the Commodity Credit Corporation, and therefore the American taxpayer, about $1 billion to keep the prices of farm products high. It would have been more, had not cotton recently turned out to be a money maker. Nearly half the total sum was spent on potato price supports, a programme which has just been terminated.



*

Last May's price war, which flared up in the big New York retail stores, spread to only about 40 other cities and became serious in only five of them. By the end of June it had died down completely and prices almost everywhere had returned to the old levels. Congressional committees, which were concerned at the harm that might be done to small businesses, have now decided that the price war is no longer worth investigating.

THE WORLD OVERSEAS

Australia's Future as a Primary Producer

(From Our Melbourne Correspondent)

IT has come as a shock to complacent and well-fed Australians to experience, as they have experienced this winter, a severe shortage of butter. Australia was recently treated to the amazing spectacle of people rushing to send thousands of parcels of butter by air freight from Brisbane and Melbourne to their luckless friends in New South Wales, where butter had disappeared from the shelves of retailers.

Everyone knew that the shortage was only temporary, if none the less exasperating; but behind the disappearance from the grocers' shelves of a basic foodstuff, which was generally thought to be in permanently good supply, there lies the story of the failure of the farming industries of Australia to meet the increasing demands for their products both at home and overseas. At the same time, manufacturing industries have been rapidly expanding and many contend that this is being achieved only at the cost of neglecting primary industries. This trend has led to the rather startling but authoritative prophecies that meat, butter and other foodstuffs might have to be imported within the next ten years.

Australia, as a great producer of primary commodities, is basically dependent upon achieving a large export income to pay for the wide variety of imported goods which play such a large part in maintaining a high standard of living. Farm products account for more than 80 per cent of the country's overseas trade and there seems little likelihood that they will be displaced from this dominant role in the foreseeable future.

Since 1939, however, there has been no significant expansion in the output of Australia's great primary industries. Increases have barely kept pace with the growth of population, and in some cases there have actually been falls in output. At the same time, since 1945 the wartime expansion of secondary industry has gathered momentum until today Australia employs a greater proportion of its population in manufacturing than almost any other country, giving it the doubtful honour of being, on this count, probably the most highly industrialised country in the world.

The following table shows the trend of production in Australia's chief primary industries over the last twelve years. It is noteworthy that there has been little response to the considerable increases in price which have taken place over the period:

Year	Wool	Meat	Whole-milk	Butter	Cheese	Wheat
	Mill. lb.	'000 Tons	Mill. Galls.	'000 Tons	'000 Tons	Mill. Bus.
1938-39	984	966	1,189	203·5	29·3	155
1939-40	1,128	950	1,254	212·0	31·2	210
1940-41	1,142	865	1,190	192·9	26·8	82
1941-42	1,167	1,027	1,105	167·6	30·1	167
1942-43	1,151	1,057	1,130	171·2	36·1	156
1943-44	1,169	1,043	1,067	156·3	35·8	110
1944-45	1,016	984	1,013	142·0	34·6	53
1945-46	936	805	1,077	150·4	41·2	142
1946-47	977	885	1,080	143·3	42·4	117
1947-48	973	947	1,173	162·0	41·5	220
1948-49	1,031	991	1,213	165·8	43·2	191
1949-50	1,165	1,051	1,254	173·2	44·9	217

(*Source:* Commonwealth Bureau of Statistics.)

Against this relatively static output there has been a continually rising consumption of farm products because of the postwar expansion in the community's purchasing power and the rapid increase in population. The inevitable result is that there must be less to export, if no significant expansion in production is achieved.

Demands of Increased Population

In 1949 and 1950, the population of Australia increased at a rate of about 3¼ per cent per annum. Such a high rate of increase, according to Mr Colin Clark, Director of the Queensland Bureau of Industry, has not prevailed since the early days of settlement, either in Australia or in any other country. The demands made by this increased population on the food resources alone are enormous. Before the Government's recent decision to reduce the flow of immigrants the Commonwealth's Bureau of Agricultural Economics estimated the additional quantities of foodstuffs required by 1960 to meet the annual needs of the additional population assuming that this increased at its present rate of about 180,000 annually. These increases, together with the percentage increases in production required by 1960 to keep exports from falling below the average of the last four years and maintain domestic levels of consumption, are shown in the following table:

	Annual Needs of Additional Population, 1960	Increase on Average Production, 1946-47/1949-50
Beef and veal	220,000 tons	40 per cent.
Mutton	105,000 tons	58 ,,
Lamb	32,000 tons	23 ,,
Pigmeats	70,000 tons	78 ,,
Eggs	64,000,000 doz.	31 ,,
Sugar	214,000 tons	28 ,,
Citrus fruits	4,000,000 bushels	61 ,,
Dried grapes	9,500 tons	15 ,,
Total milk*	438,000,000 gallons	37 ,,

* Including butter, cheese, milk and milk products.

Australia has been able to increase the volume of farm production by about only 10 per cent above the average of the five prewar years. Against this, the United States can point to an increase in output of farm products of 30 per cent since prewar and Canada an increase of about 20 per cent. At present, the rate of increased production of farm products in Australia is not sufficiently great to meet the requirements of the influx of new people without reducing the quantity of goods available for export. And this has far-reaching effects upon the Australian economy, which is extremely sensitive to fluctuations in export income, and upon the British economy, the largest purchaser of Australia's food exports.

Strange as it may seem to people outside Australia, who may fancifully visualise the continent as a "vast empty space" just waiting development, the lack of available land makes clear limitations to the development of Australian farming. The empty spaces are not only vast, but they are also mostly arid. Only 7½ per cent of Australia, or about

144 million acres, has a climate, soils and topography suitable for cropping and intensive livestock production. In the semi-arid grazing areas, which comprise 42 per cent. of the land area, the problem is not so much one of expanding as of maintaining production. The day of easy exploitation of the land by the rugged pioneer is over and the call today is rather for large development schemes supported by large resources of capital.

There is tremendous scope for expansion of rural industries by means of irrigation, more intensive use of land, greater application of policies of pasture improvement, fodder conservation and rabbit control, together with development of transport in the inland regions. To meet the immediate demands of an expanding population, there will need to be a considerable increase in productivity in established areas, followed by the more hazardous development of the outback. Primary production in Australia is hampered by acute shortages of materials and equipment and the labour to use them. There is great competition for scarce resources from heavy Government and private investment programmes.

In the meantime, expansion of manufacturing industries proceeds apace, despite difficulties in obtaining raw materials and equipment. If the vitality shown by manufacturing industries could be shared by the farming industries, there could be grounds for feeling that a "right balance" between the two could be achieved. As it is, farming is making slow progress, and must continue to do so unless positive action is taken to stimulate production of those commodities which are primary and basic in the full sense of their meaning.

Signor De Gasperi's Seventh Innings

[FROM OUR ROME CORRESPONDENT]

THOSE who cherish the ambition of shortly furnishing Italy with a new and strikingly outlined political profile, whether turned sharp to right or sharp to left, have been watching with quiet complacency the proceedings of Signor De Gasperi in readjusting the poise of his full-faced model of government, so that any side-glance to one side is decently compensated by one to the other. The seventh De Gasperi government, in fact, varies from its predecessor only by two or three personal replacements and by an inscrutable revision in the machinery of the economic ministries. After variegated rumblings about Trieste, about agriculture, and about tax reform, the crisis of the sixth government found its public expression in controversies about Signor Pella's handling of the currency, and this circumstance is now reflected in a reassortment of offices between Signor Pella, hitherto Minister of the Treasury, and Signor Vanoni, hitherto Minister of Finance (that is, essentially, Minister of Taxation). Signor Pella will now become Minister of the Budget, a post specially created for Professor Einaudi some years ago, and left vacant since he became President of the Republic. Nobody knows of any difference between the policies of Pella and Vanoni, who have worked so closely that they inhabited contiguous flats, nor is it at all clear how many functions of the Treasury, which nominally now goes to Vanoni along with the Finance Ministry, will be switched to that of the Budget. Most evidently these changes are a mere by-product of the change of government, which in economic policy leaves things just as they were.

Count Sforza has been sacrificed to public opinion, or one might say to the caricaturists. In his artless public appearances, he scarcely troubled to belie their presentation of him as a preposterous feudal survival, so that his hard work and efficiency behind the scenes, his shrewdness and steadiness of vision, have been known to very few. Even here, however, the dropping of this diplomatic pilot is said to betoken no shade of deviation from the previous course. It is the agitation about Trieste, the belief widespread in Christian Democrat circles that Jugoslavia is being helped by Britain to filch a big bite of Italy's expected reward for good Atlantic behaviour, and Count Sforza's failure to appear sufficiently agile in interfering with that sinister deal, that have persuaded Signor De Gasperi to effect what must be a more painful breach of partnership than he can allow it to appear. Count Sforza's retention of an honorific post in the Cabinet will hardly give him a voice in the handling of affairs, so that the prevalence of discretion, realism and of the wider view over Christian Democratic eagerness to break even with the extreme right in militancy over the Trieste question must now depend upon Signor de Gasperi's notable strength of character. (The Communists, of course, are a third competitor on the slightly narrower ground of hostility to Tito.)

No Rows in the Piazza

The other Cabinet changes have displaced the keen reformer Signor Segni from the Ministry of Agriculture, to the pleasure of opponents of the agrarian reform; but his place has been taken by the younger and possibly still keener Signor Fanfani, and he has himself displaced Signor Gonella, the most Vatican-minded of the Ministers, from the Ministry of Education.

Never has there been a circumstantially quieter crisis, partly, no doubt, because physical heat at this season dissuades the youth from the ritual rows in the piazza. It would seem, however, that there is some deliberation in the decision of the left and right oppositions to let Christian Democracy stew this time, physically and morally, in its own juice, with the little Republican party as sole seasoning. The moral flames of the majority party's internal disputes have been quite warm enough in themselves. It is striking that the great hammer of the political infidels, Signor Mario Scelba, who a year or two ago drew the loudest applause of all at Christian Democratic congresses, was in the recent crisis mentioned only as a head which De Gasperi might be ready to sacrifice to somebody if Count Sforza's did not prove valuable enough. The piazzas were so quiet that the party almost forgot the existence of this resolute crusader who has had to cope with the forces of disorder when they thought it worth while to exert themselves. It will be Signor De Gasperi's greatest triumph if he can now show the extremists on both sides that their present complacency is based upon a gross under-estimate of Christian Democracy's powers of moral recuperation. The Social Democrats and Liberals who have refused to enter the seventh De Gasperi government would be shown up as making the same error.

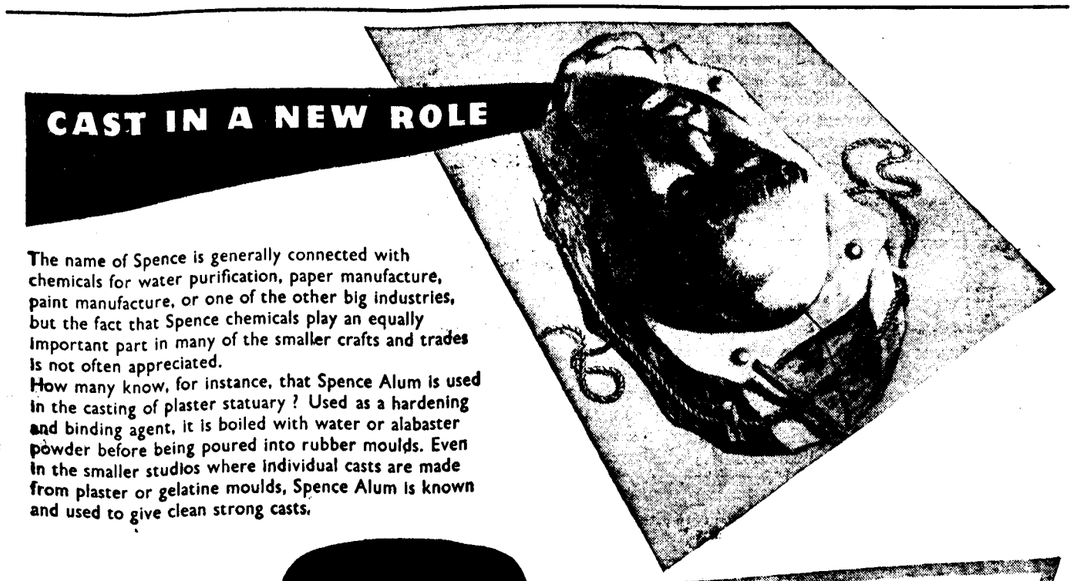
The Hungarian Deportations

[BY A CORRESPONDENT]

ON the night of May 20-21st the Budapest secret police suddenly rounded up some hundreds of persons. Whole families were taken at a time, and after being given a few hours to pack immediate necessaries, were taken by train to Debrecen. Here the children were separated from their families; the adults were loaded on to trucks provided with authorisation to enter the prohibited zone on the frontier with the Soviet Union, and driven away north-eastward. Nothing has since been heard of them.

This proved to be only the first step in a process of mass deportation. A second convoy was sent off on May 23, and since then convoys have been leaving Budapest three times

weekly. In spite of official statements to the contrary, it seems well attested that if the process has stopped, it has only done so recently: reliable sources stated that persons were still being deported from Budapest a few weeks ago, and a similar operation has been going on in the other larger towns of Hungary. It even appears that the net has been cast over the small towns and remote country districts.



The procedure is always the same, except in detail. The police arrive at night, with a "notice of expulsion." The expellees are given a short period—in the most favourable case 24 hours, in others as many minutes—to pack a quantity of effects which again varies from some hundredweight to a few pounds. They are then taken in lorries to a railhead and put into trucks. So far as is known, with the exception of the first batch, the deportees have, at least for the present, been kept in Hungary. As a rule they are taken to the area between Szolnok and Debrecen. The aged, young children, etc., are, in favourable cases, quartered on peasants, who are made responsible for their maintenance. The remainder are put in camps, where they are employed in forced labour on public works or on the state farms.

Many Humble Victims

The first open and direct admission that deportations were taking place was made on June 15th, after wireless stations outside Hungary had published the facts in considerable detail. A government speaker in Budapest then announced that 924 families had been deported. These, he said, consisted of "6 ex-Princes, 52 ex-Counts, 41 ex-Barons, 10 former Horthyite Ministers, 12 Secretaries of State, 85 Generals, 324 other army officers, 67 officers of the gendarmerie and police, 30 industrialists, 45 bankers, 53 factory managers, 93 wholesale traders and 105 ex-landed proprietors, in each case with their families." He implied that the operation was now concluded. This was untrue, and in other respects also he suppressed much of the truth. The number of victims, even by the time he spoke, was probably not less than 15,000, nor were they at all limited to ex-aristocrats, high officers, or other leading supporters or beneficiaries of the old regime. They are known to include many humble enough persons: small employers in trade and industry, doctors, teachers, even some priests and at least one rabbi. In short, the whole ruling class of the former Hungary, rank and file as well as leaders, so far as it has not positively and actively identified itself with the new regime, is being rounded up and liquidated by a process of quick or slow extinction. The process is proving quick in many cases, for many persons served with expulsion orders have committed suicide, and the conditions under which the deportees are kept results in an exceedingly high death rate.

A Long-Planned Move

The calculations which led the present rulers of Hungary to take this step seem to have been long-term, and completely cold-blooded. There was no question of an immediate danger to the state. The majority of deportees are "dependants" of the various individuals whose qualities put them on the list (and many of these individuals are dead or have long since vanished into the Soviet Union). Moreover, every "Horthyite" General, Minister, etc., was, in 1945 and 1946, subjected to a most thorough screening by an extremely hostile "People's Court," which condemned to execution or a long term of imprisonment any person in whose past record the smallest flaw could be found. That they had survived this scrutiny was a guarantee of their good character, and since then their every move has been watched by an Argus-eyed police. Nor has the Government now alleged any misdemeanour against any of them, nor

even cooked up a story of conspiracy, which would, indeed, have been hard to make even remotely plausible, in view of the great age of many of the deportees, and the sex and characters of others. It has invoked a paragraph of the Hungarian Military Service Act of 1939, which empowered the authorities, on proclamation of a state of emergency, to take into custody, or expel from certain areas, "dangerous, work-shy persons and elements harmful to political, social and economic life." The "state of emergency" appears to be that which was proclaimed on August 1st, 1939, and has never been repealed.

The move must have been decided some time ago, for on February 28th Gero, the President of the National Economic Council and one of the two or three men in Hungary who have any voice in, or at least fore-knowledge of, policy, made a public reference to "remnants of the exploiter class, various *déclassé* elements," "considerable numbers" of whom, he said, were not productively employed, but spent their time in "speculating, undermining our supply position, and spreading the various lies and slanders of the imperialists against our people's democracy. . . . Obviously we must put an end to this condition by decisive means and make sure that these elements are transferred from the field of speculation to that of productive work." I. Kovács, Chairman of the Presidential Council, seemed to echo this allusion on May 22nd, when he announced that "the rotten liberal attitude towards the enemy must be liquidated. . . . Class-alien and unreliable elements must be kept occupied in specialised jobs under supervision. It is not irrelevant to us where the enemy and the doubtful elements are hiding. We must choose their place of work, and they must not penetrate where they will."

It is impossible to say whether any specific event made the Government decide to put this long-conceived plan into operation. It has announced that the flats of the expellees have been given to Stakhanovite workers and workers with large families. If this is true, and the occupants of the flats are not Russians, the Government may have thought that the expulsions might serve to kill two birds with one stone: they might finally extinguish the last survivors of a class which stood for something different than the present regime, and also reduce the discontent with the regime which for the last year has clearly been considerable among the industrial workers themselves.

The Twelve, the Six, the Five and the Three

[FROM OUR PARIS CORRESPONDENT]

As the continent goes away for its summer holiday, the stage is set for the second act of European integration. In Paris, the undisputed centre of the higher planning, the twelve-cylinder brains of international functionaries will be turning over steadily during August and September. Although a temperature of 107.6 has already been recorded in Cordoba, it is hoped that Paris will be spared the experience of the constituent conference of the Organisation for European Economic Co-operation in 1947 when the thermometer stood in the hundreds.

The drive towards European unity began in earnest on May 9, 1950, when M. Schuman proposed the pooling of Europe's coal and steel industries, although Mr Churchill's original conception of a European movement, and in particular of a Franco-German *rapprochement*, came as early as 1946. Since May of last year the Schuman Plan treaty, a constitutional document of an entirely new type, has been elaborated and signed by the governments of France, Germany, Italy, Holland, Belgium and Luxemburg and now awaits ratification by those countries' parliaments. A second phase of the process of integration opened with the decision taken by the North Atlantic Treaty Organisation in Brussels last December that Germany should be associated with the 12 member states in the defence of the European continent. This decision gave rise to two parallel and rival consultations: the Petersberg conversations between the three powers occupying Germany and a German military committee on a German defence contribution viewed in purely German terms; and the Paris conference on a European army between delegations from France, Germany, Italy, Belgium and Luxemburg. The Petersberg report, which virtually rejected all the limitations upon a rearmed Germany envisaged in Brussels, has been in the hands of the Three for several weeks. The Paris report, which contains a large area of agreement between Germany and the other four participants as to the manner of Germany's integration in a European army is now before the governments of the Five. Another and most important consequence of the Brussels meeting of Nato was the establishment in Paris last May of a financial and economic board to assess the economic burden of the armaments programmes of the Twelve. The FEB has now completed the examination of the national burdens and is compiling its report for the Nato conference in Ottawa in September. Germany, which is not a member of Nato and has as yet no defence programme, will figure only indirectly in the FEB's report.

Tying-up Loose Ends

Provided a French government is formed fairly soon, the planners foresee the following ideal timing of events, whereby the loose ends of the tangle of defence diplomacy will be neatly rolled into the Atlantic-plus-European ball. The Five of the European army conference will, by courtesy of the Three occupying Germany, as soon as possible sign a treaty establishing an integrated continental defence force containing Germans. (Before this can happen the Paris conference, which remains in session, must iron out the outstanding points of disagreement.) The resulting army of the Five, having received the blessing of Nato in September, will then gradually take form and come under the command of General Eisenhower alongside the American, British, Canadian and other European forces at present under SHAPE. Continental officials stress the economic importance of the single military complex, which will rest on the single economic complex of the Schuman community (less Holland, which has hitherto remained outside the European army as an observer). The Schuman community will be finally consecrated by the ratification in the autumn of the Schuman Plan treaty by the parliaments of the Six. It is believed in Paris that neither the opposition of the French steel industry, which is represented in parliament within the Independent bloc, nor that of the Communists, will muster enough votes from other groups to prevent ratification in the National Assembly. The same assumption is made of the Federal German industrialists, Socialists and Communists. However, ratification of the Schuman Plan by Germany depends, it is well realised, upon the goodwill of the British Government, which must somehow be prevailed upon to withdraw its curious proviso that the Ruhr Authority (which compulsorily exports German coal) should remain in being until Germany agrees to deliver a satisfactory amount of scrap to Britain. For the condition of German ratification is certainly the abolition of the Ruhr Authority, to which the United States and France, the other two occupying powers, have already agreed.

When all these things and some others have been done it is expected that Marshal Stalin will be confronted with an Atlantic alliance in which Federal Germany will play a contractual military and economic role and Marshal Zhukov by an Atlantic defence force in which the European army anchored to a European economic community will prove an increasingly effective component.

What is a major road, Major?

A road for busy people who want to get somewhere quickly.

Aren't we busy?

I see what you mean! But I can't drive the old car too hard—she still isn't getting the petrol she'd like.

What petrol would she like?

I always ran her on BP in the old days.
Will do again when I can get it.

When *will* BP be back, Major?

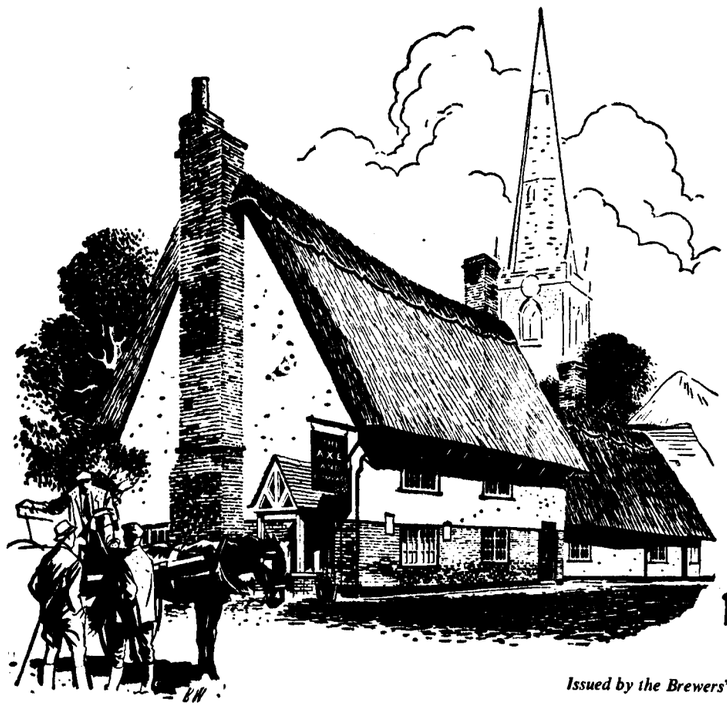
There's many a motorist would give his right mudguard to know that, my boy!

BP is the trade-mark of

ANGLO-IRANIAN OIL COMPANY LTD., whose whole organisation is behind it.

"Everything but pack your bag"

Let your local Travel Agent organise your flight to Australia or New Zealand by British Commonwealth Pacific Airlines.



Why should you worry? As long as you catch the plane (and they fly so often you can't miss by much!) there's nothing left for you to do but pack your bag. You can even sleep while you fly across the Pacific from San Francisco or Vancouver via Honolulu and Fiji. Yes, you can—B.C.P.A. has the most comfortable sleepers on earth—in the air! (No extra charge for this sleeper service luxury.)

Excellent connections are available from London, Glasgow or Shannon via New York or Montreal. And the fare's no more than by any other air route.

VIA NORTH AMERICA AND BCPA

FARES: *Sydney £260 single, £468 return. Auckland £279 single, £502.4.0 return. (Includes dollar allowance for transit expenses.) Book through any accredited Travel Agent or through B.O.A.C., our General Agents in the U.K. (telephone: VICtoria 2323).*

BORON

PURE BORON has few uses, but the compounds of this element are of great value to industry, sodium tetraborate, known to most people as 'borax', being by far the most important. Borax was originally found in Tibet, but the bulk of the world's supply now comes from California, where kernite, a crude form of sodium borate is mined from a deposit 4 miles long and 100 feet thick lying beneath the Mohave Desert. Borax is used to make porcelain enamels for baths, refrigerators and basins. It is important as a flux in brazing and welding, and in the refining of precious metals, and it is used in laundries, and for domestic water softening. Both borax and boracic acid are well known in medicine, and other boron compounds are employed as glazes for ceramics, in the manufacture of heat-resisting glass and in agriculture.

I.C.I. manufactures the boron compound sodium perborate, which is used in large quantities in household washing-powders. It is also an important ingredient of denture cleansers and other toilet preparations, besides having uses in industry as an oxidising and bleaching agent.

The Dividend Monstrosity

IT needed only Dr Dalton to set the crown on the Government's proposal to control equity dividends. For such a specialist in irresponsibility, this was too good an occasion to be missed, and the ex-Chancellor dutifully obliged last week-end:

> Mr friend Gaitskell's speech, whatever else it has done, has thrown the Stock Exchange into complete disorder, and that is good fun anyway.

Dr Dalton has his own standards of fun, and the best monument to his brand of jollity is the present price of the eponymous "Daltons," which have lost one-third of their value since he issued them in 1947. Such frivolity from a senior member of the Cabinet is shocking, and it has been well answered this week by a public rebuke from the chairman of the London Stock Exchange—the second occasion in eighteen months on which Mr John Braithwaite has explained for the benefit of Ministers who ought to know the facts, and for the information of the wider public which can so easily be deceived, what the Stock Exchange does and how its work embraces almost every aspect of the life and activity of the country:

> Is it "fun," then that all this should be thrown into "complete disorder" by a scheme for the limitation and reduction of dividends, which, by the manner and timing of its announcement, and the anomalies and obscurities that cannot be at once resolved, must keep this great market in suspense for several, and perhaps for many, months? Is it, indeed, "fun" that scores of millions of pounds should be struck off the value of the national assets, to the great detriment of the collection of estate duty? Or that the slender incomes and capital of countless small families and persons should be reduced . . .? And is it "fun," or sense, or anything else, that the possibility of raising new equity capital for new industry . . . should be killed stone dead?

It is good that the chairman should have delivered such a trenchant reply to Dr Dalton's expansive mischief. But it is addressed as much to the injury as to the insult that followed, and it is extraordinary that no other protest has been expressed with the authority of industry or the City at "friend Gaitskell's" proposals themselves. The basic irresponsibility of the scheme is a fact that needed no embroidering from Dr. Dalton. It amounts to government by White Paper—and a White Paper of a most confusing and indefinite kind. It is entirely in character with recent Treasury attitudes on financial and fiscal problems that the most explicit, and almost the longest, paragraph should be concerned with action against forestalling and evasion; no doubt the Bill, if and when it comes, will be able to improve even on this, by making sure, for instance, that any sums set aside specifically to dividend reserves during the next three years are somehow brought under Treasury control or flatly forbidden. The White Paper is couched in draftsman's language that gives it a specious air of precision; in fact its precision vanishes as soon as one tries to discover what is likely to happen in anything more complicated than the most self-evident cases. There are any number of points of detail that have to be resolved. How will the Treasury define the "exceptional circumstances" that may—in its sole judgment—justify an increase in controlled dividends? How precisely is the "proportionate adjustment" of controlled dividends to be carried out in cases where "the relevant capital" is increased during the period of control? The vagueness of the proposals will ensure a special kind of "fun" for Treasury officials if they attempt to find answers to the hundreds of questions that companies and the issuing houses will want to put to them. Their reply, indeed, is likely to echo that of the mayor in *The Lady's Not For Burning*—"This will all be gone into at the proper time." And the proper time can hardly arrive until they have definitions and authority embodied in an Act of Parliament—say the beginning of next year, at the earliest.

* * *

Last week's leading article on dividend control demonstrated the emptiness of the Chancellor's assertion that his proposals were necessary on "psychological" grounds. In no sense do the facts support the "psychology." They have been repeatedly demonstrated from official figures given in the National Income White Paper—the suppression of which would doubtless be another good "psychological" move if any large proportion of the Labour Party's supporters read and understood it. The following extracts from the White Paper show that since 1947 wage and salary incomes have increased by one-quarter, professional earnings by one-fifth, farm incomes by one-half, and company profits by one-tenth. Interest and dividends paid by companies have remained completely stationary, in terms of money, and have fallen in real value by one-eighth:

SHARES IN THE NATIONAL INCOME (£ MN)

	1938	1946	1947	1948	1949	1950
Wages	1,735	3,140	3,580	4,025	4,230	4,470
Salaries	1,110	1,790	1,960	2,200	2,350	2,500
Professional Earnings	84	133	150	161	172	182
Farming incomes	64	190	205	261	304	302
Traders' profits	440	765	800	810	815	845
Company profits	536	1,224	1,527	1,580	1,488	1,692
Interest and dividends paid by Companies	560	755	824	796	803	827
Price Index of Consumers' Goods	*55*	*87*	*93*	*100*	*102*	*105*

Source: National Income White Paper.

At intervals since his Budget Speech, when he referred in moderate terms to profits and dividends, the Chancellor of the Exchequer has in fact gone a long way to create the "psychology" that he now puts forward in justification for the control of dividends. He has dealt,

rather less than fairly, in percentage increases in dividends, without giving the actual rates of dividend on issued capital—much less on real equity capital. In this way he has conjured up a menace that is magnified beyond all reason, "psychological" or otherwise. Even if it is legitimate to take the gross rates of dividend (that is, before deducting income tax at the increased rate and allowing for the depletion of company reserves by the 50 per cent tax on distributed profits, which was increased by the Budget from 30 per cent explicitly as an alternative to control of dividends) the facts do not bear this kind of exaggeration. The following table shows the gross rates of ordinary dividend paid by companies in various industrial groups; they are calculated from the results of companies published in the second quarter which can be said with reasonable accuracy to relate to the preceding calendar year:

AVERAGE GROSS DIVIDENDS of "SECOND QUARTER" COMPANIES, ATTRIBUTABLE TO CALENDAR YEARS.

Industrial Group	1948	1949	1950
	per cent	per cent	per cent
Breweries	17·5	15·6	16·4
Clothing and footwear	23·6	21·6	22·7
Entertainments	15·1	15·5	15·6
Food and confectionery	16·0	13·5	16·4
Hotels and restaurants	15·1	18·6	11·4
Shops and stores	23·5	25·1	29·1
Tobacco	25·1	25·5	27·8
Building	17·8	14·7	18·5
Engineering	16·5	14·0	15·6
Iron and steel	11·8	10·9	13·3
Shipbuilding	9·5	8·5	10·5
Chemicals and paint	11·8	11·8	13·9
Electrical manufacturing	14·4	11·8	13·5
Newspapers and printing	19·5	16·6	19·2
Cotton	12·2	12·7	14·5
Wool	16·0	15·6	18·1
Oil	14·9	14·0	22·5
Rubber	3·3	5·3	19·8
Average of all companies (including other groups)	13·8	13·3	16·2

This table serves two purposes. It demonstrates that industry has not exceeded the bounds of moderation and restraint which it promised to observe when voluntary limitation of dividends came to an end. Six of the eighteen groups paid lower percentage dividends in respect of last year than were paid in respect of 1948. Secondly, the latest increases have in no case involved the kind of extravagance that the Chancellor has denounced; they have gone a very small way towards redressing the sacrifices imposed by dividend limitation in earlier years.

But the real test is in terms of risk capital as a whole, not merely that part of it that is represented by share certificates. The figures have been given quarterly in *The Economist* for more than three years; they show the gross return in terms of earnings and dividends, on the net worth of the companies whose reports are brought into the analysis—nearly three thousand a year. The answer to those who argue (on the lines of a correspondent on an earlier page) that "the return for investors should not exceed the gilt-edged return by much more than the risk involved" ought to be evident from the next table. The return does not in fact exceed pure interest by more than the risk element. The dividends declared in the second quarter of which the Chancellor makes such loud complaint represents 5½ per cent on the capital belonging to the ordinary shareholders—on the capital that they have subscribed and reinvested in the undertakings that they own.

EARNINGS (E) AND DIVIDENDS (D) AS PERCENTAGE OF REAL EQUITY CAPITAL.

	1948		1949		1950		1951	
	E	D	E	D	E	D	E	D
1st Quarter	13·6	9·4	15·3	8·4	14·7	7·3	16·1	7·8
2nd Quarter	13·6	6·7	15·4	6·0	13·7	5·1	12·9	5·5
3rd Quarter	12·7	6·0	16·7	6·4	16·1	6·0	...	...
4th Quarter	14·2	5·6	13·1	5·6	14·2	5·6	...	...

Note: Dividend percentages have been grossed up for income tax; earnings percentages allow for profits tax at full rate.

Whatever the "motivations" of the public company may be, the motivations of shareholders are quite clear: they provide their savings for the development of industry; they remain invested in particular companies because they are satisfied with the management and with their return; if they are not satisfied with these things, they sell their shares, the price is depressed and the company finds greater difficulty in raising new capital on the market. The institutional view of public companies that Mr Albu seeks to assert is acceptable only on the assumption that the role of the private investor is finished. It is not finished yet, and it will be a bleak day for economic progress and industrial efficiency if it should ever be finished. The private investor can be got rid of by inflation, heavy taxation and spiteful interference with his income; he would not be the only "capitalist" so to suffer. The price, however, should be clearly realised; it would be industrial sterility, the end of risk capital and the end of risk taking, the temporary preservation at best of industry's assets until they waste away. There have been abundant signs in recent years that this process is afoot; it needs only a little more determination by those who think, as Mr Albu evidently thinks, that the economic development of this country has reached its apotheosis in the companies that now exist (with the privately owned companies, despite their income tax and estate duty problems, charged with the responsibility for what innovation there is) to complete it. That was the gist of what was said here last week, and it calls for strengthening rather than modification.

*

The many months of uncertainty, of which Mr Braithwaite spoke, will bring debilitation to the equity share markets and the cessation of new issues. To issue a prospectus would be in these circumstances not a mere technical problem—it has long been that—so much as an exercise in metaphysics. The position of issuing houses and brokers who have held out legitimate expectations of dividends on new shares has been made acutely embarrassing; will the Treasury exercise its discretion in such cases where the dividend forecast in the prospectus exceeds the "controlled dividend" as defined in the White Paper? What is the position of emigrant companies who removed their seat of control from this country before the Finance Bill was introduced but are still companies "registered under the Companies Act, 1948, or its predecessors"? The case of rubber companies cries out for special dispensation, but will the Treasury "think fit" to provide it? The limitation imposed on new companies of 7 per cent ordinary dividends is ridiculously unfair; this is "equity" as the mediaeval lawyers condemned it—a monstrous thing that varies with the length of the Chancellor's foot. They were talking of a different equity and of a different Chancellor, but they would have voiced the same condemnation for the arbitrary setting of such unfair limits from which the only escape rests upon the exercise of a discretionary power delegated to the Treasury by the Chancellor himself. All these questions, and the hundreds of special cases of other kinds that cannot be fitted into the formal compartments of the White Paper will presumably remain in suspense until the Treasury is empowered, and staffed, to answer them.

The net effect on equity prices between Thursday last week and this is measured by a fall from 132.9 to 127.1 in the *Financial Times* index. Mr Gaitskell accepted this fall as desirable, since he argued that the rise of 17 points since the Budget had "inflationary consequences." There has been no general selling of ordinary shares, and the lower and wider prices quoted immediately dividend control was announced have played a useful part in giving fair stability to the market while investors think out their policy afresh. The main impetus to ordinary shares in the past three and a half months has come from institutional buying; the institutions are now out of the market and seem likely to remain out until the issues raised by dividend control are clearer. They are certainly not coming back to the support of gilt-edged; a government that has no scruple about the treatment of ordinary shareholders cannot provide much attraction for its own wares. There will, eventually, be some level at which the ordinary share market can find a firmer foundation—when the Bill appears, perhaps, or when the election takes place. But no ordinary share investor, after the experience of the past week, will forget the animus that has inspired the Government's proposals. Thrift, wise investment, and economic progress do not flourish on hate.

Resort to Price Control

THE Chancellor's announcement of new price controls last week was couched in very general terms. He revealed that the Central Price Regulation Committee is undertaking a special review of all goods that have been de-controlled since the war. So far, it can only have nibbled at this task, but it has already recommended the reimposition of price control on a wide range of household and kitchen utensils, stationery and paper goods. Discussions are now proceeding about "the most suitable form of control" for these goods, and manufacturers have been asked not to raise prices while standing in line for the guillotine; some of them have apparently agreed. For certain goods that are already price controlled, the notorious "cost-plus" system of fixing prices for individual manufacturers' products will be resurrected. Since this system normally destroys all incentive to efficiency—for any reduction achieved in costs automatically leads to a reduction in controlled selling prices—the Government "has in mind" to bring efficient producers under a lower ceiling; if they can further reduce their costs, the greater will be their reward for efficiency. The Minister of Food is considering the reintroduction of price control for certain groceries, and he is also "prepared" to introduce a scheme of "full price control" for fish in the autumn, unless supplies and prices make it unnecessary—thus indicating that pressure from his backbenchers has got the better of his previous judgment on this matter. The Government's professed objective is to play Canute with "a very wide range of commodities."

This programme is obviously inspired by politics, not by economics. Unfortunately, however, it is in the economic field that its consequences will be reaped. There are three questions, in particular, that are raised by this decision to resort once again to price controls in preference to asserting an economic policy. First, how far will these controls, which can only tend to encourage increased domestic consumption, drag resources away from the export drive, from the rearmament programme and from essential capital investment? Secondly, how is the new system going to be made to work? And, thirdly, what will be the long-run consequences for the standard of living and for industrial efficiency?

*

To the first of these questions it is possible to give a reasonably specific answer. The Economic Survey estimated last April that disposable personal incomes would rise by £747 million in 1951, but that personal consumption would have to be cut by £50 million (at 1950 prices) to make way for increased exports and rearmament. authors of the Survey believed that £684 million of this apparent "personal inflationary gap" of £797 million would be bridged by automatic price increases (in short, that British consumers would buy £684 million worth of "nothing" in 1951); the bridging of the rest of the gap—and also of any additional gap that might be caused by withdrawals from personal savings—was left to the deflation of personal incomes through the Budget.

In the first quarter of this year (which is as far as the available statistics stretch), personal spending was reported to be running at an annual rate £788 million above that of the first quarter of 1950. Of this increase of £788 million, only about £350 million represented the annual rate of "purchases of nothing" (i.e. was due to price increases); real consumption was running at an annual rate some £440 million higher than in the first quarter of 1950. In other words, up to March 31st, the rate of price increases seems to have been well below what the "Economic Survey" had postulated for the year, while personal incomes or withdrawals from personal savings must have been very much higher than was assumed. It is difficult to assess exactly what has happened since March. It seems probable, however, that—on one side of the equation—personal incomes have risen more than was expected and that withdrawals from past savings, though slackening, have continued at an alarming rate; on the other side of the equation, price increases—though probably also slightly above the estimate—have not been sufficient to restore the balance. Real consumption has continued to increase, and the external balance of payments has continued to deteriorate.

*

The decision to tighten price controls must necessarily aggravate these alarming tendencies—alarming because they jeopardise the already narrow economic foundations on which the defence programme purports to be based. It will aggravate them even if the new measures are followed by a quite unexpected diminution of wage demands. Wage increases only add to the excess of demand over supply to the extent that there is a lag between industry's cost increases and its price increases; price control may now damp down cost increases, but it will also make this inflation-generating lag longer. It may be true theoretically that if allocations of materials and controls of production and trade are strengthened at the same time as price controls, the newly created excess of consumers' purchasing power may not exert its full effect in diverting potential exports to home consumption, of increasing the demand for imports and of impeding the industrial changes that the rearmament programme requires. But if the country had any taste for this compulsive logic, the Government has none. If the measures announced by Mr Gaitskell on Thursday last week are determinedly carried into effect, the policy of aiming at a nice balance between monetary demand and available physical supplies, a policy that Sir Stafford Cripps laboured so hard to forge, is now to be virtually abandoned.

If Mr Gaitskell really meant what he appeared to say, moreover, the administrative task that will face the Government departments concerned with price control is going to be immense. The history of British price control has always savoured of a Gilbertian ballad. Wartime experience showed that there are three different methods of price control that can be used. The first was that introduced under the original Prices of Goods Act, 1939. This had its legal basis in a standstill order that adjured each manufacturer, wholesaler and retailer to freeze the price of his products—except that he could mark them up, on a stipulated scale, as costs increased. Since it was soon found to be impossible to define exactly what "costs" meant—and since it was also proved to be impossible, when specifications were changing, to define "products" either—this system relapsed quickly into a mere tacit understanding that manufacturers would not increase their profit margins to even approximately the full extent that conditions of shortage allowed. The Government provided appropriate background noises, by staging a few publicised prosecutions, but the full ineffectiveness of the system became startlingly apparent when Mr Harold Wilson tried to amend it in 1948. It was then discovered that several smaller producers genuinely did not know that they had been—and still were—subject to statutory price control at all.

*

By the end of 1941, the extreme difficulty of enforcing the system originally envisaged under the Prices of Goods Act had led the Government to lean more heavily on the alternative system of enforcing industry-wide maximum prices wherever goods could be precisely defined and their qualities specified. This system, which is the one mainly in use today, is often nominally based on a "voluntary" agreement between the Board of Trade and the trade association concerned—but the pistol of possible statutory enforcement is always ominously rattling in its holster. The first step in setting up such a system of control is for the Board of Trade or other controlling department to carry out a sample costing inquiry. On the basis of these inquiries, the Government then suggests an appropriate maximum price to the trade association concerned; after some haggling, a maximum price is usually agreed upon by adding a stated percentage of capital or turnover to some commonly accepted definition of costs. Throughout the history of these arrangements there have inevitably been continual difficulties and disputes. Problems arise about specifications and about the scope for evasion of price control through dilution of quality; even in the utility schemes there is wide room for this—the specifications for price-controlled woollen cloth, for example, merely demands that over 15 per cent of "wool or animal fibre" is incorporated in the product. There are also disputes about the correct definition of "costs"; the tendency here has been to include in costs any items for which the trade presses unanimously, but to leave out those that are important only to individual producers. There have also been long disputes whether prices should be fixed at the retail or at the manufacturing stage. The former method is usually preferable, for it allows some competition between manufacturers, wholesalers and retailers, and does not lead to the absurd situation in which retailers prefer to buy high cost rather than low cost goods (because the usual Board of Trade system of permitted percentage mark ups on original cost then gives them a higher profit margin). Nevertheless, distributors complain that they tend to be "squeezed" in times of shortage if prices are only fixed at the retail level—and the Government has sometimes lent a sympathetic ear to this argument.

The main difficulty that arose from the very outset of the establishment of this system of industry-wide maximum prices in 1941, however, was that prices that were fixed to give a reasonable margin to high cost producers (and thus to keep them in business) yielded very large profits to the more efficient producers. In normal peacetime conditions there should be no objection to this. Low-cost manufacturers should ordinarily be allowed to earn a higher profit margin and thus have some incentive to expand. But in the exceptional conditions of wartime, when factories were jolted out of their usual lines of production by the lottery of conversion for defence needs, there was some case for arguing that this system was an unfair one. The Government, therefore, slipped increasingly into the bad habit of fixing statutory prices for each individual producer—at a level that would pin him down to a "reasonable" level of profit. This so-called "cost-plus" system was not only destructive of all efficiency; it also had the anomalous result that better types of branded goods were often cheaper in the shops than inferior ones. Even in wartime, therefore, there was some move towards allowing very low cost producers to charge a higher price than a purely cost-plus system of accounting would have indicated for them. It is this system of introducing some inducement to competitive efficiency into cost-plus pricing to which the Chancellor referred last week when he put forward the proposition, which he apparently regarded as quite new, for allowing "two price ceilings" in any cost-plus system of price control that may now be battened down upon the economy.

*

Between the end of the war and last Thursday week the Government made some slow progress towards dismantling this incredibly complex and hybrid wartime system of price control. There were two main lines of advance. First, the cost-plus system, which was obviously unsuitable for peacetime conditions, was gradually abandoned; and, secondly, more and more non-utility consumer goods were freed from price control altogether. Since high rates of purchase tax have increasingly concentrated domestic demand on utility goods, however, the various bonfires of controls (even the big blaze of August, 1949) had less effect on consumers' pockets than was expected. The President of the Board of Trade estimated two months ago that between 50 per cent and 70 per cent of the goods and services available to the public are still subject to maximum price control either directly or indirectly; in food the relevant proportion is two-thirds. It is difficult to say, however, how far these remaining controls have really kept down prices. The pull of competition has fortunately made some unexpected appearances at the bargaining table. In the all-important field of utility textiles, for example, the Government has generally been unable to depress maximum prices below the level at which manufacturers find it profitable to switch over to non-utility production; on the other side of the table manufacturers, even in the past few months of relatively heavy buying, have often encountered sufficient sales resistance to persuade them to try to sell below the stipulated maxima wherever possible.

The great question at the moment, therefore, is whether the Chancellor's announcement of last week merely presages the proliferation of a mass of new committees to placate the Labour Party, or whether it really heralds a new campaign to depress prices and profits below competitive levels. Unfortunately, there are signs that something of the latter sort is to be attempted. One field that may suffer heavily is that of textiles. New and higher prices for wool clothing that are now coming into effect reflect the increase in wool cloth prices of last February, which in turn reflected the level of raw wool prices in October, 1950. No adjustment has been made for the great increase in raw wool prices that took place between October and March, and the indications are that the Government may seek to "jump" the effects of this period and proceed straight to the reduction in prices made possible by the fall in raw wool since March. Similar steps are feared by the other textile industries. The carpet industry has already been served with notice that maximum prices will be reduced—and, possibly, that a "cost-plus" system for individual manufacturers will be introduced; this announcement, it is claimed, is already exerting a catastrophic effect on the industry's stability and orders.

800 809 162 854

*

The other *cause célèbre* that provides an ominous straw in the wind for industry as a whole is that of British Plaster Board Ltd. This company was subjected to a "cost-plus" system for its plasterboard sales last March (in place of the industry-wide price control system previously agreed between the Ministry of Works and the Gypsum Building Products Association); the company also seems to have had some reasonable complaint about the methods used for the assessments of its costs in producing building plasters. Last April, therefore, it withdrew from the voluntary control arrangements—and the weapon of statutory enforcement was immediately drawn from its scabbard. In default of a satisfactory presentation of the Ministry's case—despite plentiful opportunities for Parliamentary discussion—it is difficult to avoid the conclusion that the Government has hit out at this company simply because its efficiency has made its potential profit margins look unusually high.

If this really is the line along which policy is now to develop, the detrimental effects that it will exert in the long run on industrial progress cannot be exaggerated. The logical conclusions of Mr Gaitskell's proposals are that producers will now find it most profitable to concentrate on inessential (and therefore uncontrolled) articles; that the home market will no longer be able to serve as a testing ground for new export goods; that successful and essential domestic producers will be unable to raise new capital for expansion; and that all incentives towards checking cost inflation within individual factories will be destroyed. There is not even the valid excuse that the new measures merely constitute a return to conditions still nominally ruling in the immediate postwar years; at that time industry was advancing out of the tunnel towards the light, now it is trudging back wearily into the dark. Unless the administrative machinery now being pulled out from under postwar dust sheets proves too rickety to work—which seems very likely—the principles on which Mr Gaitskell based his Budget, the prospects for optimum deployment of resources for exports and rearmament, and the scope for long-run expansion of British competitive efficiency may be disappearing into the darkness with it.

Business Notes

How Large a Deficit?

In his statement to Parliament last week, the Chancellor of the Exchequer seemed inclined to treat the deterioration of the balance of payments as a purely secondary issue—although it was this deterioration that was the immediate pretext for the debate. The little that he did say was, however, disquieting. He estimated, first, that the sterling area would run a gold and dollar deficit—"possibly a quite substantial one"—in the third quarter of the year. This deficit would be partly due to unusually large dollar imports amounting to at least $100 million more than in a normal quarter, and partly to further losses of gold and dollars to the European Payments Union. Mr Gaitskell believed, in fact, that Britain might have to pay back to EPU this quarter the whole of the $80 million of gold and dollars that it had received from the Union in previous months. He added, however, that the sterling area's dollar balance in the fourth quarter should not be so unfavourable—though he expected another deficit. The Government has decided, therefore, to "review the dollar import programme ... and reduce expenditure wherever this can be done without damage to our long-run interests."

The Chancellor's review of the prospects for the United Kingdom's own overall balance of payments was equally gloomy. He believed that the import bill this year, without allowing for Government stockpiling, would probably be "well over £100 million more" than the Economic Survey's estimate of £3,200 million. Furthermore invisible earnings this year "are unlikely now to exceed £400 million" (compared with the Survey's estimate of £450 million). Consequently export earnings will now have to be considerably above the Survey's target. To secure bare equilibrium, even excluding stockpiling, exports in the second half of 1951 may have to rise by £300 million (or by nearly a quarter) above the figure of £1,300 million achieved in the first half of the year. The recent trend of overseas trade figures do not suggest that this increase can possibly be achieved. To estimate an increase of £100 million in United Kingdom exports in the second half of the year would seem to be to strain optimism to its limits. That would leave exports £200 million short of their new target and, since the bill for stockpiling may now be nearer £150 million than £100 million, this suggests that there may be an overall external gap of about £350 million in 1951.

ESTIMATES OF UNITED KINGDOM'S EXTERNAL PAYMENTS IN 1951
(£ Million)

Economic Survey Estimate		Chancellor's New Estimate	
Imports*	− 3,200	*"Well over"*	− 3,300

The Chancellor and the Banks

In his speech Mr Gaitskell was more explicit about his views on credit policy than he has been hitherto. These views can be fairly summarised by saying that the Government is now prepared to sit at the sideline and cheer on any steps toward dearer money that are taken by anybody but itself. America's cheap money policy, Mr Gaitskell noted approvingly, has lately been modified "with marked effect." The rise in British banks' advances rates and commercial bill rates was a development to which he "raised no objection." But, as a rise of a half per cent in floating debt rates would impose—according to his calculations—a net strain of £16 million on the budget, the anomalous subsidisation of short-term Government borrowing is to go on. "The important thing," according to Mr Gaitskell, "is that, without increasing the burden on the Exchequer unnecessarily, the level of bank advances should not be allowed to expand at a rate which produces inflationary consequences internally." To this end, the Chancellor has asked the Governor of the Bank of England to "repeat with emphasis" the customary request to the banks "to restrict any extension of bank credit for any but essential purposes"—and he has received the customary reassurance that the banks will continue to do what he now terms "their duty."

This reiterated exhortation comes at a time when the rate of expansion of bank advances, in any case, would normally be expected to slacken. In the second half of 1950, it will be remembered, clearing bank advances fell by £3,800,000, after having risen by over £125 million in the previous six months. Bank advances have made a similar good start to the second half of 1951. In the first eighteen days of July they fell by £33½ million, after having risen by nearly £238 million between end-December and end-June. Part of the fall in July will have been due to the repayment of up to £7,500,000 of bank advances out of the application money put up for the Gas Council's recent issue. Unfortunately, however, the clearing banks' net deposits continued to rise—by £46 million in the eighteen days—because of increased Government borrowing from them on Treasury bills; some of this increased borrowing will have been due to switches out of floating debt into the new Gas stock by the Bank of England, but, even so, the rise in Government borrowing was unexpectedly large—especially in view of the receipts the Government must now be securing from the sterling counterpart of the external deficit. The main inflationary impetus behind bank advances in the next few months will spring from the Chancellor's dividend freeze, which has effectively slammed the door on any industrialist who would otherwise have been able to mobilise genuine savings through the medium of new issues. This factor, however, is unlikely to counteract fully the seasonal slackening in new bank lending. It may be for this reason that the Chancellor has chosen this moment to reiterate a directive that was being faithfully carried out already. After all, Canute would have considerably enhanced his reputation as a controller if he had timed his exhortation for the estimated hour of high tide.

* * *

Production Prospects

The official index of industrial production continues to support Mr Gaitskell's confidence that output will rise this year by the full four per cent assumed in the Economic Survey. For the first five months of the year, output was 4.6 per cent above the 1950 level; and the forecast for June puts the index figure at 147-8, compared with 143 in June, 1950. The seasonal pattern of output since the war shows a marked increase in the autumn, following the naturally low figures of the holiday months. If the 1951 pattern follows last year's, the four per cent increase would be achieved; on the pattern of 1948 and 1949, the increase might be fractionally lower. Statistically, however, the estimate still looks reliable.

But production, as Mr Gaitskell admitted, depends upon many material factors: in particular, supplies of steel. The industry is still fairly confident that 16 million tons will be produced this year. This would enable deliveries to consumers slightly larger than last year's, but assuming slightly less drawing from stock, consumption at about the same level. The large annual increases in industrial production achieved in 1949 and 1950 were associated with increases in home consumption of steel, in the first year by almost a million tons, and in the second of about half a million tons. The absence of such an increase this year must affect output; but this was allowed for in the official forecast. Next year, coal may impose a check upon industrial production: partly through home shortage, and partly because the decline in exports may adversely affect imports of iron ore, timber, woodpulp, and pyrites.

The Question of the Waiver

Between now and the end of the year the question of the proper interpretation of the waiver clauses attached to the United States and Canadian credits raised by the British Government in 1946 will become increasingly topical and perhaps controversial. The first payments on these credits are due at the end of December. The loan agreements provided that, in certain adverse economic circumstances, the British Government could ask to be forgiven interest payments from year to year. The Chancellor of the Exchequer will undoubtedly be discussing this matter with the United States Secretary to the Treasury and the Canadian Finance Minister when they meet in Washington in September at the annual meeting of Governors of the International Monetary Fund and the International Bank.

Mr John Snyder recently stated in Washington that he had no reason to expect that full payment would not be made. This week the Chancellor of the Exchequer stated in Parliament that he was not yet in a position to say whether circumstances would justify a request for the waiver of interest, but repeated what he had already said last April, namely that provision had been made for full payment in this year's budget. If the waiver is to be invoked, the British Government must first detail its own views about the adequacy and likely movements of the gold and dollar reserves. Thereafter, these views must be tested in the light of intricate calculations that relate the outturn of the 1950 balance of payments to imports into the United Kingdom for the period 1936-38; in these calculations the findings of the IMF are to be regarded as definitive. There is all the more reason, therefore, why the matter should come to a head at the IMF meeting next September.

Agreement with Canada

Another dollar loan—the $700 million interest-free loan granted by Canada to the United Kingdom in 1942—has also been in the news this week. Mr Gaitskell has announced that, subject to confirmation by the Canadian Parliament, the existing arrangements for gradual repayment of the capital of this loan will be extended until the end of 1953. The British authorities will therefore continue to earmark for repayment of the loan all Canadian dollars secured from the sales or redemption of Canadian securities held by United Kingdom residents—except that, under the agreement reached in 1948, the British authorities may first deduct the dollar equivalent of new direct British investments in Canada. Unfortunately, this formula involves a ban on any switching of Canadian securities held by British residents. The Canadian Government was apparently asked whether it would agree to any modification of this restriction but, although it generously agreed to extension of the interest-free repayment arrangements, it did not feel able to accede to this request. The ban on switching in Canadian securities will therefore presumably remain for another two and a half years—or until such time as the outstanding $250 million of the loan is repaid.

* * *

German Scrap

Steel production plans for 1951 were originally based upon the hope that a million tons of scrap would be imported from Germany, though firm contracts were held for only about half a million tons in the first half of the year. By the end of June, in fact, deliveries were 90,000 tons in arrear under the agreement: for the second half of the year, the German offer amounted to only 10,000 tons a month, compared with the 100,000 tons a month mentioned earlier by the Federal Government. New proposals put forward by the British representatives in current negotiations, however, appear to be receiving rather more favourable consideration from the Germans than earlier suggestions.

The British case is based upon the belief that German collection of scrap is not bringing in the amounts that are still to be had—a view partly supported by the report of the Economic Commission for Europe committee on scrap supplies. It is suggested that the first 300,000 tons per month should be delivered to the German steel industry, that the next 50,000 should be made available for export and that any supplies in excess of 350,000 should be shared equally between home and export customers. Of the total exports, the existing formula, which does not seem to be in dispute, would allot the United States and Britain 60 per cent—of which Britain up to now has received the larger share. With scrap collections at the present rate of some 400,000 tons a month, this would leave the Germans 325,000 tons and free 75,000 tons for export, of which Britain might hope to receive perhaps 30,000 tons or more a month. Imports under even this sliding scale—and the German contention so far has been that no allocation for export should be made until its home industry has received 350,000 tons—would offer only meagre imports for the British industry in the remainder of this year and 1952. But they would represent a considerable improvement upon the prospect presented by the first German offers.

* * *

Winter Power

If this winter is as bad as last, electric power cuts may be the most frequent and severe yet. Some shortages of domestic coal seem certain, and electricity demand is already rising far more steeply than generating capacity. There is some danger, indeed, that the British Electricity Authority may not be able to commission as much generating plant

this year as it did last year, though it planned to bring in more. Shortages of non-ferrous metals and special materials have been quoted as the reasons for delays in delivering some generating equipment: on the sites, shortage of structural steel has delayed and in one or two cases entirely held up the construction of power station buildings. The BEA is experimenting at one site with the installation of "semi-open" boiler plant, on the lines of stations in America described by its recent productivity team; this should provide some moderate savings in structural materials.

At a conference last week with the Minister of Fuel and Power, representatives of domestic, commercial and industrial users of electricity agreed to set up regional committees to publicise the peak load problem. They will attempt to induce other users to share the inconvenience accepted by industrialists who agree to "spread" their electricity load. Area Electricity Boards are now studying the extension of such load-limiting systems, of various types, as exist within their localities: and the BEA's experiments with larger-scale load control by central control are continuing. There seems no great hope that this system, even if it overcomes the BEA's ingrained caution, could make much difference this winter. It would involve the production and installation of a considerable amount of equipment at central stations and consumers' premises. Moreover, inducing a consumer to accept a limitation upon his "firm" supply of power will not be easy: the BEA considers that purely financial incentives are not likely to be effective, and may seek some statutory power to renegotiate contracts on this conditional basis (and to protect it from any responsibility arising from compulsory reduction of power supplies). Such possible statutory provisions are perhaps the cause for rumours that "rationing of electricity used in electric fires" might be imposed this winter; such a measure would set administrative—and electrical—technicians some quite remarkable conundrums.

* * *

Directors for Steel Companies

Characteristically, Mr Steven Hardie has not bothered to explain—still less to justify—the policy followed by the Iron and Steel Corporation last week in opposing the re-election of two directors of Thos. Firth and John Brown, Ltd., and "expressing its desire" for the retirement of five others. The five directors resigned, as did their chairman, Lord Aberconway. A day later, two directors resigned from Gjers Mills, Ltd., saying that the Corporation had intimated that it wanted only executive directors on the board of this company.

More than one issue may be involved here. The seven directors of Firth Brown are also directors of John Brown, Ltd., its former parent company and chief customer. It might be questioned whether directors of such a company should retain their seats on the board of a subsidiary sold to new owners: last week, for example, certain nominee directors on the board of English Steel Corporation, formerly representing its joint owners, left the board. The two cases, however, are not strictly comparable; and any justification of Mr Hardie's action upon this ground is weakened by the fact that he apparently asked Lord Aberconway, chairman of both companies, to remain at the head of Firth Brown.

The second question involved, according to certain of the resigning directors, is the composition of nationalised steel company boards in general. A "proper balance" between executive and outside directors, which Mr Hardie mentioned in certain disjointed remarks about the Corporation's action, is a formula that few management theorists would like to define: in practice it must depend entirely upon the company and the personalities involved. In most large industrial organisations—including other nationalised industries—there is agreement that the general business experience of outside directors can be of considerable value within a company. In any case, certain of the directors whose resignation was suggested from Firth Brown were executive directors who could not be considered as outside the steel industry in any sense. There has been no hint whether this policy is to be applied throughout the companies that have been nationalised: and it may be said that in view of the personalities involved the selection of these particular companies for arbitrary action has a special interest of its own. The suggestion that has been made this week that the directors concerned should not have accepted the Corporation's mere "expression of desire," and should have stayed might mean some embarrassment for them or others placed in the same position. But it would place Mr Hardie in the position of any other controlling shareholder wishing to impose a sudden decision upon a company; and the procedure might, at least, draw an explanation of his conception of the composition of the boards of directors of his creative companies.

Wages and Transport

It would perhaps be unfair to describe the claim for a 10 per cent increase in wages jointly presented by the three railway unions as the first psychological reaction to dividend control. Certainly the Commission, with its mounting deficits, can hardly have excited the envy that Mr Gaitskell claims to find among the trade unionists as a whole in their attitude towards dividends. But it is certain, without need for question, that the claim has been encouraged, and will be almost impossible to resist, by reason of the way in which last February's increase came to be granted—namely, by the intervention of Mr Bevan, then Minister of Labour, in demanding a settlement on his terms and overriding the Railway Executive's views. The increase now claimed would cost practically £20 million a year—which is roughly the size of the current deficit on the Commission's revenue account. It is questionable whether the normal process of negotiation is worth proceeding with after the experience of six months ago. If any proof were needed that the unions can order affairs to their own wishes, the failure of the experiment to secure the better use of railway manpower is surely conclusive; the unions have made "concessions" on van guards and knockers-up, but there has been no sign whatsoever of progress towards agreement on lodging turns; locomotive manpower is short, and the best use is not being made of what there is.

These points were not brought out in Tuesday's debate on transport. But the discussion was notable for a presentation of Conservative policy on transport by Mr Peter Thorneycroft, who urged that the private road haulier should be freed from restriction, and that the railways and publicly-owned road haulage should be reorganised in regional groups "of a size at which there is some possibility of finding somebody big enough to run them." Mr Thorneycroft would wind up the functional executives (which would have no useful purpose to serve) and give greater scope for competition, flexibility and freedom. This is perhaps not a completely detailed picture of what would have to be done; if the Commission is to become an effective board of direction, concerned with general policy, it will still need some central management service to deal with such questions as wages, purchases, capital investment, and charges.

None of this found any place in the Minister's reply. "It is no use," said Mr Barnes "dismissing lightly suggestions of this kind made by responsible people when advanced as a solution of this problem." The suggestions he referred to were four: a subsidy; payment for strategic lines; a cut in interest payments; and a drastic curtailment of C transport. "Whatever may be the ultimate decision of Parliament," Mr Barnes proceeded "I do not consider that any of these solutions are correct at the moment." This is too equivocal to be satisfactory. As for the charges scheme, promised for August 5th, a further delay has been accepted. The scheme (which

is not in any case to include road haulage rates) is to be delayed while discussions take place between the Commission and coastal shipping, and the chairman of the Commission has welcomed the opportunity of a little further time until the end of the year to "polish up" the scheme. Polishing up, however, is unlikely to resolve the basic difficulty—how to obtain more traffic by quoting cheaper rates for high-value freight, and recouping the loss of revenue by increases in low-rate traffic. The latter process implies increases in British industrial costs that are not pleasant to contemplate.

* * *

Wheat Argument Continued

A special meeting of the International Wheat Council was held in London on Monday and Tuesday of this week to discuss the proposed carrying charge. The greater part of the time was spent in debating the case for the carrying charge which Canada, the United States and Australia want to add to the maximum International Wheat Agreement price of US $1.80. No settlement was reached ; the problem has been referred to the executive where it is hoped some agreed compromise will be reached. It never seemed that any settlement would be possible. In any case a body of some 50 members is less fitted to this kind of thrust and parry than the executive committee on which sit the three major exporters and seven importing countries—each group with equal votes. The Council meeting was important as the first occasion when importers and exporters presented their arguments to one another. The dispute turns on the reading of the sentence in article VI of the agreement and on the meaning of "carrying charge." Article VI states: —

> The basic minimum and maximum prices, and the equivalents thereof hereafter referred to, shall exclude such carrying charges and marketing costs as may be agreed between the buyer and the seller.

Canada, the United States and Australia argue that the charge is a proper one in view of the extra cost of storing wheat in the exporting countries when deliveries are made steadily during the year ; it was imposed before under the Anglo-Canadian agreement and during part of the first year of the agreement, and they consider that the exporter has the right to impose a carrying charge when necessary.

The importers oppose the charge on the grounds that circumstances have not changed since last year when no charge was suggested and that a unilateral attempt to impose the carrying charge on importers is against Article VI. If there is no agreement between importer and exporter, they argue, then there can be no question of adding a carrying charge. One of the telling points that can be made on the importers' side is to question the interpretation of the words, "carrying charge." The importing countries argue that a carrying charge can only be levied in respect of costs incurred after wheat has been moved from bulk storage ; and that the maximum price in the agreement should not be altered to compensate for any change in cost of harvesting or storing the wheat up to the port bulk store. Since the exporters' case as presented is based on general costs of storage inside the producing countries, this is crucial. The definition of "carrying charge" in the agreement is ambiguous: the importers argue that it is intended to refer to some exceptional charge because of delay in shipment or of loading, not to normal expenses.

Canada has already shipped a quantity of old crop wheat intended to be sold with the new carrying charge. If no settlement is reached by the executive committee, any such shipment could possibly be taken as a test case whether or not the 6 cents is to be paid. Such a matter could probably be settled under the rule which allows for a challenge of any transaction. It was decided at the recent Council meeting to record shipments made during negotiations as IWC transactions ; if a carrying charge is included that will presumably be recorded too. Outside arbitration may even be necessary. But the agreement is most unlikely to break down on this point. Both importers and exporters are anxious not to put an impossible strain upon it. For this reason, no proposal was put to the vote on Tuesday in order not to avoid embarrassing either side. The claim comes from Canada and has been much discussed in the Canadian press, although comparatively little elsewhere. It may prove difficult to settle.

* * *

A Case of Price—

What is at issue for Britain is something more than the payment of 6 cents, though this would have meant an increase of some £2,500,000 in the cost of British imports under the agreement in 1950. It is the value of international or bilateral agreements and the whole process of centralised buying. Is the exporter to be able to force concessions from the importer as soon as he feels in a strong position ? Canada was not interested in the carrying charge last year because at that time it was more dependent on exports under the agreement. It will be remembered that the revised meat agreement with Argentina also involved a substantial financial "adjustment" on the part of this country. The Canadian claim for the 6 cents carrying charge is really made because of the difference between the maximum agreement price and world wheat prices during the last year. Indeed, the shadow of Canadian internal politics hangs over it, for the Liberal Party is afraid of losing farmers' votes.

In 1949 the wheat producers were satisfied with the agreement because it offered guaranteed markets at a time of expected surpluses. Although a wheat surplus, at least of any magnitude, is unlikely in the coming year, it is by no means impossible in the next few years. The question arises whether international agreements for the supply of given quantities at given prices have any meaning ; if the supplier considers that the contract price is too low, he will try to secure an increase—carrying charges or retrospective payment or any other device. If it is too high, the importer will seek to avoid his contract. This is not cynicism ; it is just simple economics.

* * *

No Relief for the Motor Industry

The Austin Motor Company, the largest exporter in the British motor industry, opened a new assembly plant last month capable of handling 4,000 cars a week. The company has for long been short of assembly space, and needed the new facilities offered by a highly instrumented plant of this kind. It opens barely a year after building work commenced, and, less happily, at a time when the industry's output is being restricted not only by shortages of sheet steel, but also by shortages of other materials such as zinc, for which no relief is in sight. In the first six months of the year, the industry's output reached only 244,509 cars, seven per cent less than in the same period of 1950. The allocation of sheet steel for the third, and probably also for the fourth quarter of this year is unlikely to be any higher than in the two preceding quarters. Should the total supply of steel-making materials increase, the new steel mills will ensure more sheet steel and the motor industry's case for a larger allocation is a strong one. But it is by no means certain that extra raw materials will be found.

Out of the present allocation, steel has to be found to meet the defence orders that have so far been placed with the industry, for although the individual manufacturer receives a special steel allocation for defence production, the industry, as a whole does not. The orders placed are not large, but by now they amount to several thousands of vehicles. Since the great majority of these orders goes to the manufacturers of commercial vehicles, production of passenger cars may remain unaffected, but this is by no means certain.

The latest of the defence orders was announced this week by Rootes Ltd., for "several thousand" three-ton army

lorries. With minor adaptations, the design is one already developed by the Rootes subsidiary, Commer Cars Ltd., for use abroad in rough country. This is classed as a "general service" vehicle to distinguish it from the "combat" vehicles that are designed to operate near the front lines. Standardisation of vehicle design has been popular with the Army, which knows the number of man-hours now devoted to storekeeping, but unpopular in the industry, where there is a strong disinclination to manufacture to another company's design. All the combat vehicles have the same standardised engine, and a fair degree of standardisation on the chassis has been achieved by giving the entire order for each type to one manufacturer. Rootes, for example, are building all the one-ton combat vehicles. But the industry appears to have carried the day in the design of the general service vehicles. The orders are too large to give to one company only, and at least two others besides Rootes are expected to build 3-tonners, each to its own design of engine and chassis. The fighting in Korea is believed to have convinced many members of the United States Army of the need for vehicle standardisation in a highly mechanised army. The War Office may soon regret that it did not take a firmer line while there was still the opportunity to do so.

* * *

Motor Exports

The fall in car production during the first half of the year has had its effect on export deliveries. By the end of June the industry had exported 185,923 cars ; 9,753 fewer than in the six months ending December 31st and 17,703 fewer than in the first six months of 1950. Shipping difficulties have also had their effect on exports, for when cars have to be specially modified to comply with local traffic regulations, they cannot easily be switched from one market to another. Deliveries to Australia, the industry's best market, have been the worst affected by lack of shipping. In the first half of the year, only 23,177 cars went to Australia compared with 46,701 in the same period last year, although the orders are there. Standard and Austin began to charter their own ships to Australia this spring more to prevent an accumulation of cars in their warehouses and on the docks than in the hope of speeding delivery, but the experiment has proved so successful that Austin, for one, is considering further chartering.

In most of the industry's markets, demand is still in excess of the number of cars that can be supplied. One exception is Canada, where exports in the first half of this year were only 24,741 compared with 38,670 in the same period of 1950. This fall may be no more than a normal reaction to the very high rate of Canadian shipments in 1950, but some members of the industry are beginning to ask whether this year's figures do not, after all, suggest that the Canadian market is satiated. The credit restrictions, in particular, appear to be checking car sales, for few customers are prepared to make a down payment of as much as 50 per cent of the purchase price. A more consoling fact is the steady rise in shipments to the United States, 11,488 this year compared with 6,005 in the first six months last year.

Curbing Inflation in Australia

The Australian Government seems at last to have awakened to the inflationary dangers that threaten the economy of the country. This week the Prime Minister, Mr Menzies, has proposed a number of positive anti-inflationary measures—and has tried to persuade a special conference of state Premiers and representatives of sectional interests to agree to them. The first of these measures is a general pruning of the public works programme, to ease the demand on labour and materials and to enable available supplies to be channelled into primary production—notably of coal, power, basic materials and food. Mr Menzies also wants a corresponding check on private investment, new powers of physical allocation that would divert scarce materials to essential instead of luxury industries, and closer control over new capital issues. His other proposals include a general tightening of bank credit and special experiments in the field of selective credit control, aimed more particularly against hire-purchase credit. Heavier taxation will be introduced in the next budget. The question of revaluing the Australian pound has also been under consideration, but on this subject Mr Menzies said that "the best and most responsible economic advice is against any alteration in the exchange rate—on purely economic grounds."

All these measures still lie in the realm of good intentions and no steps have yet been taken to put them into operation. The immediate response to Mr Menzies' statement suggests that considerable resistance to any such disinflationary programme must be expected from many quarters, including the state governments. Meanwhile the cost of living in Australia is still spiralling upwards, despite attempts by various states, notably New South Wales, to launch new price control measures.

* * *

Speculation in Australian Pounds

Despite the increasing tempo of inflation in Australia, the Dominion's balance of payments remains in roaring surplus. Mr Menzies' statement this week has therefore so far done little to damp down rumours of a possible revaluation of the Australian pound in terms of sterling. These rumours have been accompanied by a considerable volume of covered "bull" speculation by commercial interests both within and outside Australia. Payments to Australia have been accelerated, while payments from Australia have been postponed to the last possible moment.

This week the Commonwealth Bank of Australia, acting in concert with the trading banks, has taken steps to remedy at least one of these undesirable types of pseudo-commercial speculative operations, namely the postponement of commercial remittances from Australia. In future the Australian banks will not issue acceptance credits with provisions for drawing in excess of sixty days' sight. Moreover, the negotiation in London of drafts payable at the rate of exchange current on the day of payment in Australia will be restricted to drafts drawn at sight ; these drafts must now be presented within 45 days if the draft is sent by air or 15 days if sent by sea mail. These restrictions on the length of time during which Australian importers can lean on the banking system and hope for revaluation should do no more than compel adherence to normal commercial procedures.

* * *

Changes in EPU Quotas

At its recent session in Paris, the managing board of the European Payments Union decided to increase the quotas of Germany and the Netherlands. Western Germany's quota is being raised from $320 million to $500 million, and the Dutch quota from $330 million to $355 million. These changes reflect the special difficulties that both countries have encountered over the past year. They also restore a more normal relation between the quota extended to Germany and those of other members of EPU. They rectify, for example, the absurdity that Germany, because of the limited volume of its trade in the base year of 1949, had a smaller quota than the Netherlands. The increase in the German quota does not mean that Germany will necessarily be taking more credit from EPU. On the contrary the trend is now in the opposite direction, for Germany is paying back its debit balance and is also rapidly recovering the gold that it previously lost to the Union.

The Dutch representatives asked for a somewhat larger increase in their quota than they in fact secured. The

Netherlands has been a persistent debtor with EPU ever since the Union was set up, and there was some discussion at the Paris meeting whether it should not be granted special help outside its quota—on the lines of the credit extended to Germany last year. The extension of such a special credit, however, would have involved greater intrusion by OEEC into the domestic policy of the Netherlands than the Dutch Government would have found palatable. The decision has therefore been taken to permit a slight increase in the Netherlands' quota (which should help it to tide over its affairs for a short period), and to discuss the broader problems of Dutch relations with EPU at the next meeting of the managing board in September. Those problems are very largely the result of the persistent and abnormal deficit that the Netherlands is running with its Benelux partner, Belgium.

* * *

More American Cotton

The estimate of United States cotton crop acreage for the current season, recently published, gives the area on July 9th as 29,510,000 acres. This is an increase of nearly 60 per cent over last year's acreage planted of 18,613,000 and is the largest acreage estimated since well before the war. No official estimate of the crop will be made until August 8th, but given an average yield of the last three years of 288 lb. per acre this acreage is likely to give an output of over 17 million bales. The weather so far has been favourable and the boll weevil has been kept down; there is a good prospect of a large crop. The carry-over stock at the end of July was some 2,000,000 bales. The quota of cotton for export by the United States for the four months August to November had already been fixed at 2,500,000 bales, but following the acreage estimate the United States Government has raised it by 1,000,000 bales to 3,500,000 bales. The British share of the original export quota was to have been 307,000 bales; but this has been increased to 419,000 bales. France has a quota of 458,000 bales, Western Germany 419,000 bales and India 250,000. Increased crops from Commonwealth countries are also expected, while the area under cultivation in Egypt in the coming season is almost as large as in 1950.

Raw cotton supplies should therefore be adequate in the coming year. As a result of the satisfactory reports from the United States the market in Manchester has been slack. Although the Lancashire holiday season is now in swing and the volume of business would be expected to shrink, buyers have been noticeably cautious. The British share of American raw cotton in the four months August to November is greater than British imports of American cotton in the whole of 1950. The assurance of good supplies of raw cotton should lighten the task of the cotton industry, in particular, in expanding its exports; wool and rayon supplies are likely to be less plentiful. Spinners and manufacturers are now adjusting themselves to lower prices of their raw material. The advantage of having good supplies of American cotton instead of having to mix four or five different growths of American-type cotton will be felt in the carding-room. But the effect of this on manufactured costs may be to some extent counteracted by the wage claims outstanding both in spinning and weaving.

* * *

Bank of England Statistics

The only new statistics in the Bank of England's report for the year ended February 28, 1951, again tell the story of the widening use of transferable sterling. In 1950, the use made of "automatic" facilities within the transferable account area was virtually unchanged at £143 million. The use of special "administrative" facilities for sterling transfers, however, expanded by £30 million, to £155 million. Within these totals OEEC countries transferred £78 million between themselves (against £48 million in 1949); simultaneously they received £99 million gross and £40 million net of sterling from countries outside Europe and outside the sterling area. Apart from its presentation of these figures, the Bank's report is again merely a useful work of reference, containing information already obtainable elsewhere; some of this information, however, and especially that about operations that affected the total size of the floating debt, is more fully documented than before.

The Bank's statisticians have also extended their previous survey of United Kingdom overseas investments to cover the year 1949. In a separate pamphlet published last week they estimate that devaluation increased the nominal sterling value of British overseas investments by £84 million. But since £14 million of these investments were either repaid or sold during the year—in return, incidentally, for cash receipts of £8,000,000—the nominal value of British overseas investments rose by only £70 million, to £2,037 million; this compares with a nominal value of £3,545 million at the end of 1938. These nominal figures, however, have little real significance, and the most effective comparison made in the pamphlet is that between interest and dividend receipts of £116 million in both 1948 and 1949 and interest and dividend receipts of £155 million in 1938. The receipts in 1949 included just over £74 million from the Commonwealth, just under £10 million from the United States and about £7,200,000 from Persia. Approximately £18 million was received from oil investments, £8,300,000 from gold mines and £15.5 million from other mines.

* * *

Iron Ore Fleet

For some months discussions have been going on between the steel industry and shipping companies concerning the provision of special ships for the carriage of iron ore to Britain. Formation of Ore Carriers, Ltd, a joint enterprise of the Houlder shipping group and the British Iron and Steel Corporation, is the first result of these discussions: its purpose is to build and operate a fleet of ore carriers to carry ore to British ports, in particular to Port Talbot.

The creation of a special fleet of ore carriers for the steel industry has been discussed on several occasions since the war. The present venture, on the board of which Sir John Green, the deputy chairman of the nationalised Iron and Steel Corporation, Mr D. H. Kyle of BISC(OR), and three other steel representatives will sit with four from the Houlder group, of course pre-dates the recent agreement for joint control of raw material supplies for steel: but it is one in which Mr Hardie and the Corporation have recently taken a particular interest. The capital is £2,000,000 in £1 ordinary shares, 51 per cent being provided by the Houlder group and 49 per cent by the iron and steel industry. The steel industry's share will be held through BISC(OR), which is a non-profit-making subsidiary of the British Iron and Steel Federation; the proportion of this capital that may be provided by nationalised steel companies has not been stated. Nor is it known whether this joint venture may be followed by other similar arrangements with shipping companies: the Houlder group, it may be noted, has a long trade connection with South Wales in particular. Contracts are being signed by Ore Carriers, Ltd, with Wm. H. Gray, Ltd, of West Hartlepool, for the construction of six motor vessels particularly designed for the carriage and rapid handling of iron ore, the first four being of 8,600 tons deadweight: all are expected to be in operation by mid-1953.

Barcelona Traction

The directors of Barcelona Traction's subsidiary companies in Spain have announced in certain Spanish newspapers that they propose to issue new shares of these

Drawn by A. R. THOMSON, R.A.

A.B. in a paper boat

It takes more than the boy with the bicycle to deliver the morning newspapers which rustle so regularly through your letter-box. Well back in the chain of production you would find Olaf Larsen*—that is, if you knew where to look for him. A likely place would be Bowaters' private docks at Ridham, serving their paper mills at Kemsley and Sittingbourne in Kent.

Larsen is an Able Seaman, a foremast hand in one of the ships which, from May to December, converge on England with decks stacked high with logs of spruce which is paper in the raw. There are many such ships chartered by Bowaters, for each separate paper-making machine needs the trunks of 10,000 trees to keep it going for one week.

Some of the widest paper-making machines in the world are in operation at Kemsley, turning out their eight miles of newsprint every half hour, all round the clock, but even that rare sight fails to tempt Larsen down the gangway. "For the engineers, yes" he explains politely. "But me, I am a sailor." The real reason is he dare not spare the time; he is working for his Second Mate's 'Ticket'. If you told him he was already doing quite a job helping to ensure the constant flow of raw material for the free press of the world he would modestly take your word for it!

The whole wealth of Bowaters craftsmanship, experience and research in the art of making paper—the 'know-how' in short—is freely at your service.

companies and that the new shares must be applied for within thirty days, after which the present outstanding shares will become valueless. The directors of these subsidiaries were appointed following the declaration of bankruptcy of Barcelona Traction by a Spanish court. The National Trust Company of Toronto, the trustee company for Barcelona Traction bondholders, has pointed out that the shares in question are held by it in Canada as security for Barcelona Traction sterling bonds and that it has protested to the persons in Spain "purporting to act as directors" refusing to recognise the validity of the proposed exchange of shares. The planned issue of the new shares may be read as evidence that the bankruptcy proceedings in Spain are being carried a stage further, involving the ultimate sale of the assets in that country.

The Barcelona Traction Company itself, in drawing attention to the latest development, again urgently calls for the publication of the report made upon the affairs of the Company by the British and Canadian accountants. A British Foreign Office spokesman, referring to recent discussion of the affairs of the Company based on an unpublished report of Canadian and British accountants on the affair, has pointed out that publication is, in fact, the subject of discussions between the Governments concerned and must, in any case, include the report furnished by the Spanish accountants together with the documents upon which both reports were based. These steps are welcome and they should be expedited, for it is high time that this affair was brought to a clear conclusion.

* * *

Base Metal Prices

The declines in Continental prices of lead and zinc about ten days or a fortnight ago have not continued. Lead has recovered from £190 to about £205 a ton; zinc is now selling at about £290. These prices compare with £215 for lead in the middle of June, and £320 for zinc. Copper has not weakened during this period and still sells at the equivalent of £380 per ton. British official prices of these metals at the present time are £180 per ton for lead, £190 per ton for zinc and £234 per ton for electrolytic copper. The slump that was feared in base metal free prices has not occurred, but the market on the Continent is still quiet. Some Indian dealers have been offering lead at very low prices, but it cannot be shipped out of India. The statistical position of all three metals is strong at the present time and if weakness arises it is because demand is artificially restrained by Government buying. The British Ministry of Materials is to buy no more copper at market prices on the Continent, although purchases of lead and probably of zinc are continuing.

The difference between the American controlled price of lead and the world "free" market price (17 cents per lb. as opposed to 25 cents or more) has resulted in a scarcity of lead in the United States. American imports of lead in the first half of 1951 are much below the 1950 rate. Because of the difficulty in obtaining lead at the official price the American Government is expected to become the sole importer, as of tin. But lead is still scarce whereas tin is plentiful; the tactics of the Reconstruction Finance Corporation in forcing down world prices of tin are inapplicable to lead. This week the RFC lowered the American price of tin to 103 cents per lb. American lead importers favour raising the controlled price as Britain did at the beginning of July. The British Government would prefer to have uniform international prices set by the International Materials Conference, but the American trade is firmly opposed to this; the surest and most satisfactory way to get a uniform world price is to have free world markets. Meanwhile not only are there wide differences between free market and official prices, but in the United States itself there is one price, 24½ cents, for copper mined in the United States, and another, 27½ cents, for imported copper from Chile and, if the proposal made by the Office of Price Stabilisation is approved, for other foreign imported copper.

Shorter Notes

From the beginning of this month the Ministry of Supply has set maximum prices for the main specifications of alloy steel scrap, including for the first time the more important types of stainless steel. These prices, which in certain cases will allow an increase on existing levels, follow upon the recent increases in the prices of alloy metals, and are designed to encourage the complete segregation of alloy steel in scrap collections.

*

The Minister of Supply this week appointed members to the Iron and Steel Consumers' Council that he undertook to set up under the Iron and Steel Act, 1949. Sir William Palmer, who is chairman of the British Rayon Federation, principal industrial adviser to the Board of Trade, and chairman of the Oil Consumers' Council, will be the independent chairman of the Council, which includes representatives of industry, of the TUC, of iron and steel stockholders and scrap merchants, and of the nationalised industries.

*

The £50 million increase in the fiduciary issue made on June 10th last has not proved sufficient to tide the note issue over the bank holiday period. As from July 31st, therefore, the fiduciary issue has been raised by another £25 million to £1,425 million. This extension has been authorised for not more than one month. After allowing for this £25 million increase, the note reserve in the banking department stood at £31 million on Wednesday last.

*

The arrangements for the import of tungsten and concentrates by the Ministry of Materials have now been announced. It is proposed to form a company for the purpose, whose management will include representatives of three of the leading firms in the trade: Derby and Company, Metal Traders, and H. A. Watson and Company. Consumers are to be asked to state their requirements. The price of standard concentrates is to be 535s. a long ton unit. The price is a little above the present market price of 530s. The intention is to keep this fixed for the first quarter of operation and then to review it.

*

The Board of Trade has established the nucleus of an organisation which would, in the event of an emergency, become responsible for the control of factory and storage space. This would prevent the confusion that can so easily arise when government departments are competing for factory space and it seems probable that one of the organisation's first objects will be to carry out a country-wide survey of factory and storage premises. Government departments will in any case need its help in finding adequate storage room during the present rearmament programme.

*

One of the unnamed fighters said by the Prime Minister in February to have been ordered for the RAF has now been identified as the Hawker 1067 which made its first flight last week. This week, in the Commons, the Air Minister described it as the fastest fighter in the world, surpassing the American Sabre and Russian MIG. Like the Supermarine Swift, which is also going into production, the 1067 is an interceptor fighter developed from a notable series of prototypes. It is powered by a Rolls-Royce Avon engine; the engine of the Swift has not been announced. Allowing a year to prepare the production lines, deliveries of these fighters could be expected to start late next year.

Company Notes

Thomas De La Rue.—In the financial year to April 1, 1950, de la Rue's plastics division showed a loss; in the latest year the sale of laminated plastic products has more than doubled and the division has made "a considerable contribution" to group trading profits which have advanced from £644,969 to £761,463. Satisfactory progress is also claimed for the company's other manufacturing divisions. Owing to this general improvement in trading results from the manufacturing side of the business the directors have decided to "postpone indefinitely consideration of the question of fresh capital." After maintaining the ordinary dividend at 50 per cent, the release of £222,463 from a taxation provision has enabled the company

	Years ended April 1, 1950	Mar. 31, 1951
Consolidated Earnings:—	£	£
Trading profit	644,969	761,463
Total income	686,041	793,883
Depreciation	170,876	162,149
Taxation	143,541	420,648
Group earnings for ordinary stock	*128,339*	*154,029*
Ordinary dividends	127,325	123,274
Ordinary dividends (per cent.)	50	50
Added to group general reserves and carry forward	1,014	276,208
Cons. Balance Sheet Analysis:—		
Fixed assets, *less* depreciation	2,329,684	2,233,433
Net current assets	699,508	1,146,045
Stocks	1,646,762	1,467,122
Cash	77,951	124,713
Reserves	2,151,509	2,539,314
Ordinary capital	463,000	463,000

8s. ordinary stock at 33s. 1½d. yields £7 11s. per cent.

to put £250,000, against £50,000, to general reserve.

The fall in the book value of stocks from £1,646,762 to £1,467,122 is somewhat exceptional in a year of rising prices, but this factor may well be reflected in the substantial rise in debtors from £739,044 to £1,337,202. There still appears to be some stringency in liquid resources, even after the rise in cash balances from £77,951 to £124,713 and the reduction in bank loans from £565,000 to £520,000. Since the end of the financial year, the mortgage debenture stock, which then amounted to £206,119, has been repaid. A further growth in the manufacture, sale and export of laminated plastic products is anticipated this year, and now that the plastics division is making profits the future can be faced with a greater degree of confidence. Unfortunately the limitation of dividends ensures that equity shareholders will not receive their due share in whatever measure of recovery the company may secure.

*

General Electric.—The announcement that G.E.C.'s ordinary dividend was to be increased from 17½ to 22½ per cent coincided with the Chancellor's statement on the limitation of dividends. Satisfaction with the year's trading results will be tempered by the realisation that if the Government has its way a dividend of no more than 20 per cent can be expected in the next three years. Increased demand for the company's products both at home and abroad is partly responsible for the advance in group trading profits from £6,021,980 to £7,424,716. Shortages of materials and labour, however, were beginning to have some effect towards the end of the financial year. The inflation of prices, which will have contributed to earnings through automatic profits on stocks, has brought further problems and in common with many other industrial firms G.E.C. have taken some steps to combat them by appropriating £750,000, against £140,000, to a plant replacement reserve and £481,372, against £175,302, to a reserve "against future stock depreciation."

	Years to March 31, 1950	1951
Consolidated Earnings:—	£	£
Trading profit	6,021,980	7,424,716
Total income	6,392,279	7,979,793
Depreciation	932,435	1,038,724
Taxation	2,730,690	3,640,848
Group earnings for ordinary stock	*1,098,752*	*564,467*
Ordinary dividends	404,093	495,933
Ordinary dividends (per cent.)	17½	22½
Added to group general reserve and carry forward	903,399	471,768
Cons. Balance Sheet Analysis:—		
Fixed assets, *less* depreciation	9,255,050	10,234,710
Net current assets	24,421,137	25,241,616
Stocks	25,449,904	25,217,010
Cash	4,102,870	4,676,590
Reserves	17,300,991	19,043,820
Ordinary capital	4,198,372	4,198,372

£1 ordinary stock at 90s. yields £5 per cent. on 22½ per cent. dividend.

Reserve appropriations were clearly necessary after the expenditure of some £2,000,000 on capital account. Despite this expenditure and the expansion of turnover the company's liquid position has not been impaired, and in fact cash balances have risen from £4,102,870 to £4,676,590. Stocks of finished goods have fallen but the value of work in progress has increased so that the book value of stocks has only fallen by some £200,000 to £25,247,010. The company should continue to earn very satisfactory profits this year, within the limits set to production by labour and material supplies. The one cloud overhanging equity shareholders is the threat of controlled dividends.

*

William Cory.—The improvement in group trading profits from £1,675,295 to £1,809,750 is due almost entirely to the increased participation of the Mann George group of companies in the export of coal from South Africa, where exports achieved peak figures both in volume and price. At home, the total tonnage of coal, including imported coal, distributed was 5 per cent greater than in the previous year, but the percentage of coal carried in the company's coasters was smaller, owing to delays in loading through strikes and stoppages due to crew shortages. Unfortunately, since the end of the financial year, the action of the Persian government has meant the end of oil shipments from Abadan, which provides a very substantial part of the company's business in oil supplies for marine and other purposes. Secondly, an unexpected shortage of rail transport in South Africa since May has reduced coal deliveries to the ports to a mere trickle.

	Years to March 31, 1950	1951
