Communist Yugoslavia must have someone to gird at, either at home or abroad. British policy towards it must therefore be based on the calculation that it may be a temperamental and brusque ally, stubbornly independent, but deeply committed—at any rate for the predictable future—to common policies with this country. For overwhelming economic reasons, created by the Soviet and East European blockade, it must work with the West on long-term as well as short-term plans. For obvious strategic reasons it must look westward for modern weapons, technical advice and supplies. For obvious ideological reasons it favours the British rather than the American connection, while wishing to keep both. If Mr Eden decides—as he doubtless will—that he can hold to the British course in company with a ship that may from time to time tack erratically, whose officers might one day signal “mutiny on board,” but whose company is loyal, friendly and brave—then he should order it to be done with more speed and conviction than have been shown hitherto.

NOTES OF THE WEEK

A Moscow Banquet

If the communiqués issued in Moscow this week are to be taken at their face value, the conference held there between the Soviet leaders and a strong Chinese team headed by Mr Chou En-lai, the Prime Minister and Foreign Minister, has been a disappointment. Four weeks of negotiation have so far only produced the announcement that the Russians are to withdraw from the Manchurian railways, as they were committed to do by the 1950 agreement, but that they will remain in the Port Arthur base despite a similar commitment to withdraw. This would seem a poor record of achievement for a conference attended by a massive Chinese delegation including ministers of heavy industry, fuel and machine building, and a glittering array of generals and admirals. It seems just possible that the Chinese really did ask the Russians to stay in the massive stronghold of Port Arthur, which covers the approaches to Peking, owing to fears of possible developments from the Korean war. But it is quite impossible that they sent such a team to Moscow merely to make that request.

Despite the communiqués, however, it is unlikely that this mountainous conference has laboured for a month only to produce such a mouse. The Peking press must have had at least some grounds for stating that the talks were “extremely important” and that they would make a “significant contribution” to Sino-Soviet friendship and to “peaceful construction” in both countries. The Chinese undoubtedly sought not only Russian arms but also Russian capital equipment with which to expand their own arms industry. If they had won any major concessions from the Russians in this direction, would not an announcement have been made at the same time as that on Port Arthur and the Manchurian railways? One possible explanation for their silence might be that further Soviet aid for China will be announced, with suitable trumpet flourishes, as a curtain-raiser for the coming congress of the Soviet Communist Party, and for the Chinese revolutionary celebrations which also take place in October. But the fact that this week’s communiqués did not specific-

ally state that the conference had ended may imply that the really hard bargaining is only now beginning. Mr Chou En-lai has not, apparently, yet returned to Peking, and even if he does so within the next few days he may leave in Moscow some of his formidable team of technical advisers to keep up the pressure. This would be an interesting departure from the normal Communist conference technique, according to which the banqueting and the personal appearance of Marshal Stalin only take place when the agreements are in the bag.

* * *

Korea and the Assembly

There is much to be said for holding a debate in the United Nations General Assembly on Korea, as is proposed for this autumn. The UN forces in Korea, under American auspices, have done their best to carry out the directions of the Security Council. But it has proved impossible to bring the campaign to an end, and every effort to do so has now been frozen for fifteen months at the truce talks. Although there is no obvious solution for the General Assembly to devise, so long as the purely military negotiations at Panmunjom are continued under the direction of the Supreme Commander a general airing of views in the Assembly might yet succeed in creating a more promising political atmosphere. The chances of a shift in the attitudes which have now been struck for so long is also enhanced by the fact that the Russian and Chinese leaders have just been conferring in Moscow.

One rumour has it, however, that these deliberations have cleared the ground for a Chinese declaration of war on America during October. The aim might be to drive a wedge between the United States and its allies, on the argument that London and Paris would not support Washington by declaring war themselves; they would fear the consequences for Hongkong, in Indo-China and on the high seas. This rumour seems unlikely to be true. If the Chinese will not accept peace, the present state of suspended and isolated

war in Korea—even continued indefinitely, would seem to suit both them and the Russians better than a wider conflict which could hardly help but become general. And if, as seems to emerge from what is so far known of the Moscow meetings, Russia in the last resort retains the whip hand over China, the caution which Moscow at present displays elsewhere in the world is likely to prevail in the Far East too. That, on the other hand, does not render it any less necessary for the British and French leaders to make it clear, to the Communists as well as their own people, that if the war bursts out of Korea they stand or fall with America, come what may.

Boomerang for Persia

Dr Mossadegh has caught the occupational disease of dictators. His "patience is exhausted," and he has set forth a last basis for settlement with Britain which runs as follows. First, Persia is ready to pay compensation to the Anglo-Iranian Oil Company only for its installations at Abadan; so it denies the validity of the 1933-1993 agreement on the basis of which the company invested British money on a vast scale. Secondly, Persia's counterclaims must be recognised on the basis of the 1933 agreement for the years 1933-47, and on the basis of the Supplemental Agreement that the company offered, but that the Persians never accepted, for the years 1948-51. In a word, contracts are valid where they benefit Persia though invalid where they benefit Britain. Third, Britain must pay compensation for oil which Persia failed to sell in 1951-2 owing to the British counterclaim thereto. Fourth, the company must advance Persia the sum of £49 million which would have been due to it in 1950 had it signed the Supplemental Agreement.

To a western mind these demands far exceed the limits of reasonable negotiation; yet to a Persian they appear logical. They do so because he considers himself to have been cheated of his rightful earnings over many years, because he is infuriated at the sight of the Anglo-Iranian Oil Company developing alternative sources of wealth by investing profits made in Persia, and because he badly needs funds. His subjective thinking runs no farther. All over the world, Persians are putting these points to anyone who is ready to listen. Their hearers can fairly make the comment that if Persians want to attract funds for their country's development, they are frightening away new investors by the arguments they use against the old.

Wage Talks at the Ministry

These are critical days in St. James's Square. After talks with the leaders of the shipbuilding and engineering unions last week, Sir Robert Gould, the chief industrial commissioner at the Ministry of Labour, met the engineering employers on Thursday. In a statement issued afterwards the employers repeated their contention that in the present state of its markets, the engineering industry could not afford any extra burden on its costs; but they said they would be willing to submit the matter to arbitration. At their conference in York last week the unions rejected arbitration—but no doubt they will reconsider it. The shipbuilding employers are to meet Sir Robert on Tuesday—a separate meeting because, according to an official statement after last week's meeting, "although the decision to impose a ban on overtime and restrict piecework was directed against the employers in both industries, in fact the problems of the two industries are distinct and will need to be discussed separately."

The difficulties of finding a basis for settlement have been increased by the rash statements of the embattled principals before the Ministry of Labour intervened. Both sides took up an extreme attitude—the unions in pressing for such an

excessive increase and the employers in refusing to offer any increase at all. While through the working of sliding scale agreements, wages boards, the arbitration tribunal and the industrial court, wages in several other industries are being raised to meet the higher cost of living, it is unrealistic to expect that such a powerful group as the engineers and shipbuilders should receive nothing. If the employers had made an offer they might well have got off more lightly than they would do by arbitration.

It is true that on the supposition that a dispute will eventually go to arbitration an extreme attitude is sometimes of advantage to both sides. The tribunals so often "split the difference" that it may pay the unions to ask as much and the employers to offer as little as possible. But in this dispute over engineering and shipbuilding wages, both unions and employers have carried these tactics so far that they have stiffened each other's resistance and made compromise impossible without some loss of face to both. It will need all Sir Robert Gould's skill to reach a settlement.

Mr Shinwell Goes Shrimping

The metamorphosis of Mr Shinwell, from champion to assailant of the two-year period of national service, is remarkable. It may appear to be so obviously connected with his loss last year, and his hopes this year, of a seat on the executive committee of the Labour party, as to need no further explanation and merely to stimulate depressing reflections on public gullibility as assessed by a very shrewd politician. But the arguments adduced for his *volte-face* have enough in common with the "new strategic thinking," which even in Mr Churchill's hands has the convenience of lessening the economic burden of defence, to deserve rather closer examination than might be due to a mere political manoeuvre. In sum, the arguments are that the threat of war has receded since the two-year period was instituted, that the aim of building a large trained reserve has been amply achieved, and that time spent in the services after training is largely wasted.

The diminution in the threat of war, even if it is real, must surely be attributed in part to precisely that evidence of a firm will to resist which the lengthened period of service provided. To this extent, reducing the period, just as the defence programme is in some respects getting into full swing, would revive the threat. It would be short-sighted folly. The third argument deserves even less consideration. Waste of servicemen's time may be evidence of faulty organisation; it may also merely be part of that "nine-tenths boredom" which characterises cold wars no less infallibly than it does hot ones. It is no more conclusive evidence of a superfluity of armed manpower than the spectacle of idle trucks on sidings is evidence that British Railways have overcome the rolling-stock shortage.

The real cause, however—and the answer to Mr Shinwell's second and most serious argument—lies in the dual aim of the national service system. The aim of building up a large trained reserve is certainly important, but it does not stand alone; the other, and equally important, aim is to enable Britain to meet current commitments, and to that aim the later months of service are supremely relevant, since it is only during those months that the serviceman is a fully trained and fully disposable soldier. The army is in fact already fully stretched, and it faces the prospect of some fall in strength even with national service continuing at the present span. To meet the obligations assumed under Nato, in the Middle East, in the Far East and in South-East Asia while drastically depleting the supply of trained and disposable national servicemen would require either a revolutionary expansion of regular recruiting—of which there is not the slightest likelihood—or a still more revolutionary stiffening of the terms of Territorial service, causing incom-

parably more dislocation, loss and hardship in civilian life than the earlier freeing of the national servicemen would save. There is no sign that Mr Shinwell contemplates either of these alternatives. Yet the only alternative is a clear-cut breach of agreements for which he wholeheartedly shared the responsibility. On the past record, Mr Shinwell is entitled to enough respect to deserve an answer. But it is hard to avoid the conclusion that he is engaged in a political manoeuvre that destroys his right to such consideration in future.

The Right Road Again?

The "progress report" on the Government's first year, issued this week by the Conservative Central Office, gives at least a remarkable simulation of self-confidence. But its impressiveness perhaps depends too much on the vigour of the title—"We Shall Win Through"—and the lavishness of the production. The standard of the content is somewhat lower. It is significant that the nearest thing to a novel point is the admission that Government spending is out-running the Budget estimates. Though the efforts to economise are continually stressed, the resulting cut of £90 million in spending (other than for defence) is neatly described as "the reduction as embodied in the Budget." "There has since been unavoidable supplementary expenditure."

For the rest, the argument is on familiar lines. It rehearses the warnings about the crisis that Mr Churchill gave before the election, not the gayer promises of benefits that some Conservatives offered to the electors. It makes much of the improvement in the balance of payments and little of the circumstances, many of them probably temporary, on which the achievement rests. Under the general heading of "trade not aid," the Commonwealth conference is to provide "a great opportunity," but there is little attempt to define its value except for a reference to "the whole system of Imperial Preference to which we attach so much importance." On the other hand, among all that is said about economic policy, housing—which does so much to frustrate the efforts to cut Government spending in other directions—is ignored. On this field the attitude to "sound money" is the same as Dr Dalton made famous; the achievement is boasted about in the section of the pamphlet on social policy, and the economic cost goes unreckoned. After all this, the pamphlet's confidence that one year of Conservative government has already put Britain "back on the right road" cannot encourage anything but concern.

Is it a Slump?

Those who are worried by the decline in Britain's index of industrial production will find thought stimulated by the current Economic Bulletin of the Economic Commission for Europe. It reveals that there has been, between the first quarters of 1951 and 1952, a fall in the index of industrial production of all west European countries with the exception of France and Germany. How have these two avoided a setback? Could Britain have done likewise? It is certainly not the case that production has expanded in every branch of industry of these two countries. They, too, have suffered from the general fall in demand for textiles and for some of the lighter durable consumer goods such as footwear, furniture and household appliances.

In France the general index is up because there have been more than compensatory increases in the output of capital goods from the engineering trades (partly for defence purposes) and of automobiles for the home market. During the first quarter of this year, the home market has taken 40 per cent more cars than in the same period last year. This was more than enough to offset the decline in exports of auto-

mobiles. In Germany the rise in the general index was due almost entirely to expanding production of steel and finished capital goods. It is interesting that this expansion was accompanied by an appreciable decline in the building of houses. Presumably in Britain, too, total production could have been maintained if it had been possible to produce automobiles for the home market and if there had been no cut in the production of capital goods. This was not possible because of the steel shortage in the engineering industries, where production was held back by the inability of the British steel industry to adjust itself quickly enough to the fall in supplies of scrap from Germany.

The Bulletin also discusses the persistence of the dollar gap. During the first quarter of this year dollar imports continued at a high level. For Europe they were 25 per cent higher than a year ago, for the sterling area 90 per cent higher. This was allowed to happen at a time when American aid was being reduced and European exports to the dollar world were falling. Of all the European countries only the United Kingdom managed to increase its dollar exports by any significant amount.

At no time have Western Europe's efforts to live within its means included a sustained and effective attempt to cut down consumption of dollar imports. With the spectre of a slump before them, Europeans are now even less disposed to make the attempt. In every country there are people only too ready to attribute the decline in production and consumption to an excess of financial orthodoxy. These critics are unlikely to take as their model Western Germany, where inflation and balance of payments difficulties have been avoided by ensuring that both production and exports increase at a faster rate than home consumption. They will prefer the easy way taken by France—the way of inflation.

ADVERTISING

WISDOM . . .

Quality sells . . . slowly

There are people who say that you don't need to advertise a really good article. They say that quality sells itself; and up to a point they're right. But quality by itself can be a slow salesman; by the time the world knows what an excellent product you are offering, you may have gone out of business.

One of the basic principles of selling is that, in the long run, if a product is going to be advertised it has to be good. But another is that even if a product is good, it still has to be advertised.

In fact, before you congratulate yourself because your product is selling very nicely on its quality, wouldn't it be as well to ask how much better it would sell if you helped it with a little of the right sort of advertising?

Why not drop in and talk about it? We can show you some actual examples that will convince you.

At M. Pinay's Coat-tails

If it is true that the extravagant profits sought by the peasant, the manufacturer and the middleman have been the chief forces menacing the French economy, then the franc should by now be out of danger. M. Pinay has refused to raise the price of wheat and, with an unusual flair for publicity, is waging all-out battle against price rings, cartels and monopolies, a battle worthy of the master trust buster, Teddy Roosevelt. Its climax is a decree fixing prices at the level of August 31st.

In fact the real struggle is one that entirely lacks public appeal and is being fought out far from the microphones. It goes on around the issue of dear money and credit controls. For some time business interests have been pressing the French Government to reduce the discount rate and to liberalise credit policy. At this moment nothing could do more harm to M. Pinay's anti-inflation policy, since the failure to control credit during the Korean boom is now seen to have been one of the prime causes of France's present troubles.

Last autumn, belatedly, the Bank of France raised the discount rate from 2½ to 4 per cent. Presumably the increase was insufficiently supported by other credit controls, for it was not until April of this year that the volume of credit ceased to expand. Moreover, the investment credits in this year's budget, frozen in order to balance accounts, seem to have become partially defrosted. The Economic Commission for Europe in its latest report notes that "ways seem to have been found . . . to prevent the cuts in, and blocking of, credits from having any immediate effect on any major public investment project. . . ."

M. Pinay must be aware that platform appearances, exhortations and even price-fixing decrees cannot by themselves dam the tide of inflation. They must be accompanied by energetic steps to drain off the floodwaters. Recently, however, there have been signs that both note circulation and bank credits are again beginning to rise. Is the French Government weakening because it fears setting in motion a decline in employment that would be politically dangerous? This is difficult to believe since the volume of employment is now higher than at any time since the end of the war. It is more likely that the government may be giving way to the demands of the businessmen among its supporters that credit controls should be relaxed. If so, there is serious political as well as economic trouble ahead.

Berlin Calls on Bonn

The visit this week to Bonn of a deputation from the People's Chamber of Eastern Germany may start more than one lively hare. Its members have been selected to suggest that democratic parties with reassuring names survive under Herr Ulbricht's regime; but in fact Dr Ehlers, the president (or Speaker) of the Bundestag, will be receiving a carefully prepared Communist mission. As he is considered a likely successor to the Chancellorship, if anything happens to Dr Adenauer, his decision to do so without consulting Ministers is important and has been criticised from many quarters, including the Social-Democratic Party. It is probably significant that Dr Ehlers is a prominent Evangelical churchman; for it is well known that Protestants are more inclined than Catholics to run risks with the Russians in order to regain the Protestant areas of the east.

In both churches, of course, there are men who hope to learn from the Communist visitors what these risks might be. That is not to say they are interested in German unity at any price; but they are influenced by politicians and journalists who say the Russians cannot be expected to abandon their zone of Germany without the West paying some price. Recognition of the Oder-Neisse line in return for a Russian withdrawal is one favourite rumour.

It has also been suggested that the Russians might be interested in a limitation of German commitments to the European alliance—in other words the abandonment of the European Defence Community and rearmament. But the suggestion gets no organised backing among Germans and no support from the western governments. Its sponsors therefore feel discouraged, and are heard to say that the French—except for M. Schuman and his circle—want neither the EDC nor German unity, that the Americans are interested only in German divisions, and that the British are quite ready to see nearly twenty million Germans submerged in another Sovietised state.

M. Schuman's Chances

The future of the European Defence Community is, of course, still in doubt; although the giant strides that M. Schuman and Dr Adenauer are taking towards European federation may strengthen its chances of ratification. Indeed, Dr Adenauer seems likely to get the agreement of the Bundestag next month; but the same cannot be said of the French Assembly. Whatever may be thought of suggestions that M. Schuman's position is weakening, the future of M. Pinay's government is clearly, for domestic reasons, most uncertain. If it should fall, it is doubtful whether any man could be found ready to go as fast and as far as M. Schuman has gone—with great courage and skill—towards reconciliation with Germany.

This is a situation that Soviet diplomacy is bound to exploit, if it has not already started doing so. The last Soviet Note about Germany was baited to appeal to waverers in France and elsewhere, with its blatant suggestion that the arming, sealing off and Sovietisation of Eastern Germany might yet be reversed if a four-power conference could agree on a peace treaty over the heads of the Germans.

The western reply to that Note will doubtless counter those tactics; and its effect will be strengthened by the knowledge that Dr Adenauer has again been consulted about its contents and that members of Nato have also had a chance to express their views. It is worth noting, incidentally, that this is the first time that Nato has been formally associated with an act of policy towards the Soviet Union. It should be the precedent for regular consultation within the Atlantic Community on major matters of foreign policy.

Sweden at the Polls

A strengthening of the government—a coalition between Social Democrats and Agrarians—is the most probable result of the Swedish general elections tomorrow. The Socialists at present have 112 of the 230 seats in the Second Chamber and are allied with the Agrarians (30 seats) to provide a majority. It is a foregone conclusion that the Communists, after the recent spy trials and Russian actions in the Baltic, will, in spite of their somewhat comic attempts to pose as patriots, lose most of their eight seats. These will go to the Socialists; and the question is whether there will be a corresponding loss of Socialist seats on their right wing, either to the Liberals (*Folkpartiet*) or to the Conservatives (*Högeren*). The Liberals, with 57 seats, are now the second largest party in the Second Chamber; but most observers expect them to lose one or two seats. This is partly because there has been a certain disillusionment with the Liberals since the previous elections in 1948, partly because the new Conservative leader is proving unexpectedly effective.

With a gain of four seats, which they are pretty certain to get, the Social Democrats would once more be in an

absolute majority. Even so, it is generally believed that they would still share office with the Agrarians, at least until the pending annual negotiations on wages were concluded.

The election, as usual in Sweden, has been fought almost entirely on domestic issues. The recent attacks on the Socialist Foreign Minister, Hr Undén, are a personal, not a political, matter, and do not imply any significant increase in opposition to the country's "neutral" foreign policy. It is worth noting, however, that as early as June the Socialists started attacking the Communists as tools of a foreign power. In June also, at their party conference, it became clear that the preservation of Socialism as it is, rather than the intensification of radical measures, would be the Socialists' aim. The Communist suicide has freed the Socialists from the need to compete with them, so that a more moderate policy may also gain votes from the left wing of the opposition. But the Social Democrats' trump card is the fact that, while they have been in office, the lot of most Swedes has greatly improved, and this, rightly or wrongly, is identified with the government's policies.

Dearer Food

The cost of living index fell a point in August for the first time for two years—mainly because apples and potatoes were cheaper. But the net rise in the index this year, from 132 in January to 137 in August (June 1947=100), was due almost entirely to the higher cost of food; other items in the index increased by less than 1 per cent. And dearer food prices may well raise the index by another point or so in October, with the second instalment of subsidy cuts—delayed until higher family allowances and benefits were all in force. This adds another 4d. to the weekly cost of one person's rations; with the earlier cuts the total extra cost per week is now 1s. 4½d., compared with 1s. 6d. forecast by the Chancellor at the time of the Budget. The reason why it is less than he forecast is, presumably, that food rations are lower than was expected—especially, perhaps, for eggs; but it is enough to bring the food subsidies down by £160 million to the annual rate of £250 million at which the Budget aimed. The actual expenditure for the financial year—as opposed to the rate at which the subsidies will run in the last five months of it—will be £310 million.

The subsidy cuts will not cause the last rise in food prices because higher prices have just been agreed for several

RETAIL FOOD PRICES AND SUBSIDIES

Commodity	Retail Prices			Estimated average un-subsidised prices 1952-53
	Oct. 24, 1951	July 24, 1952	Oct. 5, 1952	
Bacon, lb.	s. d. 2 7*	s. d. 3 5*	s. d. 3 10*	s. d. 4 2½*

* Average for all cuts or grades.

imported foods. The Ministry of Food is to pay 1s. 3d. per lb. more for Australian lamb—the beef price has yet to be agreed—and an average of 12½ per cent more to New Zealand; Argentina is asking for a large increase; Australia, New Zealand and Denmark are to get 7½ per cent more for

their butter. But bacon at least is cheaper. In the negotiations just concluded with Denmark a price of 252s. 6d. per cwt. was agreed, compared with 262s. 5d. last year. The increase in home supplies, besides improving Britain's bargaining strength, has made it possible to allow, from October 5th, the sale of cooked gammon off the ration. Its controlled price of 8s. a lb. will cut into the profits that have been made on tinned ham, sold to the public at 12s. Indeed, if it is removed from the tin it will have to be sold at not more than 8s.

This, however, is a small point. In general, food cannot be expected to become cheaper. A few extra pence on the weekly food bill do not, however, herald still larger wage claims; the unions have allowed for them with a vengeance. Indeed, one might almost conclude that for every rise in the weekly food bill they want to be compensated many times over.

Unrest in Kenya

It may be as easy to belittle the importance of the present outbreaks of crime in Kenya as it is to exaggerate them. The imposition of the curfew, a demonstration of force by the Kenya Regiment and the summoning of an emergency meeting of the Legislative Council have encouraged fears that the colony may be becoming another Malaya, as do also the reports of intimidation of Africans and their reluctance to give the police information about the criminals.

The crime wave is, in fact, largely the work of the Mau Mau secret society, an organisation which is virulently anti-European and pledged to achieve the eviction from Kenya of all races other than the African. Yet membership of the society is virtually confined to the Kikuyu tribe, which,

though the largest tribe in Kenya, only comprises one-fifth of all the colony's Africans, and most of the tribe is loyal and law-abiding. One of the two members of the Kenya Government who have arrived in London to discuss measures to restore law and order with the Colonial Secretary has said that the activities of the Mau Mau have been greatly exaggerated.

What is important is that the agitators have genuine discontent to work on. For many years the Kenya Government has been confronted with the problem of an increasing African population trying to obtain a living from an eroding soil. For years it has been trying to solve it by patiently persuading the African to adopt modern farming methods and take steps to prevent soil erosion—with a considerable measure of success. Neither problem nor solution is peculiar to Kenya. But there the Africans are made to feel more deeply about it by the existence of the White Highlands, farmed by Europeans and containing some of the richest land in the colony. As Mr Griffiths said in the colonial debate last July, here are all the makings of "an explosive racial situation"—Europeans each farming 2,000 acres surrounded by Africans for whom the land available per person is steadily getting less. Neither he nor anyone else could see a clear way out. But sporadic outbursts of crime are always likely to recur so long as the Africans' land hunger is unappeased. Mr Lyttelton stated in the same debate that a "far-reaching inquiry" into the land problem was urgently called for. The present unrest should stimulate him to hurry it up.

Nato Rides the Waves

Of all the autumn manoeuvres now in swing in various parts of Europe, none has caught the public imagination as much as the naval exercise in Norwegian and Danish waters in which ships and aircraft from eight Nato nations are taking part. Commentators have had to go back to the Battle of Jutland to find a parallel for Exercise Mainbrace, involving nearly 200 ships. But it is not a rehearsal for unlikely new battles; the main emphasis is on the role of naval and air forces in support of troops resisting invasion on land. It provides a stiff test of co-ordination between all arms, including wholly amphibious operations. Even more important is the testing of co-operation between the eight participating countries; for although much has already been done to standardise both equipment and procedures in Nato, only full-scale operations of this kind can reveal what weaknesses remain.

In addition to practising international liaison from ship-to-ship and from ship-to-air levels, Mainbrace will test, on an unprecedented scale, the practical working of the higher Nato command structures. The principal standing commands involved are shown in the accompanying diagram.

Thus, for the first time, the newly organised Atlantic Command of Nato is joining its European counterpart in a large-scale operation, for the duration of which Admiral Brind has been entrusted by both supreme commanders with overall authority. The fact that an exercise of these proportions could be mounted at all is an impressive reflection of the growth of Nato's defensive power during the past eighteen months; but it is to be hoped that the time is not far off when troops can be got to Norway and Denmark in fast transport aircraft.

* * *

The Mouth of the Baltic

A writer in the Moscow paper *Red Star* this week declared that everything about Exercise Mainbrace was aggressive, even its name. But its purely defensive character is apparent. It does not even envisage opposed landings, although these would be a legitimate part of any defensive plan which assumed that Allied territory might be overrun by an early enemy offensive. Precautions have been taken to ensure that the modest part of the operation which involved entry into the Baltic should give the Russians no grounds for claiming provocation. No American ships will enter the Baltic, and the light British forces which have done so were under Danish command. All ships kept at a distance of fifteen miles from all Baltic coasts except the Danish, and the exercise area extends no further than thirty miles east of the Danish island of Bornholm. Soviet press claims that its inclusion in the exercise was "provocative" have been firmly rejected by the Danes, who justly point out that the island is part of the national territory.

Denmark, indeed, has shown in recent weeks a praiseworthy steadiness in the face of violent Communist propaganda attacks on the proposal to make bases available to Allied air forces. Taking their cue from a *Pravda* article in which this proposal was denounced as "aggressive and provocative," and which warned the Danish government that it would be held responsible for the consequences, the Danish Communists have built up a campaign which culminated last week in a demand for a special meeting of parliament. The Radical-Liberal opposition, while more moderate in its tone, has also demanded full parliamentary consideration of the question. The Prime Minister, Hr Briksen, and his Foreign Minister, Hr Kraft—who has just assumed the chairmanship of the Atlantic Council—have handled the situation discreetly and firmly, reaffirming their loyalty to parliamentary decisions but making clear their belief that Denmark needs to play a full part in Nato if it is to secure full protection. All the evidence indicates that the first-hand sight of western power provided by Mainbrace is further stiffening Danish resolution.

Is Greece in the Middle East?

How well-founded is the request of the Greeks, made last week in Athens, to join the Middle East Defence Organisation? Clearly, they can claim vital interests in the Eastern Mediterranean, for they live there. Further, their ownership of the Dodecanese, the size of their merchant colony in Egypt, and the part which their navy, in particular, played in the war all reinforce their case as staunch allies. Yet Greece is a poor country, and is already stretched to the limit by the burdens inherent in its membership of Nato. To assume commitments that might range as far east as the Persian Gulf and Pakistan would be beyond its means. Greece, unlike the rest of Europe, is still costing the United States nearly as much in military and economic subsidies as it did in 1948; additional subsidies would probably be needed were it to fulfil its ambition in anything but name.

This desire to extend Greek commitments eastward was not heard of when western defence planning was based on expectations of the British staying on for some years in the Suez Canal Zone. It took shape last month when a British memorandum to the seven powers at present sponsoring Middle East defence suggested that, pending better news from Egypt, a planning organisation might be set up in Cyprus. The Greek claim to the island is well known; it would get a fillip if Greek generals visiting a headquarters guarded by British sentries were received with popular shouts of *enosia*. To achieve this, the Greek Treasury and War Office seem prepared to bite off far more than they can chew and to cock a furtive snook at this country.

A Literary Event

Uncle Tom's Cabin, or *Negro Life in the Slave States of America*. By Harriet Beecher Stowe.

Some books may be said to be events, and this is one. They come opportunely on the world, like a promised revelation, and are believed in as soon as read. . . . We may quote as an instance of such books as we mean Malthus's "Essay on Population," which had no charms for the multitude, but which came at a time when the world was seeking, almost distracted with doubts, and was at once received by many leaders of the nation as a revelation of a great truth, if it found, as all such books do, many opponents and cavillers. . . . Mrs. Stowe's book, like that of Malthus's, supplies a great public want, or touches a chord of universal sympathy; it serves a great purpose, and leads forward a great crusade against an acknowledged wrong. As she says more than once, there is an upheaving of the masses, a desire for liberty, a yearning for freedom, a growing hatred against oppression, an indignation ready to break forth against wrong throughout society, and of that universal sentiment, Mrs. Stowe's book is an expression. . . . The book makes us acquainted, too, with the domestic manners of the Americans, and we are struck at every page, whether we read of the little woolly heads rolling on the floor round aunts Dinah and Chloe, or of the Mas'r Georges and Miss Evas who play about the verandahs and in the parlours, with the freedom which children enjoy in the States. Neither slaves nor free are found to be an incumbrance; they are all easily raised, they are not sources of painful anxiety like children in crowded Europe and like children in savage life, and they seem to be loved more, tolerated more, found much less in the way, and are probably happier, on the whole, than children in Europe. . . . From the general freedom and well-being of the children in the United States the generations of men should grow up improved, not perhaps in the sense of us old Europeans—but improved in that manner, whatever it may be, which Nature is preparing for the future of mankind.

"Neutrality" in Asia

The British may not particularly like the fact that the newly independent nations of Asia tend to seek neutrality in the division between the Communist powers and the free world, but they can nevertheless understand the point of view. It is only in the last decade that direct European rule has been withdrawn from large areas of Asia and the memory of the old imperialism is still strong enough to blind their peoples to the danger of the new Soviet variety. "A plague on both your houses" may not be a constructive approach, but there are clear historical reasons for it.

To Americans, on the other hand, it is bewildering. The United States has a long record of vocal anti-imperialism, and such states as Indonesia undoubtedly owe their independence in some measure directly to American support. How then, they say, can Asia refuse to take sides? The fight against Communism is the fight for freedom. How can people be neutral in such a crusade?

This reaction has undoubtedly been made more bitter by the debacle in China. Communist propaganda battered on the American assistance given to Chiang Kai-shek, and branded the Americans throughout Asia as "imperialist interventionists." In a mood of combined disillusion and irritation, Congress wrote into the Mutual Security legislation clauses laying it down that nations receiving aid should actively contribute to the defence of the free world. These clauses, applied in Indonesia, brought down the government.

Now, however, there is some indication of a more flexible American approach. Mr George Allison, Assistant Secretary of State, dealing with the Far East, has warned Americans to expect "neutrality" in Asia, but also to recognise that the new states are ready to preserve their independence at all costs. The advice is wise. Nations determined to preserve their independence are already on the side of the free world.

Aluminium School

At Coventry a new type of school has been erected with less than half the number of building man-hours needed for a comparable school of traditional construction. It is the first school to be designed by the Ministry of Education in collaboration with a local authority, and is built from standardised prefabricated components. The manufacturers are the Bristol Aeroplane Company, who have turned over to schools the resources they once used to make the aluminium temporary house. But their aluminium unit construction for schools is not temporary, and the components can be assembled in a great variety of ways.

It is to be hoped that local authorities will not prove irrevocably wedded to traditional construction, for the new project has several advantages. One is that it is a good proposition for export—about three-quarters of the present output is exported. Another is that its use of steel is negligible. A third is that its cost is within the Ministry's limit of £140 per place, and although greater than that of the average traditional school, is no more expensive than one of comparable quality. It should appeal to those local authorities who find that their school building is held up because local housing is taking more than its fair share of bricks and bricklayers.

The principal problem of local authorities remains unsolved, however. It is that they can plan only from year to year, within the limits of one year's capital investment programme and one year's allocation of steel. Plans have to be made now for schools that will be under construction in 1954; and if conditions are suddenly changed months of work by designers and planners can be entirely wasted. The Ministry of Education gives as long a notice as it can by announcing programmes for one year with a provisional or "reserve" list for half the following year. But the only satisfactory answer for the local authorities is that they should know how much school building they can do for two or three years ahead.

NEW RETURN CHEAP FARES
to Paris
£9.15.0 by night
£11.14.0 by day

These new return fares take effect on October 1st. They are available for services leaving London throughout the day, from early morning to late evening. (There is also a cheap single fare at £6.10.0.) Light refreshments (coffee and biscuits) are included in the fare. Drinks and cigarettes are duty free. The new fares represent a real advance in popular-priced air travel. For full details and bookings please apply to your Travel Agent, or BEA, Dorland Hall, Regent Street, London, S.W.1. (Tel: GERrard 9833.)

BRITISH EUROPEAN AIRWAYS

*Painted 1926—
repainted 1951*

The brick and stucco of the Chadacre Agricultural Institute were painted with white lead in 1926. For a quarter of a century it was not touched. Then, last winter, the accumulated dirt was washed off before repainting—and that was all that was needed to be done: the original paint had worn thin, of course, but the film was smooth and unbroken; it formed a perfect foundation for the three coats of white lead. Although we do not pretend that 25 years between paintings usually gives the most economical maintenance, this building is a very good example of what we mean when we say white lead paint lasts.

UP...UP...UP go Reader's Digest sales—

**—so advertisers get
bonus circulation free**

UP FROM 300,000 circulation in 1949 to a guaranteed 700,000 monthly average this year — and Reader's Digest sales are still shooting up!

Our advertisers gain handsomely from this rapid rise. This autumn, for instance, they are getting about 100,000 circulation per month free.

Indeed, each year since The Reader's Digest accepted advertising, they have had a substantial bonus of circulation—for the page rate is based on a conservative guaranteed sale which has always been exceeded.

The Reader's Digest is a magazine for the family, skilfully edited to carry your message to both men and women. It is read at home by 90 per cent of its readers, and more thoroughly than most magazines.

Rates are low for black-and-white and (especially) full colour advertising, and space should be reserved early. 27 overseas editions are also available.

Thrifless Britain

Sir,—It is an arguable point whether "additions to tax reserves" should be treated as part of private or of public saving. But the contention of your leading article this week is that they are neither—which is surely taking an unnecessarily gloomy view of things. It is true, of course, that "additions to tax reserves" appear as an item only when the taxes chargeable on a year's income exceed the taxes actually paid in the year. But this does not mean that the disappearance of this excess would automatically cause this particular source of saving to disappear—it would only mean that it would become converted into a correspondingly larger budget surplus. Hence, taking private and public savings together, this item should certainly not be excluded from "savings."

Actually, the national savings of each year can be derived from table 31 of the new national income estimates, by adding net overseas investment (or deducting disinvestment) to domestic capital formation; adjusting the former item for grants, etc., received from abroad (as shown in Table 7) and adjusting the latter for stock appreciation (as shown in Table 1 *et al.*). With these adjustments gross national savings (public and private) appear as £1,541 million, £1,640 million, £1,746 million and £1,707 million in each of the four years 1948 to 1951, or 14.9, 14.9, 15.1 and 14.0 per cent respectively of the gross national product. Net national savings (after deducting depreciation provisions) appear as £971 million, £932 million, £964 million and £876 million in the same years. The difference in the trend shown in the two sets of figures is due to the rapid increase in depreciation provisions (from £570 million in 1948 to £870 million in 1951) which in turn partly reflects the increasing amounts paid in respect of initial allowances. If initial allowances are excluded from depreciation (as they should be) net savings appear as 10.8, 10.8, 10.9 and 9.6 per cent of the net national income (= gross national product minus depreciation) in the years 1948 to 1951. Thus on either showing, savings were a steady or slightly rising proportion of the national income or product until 1951, but suffered an appreciable reduction in that year.

It is interesting, however, to inquire into the causes of that reduction a little more closely. The estimates of real national expenditure given on page 13 of the new publication show that the increase in personal and in the public authorities' consumption (thus including defence) amounted to less than half of the increase in domestic output both in 1950 and 1951. Hence as far as the balance between domestic production and consumption is concerned, national savings should have shown an increase in 1951—both in real terms, and as a percentage of output—and not a reduc-

Letters to the Editor

tion. However, the deterioration in the terms of trade in that year, combined with the large reduction in net income received from abroad meant that, for the first time for a number of years, the national income in real terms showed an appreciable fall. On the basis of the new national income estimates, the effect of the change in the terms of trade between 1950 and 1951 can be put at some £330 million in terms of 1950 factor cost, and the reduction in net income from abroad (due, I presume, to Persian oil and the interest payments on the American and Canadian loans) at £130 million. The two factors combined thus caused a reduction of £460 million in terms of 1950 output prices while the increase in domestic output was only £203 million. Hence the real national product in 1951 was some £260 million lower than in the previous year. A similar calculation for 1949 indicates a rise in real income by £330 million and for 1950 a rise of £170 million (all measured in 1950 output prices). There can be little doubt that the fall in real national savings in 1951 was due to the sudden fall in real income—in contrast to the trend in earlier years—rather than to any new factor operating in the domestic field; although the large increase in the volume of stocks carried in that year (partly the result of speculative influences) has made the adverse changes in the terms of trade and in foreign income more spectacular in their effect on the balance of payments.

In all this I do not differ from your contention that in relation to long-run requirements, the level of saving in post-war Britain (though nothing like as low as the 2 per cent of income suggested in your article) has been too low. But your leading article also gave the impression that in addition to being low, savings were steadily diminishing in recent years, so that the aggravation in Britain's economic position could be directly attributed to internal causes. This was not, in fact, the case.—Yours faithfully,

NICHOLAS KALDOR
King's College, Cambridge

[We did not deny that "taxation reserves" were properly available for investment in the year in which they arise. Our contention was that something that might be non-recurrent should not be treated as a reliable constituent of the permanent level of national savings. We cannot find anything in our article to justify the "impression" to which Mr Kaldor refers in his last sentence. Savings in 1951 were below the average of recent years, but we nowhere said or implied that there had been a continuous fall. We should rather say that, throughout the post-war period, they have been steadily too low. It has never been our contention that "the aggravation in Britain's economic position could be completely attributed to internal causes," or that the effect of the shift in the terms of trade could be ignored. Our view has been that not nearly enough was done internally to adjust the economy to the changing impact of external forces.—EDITOR.]

Britain Puzzles Canada

Sir,—In your issue dated September 13th, your Ottawa correspondent pointed out that Britain was being slow in promoting sales of defence equipment in Canada, and that some unnamed Government department was actually hindering. May I, as one who has had some experience in trying to sell defence equipment to Canada point out some of the difficulties which arise? Canadian defence departments may desire to place business with this country, but they give as their reason for not doing so the uncertainty of being able to get spares in the future. They are encouraged in this attitude by vigorous American salesmanship from across the border.

This objection is lessened if the British firm has a manufacturing subsidiary in Canada, but there is a good reason making it hard for new Canadian subsidiaries of British firms to expand and prosper. For some reason which is not clear to those of us used to defence contracts in the United Kingdom, the Canadian Government does not pay any progress payments. A new firm must be necessarily short of liquid assets and unable to carry the load of perhaps a million dollars' worth of work in progress whilst it is producing and delivering rearmament orders. It is natural that the Canadian banks cannot advance sums of this order whilst firms are in their early stages of development and whilst they are manufacturing specialised equipment for which there is only one customer. If the Canadian Government really wants to encourage the development of British firms with British engineers in its own territory, then it should provide progress payments forthwith. If it insists on continuing on present lines, then only the largest Canadian firms can finance the Government's business, and in most cases these firms are off-shoots of their American equivalents.—Yours faithfully,

C. T. ORR-EWING
House of Commons

Sir,—Your Ottawa correspondent, in the article published in your issue of September 13th, gives a most misleading picture of relations in the television field between the Canadian Broadcasting Corporation and the BBC.

He speaks of forceful Canadian requests for British programmes and this section of his despatch is printed under the heading "Vain Appeals to the BBC." There have been no such forceful requests and no vain appeals. At the recent Commonwealth Broadcasting Conference there were general discussions of a most friendly character with the representatives of the CBC about the provision of BBC television programmes to Canada. Early this month when the CBC was placed in a difficult position, shortly before the opening of its television service, by the breakdown of negotiations with United States television interests, the BBC offered what help it

could in the way of the provision of available films. The CBC has, in fact, ordered two BBC films so far and it is hoped that other orders will follow.

Your correspondent seems to make light of the difficulties connected with the recording of "live" television programmes including artistes. In point of fact such recordings, which are in any case very expensive, are at the moment completely out of the question owing to the opposition of the artistes' unions to any form of recording of television programmes. The BBC is opening negotiations with certain of these unions to see if any arrangement can be made which will allow for the provision of recorded television programmes to the CBC to assist them in their present difficulties.

In taking this action the BBC is putting aside its misgivings about the provision for overseas use of telefilms or kinescopes, as recordings of "live" television programmes are known. At present such recordings are of variable technical quality and often unsatisfactory, and the viewer is bound to notice a great difference between them and "live" programmes or ordinary films. In the case of Canada quality will be further impaired by the need to reduce any telefilms which may be provided from 35 mm. to 16 mm.

Finally, your correspondent states that the BBC is getting an appropriation of £250,000 to make half a dozen elaborate films for television. In fact the BBC has not received and does not know whether it will ever receive, any such appropriation for the production of television films. The sum of £250,000 is the estimate given recently by the BBC in evidence before the Select Committee on Estimates for the annual expenditure of an overseas television service. If the BBC ever receives such an appropriation it will not make "half a dozen elaborate films" but a very large number of inexpensive films which would enable Canadian viewers, if the films were taken by the CBC, to see a regular flow of British productions week by week.—Yours faithfully,

HUGH CARLETON GREENE
(Assistant Controller)
Overseas English Services,
BBC, London, W.1

"Liberation Not Containment"

Sir,—The distinction drawn in your issue of August 30th, between the Acheson policy of containment and the Dulles-Eisenhower attitude towards what you call "Russia's conquests," seems to me to be too strong.

Containment, as defined by Mr Acheson, is an effort to make "negotiation from strength" possible. But, as you have noted yourself some time ago, one must know what to negotiate for once strength is achieved and the balance of power is restored. Mr Acheson has faced this problem too. In one of his great policy speeches he outlined the points at issue between the Soviet Union and the West; he gave as one of them the Soviet military and police control

over the "satellite area," and expressed the hope that "the progress of the free world" may change Soviet conduct.

It is now becoming more generally recognised that Soviet domination of Eastern Europe is one of the basic causes of the cold war, and that the threat to Western Europe which the presence of Soviet armies on the Elbe presents must be eliminated before Europe can feel secure again. Neither General Eisenhower nor Mr Dulles calls for war to achieve this object, but they do realise that Russia's power in Europe is not an eternal phenomenon, and they certainly do not intend to make it more permanent by recognising its legitimacy. What, it seems to me, General Eisenhower was talking about when he said that "the conscience of America can never know ease" was the Yalta agreement, concluded by a Democratic administration, which is now generally taken as having sold Eastern Europe over to the Soviets and is widely condemned in the United States.

For these reasons, there is no contradiction between the containment policy, which is now accepted in the West, and the policy proposed by General Eisenhower and Mr Dulles. But neither the word "containment" nor "liberation" does justice to the policies it is supposed to stand for. While the withdrawal of Soviet power from Eastern Europe must be one of the long-term aims of containment, "liberation," though a catching phrase, seems to exaggerate the length to which even General Eisenhower and Mr Dulles are prepared to go to achieve Soviet withdrawal.

Since you yourself do not wish "to accept or condone Russia's conquests"—which must mean that you, too, stand for the repudiation of the Yalta agreements, and that you, too, are willing to risk provoking Soviet hostility on this account—and since you do not want the lessening of contact with the "enslaved," by radio or by "any other means," there are really no grounds on which you can justly criticise General Eisenhower.—Yours faithfully,
London, W.11 J. A. MODELSKI

The Right To Work

Sir,—Your article of September 6th and its conclusions are hardly warranted by the facts you are able to give. The closed shop is not widespread and I know of no case similar to *Abbott v. Sullivan*. This one is, of course, disturbing. Before it can be registered a union must have its rules approved by the Registrar of Friendly Societies. May not some safeguard be injected here?

You at least mention the professions, where the closed shop is much more widespread and effective than in the unions. Very few professional organisations, however, are regulated by statute as is the Law Society; and the difficulty of establishing appeals machinery uninfluenced by the official attitude is not confined to trade unions. In the newer professions, all of whose members are not yet in the appropriate associations, some freedom of choice and movement still exist. But under the pretext of rais-

ing standards (in itself a commendable and perhaps necessary objective) entry is becoming increasingly restricted.

While conscious self-criticism—a product of intellectualism and a concomitant to doctrine—does not come naturally to trade union leaders, are you really justified in writing of the sacred cow? The Transport and General Workers' Union apparently gave every facility for Dr. Goldstein's researches, and Mr Deakin even contributed a foreword to a book very critical of his union.—Yours faithfully,

GEORGE SPRINGALL
Shortlands, Kent.

Export Markets for Cars

Sir,—“Colonial Civil Servant,” in his letter about British cars published on August 23rd takes a great deal on himself when he extends his complaint to “other colonies.” While no one will claim that everything to do with the British motor trade is beyond reproach in Malaya, British cars have established here an excellent reputation for reliability and value for money and in general the servicing arrangements have been the best possible taking into account the size and quality of the local firms dealing in cars.

Nor is it true that British cars can be sold only while American cars are excluded by a shortage of dollars. At the present time in Singapore there are several hundred American cars which have been in stock for months which are almost unsaleable. The more economical British cars continue to sell like the proverbial cakes, which although not so hot now as during the rubber boom in 1951 are still decidedly warm.—Yours faithfully,

K. E. MACKENZIE
United Kingdom Trade Commissioner
Singapore

Spare Parts and Service

Sir,—In the letter published in your issue of August 23rd, Mr T. W. Stanier states that the oil companies are largely responsible for their spare parts trouble by insisting on placing all their orders in London. As far as this company is concerned, this is far from the case, and we have continually urged on manufacturers the necessity for setting up adequate spare parts service overseas.

In this connection a distinction must be made between spare parts for automotive vehicles, for which it is reasonable to ask for local spare parts service, and the many thousands of specialised pieces of equipment which are used in oilfields and refineries. Since these are usually far from large centres of population, it would be utterly unreasonable to expect all the hundreds of manufacturers involved to set up spare parts stocks and “factory-trained service engineers” in such locations. In most cases we have to provide them ourselves.—Yours faithfully,

L. H. J. HERSCH

London, E.C.3

Books and Publications

Boom and Slump in Strikes

Strikes. By K. G. J. C. Knowles. Basil Blackwell. 330 pages. 42s.

This detailed and valuable analysis of strikes in Britain breaks new ground. Mr Knowles's book begins with a study of the changing background of strikes, particularly of the influences which, over the past forty years, have made the trade unions less militant. The real turning point was the General Strike. With the exhaustion of funds and of morale, the leaders of the Trades Union Congress were willing to discuss ways in which they could co-operate with the employers to avert strikes, and although the resulting proposal for a National Industrial Council was rejected by the employers, the effect of the Mond-Turner discussions on the outlook of the union leaders was lasting. Other influences were also at work to make them less belligerent. Unions which were friendly societies as well were unwilling to dissipate their funds in strike pay. The amalgamation of smaller unions into larger ones lessened the sort of unanimity of purpose that is liable to lead to strike action. The typical union leader became a professional negotiator instead of a local fire-eater. The increasing organisation of employers also tended to remove a cause of strikes in so far as it led to the general observance of nationally agreed rates.

Mr Knowles shows that as a result of all this the number of days lost in strikes has gradually fallen in the course of the past forty years. Strikes have become less severe both in the number of workers involved and in duration; but he also makes the point that they have become more frequent because unofficial strikes have increased as the union leadership has become more remote from the rank and file.

Mr Knowles makes a valuable comparison of the incidence of strikes with various indicators of the trade cycle and finds no very close correspondence. Strikes, he points out, are influenced by many factors that have nothing to do with economics. On the whole it is the number of strikes, rather than their severity or duration, which seems most sensitive to economic fluctuations; and the correspondence is closest, as one would expect, with the level of unemployment—inversely. It is interesting to learn that there is little evidence that rising prices cause a strike wave; the critical time, it appears, is the transition between boom and slump.

A study of the seasonal frequency of strikes shows that for all industries taken together, and in several of the main industries, strikes reach a peak in May and fall in December. Mr Knowles thinks the explanation is economic rather than climatic—

due above all to the fact that a number of industries work more, or even exclusively, during these seasons [spring and early summer] which increase the prospects of a successful fight for the workers.

Evidence on the causes of strikes is

uncertain because the immediate cause may not be the underlying cause. A mood of resentment, due to a sense of inferiority, boredom or fatigue, or dissatisfaction with working conditions, may find its expression in a strike about wages or perhaps about something quite trivial. But accepting the Ministry of Labour's classification of causes of strikes at its face value, Mr Knowles finds that if the yearly numbers of workers striking for wage increases are compared with the number of workers actually receiving wage increases, the correspondence between the two curves is remarkable. But the number of strikers was only a fraction of the number who received wage increases, and the importance of strikes—as opposed to threatened strikes—as levers for higher wages is slightly declining.

Strikes are taking place less and less on basic questions of wages and hours, and more on apparently minor questions of working arrangements.

Other interesting and important facts are brought to light by Mr Knowles's researches, which have made an important contribution to the study of labour relations. In addition, his book is very readable and refreshingly free from the jargon which sometimes adds weight to major works of research.

Social Security for Grain Growers

The Canadian Grain Trade, 1931-1951. By D. A. MacGibbon. Toronto University Press. (London: Geoffrey Cumberlege.) 227 pages. 36s.

In this volume Professor MacGibbon carries forward his earlier study (1932) of the Canadian grain trade. Combining theoretical insight with twenty years' practical experience on the Board of Grain Commissioners for Canada he traces with lucidity and balance the intricate and controversial sequence of events in the past twenty years.

These have been momentous. They witnessed the fantastic collapse of wheat prices between 1929 and 1932 at the beginning of the Great Depression; drought and crop failure and, at the opposite extreme, bumper crops and “burdensome surpluses”; the triumph of economic nationalism in wheat importing countries; the second world war; the emergence of bulk importation by governments and of the dollar gap and exchange controls. These developments evoked drastic changes in the organisation of the trade, changes which are important not only to Canada but to Great Britain as a heavy importer of Canadian wheat, and to the international wheat market as a whole. In the twenties a highly organised futures market still dominated the Canadian grain trade, despite the challenge of strong farmers' co-

operative marketing pools. Now it is dominated by a central government buying and selling agency, the Canadian Wheat Board, and, internationally, by the Wheat Agreement, though there is still "great uncertainty over what direction the marketing system will ultimately take."

The story of the transition is an illuminating account of an "experiment in stability." The wheat growers of the Canadian West were vulnerable to the whole violence both of harvest vagaries and of fluctuations in price on an international market. To meet their insistent demands for security the Canadian Government found itself drawn into buying wheat to support prices and negotiating long term selling agreements first with Great Britain and then on an international scale. The problems inherent in such a programme stand out in sharp relief. They range from control of production when price is maintained above the market level to the sacrifice of possible high returns as the cost of a guaranteed price in an unpredictable future.

Crises of crop failure and of over-production are characteristic of primary staple export industries. Since 1931 they have had a special significance in the Canadian grain trade in that they have marked the end of that rapid expansion of wheat growing in Western Canada which from the turn of the century to the twenties dominated Canadian economic development. Professor MacGibbon indicates the existence of this deeper problem of readjustment but leaves it to "future scholars . . . to judge and assess the significance" of the events which he so authoritatively chronicles.

The Great Imperialist

Lord Milner and the Empire. By Vladimir Halperin. Odhams. 256 pages. 21s.

Of all the prominent figures in British politics at the turn of the last century, Milner was one of the most important. He devised the death duties which have transformed the social structure of this country; he was the architect both of the South African war and of the generous reconstruction that followed it; he was the principal, though hidden, inspirer of the Unionist party in the years before the war of 1914; in the darkest days of that war it was he, even more than Lloyd George, who drew up the main lines of British policy, and he never lost his nerve. Yet, because he was a shy man who disliked self-advertisement, preferring to "do right and damn the consequences," and because no one has written an adequate life of him, his importance has been far too little recognised. The studies of him which have so far appeared all concentrate on his career in South Africa, for which alone there is much published source material.

The latest monograph has "The Evolution of British Imperialism" as its sub-title, but does not do justice to its ambitious theme. It can serve as a useful introduction to the whole of Milner's work, not only in South Africa—there

is an appreciative chapter, for instance, on his work in Egypt, unusually appreciative considering that the author is a French citizen. But the book contains little more than 200 pages of actual text, and too much of the text is barely relevant; great themes are introduced, only to be set aside in favour of points of secondary importance. There is a portentous bibliography, but Dr Halperin should surely have made much more use of the unpublished Milner papers now at Oxford, and of Milner's own diary; these are the two cardinal sources on which any fresh judgment of Milner must draw. Nevertheless he has made good use of conversations with Mr L. S. Amery and other members of the "Kindergarten," and a short introductory memoir by Mr Amery forms the feature of the book which contains most points of genuine interest.

Special Force in Burma

Prisoners of Hope. By Michael Calvert. Jonathan Cape. 303 pages. 16s.

Although a latecomer to the company of writers on the Chindit expeditions into Burma, Brigadier Michael Calvert deserves attention, for he took a leading part in both operations and on him perhaps more than on any other of his fellow-officers fell General Wingate's spiritual cloak after the latter's death in March, 1944. His account of the second campaign fought by Wingate's Special Force behind the Japanese lines in the spring and early summer of that year is a soldierly rather than a literary work, written in a colloquial style often bordering on the naïve, which makes one realise with what accomplishment others—Brigadier Fergusson in "The Wild Green Earth" for instance—have dealt with the same episodes. But once this limitation is accepted the reader will find in "Prisoners of Hope" a full share of the successes and failures, excitements and controversies which are a part of every military operation.

The object of the Special Force, as agreed at the Quebec Conference in the autumn of 1943, was to cut all communications south of the Japanese troops opposing General Stilwell's Chinese-American force and to help capture the airfields of Mogaung and Myitkina, thus allowing a road to be built which would link up with the Burma road to China. To this end Brigadier Calvert's force of 4,000 men with mules, guns, stores and equipment, were flown 150 miles into the heart of Burma, where they made a spectacular glider landing at "Broadway" and established a fortified "stronghold" which, supplied from the air, withstood Japanese attacks for four months. Finally Mogaung was captured, but the whole operation had cost casualties totalling over fifty per cent of the entire brigade and a good deal of uninformed criticism from Stilwell and his staff. The author is still very resentful of this criticism, but it seems clear that he could have avoided much of it by ensuring that some reliable system of liaison and communications existed between the two forces from the outset of the campaign.

Austria-Hungary in Full

The Hapsburg Monarchy, 1867-1914. By Arthur J. May. Harvard University Press. (London: Geoffrey Cumberlege). 532 pages. 40s.

Professor May, of the University of Rochester, is the latest scholar to attempt the proverbially impossible task of writing the history of the Austro-Hungarian monarchy. Moreover, he has done so on the most ambitious scale; he has tried to include, along with a political narrative, an account of the social, economic and cultural situation in each part of the monarchy. And he has been partially successful.

As far as the political story goes, his book lacks the clarity and edge of Mr A. J. P. Taylor's narrative, but the account is full, balanced and painstaking. The economic sections are useful, with some interesting material from United States consular reports. The cultural sections, on the other hand, are almost useless: they consist of lists of names, with few dates (the ignorant reader might be led into thinking Bartok a contemporary of Bruckner); and there is no attempt to assess the relative importance of persons. The author does not try to account for the extraordinary intellectual flowering of Vienna in the last years of the monarchy when so many new trends that were to cause a revolution in Western culture were appearing: among them psycho-analysis, the first presages of logical positivism, and the twelve-tone system in music.

The style throughout is better than in much American historiography, though the English reader will jib at phrases like "the episode out of which World War I cycled," or "Machinofacture . . . was attended by the growth of the Czech bourgeoisie." In general, however, Mr May arranges a lot of information well, and he has provided a useful textbook.

The greatest problem any historian of Austria-Hungary has to face is one of judgment: for in writing about a period where so many passions were aroused it is impossible not to become engaged. Professor May is a rather naïve observer. On social matters his judgments are straightforward enough: in Vienna, "there was much marital infidelity and unconventional licentiousness"; "moral laxity was rather prevalent among rural churchmen." Politically, he is torn between dislike for Magyar methods of oppressing the subject nationalities, a sentimental regard for Francis Joseph and an awareness of the advantages conferred by the existence of the Empire. Like most liberal writers he fails to see that in Hungary oppression and Magyarisation were, in fact, solving the national problem, and that (as Andrassy realised in 1878 and Stephen Tisza in 1914) it was only when the monarchy became internationally involved that there was real danger. It was in the Austrian half of the monarchy, where liberalism and nationalism, indissoluble partners, were given more rope, that the problems were unanswerable. Perhaps therefore all liberal schemes for reconstructing the empire were a dream, and only force and skilful diplomacy could have kept it in being a little longer.

The new Hulton Readership Survey makes research history!

IT HAS BEEN DOUBLE-CHECKED

The readership trends demonstrated by preliminary tabulations were considered (by an Advisory Panel composed of leading figures in industry and advertising) of such significance that an elaborate checking procedure was devised with all possible speed.

BY CHECKING THE QUOTA SAMPLE AGAINST A RANDOM SAMPLE

The methods and controls devised were approved by leading academic statisticians. The same questionnaire was used by two independent research organisations, each operating a different sampling procedure over the same period of time. It is probable that no check on this scale has ever been operated anywhere before.

THE RESULTS CONFIRMED THE FINDINGS

When the figures obtained by the two different samples were compared they showed that:

- More than 50% of the findings differed by less than half of one per cent.
- In all other cases (with the inevitable handful of exceptions) the differences were within the narrow margins of sampling error used in Market Research as a matter of standard practice.

WHICH PROVIDES THE MOST SIGNIFICANT JUSTIFICATION OF SAMPLE SURVEY TECHNIQUES EVER SHOWN

Most industrialists, government departments and academic institutions accept the fact that a properly constituted sample of a group of people will provide an accurate picture of the whole group. The question still remained whether this had to be a random sample or whether it could be the less expensive quota sample. The Hulton Readership Survey has shown that, properly done, the quota sample will give the same results as the random sample.

It is with the full confirmation of this unique double check that the HULTON READERSHIP SURVEY offers its findings to industrialists and advertisers.

THE COUNCIL OF EUROPE

The Records of Proceedings of the Consultative Assembly (Official Report of Debates, Working Papers, etc.) are published in French and English in the period following each session.

Other Publications:

THE CONFERENCE OF STRASBOURG

(Record of Debates—19th to 23rd November, 1951—between Delegations of the Congress of the United States of America and the Consultative Assembly of the Council of Europe). 248 pp. 5/-; \$1.50.

Two economic studies prepared by the Research Directorate of the Secretariat:

FULL EMPLOYMENT OBJECTIVES IN RELATION TO THE PROBLEM OF EUROPEAN CO-OPERATION.

*a
Poem
in
Pigskin*

At Bury in Lancashire a small band of craftsmen is expressing an age-old tradition... in beautifully stitched and hand-finished briefcases which combine the capaciousness of a conjurer's hat with a handsome 'note-case' slimness.

This particular poem in pigskin has an inside story which is common currency among travellers in five continents... a 17" x 11½" briefcase in Golden Tan or Autumn Tan Shades with a single easy-to-pick-up handle, outside zip pocket for travel literature, two interior foolscap compartments and a private zip-sealed section for overnight tackle. English Lever lock and fittings of solid brass. You can obtain these briefcases only direct from the craftsmen who make them, at the workbench price of 12 guineas, post free. Matching folio cases available at £2.15.0. each (in U.S.A. \$35.75 and \$8.50 respectively, carriage and insurance free—20% Customs duty payable in U.S.A.). Money-back guarantee of complete satisfaction.

AMERICAN SURVEY

The General Capitulates

Washington, DC.

"WE find it difficult to be in two places at one time, however well intentioned we may be," said Mr Arthur Summerfield, the chairman of the Republican National Committee, apologising for being late, as he appeared alone at a press conference which had been advertised to include Senator Taft, with whom he had spent the morning. Unconsciously, he stated with precision the peculiar problem of his party, still, eight weeks after choosing a candidate, unable to make up its mind. And, until it made up its mind which of the two places it would rather be in, General Eisenhower, who, in June, was lecturing delegates on the dangers of half-truths and slogans, had to fall back on "kick the rascals out" because, as Mr Stevenson has said, "that is the only issue in this campaign that the two wings of the Republican party can agree upon."

It is not easy to remember now, in mid-September, the mood just after the General was nominated, when the old guard seemed to have been decisively defeated and the faces and the words of the young Republican state governors were uppermost in the public memory. Things have not gone well for those who worked so hard for General Eisenhower before the convention and who were probably quite unprepared for the stubborn refusal of Senator Taft and his embittered supporters to help in the campaign unless their demands were met. Certainly the General's friends had no strategy ready with which to counter this refusal and, when it came to a contest in patience, the Senator could sit quietly in Murray Bay while the General had to try to build a campaign of national unity on the base of a disunited party. And, when he failed, as he could not help failing, the Scripps-Howard press took the opportunity of his first big speech in New York to announce that, in the view of its editors all over the country, he was "running like a dry creek." They forgot to mention that the creek was not being filled by the normal springs and tributaries; a candidate needs money, as well as good intentions, to make his campaign flow.

In desperation, the high-level approach was forgotten and, on his southern tour, General Eisenhower concentrated on corruption in all his talks. The result was so satisfactory that, since then, everything else has been forgotten and most or all of every speech—except that on farm policy in Minnesota—has been devoted to the one subject. And, when he was in Washington last week, the General told the staff of the Republican National Committee that he had thought that peace would be the most important issue but instead he had found that it was "the desire for a change." There is nothing surprising in his discovery that attacks on "the mess in Washington" evoke more enthusiasm among his audiences than talks about peace; they are the normal weapons of partisanship.

And General Eisenhower has had no luck at all with his serious speeches. His troubles with the teleprompter robbed him of the applause he might have expected from the American Legion and his one attempt to find an issue with which to make a fight over foreign policy—Mr Dulles's "liberation" idea—blew up and frightened even his faithful

supporters. Moreover, something, which has not yet been fully explained, went wrong when the General spoke on farm policy. It was not so much the mere shortage of applause—Mr Stevenson, though doing appreciably better, did not light any bonfires—as the meaningful silences which greeted what were intended to be his most telling passages. When he told his audience that they had been hoaxed by the Democrats in 1948 over the shortage of storage bins for grain, he got no response. The farmers clearly thought they knew better than his speech-writers and did not enjoy being told they had been fooled when they were pretty sure they had not.

But there is a deeper and more disturbing reason for the failure of General Eisenhower's serious speeches. He does not seem to be making much progress in learning about the various subjects which never troubled him as a general but on which he must, at some point, have an opinion of his own. Mr Stevenson has pulled his leg about the unfortunate day when he displayed to some labour leaders his ignorance of the difference between the closed shop, the open shop and the union shop. A discovery of the same sort was made at Kasson. There were no cheers when he announced that "a fair share for the farmer is not merely 90 per cent of parity—it is full parity." There was something in the way he spoke these words which made reporters suspect that he had only the haziest idea of what parity meant—and that the farmers knew it. Their suspicions were confirmed at press conference later in the day.

*

The poor rewards the General has won from attempts to be reasonable and discuss issues and the rich ones which have come from the simpler tactics, which Senator Taft considers the right ones for winning an election, put a number of valuable cards into the Senator's hand. And then came the disastrous blow of Senator McCarthy's devastating victory in the Wisconsin primary. At once Mr Taft, who had refused until then to set a date for his meeting with the candidate, took off for New York and emerged, as far as can be seen at present, triumphant. Except on foreign affairs where their differences were, he said, "differences of degree, he had found that the General agreed with him all along the line. And he was particularly pleased to be able to report that "those who have been the most active workers for Republican principles in recent years" would not be discriminated against when the time came for making appointments.

The fact that Mr Taft also seemed to have laid down the main line of the speech which General Eisenhower made before the American Federation of Labour a few days later was probably more important than the line itself. No Republican candidate could, at this moment, try to win labour votes by approving the repeal of the Taft-Hartley Act and nobody expected the General to try to outdo Mr

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Stevenson in his Labour Day speech at Detroit—or even, as he did with the farmers, match the Democratic platform. But it is probable that the AFL would have preferred to hear his policy from the General himself and not have his opposition to repeal announced ahead of time by the author of the Act.

Many of those who have most faithfully supported General Eisenhower hitherto fear that the result of last week's jockeying for position—and of Senator Taft's ability to choose the right moment, from his own point of view, to extract the greatest possible advantage from the meeting—will be a decision to forget the high hopes of July and fight a Taft campaign for Taft policies. Such a decision was probably unavoidable, given the evidence of the strength of McCarthyism provided by the Wisconsin figures and the evidence of the depth of the bitterness of Taft supporters throughout the country.

Even two months ago most political observers would have said that General Eisenhower was courting certain defeat by abandoning the independent voter, who was supposed to be the backbone of his support, and turning to the "real Republicans" for help—and not even being too fastidious about the reputation of some of the "real Republicans." But today the same judges would say that he is grasping the best chance of success. He may have lost some of the independent voters—Governor Stevenson has an overwhelming attraction for intellectuals. But he has a long way to go before he can overcome the Eisenhower personality and the Eisenhower myth among the public at large.

Were the election to be held today the General would, no doubt, win easily—though perhaps not as easily as Mr Dewey would have done in September, 1948. It is normal for the Democrats, as the party in power, to gain strength during the last weeks of the campaign, but it is by no means certain whether they can do so this year. General Eisenhower has much of the appeal of Mr Truman among small crowds and on the back platform of a train, and there is no reason why he should lose support as Mr Dewey did. As his staff seems to have decided that it is better to avoid making policy speeches and debating issues, he will be able to bend all his energies to making friends and influencing people. It seems to depend on whether the electorate wants, at some point in the campaign, to know what a candidate is for or whether it is enough to know what he is against—the "mess in Washington."

Mountain Politics

[FROM A CORRESPONDENT IN COLORADO]

THE twelve states which contain the Rocky Mountains and the Great Plains are the most sparsely populated in the country and they have only 54 of the 531 votes in the electoral college where a presidential candidate must obtain a majority if he is to win; New York State alone has 45. But as a rule these states get more attention at election time than seems justified by the number of voters in them. This is partly because the candidates' campaign trains and airliners must pass through or over the plains and mountains to get to California from the eastern industrial centres; it is partly because the region provides one quarter of the 96 members of the Senate, since each state sends two Senators to Washington, however few its inhabitants; and it is partly because the political allegiance of the eight mountain states is variable and in a close race, such as there is this year, not even the three electoral votes of Nevada can be ignored.

The four plains states—the two Dakotas, Nebraska and Kansas—are among the few on which General Eisenhower can rely, but the mountain states are much less set in their political ways. These are the states which unexpectedly gave the Republicans a majority in the Senate in 1946, yet in 1948 they voted for Mr Truman. However, in that year or in 1950 all but Montana elected a Republican Governor, and General Eisenhower therefore has reason to hope for most of the region's electoral votes, especially since he spent the first weeks after his return from abroad in Colorado fishing for local support as well as for trout. But he is being told that he lost Arizona, and probably New Mexico, Utah, Colorado and Wyoming as well, on the day that Senator Nixon of California was chosen as vice-presidential candidate.

The people of these five arid states are prejudiced, whether or not with reason, against a Californian in or near the White House. For between them and California there is a deadly feud, in which the dividing lines are state boundaries not

party affiliations, over the waters of the Colorado River, which the five states provide and which California consumes—and California is constantly asking for more. The depth of this distrust is not generally appreciated in the rest of the country, but past elections have shown its importance. In 1944 Mr Dewey, with an Ohioan as his vice-presidential candidate, did better in these five states than over the nation as a whole, and carried two of them; in 1948, with a Californian running mate, who was generally much better liked than his 1944 companion, Mr Dewey did less well in these states than elsewhere, and all of them were for Mr Truman.

Other election issues special to this region also grow out of its natural resources, its only source of wealth. There are still some 45 million kilowatts of hydro-electric energy to be developed, a task which rests with the federal government because the rivers cross state boundaries. The private power companies oppose such development, unless they are allowed to distribute and make a profit on the electricity. The present law gives public users, such as rural electricity

schemes and municipally-owned power plants, first claim on the electricity from dams built with public money. Mr Stevenson has embraced this doctrine wholeheartedly, but General Eisenhower's sympathies seem to lie with the private power companies, to judge from his remark in Idaho that the government wants so much power that it will soon be telling the housewife when to turn her lights off.

The need for pure water supplies for cities like Los Angeles and Denver is one of the reasons why grazing has been restricted in the national forests and other federally-owned lands, which lie on the mountain slopes from which the water comes. But a more important reason is that reckless overgrazing had led to soil erosion and exhaustion of fodder, so that the livestock-carrying capacity of the western ranges had been halved. These restrictions for the sake of conservation make the western ranchers see red; Republicans are inclined to look at the question in the same light, while Democrats take the opposite point of view, but neither party platform was specific on this issue. Another special interest that carries weight in the western states is that of the metal mining industry, which at the American Mining Congress in Denver next week will be bludgeoning the Democratic Administration for having restricted mining profits, by its policy of encouraging metal imports and keeping down metal prices for the sake of the economic strength of the nation as a whole.

The mountain mining industry's pet politician is Senator McCarran, the most hide-bound representative of a region that is notorious for its conservative Senators—but the other conservatives are Republicans, while Mr McCarran is a Democrat. The region owes its disproportionate influence in Washington to its twenty-four Senators, a number quite

out of balance with its comparatively small contribution to the national wealth. Nine of the twenty-four are up for re-election this year. The three Democrats are among their party's best Senators, although Mr McFarland of Arizona has not been conspicuous for his courage as leader of the upper house. His Republican opponent is Mr Barry Goldwater of Phoenix. Senator O'Mahoney of Wyoming is fighting the state's present Governor, Mr Frank Barrett, while in New Mexico Senator Chavez will have a close battle with the dashing and voluble General Pat Hurley, who nearly won a Senate seat in 1948 and has been an outspoken critic of the Administration's China policy.

Senator McCarran himself is not up for re-election this year, but his machine has just been routed in the primary election in which Nevada's Democrats chose their candidates for the state's other Senate seat. His protégé, Mr Alan Bible, was defeated by a hard-working young amateur, Mr Thomas Mechling, who claims to have shaken hands with over half the state's voters—there are only 91,000 of them. He had the support of the metal miners' trade union and it seems safe to say that, even if Mr McCarran and his machine do not work for the present Republican Senator, Mr Malone, they will do little to help Mr Mechling defeat him.

Mr Malone is one of the least admirable of all the low-level Republican Senators who go to Washington from these high-altitude states. He is more isolationist than Senator McCarthy and as extreme in his domestic views, although he has not made so much demagogic hay out of them. The other Republican Senators from this region who are standing this year—Senator Langer of North Dakota, Senator Ecton of Montana, Senator Butler of Nebraska and Senator Watkins of Utah—are all nearly, if not quite, as isolationist and nearly,

if not quite, as undistinguished as Mr Malone. However, Nebraska Republicans have chosen a better candidate, Mr Dwight Griswold, a former Governor, for the seat left vacant by the death of Senator Wherry.

An unsuccessful attempt to wrest the other Republican nomination in Nebraska from Mr Butler was made by the present Governor, Mr Val Peterson, who will therefore return at least temporarily to private life next year. He has been the most outstanding of the Republican Governors in this region, nearly all of whom, in contrast to the Republican Senators, are young and able and all of whom joined the protest against the methods of the Taft machine which did so much to secure the Republican nomination for General Eisenhower. Most of these Republican Governors face an election this year. One of the safest of them, and one of the least competent, is the picturesque Mr Thornton of Colorado, who has lost no opportunity of pushing himself and his cowboy costume before the television and press cameras beside General Eisenhower.

Senator Watkins is another candidate who has tried to turn General Eisenhower's popularity to his personal ends in the fight, which he has now won, for the Republican nomination in Utah against Mr Marriner Eccles, the former head of the Federal Reserve Board. Mr Watkins managed by cunning footwork to get himself photographed with General Eisenhower and on the front page of the local papers three days before Mr Eccles. The voters of Utah were thus given the impression that Mr Watkins was closer to the General and to his point of view than was the experienced and internationalist Mr Eccles, although the opposite was the truth.

Similarly there can be little doubt that the General would find himself much more sympathetic, if he could allow himself to be, to some of the talented Democratic candidates in the mountain and plains states rather than to the present Republican Senators, to Representative Mike Mansfield in Montana rather than to Senator Ecton, for example. Several of these Republicans would almost certainly be beaten if he refused to let them cling to his coat-tails; and there is no doubt that they are clinging just for the sake of the ride back to Washington and will abandon him as soon as they get there. But on these isolationists depends the Republican chance of a majority in the Senate, with the control over committees that goes with it, and for this reason General Eisenhower dare not repudiate them.

American Notes

Crop Report for Candidates

With General Eisenhower and Governor Stevenson both promising the farmer all the price supports he now has, and the heaven of price supports for perishable commodities too (although they have not decided how the pearly gates are to be opened) agriculture has been taken out of the election campaign; there is no difference between the candidates on this issue. Yet farmers will have to choose, and the result of the election will probably depend on their choice; this at least is the view of those who blame Mr Dewey's defeat in 1948 on the defection of the midwestern agricultural states to the Democrats. That defection is believed to have been caused by the sharp drop in farm prices in the autumn of that year. The farmers apparently felt that they could rely on the Democratic Administration to save them from the depression they feared was coming, as it had saved them from the depression of the nineteen-thirties which the Republicans had been unable to cope with.

In 1948 this distrust of the Republicans was confirmed by the Republican Congress's attack on the price support

programme; it weakened the Administration's power to provide adequate storage space for crops under loan at a time when prices were falling. The Republicans are still trying unsuccessfully to explain away this mistake, but at least they have not repeated it. Some of their representatives in Congress have, however, advocated modifications in the present price support system for the sake of economy and more efficient farming. Sound as this proposition may be in theory, it is not one which will inspire confidence in farmers and their families. And this year they need confidence, if they are to vote Republican, as much as they did in 1948, for the agricultural pattern of that year seems to be repeating itself this autumn.

The September crop report forecasts that, in spite of the July drought, this year's harvest will approach 1948's peak and with record quantities of meat animals and livestock products going to market, the total output of American farms may be greater than ever. This is hardly reassuring for the farmers. The Department of Agriculture does not expect any troublesome surpluses, but it is already issuing warnings against planting too much wheat for next year. And already the price of wheat is below the level (\$2.21 a bushel) at which the government is required to support it, while maize and hogs are other important commodities which are selling below parity (which is the sum, based on the ratio between the prices of the things the farmer sells and those he buys, which is intended to ensure him a fair return for his labour). At the moment the parity ratio for all products combined is just above 100, supposedly the fair level, but it is not so far above as it was at this time in 1948. Farm income, on the other hand, is higher than it was in that year, when it dropped sharply. Farmers are almost as well off as they have ever been, and better off than they could possibly have expected to be twenty years ago. Nevertheless the latest crop report will make them think twice, or even three times, before they take the risk of voting for a Republican President, however disgusted they may be with the general administration of the Democrats.

Hard Bargaining in Soft Coal

Unless something unexpected turns up, Mr John L. Lewis will take his soft coal miners in the northern states out on strike on Monday. Hard times have made the northern operators determined to strike a hard bargain, and in their view a shut-down at the mines would help to reduce the unprecedented stocks of coal which are depressing its price. Mr Lewis is still unexpectedly shy about revealing his terms; in the northern soft coal mines he is believed to be asking an increase of \$1.80 in the basic wage of \$16.35 a day; a reduction of 15 minutes in the eight-hour day; and an increase in the royalty of 30 cents a ton that the coal companies pay to his miners' welfare fund. An increase to 50 cents a ton is the major concession made by the anthracite operators, who for once seem nearer to a settlement than the soft coal companies. The anthracite miners' welfare fund is deeper in red ink than that of the soft coal miners, because so much less hard coal is dug by each miner, but even in the bituminous coal fields benefits have had to be reduced as production has fallen. Mr Lewis, who quite rightly regards the welfare funds as the best memorial he could leave, and who hopes to see ten miners' hospitals built in the south, is anxious to remedy this.

The southern soft coal contract does not expire until September 30th, and Mr Lewis may use these extra days to press a new "share-the-work" scheme which is more attractive to southern operators, whose mines are working only two or three days a week, than to busier northern ones, particularly the "captive" mines of the steel companies. Premium wage rates would be paid by any company working more, say, than three days a week. Such a scheme, if industry-wide, might force the steel companies on to the

open market for coal, and keep high-cost mines, and their miners, in existence.

But it is a counsel of despair for an industry which today provides only about 45 per cent of the nation's fuel needs instead of the 72 per cent it did in 1920. More enlightened elements in the industry stress research, which up till now has been starved of funds, as a means of making coal a more attractive and cheaper fuel, and of expanding the uses of coal, particularly as a raw material. Production of synthetic liquid fuel from coal by hydrogenation may still be, as a new independent report suggests, too costly for private enterprise, but the Union Carbide and Carbon Corporation, using a similar process to turn out chemicals from coal in an experimental plant, has high hopes of rivalling the chemical industries built on gas and oil. More mechanisation and cheaper transport, perhaps including the Pittsburgh Consolidation Coal Company's experimental pipe-line for crushed coal, may win back industrial markets lost to gas and oil. The same company has developed a process, as yet untested on a large scale, for making electricity almost directly from coal, conserving most of the energy now lost. Coal interests have joined with electric power producers to develop and push the use of electrical furnaces in making steel from low-grade iron ore. Smaller projects include a portable crop drier and completely automatic stoker, which even carries out the ashes, but, as yet, is too expensive to turn the tide of oil and gas heaters in the home.

Cleaning House under Fire

The steady swish of brooms cleaning the rascals out of government no doubt sounds to General Eisenhower like proof that his attacks on corruption have found their mark, though to Governor Stevenson it may merely show that the

Democrats can be counted upon to do their own housework. The Chelf subcommittee of the House, which seems to have taken on a new lease of life, is this week to hear, in open session, the reply of the former Attorney General, Mr McGrath, to the testimony of Federal Judge Moore that the Department of Justice tried, unsuccessfully, to obstruct a grand jury investigating tax frauds in Kansas City. Mr Lamar Caudle, the head of the tax division whom Mr Truman sacked, may soon make it clear whether a Republican member of the committee was justified in saying that Mr Caudle's secret testimony showed that the department was under pressure from the White House, though not the President, to go slow at times.

The department is giving unusual co-operation to the committee. It has even opened its files on the celebrated Kansas City vote fraud case of 1946, in which dynamite was used to destroy the alleged evidence of trickery employed to nominate Mr Truman's favourite candidate. Mr McGranery, the Attorney General, seems as convinced as the Chelf committee that more tightness is needed in the singularly ineffective "conflict of interest" statutes which are supposed to prevent government servants from putting their inside information and associations to private use when they leave.

Corruption, as Mr Stevenson is fond of pointing out, is the monopoly of neither party. Rock-ribbed Republican Maine less than a fortnight ago forfeited its chance of giving an electrifying lift to Republican hopes for November; a scandal in the state liquor authority moderated the usual Republican landslide. But post offices, where patronage is traditionally dispensed along with stamps, and party contributions collected as well as letters, are in Democratic hands. Mr McGranery has hastened to instruct grand juries in New York and Chicago to investigate charges that post office jobs are being sold for party profit. Congress, which recently turned down Mr Truman's suggestion that all postmaster-

World-wide Banking

Businessmen with international interests rely on a bank whose services are world wide.

The National City Bank of New York provides a global network of 56 branches, as well as banking correspondents in every important centre of the world. The staff of the London branches are experienced not only in British banking, but also in the financing of overseas trade, and are uniquely equipped to advise on trade with the dollar countries.

Wherever your interests lie, a world-wide organization stands at your service.

THE NATIONAL CITY BANK OF NEW YORK

1812 — ONE HUNDRED AND FORTIETH ANNIVERSARY — 1952

Incorporated with limited liability under the National Bank Act of the U.S.A.

HEAD OFFICE: 55 WALL STREET, NEW YORK

ships be put on a pure merit basis, took the plunge where the Bureau of Internal Revenue was concerned and, coupled with the dismissal, in the past year, of 100 of the Bureau's 57,500 employees for such serious offences as accepting bribes, embezzlement, or extortion, this may mean the dawn of a new era. A former assistant tax commissioner—one of three high officials in whom the Republicans are particularly interested—has now been indicted for cheating on his own income tax returns, though the indictments do not go into the question of how Mr Bolich managed to obtain so much more than his official salary.

* * *

Getting Out the Vote

One of the best-known breakfast cereals now comes in a package with photographs of both presidential candidates, urging buyers to "vote as you please, but remember to vote," while a dog-food company offers its clients blankets stamped with "vote as you dog-gone please, but vote." In Illinois people enquiring about the weather from the telephone company are reminded that they must register now and vote in November, and no radio listener can avoid hearing the same message. All this is part of a campaign sponsored by numerous non-partisan public service organisations, and by business groups and trade unions, to reverse the disquieting decline in the number of votes cast in presidential elections. The figure has fallen from 79 per cent of those of voting age in 1880 to 51 per cent in 1948, which compares unfavourably with other democracies.

There is no expectation of getting back to 1880 this year, but it is hoped to return to 1940, when 63 per cent of the electorate voted. That was the year when Wendell Willkie was the Republican candidate: this year the Republicans are again offering the voters a fresh face. So are the Democrats, but the frequent defeats of the entrenched party machines in primary elections have led to the belief that the electorate is in a mood to rebel against all "ins." For this reason, and because General Eisenhower is better known than Governor Stevenson, it is argued that this time the hoped-for heavy poll would be to the advantage of the Republicans. It has usually been held that most of those who do not bother to vote are by nature Democrats, since it is among the poorer and less well-educated sections of the population that the vote is lightest—and among the women.

But apathy is not the only explanation of the habitually light vote in the United States. This year's official estimate of civilians of voting age (21 except in Georgia where it is 18) is 98.4 million, 3.4 million more than in 1948. To this must be added about 2½ million members of the armed forces, but from it must be subtracted nearly 3 million aliens and an unknown number of citizens who are insane, criminals or paupers. Voting disqualifications of this kind vary from state to state; in some it is enough to be an "immoral person." So do residential qualifications; to vote in almost any state a person must have lived there for at least a year, and sometimes more. There are only five states where the payment of a poll tax is still required, but registration is not automatic and the regulations on this also differ, so that people who want to vote have to prepare in advance.

At present those who are trying to get out a big vote are concentrating on seeing that all potential voters know when and how to register, and actually do it. Only a third of the states allow registration by post, although most of them make some provision for absentee voting, a matter of special importance to residents in the voteless national capital. But such provisions are frequently unsatisfactory, particularly as regards members of the armed forces overseas. And Congress has failed to renew the legislation passed during the last war which provided for a federal ballot, when necessary, so that all servicemen might have an opportunity of voting for their President.

Headaches in the Schools

Schools opened last week all over America with too many pupils and too little of everything else. Parents are becoming accustomed and, unfortunately, almost resigned, to the tale of shortages of teachers, classrooms, money and materials they hear each autumn. The shock of realising that one out of every five children goes to school in a fire-trap has worn off. Rising prices are one cause of the trouble. More money is spent on education than was spent five years ago, but it buys less. Teachers' salaries buy less, too, so the teachers go into industry or business. What makes the situation worse each year is the relentlessly rising tide of children. There are nearly 35 million students enrolled this year, an increase of nearly 1,600,000 over last year. Virtually all this increase is concentrated in the primary schools, where teachers are the scarcest. It is the largest increase ever experienced in a single year, and may not be reached again, but the high postwar birthrate promises, in the four years to the end of 1955, to bring 5 million more children to the school doors.

By the time 1955 arrives, during the term of the President to be elected this November, it may no longer be possible to evade the problem of federal aid. The nation is spending less than 2.5 per cent of its income on education, compared with 3.2 per cent in 1930, when both the national income and the need were so much smaller. The cost of publicly supported schools is met, with tiny exceptions, by the cities and states, whose resources are already strained. This is particularly true of the poorer states of the south, and was one reason why Senator Taft, two years ago, gave his name to a federal aid Bill which would have done something to equalise educational opportunities. But this went ashore on an old shoal: the problem of whether federal money should be given to the Roman Catholic schools. Last year no attempt was made to float it off, except Senator Hill's proposal that off-shore oil resources should be made a sort of endowment fund for the schools of the whole nation, not just those in Texas. This came to nothing, and teachers are afraid that Congress, in a period of budget deficits, will turn thumbs down on new appeals unless some similarly unexpected source of income can be found.

Senator Taft, on the schools, is more progressive than most of his party, including General Eisenhower. The Republican platform said firmly that education is the responsibility of the states and local communities, and the General, fearing, as many Americans do, that federal control is the inevitable companion of federal money, has opposed any central educational fund. The Democratic platform, on the other hand, pledges immediate study of federal aid for school construction and for teachers' salaries and promises that the federal government's role will be restricted to writing the cheques.

Shorter Notes

A wage bill of \$9.5 billion was paid by America's largest employer, the federal government with its 2.6 million employees, in the year ending on June 30th, the highest in the nation's history and 24 per cent above the government's wage bill for the previous year. Pay increases averaging 10 per cent and additions to staff during the year accounted for the rise in the total; the military establishments hired 32 per cent more civilian workers and now have 1,339,501 employees, over half of the total number of government workers.

New England, once proud to call itself "the workshop of the nation," has lost a long-sought opportunity to regain its old position. The government authorised rapid amortisation for tax purposes on a \$228 million steel plant to be built in Connecticut as part of the defence expansion of the industry. But after various towns, with what some would call the lack of enterprise which explains New England's economic decline, had refused the honour of having the new plant, the authorisation, twice renewed, finally expired.

"I thought dictating machines were bulky things"

The trim, streamlined Dictaphone Time-Master is changing ideas about dictating machines!

Many a business man has been amazed at his first sight of the Dictaphone Time-Master. It is so small, so good-looking, such a credit to an office desk.

Yet this smart little machine also represents the last word in dictating efficiency and simplicity. It records on Dictabelts—little plastic belts, each one taking 15 full minutes of crisp, crystal-clear dictation. Dictabelts fold flat for filing and may be posted in an ordinary envelope, up to ten at a time for a 2½d. stamp.

EASY TO OPERATE

Another big Time-Master advantage is its sheer simplicity.

Controls are few and simple, and wherever possible, automatic. There are no intricate adjustments. It is a machine you can operate, literally, with one finger.

ONLY THE TIME-MASTER OFFERS ALL THIS!

1. Streamlined machine, only 4½ ins. high, slightly larger than a letterhead. 2. Uniformly clear recording and reproduction. 3. Uniform backspacing, immediate place finding. 4. Simple automatic operation. 5. Mailable, filable, expendable Dictabelts, low-cost plastic medium. 6. Nation-wide service, Dictaphone dependability.

Write for Time-Master literature to Dictaphone Co. Ltd., Dept. O, 107, Kingsway, London, W.C.2, or ask for a demonstration at your local Dictaphone branch.

Power Factors in Egyptian Politics

(From a Correspondent)

MAJOR-GENERAL MOHAMED NEGUIB, Prime Minister, Minister of War and Marine and Commander-in-Chief of the armed forces, is maturing swiftly in the role of leader. His strength in the country has increased, if only because he has recognised and been willing to exert it at necessary moments but without extravagance. He has developed a sense of public reaction which transcends the gaucheries of some of his earlier public statements. He acts the part of the boss more openly, but does not forget to avoid those acts of social precedence and privilege which clearly stamped the "pasha." His rugged, honest face helps. Perhaps the pipe, somewhat out-of-date hall-mark of the Englishman, will become a symbol of Egypt's would-be benevolent dictator. At the outset his power was derived from a *junta* of officers, on some of whom he still leans and all of whom still exert influence, but as his hold on the country develops his pre-eminent position in the *junta* increases.

General Neguib and his army caucus have attacked, and possibly destroyed, the power of the topmost, over-privileged stratum of Egyptian society. It is in this light that the land reform law must be seen: it is a political action as much as an economic reform. The reform will barely provide 700,000 acres for distribution among the mass of peasants which includes 1,500,000 landless people, of whom only about 140,000 will benefit.

The ignorant fellaheen have already shown their susceptibility to ideas of agrarian reform which promise them land, the possession they most dearly prize. They had to be warned against refusal to pay rents nearly two weeks ago. They are going to be gravely disappointed in that the distribution of land over five years in two to five-acre plots to a tiny fraction of their number will seem a small matter. The problem of who shall benefit is immense; the Moslem Brotherhood suggested drawing lots to decide. Furthermore, there are extremist elements in the army and among the up-and-coming effendi class in the town who will demand more and more attacks on privilege and benefits to themselves. The Government is already promising a law to restrict the freedom of employers to dismiss labour. As General Neguib intends a restricted and controlled revolution—a bourgeois reform based on the maintenance of private property—he will almost inevitably be driven to oppose many people who consider themselves the inspiration of the movement and a mass who consider themselves the natural beneficiaries.

Models for Land Reform

This potential clash is a real danger ahead. It may prove even greater than the obvious danger inherent in any swiftly moving land reform—the threat to the country's economy. Egypt will not easily muster enough trained officials to organise smoothly the complicated problems of water distribution, village rights, co-operative buying and selling and hard set peasant prejudice. Further, its new law makes woefully little provision for the quality of the farming to be practised by the new owners; the country is therefore exposed to the risk that the peasantry as a whole will be worse off than hitherto. Before proceeding further, General Neguib would do well to examine the schemes whereby other countries have turned land into small holdings without detriment to farming

quality. The famous Sudan Gezira method is probably most suitable where new land is being reclaimed. A closer parallel to Egypt's immediate problem is available in Ceylon, where the government is buying the large estates, is itself working them up into good condition, is establishing machinery for co-operatives and is only then parcelling the land. This it is doing on nearly, but not quite, freehold terms; the state as landlord retains a right to forbid alienation, subdivision and mortgage. The clause in the new Egyptian law whereby landlords are permitted to sell direct to peasants might handicap the quality of production for a generation. The law, which is to be tackled progressively over five years, leaves room for many improvements, yet it has its good points. It bears the stamp of Abdel Gelil el-Emary's careful calculations at the ministry of finance for, given the five years' grace, he can issue government bonds for compensating the dispossessed landowners in instalments which he thinks the country can support.

Two Lines of Attack

Just as the land reform is something more than an economic reform, so the arrest of about fifty prominent politicians and their associates was more than just an attack on corrupt elements in the political parties. The arrests fell into three separate groups. One is the hard core of the three main political parties, the Wafd, the Saadists and the Liberal-Constitutionalists; the second is the residue of people associated with ex-King Farouk; and the third, influential independents such as Hafez Afifi, Neguib el-Hilali, and Mortada el-Maraghy, who have no crimes laid at their door but who offer a rallying point for the best elements in the political old guard and therefore a potential challenge to the regime. Some of the people arrested, such as the honest functionary of the Palace, Hassan Youssef, will be released shortly. Some, like Fuad Serag el-Din, the ex-secretary-general of the Wafd who resigned this week, Osman Moharram and Soliman Ghannam, his party associates, and Ahmed el-Wakil, the brother of Mme. Mustapha Nahas, will be held until the Parquet has time to determine definitely whether it can have them convicted on charges of corruption. Others, such as Ibrahim Abdel Hadi, the Saadist who withdrew his resignation from the presidency of the party, and Abdel Hahman Ammar (who has been detained for some weeks) are in danger of the vengeance of the Moslem Brotherhood, because the former was Premier and Minister of Interior and the latter Under-Secretary of the Minister of Interior in 1948 and 1949 when the Brotherhood was smashed by the Government.

The arrests were basically an attack on the top ruling group and complementary to the agrarian reform law. The subsequent law for controlling parties, with its insistence on the supervision of party funds and regulations concerning policies and administration, confirms the policy evident in the arrests, as the reconstruction of the parties will take place while the old leaders are still in detention. It therefore hands the parties to the younger elements who, to a large extent, come from the same social group as the old elements but are more diluted by less privileged people.

What will be the effect of this change in the parties? It is early to analyse the present situation, and the political programmes which the parties will produce under the new

law will hardly help to do so. Hints that have already appeared suggest an eagerness to support the revolution which will make differences between the programmes a matter of detail and emphasis rather than of ultimate aims. The "bourgeois revolution" through which Egypt is now passing, with its continued emphasis on private property and its insistence on a better distribution of it, is not something which the ordinary Egyptian will oppose. The more important development will be the splintering of parties as new personalities emerge, and these are likely to coalesce under conditions in which power rests and is likely to stay with the army, for the latter is bound to modify the ambition for personal power which was the dominant characteristic of Egyptian party politics.

Two forces are still of major importance: the Moslem Brotherhood and the Wafd. The old Wafd was not a party. It was an amalgam of two elements diametrically opposed to each other but held together by the leader's innate sense of street politics and control of the party funds and machine. The first was the extremely reactionary and corrupt leadership with its large satellite group which benefited from the funds and nepotism of the leaders; the second, the popular movement led by men who were nationalists and radicals. The army's action is intended to smash the first group, and the emergence of Dr Mohamed Salah el-Din, Foreign Minister in the recent Wafd government, means the dominance of the second. Salah el-Din will almost certainly become the new secretary-general of the Wafd.

The Moslem Brotherhood is politically immature, but under the late Hassan el-Banna became a political force which probably transcended the power of the Wafd machine. For that reason, the Wafd leadership bitterly opposed the Moslem Brotherhood and only began to seek a rapprochement when the government of Ibrahim Abdel Hadi had broken the power of the Brotherhood. An interesting facet of the present situation is the natural affinity which exists between the Salah el-Din wing of the Wafd and the Brotherhood, and it is in this combination that a new power may grow in Egypt. It would very easily be reinforced, by nationalists from other parties such as the present Minister of State, Fathy Radwan.

Finland Squares the Accounts

[FROM OUR SCANDINAVIAN CORRESPONDENT]

A FEW days ago a small ship sailed east from the Finnish harbour of Turku and made history. It was the last of Finland's reparation deliveries to Russia. It also typified them. For it was a small wooden schooner which, although not impressive to look at, was nevertheless a special design, a non-magnetic survey ship. Its official cost, the cost, that is, which will be credited to Finland in the reparations account, was but a fraction of its real cost: it was locally known as "the golden ship." And it had to be delivered on time to avoid stiff fines. It was built in a yard created from nothing in a few months, regardless of cost, to produce ships which, owing to their uneconomic specifications, could be supplied only to Russia as war reparations, to the payment of which, however, they contributed much less than their real value.

Such illustrations could be multiplied a hundredfold to depict in detail what the payment of reparations has meant to the Finns in sum. But they have done it. In the eight years up to September 19th they have worked off war indemnities which seemed beyond their capacity. They have, it is true, been aided by a rare Russian display of reasonable cooperation so that the final payments amounted to \$226.5 million spread over eight years, instead of the original \$300 million in six years. As the dollars concerned in these calcu-

lations are arbitrary "reparations dollars" equivalent to 1938 dollars (with certain small adjustments for some categories of goods), it is clear that the cost of reparations at present day prices is considerably above this figure. Professor Suviranta, who has made a special study of the economic effect of reparations, estimates that the cost at today's prices is about \$570 million.

But this is not the whole story. The reparations payments that have just been concluded were only one of a series of burdens imposed on Finland by the peace treaty. About 13 per cent of Finland's national wealth was lost by the cession of territory to Russia. Russian property removed from Russia had to be restored. German arms in Finland had to be delivered to the Russians (at a cost of about \$7,000,000) and German property given up. Similarly all German claims against Finland (mainly for delivery of war material) had to be renounced in favour of the Russians. Nor should the substantial economic loss involved in the scrapping of Finnish weapons to a value of several thousand million marks be overlooked. Finally, the whole process had to be administered by the Allied Control Commission at a cost of about \$3 million a year, and by SOTEVA, the Finnish reparations supervisory committee, at a cost of a further \$1 million a year. The total burden has been estimated at \$949 million in 1944 dollars.

A Distorted Economy

So much for the figures. They are impressive enough testimony to the Finnish effort. But, as output rose again, the fixed amounts due as reparations payments became a comparatively smaller burden on the national income and on exports. In 1945, for example, when the volume of trade was a mere 18 per cent of the 1935 figure, reparations deliveries accounted for 61 per cent of total exports. In 1948 the corresponding figures were 67 per cent and 17 per cent, and last year 110 per cent and 6 per cent. In the same year reparations payments as a percentage of national income were estimated (probably on the low side for 1945) at 7.3 per cent, 5.2 per cent and about 2 per cent respectively. These figures apply only to reparations payments and do not include the value of German assets and so forth. Expressed statistically they are not as large as, for example, the British rearmament effort at present. But such criteria fail to show the terrific distortion of Finland's economy which the pattern of reparations has caused. For example, the engineering and shipbuilding industries accounted for 58 per cent of all reparations; but before the war they contributed only 2 per cent of Finnish exports. The forest industry, responsible for about 90 per cent of Finland's exports, paid only a third. Finland is thus left with uneconomically large engineering and shipbuilding industries. There are now, for example, 82 shipbuilding berths compared with 15 before the war. The market for the staple forest exports is poor. Consequently the importance of other exports, particularly machinery and ships, is enhanced. But Finnish costs are so high that these products cannot compete on the world market. Internal demand will partially replace reparations orders. But the main reliance is on increased and steady normal sales of these goods to Russia, and the Russian satellites, under the five year Russo-Finnish trade agreement of June, 1950.

Openings for Russian Pressure

To the pessimists, therefore, the structure of Finland's economy, as modified by reparations, gives Russia good opportunities of exerting political pressure even after the last reparations have been delivered. Just now the tendency is for Finnish Communists to compare the harm done to Finland by reduced British imports and prices with the benefit resulting from continued Russian support of the engineering industries. Furthermore if, as rumours of Russian interest in large tankers indicate, the Russians increase their orders for ships, Finland, like Denmark, may run

These facts are published to show what British workers can achieve in spite of difficulties, given opportunities and backed by enterprise

It can be done

In July 1950 a team of men started work at Fawley in Hampshire. Their job was to construct the administration building for the Esso Petroleum Company's new refinery, the largest in Europe. This building—550 feet long, containing 64,000 square feet of office floor space, a fully equipped medical section and stores—was to be completed in twelve months.

After a flying start, six weeks' delay in the first delivery of structural steel put back commencement of the main work until autumn. Then the Esso Company asked for the completion date to be advanced. It was the wettest winter for years. The men worked on. At night they worked by floodlight. The steel framework took shape

and was clad with over a million bricks. Roof, woodwork, fittings, decoration, a terrazzo staircase four floors high... The building was finished and occupied before the end of June 1951. The two hundred men who did the job overcame the difficulties; they played their part in a great industrial effort: and more—they showed us what can be done.

Could your business burn tonight?

Your business is in danger as long as your records, the basis of business, are not safe from fire. And the longer fire has left you alone, the greater the odds that it will call. Tonight is as likely as any other night. And papers, files, ledgers are the fuel flames feed on.

But fire will not destroy papers locked in Chubb Files. They are severely tested not only against fire but against fall.

To ensure that your records are as secure as this, send for further details of Chubb Fire-resisting Record Protection Equipment for the office.

into difficulties with the United States. For the United States, by various loans, played a great part in strengthening Finland's economy sufficiently to pay off reparations. If Finland now begins to produce on an appreciable scale goods which Russia is denied from other countries on strategic grounds, there might be difficulties. There thus seems a case for giving Finland special treatment by Britain, which takes 21 per cent of all Finnish exports, compared with the 15 per cent which go to the Soviet bloc. In so far as British import restrictions aim at reducing indebtedness to EPU, smaller imports from Finland are irrelevant, since Finland is not a member of EPU. On both economic and political grounds, therefore, it would seem desirable to increase trade with Finland, since its sterling receipts could be used only for buying British goods and could not indirectly incur gold payments by Britain.

Finally, is there any possibility that with the end of reparations Finland will move towards closer ties with the West? No doubt an intelligent American policy, directed by the new ambassador to Helsinki, might improve Finland's bargaining position, but with its skeleton army, its common frontier with the Soviet Union, and the Russian bases on the outskirts of its capital, Finland can hardly hope to translate its pro-western feelings into action. The end of reparations will mark a new psychological stage and may entail a new economic situation, but it is unlikely to produce any new directions in Finland's cautious and ascetic foreign policy.

Austria and the Four Colonels

THE three western powers have invited the Russians to resume the Austrian peace negotiations in London on the 29th of this month, but prospects for a final settlement seem as barren as they were two years ago. After more than two hundred and fifty sessions, agreement had been reached on the major part of the eighty-six clauses comprised in the original treaty draft, but a deadlock ensued over the problem of reparations and over certain property assets which the Russians defined as German war loot. In March of this year the western powers submitted to Moscow an abridged version of the treaty in which the essential areas of agreement were emphasised. The Soviet reply was not forthcoming until August 14th. It amounted to a rejection of the "skeleton treaty" and claimed that the latter contained no guarantees for the denazification of Austria, for the existence of "social democratic" parties and for the establishment of an Austrian army.

With the possible exception of the denazification issue, on which the western powers have often shown a rather diffident approach, these were mere points of rhetoric. The Austrian constitution explicitly guarantees political liberties, and the maintenance of armed forces (which the draft treaty set at some 50,000 men) is included in the very concept of national sovereignty. Nevertheless, in order to unmask Soviet intentions, the western powers, on September 6th, accepted the objections advanced by Moscow and duly amended their treaty proposals. There has, as yet, been no reply but it is generally felt that the Russians, whatever their strategy regarding the resumption of negotiations, are by no means prepared to initial a treaty and evacuate Austria.

Cloudy Western Motives

Even on the part of the West there appears to be a perplexity of motives with respect to the Austrian stalemate. It is not clear why a "skeleton treaty" was put forward in the first place. There is, in addition, an element of simple

truth in the Soviet propaganda claims that American tactical interests are increasingly involved in the Austrian position. The militarisation of certain areas in the Salzburg zone and the possibility of jet-fighter bases within comfortable range of the Balkans are factors which it would be foolish to disregard. The recent visit of M. Schuman to Vienna and certain trends in the Austrian economy, moreover, suggest that Austria may find a place prepared within a larger framework of Atlantic defence. The western position in Austria offers a good example of gradual involvement in what had at first been taken to be a temporary and unstable state of affairs. At this stage it would be difficult to deny that an evacuation of Austria entails significant drawbacks. There are vested interests in a stalemate.

Jokers in the Russian Pack

The motives behind Russian obstructionism, on the other hand, are quite plain. The Soviets are deriving important economic benefits from their zone of occupation and are keenly aware of the military advantages of having forces in Austria. If the latter (which may amount to some forty divisions) had to be quartered in the satellite countries, there might arise the type of friction which the Russians are especially anxious to avoid. There are, moreover, unmistakable signs of an Austrian-Yugoslav rapprochement under Western sponsorship, and a link between a free Austria and a hostile Tito is not calculated to allay Soviet fears of encirclement. General Sviridov knows that no more than five per cent of Austrians are Communists, so there is little prospect of recovering by election or a disguised coup d'état what might be lost by evacuation. What is perhaps most important is the fact that Austria is a bargaining point. The Russian Note specifically demanded the inclusion of Trieste in the London agenda. In return for concessions on the Trieste issue the Soviet negotiators might take a more flexible view of the Austrian question and vice versa. When sitting down at a conference table, the Russians feel better if there are several jokers in the pack.

The Austrian economy is trying to adjust itself to the country's ambiguous position and the process is not altogether an easy one. The dominant fact is a shift from consumer goods industries to the export of raw materials and semi-finished products. But this shift, particularly in its incipient stages, means an increase in the import both of coal and iron and of foodstuffs. The productivity of Austrian agriculture remains inadequate; as compared with 1937 the import of wheat has nearly doubled, and that of sugar and fats has increased fivefold. Import of machinery and machine tools has attained six times the total of 1937. Up to now, however, Austrian exports have not kept pace and the demand created by stockpiling after the outbreak of the Korean war is tapering off.

The Best of Two Bad Worlds

In the last quarter of 1950 exports had reached 133 per cent of the 1937 total, but they are now down to 96 per cent. The decrease (by 175 million schillings) of the trade deficit between June and July was not due to higher exports but solely to import restrictions. Two factors have tended to disguise the seriousness of the problem. The release of large sums from counterpart funds have stimulated investment goods industries and absorbed some of the unemployment in textiles and leather. Secondly, owing to the tourist trade, Austria's EPU account for the first time showed a favourable balance (\$6.1 million).

What makes the Austrian position something of a planner's nightmare is the fact that its demand and supply factors can be geared neither to eastern nor to western conditions. In some ways, of course, the Austrians are trying to make the best of two rather bad worlds. A recent trade agreement with Poland should ensure cheaper coal to the extent of

some 2 million tons a year. The Viennese trade fair, which opened on September 7th, shows that the people's democracies and their Soviet masters are prepared to compete extensively on the Austrian market, and presumably the reverse will be true. The need for strategic materials for the Nato countries, on the other hand, has given an essential boost to Austrian iron and steel exports. The latter have been increasing monthly by an average of 50,000 tons, and the production of coal has risen by 7 per cent as compared with the first half of last year. None the less, Austria has suffered from the general downward trend in prices. Although the volume of total exports rose from 347,300 tons in June to 356,600 in July, their value declined by 57 million schillings.

The idea that Austria might serve as a kind of economic neutral ground or quarantine zone between east and west is not entirely unattractive. Whether or not this is a result of Vienna's celebrated atmosphere, relations between the Allied and Soviet occupation powers have always shown a somewhat lighter aspect, a greater susceptibility to humour than has been evident in Germany. None of the four colonels wishes to leave the enchanted land, and Austria may have to resign itself to being their host for some time to come. This seems to be the essential fact on which any realistic thinking about Austria's economic future must be based.

Malaya Picks Up

THE entry into force this week of a new citizenship code in the Federation of Malaya marks the welcome end of a long and slow political chapter which has covered the last three years. It has taken many discussions in the Communities Liaison Committee and new laws in all the nine Malay states as well as the central federal government to bring this about: many of the 1,200,000 Chinese and 180,000 Indians who are now citizens of Malaya may well be excused if they doubted whether the ramparts of Malay privilege would ever open up to let them through. Now that they have and that sixty per cent of the Chinese in the Federation have become its citizens, efforts must equally be made to improve the position in Singapore.

Coming now, this new Malayan citizenship rightly emphasises the importance of political development at a moment when the spotlight is being turned on the favourable progress of the war. In August, 101 Communist guerrillas were killed, 18 were captured and 24 surrendered. These figures were second only to those of June, the record month since the emergency began: during the last six months 648 Communists have been killed, compared with 1,025 in the whole of last year, 639 in 1950 and 618 in 1949. It is also significant that casualties have lately included more of the Communist leaders, such as heads of district committees, against whom the security forces are making a special drive, and that the heavier guerrilla losses have been accompanied by a decline in the number of serious incidents. At the beginning of this month, it was a symptom of the turn for the better that the night mail between Kuala Lumpur and Singapore started running again for the first time for over a year and a half.

Confidence Reborn

The improvement is a reflection of the impact which the High Commissioner, General Sir Gerald Templer, has been able to make on the scene. He has resurrected confidence from the grave in which the mounting toll of the Communist onslaught was burying it, particularly after the murder of Sir Henry Gurney nearly a year ago. This greater confidence is shown in the better co-operation being given to the government by the public and in the vital flow of information which follows from it. Confidence also springs from the rising

efficiency and wider security coverage of the police jungle squads and General Templer's Home Guard.

The improvement does not, however, bring the emergency within sight of an end, and recent over-optimism from the Colonial Secretary in Singapore does nothing but harm. That the Communists can still terrorise whole villages into submission is being proved every day. Last month, when a particularly bad incident took place at Permatang Tinggi and a Communist gunman shot a Chinese resettlement officer in full view of a dozen people in a chophouse without any one of them being prepared to give evidence of any sort afterwards, the High Commissioner once again tried to meet the challenge by collective punishment. Abroad and in cold blood, this has an alien ring of ruthlessness which may seem hard to justify. But when people lose their individuality under mass terror the only way to help them is to deal with them collectively. So far this type of measure has been used only in extreme cases and after other steps have been tried and failed. Judged by the greater willingness of the people to come to the government with information—the most precious commodity in the fight against terrorism—these means when adopted sparingly by General Templer do appear to be justifying themselves.

In spite of a change in national morale, no one could claim that political progress in Malaya is what it might be if the pressure of the emergency were really slackened off. At the same time the main alarm signals are now to be seen on the economic front. In the first six months of this year the fall in the prices of rubber and tin led to an adverse trade balance of £5,000,000 compared with a favourable balance of £115 million during the same period last year. This is but one aspect of a development which has cut like a sword into the recently booming prosperity of Malaya and which has created a political problem full of ugly possibilities in the dispute about wages on the rubber estates.

For the second time in six months the employers feel justified in invoking the sliding scale agreement, whereby the unions have contracted to accept falls in wages when the price of rubber moves below certain specified levels, just as they are entitled to claim rises when it moves up. Unfortunately theory and practice are two very different things: and it is an unwritten economic law that wages go up but not down. The workers now claim, and accurately, that many Malayan estates are still making profits at the present level of production costs. Their leaders also point to the danger to the existing moderate trade unions of the obvious Communist charge that, in seeking to stand by the agreement, they are traitors to the workers' interests. Yet, if the wage agreement is not kept and the price of rubber falls further, many estates will have to lay off considerable numbers of men—and in the last resort that could be as dangerous in the present fight against the Communists as attempting to call the 370,000 estate workers out on strike. In this, as in every other aspect of Malayan life, employers and trade unionists have a common interest in working together at almost any cost until the guerrilla movement is beaten. It is to the new High Commissioner's credit that the improvement in general morale which he has brought about makes this better understood than it would be in an atmosphere of defeatism. But nothing that has so far happened in Malaya warrants any let-up whatever in the new spirit of resolve which is just beginning to get results.

Chilean Come-Back

SOME surprise, and even a little alarm, has greeted the victory in Chile's presidential election of General Carlos Ibáñez. Best known for the autocratic methods he used during his earlier presidency, General Ibáñez conducted his electoral campaign on a basis of nationalistic emotion and pledges to "fumigate" the administration, rather than on any defined policies. His candidacy was warmly supported by the

Peronista press in Argentina, and at one point seriously compromised by the action of Argentine consular officials in Chile. His victory has had an equally warm welcome in Buenos Aires, where it has been described as "a triumph of all the Latin American nations over imperialism." Señor Lira Merino, one of the General's chief supporters, declared on the day after the polling that the new government would denounce the mutual aid agreement recently signed with the United States, and would nationalise copper and other foreign-owned interests.

Peronismo on the March?

In a year which has already seen the seizure of power by a military dictator in Cuba, the overthrow of the Bolivian government by the followers of Señor Paz Estenssoro (formerly an exile in Buenos Aires), and the electoral victory of the demagogic Dr Velasco Ibarra in Ecuador, the turn of events in Chile might easily be taken as further proof that democracy is in retreat in South America, and Peronismo on the march. But the pattern is not so simple. Unlike General Batista in Cuba, General Ibáñez has obtained power by constitutional means, as he did a quarter of a century ago. Although, like Dr Velasco Ibarra, he has enjoyed Peronista support, he will have to deal with a people who are fully alive to the danger of pressure from their big neighbour across the Andes. And while Señor Paz Estenssoro—like General Perón himself—has been hailed as the bringer of social reforms long overdue, General Ibáñez cannot offer so much in this direction to a country where labour is already a powerful force and "new-deal" legislation a reality.

What he claims to offer is stability and order. Chile has long been plagued by splinter politics, and in recent years an interminable series of labour disputes has half paralysed its economy. President González Videla seems to have seen the problems clearly enough, but he lacked the authority to solve them. During his term of office the coalition of the centre and left on which he based his government has steadily disintegrated; and, since constitutional provisions prevented him standing for re-election, he was forced to cast his mantle upon the uninspiring Señor Pedro Alfonso, who got only 184,000 votes against General Ibáñez's 433,000 and the 252,600 cast for Señor Matte Larraín, the conservative-liberal candidate.

No Meek Vassal

General Ibáñez's victory thus certainly reflects the failure of conventional political methods to solve Chile's present problems. But it does not necessarily imply a return to autocracy. At 74, the man who acquired dictatorial powers in 1927 and yielded them in 1931 seems somewhat mellowed, and the Chile of today is a very different country from that of 1927. In Brazil, President Vargas has shown that a former dictator can both gain power and govern by constitutional means; General Ibáñez may well seek to follow suit, if he can curb the more headstrong among his supporters. Nor is it at all probable that General Perón can now count Chile as a meek vassal. Natural rivalry between the two countries, Chile's more liberal traditions, and the new president-elect's independent personality make such a development unlikely. General Ibáñez is a hard bargainer, and he will no doubt keep his promise to ensure that foreign capital is allowed no favours in Chile. But he has already discounted Señor Lira Merino's talk of sweeping nationalisation, and categorically denied that the mutual aid agreement will be immediately revoked. In spite of all the sound and fury of the election campaign, it is far too soon to write Chile off as a new recruit to the Peronista bloc.

Glenfield Control

IN THE OIL INDUSTRY

Oil valves, which control in all stages of its preparation and distribution a product that has become indispensable to man, are designed to meet conditions which are probably the most severe of any industry and accordingly a very high standard is set.

Unnumerable "Glenfield" oil valves are controlling the flow of oil in pipe-lines, in boosting pumping stations, in refineries and to storage tanks.

HEAD OFFICE & WORKS: KILMARNOCK SCOTLAND

THE BUSINESS WORLD

Recovery on the Big Screen?

STRICTLY speaking, Anglo-American negotiations over film dollars are concerned with a detail of currency transfer, not with British film policy; and this year they seem to have been accepted as such not only in Hollywood but in Wardour Street. The Board of Trade officials who reached an agreement with the Motion Picture Producers' Association of America in Washington last week had been sped on their mission with rather less domestic advice than usual about the exact degree of protection for British film production for which they ought to be bargaining. Their brief from Mr Butler was simple—to reduce the \$25.2 million a year that Britain was spending on American films at the beginning of 1951—and they carried it out. Under the revised agreement announced this week, the American producers can still transfer unconditionally \$17 million of their films' earnings in Britain, and can still use their frozen sterling in the other ways that have up to now enabled them to transfer annually about \$8 million more. But their additional right, granted last year, to transfer earnings due to them from the Eady levy for films they financed or distributed in Britain, is curtailed: over the two years, 1951-52 and 1952-53 by \$5.9 million in all. This would suggest that the rate of total dollar remittances on behalf of the American producers may fall to about \$23 million a year. This is a modest change, but perhaps as much as the Government could expect from the American producers—for whom overseas earnings have become much more important since they have been divorced from exhibition and are meeting increased competition from television.

The seeming indifference with which these negotiations were regarded by the British film business was one current indication, among several, of an unwonted placidity in that mercurial trade. All sections, from exhibition to production, have perhaps found the past year more comfortable than they might have feared. It is true that the graph of cinema admissions, the real temperature chart of the industry, has continued to fall; in 1951, 1,365 million admissions were recorded, compared with 1,396 million in 1950 and with the peak of 1,635 million in 1946, and in the first quarter of this year admissions were again 3.6 per cent fewer than in the first three months of 1952. Nevertheless, the cinema exhibitors gained some freedom to increase seat prices, both last summer and this, though not all of them have followed the main circuits, Rank and Associated British, in the latest increase. Thus gross box-office proceeds in 1951 rose to £108 million, compared with £105 million in 1950; net takings, at £69 million, were nearly a million pounds higher than the year before. The Associated British circuit, in the year to March 31, 1952, showed a slight increase in its net takings over the previous year. In the same way, the Odeon and Gaumont-British circuits, in the year to the end of June, show an increase of about 4 per cent in net box-office takings. Entertainments duty, the exhibitors' main source of

complaint, in 1951 still took 36 per cent of all that the public paid for admission to cinemas; but after paying film hire and the special Eady levy to support British production, the exhibitors' share of the box-office receipts—some £45 million—was still slightly higher than in the previous year. These results do not add up to general prosperity among exhibitors, but they need to be considered against the trade association's expressed fears early in 1951, that some hundreds of cinemas might be forced out of business in the following twelve months.

★

On the production side of the British industry, the improvement is rather more marked. Three years of attempts to reduce production costs have brought about much greater economy, as producers have gradually learned to make films within budget; and two years of larger producers' shares in the eventual box-office receipts on those films have made it reasonable to hope for a profit from at least the aggregate earnings of a group of, say, six films. The National Film Finance Corporation estimated some months ago that of the 34 films it released last year, perhaps 21 would have made a profit under present conditions, and that the earnings of about 28 would have covered the 70 per cent of costs that distributors generally guarantee. In his annual statement this week, one of Mr Rank's remarks bore much the same implication:

A year ago it was necessary to make provision for losses on unreleased films. I am happy to say that at the 28th June, 1952, we have not considered such a provision necessary.

Production within the Rank group has admittedly been much curtailed; but its loss on production and distribution has been reduced from £1,182,000 in 1950-51 to £25,000 in the current year, which suggests a striking improvement in economy in the studios. Repayments to the National Film Finance Corporation from independent producers have now reached the level at which it may not need to exceed the £6 million of borrowings directly available from the Government; up to March this year, it had lent £5,300,000 for film production, and expected to get all but £1,610,000 back. The trade is awaiting with considerable interest the latest financial results of the main film group unconnected with cinema exhibition, British Lion, to which the Film Finance Corporation has lent £3 million.

This steadying of finance has enabled the producers to maintain a fairly steady output of creditable films. They are now turning out about 50 first features a year, on which full-time employment seems fairly steady at about 3,500-4,500 people. Comparing this level with the figure of about 7,700 attained in 1948, the technicians' and actors' unions still complain bitterly that the industry deserves yet more protection from the competition of the American product, by higher quotas or import limitations. But even if this plea for greater

Cleaner

laundry

Shell Chemicals

Shell research has brought a new, improved technique to the laundry. The modern detergents are kind to all fabrics; their efficiency is unaffected by the hardness of water and they deposit no lime scum—a major cause of greying in white materials. Outstanding among these Shell products from petroleum is LENSEX—an all-classification detergent now being used on an ever-increasing

scale in many laundries. Its versatility ranges from the safe washing of delicate fabrics to powerful grease-removing action on mechanics' overalls. LENSEX is also playing an important part in laundry economics, because with all types of laundering—light, heavy, white, coloured—it gives a cleaner wash on less fuel and water, and in less time.

SHELL CHEMICALS LIMITED, Norman House, 104-109 Strand, London, W.C.2
(DISTRIBUTORS)

protection were to be accepted, the public could not be compelled to see British films they would not choose, and it is difficult not to agree with Mr Rank that

the basic factor which must always control the volume of British film production is the availability of creative talent . . . (which) cannot be manufactured; it must be developed gradually through experience and practice.

Some exhibitors now fear that production economies have now gone so far as to limit British films to a "utility" type lacking the colourful "big screen" qualities they believe will become more necessary as time goes on to meet competition from television's little screen. Nevertheless, the British films produced in the last two years, on a budget of less than £150,000 compared with perhaps £250,000 in the palmy days of 1947-48, include a number that are already doing good business in specialised American theatres. British technicians and actors would also complain about the films being made here with American money, stars, and directors. Their criticism of the description of some of these films as "British" is understandable. But the American producers are using their own money, withheld from them by *force majeure*, to make films of a kind that they are sure will appeal to their primary market at home. And they are also providing a proportion of employment, often at high rates, that few British film workers seem aggrieved enough to decline.

*

Neither exhibitors nor producers, however, find their future prospects reassuring. The downward trend in cinema attendances may well continue for at least a year ahead. Four television stations are operating today, against only one for the whole of 1951; and even the major circuits would argue that the prices of cinema seats are now becoming too high, certainly for family patrons. Nobody knows how big a place in entertainment television will eventually command, nor quite what the cinema industry can do to meet this challenge. The technique of large-screen television to cinemas—though not its entertainment value—is already proved. The industry would probably prefer a really new technique for celluloid; but so far stereoscopic films show no signs of becoming a practical proposition. Meanwhile, costs have been rising faster than net box-office receipts, and the exhibitors are now faced with a wage claim of formidable dimensions from cinema employees. All exhibitors are united in the belief that the solution to their problems lies in a reduction in entertainments duty; but the particular formulas proposed differ with the varying incidence of duty on their cinemas. In the first three months of this year, cinemas with a seating capacity of less than 1,000 retained 6 per cent more money, after paying duty, Eady levy and film hire, than they did in the first quarter of 1951; but for cinemas with more than 1,000 seats, the "exhibitors' share" fell by 2.7 per cent. Duty and levy represented only about 20 per cent of the takings of the smallest cinemas, but some 39 per cent for the Odeon and Gaumont-British circuits, and 42 per cent of box-office receipts for cinemas seating over 2,000 people. These figures would not seem to support the constant requests for special treatment made by the "small men" in the Cinema Exhibitors' Association; if these smaller exhibitors really have a good case, they have never yet produced figures to prove it. There may well be a large number of cinemas that do no better than break even on film exhibition itself, and rely for their margin on the proceeds of advertisements, ice-

cream and other refreshments; but it is not clear that the smallest are in the most strained financial circumstances. The industry's case for a general reduction in duty has weight, despite the assumption too often implied that tax increases that were passed on as they occurred to the public are in some way the exhibitors' property.

Better fortunes in production, too, rest on two supports that cannot be counted on to last, the Eady levy and the NFCC. The levy, made possible by increases in admission prices, forms an addition to the producer's normal revenue from film hire; at the higher rate that has been operated since last summer, it increases those normal earnings by roughly 40 per cent. Without the levy, production in 1950 cost about £8 million a year and brought in about £7 million; the levy now brings in a further £3 million. It has, undoubtedly, been the most important factor in bringing the production of groups of films at a profit within the bounds of possibility. But it is a voluntary payment from box-office receipts by exhibitors (though it was made possible by higher prices without a proportionate increase in duty, so that exhibitors are strictly only collecting it on behalf of producers). Some exhibitors—two or three hundred small cinemas—are already refusing to pay it; and, in any case, the voluntary agreement is due to come to an end in August, 1954. A British film of reasonable quality would now require perhaps eight months' extra receipts from the levy, plus its normal revenue from hire, to cover production costs. Film production requires plans and commitments well in advance, and there may be three months between completion in the studio and release. That being so, no film planned much after early summer next year could hope for enough extra revenue by August, 1954, to break even. The Rank Organisation has announced this week that it will "materially curtail" film production in August next year unless it knows by then that the levy scheme is to continue after August, 1954, and Sir Philip Warton of Associated British some time ago supported the continuance of the levy on a statutory basis. These major groups are thus beside most other producers in supporting extension of the levy, though Sir Philip has said that the amount handed over under it by his group's cinemas exceeds the amount received from it by its production organisation. Other exhibitors are less convinced, though opposition to extending the levy scheme may be more vociferous than it is powerful. Most producers are hopeful, as is the Government, that the levy will be extended with the voluntary agreement of exhibitors as a whole; but they are not sure that it will be done in time to avoid a sag in production.

Mr Rank this week put "availability of finance" second to talent as a limiting factor on the expansion of British production. He personally believes that continuance of the National Film Finance Corporation, with its partial public support for British film production, is less necessary to the industry as a whole than extension of the levy. Other producers might be less sanguine that by mid-1954 British film production will look so good a bet as to attract the money from private sources to support a steady level of production; and other exhibitors might care less. Neither party in Parliament has committed itself to this form of Government subvention for British films beyond its original five-year term. Some producers and technicians are confident that any British Government can always be counted upon to support some level of British film production, and on postwar experience they may be right. But the division between the

two sides of the industry, in spite of the major groups that bridge it, remains a deep one. The circuits might argue, even as exhibitors, that they need a stable if modest British production industry to save them from facing a foreign seller with a monopoly of the product that they need to present to the public. But many exhibitors count the British market as important to the American producer today as Hollywood is to them. The attitude of the two sides of the industry even towards its most powerful new competitor, television, is beginning to

Oil and Cartels

FIVE American and two non-American oil groups are now involved in grand jury proceedings in the American courts. This process will determine whether a *prima facie* case is established against them for engaging in commercial practices that are in violation of the anti-trust laws. The grand jury proceedings, when they get under way, will be held behind closed doors and they may prove bitter and lengthy. A mass of documentation has been demanded of the seven groups, and it seems probable that out of this the grand jury will find a true bill and thus set in motion the even lengthier processes of trial. A similar case against the investment bankers has been going on for two years and the prosecution has not finished its opening argument.

The substance of the case against the groups is to be found in a report prepared by the staff of the Federal Trade Commission headed "The International Petroleum Cartel," which, after much delay, was published last month by the US Senate Committee on Small Business. In a preface to the report, Mr John Sparkman (who is chairman of the committee and is also Democratic candidate for Vice-President) declares that this is "a factual report" and as such "subject to a variety of interpretations." But it is significant that he also emphasises the need to hold in check the power of great organisations and that he reaffirms "the determination of the American people that American companies, whether at home or abroad, shall so conduct themselves as to promote the interests of all people everywhere." These are standards not consistently attained by sovereign states, and they import a wider philanthropic purpose to American anti-trust legislation than many observers outside the United States—and not a few inside—would be prepared to concede. The charges concern the operations of the

be divided; a few producers are perforce beginning to consider making special short films for television, while the Cinema Exhibitors' Association has proclaimed a ban on business with any producer—in Britain—who does this. Agreement on broad issues has been reached before in the British film industry, sometimes under Government pressure, and it may be this time. Unless it is, Mr Rank's description of the coming years in his annual review this week as "a transitional period . . . with many new problems" may be an understatement.

seven groups (two of them wholly or partly British) outside the United States; some delicate issues of jurisdiction may therefore ultimately be involved in the legal proceedings in Washington.

The report itself is a mine of information and contention that does not lend itself readily to summary, much less to the drawing of "a variety of interpretations." It is concerned with the acts and agreements of the seven groups since the late twenties, which appear to infringe (in the judgment of the Federal Trade Commission) the canons of the anti-trust laws. It is concerned scarcely at all with the economic background of the groups' actions; nor does it examine whether the development of oil outside the United States (which has some connection with "the interests of all people everywhere") would have been undertaken on any other terms. Bigness is a fact in the oil industry, and it was already a fact when the companies began their development of Iraq, Arabia, Kuwait and Venezuela. A worse crime than exploiting bigness would have been not to exploit it.

The dominance of the seven in non-American oil production—and their important contribution to American production—is shown by the two charts reproduced from the report. It submits to meticulous examination their joint ownership of subsidiary and affiliated companies in the Middle East, Europe, South America, the Far East and Canada, and the exchange directorates that exist between them. Four of them—Socony-Vacuum, Standard Oil (New Jersey), Royal Dutch-Shell and Anglo-Iranian—own more than 70 per cent of the shares of Iraq Petroleum. Jersey Standard, Socony-Vacuum, the Texas company, and Standard Oil of California together own all the shares of Arabian American Oil. Gulf and Anglo-Iranian are equal partners in

OIL PRODUCTION—THE WORLD AND THE SEVEN IN 1949

Kuwait Oil, and Standard of California and Texas equal partners in Bahrain. Three of the seven, in partnership and separate operations, control most of the oil resources of Venezuela. And with this control of crude oil supplies there goes similar control of refining, transport and marketing. All this is set down in detail at the outset of the inquiry and the conclusion follows: "The concentration of an industry into a few hands may be regarded as the *sine qua non* of effective cartel operations."

Joint control over non-American oil, the report argues, developed from two presumed facts in the early twenties. There was a widely held fear that the United States was running out of oil, and a no less general fear in the United States that foreign groups (Royal Dutch-Shell and Anglo-Iranian in particular) were cornering oil reserves outside the United States. Shell had a long start in Venezuela, whereas Gulf and Jersey Standard had to buy their way in later in the twenties. In the Middle East, in the same period, the prospects of large and cheap reserves attracted the seven groups, using the twin techniques of joint ownership and long-term contracts for the sale of crude oil for their development. The conclusion, painful to the Federal Trade Commission, has less sting for the reader outside America:

The long period of the contracts, the great quantities of oil involved, the unusual nature of the pricing methods and the conditions of sale, and the inclusion of provisions restricting the marketing of oil suggest that these contracts extend far beyond the ordinary business transaction.

Indeed they do. Perhaps the physical development of these resources in the Middle East and elsewhere could have been undertaken by a multitude of "ordinary business transactions" conducted by many smaller, less resourceful and more competitive companies. Perhaps, on the other hand, the economic, technical and political risks were themselves so great that only an effective joining of the power of the already large in the oil industry into even larger new cooperative forms was enough to match the tasks and the risks.

The reader of the cartel report will not, indeed, find any sympathy for this point of view. And it is one that the oil industry, feeling itself vulnerable to legal attack—oilmen have, after all, suffered prison because their ideas of competition did not match the judicial interpretations of the anti-trust laws—has great diffidence in putting forward. It is no answer to an indictment under the Sherman Act to admit a technical offence and to argue that from the offence positive benefit has accrued to the world at large. The offence, technical or not, is of the essence. It is this fact that gives the account in the report of the development of the Iraq Petroleum Company by the four American and British partners, together with the French and Gulbenkian interests, such a deadly lucidity. First, there is the resistance of the British to any intrusion of outside interests in Iraq; then the American campaign for the "open door" successfully won, and before the twenties were out discarded because of over-production of oil; then the "red line" agreement, by which the participants in IPC were won over by the French and Gulbenkian to the principle of not competing with each other for concessions. Yet, even so, competition persisted in breaking out; Standard of California obtained concessions in Bahrain and Saudi Arabia, and the four leading partners in IPC tried for seven years to alter the red-line agreement that they had made to protect themselves in order to keep pace with the competitive effects of Standard of California's advance. Even the report is

forced to describe the agreement as a millstone round the necks of the participants.

There are inevitably many facts and episodes in the history of IPC (including the incredible complications arising out of the war when the French and Gulbenkian interests were adjudged to be under enemy control) that could by no means be described as "ordinary business transactions." Many were serpentine, and some not entirely creditable. The development of Saudi Arabia and Kuwait had the merit, initially at any rate, of competitive endeavour, which the report is fair enough to concede; but by a series of agreements for purchase of crude oil and the protection of existing marketing facilities, these newcomers presently became part of the family of wrongdoers. The report manages to suggest, indeed, that Anglo-Iranian and Shell got the better of the bargaining, for example, with Gulf over the provision and marketing of oil from Kuwait, thus "carrying forward into the post-war period, the 'as is' principle, preserving the historic position of participants in each market."

★

"As is" is oil industry shorthand for describing the principles underlying the agreement reached in 1928 between Jersey Standard, Shell, and Anglo-Iranian, sometimes known as the Achnacarry agreement. These principles, the report explains, embodied seven main heads: acceptance by the participants of their 1928 level of business ("as is") and keeping the same proportions of any future increase in consumption; the joint use of existing facilities; no new construction except to meet increased demand; identical values for products at all points of origin; the drawing of supplies from the nearest producing area; the shutting in of excess production; and the elimination of competitive expenditures that would materially increase costs and prices. The principles emerged from a price war between Shell and Standard Oil, and they were re-affirmed, though in the form of different and more complicated agreements, through the thirties when depression and competition from Russian and Roumanian oil led to further instability in the world oil market. The report draws a somewhat curious contrast between what was happening in the world oil market during these years and the steps that were taken in the United States to secure "lawful ways of controlling production and exports." These latter resulted in a system of inter-state oil compacts, sanctioned as a conservation measure. But, declares the report, "conservation became the cartel's slogan at a time when a rising flood of international production threatened to depress world prices." The legal implications of this line of argument seem clearer than the distinction between the economic forces that were impelling American oil producers to seek sanction for "conservation" and those that were driving the non-American producers into policies with the similar objects of protecting themselves. Nor does the report accept any argument that cartel cooperation came to an end just before the war as a result of the withdrawal of Jersey Standard from the agreement in 1938. The British and Dutch interests continued to co-operate and the British Government sponsored a pooling arrangement during the war "modelled closely on 'as is' principles"—not the only betrayal of competitive principle with the enemy at the gates. But, war apart, the observance of "as is" principles had become "practically a custom of the

trade" and was fostered by "the intricate maze of contractual and other relations developed over the years among the small number of large international oil interests."

Simplicity is perhaps hardly to be expected in the relations of the dominant groups of a highly technical and rapidly expanding industry serving world markets. Perhaps the two questions that the lay observer would put first in determining whether such relations were good or bad (as distinct from legal or illegal under American law) would be these: Has it delivered the goods? And are its prices rapacious? With the first question the report is not concerned, but the general verdict would surely be that the industry has been more successful than any other in expanding its resources to meet growing demand since the war. If a cartel is found to exist today, it can scarcely be motivated by prewar principles of restricted output. On the much more complicated question of prices, there may well be room for discussion. The most difficult chapter in the report is concerned with price determination in the industry which, as is well known, rests largely on an international basing point system known as "Gulf-plus." The report argues that Gulf prices as used in this system are high and unrepresentative of the bulk of world trade in oil. But apart from the relevance of the particular prices used, the system itself has "the ultimate effect upon any given buyer of eliminating price differences as among the various sellers." The Gulf price, plus the freight charges from the Gulf to particular markets, give an identical delivered price for all sellers, irrespective of their location. Sellers who are located nearer to the buyer than the basing points thus get an advantage of "phantom freight" and those further away have to "absorb" freight since their actual costs are higher than freight from the basing point.

The application of this system, the report shows, has been modified from time to time. During the war, the Persian Gulf was made a basing point (using prices equal to those at the Gulf) and thus eliminating the element of "phantom freight" that would otherwise have been in-

cluded in the price charged for oil delivered to the British Navy in the Persian Gulf. There were other changes in basing points after the war—in 1949, for example, when Persian crude was moving in quantity to the eastern seaboard of the United States, New York was made the point of freight equalisation. The report examines the changes in tanker freight rates, actual and notional, that have played their complicating part in the application of the price formula and notes the concessions "largely as a result of government pressures" that the companies are declared to have made. But the burden of the charges it makes is clear. The effect of the system has been to keep the price of Middle East oil higher than it should be; it is oil produced at low cost, and the result has been substantial profit for the companies.

It is possible to have misgivings about these pricing arrangements, and to suggest that they call for objective examination, without following the report too closely in its criticism that the companies have made good profits. There is no general feeling among the public that the companies (as distinct from the tax gatherers) have cynically exploited them. The movement of petroleum prices (ex tax) compares distinctly favourably with the movement of many other primary materials, and if in the process of meeting expanding demand at relatively stable prices the major oil companies have been able to make a lot of money, that presumably formed part of their intention in going into new fields, and provides the major financial resources for further expansion in future. Changes in the balance of world oil production and consumption must no doubt in time lead to changes in the way that prices are determined; but if it is a fair conclusion that "Gulf-plus" and its various modifications carry less conviction than they might have done in former years, it might equally be an optimistic conclusion for the European consumer to suppose that a pricing system based more specifically on actual costs of production and transport would inevitably be to his advantage. It is here, perhaps, that the major companies could usefully explain their purpose.

Business Notes

Pause in the Markets

The stock markets in this past week have taken their first real pause since the breath-taking climb began three months ago. A rest was in any case long overdue; and some would say that the climbers are now finding—or at least ought to find—the rarefied air of these heights rather exhausting. The first consideration, however, is in itself quite sufficient to account for this week's modest relapse: there is no need to assume that more subtle influences lie hidden beneath the obvious one. In the equity markets, however, the buoyancy of mood had already been damped down a little by the engineering wages dispute, and the alternation of fear and hope about this has been an important influence. It certainly explained the first slipping of prices from the peak reached early last week, when the ordinary share index of the *Financial Times* reached 117.6, or fourteen points above the midsummer trough; the slither became rather more pronounced on Wednesday last, when the index dropped by 0.8, carrying it to 115.8.

In the gilt-edged market the rising tendency was sustained until last Monday. The three months' climb in this market, though proportionately smaller than in industrials—it has ranged up to 9 per cent, or a little more—has been even

more remarkable. What is surprising now is not that there has been a pause, but that it should have been so long delayed. The short-run profits shown by operators who bought in the early summer far exceeds anything that could ordinarily be hoped for from gilt-edged securities; yet such profit-taking as has occurred has been comfortably absorbed; the reaction on Tuesday and Wednesday did not exceed $\frac{1}{2}$ point. It marks, however, the realisation that the autumn season for new issues is now opening and must soon resolve the most immediate question in the market's mind—the question whether the authorities are to assail it with a large and genuine funding issue, or whether they will remain content to see the banking system glutted with liquid assets. The arrangements last week for a £4,500,000 issue of the East Africa High Commission brought these discussions to a head, though they do not really throw any light on the main problem. The loan takes the form of £7,135,000 of $4\frac{1}{2}$ per cent stock, 1964-69, of which £1,635,000 has been placed privately and £1 million is reserved for residents in East Africa. At the issue price of 99 $\frac{1}{2}$, this trustee stock should appeal to investors interested in the gross income yield—provided that the market does not subside further before the lists open (and close) next Tuesday.

Cotton Goods in World Trade

At the invitation of the Cotton Board business men representing the cotton industries of the chief textile exporting countries have assembled for the international cotton textile conference which opened in London on Wednesday and subsequently continued its meetings at Buxton. The conference, planned more than a year ago, meets when the severe textile recession which this year affected the industry in all parts of the world, appears to be less formidable. But basic problems remain. Two things in particular have changed in the pattern of the world trade in cotton textiles compared with before the war. First, there is less trade; secondly, the two biggest exporters, the United Kingdom and Japan, are getting smaller shares of that trade and two countries, India and the United States, formerly relatively small exporters, have greatly increased their shares. Before the war international trade in cotton textiles amounted to about 7,000 million yards a year; in 1951 it was about 5,600

EXPORTS OF COTTON PIECE-GOODS FROM THE FOUR
CHIEF PRODUCING COUNTRIES

* Exports by sea only; excludes land trade, in particular to Pakistan. Total for 1937 excludes exports to Pakistan. † Million yards.

million yards or about 17½ per cent less. The share, by volume, of world trade of the four leading exporting countries has shown impressive, and conceivably permanent, changes between the years 1937 and 1951. The United Kingdom's share fell from about 28 per cent to 15 per cent and Japan's fell from about 38 per cent to 19 per cent; by contrast the Indian proportion rose from a mere 3 per cent of world trade to 14 per cent and the United States proportion also rose from 3 per cent to 14 per cent. Apart from political reasons, such as the closing of the Chinese market to Japan, both the United Kingdom and Japan have lost trade in textiles largely because a number of consuming countries have increased their own production, but also because the new growing competitors have captured part of their markets. But the countries with increasing exports are also aware of obstacles and difficulties, and their presence at this international conference shows an anxiety to exchange facts and views, even if positive decisions cannot be reached.

The Big Five

The opening session of the conference fairly clearly set out the common problem of the world's "Big Five" cotton goods exporting countries. They also furnished a foretaste of the special interests—and pleas—to be expected from these countries—Britain, the United States, India, Western Europe and Japan. Although the public speeches were wreathed in amity, they were also candid enough to promise more forthright discussions in private at Buxton. But no hints were allowed to emerge of just what "joint action to increase world consumption of cotton goods" these competing producers might have in mind.

Sir Raymond Streat, Chairman of the Cotton Board, who presided, gave a warning for those who always see boundless possibilities in the so-called under-developed countries. When the very poor enjoy their first rise in income, he pointed out, up goes their consumption of cotton goods, but with each subsequent rise in their standard of living their additional consumption of cotton goods becomes smaller. He

added that the first forms of industrialisation to which a developing country turns is the cotton mill, and the second a tariff to protect it. This original sin among the under-developed countries also roused the ire of Mr Stevens, the American delegate, who declared that the United States has been steadily reducing its Custom duties since 1935 and that import of cotton goods into the USA is "not encumbered by quotas, exchange restrictions, exchange taxes, sales taxes at port of entry, or by any other form of hidden tariff."

Sharper differences in view-point became apparent when the other delegates spoke—the West Europeans anxious to maintain their extra-European trade which they saw passing into the hands of India and the United States, and the Indians concerned to nurture their growing textile industry. But the main interest, of course, lay in what the Japanese had to say. Mr Abe emphasised that the export of cotton piece goods was vital to the Japanese economy. Japan, he said, had now to feed 12 million more people than before the war from the disorganised resources of a smaller territory. In 1951 raw cotton accounted for 22.9 per cent of Japan's total imports and cotton textiles for 27.8 per cent of total exports, even though these exports were less than before the war. Clearly the Japanese are in no mood to curtail their export drive.

There are no government representatives at the conference, which is a gathering of business men responsible for 90 per cent of the world's cotton textile trade. Whether the British chairman's hope will be fulfilled that they can find the way towards an enlargement of trade in cotton goods "without coming into a form of conflict which would be wasteful of national resources, injurious to general prosperity and restrictive to the expansion of world trade," remains to be seen. Not the least interested observers from afar will be the world's main importers of cotton textiles.

Bank Advances' Biggest Fall

The latest quarterly analysis of bank advances in Great Britain gives by far the most striking, as well as the clearest, picture yet furnished of the contraction that has been taking place in the supply of bank credit to the private sector of the economy. The decline in total advances between May and August proves to have been even larger than had been suggested by the monthly figures of the clearing banks; it amounted to £156 million, easily the biggest ever shown, reducing the total to £1,848 million. Of this decline, a large part must have been due to repayments of advances made to the British Electricity Authority, although the total calls on the £150 million BEA loan during the quarter exceeded the reduction—by some £56 million—shown in advances to public utilities (excluding transport) during the quarter. The decline of £100 million in advances to all other domestic borrowers follows one of £22 million in the previous quarter, when seasonal influences were still tending to maintain demands for credit.

The question raised by these figures is how far this big contraction in advances to the private sector—it is the first substantial decline since the war—is due to the present monetary policy and how far to other major influences. There is no doubt that the delayed effect of the recent decline in commodity prices has been an important factor reducing the demand for credit; and, in textiles especially, there has been the further effect of a decline in physical stocks, which cannot be wholly attributed to the credit discipline. It is notable that the two biggest declines in individual categories of borrowers, other than the utilities, have taken place in food, drink and tobacco (by £39 million) and in retail trade (by £27 million). These groups, with textiles (a decline of £11 million) and leather, rubber and non-ferrous metals (one of £5 million) have together accounted for four-fifths of the fall in advances to domestic borrowers apart from the utilities; and these are the very categories whose credit

In the Seaports of the East...

from the Arabian Sea to the Pacific Ocean the branches of the Chartered Bank perform a wide range of banking services connected with overseas trade and local industry. Merchants and manufacturers in the United Kingdom who trade into the East are invited to consult the Bank's managers in London, Manchester and Liverpool.

THE CHARTERED BANK OF INDIA, AUSTRALIA & CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2.

West End (London) Branch: 28 Charles II Street, London, S.W.1.

Manchester Branch: 52 Mosley St., Manchester, 2.

Liverpool Branch: 27 Derby House, Liverpool, 2.

New York Agency: 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

Hard lines about hardware!

A client of ours in the Hardware Trade was recently offered a contract from a Latin American country. "If I send the goods on a cash-against-documents basis," he asked "can I expect prompt payment?"

We were able to quote him the latest report from our Branch in the country concerned. This stated that the market showed signs of being heavily overstocked. Goods were moving slowly and delays had been experienced. Furthermore a marked (though temporary) shortage of sterling had lately complicated the situation, and some exporters had found the delays so serious that they had re-shipped their goods.

This factual information was of the utmost importance to our client and it is unlikely that he could have obtained it so quickly or in such detail from any other source.

THE ADVANTAGES OF BEING HERE AND THERE

As the only British Bank with branches throughout Latin America, we can offer you special services—either direct or through your own bank. These services are set out clearly and concisely in our booklet "The advantages of being here and there". We shall be glad to send you a copy on application to:—

requirements would be most responsive to a fall in commodity prices. In the nine-month period since the launching of the new monetary policy in November, 1951, total advances (again excluding the public utilities) fell by £123 million, whereas in the corresponding period a year before, they rose by no less than £253 million, a much bigger increase than that shown in earlier years. It is reasonable to infer that a substantial part of this year's contraction has been due to a reduction in credit demands by reason of the reversal of this boom. But in one category, that of "personal and professional" loans, where there was a substantial fall (of £18 million) for the second quarter in succession, pressure from the side of the banks must have been the main factor (even though this category includes some small businesses that may likewise have experienced a decline in the cost of carrying stocks).

The major increases in advances during the quarter were to industries generally considered as high in the scale of national priority. Iron and steel, engineering and ship-building each increased their borrowings by some £2 million, whilst the chemicals group secured nearly £5 million, after the repayment of some £12 million of advances in the previous quarter. The expansion of loans to local authorities (by nearly £4 million) and to agriculture (£3 million, against £18 million in the same quarter of 1951) were less than has been usual at this time of year. Agriculture's share in bank advances as a whole has been only slightly raised during the past year, from 10.3 to 11 per cent—a high proportion that is now almost equalled by the engineering and steel groups, which together account for 10 per cent of the total, compared with only 6.4 per cent a year ago.

IMF Link with EPU?

The meetings of the Governors of the International Bank and Monetary Fund at Mexico City have closed without bringing to light any unexpected or untoward developments—but it is clear that there has been some searching discussion of the future of the Fund. This debate has left the general impression that if the Fund is to survive as a live and effective institution, it will have to adopt much more flexible policies than hitherto. Some modest signs of increased flexibility have, indeed, been seen in its policies in recent months. The first of these was the redefinition, issued by the managing director, Mr Rooth, in the earlier part of this year, of the rules for making the Fund's resources available to its members. This suggested that the Fund is to be regarded more as an automatic provider of foreign currencies, and less as a severe critic of any application for assistance, than it has been in the past. But this redefinition of its relationship to member countries still has to meet the test of action. A more significant and practical illustration of greater elasticity was the readiness of the Fund last June to give its assistance to Belgium in order to make possible the partial mobilisation of Belgium's EPU surplus. The "stand-by" loan of \$50 million granted to Belgium by the Fund on that occasion was an operation for which the articles of agreement provided no clear sanction; it was made possible only by an extremely loose and generous interpretation of them.

It is, however, in the Fund's relation with regional institutions, and more particularly with the European Payments Union, that the biggest test of its flexibility will emerge. Under the leadership of the French Governor, M. Mendes-France, a widespread demand was made at Mexico City that the Fund should follow the precedent of its operation with Belgium, and should grant increased assistance to EPU. M. Mendes-France argued that EPU was the only realistic alternative to strict bilateralism in payments between western European countries and pointed out that the good work it was doing in this respect was in no way invalidated

by the fact that the members of EPU should for the time being find it necessary to discriminate against the dollar. The need for such discrimination might, he said, be lessened if EPU received greater support from the Fund; in any case it was the Fund's duty to support multilateralism on the widest possible regional basis. This thesis met sharp criticism, in particular from the Canadians, who questioned whether a further extension of regional arrangements was the best way to achieve multilateral trade and general convertibility of currencies. Aside from this questioning of the general logic of the argument, it must be admitted that a closer practical collaboration between the Fund and EPU would create some important technical problems. The Fund at present has no authority to make its facilities available to international institutions. It can do so only to member countries. This, however, would be no insuperable bar, as the loan to Belgium has shown. If the Fund can bring itself to make its facilities available to strong creditor countries in EPU, it would have the effect of strengthening the whole EPU membership. If creditors within EPU found it possible and advantageous to discount part of their surplus with the Fund, the strain on EPU's convertible resources would be correspondingly eased. The problem deserves further investigation than it could receive at Mexico City.

Merchant Banks and Canada

British merchant banks are showing a somewhat belated, but nonetheless welcome, awareness of the opportunities for participation in Canadian economic development. Last week, Baring Brothers and Morgan Grenfell and Co. announced that they were taking an interest in a Canadian finance house, Harris and Partners; they are associated in this venture with W. C. Harris and Co., of Toronto. This week Messrs N. M. Rothschild and Sons announced that they are arranging for a small group of British and Canadian technical experts to visit Newfoundland, to report on the possibility of substantial United Kingdom participation in the exploration and development of the natural resources of Newfoundland and Labrador. On his visit to Britain last month, the Prime Minister of Newfoundland had suggested to the Federation of British Industries that the investment of some £2 million by a British syndicate for prospecting in Newfoundland and Labrador would yield abundant rewards.

These two initiatives from London merchant banks, coming in quick succession, suggest that the United Kingdom exchange control may now be looking with a more benevolent eye on applications for conversion of sterling into Canadian dollars for investment in that Dominion. It is unlikely that any really substantial participation can be envisaged; this is the inevitable consequence not merely of the shortage of dollars but also of the shortage of real resources out of which Britain could ensure massive collaboration in Canadian or other overseas development. There is, therefore, probably little to be gained by the creation of new institutions (even with the ambitious name of Commonwealth Finance Corporation) or by exhortations to the City such as that made recently by Lord Bruce "to do its duty in the realm of Commonwealth development." But some bread cast upon the waters of Canada's boom should bring back a worthwhile return to the British economy.

German Losses to Brazil

German exporters have lately burned their fingers very badly in Brazil, and it is possible that their experience there may lead to a significant alteration of Germany's "easy credit" export policy. Under the German-Brazilian trade agreement, the Bank Deutscher Länder and the Banco do Brasil allowed certain definite credit limits to each other, and it was laid down that any balances accumulating in excess of

this "swing" should be settled wholly in dollars. Lately Brazil has run a heavy bilateral deficit with Germany, and, although German exporters were not acquainted with the fact, the Banco do Brasil's debt to the German central bank ran up well above the permitted sum—reputedly to \$70 million.

The news that Brazil could not, as agreed, settle the outstanding balance in dollars, created consternation in Germany. A German delegation went at once to Rio de Janeiro to find some way in which trade could continue. After its return, the Bank Deutscher Länder issued new regulations for imports and exports that have roused strong criticism from German exporters, some of whom are now faced with heavy losses on contracts. The new regulations take as a basis the fact that imports from Brazil are too expensive owing to the over-valuation of the Brazilian currency, while Brazilian traders are making large profits out of comparatively cheap imports from Germany. The German authorities have therefore ordered that payment demands made by the Banco do Brasil shall in future be settled by crediting the Brazilian bank in Brazilian currency, instead of in D-marks. German exporters who receive this Brazilian currency can sell it to German importers at a free exchange rate that has gone to a heavy discount. The importers in Germany can pay 80 per cent of the value of their imports from Brazil with the currency obtained at this free exchange rate, but the remaining 20 per cent must be bought at the official rate from the Bank Deutscher Länder. Moreover, the arrangements are partly retrospective. For contracts concluded before September 4th, the Bank Deutscher Länder will convert only 50 per cent of the total amount at the official rate, and the remaining 50 per cent must be sold at the free rate.

This retrospective measure means that German exporters are faced with heavy exchange losses—according to some reports, as much as \$10 million. As things stand at the moment, the insurance granted by the "Hermes" credit insurance company does not cover losses through measures taken internally by German authorities, and German exporters certainly seem justified in feeling that they were first encouraged to make a big export drive in Brazil, and then were not warned when that country's payments position passed the danger mark. It is not surprising that one of the big German commercial banks has publicly—and tartly—declared that the central bank's experiment with Brazil must not be made into a precedent for other countries that are involved in payments difficulties.

* * *

Rank Results Outlined

Although film exhibition in Britain is the major source of profits earned by the Rank Organisation, it has not been responsible for the advance in the consolidated trading profit of Odeon Theatres from £5.1 million to nearly £6.4 million in the year to June 28th. Gross profits from film exhibition in this country have in fact fallen, from £4,155,379 to £3,848,283, despite an increase in gross box-office receipts at Odeon and Gaumont British cinemas from £27,918,192 to £30,018,278. Admittedly £11,808,831 of this sum, against £10,527,761 in 1950-51, has been drained away in Entertainment's duty; but obviously the group has not been able to hold down costs, and particularly labour costs, as much as it might have wished. The decline in earnings from exhibition in Britain has been more than offset by an increase in the profits from film exhibition overseas and from the group's manufacturing and ancillary operations. Even so, the principal cause of the advance in trading profits is the substantial reduction in losses on film production and distribution from £1,182,099 to £25,094.

This continued recovery in the fortunes of the Odeon Theatres group, together with the receipt of a substantial surplus from the sale of the group's minority interest in Universal Pictures, has enabled the company to pay off two

years' arrears of dividend on its preference shares. These preference dividend payments, according to Mr Rank's statement, should be brought up to date this year, but the directors have no intention of paying an ordinary dividend until "the reserves of the group have been still further strengthened and the liquid position further improved." It is to the strengthening of the balance sheet of the Gaumont-British group that the increase in that company's equity dividend from 5 to 7½ per cent, despite a slightly smaller net surplus on the year's trading, can be ascribed.

The financial resource of Odeon Theatres have also been materially reinforced. Its revenue reserves have risen by £375,691 to £1,421,645, partly as a result of the ploughing back of profits and partly from the sale of the shareholding in Universal Pictures. At the same time, following the repayment of one loan and the switching of part of the group's holding of unsecured loans in British Optical and Precision Engineers to the Gaumont-British group, the loan capital of Odeon Theatres has been reduced from £18,644,718 to £16,733,443. The indebtedness of the group to the banks

ODEON THEATRES GROUP
Gross Operating Profits Years to end-June

	1949-50	1950-51	1951-52
Exhibition in Britain.....	3,487,613	4,155,379	3,848,283
Exhibition overseas.....	619,741	562,081	721,348
Manufacturing.....	432,954	974,365	1,213,643
Other activities.....	758,333	615,504	639,098
TOTAL.....	5,298,641	6,307,329	6,422,372
Less: Production and distribution losses.....	2,005,215	1,182,099	25,094
Trading profit.....	3,293,426	5,125,230	6,397,278

has also been reduced by a further £2,437,008, to £6,776,738; of this balance only £2,265,882 was owing at the end of June by companies concerned with film production and distribution. But Mr Rank added that in the future bank loans would not be reduced at the same rapid rate. This guarded statement, taken together with the slowing down of the rate of increase in trading profits, suggest that further progress in the Rank group can hardly be expected to continue at the pace of the last three years. Cinema attendances seem still to be falling, and whatever the hopes offered by the group's progress with the technique of large-screen television, growing competition from television in the home must be expected in coming years.

Surf on the Tideway

For some months the detergents market in this country had been waiting for Unilever's next move; and this week it came. A new all-purpose synthetic detergent called "Surf," which the company has been marketing in the United States for some time, was formally introduced to Britain in a speech from the chairman of Lever Brothers, made appropriately at a Thames-side ceremony. "Speeches apart, the detergent was this week made generally available to 30,000 grocers throughout an area stretching roughly from the Wash to the Isle of Wight that contains about a third of Britain's population. In this area some 6 million housewives simultaneously received a coupon enabling them to buy their first packet of "Surf" for about a third of the marked price.

This elaborate marketing operation has followed intensive "consumer research" on the product: Lever Brothers describe their tests, in which 6,000 housewives co-operated, as the largest ever undertaken in history for any household article. Part of the technique consists in "blank package" tests of the new detergent against existing soap and synthetic washing powders. In recent months Lever Brothers has

Who are the unusual men?

IN ALL CITIES, in nearly all states, there are men and women who stand apart from the herd. They are indifferently called the intelligentsia, highbrows, revolutionaries, reactionaries. What is meant is that they think.

To put in the hands of these unusual people a newspaper like the Manchester Guardian is to marry true minds. These lively-minded people have no hunger for huge type, for slick make-up, for whimsy, flimsy, the flamboyant or baroque. Their need is to know what of importance is happening in the world.

They respect good writing and good reporting. To them, as to the Manchester Guardian, facts are sacred.

To these fortunately not-so-few, the daily reading of the Manchester Guardian is a deep pleasure. Perhaps you will try the Manchester Guardian and find how it gradually endears itself to you.

If you have any difficulty in getting your Manchester Guardian regularly, please write to: The Manchester Guardian, Manchester.

22/PA/52

The fifth of the twelve Labours of Hercules was to cleanse the stables of King Augeus's 3,000 oxen; this he achieved by diverting the river Tiber through them.

The Nickel Organisation, too, uses water to perform a Herculean task. Each day 1800 tons of ore, crushed to powder and mixed with water, are carried by pipeline across 7½ miles of rugged country to the refinery at Copper Cliff, Ontario. A further 8,200 tons of waste are removed each day by the same means. This pipeline, mounted on trestles sometimes as much as 65 feet high, is the longest pipeline in the world for transporting mining concentrate. Such an installation is typical of a progressive policy designed to provide more and more nickel to meet the ever-increasing demands of industry.

THE MOND NICKEL COMPANY LIMITED

Sunderland House • Curzon Street • London • W1

devoted little publicity to its other domestic detergent, Wisk; and when the new detergent becomes generally available throughout the country, the company may decide that the older one should be withdrawn.

The domestic washing powder market in this country offers scope for a new detergent to establish itself in three ways; through some growth (even if temporary) of the total market, at the expense of soap powders, or at the expense of existing detergents. Though both Lever Brothers and the other heavyweight in the field, James Hedley and Sons of Newcastle, a subsidiary of the American company Proctor and Gamble, have this week been at pains to mention the growth of the market, there seems little doubt that the public expectation of a trial of strength between Surf and Hedley's general-purpose Tide will be fulfilled. Hedley's at present seem entrenched in command of the field; but the initial momentum that the combined resources of modern marketing technique can give a sufficiently attractive new product, in a field where most housewives are inveterate experimenters, must not be underestimated. This "coupon sales" technique in a limited area—which Hedley's employed with tremendous success in introducing Tide—has the virtue in terms of publicity of being elaborately "keyed"; the sales technicians can follow the success of their advertising and promotion schemes round by round. Both of the two main companies have much at stake in this lively and competitive period of expansion in detergents. Apart from the success of their powders against strictly competitive products, these manufacturers have to estimate the prospects of these synthetic products against their own soaps. Soap still probably holds 60 per cent of the market in Britain, though the detergents have surpassed it in the United States. This progressive transformation of the washing powder market must offer manufacturers of both types of product some of the most intricate calculations about policy that any industry has had to face in recent years.

Large Premium for London Wool

After some initial falls wool prices now seem to be standing up to the seasonal increase in supplies. At this week's London sales prices were only a little lower than at

Matters of Fact

Ever since its earliest days, over a century ago, *The Economist* has taken as its task, not merely to comment on the passing scene of events, but also to provide a permanent record of facts, both statistical and documentary.

This task is now performed in the *Records & Statistics Supplement to The Economist*. Week by week this supplement contains, in condensed form, the record of world events—industrial, commercial and financial. And the facts can be found quickly and easily by means of the cumulative index that appears in the first issue of alternate months.

Records & Statistics is obtainable by postal subscription only, at £2.10.0 a year: a combined subscription to it and *The Economist* costs £5.0.0 a year.

For a specimen copy please apply to:
Records & Statistics Department, The Economist, 22 Ryder Street, London, S.W.1.

the close of the July auctions: good merino wools fell on average by less than 5 per cent and other qualities dropped by some 7½ per cent. There were insufficient greasy crossbreds offered to establish a quotation. Most of the demand came from home mills whose stocks are in many cases insufficient to last until the new season's Dominion wool arrives. As the need for spot supplies is particularly keen this year, London prices are showing an unusually high premium of 10d. to 20d. a lb over those offered for equivalent grades in Australia. In London the home and continental spinner is able to buy for immediate delivery, whereas the wool he buys in Australia takes some three to four months to reach him.

On the other hand, because the Australian market is less influenced than London by temporary stock considerations, its prices offer a better guide to the trend of wool values. When selling began in Australia and South Africa during the first week of September there were some sharp falls in value for the finer grades of wool. At Brisbane a week ago merino prices recovered by 5 per cent and the improvement was fully maintained at Melbourne this week. There was keen competition for crossbred wools and prices advanced by 8 per cent at Melbourne between Monday and Tuesday. The firmness of prices is particularly striking in view of the large quantities scheduled to reach the market during the current fortnight. No less than 140,000 bales are being offered in Australia at sales in Melbourne, Sydney and Perth. Meanwhile in London 50,000 bales are being auctioned at the four sales extending over a similar period.

The outlook for wool prices this year remains generally firm. World output of raw wool is likely to be somewhat smaller than in the 1951/52 season and commercial stocks are at a low level in most countries. Even if consumption remains at about last year's level, there will be very little to spare for government and commercial stockpiling, but if the recent improvement in the textile trades continues consumption of wool may in fact rise. Crossbred wools may provide an exception. Good supplies are expected from New Zealand this year and the heavy stocks still held in South America continue to exert a depressing influence on the market. Only small quantities of Argentine wool have in fact been sold since the incentive of special exchange facilities was granted to growers in August: export licences are apparently causing the delay. The New Zealand selling season does not open until November and for the time being there is strong competition for crossbred supplies as little has been offered since the New Zealand sales ended in April.

Dichotomy in Distillers

The boom in the whisky trade continues but the boom in the industrial division of Distillers, Ltd., is now over; at the annual general meeting of the company this week, the chairman, Sir Henry Ross, warned shareholders that "the heavy recession" in this younger branch of the business "is bound to reveal itself in the results of the current year." The trading setback appears to have been particularly marked in the alcohol and plastics divisions. The Distillers group's own sales of resins and moulding powders have apparently been particularly curtailed, although its subsidiary, British Geon, Ltd., has not received quite so hard a knock owing to the ever-widening uses to which Geon polyvinyl chloride is being applied. There has clearly been considerable consumer resistance to the high price of molasses and consequently of alcohol and its derivatives. Distillers have been quick to apply the only remedy for this—a reduction in the price of industrial alcohol, in advance of any fall in the price of molasses. But this reduction has only been made possible by writing down large stocks of molasses and alcohol by drawing a considerable sum from reserves that had been specifically created for this purpose. This step may mark the turning point of the recession in the plastics

industry and in the other industries using industrial alcohol. A similar turning point is not, however, in sight for Distillers (Biochemicals), Ltd., the subsidiary engaged in the production of penicillin and streptomycin. Technical improvements by all major producers and the installation of new plants overseas have led to a startling increase in the rate of production of these drugs in the last few months. For the first time, world production of them now exceeds current demand.

Sir Henry does not make it clear in his address whether the slowing down of the group's capital development programme followed the recession in trade on the industrial side of the business, or whether it arose from such other causes as the high costs of equipment and the difficulty of finding the funds needed to finance development. Whatever the cause, the curtailment of the capital programme and the recession in trade is a hard blow to those investors who believed the issue of the convertible loan stock would usher in a period of massive development, buoyant profits and expanding dividends. A welcome light might be thrown on these prospects if Distillers issued financial accounts revealing the split between the industrial and the potable spirits divisions of its business.

Fawley's First Year

Since the Esso refinery at Fawley was opened twelve months ago, it has processed some 6 million tons of crude oil from the Middle East into a volume of refined products equal to about 30 per cent of the total oil consumption in Britain during the period. In fact, about 16 per cent of the refinery's output was exported, so that the Fawley share in the British oil trade in 1951-52 would be about a quarter; it is the largest single refining unit in the country, though the dispersed units of both main British groups exceed it in total capacity. During this first year Fawley turned out 1,750,000 tons of motor spirit, 300,000 tons of kerosene, and 3,500,000 tons of gas and fuel oils. During the coming year the throughput should exceed 6½ million tons; additional units are still under construction, including a polymerisation plant that is almost ready and a sulphur recovery plant due for completion next June, but all the major units should come into operation by September, 1953.

By that time Fawley will have cost about £37½ million. Its output in the past year was valued at £60 million, plus about £75 million in taxation on the motor spirit and diesel oil it produced. After deducting the dollar component in the cost of the imported crude oil from the value of the refined products produced—assuming all of these would have been purchased from dollar sources—Esso puts Fawley's "dollar saving" at \$80 million, and expects this to reach \$100 million during 1953.

Esso has so far produced about 100 million gallons, or 325,000 tons, of motor spirit from its catalytic cracking unit at Fawley, the first to come into operation in this country. In common with the other oil groups, it is anxious to sell the high grade motor spirit such units produce to the motorist in Britain, instead of blending it with lower octane fuels to bring it down to "pool" standard. During the last fortnight the companies' arguments received perhaps unexpected support in the Ridley Committee's report; on the grounds of making the best use of available fuel, the case for higher-octane spirit is unshakeable. This week hints from official sources suggested that the Government might be relenting, and that the companies might hope for their "premier petrol" in the spring. The resumption of sales of higher-grade motor spirit would bring a real meaning back into the brand names on the pump. It would therefore enable the companies to enter upon the elaborate sales promotion campaigns for which they have been preparing their dealers with the "tied garage" agreements, to sell only one, or a given range of, motor spirit.

Ministry and Metals

The metal market is preparing for the resumption of private trading in lead on October 1st. The Ministry of Materials announced at the end of last week that it does not intend to release more than a relatively small tonnage of lead for sale during the early months of the operation of the London Metal Exchange, but it appears to be satisfied that this tonnage will be adequate to meet the requirements of consumers. Given the facts of high Government stocks and a lower continental price than the prevailing Ministry price for lead, the tone of the announcement was hardly surprising. During the twelve months to last August, stocks in consumers' hands fell steadily, while Government stocks increased. At the end of July they were estimated by the Bureau of Non Ferrous Metals at about 102,600 tons, compared with about 12,700 tons in July, 1951.

The market, meanwhile, is wondering whether the Government will lower its present selling price of £131 per ton towards the continental price of about £115, but so far there is no indication that there will be any change before October 1st. The Ministry of Materials has appointed a well-known broker to act for it on the Metal Exchange. The Bank of England will make foreign exchange available for the purchase of lead to dealers approved by the committee of the London Metal Exchange on the lines of the tin and rubber arrangements.

This week the Ministry of Materials raised its selling price for zinc from £122 a ton to £126 a ton following a corresponding increase in the American smelter price from 14 cents to 14½ cents a lb. American consumption of zinc, which had fallen sharply during the steel strike, recovered in August. But as there was little reduction in commercial stocks—they remained at about 97,000 tons—the increase in price seems to have been a little premature. Moreover, it contrasts sharply with the experience of the continental free markets where prices have recently eased to about £105

THE GLASGOW SCHOOL OF MANAGEMENT STUDIES

ROYAL TECHNICAL COLLEGE GLASGOW

and GLASGOW and WEST of SCOTLAND COMMERCIAL COLLEGE

SESSION 1952-53

The school will offer the following full-time courses of one session's duration:—

- Course in Personnel Management.
- Course in Works Management.
- Course in Business Administration.

The following courses will also be available:—

- Course in Management and Labour Relations (Nine Weeks, Full-Time).
- Industrial Relations Course (Four Weeks, Full-Time).
- Part-Time (Day Release) Course for Business Executives.

For commencing dates and full details see special pamphlet, "EDUCATION FOR MANAGEMENT," obtainable on application from either of the following addresses:—

THE ROYAL TECHNICAL
COLLEGE,
GEORGE STREET,
GLASGOW, C.1.

THE GLASGOW AND WEST OF SCOTLAND
COMMERCIAL COLLEGE,
PITT STREET,
GLASGOW, C.2.

to £110 a ton for refined zinc. Consumption of zinc in the United Kingdom is believed to have increased slightly during the last few weeks, but this may be merely a seasonal movement after the holidays.

Freights at Low Ebb

There is a certain amount of confidence among tramp shipowners that the Chamber of Shipping tramp freight index for August represents the low water mark of 1952. The month's fall to 79.2 was rather sharper than most shipowners expected, but the index is still slightly higher than it was when the tide went right out in July, 1950. At that time ships were being laid up, and the same thing has been happening in the last month or so, although many more are being broken up altogether. Then the flood tide came in with great rapidity, under the influence of the Korean moon. This time there is no such exceptional phenomenon to exert an influence on freight rates, and today the shipowners are basing their hopes on more normal economic influences.

The steep dive of rates in the last six months or so has served to "precipitate out" some of the less efficient tonnage (not excluding the 500-odd ships that the American Government had unsealed from its reserve fleet). Charterers have not been slow to take advantage of the situation, but, once more they seem to be having to compete with one another for vessels in certain trades. The Ministry of Food charterers, for example, have been refusing to fix vessels at 75s. for grain from the north Pacific coast; but German charterers have been taking vessels at some 10s. more, and lumber and general cargo charterers are also looking for ships in the same area.

Here and there shipowners are becoming less willing to accept low rates, with some effect. As it happens, most of the hardening of rates that has begun in the last few weeks has been in dollar fixtures, so that the Chamber of Shipping index, which takes into account only fixtures in

sterling, may have over-accentuated the general movement of freight rates in August. Meanwhile, the lower level of sterling rates has been somewhat offset by slightly lower bunker prices and improved turnaround in many ports. These are factors that benefit the earning power of the more efficient ships, the owners of which have not yet had seriously to consider the possible advantages of laying up.

"Switch" Sterling and Scandinavia

The British Exchange Control authorities, acting within their discretionary administrative powers, have recently curtailed the freedom with which sterling securities and "switch" sterling can be transferred from "non-residents" outside to those within the Scandinavian countries. No official reason for this decision has been given but it seems probable that it is due to a recent expansion in the volume of sales of sterling securities by Scandinavian holders who, under the Uniscan agreement, are entitled to repatriate the proceeds of these sales to their own countries. Until recently such sales and repatriations had been kept down to modest proportions, but within the last few weeks it became evident that switch sterling and sterling securities were being transferred to Scandinavian accounts for the purpose of sale in London and repatriation of the proceeds. The result was an undesirable addition to the volume of cheap sterling deals and a general frustration of the spirit of the Uniscan agreement. In the normal course the British Exchange Control sanctions transfers of security sterling and of sterling securities between non-residents, provided these do not convert a commitment to transfer interest in soft currencies into a commitment to make interest payments in hard currencies. This continues to be the procedure, but Scandinavian countries will be excluded from its provisions. Meanwhile, the right of genuine existing Uniscan holders of sterling securities to sell them in London and repatriate the proceeds remains unimpaired.

Company Notes

Great Universal Stores.—In the year to March 31st Great Universal Stores was able to record yet another advance in group trading profits, by £1,846,405 to £10,007,555, enabling the directors to raise the ordinary dividend from 40 to 50 per cent. Over half of this increase in profits—in fact £930,292 of it—represented profits earned by recently acquired subsidiaries; but, even so, the achievement was a remarkable one in a year of almost general recession in the retail trades. In contrast to some other retail groups, GUS increased its sales in Britain by 15 per cent and in South Africa by 24 per cent. In Canada, however, its sales fell by 4 per cent; this reduction followed on restrictions on consumer credit, and since the lifting of these restrictions last May sales in Canada have again increased. In the consolidated balance sheet the book value of hire purchase debtors, before deducting provisions for unearned interest and collection charges, has risen from £28,386,636 to £31,390,165. Mr Isaac Wolfson, the chairman, attributes this increase to "the normal course of trade and the consolidation of shops acquired or opened during the year," but the figures certainly suggest that—outside Canada—the hire purchase business was buoyant last year.

The group has been able to finance this increase in its business and at the same time to supplement its liquid resources; cash balances have risen from £3,168,707 to

£4,140,888, while bank overdrafts and loans have been reduced from £8,687,403 to £7,498,555. Mr Wolfson describes the stocks held by the group, valued in the balance sheet at £16,528,803, as being "extremely low," and outstanding commitments for supplies of merchandise show a substantial reduction.

5s. ordinary stock at 15s. 6d. yields 8 1s. per cent.

The rate of stockturn is improving and sales in the first months of the current financial year are in excess of those secured in the corresponding period of 1950-51. But Mr Wolfson adds the warning that "difficult conditions may continue for some time and it would be unwise to make any forecast as to future results."

Watney Combe Reid.—The statistics of beer production in the first seven months of this year suggest that the long decline in beer consumption has been checked. But in his statement accompanying the full accounts of Watney Combe Reid, Mr S. H. Combe strikes a sober, indeed almost pessimistic, note. He doubts whether a point has yet been reached in the South of England "where no further decline is likely." The consumption of beer may be increasing in the North of England, but many brewers are still feeling the pinch of falling sales in the London area, where their trade suffers with each shift in the population towards the new towns and housing estates. The brewers cannot readily counter this decline in trade in London by building licensed premises in these new centres of population; building costs are high and sites for licensed premises and building permits are difficult to obtain. Exports are also suffering as a result of these restrictions. Without a permit the Watney group cannot adapt a factory to the needs of the export trade, so that "in spite of inquiries for considerable quantities of beer, the company is not in a position to quote, let alone promise, delivery in a reasonable period of time." Meanwhile, costs have been rising so rapidly that "any benefit derived from the increase in the price of beer to the public last year has long since disappeared." As some protection against the difficulties still being experienced by the brewing industry, the

Watney group has acquired a half interest in the manufacture of Coca-Cola in this country; but Mr Combe points out that "some years must elapse before any great benefit can accrue to the company from this new venture."

£1 deferred ordinary stock at 55s. 6d. yields 6 3s. per cent.

Preoccupied with these problems Mr Combe appears to draw little comfort from the growth in business and in trading profits—from £1.5 to £1.7 million—achieved by the group in the year to June 30th last. The advance in profits seems to have sprung mainly from a further increase in the sales of bottled beers, but some new British markets have apparently been opened up for the sale of Watney's draught beers as well. Presumably the group has been able to make further arrangements with other brewers to sell its beers in their tied houses. Competition among the larger brewers to secure these new outlets seems, however, to be growing keener—as is competition in the bottled beer trade. The odds, therefore, appear to be weighted against any increase in equity dividends by Watney or other London brewers. It is, perhaps, on the smaller breweries trading in the North of England that investors' main hopes for dividend increases should be pinned.

Davy and United.—Gross profits earned by the Davy and United group fell from £675,179 to £584,455 in the year to March 31st, but this was almost entirely due to the fact that the number of major contracts maturing in that year was less than in 1950-51. The directors attribute the increase in the net book value of stocks and work in progress, from £895,437 to £1,293,702, to the fact that deliveries of completed major contracts were lower than last year, and there have been substantial increases in materials and other costs. The gross book value of stocks and work in progress actually increased from £2,332,522 to £3,148,579, but payments in advance and on account also increased, from £1,437,085 to £1,854,877. These figures suggest that the number of completed contracts may increase once more this year, bringing a corresponding benefit to profits.

£1 ordinary stock at 34s. 4d. yields 15 16s. per cent.

In his statement to shareholders, however, Mr D. F. Campbell makes it clear that though the group's order book is still "very large," the nature of these orders is changing. The British steel industry is now concentrating its capital expenditure on coke ovens and blast

furnaces; no major rolling mill installations—the manufacture of which is the heart of Davy and United's business—have been ordered by the British industry for more than two years. The new programme to increase British steel production should eventually lead to new orders for rolling mill equipment, but in the meanwhile the Davy group must depend upon foreign orders, which have to be secured in the face of keen competition from overseas manufacturers. If the Davy group—and the engineering industry generally—is to continue to secure contracts from foreign buyers, Mr Campbell insists that two conditions must be fulfilled. One is that firms should be allowed to plough back sufficient profits to keep their plant up to date; this would mean that the taxation authorities and the accounting profession would have to adopt a different basis for computing depreciation allowances. The other is that there must be a period of reasonable stability in costs; in securing this the chief responsibility rests with the engineering unions.

International Tea.—In common with many other enterprises, International Tea experienced a sharp increase in its sales and an even sharper increase in its costs in the year to May 3rd. Although sales in all sections of its business reached a new record level in the first six months of its financial year and were well maintained thereafter, profits earned by the group fell from £1,817,917 to £1,695,497. This decline was due to a reduction in profit margins on high tonnage lines and to increases in wages and other costs. The increase in sales offset the increase in costs in the first half of the financial year, but in the following six months further increases in expenses began to eat into profits. In the year as a whole, therefore, group net profits were reduced from £652,653 to £592,189, a figure which the chairman, Mr Frank Wilson, considers is "inadequate in present conditions to finance the increased cost of stocks or to permit reasonable and necessary development." The directors therefore insist that as much as possible should be ploughed back into the business; and for some time to come shareholders will presumably have to remain content with an ordinary dividend of 16 per cent—and even this rate might be in danger if profits were again reduced.

5s. ordinary share at 12s. 6d. yields 8 8s. per cent.

The increase in stocks (by £1 million to nearly £7.5 million) has imposed a considerable strain on the group's liquid resources. In order to finance this increase, £300,000 of tax reserve certificates has been used up, the group's cash balances have been run down from £399,300 to £296,308, and £208,648 has been borrowed from the banks. As the increase in the book value of stocks is due in the main not to increased quantities but to higher prices, it is not surprising that the chairman warns shareholders that retained profits will be insufficient for the company's needs if the upward trend in prices continues. There is a clear need for fresh capital but this might be difficult to obtain at a time when a further fall in profits could put the equity dividend in danger.

Statistical Summary

EXCHEQUER RETURNS

For the week ended September 13, 1952, total ordinary revenue was £48,748,000, against ordinary expenditure of £79,168,000, and issues to sinking funds £770,000. Thus including sinking fund allocations of £16,055,000 the deficit accrued since April 1, 1952, was £297,994,000 compared with a deficit of £8,970,000 for the corresponding period of the previous year.

COMPANY MEETINGS

THE DISTILLERS COMPANY, LIMITED

RESULTS AN ALL-TIME RECORD

REPUTATION OF COMPANY'S BRANDS STRENGTHENED

SIR HENRY J. ROSS ON FUTURE PROSPECTS

The seventy-fifth annual general meeting of the company was held in the North British Station Hotel, Edinburgh, on Friday, September 12, 1952, when the chairman, Sir Henry J. Ross, presided.

The following is an excerpt from the chairman's speech:

I am sure you will agree that it is a matter for congratulation that the results of the past year's working constitute an all-time record in the annals of the company. The manufacturing and trading profits of the company and its subsidiaries for the year to March 31, 1952, reached £21,265,450. Adding to this the income from investments, the total revenue for the year was £21,729,345, an increase of about £3,300,000 over the previous year. From this had to be deducted the necessary provisions for depreciation, etc., the charge for interest on debentures and loan stocks and the interest of outside shareholders, leaving £18,918,909. The charge for United Kingdom taxation, covering Income Tax, Profits Tax and Excess Profits Levy, came to nearly £11,750,000, leaving £7,170,450 as the net profit attributable to the group. It should be emphasised at once that of the increase of £3,300,000 in revenue, only a little over £300,000 remained as net profit although the charge for Excess Profits Levy was for a three month period only, being based on the profits for the three months from January 1st to March 31, 1952. This was in effect a smaller figure than would have been required if it had been based on one quarter of the profits for the year.

Adding the balances brought forward at the start of the year, there was available £13,615,615. The directors agreed to transfer to general revenue reserves £1,679,824 and to stock contingencies reserves £1,561,274, while it was considered desirable to write down certain investments by £238,252. The dividends paid or proposed to be paid absorb £2,737,716, leaving to be carried forward the substantial sum of nearly £7,400,000, an increase of about £950,000.

It will be seen that, of available net profits for the year under review, the amount of £4,194,482 was "ploughed back" into the company.

The board views with great concern and anxiety the demands for taxation made on companies generally at the present time. In your company in particular, because of the large expansion programme undertaken, and to a large extent carried through over the past few years, and the consequent reward now coming to the company by way of profits, we have to face charges for considerable amounts by way of Excess Profits Levy, in addition to income tax and profits tax. To "plough back" over £4 million in a year is reasonably satisfactory, but by no means excessive, having regard to the total requirements of the Group mainly for future developments and the building up of whisky stocks.

SUCCESS OF NEW ISSUE

Heavy taxation and the increased cost of stock replacements led to the board making

an approach to the Capital Issues Committee of the Treasury with a view to borrowing a further £10 million. The necessary permission was granted. After close consideration they decided to issue at par on May 13, 1952, £10 million 5 per cent unsecured loan stock redeemable in 1964 but convertible into ordinary stock units between 1952-57. The issue was heavily over-subscribed, and in making the allotment the board had regard to the preferential claims of the stockholders and of the staffs, only a small percentage going to non-stockholders. It is hoped that a large majority of holders of this unsecured loan stock will avail themselves of the opportunity to convert their holdings into ordinary shares at some time before this right is lost in the year 1957.

In view of present market conditions and the fact that the Group held at March 31, 1952, large stocks of raw and other materials which were valued at the lower of cost or market, the board considered that when these stocks were used the values put on them might well prove to be inflated, and it decided to add generously to the stock contingencies reserves held within the companies. After deducting the proportion applicable to outside stockholders the aggregate of these reserves available to the Group amounted to a little over £2 million at March 31, 1952. If the general level of prices should fall and these reserves were applied, the values of the stocks of materials held would, in the opinion of the board, be in the inventories at safe and satisfactory figures.

SCOTCH WHISKY SALES—HOME AND EXPORT

Once more I have to report that our sales policy, both at home and abroad, has been governed by considerations of national interest and will so continue until we attain a stock position capable of meeting all demands. As already mentioned, our stocks of maturing whiskies have been substantially augmented during the year under review, but a return to conditions of free supply consistent with maintenance of our high standard of quality and age is not yet possible.

The board is determined to continue the policy of supplying a quality article at a reasonable price. Although it might well have been possible at times in the recent past to obtain higher prices for our whisky brands, we are satisfied that to have taken advantage of the temporary conditions would not have been in the long term interest of the industry. In like manner, the successful efforts made to maintain the well-established quality of our brands have strengthened the reputation we have held for many years throughout the markets of the world.

During the year, considerable publicity has been given to the existence of a traffic in immature whisky which has been shipped in substantial quantities from this country to certain export markets where no restriction as to age is in operation. I can only repeat here the views which I have expressed at various trade meetings and in discussion with government departments, namely that this traffic is detrimental to the goodwill and high reputation which has been built up for Scotch whisky over a long period of years.

It is our considered opinion that the export from this country of immature whisky is diametrically opposed to both trade and national interests and this opinion I know is fully endorsed by the vast majority of the trade. I profoundly hope that in the national interests and in the interests of the good name of Scotch whisky, the responsible government department will shortly decide to impose a complete embargo on exports of immature whisky.

Following the pattern of previous years and in accordance with the dictates of our national economy, the dollar markets have again received prior consideration. Because of this and the continued shortage of whiskies of our prescribed standard of age and quality, many other important markets have perforce had to go short of supplies.

We are still experiencing obstacles and difficulties in connection with our general export trade. One of our more important markets — Australia — recently imposed a drastic cut of 80 per cent on importations of Scotch whisky, followed shortly afterwards by New Zealand with a cut of 20 per cent. On the other hand, it is satisfactory to report that the position as regards South Africa has shown a marked improvement and import licences issued for 1952 have been substantially higher than in 1951.

GIN

Our sales for the year showed a reduction compared with the previous 12 months. This was due to abnormally heavy pre-Budget buying at home in the first three months of 1951.

In the United States also our gin sales showed a slight recession due to the fact that the previous year included the commencement of the war in Korea, followed by heavy stock-piling at all levels of the trade.

Nevertheless, results were most satisfactory and consumer acceptance of our proprietary

wide demand to which I referred at our last meeting. Towards the end of the year, however, a sharp recession developed in the industries we serve and this still continues. A large contributory factor to this sudden change in the state of trade is undoubtedly the heavy liquidation of stocks and at present there is no clear indication when normal buying will be resumed.

Supplies of molasses remained costly throughout the period, with resulting high prices for alcohol and its derivatives. There is no doubt that these high prices have acted as an aggravating factor in the present recession. Indications are that supplies of molasses are becoming very much easier and a fall in price is anticipated shortly. It is our intention to apply the reserve created for this purpose in writing down the cost of our stocks, in order to reduce selling prices at the earliest possible opportunity.

The Plant of British Petroleum Chemicals Limited at Grangemouth, in which we hold an equal share with the Anglo-Iranian Oil Company Limited, has, after some teething troubles, produced a steady output of industrial alcohol. Had this source not been available, the supply position would have been even more difficult and the price yet higher.

The supply of isopropyl alcohol from Grangemouth, together with the new capacity of other companies in the United Kingdom and some reduction in demand, has completely eliminated the shortage of acetone, which is now in very free supply.

In common with most construction programmes, there has been some delay in completing the styrene plant of Forth Chemicals Limited at Grangemouth, but it is still hoped to start commissioning this by the end of the year.

RECORD SALES OF PENICILLIN AND STREPTOMYCIN

The Distillers Company (Biochemicals) Limited at Speke enjoyed a record year in the sale of penicillin and streptomycin. Technical improvements of a very marked character, and common to all major producers have, however, brought about a startling increase in the rate of production in this industry during the last few months. In addition, new plants in Europe and elsewhere have come into operation, and for the first time since penicillin was discovered in this country, world production exceeds the current actual demand. Our own technical progress has been maintained and we believe that the efficiency and scope of our operations will assist us greatly in meeting the intensive competition—particularly in export markets—which has been in evidence during recent months.

New discoveries, variations in the trend of medical thought and other imponderable factors all combine to make the production of antibiotics a very exacting business in which the capital investments are also substantial. In this young industry, our policy has been to "plough back" most of our profits and, by keeping abreast of the latest developments and diversifying our activities, we believe we are creating a solid foundation for our future developments in this field.

PLASTICS

With regard to our Plastics Group, the shortage of critical raw materials, to which I referred last year, showed signs of improvement towards the end of 1951, and this has continued to date. Unfortunately, however, the recession to which I have already made general reference has been very severe in most branches of the plastics industry, and in the current year our sales of resins and moulding powders have suffered accordingly. The trading operations of British Geon Limited did not

decline to the same extent. This can be explained by the ever-widening uses to which Geon polyvinyl chloride is being applied.

MAGNESIUM METAL INTERESTS

Our magnesium metal interests have made notable progress during the period under review. Last year I referred to the introduction by Magnesium Elektron Limited of special new alloys developed by that company to meet the requirements of jet engine producers. With the continued progress of design, the demands of the engineering industry for light alloys with still further improved properties and able to withstand ever higher temperatures, has again been met by the development and introduction of new alloys of magnesium containing zirconium and thorium. Further licences have been granted to magnesium fabricating companies overseas.

The programme of capital expenditure in the United Kingdom in improved methods and new industrial products, which we have steadily pursued since the end of the war, has had to be curtailed, although I hope this is temporary. I should again emphasise—and it cannot be repeated too often—that the cost of new equipment, together with the excessive rate of taxation on profits, make it increasingly difficult to provide funds out of our resources for such investments. Reductions in capital investment for production which would contribute to the national economy can only in the long run adversely affect the competitive position and trade of our country. It is imperative that the Government should take early action to improve this position.

FUTURE PROSPECTS

From what I have already said, stockholders will appreciate that, although we are reviewing a financial year which has been outstandingly successful we have since entered upon a phase which in certain respects is less favourable.

So far, the Potable branch of the Company's business does not show any material change, and I see no reason to doubt that it will—in the main—so continue. Our industrial group, however, has reflected sharply the prevailing economic conditions in the United Kingdom, and, although a general improvement is looked for in the near future, the heavy recession which has taken place is bound to reveal itself in the results of the current year.

The company is built on solid lines and has strong reserves, and having regard to our great variety of interests it is reasonable to assume that, with our risks thus spread, we can at least look forward to producing results which will be satisfactory to our stockholders.

The report was adopted.

Economic Intelligence

The Economist Intelligence Unit provides a means whereby the specialist knowledge of *The Economist*, its research facilities and its sources of information, both at home and overseas, can be directed to the particular requirements of business firms and other organisations. The Unit can supply information and prepare reports on a wide range of subjects. In suitable cases, it can provide authoritative opinions on specific problems.

22 Ryder Street, St. James's, London, S.W.1

CONSOLIDATED TIN SMELTERS, LIMITED

BENEFITS OF AMERICAN AGREEMENT

The twenty-third annual general meeting of this company was held on September 11th in London, Mr Ernest V. Pearce, AMIMM, the chairman, presiding.

The following is an extract from his circulated statement:

The net revenue of the parent company for the year ended March 31, 1952, is £286,626, compared with £309,125 for the year to March 31, 1951. Your directors have decided to recommend for approval a dividend of 2s. 6d., less income tax, on the Ordinary stock.

The burden of taxation will be evident from the figures, which show that from a net profit of £1,311,492 income tax, profits tax and excess profits levy take no less than £847,873. The imposition of excess profits levy is a further burden with which industry is faced in this country. It can in general only result in destroying incentive at a time when enterprise, initiative and maximum production are of vital importance to the country.

World production of tin in concentrates for the calendar year 1951, as disclosed by the Statistical Bulletin of the International Tin Study Group, totalled 164,500 tons, compared with 166,500 tons in 1950. Of the countries from which we draw the major part of our supplies for smelting, Bolivia and Nigeria registered small increases in their production, while both Malaya and Thailand showed a decrease. The aggregate tonnage of concentrates treated in our works during the year under review was approximately 9 per cent less than that treated in the preceding year.

World consumption of tin, according to the Statistical Bulletin, is shown at 136,000 tons for the calendar year 1951 against 147,000 tons for 1950, a decrease of 11,000 tons. The same source shows the USA consumption to have declined by approximately 15,000 tons, from 71,774 tons in 1950 to 56,542 tons in 1951.

ADVANTAGE TO PRODUCERS

While the United States of America refrained from purchasing tin on the Singapore market during the period under review, it is pleasing to record the arrangement for mutual assistance in the supply of steel, aluminium and tin which was made between the Prime Minister and President Truman when Mr Churchill visited Washington in January, 1952.

I think it can be fairly stated that this arrangement has been beneficial, not only to the United States of America and the United Kingdom in supplying them with the commodities of which they were in great need, but also to the tin producers of the world in establishing what was in effect a guaranteed floor price during some part of the term of the agreement.

At the time this statement is being written there is as yet no indication of when normal trading in tin in the United States of America is likely to be resumed. Various statements have been made, mainly in the technical Press, to the effect that dealings in tin by the New York importers may be resumed in August, but other reports tend to place the date later in the year.

Recent reports from Malaya are much more encouraging. The number of casualties inflicted on the terrorists and the fact that voluntary surrenders are becoming more numerous and frequent show that progress is being made.

The report was adopted.

LONDON & OVERSEAS FREIGHTERS

CHANGES IN INTERNATIONAL TRADING CONDITIONS

HIGH REPUTATION OF TANKER FLEET

MR B. M. MAVROLEON'S CONFIDENCE IN THE FUTURE

The fourth annual general meeting of London & Overseas Freighters, Limited, was held on September 15th at The Baltic Exchange, St. Mary Axe, London, E.C.

Mr Basil M. Mavroleon, chairman and managing director, presided.

The secretary, Mr Stanley Sedgwick, ACA, read the notice convening the meeting and the report of the auditors.

The following is the chairman's review which had been circulated with the report and accounts for the year ended March 31, 1952, and which was taken as read:

In the course of my review accompanying last year's accounts I referred to the boom conditions in the tramp shipping industry which existed at the time. It is common knowledge that shipping freights commenced to fall early this year and that today the position has deteriorated to such an extent that many tramp owners are laying up tonnage rather than operate at a loss. The changes in international trading conditions which have brought about this state of affairs have come at a time when the operations of your company are undergoing a switch of emphasis from dry-cargo ships to tankers as the building programme materialises. The prevalence of long-term time-chartering in the tanker field, as opposed to the customary "day to day" trading of dry-cargo ships, smoothes out the effects of what may be termed relatively short-term fluctuations in market conditions. It is the policy of your board, at any rate during the early years of building up a fleet, generally to secure employment for the company's tankers on a long-term basis in advance of availability.

SUMMARY OF TRADING RESULTS

At this stage I feel it will be helpful to give some figures relating to the trading of your fleet during the last two financial years and at the present time. The position is summarised at the bottom of the page.

The results of the current financial year ending on March 31st next will, in the absence of unforeseen circumstances, reflect the results of the trading of the two dry-cargo ships and the four tankers referred to above for a full year, together with that of three further tankers totalling 48,750 d.w.t. which have come into operation during the last four months. As I informed you last year, these tankers are all fixed for several years and you will not be surprised, there-

fore, that I look forward to the future with the utmost confidence in the prospects of your company.

THE YEAR'S TRANSACTIONS

I turn now to the transactions which have, during the year under review, played their part in the building up of a capital reserve in excess of one-half of the issued share capital of your company. I mentioned in my review last year that contracts had been entered into for the sale of the three remaining tramp steamers, thus reducing the company's dry-cargo tonnage to two 10-year-old 10,000 d.w.t. motor ships. In addition to the above sales and the s.s. *Mill Hill*, to which I also referred last year, the company purchased and, after a short period of trading, sold another dry-cargo ship, the s.s. *Bisham Hill*. The sales of these five vessels realised a surplus of £881,259 over the values at which they stood in the company's books, of which sum £109,175, representing the depreciation written off to the date of sale, has been credited to profit and loss account. The balance of £772,084, being realised capital appreciation, has been added to capital reserve. The latter has been further augmented by the sum of £110,871 in respect of the excess of the liquidator's distributions to date over the book value of the company's holding of 5,993 ordinary shares of £1 each in *Mill Hill Steamship Company, Limited*. The cash which flowed from these transactions has been applied towards the cost of new ships under construction.

Four tankers were in service at the balance-sheet date and three more, the *London Majesty*, *London Endurance* and *London Spirit*, having a total carrying capacity of 48,750 d.w.t., have come into operation since. Thus the company's tanker fleet now comprises seven ships totalling almost 115,000 d.w.t. A further tanker, the first of the 24,750 d.w.t. class, is to be launched next month, and it is probable that the accounts for the current financial year will include the earnings of this vessel for two or three months. The keel has been laid for another 18,100 d.w.t. tanker due for delivery in the middle of 1953. The shortage of steel which exists at the present time is unlikely to delay the delivery of our first big tanker, but, unless some unforeseen improvement takes place in the supply position in the very near future, it is difficult to see how the shipbuilding industry in general can recover the time now

being lost. Consequently, it would be unwise to rely upon our own building programme being fulfilled exactly on schedule.

No additional vessels have been ordered during the year under review, but your directors, having regard to the prevailing trading conditions and to the relatively high cost of construction of dry-cargo tonnage, have ordered an additional 24,750 d.w.t. steam-turbine tanker in place of the 10,000 d.w.t. dry-cargo vessel which was already on order. The tanker is for later delivery than was visualised in the case of the dry-cargo ship, thus the additional actual cost will not upset your board's plans for financing the building programme.

The sum of £55,000 is charged in the accounts in respect of the estimated profits tax liability for the period, and you will observe that the sum of £350,000 has been set aside out of the accumulated surplus to tax equalisation reserve. In so far as your company is concerned, the incidence of initial allowances on new buildings very much reduces the liability to taxation during the year under review and during the next few years. This arrangement is of considerable assistance to the company at a time when every penny is needed to finance the construction of new ships, but is by no means a free gift or a remission of tax.

The board, adhering to the dividend policy declared at the time the company secured a Stock Exchange quotation, recommends the payment of a dividend of 5 per cent (less tax) for the year ending March 31, 1952, and reaffirms its intention to limit dividend payments on the shares of the company to that rate for the two succeeding years.

WORLD-WIDE REPUTATION

The company's fleet of tankers is establishing for itself a world-wide reputation and widespread interest is expressed in their appearance, efficiency, and accommodation. In return for adequate remuneration, generous conditions of employment, and excellent prospects, we demand efficiency and loyalty from our masters, officers, and crews. We aim to build up a staff comprising the best type of men in the Merchant Service and to retain their services throughout their working lives. During the year we have initiated a scheme in conjunction with a life assurance company whereby officers, at no cost to themselves, are assured a pension on retirement, commensurate with their years of service and salary grades, in addition to anything to which they are entitled from the Merchant Navy Officers' Pension Fund or from previous employers. The scheme also provides for the payment of a lump sum in the event of death.

To the men who sail our ships and to those who direct their movements I express my appreciation of their efforts in the past year and I am sure that you will all join me in these sentiments and in the wish for the continued goodwill, co-operation, and well-being of all concerned.

The report and accounts were unanimously adopted and the dividend, as recommended, was approved.

The retiring directors, Mr J. E. G. Kulukundis and Mr A. E. Hodgkins, MC, were re-elected, and the directors having been authorised to fix the remuneration of the auditors, Messrs Moore, Stephens and Co., the proceedings terminated.

YEAR ENDED MARCH 31, 1951		YEAR ENDED MARCH 31, 1952

PYE LIMITED

TELEVISION NO LONGER A LUXURY

The twenty-third annual general meeting of Pye Limited was held on September 17th in London.

Mr C. O. Stanley, CBE (the chairman), in the course of his speech, said: Our turnover expanded considerably during the year and although our profits were increased from £541,000 to £611,000, the amount left after taxation was less by £21,000.

Immediately following the close of our financial year we suffered a recession in the home market, and this has been publicised in the press. I am glad to tell you that we are more than satisfied that we have made adequate provision for any obsolete or non-current stock which we held on March 31, 1952. The recession that was so clearly existing in the domestic market after the close of the accounts has, I am glad to say, lifted to some degree.

In the export market I sometimes wonder if the Government realises the very determined attack which Western Germany and other European countries are making on the export radio market. There is possibly no other market that is attracting as much attention from German salesmen at this moment as the British radio export trade. In one country where we have a substantial trading position there are 110 importers—two of these are American, two British, one Swedish and the balance German. As well as this, it appears to be completely forgotten that we can only maintain our export trade in radio and television if we have a stable market at home.

PURCHASE TAX AND WAGES

The incidence of the restriction of hire purchase and the continuance of the 66½ per cent purchase tax are not only crippling the market, but creating the worst possible state of instability. The United States, Canada and Australia learned by experience that extreme hire purchase restriction was fatal and consequently changed their policy, but we in this country have failed to profit by their example.

Television is no longer a luxury; it has become essential and is one of the highest priorities in popularity for the working man. This country is trying desperately to keep wages down in order that we can maintain our export markets, and, as television is essential, would it not be better to sell sets at a more reasonable price without the crippling burden of purchase tax?

We have, either in partnership with others or on our own responsibility, established important companies during the last few years in Australia, New Zealand, Ireland and Canada. It costs a lot of money to go into a new country, start from scratch and build a business. We feel that this is one of the ways in which England can earn money to pay for its food imports but we have been limited in our efforts by the resources we have had available. We have been told so many times by our politicians that the development of industry in Commonwealth countries must be left to other nationalities. However much we have felt that this was completely wrong, we had to accept.

Your directors have now decided to apply to the Capital Issues Committee for permission to raise approximately £300,000 in the form of a rights issue of deferred ordinary shares to our existing deferred ordinary shareholders.

The report was unanimously adopted.

MUREX LIMITED

CONTINUED PROGRESS

CAPITAL INCREASE FORESHADOWED

The thirty-third annual general meeting of Murex Limited was held on September 17th in London, Mr George P. Joseph, the chairman, presiding.

The following is an extract from his circulated statement:

The substantial increase in the value of sales for the year is attributable, in general, to higher selling prices necessitated by increases in raw material costs and operating expenses. The company's products are, however, diverse, and although the overall increase in the value of sales was due to higher selling prices, there was a satisfactory increase in the volume of those products not dependent on raw materials in short supply.

The effect of rising prices is reflected in the continued high level of trading profits of the year, which are only £56,000 short of the record figure achieved in the previous year. I am glad to say, however, that the proportion of the trading profits which arose fortuitously on the turnover of stocks purchased at prices below replacement cost was considerably less than in the previous year.

The company's business has expanded progressively over the past fifteen years; during that period the board's policy has been to plough back into the business the major portion of the profits and to maintain a conservative rate of dividend distribution. The directors consider that the results of the year under review merit an increase of 2½ per cent in the ordinary dividend, making this 15 per cent before taxation.

HEAVY DEVELOPMENT PROGRAMME

During the past three years your company has expended over £1 million on capital development at home and overseas, and there is still a heavy programme ahead; expanding business and rising costs have added more than £1,500,000 to the working capital requirements. Notwithstanding the steady and continued progress which your company has made, expenditure of this magnitude has placed a considerable strain on the liquid resources, and there are heavy commitments for taxation which are due for payment over the period to January, 1954.

It is probable, therefore, that in due course it will be necessary to raise additional capital. In preparation for such a step the board recommend the stockholders to pass a resolution increasing the authorised capital by £1,800,000 to £4,450,000. At this stage this is purely a formal measure designed to place additional authorised capital at the disposal of the board.

AVAILABLE SUPPLIES

The gradual improvement in the availability of raw materials which became apparent towards the end of the year under review has continued. The overall demand for your company's products in the opening months of the new financial year has been satisfactory, although there has been some falling-off in the home demand for certain products; in consequence it has been possible to increase somewhat the volume of exports, but in spite of this overseas demand continues to exceed available supplies.

The report was adopted, and a resolution increasing the company's capital from £2,650,000 to £4,450,000 by the creation of 1,800,000 shares of £1 each was approved.

THORN ELECTRICAL INDUSTRIES

RECORD PRODUCTION AND SALES

The sixteenth annual ordinary general meeting of Thorn Electrical Industries, Limited, was held on September 17th in London. Mr Jules Thorn (chairman and managing director), in the course of his speech, said: The net profit amounts to £500,004, as compared with £379,961. Taxation requires no less than £303,185. Out of the total profit of half a million pounds, less than one-tenth is paid in dividends to shareholders, more than three-fifths is taken by taxation and the balance of £150,000 is retained to augment the financial resources of the group.

The increased trading profit is the result of record production and sales, but unfortunately taxation has a crippling effect on any expanding organisation.

The lighting division has continued to make good progress and our achievements, particularly in the fluorescent field, have been quite outstanding.

The Ferguson radio and television division has enjoyed another record year. Our ability to offer outstanding value and reliability has further enhanced our reputation and attracted more business than ever before.

Spectacular though our achievements were in television, they were matched by achievements in the field of sound reproduction.

Exports in the past year have advanced satisfactorily and progress has been substantial. Your company has been successful in securing a contract from the United States Government for aircraft communication equipment to the value of 2½ million dollars.

The report was adopted.

A. C. COSSOR LIMITED

ORDINARY DIVIDEND PAYMENT RESUMED

The fourteenth annual general meeting of A. C. Cossor Limited was held on September 16th in London, The Rt Hon Lord Burghley, KCMG, LLD (chairman), presiding.

The following is an extract from his circulated address:

We again had a satisfactory year's trading. As a result, we have been able to pay off the whole of the arrears of dividend on the preference shares, and to recommend to you a dividend on the ordinary shares, the first since 1947.

The sales turnover for the year was the highest in the company's history, but the net profit was less than that for the previous year.

Like many other companies at the present time, particularly those with successful and expanding businesses, we are finding our working capital inadequate.

We expect the current year to be somewhat less good for us than the last. The rearmament programme is of the utmost national importance, but it does not provide us, as manufacturers, with a sufficient rate of profit to enable us to finance our business, to support an enterprising research programme, or to incur the risks of attempting to force our way through the obstacles which hedge so many export markets against our products. Television is important to us, and naturally our results next year must be considerably affected by the buoyancy of this market. Subject to that reservation, however, we shall hope for results which will again be a credit to us.

The report was adopted.

THE CONSOLIDATED SISAL ESTATES OF EAST AFRICA

PERIOD OF EXCEPTIONAL PROSPERITY

The sixteenth annual general meeting of the Consolidated Sisal Estates of East Africa, Limited, was held on September 16th in London, Mr N. C. S. Bosanquet (the chairman) presiding.

The following is an extract from his circulated statement:

We meet this year in a very different atmosphere as regards the buying and selling of sisal fibre, and in examining the accounts I should like to analyse the figures with the object of seeing how far we are equipped financially to meet perhaps low selling prices and certainly competition. In speaking of the low selling prices I am not suggesting that the selling prices of 1939 are returning in the near future, for that would mean the disappearance of large quantities of East African fibre from the market. It must be remembered that while selling prices have been rising and the industry enjoying exceptional prosperity, the costs of production have also increased though not in the same ratio as the rise in prices. Compared with the increased costs in some other primary commodities the increases in this industry have been very modest, and I question whether lower selling prices can be followed by much relief in the expenditure column. Before the war in 1938 we managed to survive with sisal fibre selling at £18 10s. 5d. per ton and a cost of production of £15 17s. 7d. I question whether the average estate today would find it economic to continue production with the selling price of fibre averaging £60 per ton.

THE YEAR'S TRADING

We harvested 6,440 tons of fibre which realised £1,139,294, and after adding interest and sales of by-products, the credit side of the account shows a total of £1,147,039. Taxation takes £424,335, and the profit taken to the appropriation account is £309,091.

We propose a final dividend of 50 per cent, making 60 per cent for the year.

The estimate of crop for the current year is 6,900 tons of fibre, and stockholders will note the steady increase which has taken place in output since 1949-50.

In the balance sheet current assets amount to £943,052 and liabilities, including future income tax £727,987. Our net current assets at the date of this balance sheet were therefore £215,065.

We start, therefore, upon a new period of the sisal industry with a strong financial position and with equipment which promises to make us a more efficient producer in the future than we have yet been in the past. I look forward to the time when we shall be offering the market an artificially dried fibre of better colour and quality than anything which we have so far been able to achieve.

It has been my custom in my annual statements to give stockholders some idea of what they may expect in the current year. In the circumstances ruling today I shall not be expected to attempt such a task. All I can say is that our crop is coming in well, and that we may expect to reach our estimate for the year, subject to weather and labour conditions during the remainder of the year. I do venture the suggestion that we sisal producers are in a much happier and safer position today than has been the case for some time.

The report was adopted.

INTERNATIONAL TEA COMPANY'S STORES

RECORD TURNOVER

The annual general meeting of The International Tea Company's Stores, Limited, will be held on October 7th in London.

The following is an extract from the annual review by the chairman, Mr Frank Wilson, circulated with the report and accounts:

Turnover in all sections of the business reached a record high level. There were, however, various adverse factors. Reductions in profit margins took place while costs in all sections increased, particularly wages. Prior to this increase of wages there were in the Mason company a number of branches producing losses. To prevent further losses we closed down a number, and it may be other small branches will need to be closed. In addition to heavily increased wages, we had to meet heavier expenses in transport charges, a very considerable item of cost in our business. The additional turnover enabled the Group to cover the increased expenses in the first half of the year, but failed to maintain that position in the second half.

A SATISFACTORY RESULT

These various factors have resulted in a fall in the Group trading profits of £122,000 and a reduced Group net profit (after tax) of approximately £60,000. In the circumstances, therefore, I hope you will consider that the results are satisfactory.

We, in common with other industrial and commercial undertakings, find that very largely increased sums of working capital are now required to finance our operations. The amount of the stock has increased by approximately £1 million since last year. This is due, in the main, not to increased quantities of stock, but to the higher prices which have to be paid for the goods we hold. Our stocks are not in excess of our requirements.

There are certain people rather vociferous, who seem to think that it is a sinful thing that profits should be made. No trading undertaking can survive unless it makes profits. I would like to point out that it is the Group net profit upon which attention should be focused. This net profit presents a very disturbing picture, and I cannot say too strongly that it is inadequate in present conditions either to finance the increased cost of our stocks or to permit reasonable and necessary development.

During the year we have explored still further the field of self-service trading. We now have self-service branches in the International Company, the John Quality Company and the Payantake Company. All the results of self-service trading have been satisfactory. We shall continue to extend this method of trading.

DIVIDEND AGAIN 16 PER CENT

We are proposing to pay the same final dividend of 11 per cent, making 16 per cent for the year. Stockholders will, very naturally so, be hoping for more, but I emphasise again we must plough back the maximum sums available for this purpose.

We have transferred the major part of the profits remaining after the proposed dividend to general reserves. A regular dividend distribution is preferable to fluctuations from year to year. We shall endeavour to maintain our position in this matter.

To make any forecast in these times is difficult, but, as I have said, our turnover is being maintained at record high figures. We must, however, feel a degree of apprehension as to further wage advances and further advances in general day-to-day expenses of running our business.

HICKING PENTECOST & COMPANY, LIMITED

MR LEONARD S. PENTECOST'S STATEMENT

The sixth annual general meeting of Hicking Pentecost & Company, Limited, was held on September 18th at the Victoria Station Hotel, Nottingham, Mr Leonard S. Pentecost, the chairman, presiding.

The following are extracts from his circulated statement:

We are pleased to report that we have again been able to achieve a satisfactory figure of profit, in spite of some deterioration in trading conditions during the later part of the period.

The first six months showed an increasing turnover, but the general recession in the textile trade towards the end of 1951 had some effect on your company. Certain branches of our business felt this more severely than others, which are still extremely busy, but the company as a whole is not at present fully maintaining the high output of last year. However, owing to the wide variety of the products we process, the general effect on us was not so severe as in many other sections of the textile trade.

As regards the immediate future, there is no doubt that the boom conditions of the past few years have passed for the time being and that trading will be keener, more difficult and more competitive. I am satisfied with the position of your company under these conditions, but it does not at present appear that we shall attain during the current year the standard of profits of the past two years.

The reports and accounts were unanimously adopted and the dividend of 12½ per cent was approved.

YORKSHIRE FINE WOOLLEN SPINNERS

SIR FRANK BINNS ON TRADING CONDITIONS

The fourth annual general meeting of Yorkshire Fine Woollen Spinners, Limited, was held on September 15th at the George Hotel, Huddersfield, Sir Frank Binns (chairman and managing director) presiding.

The following is an extract from his circulated statement:

The profits for the group for the year ended December 31, 1951, are £137,291. After charging depreciation, directors' remuneration and providing £72,700 for taxation, the net trading profits amount to £33,695. The fall in net profits is regretted, but taking into consideration the unprecedented fall in wool values and the continuing recession in the industry during the last eight months of 1951, it is considered that the figures are not unsatisfactory.

At the present time trading conditions throughout the whole of the textile industry are exceedingly difficult. Short-time working in mills is prevalent and there is a general feeling of uncertainty as to future prospects. It is quite impossible to arrive at any definite conclusion as to the immediate future of the industry. As a result of strong sales efforts, our mills are fully employed, with some night-shift working, and a good percentage of our production is assisting the rearmament drive. I would add a note of warning that boom period profits having ceased, we must rely upon increased machinery production per unit, combined with greater efficiency, for our profits and we are concentrating on these.

The report was adopted.

DAVY AND UNITED ENGINEERING COMPANY, LIMITED

EXPORT PROGRESS IN FACE OF SEVERE FOREIGN COMPETITION

NEED FOR COST STABILITY

MR D. F. CAMPBELL'S STATEMENT

The seventy-ninth annual general meeting of Davy and United Engineering Company, Limited, will be held at the Royal Victoria Hotel, Sheffield, on Friday, October 3, 1952.

The following is the statement to be made by the chairman, Mr D. F. Campbell:

The directors' report and accounts set out the results for the year ended March 31, 1952, and you will note that the net profit, after providing for depreciation and taxation is £221,302. In comparing this with the corresponding figure of £279,333 for the previous year, stockholders should bear in mind what I have said repeatedly, that in a business of this kind some fluctuation in the results from year to year is quite normal. Some of our large contracts take two years or more to execute and we do not normally bring the profits on them into account until they are completed. Thus the profit in any financial year is dependent to a large extent upon the major contracts actually completed in that year. The average profit before taxation for the last three years is £533,559.

PLANT AND MACHINERY REPLACEMENT RESERVE

The most important appropriation of profits made by the directors is that relating to the plant and machinery replacement reserve. While the transfer of £80,000 which we are again making this year from profits to reserve is described as an appropriation of profits, it is in reality a charge on profits because we shall be unable to replace and maintain our plant in an efficient and competitive state unless considerable sums are set aside for this purpose.

The directors have again decided to make a small increase in the issued capital in the same terms as last year and Letters of Rights will be posted on October 17, 1952.

APPALLING WEIGHT OF TAXATION

Taxation, as you will see, is relatively higher than ever. Company chairmen are constantly raising their voices in complaint at the appalling weight of taxation which industry is made to bear, but each year the load increases. In 1948, taxation accounted

for 35 per cent of your company's so-called "profits" and each year since then has seen a heavier burden, until in 1951-52 it has reached 51½ per cent. Even then, we have suffered the Excess Profits Levy in respect of only three months of the year.

We are told that we must export, and that engineering capital goods are to provide an important part of the national export programme. But how can this be done unless funds can be conserved to keep our works up to date, particularly in relation to an industrially resurgent Germany, stripped after the war and now rebuilding with the most modern machinery. The situation is further aggravated by the fact that our taxable profits are assessed upon an obsolete system of depreciation allowances which are inadequate. This is of particular significance to your company whose plant is expensive and which must look to foreign trade in the future for a large part of its livelihood.

TRIBUTE TO MANAGEMENT, STAFF AND WORKPEOPLE

Your company, being makers of heavy machinery for metallurgical works, depends for success on a careful appreciation of the rapidly changing technique of engineering and metallurgical science. The skill and energy of the Davy and United personnel is of the utmost importance and the stockholders are fortunate in having enterprising and inspiring leadership, ably supported by a strong team of engineers, designers, planners, office staff and erectors, working in close touch with the highly skilled craftsmen in our foundries and workshops. All of these are to be congratulated on the excellent machinery produced during the last financial year.

Whilst the results and the financial position of the Group are satisfactory and we still have a very large order book, the character of our future commitments has changed markedly since our last meeting. It is more than two years since any major rolling mill installation was ordered by the British Steel Industry, which has concentrated its capital expenditure on coke ovens and blast furnaces to relieve the shortage of scrap steel. As a

result of this, our large home contracts are rapidly approaching completion although the new British programme to increase steel production should improve the home demand for rolling mill equipment during the next few years.

EXPORT CONTRACTS

The bulk of the work now before us is for export and some of these forward contracts have been obtained in the face of severe foreign competition in a buyers' market. We have met and overcome this competition and I am satisfied that we can continue to do so if we are allowed to retain enough money to keep our plant up to date and if some stability in costs can be achieved and maintained.

It is, however, becoming increasingly difficult in the export markets of the world to fix prices and agree contract conditions. Foreign customers are frequently unwilling to enter into commitments in which they have to bear the unknown cost of rapidly increasing wage rates and material prices, or are unable to do so owing to the difficulty of obtaining sterling for contracts of indefinite magnitude. A period of cost stability is clearly essential if current overseas demand for heavy capital goods is to be satisfied by British engineers.

PARTICIPATION IN STEEL COMPANY OF WALES PLANT

No review of our activities in 1951-52 would be complete without a reference to your company's participation in the vast Steel Company of Wales plant at Margam which is now in production. Almost the whole of the rolling mill machinery was furnished either by our American associates, United Engineering and Foundry Company, or by ourselves. The contribution of Davy-United amounted to more than 7,000 tons of machinery and I am glad to say that it is giving excellent results. The ability of Davy-United to undertake the engineering and construction of big strip-mill plants is the result of many years of patient endeavour; and the help of our American friends, so freely given, has been of the highest consequence.

Although it is not strictly relevant to the year under review, it is appropriate to mention that Mr F. B. Findlay retired on August 31, 1952. Mr Findlay gave no less than 49 years of devoted service to your Glasgow subsidiary, Duncan Stewart and Company, Limited, and for the last 13 years has been general manager there. Stockholders will no doubt wish me to record their gratitude and offer their best wishes to Mr Findlay in his well-earned retirement.

NATIONAL COAL BOARD invite applications for the post of Manager of their London and Southern Counties Marketing Office in London.

The Manager will be responsible to the Director-General of Marketing at the Headquarters of the National Coal Board for surveying the demand for coal in the London and Southern Counties area and for co-ordinating generally the supply of coal sent in to the area by the several NCB Divisions. Applicants should have considerable personal and capacity for leadership. An extensive practical knowledge and experience of the coal trade, particularly in this area, and of the coals of the various coalfields is most desirable.

The post, which is pensionable, will carry a salary of not less than £2,500 per annum depending upon the qualifications of the successful candidate.

Write, giving full particulars, (in chronological order) of age, education, qualifications and experience (with dates) to National Coal Board, Establishments (Personnel), Hobart House, Grosvenor Place, London, S.W.1. marking envelope TT/531. Closing date October 4, 1952. Original testimonials should NOT be forwarded.

PROPRIETORS AND DIRECTORS with controlling interest in Private Companies manufacturing and selling proprietary lines through Grocery and/or Ironmongery Trades are invited to communicate with large London Manufacturing and Selling Concern with a view to discussing working arrangement and eventual sale of shares thus avoiding possible difficulties at retirement or death.—Write in confidence Box 74.

MEN'S WEAR.—Export Manager, very well introduced Continental markets, travelled extensively, fluent French, German, notions Italian, Dutch, seeks change.—Box 70.

NUFFIELD COLLEGE proposes to elect an Official Fellow who will be required to devote himself to research (with some teaching) in Economics or in recent Economic or Social History, and invites applications from men and women to be received not later than October 21, 1952. The stipend will be according to age. Further particulars may be obtained on application.—September, 1952.

CHIEF EXPORT EXECUTIVE.—A leading firm, specialising in a wide range of high electrical and mechanical products, invites applications for the post of executive direction and control of its export subsidiary. Consideration will be given only to applicants of director calibre, who can prove successful ability, and the knowledge of industrial markets overseas and personal contacts with leading industrialists abroad, needed to develop further the company's extensive export trade in supply industry with its products. The retail and wholesale trades are not involved. Applicants should hold a good Honours Degree (preferably in a branch of Science) or an equivalent qualification, and should have a background of administrative and control within the light engineering industry. Salary and other terms, which will in any case be commensurate with the responsibilities involved, will be a matter of agreement.—Letters, which will be treated in strict confidence and which should contain details covering the above points, should be sent to Box 64.

SALES EXECUTIVE seeks change of position. At present Sales Manager London and Southern England. Experienced commercial and domestic selling through distributor and trade outlets, including organising a training of sales staff.—Box 69.

TOP Market Research Man seeks change. Four-figure salary.—Box 56.

Farewell to Arms?

THE tactics of Communism in its dealings with the West are now clearly in a phase of change and adaptation. To call it new is to ignore the continuity of the strategy that directs the Party's work everywhere; to call it old is to ignore the importance and difficulty of the transition that is being made. There is no question of active comrades being ordered to turn about; but they are being told to dress smartly by the right, a movement that is both painful and conspicuous. Just what the new rules of the united front are to be will not be made explicit until the Soviet Party Congress in October—if then; but they can be deduced from a number of recent events, including the interview between Stalin and Signor Nenni, the Italian left-wing Socialist.

Stalin expects the present situation in the West to stabilise, with tension between the free world and the Communist block at a more or less constant height. Both camps will dig in on established positions, the diplomats following the example of the soldiers in Korea. The men in the Kremlin are probably persuaded that time works in their favour and that their empire is better placed than the Atlantic alliance to withstand a long period of strenuous alertness. They probably calculate that the United States is moving in its development of atomic weapons towards a point of diminishing returns, beyond which the technological gap between American and Soviet power can be gradually narrowed by research and increased productivity. They must reckon, too, that all the seeds of grave crisis are present in the defence plans of the comfort-loving West; whereas their own regime can safely maintain only modest standards of living, while military and industrial development continue side by side. That, certainly, is the picture suggested by the current five-year plan.

To this diagnosis Communist parties outside the Soviet Union have to adjust themselves. They have to master the theory and practice of "peaceful co-existence" between socialism and its capitalist enemies. Marxism, they argue, will—indeed must—triumph eventually; but the final onslaught is best postponed for a time. Recent gains are to be consolidated, while the forces of natural decay continue their work within the capitalist system. For the militant Communist in Europe this means a temporary farewell to arms, to be justified by reference to the texts of Lenin and Stalin. It is significant that on September 9th *Pravda* marked the anniversary of Premier Stalin's statement 25 years ago to a group of visiting American workers that "peaceful co-existence" was possible.

Five years ago, however, things looked very different, at least to the mettlesome mind of Andrei Zhdanov. He believed, when the Cominform was founded, that Communist victories were still possible in Europe because of the prestige gained by the party during the resistance. It was, therefore, to plan a victorious role in the inevitable struggle against the Americans by preparing underground and militant action. There was to be sabotage of arms deliveries, violent strike action, infiltration of wreckers into public services and communications.

and so on. But as the backbone of the democracies stiffened, and as the risks of provoking the West became more apparent from such happenings as the air lift that broke the Berlin blockade, the alternative analysis began to find favour, especially after Zhdanov's death in 1948. From it proceeds the long-range view that it would now pay to have a pause in the battle of Marxism *contra mundum*—a view that Stalin himself may never have given up, even while allowing his lieutenants to make all the mischief they could short of war.

Twenty-seven years ago—after the Communist failure to cause revolution in Weimar Germany—Stalin announced a similar decision, the terms of which are worth recalling. In his report to the 14th Congress in December, 1925, he said:

What is fundamental and new, deciding and permeating all events for this period in the sphere of foreign relations, is that a certain temporary equilibrium of forces has been established between our country which is building socialism and the countries of the capitalist world, an equilibrium which has determined the present phase of "peaceful co-existence" between the land of the Soviets and capitalist lands. That which we at one time thought of as a brief breathing space after the war has changed into an entire period of respite. Hence a certain equilibrium of forces and a certain period of "peaceful co-existence" between the world of the bourgeoisie and the world of the proletariat.

★

If Moscow sees—or wants to see—another static period in the offing, then armed insurrection and mob violence must until further notice be rejected by the party in favour of parliamentary activity and joint action with parties, groups and individuals on certain issues. For the last year or more this necessity must have become apparent in the higher counsels of the party and reactions to it—both in eastern and western Europe—have revealed two different types within the Communist élite. On one side stood the partisan leaders, whose finest hour came with Nazi occupation, the veterans of the Spanish civil war and the *Maquis*, the mutineers of 1917-18—an entire generation of Marxist fighters who shoot and talk their way through the novels of Hemingway and Malraux. For them politics and violence were inseparable. On the other side stood the astute parliamentarians, the trade union tacticians, the intellectuals who wielded bourgeois weapons. These are the two factions, the wolves and the foxes, the partisans and the back-room boys, who have been locked in combat.

Since the beginning of 1951 it has been increasingly evident that the foxes would come out on top. Now, with the overthrow of Marty and Tillon in France, the conflict has probably reached its epilogue. In the campaign against General Ridgway three months ago they made a last gesture to assert their view; the fiasco in the streets of Paris showed them to be wrong. There will be no more rattling of sabres under bourgeois windows, but rather invitations to join hands in common enterprises.

The realignment is well timed. There will be no lack of planks for the united front platform. Any relaxation in international tension will make people question, even more than they do now, the need for arms programmes and high taxation. It will not be difficult to conjure up the spectres of unemployment and deflation around the corner. The western democracies are only

too prone to doubt, self-scrutiny and impatience. If their voters are led to believe that the danger of real war has receded, they will start questioning the cost of what is called the cold war. Moreover, there are plenty of people in Europe who are genuinely frightened of Fascist resurgence and German revival. Communists will make a speciality of organising opposition to such happenings as the success of the MSI in Italy, the re-appearance of old familiar faces in the Bonn Defence Ministry, and the movement to amnesty war criminals. They can appeal to the nationalism of Frenchmen against the European defence community and to the nationalism of Germans against the division of their country. Above all they can mobilise and intensify anti-American feeling along a wide political front.

★

It may be, of course, that the Communists are too discredited by the experiences of the last five years for the united front tactic to succeed. Certainly their manoeuvres are better understood than they were, say, in the middle thirties. With the Soviet armies in central Europe and with fighting going on in Korea, Indo-China and Malaya it will not be easy to persuade people that there is much difference between peaceful co-existence and cold war. So long as Moscow continues to reject reasonable terms for a postwar settlement, the picture of Stalin as the peacemaker will remain blurred and unconvincing. But there is a real danger that those who try to lead public opinion in the free world may suddenly find themselves, as it were, out of date. So intense has been the effort to develop military strength and to restore Western Europe's confidence in the possibility of defending itself that the statesmen and the fighting men, the newspapers and the newsreels may find themselves still describing American hydrogen explosions, British atomic bombs, German recruit training and large-scale manoeuvres to audiences whose thoughts have been diverted in other directions—by the suggestion that for the time being peaceful co-existence, whatever that may mean, is what the Russians want.

In what form the idea will reach the western public is still uncertain. It may be the central feature of the Party Congress in Moscow; or it may become apparent in new Soviet moves over Korea or Germany. It may be presented in one striking set piece; or there may be a constant flow of informal suggestions taken up and spread around by the Communist Party. Whatever the method, the western foreign ministries should start thinking now what is to be said when the moment comes for comment and retort. This is, perhaps, a task for the Atlantic Council, which has given so much thought to military defence and so little to political initiative. A considered statement on the whole idea of peaceful co-existence, agreed by fourteen nations and issued in the name of the Atlantic alliance, would be a valuable and salutary act of statesmanship. For it is as certain as anything can be in the field of foreign relations that allied determination to match Soviet power by organising the political, economic and moral strength of free Europe will be exposed in the months ahead to sustained and ingenious propaganda. The task of the Communist Party is to induce a lull, to prepare a situation in which the West will relax its defensive effort while the Soviet empire increases its economic strength for a fresh challenge later.

The Public Schools

THE public schools are starting another year with every place filled and with hundreds of disappointed applicants turned away. Yet in spite of these continuing evidences of buoyancy, there are apprehensions among the governing bodies, and renewed discussion of the place that the public schools—by which, it is always necessary to explain to foreigners, is meant the private, and mainly boarding, schools to which the professional and business classes and the remnants of the landed gentry send their children—should occupy in the educational system of the country.

It is some seven years since the subject was last in the forefront of public discussion. Those were the days when the Education Act of 1944 was new and when the Fleming Report had come out with its proposals for sending boys from the state schools to the public schools at public expense. The Fleming proposals were given a trial; but it was clear long ago that they were not a success. Most of the schools—not all of them—did their best to give the Fleming scheme a fair trial, and there are many instances of individual successes. But the real difficulty has been the unwillingness of the local authorities to send more than a handful of acceptable candidates. Very few councils have been willing to operate the scheme as the public schools understood it.

Perhaps greater efforts would have been made to court the local authorities if the public schools had not been overwhelmed with applications from parents willing to pay the fees. The last seven years have continued the boom of the later war years. Nearly every school is larger than it was, and the waiting lists are still long. What every governing body would like to know is how far this sustained pressure of demand has been due simply to inflation—in which case it may disappear—and how far to more permanent causes. As a result of the abolition of fee-paying places in all schools that are financed by public money—except for the relatively few direct-grant schools—parents who aspire to a secondary education for their children must either stake everything on their passing through the Caudine forks of the selective examination at the age of 11, or else send them to a school which will charge in fees the full cost of the education it gives. The old alternative of getting a place at a local secondary school by paying a fee has very largely disappeared. Moreover, the parents' dilemma is heightened by the fact that the great majority of the good privately financed schools are boarding schools and therefore expensive. That so many parents, faced with

this dilemma, have found the money to send their sons to public schools is eloquent evidence of the determination of the English middle classes to give their children the best education they can.

Every public school has had to make two or three, or even more, increases in its fees since the end of the war. Indeed, the process has recently seemed to be so continuous that it is virtually impossible to compile a table of fees without some of the figures being out of date. Broadly speaking, however, the prewar range of fees for boarders in the boys' public schools was from about £150 a year to about £250 a year, with a large concentration of the famous schools between £175 and £200. Today the range is from about £250 to £350, with much the same concentration between £275 and £300. The representative increase has been about £100, which is about 50 per cent, or a little more, of the prewar level. Compared with nearly anything else, this is very moderate, and it has been the general experience of the schools that the increases have been well received by the parents.

★

Nevertheless, bursars and governing bodies wonder how much further fee increases can go. Such economies as are possible have already been reaped—as the moderation of the average increase demonstrates. Indeed, the fees would have had to be pushed much higher if the schools had not been so full. The greatest rise in costs, that of domestic labour, has been met by reducing the amount of such service—the public schoolboy was never exactly feather-bedded, but never less so than to-day. Food costs are largely beyond the control of the schools, though quite a number have found an economy in central feeding. The only other large item in a school's accounts is masters' salaries. Most of the public schools have scales somewhat above the Burnham scale of the state schools, and their ratio of staff to pupils is high. In both respects they have been forced to make concessions; but they cannot go very far, since it is on the quality of their staff and the small size of their classes that their reputation is built. As it is, the greatest long-term anxiety of most governing bodies is whether they can pay their staffs sufficient to attract and keep good enough men. There is a widespread tendency to ease the master's lot by providing him with a house, but that can only be done within the limits that the Inland Revenue will permit.

The successful continuity of the 'Royal Exchange' over a period of two and a quarter centuries has resulted purely from the satisfaction of its Policyholders.

ROYAL EXCHANGE
ASSURANCE: INCORPORATED IN 1720

So far, the position has been held; few schools are operating at a deficit. But the steady rise in expenses is not ended. Boarding schools were hard hit by this year's reductions in food subsidies—without gaining anything directly from the countervailing reductions in taxation—and they fear that they may be hit again. The first moves for the next increase in the Burnham scale have already been taken, and though the public schools are independent of the Burnham scale, they would have to follow it up. Some schools will have to find money for the redemption of tithe, and heavy increases in rates are threatened both by recent legal decisions and by the prospect of a new valuation. Repairs cannot be deferred for ever; the great period of school building was almost a century ago and the school that has in the past made adequate current provision for the obsolescence of its buildings is a great rarity—if it exists at all. Over-shadowing everything else is the possibility of a fall in numbers, which would sharply increase the cost per boy.

Faced with all these possibilities, bursars wonder aloud where on earth the money is going to come from. To keep a boy at an average public school already costs £350 a year, when clothes, holidays and half-term visits are included. If a family has two children away at school at one time, it has to find £700. How many professional people, salaried employees or small businessmen can do that out of income today? Every school sees the evidence of fees being paid out of capital—which certainly shows how much the parents care. But how long can it go on?

There is perhaps a certain tendency to cry out before any real hurt has been felt. Year by year the tide of entrants comes up to, and sometimes beyond, last year's high-water mark. If money for boarding school education were beginning to run short, it would be reasonable to expect the earliest signs to appear in the girls' boarding schools or in the boys' boarding preparatory schools, neither of which are perhaps quite so high on the parents' scale of essentials as the boys' public school. But few such signs are yet visible. Moreover the cost is not in reality so stupendous as it appears to be when one year's fees are set against one year's net income. A boy stays at a public school for only five years; the total cost per boy is about £1,750, and this is not so large a sum that the average professional man cannot hope to set it aside, for each of his sons (provided he does not have too many), in the course of his working life. Many of the lump-sum payments of fees which seem to the schools to be coming from capital are in reality the savings of a period longer than five years, but shorter than a lifetime.

Similarly, much of the talk of the public schools becoming the preserve of the wealthy and losing the professional men's sons is premature, to say the least. No doubt there is a change in their *clientèle*—there always has been, from generation to generation, and the proportion of boys drawn from business (i.e. non-professional and non-land-owning) families has been steadily rising for at least forty years. The public school class has always recruited itself from outside; even a hundred years ago the sons of the *novi homines* were probably in a majority. But these are guesses; nobody knows. If the public schools feel that they are being driven out of touch with the professions, they should collect the evidence. Ordinary observation suggests that it is not so.

These arguments suggest that there should be no

urgency about the apprehensions that the public schools feel. But they do not suggest that the apprehensions are unfounded or that no thought need be given to the future of these unique and—in the passionate view of a large body of people—uniquely valuable institutions. Seven years ago there was a very general willingness to see their future developing along Fleming lines—that is to say, solving their financial problem by a steady and growing stream of boys paid for by local education authorities. There is very much less willingness to think along these lines today. Rightly or wrongly, the public schools have come to distrust the intentions of most local authorities towards any schools that they do not control. The old direct grant system, by which a capitation fee was paid direct from the Exchequer to the school, without passing through the local authority, could have been extended to—and would perhaps have been accepted by—the public schools. But the direct grant system was another of the victims of the 1944 Act (or of its administration) and in its present form gives the local authorities too close a control over the schools and their pupils for it to be acceptable to the public schools except as a last resort. Nevertheless, a revised direct grant system will perhaps some day prove to be politically and financially possible.

Thought in the public schools themselves, however, is turning increasingly to the idea that any assistance that the state can be induced to give should be given directly to the parents in the form of tax relief in respect of expenditure on school fees. The argument is that every parent who sends his child to a privately financed school is directly saving the state money. The measure of the saving to the state is the cost of providing one extra place in a tax-financed secondary school, which is variously estimated at figures from £50 upwards. It is agreed that every citizen should bear his fair share of the overhead costs of the state educational system, but that those who contract out of the system should have repaid to them the running cost that they save the state.

This is too large a subject to receive a full discussion here. Clearly, no state could long endure if individual citizens were allowed at will to contract out of the burdens and benefits of such of its activities as they chose. But, equally clearly, the modern conception of the welfare state, providing costly services for its citizens, is something different from the old conception of the state whose "services" did not extend much beyond justice, defence and sanitation. Nobody can contract out of law and order; but those who do not use nationalised gas do not pay for it.

Whatever the method by which assistance is sought, this at least can be said about the object—that there is a large class of deserving citizens, who have shown by their actions that they attach more importance to a particular sort of education for their children than to almost anything else, and who may be in danger of losing it because—in part—they are compelled by the majority to pay a share of the cost of providing another sort of education for other people's children. Unless the welfare state is to pay no attention to minorities—even large and worthy ones—unless it is always to give people what the party in power thinks they ought to want and not what they clearly and urgently do want, the attachment of the middle classes to the public schools ought not to be ignored.

Bridging the Adriatic

MR EDEN has had a successful visit to Belgrade. The warmth of his reception from crowds in the street, as well as from Marshal Tito and the members of his government, has opened a fresh chapter in relations between Britain and Yugoslavia. By making this visit, however, Mr Eden has taken on certain commitments and responsibilities which should now be neither overlooked nor misunderstood. The purpose of the visit was a *tour d'horizon* with the Marshal. Yet, standing up in the foreground, large, forbidding and almost blocking the view, was the problem of relations between Yugoslavia and its biggest neighbour, Italy. Since the key to this problem is Trieste, Mr Eden has spent a good deal of his time during the past ten days talking and thinking about it, and his intervention must be reckoned a new factor in the fickle history of that disastrous dispute.

During the past few months Marshal Tito has revolutionised his relations with Greece and Turkey: exchanges of one friendly mission after another have led the three countries to the brink of discussions about common defence problems that would have been unthinkable a year ago. In the north a similar goodwill has replaced the suspicions which existed between Yugoslavs and Austrians. Only with Italy has the clock stood still, until today the leading powers of the Atlantic alliance find themselves helping to arm and aid two neighbours who give almost more thought to the possible dangers of having to fight each other than to common defence against Soviet imperialism. Moreover, Rome and Belgrade, in a state of hostility at arm's length, represent a relatively poor return for the aid being passed to them. Although the western alliance is dependent on both for the bulk of the effort needed to defend their own sector of Europe, it is not a practical proposition to build up their armed strength without regard to their mutual antagonism.

Earlier this year, after unsuccessful attempts to find a solution last winter, the Trieste dispute looked as if it would have to go into cold storage until after the American and Italian elections. Nothing, that is to say, could be done with any hope of success to improve Italo-Yugoslav relations for perhaps a year; it was argued that Washington could not at present be expected to play an active role as mediator and that no Italian government could risk concessions for an agreement which might be used by extremists against it in the elections. A new situation, however, has arisen with the development of Marshal Tito's friendship for his other neighbours and with a change of mind in Rome. There, Italy having secured a new status in Trieste itself through the London agreement in May, Signor de Gasperi, as head of the government as well as Foreign Minister, has made it clear that he would, after all, welcome a fresh attempt to reach agreement. If successful, the hope is that such an agreement would be at least as useful to the government in the electoral campaign as it would be to the extremists of the right-wing opposition. Mr Eden, having met Signor de Gasperi in Strasbourg on the eve of departure for Belgrade, knew this; and he is the first senior statesman of a third power to have the two opposing arguments presented to him, with the implication that his mediation would be well received.

With this unique opportunity, what has he found? On the Yugoslav side there are four main difficulties in dealing with Italy. If they could be overcome, even the

passionate and elaborate arguments about Trieste itself might be settled relatively quickly. The first is distrust, based on memories and legends of the past. The Yugoslavs cannot forget or forgive the deeds of Italian troops in their country during the last war. They also genuinely fear that, if agreement over Trieste were reached, Italian revisionists would simply move a step forward to claim Fiume, and eventually other historically Italian settlements on the east Adriatic coast. Thirdly, Yugoslavs are convinced that the Vatican, working hand in glove with the Italian government, seeks by every means to make trouble for Marshal Tito's Communist regime. Last, but not least, Yugoslavs do not have so high an opinion of Italian capabilities that they are prepared to make any sacrifices to ensure Italian friendship.

★

On the Italian side, the grievances are more pedestrian and specific, though no less deeply felt. Italians profoundly resent the Yugoslav attitude to territory which has been regarded as traditionally Italian since it was colonised by the Venetians several centuries ago; much of it formed an integral part of Italy right up to the defeat in the last war. They protest that thousands of Italians have been victimised, humiliated and driven from their homes by Marshal Tito's Yugoslavia; that this more than makes up for anything Mussolini may have done; and that there has never been any real sign of sincerity in Belgrade's approach to the question of a settlement. In the Italian view, the depth of the division between the two countries has been proved once again by the recent Yugoslav proposals for a condominium, whereby the governor of the Free Territory of Trieste would alternately be a Yugoslav and an Italian. The Italians, on the other hand, in practice stand out for partition, provided agreement can be reached on an ethnic line, although in theory they still claim the whole territory. To Italians the idea of alternating governors in an area where racial feeling runs so high is so unrealistic as to be insincere; they would argue, indeed, that the many "offers" which the Yugoslavs claim to have made are not in reality "offers" at all, since everyone in Belgrade must know that no Italian government could accept them and survive.

This, then, is the background of a problem of which Trieste is as much the expression as the cause. For many months attempts have been made to reach a solution by trying to get the Italians and Yugoslavs to meet and thrash out an agreement between themselves. But nothing whatever has emerged. Today, if the defences of Southern and Western Europe are to be planned effectively, the western powers have a right to consider whether anything more can be done to bring about a settlement; unless it is, no proper steps can be taken, for instance, to guard the Ljubljana Gap, the route through Croatia from the plains of the Danube to those of northern Italy. There can be no question, it is true, of putting any serious pressure on either side to make concessions. To attempt to do so would, for one thing, provoke strong resistance and preclude the very improvement in the general atmosphere which it is the main object of any settlement to promote. For another, the western powers cannot afford to cut down their aid to

either side; nor are strings to aid particularly effective, however judiciously they may be attached.

But if outside pressure is ruled out, why not some positive inducement to agree? There would seem to be two things that the leading western countries—America, Britain and France—have it in their power to offer: a positive increase in aid if a settlement is reached over Trieste—especially to Marshal Tito, who already receives tripartite assistance—and an international guarantee of any such settlement. There is much to be said for both. From the point of view of the Atlantic alliance, proper staff planning of the defence of Northern Italy cannot take place without genuine Italian and Yugoslav co-ordination and without adequately equipped forces in both countries. From the point of view of both disputants, an international guarantee of the terms of a Trieste settlement should remove many of the present doubts about the wisdom of concluding it.

Replanning the Black Country

THE rearmament programme has brought new prosperity to one of the most prosperous parts of the country. The West Midlands region, comprising the five counties of Warwickshire, Worcestershire, Staffordshire, Shropshire, and Herefordshire, contains a high proportion of the expanding industries, such as vehicle manufacture, electrical engineering, metal goods and manufactures. The region is well protected against unemployment by the great diversity of its industries; and its population has increased between 1931 and 1951 by 18.1 per cent, a rate about twice the national average.

As with London, however, the region's very prosperity creates problems in planning the use of land. The most difficult of these problems relate to the densely populated area consisting of Birmingham and the adjacent Black Country. This central area is recognised by the 1951 Census to be a single industrial conurbation containing 2½ million persons, over half the population of the region. Local planning powers are shared between three county councils and six county boroughs, a division which inevitably adds to the difficulties of effective planning. The local authorities are also ill-matched. Birmingham, with a population of over a million, is the largest and richest county borough in the country, whereas the industrial sprawl of the Black Country is administered by 23 local authorities in all.

The rate of growth of this central conurbation has been faster than that of the region as a whole. For twenty years there has been a steady movement of young workers into the area, matched by an exodus of older persons to enjoy retirement in quieter surroundings. Thus the population is comparatively youthful and the birth rate is high. Since the war many industries have had a large unsatisfied demand for labour; and if houses were available there is little doubt that more workers, and the families of many workers already there, would pour into the conurbation. Unless strong preventive measures are taken, it will continue to swell in size and population.

The local planning authorities are in agreement that the conurbation is already large enough. This conclusion is based on the familiar Barlow doctrine that an industrial concentration may get too large both for its own wellbeing and for the economic health of the rest

Even if this course were agreed upon, it may be argued that there remain the problems of making the first move and then of actual negotiation between Italy and Yugoslavia. Here Mr Eden's visit first to Strasbourg and then to Belgrade may already have broken some ice. After this the next move must surely lie with Marshal Tito. Not only has he now been told on the best authority of Italian willingness to negotiate; but it really is true—as has often been suggested—that his political position at home is stronger than that of Signor de Gasperi, who must soon face a most difficult election. At the same time, Rome would greatly help to clear the air if it made a declaration in advance that, once Trieste were settled, no further territorial claims would be made. As for the method of negotiation—why should not the heads of the two governments meet? There is at present no reason to assume that if either proposed this privately, the other would necessarily turn it down.

of the country. There comes a point when the social and strategic disadvantages outweigh the economic gains of industrial concentration; and this point has certainly been reached in the West Midland conurbation. As it is, the first task of the planning authorities is to relieve the urban and industrial congestion that already exists. The problems of traffic congestion, of crowded living conditions, and of excessive journeys to work would all be intensified, and vulnerability to air attack increased, if any further growth were to take place.

The local planning authorities have recently completed, under the Town and Country Planning Act, the development plans that are intended to guide the region's whole course of development, both public and private, for the next twenty years. These plans follow in the main the general strategy, laid down in the West Midland plan of Sir Patrick Abercrombie and Mr Herbert Jackson, of diverting the inevitable further development to a large number of towns outside the main conurbation. The conurbation itself would be strictly confined within an "urban fence" and surrounded by a green belt permanently reserved for agriculture and recreation.

This approach has a resemblance to Government policy for the London region, except that no new towns are proposed in the West Midlands. The London and Birmingham areas are the two parts of the country in which the Board of Trade is striving, as yet with limited success, to discourage any further growth of industry. But there is one important difference. The West Midland conurbation has a much lower average density of population than has Greater London. It contains less overcrowding and congestion and much more vacant land—although a great deal of it consists of derelict industrial sites in the Black Country. The problems of the area revolve as much around the wasteful use of land as its absolute shortage.

A voluntary survey by the West Midland Group, published under the title "Conurbation," reached the conclusion that satisfactory provision could be made for the re-location of the whole existing population of the urban area within its boundaries and without further outward growth. The present official development plans, however, make it clear that this was too optimistic. The redevelopment of derelict land for housing and other purposes will

accommodate some, but not all, of the people who are at present overcrowded. But in any case the real difficulty lies in the rapid rate of natural increase. The official planners considered that some 250,000 persons, who otherwise would be living in the conurbation in 1962, should be provided for in other parts of the region; and there certainly will have to be large movements of population between different parts of the region. All the county boroughs in the central conurbation, except for West Bromwich, have almost exhausted their reserves of building land. They already have, or will have shortly, a problem of surplus population, due partly to their own redevelopment schemes and partly to natural increase. Altogether, the "overspill" of population over a period of twenty years has been estimated at perhaps as many as 196,000 from Birmingham and a further 80,000 or more from the other county boroughs. It would be the line of least resistance to allow Birmingham to expand eastwards and Wolverhampton westwards, but the result would be the further sprawl of the conurbation as a whole as well as a wasteful use of land resources. Wolverhampton failed to persuade Parliament of its case for an extension of its boundaries and Birmingham has now declared that it does not desire one.

★

The adjacent county councils have therefore the responsibility of providing for a very large influx of population over the next twenty years. Staffordshire has led the way in working out a comprehensive "overspill" scheme. Altogether, houses will be provided for about 137,000 persons from overcrowded county boroughs, including Stoke-on-Trent in the north of the county. There will also be considerable movements of population within the administrative county itself—mainly from the congested county districts of the Black Country to those parts of it with vacant land. No less than 28 county districts in Staffordshire will act as reception areas, while six are "exporting" areas. The Staffordshire county development plan envisages many minor changes, mainly extensions to existing towns, rather than any spectacular development such as a new town. But their effect on the distribution of population will be considerable.

This overspill scheme is already in operation, and the cost of the new houses is being shared, in roughly equal proportions, between the county council itself and the district councils of the reception areas. The actual development is carried out by the county districts, but the county provides highly necessary technical and administrative assistance. The Town Development Act will enable both the Exchequer and also the "exporting" county boroughs to make contributions to schemes of this type. But it is significant that this particular scheme has been started successfully without outside assistance, partly because of the resistance of the other authorities to the further growth of the county boroughs. If reception areas can be chosen which are attractive to private as well as public development (as they seem to be in Staffordshire), then the local authorities are much better able to cover the cost of the additional services they have to provide.

The Staffordshire scheme is only a start towards a general redistribution of population within the region. The other counties chiefly concerned, Worcestershire and Warwickshire, have not produced comparable schemes as yet. They accept the general principle of expanding certain towns as a means of relieving the pressure inside

the conurbation; but the Worcestershire plan seems to assume that these changes will come about by voluntary migration and that there is no need for public schemes of overspill housing within its area. Many gaps in the development plans are due to the fact that the treatment and destination of Birmingham's large surplus population has still to be worked out.

The notion of developing other existing towns, which will act as counter-attractions to the main conurbation, has a very good chance of success in the particular conditions of the West Midlands. Several of these towns, such as Stafford and Rugby, are industrially flourishing and at present short of labour. Their rapid development is thus justified on economic as well as on planning grounds. Other towns, such as Tamworth and Lichfield, are well suited for receiving an influx of industry as well as of population. Some of the towns selected for expansion—such as Coventry, already growing fast and rather close to Birmingham—seem less suitable. But in general this part of the plans is feasible.

★

What is more doubtful is whether the industrial growth of the central conurbation can be successfully curtailed. The West Midland plan recognised the folly of disrupting what it called this "industrial machine *par excellence*." The many linked metal trades of the Black Country, for instance, ought not to be denied the scope for some further development on the spot. Yet there are many industries, such as textiles and chemicals, whose diversion to other parts of the region, or out of the region altogether, would do no economic harm. Some linked industries, again, could profitably establish themselves within 20 or 30 miles of the main conurbation.

But to achieve such results is beyond the powers of the local planning authorities. Their role is confined, essentially, to the provision of adequate industrial sites in the right places. They can, for instance, lay out attractive industrial estates in the reception towns to which firms on congested sites may be persuaded to move. This is the policy followed by the Staffordshire plan, which altogether provides an additional 2,000 acres for industry on major sites. But they cannot, nor probably should they, exercise more than a persuasive function on major aspects of industrial location. More drastic action, so far as it can wisely be applied by anyone, is the prerogative of the Board of Trade, which has the power to ban new industry in the conurbation and, if it chooses, to squeeze out some existing firms by denying them scope for expansion. It is obvious that these powers must be used with skill and moderation, if they are not to cause serious economic damage. But they will also have to be used more effectively than at present if planning policies are to be realised. A much closer co-ordination of policies between the Board of Trade and the local authorities is clearly necessary.

The West Midlands seem assured of a prosperous future. Gradually the development plans should ensure that their population will live and work in satisfactory conditions. The great task of "tidying up" the Black Country, of converting its derelict sites into schools, houses, and parks, will be tackled on a large scale in the next twenty years. The chief danger is lest, in concentrating on measures to create a better environment, the plans may be swimming too strongly against the economic currents of industrial growth.

NOTES OF THE WEEK

Party Preparations

The autumn political season, which opens this weekend with the Labour Party conference at Morecambe, brings to an end the two months' respite which Mr Churchill and his ministers have enjoyed during the summer recess. These two months, free from alarms and excursions, have placed the Government in a more favourable political situation than at any time since they took office. Though the unsolved economic situation and the engineering dispute loom dangerously on the horizon, ministers can go before the Tory conference at Scarborough next month with some achievements in hand to satisfy their supporters. They can point to the improvement in the balance of payments, to the increased number of houses, and to the hopes of long term improvements which they pin on the Commonwealth Conference.

The resolutions tabled for Scarborough show that the rank and file of the Tories are not dissatisfied with the Government in most fields. Defence, foreign affairs and even the economic situation come in for little criticism, while there is a chorus of congratulation for the housing drive. Back-bench criticism of the transport levy finds an echo in at least one important resolution, and there are demands for repeal of the Rent Restriction Acts, restoration of corporal punishment, a revision of Gatt, and higher Imperial Preference. Protection for British horticulture is again urged.

Against this must be set an outburst expressed in some twenty-five resolutions, attacking the failure of the Government's public relations. But the attack is misdirected. It is not the public relations officers, either of the Tory Central Office or of the Government, who have been at fault. The weakness in presenting the Government's case has been on the Treasury bench and nowhere else. Mr Churchill himself was responsible for two of the biggest publicity gaffes—the fares bungle and his trumpeting of alarm in July when Mr Butler was piping a more optimistic tune. If the Tories at Scarborough go off hunting their publicity experts, they will be after the wrong hare.

The Tories are hoping that a real row at the Labour Party conference next week will allow them to make capital of Labour's dissensions. Whether the Bevanite dispute will flare into a major public argument at Morecambe depends largely on the outcome of the voting for the party executive on Monday, the results of which will not be known until noon on Tuesday. If the Bevanites gain ground in the constituency section, their supporters on the floor of the meeting are likely to press with great vigour for the adoption of the Bevanite resolutions tabled by a number of constituency parties. A Bevanite reverse in the voting would equally well open up a counter-attack from the orthodox wing of the party. It is true that the party managers will have some opportunity for blunting the discussions; the composite resolutions which they will draft to cover groups of resolutions having the same theme can be framed in wide and vague terms. But some hard words will certainly be spoken from the floor.

This, however, will be due to mutual hostility accumulated in the past rather than to existing bones of contention. Events in recent months have greatly narrowed the gap between left and right in the party. Reduced rearmament is a fact, and even Mr Gaitskell has endorsed the party line that all charges in the health service must be abolished as soon as possible. Indeed, the greatest problem which Mr Bevan and his supporters face at Morecambe is that their line is now the party line. If there is nothing left to quarrel about, how can they make it clear that they, and not the present leaders, should be the cabinet ministers of the future?

The Wages Deadlock

In the dispute about wages in the engineering and shipbuilding industries the ball is now back in the employers' court. On Tuesday the shipbuilding employers, like the engineering employers the week before, rather grudgingly agreed that the matter should go to arbitration, while reiterating their statements that they could offer nothing. On Wednesday the executive council of the unions' confederation retorted by announcing that the ban on overtime and the restriction of piecework would start on October 20th. Next morning, after further talks at the Ministry of Labour, the confederation's reasons for not accepting the offer of arbitration were amplified:

the confederation took the view that the employers were refusing opportunities for further discussion which would enable the normal process of collective bargaining to operate. Whatever had been the position when the claim was made, they had, since their executive meeting at Southsea, been in a position to negotiate freely on the merits of their case.

The unions, it appears, had made it perfectly clear that they were prepared to negotiate on the basis of something less than £2 a week if the employers would agree to resume negotiations. But they did not have a mandate to accept arbitration, which was expressly rejected at the conference at York three weeks ago.

Their answer is not a sign of weakness. If the employers still refuse joint talks by the ordinary process of collective bargaining, the ban will be enforced with all its disastrous consequences to production. It is true that the general unions may not agree to it, but whether they do so or not they will in fact have to restrict their work to the same extent as the skilled workers whom they serve. The Ministry has three weeks in which to try to bring the two sides together. So far the unions have shown themselves flexible on the substance of their claim but uncompromising in their methods of pursuing it, while the employers have exactly the opposite attitude. It should not be impossible to work out a compromise.

No Diktat for Germans

When Herr Nuschke and his fellow-travellers from Berlin-East visited Bonn last weekend they were using the technique of the door-to-door salesman who badgers housewives. If he gets a rude reception from most of them he does not mind; his object is to get a foot inside some doors so that he can demonstrate his wares. Then it is only a matter of time before some wife has involved her husband in weekly payments on the never-never system. The East German salesmen did not expect much of a welcome and took the precautions of bringing their own bouquets of flowers with them, so that press photographs and newsreels for the Soviet world should give a cordial picture. The hostile reception organised for them was too feeble to be effective and the public was on the whole more curious than antagonistic. Much the worst *faux pas* made by Herr Nuschke was his admission, in answer to questions about the outrageous kidnapping of Herr Linse, that the People's Police in Soviet Germany are beyond the control of the government.

In spite of everything, the gain on balance was Moscow's. Herr Nuschke has his foot in the door. He left behind proposals for joint discussions between the two assemblies in Bonn and Pankow and indicated that the Russians would be prepared for elections and the peace treaty to be negotiated in committee simultaneously. The feeling in Bonn political circles is that the East German proposals are quite unacceptable. But the onus will be on Bonn to refuse them, and

all the to-do about the personal delivery of a message that might quite well have been sent by post means that the maximum publicity will be attached to the Bundestag's reply. The only way in which the tables can now be turned on Pankow is if the Bundestag were to make counter-proposals that the People's Chamber would be compelled to reject. The pattern of a possible reply to some extent already exists in the latest Western reply to Russia on the matter of four-power negotiations. This Note makes it more clear than ever before that the Western Allies stand firm on the subject of free elections, and are not prepared to negotiate a *Diktat* to be imposed on the all-German government that would emerge from such elections.

Americans Think of Development

In spite of the American public's absorption in the election, the signs multiply that thinking about future plans goes forward on many sides and is even acquiring a certain pattern. A fortnight ago Mr Adlai Stevenson, in a campaign address given at San Francisco, expressed the ideas of liberal Democrats when he pointed out that the struggle against Communism is "not a hundred-yard dash," but "a test of endurance," and went on to argue that in the Far East this sustained effort should be based upon American support for Asian development, upon the encouragement of agriculture and upon creating "new sources of the products we need to import."

More recently the Committee for Economic Development—an influential, private and largely Republican body of industrialists, economists and publicists—has issued a statement of policy which declares that political and economic stability in Asia and the Middle East must be backed by "administrative assistance and foreign capital on a large scale." The capital would in the main come from American sources. At the same time the Administration itself, now armed with at least three impressive reports on future economic development—the Gray Report followed by the Rockefeller and then the Paley Report—is drawing up extensive plans for investment and expansion in Asia. (Next week an official conference on President Truman's Point Four plans for backward areas is to be held in California.) Outside the diehard wing of conservatives, a reasonable degree of agreement upon the direction in which policy should aim appears to be taking shape.

There are, however, at least three unsolved riddles ahead of all the planners, whatever their good will. The first is the difficulty of investing anything like a sufficient flow of capital in what are truly underdeveloped areas. The term "underdeveloped" may have to be extended to cover not only the agriculture of India but that of Australia, and even of France. The second is the fact that sufficient capital will not be forthcoming from private sources, and American opinion moves very cautiously in the matter of massive government grants financed out of taxation. The third and possibly most difficult point is the attitude of the recipients—their administrative competence, their nationalism, their racial resentments—and also of America's potential partners in development. The liaison between Point Four and the Colombo Plan is still shaky. The role of Germany and Japan has not even been sketched in. The movement of American ideas is sound and encouraging; but here, too, the "hundred-yard dash" is not the answer. Much thought and more work lie ahead.

Bradley Breaks the Ice

It was brave of General Bradley to point out publicly the obvious disadvantages of giving to American commanders full information about the potentialities of atomic weapons which is denied to the distinguished British and European

officers working with and under them. He might have added—if it would not have given offence in many quarters—that American policy in this matter is one reason why the Exercise Holdfast just completed in Germany looked and sounded so old-fashioned. How are men like Marshal Juin and Lord Montgomery to insist on a fresh and thoughtful approach to tactical problems by their junior commanders if they cannot judge the power, quantity and disposition of atomic weapons to be made available to American—and presumably only American—forces in Europe?

Quite apart from the unrealities which marked Holdfast, there is a political issue involved. The time is not far off when British scientists working on new methods of defence will have valuable new ideas to communicate to—or withhold from—their allies. Nothing could be more unfortunate for Anglo-American relations than a disposition to bargain confidence in one matter against confidence in another. If there is not to be a wasteful and rancorous competition where there should be a real sharing of burdens and information, Congress should look again at the McMahon Act.

ANZUS Pledge or Pacific Council?

When, last year, Australia and New Zealand signed the Peace Treaty with Japan they did so only because they had obtained a specific guarantee of their security from the United States. This Australian-New Zealand-United States (ANZUS) pledge did not take the form of a regional defence arrangement; indeed, it could not do so, for any such arrangement would need to include not only Britain, Canada, France, Holland, South-East Asia and the Philippines, but also Japan. Japan the Australians would not even consider, and they still continue to regard the ANZUS pledge as safeguarding them more against an aggressive revival in Japan

Aircraft designers and operators know that BTH reliability—important on land, but vitally significant in the air—is traditional. BTH design and develop the complete electric power system, and supply the equipment appropriate to the application. But this is only one direction in which the specialisation and long

experience of BTH have built up an enviable reputation. It is the same in marine engineering, traction, power supply, mining—wherever first-class electrical products are needed. With over fifty-four years' experience and eleven factories, BTH can give outstanding service to industry in every sphere of electrical engineering.

than against any conceivable Soviet-backed Chinese expansion. It was its special non-regional character that explained, however inadequately, the exclusion of Britain, in spite of Mr Herbert Morrison's protest.

Yet even this limited guarantee requires implementation, and the meetings between America, Australia and New Zealand in Honolulu have been designed to fill in the practical details of mutual defence. In the course of them the phrase Pacific Council has crept in, replacing the old limited ANZUS concept; this has naturally rendered more suspect the original reasons for excluding Britain and more unacceptable the decision taken, under American initiative, to exclude even British observers. If this meeting did in fact represent a genuine Pacific Council, then a wider circle of powers, Britain first among them, and Canada only next, should clearly have been invited. Since it is no more than the ANZUS group, the misleading title should be dropped at once.

Even then the question remains whether it is right to exclude this country from the smaller grouping. Britain is the oldest and most intimate partner of two direct participants; much of their defence strategy must be—indeed, has been—worked out in close co-operation. Britain has naval forces in the area, guards its western approaches, and also carries direct responsibility for the great naval base at Singapore. To place it on a par with the Philippines is one of those specious and unmannerly arguments that look well enough—until they get outside certain offices in the Pentagon; but it contributes nothing to the general security and confidence of the free world which is, or should be, the first consideration.

Labour and the Social Services

The Labour party's discussion pamphlet on "The Welfare State" is a curious blend of self-justification, criticism and caution. The party that has hitherto been the most ardent champion of higher old age pensions, and which in 1940 was responsible for lowering the pensionable age for women to 60, now recognises that there is a case for raising the retiring age all round. The party that was responsible for virtually all the social service legislation of 1944-48 and never stopped to count the cost now recognises that a limit has to be set. The social services

are not the only charge [on the community] and consequently the money which can be spent on them is limited. We must also face our commitments in the field of defence; the colonies and the undeveloped countries need our aid badly; our own industry needs plant and machinery; houses, power stations and factories must be built besides schools, clinics and hospitals; our export trade must be expanded.

Welcome as this new outlook on the social services is, it is not nearly revolutionary enough. Moreover, the pamphlet's attempt to reconcile the need for priorities with social justice produces some odd results. The new charges in the health service are unfair, and all charges will be abolished by the Labour party as soon as is practicable.

This means that the development and expansion of some parts of the service may slow up. But we consider that free treatment is more important both from a moral and economic standpoint.

It is a curious concept of social justice that considers the provision of free spectacles and medicine for everyone more important than the opening of more beds for sufferers from tuberculosis who cannot afford private treatment. Health service charges, it may be pointed out, are considered so wrong that they are not even "questions for discussion."

A more fundamental weakness of the pamphlet is the authors' refusal to admit that the present proportion of the national income allotted to the social services may be too high. Estimates showing that some other countries are spending a larger proportion "effectively dispose of the argu-

ment that social services are swallowing up an unduly large part of the [British] national income." By some means, the pamphlet implies, Britain has hit on a proportion which is just right in present economic circumstances. If those circumstances become more favourable, the proportion may be increased. But there is not the slightest hint that economic circumstances are such that expenditure on social services should be reduced or that the present high level of expenditure and British insolvency are in any way connected—indeed national solvency is not even considered.

Airborne Yeomanry

One of the most extraordinary episodes of Exercise Holdfast was the intervention of the 46th Parachute Brigade, TA, which made a drop over Germany on the afternoon of September 21st. The paratroopers were drawn from companies centred at Liverpool, Cardiff and Renfrew. They were called from their daily jobs with a bare minimum of warning and left England at teatime on Saturday; they jumped a few hours later and were flown home the next day. By Monday morning the men were back at work in factories, mines and offices. This is the first time that paratroopers of the Territorial Army have carried out this kind of mission. Very few of the men involved were ex-national service.

The tactical importance of this exercise is obvious, and it served as a brilliant example of high-speed mobilisation. The quality of performance shown by the paratroopers during and after their jump, moreover, proves the efficacy of what could be described as "part-time training." But this display of military virtuosity also shows how thin the line between civilian and military life has grown. This instantaneous transition from factory or farm to battlefield is characteristic of warfare at a rather primitive and parochial stage; preparedness is once again a matter of the backyard—as Lord Montgomery persistently points out. It is interesting, moreover, that brusque interruptions of everyday activities by military needs should come to be accepted as normal. The psychology behind the success of this Territorial Army exercise is something new in British national life, or rather something which had tended to disappear during the nineteenth century—with disastrous consequences in 1939.

The Farmers' Patience

The council of the National Farmers' Union has, by the two decisions unanimously taken last week, demonstrated both a considerable talent for diplomacy and a common sense deserving congratulation. The first decision was an endorsement of Sir James Turner's request for an interim review of the farming industry after last month's increase in the agricultural minimum wage; the second was an agreement not to press this request in face of the Minister of Agriculture's initial refusal. Thus a major gesture, even if only a negative one, towards stabilising the cost of living is made without prejudice to the usual negotiations in February, and without too much outrage upon the feelings of the NFU's constituents.

Not all these constituents, however, are feeling equally contented with this policy of patience. The line between resignation and indignation corresponds less to that between the prosperous and the struggling farmer than to the distinction between the mixed or arable farmer on the one hand and the milk or egg producer on the other. Sir James Turner's application was rejected not only on the familiar grounds that everyone must share the pinch of national emergency but on the argument from costs themselves; wages, indeed, were up, but binder twine, fertilisers, and

THE GENERAL ELECTRIC CO. LTD

House on the cards

However conveniently you live (thanking TI for ready hot water, well cooked dinners and well ironed shirts) the future holds surprises. There seems quite a chance that the house of tomorrow will draw all its heat from the soil in the garden . . . that your telephone will take messages by night and pass them on in the morning . . . that your food will be cooked by radio-frequency waves. It's by no means impossible that your clothes will be cleaned by sound instead of soap. . . . What's the link between scientific principles and practical politics? Component parts. When TI is consulted about the components, good ideas take shape.

LONG-PLAYING MICROGROOVE
FLEXIBLE RECORDS

Nixa Long-Playing Records find increasing favour amongst the most musically discriminating. The latest catalogue lists over 200 L.P. Records of outstanding merit, ranging from attractive classics to important modern works.

THE CONNOISSEUR'S LONG-PLAYING RECORD

ARRIAGA (1800-1826)

Quartet No. 1 in D. minor.
Quartet No. 2 in A.
Played by the Guilet String Quartet. Acclaimed one of the most important records in years.
On one 12" L.P. Disc. CLP 1068

BACH

Concerto for 3 Harpsichords in C.
Concerto for 4 Harpsichords in A minor.
On one 12" L.P. Disc. PLP 547

BEETHOVEN

"Archduke" Trio, Op. 97.
Agi Jambor, piano, Victor Aitay, violin, Janos Starker, cello.
On one 12" L.P. Disc. PLP 707

CHOPIN

Twelve Studies, Op. 10.
Three New Studies.
Robert Goldsand, piano.
On one 12" L.P. Disc. CLP 1132

MOZART

Concerto No. 16 in D, for piano and orchestra: 12 variations on a theme "Je suis Lindor".
Artur Balsam, piano, and the Winterthur Symph. Orch., Victor Desarzens, conductor.
On one 12" L.P. Disc. CLP 1405

TCHAIKOWSKY

Piano Concerto No. 2.
Mewton Wood, piano, and Winterthur Symphony Orch., Walter Goehr, conductor.
On one 12" L.P. Disc. CLP 1125

Ready Oct. 1st. New Nixa Catalogue of over 200 L.P. Records.
NIXA 12" L.P. Records, 39/6 inc. P/T.; 10" L.P., 29/6 inc. P/T.
NIXA Album Sets of 2 or more discs to one work, 42/6 per record, including Album and P/Tax.

NIXA RECORD CO., LTD., 35 PORTLAND PLACE, W.1

equipment were all cheaper than last year, leaving no more net increase in the cost burden than the farmer could reasonably be expected to absorb for himself. With some justice, the specialist producers now point out that this relief affects them less, while the increase in wage costs affects them more, than the arable farmer; gain on the roundabouts cannot counterbalance loss on the swings if one happens to be a swing specialist. In a free market economy, of course, the result of such a shift in the pattern of costs as has marked the last few months would be a corresponding shift in the relative prices of milk and eggs and arable crops. The penalty of that escape from the uncertainties of the free market, which farmers have so long claimed as the essential foundation of sound agricultural policy, is precisely the sort of anomaly which has now arisen, not for the first time nor for the last.

In Stalin's Corsica

The fact of being Stalin's Corsica has not rendered Georgia immune from criticism or purges. On the contrary, Stalin's interest in the affairs of his home country, and subsequently the interest shown by his fellow Georgian and assistant, Beria, have made this small Caucasian Republic of some four million inhabitants rather more liable than others to attacks from the centre. Now, once again, the campaign of criticism which received official blessing as soon as the new All-Union Congress was announced seems to have hit the Georgian party particularly hard. Indeed, the congress it held last week revealed that purging in Georgia had already started and has been conducted on an exceptionally large scale.

The first two blows were dealt last November and in April this year. On the latter occasion Beria himself came down from Moscow for the meeting of the Georgian Central Committee in order to admonish the culprits and show the road to be followed. The whole committee was sacked and a new one elected. This cleansing at the top, however, was not considered sufficient and has now been supplemented by a reshuffle in the lower ranks of the party. On the eve of the present Congress most of the 9,450 primary organisations in factories, offices and farms held special meetings and over one-fifth of these cells chose entirely new executive organs.

What has made necessary such a thoroughgoing reorganisation? To judge from the report of the First Secretary Mgeladze, most of Georgia's "crimes" are shared with the other regions of the Soviet Union: the now fashionable sins of nepotism, intolerance of criticism, lack of vigilance, slackness and corruption. Georgia was, apparently, particularly guilty of corruption, and wholesale appropriations of communal land and stock for private use were tolerated—indeed, indulged in—by party officials. Also emphasised time and time again are the tolerance of nationalism, the fostering of separatist tendencies and the "insufficient appreciation of Georgia's links with Russia." This may well have been the main cause of Moscow's wrath. In education insufficient stress was laid on Russian language and literature; novelists, playwrights and historians failed to grapple with new problems and, influenced by bourgeois trends, looked back to Georgia's past and felt too much reverence. Encouraged by the progress of Russian nationalism, the Georgians probably thought it safe to indulge in their own brand; but now they have burnt their fingers.

It may seem unnatural that Stalin or Beria should impose Russian nationalism on their fellow Georgians. Yet, as architect of a monolithic centralised state, Stalin has never tolerated, nor will tolerate, any centrifugal forces. He will help his home country to produce more tea or wine, to extract more oil or manganese, or to develop its steel industry; but he cannot tolerate any Georgian aspirations to greater independence.

Mongols in Moscow

The Mongol Peoples' Republic, which covers the territory formerly known as Outer Mongolia, has sent a delegation to Moscow concurrently with the visit of the Chinese representatives. Although no part of the published report of the conference deals with that state, it was probably involved in the secret political, economic and strategic decisions reached by the Russians and the Chinese. As a large, though sparsely populated, country lying between them, Mongolia must play a part in any joint strategic plan of Moscow and Peking for a possible future war, not only because it is able to provide troops, but even more as a zone of communications set further back in the interior of Asia than Manchuria and less accessible to air attack from the Pacific. It is possible that discussion may now be revived about the old project, going back to the last decade of the nineteenth century, of a direct railway link between Irkutsk and Peking following the former caravan route across Mongolia. The Chinese claim to be already working on construction of a railway along the old silk route through Sinkiang which will eventually link up with Soviet Central Asia. Such development of short-cut communications between the Soviet Union and China could have considerable economic, as well as strategic, importance.

Politically it may be even more expedient than before for the Russians to flatter the Mongols and play the part of their champion, because there is now a certain possibility of rivalry between Moscow and Peking for influence in Ulan Bator. As long as China refused to recognise the *de jure* independence of the Mongol Republic—that is to say, down to 1945—the Mongols were dependent on Russian support against any renewal of the attempt to assert Chinese authority. Meanwhile China had no official representation of any kind in Outer Mongolia. When, by the Sino-Soviet treaty of 1945, China agreed to recognise Mongolian independence, it was a Russian diplomatic victory; but it also meant that henceforth China would have an embassy in the Mongolian capital, which would no longer have diplomatic relations exclusively with Moscow. When the Communists replaced the Kuomintang the ideological opposition between Mongolia and China was also eliminated, so that the Communist rulers of Mongolia are able to strengthen their position to some extent by balancing between the two Communist great powers. The economic dependence of Mongolia on the Soviet Union and the fact that its army is equipped by the Russians are still, however, probably decisive factors in favour of preponderant Soviet influence. The proceedings in Moscow, whatever other results they may have had, have served to emphasise that there is the proper place for the Chinese to negotiate with their former subjects.

The Microbe Hunters

Peking is preparing to release yet another report on "germ warfare," with 46 appendices, numerous illustrations and some 300,000 words of text. It is based on the investigations of a so-called commission of foreign observers, including such "unbiased" members as Dr J. Needham, president of the British-Chinese Friendship Association and member of the London Peace Council, and Dr Peossa, who was a Communist Party candidate in the Brazilian elections. It was hand-picked by the Communists and those parts of the report already released border on the ridiculous. Nevertheless, the propaganda campaign launched last March has succeeded in disturbing liberal opinion by sheer weight of shouting.

It is important to restate certain aspects of the western case which have been obscured. Both the International Red Cross, the United Nations, and numerous neutral countries have offered time and again to examine the evidence collected in Peking. They have even suggested setting up a commission

of whose members a half or a third could be recognised as independent. The Communists have rejected all proposals of this nature, contending that the Red Cross and the World Health Organisation were mere tools of American imperialism and propaganda. If authentic evidence were on hand the Communists should be most eager to reveal it to western observers, as the United Nations would then stand totally discredited in its own eyes. The entire fabric of lies about bacteriological warfare can be exploded by common sense. "Germ weapons," like poison gas, cut both ways with devastating speed; there is no way of containing disease and epidemic in a given strategic area, and cholera especially spreads in a quickly widening circle. The UN command in Korea is highly sensitive to the danger of disease to its own troops, and tries to protect them in every way possible. Evidence gathered behind enemy lines by intelligence officers attached to the medical corps shows that typhoid and symptoms of bubonic plague are prevalent among the uprooted civilians and soldiers of North Korea.

One aspect of the whole matter that is grotesque is the unscrupulous use of the word "scientific," and the duping of honest scientists, with dishonest evidence. Has nothing been learned from the Lysenko case? Why do not scientists of repute all over the free world say—what they must suspect to be true—that neither the evidence offered by the Chinese nor the method used to investigate is scientific? Even M. Joliot-Curie was reduced last year to a period of shameful silence when appealed to by a group of Nobel Prize-winners.

Visitors to the Enemy

The recent eruption of Dr Needham is yet another consequence of the negligence of successive governments in failing to restrain collaboration by British civilians with the enemy against whom British soldiers have been fighting in Korea for the last two years. It appears to be the official view that there is no war because there has been no formal declaration. Common sense rejects such a quibble about a campaign that has cost the lives of many British national service men sent out on active service. There is also the august authority of the Nuremberg Tribunal to sustain the view that even undeclared war must be regarded legally as war. If a British soldier refused to serve in Korea on the ground that Britain is not at war with either North Korea or the Chinese People's Republic, what would the Law Officers of the Crown say? How would they reconcile the full wartime application of military law with the view—implied in official inaction—that British civilians may give as much assistance as they please to the British soldier's enemy in the field?

It may be wise and prudent politically to keep an official in Peking supplicating for diplomatic relations and to allow established businessmen to carry on in Chinese ports whatever remnant is left to them of former trade; but the comings and goings of British Communists and fellow-travellers between this country and the Far East are quite another matter. There have been the journeys of Mrs. Felton, the Dean of Canterbury and now Dr Needham, who assist enemy propaganda in this country by their claim to have studied evidence which persons not specially invited by the Communists have no possibility of seeing. There has also recently been a delegation of the Britain-China Friendship Association, including two MPs, visiting Peking as if it were the capital of the friendliest country in the world. In no case has there been any attempt by the British Government to prevent such activities or any suggestion of a prosecution.

It would surely have been possible to proclaim (obtaining parliamentary sanction if there were any doubt about legal powers) that for the duration of hostilities in Korea a special permit would be required for a British subject to travel to

China or North Korea, and that anyone going without it would be regarded as making the journey for a treasonable purpose. It is not too late for some action to be taken. The present situation is an abuse of liberty.

Ireland Moves Towards Solvency

The state of Ireland's external trade and payments promises to improve out of all recognition before the end of 1952. Normally, there is a heavy deficit on visible trade which is partly offset by invisible earnings. In 1951, there was a deficit of £123 million on visible trade which was reduced to £62 million by invisible earnings. This deficit formed the subject of much political controversy during the winter. Mr de Valera's government claimed that so unprecedented an excess of imports was due to the unwise financial policy of its predecessor while the Opposition claimed that it was due to Government stockpiling.

Including the provisional returns for August, the first eight months of the year show that the adverse balance of trade has been reduced from £92 million a year ago to £56 million. Imports have fallen by £20 million and—much more gratifying—exports have risen by £16 million. It is a new feature of Irish trade for exports to show such expansive powers; and the achievement is all the greater because it owes little to changes in price. The expansion has come mainly through the development of what is practically a new trade, the export of carcass meat and processed foodstuffs. Altogether the trade returns give better promise of solvency than they have done for many years.

There will be a good deal of political argument about who should get the credit for this improvement. At any rate, it provides a favourable background for the 5 per cent new loan, by which the Minister for Finance hopes to find £20 million for domestic investment.

Stately Homes Still Decay

The National Trust is still making vain appeals that something should be done to save Britain's historic houses. Its annual report for 1951-52, published last week, tells a story of desolation.

Buildings on which our greatest architects, sculptors and painters have lavished their genius, and which stand high among the country's achievements, are today literally falling down; their irreplaceable contents brought together by successive generations, are being dispersed; their gardens are overgrown; and the surrounding parklands of which they form the central and essential feature are becoming derelict.

Of 320 houses which the Trust and the Ministry of Works classified in 1939 as being of the first importance, about a dozen have been abandoned or destroyed and many more are in danger.

To prevent this destruction the National Trust can do nothing. The houses are continually offered to it, but as the owners cannot also provide endowments to maintain them, the Trust is compelled to refuse them. Its resources are very limited. They consist of the annual subscription of 33,000 members, amounting to less than £20,000 in 1951; a few legacies, totalling £58,000 last year; the Jubilee Fund raised in 1946 to pay for repairs accumulated during the war, of which only £9,000 now remains; various gifts—often, unfortunately, tied to some particular use; and the admission fees charged to visitors. Although its work benefits the whole nation, present and future, the National Trust gets nothing from the Exchequer.

Two years ago a committee under the chairmanship of Sir Ernest Gowers recommended that the cost of maintaining historic houses should qualify for income tax relief. The Labour Government rejected this solution and proposed

instead that the Ministry of Works should make grants or loans towards approved expenditure on historic houses; but the election came before legislation could be introduced. The present Government is as loth as its predecessors to grant new discriminatory tax reliefs, but certainly anxious that something should be done. The difficulty is to find time for the legislation that would be required. But time must be found, for each month that passes brings losses that can never be made good.

Intellectual Investment

The seventh report of the Nuffield Foundation demonstrates once again the peculiar value of an organisation which can, within limits much wider than those circumscribing the financial behaviour of universities, Government departments and industry, back its fancy in matters of research. Industry must watch for reasonably immediate and measurable money returns; Government organisations and universities must constantly weigh the claims of new and pioneering projects against those of the routine activities, or the teaching and administration, which absorb the bulk of their funds. The private trust is, initially at least, free of these bonds. It can throw its resources wholeheartedly behind the gifted individuals, the single schemes, which appear (in the words of the report)

to be important, to contribute to the general objects laid upon it, and to be comparatively backward or neglected and therefore in need of special encouragement, or to be in a specially favourable state for advance.

Whether this freedom can be permanently preserved is another question. One serious threat, noted in last year's report, has been averted; there has been no reduction in the "total of State support for learning and research," such as might have produced an irresistible pressure upon the private trusts to divert their support from particular individuals and projects to the general purposes of the universities. Another danger to practical freedom of action is internal rather than external. Particular schemes launched or expanded by the foundation's funds may either need more time and money to reach fruition than was originally calculated, or prove less capable than expected of attracting the support which would maintain them as going concerns. Either miscalculation confronts the foundation with the alternative of spoiling a number of useful ships for a ha'porth of tar or of becoming, indistinguishably from any other source of academic funds, the quasi-permanent patron of a particular set of continuing research activities. The essence of a banker's expertise, it used to be said, is the ability to distinguish between a bill and a mortgage. Much the same sort of ability is demanded of the Nuffield Foundation's trustees in their long-term task of building up and maintaining a sound portfolio of intellectual investment.

Implications of the Schuman Pool

The British delegation to the Schuman Pool High Authority seems to be taking shape with greater speed than the Authority itself. Now that advisers have been chosen from the coal and steel industries, the British team is complete; but so far the names of their counterparts on the staff of the pool have not been announced. The comment has been made that the two most powerful bodies on the scene are the British delegation and the German coal selling agency which was supposed to disappear as an obnoxious cartel. For Britain the immediate aims at Luxembourg are to safeguard its continental market for coal and steel and to assure supplies of those raw materials controlled by the six nations. Much will depend on what kind of commercial policy they evolve. It is their declared intention, while setting free the coal-steel trade among themselves, to erect a common tariff wall against the outside world.

The natural tendency will be for this wall to creep up to the level of a high-tariff nation like France instead of falling to the low level maintained in Benelux. However, in order to form what amounts to a customs union in coal and steel, the Luxembourg group must seek a special dispensation from the General Agreement on Tariffs and Trade (GATT) releasing them from their obligation to extend most-favoured nation treatment to all GATT members. It is possible that consent will be given only on condition that the common tariff wall is of moderate height.

However this question is resolved, the hard fact remains that Britain as a seller to Europe will from now on face an association of six countries speaking with one voice. Ultimately, too, it will face in non-European markets the competition of a large-scale steel and coal industry, highly modernised and rationalised. Potentially the High Authority wields enough control over investment to achieve this, and may also acquire enough financial resources.

Mr Black, president of the International Bank, has hinted firmly that the pool should expect little dollar help from this source, but he has promised the Bank's aid in "mobilising European capital" for the community. It is also reported that M. Monnet has plans for imposing a one per cent levy for investment purposes on all coal and steel production of members. It is thought likely that in addition the Authority will assert its right to a decisive voice in the use of "counterpart funds"—that is, the counterpart in local currencies of American aid.

Hitherto, Britain has had as much say in the heavy investment plans of its neighbours as an outsider could hope for. In OEEC committees it has periodically reviewed all West European investment plans, probing them in detail and either approving or opposing them on the grounds of economic soundness. What happens now? Since committees rarely die, they will probably continue to function and so will the coal allocation group at Geneva. But Britain's voice is unlikely to carry the influence it once did in these informal councils, and the real centre of decision will tend to shift to Luxembourg. Compared with these realities, the oratory at Strasbourg about political links is of secondary importance.

Joint Venture in Burma

The world's attention is easily focused on the destruction or paralysis of great economic ventures by violent nationalist reaction against foreign capital. Attempts to solve this problem are less exciting, and therefore less well known. But it is time credit was given to all parties involved in the present attempt to transform one major British investment overseas into a shape suited to new political conditions. This concerns the oilfields of upper Burma. Since Burma became independent, its government has discussed the future of this industry with the oil companies at great length, and last December a provisional agreement was reached on what has become known as a "joint venture."

It is proposed that the companies' assets in Burma shall be transferred to a new company, that the Burmese Government shall buy from them, initially, a third of this company's shares, and that it may later buy further shares and thus acquire a controlling interest. Burma's initial one-third share has been valued at £5 million but, as U Nu, the Prime Minister, recently pointed out, his government will not have to find this sum from its meagre budget, nearly 60 per cent of which has to be devoted to defence. The British Government have undertaken to lend Burma half of the price, and the remaining half will be offset against profits and taxation.

This solution has not been reached without much negotiation and delay. The delays, indeed, are not yet at an end, for it became known in Rangoon this week that opposition

criticism had compelled the government to ask the High Court whether the "joint venture" was constitutional. It is also true that the disorders in the interior of Burma, which still restrict the domestic oil industry to supplying only the needs of the north-central area, have permitted the negotiations to proceed in a rather academic atmosphere. But these negotiations have been marked by unusual good will and patience, and their ultimate significance may prove to be great, not only for Burma, but for countries facing similar problems.

* * *

Worlds Within Worlds

This week a number of members of parliament from various countries have met in London to discuss methods of bringing the whole world—repeat whole world—under one government. Such a gathering is inevitably in danger of being used as a platform for cranks and devotees of particular causes, and these have not been lacking. Moreover, the decision to allot part of the conference's limited time to a debate on developing backward areas, which resulted in the reappearance of Mr Harold Wilson's well-known project for a world development authority, started the parliamentarians turning up some odd stones. But the most substantial task set to the delegates was to frame suggestions for amending the United Nations Charter. The Minister of State, Mr Selwyn Lloyd, said in his speech of welcome that this is a topic on which it is important that there should be the widest discussion, for the Charter itself provides that its amendment must be considered not later than 1955.

There is no reason to suppose that amendment will be any easier to achieve in 1955. The Charter cannot be altered, now or then, without the consent of all five Great Powers. The Soviet veto will almost certainly be imposed on any proposal that would significantly increase U.N.'s authority over national governments. This is not to say that to discuss desirable amendments is futile; but it is a reminder that such discussions should be realistic and should take into account, first, the possibilities of strengthening the United Nations without altering the Charter (as has already been done through the "Uniting for Peace" machinery) and, secondly, the influence and efficiency of non-universal organisations such as Nato. It may be—indeed, it is envisaged in the North Atlantic Treaty itself—that development of such organisations will eventually make possible the creation of a world authority capable of maintaining peace. It is in this direction that public attention should be urgently directed. The unreal and legalistic tone of much of this week's debate provokes the reflection that the best is too often the enemy of the good. There are some people who, if world government were on the point of achievement, would begin agitating for inter-planetary union.

* * *

Faith and State in Israel

As a result of the resignation of two rabbis from the Israel cabinet, the ratio between government supporters and opposition in the Israel Parliament (*Knesset*) is reduced to 60:60. Yet Mr Ben Gurion need not resign; his Labour party (*Mapai*) may even, in the lull before parliament meets, be able to muster another vote or two from its left or its right. At worst, he could continue to govern on the 60:60 basis, for there is no conceivable issue on which both left and right would vote together against him. But though slight in its effect upon immediate politics, the quarrel that lost him the support of two members of the religious bloc is profound, recurrent and important, if viewed in the light of Israel's need for peace of mind. It is a struggle between an old religion and a new state about how far the observances of the

former—many of them archaic—need be imposed by law upon the whole population of the latter. The classic battleground is in the schools, where four "trends"—two of them religious—compete for the youth of the nation.

Already, Israel has been shaken politically by the dispute as to who is to teach the children in the immigrant camps; this time the cause of controversy was national service for girls. They used to be able to claim exemption on grounds of religious law and could either perform their service in agriculture or evade it. Mr Ben Gurion, claiming that full freedom to exercise all religious observances exists in the army, cancelled the right to exemption. With good reason, he sees in military service the best method of welding together the extraordinarily various elements among immigrants and *sabra* (literally, cactus, or hardened resident). The rabbis objected on grounds of religious law.

A problem of the future is here apparent. Will old laws and forms and rituals, many of them connected with the Dispersion, continue to hold attention now that the Return has been achieved? If they were revised what would be the effect on the synagogues of the diaspora? What group, or even, what generation, is qualified to undertake such revision? The religious group inside Israel has to grapple with a problem that has faced many faiths seeking to remain a living force. Are they to meet new circumstances by formal revision of their laws or, more weakly, by tacit acceptance of new practices?

As the Duke Would Have Done

It is, perhaps, too early to speculate on the political consequences of the death of the Duke of Wellington, but some results are so plain, that they are already beginning to attract attention, and we may, therefore, advert to them. We pointed out last week that the Duke had, by his influence over the aristocracy, saved them from themselves, and been for more than forty years like a guardian angel to his class, his party, and the monarchy. From his first entrance into life he stood up as a bulwark against violence and wrong. . . . He fought against them in the field, and always made head against them in the Cabinet. . . . Who is henceforward to guide the House of Peers? Lord Eldon preceded the Duke of Wellington in the office, but who is to succeed the Duke? There is no other living peer of equal or similar influence, and the House is likely . . . to "wander without a shepherd," and to give the Minister of the day, instead of the profit of a peaceful and obedient flock, the trouble of an unruly one. Instead of being the steady ballast of the State, as under the guidance of the Duke, it seems likely, from many jarring political and religious elements within it, to become the top hamper that may endanger its safety. . . . To avoid such evil consequences, the House must follow the Duke's example, and continue to show the respect it entertained for him in life by doing after his death as he would have advised them to do. His first principle was to make himself thoroughly acquainted with facts. It was by being a slave to them that he became the master of other men, even of the peers. Let them, therefore, now go to facts for guidance as facts guided him. Let them study society; let them read Blue Books, and the daily records of all men's actions; let them discard, as he discarded, all respect for mere traditional maxims, all veneration for party shibboleths, and look on the face of Nature and in the eyes and hearts of men as far as they can, to learn what they have to do; and then they will do as the Duke would have done, and he would have recommended them to do.

JOSÉ
JOURNEYED SOUTH

José is a cigar expert from Havana. His skill he inherited from Manuel, his father, who was a pupil of the greatly respected Juan. Today, José is in Jamaica producing Larra* cigars for Por Larranaga. Thus he carries on the tradition of craftsmanship of which he is so proud, happy that the wrapper leaf which he has always known is sent regularly from Havana. José is pleased, too, that he is still with his old Por Larranaga colleagues. Truly, he feels, Larra cannot help but be very fine cigars indeed.

What are silicones, Mr. Sims, Sir?

The silicones are a most interesting group of materials based on organic compounds of silicon.

To industry the most outstanding merit of silicones is their marked resistance to the effects of intense heat and cold. They are used, for example, in jointing and insulating materials for jet engines and electric motors. They have other special applications in heat-resistant paints, car polishes, and the shower-proofing of textiles.

Midland Silicones Ltd. are the marketing organisation for the full range of silicone rubbers, resins, varnishes and fluids, some of which are already being manufactured by Albright & Wilson Ltd.

Letters to the Editor

The Public Service

Sir,—I should like to say how strongly I agree with the article in your issue of September 20th. I am hopeful that it will be a spring board from which we can move forward, though the practical difficulties are formidable, and while the Treasury is so preoccupied it will be an uphill business.

There are, however, a few additional points that, it seems to me, ought to be made:

(a) What troubles me most at the moment is not the pressure on the civil servants at the top, but the pretty continuous pressure on a number of people in the middle roads of the administrative class—say, senior principals or youngish assistant secretaries of 35 or so, especially in the "economic" departments. They work very long hours; they have not the compensations (such as they are) which come to those of us actually at the top; and (though efforts are made to move them round to easier assignments) there is little prospect of any early relief. Most of them are married and have children (they have tended to marry younger than civil servants of my own generation) and are troubled by domestic and financial anxieties. Civil servants like myself had a relatively easy and, by present standards, comfortable life before the war, and have therefore a good deal of energy in the bank. But one has to ask oneself "will these men make old bones?" The answer, I fear, is that many of them will be played out before they are 50.

(b) Your article did not refer to civil service wives. But the general pressure—particularly the long hours—is, of course, peculiarly unfair on them, and they usually cannot share the compensations (e.g. official travel abroad) which some of us enjoy. The sense of unfairness in this sphere is, as I well know, a potent factor in inducing officers to leave the civil service, and it is noteworthy that in many such cases those concerned are at pains to make special terms with their new employers about such things as the payment of wives' fares, etc. on business journeys abroad.

(c) You rightly refer to the loss of experience which is suffered when a particular Permanent Secretary leaves the civil service. But what troubles me much more is the tendency of much younger men—of the rank of under secretary or at most deputy secretary—to leave before they have given the state anything like a full measure of service. (Personally I hold the old fashioned view that in most cases it is wrong for people in their position to leave, but that is really neither here nor there.) There have been losses of this kind in recent years which the service and the state will, I fear, feel for years—and there is no sign that the losses will stop.—Yours faithfully,

SENIOR CIVIL SERVANT

Sir,—It is gratifying that you should have discussed the grave problem created by the constant overstrain in the higher ranks of the civil service. Your references are directly to the administrative class. I imagine, however, that you would not dissent from the view that they could be applied to the whole range of the higher civil service.

May I suggest that your proposed remedy would not really help. To introduce temporary officers at various levels does not meet a problem which derives in part from chronic understaffing in certain grades and partly from wrong staff organisation. So far as chronic understaffing is concerned, the only answer is to increase the number of officers in that grade. If there were not competent officers at lower grades in the service able and willing for promotion, there would obviously be no reason at all why persons should not be brought in from outside the civil service. There has been no real suggestion that able people are not available for promotion in the civil service.

In organisation in the civil service a serious problem is created by the complete misuse of administrative officers by placing them in charge of professional sections which they are not adequately trained to cope with and where their contribution is at a minimum. In the Admiralty, for example, there is at least one important committee on which professional men from the Admiralty serve together with ship-building contractors and engineers. This committee is presided over by an administrative officer. This work could be more efficiently and usefully done by a professional officer. Examples of this kind could, unfortunately, be multiplied in a number of departments.

There have, in the last year, been two reports from committees presided over by Sir Thomas Gardiner, which have directed attention to the fact that all too little use has been made of professional officers in the civil service in any save the higher administrative jobs.—Yours faithfully,

STANLEY MAYNE,
General Secretary
Institution of Professional
Civil Servants,
London, S.W.1

Keeping up the Pressure

Sir,—Your article on the new Russian Five-Year Plan in your issue of August 30th ends with the grim warning that the Russians will probably bank on General Time. It is a well known dictum amongst Communists that "time" is on their side. We must never forget that Communists are ruled in their thoughts and actions by a fanatical and historically fatalistic creed that to them is divine law and *a priori*. The final triumph, according to them, of dialectical materialism is inevitable and the bourgeois liberal democracies are doomed to be overthrown into the melt-

ing pot of the so-called classless society. Thus, although we might avoid war in the near future, we are fated to a ceaseless struggle against Communism until either side gives way.

The western democracies are both complacent and optimistic. They refuse to recognise that they are facing a force like the Turks of old, though infinitely more subtle, which is determined to convert the world, the cost and means regardless. Yet few people seem determined to face the horror of the situation. It is not just a question of rearmament now, or in 1955 or in 1960 even, but of unceasing and absolute preparedness until the final *dénouement* arrives, which may be far into the future.

Yet no recognition seems to be made of the fact that the cold war must be planned on the assumption that it is going to last practically indefinitely, unless a war intervenes. Little honest attempt has been made to drive home to the people that their present anxieties, trials and tribulations are not just transitory events, but are probably the hall-mark of this century. Nor is it sufficiently realised that to keep pace with Russia's rapid increase in industrial potential and provide a minimum of aid to the backward countries must lead to a temporary lowering of our standard of living.

This is the dilemma. The western democracies wish to preserve their freedom, but are not really prepared to make all the sacrifices necessary to do so. The solution is for people to be really conscious of what they are defending, of the way of life they are trying to preserve. If we see that it is worth the cost, then logically the full sacrifice to defend it must be made. It is only by being fully conscious of our faith that we can set aside our complacency and indifference and at the same time prevent the deprivations of our liberty that we shall have to endure from dragging us down to the Communist level.—Yours faithfully,

K. R. H. ALLEN
Lincoln College, Oxford

Sheets in the Wind

Sir,—Your article makes the point that hotels with bulk orders get a flat rate service from laundries very cheaply.

As chairman of a multiple company operating a group of hotels I would like to say that before the war we contracted with at least eight laundries in the eastern counties to carry out all hotel laundry of every type required by a country hotel at the flat rate of just under one penny per piece; it was a penny per piece, less a small settlement discount.

Since price control came in and a sellers' market developed, all these laundries abandoned their special hotel services and the majority of them started charging hotels the same rate as their family domestic customers. At one time they were charging in effect almost as much as five times the prewar figure.

A little competition has fortunately recently developed, and this alone has enabled hotels, which are now hard pressed to make ends meet, to arrange slightly better contracts; but in a recent survey carried out in connection with a number of laundries in this area it was found that in June, 1952, prices had risen as follows:—

Article	Price range available.	Prewar price.
Sheets	3d. to 5½d.	1d.
Tablecloths	3d. to 6d.	1d.
Turkish towels	2d. to 3d.	1d.
Glass cloths, etc.	1½d. to 3d.	1d.
Porters' white coats	4½d. to 1s.	1d.
Roller towels	3d. to 3½d.	1d.
White overalls	6½d. to 1s.	1d.

The best flat rate obtainable in this area is at the rate of about 3d. per article against 1d. before the war, but in the majority of cases a flat rate is not accepted, and the most serious increase is for sheets, which are the main constituent of hotel laundry. In view of the fact that the small country hotel usually caters for one-night visitors, it means that for sheets alone the visitor's bed has cost somewhere in the neighbourhood of 10d. or 11d. with another 2½d. or 3d. for pillow cases, to which must be added towels, serviette, tablecloth, and so on.

From the hotel industry's point of view laundries have taken the fullest possible advantage of the sellers' market and really have only themselves to blame if a number of hotels are now contemplating the installation of suitably sized home laundries, which are, fortunately, being offered in increasing numbers by specialists in this class of machinery.—
Yours faithfully,
H. B. PATEN

South Africa Makes Crime Pay

Sir,—I have no wish to offer general comment on what your Johannesburg correspondent wrote about South African farm jails in your issue of September 6th, but may I point to a number of minor but significant inaccuracies and misleading innuendoes that disfigure his article?

First, please consider the juxtaposition of the following statements: "... in the gardens and fields of Kroonstad a familiar sight is red-jerseyed African convicts ... hired out to private employers" and: "The South African Government has in the past year or two pursued a deliberate policy of building 'outpost' prisons in rural areas and allowing farmers to hire convict labour from them." Anybody, I am sure, will read this to mean that the "letting out" of convict labour is a development of the past two years, and the title of the article confirms the interpretation. The facts are different. Farm jails may be new, but for many decades all South African governments have followed the practice of "letting out" convict labour in towns and villages, and red-jerseyed African convicts could be seen working in gardens and fields forty years ago. The system may be quite wrong, but so is the innuendo that it is recent.

Secondly, your correspondent suggests that incomes of individual maize farmers reach £40,000 (a year, I assume). If this is so, then I do not think it can be proved to be the result of "cheap black labour," or even of maize-farming; doubtless the incomes "plausibly mentioned" to your correspondent were those arising from the mercifully short-lived rocketing of the world price of wool.

Thirdly, to say that "the new prison was called 'Geneva'" is to betray ignorance of the fact that it is located on or near a farm and railway station which have been called Geneva for the best part of fifty years.

Fourthly, deplorable as the festivities outside the jail may have been (I was in England at the time, and unaware of them), the fact that "the South African flag flew from a tall white flagpole" can have had nothing whatever to do with the "gala day." The South African flag flies every day on every jail in South Africa.

Fifthly, it is strictly correct to say that "Kroonstad ... is now the second largest town in the Free State," but this state of affairs has existed for thirty years, and use of the word "now" is thus a little remarkable.—Yours faithfully,
W. J. VAN ROOIJEN
Bloemfontein

How Full Employment?

Sir,—I was surprised to find, in the article in your issue of August 23rd, only a passing reference to the obstacle against full mobility of labour which is, I think, next in seeming insuperability to the housing situation.

On present day costs the outlay in moving from one house to another any great distance away must amount, at the least, to about £30; apart from the removal contractor's charges, an appreciable expenditure on the installation, replenishment and adaptation of fittings and furnishings is bound to be incurred. The worker must be very rare indeed who has such an expendable sum available, especially at a time when (perhaps for some weeks or months) he and his family have been forced to rely upon an unemployment allowance only just commensurate with, if not substantially below, the cost of bare subsistence. And although some of the expenses of removal may be met out of future income one cannot, as far as I know, pay removal contractors by instalments.

This being so, can even the incentive of an ascending step on the ladder of promotion avail anything? There is, besides, the sheer physical effort entailed in establishing oneself in a new home, which, for the busy housewife with children to care for, must amount to two or three months of unpaid overtime and for the man (very often) an even longer back-breaking period of redecorating the house or working in a virgin or neglected garden.

There is need for a detailed, factual survey of those bristling difficulties to which you refer, and of the ways in which they might be overcome. It might provide some very approximate estimates

of the cost to recruiting industries of various kinds of "transfer" grants.—
Yours faithfully,

VERNON BLANCHARD
London, W.C.2

Power Stations

Sir,—In your issue of August 16th Mr R. M. Wynne-Edwards expressed the view that the screen walls surrounding our modern power stations are quite unnecessary and he commended what seemed to him the more rational and economical arrangement exemplified in oil refineries where the industrial plant is exposed.

The two cases are in one important respect not comparable. In an oil refinery, as a highly inflammable material is being processed, the fire hazard is exceptionally great. The fire fighting services could not operate effectively if the units of oil refining apparatus were enclosed in buildings. Moreover, power stations are often situated in built-up areas and need to take account of an existing urban environment or, alternatively, when electric power is being provided for the benefit of an agricultural community, the stations should be harmoniously related to the landscape.

The comparison between power stations and cathedrals is irrelevant because the question at issue is not one of "architectural glory," but one of architectural good manners. The screen walls which help to enable a power station to be a dignified and reposeful composition represent but a minute fraction, perhaps less than one per cent, of the total capital expenditure involved in the undertaking. In insisting that all power stations erected under its auspices should have a decorous appearance the British Electricity Authority in my opinion has shown itself to be an enlightened patron of the art of architecture and has done much to raise the standard of industrial building in this country.—Yours faithfully,

A. TRYSTAN EDWARDS
Merthyr Tydfil

Thrifless Britain

Sir,—The reason why we are a thrifless nation stands out a mile. There are only two ways of saving, one is forced saving and the other voluntary saving. Forced saving can only be really successful in the slave state such as exists in Soviet Russia; free citizens by hook or crook will escape being taxed to death for the benefit of the state. On the other hand, how can you expect to get voluntary savings unless you encourage them? No citizen either individually or as a shareholder will save if his savings are taken away from him or are under threat of being taken away. In the past when we accumulated our great internal reserves, now being recklessly spent, a citizen who saved was regarded as a man to be admired, now he is regarded as a knave or a fool. The answer to successful voluntary saving lies in the hands of politicians of all parties.—Yours faithfully,

C. L. OVERTON
Burton, Cheshire

Books and Publications

Studies in Delinquency

The Young Delinquent in His Social Setting. By Thomas Ferguson. Oxford University Press. 158 pages. 10s. 6d.

Approved School Boys. By John Gittins. Her Majesty's Stationery Office. 126 pages. 4s.

The literature on delinquency among the young must be increasing even faster than delinquency itself. The first of these two books has grown out of an earlier study, also made for the Nuffield Foundation, of 1,349 Glasgow boys, who left school in January, 1947. This study, published under the title of "The Young Wage-Earner," assessed the experience of "ordinary" boys at work and the relation between this experience and their home and school background. The incidence of delinquency was one yardstick used in assessing the boys' well-being. In Professor Ferguson's new work the social and environmental circumstances associated with that delinquency have been studied in detail, together with the similar circumstances of a group of physically or mentally handicapped boys.

Mr Gittins's book is an account of the first classifying approved school (whose principal he is) to be set up in this country. He himself describes it merely as a workshop note-book. But his first chapter, giving a subjective description of the approved school boy, is remarkable for its insight and sympathetic detachment. He has contrived to incorporate just the right amount of detail to make his description ring true without overloading it.

Unlike Dr Ferguson's Glasgow boys, the boys at Aycliffe school are selected, for only a small minority of young delinquents are sent to an approved school by the courts. It would be wrong, therefore, to expect Mr Gittins's description to coincide in every respect with the picture of a delinquent built up from Dr Ferguson's statistics. For instance, delinquency was much more common among the Glasgow boys of stunted growth and underweight than among the average, whereas Mr Gittins finds the physique of his boys to be about normal. Similarly, Dr Ferguson finds a high association of blind alley jobs among his delinquent boys; indeed, he appears to regard this sort of unskilled work as a contribution to delinquency. Mr Gittins regards it rather as a symptom. An approved school boy, successfully trained for a trade, may disappoint all hopes for his future by insisting on a blind alley job, "because he is scared of the effort needed to progress in his trade."

Where, however, both agree is on the association of low intelligence and backwardness with delinquency. Dr Ferguson shows that a high incidence of juvenile crime will be found where low scholastic ability is combined with another adverse social factor. About 40 per cent of his "ordinary" boys who

were in the lowest tenth in scholastic ability were found to have been convicted between their eighth and eighteenth birthdays when they lived or worked under bad conditions.

But why do the remaining 60 per cent steer clear of crime? The danger of this sort of analysis is that people will label as causes of delinquency what are no more than factors associated with it. The danger is particularly great today because people are so worried about the increase in juvenile crime that they want to be given a clear-cut explanation of it. They expect the cause to be stated in black and white so that it can be identified and removed. For instance, someone who thinks that juvenile delinquency could be reduced if adolescents went to church or joined youth organisations may cite in support Dr Ferguson's findings: that the incidence of crime was appreciably higher among the non-churchgoers and those who were not Boy Scouts or members of similar organisations. But do these findings really prove anything more than that the good boys go to church and the bad boys do not?

Dr Ferguson is, of course, fully aware of the limitations of his analysis. He says, apropos of poor performance at work and delinquency, that it is often difficult to say which is cart and which is horse, and that a bad work record may simply reflect the innate personal qualities of the boy. But there are times when he, too, appears to believe that removal of an adverse environmental factor would of itself reduce juvenile crime, although on his own showing the delinquency rate among rehoused former slum-dwellers was as high as among boys still in the slums.

It would be quite wrong to discuss the causes of delinquency as another aspect of the old argument of nature versus nurture. Most people today recognise that both are inextricably interwoven. Dr Ferguson's analysis, and others like it, appear to be biased towards nurture simply because environmental factors can be assessed more objectively than innate qualities—other than intelligence, and even in this respect Mr Gittins shows that unmodified standard tests may not give an accurate assessment of a delinquent's intelligence. In the context of the backward child, he says some wise things about the prevention and treatment of delinquency:

A bright boy can cope with difficulties: a dull boy can succeed in a stable home. What of the very dull boy who is not mentally defective but who comes from the very unsatisfactory home? By returning him we are setting him a task

beyond his powers. . . . We have gradually developed at Aycliffe the conviction that certain boys must be permanently regarded as wards of state. . . . Some of our boys achieve it in a most undesirable way by becoming regular inmates of prisons. There is no reason why wards of state should be regarded as useless or unproductive. . . . Given a village community (e.g. on the Papworth principle) and opportunities of factory or rural employment suited to their capacity, most of these lads would probably settle down and make useful citizens. . . . The problem is not great in extent and could be solved by determined action. It must be remembered that these boys are the potential parents of the approved school children of tomorrow.

Film Personality

Mr Rank. By Alan Wood. Hodder and Stoughton. 288 pages. 20s.

In its recent and useful survey of the British film industry, PEP apologised at one point for an inevitable weakness of its approach:

It is a fault of this short chronology that in concentrating on the men and mergers—the "kings and battles" of film history—there has been neither space nor mood to bring these men to life and let them be seen as individual personalities.

This was an important proviso. Any historical and economic account of an industry that ignores the personal element is the weaker for doing so. But in the film industry, the personal factors have not infrequently been so strong as to chase ordinary economic considerations right out of the room.

Mr Wood's readable story goes some way towards filling in these essential personal considerations. In form, it is a smoothly written, enlarged magazine profile—in the tradition of *Colliers*, perhaps, rather than of the *New Yorker*—amplified with the anecdotes of which the film business supplies so flamboyant a stream. Many of the people whose names, themselves often exotic, have flashed in and out of public view in the turbulent swirl of film fortunes are here shown, if not in the round, at least in bas-relief. Without some understanding of them the odd complex of artistry, commercialism, and national expression that lies behind British film production would indeed be incomprehensible.

Mr Wood is to some extent handicapped in discussing the financial history of the Rank Organisation by his own exuberantly admitted political prejudices. As a vigorous Australian-born socialist, he likes Mr Rank personally, while disagreeing with him on "almost every conceivable point." This disagreement, but probably not the same liking, he extends to the City of London; and on points where the City has taken issue with Mr Rank, Mr Wood blithely confesses himself "peculiarly unfitted to

discuss questions of business ethics." This unfitness makes his analysis of the economic pattern of the industry less convincing than his profile of Mr Rank—though equally entertaining.

Picturesque Biography

Alexander of Tunis. By Norman Hillson.
W. H. Allen. 252 pages. 18s.

The one good thing that can be said of the blundering wastefulness of the military methods of the first world war is that those younger battalion officers who survived their years in the trenches were to provide some of the most skilful and determined British commanders of the second war. Alexander, like Montgomery and Freyberg, was one of the few who were young enough, strong enough and lucky enough to emerge from the ordeals of the Western Front with their strength and resolution unimpaired. After Loos and the Somme, the ordeal of Dunkirk or the Western Desert or the retreat from Burma were relatively light burdens to suffer personally. Even though the consequences of defeat would have been so much the greater, Lord Alexander carried his responsibilities in them with an imperturbability and calm which won admiration from Mr Churchill and from the ranks of the armies he commanded.

The course of Lord Alexander's life, from his boyhood in the County Tyrone mansion built by his great-great-grandfather out of a fortune won in the East India Company's service, through Harrow, to service with the Irish Guards in the first war, in the Baltic, Turkey and India in later years, and then to his great command—all this is faithfully set out. None of the picturesque details is omitted—such as the presence of Walter Monckton behind the stumps for Eton in the Eton v. Harrow match in which the future Field Marshal bowled with success in 1910. But there is little else beyond this faithfulness for which one can commend the book. Mr Hillson makes no attempt to delve below the surface virtues of his hero, to examine the characteristics which made Lord Altrincham speak of "something inscrutable" about him, the "life of his own beyond his career," which very few are allowed to enter. Nor does the author pose or examine the crucial decisions which it fell to Lord Alexander to make throughout his campaigns. He is, perhaps, very much a conventional figure; but he is an outstandingly able one, and he surely does not merit quite such conventional biography as this.

The Recovery of Man

The Conduct of Life. By Lewis Mumford.
Secker and Warburg. 342 pages. 21s.

In this summing up of a philosophy that has evolved through the last twenty years, Lewis Mumford offers the programme of a new humanism for the recovery of man, the unfinished animal; the final stage of whose growth rests with himself—not solely determined, like that of other animals, by his biological

past, but also controlled by his own plans for the future—and who in his realisation of death has added a new dimension to his life. For Mr Mumford does not agree with the prevalent view that man is an insignificant speck in a depersonalised universe, but believes that the universe itself is insignificant until the emergence of man, who interprets it.

He further declares that by the false logic of religions God has been placed at the wrong end of the cosmic process, and instead of an all-powerful, all-knowing providence, he opposes a God who in the long process of time emerges from the universe "as the far-off event of creation and the ultimate realisation of the person towards which creation seems to move." Thus he makes the Kingdom of God latent in nature, and man's goal the enlargement and projection of the province of the divine.

Mr Mumford believes that the curse of the modern world is a monomaniac concentration on a limited order of truth; that acceptance of the scientifically verifiable as the only basis for action, and insistence on quantitative rather than qualitative benefits, have led to the tuning of men's lives to the movement of a production belt over which they have no control, until they are faced with the paradox that their efforts after total security are propelling them towards total extermination.

We have heard this before. No one who is able to read and hear can remain in ignorance of the worldwide disintegration of society. Most writers on the subject, whether erudite or popular, content themselves with warning and admonition, but here a cure is proposed—the re-establishment of the primacy of the person. The grand human imperative is to foster life, to select higher forms of life, and to project further goals for life's development: "As a species, man has a moral obligation to be intelligent, as well as an intellectual obligation to further his own moral and aesthetic development." Man is not born free; his education is a slow induction into the possibilities of freedom. The new age will begin when a sufficient number of men and women in every land assume the burden they once sought to transfer to a single God-like man. This, for Mr Mumford, is the ultimate lesson of democracy.

It is curious that his suggestions for the rebuilding of the self bear a close resemblance to the prospectus of an English public school, where character-building through co-operation, versatility, self-reliance, initiative and manual dexterity are considered on a par with scholarship; so that the traditional education of the "historical ruling classes" whose lives Mr Mumford castigates as "vapid, boring and flavourless" embodies most of the points in his schema, while his regimen for autonomous development in the adult, by means of avoiding undue dependence on others, is so like what obtains in the normal household in Austerity Britain as to be almost a parody.

This book is stimulating for its enthusiasm and conviction, and the force-

ful presentation of old truths in a guise that might well arrest the present generation. There can be little doubt that if the one-tenth of the world he postulates would accept his programme and consciously apply it, world morale would be immeasurably raised; for Mr Mumford, its acceptance means the advance of mankind to a future of hitherto undreamt fulfilment, and its rejection means annihilation. Perhaps he is right.

Educational Broadside

Freedom and Authority in Education.
By G. H. Bantock. Faber. 212 pages.
18s.

It is a pity that Mr Bantock's symposium of his earlier magazine articles belies the portentous title he has given them, for the subject is one well worthy of serious study. Exasperated by much contemporary educational theory and, in particular, by what he regards as an undue consideration for the varying needs of the human personality, he has discharged a ragged broadside of quasi-philosophical criticism. This is all very well in its way and is, indeed, a healthy example of the dialectical swing from excessive formalism to an overdose of freedom but its effect is marred by an apparent lack of contact with children—except as found in the text books studied earnestly by students in Departments of Education. Moreover his mentors, Newman, Arnold and Lawrence, are an odd trilogy; for the first two knew about as much about small children as Aristotle knew about atomic physics and the last was an exhibitionist with a strong sense of social inferiority whose practical experience of the class-room was extremely limited. Even if it be argued that their views were based on *a priori* assumptions or that—in Newman's case—he spoke for the accumulated wisdom of centuries, it was surely unwise to ignore the social and economic conditions that provided the setting for their educational thinking.

It is, perhaps, unfair to Mr Bantock to complain that his views are largely negative. His criticism of the current concentration on means rather than ends is not only valid but written with a sprightly vigour and, occasionally, his rolling periods are interrupted by asides with which, like all competent lecturers, he enlivens an otherwise polysyllabic discourse. But the reader who endures to the final pages will be disappointed to discover that the only authority Mr Bantock can quote as a sanction is the authority of the subject and the authority of the teacher, and the latter is described both as "a representative of the human heritage and the human tradition" and as "the representative of something beyond himself." Mr Bantock must have been fortunate in his contacts with the profession. And what does he mean by asserting that there is "an authority inherent in the various aspects of human knowledge" except possibly in mathematics and the more elementary stages of natural science? Let him listen to the conflicting "authorities" in any one school when anything requiring opinion rather than a recital of facts forms the subject matter of the pupils' labours.

Bryanston, 1884

What Age did they build for?

Who could have foreseen in 1884 that the Age of the stately homes of England would vanish so soon. With confident faith, the landowners of those spacious days ordered solidity on a grand scale—and with equal good faith Cubitts built great mansions which still stand today, timeless tributes to craftsmanship and integrity. Bryanston, now a famous school, is one, whilst a modern example of traditional Cubitts work can be seen in the London University Senate House. Within

these buildings the wisdom of the past is handed down to succeeding generations—with these buildings is handed on a tradition of fine workmanship and service.

AMERICAN SURVEY

Delivering the Arms

Washington, D.C.

AUTUMN is no longer only the "season of mists and mellow fruitfulness." It is now also the time when officials of the North Atlantic Treaty Organisation get down to some sharp fighting on the size and weight of the military burdens which their various countries can be expected to bear during the coming year. This year it is also the season when the politicians and the generals must decide once and for all whether the military goals set at Lisbon for 1952, for 50 divisions and 4,000 aircraft in Western Europe, will in essence be reached before the year is out. It is a time not of mellow but of nervous reflection, for it involves something far more difficult than resolute opposition to a common enemy—an almost Marxist degree of self criticism and justification on the part of the fourteen members of the Atlantic Council.

Caught between the demands of the generals for the forces that, on military considerations alone, are considered essential for the defence of Europe, and the complaints of finance ministers and Cabinets that rearmament is imposing too heavy a burden on their countries, the natural tendency for European officials in Nato is to look for a whipping-boy in order to excuse the failure to meet the Lisbon goals fully this year, and to explain why it will be difficult, for some countries at least, to achieve as large forces next year as they had hoped. The natural tendency is to blame the shortcomings of American military aid to Europe. If the United States had made good on its promised deliveries of aircraft and equipment, it is argued both officially and in discreetly inspired articles in the European press, the European members of Nato would have been able to fulfil their commitments.

Like many arguments, this one suffers from displacement in time: what was true a year or more ago is advanced as being true today. The Military Assistance Programme got under way at the beginning of 1950 as a trickle of arms which became increasingly erratic as the demands of the Korean war burst upon the Department of Defence later in the same year. Even in November, 1951, Senator Lyndon Johnson's Preparedness Committee could report (with greater accuracy than has been contained in most of its windmill attacks on the Defence Department) that

requirements for military aid to European countries were established and schedules for deliveries adopted even before the outbreak of the Korean war. Actual deliveries, however, fell far short of these schedules. . . . When the original schedules broke down, the Office of Military Assistance found a simple solution to the problem. It merely established new schedules which provided for smaller shipments to Nato countries.

This is no longer true today. Until about six months ago defence officials at the Pentagon were labouring to balance, mostly out of stocks left over from the last war, the demands of the Korean fighting with America's obligations to its Nato allies. Thanks partly to the fact that supplies are at last beginning to flow steadily through the rearmament pipeline, and partly to the fact that the Korean theatre has not lately been consuming large supplies of equipment, the rate of delivery to the Nato countries has increased sharply. For instance, by the end of March the United States had shipped

only 9,000 tanks and 34,000 other vehicles under the military aid programme, but by the end of July it had shipped a cumulative total of 13,400 tanks and nearly 70,000 other vehicles and the rate of delivery in August and September has risen more steeply still. In the last quarter of 1951 \$356 million worth of equipment was shipped to Europe, which receives about 70 per cent of all military aid; in the second quarter of 1952 \$610 million worth was shipped.

With the output of aircraft now running at 800 a month and expected to rise to over 900 a month by the end of the year, there is little reason to question the judgment of Pentagon officials that there are now more aircraft available for delivery to European air forces than there are trained aircrews to receive them. Similarly, now that a defect in the turret mechanism of the M47 tank has been rectified, there is a substantial flow of tanks. There are still, however, many gaps in the programme. Electronic equipment is short, since no way has been found of speeding up its manufacture, and there is a long lag between the time a Nato country requests a certain kind of radio or radar set and its delivery. For reasons of morale, certain weapons and aircraft have been delivered without all the accessories needed if they are to be used. The true effect of the steel strike last summer will begin to show in the middle of the coming winter when the stocks of components manufactured before the strike have been used up.

★

But the Pentagon is prepared to maintain against all comers that in none of the 25 divisions which the Lisbon plan envisaged as being fully mobilised by the end of this year is there now a first-line unit which cannot reach its full strength because of lack of equipment which the United States has contracted to supply. If the Lisbon target is not reached, and it will not be, it is for other reasons. It is true that this assertion from the Pentagon is slightly disingenuous, since it does not cover the case of the 25 reserve divisions which are also supposed to be in a position to mobilise within three to thirty days of an emergency. For these, there is still considerable leeway to be made up in the provision of American equipment. But personal observation shows that there is probably more equipment for training purposes available to a British territorial battalion or division than to its equivalent in the National Guard of the United States, where many units have been reduced almost to the "broomstick and pike" stage in order to meet the demands of Korea and Europe.

The need to put flesh on the bones of Nato's skeleton army is at present concerning the planners in both Washington and Paris. There is no virtue in having 25 or nearly 25 mobilised divisions in Western Europe if there is nothing to fall back on. Not only must the reserve divisions in Europe

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

be adequately equipped but a network of corps, army and theatre reserves of equipment must be built up in Europe to keep the existing forces in action in the event of war. It is to this purpose that a large proportion of the next year's supply of American military aid must be devoted. For this reason it is clear that, when it has completed its autumnal wrestling with next year's military targets, the Atlantic Council will not need to demand nearly as great an increase in the number of divisions and airwings for 1953 over 1952 as it had to do for the Nato forces this year compared with last year. The public statements made by Generals Bradley and Ridgway during the past week, that progress in atomic weapons has not diminished the need for foot soldiers, seem designed to counteract any false sense of relaxation which might arise from this change.

In a sense, Britain and Europe have reason to be grateful for the fact that American military aid got off to a slow start since otherwise it is doubtful whether the idea of "offshore procurement," which is coming to play a more and more important part in the whole idea of American aid, would ever have been born. Conceived originally as a plan for manufacturing spare parts and accessories to American equipment, it is now being used to broaden the "mobilisation base" and to manufacture tanks and aircraft which could not have been financed out of domestic budgets. But if American tanks had been more readily forthcoming earlier this year, Britain would not have been able to sell its Centurion tanks to Holland and Denmark for dollars and, if the American programme for fighter aircraft had been up to schedule, the British Swift and the French Mystère would have been regarded with a less sympathetic eye by the Pentagon's purchasing experts. Yet offshore procurement, which will amount to about \$1 billion in the current fiscal year, is the largest and most direct contribution to the concept of "trade rather than aid" that the American Government is capable of making at the moment, and it has the added advantage that it can be applied with most emphasis to the two countries, Britain and France, which have the worst dollar problem of any of the European countries.

Cæsar's Running Mate

[FROM A CORRESPONDENT IN CALIFORNIA]

DILEMMAS which might baffle the most accomplished politician have been the lot of General Eisenhower ever since he stepped on the political stage four months ago. The latest is the discovery, just as his crusade against corruption was reaching its climax, that his own running mate, Senator Nixon of California, has, during the last two years, supplemented his substantial expense allowance as a Senator from a fund established by businessmen in his native state. Senator Nixon may have done nothing illegal. But many supporters of the Republican cause were as dismayed as the Democrats were delighted to find that one of their crusaders had been imprudent enough to incur even a shadow of suspicion. Some felt he should resign from his candidacy, unprecedented though this would be. This has widened the gulf between General Eisenhower's own supporters and the professionals of Senator Taft, who loudly insist that Senator Nixon has done nothing wrong. Some \$75,000 was spent this week to enable him to put his case to the country on television and radio, which he did so effectively that there is apparently no longer any question of his resignation.

Senator Nixon's defence, apart from his indignation at a "leftist smear," is that none of the money went into his own

pocket, but that all of it went on postage, clerical expenses, and other costs of keeping his name before the voters in the second largest state. Senators from big states are given handsome official allowances—Mr Nixon's was over \$60,000 a year—and are not encouraged to regard politics as a part-time occupation, as are members of the House of Commons. In fact many Senators and Congressmen do supplement their government incomes in one way or another. Mr Nixon contends, furthermore, that there is a distinction between official and political expenses, and that the tax-payer should not be asked to meet the latter. The politically fastidious may not feel that this argument quite meets the difficulty that those who pay the piper often expect to call the tune. But Senator Nixon's case is certainly not unique, and the law on political contributions is so unrealistic and out-of-date that it is often difficult to draw the line between proper and improper conduct.

A more experienced and self-reliant politician than General Eisenhower might have acted, in this crisis, without waiting for the response to Mr Nixon's broadcast, and thus avoided the appearance of putting political expediency before the merits of the case. But to the professional politicians, the main question is whether Mr Nixon's usefulness has been impaired and, in particular, whether he can still be relied upon to carry the important state of California for the Republicans. This was one of the reasons why he was chosen, though his youth, the fact that he is one of the new generation of ex-servicemen, and his vigilance and success on the anti-Communist front at home all helped. With Senator Nixon on the team, General Eisenhower had not expected to have to do much campaigning in California.

Although California has a Republican Governor and both its Senators are Republican, it has gone Democratic in the last six presidential elections. Even before his present troubles, therefore, Mr Nixon laboured under handicaps. One is the fact that registered Democrats outnumber registered Republicans in the state by about 1 million. Even so popular and bi-partisan a leader as Governor Warren failed to win it for the Republicans when he was their vice-presidential candidate in 1948, although the Wallace Progressives deprived the Democrats of 190,000 votes. The Republican total was 1,895,000, the Democratic 1,913,000. Another of Mr Nixon's difficulties is the split within his own party in the state, roughly between the conservatives of the south, from which the Senator comes, and the Warren progressives in the north. Mr Nixon himself lacks experience in state politics.

Party lines are not solid in California, where local offices are filled on a non-partisan basis and candidates for national state offices are allowed to seek, and often secure, the nominations of both major parties. Governor Warren and Senator Knowland, both of whom came up through the Republican ranks, have only succeeded in remaining in office by winning the support of registered Democrats through this practice of "cross-filing." Mr Nixon must also attract Democratic votes, but he must keep his Republican following intact too, and what supporters of Governor Warren consider the Senator's disloyalty before the Republican convention has cost him a voice of authority in the Republican state organisation. Mr Nixon, an ardent supporter of the General although he was a member of the Warren delegation, questioned 20,000 of his constituents about their second choice for the presidential nomination. The results, strongly favouring the General, were allowed to leak out and damaged

Governor Warren's chances as a compromise candidate. Such tactics still rankle, but Governor Warren has supported Mr Nixon in the campaign, and national attacks on their Senator may help to close the Republican ranks in California.

To develop a state-wide following, and make himself better known, Senator Nixon has resorted to short-cuts. He has relied on an extensive public relations programme, to an extent never before used; lavish posters, extensive mailings to individual voters, and well-timed feature stories in the national glossy magazines have emphasised the Senator's homespun background in the citrus belt section of southern California, his Quaker faith, his success in college, and his career in the Navy. Such personal campaigns require heavy financial backing. Senator Nixon, who is now only 39, entered politics by becoming the hand-picked candidate of a group of business leaders in his home town of Whittier, to run against a New Deal representative, Mr Voorhis. The personable and eloquent young lawyer and ex-serviceman won the committees' immediate approval, and went on to win the election. He was re-elected to the House in 1948, and in 1950 ran for the Senate, defeating the Democratic candidate, Representative Helen Gahagan Douglas.

In all of these campaigns Senator Nixon's managers have stressed his role as a pursuer of subversives. His success, as a member of the House Un-American Activities Committee, in bringing Mr Alger Hiss to justice has been told over and over again, and recorded for broadcasting with full regard to all the dramatic and bizarre details of the case. In each campaign it has been insistently implied that Mr Nixon's opponent was indifferent, if not actually sympathetic, to Communist infiltration. The instances in which Mrs Douglas's votes in Congress coincided with the Communist line were stressed; those in which they did not were overlooked.

This year, Mr Nixon's campaign managers, who include some of the most successful public relations counsel in the most public relations-minded part of the country, hope that their candidate can continue to run against "Communism and corruption," and make it unnecessary to air his rigidly conservative voting record, which might alienate independent and Democratic voters. Senator Nixon was a framer of the Mundt-Nixon anti-subversive Bill of 1948, later incorporated in the McCarran Act. On corruption, he has favoured freeing grand juries from political control and he advocated the resignation of the chairmen of both the Democratic and Republican National Committees last winter when both were under scrutiny for using their influence to secure government loans for favoured clients—a precedent now being brought to his attention.

On other issues, Mr Nixon and his managers are reticent, though his voting record contrasts sharply with that of Mr Sparkman, the Democratic vice-presidential candidate, and the voters are thus offered a clear-cut choice. In the foreign field both are internationalists, though Mr Nixon has adopted the orthodox Republican attitude of accusing the Administration of "losing" China and bringing on the Korean war without being willing to win it. At one time he advocated Atlantic Union and he has supported the United Nations. But on domestic issues he has almost unfailingly represented the conservative element in California, voting for exemption from the anti-trust laws for railways, against forcing businessmen to accept lower prices, to limit public housing programmes, against government development of hydro-electric resources, and for ownership by the states,

rather than by the federal government, of underwater oil. He was one of the original framers of the Hartley Bill, which became part of the controversial Taft-Hartley labour law. With justice, the organiser of Mr Nixon's fund commended him as the "best salesman against socialism . . . and government control."

Mr Nixon's strongest financial support comes from industrial, utility, and oil interests in southern California, most of which find the brand of Republicanism popular in the north and symbolised by Governor Warren too liberal. His problem is to capture the independent and centre vote. Seasoned observers think he will do this in southern California, but that his chances in the rest of the state are not bright enough to warrant any confident claims. Only if the campaign is centred on the Communist issue is it likely that Senator Nixon can deliver to the Republicans any substantial number of votes from the trade unionists, young voters and habitual "floaters" who make up so much of the electorate in the valley towns and bay cities of the state.

American Notes

Stevenson's Seminars

Governor Stevenson's treatment for the voters—a few witty exercises at the Republicans' expense to limber up his audience, followed by deep massage of a particular political issue—has the rival doctors worried. They are claiming that the Governor's light touch shows him to be a quack unable to take politics seriously. It is an argument that would carry greater weight if the Republican candidate were offering more effective prescriptions, but General Eisenhower seldom recommends specific cures for the critical national illnesses he diagnoses. Vague generalities are well suited to short talks at the railway whistle stops where the

NEW YORK . . . 70 Broadway

General has been received with great enthusiasm, but something more detailed is needed in major speeches.

The only occasion recently on which the General has provided something more was when he addressed the American Federation of Labour. But he had no hope of winning this audience, however constructively he might discuss its complaints and however attentively it might listen, unless he repudiated the Taft-Hartley Act, and he could go no further than to agree that it should be amended. This was once Mr Stevenson's position, but now he is for complete repeal, one of the few concessions he seems to have made to political expediency, and one which has gained him the formal endorsement of the AFL, the first time that its convention has supported a presidential candidate officially.

So far in his series of seminars for voters Mr Stevenson has dealt, in an open-minded and creative way, with foreign policy, Communism, atomic problems, inflation and the South. In picking up this, his party's hottest potato, at Richmond, Virginia, he gave one of his most effective displays of courage and imagination. Refusing to yield an inch on the question of federal guarantees for Negro civil rights, Mr Stevenson recommended that the question be dealt with by reason, not by recrimination. Reason showed that minority tensions were basically an economic and cultural problem and one that had been fostered by Republican prejudice and pride. It was the Republicans, he insisted, who had turned the South into a colony of the North and it was the Democrats who were reuniting it with the nation, which as a result was seeing "the richest flowering of a great region" it had ever witnessed.

In his effort to induce the South to turn this resurgent vitality to the political as well as the intellectual and economic benefit of the rest of the country, Mr Stevenson paid special tribute to southern statesmanship and talents for government. One southern statesman, however, Governor Byrnes of South Carolina, once a leading member of both Mr Roosevelt's and Mr Truman's Administrations, had just shown that with him personal resentment came first, by declaring that he would vote for General Eisenhower. He had been dithering for a long time and South Carolina is unlikely to follow his lead. The Republican chances are better in the other states, Texas and Louisiana, whose Democratic Governors have also deserted to the General.

Locked Out

Mr Charles Chaplin, who has made generations laugh and cry, and has often been locked out on the screen, is in danger of being locked out in real earnest. No sooner was he on the high seas, on his way to visit England, his native country, than the Attorney General, Mr McGranery, announced that there would be an investigation to determine his fitness to be readmitted to the United States. As an alien, despite his forty years' residence, Mr Chaplin has no automatic right to re-enter the country. The re-entry permit granted to him is merely proof of residence.

Mr Chaplin, who is well provided with expensive legal advice, can hardly have walked into the trap with his eyes shut. For years there have been murmurs of resentment at his refusal to become a citizen of a country which has treated him handsomely. He has often been accused of subversive associations, though he has always denied being a member of the Communist party. The paternity suit he lost in 1944 left an ugly taste in many mouths—moral turpitude is a cause for exclusion, though apparently not the one on which Mr McGranery expects to rely.

If the Department of Justice has the evidence its spokesmen claim of Mr Chaplin's association with Communist-front organisations, it need not have waited for him to turn his back before launching its thunderbolt. Indeed, under the

McCarran Internal Security Act it is mandatory for the Attorney General to deport any alien who at any time has joined a "subversive organisation." Mr McGranery himself quite possibly relishes bringing to a head a long investigation, proving himself a new broom after Senator McCarran's heart, and providing an answer of sorts to the Republican charge that the Administration is sympathetic to subversives. It is more difficult to imagine that Mr Truman would have any enthusiasm for such a case, unless he imagines that the attention it would command might help to rally public opinion and halt the wearing away of the rights of resident aliens by the Security Act and the more recent Immigration Act. Most liberals consider that the powers of deportation and exclusion of aliens given by these laws to the Attorney General are a serious danger to civil liberties. The inquiry may come to nothing, or be dropped by the new Administration. If it is not, Mr Chaplin, who has friends and wealth to fight his battle, and a welcome elsewhere if he loses, may yet have an opportunity to strike a blow for the dispossessed with whom he has such sympathy.

* * *

Coal's Next Hurdle

Where Mr John L. Lewis is concerned nothing ever happens as expected, at least not as other people expected. Last week's unexpected development was the settlement of the coal dispute just as a work stoppage was about to begin in the northern fields, which produce nearly half the country's soft (bituminous) coal. The northern operators, it had been reported, had little objection to a strike which would reduce the excessive stock of coal above ground, but at the last moment they seem to have decided that, since they would have to accept Mr Lewis's terms sooner or later, it might as well be sooner. The terms in their turn were unexpectedly straightforward, without the complication of a share-the-work scheme or even of shorter hours. There were two main clauses: an additional 10 cents for every ton mined to go to the welfare fund, bringing the total contribution up to 40 cents a ton, and an increase of \$1.90 in the basic daily wage of \$16.35.

IN THE SOFT COAL MINES

This works out at 32 cents an hour, and will take average hourly earnings above \$2.50; on an hourly basis it is half again as much as Mr Murray got for his steel workers and is far more than Mr Lewis has ever won before. It is also far more

one
inch
thick...

...155,000 MILES LONG!

They are less than the thickness of a child's wrist, these underwater telegraph cables that link five continents. They do not seem elaborate, consisting as they do of copper conducting wire, insulated by gutta percha, bedded in jute, sheathed in galvanised steel. Their average diameter is barely an inch. But they carry in complete security the messages entrusted to Cable & Wireless Ltd. for passing between the United Kingdom, the Commonwealth and many foreign countries. There are 155,000 miles of them down on the sea bed, more than half of the world's total of submarine cables.

The traffic load they have to carry is heavy and there are times when their capacity is fully occupied even though transmission can be made at speeds up to 150 words a minute in both directions simultaneously. Nothing stops the flow;

if a cable link is interrupted, a wireless link takes over. Continuity of service is maintained through the world-wide chains of Cable & Wireless stations by a staff whose professional pride it is to see that "the message gets through".

The Cable & Wireless system is extensive and its links are varied. It includes 195 wireless circuits for telegraphy, telephony and phototelegraphy. Twenty-five of them were new last year. There are twenty-three coast wireless stations: there are eight cable ships.

In the face of ever rising costs of labour and materials the Company has made solid progress in extending Britain's incoming and outgoing communications. Its operations in foreign countries are earning money for Britain, and further extensions are proposed. Cable & Wireless Ltd. are part of Britain's Business.

part of Britain's Business...

CABLE & WIRELESS LTD

ELECTRA HOUSE, VICTORIA EMBANKMENT, LONDON, W.C.2

than the coal operators in the south, where the industry is doing even less well than in the north, say they can pay without being forced out of business altogether; nevertheless it seems likely that they too will come to an agreement before October 1st, the deadline for a strike in their area. But Mr Lewis has another hurdle to get over before he has won this year's wage race: the agreement must still be approved by the new Wage Stabilisation Board. It will also be a hurdle for the board, its first, and the decision will be nearly as important for its future as was the steel ruling which brought its predecessor down.

The new board has power only to make recommendations, not to intervene in labour disputes, but if it decides against the coal settlement and if its recommendation is accepted by the Economic Stabiliser, it will be responsible for a labour dispute—a coal strike. For this reason the board will try to find reasons, as it is permitted to do, why the coal miners are entitled to special consideration. The board can hardly approve the increase if it adheres strictly to the standards it has set for itself. Its basic regulations permit a wage rise of 10 per cent over January, 1950, and a further cost-of-living rise, about 6 per cent at the moment, equal to the rise in the consumers' price index since January, 1951. The miners had an increase of about 4 per cent in March, 1950, but they had been striking for it off and on for months and, for stabilisation purposes, it will probably be regarded as having been granted in 1949. But in January, 1951, coal miners' wages went up another 20 cents an hour, just about the permitted 10 per cent. This leaves Mr Lewis with only 6 per cent in hand, a good deal less than the latest rise.

Trimming Sails in Massachusetts

A gust of indignation swept Massachusetts, the Bay State, early this month, just before the primary elections in which members of both parties chose their candidates. The Federation of Taxpayers Associations, poring over the statute books, discovered an amendment to the Retirement Act, adopted this year by a Republican Senate, and Democratic lower house, and signed by the Democratic Governor, which increased pensions for state legislators. It also related them to the highest salary earned in public office of any kind, a provision which would have entitled the controversial Mr James Curley, who sat in the legislature fifty years ago and has since sat in the Governor's chair as well as the federal penitentiary, to a pension of \$12,000 a year. The scandal was a much-needed windfall for Mr Herter, the Republican who is running against Governor Dever for the governorship. He forced Mr Dever to call a special session and the legislators sat up into the small hours of election morning to repeal their ill-advised generosity.

In the primary, not many more than the usual quota of sitting members were turned out, but the incident seems to have damped the enthusiasm of his own party for Governor Dever. He could not be defeated, as he was running unopposed for the nomination, but he did not do nearly as well as Mr John Kennedy, the Democrat who is hoping to displace Senator Lodge. It is for Mr Kennedy's sake, rather than for the virtually certain sixteen electoral votes of Massachusetts, that Governor Stevenson recently campaigned in the state, twitting General Eisenhower, where Irish Catholic votes are so important, with his admiration for Cromwell. Massachusetts has faithfully supported the Democratic candidate for the Presidency ever since 1928, although its two present Senators are Republicans.

General Eisenhower is expected next month, and there is talk of his winding up his campaign in Boston, though it is the most solidly Democratic of the big cities. This would be a pleasant expression of his gratitude to Senator Lodge, whose efforts helped to win the General the nomination at Chicago. Until General Eisenhower's reconciliation with

Senator Taft, there had been fears that Senator Lodge would pay for his enthusiasm; diehard Taftites were threatening to vote Democratic, or not to vote at all. Senator Lodge, a liberal, has long been at odds with Senator Taft on foreign and domestic issues, but he was reduced to promising that, if he were re-elected, he would not make a second effort (he failed in 1949) to take the chairmanship of the Senate Republican Policy Committee away from Mr Taft. He has explained that he was not "against Taft, only for Ike."

Senator Lodge is too progressive for Mr Kennedy's New Deal record to tell and, unless there is a Stevenson landslide in the state, Mr Lodge may hang on. But Mr Kennedy has the advantage that, as the son of a prominent Catholic family (his father was once the Ambassador to Great Britain), he may win away some of the Catholic votes which Senator Lodge, though a Protestant, has secured in the past.

Wolf in Wool's Clothing

American wool growers, alarmed by the inroads which the new man-made fibres threaten to make in their traditional markets, have asked the Federal Trade Commission to examine their rivals' claims that the new fabrics "outwear and outperform" wool. They do not even concede that imitation is the sincerest form of flattery; they would like to prevent the makers of the new synthetics from using names such as worsted, a practice which they consider deceives and confuses the public. Some spokesmen for the synthetic industry are willing to admit that enthusiasm for the new "miracle" fibres has, on occasion, out-run the facts. But on the whole they feel that their claims, particularly for the "engineered" blends of synthetics with wool and cotton, are well justified.

Wool has yet to share the reviving demand for textiles, which, as retailers and consumers exhaust the stocks accumulated in 1950 and 1951, is encouraging rayon and cotton plants to reopen and work longer hours. The Department of Agriculture believes better times for wool are also coming. But the wool growers are afraid that in the long run the new fibres will establish themselves in the carpet and men's clothing fields as firmly as they are now settled in women's clothing. Blends of Orlon and cotton appeared this spring on Fifth Avenue in light-weight men's suits, which it was claimed kept their sharp crease through innumerable tubbings and needed only the occasional touch of an iron. Blends of wool and Orlon, the du Pont Company's latest test-tube fabric, are on the market this autumn in men's suits. The American Woollen Company, the last great stronghold of all-wool, revealed, after a disappointing fall in earnings, that it has surrendered and will make blends of wool and Orlon for the civilian clothing industry; it has long done so for the military.

Competition from the new fibres is restrained today by their cost and limited supply. But commercial plants are replacing the pilot-plants of yesterday. The government, which is giving tax concessions to encourage the expansion of nylon, the only man-made fibre which the armed forces want in quantities greater than can be provided at present, turned down virtually all applications from makers of the "miracle" fibres. A government spokesman noted that most of the \$177 million worth of new plants concerned were already under construction in any case.

Wool growers are not only threatened from one direction. This autumn "all-the-year-round" cottons, which have the appearance, though not the warmth, of wool and the brightness and washability of cotton, are making headway in the shops. And the invention of a tufting machine has produced cotton carpets which look like wool, even though they may not wear so well, and are considerably cheaper. It is not surprising that wool growers, in a year when military demand has fallen off, are anxious to exploit every advantage which the tariff and the "Buy American" Act give them.

THE WORLD OVERSEAS

Kashmir Seen from Karachi

(From Our Correspondent in Pakistan)

THE Kashmir dispute, nearly five years old, now returns again to the agenda of the Security Council with Dr Graham's report of his failure to achieve an agreement. His patient—perhaps too patient—attempts at mediation broke down for the same reasons as before: India would not agree to his proposals on either the strength of the forces to be maintained on both sides in the state or the induction of the plebiscite administrator. Eighteen months have been wasted, for it is evident that no progress whatsoever has been made since Dr Graham was appointed by the Security Council resolution of March 30, 1951. Moreover, the delay has been detrimental to Pakistan, for during the intervening period India has continued to consolidate its hold over the better part of the state. The so-called Constituent Assembly of Kashmir has, in defiance of the Security Council, resolved on accession to India, Mr Nehru has been able to claim that that accession is complete, and Sheikh Abdullah has had time to enhance the popularity of his administration by social reforms.

It has of course been clear, to Pakistan if not to the world, that playing for time has been an integral and important part of India's whole policy in regard to the dispute. Mr Nehru, or those speaking to his brief, said "No" to the United Nations Commission's arbitration proposal of August, 1949, though it was endorsed by President Truman and Mr Attlee and accepted by Pakistan. He said "No" to General McNaughton's proposals of December, 1949, which Pakistan again accepted. He said "No" to Sir Owen Dixon's scheme in July, 1950, though Pakistan was at least prepared to discuss this. He said "No" in January, 1951, to the three alternative proposals put forward by the Commonwealth Prime Ministers at the London conference, all of which were accepted by Pakistan. And now he has said "No" to Dr Graham.

Counsels of Despair

One thing at least is now certain, and that is that there is no place for any further attempts at negotiation or mediation. The Security Council can no longer postpone the evil day of decisive action. It has become fashionable, both in Karachi and elsewhere, to say pessimistically that the Security Council can and will do nothing. A pronouncement by Mr Daultana, the young and ambitious Chief Minister of the Punjab, is typical of the Pakistani attitude. He urged that the Pakistan Government should sever its connection with the United Nations without further ado, on the ground that that body is dominated by the Anglo-American bloc which will never see justice done at the expense of India.

But is there need for any such counsel of despair at this stage? After all, very substantial headway was made by the deliberations of the Security Council in March, 1951; the resolution adopted on that occasion committed it to call upon the parties to accept arbitration upon all outstanding points of difference in the event of their discussions with the United Nations representative failing to result in full agreement. Presumably the Council will not retreat from this position, and there is no reason to believe that the governments of the great powers intend to change their tune. During that memorable debate Sir Gladwyn Jebb, the representative of the United Kingdom, urged, with the support of the repre-

sentative of the United States, that arbitration in the form proposed could not in any way act to the detriment of the Government of India's rights and responsibilities. "Indeed," he added, "in a matter such as this, where an international agreement exists between two governments, it seems to us to be the only right course to accept arbitration on differences concerning its interpretation and application." Assuming, therefore, that the Security Council proceeds according to plan, we must expect Pakistan to agree to the proposed arbi-

tration (for it has always welcomed the idea) and India to refuse. What comes next? The general belief seems to be that the Security Council will simply fold up, as far as this dispute is concerned, and lapse into impotence. The ultimate result might well be war between Pakistan and India.

As a matter of fact, this must be one of the simplest disputes ever to come before the Security Council. No question of the merits of the claims of India and Pakistan is, properly speaking, at issue, for both sides have accepted, and repeatedly declared themselves in favour of, the proposition that the future of Kashmir shall be decided by a plebiscite. All that the Council has to do is to perform the mechanical task of ensuring a fair plebiscite under United Nations' supervision. This involves, as Sir Gladwyn Jebb emphasised in the March, 1951, session, the removal or disbandment of the military forces of all interested parties and their replacement by United Nations' forces which can have no interest to sway the vote either way. "As a principle," he said, "this seems to us so axiomatic that we can hardly believe that it will not be accepted by the Council and by those immediately concerned."

Mr Nehru's objection that, if Indian forces are withdrawn, the country will lie open to invasion by Pathan tribesmen can surely have no validity if the peace is to be kept by the United Nations' forces, which would take the place of the Indian and Pakistani forces on both sides of the cease-fire line. Pakistan in any case could hardly be expected to take the opportunity of invading Kashmir just when it had achieved its objective of securing fair conditions for a free plebiscite. If India refuses to accept arbitration on these comparatively minor disagreements on matters leading up to the plebiscite, the Security Council will have to prove its worth and act firmly.

Blue Print for Europe's Constitution

THE *ad hoc* constituent assembly that is to draw up a federal constitution for the six European countries belonging to the Coal and Steel Community and the proposed Defence Community met this week for the first time and appointed a small working group to get down to business immediately. In drafting a constitution for a European political authority, it will be breaking new ground; but as the accompanying chart shows (in simplified form) the road to European co-operation and integration is already thickly studded with organisations of different shapes and sizes, and of various capabilities and potentialities. They range from the Council of Europe, with its purely advisory functions, to the Defence Community (not yet actually in being) whose proposed common budget will—quite apart from its military provisions—make a definite inroad into the national sovereignty of member-states.

The relations between these organisations are equally varied. In the case of the Atlantic Council and the organs of the Defence Community, for instance, close links are formally provided in the treaty setting up the EDG. In other cases, more informal links are provided by the submission of reports from one body to another; and in other cases, still more tenuous links are formed by partial or wholly common membership. Between the Atlantic Council and the OEEC quite an important connection exists through the provision of background information for the Council by the OEEC's economic experts.

In adding yet another to the multiplicity of European organisations, the constituent assembly has no very specific brief on which to work. The Foreign Ministers of France, Italy, Germany, and the Benelux countries have defined its objective as

the establishment of common bases of economic development and a merging of the essential interests of the member states. And they have instructed the constituent assembly to study the constitution of a new assembly

elected on a democratic basis in such a way as to be able to form part of a subsequent federal or confederal system based on the principle of separate powers and, in particular, on a bicameral system of representation.

The constituent assembly also has before it the report of a committee of jurists headed by Professor Dehousse, of Liège University, which was asked by the Council of Europe to explore the legal problems of European federation. This

report is cautious and tentative in many of its conclusions and for some problems provides alternative solutions. But, unlike the six Foreign Ministers, it comes down firmly in favour of a federal (as opposed to a confederal) community, to which member states will make a real surrender of sovereignty.

The Dehousse report suggests a bicameral legislature. The first Chamber should be elected by direct popular vote and its members should regard themselves as the representatives of Europe, not of their own countries. The second Chamber,

which will represent the member-states, should be appointed by the national governments or by the governments and parliaments jointly; it should have no unanimity rule or right of veto. The executive, elected jointly by both Chambers, could, it is suggested, be modelled on either the Swiss or the American models, but the jurists show a preference for the former in which no one person plays the dominating role of the American President. They also believe that there will have to be a strong court of justice on the lines

THIS EXAMPLE of one of Honoré Daumier's famous caricatures of bourgeois society first appeared in the French comic journal *Charivari*. The title of the picture is a pun on the name of the subject, Baron Joseph de Podenas.

Daumier, who was born at Marseilles in 1808, often modelled his subjects in clay before drawing them on lithographic stone. His satirical drawing of King Louis Philippe as "Gargantua", which was published in *La Caricature* led to his imprisonment for six months.

That Daumier's work continued to appear even after his imprisonment epitomises the traditional freedom of the Press in a free world. In contemporary times the caricaturist continues to satirise public figures with no hindrance except the censorship of good taste exercised by the Press itself.

Today the newspapers and journals of the free world, with their immense facilities for obtaining news and information, bring the searchlight of knowledge and comment to bear on world-wide affairs which otherwise might be conducted (and in countries where news is censored are so conducted) behind a curtain of secrecy. With a free press at his disposal no literate person need today be ill-informed.

Many hundreds of newspapers published in many countries throughout the world are supplied with paper by the Newsprint Division of the Bowater Organisation.

200,000 BAKING TINS by WARWICK

The large-scale introduction of strong, light hygienic aluminium to the food industries has been the main pre-occupation of the WARWICK PRODUCTION COMPANY since 1945. Two hundred thousand baking tins for the bread-making industry is a typical effort.

ENTERPRISE IN ALUMINIUM

Warwick Production Co. Ltd., of Saltisford, Warwick, is one of the manufacturing companies of the ALMIN GROUP; a sister company to SMD Engineers of Slough, who built the Aluminium Structure of the Dome of Discovery and the world's First All-Aluminium Aircraft Hangars at London Airport.

of the American Supreme Court, to decide on any conflicts of authority between the community and the constituent states.

The Dehousse report suggests that the new community should not try to embrace too much power at once. Since the need for security against external aggression is the overriding common interest of the six nations, it proposes that the community should at first confine itself to defence. This would to a large extent involve control of foreign policy and the right to raise an appropriate revenue. The jurists consider that it would be wiser to postpone integration in other fields such as customs, foreign trade, currency and communications, but that the community should be given authority gradually to bring about integration in these and other spheres, subject in each case to the approval of the national parliaments concerned. In view of the immense complications involved in any economic or financial integration, this approach is probably right. But if the community is going to eschew all economic powers at first, it is not easy to see how the Coal and Steel Community is going to be fitted in. And in the field of defence, not the least difficult part of the constituent assembly's task will be to fit the new community into the wider Nato set-up. Nato has no supra-national powers, but it is already in the middle of a comprehensive task of defence planning. Similarly, at a later stage, the community can hardly move on to economic integration without forming some stout link with the OEEC which has already studied closely the problems involved.

Towards Sudanese Self-Government

WHEN the Sudanese Government Statute was drafted in Khartoum in the spring of this year, a schedule of dates was laid down for its amendment and passage into law. From the date of its communication by the Governor General to the co-dominion—Britain and Egypt—six months were to elapse. If in that period neither had objected, the Statute was automatically to become law. The date of communication was May 8th, and the six months are therefore up on November 9th. No answer or comment has yet been made by either government. It is not difficult to guess that their answers are the topic which General Nguib and the British Ambassador in Cairo are discussing during their conversations this week.

Egypt's position has somewhat altered with the recent change of regime. In the first place, ex-King Farouk's claim to sovereignty over the Sudan is no longer actual; in the second, the reserve displayed by the champions of Sudanese independence who talked with the Hilaly and Sirry governments in the summer revealed to Egyptian politicians a fact that most did not know before—that many Sudanese do not want to be politically linked with Egypt and that if the Egyptians want a connection, they must pay more respect to Sudanese aspirations than they have been wont to do. General Nguib knows the Sudan better than any of his predecessors did. Yet he is in a difficult position. If he delays an answer to Khartoum, a Sudanese constitution that Egypt does not like will become law. Yet if he offers amendments to it he flies in the teeth of much past Egyptian policy that was popular with the crowd; he admits to a status as co-dominus that his predecessors of the Wafd abrogated when they denounced the condominium agreement of 1899 and the Anglo-Egyptian treaty of 1936. Neither the British nor the Sudanese governments recognise this unilateral denunciation. In their eyes Egypt is still co-dominus. In the interest of good Egyptian relations both with the Sudan and with Britain, it would be as well, therefore, if the General can be helped to devise some association of Egypt with the new

arrangement—that is, for the period between November 9th and the Sudanese pronouncement on self-determination which is likely to take place in 1953.

Since *The Economist* last told the tale of the draft constitution in its issue of November 24, 1951, that document has undergone vicissitudes. It will be remembered that the Sudanese Constitution Amendment Commission, its work almost completed, broke down on an irrelevant issue. Its British chairman subsequently produced a report that served as a basis for discussion in both the Sudanese Executive Council and Legislative Assembly; the outcome of this was the document sent to London and Cairo in May. This draft statute, which is intended to cover the period until the Sudanese "decided freely for themselves the time when, and the method by which, their right to self-determination shall be exercised," provides for the following apparatus of government: a fully self-governing parliamentary democracy with a cabinet system of government; an all-Sudanese cabinet; a two chamber parliament of which the lower house is to be wholly, and the upper house three-fifths, elected; and a British Governor General as head of the State. This last will have powers less than at present, since he is entitled to act only upon the advice of his ministers except on four reserved matters; these matters are foreign affairs, civil service contracts, the affairs of the Southern Sudan and "in time of crisis," when he is empowered to act "either constitutionally or financially or if law and order are gravely menaced." Naturally, these last provisos furnish all those who are opposed to continuance of any British influence in the Sudan with plentiful arguments about disguised maintenance of British imperialism. Egyptians, though they said nothing official because of the legal stand they had taken, let it be known privately how greatly they objected to the suggestion that the Governor General would be, even temporarily, "head" of the state. Elections for the new chamber are due to take place as soon as the electoral lists are completed; these are not yet quite ready, but will be soon after the rains which are now coming to an end. Before the rains began, several parties had started electioneering.

Confused Party Scene

The party scene in the Sudan, always confusing, has become even more so as a result of this year's vicissitudes in Egypt which have somewhat altered the views of pro-Egyptian and even of anti-Egyptian parties. At one time the Umma party, standing for independence and following Sayed Sir Abdel Rahman el-Mahdi Pasha, was the only important group favouring complete severance from Egypt, while the Ashigga was the chief of the unity parties. (Ashigga vehemence used to wax and wane with the volume of financial assistance it received from Cairo.) The folly of the Wafd in claiming complete dominance over Sudanese affairs altered this picture, and called forth groups which, while not wanting Egypt, did not for sectarian reasons want Mahdist leadership either. The instability of Egyptian politics in 1952 accelerated this trend; at the same time, Sir Abdel Rahman's willingness to talk with a succession of Egyptian governments confused many minds in the Sudan. He had always been regarded as an adversary of the Egyptian crown; suddenly, his adversaries were faced with the fear that he might, while abroad, do some deal whereby sects other than his own would find themselves worsted.

A situation has therefore arisen in which the Umma is not the only party favouring independence; others of that mind are a Sudanese Republican party and a group of Khatmia—that is, orthodox Moslem and anti-Mahdist sectarians; it is an open question whether these two groups, if they were to join forces, would outnumber the Umma supporters. All combined now certainly outnumber the groups favouring union with Egypt, though not necessarily the groups which are simply anti-British, and would prefer to conduct their march towards self determination under international, not

British auspices. The chief of these last is a body that calls itself the United Front for Sudanese Liberation, which consists of organised labour, some unions of officials, the Ashigga and the Unionists; it stands for non-co-operation with any Sudanese government that works upon British suggestions, and is therefore bound to boycott the elections when they occur. The Umma party, which has the great merit that it has taken part in the government at every stage, in the years of progress towards autonomy, will certainly take part in them. Whether or no other parties do so may well depend on how much they suspect—a wholly mistaken suspicion—that Sayed Sir Abdel Rahman el-Mahdi Pasha has undertaken his present grand tour to London and elsewhere in order to fix matters in his own favour. In the interests of a workable democracy it would be a good thing if all were to go to the polls.

Looking ahead, therefore, there are grounds for anxiety both as regards Anglo-Egyptian relations and as regards internal peace in the Sudan. If General Neguib cannot see his way to offering or accepting some participation in future arrangements (such as a seat on an international commission of the kind that has been several times suggested for supervising matters during the elections and after) Anglo-Egyptian relations are bound to suffer. And if Sudanese self-government is born lopsided because most parties boycott the elections, democracy is bound to fail. No one can regard its chances as rosy. In almost every neighbouring underdeveloped state, it has failed, and given place to dictatorship. Yet since all Sudanese want it, and since they cannot, for sectarian reasons, agree upon a monarch, there is no alternative but to try it.

Norway in Nato—II

The Economic and Political Background

[FROM OUR SCANDINAVIAN CORRESPONDENT]

SINCE the war Norway has been spending on defence an average of 3 per cent of its national income each year. At first sight this seems rather a small percentage, but the comparative poverty of the country and the peculiar difficulties and high cost of making good the heavy war damage, especially in the far northern county of Finnmark, make the Norwegian contribution somewhat larger in real terms than its statistical rating might suggest. Norway has no idle resources, no surplus industrial capacity to devote to rearmament. Most important, it must for practical purposes get all its weapons and equipment from abroad. Thus the Norwegian effort is designed primarily to produce men and facilities capable of putting to their best use the arms and equipment it receives as a member of Nato.

Norway's chief contribution to Nato is, strategically speaking, the provision of important air and naval bases and of the forces to guard them. Economically speaking, therefore, the strain is twofold. There is the increased cost of larger forces and, secondly, there are the claims on labour and resources made by the military construction programme. Some idea of the size of the first of these components was given in a previous article. The effect of the second must now be considered.

It can be said straightaway that the military construction programme is within Norway's capacity and does not impose a particularly large strain on its resources. But it does mean that cherished schemes for rehousing many people will have to be postponed for several years. As the Finance Minister said in his Budget Speech on January 13th:—"Broadly speaking, defence will be the central task in the next two or three years." The very competent white paper issued

by the Defence Department to explain the present programme estimates that in 1951-52 about 3.7 per cent of the total working population was engaged in defence work of all kinds, while the figure for 1952-53 will be about 4.6 per cent. The numbers of military personnel and civilians employed by the Services will rise from 46,400 to 53,000. Corresponding figures for both civil and military employees working on defence construction are 9,209 and 15,359 respectively—which means that in 1952 defence needs will take about 7.8 per cent of the available building labour. Nor are the claims on building materials much higher—8.3 per cent of the building timber, 10.7 per cent of the cement and 6 per cent of the building stone produced. There have, it is true, been reports that with the aim of completing certain projects in North Norway, particularly airfields, as soon as possible, wages were being offered which upset the labour market and caused difficulties for local firms. Investigations by the Defence Ministry, however, showed that there was little substance in such accounts: and, in any case, military construction work in North Norway is welcomed to offset local unemployment.

On a broader view, and overlooking any benefits arising out of the improved communications which military needs have created, Norway's economy—its production and its trade—is little affected by defence plans. It is estimated by the Defence Ministry that, in the three years ending in July, 1954, present plans will call for an expenditure of Kr. 343 million in foreign currency, of which just over Kr. 29 million will be in dollars. Against this must be set payments by the Mutual Security Agency for the expansion of the country's two small ammunition factories, the reconstruction of the main naval dockyard, the establishment of an ultra-short-wave link between Stavanger and Bergen, the construction of five minesweepers and various similar projects.

Anxiety Over Exports

The general trend of Norway's trade, however, gives more cause for concern. Recent developments are hitting the country in its three most important exports—fats and oils, pulp paper and timber, and shipping services. Revenues from these items account for about 60 per cent of the country's total export income: and in the last few months they have all fallen. In the first six months of the year, it is true, there was a surplus of Kr. 250 million in Norway's balance of payments compared with a deficit of Kr. 40 million in the first half of last year. This was due mainly to the increased earnings from ore and base metal exports and from sales of fish and paper pulp. But the decline in income from the three important items mentioned above is now making itself felt.

It is against this background that far-reaching proposals for increasing state control of economic activity are being debated. Early in July a committee produced (in three volumes and some 600 pages) its recommendations for a price control and rationalisation law. They have been criticised heavily and, in some quarters, likened to the strict controls imposed in Nazi Germany. In brief, they would give the state complete and detailed control of the country's economy. They have now been reviewed by interested departments and the draft law based on them will certainly be much less severe than the committee's original proposals. Even so, until the law is passed, which may not be until Christmas or even until the Storting's 1953 summer recess, there will be a period of unusually lively and heated discussion on Norway's economic affairs.

This indeed is likely to be the main focus of political interest. But, from the point of view of Norway's position in Nato, there are two other political factors of some importance. The first is the extent of "Bevanism," or the "third force" idea. There are about 18 members of the Storting who might be classed as "neutralists" and they have a small but vocal following in intellectual circles. They represent

partly the old pacifist traditions of the Norwegian Labour Party, partly the understandable, if unrealistic, attempt to rationalise a natural dislike at being compelled to spend money on defence when there is so much else to spend it on. But as a political force they are negligible.

The second political factor is the delicacy of Norway's relations with the Soviet Union. It has withheld permission to station permanent Nato forces in its bases largely in order to deprive Moscow of valid grounds for complaint. But if one recalls the Norwegian attitude in the crucial days of 1949 before the die was cast, one must concede that national honour *propre* also plays its part. The Norwegians are determined, so far as they can, to make the defence of their country a Norwegian affair, even if it is fitted into the framework of Nato.

(Concluded.)

Hands Across the Atlantic

At times, the North Atlantic Treaty Organisation gives the impression of an entity without visible means of support. Remote, impersonal and complex, it scarcely involves the emotions of any of the hundreds of millions of people to whom it holds out the hope of peace and security. Its secretary-general, Lord Ismay, told a conference in Oxford earlier this month that, when he assumed his post:

I set out to inquire, and I got no evidence of any considerable popular support for Nato. On the contrary, I got the impression of a general lack of knowledge, of interest and of faith. Accordingly I formed the conclusion, and the Council agreed, that one of our first tasks should be a crusade against ignorance and apathy.

The international study conference on the Atlantic Community which Lord Ismay was addressing was already dedicated to precisely such a crusade. Although it heard speeches on general themes by such personalities as Senator Kefauver, Mr William Draper, and the permanent representatives on the Atlantic Council of Canada, Greece and Italy, it did not involve itself in analysing the nature and aims of the Atlantic partnership. Instead, taking the value of that partnership for granted, it applied its time to suggesting how public support for it could be developed and maintained.

Despite Lord Ismay's efforts, Nato itself has not as yet found means to publicise its objects and activities on any large scale. Its information staff, numbering less than forty, are neither adequate nor authorised to conduct educational campaigns throughout the fourteen member countries; and if they were able to do so, they would inevitably run into the same difficulty as their counterparts in the United Nations—the impossibility of producing lively material and at the same time satisfying the susceptibilities of all the governments to which they are responsible.

Recognising these limitations, the Oxford conference concentrated on discussing the best methods of encouraging the growth of popular support for Nato by unofficial action. The result was the evolution of a number of sensible proposals in the fields of adult and ordinary education, radio, films and publications. If at times the conference tended to take on the appearance of one of Unesco's endless debates on "mass media," it also displayed a streak of shrewd realism. The idea that new student societies should be formed to propagate Nato was played down in favour of working through existing student bodies, of which there are undeniably enough already. It was suggested that people might be able to attend holiday courses on Nato in other Atlantic countries without using up their foreign currency if their expenses were cleared against those of people moving in the opposite direction. The need for international courses for civil servants was stressed, and it was hoped that representative military units could be sent on exchange visits between member countries. As to the matter of the various educa-

tional programmes envisaged, it was agreed that special pleading must be eschewed and objective fact stressed, but that no full understanding of the necessity for the Atlantic alliance could be imparted unless the facts about recent Communist policies were also outlined.

Teachers and government departments alike may groan at the prospect of adding to their responsibilities in the ways recommended by this conference. Some of the recommendations stand no chance of fulfilment at any early date—for example, the issue of "Atlantic identity cards" to permit free movement between Nato countries without passport or visa. But many of them, such as the publication of school handbooks on Nato, an increase in broadcasting on Atlantic themes, and better preparation of soldiers and airmen before they are stationed in allied territory, are perfectly practicable, given a modest amount of energy, imagination and expenditure. Member governments should take the Oxford conference's suggestions seriously.

Czech Trade Unions Reorganised

[FROM OUR VIENNA CORRESPONDENT]

THOSE interested in the rake's progress of trade unionism in a state which is "building socialism" may derive much profit from examining the present position in Czechoslovakia, where the "Revolutionary Trade Union Movement" (ROH) and its governing body, URO (corresponding roughly to the British TUC), are now in process of "re-organisation."

The changes in the functions of the unions began when the Communists seized power in February, 1948. At that moment, which coincided with the nationalisation of nearly all industrial undertakings, the workers had, theoretically, won their victory against capitalism and the original *raison d'être* of the unions—the protection of the workers against capitalist exploitation—came abruptly to an end. But instead of dissolving the unions, the Communist party skillfully incorporated them into the state organisation and gave them the new task of "educating" the workers into being worthy of the hire meted out to them by the politicians who have taken over from the dispossessed private capitalists.

The "new look" given to, and by, the trade union officials at once brought them into conflict with the rank and file of the movement, and already in June, 1948, less than four months after the Communist *coup d'état*, Comrade Zapo-

ECONOMIC CONDITIONS ABROAD

The Economist Intelligence Unit provides quarterly reports on economic and business conditions in

Argentina, Australia, Belgium, Borneo, Brazil, Burma, Canada, Chile, China, Colombia, Cuba, Denmark, Egypt, Finland, France, India, Indonesia, Indo-China, Israel, Italy, Japan, Yugoslavia, Kenya, Malaya, Mexico, Netherlands, New Zealand, Norway, Pakistan, Persia, Philippines, Portugal, Siam, Southern Rhodesia, Spain, Sweden, Switzerland, Turkey, Union of South Africa, Uruguay, USA, Venezuela, Western Germany.

These reports give a concise analysis of matters of concern to exporters and investors. Particulars may be obtained from The Economist Intelligence Unit, 22 Ryder Street, St. James's, London, S.W.1.

tocky, who was then Chairman of URO as well as Premier, launched a bitter attack on the workers whose leader he was supposed to be. Their output, he complained, was not enough to warrant the continuance of the high wages they were getting. The workers, he went on, wanted to get everything and give as little as possible in exchange. There were too many missed shifts, too many people who pretended to be ill, too many fires, too much movement of labour from one factory to another, too much stealing, too much carelessness in handling machinery. Comrade Zapotocky has been saying the same thing at intervals ever since, always stressing, however, that the fault lies with the trade union officials and the management.

During their first two years of power, the Communist rulers of Czechoslovakia went on trying to make the trade unions change their spots. Having failed, they decided to effect a complete separation between the unions and the politicians. In the summer of 1950, Mr Zapotocky, at a meeting at which he was reported to have broken down and wept, resigned all his trade union functions and called upon all others holding both union and political jobs to choose that day whether they would henceforward serve a political god or an industrial mammon. But still the new look remained unfashionable, and within a year talk of "reorganisation" began afresh. The pot finally boiled on July 18th last when a special meeting of URO sacked (but without purging) the Slovak chairman, Mr Zupka, who had taken over from Mr Zapotocky, put Mr Kliment, the Minister of Heavy Industry, in his place and brought back the Premier himself into the presidium of the new URO. At the same time the whole trade union movement was pulled to pieces and put together again. The number of unions was increased to 25. The new general council, though it also consists of 25 members, no longer represents the individual unions but is "a politically directive organ" the object of which is "to guide the trade union movement in fulfilling the tasks for the building of socialism." The process has, of course, been accompanied by the usual weeding out of political undesirables.

Examination of Comrade Zapotocky's speech on this occasion shows that many trade union officials, unlike Comrade Zapotocky, have been unable to accustom themselves to the changed duties they are now expected to perform. There is, in fact, more than a suspicion of "social democracy" still left in their make-up. Either they secretly sympathise with the workers to whom they are expected to impart the new look in the interests of state capitalism or they get busy not merely with the whips of private enterprise but with the far more effective scorpions of a completely nationalised industrial system. They have also been known, not infrequently, to use their new powers to enrich themselves.

Unsatisfactory Officials

The Prime Minister's speech also threw a vivid light on other worries facing the unions. He was especially bitter about the trade union functionaries who are sent to the "new look" training courses. In some trade union schools, he said, "10,000 crowns are paid to students in addition to board and lodging. Then, when they go back to their factories, these students take up no union function at all." In other words, either they are afraid to put into practice what they have been taught or they still have too much of the old trade union spirit left to be willing to do so. Meanwhile they have at least had a nice holiday at the State's expense.

The three principal functions of trade unions in a "people's democracy" are given by Mr Zapotocky in his speech on July 18th, are: to reduce production costs, to consolidate working discipline and to develop socialist competition. At present, he added, "the unions definitely are not fulfilling these tasks. That is why they must be reorganised." In spite of the fact that the meeting he was addressing had just voted

to establish a political directorate in place of the old professional one, he went on to say:

The trade unions are a unified organisation of the working people and therefore are not Communist. . . . The Communist party of Czechoslovakia has never dictated to the trade unions and those who, like Slansky and company, tried to do so pursued a bad, un-Communist policy.

Six days later, Lubomir Subrt, writing in the trade union journal, *Prace*, said:

The trade unions must subordinate themselves to the leadership of the Communist party if they do not want to depart from the right path. . . . The Communist party is the decisive factor in all problems which occur during the building of socialism. . . . Many trade union functionaries cannot adjust themselves to their new tasks such as political activity among the masses.

These two totally contradictory pronouncements suggest that the reorganisation now in progress is going on in an atmosphere of complete muddle. Mr Zapotocky maintains that there should be no Communist dictation to the trade unions. He stands in fact for a policy in which the union officials "persuade" the workers instead of dictating to them. Mr Subrt, on the other hand, instructs the same officials to do only what they are told by the Communist party to do. The new URO presidium of which Mr Zapotocky is the leading member evidently agrees with the latter. At a meeting on August 21st, it complained about the political level of union functionaries and ordered them to receive political education outside working hours. The object of political education, of course, is to enable the union leaders to bring the workers into a state of mind when they really will "produce more today than yesterday."

"Persuading" the Workers

The workers, in short, must be "persuaded" by hook, crook, whips or scorpions to give up the old eight hour day in favour of a system under which they must go on working with no extra pay until their "norm" has been fulfilled. They must be "persuaded" to welcome the introduction of arbitrary and often unpaid extra weekend shifts and to give up their "Bolshevik Saturday" which the miners won in 1921, at the whim of the Government and for the benefit not of themselves but of the socialist fatherland, the Soviet Union. When they do not close the gap between output and wages, the real wages are cut by raising either norms or prices or both alternately; in addition, the hardly-won privileges the workers fought for against private capitalism are taken away or transformed into a machine for keeping their noses well down on the nationalised grindstone. Thus when a Soviet trade union delegation visited Czechoslovakia this summer, one of its members, Comrade Osipov, pointed out that the existing method of basing the payment of relief on the amount of subscriptions and the length of membership "is not an incentive to work." When granting relief, he went on, "not only should the social conditions of the union member be taken into consideration but also the results of his work." Commenting on this, the trade union fortnightly *Odbor* said ominously that the standpoint of Comrade Osipov "is certainly right. The existing formula for paying relief is becoming out of date."

In such circumstances it can be surmised that however much the trade unions are reorganised, the workers will not be best pleased. The object of the reorganisation is clearly to bring pressure on them to work harder still and harder for the benefit not primarily of themselves and their families but of "socialism." Nevertheless, the very fact that reorganisation is again considered necessary is proof that so far the Communists have failed either to win over or to subdue the Czech workers.

Correction.—The statement about the number of Russian divisions in Austria in last week's article entitled "Austria and the Four Colonels" was erroneous. The forces in question may amount to some four divisions.

PRODUCTIVITY, EXPORTS and COAL

are the core of our Balance of Payments problems. Higher productivity in house building sets free labour for other purposes. A reduction in imports, within certain limits, can reduce the strain on the nation's finances. Economies in coal consumption release additional supplies for productive work and export. We have, in the Building Industry, already contributed greatly to all these factors by adopting solid floors, suitably covered, throughout our building programme.

THE BUSINESS WORLD

European Export Subsidies

MOST of the major trading countries of Western Europe—except Britain, Belgium, Switzerland and Sweden—now subsidise their exports in one way or another. The oldest and most familiar forms of subsidy are by way of tax rebates. The newest bear a strong family resemblance to the Schachtian devices that gained such notoriety in the 'thirties. They are the so-called "currency retention" schemes, which came under heavy criticism at the meeting of Governors of the International Monetary Fund in Mexico City earlier this month. An IMF committee is now enquiring into these schemes, and presumably it will try to exorcise them; since the Fund lacks any weapons more potent than the traditional bell, book and candle, however, it must remain to be seen whether exorcism will have much effect. Certainly the fact that these schemes are now under investigation does not mean that this country can expect any immediate respite from the unfair competition that they generate. It is not surprising, therefore, that some voices have recently been raised to urge that these dubious weapons of selective devaluation should be added to Britain's own armoury. Imitation, it is argued, is not always a sincere form of flattery; it is sometimes merely the best available means of self-defence.

The first step in any discussion of this problem must obviously be to find out how far these various sorts of subsidy have been allowed to spread in continental Europe. The complexity of European tax and exchange control systems means that even this preliminary task is not an easy one; and it may be that the IMF committee will be able to unearth more systems of export subsidy—especially disguised ones—than can any private hunt. The export subsidy schemes that are known to be in operation in Western Europe are, however, summarised at the end of this article. It will be seen that three countries—Germany, France and Austria—now openly give tax rebates to exporters; and that Italy has already decided to follow them, while Holland seems to be on the verge of doing so. The French tax rebate system can amount, on some products at any rate, to a subsidy on export prices of as much as 10 per cent. The German and Austrian tax rebate systems are not quite as effective as this; but each of these countries operates a more virulent form of currency retention scheme than that in force in France.

All the countries that operate tax rebate systems have also set in hand facilities for the provision of cheap credits to exporters. In these, Germany has led the field. Until it exhausted its resources at the end of 1951, the German Reconstruction Credit Institute granted credits of up to four years' maturity to exporters, at a maximum interest rate of 5½ per cent; German exporters have also benefited from the fact that 90-day export bills and export drafts (credits advanced against firm export orders) have been discounted by the German central bank at the rates

ruling in the markets to which the goods are to be exported—which are usually much lower rates than those current in Germany. In addition, German exporters can insure themselves on favourable terms against foreign risks—other than foreign exchange and price risks—through the officially sponsored Hermes Insurance Company and the Deutsche und Treuhand A.G. Now that the Reconstruction Credit Institute has exhausted its resources (which came mainly out of the "counterpart funds" to American aid) the whole system of export credits in Germany is in a state of flux; but the new finance company, the Ausfuhrkredit A.G. (set up by a consortium of private banks), is expected to work along much the same lines as its predecessor—certainly so far as long-term credits are concerned. Like France, Italy and Austria, the German Government has also intervened to ensure that manufacturers receive sufficient credits to enable them to buy raw materials that are essential for export production; the French Government, indeed, guarantees bank loans to potential dollar exporters for this purpose, and the Italian and Austrian Governments provide part of such credits themselves at specially low rates of interest.

★

These credit facilities have not been included in the summary of export subsidies at the end of this article, for in some cases they can fairly be regarded as necessary bridges across the void of local capital markets, rather than as devices to steal a march on foreign competitors; the Germans, for example, would strongly oppose any suggestion that their export credit and insurance schemes contain any significant element of subsidy. It is obvious, however, that no such disclaimer can be made on behalf of the currency retention schemes now in operation in six countries of Western Europe. These retention schemes are weapons of competitive and selective devaluation of the worst kind. The first important scheme was introduced by Holland in the early autumn of 1949; since then Dutch exporters have been allowed to retain 10 per cent of their dollar earnings and sell them in the free market at a premium that has hovered around 70 per cent (in other words, they have obtained a premium of about 7 per cent on their dollar exports as a whole). The object of offering this premium was to induce Dutch merchants to search diligently in North American markets to find what Dutch products they could sell there; but the premium has inevitably induced them also to search diligently to find what foreign goods they can shunt there. The spread of currency retention schemes in five other European countries—Germany, France, Denmark, Norway and (to a limited extent) Austria—has been partly due to their reaction to this shunting by Dutch merchants. In each of these five countries, however, as will be seen from the summary

below, the dollars that can be retained by exporters do not carry with them automatic rights to purchase every sort of product in the dollar area; in consequence, the premium they have accorded to local dollar exporters has usually been less than the Dutch merchants' 7 per cent.

There seem to have been three phases in Britain's reaction to the spread of these schemes. At first, the authorities were merely concerned to see that the schemes did not lead to increased shunting of sterling area commodities. The Bank of England has negotiated some not entirely ineffective "gentleman's agreements" with the central banks of the countries concerned. In the course of these and similar negotiations the British authorities probably expressed strong and sincere convictions about the commercial immorality of currency retention devices—thus making it difficult for Britain later to embrace them itself without a severe loss of face. In the second phase—beginning, broadly speaking, at the turn of this year—the British Government seems, however, seriously to have considered taking a leaf out of other people's bad books. But it soon became apparent that the introduction of any export bonus scheme in this country would entail much administrative inconvenience and many glaring inequities; many leading British industrialists, although bitterly critical of subsidised German competition, were opposed to schemes that would benefit merchants more directly than they would benefit manufacturing industry. In the third phase, therefore, the British Government, speaking through Sir Arthur Salter at Mexico City, threw its weight behind the Belgian crusade against these schemes. Since the

Government believes that many European countries have resorted to currency retention devices only in defence against themselves, it hopes that an IMF attempt at exorcism might be more widely obeyed than past history—for example, the history of the IMF's injunctions against premium gold sales—would suggest.

There, at the moment, the matter rests—another manifestation, perhaps, of the present era of uneasy equipoise. In most cases where administrative convenience pulls one way and immediate economic advantage seems to pull the other, outside observers are wise to try to prod Whitehall into action. But this instance is the exception that proves the rule. If Britain were once to take the plunge into the morass of this soggy neo-Schachtianism, it would find great difficulty in extricating itself ever again. There are, it is true, certain hypotheses on which the case for the introduction of a currency retention scheme in Britain would have to be conceded. They are: if it were accepted that European currencies must always be inconvertible and overvalued against the dollar; if it were considered that demand at home and in soft currency countries will always be so excessive that only discriminating devices will divert sales to hard currency markets; and if it were conceded that the long age of multilateralism is over and that countries that live in the shadow of dollar shortage will always bend their main effort to stealing marches from each other in the dark. But the week in which an army of Commonwealth officials has gathered in Great George Street to plot the strategy of long-term advance is not the time to sound over their heads such a wail for tactical retreat.

European Export Subsidies Summarised

Tax Rebates to Exporters

(1) **Germany.** When calculating their profits for purposes of income tax (but not for purposes of the 12½ per cent trade tax on profits) manufacturers may deduct 3 per cent, and export merchants 1 per cent, from their export earnings; deductions of from 6 to 10 per cent may also be made from earnings on transit trade and of from 1 to 4 per cent on income from services rendered abroad. In addition, manufacturers may set aside another 3 per cent, and export merchants another 1 per cent, of their export earnings into a special reserve; tax payments on earnings transferred to this reserve can be spread over ten years. Export transactions are exempt—or partly exempt—from the tax on bills of exchange (normal rate DM 0.15 per DM 100) and on transport insurance (normal rate 5 per cent of premium), while rebates are allowed on the turnover tax (normal rate 4 per cent of turnover), amounting to 2½ per cent for exports of finished goods, 1 per cent for exports of semi-manufactures, and ½ per cent for other exports. In all cases export earnings must exceed DM 5,000 per business year before deductions are allowed.

(2) **France.** Exporters of a wide range of goods may claim reimbursement of a proportion of their social security charges and salary taxes, dependent upon the proportion of these charges that they can attribute to their production for export. Exporters of some (but not all) of these goods may also claim reimbursement of from one-third to eight-fifteenths of the production and turnover tax that they can attribute to these exports. Exports to Argentina and iron curtain countries do not qualify for any of these rebates.

(3) **Austria.** Turnover tax (normal rate 1.2 per cent) is refunded on certain exported goods, excluding goods that are "easy to sell abroad."

(4) **Italy.** A scheme is being brought into effect by which the general trading tax will be refunded on certain exports to hard currency areas.

(5) **Holland.** Tax allowances and accelerated depreciated provisions for exporters are under consideration.

Currency Retention Schemes

(1) **Germany.** Two schemes are in operation: (a) Exporters may set aside 4 per cent of their net export earnings into a special non-transferable bank account, out of which payments can be made for the purchases of certain scheduled raw materials and auxiliary goods. American dollars are separated from other currencies in this account and may be

used for the purchase of the scheduled goods from any area. Earnings from exports of food and other scarce goods do not qualify. (b) Exporters receive transferable "import drawing rights" equivalent to 40 per cent of their earnings of US dollars or Swiss francs. These drawing rights, which can be sold for a substantial premium on the free market,

permit the holder to import a wide (but not all-embracing) range of consumer and other goods from dollar countries.

(2) **France.** Exporters may retain 12 per cent of their hard currency earnings and 10 per cent of other foreign currency earnings for purposes related to their business—e.g., purchases of foreign raw materials, selling expenses abroad, etc. In addition, they may retain another 3 per cent of their hard currency earnings for the purchase of any kind of imports.

(3) **Holland.** Exporters can retain 10 per cent of their dollar earnings for the purchase of any kind of imports. These dollars are freely transferable, and have recently fetched around Fl 6.50 to the \$ on the free market, compared with the official rate of Fl 3.80 to the \$.

(4) **Denmark.** Exporters receive "import licence promises" equal to 10 per cent of their earnings of U.S. or Canadian dollars. These import licences are available for purchases from Western Europe and sterling area countries only, but they can be sold for substantial premiums.

(5) **Norway.** Exporters can retain 10 per cent of their dollar earnings for the import of certain essential goods and equipment, mainly those designed to promote dollar exports.

(6) **Austria.** Exporters of goods that are difficult to sell abroad can retain a percentage of their foreign exchange, the exact retention from each transaction being agreed with the Austrian National Bank. This foreign exchange can be sold to merchants for the purchase of certain imports that are not otherwise allowed.

Machine Tools over the Hump

ONE of the main objects with which the Machine Tool Trades Association was founded in 1911 was to stop machine tool exhibitions being held too often. The exhibition that the Association is now holding at Olympia is its first for four years; even so, it is perhaps traditional that some in the industry should have argued that an exhibition in 1952 would be one too many. To put on a show of this kind costs a lot of money and effort in bringing together a company's latest machines and sometimes in producing prototypes, and it diverts some of the company's best technical staff from their most pressing job, in 1952, of satisfying a backlog of orders. This exhibition, it was argued last year, would interfere with the industry's heavy responsibility of tool production for defence. It is also not entirely a coincidence that three days before the exhibition at Olympia opened a European machine tool exhibition began in Hanover. Though the British exhibition is named the International Machine Tool Exhibition, and, in fact, more than 400 of the thousand or so tools to be seen on British manufacturers' or importers' stands are foreign made, few foreign makers have their own stands; at Hanover, while there are French, Belgian, Dutch, Italian, Swedish and Swiss exhibitors as well as German, there are hardly any British exhibitors and few British tools.

Formally, the main reason why Britain is not represented at Hanover is that the "European Committee for the Co-operation of Machine Tool Industries," which was set up in October, 1950, restricts its annual exhibitions to machine tool manufacturers showing their own equipment. In Britain many of the companies are traditionally merchants as well as manufacturers of machine tools; the Machine Tool Trades Association, which includes importers, therefore decided it could not take part. But the tool requirements of British defence, and the recent growth of European machine tool output, and the British industry's desire to show its best products in its own shop window, are rather more closely connected.

At a time when most British defence industries are still several months or more away from feeling the full weight of their rearmament work, the machine tool industry is probably "over the hump" of its defence task. Some 36,000 tools were ordered for defence. More than half of these have been delivered, and by next spring almost all the rearmament demand should have been cleared, apart from repeat orders and certain special tools of which production is tiny. This timing is logical enough in any defence plan; the tools must be on hand before the other defence industries can begin to make armaments with them. It is a credit to the industry and to foreign tool makers that the operation has gone according to plan. But it has been mainly achieved by a deliberate policy of holding the full weight of defence demand off the British machine tool industry and going abroad for half the tools: a successful policy that has at once preserved the British position in the export markets for machine tools and, perhaps, hastened the advent of serious competition.

The tool problem of defence planning in 1950-51 was not simple. The British industry was already extended; it was sending overseas about a third of the 45,000 tools

it was producing each year, and increasing its export commitments. In particular, it had just achieved a successful penetration of the Canadian market for machine tools, hitherto an American preserve, and the Canadians, already afraid that their deliveries might be cut, were warning the British tool industry that if it should pull out of Canada, even for defence, it would do so for the last time. In any case, not more than three-fifths of the British tool output was of any use for defence, and a third of this was mortgaged for export orders. If the British industry had been called upon to provide all the defence requirements (except certain special tools unobtainable here in sufficient numbers), it would have involved the whole of its capacity for making these classes of tool, the turning away of export orders, and the postponement of deliveries for civil customers for years. Indeed, it would also have needed the diversion to tool manufacture of perhaps 80 per cent of British printing equipment manufacture, half of fine textile equipment manufacture, and part of the diesel engine industry. On the other hand, Britain seemed well off in overseas purchasing power, with the hope of defence credits from America and an accumulation of EPU credits in Europe. The Ministry of Supply decided to use this to buy a large proportion of the tools overseas.

The Ministry began by placing orders for more than 9,000 tools in the United States, where the machine tool industry was facing slump conditions and welcomed the orders. That looked very well until about five months later the American authorities discovered that their own vast defence programme would also need some tools. They were good enough to grant Britain about \$120 million to pay for American tools; but at the same time Britain had to agree to cut its orders down to some 6,000 tools, mainly of types not readily available or not made at all outside the United States. The Ministry had to lay off the balance of its requirements in Britain and in Europe. It placed orders for 12,000 tools in Europe; at the same time, it revised its demand on the home manufacturers from about 15,000 to 18,000. That demand represents, over the two years of the planned programme, about half the output of the types of tool concerned that would be available for British industrial customers. For certain special tools and certain high-capacity sizes of tool, it represented much more; Mr. S. W. Rawson, who came from industry to the Ministry's Machine Tool Directorate, has said that the number of big turret lathes available in Britain and the United States, for example, would have been about 25 per cent less than were needed for the British and American aircraft programmes plus less than half the American land armament programme, while supplies of some other tools were even more hopelessly inadequate.

The British machine tool industry was left to satisfy about half of the defence needs. This involved diversion of tools from British customers for whom they were being custom-made, but less diversion than was expected, because the industry has achieved a remarkable increase in production. Last year its total output rose to about 54,000 tools, worth £47 million, an increase of about 20 per cent on its static volume of output in recent years, and in the first four months of this year it was producing

at the rate of some 62,000 tools a year. There has been very little diversion of tools ordered by overseas customers.

Today about half the foreign tools, and probably rather more of the British, have been delivered. Delivery periods for most of the European tools have been shorter than here, but these orders were mainly supplementary to British and American orders, and thus placed later; most of the tools have arrived on schedule, though the Italian makers ran into some difficulties. By the spring of next year, defence demand should have fallen back to a number of special tools, and the filling of the unsuspected gaps that always appear: much defence work is now being done by main contractors and subcontractors on existing tools that are being driven hard and wearing out fast. A few makers of particular types of machines, of course, will remain preoccupied with defence for another two and a half years.

Today, looking at this official tool policy from the other end, some disadvantages have emerged; but it is fair to say that in spite of them it seems a strikingly successful example of co-operation between Government and industry. The cost of the tools, certainly, may have been multiplied. The £48 million worth of tools that have been imported since the middle of 1951 (at about seven times the rate of imports in 1949 and 1950) have cost far more than the British tools being sent overseas; though it is not easy to compare them type for type, there is no doubt that the Ministry has paid dearly for certain tools of types that British makers were at the same time sending abroad at much lower prices. The dollar tools, admittedly, have come largely free, financed by American military aid; but owing to the swing in Britain's EPU position since early 1951, many of the European machine tools—also generally costlier than British—have had to be paid for to a large extent in gold. Moreover, it is true that British defence orders have enabled the German industry to recover a little faster than it might otherwise have done, and perhaps fostered the growing tool industries in other countries. But this policy has delivered Britain's defence tools requirements probably 12-15 months earlier than complete reliance on home manufacture would have done, and its success is not affected by the subsequent decision to take some of the weight of defence off the engineering industry—which it indeed anticipated. Most important of all, it has left the British industry healthily abreast of its export commitments and able to seek further export orders.

★

At Olympia, therefore, the British machine tool makers are looking beyond defence to the export tasks that they have fortunately never needed wholly to neglect. The market prospect, even for this most vital capital equipment, is not entirely clear. It is difficult, in all countries now rearming, to know how far extra tools for defence production are additional or complementary to the normal replacement demand of the engineering industries concerned; and in other countries, as in Britain, curbs on credit are liable to tighten the rein on re-equipment. This replacement demand will have been dammed up for two years (some American civilian manufacturers, for example, have been forced by it to buy British in the last 18 months). In Britain, on the other hand, the decision to end initial allowances will perhaps have abnormally increased civil demand last year and

may now be depressing it. World production of tools has considerably increased, with less increase in capacity (the American industry, in particular, has relied heavily on sub-contracting). But some eventual slackening in the rate of industrial re-equipment, and hence in demand for machine tools, must be counted as likely when the special effects of rearmament subside—though this will not necessarily occur immediately the defence orders for tools are fulfilled.

It is natural and sensible, therefore, that Britain should now be displaying its tools in a British shop window; and with about 40 per cent of the exhibits at its current show coming from abroad, it cannot be accused of shirking comparison. The foreign buyer visiting Olympia, or both exhibitions, can inspect a remarkable array of equipment from the countries now competing for his favour. The West German tool industry is now nearly as large as the whole German industry before the war; in design and quality, its tools are first-rate, comparing with the other two leading producers, Britain and America. France is showing some fine machines, particularly advanced in design, though it does not approach the British or American standard for general-purpose tools. The Italian tools display the excellent craftsmanship to be found in Northern Italy, though they are often slightly less robust than a British engineer would choose. Outside these industries on show, of course, there is the massive American industry (of whose machines about 90 are to be seen at Olympia), and a growing Japanese industry producing about 12,000 tools a year—mainly good copies of British, American or German types. Britain's machine tool industry, therefore, is certain to encounter heavy competition as it passes from the assured demand of defence to a less predictable civil market at home and abroad. But at least it is probably in better fettle to do so than at any time since the war; indeed, so far this year it has managed to increase its exports by 30 per cent to some £15½ million, despite defence preoccupations.

WORLD RECORD

Week by week the record of world events—industrial, commercial, and financial—appears in condensed form in the *Records & Statistics* supplement to *The Economist*. Each week in this supplement more facts are put more promptly on record than anywhere else in the world—and the facts can be found without difficulty by means of the cumulative index that appears in the first issue of alternate months.

Records & Statistics is obtainable by postal subscription only, at £2.10.0 a year; a combined subscription to it and *The Economist* costs £5.0.0 a year.

A specimen copy of *Records & Statistics* may be obtained from:

LONDON, S.W.1

Business Notes

Gilt-Edged Take a Header

Last week's pause in the gilt-edged market, at the crest of its long summer climb, became a slide, and this week the slide has become a headlong tumble. The shock has been the most violent since the morrow of the increase in the Bank rate to 4 per cent last March, and rather worse than that experienced in June. On Wednesday, the worst day, prices dropped by a full point or more, the biggest movement being shown in War Loan, which lost 1½ points. From the peak reached early last week, this stock has dropped by 3½ points, to 76, or by 4½ per cent. The other irredeemables

have fared almost as badly, but prices of the long-dated stocks have naturally shown a slightly better resistance—the falls from the peaks here have ranged from 2.7 per cent in Savings Bonds, 1965-75, to 3.3 per cent in Gas Stock, 1990-95. One section only has escaped this landslide; the short bonds have firmly held their ground. On the other hand, the reverberations have naturally been felt through the equity markets, which had already begun to slip back under the influence of the dispute about engineering and shipbuilding wages. In the past week the ordinary share index of the *Financial Times* has dropped by just over 2 points, to 113.6, and is now 3.4 per cent below the peak reached on September 9th.

The force of this sudden break in the gilt-edged market, like that of its previous extraordinary climb, has, of course, drawn much from psychological factors. The actual movement of prices, especially on the fall, has been out of proportion to the volume of business. The summer's rise, dating from midsummer, had raised prices of stocks in the long-term market by 9 per cent or more in about 2½ months, reducing the flat yield on 2½ per cent Consols by fully ½ per cent to 4½ per cent, and the redemption yield on Savings Bonds, 1965-75, by more than ½ per cent, to 4½ per cent. In this short period these stocks had made good three-fifths of the whole rise in yields that took place between last November and midsummer. A movement of this magnitude inevitably attracted, especially in its later stages, widespread speculative buying, so that the market was particularly vulnerable to any abrupt change in sentiment. The upshot is that the yield basis on the longs has risen in ten days by more than half the remarkable reduction achieved in the previous dozen weeks. Consols on Wednesday showed a flat yield of 4½ per cent, and Savings Bonds, 1965-75, offered just over 4½ per cent to final date.

★ ★ ★

Fear of Funding

The rock on which the tiring market first stumbled was the £4,500,000 East African loan announced last week; and this unfortunate stock (70 per cent of which was taken by the underwriters) showed a discount of 1½ points on its

opening day. But the significance of this small issue lay in the fact that it gave point to fears that had been spreading among the more thoughtful investors for some time—fears about the impact upon the market of the Government funding and refinancing operations that lie ahead. The possibility of such operations has not, of course, suddenly dawned on the market. The maturities to be faced are not optional but final maturities—£450 million of Serial Funding stock on November 14th, £60 million of yearling Transport stock (held by the National Debt Commissioners) in the following month, and £522 million of National War Bonds next March. During its buoyant phase, however, when the market saw every factor through rose-tinted spectacles (and was apparently encouraged by the Government to do so), it was actually disposed to regard these maturities as a "bull" point—on the ground that the Government itself would be anxious to keep the market strong.

But in the past few weeks attention has been increasingly drawn to the growth of the Exchequer deficit, now £605 million (taking both "above-line" and "below-line" items together), or £316 million worse than at the corresponding date last year, whereas the budget assumed that in the year as a whole there would be an improvement of some £60 million. This disquieting trend has upset the market much more than has one of its secondary consequences—the rise in the liquidity ratio shown by the banks because of their huge intake of Treasury bills to finance this Government deficit. This ratio is now almost back to the level at which

it stood before its deliberate reduction by the enforced funding operation of last November, a change that may tend to loosen the banks' squeeze on advances. But, so long as the authorities seemed indifferent to the rise—and their day-to-day tactics in the gilt-edged market have certainly not implied any concern—the market regarded the movement as yet another indication that monetary policy would not be tightened. The first maturity, it was said, could and would be dealt with easily by "persuading" the banks to take a replacement stock (ignoring the fact that at least £200 million is held outside the banks), and there was no need

Green fingers

No one grows roses like old Charlie. He knows his soil and plants, and experience tells him how to get the best from them.

We help to make things grow too — industries, homes, businesses. Our soil is Australia, New Zealand, Fiji, Papua and New Guinea. For our fingers we have over 850 branches and agencies throughout these lands. And our experience dates from the first banking business in the South-West Pacific.

If experience and local knowledge can help your ventures to success in this area, consult and use—

affected by falling consumer demand or by import restrictions abroad began with the introduction of the "D" scheme into purchase tax on textiles and clothing, and was continued with the return to free sales of coloured pottery at home. The tax changes that were granted last weekend are less sweeping. Purchase tax comes down from 66½ per cent to 33½ per cent on pianos and most other keyboard instruments; from 100 per cent to 66½ per cent on cut glass and certain leather goods such as trunks, suitcases and purses; and a few minor objects such as walking sticks, nylon pot-scourers, and "Australasian red opossum fur skin, undyed, in strips not more than nine inches long and one inch wide, used as linings in textile shuttles" become free of tax.

The main industries that have been given relief have all suffered severely from import restrictions imposed by the Commonwealth and other countries. In January the piano makers exported about 95 per cent of the 1,900 odd pianos they delivered, the bulk of the exports going to Australia, New Zealand, South Africa and Brazil. All these countries have now drastically restricted their buying, and trade with Argentina, the only other big customer, is at a standstill pending a new trade agreement; as a result output in the 30-odd North London companies that make pianos has dropped by about two-thirds and they have had to dismiss many of their skilled craftsmen. Cut glass, like pottery, has suffered particularly in the Commonwealth market; and neither business has been able to redress the balance with home sales to any considerable extent.

Near the head of the queue pleading for similar treatment come the jewellery and cutlery industries, with radio and some domestic equipment not far behind. Not all of these can put forward with equal justification the favourite argument that export success must be based on a thriving home market; some are simply seeking relief from the shrinkage in export markets. The Treasury will have considerable difficulty in sorting out the various degrees of relief that are being sought. It is one thing to keep alive stricken industries such as piano-making; or to enable others to withdraw to some extent from the temporarily unequal struggle in the export markets. But where the plea is for underpinning of full employment in industries on the fringe of engineering such as radio—or in major engineering exporters encountering similar difficulties, such as the motor-car industry, where the same argument may soon be heard—relief might tend to defeat the major aim of Government policy, that of transferring resources to the sections of industry most useful for defence and future exports.

* * *

Export Stocktaking

Although engineering exports have been slipping during the last few months they have been the biggest single factor in the increase in exports during the first eight months of this year compared with the corresponding months of 1951. This basis of comparison, adopted in this and the succeeding note, may give some indication of the degree of success of the Government's trade policy and of the effort that is still required to fulfil it. Engineering exports indeed have been sufficient to offset the losses on textiles and leave something to spare. United Kingdom exports from January to August this year totalled £1,735 million, some £46 million more than in the corresponding period last year. Exports of metal products amounted to nearly £920 million and were £118 million higher than for January to August last year; while textile exports, at £263 million, were lower by more than £100 million. Such figures stress the dependence of the British trade effort on the metal-using industries, and the frustration of official planning calling for an increase in exports of textiles because defence needs would divert engineering output from export markets. To some extent, however, the eight months' totals conceal a small but distinct

improvement in exports of wool textiles and other consumer goods in recent months.

Exports of machinery have not been affected by cuts in exports imposed by the Dominions early this year; the total for the eight months has risen to £286 million, an increase of no less than £52 million over the total for the same period last year. Australia has remained the biggest market taking £33 million in the eight months compared with £26½ million twelve months earlier, but the increase in machinery exports has been widely distributed among the different markets. Total vehicle exports have risen from £309 million last year to £333 million in the first eight months of the current year, but experience in the leading markets has varied greatly. Australia took 7,560 British cars a month during the first quarter of this year but import restrictions have cut shipments to some 1,100 a month since then. Yet exports to Australia so far this year have been larger than to any other country and their total to date of £11 million is less than £1

Sweden	4,588	3,093			

million smaller than the corresponding figure a year ago. Exports of other types of vehicles to Australia have, however, fallen more sharply. To some extent, the eclipse of Dominion markets has been compensated by a sharp increase in car sales to North America during the summer. Shipments to Canada and the United States in July represented a third of the total number of British cars exported and one-third of the total value. Exports to most European countries have increased, with Sweden as an important exception. Coal exports so far this year have reached £35 million, double the rate during the same period of 1951. Shipments to most European countries have risen proportionately but exports to Denmark, the biggest market, have increased even more steeply.

Compared with the first eight months of 1951, cotton exports have fallen by £35 million, silk and rayon goods by £14 million and wool manufactures by £45 million. But contrary to the appearance of these totals, import restrictions imposed by the sterling area countries have had a more marked effect on cotton and rayon than on wool exports. The reason is that whereas Australia and South Africa are the principal destinations for cotton and rayon goods, North American countries (which have not imposed restrictions) are the largest markets for wool textiles. Part of the fall in exports of cotton and rayon goods to Australia and South Africa has also been offset by an increase in shipments to British Africa. Wool exports have shared in the general recovery in exports to the dollar area in the past few months, but the improvement in Canadian business is too recent to make its mark on the eight months figures. Exports of pottery this year have amounted to £49 million—an increase of £6 million.

Import Cuts in Action

Mr. Butler has to thank the textile recession for most of the saving in the import bill this year. Imports of textile materials in the first eight months of 1952 cost nearly £190 million less than in the same period last year, whereas total imports fell by only £132 million. Lower prices largely account for the fall in value of textile imports and of many other raw materials. But the physical cuts in the volume of imports projected for this year have also played their part in reducing the total spent on raw materials from £1,129 million in the first eight months of last year to £979 million this year and in lowering the bill for imported foodstuffs by £11½ million to £865 million. Imports of manufactured goods as a class have increased this year compared with 1951 because of heavier imports of metals and machinery for the rearmament drive which have only been partially offset by reductions in other commodities.

The reduction in imports of wool to £117 million—little more than half their value in January-August last year—results entirely from the fall in wool prices; indeed, 60 million lb more wool has been imported this year than in the first eight months of last year. Imports of wool from Australia have fallen sharply from £119 million to £58 million in the eight months, and imports from New Zealand from £45 million to £34 million. Although lower prices partly account for the fall in raw cotton imports a significant drop in imports of medium and short staple cotton is recorded. As a result imports from Egypt declined from £41 million

Brazil	21,135	598	Germany	1,086	6,405

to £9 million this year, and from the Sudan from £40 million to £25 million. Imports of Brazilian cotton have fallen from £21 million to the astonishingly low figure of £500,000. On the other hand, more has been spent on imports of American cotton—which have increased from £14 million to £25 million. The fall in the value of rubber imports also reflects the sharp reduction in prices. Imports from Malaya have dropped from £76 million in January-August, 1951, to £60 million this year. "Seeds and Nuts for Oil, Oils, Fats, Resins and Gums" have increased by no less than £69 million to £273 million this year because of increased imports of crude petroleum.

The most striking feature in food imports has been the sharp increase in imports of grain and flour. Bigger imports of grain from Canada and the Soviet Union have been offset by reduced supplies from the United States. Imports of dairy produce have cost £16½ million less, because of smaller supplies of butter from Australia and Denmark and of cheese from the United States and New Zealand. The effects of the Chancellor's cuts are clearly shown by reductions of £10½

million in fruit and vegetables and of £12 million in other foods.

Supplies of iron and steel manufactures have cost £87 million this year—more than £64 million above the level for the corresponding period of last year. Imports from the United States have increased from £1.8 million to £21.6 million and from Belgium from £4.9 million to £13.5 million. Here the hurriedly concluded arrangements for extra steel for defence are translated into hard currency costs. The rise in imports of nonferrous metals this year has come mainly from a sharp jump in aluminium imports from Canada, copper from Rhodesia, and zinc from Canada, United States and Australia. A steep increase in imports of machine tools for defence needs accounts for almost the whole of the increase in machinery imports from £33 million to £71 million.

Benefits from the Terms of Trade

The terms of trade continued to move favourably in August. According to the Board of Trade index (1951=100) there has been an improvement of some 7 per cent since the beginning of this year. The improvement has resulted mainly from a lowering of import prices rather than increased prices for exports, though the lower cost of imports has been chequered by rises in some raw materials such as wool. Raw material import prices fell, nevertheless, by as much as 3 points in August. Food prices remained unchanged

from the July level, but increases granted recently to overseas suppliers have not yet affected the food bill.

Prices of textile exports ceased to fall in August for the first time since September, 1951. During the last few months the deterioration in textile prices had been particularly steep and combined with a slight fall in prices of "other manufactures" had more than offset the continued rise in the price of metal exports. Last month's movements left the index for export prices unchanged compared with July.

secured loan stock, complete with an option to buy ordinary shares later on; it is one of the numerous oddities of EPL that borrowing on such a loan stock need not have an adverse effect on the amount of profits available for equity distribution, and in some cases may actually increase them. Bowaters have successfully raised £5,400,000 on a 5½ per cent unsecured loan stock, 1963-67, issued at par by way of "rights" to ordinary shareholders in the ratio of £3 of loan stock for every £2 of ordinary stock held. Every £3 of loan stock allotted will give the owner the option to take up one new £1 ordinary share between March 31st and May 31st, 1954. This means that Bowaters full accounts for the year to September 30, 1953, will be available to shareholders before the date on which the options can be taken up. The question arises, however, whether if present trends continue, this report will make such cheerful reading; the chairman's disclosures this week about stock losses may have relevance here, and in any case the period of option is a narrow one.

The offer by the General Mining and Finance Corporation is less novel than that made by Bowater, but it has the distinction of being the first for a good many years to be made by the publication of a prospectus in London by a South African finance house. The corporation is offering for public subscription 750,000 6 per cent cumulative redeemable £1 "A" preference shares at par. The holder of these shares has the right to exchange them into ordinary shares at varying prices in the next seven years. These conversion rights, which are a more common feature in the Kaffir market than in the industrial share market, are not immediately profitable to exercise as the existing ordinary shares are currently quoted below the conversion prices. But the taking up of the preference shares at par may ultimately offer a cheap entry into the corporation's equity; in any case the preference shares are well secured and offer an adequate yield. Both this offer and that made by Bowaters have their attractions—as was proved on Thursday when dealings began in the Bowater stock at 4½ premium, and pushed up the price by a further 3 points before the close. But the new issue season was sent away to a bad start by the fate of the 4½ per cent East African stock. Seventy per cent of this stock, offered at 99½, was left in the hands of the underwriters, and by the end of the first day's dealings it was quoted at 1½ discount.

Saving Skill for Export

The extension of arrangements for the deferment of call-up for skilled men completing engineering apprenticeships to favoured industries outside the super-priority class of defence work—in particular to engineering firms largely engaged on exports and to merchant shipbuilding—is a logical corollary of the greater emphasis on exports as distinct from defence. The scheme allows the men to delay their national service for two years after they come out of their time; it will cover men in most skilled engineering grades and draughtsmen, except where the Service need is considered paramount. About 2,000 men a year are expected to be affected out of the 23,000 called up each year on completion of engineering and metal-working apprenticeships: deferment will be granted only to individuals whose importance to their employer for export work can be proved, and need not be accepted. The industries concerned include most of the more important engineering exporters and a number, such as precision chain, pumps and valves, and ball-bearings, which are important indirect contributors to engineering exports.

The measure should at any rate plug one important leak of skilled labour from these industries, and it may have some importance in helping them to recruit young workers. The larger problem of shifting sufficient people into these industries remains; the flow into engineering as a whole has been disappointing in the last six months, though there has been

some shift within engineering into defence work. The Services have recently taken a substantial share of the increase in civil employment, as is illustrated by the chart, taken from the annual report of the Ministry of Labour. The work of the Ministry's employment services,

measured by the number of placings, was last year down to about its prewar volume. Given a larger working population, this presumably indicated much less mobility of labour; but many people changing jobs in the years illustrated did so without using the exchanges—a freedom ended this year by the Notification of Vacancies Order.

New Money for Eire

On Monday subscription lists open in Eire for the biggest—and most attractive—public issue yet made by the Republican government. The Irish authorities are seeking to raise £20 million for a wide range of capital developments, on a 5 per cent National Loan, 1962-72, issued at par. The loan is clearly intended to serve as a maid of all work. The high interest rate attached to it should serve as another weapon in the fight against internal inflation (especially if it attracts genuine new savings); and the government hopes—with some reason—that the terms of the loan should be sufficiently attractive to induce Irish investors holding assets outside the country to reinvest in the Republic. The stock, which is an Irish—but not a British—trustee stock, therefore carries the high coupon rate of 5 per cent; it will have a sinking fund larger than has been applied to other government issues; and it will be accepted at its face value in payment of Irish death duties.

Almost every branch of the public sector of the Irish economy is scheduled to benefit directly from the loan. A large part of the £20 million will finance the extension and development of the electricity supply system, while another part of it will finance the further exploitation of the country's peat resources. Some of the proceeds will also be used in the development of the industrial activities of the state, ranging from afforestation to harbour works and airport construction; and some will finance capital expenditure for social purposes—such as houses and schools. To investors on both sides of the Irish Channel this is likely to be attractive Irish butter, even if the intention does seem to be to spread it rather thinly on a large slice of bread.

Better "Small" Savings

The flow of funds into National Savings has responded sharply to the improvements in terms that took effect on September 1st—improvements that were evidently timed to coincide with the end of the main period of holiday spending. From that date the issue of 3 per cent Defence Bonds was discontinued and offerings began of the new issue of 3½ per cent Bonds announced last June. Simultaneously, the limit upon individual holdings of the current series of Savings Certificates, (the terms of which are not being altered, although the series dates from February, 1951) was raised from 500 units costing £375 to 700 units costing £525. Thanks to these inducements, the gross receipts from all forms of National Savings have this month exceeded repayments for the first time since last spring, and in the week to September 13th the net credit amounted to £5,330,000, the best figure for more than two and a half years. This is in very sharp contrast to the deteriorating trend of recent months. In the first five months of the current fiscal year, aggregate receipts, at £362 million, fell short of repayments and encashments by no less than £90 million, compared with £67 million in the similar period last year; moreover, £24 million of Defence Bonds were this year redeemed at maturity.

The recent improvement has naturally been wholly attributable to a spurt in demand for certificates and bonds. Sales of bonds, which in the previous five months had averaged only £500,000 a week and had dropped to as little as £20,000-£30,000 towards the end of August, shot up to £6,070,000 in the first full week of the new campaign, while sales of certificates rose to £6 million, compared with an average of only £2 million during August and under £3 million over the five months. Although withdrawals from post office and trustee savings banks rose simultaneously, it does not appear that any large proportion of these gains was attributable merely to switches from one branch of national savings to another. But it does seem probable that the sudden rush arose very largely from purchases by people of more substantial means who were acquiring their maximum permitted holdings forthwith. This interpretation finds some confirmation in the weekly Exchequer return, which discloses figures for Defence Bonds and Savings Certificates (but not, of course, for savings deposits) a week ahead of the regular return from the National Savings Committee. The Exchequer statement shows that in the week to September 20th sales of Defence Bonds relapsed to £4.8 million and those of Savings Certificates to £3.8 million—still, however, well above the levels of earlier weeks. At September 13th, the net excess of repayments over receipts from all national savings for the current fiscal year had been reduced to £84.5 million (plus £25.5 million of Defence Bonds redeemed at maturity) compared with £66 million (plus £1.3 million) in the similar period last year.

More Freedom for Fibres

Last week the Ministry of Materials announced the ending of controls on the use of jute and sisal (the import of jute will remain in government hands). The new Order for jute came into effect on September 16th, that for sisal will operate from October 1st. In practice the restrictions had been nominal since the world shortage of both commodities ended some time ago. Jute consumers are now free to buy imported or home-produced jute goods without getting a certificate of approval from the Control and licences are no longer needed to process raw or waste jute. Control over purchases of raw jute and yarn for delivery abroad has also been removed. It was in any case purely a formality but the delay in getting a licence often put the British merchant at a disadvantage with his overseas competitor. In spite of these relaxations jute has still only attained partial freedom. Import of raw jute and goods remains in the hands of the Jute

Control. Some sections of the trade feel that the Ministry is being unnecessarily cautious in refusing to let go this last strand of red tape. They argue that although the Control's release prices are mostly in line with world levels, there are some exceptions: some of the Control's prices are higher and others lower than world prices. However, the majority of the trade take a more tolerant view. There are indeed several reasons that may have influenced the Minister in his decision to keep jute buying under the government wing. Memories of earlier difficulties in getting supplies—particularly since the partition of India and Pakistan—undoubtedly die slowly. Moreover, although there is likely to be ample jute to meet world needs this year the prospects for 1953-54 are much less reassuring. Pakistan has already announced its intention to cut the jute acreage next year to three-quarters of the current level. Whatever the reasons for its decision the Ministry will undoubtedly gain from a continuation of government trading if there is an increase in prices. In the light of the recent firmness in the market this cannot be ruled out. The resultant increase in the value of the Control's stocks would go some way to offset the heavy losses sustained earlier this year.

From October 1st there will be no control on the use of sisal and other hard hems with the exception of manila and true hemp. The ending of the restrictions on sisal means that merchants will no longer have to obtain firm orders from spinners before they can import the hemp, thus, the trade will be thrown open to all comers. Demand for sisal is not likely to increase. On the contrary, the market during the last ten days has tended to be steady rather than continue the upward previous movement. The price of BEA No. 1 sisal is now at £108 a ton compared with the low point of £90 a ton reached during August. There are signs of a more confident feeling in the market as spinners are reported to be placing orders further ahead. But so long as world production of hard fibres remains far in excess of requirements there is not likely to be any prolonged upsurge in prices.

Taxation and Private Companies

The revelation in the recent national income blue book that fixed capital formation in the private but non-corporate section of the economy has fallen significantly in the last four years—and this despite heavy sales of financial assets and a sharp increase in borrowing by non-corporate businesses—mirrors a state of affairs that is almost certainly true of small private companies as well. In every recent year the number of private companies on the Board of Trade's register has increased, but in every year, too, it has become clearer that the real capital of such businesses is being eaten away by the heavy—and in at least two instances discriminatingly heavy—burden of taxation upon them. The two discriminating burdens that most obviously need to be alleviated are those laid by the distributed profits tax on director-controlled private companies and those laid by death duties on business assets (especially where such assets are assessed under Section 55 of the Finance Act 1940) far above their realisable value.

A special committee of the Institute of Directors last week approached the Chancellor of the Exchequer and the Royal Commission on Taxation, and submitted five specific recommendations on these problems. Two of these recommendations will command wide approval: first, that all executive directors should be allowed to participate in company pension schemes in the same way as ordinary employees; secondly, that the amount of directors' remuneration chargeable as an expense against company earnings should be raised to £10,000 or 25 per cent of profits (with a limit of £5,000 for any one director). Safeguards against abuse of such proposals would be needed but they should not be impossible to devise. The special committee's recommendation on the knotty problem of gifts *inter vivos* may be more open to debate. The committee believes that the

arbitrary limit of five years should be abandoned in favour of a system of gradation "so that where the deceased survives the gift by four years, only one-fifth of the duty should be payable, and should he survive only by three years, then two-fifths of the rate would be the rate payable"; there are the germs of a more logical system here, although the different rates payable on each step of the ladder might need to be less evenly phrased.

The committee's other two recommendations go to the heart of the main problems now facing small private companies. The first of these recommendations is that "all direct taxation of companies including profits tax and distributed profits tax should be at half rates for those business men earning £12,000 a year or less, and should reach the full rate only when profits are £25,000 a year or more, the rate of tax being graded in appropriate stages between these two figures." There will be a widespread feeling that in applying this recommendation for special alleviation to "all direct taxation" the committee may have risked spoiling a good case, for their proposal would certainly seem to be wide open to abuse. The committee's final proposal is, in effect, that Section 55 of the Finance Act 1940 should only be applied to those companies for which it was originally intended when this hasty and ill-considered legislation was brought in under the shadow of Dunkirk—namely to baulk those companies that might be formed expressly for the purpose of avoiding estate duty. "Subject to satisfactory safeguards," the committee argues, "the basis of valuation of the shares of the deceased director shareholder should not exceed the normal stock exchange valuation and there should be the right to appeal to a tribunal." There is no doubt that there is a real problem here; under the present system of inland revenue assessment many small businesses are being restricted or ruined because of their subjection—sometimes through pure accident—to this clumsy Estate Duty axe. But the difficulty of devising the necessary "suitable safeguards" should not be underestimated; it is for this reason that some experts have recently suggested that the best way out might not be to tackle Section 55 of the 1940 Act directly, but to grant relief from the full rate of estate duty to certain business assets, perhaps along the lines of the relief already granted on assessments of agricultural land.

Report From Australia

In the last few months Australia's current external accounts seem to have regained a precarious equilibrium, and the continued private outflow of short-term capital no longer exceeds the net inflow of capital for genuine long-term investment. Its international reserves are therefore no longer falling. But it seems clear that there will have to be considerable further internal adjustments before the dominion can safely ease its stringent import restrictions. That is the implication that emerges from the report of the Commonwealth Bank of Australia for the year ending on June 30th last. The report reviews the vicissitudes of a year in which Australia's balance on current account fell from a surplus of just under £A100 million to a deficit of approximately £A575 million. While Australian exports fell by £A308 million in the year, and imports rose by exactly the same figure—in response to the higher incomes created by the wool boom of 1950-51 and despite the import controls imposed in the second half of 1951-52. These misfortunes, coupled with some deterioration on invisible account and with an outflow of speculative capital (owners which had presumably become convinced during the year of the improbability of revaluation) caused Australia's international reserves to fall by nearly £A500 million, to £A362 million. The bank points out that the dominion's terms of trade are now no more favourable than in the late thirties. The probable favourable trend in the terms of trade of food-exporters will fail to

benefit Australia unless the fall in its food production is halted; the recent boom in wool prices served to conceal the necessity for doing this.

There is, however, some evidence in the report of a long overdue diversion of resources away from the less economic secondary industries last year. The price rise in Australia during the first nine months of 1951-52 was greater than in any other major trading nation, except France and Japan: this rise in relative costs led to increased competition from imports for many Australian secondary industries, which therefore suffered some increase in unemployment. Consequently, basic industries have at long last been able to fill long-standing vacancies and their production has begun to increase. But the secondary industries may benefit from the protective effect of general import controls, once Australian demand has consumed the large stocks accumulated during the last nine months of 1951-52. Australia, in short, still has a persistent demand-inflation superimposed upon the cost-inflation that seems to be inherent in its system of basic wage adjustments. Such a situation, if permitted to continue, is virtually certain to lead to persistent balance of payments difficulties, and therefore to persistent import controls, or even devaluation.

British Steel Remains Cheap

To hear a motor manufacturer assailing the steelmasters sounds like an echo of the thirties; but Sir William Rootes's complaint this week that at a time when the motor industry needs to cut costs the steel industry "has now again raised prices" has not as much weight in it as Lord Nuffield used to wield. Sir William spoke a week after the British Iron and Steel Federation had published comparisons showing that Britain still sells its steel at home much more cheaply than most of the other main producing countries. Whatever a British motor manufacturer has to pay for the limited quantities of various steels that go into a passenger car his American competitor pays 30 per cent more and the French and German makers even more than that. The table, produced by the British Iron and Steel Federation, compares home trade prices, mainly delivered at consumers' works; it shows that comparable steel products sell in Britain at roughly 30 per cent less than in America, while French and German prices are even higher. Belgian steel (of Bessemer quality, compared here with Britain's open-hearth quality prices) is not quite so much above the British price.

The comparison shows that the two increases in the price of British steel have still left it thoroughly competitive in the world market. Export steel still sells at a premium, and

HOME PRICES FOR STEEL IN MAIN PRODUCING COUNTRIES

Product	UK	* USA	France	Germany	Belgium
Angles	£ s. d. 27 19 6	£ s. d. 36 16 0	£ s. d. 36 0 5	£ s. d. 38 3 6	£ s. d. 31 9 11
Joists	28 0 6	36 8 0	33 18 11	36 1 6	31 12 10
Plates	31 16 6	37 4 0	41 8 2	44 15 0	37 8 3
Strip	32 14 6	39 16 0	34 6 5	43 18 0	35 11 2
Rails	28 12 6	32 0 0	36 15 11	35 13 3	38 2 0
Sheets	40 2 6	42 12 0	49 10 8	51 17 6	52 5 0
Tinplate (per basis box) ..	2 15 10½	3 2 10	4 12 5a	(b)	(b)

The general basis of comparison is tested steel, delivered to consumers' station (rails and tinplate—F.O.T. makers' works). The prices are for open-hearth quality, except in the case of France and Belgium where they are for basic Bessemer quality. The extra for open-hearth quality is approximately £3 per ton in France and £10 per ton in Belgium. (a) Delivered consumers' station. (b) No comparable price available. Production is relatively small.

in the international market the competing exporters price their products more closely; but the home price offers at least a yardstick of the producers' strength should steel become abundant on the world market. It is the home price, too, that concerns steel eventually going abroad in indirect

exports such as cars. Steel prices in Britain are controlled by the Ministry of Supply; no major change has taken place in them since February, though recently there have been small changes in the prices of certain alloy steels following rises in the cost of alloying metals. It is true that steel-using exporters, after some years of selling abroad too cheap on the basis of steel prices that were kept low partly by subsidy, are now meeting price competition abroad; but if they find difficulty in competing they can hardly blame it on their steel suppliers.

Responsibility at Easington

Of the 81 men who were in the Duckbill district of Easington Colliery at about half-past four in the morning of May 29, 1951, all are dead; so there remains no direct evidence of what caused the explosion that cost them—and later two rescue workers—their lives. In his report on the disaster, published last week, Mr H. C. W. Roberts, Chief Inspector of Mines, concludes that the picks of a coal-cutter, striking pyrites in the coal-face, ignited firedamp that had seeped into the working from the waste area behind it. The seam was being cut by the "longwall retreating" method, leaving behind the path of the cutter as it took 54-inch slices off the coalface a widening gap from which supports were being withdrawn, allowing the roof that was left to cave in. The layers of rock above this cavity seem to have sunk downward on to the piles of rock that had fallen from the roof, forcing out from the cavity in between a large volume of firedamp into the working. The cutter struck pyrites with a spark, as it may well have done before during the cutting; but this time it set off a flame that surged through 16,000 yards of the pit workings. All the men in the two shifts that were there at the time died almost immediately, except one who lived a few hours; but so large and dangerous an accumulation of "afterdamp" was left in the working that it took some 350 rescue workers 257 hours to recover all the bodies and restore the ventilation system. Two of these workers were overcome by the gas remaining in the area.

Mr Roberts finds that in planning to use the "longwall retreating" system and "caving," the management and the area planning staff paid insufficient attention to the likelihood that "caving" might not occur satisfactorily and to the consequent risks of firedamp accumulation and "roof weight." The explosion began in firedamp, but after a point it was continued in coal dust; he finds that there were defects in the system of dust sampling and the measures taken to prevent, suppress and treat coal dust. Insufficient consideration, also, had been given to ventilation, and "as a result of weaknesses in the organisation, there was a lack of effective supervision and control." The blurring of actual, as distinct from legal, responsibility in colliery planning and management that has resulted from the inevitable growth of specialist services before and since nationalisation is now under review within the National Coal Board. But another lesson of Easington must be that however its organisation at various levels may be clarified and strengthened, the most important need in the coal industry is for more men of the right calibre in management.

Decline of the British Tramp Steamer?

The high level of freight rates last year may temporarily have postponed the breaking up of obsolete British tramp dry-cargo ships, but it did little to encourage owners to contract for new tonnage to replace them. With freight rates at present levels, more ships are being broken up, and the high costs of shipbuilding are continuing to deter many owners from ordering replacements. Attention to this trend

is drawn in the annual report of the Council of the Officers' (Merchant Navy) Federation, which states that the amount of tramp tonnage on the British register has dropped from 3.4 million tons in 1939 to 3 million tons in 1950 and to 2.8 million tons in 1951. The Federation is naturally concerned with any reduction in the number of berths available to its members, but it also points out that without an adequate number of modern and efficient ships Britain will be unable to retain its position as a leading maritime nation, particularly in the face of increasing competition from foreign flags. The Federation, like other sections of the shipping industry, attributed this mainly to the burden of taxation on shipping profits. Its "hope that the inevitable consequences of Government failure to leave sufficient profits in the shipping industry to finance essential rebuilding will not be used at some time in the future as an excuse to advocate the nationalisation of the Merchant Navy," however, seems an early answer to a threat that observers outside the industry have not yet visualised.

Everyman's Guide to Whitehall

The "Directory of Board of Trade Departments and their work" that appears in the latest issue of the *Board of Trade Journal* is an innovation that other Ministries in Whitehall might well copy. This 16-page supplement, which lists the separate sections of the Board, in London and the regions, and the work they do, and then directs the inquirer about particular subjects to the right section, should be of considerable value to the businessman groping round Whitehall in search of just the right planner. For good measure, the *Journal* adds a summary of the other "production departments" of the Government and the manifold responsibilities they bear concerning industry. There is probably a need for similar directories of the Ministry of Supply and the Ministry of Materials and perhaps of the Ministry of Works. The industries that come under other main departments with industrial responsibilities are more easily identifiable—though it would not perhaps immediately occur to the outsider that questions concerning optical glass should naturally be addressed to the Admiralty, nor that the manufacture of life-saving appliances comes logically under the aegis of the Ministry of Transport.

Shorter Notes

The owners of 3 per cent Defence Bonds maturing in the first six months of next year will be invited by the Treasury to continue to hold their bonds until July 1, 1953. On that date a full six months' interest, at the rate of 3 per cent a year, and the maturity premium of £1 per cent will be paid, and the bonds will be exchanged into the same amount of 3½ per cent Defence Bonds (Conversion Issue). The terms of these Conversion Bonds will be the same as the 3½ per cent Defence Bonds now on sale.

*

The International Materials Conference has dissolved the Pulp Paper Committee because of improved world supplies of newsprint. The Cotton and Cotton Linters Committee has also been dissolved.

*

The estimate of softwood stocks given in the note on decontrolling timber in the issue of September 13th was inadvertently given as 5 million standards, owing to the intrusion of an extra nought. Current softwood stocks in this country are in fact estimated at a little over 500,000 standards.

JIGGER IN THE WOODPILE

IMPORTANT jetties in Swansea Docks were being damaged by marine borer shipworms, which had gnawed their way into the wooden piles under water, honeycombing and weakening the entire structure. Immediate action was needed to save the jetties. The owners took their problem to the technical service organisation of I.C.I., and a representative of the Company's Nobel Division in Glasgow was sent to make an investigation. He began by experimenting with small charges of gelatine explosives fired at known distances from the piles. The shock wave from these underwater explosions had to be strong enough to kill the borers in their holes, but not so powerful as to weaken the jetty piles. After each shot a diver went down to look for signs of damage, and small sections of the wood were removed to assess the killing effect on the borers. The work went well and a local man who had studied the technique took over. These unorthodox methods were completely successful. The borers were killed and at low cost to the owners the safety of the jetties was ensured for another season.

	£
Profit for year, after providing for Taxation, Staff Insurance Schemes, etc.	185,981
Net Distributions for year:	
Preference Dividends	16,847
Ordinary Dividends	84,591
	101,438
Retained in the business	£84,543

Extracts from the Chairman's Statement are appended:

"During the past year the number of Gestetner duplicators produced was higher than ever. The volume of sales of all products created a fresh record.

"The majority of duplicators exported from this country are of your Company's manufacture. Your Directors regard this distinction as proving conclusively that the outstanding quality and reliability of your Company's machines are recognised everywhere.

"Our position as the world's leading duplicator specialists is maintained by continuous technical progress. The Gestetner system of reproducing Braille was demonstrated at the British Industries Fair and has attracted great interest at home and abroad; we are proud to have made this contribution towards the welfare of the blind in the centenary year of the death of Louis Braille."

Copies of the Accounts and Chairman's Statement may be obtained from the Secretary, Gestetner Works, Tottenham, London, N.17.

Company Notes

British Celanese.—The precipitate switch from boom to slump in the textile trades is vividly shown in the preliminary statement by the directors of British Celanese for the year to June 28th. In the last six months of 1951 earnings before tax by the British Celanese group were higher than for any corresponding period in its history; by the last quarter of the financial year the company was trading at a loss. For the year as a whole, therefore, the group's profits before tax slumped from £7,291,578 to £2,546,233. Turnover in the last six months of 1951 was higher than that in the corresponding period in 1950 although trade began to fall off both in the home and export markets in November and December; thereafter, as the recession deepened, output had to be progressively reduced, adding very considerably to production costs. Since the end of the financial year there has been a definite improvement in trade, but it is not yet known whether the recovery has progressed sufficiently to replace trading losses by profits.

The slump in trade naturally led to heavy losses on stocks. The figure of £2,546,233 for profits before tax is struck after making a "special write-down of approximately £900,000, mainly on raw materials." The decline in profits has been cushioned to some extent by the reduction in the provision for taxation from £4,137,486 to £1,612,611, but, even so, group net profits have fallen from £3,154,092 to £933,622. Of this sum £217,098 will be absorbed by a total ordinary dividend for the year of 11 per cent; this payment has been recommended on the equity capital of £3,759,267, as increased from £2,211,333 by the "rights" issue last November. Last year's total dividend (on the old capital) amounted to 16 per cent; it included the special dividend of 7 per cent (requiring £81,267 from the latest appropriation account) which was paid last December, when it was recognised that the white paper on dividend limitation had been killed by the General Election. The latest dividend payment presumably reflects a belief by the directors that the recovery in the rayon trade will not falter. But it means, inevitably, that very little has been ploughed back into the business. Nothing has been appropriated to general reserves (compared with £1 million in 1950-51), and the appropriation to plant replacement reserves has been reduced from £1 million to £100,000. Moreover, the amount to be applied in redemption of the group's prior charge funding certificates has been reduced from £556,571 to £131,125. A year ago it seemed that shareholders could look forward confidently to the total repayment of these certificates in the financial year 1951-52; this hope has now been deferred, and a call of about £225,000 for redemption will have to be made on future earnings. At the current price of 22s. 3d. the 10s. ordinary shares yield £4 19s. per cent.

British Lion Film Corporation.—A year ago, answering a question at the general meeting of British Lion Film Corporation, the chairman, Mr Harold C. Drayton, said that "next March" would show whether there was a future for the company or not. The accounts of the company for the year to March 31st last have now been published, but the question of the future of the company remains unanswered. Last year the company plunged deeper into the red. Gross profits, after deducting office expenses, fell from £215,745 to £62,151. This profit was turned into a net loss of £148,422 by the deduction of various charges, including £156,161 set aside for loan interest and a provision of £94,317 for estimated future losses on films. In the upshot the company had to carry forward a loss of just

over £2 million. A delay in the completion of film productions, and disappointing receipts from film hire both played their part in this gloomy story. In the three years to the end of last March films made by the company earned about £12.6 million in British cinemas, but after the payment of Entertainments Duty and exhibitors' fees, only £3,240,000 of this sum came back to the company. Payments from the Eady Fund should ensure that the company will receive a bigger share of box-office receipts in the future. The Eady scheme was in existence during the year under review, but the company, owing to delays in completing its film productions, did not receive the full benefits from it. Mr Drayton suggests that in the future the company can expect to receive well over £500,000 a year in additional revenue from the Eady Fund. This figure might have to be revised downward if the fall in cinema attendances continues.

Having pointed out that the company has to pay out over £150,000 a year in loan interest, Mr Drayton makes the odd statement that "had this interest been paid out in the form of dividends the status of the company would be somewhat different." But could the company have found the money it needed to keep in being in any other way except on loan? The company's very existence seems to depend upon the loan of £3 million made by the National Film Finance Corporation and upon the £1.3 million borrowed from the banks.

Gestetner.—The full accounts of Gestetner for the year to August 31st tell the now familiar story of an increase in sales, an increase in costs, and a fall in profit margins. In spite of further increases, both in production and the volume of sales, trading profits fell from £1,199,740 to £1,151,330. But the decline in distributable earnings, from £367,951 to £340,408, was not sufficiently serious to prevent the directors from recommending the same distribution on equity capital as had been paid in the six previous financial years; the actual dividend rate was reduced from 18½ to 15 per cent, but this did no more than allow for the one-for-four scrip bonus made a year ago. Although the appropriation to the parent company's general reserve has had to be cut from £121,218 to £75,000, lower profits have not been accompanied by a weakening in the group's financial resources. In fact, follow-

ing the £250,000 preference issue, the group's cash holdings have increased from £589,977 to £1,019,225.

In his statement to the shareholders, the chairman, Mr S. Gestetner, emphasises that the company, like many other exporters, were hard hit by overseas import restrictions in the last months of its financial year. The fall in export sales has already been followed by a reduction in output in the company's factories. In view of this fall in sales and the continuing increase in costs, shareholders should be prepared for a further decline in profits. But profits would have to fall quite sharply to put the equity dividend in danger.

Statistical Summary

EXCHEQUER RETURNS

For the week ended September 20, 1952, total ordinary revenue was £47,805,000, against ordinary expenditure of £68,998,000, and issues to sinking funds £240,000. Thus including sinking fund allocations of £16,295,000 the deficit accrued since April 1, 1952, was £319,436,000 compared with a deficit of £30,976,000 for the corresponding period of the previous year.

COMPANY MEETINGS

LONDON TIN CORPORATION

CHAIRMAN'S SPEECH

The twenty-sixth annual general meeting of London Tin Corporation, Limited, was held on September 19th at the Chartered Insurance Institute, Aldermanbury, London, E.C.

Mr J. Ivan Spens, chairman of the corporation, who presided, said:

ACCOUNTS

The feature of the accounts this year is the marked increase in the taxation payable on the year's profits which more than offsets the satisfactory increase in the gross income.

GENERAL RESERVE

The successful rehabilitation of the mines in Malaya and Siam has rendered no longer necessary certain provisions against investments and loan, which were made in previous years, and the sum of £183,500 has accordingly been transferred to General Reserve. This sum, together with an appropriation from profit and loss account of £41,500, brings the General Reserve from £500,000 to £725,000.

DIVIDEND

In order to pass on to shareholders some benefit from the corporation's increased income, the directors have recommended a bonus of 2 per cent, payable with the final dividend of 13 per cent, making 20 per cent for the year, against 18 per cent last year. It must not be assumed, however, that the current year's accounts will permit a similar distribution.

TAXATION

The heavy increase in taxation on the profits for the year under review is partly due to the fact (explained in my speech last year) that the corporation's taxation "losses forward" were to all intents and purposes exhausted; and partly to the appropriate provision for Excess Profits Levy for the four months to April 30, 1952.

For taxation purposes the Corporation is treated as a finance company. Our investments in the years 1947, 1948 and 1949 were almost entirely in the tin-mining industry overseas—of which more than two-thirds was in the Far East in countries which had been in enemy occupation. Moreover, firstly, dividends received from investments are received a considerable time after they are earned and the basic years for Excess Profits Levy are unrealistic as regards this Corporation and, secondly, over 60 per cent of our income from investments in the tin-mining industry is received from companies registered abroad.

On this basis representations were made by this Corporation to the Chancellor of the Exchequer for some measure of relief from the Excess Profits Levy, but, unfortunately, without success. Consequently the relief extended to mining companies registered in this country and operating abroad (including the choice of an additional basic year for companies operating in enemy occupied territory) does not appear to apply to us. In addition, when this Corporation holds less than 25 per cent of the share capital of a Malayan tin-mining or any other company ordinarily resident in the United Kingdom, even despite the fact that such companies are liable to Excess Profits Levy, the dividends received called "franked investment income" are not excluded for the purpose of

computing this Corporation's liability to Excess Profits Levy. While "franked investment income" is excluded for Profits Tax, I do not understand why all "franked income" (as in the case for Profits Tax) has not been excluded for Excess Profits Levy since clearly double and unfair taxation is involved.

INVESTMENTS

In my speech last year I advised members that it was the Board's intention to use some of the Corporation's funds for investment other than in gilt-edged or in tin-mining projects in order to broaden the basis of the Corporation's portfolio. This has been implemented to some extent during the year but clearly it is necessary to consider carefully, with the charge for Excess Profits Levy computed as it is at present, what alternative policy might be more in the interests of our shareholders.

PRICE OF TIN

The average price of metallic tin during the year under review was approximately £968 per ton. The price of tin, however, must be considered in relation to the economic situation of the producer and it has to be remembered that the provision necessary for maintenance and replacements, and for prospecting and development of fresh ore reserves has greatly increased. As compared with the period prior to 1939 the yield has tended to decrease disproportionately to the risk involved. Moreover, it must be stressed that the shallower, richer and more easily worked deposits of tin ore, to which we had become accustomed in the past in the Far East and in Nigeria, are becoming exhausted. The problem under present conditions is how economically to continue to mine

moving equipment has been installed and a new ore treatment plant came into operation. The output of Columbite has continued satisfactorily and every effort is being made further to increase it.

GENERAL PROSPECTING

In Nigeria on behalf of this corporation a preliminary investigation of possible lead-zinc deposits was made in the last dry season and work will be resumed shortly. The indications at present are that no large-scale production from one substantial ore body is anticipated but a number of ore shoots may be proved from which a satisfactory production might be obtained.

A decision as to whether the prospect might prove worth developing must await the result of the work now to be undertaken.

During the year our chief geologist and mining engineers have visited South Africa and British Honduras on behalf of this corporation.

In regard to South Africa, it was decided not to proceed in taking an interest in a company already operating there.

The results of the examination for the possibility of tin ore deposits in British Honduras did not warrant any further action.

On behalf of this Corporation engineers from the staff of Anglo-Oriental (Malaya), Limited: (1) prospected in Borneo without success; (2) did some preliminary work in the Solomon Islands, and their reports are now being studied.

DIRECTORATE

Mr Warren retired from the board of this Corporation on April 30th this year. He is relinquishing the chairmanship of Anglo-Oriental (Malaya), Limited, as from October 1, 1952, because for reasons of health he should not reside, as formerly, in the East.

Shareholders, I am sure, will be glad to know his services will still be available to the Corporation and that he will visit Malaya, Nigeria or any other future sphere of our operations from time to time, as appears desirable.

I cannot express sufficiently strongly my own and my co-directors' appreciation of all Mr Warren has done throughout his service with your Corporation's organisation.

We all deeply regret that Mr H. A. Coates, until recently chairman of AO (Australia) Proprietary, Limited, to whom I referred last year, died in July this year.

On his appointment as Speaker of the House of Commons, Mr W. S. Morrison resigned from the board of the Corporation and we shall miss his wise counsel. Sir Kenneth Harper has accepted a seat on the board and his appointment will be submitted for confirmation at the meeting.

STAFF

I have again to express my own and the board's appreciation of the loyal service rendered by the management and staffs throughout the organisation. Conditions nowhere are easy and call for constant diligence and resourcefulness.

The report and accounts for the year ended April 30, 1952, were adopted and the retiring directors re-elected.

The chairman informed the shareholders that Mr Douglas T. Waring would become chairman of Anglo-Oriental (Malaya), Limited, on October 1, 1952, and the board of London Tin Corporation had at their meeting before this annual general meeting elected Mr Waring a director of London Tin Corporation, Limited, as from the date of his appointment as chairman of Anglo-Oriental (Malaya), Limited.

BRITISH CELANESE LIMITED

The Report and Accounts for the year ended 28th June, 1952, contain the Directors' recommendation for the payment on 15th November, 1952, to Stockholders registered at the close of business on 7th October, 1952, of a final dividend of 6½% (less tax) making, with the interim dividend of 4½% already paid, a total of 11% (requiring £217,098), on £3,759,267 Ordinary Stock in respect of the year ended 28th June, 1952. In addition a dividend of 7% (requiring £81,267) was paid in December, 1951, on the £2,211,333/10s. Ordinary Stock outstanding prior to the issue of the new shares in November, 1951, to compensate Stockholders for the fact that the final dividend paid in respect of the year ended 30th June, 1951, was limited to 3%, making 9% for that year (requiring £104,486), owing to the implications of the White Paper on Control of Dividends.

The following details are extracted from the Report of the Directors and audited Accounts for the year ended 28th June, 1952, which will be posted to Stockholders on or about 14th October, 1952.

47,345	Subsidiary Companies	7,769
£696,800	Consolidated Balance carried forward at 28th June, 1952	£731,126

Turnover for the half-year to December, 1951, was in excess of that for the corresponding period of the previous year, although in November and December there was a falling off in trade both in the Home and Export markets. The second half of the year showed a serious decline in all sections.

Earnings before tax for the first six months of the financial year were higher than for any previous corresponding period, but during the second half of the year, as the recession developed, production had to be progressively reduced, which added very considerably to production costs and the third quarter's earnings were very greatly reduced. The last quarter's operations resulted in a loss.

Since the end of the year there has been a definite improvement in trade which is referred to in the Statement by the Chairman annexed to the Report and Accounts.

LONDON, W.1. 19th September, 1952.

UNITED DAIRIES, LIMITED

MILK SUPPLIES: POSITION NOT VERY SATISFACTORY

ADVERSE EFFECT OF RELATIVE BEEF PRICES

POSSIBLE SHORT PERIOD OF SCARCITY

MR LEONARD MAGGS'S VIEWS

The thirty-seventh annual general meeting of United Dairies, Limited, was held on September 19th at The Connaught Rooms, Great Queen Street, London, W.C., Mr Leonard Maggs, chairman and a manager director, presiding.

The secretary, Mr Ernest Evanson, ASAA, read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman to the members, which had been circulated with the report and accounts for the year ended March 31, 1952, and was taken as read:

In the interests of many members who are unable to attend the annual general meeting on September 19 I am again circulating my remarks with the directors' report and accounts.

It is with deep regret that I have to report the death, on July 16, 1952, of Colonel A. S. Barham, CMG. Colonel Barham was appointed a member of the board on the formation of the company in 1915, his company, The Dairy Supply Company, Limited, being one of the companies which amalgamated with others to form United Dairies, Limited. Although he retired from active management in 1923, he served as a director until his death, and his great experience and wise guidance were of inestimable value to the company.

I do not think the accounts call for much comment, as the consolidated statements published give a clear and concise picture of the financial position of the whole group. As mentioned in the directors' report, of the group net profits of £784,233 there has been brought into the parent company's accounts £776,587, the balance of £7,646 being left with the subsidiary companies as an addition to their undistributed profits.

PROVISIONS

(a) £1,801,157 for Taxation: This amount, which is provided in conformity with the latest Finance Act, is, in my opinion, out of proportion to the balance of profits left for other purposes, including replacement of assets, as well as dividends. The present rates of taxation are an intolerable burden on industry. While I realise that the campaign for the reduction of the costs of running the country cannot proceed quickly, it is disappointing to find that taxation of industry has been increased.

(b) Depreciation on Commonwealth Loans: The parent company and the Australian subsidiary company invested funds in Australian Commonwealth Loans so as to realise them as required to meet expenditure in connection with the company's development in Australia. In Australia, as in this country, the market for gilt-edged securities has fallen sharply, and it was considered prudent to reserve, out of the profits of the year under review, £20,000 against the parent company's investment which is repayable at par in 1962, and £20,000 against the Australian subsidiary company's investment which is repayable at par in 1964, making £40,000 in all. You will notice that the book value is now less than the market value at March 31st, but, as you will know, there has been further depreciation since that date.

Investments in home gilt-edged securities were realised two years ago.

RESERVES

The following are the reserves of the group at March 31, 1952:—

The share premium account	£5,814
Capital reserves:	
Profits, less losses on realisations of:	
Properties	165,243
Investments in sub. cos.	99,157
Revenue reserves:	
General reserve	3,000,000
Insurance fund	100,000
Depreciation not required on properties sold	46,368
Future income-tax	1,327,001
Profit and loss appropriation accounts	3,111,492
	£7,855,075

The total of these reserves at March 31, 1951, was £7,550,233.

CAPITAL REPLACEMENT

At March 31, 1951, there was standing on the books of the group an amount of £130,690 in connection with plant and machinery, fixtures, fittings, transport vehicles, churns, rail tanks, and other assets acquired prior to March 31, 1945: the whole of this has been written off as depreciation in the year under review.

Owing to the present high prices of equipment the charges for depreciation are increasing as new equipment is installed. In the year under review the charge for depreciation on plant, machinery, etc., in respect to the subsidiary companies was £753,964, against £613,323 in the previous year. Depreciation funds being insufficient to meet the higher costs of new equipment the balance has to be found out of retained revenue.

Considerable progress has been made in modernising the buildings and machinery of United Dairies (London), Limited. The bottling plants at Ilford and Willesden have been re-equipped, and progress is now being made in repairs after war damage at Vauxhall: this depot suffered from three bomb attacks during the war, one of which resulted in temporary closing. In Scotland, three complete new milk plants have been installed at the premises of Edinburgh and Drumfrieshire Dairy Company, Limited. The new milk-collecting depot of United Dairies (Wholesale), Limited, at Attleborough, in Norfolk, is now in operation, and is a fine example of modern dairy engineering practice. I have mentioned before the Standard Yeast Company's factory at Harwich: this is now complete, and we are hoping for good results from this enterprise.

DEFERRED REPAIRS

This provision remains at the same figure as last year—namely, £1,132,203. During the five years ended March 31, 1952, £758,120 has been expended on deferred repairs and charged against current trading, leaving the provision in the balance sheet intact. This fund remains available tem-

porarily as working capital. It is expected that a settlement of the claims will be made this year, and this will enable us to deal with the balance of the provision in the next accounts.

DISPOSAL OF GROSS REVENUE

The following statement shows how every pound sterling received by the group in respect to sales of milk, milk products and other products was absorbed during the year under review, with comparative figures for the previous year:—

	1952	1951
	s. d.	s. d.
Cost of milk, goods for sale, and raw materials for production of other goods	15 0	14 8
Salaries and wages	2 3½	2 4½
Other expenses, including containers, depreciation, rent and repairs	1 10½	1 11
Taxation	0 7½	0 8½
Paid as dividends	0 1½	0 2
Retained in business for development	0 1	0 2
	20 0	20 0

The relation of the various items, in the comparison with the previous year, has been disturbed by the increase of 8d. per gallon in the purchase and selling price of milk during the year under review, and by increased costs in all directions. The foregoing statement covers the whole of the operations of the group.

On the milk side of the business, including subsidiary activities difficult to segregate, such as goods purchased for resale in the 693 shops, and (in Scotland) the bakeries, the net profit was only 0.9045 per cent of the turnover: in 1951 it was 1.043 per cent and in 1950 it was 1.135 per cent.

COSTS AND PROFITS

Costs have continued to rise, and applications to the Ministry of Food for a review of margins have to be made at regular intervals. Although the Ministry of Food is not unsympathetic in such cases, there is always a time-lag, which means that the notional target of net profit is not, in practice, obtained.

The notional margins of net profit on milk distribution services are those which were obtained in February, 1948, at the time when the Government issued the White Paper, "Statement on Personal Incomes, Costs and Prices." They were based on the experience for the year 1946-47, which was an unfavourable year to the trade, and an application for an increase in these notional profit margins is now with the Ministry of Food.

In connection with milk products which are acquired by the Ministry of Food, prices are fixed retrospectively, and the true weighted average costs of the industry are, in the main, recovered. The unit margins of profit allowed on costs are substantially those which were obtaining immediately before the war: in view of the reduced manufacture, and the changed conditions of to-day, these are inadequate, and an application is now before

the Ministry of Food for these margins also to be increased.

MILK SUPPLIES

The year under review was not a very satisfactory one as regards milk production, which is still being adversely affected by the relative prices for beef and milk fixed by the Government. It seems that the importance of an adequate supply of milk, and of home-manufactured milk products, is eclipsed by the significance attached to the meat ration.

It is very doubtful whether there will be enough milk available during the later months of this year always to meet the full demand. It is now probably out of the question to bring back consumer registration, but in the absence of such a scheme equitable distribution is most difficult. The burden of complaints falls on the unfortunate salesman, and it is sometimes forgotten at these times what excellent service he gives during the rest of the year. I am sure, however, that the Ministry of Food, with the full co-operation of the trade, will do everything possible to ensure fair distribution of what is available during what I hope will be a short period of scarcity.

Sales of liquid milk are now receding, reflecting the three latest increases in the price to the public, each of 1d. per quart—the first on July 1, 1951, the next on December 1, 1951, and the latest on July 1, 1952.

I feel I should point out that, except for relatively infinitesimal awards to the trade on account of increasing costs, the whole of the amount accruing from these increases goes to the Government to reduce the amount of subsidy, and as a contribution towards the cost of free and cheap milk to priority consumers.

The Minister of Food—I think quite rightly—decided this year not to permit the manufacture and sale of cream. I say "quite rightly" having in mind the national interest, and disregarding the interests of the industry, which for many reasons would have welcomed a resuscitation of the cream trade.

We are, however, doing our best to fill the gap by selling by retail synthetic cream manufactured by our subsidiary company, The Farma Cream Product Company, Limited. Sales of this product are expanding, and it is giving general satisfaction.

ENGINEERING AND TRANSPORT COMPANIES

The operations of The Dairy Supply Company, Limited, manufacturing dairy utensils, and of The UD Engineering Company, Limited, manufacturing dairy machinery, were, during the year under review, severely hampered by shortages of raw materials. Now, however, the recession in demand is a bigger limiting factor in restricting sales than the shortage of raw materials. As regards export trade, currency and import restrictions operating in many countries of the world are seriously curtailing trade.

Mickleover Transport, Limited, in addition to work for other subsidiary companies, is expanding its business in the building and mounting of special bodies for lorries for commercial and Government undertakings.

OVERSEAS INTERESTS

Australia—The position is more or less the same as I reported to you last year, except that slower progress than I then expected is being made with the building of the new factory to be equipped for the reception of liquid milk and the manufacture of milk powder and condensed milk. Great difficulties have been experienced with labour and in getting materials for this building, and its erection has been hindered by exceptionally bad weather. All these delays postpone

the time when we can hope for results from the investment.

New Zealand—Our subsidiary company again had a good year's trading, and earned a satisfactory profit.

CONCLUSION

I feel it is my duty to say that the results of the subsidiary companies are not so favourable since March, 1952, as they were in the corresponding period last year. The factors influencing the profits are: increased wages; lower demand; higher prices of all consumable stocks such as petrol and coal; and the greater working capital required to finance the businesses. To illustrate this point I call attention to the figure of stocks at £4,161,950: a comparable figure before the war was under £1 million.

Although the various businesses have expanded, and new enterprises have been acquired, this figure shows the effect of inflation: we can now, perhaps, hope that the spiral of inflation, of which we used to hear so much, has ended.

APPRECIATION OF THE STAFF

I am sure all shareholders would like to join with the board and myself in expressing thanks to the officers and staff of the company for their loyal and devoted services during the past year.

The report and accounts were unanimously adopted and a final dividend on the ordinary stock at the rate of 10 per cent actual, less tax, making 15 per cent for the year, was approved.

The remuneration of the auditors, Messrs Peat, Marwick, Mitchell and Company, was fixed.

The proceedings terminated with a vote of thanks to the chairman, directors and staff.

GEO. BASSETT AND COMPANY, LIMITED

RECORD EXPORTS

The annual general meeting of this company was held on September 25th, in London, Mr E. M. Mott, chairman and managing director, presiding.

The following are extracts from his circulated statement:

The accounts for the year ended March 31, 1952, show a net profit of £66,632 (£56,438) after deduction of taxes. Your directors recommend a final dividend on the ordinary shares of 17½ per cent, less tax, making 22½ per cent for the year, the same as for the five previous years. The trading profit shows an increase of more than £35,000. I make no apology for describing the increase as satisfactory since it is due entirely to a substantial increase in sales, the rate of profit as a percentage of turnover being slightly lower.

Our sales in the home market continue to be governed entirely by the supply of sugar and not at all by demand or production capacity. Our exports during the year were 36 per cent higher and established a record in the history of the company.

As to the prospects for the current year, it is gratifying to be able to report that the demand for Bassett's Allsorts seems higher than ever. Consequently the prospects of your company are largely bound up with the possibility of derationing and the decontrol of sugar supplies. In my opinion the time is rapidly approaching when sweets could be taken off the ration and a free market restored.

The report was adopted.

POWELL DUFFRYN LTD.

DIVIDENDS MAINTAINED

SIR HERBERT MERRETT'S STATEMENT

The annual accounts to March 31, 1952, were presented at the annual general meeting held on September 24th. The following is an extract of the statement of the chairman, Sir Herbert Merrett:

Dividends are maintained at the same rate as for the past eight years and the carry-forward further increased.

After six years' concentrated work some progress can be reported towards a settlement of the compensation to be received for the nationalised assets. In South Wales 97 per cent of the owners have reached voluntary agreement on the division of the district's share of the global sum, and the value of all short workings has been agreed. The company and the Coal Board have agreed to appoint an independent person to value the main ancillary assets. Final settlement of compensation will not result in any return of capital.

Although coal output has increased, coal exports are still only 35 per cent of 1938 quantities. With home demand overtaking production and foreign markets demanding better quality coal, what of the future? Exports have only been maintained because of lower freight rates and scarcity of dollars.

PROGRESS AT CORYTON

Most satisfactory progress has been made at the Vacuum Oil Company's refinery at Coryton, and great credit must be given to the supervising Socony-Vacuum technicians. Crude oil is now being received at Coryton and refined products will be available in a few months, and by midsummer, 1953, the refinery should be in full production.

The coastwise colliers of Stephenson Clarke, Ltd., have been fully employed, and the fleet is being further increased. Its subsidiary and associated companies operated satisfactorily at home and abroad.

Cory Brothers and Co., Ltd., has extended its Tank Farm at Barry, storing edible oils for the Ministry of Food and fuel oils of all kinds for ships and inland consumers. Another Tank Farm is planned for Ipswich. Further investment has been made in Tunisia where we have a refining company as our partners, and prospects are good. Cory Brothers recently acquired the whole of the share capital of Chellev Steamship Management Co., Ltd., which manages the ships of Chellev Navigation Co., Ltd.

The scope of Cambrian Wagon and Engineering Co., Ltd., has been extended to include mine cars, oil tanks and other items. Negotiations are on hand for a large new contract for mineral wagons.

Powell Duffryn Carbon Products, Ltd., are now producing chemical engineering plant of first-class quality as well as electrical and mechanical carbons. These are finding new markets in various parts of the world.

Our increased investment in the Tractor and Engineering Co. in Egypt has shown gratifying results. In Spain record profits have been made by our company. Our partners, Duro-Felguera, have given us much assistance in providing coal for our customers when suitable British coals were not available.

In today's trading conditions continued and concentrated effort and initiative are still needed, and I am confident that the management of your company is well balanced and will continue to overcome, so far as is humanly possible, all obstacles which we will have to face.

The report and accounts were adopted.

THE CONTINENTAL AND INDUSTRIAL TRUST

A SATISFACTORY YEAR

THE PROSPECTS FOR INDUSTRY

MAJOR ALBERT PAM'S VIEWS

The annual general meeting of The Continental and Industrial Trust, Limited, was held on September 25th at 146, Leadenhall Street, London, E.C.3, Major Albert Pam, OBE (chairman of the company), presiding.

The Chairman said:

The directors' report and accounts of your Trust have been before you for the necessary period and I am glad to be able to say that the past year has been a satisfactory one, although owing to the rise in the Bank Rate, which is part of the monetary policy of the Government, the prices of most securities have fallen.

INCREASED FINAL DIVIDEND

The revenue account is very similar to that for the year 1950-51, but your directors have felt able to increase the final dividend from 5 per cent to 6 per cent, making 8 per cent for the year. The balance sheet of the Trust and the consolidated accounts are so simple and clear that I have no comments to make about them.

You will find on page 10 of the report and accounts a list of the distribution of the Trust's investments on May 31, 1952; this shows that over 88 per cent of the total is in British Commonwealth countries. In the early years of its life your Trust had substantial investments and other interests in Germany, but our holdings in German securities are now relatively unimportant.

VALUE OF THE £

As the future prospects of every industry, every commercial undertaking and mining venture, every public utility concern, and thus of every investment trust company, depend on the value of the £ sterling and on our power to build up sufficient reserves of gold and of hard currencies to stand on our own feet without help or aid from other nations, you will, I hope, allow me to say a few words on these most important subjects.

Within the past few days we have had a forecast from the Prime Minister about the prospects of the sterling area. He stated that in the second half of this year the whole sterling area will be in balance with the rest of the world and that we in this island, after taking credit for defence aid, will be in general balance with the non-sterling world. This is certainly a great improvement in our position and shows that we are for the moment supporting ourselves.

MORE FREEDOM TO TRADE AND COMMERCE

The periodic publication of the figures by the Treasury causes much confusion by the policy of showing our actual outgoings and receipts of gold and dollars without any allowance being made for the variation in the quantities of stocks, the so-called "stock-piling," held in this country on national account. Clearly without some guidance on this point the figures may be entirely misleading, and I can see no good reason why the aggregate should not be published without the specification of the products. This "stock-piling" was a necessity during the

war, and for some commodities it may be a necessity still. The government is giving trade and commerce more and more freedom, which is an excellent policy; it is to be hoped that, in proportion to the rise in trade stocks of commodities, the need for governmental stock-piling will be greatly reduced, although it will now probably never be completely abolished.

Whatever modification is called for in the published statement of our position, however, Mr Churchill warned us that we were by no means out of the wood and that further efforts must be made by the whole nation to export more and to import less. This is, we should realise, a long-term need called for by our war losses, especially the loss of the overseas investments which contributed so much before the war towards meeting the cost of our imports. To export more and to import less, therefore, is a sound policy. But it is not an easy policy to adopt. If all the world's markets were open to us, we could increase our exports considerably. But the world is a different place from the world of my youth; even our own market is now far from being open to the goods of other countries.

A PROTECTIONIST POLICY

Quite apart, therefore, from the difficulty which our exporters are now meeting in finding customers in the markets open to us, as the prolonged re-stocking boom which followed the war exhausts itself, we have to face the fact that protectionist policy now conditions all foreign trade. It is time that we recognised this and adapted our policy to the need of buying our imports, so far as possible, from countries which are willing to admit our exports in payment. Such a policy would be a second best but currency difficulties and deep-seated protectionist prejudices render it unsafe to base our policy on the assumption of unrestricted exchange of goods throughout the world.

But first we must recognise that we ourselves have some blame for our position. I believe that a considerable part of our trouble has been caused by the inflationary conditions which have been allowed to continue in this country and the Commonwealth since the war, and I think that the Government took the first and most important step to cure our ills when the weapon of the "restriction of credit" was once more brought into use. There is no doubt that, with a high and largely illusory standard of wealth, enormous quantities of unnecessary dollar goods have been imported and it is to be hoped that this will now gradually be stopped.

AN ADDITIONAL TAX BURDEN

The Government has rightly insisted not merely on a balanced budget, but a budget surplus. Unfortunately, one of the measures to this end has been the institution of an Excess Profits Levy. Were this a levy on excess profits resulting from the armaments programme, there could be no complaint. It is in fact a substantial additional burden upon ordinary shareholders, levied upon "profits" which are inflated by the fact that no adequate provision for the replacement of fixed assets or stocks in trade can be made under existing tax rules. This

must be changed and the whole burden of taxation must be reviewed to make it fit modern conditions and the reduced purchasing power of the currency.

In the realm of industrial activity we are being pressed for more production, greater efficiency and a larger and better use of machine tools. There are without doubt industrial concerns in this country which are not efficiently run and where labour is not provided with sufficient mechanical help. This should be taken in hand at once by the managements and the trade unions concerned. But we have many industries spread all over the country, of which we can be proud, where management and labour work hand in hand, where production is good and pay runs into high figures for the employees. It would be a mistake if the view were spread about that we are generally industrially inefficient, even compared to the United States.

BETTER USE OF MANPOWER NEEDED

However, we could surely make better use of our manpower: there are now over 1,400,000 persons classified as employed in Government Ministries and Departments, and in Municipal offices; most of these perform no directly productive work, and many seem to hamper and frustrate the efforts of those who produce or are engaged in the distributive trades. These are the bureaucrats who demand returns in triplicate and who complicate the life of the rest of the community. The ministries of Health, Food, Fuel and Power, Labour and National Service and National Insurance, are represented in the smallest towns by an office with a manager, clerks and a telephone. The staff of every municipality has grown to much above its prewar strength, and it is the public which pays for all these officials, not only in money but in worry, and loss of time. If only half these bureaucrats were sent to productive occupations, where they are badly needed, it would greatly help industrial output. These suggestions deal of course mainly with available manpower but the cheapness and efficiency of production are of equal importance if we are to compete in the world's markets.

INDUSTRY'S LABOUR SHORTAGE

We pride ourselves since the war in having eliminated the evil of unemployment in this country. It is true that in recent years the volume of unemployment has been very small. If, however, we compare the recent position with 1939, using the classification in force then, the decline in the number of registered unemployed is just over a million. If then we look at the numbers employed in central and local government administration (leaving out of account those employed in industry by Government authorities) we find there is an increase of over three-quarters of a million, to which must be added 330,000 additional in the armed forces. Although there has no doubt been some change in the size and character of the working population during this period, it is broadly true to say that the reduction in unemployment has been absorbed into central and local government services instead of providing additional labour to industry.

As I have said above, industry is still short of labour, although there may occasionally be temporary unemployment in some branches or localities. But I do not

mean to imply that there is any likelihood of the nation being able to pass out of the period of austerity which has been our burden for too long. Trading conditions, as I have said, are becoming more and more unfavourable, and foreign markets will tend to be more difficult and competitive. Added to the points which I have already mentioned in this speech, there is the ever-present dollar gap, which brings about one crisis after another. It is therefore to be hoped that there will be the utmost possible co-operation between the Government, the trade unions and the leading commercial and industrial concerns to prevent unrest and labour troubles. Nothing could be worse for the whole nation in its present plight than labour disputes and strikes.

The report and accounts were unanimously adopted.

ARTHUR BALFOUR & COMPANY, LIMITED

A SUCCESSFUL YEAR'S TRADING

LORD RIVERDALE'S STATEMENT

The fifty-third annual general meeting of Arthur Balfour & Company, Limited, was held on September 23rd in Sheffield. The Rt Hon The Lord Riverdale of Sheffield, GBE, LLD (the chairman), presiding.

The following is the chairman's circulated statement:

This is the second annual general meeting since this organisation became a public company and covers the first full year's operations as such. I am glad to be able to present a favourable report. We have achieved a very successful result from the year's trading. This substantially exceeds the figure for the year 1950 which we considered to be a good year, and has surpassed our expectations, due to a combination of circumstances, many of which could not have been foreseen. We were fortunate in that shortage of alloys did not curtail our production. Overseas trade, which might well have been reduced, was, in fact, increased, while a brisk demand from normal markets at home continued. It is, of course, difficult to determine to what extent our products contribute to rearmament, as they do so both directly and indirectly, but it is apparently only in recent months that the influence of the rearmament programme has had any appreciable effect on our operations.

TAXATION A MATTER OF CONCERN

The accounts of the group show a profit, before taxation, of £1,150,636. This satisfactory result carries with it, however, a feature not so satisfactory. The tax due next January will be the highest ever recorded in the history of the company. The monetary value (not the volume) of materials in stock, or even more important work-in-progress, rose further during the period. It is all too obvious that this leaves us vulnerable in the case of a fall in material values.

I referred last year to the rate of taxation. This drain on our resources is common to all successful British undertakings, but it does give us even greater cause of concern in the current year. If taxation at the present fantastic levels is continued, it must involve, in our opinion, a decline in the volume of our operations, or an ultimate decline in our manufacturing efficiency, due to the depletion of our resources, unless fresh capital is forthcoming. It is surely unrealistic that a company in a strong position,

and after a successful year, might be placed in the position of having to incur substantial overdrafts to meet tax liabilities, in spite of the adoption of a most prudent and conservative financial policy. The position is even harder to contemplate when we consider that tax is levied, and must be paid on profits arising overseas, which owing to currency restrictions, are frozen and cannot be remitted to this country.

BOARD'S CONSERVATIVE POLICY

It follows from the above that we must adopt a cautious policy in an endeavour to conserve our resources. After careful consideration the board feel justified in recommending an increased distribution to a total for the year of 20 per cent, made up as follows: Interim dividend 6 per cent (already paid) final dividend 10 per cent bonus dividend 4 per cent. Similarly, we consider it prudent to place to the special stock reserve the sum of £100,000 and to the general reserve £325,000.

The contribution to the results of the year derived from subsidiary companies has been satisfactory at a slightly higher rate in spite of taxation.

THE OUTLOOK

Turning now to the current year, I am able to report that we have held our own and have achieved a comparable rate of turnover during the first six months of this trading period. This has been accomplished in the face of increasing difficulty, and it may not be possible to maintain this state of affairs throughout the year. Expenditure in general has risen, and I would refer to the fact that the considerable wage awards which became effective in November, 1951, will apply to the whole of the present trading period and will have a marked effect.

Export trade is an important part of our operations and many markets overseas have applied financial or economic restrictions which are bound to hamper our trade. Export restrictions imposed by this country are an additional handicap, and at this time when increasing competition is being encountered it is of the utmost importance that we should enjoy freedom and flexibility if permanent damage is not to be done to our markets overseas. We are, nevertheless, energetically exploring opportunities in overseas markets and feel confident that we shall maintain our share of the available trade. As I have already indicated, we should derive some help from the rearmament programme in this country. Within the financial limitations imposed by taxation, we shall endeavour to continue our policy of expansion overseas and re-equipment at home. Existing buildings and plant are being adequately maintained and numerous improvements have been effected since my last report. Every effort is being made to preserve the quality and service on which our reputation has been built and upon which we rely to overcome more difficult trading conditions in the future. It may be necessary to increase our holding of fully finished stocks to give the service required, and this may involve a further call upon our resources.

Despite the uncertainties and difficulties ahead, I take no gloomy view of present trading or of our future. I am confident that we shall hold our own.

I should like to conclude with a tribute to the management, staff and all employees at home and overseas. Their loyal service is greatly appreciated and has contributed effectively to the results which are shown in the accounts now placed before you. I am sure you would wish me to convey your thanks and appreciation to all concerned.

The report and accounts were adopted.

CELLACTITE & BRITISH URALITE

RECORD TRADING RESULTS

The twenty-fourth ordinary general meeting of Cellactite & British Uralite, Limited, was held on September 23rd at Gravesend, Mr George V. Parker (the chairman) presiding.

The following is an extract from his circulated statement:

The accounts for the year ended March 29, 1952, disclose a trading profit of £61,139 a record in the history of your company, both measured by production and by sales in spite of the considerable increases in manufacturing and distribution costs and the inflationary movement of prices in general. The most disheartening item in the accounts is the deadweight of £37,418 taxation, which in simple words means that during the last year we have been working over three days out of every five for the Government.

We look upon "Nuralite" as of major importance, its low cost compared with zinc or lead being an advantage. We have even heard that in some cases the salvage value of old stripped metal is more than enough to pay for the purchase and application of "Nuralite" which is in abundant supply and free of all restrictions.

On the sales side there is a falling off in demand. This falling off in demand, has, I understand, been the experience of other manufacturers of asbestos cement products. We often experience a seasonal lag in demand, but not to the same extent as at the present time.

The report was adopted.

GORDON (MALAYA) RUBBER ESTATES

CONDITIONS AFFECT OUTPUT

The twenty-ninth annual general meeting of this company was held on September 24th in London, Mr T. J. Cumming, chairman, presiding.

The following is an extract from his circulated statement for 1951:

The results of the year's working show a profit, before providing for taxation, of £154,660. The balance brought forward was £12,816, and after adding provision for taxation in previous years no longer required and the sum of £1,633 in respect of payment received under the war risk insurance scheme, the amount to be dealt with is £172,648. Taxation is expected to absorb £97,870. We recommend the payment of a final dividend on the ordinary stock of 10 per cent (less tax) making 20 per cent (less tax) for the year.

The crop for the year amounted to 2,221,688 lb, a disappointing figure by comparison with 2,752,047 lb in 1950. The fall in output can be attributed almost entirely to the conditions prevailing in the country. Adequate labour was difficult to recruit, and when obtained was subject to repeated interferences and intimidation by the terrorists. Complete stoppage of tapping on one or other of the estates was enforced on several occasions. Crop to the end of July this year, from the Negri Sembilan estates, was 1,207,960 lb compared with 1,174,400 lb in the same period last year, and crop for the month of July was the best for nearly eighteen months.

The crop estimate for 1952 is 2,100,000 lb, mainly, of course, from the Negri Sembilan properties.

The report was adopted.

DICTAPHONE COMPANY, LIMITED

RECORD SALES AND PROFITS

WARTIME EQUIPMENT

SUCCESS OF DICTAPHONE TIME-MASTER

MR C. KING WOODBRIDGE'S ADDRESS

The fortieth annual general meeting of the Dictaphone Company, Limited, was held on August 26th, at the registered office of the company, Kingsway, London, W.C., Mr C. King Woodbridge (chairman of the company and president of the Dictaphone Corporation) presiding.

The chairman, in the course of his speech, referred to the remarkable progress that had been made, since the last meeting, with the manufacturing of the Dictaphone Time-Master at the company's London factory resulting in record sales and profits for the year under review, the profit amounting to £125,799, being an increase of £90,176 over the previous year after taxation.

Mr Woodbridge in moving the adoption of the report and accounts said: The first electronic dictating machines were produced in 1936. A group of them was placed in the hands of one of our large companies to find out how they would operate in everyday use. Interestingly enough, they operated so well that the company purchased these experimental machines. The Dictaphone electronic dictating machine was placed on the United States market for general sale in 1939.

RESEARCH AND EXPERIMENTAL PROGRESS

In the meantime, research and engineering were experimenting with other types of recording media. The basic design of cutting a helical groove on a cylinder has unquestioned superiority. The cylinder is rotated at constant speed. The recorder travels along the cylinder at constant speed. There is no problem of a change in tone line speed. In considering all recording media, Dictaphone has always come back to the scientific principle of a helical groove on a cylinder or a belt, which is really a flexible cylinder.

Experiments were started in 1937 and 1938, using a plastic belt as a recording medium. The result of this experimental work was the introduction and sale, in 1940, of the belt recording machine. This machine uses a plastic belt, five one-thousandths of an inch thick, twelve inches long, and three and one-half inches in width. Many of these were sold in 1940 to the Civil Aeronautics Authority and to other Government agencies. Large numbers of these machines were built for the Government during the war years.

WARTIME EQUIPMENT

During the second world war, the manufacture of office equipment was suspended and inventories were ear-marked for Government use. Dictaphone devoted its entire effort to the winning of the war. Having the machine tools, the supervisory force, and the trained personnel to manufacture instruments requiring the highest degree of precision, very logically, Dictaphone was asked by the government to make fire control apparatus. The remote control system which connects the 40 mm. anti-aircraft gun with the director was first produced by Dictaphone Corporation.

Telescopic sight mounts for tanks, gunners' quadrants, computing sights, which automatically calculate the amount the anti-

aircraft gun has to lead the plane in order to score a hit, were produced in quantity by Dictaphone Corporation.

With the release of wartime restrictions, the production of machines for civilian use was once again our prime objective. The electronic cylinder dictating machine, introduced in 1939, was re-designed using the vastly improved components developed during the war. New models were introduced in late '45 and '46, the most efficient wax cylinder machines ever produced.

CURRENT PRODUCTION

The new recording machine with plastic belts, used by the Civil Aeronautics Authority and the Signal Corps during the war, commenced to supplant the Telecord using wax cylinders. When restrictions were removed, many were purchased by fire departments, police departments, doctors, societies, and other groups who had occasion to record meetings, conferences, and the like.

Experimental dictating machines using the plastic belt were made in 1941, but the war prevented their development. At the war's end, development work was resumed and dictating machines of this type were tested in our laboratory, tested in the hands of consumers, and finally offered for general sale in 1947. This new machine, the Dictaphone Time-Master, with its sensational development, the Dictabell, has shown itself to be the outstanding equipment in the dictating machine field. The Dictaphone Time-Master has rapidly supplanted the very excellent electronic cylinder machine. Today, more than 90 per cent of our present production is of this new model.

The heart of this new model machine is the recording medium, the plastic Dictabell. Dictaphone Corporation produces the Dictabell, by the extrusion process, a method which many claimed was impossible.

Again, in 1952, Dictaphone Corporation is contributing its part to the defence effort. We again are making computing sights for anti-aircraft guns, sub-assemblies for range finders for use in tanks, sub-assemblies for aircraft, and special research and development work for the Government.

COMMUNICATION

The industry's place in our economic and social complex needs identification. Our function lies in the field of communications. The very life blood of business, the professions, and Government, is the communication of information and ideas.

This, then, is the history of an industry born only 66 years ago and the part played by Dictaphone. Its life span from inception to its present adolescence is within the lifetime of many of us here. What its maturity may bring, no one knows, but I can assure you that it has a colourful past, a sparkling present, and an intriguing future.

The report and accounts were adopted and the retiring directors were re-elected.

The proceedings terminated with hearty votes of thanks to the chairman for his informative address and to the managing director for his services.

SALTS (SALTIRE) LIMITED

BURDEN OF TAXATION

The twenty ninth annual general meeting of Salts (Saltire) Limited was held on September 24th at Saltire.

Sir Frank B. Sanderson, Bt, the chairman, said that the profit on trading of the group before charging depreciation of fixed assets, £92,572, and auditors' remuneration, £1,908, amounted to £517,156. After making provision for those items there remained a profit on trading of £422,676, compared with £1,872,662 for the previous year. The board recommended payment of a dividend on the preferred ordinary shares of 1s. 3d. per share and a dividend on the ordinary shares of 6d. per share.

He made no apologies for again referring to the crushing burden of taxation. That it should be necessary to increase taxation during a period of so-called "peace" was really alarming and left no reasonable margin in times of serious trouble. It was most certainly in the interests of the country that taxation should be drastically reduced without delay.

The whole business and industrial world was alarmed at the present rate of increased and increasing Government peacetime expenditure. It paralysed the industrial development which would become increasingly essential if they were to compete profitably in the markets of the world in future years. Their directors were constantly striving to expand and develop the sale of their products abroad but it must be appreciated that the difficulties in their path were legion. They were continually facing new impediments by reason of quotas, licences or even total restriction from one country after another, in which the ultimate consumer was only too willing to purchase their products were he permitted to do so. That at a time when their exports amounted to nothing less than the life blood of this country. Here indeed there was a wide field for energetic action by Her Majesty's Government.

FUTURE PROSPECTS

It was difficult—one might almost say hazardous—to venture an opinion as to the prospects for the future, when world conditions were so unstable and affected the prosperity of the textile industry in the same way as all other industries. Although wool values had declined some 75 per cent from their peak prices, they were today some four to five times higher than the average prices prevailing before the war.

It would be idle to deny that the wool textile industry was passing through a serious recession in trade which had to be faced and which they hoped might prove to be only temporary. The current year was likely to prove a difficult one, but when more stable conditions prevailed in the wool markets and a recovery in the wool textile trade commenced, they were in a position to take full advantage of it. Although recently some of their mills were working short time, today their machinery activity had increased, but it remained to be seen whether that improvement was of a temporary or permanent character.

Stability in the price of wool would contribute greatly to a promotion of confidence and the risk of loss on stocks carried was much reduced at the lower prices now prevailing. Despite the difficulties which they had encountered, he felt that in view of the abnormal conditions which prevailed the result of their year's activities might be regarded as not unsatisfactory.

The report and accounts were adopted.

AMALGAMATED ANTHRACITE COLLIERIES

DEVELOPMENT OF ACTIVITIES

The twenty-eighth annual general meeting of Amalgamated Anthracite Collieries, Limited, was held on September 24th in London, Mr John Waddell, the chairman, presiding.

The following is an extract from his circulated statement:

At last our general position arising from the Coal Industry Nationalisation Act has become reasonably clear. The net amount which we have been awarded is somewhat below the average of the district, but, having regard to certain long-term contracts and the general anthracite background, there seems little doubt that we would have done no better by going through the valuation procedure and we might have done very considerably worse.

Our overall capital is £4,186,770; our sole future asset is the share capital of the British Anthracite Co., which is a large operating concern making good profits. The saleable value of this asset might be such that one could realise somewhere near two and a half millions for the parent company. The British Anthracite Co., Ltd., has earned before taxation more than 10 per cent on the entire capital of the parent company. Subject to completing the payment of Funding Certificates and were it not for the penal effect of profits tax on equity shareholders, it is clear that the earnings available to ordinary stockholders are really substantial, because the maximum the preference stockholders are entitled to in any year is £179,000 gross; therefore, were it not for that tax there would be about £300,000 of earnings available for the ordinary stockholders, who therefore are very substantially interested.

RE-DEPLOYMENT OF RESOURCES

I think members will realise that although we have had to face up to a terrible situation arising from the Coal Industry Act, which could not have come at a worse moment for South Wales, and in particular for anthracite collieries, and although we have had to face up, even on our operating companies, to further effects of nationalisation in respect of the loss of our wagons and our business as sales agents, we have, by careful re-deployment of our resources, done a great deal to offset the ill-effects of the Coal Nationalisation Act and to provide our stockholders with a real future which I hope will become a future reflected in dividends when two conditions can be complied with.

One of these conditions is a need for more liquid cash. The effect of inflation over the last few years has meant that our cash resources have not been adequate to meet our requirements for stocks, debtors and things of that kind, and that we can do with half a million more of liquid cash.

We propose, as soon as the opportunity is right, to raise this by means of notes or something of that nature so as to put our liquid position right and thus enable us to start a policy of increased dividends on the preference stock and some dividend on the ordinary stock of the parent company.

The Anglo-French Trust, Ltd., and our industrial group of investments have also made an exceedingly substantial contribution to our profits. Our activities generally are showing normal development. In the meantime I am pleased to say that for the first half of 1952 practically all of our activities are as good or slightly better than for the first half of the previous year. With regard to dividends, I feel these should be a possibility immediately we have finally settled up all the

colliery matters and have put our liquid position right by obtaining some half a million of further funds.

The report was adopted.

SILENTBLOC LIMITED

STEADY PROGRESS

The seventeenth annual general meeting of Silentbloc Limited was held on September 24th in London.

Mr H. Vezey Strong (the chairman), who presided, in the course of his speech said: Once again I am able to report steady progress inasmuch as the net profit for the year ended May 31st last, before providing for taxation, amounted to £211,263, an increase of £24,027 on the previous year.

Combined sales rose by nearly 37 per cent—a record turnover—but the profit margin fell by 17 per cent, reflecting the policy pursued by your board of keeping prices steady in a period of sharply fluctuating costs of material. Even so, had taxation remained at the previous year's level, our provision of £140,523 under this head would have been reduced by £15,878, turning our net profit, after providing for tax, also into a record.

According to plan, your company has been actively engaged in developing new proprietary components within its own especial field—in short, those products designed to redress any adverse trend should changes take place in present demands or fashions, and which will serve to flank and buttress the company against any trade recession should this occur.

In regard to the current year, combined sales to the end of August keep pace with the high level achieved during the corresponding period of last year, and combined orders in hand exceed in value £1 million.

The net profit amounts to £70,740. Your board proposes a final dividend of 3d. per share, less tax, making 6d. per share, less tax, for the year.

The report was adopted.

ALLIED INDUSTRIAL SERVICES, LIMITED

RECORD PRODUCTION AND OUTPUT

The eighteenth annual ordinary general meeting of this company will be held on October 17th at Bradford.

The following is an extract from the circulated review by the chairman, Mr W. H. Rhodes, CBE:

During the twelve months ended June 30, 1952, the steady progress achieved in previous years has been maintained and your factories and servicing departments have in total, by reason of the consistent demand for the materials we sell and for the services we provide, achieved a higher production and output than ever before. The net profit amounts to £188,468, which, added to the balance brought forward and taxation adjustments, gives a total of £214,360.

It has been the endeavour of your board during the year to take delivery of all outstanding orders as quickly as possible and accordingly it will be noted that the amount of the stocks held by the company, at values on which no loss has occurred to date, is slightly higher than at June 30, 1951. Present commitments for raw materials have practically all been entered into since June last and are moderate in quantity and price.

Towards the close of the year the board capitalised reserves to the extent of £42,187. This brings the issued ordinary share capital a little more comparable with the amount of capital employed in your company. It is the

board's recommendation that a final dividend of 18 per cent be paid on the capital so increased.

Concerning the present year, of which almost three months have already passed, whilst our output has again been in excess of the same period last year, extended summer holidays generally have prevented us from maintaining quite the same rate of increase as before, but should the level of industrial output of the United Kingdom remain as during the last twelve months I anticipate that the demand for our products and services will be maintained. With this in mind I am hopeful that this year's results will again be satisfactory.

RUBBER PLANTATIONS INVESTMENT TRUST LIMITED

The annual general meeting of the Rubber Plantations Investment Trust, Limited, will be held on October 17th in London.

The following is an extract from the circulated address of the chairman, Sir Eric Macfadyen:

The postwar constitutional changes in Indonesia, now independent and self-governing, may we all hope in time bring contentment and prosperity to its peoples: at present the labour situation, in Sumatra especially, is creating conditions quite inconsistent with economic production and destructive of capital values.

As to the position of Sumatra Tea in particular, you have been very fully advised from time to time. It was the prospect of that company having to cease operations—as it did, in fact, on July 24, 1952—which led to the directors' decision to postpone the annual meeting this year. We are now placing before you our proposals for dealing with the balance sheet losses incurred on our Indonesian investments as a whole.

In the accounts before you, our issued capital is shown in the balance sheet, as previously, at £2,469,384. The adoption of the proposals to come before the extraordinary general meeting, of which you have received notice, will give the more realistic figure of £1,728,569. Stockholders' holdings will be written down by 6s. in the £, thus reducing the nominal value of each stock unit to 14s.; each stock unit will then be divided into seven stock units of 2s. each.

During the fifteen months now under review, our revenue for the period rose to £307,431. Of this, £136,175 went in taxation, and the 10 per cent dividend paid on July 22nd cost £135,816. The dividend was declared as an interim to avoid the delay in payment which the postponement of this meeting would otherwise have involved. The carry forward at £149,313 is higher by £23,524.

Economic Intelligence

The Economist Intelligence Unit provides a means whereby the specialist knowledge of *The Economist*, its research facilities and its sources of information, both at home and overseas, can be directed to the particular requirements of business firms and other organisations. The Unit can supply information and prepare reports on a wide range of subjects. In suitable cases, it can provide authoritative opinions on specific problems.

The Meaning of Morecambe

The Labour Party had been nervous about the Morecambe conference for weeks before it opened on Monday, and both wings of the party had been making uneasy protestations about their basic unity. But the constituency parties thought otherwise. Whether as a result of Bevanite caucus-tactics (as Mr Deakin alleged) or by spontaneous combustion (as Mr Bevan declared), the constituency delegates blew unity sky-high by electing six Bevanite rebels out of seven representatives on the Party Executive.

The announcement of the poll provided only the first of a series of melodramatic scenes. Nor was it the only one to give an impression of bitterly conflicting attitudes amounting, for the party as a whole, to something like dissociation of personality. Speeches breathing the maximum of sober good sense and realism were followed, in strikingly regular sequence, by blasts of emotional auto-intoxication ranging from Mr Bevan's bravura performance on unemployment and American iniquity to Mr H. M. King's demand that the public schools be "re-nationalised without compensation" (whatever that might mean). The audience deprived itself by its own ecstasies of applause of Mr Bevan's full prescription for socialist planning, leaving only a whiff of syndicalism for the record; no one now will ever know whether some of his sentences would have contrived to make their way back to solid earth. Even when full allowance is made for that heightening of party sentiment which conferences of all colours are largely intended to achieve, it is evident that very little stimulus is needed to produce in a body of Labour delegates an atavistic revulsion from reason to shibboleth and from public spirit to class prejudice. The Old Adam will out.

The Old Adam is certainly rampant in the election returns. The first reaction of official Labour, and of optimistic sympathisers outside the party, has been to minimise their importance. The triumphant Bevanites remain a small minority on the Executive—six out of twenty-seven. Mr Morrison, however sensational his defeat at Morecambe, remains Deputy Leader in the House of Commons, and it is in the House of Commons, not at Morecambe, that the party's real work is done; the Parliamentary Labour Party, in which Mr Bevan's strength is even less than it is on the executive of the whole party, continues to frame practical policy and tactics. If, as is possible, he and one or more of his associates now win places in the shadow cabinet, then they will be automatically barred from simultaneous leadership of a cabal or cave. Both the real strength of the Bevanites in the country, and any decline in popularity of such stalwarts as Mr Morrison and Mr Dalton or the white hope Mr Gaitskell, are grossly exaggerated by the accidents of a complicated party constitution. The movement as a whole will not tolerate rebellion. In the view of the most sanguine, Mr Bevan, dizzy with success, has shot his bolt and overshot his mark. Having "organised himself in," he has aroused enough antagonism to

organise him out. So the Morrisonians console themselves as they lick their wounds.

The fact remains that Morecambe is a misfortune for the party, and for the country. However the dimensions of the Bevanite triumph may be whittled down, it remains a triumph. Delegations drawn from the active and articulate party workers in the constituencies are, by an almost inevitable process of self-selection, naturally extremist. They do not represent the many millions of Labour voters—in particular, they do not represent the million or two who make the difference between victory and defeat. Nevertheless, the conference is the governing body of the party and what happens there has a great influence. After Morecambe, the constituency tail is going to wag the party dog. Labour's obsessive preoccupation with unity, dating back to 1931, has muted rebellions in the past; but once rebellion refuses to be muted, that obsession works on the rebels' side. In any alliance that is becoming uneasy, from the military to the matrimonial, it is always the partner who values unity most highly who has to make concessions, whether reasonably or unreasonably. It follows that no Labour policy can, in the near future, be framed in terms or stated in ways which ignore Bevanite opinion.

*

There is much talk of a counter-offensive by the moderate wing; the big trade unions are out for Mr Bevan's blood. But the effect on the policy of the party of smashing the rebels is likely to be much the same as that of conciliating them. To discredit Mr Bevan, it will be necessary to give him no opportunity of levelling at the leaders the most damaging accusation that one Labour politician can bring against another—that of timidity and lukewarmness in the socialist faith. The formula will be that of the last twelve months, only more so—Attleeite men but Bevanite measures. Whether they aim at counter-attack or at conciliation, the moderate leaders of the party from now until the next election will be constantly distracted from their vitally necessary job of constructing a coherent and genuinely national policy by the need to appease or—as the case may be—to outbid Mr Bevan and his friends. In the course of doing so, they will have to commit themselves to promises of extremism which will prove to be millstones round their necks when next they face the responsibilities of office. The process started at Morecambe, with the passage by acclamation of a resolution committing the party to the preparation of a list of further industries to be nationalised. The sober leaders of the party, the members of the next Labour cabinet, know that this is foolishness. But they make no effective protest, and when they are again in office they will find themselves bound. The history of the Steel Bill will be repeated over and over again; moderate and realistic Labour ministers will find themselves compelled to do what they know to be wrong, simply because in opposition they had to follow the tradition of the party that regards all moderation as a preparation for treachery.

This might matter less to the nation, in the short run at least, were electoral realities closer than they are to democratic theory. Labour discredits itself, in the eyes of the uncommitted voter who swings elections, by a reversion to irrationality: very well, say the text books, Labour stays in the wilderness until it returns to its senses. While only the most uncritical Tory supporter could welcome the prospect of a semi-paralysed Labour

Party doomed to a generation in opposition, this would at least be preferable to the return, in two or three years' time, of the sort of government foreshadowed by the Bevanite display at Morecambe and the response which it evoked; and this remains true whether Bevanite policy is carried out enthusiastically by Mr Bevan himself or half-heartedly by Mr Attlee. Elections, however, do not work like that. They are decided by the view the electorate has formed of the government. Within wide limits, the attitude that the opposition strikes matters relatively little. If the Tories are thought by public opinion to have done well, not even the most perfectly sensible Labour party will win the verdict. If the performance of the Tories has disappointed, not even the widespread distrust of Mr Bevan will count for much against the desire for a change.

On the present evidence, the odds are heavily on a Labour government next time. The general election, it is true, may still be four years off, and anything is possible. But parties in office always tend to lose ground unless they have great external good fortune or show themselves exceedingly competent. Twelve months have been enough to rule out the second possibility, and external events, so far as they can be foreseen, offer more promise of difficulty than of triumph for those who bear responsibility in Britain. It must, therefore, for the present be the working assumption of British politics that the electorate will be less pleased with the Tories after four or five years of their rule than they were in the autumn of 1951. This, after all, is not to say that Mr Churchill and his colleagues are an unusually bad government, but simply that they do not look like proving themselves to be fortunate or competent above the average. But if the Tories lose any electoral ground at all, they will be out of office—and Labour's relative merits will have very little to do with it. A Bevanite Labour party might, in those circumstances, get a somewhat smaller majority than a Morrisonian Labour Party; but it takes a very great deal of optimism to believe that distrust of Mr Bevan will arrest the swing of the pendulum or keep the Tories in office. The verdict will be pronounced on the government; and if the verdict is adverse, the opposition will automatically get office.

Here is, prospectively, a lamentable state of affairs indeed. The policy, and perhaps the membership, of the next government will most probably be determined by a minority of opinion whose unstable constituents are personal ambition, class malice and a burning desire to escape from reality and responsibility. Such a government will lack that wide, popular support which can often make second-best measures work better than a theoretically preferable policy driven through against the grain of opinion; it will have lost the hard-won contact with reality which the Bevanite mind finds so uncongenial, but which national circumstances so urgently require. In class relationships it will most probably revert—with what ease the record of 1945-51 makes clear—to that policy of two-hoots-and-a-tinker's-curse which is the cheapest and easiest way of gaining extremist support. Worst of all, its foreign policy will be shot with ideological distrust of Britain's allies and with starry-eyed illusion about its enemies, to the detriment, if not to the complete undoing, of the western alliance on which the free world depends.

Can anything be done to fend off this catastrophe? Not under the present electoral system.

Private Lives of Nations

THE seventh General Assembly of the United Nations opens in New York on October 14th. It will face problems ranging from Korea and disarmament to technical aid and refugees. But over a dozen of the items on its agenda have one thing in common: they raise the question of the United Nations' right to concern itself with the internal affairs of member states. On the eve of this Assembly, there is perhaps no question to which it is more urgent that serious thought should be given. The friction and frustration generated by it are steadily mounting, and the rift between Uno's member nations on this issue becomes clearer every year. It is surely time for a review of the facts and arguments involved.

This is primarily a political, not a legal, issue. Although the Charter forbids the United Nations to intervene in matters "essentially within the domestic jurisdiction of any state," it does not attempt to define "essentially domestic" affairs. Nor does it assign to any organ of the United Nations the right to decide whether any particular matter is domestic or not. It can, indeed, be plausibly argued that any conceivable question ceases to be "domestic" as soon as it is raised before an international body; but common sense demands that a line be drawn somewhere. If no line is recognised, the United Nations must be dragged into the most intimate affairs of its member states, with intolerable results both for them and for itself. If, on the other hand, each nation is left absolutely free to decide for itself the limits of its domestic jurisdiction, how can the United Nations hope to carry out its aims? It is, for example, argued by Communists that the conflict in Korea originated as a civil war between south and north, in which Uno had no right to intervene.

The men who drafted the Charter at San Francisco could not resolve this dilemma. They fell back on compromise and confusion. Having given each member state the right to lay before the United Nations "any situation which might lead to international friction," and having pledged the organisation to promote economic and social progress and observance of human rights, they went on to declare that "nothing contained in the present Charter shall authorise the United Nations to intervene" in essentially domestic matters. The results of these contradictory undertakings have been as unfortunate as might have been expected. A series of complaints have been laid before the Assembly or the Security Council, only to come up against the argument, put forward by the accused nation, that the issue was a domestic one. Lacking any coherent body of law or doctrine on which to rely, the United States has taken decisions influenced by expediency as much as by principle. Thus, the Dutch claim that the conflict in Indonesia was a domestic one was dismissed with all the more ease because it was clear that the Netherlands was in no position to resist international pressure. In the case of the Indians in South Africa, the Assembly at first preferred not to pronounce on South Africa's plea of domestic jurisdiction, but later declared itself competent to make recommendations—which have had no result. As to Spain, in 1946 the Assembly considered the nature of the Franco regime sufficient grounds for a recommendation that all ambassadors should be withdrawn from Madrid; but in 1950 it quashed this decision admitting that its intervention in Spain's domestic affairs had been unjustified.

The logic of this situation is plain. Only when the accused nation is exceptionally altruistic or exceptionally weak and friendless can Uno hope to impose its will in a matter that involves domestic jurisdiction. The system penalises virtue and weakness, while setting a premium on ruthlessness and obstinacy. Totalitarian states are particularly invulnerable; sealed off from the world, they can blandly deny the existence of any evils alleged against them; and however hotly their sins are denounced in the Assembly no whisper of this criticism will reach their own peoples. Moreover, a premium is also set on irresponsibility and malice. A state that wants to make trouble has nothing to lose by accusing another of infringing human rights; the spotlight is turned on the accused, not on the plaintiff. Countries such as Afghanistan or Yemen can denounce France for giving inadequate voting rights or health services to the people of Morocco, without the least regard to the possibility that the Moroccans are better off in this respect than their own peoples.

*

Nations responsible for dependent territories are an obvious target for such attacks in an age in which "colonialism" is a term of abuse. In this respect the United Nations has fallen victim to the aptly named "salt water fallacy"—the idea that any country that has expanded overseas must submit to a degree of international criticism from which nations whose conquests have been overland are immune. Today there are at least as many primitive tribes in need of protection, as many minorities without political rights, and as many peasants held in virtual serfdom, in the territories of those Asian and Latin American states that term themselves "anti-colonial," as there are in the dependencies of European countries. Yet, while the scarcity of doctors in West Africa and the conditions of labour in the South Pacific are regularly subjected to the scrutiny of representatives of Asian and Latin American governments, those governments face no awkward questions about the slow extermination of Amazonian Indians or the armed repression of South East Asian minorities who claim their right to self-determination. Such questions would be regarded as an intolerable interference in the private affairs of sovereign states.

This lop-sided development has produced its inevitable results. The nations most subject to attack have come to regret the liberal attitudes which have led them into so much embarrassment, and some of them are on the verge of retreating into less co-operative positions. As the rift widens, the prospects of any particular case being discussed on its own merits diminish. Every time a doctrinaire resolution explodes futilely against an equally doctrinaire resistance the moral authority of the United Nations suffers, and it is not heightened by the spectacle of civilised states being harried by self-styled champions of human rights in whose own countries child marriage, the dungeon, and the secret police are still respectable institutions. Only one group benefits from the situation: the group of totalitarian states, themselves invulnerable to criticism, totally unconcerned with human rights as such, and delighting in every new division that appears between their less monolithic neighbours.

It is temptingly easy to seek a solution in retreat. The

idea that the United Nations should be deprived of every chance of disturbing the private lives of its members must appeal to the isolationism latent in most people. But even if such a solution were possible, it would be a tragic admission of failure. If the ideal of world order is ever to be realised, mankind's slow and painful progress towards the ideals proclaimed in the San Francisco Charter must not be checked too sharply. The first essential, perhaps, is to recognise that those ideals are interdependent. If the United Nations is wrecked on the issue of domestic jurisdiction, every one of its aims will pass out of reach, and the very nations that have pressed most eagerly for more interference in the affairs of others will be among the first to suffer. The second essential is to place Uno's functions in perspective. First wrongs must be righted first, and if the member nations have a certain moral obligation to point out the mores in each other's eyes, they have a much more urgent obligation to shoulder their proper shares of the common burden of collective security. The trouble is that the first task is so much more attractive than the second.

It might, however, be made less attractive. Since 1945, experience has shown that the most irresponsible charges have generally been laid before Uno by those members whose own domestic records are extremely dubious. The most effective way of curbing malice and friction might, therefore, be for the Assembly to require any government that accuses another of violating human rights to offer its own conduct for simultaneous examination. This would be no obstacle to complaints presented

in good faith; indeed, the plaintiff would stand to gain from a favourable comparison. The effect might be to clear the decks for genuine and responsible charges and to ensure them a fair hearing. A necessary corollary would be the elimination of the salt-water fallacy, for a country that denies its own metropolitan population the very rights which it accuses another of denying to dependent peoples must clearly be exposed for a special hypocrisy.

Means might also be found by which the Assembly could assess an accuser's right to a hearing in the light of his readiness to contribute to the common tasks of the United Nations, on the principle of no representation without taxation; precedents for this can already be found in the Charter, and it is surely only just that a state which has served the organisation loyally, whether by sending troops to Korea or by helping to finance technical aid or the feeding of refugees, should be preferred above those whose record is one of inaction or even obstruction.

Such devices would place a premium on virtue instead of on irresponsibility; they would silence some discordant voices, and lend more weight to sober judgments; and they would restore an element of judicial fairness that is lacking in many United Nations debates today. Above all, it is to be hoped that they would save the good name of the organisation from further depreciation, and thus advance the very ideals that are so eloquently and vainly evoked by the states to whom they would be applied.

Correspondence Colleges

IN 1951, 2,035 candidates sat for the examinations of the Institute of Chartered Accountants; all but two of these had taken a correspondence course as a method of study. No one knows very much about correspondence colleges as a whole, but here is one indication, by no means unique, of their growing importance. Most people not directly concerned dismiss them as academically disreputable or socially *infra dig*, and professional educationists would like to ignore them altogether; but for the examinations of the commercial professions and the external degrees of London University the ten largest correspondence schools have between 40,000 and 50,000 students—more than all the technical colleges in the country—while for engineering and industrial subjects, one correspondence school alone enrolls some 17,000 students a year. In the light of these figures, it is surprising that no serious attempt appears to have been made to assess either the value of the colleges as educational media or the circumstances which called them into existence. All that will be done in this and a second article is to indicate the outlines of this unexplored subject.

All correspondence colleges are highly competitive and (with one exception) profit-making concerns; detailed figures of their operations are not, therefore, available. However, if those of the type that offer to teach piano-playing, journalism or memory training are left out of the picture, the dozen or so leading ones fall broadly into three groups: those principally concerned with preparing students for the examinations of the commercial professions, such as accountancy, company secretaryship, banking and insurance; those which specialise in academic subjects and cater mainly for the

General Certificate of Education and first university degrees; and those which concentrate on the various aspects of industrial technology.

It is in the first of these groups, the colleges specialising in the commercial professions, that the success of postal tuition is most easily measured and most conspicuous. Aspiring bank managers, solicitors or accountants, for example, gain professional status only by passing a series of qualifying examinations after a period (usually five years) of approved or articulated professional apprenticeship. Evening study is therefore universal, and the student usually has the choice of going several nights a week to the local technical college, or taking a correspondence course, or—by no means uncommonly—doing both. Many of the advantages of the correspondence course seem obvious to the eighteen-year-old. He feels he has outgrown the classroom, or he absorbs material like company law or the income tax acts more thoroughly from the textbook than from the spoken word; or he prefers to concentrate, for example, on the minimum economic knowledge needed for his own examination rather than share a general economics class with twenty people whose needs are different. He probably fails to realise the biggest advantage of all. By the time he has written a hundred or two answers to test questions he has gained some facility with his pen, and his examination technique is probably as good as it can be made. And whatever derogatory things may be said about examination technique in other fields, it is perhaps no bad thing for an accountant or a banker to be quick, orderly and exact on paper.

Whatever the reasons, between 60 and 80 per cent of

commercial professional training for examination is conducted through the post, and the correspondence colleges continue to win the gold medals and "four top places" with almost monotonous regularity. Indeed, the system is becoming inbred. The Institute of Chartered Accountants last year declared itself uncompromisingly in favour of correspondence tuition, as opposed to evening classes, for its articled clerks—a step probably not unconnected with the rise of a generation of correspondence college students to eminence in that profession.

★

The widespread use of correspondence tuition in technical subjects presents a somewhat different picture. Whereas the bulk of students of commercial subjects are young men qualifying for a professional badge in a clearly defined field, the demand for theoretical coaching in industrial techniques is infinitely more varied, both in subject matter and standards of difficulty. A foreman, for example, with ten years of workshop experience, who left school at fourteen, wants to learn the theory of his own "line"—plumbing or plastics or power-houses. A well-qualified engineer may find himself needing a knowledge of rubber technology, or an aeronautical draughtsman may jib at the higher reaches of the Royal Aeronautical Society's examinations, but turn aside to specialise in certain aspects of radio or heating technique. Such an assortment of highly individual needs is hard to meet by conventional class teaching. Differences in age, practical experience and general education make the assembling of evening classes difficult for all but the elementary levels or the well-trodden paths such as Higher National Certificates. There exists such a wide demand for systematic theoretical teaching to supplement practical experience on so many levels and in so many industries that although evening classes are probably better and more numerous in technical subjects than in any other, they are still unable to meet more than a fraction of the need. Again, although the law and commercial needs are constantly changing, the practising solicitor or accountant takes these changes in his stride. But the numerous branches of industrial technology advance with much greater rapidity and complexity. The best practice outstrips the textbooks before they are printed, and in any case the demand for up-to-date technology comes largely from a class of practical men who want not textbook abstractions, but pre-digested and strictly utilitarian teaching.

Correspondence courses in the purely academic subjects form the smallest of the three broad groups, and are

taken by a miscellaneous collection of people, difficult to classify. The largest single section is probably the popular cramming courses for the competitive entrance examinations of the Civil Service. The General Certificate of Education and the external degrees of London University account for the bulk of the remainder. A large proportion of their work goes abroad to people of all races in remote parts of the world—an Indian Prince, a missionary on Tristan da Cunha. The demand at home is from people who for one reason or another are misfits in the general educational system. School teachers with training college certificates who want degrees, graduates who want certificates in education, grammar school pupils who want subjects not provided in their own school; and above all the large numbers of people who, having missed an education suitable to their talents, are anxious to repair some of that loss. This kind of correspondence course is the oldest of all. The two best known concerns started in the eighties and made their reputation with London matriculation and the external degrees. It might seem, as the conventional education system is becoming more democratic, that the need to stop up the gaps in the system will gradually disappear. In fact, the reverse is probably true. As educational labels become more and more conspicuous at all levels, their prestige and money value increase in the eyes of those who have them not.

★

All the correspondence colleges have certain features in common. The heavy overhead cost of preparing and printing new courses is one of these. In the commercial and technical fields particularly, courses need constant revision and many are rewritten every two or three years by good people who are well paid for this rather specialised job. This is a strong deterrent to dabbling in new fields before a sizeable demand has been built up—as also is the heavy cost of advertisement. Even the best known colleges estimate that about half their new enrolments come from advertisements and the remainder from personal recommendation. Economies of scale are therefore very considerable, and the boost in numbers and even more in free advertisement that has resulted from the widespread sponsorship of correspondence courses in the army, during and since the war, has probably helped to keep down costs. Tutoring, that is the marking of the students' written work, is normally sent out by post to part-time tutors paid on piece rates. Only a few colleges have enough work on any one subject to keep full-time

tutors. There would appear to be no shortage of tutors willing to do this sort of work, although it is hard to judge the rates paid. It is different, of course, from the drudgery of examination marking, in that the tutor can often take a personal interest in his students' progress over a period of years. Whatever the reasons, however, it seems fairly clear that correspondence colleges can pick and choose among qualified teachers for those whose capacity for the *mot juste* and the helpful comment is considered most useful to the student. The tutor's work is under constant and critical inspection by his employers, who are selling their service not only to each student but, they hope, to each student's friends

Germany in Proportion

IT is becoming increasingly urgent to see Western Germany's recovery in proper proportion. The Germans for their part are waging a campaign, with selected statistics, in order to prove that their prosperity is not as great as it seems. The season calls for pleas of deserving poverty: reports have to be submitted to the various international organisations of the western community. On them will be based decisions about Germany's credit surplus with the European Payments Union and the amount to be spent on defence in the Nato year 1953-54. Moreover, the Bonn authorities hope that a well-presented case will secure a large American loan to finance a further big expansion of industry and exports, and make the Deutschemark convertible.

If the Germans belittle their own strength, their competitors exaggerate in the opposite direction. The Federal Republic's neighbours are too inclined to be impressed by the startling curve of graphs that show increases in production and foreign trade since 1948. Under the painful impact of lost contracts, the British business man often forgets that the Germans started from utter prostration, and that they still lag behind Britain and other western European countries. Similarly, in discussions on rearmament, the assumption that Germany

and colleagues. Moreover, most correspondence colleges promise to go on coaching a student until he passes his examination, and this too makes them keep a sharp eye on the strict relevance of a tutor's remarks to his students.

Here then is a small, but growing industry, operating outside the normal educational field, but selling for hard cash something that stands for higher education to upwards of 150,000 people at a time. This state of affairs raises a good many questions about part-time education in general which it is proposed to discuss in a second article.

(To be concluded)

will dominate the Continent within a decade or two is often made without evidence or analysis.

The purpose of the accompanying page of charts is to bring German recovery into perspective. The country's present position is compared with that of Britain—a land with roughly the same population and proportion of industry to agriculture—and with that of the European Defence Community as a whole. For it is within the framework of the community that German strength in Europe must be assessed. Only if the community were to come to nothing, and the United States be unwise enough to channel its aid direct to a rearmed Germany would all the dangers spring up that are now latent in the nation's strength.

Several important facts emerge from the charts. The position of Germany in oil refining, for example, remains weak. The projected strength of the German contingent in the EDC, moreover, makes up only a comparatively small proportion of the total forces allocated to European defence (not including reserves). The chart also shows that Western Germany's total trade in 1951, although it had doubled since 1949, was still only about a third of the United Kingdom's.

The graph of industrial production tends to support the German's claim that their progress lags behind that of other western European countries. It is true that it is based on 1938, when Hitler's armament boom was at its peak, while Britain's effort had hardly begun. Even so, it shows that Germany has still a long way to go from the trough of 1948 before it overtakes the production of other western lands. This is partly because, though employment is at a very high level, productivity is comparatively low. There is thus room for further expansion. The attempts of the Americans to induce German employers to adopt their methods of labour management will not move the suspicious and conservative Germans, but a loan for the purpose of installing modern machines will be eagerly grasped, and would doubtless be reflected in higher productivity. Perhaps the most significant fact about the present position of Federal Germany is the dependence upon imported food that is shown at the foot of the page of charts. The western portion of Germany has greatly reduced its imports of grain in the last few years, but it still remains far from the level of self-sufficiency that was reached by Hitler's Reich. The lesson of the charts is, indeed, that the Federal Republic has gone amazingly far, but that it is still comparatively weak.

Germany in Proportion

These blocks are divided to illustrate the present relative economic and military power of Western Germany, the rest of the countries belonging to the European Defence Community, and Britain.

Western Germany Rest of E.D.C. United Kingdom

FOOD IMPORTS AS PERCENTAGE OF CONSUMPTION

Notes—(a) The basic year for these comparisons is 1951 except where otherwise stated. (b) The armed forces referred to are those allocated to the defence of Western Europe under present plans. (c) The Saar is included with France as part of the EDC countries.

ECONOMIC CONDITIONS ABROAD

The Economist Intelligence Unit provides quarterly reports on economic and business conditions in

Argentina, Australia, Belgium, Borneo, Brazil, Burma, Canada, Chile, China, Colombia, Cuba, Denmark, Egypt, Finland, France, India, Indonesia, Indo-China, Israel, Italy, Japan, Yugoslavia, Kenya, Malaya, Mexico, Netherlands, New Zealand, Norway, Pakistan, Persia, Philippines, Portugal, Siam, Southern Rhodesia, Spain, Sweden, Switzerland, Turkey, Union of South Africa, Uruguay, USA, Venezuela, Western Germany.

These reports give a concise analysis of matters of concern to exporters and investors. Particulars may be obtained from The Economist Intelligence Unit, 22 Ryder Street, St. James's, London, S.W.1.

NOTES OF THE WEEK

Belligerent Comrades

It is ironical now to look back on the words of Mr Harry Earnshaw, this year's chairman of the Labour Party, when he opened the conference at Morecambe. There was no deep split in the party, he said, and differences of opinion were right and healthy. From then onwards his main task was to prevent the comrades from coming to blows.

The first major uproar occurred when Mr Deakin and Sir Will Lawther repudiated a proposal by Salford West party that there should be strike action to support a political campaign to get the Tories out. The union leaders were not going to have union policy decided by the constituencies, and Mr Deakin brutally told the delegates that if they wanted the unions' money they had better listen to them. The second big row involved Mr Crossman whose ingenuous confession that he must be less controversial now that he was a member of the executive was taken by the conference as an admission of time-serving. But the really ugly scene occurred when Mr Deakin's fraternal greetings from the TUC took the form of a slashing attack on the Bevanites. They no longer, he said, had any grounds for disagreement over policy and were simply engaged in a struggle for the leadership; he implied that their victories on the executive were due to an organised campaign in the constituencies, and he promised a counter-organisation to defeat them. It is indeed high time that there were counterblasts against the left wing faction of the party, for the complacency and inertia of the right have certainly contributed to the defeat of some of their best representatives. But it is a pity that the counter-attack had to be left in Mr Deakin's bludgeoning hands. Sir Will Lawther would have done it better.

By contrast, the performance of Mr Morrison, shortly after his defeat, won him a great ovation. He showed himself a good loser, and his speech on home policy was wise and constructive, in spite of one or two sops to old-fashioned socialism. He seems at one stroke to have won back much of the popularity he lost by his record as Foreign Secretary. The union leaders feel that it is a great pity that his talents should be wasted, and that he is the right man to deal with the dissident faction—in contrast to Mr Attlee, who, it is thought, has failed to rise to the occasion. There is no reason to believe—as some newspapers were very quick to report—that there has been any serious talk of inducing Mr Attlee to resign. But certainly Mr Morrison has not, on balance, been weakened by this week's events.

America Riles Mr Bevan

The conflict between old attitudes and new fact is apparent in many parts of the Labour party's thinking, but nowhere is it more painful than in the matter of relations with the Americans. In the traditional Socialist view the United States is a "capitalist" country, either exploiting everybody or on the verge of collapse. If only in the last decade it had plumped for either alternative, the world might have been more uncomfortable but Labour thinking would undoubtedly have been less so. As it is, the generosity and vision of American foreign policy and the obstinate refusal of its economy to collapse have confounded the old ideas, and until the period of rearmament outright attacks on America were few. But the old prejudices remained.

Rearmament has given Mr Bevan and his friends the opportunity to revert to earlier ways of thinking—a characteristic of most Bevanite political thought. In the last year the old cries of American imperialism, of warmongering, of unrepentant capitalism have been heard again and, need-

less to say, in Mr Bevan's rhetorical *tour de force* at Morecambe, petulant attacks on America—"afraid of unemployment, afraid of war and afraid of peace"—were not left out. Mr Bevan knows, as Mr Richard Nixon knows in America, which purple patches can be relied upon to arouse the right emotional response.

It is true that Mr Bevan's voice was not the only one to be raised. Mrs Jean Mann put in a courageous protest against these vindictive attacks coming from a party that supposedly preaches international goodwill—and Mr Mayhew and Mr Healey talked sense on foreign policy generally. Mr Herbert Morrison went further and reminded his audience of the generosity, progressiveness and liberalism of the United States, of the Marshall Plan and of the TVA—but Mr Bevan, not Mr Morrison, won the constituency vote.

Yet the Bevanites' attitude presents an extreme paradox. They profess to be upholders of the Commonwealth. Surely they know, or should make it their business to find out, that a split between London and Washington would undermine more speedily than anything else the unity of the Commonwealth. They also profess to believe that \$10 billion of new investment is needed each year for the backward areas. Do they expect the British community to provide it? Or do they suppose that the Americans can be blackmailed, goaded and insulted into pouring their wealth into the outside world? The only likely answer is that they have not thought about it at all.

Decision for War in Korea?

It would be hard to go beyond the United Nations' latest offer on prisoners in Korea without capitulating to Communist claims. The allies refuse to return men to China against their will; the Communist powers reject the good faith of this attitude. Now the allies have offered, on the establishment of a cease-fire, to place all prisoners who have objected to repatriation in a demilitarised zone agreed by both sides. There, "without questioning, interview or screening, each individual so released will be free to go to the side of his choice." All other prisoners would be repatriated at once in the normal way. The Communist delegates at Panmunjom could not have been expected to accept off their own bat so novel and friendly an offer. General Nam Il again insisted, with particularly bad grace, that all prisoners must be repatriated automatically, while referring the offer to Peking and Moscow.

For some months the question of prisoners has been the last point holding up an armistice. The allies have been wracking their brains throughout to think of ways of saving Communist face without surrendering the principle of not forcing men to return against their will. Rejection of the present offer would seem to confirm a suspicion which many people have had for some time—that the Communists do not want peace in Korea. In the past, there have undoubtedly been differences of view between Peking and Moscow; and for varying motives both have at times probably wanted a truce if they could get it without having to pay too high a price for it. Now the recent Sino-Soviet conference in Moscow may have produced a fresh decision to continue the Korean war on a limited basis indefinitely, since it ties down a large part of the American forces and yields propaganda dividends all over the world. Signs that this may be the case are a recent increase in the scale of Chinese attacks and the reported presence for the first time of Russian technical troops in the rear areas. If so, and the Communists evade the latest offer, the allies must themselves make the utmost propaganda capital out of the Communist will to war.

Neguib versus Nahas

On Sunday last the Wafd decided to flout General Neguib and his new law governing the regulation of parties. The crux of this law is that it compels them to refuse membership to those who have "abused privilege" or "made illegal profits." For a time, it had looked as if the Wafd would conform to requirements by ejecting its more infamous mountebanks—and re-forming in a shape that could support the Army's "sacred movement." The stumbling block to this procedure was Nahas.

Nahas is now seventy-six. For the generation since Zaghlul Pasha died, he has worn the mantle of the party's founder. He has for that period been a national idol. To attack him personally presented some risks, and for weeks General Neguib refrained from doing it; he struck only at Nahas's closest associates and at his wife's rapacious family. Then perusal of government files seems to have brought, if not sins, at least connivance at sins, to light. General Neguib's tone changed: if Nahas was innocent he was worthy of respect; if guilty, "the law will be applicable to him as to any other citizen." At the same time, the Army requested his suspension from the party. At this, the party executive adopted the slogan "No Wafd without Nahas," and published the decision already recorded.

The contest is on. Obviously, Nahas hopes by a dramatic appearance in court to appeal to the great following that his demagoguery has held in thrall for so long, and to appear in a martyr's role. But General Neguib, by the well-timed and sober tour of the Delta that he has just completed, has revealed that he too can command popular adulation, and, if he plays his cards as well as he has so far done, he may well be able to trump Nahas's ace. His strongest argument is that connected with the poor man's pocket, for when Nahas won the elections of January, 1950, he did so on a promise that he would reduce the cost of living. By efficiency and honesty he could have brought about this result; the terms of trade in the Korean war period of rising world prices were favourable to Egypt as a cotton producer. Instead the cost of living rose steadily throughout his term of office to the impoverishment and dismay of Egypt's middle and lower classes. If they can be constantly reminded of this bitter memory, Neguib and not Nahas can win the present bout.

Maisons Tolérées

The Labour party's pamphlet on "The Future of Private Industry" is neither a policy manifesto nor a statement of principle—unless the acceptance of private industry as an institution having any future at all may be regarded as such. (Socialist readers are left free to regard it as a permanent feature of the ideal economy, as an evil due for abolition as fast as legislative processes allow, or, like a continental house of ill-fame, as a regulated concession to human imperfection.) "The Future of Private Industry" is the fifth in a series of discussion pamphlets, formulating questions in the process of answering which principles may emerge and policy be given coherence. Many of these questions are, indeed, being urgently asked and discussed by non-Socialists. How, for instance, should full and continuous employment be weighed against the higher productivity and more rapid progress which its maintenance may, to some extent, conceivably injure? (It is something to see this possibility of conflict even theoretically recognised.) What is the proper role of various kinds of control, in what circumstances should they be invoked, in what circumstances dismantled? What are the possibilities of development councils? Can any scheme, for instance an amended company law, providing for a measure of genuine workers' control,

* "The Future of Private Industry." By Joan Mitchell. Transport House. 31 pages. 4d.

solve the problem of divided responsibility and loyalty which faces the workers' representatives? What is the function and importance of profit?

The Socialist colour of the pamphlet is, however, unmistakable. The axiom remains unquestioned that any identity between private profit and public benefit is a purely coincidental improbability. The question is never "What institutional framework is needed to make the profit motive serve the public welfare?" but "How can people be prevented from doing what is most profitable and made to do something else?" It is not "How can competition be encouraged?" but "How can monopoly be controlled?" The pamphlet ends with the impeccable generalisations that "steering the economy in the way we want it to go depends on getting the general economic atmosphere right" and that "there is no simple solution that is in itself obviously Socialist." To the Labour movement these glimpses of the obvious may come with the revelation of new truth or the horrific impact of heresy. If they and their implications were ever genuinely accepted and installed as part of the party's mental furniture a wide segment of economic controversy would be removed from the political field; and a good thing too.

East African Inquiry

Sir Evelyn Baring, the new Governor of Kenya, has taken up his appointment this week, and his first task will be the consideration of measures to put an end to the recent outbreak of crime. His task will not have been made easier by the exacerbation of relations between Africans and Europeans that the crimes have provoked. The Europeans tend to say that responsible African leaders, in particular, the African member of the dependency's executive council, have not identified themselves clearly enough with the forces of law and order by denouncing crimes and the agitators behind them. The Africans, on the other hand, have tended to retort that the Europeans have deliberately exaggerated the disturbances in order to cast doubt on the wisdom of giving Africans a greater share in the responsibilities of government. The report this week that five Africans on the Legislative Council have issued a statement deprecating the crimes may do something towards restoring better relations between the races.

In the meantime, the form of the inquiry into the land problem, foreshadowed by Mr Lyttelton last July, has been made known. A Royal Commission is to be appointed "to inquire into the wider aspects of land use in relation to the economic, industrial, social and demographic problems of the East African region as a whole." The inquiry is thus, it is emphasised, in no way related to the present unrest in Kenya and is not even confined to the land question in Kenya alone. Nor will the commission be concerned with claims to land. But if it is able to make some practicable recommendations to relieve the acute local congestion on the land and to reduce the problems arising from the growth of large urban African populations, some of the friction inherent in plural societies ought to be considerably diminished.

* * *

The Strange Case of Mr Zukas

Mr Simon Bér Zukas, according to reports, is a Lithuanian who arrived in Northern Rhodesia from Cape Town in March last year. From then on, his activities were mainly devoted to agitation amongst Africans against the proposed Central African Federation. He became secretary to an Anti-federation Action Committee and was joint editor of a propaganda publication, "The Freedom Newsletter." Earlier this year, in consequence, the Attorney-General of Northern Rhodesia applied to the High Court for a recommendation that Mr Zukas should be deported, on three alternative grounds: that he had intrigued against the

government of the territory, that he had excited enmity between different sections of the community and that his conduct had been such as to show him to be a danger to good order and government. The Chief Justice in Northern Rhodesia rejected the first two grounds but was prepared to recommend deportation on the third ground of the complaint. Since, as in this country, deportation itself is a matter for the executive, not the judiciary, any further action lay with the authorities. Mr Zukas then appealed against the deportation recommendation and at the hearing was represented by Mr Pritt, Q.C. The Appeal Court decided that an appeal from a recommendation for deportation did not lie to that court as the recommendation was not a "judgment," but it gave permission for a further appeal from its own ruling to the Privy Council in London, provided Mr Zukas gave security for costs, fixed at £500. Last week the Northern Rhodesian Government applied for an order that the permission to appeal to the Privy Council should be rescinded, on the grounds that Mr Zukas had not complied with the condition about costs imposed by the Court.

The interest in the case, today, is twofold. First, there is uneasiness that a man is threatened with the loss of a right to appeal to the highest court in the Commonwealth solely on the grounds that he has not enough money to pay the costs of the appeal (there is no general "legal aid" scheme for the benefit of appellants to the Privy Council). On the other hand, it is impossible not to suspect that some supporters of Mr Zukas may have desired that very situation to arise. Someone financed Mr Zukas's activities in opposition to federation. Someone found money for the costs of the proceedings before the courts in Rhodesia. Someone, one must presume, paid Mr Pritt's air passage from London to Salisbury. But no one, apparently, is prepared to finance Mr Zukas's final appeal to the Privy Council. The Northern Rhodesian Government is left with both the embarrassment of Mr Zukas in custody and the difficulty of finding an ultimate destination for a deported Lithuanian. It may well be that someone regards that as a very satisfactory result to have achieved.

The Eden Plan Goes Forward

For the last week of its session, the Assembly of the Council of Europe got the bit between its teeth and discussed in rhetorical fashion everything imaginable, whether or not the matters lay within its competence. In one spirited debate it usurped the functions of Nato and voiced the demand that every part of Europe should enjoy the same priority in defence—a conclusion calculated to leave the strategists gasping. Another debate ranged over European transport, on which a vast amount of work has been done at Geneva; another pledged the Assembly's support for a proposal that members and their dependent territories should form a single tariff and currency area with discrimination against non-members—a proposal to strike alarm in London, Canberra and Ottawa, quite apart from the graver reactions of Washington.

The last day brought a return to sobriety. By a unanimous vote, the so-called Eden Plan was adopted. It recommends that the six-nation assemblies, set up to supervise the Coal and Steel Community and the European Defence Community, shall meet in Strasbourg, that they shall use the Council of Europe's secretariat and that the nations not joining France, Germany, Italy and the Low Countries in closer association shall have observers with the right to speak at the meetings of the "six." The unanimity of the vote was secured only after the British had given fresh assurances that the presence of observers from the Council of Europe implied "not subordination of" but "co-operation with" the six.

Yet this is clearly only the beginning of the chapter. The British Under-Secretary, Mr Anthony Nutting, admitted in so many words that if the six nations set up a full federal

government, then the Eden Plan can hardly be effective, that "a new situation will arise and some re-thinking will have to be done." A council representing the fringe states of Europe would then be hardly an appropriate instrument for contact and co-operation. Nor, as some of the more unrealistic debates of the last week have proved, is the Council an adequate framework within which to express the overriding interests of its members. Defence is already the recognised prerogative of the Atlantic community. Trade and payments problems may need the attention of the whole free world. Certainly the sterling area and Latin America have a vital role to play. If federation between the six goes forward, the other nations will probably find the Council of Europe too wide to act as a means of influencing the six, yet too narrow to be an instrument of co-operation with the rest of the world.

Problems of M. Pinay

When the National Assembly reconvenes on October 7th, M. Pinay will be facing a number of serious problems, any of which could endanger the precarious coalition which has kept him in power. His own cabinet is as yet undecided whether or not it should allow the Tunisian question to appear on the agenda of the UN General Assembly. French nationalism is strongly aroused over the whole issue and a moderate course, such as is advocated by M. Schuman, may arouse not only the wrath of the Right but also the distrust of the country at large. The whole problem is to be reviewed at a cabinet meeting on the same day as the opening session of the Assembly, and M. Pinay may be hard put to it to work out a compromise under parliamentary fire.

The second major problem of foreign policy will be the ratification of EDC and the question of continued support for policies of European federation. Although these can be shelved until spring, there is no doubt that M. Schuman will come under increasing attack from several quarters. On the extreme right, the De Gaulliste RPF will continue to demand an independent French army and a reassertion of national sovereignty at the expense of closer European integration. The Communists, on the other hand, will continue their anti-Schuman campaign in favour of a united Germany along the lines of the Soviet peace proposals. Once again, as so often in France, the extremes both on the Right and the Left will seek to woo away marginal members of a central coalition. M. Pinay may find his working majority under considerable pressure from a paradoxically united front of intransigent nationalists, neutralists and Communists all operating towards the same end for very different reasons.

But as a rule, although a Foreign Minister might be sacrificed, a French cabinet would hardly fall on a foreign policy question. It is on the control of rising prices that M. Pinay's survival really depends. If the price index reaches 149, M. Pinay is bound by law to grant an inflationary rise in wages or, in short, to admit that his entire "save the franc" programme has failed. It is doubtful whether he would wish to carry on under the circumstances and, as the September index is expected to reach 145, the coming weeks are obviously critical. M. Pinay finds himself in an equally precarious position regarding the 1953 budget which he will have to propose during the coming session of the Assembly. The amount of American aid on which he can rely is uncertain, and the estimates submitted by various government departments come to 177 billion francs more than last year. Although M. Pinay speaks hopefully of a new loan, there is increasing scepticism in many quarters about the Prime Minister's predilection for stop-gap measures.

When discussing questions of European union, therefore, it is well to bear in mind how very insecure the position of the Pinay cabinet is and how critical the next few months of parliamentary battle may be.

Entertaining and Instructive

The BBC's report for the year 1951-52 shows the corporation's consciousness of its power to condition the British people almost as surely as if this were George Orwell's 1984. Its Home and Light service is the background to many people's daily lives, and its television the foreground of their evenings. How far it should give its audience what they want and how far what is good for them is a question for unending argument. Most people would probably agree that the BBC has achieved a satisfactory compromise, with its three programmes of different weights. The Light service has shown considerable success in adapting serious subjects to its audience, while the Third Programme is the most erudite broadcasting in the world—although it would be interesting to know the results of listener research into some of its more dizzily abstruse items.

The BBC takes its educational functions seriously. The "Forces Educational Broadcast" has been abandoned in favour of programmes of adult education addressed to a wider audience. An experiment was made earlier this year in methods of presenting television in schools, and further investigations into the development of a syllabus and the best kind of receiving equipment will probably follow sometime next year. The television programmes as a whole, however, give rather more cause for concern than those of sound broadcasting. Many of them have been valuable, but many more have not. Their content ought to be of higher quality than that of the Light Programme, because television is all-absorbing and cannot just be treated as a background. The evidence is that the average television owner sees about half the television programmes broadcast each week—that he views for about eight hours a week; it is important, therefore, that he—and more particularly, his children, who are even more assiduous viewers—should see something worth while.

Planners versus Objectors

One of the instructive talks given recently on the Third Programme described with enthusiasm the replanning and rebuilding of Warsaw. But how simple it is to replan and rebuild when the people who object can be ignored or liquidated; how speedily it can be done. By contrast the replanning of London must proceed at snail's pace. This week, at the Central Hall, Westminster, an inquiry began into some 6,300 objections which have been lodged against the County of London development plan. How long it will take no one can say; that depends on how many of those who have made written objections come forward to argue their case in person, and how long they talk when they do so. The proceedings of the inquiry are much more informal than those of a court of law and as very little evidence is inadmissible, it is difficult to stop people talking. The objections range from the reasoned cases presented by big property-owning bodies to the postcard which said briefly "I object." As at the end of the first day's hearing the court had dealt with only one objection, it is clear that the inquiry will last many months.

That will not be the end of it. After he has heard all the objections, Mr K. S. Dodd, chief inspector of special inquiries at the Ministry of Housing, will present a report to the Minister, and some time after that the Minister's decisions will be announced. There are no readily definable criteria for the decisions. They will depend on weighing public against private interest, on measuring individual hardship against the amenities that the plan would secure; such decisions are therefore bound to be to some extent subjective. It is to be hoped that they will give due weight to pleas for the preservation of fine old buildings.

Individual hardship can be lessened in various ways. The LCC has offered already to make some changes in the plan to meet objections. The tenant of offices in Mayfair, now "zoned" as residential, would not be asked to move until

his lease expired. The occupant of a house scheduled for demolition to make way for a school must, under the Act, be found as good a house elsewhere. In any case the changes proposed in this development plan are not the most drastic proposed in the master plan for Greater London. The development plan now under discussion covers only the first twenty years, and some of the biggest changes, such as the radial rings of roads, have been postponed until a later instalment. Imagination boggles at the objections that will have to be heard then.

Survey of the Health Service

For the first time the Ministry of Health has given in its annual report (Cmd. 8655) a really comprehensive and reasonably up-to-date review of the national health service. It begins, perhaps significantly, with a summary of the cost of the health service from July 1948 to 1951-52, broken down among its main branches. In later chapters the cost of each of these branches is analysed in more detail. These figures would save many people a deal of arithmetic at the time of the publication of the annual estimates were it not for the total exclusion of Scotland from them. As it is, one must be grateful for the official addition of the English and Welsh figures.

The report also contains some interesting figures on the work of the hospitals and the manpower necessary to maintain them. The total bed complement on December 31, 1951, including paybeds and beds temporarily unavailable, was 507,005, and the average daily number of occupied beds was 406,844. In addition, 6,298,746 new out-patients were seen, and out-patient attendances numbered nearly 26 million. To maintain these services and the casualty departments, the staff employed at the end of the year

ADVERTISING

WISDOM . . .

Buyers are human beings

In selling a product, figures can only take you so far; after that, the business becomes personal, no amount of market research can help you if your customer—metaphorically speaking—doesn't like your tie.

We don't disparage market research—we use it ourselves—but we don't close our eyes to its shortcomings. Many a thriving business has been built on a product that according to the research figures had no future. And as many theoretically promising ventures have ended in failure. The explanation in both cases was the unpredictable personal factor.

So we never forget that the customer is human, like ourselves, and that he'll only toe the statistical line if he feels that way. It's a business philosophy we developed years ago, and it is still serving us well.

If you think that you would profit by the personal touch in your advertising, why not phone or drop us a line and we'll arrange to meet and talk it over with you?

SAMSON CLARK'S

SAMSON CLARK & CO. LTD., Incorporated Practitioners in Advertising
57-61 Mortimer Street, London, W.1. Telephone: MUSEUM 5050

numbered 318,000 whole-time and 90,000 part-time, divided as follows:—

	Whole-time	Part-time
Medical and dental staff.....	10,245	23,281
Nurses and midwives.....	136,210	25,756
Domestic staff.....	105,416	33,630
Other professional and technical (excl. students).....	16,631	7,382
Administrative and clerical.....	27,285	...
Maintenance and transport staff, etc.....	22,125	...
	317,912	90,049

An even more interesting section of the report, however, shows the effect of the charges for false teeth and spectacles imposed by the Labour Government in 1951. This effect is illustrated in the accompanying graph. The dental figures

are actually the number of courses of treatment completed after the approval of the Dental Estimates Board, but most of these are for the provision of dentures. By contrast with the fall in the number of glasses supplied and false teeth fitted, the number of prescriptions and their average cost increased steadily. It is to be hoped that some idea of the effect of the prescription charge imposed this year will soon be forthcoming.

Big Brother Economics

In Communist states the approved manner of celebrating an event is not to take time off but to make resolutions to work harder. As the Party Congress to be held in Moscow next week is an occasion for celebration by comrades everywhere, it is not surprising that it is bringing out in the mines, factories and foundries of Eastern Europe a rash of production pledges in honour of this "historic event of gigantic world significance." Some of the honour goes, appropriately enough, to the current Soviet Five-Year Plan which will be presented to the Congress—appropriately because the satellites are to make their contribution to the "victorious advance" of the Soviet peoples. The plan's draft directives say that it will "facilitate further consolidation and extension of economic co-operation of the Soviet Union with the countries of people's democracy." In other words, the Czechs, Poles and others will do their bit—and a bit more—to help.

The assumption is revealed with surprising frankness in a recent radio symposium arranged in Czechoslovakia. Prominent members of the Government and the party exhorted workers—not for the first time—to try harder and produce more; what was new was the constantly repeated admission that Czechs must toil not only to build socialism in their own country but also—and primarily—to fulfil orders placed by Moscow. Dr Dolansky said the Soviet Union's economic plans counted on promised deliveries, which "would help to build the numerous new factories which

will spring to life in the Urals and the Caucasus in the course of the new five-year plan." To make this contribution, in Dr Dolansky's view, is a great honour and an important experience for Czechoslovakia.

All the speakers made much of the unselfish way in which the Soviet Union was sharing its industrial experience and scientific research with the Czechs; but they could not avoid creating the suspicion that the Soviet experts are interested only in solving the technical problems involved in fulfilling the Soviet orders. On the other hand, the speakers made a good point in emphasising the raw materials, equipment and grain supplied to them by the big brother; last year as much as half of their grain supplies came from Soviet sources. The exact degree of exploitation involved in this partnership would be better ascertained if the prices at which these exchanges are made were not carefully guarded state secrets. This may not be economic imperialism as Hobson and Lenin defined it, but it is very different from the manner in which American wheat reaches India and Pakistan.

Held Fast for Europe

A little quiet trumpet-blowing by the British is not out of place now that the two great exercises in European defence are being studied and commented on—Mainbrace at sea and Holdfast on land. Both were primarily exercises in the higher direction of operations, and it was primarily British staff methods and organisation that were under test. By all accounts they came out of it well. Indeed, General Harding's conduct of a defensive battle for the holding of Western Germany (discussed on page 32) is known to have deeply impressed American and French observers. It included allied formations, who gave an excellent account of themselves and whose presence and state of training represented a far greater effort than most people realise; but it was predominantly a British affair, improvised at short notice to take the place of manoeuvres involving all forces under General Ridgway's command.

There are three lessons to be rubbed in. First any reduction in the period of national service would cripple the British function in Germany; the dearth of junior officers and NCOs is already causing serious concern. Second, the reserves needed to reinforce General Harding's (now General Gale's) divisions do not exist, save in papers which allow them some weeks to mobilise and get fit. Britain's three armoured divisions may be deterrents to aggression but in that role they are also hostages to fortune—and well Mr Shinwell knows it. Third, until the interminable politics of the European Defence Community have been straightened out, the job of setting an example to European allies falls to this country.

It is, incidentally, regrettable and remarkable that not a single Member of Parliament appears to have attended these exercises to see and hear for himself the needs and views of British fighting men. It would have a salutary effect on future defence debates, which tend to plunge into unwieldy generalisations, if Members on both sides of the House of Commons could ask—for instance—why the armoured cars in Germany are out of date, whether the anti-tank guns would do their job, what useful purpose light anti-aircraft guns now serve—and so on. Having agreed to commit a British army on the Continent, Members of Parliament should show more interest in its safety and efficiency.

Marshal Juin's Repeat Performance

When Marshal Juin, commander-in-chief of Nato's ground forces in Europe, uttered in June his strictures on the right of the United Nations and the United States to criticise France's policy in Tunisia and Morocco, he was very properly summoned to the Palais Matignon to be reproved by M. Pinay. But the sermon fell on deaf ears, and he has offended again. Writing in the review *Hommes et Mondes*

he has bitterly criticised the impending move to place the Tunisian question on the Assembly agenda. He assumes—either from prejudice or from inside information—that the Americans are going to support the Arab-Asian sponsors of the idea, and he therefore refers to the United States as one of the part authors of "the sort of foreign conspiracy that has been tightening about north Africa since the liberation," and as "using the same language" as Moscow.

France's tetchiness about its relations with the Arab world is proverbial. Two of its chief causes have been disappointment that an ancient and praiseworthy cultural success in the Levant did not pay political dividends, and perplexity over the increasingly irreconcilable claims of French settler and indigenous inhabitant in North Africa. The fact to which Frenchmen like Marshal Juin turn a blind eye is that their difficulties are due to the way the Asian and African world is going. They prefer to ascribe all their troubles to the machinations of foreign powers, framing policies out of pure malevolence towards the French Union. Once Britain was the chief offender; now it is the United States.

A leading article on page 3 shows that there is a case to be made for French resentment about UN indictments of its North African policy, but not along the lines proposed by Marshal Juin. It is open to French diehards who are private persons to hold such views, but the soldier who has charge of Nato ground forces should be chary of proclaiming them. Such an act must prompt many of his colleagues and subordinates to have doubts about the worldly wisdom of a five-star general whose capacity to organise and lead the armies in Europe is not beyond question.

Bonn's Defence Arithmetic

Owing to the delay in launching the European army the German defence contribution, for the Nato year to June 30, 1953, will fall far short of the sum that the Three Wise Men of Nato fixed last February. The German budget (which covers the year ending March 31st) provides for less than DM 8 billion (£666 million) for those items—mainly occupation costs—that the Nato arbiters agreed to regard as defence expenditure. This compares with DM 11.25 billion which they fixed as a reasonable sum for the Nato year, on the assumption that the German gross national product at factor cost would be about DM 107 billion. In the current year more of the Federal budget is being spent on pensions, relief and subsidies than on defence. In the previous year the ratio was the other way round.

The amount that Germany is to pay during the current year is thus less than was originally estimated, but it is no less than the amount embodied in the contractual agreements with the occupation powers. For the current Nato year Britain's expenses for maintaining troops in Germany will be covered; but a very different situation will arise after June 30th next. It is all too evident that nothing will then be available for Britain from German sources.

Dr Schaeffer, the Bonn Minister of Finance, will insist that in 1953-54 the entire cost of Berlin shall be counted as German defence expenditure, and he will use the term "cost" in a remarkably wide sense, to include not only the actual deficit in the Berlin budget, which is a comparatively small figure, but also negative items of revenue which the Federal budget would otherwise receive if Berlin did not exist, or was not given favoured treatment. Thus the Germans will argue that defence expenditure must include the amount of taxes which are not levied on Berlin, and, more surprisingly, the value of contracts, private and official, that go to Berlin's industries because prices are lower and Berlin is favoured for political reasons. These contracts are deemed to have been lost to the German economy. When the Bonn Ministry of Finance has finished adding up every conceivable item the total

"cost" of Berlin will amount to no less than DM 2 billion (£166 million).

The burden of Berlin can be legitimately taken into account when assessing the proportion of the gross national product that the Republic can pay, but not again as part of defence expenditure. For the Federal authorities to claim "negative revenue" from the city as part of their defence contribution is unworthy and unjust.

Education in Africa

At the recent conference on African education in Cambridge, a young African woman teacher spoke of the unique experience she had had there of finding her opinions valued and herself accepted as a colleague by others interested in education. The immediate value of the conference lay just there. For the first time ministers, directors of education, administrators, teachers and mission leaders were assembled together with British specialists in education and officials from the Colonial Office, and were working as a team to develop African education.

The conference confined itself to discussing how best to give Africans the kind of education they most need and desire. A brave attempt was made to harness *expertise* to enthusiasm; at the same time, something was done to arrest the tendency of African politicians to hover rather uncertainly between the two. The conference implicitly recognised that Africans ought to be responsible for their own education, and that education for Africans is no different from education for anyone else, except in so far as different stages of development are reached in different places at different times. There was no disposition to slur over the difficulties involved. There is, for instance, the danger of producing more doctors and lawyers than skilled laboratory technicians or carpenters; there is the risk, while resources are slender, of giving nobody anything in the desire to give everybody something; there is

the difficulty of arriving at "a real measure of local control and responsibility" for education while African local government is still in its early stages. Finally, there is the problem of the strains and stresses arising between politicians and civil servants; this is bad enough in a politically mature society, but it may become acute in a new society, especially if its race relations are also involved. In these circumstances Sir John Maud's special talk to an audience containing both was particularly felicitous. He dived happily into his own experiences as a civil servant with a succession of political masters. But he never actually said that officials finding difficulty in keeping up with Mr Nkrumah, for instance, might thank their lucky stars they had not to cope with Mr Churchill, or Mr Aneurin Bevan, or almost any British Cabinet Minister.

* * *

The Newspapers' Opportunity

One seems to remember grave assurances from Fleet Street, in the days when newsprint was scarce and newspapers restricted in size, that every editor longed to report in much greater detail the world and Parliament and serious affairs generally. Now that newspapers are slightly expanding one has the impression that the ratio between the trivial and the weighty is being little changed. Coverage of foreign news in the more popular press has improved, but from a very low level; background material and feature articles about a world full of new personalities, novel problems and ugly possibilities are neither as informative nor as responsible as they were before the war. These are impressions that may not be borne out by statistics; perhaps the International Press Institute could confirm or correct them. There is certainly more than one newspaper—both Sunday and daily—that believes circulation will suffer if it brings home to readers the facts about the world in which Britain struggles for existence.

In the serious dailies the problem is somewhat different. They are using their greater space to give more news of serious matters, both domestic and foreign. But their correspondents abroad have not yet adapted themselves to the change. It is not often that one can read the words actually used in an important speech or statement; the habit of quoting from foreign newspapers—useful and interesting if kept within bounds—seems almost to have died. The descriptive message which enabled the correspondent to convey to readers the flavour and mood of another country is rarely seen, although it is sometimes heard from the BBC. With a few notable exceptions, foreign correspondents are saying—or are being made by sub-editors to say—things which are better left to the leader-writer.

After many years of disheartening and arduous restraint the process of adaptation to larger newspapers must be full of difficulties. No one wants to see any emulation of American copiousness. (It is said that a copy of the *New York Times*, when dropped from a mail-plane, struck and killed a full-grown heifer.) And there is a limit to the amount of sheer news that can be taken with breakfast. But for the reader who gets his main news items from the BBC, some fresh thought might be given to providing better feature-writing and more genuine, descriptive reporting—of the home as well as the foreign scene.

* * *

All-Purpose Films

Two decisions recently made by the British cinema industry underline a difficulty of suiting all tastes on a single screen. Mr Rank has announced that his organisation will neither make nor exhibit "X" films; the decision is made not on moral grounds, but on the evidence, derived from experimental showings, of damage to the family trade which is the ordinary local cinema's bread and butter. The Cinema Consultative Committee has almost simultaneously reported

that the creation of a special "C" certificate class of children's films, as recommended by the departmental committee of 1950, is "not practicable at the present time." More indirect means of raising the quality, and improving the suitability, of the films shown at children's matinees, are recommended in order to fulfil the departmental committee's intentions; but even were these fully adopted most of the film fare consumed in practice by children would continue to be of the all-purpose type. Almost irresistible economic forces are, in fact, at work to narrow the range of general release films to a lowest common denominator and to penalise deviations either towards nursery simplicity or adult sophistication.

It would, of course, be too much to expect films to be as various and as suitable for discriminating consumption as books. Readers are indeed comparatively blessed. They are not compelled to purchase "The Tale of Peter Rabbit" bound up in one volume with, say, "The Cruel Sea," or committed, when buying the Penguin edition of Apuleius's "The Golden Ass" to the embarrassing experience of reading it aloud in the family circle. To a greater or lesser degree, all these experiences afflict the filmgoer; they are the price paid for the cinema's wide diffusion, lavish initial spending, and ultimate cheapness to the public. Diversity in film-making may best be served by developing the division between the specialist cinema house, whose clients treat it as they treat the theatre, and the "local," whose audiences are, in every sense of the word, habitués.

Class Legislation ?

It is true that there is now a greater equality in the clothing, locomotion, dwellings, power, and enjoyments generally of the bulk of the people than formerly; but it is also true that this equality has been attained by raising up what was cast down, not by debasing what was high. As equality has prevailed, society has been carried to a higher level. If the proudest member of the nobility now share his best conveniences and greatest enjoyments with the commonest man in the land—if he can have no better means of communicating with friends at a distance than the telegraph or the post, which are ready, for a few shillings or a penny, to do every man's bidding—if he cannot travel faster and safer than railroad carriages and steamboats convey the very lowest of the people . . . the aristocracy must admit that on these and on many other points they have made great advances in civilisation compared to their ancestors, and have much superior conveniences and enjoyments, and much greater knowledge. For all these improvements they are mainly indebted to the exertions of the democracy to rise to their level, and it is to injure the aristocracy, as well as to thwart Nature, to attempt, like my Lord Derby, to check the growth of the democracy. . . . In general the democracy have been too prone to imitate the aristocracy, and there is some danger that they will imitate them in this respect and attempt to promote their own and the public welfare by class legislation. . . . Besides setting the democracy a very bad example by making unjust laws, the aristocracy, by their attempts and their threats to reimpose on the public class legislation for their own benefit, are doing what they can to provoke the democracy to imitate them, and try to gain and ensure that superiority by legislation, which is only to be obtained and preserved by other means. To what extent the democracy may carry their present wise forbearance . . . we cannot foresee; but the aristocracy must not infer, from the general conduct of the democracy, that they will never depart from moderation and justice. If there are fewer outrageous demands now made by the democracy than formerly, still an attentive observer may notice some which go beyond the strict line of justice.

The Economist

future imperfect

Wild animals depend for their food on what they can find.

It is a hand-to-mouth existence. Man, having evolved the idea of agriculture, sows to reap. He cozens nature, making her amenable, to produce his food *when and where he wants it*.

He asks only health and strength to work his fields, peace to enjoy the fruits of his labour and a stable economy to ensure that he can sell and buy and exchange.

The main product of the Fisons business has for a hundred years been chemical fertilizers, to enrich the soils of farms and gardens. But they make chemicals for medicine and industry too.

Fisons contribute to Britain's harvests, health and wealth.

FISONS LIMITED • HARVEST HOUSE,
FELIXSTOWE • SUFFOLK
Fertilizers • Heavy Chemicals

Fisons are also among the largest manufacturers in Great Britain
of pharmaceuticals, medicinal food preparations and fine chemicals
for industry. Many of Fisons products in these fields are household names.

it's all in **FISONS** field

Iron two feet down

Photo by Canadian National Film Board

THEY FOUND IRON 2 feet below the surface when they tested a new type of drill in the Ugava district of Northern Canada; they had hit on one of the richest deposits in an iron-field covering about 5,000 square miles.

The discovery of this vast iron-rich region means that for decades to come Canada can supply the raw material of steel for Europe and the United Kingdom; and it assures the future of the great American steel mills.

Canadians have only begun to tap their country's great wealth in oil, aluminium, uranium, titanium and other precious materials. In that friendly and profitable Canadian market there is a share waiting for British business. Canada is easily reached nowadays—TCA Skyliners leave daily from London for Montreal, connecting with every important Canadian and U.S. city. The

present tourist fare is the lowest ever for a trans-Atlantic flight.

UP...UP...UP go Reader's Digest sales—

—so advertisers get
bonus circulation free

UP FROM 300,000 circulation in 1949 to a guaranteed 700,000 monthly average this year — and Reader's Digest sales are still shooting up!

Our advertisers gain handsomely from this rapid rise. This autumn, for instance, they are getting about 100,000 circulation per month free.

Indeed, each year since The Reader's Digest accepted advertising, they have had a substantial bonus of circulation—for the page rate is based on a conservative guaranteed sale which has always been exceeded.

The Reader's Digest is a magazine for the family, skilfully edited to carry your message to both men and women. It is read at home by 90 per cent of its readers, and more thoroughly than most magazines.

Rates are low for black-and-white and (especially) full colour advertising, and space should be reserved early. 27 overseas editions are also available.

The Public Schools

Sir,—Your interesting article raises issues which ought to be considered urgently now if the necessary thought and action are to be taken before it is too late. It is the temptation of headmasters, concerned primarily with the maintenance of their own schools, to look cheerfully at their waiting lists and say, "There are still plenty of people who can pay." And we can no doubt feel that we have never been in a stronger position nor more obviously supplying a national need. But such a "supply and demand" attitude is a betrayal of the objects of our charitable founders. The questions we ought to be asking ourselves (and the country as a whole) are: "Ought all those whose sons are in our schools to be paying so much?" and "Are the sons of those people who can pay the ones who ought to be in our schools?"

The first question queries, as you suggest, whether the country is giving justice to those parents who release much-needed places at maintained schools by sending their sons to independent schools. Many people have felt it right that they should be relieved by a flat rate grant from their local education authority, and such grants, which are permitted by the 1944 Act, were in fact made by many education authorities until forbidden by the Minister's ruling in Circular 244. It has been argued that this ruling was *ultra vires*, and certain authorities have continued their grants in defiance of it. The situation might therefore be met simply by a stroke of the pen—the rescinding of Circular 244 and encouragement to local education authorities to make flat rate grants. But a system dependent on the decisions of individual authorities is very likely to lead to unfairness as between one locality and another. If any relief is to be given, it would come much more fairly from the central, not the local, source, and the best way of administering it would be by the tax relief you suggest.

My second question, however, is much more important and does not raise such a controversial issue as "whether the welfare state pays attention to a large and worthy minority." The welfare state has, as a starting point, a large amount of first-quality education available in the public schools. Which boys does it want to receive this education? So far it has, quite simply, refused to consider the question. It has left headmasters to fill their schools with those who can pay plus the very few that the schools can pay for by their small scholarship endowments. While it may be true that the parents still include the professional classes as a whole, there has been a noticeable reduction in the numbers of clergy, teachers and (if they have more than two children) civil servants. Many of us are very unhappy at this situation. We would wish to make public school education far more widely available, and welcomed the first

recommendation of the Fleming Committee in 1944 "That opportunities of education in the [Public] Schools . . . be made available to boys and girls capable of profiting thereby, irrespective of the income of their parents."

It is misleading to suggest that the Fleming Report has been seriously tried. The important "Scheme B," with its bursaries given by the Ministry, not the local education authorities, has not been attempted at all. Some of us have tried to build up similar schemes direct with the authorities (and have discovered in the process that neither their officials nor those at the Ministry are by any means the anti-educational bogeys sometimes suggested). But this too has been stopped by the Minister's ruling (the *ultra vires* Circular 244 again) that local authorities may not pay fees for normal boys who are "capable of profiting" from public schools, but only for "broken homes" and "maladjusted" boys who have shown they are likely to be failures at day schools—not at all what the Fleming Committee intended.

I would suggest that the Fleming Report should be taken out of its pigeon-hole and carefully re-examined both by the schools and by the public. And that (whether along Fleming lines or not) we should decide by conscious action, not by default, who ought to be receiving public school education in the welfare state.—Yours faithfully,

JOHN OUNSTED.

Leighton Park School, Reading

Sir,—The anxiety of the public schools is needless. All they have to do is to vote Labour at the next election. The Socialists have officially promised to abolish the rivals of the public schools, by obliterating grammar schools. When the state has made all its schools comprehensive, the public schools will flourish even more mightily than they already have done through the 1944 Education Act.—Yours faithfully,

PEDAGOGUE

Britain Puzzles Canada

Sir,—May I make a brief comment on two letters which appeared in your issue of September 20th referring to my despatch in the previous issue?

Mr Orr-Ewing rightly points out that the range of Canadian defence purchases in Britain is limited by the strategic need to avoid dependence in time of war upon trans-Atlantic supplies of spare parts. But I wonder what misunderstanding has given him the impression that "the Canadian Government does not pay progress payments." Progress payments on a monthly or a quarterly basis are a regular, almost a routine, part of the Canadian defence production programme. Moreover British companies establishing subsidiaries over here for specifically defence work have, in many cases, been given substantial capital assistance, as well as other help in the

way of depreciation allowances and what are called "prepayment plans." Such assistance, in whatever form, obviously depends on the firms in question filling a felt want in the Canadian programme. But Mr Orr-Ewing must be under some misconception which should be cleared away.

Mr Greene, writing for the BBC, denies that there have been any "forceful requests" from Canada for BBC television recordings. This, I think, must depend upon the way he interprets the word "forceful." Does he wish to be whacked over the head with a tomahawk, as was the way of earlier Canadians? But let us not quarrel about what constitutes a "forceful request." I would much rather welcome the news contained in his letter that the BBC is opening negotiations with certain unions in an attempt to meet the Canadian requests, forceful or otherwise. This, together with the "setting aside" of the BBC's technical "misgivings," represents some progress. Unhappily the actual situation remains that which I described—that Canada is still wanting BBC television programmes which it cannot get—but Mr Greene's letter indicates that steps are being taken to try to provide them.—Yours faithfully,

YOUR OTTAWA CORRESPONDENT

Oil and Cartels

Sir,—In the absence of some elucidation by the parties immediately interested, called for in your issue of September 20th, I should like to comment on one point.

What seems to bother public opinion about international oil is the apparent rigidity of the structure, with but a few companies in the field administering, as it were, a neat world-wide price system. But this rigidity stemmed originally from unavoidable circumstances. Crude oil outside the United States was found mainly in areas which for geographical, climatic and political reasons were accessible only to the biggest operators; transport of a liquid over long distances involves investments which only those immediately involved will be inclined to make; and the unit of operation of crude production and transport has to be matched by refining and distribution facilities on the same scale. World-wide operators will inevitably have to follow a certain rational supply programme based on an experimental knowledge of how much laid-down supplies are worth at any given place in the face of local competition. It is not this way of thinking which is wrong; but it might well be that what started as a factual assessment of opportunities has become ossified because competition has in many cases become somewhat hypothetical as time went on.

By condemning any generally applicable system of pricing, public opinion would appear to ignore the much more

promising opportunity to survey the actual working of the system. The problem of a balance of power between producers and consumers has of late become more acute owing to the governments of some producing countries having ceased to be mere recipients of royalties. As such, they used to be mainly interested in maximum turnover. Now, however, by virtue of their profit-sharing agreements, they have become the partners of the big oil companies. Thus the scales may be weighted in favour of the producers if the consuming countries do not appreciate their perils and their opportunities.

Thus the right course is not to condemn a comprehensive price system which is commensurate to the scale of world-wide operations. It is to insist on full information about its working, so that authorities and the public may safeguard their interests.—Yours faithfully,

P. H. FRANKEL

London, W.1

Sheets in the Wind

Sir,—As owner-manager of a laundry I would like to thank you for the article in your issue of September 20th. The position in our industry is, substantially, as you depict it.

I believe, however, that one very important factor which is hindering development is the incidence of direct taxation at its present level. The laundry trade is a microcosm of industrial enterprise as a whole. Many laundries were started by a man and wife fifty or so years ago. Gradually they grew because, instead of treating their earnings as income, they used a large part of them to finance development. It is common knowledge that, as a result of the steeply rising price of capital goods, the inequitable allowance for depreciation and the gigantic proportion of profits due to the tax-gatherer, this "ploughing back" of earnings is either utterly inadequate or totally impossible.

Industry is never static. Machinery is not only a wasting asset in that it wears out and has to be renewed; it is superseded and becomes obsolete. No small firm can afford continually to increase its capital every time an improved machine comes on the market. We are paying ever higher wages on the one hand—wages that can only be justified by increased efficiency—and, on the other hand, the money that ought to be used in providing improved machinery to make increased production possible is being taken and used for other purposes.

Possibly we can do without the laundry trade. But the same process is affecting all British industry alike. No one could possibly hold that industry in these islands is merely a luxury. Yet we continue to take out more than we put in. If this trend is not soon reversed can there be any end other than ruin?—Yours faithfully,

DAVID G. PUMFRET

Twyford, Hants.

Books and Publications

British Psephology

The British General Election of 1951. By D. E. Butler. Macmillan. 289 pages. 21s.

Both Nuffield College and the publishers are to be congratulated on the fact that this volume, the third in the College's series of general election studies, has appeared less than a year since the conclusion of the campaign. Mr Butler is perhaps more inclined to a sociological approach than either of his predecessors; and it was as the statistical assistant for the two earlier works—the 1945 election by Mr R. B. McCallum and Miss Alison Readman and the 1951 election by Mr H. G. Nicholas—that Mr Butler served his apprenticeship in the new science for which so happily classical a name has been coined. He still lacks the broad historical approach of Mr McCallum and is a slightly less accomplished writer than Mr Nicholas; he is also less ready than Mr Nicholas to question the merits of a political system that now rests on the operations of two mass parties, both forced to make little or no attempt to explain the real issues to the electorate. Moreover, Mr Butler has been handicapped by the fact that the 1951 election followed hard upon that of 1950. There was little to differentiate either the methods employed or the issues discussed beyond a greater emphasis on foreign affairs; and so far as personalities are concerned, though Mr Ernest Bevin and Sir Stafford Cripps had disappeared, there were no important newcomers in either political camp.

These circumstances, coupled with the fact that the election itself was an extraordinarily unexciting one—as Mr Butler reminds us the campaign itself hardly ever took priority in the newspapers over the King's illness and the events in Persia and Egypt—made it hard for him to avoid following very much the pattern of Mr Nicholas's book. It would, however, be unfair to let this detract from Mr Butler's considerable achievement; for within the imposed limits of his task he has contrived to present a balanced and illuminating account of the election, to add information on matters of party organisation and tactics not to be found in the preceding volumes, and to analyse the results with his customary statistical ingenuity. His conclusion from these, that despite two successive Parliaments with small majorities, the British electoral system is still as certain as ever to produce a disproportionate majority with only a very slight swing to either side, seems both indisputable and, in these days of "mandates," highly disturbing.

A novelty in this volume is a series of local studies by individual observers, five of separate constituencies not identified by name and of Northern Ireland as a whole. The constituency studies suffer from an unavoidable

brevity but help to reinforce Mr Butler's two main arguments: that an election is not to be compared to a centrally-planned military operation, and that the efficiency of the local organisation, at least at election time, is almost as unimportant a factor in the result as the personality of the candidate. "I would vote for a pig if the party put one up" observed a Midland elector; there is no reason to doubt his sincerity. In the Labour party in particular, the sense of being in a movement, of class loyalty and class antipathy is, despite the much greater social homogeneity of the candidates (328 Conservative candidates and 264 Labour candidates were University graduates), far more important than the actual policies advocated. Mr Desmond G. Neill's account of the election in Northern Ireland is not only the highlight of the book from the point of view of sheer entertainment, but an impressive illustration of how far the British electoral law rests upon the unstated assumption that everyone will play fair. In the larger island, it would seem that (apart from Labour rowdiness at meetings) everyone does.

At a time when the future of broadcasting and television is so much to the fore, Mr Butler's chapter on broadcasting is of particular interest, since it is a matter on which he writes with inside knowledge. It is clear that a combination of party pressure and BBC pusillanimity has produced a situation in which the most important contemporary medium of information and political education is almost entirely wasted. Instead of the impartiality of the Speaker, we get the impartiality of the mace. It is not good enough.

The Prosperous Swiss

The Population of Switzerland. By Kurt B. Mayer. Columbia University Press. (London: Geoffrey Cumberlege.) 336 pages. 32s. 6d.

A highly successful book recently appeared under the title "The Swiss Without Haloes." It is inconceivable that anybody should bother even to look for British, American or French haloes in order to dislodge them; but most of us, at the back of our minds, have a slightly resentful picture of the industrious, tolerant and prosperous Swiss, the blackening of which would probably cause some adolescent satisfaction. It does, however, take a deal of blackening; here is a nation enjoying one of the highest standards of living in the world—certainly in Europe—though based on a country almost devoid of raw materials. It has achieved the miracle of a high

degree of industrialisation without the attendant horrors of huge industrial cities, and has managed to remain united, though consisting of four different linguistic and two religious groups.

Mr Mayer, himself a Swiss settled in America, has produced an excellent study of these remarkable people. He traces their growth from the fourteenth century and their shifts to dispose of surplus population, first by mercenary service and then by emigration. He unravels the strands of fertility and mortality differences between German, French and Italian speaking peoples, between Catholics and Protestants; and he explains how industrialisation took place without over-much urbanisation.

There are a few puzzles still unsolved. It appears that predominantly Catholic, agricultural cantons tend to have the highest birth and death rates; yet agricultural Ticino with a mainly Italian culture has a fairly low birth rate and the lowest death rate of any canton. The small and decreasing proportion of women in gainful employment is still something of a mystery; but, having tried to buy minor labour-saving domestic appliances and to find a laundry in Geneva, the reviewer is inclined to agree with Mr Mayer that the retirement of married women from the labour market "is not necessarily a manifestation of the rising standard of living, but perhaps of the generally conservative attitude of the Swiss toward the emancipation of women." After all, Switzerland is the last remaining Western country without women's suffrage.

The Swiss vital statistics are among the best and fullest in the world. At times one feels that Mr Mayer has too many cantonal trees around, but a full and balanced picture of the Swiss forest has emerged.

The New Indonesia

Recruit to Revolution. By John Coast. Christophers. 308 pages. 18s.

This is really two books in one. It is the story of how the Netherlands East Indies became Indonesia, and is at the same time a remarkable tale of personal adventure. For some people the two do not mix. The unkind would say that the great events which attended the birth of Indonesia are made instead to revolve round Mr Coast, while those who merely want excitement may be bored by the intimate glimpses of history to which they are also treated. But the truth is that the book is unique, because its author steered himself into such a strange role during the Indonesian war of independence that no one else is in a position to write about it as he does. And for that the book is essentially worth reading by anyone who seeks to understand the new world, which has arisen in the Orient since the war.

Indonesia is now Mr Coast's adopted country—he has made his home in Bali—and there can be no doubt about the passionate sincerity of his interest and

support for the cause for which he several times risked his life during the revolution. By no means all Indonesians agree with his views about their country or with what he says in the many pen portraits of their leaders. They do, however, accept his odd relationship with them, and it is a fact that, through this book and by other means, he has done a great deal to interpret them sympathetically to the western world. Besides giving a vivid and fascinating account of the new Indonesia—at present available nowhere else—this story expresses genuine touches of that romance and idealism which, quite as much as economic and political pressures, still govern the affairs of men.

Russian Minorities

Russia and Her Colonies. By Walter Kolarz. George Philip and Son. 335 pages. 25s.

Western students know little of the fate of the non-Russian nationalities which form about half the population of the Soviet Union. Though spokesmen of the Soviet bloc talk ceaselessly of "the imperialists," their own is the most imperialist power in the world today. While the European imperial powers have given up or are steadily loosening their control over territories, Russia has annexed new territories and is steadily tightening the grip of the central government.

Mr Kolarz offers a wealth of information on Soviet subject nations patiently collected from sources not easily accessible. One may regret the deliberate exclusion of sources by exiles from these nations. While exiled literature certainly contains much tendentious or worthless stuff, a student of Mr Kolarz's learning and discrimination would have no difficulty in distinguishing the chaff from the grain. Yet by confining himself to Russian sources he has made his results in some ways more impressive; the Soviet leaders are condemned from their own mouths.

Soviet doctrine on nationalities recognised two dangers arising from two "deviations": Great Russian chauvinism and local bourgeois nationalism. Both had to be equally combated. For the first decade of Bolshevik rule there was more denunciation in Moscow of the first "deviation" than of the second, though in practice little was done to stop Russian Communists from bullying non-Russian. The exceptions were the Ukraine and Georgia, where the Communist totalitarian regime was managed, on orders from Moscow, by Ukrainian or Georgian Communists. Elsewhere Bolshevik dictatorship meant dictatorship by Russians. In the 1930s, however, "local nationalism" was considered a greater sin than "Great Russian chauvinism." The periods of greatest persecution of the nationalities coincided with the periods of greatest tension in the Soviet state and society as a whole—the First Five-Year Plan and collectivisation of agriculture, the Yezhov purge—culminating in the annihilation

during the second world war of whole nations. Since the war about one-third of the population of the three Baltic states has been deported.

Mr Kolarz gives a clear and well-balanced picture of the relatively well-known Ukrainian problem and a very valuable account of the almost unknown small nations of the interior of Russia. Perhaps the most interesting part of the book is that which deals with Russia's Moslem nations, the North Caucasians, Azerbaijanis and Central Asiatic peoples. At a time when, without any direct prompting from Moscow, Moslem nationalists all over the Middle East are turning away from Britain and France, it is of melancholy interest to read how Moslem peoples fare under the Red Star. There is plenty of food for thought for any Moslem more interested in truth than in slogans.

Imperial Russia conquered Central Asia, but allowed its local rulers to manage their own affairs—there was some similarity to the British practice of "indirect rule." Colonisation of Kazakh or Kirgiz lands by Russian peasants was discouraged by the Tsar's bureaucrats and by the earlier Bolshevik administrators, but has been intensified since the 1930s as part of the economic development under the Five-Year Plans. Uzbeks and Tadzhiks have been forced to grow less grain and concentrate on cotton far more suddenly and more ruthlessly than the Egyptians were forced by the British. Whereas Egyptian profits went to the Egyptian growers, in Central Asia the profits go to Moscow. Islam is subject to constant insult and persecution. The history of the Moslem nations is rewritten to show that their conquest by Russian Tsars was a blessing, and that those who, like Shamil in the Caucasus, fought for independence, were British agents. An Uzbek who takes pride in the Arabic and Persian culture

or shows interest in the Turkish people is guilty of "vagrant cosmopolitanism."

Mr Kolarz is scrupulously moderate in his conclusions and free from anti-Russian prejudice. He points out that the Russian people, too, suffer from Stalinist totalitarian rule. He gives examples of the sympathy shown by the great Russian writers for non-Russian peoples, and stresses the common interests of Russians and their neighbours. But he shows that the brotherhood of Russian, Ukrainian, Caucasian and Moslem can be made a reality only when the tyranny which exploits all alike is a thing of the past.

Ambitious Analysis

The Character of Peoples. By André Siegfried. Translated by Edward Fitzgerald. Jonathan Cape. 190 pages. 12s. 6d.

Nothing that M. Siegfried writes can fail to be interesting for he has a lively and inquiring mind. But his main strength lies in relating facts to some general trend, not in simple abstraction. His little memoir of his own father which has never been translated is a much more revealing book than this rather ambitious analysis of our modern predicament. The best things in this present book derive from a vivid apprehension of reality, as when he contrasts the alleged speed-up in communications with the fact that travel, after allowing for bureaucratic complications, is actually much slower and harder than in the days

of our fathers and grandfathers. Phileas Fogg made his wager and was off the same night. . . .

But when M. Siegfried examines the role of the Western peoples in this new world and talks of "Latin realism," "French ingenuity," "English tenacity," "German discipline," "Russian mysticism" and "American dynamism" in successive chapters, there is a fundamental cloudiness of thought and expression. He shows a fundamental unwillingness to commit himself to any particular order of priority between physical make-up, geographical circumstance, and inherited traditions and institutions within the communities he touches upon.

A typical paragraph shows the reader's problem of how seriously to treat these often elegant generalisations:

With such an abundance of ethnic elements, how did it come about that Germany suffered such a total eclipse? It was because there was no fusion, no happy combination of these heterogeneous elements; because each one went its own way irrespective of the others, thus becoming a factor of disorder and final ruin. The Latin contact joined with German solidity resulted in an extraordinary analytical capacity; the Prussian element operated as a marvellous organisational factor; and the Slav element contributed a mystique, but also a lack of all restraint, which finally brought the whole system down into ruins. Each of these aspects, excellent in itself, arose in the place where one least expected it: there was no healthy combination of these elements but an explosive juxtaposition.

If one sets this paragraph against the realities of the history of the Third Reich, does it after all explain very much? It is curious to be reminded that the line separating the Western powers' zones of occupation in Germany from that of the Russians corresponds roughly to the frontier of Charlemagne's Empire, and the remark may awaken echoes in the reader's imagination. But why the line runs where it does today is much better explained by Mr Chester Wilnot than by M. Siegfried.

Colonial Government

The Legislative Council of Trinidad and Tobago. By Hewan Craig. Faber and Faber. 195 pages. 25s.

This book is the sixth of the "Studies in Colonial Legislatures" which have been produced under the general editorship of Miss Margery Perham. It is primarily devoted to the development of legislative machinery from 1831 to the present day, but it also provides a valuable background for the study of recent constitutional changes, which are more important from the executive than from the strictly legislative point of view. The study of the growth of responsible government involves, for instance, an analysis of the relationships between the Governor and the Legislative Council, and the author makes adequate provision for this in his treatment of the subject.

As the sources relied on for these purposes are, for the most part, pub-

lished official documents, the account that is given of the historical processes involved is necessarily somewhat superficial. Within these limits, Mr Craig has performed a scholarly task. He shows conclusively that recent constitutional developments have been shaped by "political necessity," which has "proved more urgent than the desirability of ensuring that self-government will rest on secure economic and social foundations." This appears to him to have been inevitable; his view is that the only task left to Britain is to help to make the attainment of self-government a success, so that West Indian statesmen may be given as good a chance as possible of dealing with basic economic and social problems in their own way. From this it follows that the immediate problem that must be solved is how to strengthen the self-confidence of the political leaders of the West Indies, which, Mr Craig concludes, can only be achieved by the "institution" of responsible government in the near future rather than by a "gradual" policy aimed at social progress in slow stages, however secure these may be.

The light which books such as this throw on the realities (rather than the appearances) of colonial government gives the series in which they appear a substantial importance. It is a great pity, therefore, that the price of the present volume has been fixed at a level which will prevent a wide circulation among overseas readers.

Encyclopaedia of Geography

The Columbia Lippincott Gazetteer of the World. Edited by Leon E. Seltzer. Columbia University Press. (London: Geoffrey Cumberlege.) 2,148 pages. £16.

If ever a work had a claim to be dubbed monumental, it is this Gazetteer. It is a sort of Who's Who of the countries, towns and natural features of the world. It tells where they are, in relation to latitude and longitude and to other geographical features; what they produce; what is their climate; and adds salient facts of their economic, political or cultural importance. The amount of information packed into this quite manageable volume represents a remarkable feat of research, selection and compression. For France, for example, it includes every village of over 2,000 persons, as well as the capital of every canton, many of them hamlets with only a few hundred persons. The qualification for inclusion does not seem to be the same for all countries, but presumably the degree of detail is roughly comparable. Place names are listed in the English version wherever there is one, and pronunciation is given in phonetics except where it is obvious.

The book is beautifully printed and an alphabetical thumb index adds the final touch to an admirable work of reference. It was produced with the co-operation of the research staff of Columbia University Press and of the American Geographical Society.

AMERICAN SURVEY

Professionals in the Saddle

Washington, D.C.

THE evidence that General Eisenhower, a soldier of immortal memory, and a good man, has been caught up in a political current too strong to be mastered is now so plain that it can hardly be doubted. As the newspapers accurately report, he is at least swimming at a great rate. Never before has he made so many speeches or received such acclaim: never have there been such crowds, and never has the Republican campaign seemed to be moving so surely and so irresistibly. Everyone is impressed by the speed that the General has attained. Only a few are noticing that the faster the campaign moves, the further the candidate is being borne away from the landmarks that stood out so sharply when he was nominated in Chicago nearly three months ago.

Whether General Eisenhower himself is aware of this seems doubtful. Occasionally during the whistle-stop tour he completed at the end of last week he would come out on to the rear platform of his train and tell the people: "My advisers inside are scared to death because they don't know what I'm going to say"—and he would join in the general chuckle. He has been tearing up speeches and launching into topics that had not been discussed and charted beforehand. It was observed, moreover—particularly by the *New York Times*, which endorsed General Eisenhower back in the desperate days when it looked as if Senator Taft would win the Republican nomination unless he were confronted with something more solid than enthusiastic Eisenhower Clubs—that in a speech in Ohio, Senator Taft's state, the General shunned isolationism, conceded the rightness of the decision to fight in Korea, and agreed that the promises in the Atlantic Charter should be honoured.

The *New York Times* pointed out that these were not the views of Mr Taft and his supporters, and that was indeed true. But three months ago it would have been a work of humorous supererogation to say that the views General Eisenhower was expressing were not those of Senator Taft. Within a few days of this Ohio speech the *New York Times* found itself printing a little news item that began:

General Dwight D. Eisenhower is scheduled to appear on the platform with Senator Joseph R. McCarthy, Republican of Wisconsin, at a rally during the first week of October. The General's appearance would follow his recent approval of the candidacy of Senator William E. Jenner, Republican of Indiana. . . .

The General has arrived at a curious rationalisation of his support for Messrs Jenner and McCarthy, for whose views and methods he expressed contempt in the recent past. He told one of his audiences that "the founding fathers expected leadership to bring together differing points of view into a workable combination for the good of all" so that "we must draw upon the energy and intelligence of all those who are joined with us." Otherwise America would become as bad as "most European countries," which, in an attempt to force uniformity on their parties, had been "kicking people out of political parties who don't agree to dot every I and cross every T."

General Eisenhower's agreement that Senators Jenner and McCarthy, and all like-minded men who had been duly

nominated as Republican candidates, should be allowed to sit at his table, probably represented the first substantial victory of the party professionals who had supposedly suffered mortal wounds at the Chicago Convention. The manner and substance of his reconciliation with Senator Taft was the second sign that the General had accepted the advice of those who were warning him of the chasm he would fall into if he did not embrace the regular party men. The third and perhaps the most sobering evidence of the power and confidence of the professionals has appeared in the backstage traffic during the skilful and cool-headed production now known as the Nixon Affair.

★

The quarter-mile-long Eisenhower campaign train was making its way towards Nebraska when the newspapers first revealed that Senator Richard Nixon, the young and personable Republican vice-presidential candidate, had been subsidised quite substantially for two years through a "supplementary expenses fund" provided by a group of wealthy California businessmen. That night General Eisenhower addressed in Omaha some thousands of people who must have known this news: there were millions by now who had read it or heard it by wireless. But the General himself did not know about it, for none of the advisers and managers on the train had yet told him. He learned about it next morning, after they had had an opportunity to discuss it among themselves and, presumably, to sketch out the advice they would offer him.

From the time the Nixon news broke, up to and including the intimation (from what one of the reporters present described as the best source on the train) that Senator Nixon would have to emerge cleaner than a hound's tooth if he were to keep his place on the Republican ticket, it was plain that General Eisenhower was getting two sorts of advice. The professionals, among whom were many of those who had done their best to prevent his nomination in July, were urging him to stand by Mr Nixon and warning him of the disastrous results that would follow if the Republican party had to admit that its chosen vice-presidential candidate was disqualified from joining in the denunciation of corruption in the Democratic Administration. The amateurs, among whom were many of those who helped to secure the General's nomination, were saying that Senator Nixon would probably have to go.

But when Mr Arthur Summerfield, the chairman of the Republican National Committee, announced that something over \$75,000 of good campaign money was to be spent on television and radio network time to enable Senator Nixon to explain the fund and reply to his critics, it became almost impossible not to conclude that the professionals were in the saddle. But even then, and even on the following night

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

when Mr Nixon's prodigious performance from Los Angeles had convinced so many millions of television viewers and radio listeners that a clean-cut young American with a pretty wife and two children who owned a little dog was too sincere and too honest to deserve to lose so gallant a fight, even when the show was over, General Eisenhower seemed to believe that he had still, himself, to decide the outcome. To the Cleveland crowd who had just heard the Nixon broadcast he read his telegram to his young running-mate: "My personal decision is going to be based on a personal conclusion. . . . I feel the need for talking to you." He spoke judiciously of a possible "error of judgment" on Mr Nixon's part.

The professionals had never admitted anything as damaging as an error of judgment, and neither had Senator Nixon. Later intelligence from correspondents with the Nixon entourage was to the effect that he and his general staff had been infuriated by the General's failure to absolve him from blame in the earlier days; and that when the telegraphed summons arrived after the broadcast the Nixon party felt so sure that the Senator had put himself over and would henceforth be an important national figure in his own right that one of his aides advised him: "You're not a GI in this war, and you're not going there to be cross-examined."

Certainly Mr Nixon did not hurry. He flew first to Montana, and only when enough time had elapsed—twenty-four hours—to enable everyone, including General Eisenhower, to understand that Mr Nixon had produced a telegraphic torrent comparable with that which burst forth when General MacArthur was fired did he present himself at Wheeling, West Virginia. Here his chief was now waiting, and actually went to meet him at the airport. General Eisenhower must have perceived by that time that the personal decision, which he had planned to base on a personal conclusion, had been made for him—made, signed, sealed and delivered.

There was a lot of emotion in the air at the time, and little further discussion of the question whether any part of a Senator's expenses should be paid by private subscription, which was what the argument had seemed to be about. And there was no further mention by General Eisenhower or anyone else of any possible error of judgment. Senator Nixon returned to his campaigning and the columnists agreed that he had become an important national figure in his own right, which was what few vice-presidential candidates had ever been. And the professional Mr Summerfield expressed his conviction that the turning point had come in the Republican campaign.

Negroes for Stevenson

[FROM A CORRESPONDENT IN MISSOURI]

ALL sharp-eyed political seers, as they gaze into the crystal ball of the presidential election, pay special attention to the Negro vote. How will it go? The answer may be crucial—not in the South, where Negro voting is still a minor factor, but in the great metropolitan centres of the North and West, whose votes can determine the outcome in key states. When General Eisenhower announced that he would not hesitate to appoint a competent Negro to his Cabinet, and when he promised to make a strong effort to end racial discrimination in Washington, he was paying the politician's tribute to an important political minority.

Despite the General's gestures, Negro leaders not in politics believe that Governor Stevenson bids fair to win about the same proportion of the Negro vote that President Truman won in 1948—that is, something between 60 and 66

per cent. The Negro press is predominantly pro-Democratic, and the National Association for the Advancement of Coloured People, which does not make formal endorsements of candidates, has gone about as far as it can in indicating that it prefers Governor Stevenson.

It is the votes of the states in the Electoral College, each state voting as a unit, that decide the result of the presidential election, not the total popular vote. The importance of the Negro vote, accordingly, lies not in its total size but in the strategic position it occupies in eight states which, between them, account for 210 of the 531 electoral votes. The following table shows the electoral vote of each of these states, the estimated Negro vote, and the margin of victory of each party in the two last presidential elections.

	Electoral Votes	Negro Vote	1944 Majority	1948 Majority
Ohio	25	121,000	5,700 (Rep.)	7,100 (Dem.)
Indiana	13	44,000	47,000 (Rep.)	13,000 (Rep.)
New York	45	185,000	158,000 (Dem.)	61,000 (Rep.)
New Jersey	16	72,000	13,000 (Dem.)	85,000 (Rep.)
Pennsylvania	32	165,000	52,000 (Dem.)	149,000 (Rep.)
Illinois	27	166,000	70,000 (Dem.)	33,000 (Dem.)
Michigan	20	110,000	11,000 (Dem.)	45,000 (Rep.)
California	32	88,000	237,000 (Dem.)	18,000 (Dem.)

Five of these states, accounting for 126 electoral votes, went Republican in 1948 in spite of the clear preference of Negroes for President Truman. On the other hand, there can be little doubt that the Negro vote helped Mr Truman to carry Ohio, Illinois and California, all of which were essential to his victory. To say that the Negro vote represents the balance of power may be going too far. Had the farm vote or the labour vote for the Democrats been smaller, the Negro vote would not have sufficed to win Mr Truman the Presidency. The most that can be said is that the Negroes were one of several groups whose support was essential to him in these critical states.

★

Why do Negro leaders so confidently predict that most of their people will support Governor Stevenson this year? Mr Stevenson's appeal springs from his record; it would be even stronger if he were better known outside his own state. As Governor of Illinois, he earnestly sought to prohibit racial discrimination in employment, but he was beaten by Republican votes in the legislature. He abolished segregation in the state employment service. He vetoed the Broyles anti-subversive Bills; and Negroes have found by experience in other states that the illiberal groups behind "anti-subversive" movements usually oppose Negro aspirations for equality. Finally, Governor Stevenson made a profound impression with his frank and eloquent speech on the racial question at the Urban League convention in New York last January, long before he became a candidate for the Presidency. Negroes feel they can trust him. They also have great faith in the President. To them, Mr Truman is the man who made the first effective moves to end segregation in the armed services, and put up the first real fight for a comprehensive civil rights programme. Wherever President Truman goes whistle-stopping in Governor Stevenson's behalf, he will get a warm reception from Negroes.

General Eisenhower, in spite of anything he may promise during the campaign, labours under several specific handicaps. The most serious is his identification, as a former Chief of Staff, with Army elements which resisted attempts to abolish segregation after the war. Negroes still nurse a justified grievance over the discrimination they suffered from in all branches of wartime service, and they do not readily

Scene reconstructed by Roy Carmichael

IN LANCASTER, some eighty years ago, young Samuel Fawcett started work as an engraver of copper rollers for printing designs on oilcloth. A keen photographer, he quickly devised a way of saving time and labour. Using the natural sunlight in his conservatory-like exposing room, he prepared the rollers photographically and etched them by an acid process. Later he began to seek a means of reproducing fine gradations of light and shade. In 1890, when he had developed the system of ink control still used today, he met Karl Klic, an inventor from Austria. In collaboration they set out to apply Samuel Fawcett's methods to the printing of paper, and by 1895 they had evolved the photogravure process—now known throughout the world for the fineness and fidelity of its results. In achieving this quality, an important contribution has been made by the development through the years of the specialised gravure papers produced by the Reed Paper Group. For this is an organisation which has inherited from its founder, Albert E. Reed, a vigorous tradition of paper pioneering. As with gravure printings, so too with kraft, newsprint and other papers, the changing needs of trade and times are constantly anticipated. In this way the Reed Paper Group, with its five mills, has acquired technological experience and technical resources unequalled today in the many-sided service it can offer.

BALDWIN

—the facts

An authoritative and candid study from "The Life of Stanley Baldwin"

by G. M. YOUNG

- Was Baldwin, in politics, an honest man or an opportunist?
- What really passed between him and the King before the Abdication?
- Does Baldwin deserve the charge of having delayed rearmament to keep his party in office?
- What was the secret of his hold over the public and his party?

These and other much-debated questions are answered—on the strength of Baldwin's own papers and other unpublished documents—in this exclusive series beginning on Sunday in

The Sunday Times

You are advised to place an advance order without delay.

THIS AUTOMATIC SECRETARY

Takes care of Your Detail and Cuts Your Work

NO OTHER means will do more to ease your work and free you from petty details and many minor matters.

For this "Desk Secretary" is a complete desk organiser. It keeps in orderly form and helps you to deal swiftly and systematically with all your papers and correspondence, and automatically reminds you of all commitments and matters to be attended to.

Comprises a brown leatherette-grained container with hinged lid and front giving easy access to its contents. Inside are three classified sections: first the complete alphabetical section, then sections for your daily follow-up, followed by sections for your monthly follow-up. Supplied in foolscap size 14 in. x 10 in. x 3 in. only.

This Almost Human Device

Shows you all letters or papers requiring attention each day; Insures correspondence answered on correct day; Looks after matters pending and brings them continually

to your notice until finally dealt with; Prevents loss of all important papers; Keeps your desk clear of litter with all your papers systematically filed.

Supplies Limited - Order To-day

When the present small stocks are exhausted, it may not be possible to obtain replenishments. So make sure of securing your requirements whilst they are available, and POST THE COUPON TODAY.

forgive one who told a congressional committee that segregation should be continued. General Eisenhower is regarded as less than frank on the subject of federal legislation to end job discrimination against Negroes. And his new alliance with Senator Taft, who has never been admired even by Republican Negroes, will do him no good.

Why is it that the Negro favours the Democrats despite the prominence in the party of southern conservatives who constitute a formidable block to the passage of legislation guaranteeing minority rights? To the mass of Negroes at the bottom of the economic scale a job and a decent place to live loom larger than the more abstract slogans of civil rights. Ever since the days of the New Deal the Democrats have been identified with full employment and relative prosperity. Roosevelt's intense appeal to Negroes lay not in his civil rights record—for he actually accomplished less in this field than Mr Truman has—but in his vigorous attack on the depression. It was the Negroes, the lowest economic class, who suffered the most from unemployment. Work relief and other New Deal measures rescued Negroes from despair. Prosperity under Democratic Administrations during and since the war has enabled them to advance as never before. Like many whites, Negroes fear the Republicans as the party of deflation and unemployment.

It is as Negroes rise slowly in the economic scale and enter the middle class, that their interests turn from the bare elements of security to the broader questions of civil rights. They seek full equality—in employment, in access to theatres and other public facilities, in housing, in education, and in political expression. At this level they are also powerfully attracted to the Democrats because it is only during the last twenty years that marked progress has been made toward full Negro citizenship.

Opponents of "gradualism" in race relations do not like to admit it, but the fact is that Negroes have made substantial advances—gradually—in recent years, especially in employment. The defence boom has helped. With more jobs available, and with many communities finding the cost of importing white labour more onerous than the social changes involved in employing the available Negro labour, racial barriers have been reduced, though not abolished. Negroes nowadays are not always confined to the dirtiest and worst paid jobs; by comparison with the past they are well off. They can, so to speak, afford to think about equality. And when they do, many turn to the Democratic party, which, despite its southern reactionaries, has brought them more tangible benefits in twenty years than did the Republicans in seventy years which followed the Civil War.

Some Negro leaders believe that there has been a long-term shift of their people to the Democratic party which only a most drastic upheaval in Republican policy could reverse. It is said that Negroes are at bottom politically conservative, in the sense of being reluctant to switch parties once they have made a choice. The strongest evidence for this is their long period of loyalty to the Republicans (1865-1936) in the face of repeated disappointments. Theodore Roosevelt (1900-1908) is regarded as the last Republican President with real sympathy for Negro problems. Even so, most of the Negro vote was faithful to Mr Hoover in 1932 when vast sections of the population were deserting him for Roosevelt. It was not until 1936 that the Negro vote began to shift to the Democrats. But once the tide turned it was massive.

American Notes

Off with the Gloves

President Truman set out last week on an 8,500-mile campaign tour to the West Coast which should remedy any lack of hard hitting and personal warmth on the part of the Democratic candidate himself. Mr Stevenson's managers, alarmed by the size of the friendly crowds General Eisenhower has been attracting, no longer have scruples about accepting help from the President. But the candidates themselves seem to have decided that it is time to take the gloves off—and over foreign policy; the subject which most people thought had been safely lifted out of the realm of partisan politics by the nomination of a Republican candidate of General Eisenhower's international outlook and experience.

What has angered Governor Stevenson, and led Mr James Reston, that most perceptive observer, to report that the General's campaign, while gaining speed, seems to be losing altitude, was General Eisenhower's willingness, at Cincinnati, to twist facts to support his view that it was "the incompetence of political leaders which made military action necessary in Korea." The war, which has bereaved so many American families, is inevitably a campaign issue. The General tried to show that it was the Press Club speech of Mr Acheson, in 1950, which invited the assault by drawing an American "defence perimeter" that excluded Korea. In doing so he outrageously misrepresented what Mr Acheson said, omitting what did not support his thesis. Mr Acheson, it is true, said on that occasion that the United States could not, alone, undertake to defend Korea, but he went on to point out that an attack on a country outside the American defence line would first have to be met by the country concerned and then by the whole civilised world, acting under the Charter of the United Nations. Moreover, as both Mr

MEMBER FEDERAL DEPOSIT INSURANCE CORPORATION

Acheson and Governor Stevenson have since pointed out, it was the services who drew that defence line, and at the time General Eisenhower, who until 1948 had been Army Chief of Staff, made no objection.

In this rough exchange, General Eisenhower's statesman-like speech at Baltimore on defence, a subject he really understands, may be too easily forgotten. He spoke sound sense on the wastefulness of a "feast and famine" defence policy and on the failure to achieve true unification of the services. In place of the usual generalities, he offered two concrete proposals for achieving "security with solvency." Unfortunately, this experiment in responsibility met, not with the riotous applause the General is becoming used to, but with the quieter reception given many of Mr Stevenson's speeches.

* * *

Fewer Cities in Distress

A year or nine months ago, a number of cities were suffering from acute unemployment while their more fortunate neighbours were gorged with defence contracts and pinched for workers. Between thirty and forty, in which unemployment had reached 6 per cent or more of the working force, were designated "distressed areas" and attempts were made to channel defence contracts into them. Manufacturers in such places were given opportunities of matching low bids for defence work from other regions. Not all distressed areas suffered from the same complaint. Some, such as the textile towns of New England, had economic ailments of long standing. Others, such as Detroit, had had their civilian production severely cut to release metals for the arms and plant expansion programmes, and found defence contracts slow to fill the gap. Still others suffered from the falling-off in demand as consumers and businessmen decided to use up the goods they had bought in the panic of the spring of 1951. Total unemployment never rose above 2,500,000, but it was acute in some places, and the government decided that it was good politics, as well as humane administration, to release more metals for civilian production.

Today, the rising tide of the defence programme, the revival of demand for textiles and television sets, and the easier supply of metals has floated many of these distressed areas off the economic rocks. The "distressed" label was unpinned from Detroit last May, and now, with the automobile companies operating at the highest level in sixteen months, it is men, not jobs, which are scarce. The Automobile Workers Union is asking that employers meet the shortage by re-hiring pensioned workers, rather than recruiting labour outside the city for civilian and defence plants.

New York City, the largest labour market in the country, was pronounced cured last month, as employment in the clothing and building trades revived; so was Manchester, New Hampshire. Manufacturers have given up their advantage in winning defence contracts with real regret; in New York, at least, they are not all so sure as the Department of Labour that the recovery is permanent. At the Office of Defence Mobilisation there have long been doubts whether much unemployment could properly be attributed to the defence programme's appetite for raw materials. Now this is slackening, and unemployment is down to the rock-bottom level of 1,600,000. Non-agricultural employment in August was at the record height of 55 million and, though a sharp fall in the number of farm workers in the past year kept total employment slightly below the record, there were 62 million Americans at work. Most of the remaining centres of distress are textile or mining towns with deep-seated economic troubles.

* * *

Battle of the Funds

No sooner had the news leaked out that the Republican vice-presidential candidate's halo of incorruptibility was

somewhat awry than the Democratic presidential candidate was also found, almost as much by chance, to be uncertain of sainthood for similar reasons. Since he took office in Illinois in 1949, Governor Stevenson has been drawing on a fund, mainly left over from election contributions but augmented later and amounting, oddly enough, to the same sum, \$18,000, as Senator Nixon's fund. Mr Stevenson, however, was using the Illinois fund not for his own expenses but to supplement official salaries, so that a few able men could be rewarded for entering the ill-paid service of the state of Illinois. There is no evidence that either Senator Nixon, Governor Stevenson or the Illinois officials have shown any special favours to those who contributed to the funds, but public opinion has been shocked that neither Mr Nixon nor Mr Stevenson seemed to appreciate the potential evil of such private subsidies.

Governor Stevenson made the situation worse by partly refusing to reveal the names of either the donors or the beneficiaries of his fund, on the grounds that the transactions had been confidential. He was forced to relent later, to the relief of his campaign managers, who had feared that his silence would prevent them from making the most of the extravagances and omissions which an unemotional analysis reveals in Senator Nixon's broadcast defence. The Senator may also find himself in trouble over the absence of any reference to the gift fund in his income tax return.

Once he entered the battle of the funds, Mr Stevenson not only defended himself but struck out at his enemy. He and his vice-presidential candidate, Senator Sparkman, are both publishing full details of their income tax returns over the past ten years and have challenged their opponents to do the same. Mr Nixon claims that he has already supplied all that is necessary but General Eisenhower is preparing his accounts. The fact that his substantial profits from his book "Crusade in Europe" were treated as capital gains may cause some embarrassment.

In publishing details of their finances the Democratic candidates have adopted the course which President Truman, as his chief remedy for corruption, recommended should be made compulsory for all government officials a year ago. Legislation to this effect will almost certainly be revived in the next Congress, although there are many who feel that such an inquisition would deter many experienced and entirely honest men from entering the public service. But many of them are already deterred by the inadequate salaries offered, in state even more than in federal employment, compared with what can be earned in private life. It is this which has necessitated expedients such as those adopted by Governor Stevenson and Senator Nixon.

Other members of Congress, forced by the pressure of legislative duties to give up their normal means of earning their livings, have benefited from gift funds, although the more usual method of supplementing Congressional salaries has been by lecturing, journalism and radio appearances, or by giving a member of the family—in Senator Sparkman's case his wife—one of the secretarial posts in the office which the government provides and staffs for each member of Congress. There are other perquisites such as free hair cuts and an inadequate travelling allowance, but even so the average Senator and Representative is said to be over-spending his salary of \$15,000 by \$3,000 a year, largely because he is unable to avoid heavy social and political expenses and has usually to maintain two homes. Such a salary, however, would seem at least adequate to most Americans and, much as they dislike the idea of being represented only by rich men, they will not be very enthusiastic about the proposal, sure to be made in the next Congress, that salaries should be \$25,000 in order to make it easier for poor men to go to Washington and to remain above suspicion when they get there.

Full Cry After Communists

General Bedell Smith has unintentionally caused much alarm and given the Republicans a campaign windfall by his offhand statement that he is morally certain that Communists have wormed their way into his supersensitive Central Intelligence Agency. He merely meant that it is impossible to be sure that Communists have not made their way into minor posts, even in so security-conscious an agency as his own. Now he is aghast to find himself subpoenaed by the Un-American Activities Committee and the Republicans making political capital out of his statement.

The Administration, whether or not it is inspired by the approach of the election, has, in fact, been keeping up a steady pressure against subversives. Mr Earl Browder, the former head of the Communist party, and his wife have been arrested on the charge of falsely swearing, when Mrs Browder applied for naturalisation papers, that she had never been a member of the Communist party. The 18 third-string Communist leaders rounded up by the Federal Bureau of Investigation in the middle west a fortnight ago have all been indicted, under the Smith Act, with conspiring to advocate the violent overthrow of the American government. Of the 67 arrested earlier, 31 have been convicted, 13 are on trial, and 21 awaiting trial. Two defendants were freed last month on the grounds of insufficient evidence by Judge Dimock, who has noted several times that membership in the Communist party does not, in itself, violate any law.

Congressional committees are also active. A subcommittee of the Senate Internal Security Committee is carrying out the first nation-wide investigation of subversion in the schools. In New York, it was told by Dr Bella Dodd, a former legislative representative (or lobbyist) of the Teachers' Union, and, before her expulsion, a high Communist party official, that in 1944 there were 1,500 card-carrying Communists among the nation's million or so teachers. About 1,000 were concentrated in New York, the state which today contains nearly half of the nation's 25,000 party members. The Teachers' Union, now only a shadow of its former self, was expelled by the American Federation of Labour in the nineteen-thirties for being Communist-dominated, and later by the Congress of Industrial Organisations for the same reason.

Teachers who refused to tell the committee, on the ground that they might incriminate themselves, whether they were Communists seem almost certain to lose their jobs. The State Court of Appeals has upheld the authority of the city to dismiss employees who take refuge, in this way, in the Fifth Amendment, and the State Board of Education has withdrawn the stay granted to teachers dismissed last year on these grounds. The New York City Board of Education insists it is willing, however, to forgive those who make a clean breast of their former Communist associations and prove their sincere repentance.

Gas Among Good Neighbours

Before the Federal Power Commission permits the construction of a natural gas pipeline to serve a new district, it demands evidence that an adequate long-term supply of gas is guaranteed at one end and an effective demand for it at the other. Uncertainty about both has been holding up the authorisation of a pipeline that would carry natural gas from the nationalised Mexican oilfields 1,400 miles across the United States border to West Virginia and Ohio. There is, however, no doubt about the demand for natural gas from the expanding industries and growing population of Washington and Oregon, in the Pacific northwest where hydroelectricity is the only local source of energy. And there are quantities of gas available across the border in the Canadian oilfields, the nearest available source of supply, since California has no gas to spare.

It therefore seems logical that this Canadian gas should be brought into the United States, especially since the present demand for natural gas in British Columbia and Alberta is not large enough to justify the building of hundreds of miles of expensive pipeline across the mountains, unless an American market is also to be served. But the Albertan government has ambitious ideas about the coming industrial growth of the province, and is therefore reluctant to approve long-term commitments for deliveries of natural gas to outside consumers, at least from the central Pincher Creek field. But both Alberta and the federal government in Ottawa have now authorised the project of the Westcoast Transmission Company for building a pipeline, nearly 1,000 miles long, from the northern Peace River oilfield to Vancouver and Portland.

This is the only gas pipeline scheme that has been accepted by the Canadian authorities, and it must still be approved by the FPC in the United States. But potential American consumers are not sure whether the gas can be delivered over such a long and difficult route at an economic price, and they are also afraid that, as the demand for gas grows in

Vancouver, there may not be sufficient to provide all that is needed across the border. American companies prefer the project of the Alberta Natural Gas Company, which Canadian officials are apparently not prepared to consider. It would bring gas directly from the nearer and more developed Pincher Creek area to Spokane, and the atomic energy plant at Hanford, putting Vancouver at the end of the line. Meanwhile, gas distributors in Oregon and Washington, tired of waiting for the argument to be settled, are negotiating with an American company which proposes, if the FPC approves, to develop a natural gas field in New Mexico for their benefit. The Pacific northwest might conceivably support two natural gas pipelines, but three are out of the question.

Another project for using the American market to facilitate the development of Canadian oilfields and the supply of natural gas to Canadian cities is that of Western Pipelines, which would carry gas through Winnipeg to Minneapolis and beyond. If the Williston Basin turns out as forecast, it might provide a better source of supply for this area, but here again there may be room for two companies. There is no question of an American demand, or even of much Canadian demand on the way for the natural gas that Trans Canada Pipelines would like to bring 2,000 miles across the country to serve the great industries of Ontario and Quebec; it is therefore difficult to see how this can become an economic proposition. Canada's eastern provinces could obtain their natural gas more cheaply from across the border, from the American pipelines that are already supplying the north-eastern United States from the oilfields of Oklahoma and the Gulf region. But Canadian consumers can get no guarantee that their future needs will be met should the American demand in the northeastern states increase, as it will. Since this is the Pacific northwest's difficulty in reverse, it ought to be possible for such good neighbours as Canada and the United States to work out an exchange satisfactory to both countries.

THE WORLD OVERSEAS

Uncertainty at Strasbourg

(From a Correspondent)

THREE weeks discussion at Strasbourg—first in the parliamentary organs of the Coal and Steel Pool, later in the Consultative Assembly of the Council of Europe—have clarified many of the issues raised by the attempt to build a sea-nation “little Europe.” But they have left uncertain its final form and its consequences for the wider communities of the Council of Europe and Nato.

At its May session the Consultative Assembly gave general approval to Mr Eden's proposal for making sure that Britain and Scandinavia remained intimately associated with the six by integrating the Coal and Steel and the Defence Communities into the framework of the Council of Europe. In doing so it rejected, by a small majority, M. Spaak's proposal that the Coal and Steel Assembly should proceed immediately to construct a political authority for the six. Instead it set up an *ad hoc* committee of its own with British and Scandinavian observers, to consider the creation of a political authority at a more leisurely pace.

In the event, however, M. Schuman adopted M. Spaak's proposal. At its first meeting the Coal and Steel Assembly set up a special “pre-constituent” assembly to which a new committee is to report on the creation of a political authority. Against German and Italian objections, it agreed to invite British and Scandinavian observers to attend meetings of this committee with the right to speak but not to vote.

The Consultative Assembly itself met two days later in an atmosphere of confusion. After years of frustration under the British veto, the continental federalists at last had an assembly of their own capable of fulfilling the role which they had hoped in vain of the Council of Europe. Their elation was tempered, however, by reports from London that the British Government was unhappy about their action, for British approval was essential to their success. The French, Belgian and Dutch parliaments contain groups whose opposition would suffice to wreck “little Europe” if they thought it would divide the Continent from Britain. Apart from national fears of German domination, the Socialists dread a great increase in Vatican influence.

Mr Eden's speech was therefore heard with great relief. It was welcomed as an endorsement of M. Schuman's initiative. Indeed M. Spaak claimed that with the dispatch of the British mission to the Coal and Steel Community and with the promise of British co-operation with the Defence Community, the Eden Plan was already in operation. The Consultative Assembly, he said, should now leave political problems to be dealt with by the six and concentrate on economic issues. Nothing more need be done to assure British association with the developing continental community.

In the General Affairs Committee, however, the British returned to the attack. Mr Julian Amery obtained support for a new plan, less ambitious than the original Eden proposals. The Coal and Steel Committee, and the pre-constituent assemblies should meet at Strasbourg in the presence of observers from all other member countries of the Council of Europe, and should so far as possible, use the administrative machinery of the Consultative Assembly. Much more important, Britain and other non-members should send observers to meetings of the Council of Ministers of the Coal and Steel Community. There was little

opposition to these proposals in the Consultative Assembly except from a group of Italian delegates. But, of course, the Consultative Assembly has no power to decide the actions of the Six—as has already been demonstrated. And the Coal and Steel Assembly has already shown itself scornful of its older rival.

It is thus uncertain whether, even in their new form, the Eden proposals will prove acceptable to the six. M. Monnet himself is known to be suspicious of any link between the Coal and Steel Community and the Council of Europe. On the other hand, M. Spaak, who has great influence in the former as the chairman of its Assembly, is well aware that “little Europe” may collapse through opposition in national parliaments unless effective British association seems in some way guaranteed. Socialist opposition to “little Europe” hardened during the Strasbourg meeting. The German Socialists refused to nominate representatives to the pre-constituent assembly, on the grounds that this would imply approval of the Defence Community. Partly as a result, there is a marked Catholic preponderance in its drafting committee. The absence of Communist representatives from all the parliamentary organs of the six of course exaggerates the unfairness of this distribution of votes. Incautious speeches by German delegates have also revived French fears, although in the Consultative Assembly the Italians have been more outspoken against British participation in the work of the six. Thus it seems possible that M. Schuman's initiative, the first justification of which was that it will speed the ratification of the Defence Community in Paris, may be used as an excuse for further delay.

Support for Atlantic Community

This lends interest to a trend which is growing in the Consultative Assembly. More and more speakers have begun to maintain that, whatever the fate of Mr Eden's proposals, the Atlantic Community is the only framework capable of containing a resurgent Germany, whether or not such a Germany is tied to its neighbours in a “little Europe.” For some time Norwegian and British Socialists have pressed the claims of the Atlantic Community in the Consultative Assembly. In this they have been joined in particular by Greek and Turkish delegates, who feel isolated by the development of “little Europe” and have little national interest in association with the Coal and Steel Pool.

It might thus seem that the Council of Europe is bound to decline, since the British and Scandinavians did not want it in the first place, and the continentals, whose importunity produced it, lost interest in it some time ago and now have in the Coal and Steel Assembly an organisation better fitted to achieve their aims. Among British Conservatives in the Assembly there is, however, one active group led by Mr Boothby and Mr Amery which believes that Britain can play a unique role in organising co-operation between Europe and the Commonwealth within the Atlantic Community as a whole, and that the Council of Europe is the best instrument for this. Their greatest triumph in the Assembly so far has been to obtain almost unanimous support for the creation of a preferential area between Europe and the Commonwealth at the price of discrimination against dollar imports.

From Cell to Kremlin

NEXT Sunday in the Kremlin, in the hall where the Soviet Parliament normally holds its assemblies, the 19th All-Union Congress of the Communist party of the Soviet Union—formerly Bolsheviks—will officially open its assizes.

The present Congress, the first to be held for thirteen years, will be the culmination of a series of extraordinary meetings involving the whole machinery of the party. Even before the Congress was officially convened the primary party organisations were already holding their assemblies. These basic units of the party, which number some 300,000 in the Soviet Union, are formed in all factories, collective farms or offices, wherever there are at least three party members. The smaller units are led by a secretary, the larger ones have a bureau and a number of secretaries varying with their size. These primary organisations are the former Communist cells which were necessary for the working of the party in its clandestine days before the revolution. Now they are indispensable if the party is to fulfil its function as the controlling overseer of the whole political and economic life of the country.

After the meetings of the primary cells came the conferences of the somewhat larger units—the towns and so-called “rayons.” There are really two kinds of rayons. Those in the countryside are a kind of county subordinated directly to the *oblasts* or provinces. The town rayons are really districts—i.e., subdivisions of the town. The rayon and town conferences elected their executive bodies and then came the turn of the *oblast* conferences to choose their committees, and finally of the Republican Congresses to elect their central committees. Both republics and *oblasts* vary in size. The largest republic—the Russian—is so big that it has no separate republican party; its *oblasts* and *krais* (territories or larger *oblasts*) are directly subordinated to the all-union party authorities. The election of the All-Union Congress in fact starts on the *oblast* level, one delegate with full powers being allowed for 5,000 members and a delegate with a consultative voice for each 5,000 candidates (i.e., party novices).

Nothing could look more democratic on paper than this structure. The authorities are elected progressively from the bottom to the top. At each level the meeting of members

or delegates selects a committee to exercise full powers at statutory intervals between assemblies, and the committee in turn appoints an executive organ and secretaries to exercise control between its plenary meetings. In practice, however, things work the other way round. It is from the top to the bottom that control is exercised, decisions are taken and even elections decided. The Party statute itself calls the system “democratic centralism” because the lower organs both elect the higher bodies and owe them obedience. Actually they are subservient to them. Each executive body owes its existence to the organ above it. The primary cell is controlled by the rayon or town executive. The three secretaries who run that executive cannot be elected without confirmation by the *oblast* or republican committee. Finally no one can sit on the executive body of *oblasts* and republics, if he is *persona non grata* in the Central Committee of the All-Union Party. Hence only persons approved from the centre exercise real control in the country.

It is true that the apparent favourites of the Kremlin are sometimes thrown to the rank and file for judgment. This has already happened before this present Congress; a wave of “criticism and self-criticism” has swept many a Party boss, including some Republican secretaries, from their pedestal. The primary purpose of this purge was to eliminate from the Party all the undisciplined, careerist and other undesirable elements which succeeded in entering during and immediately after the war when the rules of admission were relaxed, as well as all those who grew corrupt during too long a tenure of office. This has not been a bloody purge of political opponents and—except when punishment was meted out for “nationalistic sins”—the downfall of too powerful bosses or corrupt dignitaries must have pleased the population and gained support for the regime. It must, however, be remembered that even this right to criticise was exercised only on a special recommendation, indeed an order, from the All-Union Central Committee.

“Democratic centralism” could still be a form of party democracy if the All-Union Congress, indirectly chosen by the rank and file, really exercised supreme power. Does it not elect the Central Committee, which in turn elected the Politbureau and now will select the Presidium? But the actual power of the Congress has been declining steadily. Even in the statutes the intervals between Congresses have been lengthened, in the present statute to a maximum of 4 years. In fact, of course, though the previous maximum

The Russian Republic accounts for about 55 per cent of the population of the Soviet Union. Thus there is no Russian Republican Party as such, but the Party is divided straight into *krais* or *oblasts*. *Krais* or territories exist only in the Russian Republic, where there are six *krais*. *Oblasts* or provinces are smaller than *krais*. There are 130 *oblasts* in the Soviet Union.

was three years, the 19th Congress will meet after an interval of over 13 years. It handed its power over to the Central Committee which in turn abdicated it in favour of the Politbureau—that is to say, of Stalin and the men who carry out his orders. In fact Stalin, sitting on the pinnacle of the apparently democratic party pyramid, could announce now, in advance, not only the size and composition of the future Presidium, but also all the decisions which will be taken and unanimously approved by the Congress.

Obviously this staging from above has deprived the Congress of much of its importance. This decline is the result of a lengthy process. In the early years of the Soviet regime it was the debating place of a fiery, if disciplined, revolutionary party. Soon, however, the Bolsheviks found it difficult to combine freedom within the party with the discipline needed to maintain themselves in power and carry out their plans. At the 10th Congress, in 1921, at the time of the Kronstadt rising and in face of the so-called Workers' Opposition, factions, "groups with separate platforms . . . and their own group discipline," were banned. At first this limitation of the right of opposition within the party was presented as a temporary necessary evil imposed by circumstances. Stalin strengthened it, made of it a virtue and finally the real essence of his regime. His opponents of the Bolshevik Old Guard were progressively eliminated from successive Congresses until his will became undisputed and unquestioned law. From the debating place of a revolutionary party the Congress became the ceremonial meeting place of an established bureaucracy.

Kashmir Seen from Delhi

Now that the Geneva talks on Kashmir have clearly failed, there seems little likelihood that the Security Council will take any stronger line on the strength of Dr Graham's latest report than it did on the one before. The report itself makes no recommendations about settling the dispute and apportioning no blame to either party. The talks themselves broke down not only because the two sides disagreed about the size of the forces needed for the plebiscite period, but also because Dr Graham had to take the question of the nature of the forces back to first principles; for India this meant denying the legal right of Pakistan to retain, at most, anything more than a police force on Kashmir territory. In the eyes of many, however, the Security Council will be failing in its minimum duty if it does not now at last come out with a firm pronouncement about the rights and wrongs of the case. On the other hand, whatever maybe the effect on Uno's prestige, the fact that it may shrink from decision because it knows that no decision can be enforced will mean in practice that the present situation in Kashmir itself must be expected to continue indefinitely.

For India this represents to some extent a "solution" to the dispute, or at any rate the best that can be made of a bad job. In the eyes of Delhi, it should not be forgotten, India's position in Kashmir rests on a legal and moral case that has never been refuted. Although the Kashmir deadlock is in fact maintained by virtue of the presence of armed forces—even if subject to a cease-fire arranged through Uno—India stands by arguments which it has long regarded as peculiarly western in nature. Indeed, much of the resentment felt against so much of the prevalent western sympathy for Pakistan is directed at what in the Indian view is a hypocritical attitude. It is no use, Indians say, for the western world to set up a United Nations charter to condemn aggression, if aggression means one thing in one place and another in another. The days when there could be one international law for the rich and another for the poor are over. Pakistan committed aggression in Kashmir and for aggression it must pay—or at least it must not gain thereby. To favour Pakistan now is merely to pander to expediency and to ignore the right.

Did Pakistan commit aggression in Kashmir? In the Indian view the case against Karachi is as watertight as on the day the struggle began five years ago, and no conversations in Geneva or anywhere else can alter that fact. There are three salient points. First, no one seriously denies that in acceding to India the Maharajah of Kashmir was within his constitutional rights and that his accession therefore had the force of law—whatever the timing or motives of his act. Secondly, Mr Jinnah had himself previously agreed that the rulers of the princely states must be the sole arbiters of their own destiny. They must decide whether their states would join India or Pakistan, and the two countries should be bound by their decision. Thirdly, in electing to join India the Maharajah of Kashmir was not in fact alone in Srinagar. His decision was supported by Sheikh Abdullah, who represented the bulk of organised political opinion in the state.

Under Two Flags

Today the Indians feel that it is impossible to put the clock back without adverse political consequences which they are not prepared to accept. To do so might mean disastrous migrations of refugees and a degree of human wretchedness excelling anything that could be claimed for a perpetuation of the present regimes. By virtue of the actual division of the state of Kashmir over the past five years, two administrations have grown up which have re-orientated the political allegiance and outlook of the people of Kashmir. Moreover, in the Indian and by far the larger sector, Sheikh Abdullah's government has lately established a position of relative independence; this represents a truer interpretation of the principle of self-determination than could any form of integration forced on it by either of its bigger neighbours. Since Sheikh Abdullah's visit to Delhi in July and the formal agreement which followed, India has only been responsible for the foreign affairs, defence, communications and, to some extent, administration of justice of the Indian sector of Kashmir. Everything else devolves back on Srinagar, and the Kashmir flag flies alongside the flag of India. Has Uno really the right to reverse all these healthy developments? In Indian eyes the answer is certainly not. Delhi is by no means without logic in prosecuting its case.

Exercise Holdfast

[FROM OUR SPECIAL CORRESPONDENT]

THIS combined army and air exercise was designed to illustrate the task which must fall to the non-aggressor in the opening stages of an attack on Western Europe: with inferior numbers both on the ground and in the air to hold the enemy fast until the mobilisation of reserve forces is complete. It is some measure of the build up of Nato forces during the past year that in exercise Counterthrust last year three British divisions, one Belgian division and a Dutch brigade took part, whereas the forces this year comprised three British armoured divisions, one Belgian armoured and two infantry divisions, two Dutch infantry divisions—though one was only in cadre form—and a Canadian brigade group of 6,000 men. With so large a force available, it was a pity that the equivalent of seven divisions was allotted to the defending side and only one armoured division and an infantry brigade group to the aggressor. This, of course, made necessary the imaginary periodical expansion of the attacking forces from companies into battalions, and so forth, thus introducing an atmosphere of unreality on one side.

The seven defending divisions, under the command of General Harding, constituted what would, in war, be the northern group of allied forces defending Western Europe. It already has a completely integrated staff. Their task was admittedly made easier than it probably would be in

reality by introducing an imaginary neutral frontier on one flank and an imaginary army on the other. Thus these seven divisions were called upon to defend a corridor about 32 miles wide, or rather less than five miles per division. One remembers that the late General de Lattre de Tassigny, in his address at the conclusion of Exercise Agility II in 1949, remarked that a division might have to cover 25 miles of front. Great as the improvement has been since then, the available forces have not multiplied $4\frac{1}{2}$ times.

Mosquito Tactics

General Harding's conception of the best way to carry out his task is interesting and impressed allied observers. He selected two lines of defence: the forward one, 10 to 15 miles west of the hostile frontier on the river Weser, was on the strong defensive position of the Eggegebirge ridge; the main position was some 20 miles further back. He placed his three armoured divisions in the forward position, with their light mobile armour out in front up to the frontier. A strong and deep belt of obstacles and demolitions was established on this forward position. The remainder of his force had the task of establishing three strong bastions of all-round defence in the rear position. A second belt of obstacles and demolitions was slightly echeloned back between the latter two bastions.

This plan imposed on the enemy the task of pressing back a constantly strengthening spring buffer until the fixed buffer of the main position was reached. The light armoured forces forward on the frontier were, by what may be called mosquito tactics, to force the enemy to employ all the hours of daylight on the first day in reaching the Eggegebirge ridge. The defences and obstacles on the ridge itself were to hold him up for at least another 36 hours. The armoured divisions were then to fall back to positions behind the bastions, from which they could strike the enemy a smashing blow after he had weakened himself in attacking these. General Harding believed that an inferior force using these tactics could not only hold fast a superior force, but could even drive it back.

Command of the Air

Although the weather hampered the air operations, enough was accomplished to drive home to the defenders the serious handicap of inferiority in the air. The march discipline and dispersion of the ground forces were generally good in the face of the air menace and the camouflage often excellent. But, human nature being what it is, there was a tendency to relax these precautions when the armoured counter-attack was launched. The hostile advance to the main position worked out realistically. In war the forward position would have delayed an enemy for at least the 48 hours prescribed in General Harding's plan, and probably for longer. With the 7th Armoured Division and a Belgian brigade group now in imagination representing a large army of many divisions, the battle in the main defensive position was inevitably somewhat unreal for the fighting troops, though the picture was admirably painted by the control staff. From 7.30 p.m. on September 20th to 10 a.m. on September 21st the exercise represented five days' heavy fighting round the three bastions. During this period the troops on each side were regrouped in the positions they would—on a realistic estimate—occupy after these five days of fighting. With fighting resumed, the battle for the bastions continued till the early hours of September 22nd, when the armoured counter-attack was launched. In the front-line atmosphere of make-believe already mentioned, this attack was really a demonstration, rather than a try-out, of General Harding's defensive theory. As such it proved the soundness of his basic conception, of which many variations are possible. As a first test it was best not to make the problem too difficult; hence the narrow divisional fronts.

It cannot be too strongly stressed that unreality in the

forward areas was much more than counter-balanced by what was going on in the headquarters in the rear. The outstanding fact is that an integrated army headquarters staff was fully and realistically exercised in controlling the operations of an army of three corps, each belonging to a different nationality and speaking a different language—a unique event. The northern group, under British leadership, is the first Nato command to reach this level. But perhaps the greatest value was gained on the logistical side, conducted throughout with great realism and extended far beyond the actual duration of the exercise. To concentrate and disperse the troops engaged involved running nearly a thousand trains of many different types. There was excellent co-operation between the army movements staff and the *Deutsche Bundesbahn*—another record in international team work. Supplies, petrol, ammunition and defence stores were delivered daily from depots west of the Rhine and from three forward maintenance areas, involving still more train movements. Umpires painted to administrative staffs, pictures of breakdowns and the news came in realistically by reports from local stationmasters telephoning to the nearest RTO. An unplanned genuine railway accident lent further realism to the picture.

Heirs of Schumacher

[FROM A CORRESPONDENT]

WHEN the delegates to the conference of the German Social Democratic Party, the SPD, assembled at Dortmund last week, they found an enormous portrait of their late leader, Dr Kurt Schumacher, overlooking the hall in which their deliberations were to take place. The question in the minds of both the delegates and the public was whether there would be a change in SPD policy, and particularly in the intransigent attitude to German rearmament and the Bonn Conventions maintained by him. The great interest taken in the decisions of the conference was due to the feeling that they would indicate the new balance of power within the party after Dr Schumacher's death. It was likely, moreover, to be the last full scale conference before the next Parliamentary election—the second in the lifetime of the Federal Republic.

The conference once more endorsed the party's opposition to a German defence contribution in accordance with the European Defence Community agreement, and to the new relationship with the western allies embodied in the Bonn conventions. Dr Schumacher had formulated his party's refusal to accept any German rearmament in present conditions with passionate fervour and his death after long and heroic suffering for the ideals of democracy seemed to have invested this attitude with the sanctity of something like a political testament. Furthermore, Herr Erich Ollenhauer, who was elected chairman of the party without opposition, had for some years been his faithful lieutenant and was committed to the party line on foreign policy.

For while it is against a German defence contribution in the form embodied in the Bonn Treaties, it is not opposed to the principle of a German contribution. The SPD's attitude towards rearmament is, however, not so unequivocally hostile as it was. Indeed, the Berlin branch succeeded in getting the party to adopt a statement to the effect that Germany must have the right to defend itself; and the official newsletter has explained that this need not necessarily wait until unity is achieved. It would appear that different views are held inside the party. The party is largely—while in opposition, at any rate—dominated by a combination of two emotional trends. With other parties it shares the German love for high-sounding phrases, many of which have little meaning in fact when coolly examined. At the same time, it exhibits the tendency of most Socialist parties without responsibility for government to think in terms of a Socialist

WHEN IT'S A QUESTION OF TIME...

closing the gap...

Some said, when mass production came into its own, that something vital went out of industry, that means would have to be found to close the gap between Management and Man. Means have been found. Today, through Internal Broadcasting, the voice of Management can be heard instantaneously, by every worker, in even the farthest parts of the works. Thus is encouraged that happy atmosphere in which production can thrive. T.R. Internal Broadcasting can also provide speedy staff location, music for workers and time signals, all essential to modern industrial efficiency.

TR SERVICE
speeds production

Today's need for maximum output has so increased demand for T.R. Service — Internal Broadcasting, Time Control, Staff Location and Internal Telephones — that new installations can now be undertaken only in organisations engaged upon work of National Importance.

An Enterprise of Telephone Rentals Limited—

You'll get action with colour!

Yes action! — and speed in your office. Colour in copies clarifies comparisons, gives instant identification and emphasis, producing immediate effect. Increased effectiveness of colour in stimulating action is shown in actual records of experience by users of the Banda 'Master' Method, which reproduces up to seven colours at once, without inks, stencils or gelatine, from a single 'Master' sheet of paper, typed, written or drawn. The Banda 'Master' Method increases efficiency, saves time and in some cases cuts costs by 75%. Banda brings colour to your copywork and control to your office. Copies are brighter, points are clearer. Organisation runs more smoothly in routine or emergency, with maximum ease and clean simplicity of Banda operation. Colour — with the Banda 'Master' Method — gets what every director and every executive wants — action!

JOBLINGS
OF SUNDERLAND

versatility in glass

Glass was first made in the Sunderland district over a thousand years ago. Today, and for some generations, the works of James A. Jobling & Co. Ltd. have been producing an ever increasing range of articles and instruments from a variety of glasses including the famous 'Pyrex' brand, the original heat resisting glass in the world

FOR HOUSEWIVES

— dinner service in Joblings heat-resisting Colourware glass. Now you can cook and serve your meals with 'Pyrex'

FOR DOCTORS

— hypodermic syringe made of Joblings Precision Bore Tubing, clear, hard glass having exceptional resistance to thermal shock and chemical attack

FOR MOTHERS

— nursing bottle in Joblings 'Pyrex' heat-resisting glass. Can be sterilised safely — boiling will not break the glass

AND FOR THE HOME — THE GENUINE
original oven-to-table glass

25/10/52

The twelfth Labour of Hercules was to raise the three-headed dog Cerberus from the nether regions. By reasoning with Pluto, King of the Underworld, and subduing the animal with his bare hands, he succeeded.

The Nickel Organisation, too, has an "underworld" extending (in operating mines) for 300 miles. Nickel ore is mined at a greater depth than any other base metal, and the shaft at Creighton, Northern Ontario, for instance, goes down 5,562 feet. Nearly eight million tons of ore were brought out of the underground workings last year, a record tonnage since mining operations began. Such giant haulage problems must be taken in the industry's stride, for new uses for nickel are always being found.

world completely divorced from reality. Herr Ollenhauer and his colleagues have no experience of the burdens and realities of power. Nearly everything that was said on foreign policy thus had a curiously unrealistic ring, for it seemed to start from premises which do not seem to correspond to the facts of the present situation. Much is made of the complaints that even under the proposed Bonn treaties the Federal Republic will not yet be fully sovereign in all respects; that it is being accepted into the European Defence Community, while being denied any share in the real strategic control exercised by Nato. Above all, the SPD holds that the treaties are based on the assumption of a continued division of Germany, and therefore tend to perpetuate that division. It sees itself, in fact, as a trustee for the population of Soviet Germany.

This emphasis on refusal to accept a continued division of Germany is not merely propaganda. Social Democrats have the impression that some members of Dr Adenauer's government coalition are in no great hurry to end it. It is claimed that they prefer a Catholic and capitalist Western Germany to a united Germany where these two elements might be proportionally weaker. The SPD is certainly confident that it would secure a higher proportion of votes in a united than in a rump Germany. Rearmament is also disliked for three reasons. First, it is feared that it would release reactionary forces with which German democrats are not strong enough to cope. Secondly, it is claimed that Western Germany is not economically strong enough to rebuild and rearm at the same time. Thirdly, there is the instinctive Socialist dislike of all armaments, the feeling that there may be other ways of achieving security.

Steering a Middle Course

But, despite all the apparent continuity of policy, a visitor to the conference was impressed by the success with which Herr Ollenhauer managed to steer a middle course, and to retain his freedom of action for the critical time after the next election. The SPD may be pledged to ask for a radical revision of the treaties, if these have been passed by the time it gets into power. Yet it was implied that pending revision, which would not be easy, the party would honour the treaties.

If the SPD came to power, it would probably be tied in another way, too. The most optimistic forecasts do not predict an absolute majority for it in the new *Bundestag*. As in the Weimar republic, the Social Democrats would have to co-operate with other parties. Here, too, the situation has been changed by Herr Ollenhauer's succession. Unlike Dr Schumacher, he may well be able to adapt himself to a coalition. The nature of the possible coalition is, of course, pure speculation at present, but a coalition between the Christian Democrats and the SPD is a more practical possibility now that their relationship is no longer dominated by the personal irreconcilability of Dr Adenauer and Dr Schumacher.

Foreign policy undoubtedly overshadowed the SPD conference; indeed, the necessities of foreign policy are likely to be a dominant factor in Western Germany for some time. But home affairs were not neglected. Attacks on "the spirit of restoration" in Western Germany, and criticism of the undoubtedly wide gulf between rich and poor, occupied much of the conference's time. However, much of what was said on raising the standard of living of the poor, the expellees and the refugees, was only a claim to be more efficient in administration than the powers that be. In matters of principle, the SPD is demanding the socialisation of the basic industries, such as coal, iron and steel. It backs the German trade union movement over *Mitbestimmung*, the workers' claim to a share in the running of both private businesses and public enterprises. The party programme also demands more social security, a public health

service, a simpler insurance system, reorganised taxation and a federal law on agrarian reform.

If the SPD fails in its bid for power in 1953, as it did in 1949, its policy may in many respects remain barren. But if it acquires a share in the responsibility for government, it may well make an important contribution to the healthy internal development of Western Germany. And if the party is, in due course, called to share in the execution of the Bonn Treaties, then the declarations of its new chairman at the Dortmund conference will not stand in the way.

Signor de Gasperi Holds His Own

[FROM OUR ROME CORRESPONDENT]

It has long been Signor de Gasperi's valuable accomplishment to present a commanding appearance on the strength of modest but multiple achievements. This appearance, founded as usual on modest realities, has been maintained during the summer. No resounding success in the dominating Trieste question, no grand haul of dollars from across the Atlantic, no perfected agreement with slippery allies for the coming general elections, have crowned the Premier's long summer absence from Rome, his parleys in Luxembourg and Strasbourg (notably with Mr Eden), his economic minister's errands in Washington and Mexico City and his own patient conversations in Alpine valleys with the minor democratic leaders. He has won little visible ground in any of these negotiations, but he has held his own, and has returned to Montecitorio with recovered wind for the last six months of his Chamber's existence.

The resistance of the West to Marshal Tito's professed Trieste aspirations has been strengthened by Signor de Gasperi's civil presentation of the Italian case. Marshal Tito himself can hardly have meant seriously his proposal for a condominium with alternating Italian and Yugoslav leadership; it was surely destined to soften up western reactions when bargaining on a territorial deal begins. The development of the Yugoslav-Graeco-Turkish combination, backed by the United States, which would leave Italy isolated and estranged, has been parried by the arrangement of a visit by Signor de Gasperi to Athens, heralded by Greek comments which show that the "miracle" of Italo-Greek conciliation is not undervalued there. At Luxembourg and at Strasbourg Signor de Gasperi has spoken in the tones of one who quietly claims some credit (which he should certainly share with the late Count Sforza) for having from 1947 to 1952 backed every single initiative for European union, and exploited to the utmost the political potentialities of economic mechanisms, from the OEEC to the Coal and Steel Pool.

Position in Atlantic Camp

In the atmosphere created by these activities, Italy's recent status as a defeated and disgraced power has been forgotten in a wide range of international affairs. Indeed, by showing marked zeal in the setting and the realisation of the Lisbon military targets it has a good position in the Atlantic camp. (The Defence Minister, Signor Pacciardi, now claims that the Italian army already has a strength corresponding to ten active divisions.) Moreover, from an economic point of view, Italy does not rank in the world's eyes as one of the perennial crisis countries, in spite of the recently growing weaknesses of the trade balances; American praise of the hard currency financial "line" at least balances criticism, from the UN Economic Commission for Europe, of inadequately adventurous investment.

Thus it is with mildly reinforced international prestige that Signor de Gasperi can plan the last six months of the five-year electoral mandate won in 1948 by his party and more broadly by the coalition which he headed. His summer encounters have not brought off a renewal of the "formula of April 18th" (a four-party government coalition of the centre). They have, however, checked the tendencies in each party to line up for the elections in some other posture: the Christian Democrats in a collusion with the monarchists, or some monarchists; the Social Democrats in a tricky "equidistance" between the centre and the Marxist left; and the Liberals in a detached secularism of the right. The exiguous Republicans, by contrast, are altogether safe; they could hardly now break the association with Signor de Gasperi which has brought them disproportionate responsibilities in office, and cost them the loss of their fanatical anti-clericals, the standard bearers of the party's old traditions. A joint approach by the four parties to the electorate next spring now looks better assured than before the summer. Among the Social Democrats the April-18th-minded Signor Saragat is making progress in winning back control from the semi-Marxist Signor Romita, who on that fateful day in 1948 still stood with Signor Nenni. The party congress, in mid-October, will finally decide between them. The four-party centre combination is now settling the details of a new-style electoral law, weighted against both the Communists and the "royal-fascist" extremes; with this in hand it would seem to have another five-year mandate awaiting it, though likely to be less cheerfully and spontaneously accorded than in 1948. And this fully entitles Signor de Gasperi to maintain his commanding appearance.

The Lebanon Follows the Fashion

[BY A CORRESPONDENT LATELY IN THE LEBANON]

THE abrupt fall from power of ex-President Bishara al-Khoury stands in sharp contrast with his triumphant re-installation after his suspension and arrest by the French in November, 1943. For the last eleven years he has been the virtual dictator of the Lebanon, where, whatever his shortcomings, he did stand for stability and continuity. Controlling both the armed forces and every branch of the civil administration, supported by an apparently docile parliamentary majority, surrounded by henchmen from all religious groups who were personally interested in the maintenance of the regime, his position seemed so unassailable that it was commonly said that opposition amounted to political and social suicide.

In that sense his sudden and peaceful overthrow by a general who has since returned to army life was a bolt from the blue. Yet the most superficial contact with public opinion and the Press revealed a practically universal and deep-seated discontent. Corruption at the highest and lowest levels; a contempt for law amounting to gangsterism; hopeless inefficiency in most departments; favouritism and nepotism to an almost unbelievable degree; callous disregard of the misery of the poor, either through chronic unemployment or through scandalously low wages when employed; indifference to the high cost of living; the hesitations of a foreign policy incapable of standing up to Syria or of making up its mind about its relation to the Arab League—all this had brought the regime into hopeless disrepute.

Nor were external factors absent. An active Communist propaganda naturally made the most of a situation that played into its hands, and the examples of Syria and Egypt showed how determination and courage could overthrow without bloodshed a discredited system. It would be too much to

say that Generals Shishekli and Neguib are the real authors of the Lebanese *coup d'état*, but it is doubtful if this could have taken place without the lead which they consciously or unconsciously gave. It is significant that M. Khoury's supporters openly accused Syria and Egypt of having directly encouraged the Lebanese opposition, and that demonstrations in Beirut in favour of General Neguib at the end of July may be said to have marked the beginning of the final crisis.

The Press had been in many ways the chief victim of the old order, and its refusal to publish government communiqués was the first direct challenge M. Khoury had to meet. His programme of reforms was ridiculed as a window-dressing hotch-potch of unrealised old promises, and his proposal that the cabinet be given full legislative power for six months turned out to be the last straw. The chief opposition leaders were M. Kemal Shamoun, a prominent Maronite Christian and M. Kemal Jumblatt, a member of a leading Druse family from the mountains of southern Lebanon. Between them, these staged a gathering, some 20,000 strong, at Deir-el-Kamar, the home town of M. Chamoun, and but a few miles from M. Jumblatt's headquarters at Mukhtara. The two leaders spoke of the need for a *coup d'état*—by force if necessary. "We have an army in every village," said M. Jumblatt. Refusal by Parliament to co-operate with any cabinet proposed by the President brought matters to a head. It was, as the newspaper *An Nahar* wrote, a question as to who was to rule, people or president.

The last phrase, however, needs qualifying. The revolt against M. Khoury was not so much against him as a dictator as against the futility of his dictatorship. Few Lebanese really believe that their people are ripe for western democracy, and ever since the days of Mustapha Kemal there has been widespread admiration for the "strong man," together with a frank confession that only such a one can free the Arab countries from outworn traditions, ecclesiasticism in politics and governmental inefficiency and slackness. It was because M. Khoury did not use his powers along the lines of public service laid down by Mustapha Kemal in Turkey, and later by Shishekli and Selo in Syria, that he was unable to keep his position. A sense of frustration was perhaps the biggest single factor in opposition psychology.

Difficulties Ahead

But now, what next. The victorious forces are only united on a negative programme of hostility to the old regime, and on a vague desire for "reform." They include many elements including Socialists like M. Jumblatt, non-Socialist radicals like M. Gemayel and his Phalanges, moderates like M. Naccache and representatives of all religious groups and all discontented elements, reasonable and otherwise. Thus the new government will not find it easy to formulate an agreed programme of action.

M. Chamoun on assuming the Presidency declared his intention to keep his office free from interference in parliamentary life; he has nominated M. Abdullah Yafi as his first prime minister. There are still, however, plenty of question marks. Will M. Chamoun dismiss officials who have been found wanting, however influential their family or ecclesiastical supporters, and if he does, where will he find their successors? Will he be able to control expenditure and see that money is spent exclusively for the purposes for which it was voted? Can he challenge the denominational influences that sway policy and appointments which all profess to deplore but whose ecclesiastical defenders no one dare so far ignore? The change of leader was doubtless desirable, but in itself it is no solution to the appallingly difficult problems which confront the Lebanon. It might in fact usher in a period of disappointment and agitation that would encourage those who believe that the solution of those problems can only be found in union with the more powerful Syrian neighbour. One can only wish M. Chamoun the courage and insight on which his success and the welfare of his country depend. He will have his work cut out.

Aspects of Enterprise No. 23

Behind the scenes the Simon companies are often concerned in well-known industrial ventures of great national importance. One example is the immense Margam steelworks, for which Simon-Carves built the new boilers, coke ovens and by-product plant. Another is the United Sulphuric Acid Corporation's project to produce sulphuric acid from anhydrite as a long-term measure to meet the sulphur shortage; Simon-Carves are the main contractors for the construction of the plant, and Simon Handling Engineers are responsible for all materials handling and preparation.

Gold Seal Motoring is here to stay...

BECAUSE it's giving motorists what they want. Throughout the spring and summer months the motoring public has confirmed that the Gold Seal—the symbol on the sidewalls of 'Dunlop' and Dunlop 'Fort'—is the sign of the best car tyres ever. The majority of British car manufacturers fit the tyres with the Gold Seal as standard equipment, too. Now's the time, before winter sets in, to fit

Yet they cost no more!

Look in the factory

or in the home

...you see **DURALUMIN**

Look where you will and you will almost certainly find one of the aluminium alloys in the comprehensive "Duralumin" range.

The increasing popularity of this versatile material is hardly surprising. It cannot rust, need not be painted, is of good appearance, and whilst only one-third the weight of steel is equally as strong and lasts longer.

"Duralumin" can be welded, machined, pressed and fabricated in much the same way as other metals. It is produced as sheet, strip, tubes, wire and sections; the latter in a limitless variety of different contours.

While shortages exist at present, this is a passing phase. Now is the time to consider the use of aluminium alloys in your business so that your plans may be complete when the needs of rearmament are satisfied. Our development department will advise, entirely without obligation.

THE traffic on these lines is non-stop, night and day—for these are oil lines in one of the four Anglo-Iranian refineries in the United Kingdom. By 1953, these four refineries will be producing at the rate of some eleven and a half million tons of petroleum products a year.

The output from the group's eight overseas refineries is also being steadily and considerably increased, and plans are now progressing for the construction at Fremantle, Western Australia, of another new refinery, with a projected annual capacity of three million tons.

For new sources of this vital mineral Anglo-Iranian is prospecting in this country itself, and in such varied regions as Nigeria, Sicily and Papua.

THE BUSINESS WORLD

Markets for Heavy Vehicles

THE motor industry stands a good chance of gaining on the swings with its commercial vehicles what it may lose on the roundabouts with its passenger cars. Commercial vehicle producers have rarely been so confident as they seem today that their products can meet and beat competition on price and on performance from all comers; makers of passenger cars, many of them also engaged in commercial vehicles, have no illusions about the force of foreign competition on both counts. Like all generalisations, this over-simplifies. There is no single market for heavy vehicles, but a complex of markets each buying vehicles to suit its special requirements and operating conditions. The market in heavy vehicles has been more competitive and the waiting lists

shorter than for passenger cars. Disposals of surplus army lorries at the end of the war met much of the replacement demand that has inflated the order books of passenger car makers. The increase in the volume of traffic carried by road in all countries has been impressive, but never so great as to force transport operators to accept without question whatever wheeled vehicles they could get. Shortage of dollars may have compelled some of them to accept British trucks in lieu of American; but the British builders were not allowed to forget that vehicles built to run on British roads in a temperate climate had certain shortcomings when used under much harder conditions abroad. From the stream of criticisms the commercial vehicle industry has undergone a painful apprenticeship, and it has learned to build vehicles that will stand comparison in export markets with anything produced on the other side of the Atlantic, and to do so at a lower price.

The evolution of a new class of commercial vehicle, designed specifically to operate under conditions wholly different from those in this country, suggests that commercial vehicle builders are no less determined than the car makers to stay in the export business. The industry's biennial show in London this week contained an

impressive muster of vehicles designed solely to meet the needs of haulage and passenger operators overseas. Clearly there are limits to such a policy of specialisation. The overseas market is not large, and a closely tailored vehicle for specific local conditions will have fewer potential users elsewhere. Production of commercial vehicles throughout the world probably did not much exceed 2 million last year, of which 259,000 were British and 1,429,000 American-built. Less than a quarter of these vehicles were sold outside the territories in which they were made. This country sold abroad 137,000 vehicles last year, or just over half its total output, while American producers exported 216,000, or 15 per cent of their output. This American figure is not far short

of the number of passenger cars exported by the United States; given the smaller size of the market in commercial vehicles, it suggests that many countries were prepared last year to allocate dollars for the purchase of American trucks, presumably on the grounds that they were better fitted for the work in hand than those from non-dollar countries. Commonwealth countries imported 25,538 American-built vehicles partly on considerations of this kind and partly, perhaps, because some of them had special sources of dollars.

Considerable dollar saving ought to be possible within the Commonwealth and elsewhere if British industry can provide the right types of heavy vehicles. Production seems to be falling; against the 11,000 buses and coaches and 248,000 goods and military vehicles produced in 1951, this year's figures to date suggest that 9,500 public service and 225,000 goods vehicles may be produced in 1952. Shortage of materials at the beginning of the year and subsequent labour troubles (notably at the Ford plant, which produces nearly 20 per cent of the goods vehicles) were responsible for lower output during the first eight months; if this year's outputs exceed the totals projected above, it will be because of a revival in demand, for there is no continuing stringency

Source: Society of Motor Manufacturers and Traders.

of materials. Exports of public service vehicles are, in fact, running at a slightly higher annual rate of 5,350 vehicles, compared with total exports of 4,288 last year. The unit value of these vehicles is between £3,000 and £6,000; but orders are not very evenly spread among the chassis and body builders. Some have received orders for 200 and 300 buses at a time for South American transport authorities, but others are hard put to find work. The industry is for the first time showing coaches with bodies extended to the new 8 ft. width, many with under-floor engines to get the greatest number of seats into the permitted length. An increasing number are now showing "integral" construction; they have no separate chassis and the stresses normally carried along its members are borne by the coach body. Coaches built on this principle show a saving in weight of nearly 50 per cent. But the passenger coach section of the industry expanded very rapidly at the end of the war to meet replacement demand, and is now suffering from some excess of capacity.

★

Exports of goods vehicles are running close to last year's rate of 132,856 units. Import restrictions in Europe have created difficult conditions in European markets, and only Finland and Sweden are taking British vehicles in quantity. Light delivery vans, usually consisting of a standard passenger car chassis with a van body, and light trucks have been seriously affected. In other classes, the industry has made valuable strides in design and particularly in heavy trucks and tractors of a type previously regarded as the exclusive preserve of American manufacturers. The Rootes and Vauxhall companies are selling abroad mass-produced 7-ton trucks under their "Commer" and "Bedford" trade marks that meet most of the criticisms previously levelled against British designs. The new Bedford range was road-tested in Tanganyika, which boasts some of the worst roads in the commonwealth, and from which some of the most pungent criticisms of British lorries have been received in the past; the Vauxhall company expects that with these lorries the British factories can equal the performance and more than meet the price of the equivalent Chevrolet truck built by General Motors in America. Such vehicles cost between £1,000 and £2,000 a unit, compared with £500 or so for lighter trucks.

The development of heavy-weight power units by such companies as Scammell and Thornycroft may be equally important. A new Thornycroft wheeled tractor will take gross train weights of up to 100 tons; it costs £10,000 and works on a road or track. Scammell are putting into production a six-wheel drive diesel tractor, costing £8,250, which will take a similar train weight across country. Vehicles of this kind can hardly expect to find a market of any size at home, and they have been designed with an eye to the requirements of oil and contracting companies overseas. Both are essentially new products and neither company has yet attempted to sell them in Canada or South America. There have been enough inquiries to suggest that such attempts might be worth while if the British factories can match the service facilities provided by American truck makers.

Re-armament orders are unlikely to employ more than 5 per cent of the vehicle industry's total capacity, if as much, but companies that have taken orders from the British Army are now beginning to get business from

Western Europe. There is a possibility that some vehicles may rank for off-shore purchases by the American government on behalf of Nato countries, although arrangements of this kind do not appear to be making much headway. The Ministry of Supply buys sizeable quantities of standard civilian trucks and it has also ordered a range of more specialised vehicles to its own designs, many of them with four-wheel drive for rougher road conditions. It has not been easy to persuade the mass producers of vehicles to undertake the necessary modifications to their assembly lines that production of these special vehicles would involve. But these difficulties are child's play compared with the difficulties of getting the special range of combat vehicles into production. These are front-line transports intended for work over any type of country and proof against dust and water. They use a range of engines designed by Rolls-Royce with interchangeable components, so that one set of spares will serve for engines of all the vehicles, an important consideration in front-line fighting. The principle of a standardised range of power units for all sizes of vehicle might have been more largely adopted in the Army but for the difficulty of getting the engines produced. Schemes whereby they might be built by manufacturers other than Rolls-Royce have so far not yielded any engines.

★

This point has some bearing on the prospects of exporting specialised vehicles. The Austin Motor Company, which is building the combat jeep, is known to be anxious to sell it abroad and was exhibiting a "civilian" version at the commercial show. This had the Austin A.90 engine in place of the Rolls-Royce engine specified by the War Office. The price for this vehicle has not been announced, but is estimated at between £700 and £750. This compares with a price of less than £600 for the Rover Motor Company's four-wheel drive, partially proofed Land Rover. The Rover company has done considerable business in the Land Rover not only as a civilian export for cross-country work, but also to Western Europe as a military vehicle and it was not to be expected that the rest of the industry would leave the company in sole command of such an attractive field. The Rolls-Royce standard engines incorporate common components, and their first cost is high. Military operation, however, is beginning to provide the company with data to show that the high initial cost may be offset by reduced maintenance. In most of the territories to which British commercial vehicles are being shipped, this is an important factor. When materials were scarce, manufacturers concentrated on producing complete vehicles, and tended to cut down the output of spare parts. The result was delay in providing spares for big transport fleets abroad that is one of the major blots on the industry's export record, and operators in remote territories now demand a high standard of reliability to avoid interruption of service from breakdowns. Whether such demands will give Rolls-Royce a market outside the front-line military vehicle and the contractors' heavy tractor remains to be seen. The company and several others are setting a hot pace in competition for heavy vehicle exports; and the overseas markets are likely to be receptive to the best products that Britain has to offer.

Buxton and After

AFTER nine days in conference, the leaders of the world's cotton textile trade have gone home to prepare themselves again, in the phrase of the Dutchman who represented the West European delegation, "for the daily struggle against each other in the spirit of fair competition." Their deliberations at Buxton solved none of the problems confronting the cotton industry throughout the world. But they had not met for any such grand purpose; their immediate objectives were limited in the first place to exchanging views about the course of trade in cotton textiles over the next few years and the shares that the different countries might succeed in getting for themselves, and, in the second place, to examining the possibilities of expanding the world's consumption of cotton textiles.

Judged by such limited objectives, the Buxton conference may be regarded as a success; but agreement that the cotton textile industry of the world is confronted by grave problems, that the volume of world trade in cotton piece goods is not likely to increase in the near future and that existing capacity is more than enough to meet foreseeable domestic and export demands does not represent a very tangible advance. Before the war, export trade in cotton piece goods was about 7,000 million yards a year; by 1951 it was only 5,600 million yards having fallen by 17½ per cent. Britain and Japan and some continental European countries are obtaining a much smaller share of that reduced trade while India and the United States are getting a bigger share; in 1951 Britain and Japan each exported rather less than half the volume of cotton piece goods that they exported in 1937 while the United States and India had increased their exports more than threefold.

Apart from these changes in the shares of world trade, the conference viewed with undisguised anxiety the economic nationalism of less developed countries which led them first to erect their cotton mills and then into the deeper sin of erecting tariff barriers to protect the mills. On this subject all delegates at the conference were inclined to become indignant easily, except perhaps the Indians. It was the hope of all delegations that their governments would impress the wisdom of a low tariff or a no tariff policy on the erring governments of the less developed countries; it was the hope of some delegations that the governments of other delegates might even set an example.

When the delegates turned to making known their hopes of future shares in world trade, they were not inclined to give anything away; only the Americans seemed to be modest, or perhaps matter-of-fact. The accompanying table shows the volume of cotton piece goods exports in recent years and the estimates of future trade presented by the delegations. These estimates, or guesses, or claims give a projection for exports in 1953 of 5,875 million square yards, about 500 million square yards more than the exports achieved by these countries in 1951. In the present state of world markets, where exports have to be won the hard way, such a grand total seems to include a generous measure of optimism.

The boldest claim for future trade, indeed, was entered by the United Kingdom, which put its expectations for 1953 at 1,350 million square yards compared with an actual achievement of 865 million square yards in 1951.

The British representatives advanced several reasons to justify such great expectations: Lancashire had still to regain advantages which were lost by the concentration of firms during the war and it hoped to recover trade diverted, at government request, from traditional markets after the war. Whether, in fact, the reversal of such policies would itself enable Lancashire to recapture trade which, once lost, may have been lost for ever is open to question. But to reach such figures would involve capturing new trade as well as recapturing its former traditional markets, and holding ground in the newer and more difficult markets. Moreover, the British argument that while world trade as a whole has been dwindling, Commonwealth markets have been expanding is itself double-edged. It is not so long since a visiting African minister from Nigeria—a traditional market if there ever was one—declared that import licences cannot be reserved for Britain unless British goods are competitive; and his standard of comparison was with Japanese goods.

The Indians were not at a loss to justify their estimate of 1,000 million square yards to be exported in 1953

WORLD EXPORTS OF COTTON PIECE-GOODS
(Mn. sq. yds.)

	1950	1951	1952*	Estim. 1953

	82	122	97	...
TOTAL	5,346	5,521	4,820	...

* Based on January to June figures.

compared with 776 million square yards in 1951; they argued in particular that a large part of their production was surplus to home requirements and had to be exported. The Americans seemed to defend their more modest estimate of 725 million yards, and a gradual increase year by year, on the assumption that in a reasonable world controls would diminish and population and trade would increase.

The Japanese appeared to rest their estimates on claims of national survival: export or die. Giving 1,100 million square yards as their target for 1953 (compared with an actual 1,082 million square yards in 1951), the Japanese declared that they must reach 1,600 million square yards by 1955. These exports were "absolutely necessary" for securing the raw cotton and foodstuffs essential for the maintenance of the Japanese economy. To the criticism that Japan relied too much on exports of textiles the Japanese replied that other manufactured exports, including engineering products, were increasing—a reminder that Japan is again becoming a world competitor in a number of fields besides textiles.

★

In thus projecting these shares in world trade, none of the cotton exporters was prepared to yield a yard. Their insistence on the sanctity of these estimates fits

oddly with their own judgment that there is not enough trade to keep all the mills fully employed. If they believe their own figures, they must be prepared either for competition fiercer than has ever been known before, or they must rest their ultimate hopes upon an expanding world demand. The conference was bound to embrace the second assumption and to stress the importance of a general increase in purchasing power and of a lowering of the costs of textiles. Textile manufacturers can do nothing to increase world wide purchasing power, so the effective conclusion of the conference turns on what they are prepared to do towards lowering their costs.

To encourage demand for cotton textiles by reducing their prices raises the immensely difficult problem of securing greater efficiency in the mill and in distribution to the retail shop or bazaar. At every stage, there is scope for significant improvement in costs which, in total, might well justify reductions in final retail prices sufficient to promote increased consumption. Apart from the immediate need for greater efficiency in production and distribution, there are longer term problems governing the future of the textile industry. The industry hopes, as it has always hoped, that more natives will wear longer shirts, and in taking longer term views, the industrialists at Buxton put considerable faith in the ultimate success of such proposals as the Colombo Plan and other endeavours to raise the standard of living of millions in the under-developed territories. Beyond the traditional uses of cotton for clothing, there are other outlets which are steadily increasing in importance. The industrial use of cotton and cotton textiles is expanding

and further research may well encourage the pace of the advance.

Presumably the delegates will now discuss in their own countries the agreed opinions—and the differences—which emerged at Buxton and apply them, presumably in several different ways, in their own national policies. They will also consider, no doubt, subjects that were not openly raised at the conference—international wage comparisons, for instance, or regional specialisation in world markets. But the plain outcome is that Lancashire has to do some serious stocktaking after Buxton. It knows that it can expect little quarter from other competitors. It has been put on warning that it cannot count exclusively or indefinitely on a protected market within the Commonwealth. It knows that it will find little support outside this country if it tries to exclude competitors such as Japan from equal competitive rights in the markets outside the Iron Curtain. It has to face competition from other textiles at home and in overseas markets; the rayon industry has this week provided an example of competitive pugnacity. Lancashire's task remains to seek greater efficiency, lower costs and ever better qualities. The trade unions cannot stand aloof from this task; the recent recession coming after a drive to bring more workers to the mills does not justify any indifference to the contribution that labour has to make towards greater productivity. The one clear message that came from Buxton was that international competition in cotton will grow keener. A posture of self defence or indifference will be fatal to Lancashire's chances of recovery and prosperity.

Business Notes

Conversion Only?

The long-expected Government borrowing operation, which was announced after market hours on Wednesday, falls far short of the genuine funding that is needed. On the face of it, indeed, it is little more than a straight conversion operation, with appropriate trimmings. Between now and October 13th holders of the £450 million of 1½ per cent Serial Funding Stock 1952, which matures on November 14th next, are being given the opportunity to switch into new tranches of the similar funding stocks maturing in the Novembers of 1953 and 1954, or into a new 3 per cent Serial Funding Stock maturing in November, 1955; if they choose the 1953 or 1954 stocks they will receive cash payments of 1 per cent and 2 per cent respectively—and it is generally believed that the joint stock banks, who are the largest holders of Serial Funding 1952, will choose to convert most of their holding into one of these two issues. At the same time holders of the £522 million of National War Bonds 1951-53, which matures on March 1st next, are being given the opportunity to convert into the new 3 per cent Serial Funding Stock 1955; the conversions will be made at par, and the only bait that is held out here is a small interest turn—since those who make this switch will start to earn interest at 3 per cent from November 14th instead of March 1st. The discount market, in which the maturing War Bonds have hitherto been perhaps the main bread-and-butter stock, may not be too happy to convert so large a proportion of its portfolio into a three year stock (even though it is a "single-dater"), and it may therefore choose to switch into 2½ per cent National War Bonds 1952-54 or into the new tranches of Serial Funding 1953 and 1954 instead. That at any rate seemed to be the import of the market's reaction on Thursday, when National War

Bonds 1952-54 were marked up by ½ to 99½, while 2½ per cent National War Bonds 1954-56 (which compete most directly with the 1955 newcomer) were marked down by ½ to 98½.

It is against this background that the decision to make three cash issues on Monday—of 1½ per cent Serial Funding 1953 at 98½, of 1½ per cent Serial Funding 1954 at 97½, and of a 3 per cent Serial Funding 1955 at par—must be viewed. There will be no limit to these cash issues; in effect, the Treasury has merely said that all applications of £100 or more on Monday will be gratefully received. It can hardly be expected, however, that voluntary applications from outside the issue department of the Bank of England and other official entities will bring in sufficient to pay off the maturing Serial Fundings 1952 and National War Bonds 1951-53 that are not converted, let alone to fund any of the banks' swollen portfolios of Treasury bills. The size of the issues as eventually announced may not be any real guide to this, for it must be assumed that the "departments" will take up part of the issues themselves; they may indeed hope that between now and next March they will be able to peddle out any new holdings of the two serial funding stocks that they acquire to holders of any unconverted National War Bonds 1951-53.

only a first instalment. One suggestion was that the authorities might start to run down allotments at the weekly Treasury Bill tenders and use their powers of moral persuasion to direct the funds thus freed into purchases of the new stocks from official portfolios ; there was, however, still no sign that anything of this sort was in fact in the wind at the time that this issue of *The Economist* went to press. Another, and some would say even more cynical, suggestion was that the authorities might be biding their time to launch a genuine medium or long-term issue later in the year—on the thesis that it might be possible to float such an issue on more favourable terms then, especially if the market signifies an illogical relief at being let off so lightly by the present operation. In addition, of course, there is still no indication of how the Transport Commission will replace the one year $1\frac{1}{4}$ per cent stock that was taken up by the National Debt Commissioners last December, or how it will raise the new finance of which it must very shortly run in need.

Liquidity Ratios Up Again

There remains, of course, the simplest—and starkest—
 explanation of all. This is that the authorities might still
 consider that a funding operation is unnecessary, because
 they believe that the seasonal return of the Exchequer into
 overall surplus will soon start to blot up the excess liquidity
 of the banking system—and that moral exhortation and a
 little more prodding with physical controls will do the rest.
 If so, they are wearing spectacles that are indeed rose tinted.
 The latest clearing banks' statement shows that net deposits
 rose by another £59 million between August 20th and Sep-
 tember 17th, thanks wholly to an increase of just over £56
 million in their holdings of Treasury bills and of just over
 £13½ million in their money at call; the banks' cash holdings
 declined by nearly £7 million and their commercial bill
 holdings also fell fractionally, but their liquidity ratios
 increased by another 0.6 per cent in the month. That ratio
 (i.e., the ratio of cash, call money and bills to total deposits)
 now stands at 38.0 per cent, compared with 38.5 per cent a
 year ago and with 39 per cent just before the funding opera-
 tion last November.

Superficially, at any rate, this continuing increase in liquidity has not yet led to any easing of bank lending to the private sector of the economy. Clearing bank advances fell by another £6,500,000 in the month, and although their investment portfolios rose by nearly £3 million the net decline of over £3,500,000 in these two items compares with an increase of over £29 million in September, 1951. A more relevant comparison, however, is with September, 1950, when inventories were also running down as they are now—and when both investments and advances remained virtually stable. The banks are clearly and sincerely seeking to abide by the rigid criteria laid down by successive Treasury directives, but there can be little doubt that their definition of what is an “essential loan” must have eased since the days when they were looking so anxiously to their liquidity ratios last winter and spring. Unless the Government is willing to see the whole policy of credit restraint come further apart at its seams, this week's operation is clearly not enough.

The Exchequer Deficit

In the last ten days of September the Exchequer achieved a small overall surplus, but this was quite insufficient to prevent the half-year's accounts from running very heavily in the red. In the first six months of 1952-53 ordinary revenue was £27 million lower than in the first six months of 1951-52, ordinary expenditure was £240 million higher, and net capital expenditure £22 million higher. The overall deficit of £589 million in the half year was thus £289 million greater than in the same period of 1951-52. The big

question mark that hangs over these figures—and one to which the new conversion operations provide no sort of an answer—is whether this deterioration can really be as bad as it looks.

On the revenue side the half-year's figures probably are misleading. The greater part of the £228 million increase in ordinary revenue that Mr Butler was expecting last budget day is due to be garnered from profits tax and income tax on company earnings; that harvest is still mainly to come—in the first three months of 1953. In addition, a large part of the fall in receipts from trading services (hidden in the table among "other revenue" above the line) was always expected to occur in the first half of the year. The two disappointments on the revenue side to date have been customs and excise

* After taking credit for £80 millions of savings originally expected on the food subsidies and social services, but before excluding the £85 million of defence expenditure that is to be written off against American defence aid.

receipts (up by less than £9 million in the half year, and thus well below the target increase of £65 million for the year as a whole) and receipts from death duties (which have already fallen by £22 million below last year's level, whereas the Treasury had expected a decline of only £8 million in the whole year). The low rate of customs and excise receipts must be largely due to purchase tax concessions wrung out of the Treasury since budget day and to the effectiveness of the import cuts. The fall in death duties may be partly accounted for by the depreciation of stock exchange securities in this year's estates, but it is still small enough to be accounted for by mere accidents of timing. It is still far too early to say that any shortfall in indirect taxes and death duties will not be more than made good by the buoyancy of direct taxation when Christmas—and with it the open season for mulcting company profits—comes round.

Expenditure Unchecked

It now seems unlikely, however, that the Government will be able to hold down the balloon of ordinary expenditure to its intended dimensions of £4,235 million—as computed before allowing for the sleight of hand by which £85 million of defence expenditure is to be swept out of the accounts and written off against the counterpart “funds” to American aid. It will be seen from the table that if this target of £4,235 million is not to be exceeded, then ordinary expenditure in the second half of this financial year will have to be £59 million less than in the second half of last. Even if

defence expenditure levels off at not far above last winter's level and if the Government secures some relief by living off its stocks, this downturn in expenditure is unlikely. The promised economies in civil expenditure are taking an unconscionably long time to make their appearance; at best they surely cannot do more in the present half-year than offset the increased commitments for expenditure incurred under the Danckwerts and other awards. In addition, the debt charge will almost certainly continue to run above the very tentative estimate published at budget time; it will be remembered that this estimate never pretended to be an accurate one, since Mr Butler obviously could not write into his financial statement any clue to the sort of monetary policy that he intended to enforce.

Perhaps the gravest lesson of the Exchequer accounts for the past half year, however, is that the Government has signally failed to keep any check on its net capital expenditure—and this at a time when capital expenditure in productive industry is being cut to the bone. The budget estimates had suggested that net below-the-line payments would fall by £23 million in 1952-53; in the first half of the year they have risen by £22 million instead. This adverse experience has been wholly due to the inflation of loans to local authorities for housing purposes. These loans (when struck net of repayments) were expected to fall by £21 million in the year, but to date they have run at £29 million above last year's level. At bottom, the cause of the Exchequer's continuing deficit is an obstruction that has become depressingly familiar in every branch of economic life since the war; real progress towards recovery is impossible while there are so many sacred cows on the line.

Rise in the Gold Reserves

The gold and dollar reserves increased by \$13 million, to \$1,685 million, in September. This increase occurred in spite of the facts that just under \$5 million was paid to the European Payments Union in the middle of the month (as a result of the sterling area's deficit with Europe in August) and that just over \$9 million of gold was lost to non-European countries; these payments were more than offset by receipts of \$27 million of American aid. There seems to be every prospect that the reserves should increase again in October, for the EPU clearing for September reveals a sterling area surplus of \$37 million—the first surplus since April of last year.

This \$37 million surplus with Europe, which will be settled by a gold payment to London in mid-October, was affected by one special factor—a debt repayment of \$24 million to this country by France. But it is not believed that the resale of dollar commodities to Europe under the short-lived commodity arbitrage scheme has yet had any significant effect upon the EPU clearing. All the dollar commodities concerned, and there are reputed to have been over \$150 million of them, must by now have been paid for by the British merchants engaging in this arbitrage. These merchants had to make their original purchases from the dollar area in August or September under the terms of licences issued—and in view of this the net loss of only \$9 million to non-European countries last month was surprisingly small. But the receipts from the resale of these commodities to Europe may be spread over as much as the next three months. This prospect, together with the fact that receipts of American aid last month were some \$25 million below the expected monthly average for the second half of this year, means that there is now a satisfying glint in the gold outlook. But it must not be forgotten that \$176 million of repayments on the American and Canadian credits fall due at the end of December; that stocks are running down in nearly every sterling area country behind the shelter of rigid and discriminating import restrictions; and that any further increase in inflationary pressure in Britain itself could quickly turn sunshine to storm.

Japan Settles its Debts

The terms of the Japanese debt settlement, announced last week-end, go almost all the way to meeting the claims of British bondholders. The service on the outstanding issues is to be resumed immediately at the full contractual rates. Arrears of interest that accumulated between December 22, 1942, and September 26, 1952, will be paid in full, in equal instalments over the next ten years; in cases where there is slightly more than ten years' interest overdue the margin will be paid on December 22nd this year. All currency clauses will be honoured—including the current rate clause in the 1907 loan, the clause that has been most hotly disputed throughout the negotiations. As with the German debt settlement, it has still not been decided whether Japan will hand over dollars or sterling to the Bank of England to meet its obligations under the "dollar clause" loans—but bondholders' interests are not affected by this point.

Bondholders have in fact had to make only three concessions. Two of these are entirely reasonable; they are the decisions to spread interest arrears over ten years and to reduce sinking fund provisions proportionately to the amount of the Japanese bonds that have been converted into internal yen bonds. The third and most important concession is that the maturity dates of bonds with a currency clause are to be extended by 15 years from the contractual date, and those of bonds without a currency clause by 10 years. Thus, the 1907 loan, which is already overdue for repayment, will not be redeemed until 1962, and the redemption date of the Tokyo Electric loan has been postponed from 1953 to 1968. The discrimination against the "currency clause bonds" in this respect is largely due to the extraordinary attitude taken up by the representatives of American bondholders, who apparently continued to oppose the honouring of currency clauses at all. This opposition—which at the start of the talks with the Germans looked like a self-righteous manoeuvre, and at the end of the talks with the Japanese looked more like an effort to save face—has not, however, had such a deleterious effect as at one time seemed likely. The settlement eventually arrived at, together with the assumption by the Japanese government of full liability for any stocks issued by cities and corporate bodies, should do much to re-establish Japan's enviable reputation as a foreign debtor.

The Market's Reaction

In these circumstances, it is not surprising that private investors and some of the smaller institutions gave the settlement a spectacular welcome. Business in Japanese issues at the beginning of this week was the heaviest ever remembered in the market and strong buying on Monday more than offset the heavy realisation of speculative holdings. The biggest gains were recorded by some of the non-government issues, including a gain of 15 points, to 135, by the Nagoya issue; this reflected the market's relief that these stocks were to be treated in the same way as the government issues. The clause discriminating against stocks with a currency option meant that rather smaller increases were recorded in these stocks than in other issues, but even here, as the accompanying table shows, the 1907 loan hardened from 130½ to 137½ between Friday of last week and Wednesday's close.

All this, however, happened in the first flush of enthusiasm. Now that this has worn off, it is being replaced by intricate slide rule calculations—and not a little guesswork—by more scientific investors. One general catch that has to be remembered is that income tax and surtax on interest arrears will be charged at the rates prevailing when the coupons in arrears are actually paid, not when they originally fell due. More particular problems are attached to the individual loans with currency options. The 1930 loan and the Tokyo Electric stock which carry a dollar option at a fixed rate, present no

Into the limelight

The shrewd advertiser, appraising his new campaign, judges it, before everything else, by its *brilliance*. For, lacking that quality, people are either going to slide past it, or be bored by it. And to that extent, the money spent on it goes down the drain.

Worse! — being dowdy and dated in its style, the implication can only be that the product advertised is likewise.

Crawfords, since the firm's foundation, have been deliberate exponents of brilliant contemporary - styled advertising. They have no part in the dimmed and dimming lights of worn-out techniques and prejudices—archaic name-blocks, trade-marks, packaging and other clichés.

Crawfords know — and their clients have proved them right — that the true genius (and the big profits) of advertising lies in leading and not in lagging, in looking forward rather than to the nostalgic irrelevancies of the past.

The immense changes in our ways and means of living, brought about mainly by science, have created a generation quite different from that of even thirty years ago. In every class there is a new sophistication, an impatience with anything that is 'old fogeyish'.

Woolly advertising is no good in a nylon age. Bring your advertising to Crawfords and have it vitalised into the fore-front of today's exciting world!

carries news on
the front page

FROM NOW ON, there will be news on the front page of the Manchester Guardian. And it will be news—not hysterical headlines.

You may wonder why the Manchester Guardian is changing thus; or, perhaps, why it did not happen before. The reason for the change is that the Manchester Guardian is more and more becoming a national newspaper. Less than a third of its readers now live in Greater Manchester. And so a front page consisting of classified advertisements of local interest will no longer do.

Let us assure those who abhor change that the character and 'flavour' of the Manchester Guardian will not in any way alter. The Manchester Guardian will remain as witty and as wise as ever.

Those who are not familiar with the Manchester Guardian should get to know it. It is one of the few great newspapers which it is a real pleasure to read.

If you have any difficulty in getting your Manchester Guardian regularly, please write to: The Manchester Guardian, Manchester.

No. 10 of a series.

STAND & DELIVER!

LONELY places and dark nights in wild country provided many strange and alarming experiences in coaching days and travelling possessed few amenities.

NOWADAYS, with good roads and comfortable hotels travellers can enjoy in security their varied journeyings. The Bank, too, smooths the way by arranging for travellers to have their cheques cashed during the course of their travels and also by taking into safe keeping customers' valuables while they are away from home.

all I possess
to my family...
the worries
to the 'General'

It's no kindness to saddle a friend or a relative with one's estate problems! So I handed mine over to the 'General'. They have long experience of investment and financial administration, and in these days, even a small estate can give rise to complicated problems. The 'General' is quite happy for

you to appoint a friend as co-executor and your own family lawyer assessor. I'd certainly advise any friend of mine to write to the manager, Trustee Dept., General Buildings, Aldwych, London, WC2 for advice regarding the administration of trust estates, however large or small.

GENERAL ACCIDENT FIRE AND LIFE ASSURANCE CORPORATION LTD.

difficulty; past and future interest payments (and the principal of the loans when they are repaid) will be calculated at about \$4.87 to the £. The interpretation of the current dollar rate option on the 1907 loan is not quite so simple.

	Original redemption date	Prices

6% Tokyo Elec.*	June, 1953	29	163	176½	176

* With full fixed rate dollar clause. † With current rate dollar clause. § With current rate Swiss franc clause.

As the loan became due for redemption in 1947, it will be repaid on the new redemption date in 1962 at the exchange rate prevailing in 1947 (that is, \$4.03 to the £); and all past and future payments of interest on this loan should be calculated at the same rate. The 1910 sterling loan, which has a current Swiss franc rate option and whose redemption date has therefore been postponed for 15 and not 10 years, has to be re-interpreted somewhat differently. All interest arrears on this loan must be calculated to allow for the effect of devaluation, but as the loan was not originally due for redemption until 1970 the principal of the loan and future interest payments will be payable at the current rate of exchange on London in Switzerland. Some other questions of interpretation of the settlement cannot be answered until the full terms of the settlement are published. For example, will the sinking fund on the 1924 loan be scaled up? And how are the dividend arrears on the South Manchurian and the Nagoya issues, which fall due for repayment in the next ten years, to be treated?

These interpretations and uncertainties make the calculation of an accurate yield basis on the loans an almost impossible conundrum. The best that can be done is to work out the total disbursements that are apparently to be made on each loan between now and their separate redemption dates, and work back to an approximate gross redemption yield from that. On this rough rule of thumb the 1907 loan (at Wednesday's price of 137½) offered a gross yield of just under 13 per cent, while the 1930 loan (at 153) and the Tokyo Electric stock (at 176) both offered gross yields of about 11½ per cent. In the late 1930's—when political conditions were, of course, very different—the yield on Japanese bonds tended to fluctuate between 6 and 10 per cent above the yield on undated gilt-edged stocks.

Output Below 1951

In the Economic Survey for 1952 no specific forecast was made of the course of industrial output this year; but output as a whole was expected to rise by £250 million at 1951 prices (having risen by some £203 million at 1950 prices last year). This might be taken to imply an increase in industrial output roughly comparable to the 2½ per cent increase recorded last year, and presumably a somewhat greater increase in output in the metal-using industries, upon which so much reliance is being placed for defence and exports. This carefully hedged forecast, however, applied to the financial year 1952-53; the Government hoped that "the increase in production, which was halted early last year, will be resumed in 1952."

There is still time for this to happen, but there has certainly been no sign of it yet. In the first eight months of 1952, industrial production seems likely to have been nearly

4 per cent lower than in the same period of 1951; alternatively, it can be said that in the first five months of the 1952-53 financial year output may have been 7 per cent lower than in the corresponding months of 1951-52, and indeed slightly lower than in the same five months of 1950. This comparison emerges from the latest official indices of industrial production, which put production in July at 102 (1948=100) and suggest that the comparable "all industries"

OFFICIAL INDEX OF INDUSTRIAL PRODUCTION (1948=100)

* Provisional.

† On the basis of information so far received.

figure for August may be 97-98. These compare with indices of 111 for June this year; and with 111 in July and 104 in August last year. From early last year until this spring, seasonal factors excluded, production appears to have remained fairly steady, but since then there has been a marked decline.

The course of production in different sectors of the economy shows sharp variations. Mining and quarrying show a slight increase in the first four months of the financial year, while the utilities, gas, electricity and water have changed little. But the manufacturing industries as a whole show a drop of 9 per cent in output during these four months, and in April and May output in "metals, engineering and vehicles," the favoured contender, was a shade lower than that recorded a year before.

* * *

"Lead, Gentlemen, Lead"

The London lead market got off to a flying start this week. When dealings in lead were resumed on the London Metal Exchange on Wednesday—after an interval of thirteen years—trading was unusually heavy; about 4,300 tons of metal changed hands compared with 700 to 1,000 tons in an average prewar day. Prices were much lower than had been expected. Business opened at £111 a ton for January delivery but by the time the afternoon session ended the price had sunk to £106½ a ton—about £21 a ton lower than the Ministry of Materials' selling price on an equivalent basis. The explanation of the sharp fall was presumably that whereas producers' agents had plenty of lead to offer for future delivery, buying was confined to consumers' needs and there was practically no speculative buying interest in the market.

It had been clear that when the London market reopened prices would fall considerably below the Ministry's level of £131 a ton, which is equivalent to £128 a ton in the market. Continental quotations of £110-£115 a ton were generally taken to be a good pointer to the probable opening price in London. But trade has been inactive on the Continent for some time and in fact these quotations are more or less

nominal. In the event opening dealings in the London market this week showed more clearly than any amount of theorising the value of an international market, which London now provides. The London price of £106 a ton was reached after extensive trading and clearly shows the unreality of the American or so-called "world price" of 16 cents a lb (£128 a ton). The new British market price is equivalent to about 13½ cents a lb—which is in fact the American price for zinc. The course of the market on the opening day suggests that there should be a strong inducement for Continental and American dealers to enter the London lead market.

Firm Finish to Wool Sales

The first series of the new season's wool sales held in London closed last week on a firm note. Prices of merino 64's had risen by 10 per cent during the four sales to reach 128d. a lb (clean basis); crossbreds at about 68d. a lb were some 5 to 7½ per cent dearer than at the start of the sales. At the opening, there were some grounds for believing that prices could not maintain the high levels of the "between season" sales in July. But demand both from the home trade and the continent has proved stronger than was expected, and almost all the wool on offer has been sold. Spinners found themselves with extremely low stocks at a time when the first signs of trade recovery became apparent; consequently they have competed sharply for spot supplies on offer in London. This fact explains the London premium of some 10 per cent over prices at the Australian sales. The latter have been firm enough but tempered by the existence of large-scale stocks in Argentina.

Estimates of world production of tops in the second quarter of this year, recently published by the Commonwealth Economic Committee, show an improvement for the third successive quarter. But recovery has a long way to go; output was still only 167.4 million lb compared with 215.3 million lb. in the second quarter of 1951. Each of the four largest producing countries, the United Kingdom, the United States, France and Italy, increased their output compared with the first quarter of this year, but output in Australia and Belgium was lower.

Is Coal Output Rising?

So far this year deep-mined coal output has been only 1¼ million tons more than in the same period of last year, although there has been a steady flow of additional workers into the mines. But last week's output—4,323,000 tons—has aroused hopes in Hobart House that its predictions of a rise in productivity this autumn will actually be fulfilled, after nine months of lower output per man-shift than in 1951. This fall in productivity seems to have come from the access of only partly trained labour underground. These men are now reaching the coalface in larger numbers, so that the number of faceworkers continues to rise, though there is a slight seasonal decline in the total numbers of colliery books. In September, the board did not lose as many men as it expected it might in the seasonal drift from the mines; so its calculations that it might end the year with 4,000 fewer men than the 720,000 odd it had in July may be too pessimistic. Output in July and August suffered from holidays and from high absenteeism following them; at today's rates of pay, many miners can afford to take off part of that second week's holiday that is still denied them. Total output may this year well reach 226 million tons, as the authorities are hoping; but it is not easy to be confident about the large increase that Lord Leathers has prophesied for 1953.

Consumption of coal in Britain is still depressed—in the first 38 weeks of 1952 it was 3,450,000 tons lower than last year—and exports have not yet risen as fast as was hoped.

So the figure of distributed stocks is still rising; two weeks ago it was nearly 18½ million tons, higher than at this time of the year in any year since the war. The industry had passed its safety minimum of stocks six weeks before the coal winter begins. It is now doing its utmost to move coal overseas. But there seems little likelihood that it can achieve an export total of more than 15 million tons, as Mr Butler hoped. So far it has exported about 8½ million tons; the best it is likely to achieve this year is something over 13 million tons of exports and four million tons of coal for bunkers.

Longer Export Credits

At the end of July the Chancellor of the Exchequer promised that there would be some widening of the facilities provided by the Exports Credits Guarantee Department; but in recent weeks there has been a mounting stream of complaints that performance has fallen short of promise. All that seems to have happened is that the exchange control authorities now look with more favour upon the granting of longer credits to foreign buyers for certain types of capital goods. This may be expected to result in more applications being made to the ECGD to insure contracts in which payment is spread over more than two years. Even before July, however, some credits for periods longer than two years were approved by the exchange control authorities. And, even now, not all contracts in which payment is spread over a longer period are approved; a decision is taken on the merits of each case, and depends on the goods concerned and the country for which they are destined. The views of the Treasury about what export markets are worth cultivating may not invariably coincide with the views of exporters. It is not surprising, therefore, that some exporters have felt that they have lost contracts through failing to obtain official approval of the length of the period over which payments were to be spread. Others have complained that uncertainty about the prospects of Treasury approval has prevented them from offering more favourable terms than their competitors—at least, until the sale had been lost.

Exporters who obtain approval from the exchange control authorities have still, of course, to persuade ECGD to guarantee their risk; some exporters with contracts that provide for delay in payment have recently failed at this second hurdle, and have complained that ECGD is not suited to provide the longer term guarantees that their types of exports require. In fact, ECGD has always had the power to grant longer term credits; whether it will do so in a given case depends upon the extent of the risks involved—for, though a government department, it acts on purely commercial principles. It is possible that this leaves a desirable scope for private enterprise concerns in the same field who are prepared to accept ventures at a higher premium. Too much hope should not, however, be laid upon this. The risks against which exporters are often most eager to insure are those arising from political factors, such as a governmental institution seems fitted to assume. And guarantees for certain other risks attached to the contracts of some recent complainants—which were not political but merely commercial and large—would not be everybody's cup of tea.

British European Airways' Loss

British European Airways' accounts for the year to last March record a net loss of £1,423,611 compared with £979,267 in 1950-51. Traffic increased considerably—BEA claims to be the first airline outside the United States to carry more than a million passengers in 12 months—and the average load carried rose from 57.8 per cent of the capacity offered to 64.7 per cent. This is approximately the same load factor as that achieved by British Overseas Airways

MARCONI serves mankind

Marconi came into a world in which communications were adolescent. When he left it, the marvels of radio were a commonplace. His name had achieved immortality; his work was established in the service of mankind. It is therefore no coincidence that the Company which he founded should supply communication and navigation equipment for aircraft like the Canberra and Comet, which are the most advanced of their class in the world.

At a time when every nerve is being strained to increase the export drive, we are neglecting our richest source of production — the land. There are 17 million acres of rough grazing in Britain whose fertility can be vastly increased — for the first time — by modern mechanical methods. Every million acres of land thus reclaimed is capable of fattening 250,000 store cattle. Yet only £5 million in 3 years has been allotted for the reclamation of marginal land.

At a time when our strategic and economic security depends on self sufficiency, this situation makes neither strategic nor economic sense. We are spending more than half the proceeds of our export drive on buying expensive foreign food. We are trying to keep food prices down by subsidies instead of by growing more and cheaper food.

One way out of this highly uneconomical situation is to equip farmers in the same way as we have equipped industry — with efficient, labour saving machinery. *Harry Ferguson Ltd., Coventry.*

Grow more food in Britain

Ferguson tractors are manufactured for Harry Ferguson Ltd., Coventry, by The Standard Motor Company Ltd.

Corporation, which—as recorded here last week—succeeded in making a profit in its latest year. Unfortunately, in the case of BEA the average loading required to break even rose as sharply as did the traffic. This is the most disappointing feature of the year's operations; BEA's commercial improvement has been swallowed up in rising costs.

Total operating expenditure rose by 23.1 per cent during the year to £12.1 million whereas revenue rose by only 20.2 per cent to £10.8 million. Costs certainly rose during the year, while fares remained unchanged but such cost increases were not confined to BEA and they cannot provide the sole explanation of the fact that BEA has now to report an increased deficit during a period when other airlines were showing improvement. Apart from rising costs, however, BEA lost considerable sums in terms of actual traffic through a strike during the period of peak summer travel, and through a twelve months' delay in the delivery of the new Ambassador aircraft. The consequential loss of the first-class European traffic because the corporation was obliged to retain obsolescent aircraft in such services is impossible to guess. But delays in delivery and costly teething trouble after delivery are risks that airlines have to provide for.

Apart from difficulties on international routes, BEA has still to carry the load of a number of uneconomic domestic services. A total loss of nearly £100,000 is recorded on the domestic services as a whole, any profit earned on the Channel Island and freight services being wiped out by losses on the Scottish, Irish and domestic internal routes. The report points out that Air France received a special payment of £2.6 million for similar services, which appears as revenue in that company's accounts. Some kind of special payment would probably be needed if, as is hoped, independent operators take over these internal services from BEA. But the corporation is experimenting this winter with special cheap fares on some of the Scottish routes and this, plus the introduction of tourist flights on some of the European services, should lead to an increase in the average load factor for the year. The corporation holds out no promise that these steps will make any great impression on the operating deficit, for shortages of aviation fuel this summer and persistent difficulties with the Ambassador may make a further loss for the current year virtually certain. This is a disappointing outcome for much hard work, and it postpones the hope of better results until 1953-54, by which time the turbo-prop Vickers Viscount aircraft will have started to show their paces.

* * *

Investment in Coal

Is the National Coal Board investing as much in the mines as it should? The 15-year plan that it published late in 1949 held that some £520 million needed to be invested in coalmining to bring output up to 240 million tons by 1965; of this, £30 million was to be spent in 1950 and £190 million, or an average of £38 million a year, over the period 1951-55. In 1950 and 1951 the board, in fact, failed to invest as much as it had planned; it spent £29 million and £32 million respectively. In part, at least, it failed through lack of high-grade technical staff and the preoccupation of most of its best men with immediate day-to-day output to the exclusion of everything else. This year the pressure has eased; and the board is hoping to invest as much as £40 million. The improvement is welcome, even though it may arise in part fortuitously from the chance completion of a number of projects during this particular twelve-month. But it is still not clear that it will be enough.

The investment laid down in the "Plan for Coal," like all other figures of value in that report, was based on mid-1949 prices. It is not easy to measure how the price of investment in coal mining has changed since then; but it has obviously gone up considerably. Mining costs as a whole have risen by 18 per cent since mid-1949, and costs of "materials,

stores, repairs and power" rose by 13 per cent between 1949 and 1951. In the accompanying table, actual investment in the mines is adjusted according to an index based upon the costs of "roof supports, general stores, repairs, coal and power" as shown in the board's quarterly financial statements, and compared with the investments laid down in the plan. By this reckoning the board's investment fell 32 per cent short of the planned 1951-55 average in 1951, and may

CAPITAL INVESTMENT IN COALMINING, 1947-52
(£ million)

	1947	1948	1949	1950	1951	Est. 1952

* Based on costs for second quarter of 1952

still fall 24 per cent short in 1952. The percentages have very limited significance; other indices that might be derived from figures published by the board could conceivably suggest that its investment performance was either rather better than that, or very much worse. Nevertheless, it seems obvious that this year's respite from coal crises has not yet enabled the board to secure even the minimum investment in coal-mining that might—just possibly—serve to give the country enough coal to meet demand in a dozen years' time.

Recorded and Indexed

To record, summarise, and index economic documents and events, this is one of the many functions of the *Records & Statistics* supplement to *The Economist*. For example, issues published during the last three months have contained information on subjects as varied as the latest Soviet Five Year Plan, the Annual Reports of the Iron and Steel Corporation and of the Transport Commission, the OEEC Report on the financial situation in Western Europe and North America, the results of the 1% sample of the 1951 census, and the American report on the Materials Policy Commission.

A monthly cumulative index, published in the first issue of alternate months, enables each item to be found quickly and easily.

Subscription rates: £2 10s. a year, or, together with *The Economist*, £5 a year.

Records & Statistics Department, The Economist, 22 Ryder Street, London, S.W.1.

A Leak in the Wellington

Nobody loves a price ring. The British Bata Shoe Company, which resigned from the Rubber Footwear Manufacturers' Association this week because it could not obtain approval of a cut in retail prices, has therefore received much free publicity—quite deservedly. This chorus of welcome has left the association and most other manufacturers, after some impromptu comments at the time, embarrassed but resolutely silent.

Though both parties have declared similar policies of passing on decreases in costs—which mainly means the fall in the price of rubber—to the consumer “at the earliest possible opportunity” the issue more precisely seems to be between differing judgments of the state of the market. Until April this year, maximum retail prices were controlled by the Board of Trade, with the advice of the association. It cannot be said that they seem to have followed recent fluctuations in the price of rubber very closely. To take an example, the changes in the retail price set for boys' Wellington boots, sizes 3-5, as given by Bata, may be compared with variations in the price of rubber:

	London Price, of Rubber per lb.	Retail Price, Boys' Rubber Boots
	s. d.	s. d.
April, 1948	1 0½	12 2
August, 1950	3 5½	13 4
December, 1950	4 4½	16 0
April, 1951	4 9½	18 0

The price of rubber this week is about 1s. 10d. per lb, but the boots of this kind made by most manufacturers were still being sold at 18s. a pair this week; Bata, which states that three months ago it suggested a 10 per cent cut in prices but could not obtain agreement, has now cut its prices for rubber footwear by roughly 20 per cent, bringing its price for this particular pair of boots down to 14s. 6d. Mr Tusa, its managing director, argues that since the price was last fixed in April, 1951, the cost of the cotton fabric the industry uses has also declined, though wages have gone up.

Bata is more concerned than the other manufacturers appear to be with competition from imported rubber footwear. During this year a large proportion of the rubber boots imported have come from Hongkong. These “Empire imports”—many of which may well have originated in China and Japan—have been considerably cheaper than British, and the Continental boots have also been cheaper. There is substance in the association's argument that a considerable cut in price now, at the beginning of the winter season, would embarrass wholesalers and retailers who have stocked up with this footwear at the existing price; Bata, which sells most of its footwear through its own retail chain, can make the change much more conveniently. No statistics are published of British production from which Bata's share might be assessed. But if foreign rubber boots, and a fair proportion of the British, are to be sold 20 per cent cheaper than similar boots of which the price is based partly on rubber at nearly three times the price today, it seems inevitable that the remainder of the trade will have to accept the inconvenience of a cut or lose some of their business.

Rayon on the Offensive

The rayon industry is making strenuous efforts to recover lost business overseas. Production of yarn and cloth showed little sign of recovery up to the end of August, but an improvement is expected with the end of the holidays and the beginning of the new season's trade. During August, combined production of staple and continuous filament yarn totalled 15.3 million pounds, 100,000 pounds less than in July and less than half the output of which the industry is capable. Production of rayon and mixture cloths in Lancashire averaged 10 million linear yards a week, or 4.4 million

yards a week less than in August, 1951, though this year's longer holidays affect the comparison. Exports of yarn in August were down from 2.3 to 1.5 million pounds compared with August last year, and exports of cloth suffered a cut from 22.8 to 10.3 million square yards.

It is now clear that revival in the rayon trade will not take place automatically. The rayon producers, moreover, have informed the industry that yarn prices will remain unchanged for the rest of the year. This will certainly disappoint those spinners and weavers who have been expecting a fall in yarn prices to follow the lower price of Swedish pulp. But the yarn producers argue that pulp prices are merely back to the level of the beginning of 1951, and that rayon prices were never raised to match the sharp rise in pulp prices that occurred after that date. If, therefore, selling prices are to be reduced, costs must be reduced at the later stages of production. Spinners of rayon staple have been cutting their own selling margins during recent months, to such an extent that there has been some discussions among the trade associations of introducing agreed minimum prices.

In a direct attempt to stimulate exports, the Central Rayon Office has revived its original plans for sponsoring a range of low priced cloths of rayon filament (but not spun yarn) designed specifically for colonial markets where British exports have been losing ground to Japanese and, to a lesser extent, to Italian and German cloths. The participating companies, weavers and finishers alike, undertake to sell such standard cloths only to specified markets, and to do so only at a single agreed price. This eliminates competition at home between exporting companies, and makes possible long production runs at lower cost. The prices asked are approximately one-third lower than those at which such cloth was selling a year ago. Whether they will be competitive with Japanese goods must be left to the test of the market. Japanese prices vary so widely that no single quotation is reliable or representative. The cotton industry is understood to be contemplating a similar scheme. It is generally suspected that Lancashire is capable of quoting highly competitive prices when finally convinced of the need for doing so, and if the CRO filament cloths are at present cheaper than the equivalent cotton product, rayon producers may later have to meet competition not only from the Japanese, but also from their own neighbours in Lancashire.

More Alloy Metals

Recommended distributions for the fourth quarter of 1952 have been announced by the tungsten and molybdenum committee of the International Materials Conference and the thirteen member governments have accepted them. Produc-

IMC DISTRIBUTION OF TUNGSTEN AND MOLYBDENUM (Metric tons)

QUEUES FOR JOBS IN ALL DEPARTMENTS

One value of a pension scheme

LABOUR is very scarce on an industrial estate near London. Yet one firm has a waiting list of applicants for jobs in all departments. The Managing Director says that this is due to the social security benefits that are provided, particularly the pension scheme. Like many other managing directors, he has proved that labour turnover falls when a pension scheme is introduced. He has also found that new staff is more easily recruited when there is a pension scheme to provide for the wives and families of employees who die before retirement age.

Robt. Bradford (Pensions) Ltd. are specialists in pension schemes and have many years' experience behind them. They have no connection with any insurance company and are thus able to search the entire insurance market in order to suit

the individual requirements of each client, often arranging for policies to be specially written.

This specialist consultancy will cost you nothing. One of the directors will be glad to discuss cases and possibilities with you.

What does

THE LONDON OMNIBUS convey to you?

It is a Vehicle of Information, carrying sample Insurance Policies from the omnibus collection built up by The London Assurance in 200 years of public service.

Sporting Offer

It is quite easy for a sporting man to have a field day of accidents. If he is covered by our Sportsmen's Policy however, he cannot lose. The cricketer's premium runs out at £1 each year, tennis 17/6, bowls 7/6 and other sports according to the risk involved.

Van-guard Action

When you have bank-notes, bonds, bullion, cash or coupons on the move, it's wiser to arm yourself with our Transit Insurance and let us shoulder the financial liabilities of a theft or loss.

There's more to be said...

If you would know more about any of the policies outlined here, if we can provide any information about any other particular policies or about insurance problems generally—pray make what use of us you wish. Our address is 1 King William Street, Department N.6, London, E.C.4.

All to Blazes

The increasing cost of replacing the contents of trade premises damaged by a fire is an additional argument for full and satisfactory insurance. We have a special Policy for insuring trade premises, lock, stock and barrel.

THE LONDON ASSURANCE

Very good people to deal with

"My—My" said the M.D.

"Yes sir, thanks to you"
"Thanks to me!—don't be facetious, Smith." "No sir, sorry sir—but you see, sir, since you had the forethought to instal Tan-Sad chairs throughout the office our typists are all still as fresh as a daisy at the end of the day, still full of youthful vigour and charm!"
"Alright Smith, there's no need to go into raptures—but—well I do see what you mean, old boy."

to some 28 countries and the allocation to the principal countries, including the amounts for the previous quarter, are shown in the table. The principal countries are all to receive slightly more of both metals this quarter compared with last, except the United Kingdom and Japan, which will receive less molybdenum.

Production of tungsten is now estimated at double the rate in 1950 and of molybdenum at 50 per cent above 1950. Even with this sustained increase in output, the IMC point out that the "defence and stockpiling requirements of the Free World are still in excess of the production in the case of both metals." The increasing supply of tungsten is reflected in a recent report of the US Bureau of Mines which shows that the yearly production of tungsten within the United States has more than doubled within the past four years; in 1949 production of tungsten was 3,043 short tons; but by 1951 it had risen to 6,214 short tons and for the first half of 1952 production amounted to 3,397 short tons.

Changes in Bolivian Tin?

This week the United States has agreed to buy 6,000-7,000 long tons of tin from accumulated Bolivian stocks at 117½ cents a lb f.o.b. Chilean ports. This is ½ cent a lb lower than the price agreed in similar spot deals during the summer when tin stood slightly higher in the market. Heavy stocks of concentrates have piled up in Bolivia since the previous long term contract with the American Government agency expired well over a year ago. Negotiations for a new contract have failed for lack of agreement between the two sides on a price.

Meanwhile the Bolivian Government is going ahead with its policy of freeing the tin industry from domination by foreign capital. At the meeting of the International Monetary Fund the President of the Bolivian Central Bank stated that a decision had been taken to nationalise the larger mining companies. More recently the Bolivian Government announced that it had concluded an agreement with an Argentine financial group to build a tin smelter in Bolivia in order to avoid sending ore to the U.S. for smelting. The projected smelter may represent no more than a bargaining point in the negotiations with the Americans, for it is pointed out in London that Bolivia's ores are of such poor quality that they are considered unsuitable for smelting by themselves. Even at the Texas smelter, which incorporates the most modern ore treatment plants, Bolivian ores have to be mixed with higher grade Indonesian concentrates for smelting. Nevertheless the tin market in this country is for nearly keeping a watchful eye on developments in Bolivia, for nearly two thirds of the concentrates used in British smelters come from Bolivia. These shipments represent more than half from Bolivia's total exports and come from the Patino group of mines, which are scheduled for nationalisation. Nationalisation need not disturb these shipping arrangements; there have been reports that the whole of the output of the nationalised mines is to be offered to the United States, but it is perhaps unlikely that Bolivians would risk putting all their eggs in the American basket.

American demand for tin since private buying and importing was resumed at the beginning of August largely explains the recovery in world tin prices. The price in London on Wednesday was £965½ a ton compared with £913 during the first week of August. But the Reconstruction Finance Corporation is willing to sell tin for 121½ cents a lb and as a result American traders will not pay more than the equivalent of 121½ cents a lb c.i.f. New York (£972) for imported tin. Unfortunately for the London market, Continental merchants have been able to capture most of this trade by using cheap sterling and thus outbidding British merchants in the East. Although future prices have fallen slightly within the last

two weeks Straits tin is too high for the London merchant to resell to American traders below the ceiling level and at a profit.

Cutting Building Costs

Everybody inside and outside the building industry is prepared to agree that costs are too high, but very few have any practical idea how to bring them down. Mr J. L. Womersley, borough architect and town planning officer of Northampton, staked his own claim last year when he took part in the design of the "Hopley" house that won a competition for low-cost housing; in *Housing Costs Today*, a publication of the *Municipal Journal*,* he has this week made some suggestions—and criticisms—that may command more than perfunctory attention in the building trade.

The standards of housing set down by the Dudley Committee of 1944, upon which most postwar housing has been based, assumed that costs would settle down at about 30 per cent above those of 1939. In fact, costs had reached about 160 per cent above that prewar level by 1949; at the present time they are well over three times the 1939 figure. In current financial circumstances, this necessitates some relaxation of housing standards of space, etc.; Mr Womersley does not believe the Government has yet gone far enough in this direction. But it also makes greater economy and

22 RYDER STREET, LONDON, S.W.1

Company Notes

Glaxo Laboratories.—The status of the 10s. ordinary stock units in Glaxo Laboratories as a "growth stock" has certainly been enhanced by the group's trading results for the year to June 30th last, but the increase in equity dividends from 22½ to 30 per cent has not altogether dispelled the impression that the current price of 76s. 3d. for the 10s. units (offering a yield on the new dividend of 3½ per cent) puts too big a premium on future prospects. The latest increase in equity dividends—which some shareholders may well consider to have been overdue—has been occasioned by a further increase in net profits, from £1,333,000 to £1,585,000. This advance has been achieved in spite of an increase in British taxation from £1,749,000 to £1,775,000. The directors have therefore been able to make the same appropriations to the research and development reserve (£150,000) and to the obsolescence and replacement reserve (£250,000) as in the previous year; they have also appropriated £500,000 (against £555,464) to a general reserve and £200,000 to an exchange reserve.

The ploughing back of profits on this scale has continually widened the gap between the company's issued capital and the capital actually employed in the business. In order to narrow this gap the directors now propose to make a 100 per cent bonus issue of ordinary shares by capitalising £796,350 from reserves. In announcing this scrip bonus the directors warn shareholders that "in itself, this action will have no effect on the future amounts to be distributed by way of ordinary dividends." In other words, if the directors decide merely to maintain the latest equity payment on the doubled capital, the actual dividend rate will be reduced to 15 per cent. Clearly, anybody who buys the 10s. ordinary stock units at their present market price must, in effect, be assuming that a reduction on this scale will not be made. But investors should remember that an export concern such as Glaxo may be harshly hit by the recent growth of overseas import restrictions; it is probably to these that the directors are referring when they point out in their statement that "the current trading position is less favourable than in the past financial year." In this context it is wise to recall the statement recently made by the chairman of Distillers that the production of pharmaceutical preparations such as penicillin and streptomycin now exceeds the demand for them. In the manufacture of these products Glaxo as well as Distillers may be feeling the pinch of falling sales.

William Doxford.—Although the shipping boom is now well past its peak, British ship-building yards continue to be fully employed. William Doxford has therefore been able to report satisfactory trading results for the year to June 30th last. The company's somewhat obscure preliminary statement shows profits before tax at £601,744, compared with £600,442 in 1950-51; but as this figure is struck after charging an unspecified amount for depreciation and £16,975 (against £47,545) for special research expenditure, it is not clear whether gross earnings are slightly up or slightly down. In any case net profits have dropped from £267,442 to £253,744, while the charge for taxation has risen from £305,000 to £348,000.

Nominally, the ordinary dividend has been increased from 17½ to 32½ per cent; but this increase is more apparent than real, for the interim dividend of 7½ per cent paid last February represents an addition to the final dividend for 1950-51 (which was originally held down to 12½ per cent in deference to the White Paper on dividend limitation). The distribution on equity capital in the last two financial years has therefore, in effect, been maintained at a rate of 25 per cent. At this

stage, however, another complication appears, for when William Doxford maintains its dividend rate, it actually pays out slightly fatter dividend warrants; this is because it makes a practice of increasing its equity capital each year by a small bonus share issue, which absorbs £50,000 from distributable earnings. In the latest appropriation account £50,000 has again been set aside for this purpose. Another £100,000 (as compared with £18,219 in 1950-51) has been transferred to a reserve for plant extensions and renewals, but nothing has been appropriated to the general

* Including a dividend of 7½ per cent, absorbing £25,594, relating to the financial year 1950-51.		

reserve (to which £100,000 was appropriated in 1951). The decision to earmark the whole of the reserve allocations to a specific reserve can be related to the fact that the company intends to extend its engineering works in the next few years. The company hopes to be able to finance this capital programme by the ploughing back of profits; shareholders should therefore not expect more than that the dividend will be maintained at 25 per cent on the gradually increasing equity capital.

Trinidad Petroleum.—For Trinidad Petroleum Development the year to July 31st last was a year of expensive exploration and fairly stable gross earnings. Thanks to an increase in oil production from 2,944,876 to 3,091,175 barrels, the profit balance from the production account increased slightly from £1,648,857 to £1,761,860. The increase in total revenue (from £1,668,137 to £1,787,483) was, however, more than offset by an increase in the provision for taxation (from £430,000 to £448,250) and by a much more substantial increase (from £654,359 to £790,245) in the amount charged to the oil well and development account. The increase in this latter account may be attributed to the high cost of the exploratory well-drilling programme recently carried out by the company, particularly in testing the extent of the oil-bearing Herrera formation. The cost of this programme of exploration has eaten into the company's gross profits, so that net profits

* Tax free.		

have fallen quite sharply from £310,787 to £237,063. This decline in distributable earnings has not prevented the directors from again recommending a tax-free ordinary dividend of 16½ per cent, but it has meant that less is available for allocations to reserves. Nothing has been appropriated to the supplementary pensions reserve, compared with £25,000 a year before, and the appropriation to the general reserve has been reduced from £100,000 to £50,000. If TPD spend less on exploration in the current year distributable earnings should increase. But the directors are not likely to regard this as an opportunity to break with the conservative dividend policy they have pursued since 1947.

Statistical Summary

EXCHEQUER RETURNS

For the ten days ended September 30, 1952, total ordinary revenue was £90,661,000, against ordinary expenditure of £63,997,000 and issues to sinking funds £449,000. Thus, including sinking fund allocations of £16,743,000 the deficit accrued since April 1, 1952, was £293,211,000 compared with a deficit of £26,292,000 for the corresponding period of the previous year.

COMPANY MEETINGS

GEORGE COHEN, SONS & CO.

(Engineers and Iron, Metal and Machinery Merchants)

RECORD TRADING RESULTS

INIQUITOUS EXCESS PROFITS LEVY

LARGE AND IMPORTANT CONTRACTS IN HAND

MR CYRIL COHEN ON THE GROUP'S STRENGTH

The twenty-eighth annual general meeting of George Cohen, Sons & Company, Limited, was held on September 25th at Grosvenor House, Park Lane, London, W.

Mr Cyril M. Cohen, chairman and managing director, presided.

The secretary, Mr N. G. Paul Boswood, read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts:

It gives me special pleasure to submit the directors' report and statement of accounts for the year ended March 31, 1952, supported by our usual explanatory charts and summaries.

RECORD COMBINED PROFITS

You will, I am sure, wish to join with me in paying a well-merited tribute to the skill, enterprise and loyalty of the managements, staffs and workpeople of your Group and to compliment them upon handling a record volume of business to such good purpose. Turnover at £14,800,000 was some £3 million greater than that of last year, while profit at £1,826,000 was the highest in the long history of this undertaking. Although the team were assisted by certain favourable influences, the outcome reflects the greatest credit on their efforts.

MACHINERY MERCHANTING

One of these helpful factors was the upsurge of activity in the engineering and allied industries with which we are closely linked. The beneficial effect was most marked in our machinery merchanting business.

You will recall that in my statement in 1950 I explained that the trading of this division was inevitably subject to fluctuations, and that a single year was really too short a period to provide a true criterion. In the year I was then discussing, opportunities were relatively few and the financial reward was meagre. The business climate in the twelve months at present under review was, as we had largely foreseen, more propitious, and it found us well equipped to reap the benefits.

We claim with pride that our machinery business is unique in its breadth and in the service it provides. Our specialists maintain the closest contact with industry and our goodwill is such that most sizeable undertakings invite us, as a matter of course, to tender whenever they have worthwhile plant for disposal. We rebuild plant to a standard which has an unexcelled reputation throughout the world and are able to supply, either from stock or within a short space of time, almost any normal item of machinery. When a manufacturer is modernising his equipment or extending his capacity we can generally meet all his needs promptly, thereby saving him money, time and effort.

Our hire fleet of contractors' plant, which is the largest and most comprehensive in

the country, continues to prove invaluable to users big and small. It constitutes a vast reservoir from which they can always draw, whether they wish to supplement their existing resources temporarily or require plant for such a period that hiring is clearly their soundest policy. They hire from us with complete confidence because of the all-round excellence of our service. Where applicable, we provide expert operators who are backed by an ample staff of mobile field engineers; and our machines are not merely up to date but are maintained at the highest pitch of efficiency.

Last year I referred to contracts which we had placed for the supply of Continental machines tools to the Ministry of Supply for the defence programme. Machines flowed in steadily and deliveries will rise to a peak during the current year.

DISMANTLING, SCRAP AND STEEL

The award to the parent company of the contracts for dismantling the Skylon, the Dome of Discovery and a dozen other buildings at the South Bank Festival Site, has turned the spotlight on one of our activities which has only received brief mention in my previous reviews.

Most of these structures were unsuitable for re-erection and whilst no doubt they will be missed as familiar landmarks, you will be glad to hear that much valuable material has been salvaged for the defence effort.

Other work which we are tackling includes the demolition of many obsolete motor-buses, trolleybuses, railway coaches, bridges, gas-works, mining and generating plants, and the last of London's trams.

Our endeavours, not only at home but in many remote lands, to increase the flow of scrap to the consuming works in this country have been unremitting and, as you would expect, your company continues to play a leading part in the national scrap drive which is showing encouraging results.

Our stocks of secondhand re-usable steel in all forms amount at any one time to a large figure and that applies also to stocks of new steel sections, etc., and steel in course of fabrication. Although it is difficult to establish within fine limits the fortuitous profit accruing to the Group from sales at the higher steel prices which were authorised, we estimate this was of the order of £100,000. It should be noted that we stand to lose pro rata should authorised prices be lowered.

I am glad to be able to report, however, that excluding the abnormal accretion to which I have just referred, the Raw Materials Division of the parent company and the three wholly-owned scrap subsidiaries—which are similarly engaged on the recovery and sale of iron and steel scrap, non-ferrous metals and reusable material—all show a considerable rise in profits.

I should mention that although the flow of iron and steel in the form of scrap through our depots is very great, our stocks of scrap for processing were relatively so small that

the permitted increases in scrap prices brought, of themselves, only insignificant profits.

MANUFACTURING PLANTS

At Letchworth, K. and L. Steelfounders and Engineers, Limited, achieved a record output in both their foundry and their engineering shops. Large contracts have been placed with this company for alloy steel castings for fighting vehicles and, to date, they have been able to meet their delivery commitments without detriment to the production of industrial steel castings.

In the engineering shops, in spite of shortages of supplies of many kinds, the use of alternative materials and processes enabled them to augment the volume of Jones K.L. Mobile Cranes manufactured. All this increase went to export markets, and it is noteworthy that cranes were delivered to no less than thirty-one countries. In order to safeguard supplies of steel for the current year, as far as possible, the company has agreed that its total crane output will either be sent overseas, sold to the Ministry of Supply, or otherwise used in connection with defence contracts. In this time of national stringency I am sure our many home customers will bear with us if deliveries to them are more protracted than they, and we, would wish.

Our extensions and improvements to the productive capacity of the Letchworth Works continued and the volume of output in the foundry division was 24 per cent higher than in the previous year. As a result of development over the last five years, the tonnage output has actually been doubled, and this in the face of ever-mounting shortages and complexities. Within the next two years we hope to complete a heavy programme of extension to the foundry, thus further increasing the volume and widening the range of our products. During the last five years, we estimate—taking into account the various models which we manufacture—that our crane output has increased by more than 50 per cent.

Within the limits set by the steel supply position, T. C. Jones and Company, Limited, continued to flourish and achieved a praiseworthy increase in profits. Both the London and South Wales works further enhanced their already high reputation and many unsought tributes were paid to the excellent quality of the company's workmanship and the punctuality with which it carried out its contracts. It has a very full book of orders for the fabrication of steelwork needed for the construction of factories, power and gas undertakings, oil refineries and chemical plants, steelworks' development schemes, television studios, schools, housing, etc. In most cases these orders embrace the erection of the steelwork.

Additionally, T. C. Jones and Company, Limited, have been entrusted with the execution of an important military

APPROPRIATIONS

Although several important contracts were received and executed for structures made on the company's unique Frameweld system, expansion in this sphere was restricted—I hope temporarily—by an inadequacy of steel for making the necessary components. For the same reason, the manufacture of Framemesh and steel reinforcement generally was also retarded.

New London Electron Works, Limited, once again enlarged its output of Iron Powders for the parent company. Further research and development in this promising new industry is in hand to meet the ever-growing demand. We are hopeful that the added profit from this activity will counteract the diminution in earnings from the company's detinning operations. These have been affected by increases in costs of materials and labour, together with decreases in the value of tin recovered.

A NEW SUBSIDIARY COMPANY

You may have seen in your newspapers that since the last Annual General Meeting we have formed a new subsidiary company—Western Metallurgical Industries, Limited.

Years ago, smelting works situated in South Wales discarded great quantities of retort residues from distillation furnaces because at that time the value of their metal content was not high enough to permit of economic recovery. Nowadays, owing to big advances in metallurgical technique and to the increased prices of metals, these residues can be re-treated on a profitable basis.

A plant with a treatment capacity of 4,500 tons of tin slags per annum is already in production at Neath. Another which is in course of erection at Morriston has been designed to handle 75,000 tons of zinc and other residues each year, and ample supplies have been assured by the acquisition of substantial dumps in the immediate locality.

The amount of £21,700 provided in the accounts of the parent company represents the loss on this company's preliminary operations during the development period. It is, of course, too early to forecast the outcome of this new venture, but I look to it to make a useful contribution to the Group's prosperity over a number of years.

I have appointed Mr Alan S. Gill, ARSM, AMIMM, managing director. He is a special director of the parent company and has been one of our executives for over 30 years. He and his brother, Mr Donald Gill, ARSM, MIMM—an eminent mining consultant—have taken a leading part in developing this company, and they, with members of their family, have a minority shareholding in it.

SALE OF BROWETT LINDLEY BUSINESS

For some time past your directors have been giving careful thought to the position of Browett Lindley, Limited, which company operates within our Letchworth works. Its steam engines and compressors have enjoyed world-wide reputation for over 60 years, but they compete domestically for labour and space with our mobile crane manufacture.

It has been decided that the best long-term interests of the Group will be served by devoting the productive facilities of Browett Lindley, Limited, to the expansion of mobile crane output. Mutually satisfactory arrangements have been entered into with Alley and MacLellan, Limited, a fully owned subsidiary of Glenfield and Kennedy, Limited, for their acquisition of the Browett Lindley business and certain related assets. The change will be effected progressively and in such a way as to cause the minimum of inconvenience to users and customers.

The combined profits of the Group attributable to the members of the holding company, amounted to £1,799,418, and, after deducting taxation totalling £1,095,400, there is left £704,018. Having taken into account all the relevant factors, your Board is satisfied that an increase of 3 per cent in the Ordinary dividend is fully justified. It is therefore recommending a final payment of 18 per cent, making 26 per cent in all for the year—which I might mention is equivalent to 5.13 per cent on the total capital invested by Ordinary stockholders. The net cost of this dividend and of the Preference dividend totals £117,338, leaving retained profits of £586,681. In subsidiary companies' accounts we have transferred £220,000 to their general reserves and have carried forward £109,303. We have also transferred £250,000 to general reserve in the parent company's accounts, carrying forward £7,377. The top summary on page 11 of the present report shows that these funds have been required in the business while the lower summary shows, *inter alia*, the manner in which profits ploughed back have been employed since this company was made public.

It is clear that during these five years a wisely balanced dividend policy has been maintained. Distributions have not been allowed to outweigh the need for preserving the Group's assets intact and for financing the current level of activity. Whilst stockholders have received net £518,000, as much as £1,200,000 of taxed profits have been retained for essential reinvestment in the business.

EXCESS PROFITS LEVY

It will be noted that in this same period of five years the state has exacted from us no less than £2,662,000 in income tax, profits tax and the proportion of EPL chargeable on the last quarter's profits of the financial year under review. These amount to more than twice the sum which, by the exercise of the most rigid economy, we have been able to reinvest, and to more than five times the sum which has been paid out to stockholders.

From now onwards we must bear the brunt of this iniquitous levy in full. You will have seen from our preliminary announcement that the Group's standard is approximately £1 million for the current year. Whilst we are relieved at the concessions made during the passage of the Bill through the House, we still condemn this tax as a thoroughly bad one which stifles enterprise, discourages thrift and is unfair in impact.

Surely the future prosperity of this island continues to be dependent in no small degree on the willingness of its industrialists to take sensible risks and, to warrant their so doing, it is indispensable that the margin between the rewards of success and the penalties of failure should not be narrowed but made more attractive.

THE PROFIT MOTIVE

In some political quarters it has long been the fashion to decry profits. For our part we are in no way ashamed of earning profits. Indeed, subject to the just and considerate treatment of staff and workpeople and to our giving full satisfaction to customers, we have firm faith in the profit motive as being the best spur to individual, industrial and national progress.

We are proud that in five years, largely out of profits and despite excessive taxation, we ourselves have been able to renew, improve and extend our productive facilities at a total cost of £1,627,000; to strengthen our leading position in the industries in which we are engaged; to build up a financial structure capable of supporting a turnover of nearly £15 millions; and to ensure regular employ-

ment with good pay and working conditions for our thousands of employees.

PROPOSED CAPITALISATION OF RESERVES

The net worth of your Group now stands at £4,731,000, of which £1,688,000 is applicable to Preference stockholders. The stake of the Ordinary stockholders is consequently £3,043,000, and this compares with its so-called "nominal" value of £600,000. It follows that for every £5 which the Ordinary stockholders have in the Group, they hold stock that only carries a "nominal" value of £1. It is apparent, therefore, that the "nominal" value of our stock is misleading and in order to bring the relationship more into line with reality and at the same time to strengthen the capital structure, we recommend the capitalisation of £900,000 Group reserves. As a preliminary step we shall shortly be applying to the Capital Issues Committee for their consent to this process.

This capitalisation would bring the "nominal" value of the ordinary stock to £1,500,000. The effect would be to freeze, for all time, part of the money already invested by stockholders in the form of retained profits by converting it into permanent capital. Thereafter, each £2 invested would be represented by stock bearing a "nominal" value of £1.

I should say at this juncture that, although the crushing burden of taxation, coupled with rising costs, has thrown a tremendous strain on the Group's financial resources, the proposal outlined above should not be interpreted as foreshadowing a further issue of stock for cash. Moreover, it would not be the intention of the Board to recommend any further increase in the dividend purely as a result of this operation.

OUTLOOK

The figures available to us relating to the current year's trading are encouraging and disclose a healthy state of affairs. Profits, so far, are accruing at what we regard as a satisfactory rate. We have large and important contracts in hand and order books at our main manufacturing plants are at their highest levels.

However, it will have been gathered from this review that last year's results were exceptional and that another record profit cannot be expected in the current year. Against the favourable factors must be set the continuing tendency of costs to rise and a distinct falling off in the demand for certain types of machinery. As is becoming well known, export difficulties are increasing, due not only to import and currency restrictions in important world markets, but also to vigorous and growing attacks on them by foreign manufacturers.

Nevertheless, our connections overseas are ever widening. Several of our directors and executives have travelled to many parts of the globe doing business, instructing our agents and discovering new sources of supply as well as new markets. These journeys have enabled them profitably to exchange with foreign industrialists views and ideas on many problems, both technical and commercial, which have a direct bearing on the activities of the Group.

Notwithstanding the mounting difficulties surrounding us, our confidence in the carefully nurtured strength of your Group remains firm. Subject to the absence of any major upheaval in the interim, I venture to think that when I next present my statement there will be no cause for displeasure with the account I shall have to give you.

The report and accounts were adopted and a special resolution altering the Articles of Association concerning directors' fees was passed.

JOHN BROWN AND COMPANY, LIMITED

(Shipbuilders and Engineers)

TWO-FOLD POLICY OF DEVELOPMENT

LORD ABERCONWAY ON EXPANSION OF OVERSEAS INTERESTS

The eighty-eighth annual general meeting of John Brown and Company, Limited, was held on September 26th, at 4, The Sanctuary, Westminster, London, S.W.

The Right Hon Lord Aberconway, CBE, LLD, DSC, the chairman, who presided, in the course of his speech, said:

As you know, the late Government, by the policy of nationalisation, deprived us of our steel works where we made alloy steel as fine as any in the world. Since then we have accordingly busied ourselves in other engineering interests, first and foremost, of course, in shipbuilding. We have made substantial further capital expenditure at Clydebank during the year of £390,000, mainly covering further modernisation of our shipyard and engine works.

SHIPBUILDING.—Our shipbuilding yard and engine works at Clydebank are fully employed, with a substantial forward order book covering ships of the highest class in the field of passenger liners, cargo ships, refrigerated vessels and large tankers. Unfortunately steel supplies have not kept pace with our requirements and at a time when we must do our utmost to ensure timely deliveries to our clients it is of the greatest importance that we should receive supplies of steel suitable, both in quantity and form, to our construction work.

In addition to naval and merchant marine work, the engine shops at Clydebank are engaged in building large water turbines for use by the North of Scotland Hydro-Electric Board and for the Owen Falls development scheme in Uganda. Development work on gas turbines continues.

We have now occupied the works erected at Whitecrook. The principal output will be fabricated work for use in our land boiler division, now engaged on a number of important contracts for the British Electricity Authority.

INVESTMENTS: A SUBSTANTIAL CHANGE

You will see from the accounts that there has been a substantial change in the nature of our investments. The book value of our holdings in Government securities is £2,070,000 less than it was a year ago. For £2,070,000 less than it was a year ago, we received our interests in the steel industry we received in British Iron and Steel stock £5,596,810. At March 31st we held in that stock £1,173,817—a reduction of £4,423,000. Of this difference £423,000 was applied towards the redemption of our outstanding 3½ per cent debenture stock. £500,000 was used in part payment for the purchase, from Thos. Firth and John Brown, Limited, of the ordinary share capital of Firth Brown Tools, Limited, and £2 million was converted into shorter-dated securities. The balance was realised to provide for the capital expenditure of the company and for the expansion of our subsidiary and associated companies.

We have increased our investments in subsidiary companies by £636,000, upwards of half of which has been derived from the capitalisation of the reserves of Wickman, Limited. Trade investments and loans have increased by £691,150, of which £280,000 represents our investment in the ordinary shares of Rhodesian Alloys, Limited. Loans and current accounts of subsidiary companies have increased by £929,724; about half of this sum covers the very large increase in stocks and work-in-progress of Firth Brown

Tools, Limited. Their principal raw material, high-speed steel, has risen greatly in consequence of the rapid rise in the world price of wolfram.

ENGINEERING INTERESTS

WICKMAN LIMITED, in its specialised field of multi-spindled automatic manufacture, occupies a leading position.

Our recent acquisition of the ordinary share capital of the well-known firm of Webster and Bennett, Limited, enables us to cover an additional field of machine tool design and manufacture.

WESTLAND AIRCRAFT, LIMITED, in which we are substantial shareholders, has the "Wyvern" gas turbine engine fighter striker in production for the Royal Navy and, as Europe's largest helicopter factory, has an important output of the S.51. This is in service with the Royal Navy as the "Dragonfly" and is exported to many parts of the world. Most recently the ten- to twelve-seater S.55 is being produced.

Westland's subsidiary, Normalair, has continued to develop, and its equipment is incorporated in all current and new British high flying aircraft.

COSTAIN-JOHN BROWN, LIMITED, having completed its work at Grangemouth, is now engaged in the construction of a large refinery at Isle of Grain, and has in hand or is negotiating important work in Iraq and in Australia.

CRAVENS RAILWAY CARRIAGE AND WAGON COMPANY, LIMITED. While inquiries for rolling stock for the export market are still very good, Continental competition is becoming keen both in price and delivery, which can only be met by a stabilisation of labour rates and an adequate supply of raw materials respectively.

MARKHAM AND COMPANY, LIMITED. During the year two large electric winders at Mansfield Colliery have been completed and commissioned for the Coal Board, and a small winder has been erected and commissioned at Dalkeith.

We have continued to finish a substantial amount of hydro electric equipment for Bovings, all of which is for export. Erection has proceeded steadily on the two large Spanish power stations, and the first of these turbines has been started up.

We delivered a complete cement kiln for F. L. Smidth for this country.

Replacement of the plant generally at Markham and Company's works has proceeded steadily throughout the period.

The preliminary plans are in hand for further development and rearrangement of some of the factory buildings, to enable us to make more expeditious deliveries.

FIRTH BROWN TOOLS, LIMITED, had a successful year as a result of very active trading conditions and achieved a substantial export turnover. Unfortunately, as a result of control by overseas governments, these export markets have become much more restricted. This company, however, continues its policy of maintaining its manufacturing equipment at the highest level of efficiency and expended £129,438 on capital account during the year.

WINDPOWER. Great interest is being taken in our experiments in the design and

building, for research purposes, of a wind-driven generator in Orkney for the North of Scotland Hydro-Electric Board.

OVERSEAS

In addition to our activities at home we have greatly expanded our overseas interests. In Southern Rhodesia the works of Rhodesian Alloys, Limited, are now almost complete and production of Ferro-Chrome is expected to commence early next year. We have an interest in the engineering concern of F. Issels and Son, Limited, in Southern Rhodesia, which is well equipped to take its full part in the development of mining and industrial activities in the Rhodesias and East Africa.

In Canada, Firth Brown Steels, Limited, has built a more commodious warehouse in Montreal from which it continues to render a great service to Canadian industry as the principal stockist and distributor of stainless and special steels. A substantial proportion of the materials this company handles comes, of course, from Great Britain, and contributes notably to our export trade. The Canadian subsidiary of Firth Brown Tools, Limited, has had a successful year and is building a new works in which orderly expansion of its business can take place.

Wickman Limited, has recently established a subsidiary company in Australia where a number of machine tools manufactured and supplied by Wickman Limited, can be serviced and maintained. The business of our Indian distributors is in course of transfer to us, and some two years ago a subsidiary company was established in South Africa to carry out developments principally in the manufacture of hard metal tools. This new company has made substantial progress and is operating on a sound financial basis.

DEVELOPMENT POLICY

This brief review of our present structure will show you that in the field of engineering we are pursuing a two-fold policy of development. On the one hand we have established businesses such as those carried on at Clydebank, Cravens Railway Carriage and Wagon Works of Sheffield, and Markham and Company, Limited, of Chesterfield. On the other hand, we are developing in new pioneer fields, such as the larger helicopters, internal combustion turbines for land power and, possibly later, for marine work, and we have entered the field of power generation at the large thermal generating stations. In all these activities we have one aim in view, namely, that every product of the Company and of its subsidiary and associated companies should be the best possible of its kind; that the equipment with which our employees are called upon to work should enable the work to be done with accuracy and economy so that in established fields we shall be competitively strong and in the new fields we shall be leaders in development and enterprise.

I am glad to say that Mr Rawson, who was seconded to the Ministry of Supply as Director-General of Machine Tools, has now largely completed his task and is again able to devote the majority of his time to our Company's affairs.

The report and accounts were adopted.

THE PALESTINE ELECTRIC CORPORATION

VISCOUNT SAMUEL ON THE POSITION

The twenty-ninth ordinary general meeting of The Palestine Electric Corporation, Limited, was held on September 30th, in London, the Rt Hon Viscount Samuel, PC, GCB, GBE (the chairman), presiding.

The following is an extract from his circulated statement:

The enormous increase of population and the great industrial and agricultural expansion in Israel have been reflected in the demand for electricity, which showed a steep increase.

Despite severe operational difficulties last year, the number of units sold (532 million kWh) exceeded the number sold in 1950 (443 million kWh) by 20 per cent. The gross revenue also increased by about 20 per cent, from £4,833,000 in 1950 to £5,768,000 in 1951. The operating costs were some 33 per cent higher than in the previous year.

Revised electricity rates, adjusted to compensate for the increased operating costs, and approved by the Government, came into force only in October, 1951—too late to retrieve the operating losses incurred earlier in the year. As a result, the operating surplus was £707,941, that is £303,032 less.

Together with the balance of £323,447 brought forward from last year's accounts (1950—£288,519), and deducting dividends already paid on the preference and second preference stock, less income tax, there is available a total of £525,708. Having regard to the steep rise in operating costs, not accompanied by a proportionate increase in electricity tariffs, conditions which have been intensified in the present year, together with the necessity for conserving cash resources for capital expenditure, the directors are unable to recommend the payment of a dividend on the ordinary stock and shares and "A" ordinary stock, and propose that £525,708 be carried forward.

The increasing demand for electricity in Israel necessitates further large extension of the Corporation's generating capacity and distribution network in the near future. The shortage of foreign currency from which Israel is at present suffering, coupled with severe financial restrictions in this country and the difficulties of the general economic situation, have created conditions unfavourable to the raising of capital at the present time. In January of this year a delegation, consisting of four members of your board of directors, including myself, initiated discussions in this connection with the Government in Israel. After these preliminary talks, the managing director and I visited the United States, where we examined the possibilities and terms of obtaining capital. The negotiations with the Israel Government have since been resumed, and you will be informed of their progress in due course.

EFFECT OF NEW ECONOMIC POLICY

In order to curb the inflationary process and to consolidate the economic development of the country, the new economic policy was introduced in February last. A system of triple rates of exchange was introduced, with the rate generally applicable being £2.8 to £1 sterling. The effect of this on the operations of the Corporation has been immediate and far-reaching, necessitating, *inter alia*, very considerable increases in electricity tariffs. The Israel Government has approved an increase in the rates, which came into force at the end of June. Your directors, however, consider this increase to be inadequate, and the position will shortly be reviewed.

The report was adopted.

CALCUTTA TRAMWAYS COMPANY, LIMITED

LARGER RECEIPTS

The annual general meeting of this company was held on September 30th in London, Mr D. E. Webb, FCA, the chairman, in the course of his speech, said: In 1951 we had a year almost free from political and labour unrest, and your undertaking was able to function normally with the satisfactory results shown in the accounts we present to you today. Those accounts have been drawn up for the first time in accordance with the agreement dated August 30, 1951, between the Governor of the State of West Bengal and the Company. Traffic receipts have increased during the year by £178,000 to a total of £1,764,183. At the same time, expenditure has increased by £106,000. Part of these increases in both receipts and expenses has been due to the fact that we have had in service during the year 30 new English Electric articulated cars. It is satisfactory, however, that we have been more than able to keep pace with rising costs without having recourse to increasing our fares.

An interim dividend of 2½ per cent free of tax was paid on April 18, 1952, and it is proposed to pay a final of 3½ per cent free of tax, making a total of 6 per cent free of tax for the year.

In the current year, receipts have continued to increase; additional costs, however, are now absorbing the greater part of such increase. This is mainly due to an award by an Arbitration Tribunal in November last year under which the cost-of-living allowance of all our employees was considerably increased.

Whilst the company welcomes such awards, when they are justified, the employees themselves must realise that when unjustified claims are put forward, often Communist inspired, by persons not even employed by the company, then they can only injure the company and, in turn, the employees themselves. It is our intention to give employment to an increasing number of men on fair terms. That is not possible where irresponsible elements make unjustified demands in order to stir up discontent to suit their own ends.

1 MILLION PASSENGERS A DAY

We are carrying more than a million passengers a day. This is a very great tribute, not only to the low fares charged and the attractiveness of our rolling stock, but also, and in great part, to the hard work of our employees. They have given our company first-class service during the past year, with the result that not only have their own wages been increased, but this has been achieved without any increase to fares. More than 75 per cent of our fleet is now composed of articulated cars and streamlined trains of modern design, and we feel that they will bear comparison with any in the world.

We, as a company, have paid a higher rate of income-tax over the past few years than most British companies, owing to the inability of the United Kingdom Government to come to a double taxation relief agreement with the Government of India. This continual drain on the resources of industry of funds which should be available for its re-equipment would be less disturbing if those funds were being used by the Government to replace the capital assets lost by the country during the war. One is left wondering when the British Government will realise that this country cannot afford to finance the bloated revenue expenditure of today with the resources which should be earmarked for its future capital investment.

The report was adopted.

BRITISH HOMOPHONE COMPANY, LIMITED

DIFFICULT TRADING CONDITIONS

The annual general meeting of The British Homophone Company, Limited, was held on September 30th in London, Mr J. Lesser, chairman and managing director, presiding.

The chairman, in the course of his speech, said: The profit of the group for the year under review was £42,168 before taxation, compared with £29,497 for the previous year. The profit after taxation was £17,078, as compared with the previous year's figure of £12,574. The profits of the British Homophone Company itself were slightly lower. Ebonestos Industries, Limited, shows a substantial increase in profits.

At last year's meeting I informed you that the trading position was being maintained for the first six months of the year under review. I added, "Provided that industry in general does not suffer one of the major crises that occur too often in these abnormal days, we have every reason to be confident that in the second six months of the current year this improvement should persist." Although the industry did not experience a major crisis, a recession did take place in the latter part of the second six months. Nevertheless, as can be seen from the profit figures, my favourable forecast was justified.

With regard to the period from April 1, 1952, to date, shareholders no doubt have also learnt of the recession I referred to previously. This trading condition has persisted and is having its effect on your plastics subsidiary, Ebonestos Industries, Limited. The volume of business available generally has decreased and keener competition for work has resulted. Orders arising from the rearmament programme have not taken up anything like the "slack."

The report was adopted.

NORTH KALGURLI (1912), LIMITED

NEW SHAFT IN COMMISSION

The annual general meeting of this company was held on October 1st in London.

Mr C. T. Ley (the chairman), in the course of his speech, said: The proceeds of ore treated are some £5,000 more than the previous year, but to arrive at this result the cost has been some £95,000 greater, almost as much as the entire capital of the company.

It will have become evident to you that some reduction in the dividend was inevitable. We are proposing to recommend a final dividend of 9d. per share, less tax, making with the interim dividend paid in May 1s. 3d. per share, less tax, for the year, against 2s., less tax, previously.

Provided wages are not unduly advanced and that we continue to derive benefit from the premium sale of our gold, I see no reason why the present year should not provide results as good as, or even better than, the year now under review.

It has been necessary to reduce the amount of our ore reserves by 131,779 tons. Increased operating costs bring this amount of tonnage below the margin of payability. This is one more evil effect which inflation is having on Australian economy. Our total ore reserves are now estimated at 2,183,162 tons of an average of 5.62 dwt against 2,314,941 tons averaging 5.53 dwt in 1950.

The new shaft has been completed and has been in commission since August 1st. Recent operations have been mainly centred round the new shaft. As an engineering feat it is a splendid piece of work.

The report and accounts were adopted.

GENERAL ELECTRIC COMPANY, LIMITED

LARGER TURNOVER AND PROFIT

The fifty-second annual general meeting of this company was held on September 25th in London.

Sir Harry Railing, chairman and joint managing director, in the course of his speech, said: We have achieved a further moderate increase in our net profit. This result is due to an increase both in the volume and the value of our turnover, following similar increases during the last two years. The majority of our establishments have contributed to this new record in spite of the difficulties of obtaining skilled labour and raw materials. We feel that the increase in turnover should have entitled us to a greater reward in increased net profit, but this was made impossible because the higher labour rates agreed by the engineering industry and the further increase in taxation imposed upon us could not be recovered from our customers.

PROFITS AND DIVIDEND

After allowing £1,093,000 for depreciation—£54,000 more than last year—and other provisions, we show a profit of £6,604,000 before taxation. Taxation absorbs £4,455,000, including £200,000 for excess profits levy in respect of the three months to March 31, 1952. Should the profits for the current year remain the same, the charge for excess profits levy for the full year will be approximately £250,000. During the last five years taxation has withdrawn £16 million from your company's capital, whilst the net dividends paid to the stockholders amount to £3,250,000.

An interim dividend of 7½ per cent has been paid. With the proposed final dividend of 15 per cent, the total distribution amounts to 22½ per cent, the same as paid last year. The proposed final dividend, however, is payable on the increased capital.

We have been giving considerable study to our future capital requirements. They must depend mainly on the success, or otherwise, of the Government's anti-inflationary measures, and on the future demands which will be made on the electrical industry.

Unfortunately, the recession in the demand for our consumer goods has continued into the current year; its effect is enhanced by purchase tax and hire purchase restrictions in the home market, and by import restrictions imposed by overseas countries. This has naturally led to some accumulation of stock in the departments concerned.

BONUS SHARE ISSUE

It is not therefore easy at this juncture to decide what further capital will be permanently required. As a first step, we have thought it wise to put our capital structure in order, so as to bring it more into line with the actual capital employed in our business. You have already been informed that we propose to capitalise some £5,877,000 out of the £7 million now standing to the credit of share premium account and apply it as a bonus issue, share for share, to the ordinary stockholders.

A corresponding increase in our authorised capital has to take place, and we thought it wise at the same time to provide ourselves with a reservoir of additional ordinary shares to be available for further finance as and when required. We are therefore proposing to increase the authorised capital by the creation of 12 million ordinary shares of £1 each.

The report was adopted and the board's capital proposals were approved.

PARKLAND MANUFACTURING COMPANY, LIMITED

CURRENT TURNOVER WELL MAINTAINED

The forty-ninth annual general meeting of Parkland Manufacturing Company, Limited, was held on October 2nd in Bradford, Mr George F. Hanson (the chairman) presiding.

The following is an extract from his circulated statement:

The period under review has been one of the most difficult years in the history of the wool textile industry, the price of wool falling by over 60 per cent during the year. This gave rise to many difficulties which tended to be more severe in the manufacturing section of the industry in which your group of companies is principally engaged.

Your directors are very pleased to be able to report that, after making full provision for all losses caused by this very severe fall in wool values out of trading profits for the year without any recourse to reserves, there are still sufficient profits to cover the preference dividend and to maintain the ordinary dividend at the same rate as for the previous year with a small increase in the balance we carry forward to the next accounts.

The profits of the Parkland Manufacturing Company, Limited, after charging taxation, amount to £48,992 for the year to February 29, 1952, against £168,223 for the previous year. For the group, the profits, after taxation, are £99,302, against £297,305.

The reduction in the profits has been entirely due to the difficulties I have mentioned as a result of the very serious recession in wool prices with all the attendant difficulties of decreased demand and general loss of confidence by the public.

RESERVES INTACT

A year ago the reserves totalled just short of £900,000 and they included a reserve for contingencies of £188,000, as well as a general reserve of £250,846. It is a pleasure to all your directors to be able to present the figures this year showing that these reserves are still intact after such a difficult year.

Although there is no further transfer to these reserves, the profit and loss account balance is rather more and thus the total of the reserves is now just over £945,000.

As we have had no need to call upon our reserves to deal with the abnormal difficulties encountered during the year, and as our profits are sufficient to cover dividends at the same rates as we paid last year, the directors have no hesitation in recommending a final dividend on the ordinary shares of 20 per cent, less tax, which, with the interim dividend of 5 per cent already paid, will again make 25 per cent, absorbing £34,650 for the year.

OUTLOOK

In recent weeks there has been a gratifying increase in the orders received from our customers, and our turnover has been well maintained during the six months since the date of the accounts. Your directors see no reason why this should not continue; but it should be understood, however, that with rebuilt and revived textile industries in Europe and Japan, world machinery capacity has expanded very considerably in relation to world demand, and the exceptionally favourable conditions and profits of the immediate postwar years can no longer be expected in the future.

Your directors welcome keen competition because it is a field in which efficient production comes into its own, and they are confident that your companies will continue to secure a good share of available business at a reasonable profit.

The report was adopted.

COAST LINES, LIMITED

LARGER PROFIT

The thirty-ninth annual general meeting of Coast Lines, Limited, was held on September 30th in London, Capt. A. R. S. Nutting, OBE, MC, chairman, presiding.

The following is an extract from his circulated statement for 1951:

In my review of the 1950 accounts I stated that our trading profits for the months of the year 1951 which had elapsed since the closing of the accounts encouraged the hope that the improvement in 1950 would be maintained. I am very glad to report that the improvement has been more than maintained. The trading profit for the year 1951 is £1,364,637, which is an increase of £335,702 on the level attained in the previous year. Voyage earnings on the whole show a substantial improvement, but expenses continued to rise throughout the year, particularly oil fuel and repairs.

The final dividend we recommend on the ordinary stock is 4 per cent, making, with the interim dividend, 6½ per cent for the year. The rate of dividend on the ordinary stock which has been paid annually for the last seven years is 5 per cent.

The year 1952 opened well, but it soon became apparent that the limitation of imports, the diversion of materials to the rearmament programme and the recession in trade would have their effect on our freight carryings. Reductions have occurred during the last few months, but to some extent they have been offset by a rearrangement of sailing schedules and in other ways. The passenger carryings and advance bookings so far this year have been encouraging.

The report and accounts were adopted.

SCRIBBANS-KEMP

DIFFICULT TRADING CONDITIONS

The twenty-fifth annual general meeting of Scribbans-Kemp, Limited, was held on October 2nd in London. Mr H. Oliver-King (chairman and managing director) presided.

The following is an extract from his circulated statement:

The profit, before deducting £828,873 for taxation, amounts to £1,378,222, as against £1,394,704 last year, a result not unsatisfactory in view of the complex conditions operating in the food trades of this country.

The various costs incurred in operating our various businesses continued to rise sharply, particularly in regard to packaging and transport, both of which caused us some considerable anxiety; but these difficulties were overshadowed when, due to economic conditions, most of the food industries were faced by a severe reduction in fats and sugar.

It is common knowledge that in a number of food industries the shortages of fats and oils and sugars had been made up by various imported materials from all over the globe, and it was an additional blow when, in November, these imports also were severely cut. Whilst the turnover of the group is some 20 per cent over the year ended March, 1951, the net profit is about 1 per cent down.

Whilst in the year under review the group has made a reasonably good showing as regards profit, it must be expected that with the very large cuts in raw materials, some fall in turnover is likely, which will have its inevitable effect on profit.

The report was adopted, and a total distribution of 8 per cent by dividend and a special bonus of 2 per cent were approved.

INTERNATIONAL DIATOMITE

CONTINUED PROGRESS

The seventeenth annual general meeting of International Diatomite Company Limited was held on October 2nd at Winchester House, E.C.2, the chairman, Mr E. W. D. Tennant, OBE, presiding.

The secretary (Mr Jesse Wood) read the notice convening the meeting and the report of the auditors was read by Mr H. J. Binder.

The following is the chairman's statement, which was circulated with the accounts for the year ended June 30, 1952:

"I am pleased to be able to report once again that the group has had a very satisfactory year; your operating subsidiary company has maintained the maximum possible output and the new production unit to which I referred last year has proved to be so efficient that we have now commenced to erect a further unit which, when completed, should add still further to the Company's strength.

With a satisfactory order book and our plant in first-class condition, I think I am safe in forecasting another successful year's trading for 1952-53, subject, of course, to the international situation or other factors outside our control.

For a considerable time your directors have felt that both the issued capital and the book value of the fixed assets of Moler Products Limited bore no relation to the true facts. While to some extent this is caused by the postwar inflation of values, it should not be overlooked that in 1935 a drastic reduction of capital took place when no less than £160,000 was written off the value of the fixed assets.

In these circumstances the directors felt justified in arranging for an independent valuation of the land, buildings, plant, etc., of Moler Products Limited and, as stated in the directors' report, this valuation has been incorporated in the balance sheet at June 30, 1952. It is for this reason that the consolidated accounts of Moler Products

Limited and its Danish subsidiary have been published instead of the consolidated accounts of the group as heretofore.

CAPITALISATION OF RESERVES

You will observe that, as a result of this revaluation, a surplus of £133,556 has been added to the capital reserve, which now stands at £170,000. Application has been made to the Capital Issues Committee to allow us to capitalise £120,000 of this reserve, and thereby to double the share capital of Moler Products Limited. If this is granted, the share capital of Moler Products Limited will become £240,000, divided into 1,200,000 4s. shares, as compared with the share capital of International Diatomite Company Limited of £150,000, divided into 600,000 shares of 5s. each.

As is shown by the balance sheet of International Diatomite Company Limited, its only asset is the whole of the share capital of Moler Products Limited, and your directors can now see no likelihood of any future developments in which Moler Products Limited will not be intimately concerned. Moler Products Limited has been known for 25 years as a producer of high quality heat insulation materials, and the goodwill of the group is vested completely in that company. Consequently, they feel that it would be more realistic if the shareholders directly controlled Moler Products Limited, the operating company.

Therefore, provided the application to the Capital Issues Committee is successful, it will be proposed, in the near future, that International Diatomite Company Limited be placed in voluntary liquidation and that two Moler Products Limited shares be distributed to the International Diatomite Company Limited shareholders in place of each share held in that company. Application would be made to the Stock Exchange for a quotation of the shares of Moler Products Limited.

Certain formalities remain to be completed before the foregoing proposals can be put into effect, but it is hoped to convene an extraordinary general meeting before the end of the current year to carry out the scheme.

A/s Fur Moler Kompagni has had a satisfactory year and has supplied Moler Products Limited with its requirements of Moler, the Danish type of Diatomite.

There has really been a remarkable improvement in the fortunes of the group in recent years, and I should be failing in my duty if I did not pay tribute to the managing director, Mr Robert Wood, and to his colleagues on the Moler Products Limited board, Mr Shaw and Mr Hart, for the transformation which has taken place. To them and all officials and employees of the company we

express our great appreciation of their efforts."

The report and accounts were unanimously adopted, and a final dividend of 15 per cent, making 25 per cent for the year, was approved.

The retiring director, Sir Ronald W. Matthews, JP, was re-elected.

Messrs Binder, Hamlyn and Company, continue in office as auditors.

BRITISH OVERSEAS STORES LIMITED

The thirty-first annual general meeting of this company was held on October 2nd in London, Mr R. J. Blackadder, MC, CA, chairman, presiding.

The following is an extract from his statement circulated with the accounts for the year to March 31, 1952:

In my address last year I said the encouraging reports received from our overseas interests led me to hope that the consolidated results for 1952 would once more show an improvement over those which we were then considering, and my hopes have been fully realised, the net profit, before taxation, having increased from £157,237 to £229,514.

The figures under review include, for the first time, those of our new subsidiary, Bickley and Bell, Limited. The accounts of that company show a very satisfactory return on the capital invested, although the measures which the Australian Government has taken to correct its balance of payments and the policy of credit restriction in New Zealand will affect the results for the current year. On the other hand, since July 1st Bickley and Bell has taken over the buying for most of our subsidiary and associated companies, and the additional business arising will, to some extent, offset the reduction in the Australian and New Zealand trade.

Apart from Bickley and Bell, there have been improvements in all our subsidiaries with one exception, where the profit was very slightly below that of the preceding year, and I feel that we can look forward to the future with confidence.

Returns to date in the current year are satisfactory, but there is so much uncertainty in the world that I hesitate to say more than that our interests are well spread and that we are organised and equipped to reap the full benefit of such improvements in trade as may develop.

The report was adopted.

Tory Touchstone

THE Chancellor of the Exchequer called his speech at the Mansion House on Tuesday a progress report on the state of the national economy and finances, and he was justified in taking some pride in the progress revealed by the latest figures of the balance of payments. The enormous deficit that was running when the change of government took place has already been converted into a small surplus. Furthermore, improvement in the balance of payments has this time been accompanied by definite signs of a sounder economy at home—the Chancellor mentioned a decline in consumption expenditures, greater mobility of labour, and a slowing-down in the speed with which wages and prices were chasing each other upward in 1951. Mr Butler had a policy; he said what he hoped to achieve by it; and he has very largely redeemed his promises.

There are, nevertheless, one or two qualifications upon his achievement that an impartial judge would make. It is true that he has been lucky where Mr Gaitskell was unlucky: the terms of trade began to move in Britain's favour in July, 1951, and are now better than at any time since the start of the war in Korea. A glance at the diagrams on page 83 is enough to show how much the British balance of payments has gained from the fact that the cost of imports has fallen while the value of exports has not; part of this has been due to the import cuts, but most of it to the movement of prices. Secondly, Mr Butler might well have been still firmer and done still better. Inflation has not been banished from the British economy, it has only been reduced; and if the benefits that have followed from its reduction have been so great, how much greater would have been the benefits of a real disinflation? Thirdly, as the Governor of the Bank of England pointed out on Tuesday, Mr Butler is now in danger of undermining his own policy by the uncontrolled growth of the Treasury's own "below the line" expenditure and of its borrowings from the banks. Moreover, the world conjuncture, which has helped Britain hitherto by its mildly disinflationary tone, shows signs of going over once again to inflation. Mr Butler sees these dangers to his policy; but on Tuesday he seemed to be more intent on explaining them away than on promising to remove them.

These things need to be said if the record is to be kept straight. But they do not detract from the fact that Mr Butler adopted a policy in his first days in office which required of him a certain political courage, and that he is now entitled to reap the credit of its success. Certainly those who for so long argued the case for monetary restraint, and who got such dusty answers from successive Socialist chancellors, would be very churlish to withhold their applause from the Conservative Chancellor who has done at least some of the things they asked him to do, and in the event has justified their arguments. It will surely never again be possible to deny that the price of money and the supply of credit together constitute the most powerful and pervasive weapon of economic control that any government can use. To try

AN ASSISTANT PERSONNEL SUPERINTENDENT is required by The Steel Company of Wales Limited (Steel Division). He will be responsible for assisting in the administration of the Personnel Department which embraces labour negotiations, education and training, and all personnel functions. Preference will be given to the applicants with experience of this type of work, particularly in heavy industry, and to University graduates. Salary, which will be in line with the responsibilities of the job, will be assessed on the basis of experience and qualifications. Applications should be made in own handwriting, marked "Personnel", to: the Personnel Superintendent, The Steel Company of Wales Limited, Box No. 3, Port Talbot, and be received not later than October 11, 1952.

MARKET RESEARCH SECTION of large public Company making mainly producer goods requires woman assistant, aged 25-30, of first-class education. Previous experience of market research work, especially of survey planning, interviewing and report writing is most desirable, but knowledge of sample survey technique not essential. Apply to Ref. MR/2—Box 72.

SECRETARY/ACCOUNTANT (35-50) for old-established expanding heavy engineering company, North-East England, 800 employees. Must have experience similar position and practical knowledge secretarial, financial and stock controls. Pension scheme. Good prospects for exceptional man.—Reply Box 65.

TOP Market Research Man seeks change. Four-figure salary.—Box 54.

CLEARANCE of Stock—Imported cigars of choice leaf. Product of Trichinopoly. Boxed 25 and 50. £10 per 100.—Call H. Mendel, 198 Goswell Road, E.C.1.

BOX 43—Applicants are requested to note that if they have not received an acknowledgement it is because their applications were not successful.

EXECUTIVE, aged 40, barrister, chartered secretary, 17 years' experience finance and commerce (War service 6 years 2/Lt. to A/Brig.) latterly Secretary/Legal Adviser important international concerns, with duties ranging from organisation and management and general administration to commercial negotiations, seeks appointment offering greater prospects. Private enterprise only. Interview London.—Box 73.

CHARTERED ACCOUNTANT, Cambridge Graduate (Natural Sciences), 6 years' commercial experience (accounting and managerial) in large group after 7 years' war service in Army on transport and staff to rank Lt.-Colonel, seeks pleasant, remunerative and energetic employment in any country, preferably travelling. No family ties.—Box 75.

EXPERIENCED in finance and economic research. Would consider part-time research work, such as preparation of reports or analysis of material—French, German, Polish. Academic qualifications.—Box 71.

THREE YEARS' intensive training and experience as Assistant Executive in Export Division of important manufacturing chemists; young man, 26, B.A. (Oxon), B.Sc. (Econ.), knowledge of languages, well travelled, seeks post with more responsibility and better prospects. References supplied.—Box 79.

ECONOMIC DIGEST (monthly) will keep you informed of many important items you are liable to miss in the modern avalanche of articles, reports, lectures, memoranda. Free specimen copy with pleasure. Economic Research Council, 13, South Street, London, W.1.

ALL kinds of bookcases from good and cheap utility to the famous Festival of Britain UNIX units.—Ask for The Phoenix Gallery bookcase leaflets M15 or call at 23, William IV Street at Charing Cross.

to run a planned economy without them is like trying to drive a car without a variable throttle—it can be done, but why should anyone want to try?

Financial policy is not important only in finance; it is beginning to pay dividends in other areas where the public—and therefore the politicians—can appreciate them more directly. The list of controls removed and restrictions abandoned since the present government came into office is beginning to be of respectable length—the most recent examples are the derationing of tea, the throwing open of the confectionery trade, the resumption of free dealings in lead and the progressive disappearance of the covenants restricting the resale of new motor cars. None of these is revolutionary; the Socialists would have done all or nearly all of them, if they had found themselves in the same circumstances. The important point to realise is that it is financial policy that has created the circumstances. By very slightly reducing the aggregate of demand, it has uncovered a number of markets in which supply is now able to hold its own with demand without control. The reason why the Conservatives can remove controls is not because they do not believe in them, but because they do believe in monetary policy. Except for the abolition of identity cards, it is difficult to think of a single one of their relaxations which does not go back to this cause. It is not “set the people free” that has done the trick, but Bank Rate and the subsidy cuts.

★

Yet how small are these few steps on the road back to a freely functioning economy compared with the barriers and obstacles that remain—or compared with the demolition programme that was promised. No wonder that the party delegates, as they assemble at Scarborough, are reported to be in bewildered mood. The most that can be said is that some progress towards the economic freedom in which Conservatives believe is now just beginning to be visible to the naked eye. But it is not politically very impressive, especially when set against the other disappointments of the past year—the failure of the cost of living to halt on command, the unexpected delay and difficulty in denationalising steel and transport, the absence of the dramatic initiatives that Mr Churchill was expected to take in foreign affairs and in Commonwealth relations. The Conservative party is still most painfully torn between its vision of the Britain it wants and the realisation, brought by office, that the road towards it has long stony stretches of unpopularity before it comes within sight of the goal. So the Tories tend to move towards their vision only when they can do so without giving offence.

This caution is, of course, heightened by the narrowness of the Conservative majority in Parliament. But that is not by any means the only reason for it. The Conservatives, as a party, are not quite sure that they believe in their own doctrine. Too many of them have taken refuge in a purely *ad hoc* attitude. Why do unpopular things now when your only reason for thinking that they will improve things later on rests on nothing more substantial than abstract reasoning? Uncontrollable external events and sheer good or bad luck are, in any event, far more powerful than any attempts at foresight that can be contrived in Whitehall. Why not concentrate on staying in office as long as you can and deal with issues on their

merits as they arise? It is a tempting argument, particularly to elderly gentlemen who do not quite understand what has happened to the world they knew. But it is an impossible attitude for those who are in command of a highly integrated and most powerful machine of economic control.

Perhaps, therefore, Mr Butler's financial measures will have political effects as well as economic. For there is just a chance that their success will convince the Tories that logic and foresight and policy are worth while. It is, after all, not only on the rarified plane of credit and currency that the longest way round is often the shortest way home. Those who advocated disinflation and dear money did not do so because they enjoyed the prospect of throwing even a single man out of work or embarrassing a single firm, but because they thought it was the most effective way of achieving an aim on which everybody was agreed—the balancing of the nation's external accounts—and thus, at one remove, staving off the threat of massive unemployment. Similarly, on a wider plane, there is a perfectly sincere argument that the best way to get wealth and welfare for the mass of the people is by returning to the principles of competitive enterprise; that a deliberate move to set prices and markets free, however disturbing in its early stages, is the quickest way to increase the national wealth on which individual welfare depends; in a word, that a free price system is not an alternative to the welfare state but much the best way of attaining it.

Why, then, are the Tories so shy about declaring and applying this faith? Why are they so apologetic about their rare departures from the Labour Government's methods? Is it because they do not yet accept the logic of universal suffrage, and regard the welfare state not as something desirable in itself but as the very expensive bribe that has to be paid to buy off the mob? Or is it because, being themselves (in the leadership) rich men, they are not sure their sincerity will be accepted? In either case, they give the impression of being a little scared of the people who elect them to office, a little frightened of confessing their real beliefs.

Perhaps this is too hard on them. Perhaps, after a slow start, and encouraged by their success in rescuing the pound sterling, they will now be ready to come out with a broad economic policy. Perhaps they are now willing to face the unpopularity of letting the price system work because they are confident that it will succeed in its purpose as quickly and as patently as Mr Butler's credit policy. In short, perhaps they are now ready to be a Conservative party, and not (to adapt Governor Stevenson's delightful phrase) a “me too” party with a “yes but” policy and “has been” advisers. Perhaps judgment should be suspended a little longer. But the test will come in the next session. If there is to be a policy of letting prices once more correspond to costs, so that the public can distribute its expenditures on a rational and realistic basis, it needs to be applied first and foremost to housing. A policy of letting rents rise and cutting the housing subsidy would unquestionably do more good to the British economy than anything else that could well be devised. Of that there is no more doubt than there was a year ago about the good that dearer money would do. But there is equally little doubt that in the early stages—before it was seen to have solved the housing problem—it would be wildly unpopular. This is a severe test for any party; but not an unfair one. It can serve as the touchstone for the months ahead.

Stalin's Operation Orders

IN the gigantic oration made last Sunday in the Kremlin by Georgi Malenkov, there was a sentence which should not escape notice: “The present effectiveness of our army,” he said, “are equal to the prewar effectiveness.” That, presumably, means that the Soviet army is as strong now as it was between 1939 and 1941. It was then that Stalin came to terms with Nazi Germany, both because he believed it would win against the western powers and because he hoped to postpone or avert an attack by Hitler on the Soviet Union. The military reference is significant, especially if it assumed that Soviet strength at sea, in the air, and in the factories and mines is greater now than it was then. But the political parallel is misleading. This is not 1939 over again.

If anything is crystal clear from what has so far been said before the nineteenth Congress of the Soviet Communist Party it is that Stalin fears an attack at some time by the United States, but sees no need yet for an act of appeasement on the model of 1939. He sees, rather, a chance to play for time, to increase enormously the economic strength of his country and the usefulness of his allies, while the rival camp of the free world heads for political dissension and economic crisis, in the company of its newly found allies, Germany and Japan. Bullying and stubbornness have not produced in Europe what was hoped for—though Stalin could hardly admit this—so stubbornness alone will suffice for the immediate future. If the Atlantic allies insist on saying that they intend to negotiate from strength, then let them take notice that the Kremlin feels no need for such negotiation—unless, perchance, the British and the French should care to detach themselves from the United States for a *tête-à-tête*.

The division of Europe made in 1945 is admittedly not satisfactory to Soviet policy; but it is better than any settlement that could now be negotiated with the United States and its allies. While the West was weak Stalin ran the risk of war, in the hope of improving his position; and the task of Communist parties in Europe was to be ready to act as an armed fifth column. Now that the West is getting stronger it is necessary to reduce risks in the hope of consolidating the Soviet position without war; the task of Communist parties is therefore to work patiently and inconspicuously with all and sundry to frustrate rearmament. Disruption of the Atlantic alliance by some years of “peaceful co-existence” (i.e., cold war) is the diplomatic and political formula. Revolution in one capitalist country—preferably Germany—is highly desirable, but not at the risk of another Korean campaign. The cold war in the West is to become colder.

Mr Acheson has reacted this week with his usual prompt warning that “we must not confuse a shift in method with a change in underlying purpose.” To him the protestations of peaceful co-existence mean nothing without peaceful behaviour; he believes in relations based on clarity and confidence, and detests the twilight world between peace and war, with its cynical calculation and suspicion. Mr Acheson is, of course, right; but one wonders whether he has measured the change in atmosphere that is bound to come after this Moscow Congress, the climax of a sustained peace campaign. And one wonders, too, whether he or his successor will appreciate the need to find political and economic, as well

as military, answers to it. It can fairly be claimed that western policy, under American leadership, has forced on Stalin a tactical retreat in Europe; but is it understood how deep and strong is the position into which he has retired, and how much confidence in that strength dominated the opening days of the Congress?

★

Its proceedings are best compared to a religious ceremony. To one side sat Stalin, head of the church, watching everything and watched by everyone. It was his apotheosis. In the pulpit stood his chosen bishop, Georgi Malenkov, reading a seven-hour sermon packed with familiar texts, couched in the words of party ritual. At intervals the audience of 1,200 uttered short hymns of praise. Little or nothing that was said was new—but it had not been said with such ceremony for thirteen years. And during those years the nation had passed victorious through great tribulation. It was an occasion for thanksgiving as well as worship, for stock-taking as well as instruction. It might prove to be Stalin's last Congress; but he was clearly the supreme figure. It might mark the first step towards transferring power from the Bolshevik revolutionaries to the bureaucratic consolidators; but the doctrine of the older generation was faithfully repeated by the younger. Malenkov on foreign policy was merely echoing what his master had written in *Bolshevik*.

Among the faithful this congress will be remembered not only for the shake-up of the Party and its organisation, but also for the picture of the future drawn by Stalin and Malenkov. Deprived of their markets in the Soviet Union, China and Eastern Europe, the capitalist nations will be driven into desperate competition between themselves. The “general crisis of the world capitalist system” will deepen because of the “disintegration of the former all-embracing world market.” Soon the Communist bloc will “feel the need to export the surplus of their production” and the rival system will then feel the pinch even more acutely. For this and other reasons “capitalist Britain and, following her, capitalist France” will be forced “to break out of the clutches of the United States and to clash with it.” As for Germany and Japan, they, too, will one day force their way to independence. Therefore, Stalin concludes, the inevitability of war between capitalist countries remains. “In order to eliminate the inevitability of war, imperialism must be destroyed.”

But there is no question at the moment of going to war to destroy imperialism; world war must be avoided until the Communist bloc is stronger. The task of Communist policy—and here Malenkov turned Stalin's directive into a practical programme—is to ensure that world war does not interfere with the consolidation of the Soviet Union's gains. Time is on the Communist side, provided time is free to do its work. The party must “struggle against preparation and unleashing of wars,” rally a “powerful anti-war democratic front,” organise national feeling against the United States, encourage international co-operation and “the development of business ties with all countries.” To the parties abroad goes Stalin's new directive for the united front instead of revolutionary

activity, with its implied rebuke to fractious militants in France and elsewhere:

The aim of the present movement for peace is to arouse the popular masses for the struggle to preserve peace and to avert a new world war. Consequently it does not pursue the aim of overthrowing capitalism and establishing Socialism; it limits itself to the democratic aims of the struggle for the preservation of peace.

In all this there is much nonsense, some tragic misinformation and not a little whistling to keep the courage up. Malenkov, complete bureaucrat though he is, cannot really believe that the Americans "have saddled their junior partners, are plundering them, enslaving them mercilessly and at the same time saying 'let us be friends.'" But, as is so often the case with Marxist interpretation, the nonsense is mixed up with penetrating insight. Before the advisers of Mr Acheson and Mr Eden dismiss it as propaganda, let them ask themselves three questions. What is the alternative to accepting the present division of Europe into spheres of influence and occupation if the Russians insist on maintaining it? What is the economically desirable and politically possible scale of armed readiness if public opinion decides that the risk of war is receding? And how is economic activity in the free world to be kept at a high level if rearmament is to level off in a year or two? Soviet orators have so far stopped short of prophesying a slump; but they clearly expect to profit politically—and quite soon—from the German and Japanese search for traditional markets in Eastern Europe and China. What is more, the Communists sound confident that they can

create and maintain a self-sufficient cold war economy for an indefinite time. The same cannot be said of the Atlantic alliance.

It is possible that Stalin has been saying to himself, as Napoleon said before his Russian campaign, "L'Europe m'ennuie." The weight of his attention may have turned to Asia, about which both he and Malenkov have said conspicuously little in these last days. With China as an ally he can manoeuvre against the free world on two fronts and along interior lines of communication. He can, if he wishes, confront the Atlantic allies with a phoney cold war in Europe while the decision against them is being sought in the Far East. To deal with such a change of emphasis—with all its military and economic consequences—they lack the organisation and the strategy. And it will need political leadership of the highest order to convince Western Europe, including this country, that the Atlantic approaches need to be held more strongly than they are at present if the main threat is to be felt outside Europe.

The picture to be kept constantly in mind—the ideal situation from the Kremlin's point of view—is that of France: France holding a flank of the free world by force of arms in Indo-China, while looking constantly over its shoulder at Europe lest ground is lost to the Germans in the effort to withstand the Russians. Stalin may have good reason for confidence as he looks forward to the state of Asia in 1956; but the West, too, can feel some confidence as it looks back to the Europe of 1946 and counts up the reverses that it has inflicted on Soviet imperialism since then.

From Korea to Manhattan

THE curtain will not go up on the United Nations Assembly until Tuesday, but keen eyes in the audience have already detected some preliminary movements on the darkened stage. At the headquarters of the United Nations in New York it is expected that Mr Acheson will lose no time over asking the Assembly to issue an appeal to the Chinese and North Koreans to make peace, and that if this appeal is unanswered the United States will press the Assembly to endorse the truce terms already offered at Panmunjom. If the American plan of action extends any further, it can only do so in a somewhat academic fashion; for within three weeks of the opening of the Assembly the fate of the United States administration is to be decided at the polls. But the very fact that in those three weeks the election campaign will be at its most active indicates that the impatience and frustration engendered in America by the Korean deadlock are likely to reach new heights during this Assembly. The third winter of war in Korea is arriving, and truce talks have been indefinitely suspended at Panmunjom. Eyes are bound to turn to the new United Nations' buildings in New York in the hope that the Assembly will somehow be able to resolve the problem that has baffled the negotiators in the field.

This week there has already been a reminder of the Assembly's continuing efforts to improve its effectiveness as a focus for resistance to aggression, in the shape of a report from its collective measures committee. This body is presenting the Assembly with proposals to impose a rigorous economic blockade on aggressor nations, and it also passes on the Secretary-General's suggestion of

an international reserve of volunteers on whom the United Nations could call in an emergency. Neither of these projects is directly linked to the Korean conflict, but their appearance inevitably provokes the question whether the Assembly ought not to attempt a decisive step towards ending that conflict before it proceeds with plans for meeting hypothetical future dangers.

That question must be answered cautiously. There are clear limits to the Assembly's capacity in this direction, and if too much is expected from it the result can only be disillusionment and recrimination. At Montreal, on Monday, Sir Gladwyn Jebb gave a timely warning against over-optimism. He pointed out that any serious attempt to develop Uno into an effective instrument for the defence of the free world would not only mean the withdrawal of its Communist members, and probably some of the non-Communists, too, but would also break down owing to the "unwarlike" nature of the organisation. This warning should be heeded. Indeed, it should be made the occasion for some sober thought about the functions and powers of the United Nations at its present stage of development.

The "Uniting for Peace" resolutions, passed by the Assembly after the outbreak of war in Korea, have undoubtedly been successful in preventing the complete paralysis of Uno by Soviet vetoes in the Security Council. But neither in fact nor in theory have they equipped the Assembly with the irresistible power which the San Francisco Charter sought to bestow upon the Council. When the member nations signed the Charter in 1945 they undertook to carry out the Council's decisions in

regard to the settlement of disputes, and to provide it with forces that would enable it to act against an aggressor. They have given no such pledges to the Assembly. It can now recommend them to take collective action in resisting aggression, and through its collective measures committee it can prepare in advance certain broad measures to be applied against aggressors; but its right to issue authoritative orders for the settlement of a conflict is disputed by the Communist nations on the constitutional level as vigorously as the United Nations forces in Korea are opposed in the field.

This is not to say that the Assembly can do nothing to reduce the dangers of conflict. Six years' experience has shown that it can perform at least three useful functions. It can order an investigation, as in the case of Greece; and, if an investigation alone is not enough to deter the offending party, it can establish and maintain an observing commission, whose presence in the threatened area serves both to inhibit the potential aggressor and to provide immediate and reliable warning of any aggravation of the danger. Finally, as already remarked, it can try to rally the moral force of world opinion behind a call to all nations to combine in resisting aggression. But none of these techniques can be applied to the present position in Korea. The time for investigation or watching commissions is long past, and the rallying call has already been uttered. The Assembly has, moreover, tried its hand at conciliation, by appointing a good offices committee last year, and failed. At its last session, it tacitly recognised its own limitations when it adopted a resolution postponing debate on Korea until after an armistice, or until the Secretary-General should convene a special Assembly as a result of some dramatic change in the situation.

That resolution was carried by a vote of 51 to 5; the Communist group was alone in opposing it, while the Arab and Asian members were almost solidly in favour. But such solidarity is easier to achieve on a negative motion than on a positive one. At this Assembly the roles are somewhat reversed, and the demand for a debate on Korea is to come from the western side. The Russians are hardly likely to oppose debate; indeed, the unusually strong team they are sending to New York indicates their readiness to do verbal battle on the fullest scale. They have probably learnt the lesson of the last Assembly, when their intransigent attitude led to the almost complete isolation of the Communist group on every major political issue. Their obvious tactics will be to win over, or lure into abstention, as many Asians and others as they can. They will stand more chance of doing so if the West presses for a strong resolution on Korea. In these circumstances, is the American project ill-advised?

It might well be described as such, if the sole aim of a vote in the Assembly was to affect directly the outcome of events in Korea. But to expect the Communists to bow to the terms offered at Panmunjom merely because the Assembly endorses them is to ignore the whole record of Communist disrespect for decisions of the United Nations. In this respect, it matters little whether a resolution on Korea musters fifty votes or only thirty. The true value of such a resolution would be of a very different kind. It is now more than two years since June, 1950, when for the first time in history collective resistance to aggression became a living reality. To the disillusionment caused by fading hopes of a settlement there has recently been added a mood of relaxation, of which

the misleading phrase "cold peace" is a symbol. Only a series of sharp jerks can rouse the nations from this new lethargy. Sir Gladwyn Jebb, by reminding the world that "collective resistance" rather than collective security is all that has been achieved so far, has provided one jerk. Another has come this week from Mr Trygve Lie, whose annual report stresses the need for "clearer and more affirmative definitions of policy from governments in support of . . . effective worldwide collective security against armed aggression."

Until there is an armistice [he continues] it is the part of wisdom and of duty under the Charter for members to carry on the fight [in Korea] . . . and to do so with a more equitable sharing of the burdens.

As a means of confronting the member nations with their obligations, there is no substitute for a public debate in the Assembly and the framing of a vote that will compel each to reveal clearly where he stands.

There is, however, an important question of timing. Until November 4th, the atmosphere in New York will not be conducive to calm debate. While the air remains thick with such election slogans as "let it be Asians against Asians," there can be little prospect of mustering an impressively solid front behind the Panmunjom truce terms. The American motive for initiating a Korean debate at the first opportunity can easily be understood; but there are strong arguments for postponing any decisive voting on the subject until November. Any move by Britain or France for such postponement would probably incur the familiar charge that Europe is again dragging its feet; but that is a charge which, in the circumstances, they may be able to sustain with fortitude.

'Clydella' lasts longer

Sizes 38 to 44 inches chest. Price 59/6d.

IN EVERY CLASS of goods there is one that sets the standard for the remainder, one that a man is proud to possess.

In men's pyjamas that one is 'Clydella'—it wears for years, never loses its softness, warmth or colour.

There's nothing to equal

Earning and Learning

IN the first article it was suggested that correspondence colleges were important enough in their own sphere to need justifying from an educational point of view. It is now proposed to look at a few of the issues involved. The professional educationist does not ask whether or why teaching by correspondence is a good thing or a bad one. His attitude to it, coloured very probably by recollections of his own sound school and well-loved university, is to dismiss it as a travesty of the real thing. But a distinction ought to be made here between academic and vocational learning. The teaching of purely academic subjects by correspondence must, in an age which looks for social as well as intellectual values in education, remain inferior; it is a second-best for those who, having missed the orthodox academic bus, are prepared to walk. But in their main sphere, that of vocational education, this sort of approach to correspondence colleges raises more questions than it answers.

A more realistic way of looking at them is to ask what is the "orthodox" way of learning the vast multiplicity of vocational subjects they offer to teach. Nowadays, in all the middle ranks of industry and commerce, it is the normal procedure to study the theoretical background of a particular technique concurrently with earning a living by it. Whether that technique be estate agency or electrical engineering or corporate trusteeship, part-time training is so well established that it is taken for granted by all those who leave school at eighteen or less, and wish to rise above the ranks of the semi-skilled. Some provision for this is, of course, made by local authorities in the form of evening institutes. But it is hard to believe that this complicated problem of part-time teaching of the theoretical background of people's employment has ever been seriously considered from first principles by those responsible for our educational system. For example, in 1945 an excellent committee was set up to consider higher technological education, but its terms of reference confined its attention exclusively to full-time study at a university. There is a real need for a committee of this calibre to take the subject further and consider how to make the best use of part-time training of working engineers, either to spread wide the knowledge of existing advanced techniques or to encourage interest in new specialisms. "Far too little attention has been paid in the past to refresher courses and new development courses," says this committee. Yet for every one engineer who can be released for a whole term of study, there are a hundred who, with an eye on their future careers, are prepared to be interested in their spare time. If British industry is to get the full benefit of applied science, the community should take an interest in ways of teaching sound theory at relatively advanced levels to far larger numbers than there is any possibility of sending for full-time courses at universities or technical colleges.

Another example of the professional educationist looking at part-time vocational training is contained in the report of the Committee on Education for Commerce. Having acknowledged that the overwhelming majority of students of the commercial professions take correspondence courses, the report proceeds virtually to ignore such courses altogether, beyond the bald statement that

it does not favour them. Moreover, the committee's own recommendations for improving the standard of ordinary teaching in this field have not been favourably received by the professions concerned; its recipe was that the professions should remodel their curricula and age-requirements in order to fit themselves into the conventional education system—the procrustean solution with a vengeance. The committee, in its advocacy of class teaching, appeared to overlook the fact that for the embryo accountant, for example, the element of personal guidance in his education—the element that corresponds to a university tutor's attentions—is provided by his day-to-day contact with his principal and seniors, whose duty it is to train, not merely to employ, him.

There are, admittedly, grave disadvantages inherent in any form of evening study for vocational purposes. Apart from the obvious strain on the student, it must tend, whatever form it takes, to encourage mechanical "cramming" rather than spontaneous thirst for knowledge. But any alternative such as day-time release or the "sandwich" principle of alternating periods of earning and learning all suffer from discontinuity as well as protracting the learning period. The United States has no such problem, but it has far more college students than this country. At bottom it is a question of cost; part-time education is cheap. And in any event, since there is no getting away from it, for a long time to come, for the bulk of the theoretical training in industry and commerce, it deserves more fundamental thinking-out than it receives at present.

*

For this spare-time teaching there are, broadly speaking, two alternatives: evening classes or correspondence courses. Is there any yardstick by which their relative value for this particular purpose can be judged? Certain criteria suggest themselves. Correspondence schools do in fact survive. In an open market, they compete with heavily subsidised evening classes run by local authorities, and even with fees at three or four times what the evening classes charge they find customers by the thousand, half of them by personal recommendation. Their examination records are impressively good—these are indeed the foundation of their popularity—and many of the professional institutions approve of their methods.

But are these criteria really, objective? They show that correspondence colleges are adept at meeting the demands of the professional bodies, but here as elsewhere nothing succeeds like success. As was suggested in the first article, a generation of practitioners trained by any one method will tend—unless they are singularly objective and conscientious about the question of education—to approve that method for their successors. Are the professions necessarily the best judges of their own needs in this respect? Professionalism tends to inculcate a practical, a utilitarian bias into the study of theory which is inevitably reflected in their examinations. This could perhaps be corrected to some extent by the fresh approach to vocational training of a lay (that is, of an academic) mind.

For example, there are reasons for thinking that the whole basis of cost-accounting as taught and practised in this country has got into a rut, and that it needs completely rethinking in the light of recent economic theory. But this sort of critical re-assessment can only arise if the rank and file are taught to think about, as well as to learn about, their jobs. The far-sighted members of several other professions are likewise aware of this tendency to over-conservatism, this hardening of the arteries, that results from too rigid a training syllabus for young entrants. They would welcome genuine help from the educational specialist in making their training more flexible. But such help would have to be sympathetic. Any profession worthy of the name (there are, of course, many mushroom growths which are not) is principally concerned with maintaining sound standards of practice, which it will rightly refuse to jeopardise for some half-baked abstraction called "general education." Real improvement in the content, and therefore the method, of training for all this broad group of non-university professions will only come when the educationist takes the trouble to look at part-time education from their point of view, instead of his own.

To ask, in this way, whether the professional examination as it exists at present should necessarily be the last word in judging part-time education is to question the main basis on which the success of the correspondence colleges rests. If, however, the existing examination framework is accepted, is there any other method of judging their value as compared with that of teaching in classes? The standard arguments in favour of individual home study are familiar enough in the correspondence college advertisements, and indisputable so far as they go. It is still scarcely old-fashioned to speak of going up to a university "to read for a degree," and a correspondence course is, in essence, a course of guided reading. What it lacks is the stimulating give and take of live discussion. This should be the value of the classes at the evening institute or technical college.

But the difficulties facing local authorities in providing evening classes are very considerable even in the large centres of population. As was mentioned last week a lack of numbers requiring any one subject on any one night becomes very marked as soon as the elementary general subjects are left behind and advanced work for specialised professions is in question. An even greater difficulty is that of finding sufficient numbers of teachers, competent in their own profession, who are willing to teach after the day's work for a couple of pounds a night. In fact, most technical colleges are glad to accept any qualified professional man who appears presentable in an interview—thereafter only the minimum inspection of his teaching ability is possible. The result, apparent to anyone acquainted with evening classes, is a very uneven quality in the teaching; some of it is excellent, but much of it is indifferent or poor. Since the problem is mainly one of numbers in any particular locality, it is hard to see how any reasonable increase in the rates of pay would make much difference. The need for laboratory or workshop practice in some of the technical subjects adds greatly to the cost of buildings and equipment. It bolsters up numbers of students, since even correspondence college students must enrol in a class for practical work, but the difficulties remain of utilising such equipment economically.

For all these reasons it is hard to make evening classes in specialised vocational subjects efficient or economical.

They suffer, therefore, by comparison with correspondence colleges, which the struggle for survival in a strongly competitive market has shaped to a pitch of efficiency in their own limited job that could hardly be bettered. To the layman trying to look at both kinds of teaching impartially, the most forcible impression is that the ideal curriculum for part-time vocational teaching would be made up of a combination of the two; intensive, disciplined fact-learning and writing practice, followed by discussion classes for ventilating and maturing the information so gained. The notion, however, is utopian. Evening classes as part of a subsidised public education system are hardly in a position to come to terms about a rational division of functions with their rivals now flourishing under the banner of private enterprise. And neither evening institutes nor correspondence colleges have the necessary authority to suggest fundamental revisions in the curricula to which they are so tightly bound by the professions they serve. Meanwhile, the correspondence college industry constitutes a challenge to educational pundits to rethink their views on vocational training along less narrow and more realistic lines.

The Importance of Wine

There is one result of our wine duties which the present thirst after social improvement makes of more than ordinary importance. The vintage in the neighbouring Continent is the most cheerful period of the year, and annually brings to many millions of people the happiest parts of their existence. The embrowned faces, the stained hands and clothes, the joke and frolic of men and maidens, the light toil under a clear mellow sky and in the free air, all combine to make the gathering of the grape crop a scene of joy. In the fate of these people we know that we are now deeply interested. . . . By opening our ports to their produce we should encourage their peaceful and happy industry, we should help to enlighten them, and we should promote political improvement and civilisation abroad. We should encourage, too, a cheerful and an honest industry, instead of a gloomy industry founded on adulteration and tainted with fraud. We have vineyards in England situated in Bishopsgate street, in Rope-maker street, in Pear Tree street, and in other busy and crowded parts of our great towns. Ginger, green ginger, orange, raisin, red currant, black currant, white currant, raspberry, cowslip, elder, and champagne, British sherry, British port, and British tent, are all manufactured by one house, and on the same spot. They are all manufactured, too, much in the same way, and about equally spirituous; but they are flavoured according to various fruits. Champagne is made from French grapes. In making port and sherry, Cape wine is used. Port, too, is made of French grapes, of raisins, with Cape and Pontac, and the bottoms of foreign wines. Tent is made from the black cherry. Families of the middle and lower classes consume these wines. They cannot well do without wine. Wine is a cordial, a restorative, a medicine. It seems peculiarly adapted, like tea, to invigorate the nervous sensibility exhausted by the sedentary avocations of civilised life. Grosser nourishment is required in greater quantities in the earlier stages of man's existence, when his muscular frame was more tasked than now. The want of wine grows with civilisation; and the people of England, rich as they are, unable to procure it at its present exorbitant price, consume the cheap substitute manufactured at home.

NOTES OF THE WEEK

A Bomb of One's Own

Britain—this teeming womb of distinguished engineers and scientists—can be frankly proud of the sheer technical and intellectual achievement displayed in the Montebello explosion. What the British atomic weapon is, is not known by anybody outside a top-secret circle; but if it were not something at least equal to American and Russian achievements, Mr Churchill would hardly have made so much of it: the announcement to the Queen at Balmoral, the personal messages to all concerned, the odds and ends of information that have encouraged the Press to boast. When all the results have been studied Mr Churchill should be able to formulate much more convincingly than hitherto—to the Americans and others—his views on what strategy should be in the age of atomic artillery and guided missiles. British scientific advisers and serving officers can start thinking for themselves.

This is the main point to seize on amid the Z-shaped cloud of speculation that surrounds the Montebello story. The layman is—and is likely to remain—without information sufficient to judge accurately the political and military importance of the demonstration that an atomic weapon can be made in this country. It cannot be said that Britain makes a third among the great atomic powers until several crucial questions have been answered. The weapon may be cheaper and smaller than anything so far produced in the United States—it has been called “a poor man's bomb”—but what does it cost? Can this country afford to produce it in quantity? How much should be devoted to its production within the limits of acceptable defence expenditure? Would its adoption lead to the fantastic extravagance of a large British strategic bombing force?

Public opinion on these matters is not easily predictable. Many consciences have been deeply troubled by the thought that American atomic bombs have been the main deterrent to aggression in the last seven years; and it was not difficult to take a high moral tone about the weapon of an ally. Now the question of right and wrong comes home to Englishmen; and it is particularly difficult for those who advocate “independence” of the United States. To make atomic weapons in quantity is to decide that they would be used in war; to dispense with them is to run risks which a world power can ill afford; to plan a joint venture with the Americans is to share not only technical but also political responsibility. Mr Churchill, when the time comes to say more, should put these questions fairly and fully before a public that is not quite sure of its own mind.

Unequal Partners

To assume that success at Montebello reopens the way to full Anglo-American co-operation in atomic research would be rash. General Bradley, it is true, has put his unique authority behind the argument that the restrictions of the McMahon Act hamper military co-operation between American military commanders and their allies in the defence of Western Europe. He and his colleagues have been able to tell men like Lord Montgomery and Marshal Juin that atomic power could in time cause a revolution in tactical thinking; but they have been prohibited from explaining how and why. It is an embarrassing state of affairs, and it may be easier to change it if Congress feels that the British have something new in “know-how” to contribute. Certainly the American press has reacted to the Montebello news with a mixture of admiration and astonishment that the Cousin has begun to catch up.

But it is as well to understand in advance that a return

to wartime partnership in atomic matters could not be on a fifty-fifty basis. Whatever the British have to offer the Americans in technical skill and the brilliance of individuals cannot counter-balance the enormous discrepancy in the production and resources of the two peoples. This would be true even if Britain decided to do some stockpiling of its own weapon. The cards that Mr Churchill can play in any future negotiations with Washington are, therefore, probably not as strong as some comment has assumed.

The vital British interest in a return to partnership is obvious—and not only because secrecy and rivalry do no good to relations with the United States. Again and again this country has shown the quality of its scientific and technical skill; but again and again the Americans have had to convert the ideas of genius into large-scale production. Both countries benefit technically from the teamwork between their special talents; and the political arguments in its favour were admirably set out by Mr Conant in the address on “Anglo-American Relations in the Atomic Age” which he gave in London last March.

The Washington Embassy

The announcement that Sir Roger Makins is to succeed Sir Oliver Franks as Ambassador in Washington will set at rest speculations that have flourished in Whitehall for some time past. The debate has not arisen merely out of the normal and natural interest in knowing who is to have the honour and the burden of one of the most responsible posts in the service of the British Crown, it has also reflected a real difference of opinion about the sort of person who ought to be sent to the Embassy on Massachusetts Avenue. The last three Ambassadors have been a politician of the highest rank and distinction, an experienced professional diplomat and an academic philosopher who was during the war a very successful amateur administrator. There are arguments for all three types of men, but the decision has gone in favour of the professionals—and certainly no professional could be found of sharper intelligence or greater devotion to his work than Sir Roger Makins.

Perhaps the real conclusion to be drawn from the debate that has been going on is that, in these days, no one man of any sort can do the job properly in all its aspects. An Ambassador's normal business is with the Foreign Ministry of the government to which he is accredited, and the volume of business with the State Department that the Washington Embassy has to handle is certainly large enough. But it also has at least four other functions to perform which in other countries either do not exist at all or only in much smaller degree. There are direct relationships, formal and informal, with the other departments of the Administration. There are many informal and personal contacts with Congress, which have to be very carefully handled. The press in Washington is a body of formidable skill, knowledge and influence. And finally the cultivation of public opinion in the widest sense is much more important in America than elsewhere. On top of all this, the Ambassador is the Queen's representative and the volume of his purely ceremonial duties, though not large, is probably larger than in any other post.

Those who saw the wartime system at work, when there were seven or eight British personalities in Washington as Heads of Mission, most of them of fully ambassadorial quality—men such as Lord Brand, Sir Arthur Salter, Sir Robert Sinclair, Sir Clive Bailieu to mention only a few—will inevitably think that something of the sort ought to be attempted in peacetime, and that the British Government

should arrange to have several men of first-class competence and authority in Washington at any one time, as the Americans themselves do in London and Paris. The Ambassador would, of course, be incontestably the leader of the British in Washington, as Lord Halifax was in the war, but he would be *primus inter pares* in his own sub-cabinet rather than alone in his eminence.

The relations between the British and American governments are unique both in their character and in their volume. The only possible reason for deploring the appointment of an able professional diplomat would be if it implied an attempt to force them back into the established channels of prewar diplomacy.

Triple Disaster

All the ingredients of horror combined in the triple railway disaster at Harrow early on Wednesday morning. The number of dead exceeds one hundred—a dreadful record in English railway disasters and only outmatched by the tragedy at Gretna thirty-seven years ago. Within a minute last Wednesday an overcrowded suburban train bound for Euston had been overrun on the same track by a night express from Perth; tragedy was almost instantaneously made doubly hideous when a north-bound express crashed into the wreckage. In this static shambles of coach piled upon coach, the work of rescue and clearance has been immensely difficult and utterly devoted.

The British railway traveller tends to take it for granted that adequate precautions are taken for his safety. But an occurrence of this kind is bound to leave doubt in some minds about standards of safety. The recent record of the railways has been less satisfactory than it should have been. Less than a month ago, the report of the Chief Inspecting Officer showed that the safety record in 1951 compared unfavourably with the high standard achieved in the two previous years, though special operating difficulties last year, as Colonel Wilson acknowledged, may have contributed to the crop of accidents. Some months ago a series of fires on trains caused much concern, which the railway authorities seemed rather slow to allay. And only this week a report in the valuable series issued by the inspectorate has commented on an accident resulting from the failure of a train crew to observe a simple safety rule; fourteen accidents occurred last year for the same reason.

Complete safety on rail is not to be had, at any price. There are safety devices, including the various forms of automatic train control and continuous track circuiting, that would undoubtedly contribute to greater safety. But there is no complete solution in mechanical safeguards of this kind, even if the money could be found for them. Perhaps the most important contribution to safety comes from a railway staff that is keen on its job because it knows that the railways are in good shape. Mistakes and instances of lack of responsibility have been exposed in a number of accident reports since the war; they may be few, and by great mercy they have not resulted in the kind of calamity that occurred at Harrow on Wednesday. The task of unravelling the cause of this latest disaster from the tangle of wreckage will take time and skill. But the public will have the right to demand that the lessons that emerge from the Inspector's report will be quickly learned by the railway authorities.

* * *

Post-Morecambe

The struggle for power in the Labour movement is now transferred to Westminster, where the anti-Bevanites are preparing to use their strength inside the Parliamentary Labour party to force Mr Bevan either into obedience to the official line or into an open rebellion which would incur the

full weight of party discipline. The first moves will come when the parliamentary party elects its officers for the new session which the Queen is to open on November 4. The rumours that Mr Attlee might be asked to stand down in favour of Mr Morrison as party leader have, as was to be expected, shrivelled away the moment they emerged from the overheated hotel lounges of Morecambe. Mr Bevan appears unlikely to challenge Mr Morrison as the deputy leader, as this would merely invite a full rallying of the anti-Bevanite forces, but he may well make a bid for election to the Parliamentary Committee—the so-called shadow Cabinet. But whether he returns to the front bench, or remains on the back benches, he is bound to prove a source of continuing embarrassment to the other party leaders.

Not only do the divisions within Labour's ranks extend deep into the constituencies, but they are also apparent inside the trade unions and cannot fail to be exposed in Parliament. It is essential that Mr Morrison and Mr Gaitskell, who have emerged as the leaders of the drive against Mr Bevan, remember that clear thinking about the party's day-to-day policy at Westminster may be an even more valuable weapon in this battle than skill in party and parliamentary tactics. If they are to make Mr Bevan toe the line, they must draw that line clearly in their definition of day-to-day policy. In recent months this was not done. The real advances the Bevanites made in the last nine months were in fields where the official policy was either weak or uncertain. The Bevanites' first big opportunity since the election occurred in the debate on Far Eastern policy in early March, when Mr Bevan alone proved capable of counter-attacking Mr Churchill for revealing Mr Morrison's secret agreements about the bombing of China in certain circumstances. And it was a weakness of policy, rather than tactics, which gave the Bevanites another win over German rearmament.

The first test in the new session may well come on the equally important question of the results of the Commonwealth Prime Ministers' conference. If the orthodox Labour leaders do not have ready their long-term economic policy when these come to be discussed, they will leave a vacuum which will be filled by Mr Harold Wilson's “In Place of Dollars.” The hurling of insults in weekend speeches is part of this battle, but in the long run the anti-Bevanites will do more to win it by guiding the Labour party on a clear course than by simply counter-attacking their rivals.

* * *

Mr Gaitskell Hits Back

In a speech at Stalybridge on Sunday, Mr Gaitskell took up the cudgels that Mr Deakin wielded so heftily at Morecambe. As he said, the case against the Bevanites has never been properly stated until now—partly because much of the left-wing press is of their persuasion, and partly because the orthodox wing of the party was reluctant to widen the split by counter-attacks. But Mr Gaitskell was scarcely wiser than Mr Deakin in his method of approaching this long neglected task.

A most disturbing feature of the conference, he said, “was the number of resolutions and speeches which were Communist inspired”: he had been told by some observers that about one-sixth of the constituency party delegates appeared to be Communists or subject to their influence. This was rather an explicit statement to make on the basis of mere surmise. It would be surprising if the Communists were trying to infiltrate the constituency parties, as they did the unions; and among the constituency flock there are no doubt some wolves who are trying to pass themselves off as merely woolly minded like the rest. But a good reason for not making such charges is that they simply will not be believed. The constituencies regard themselves as people who preserve their socialism in all its prewar purity. They know their delegates, not as Communists, but as the most active members of the party, who, as it happens (as it so often happens), have

left-wing views. To talk of Communist plots, or as Mr Deakin did, of widespread campaigns, is to meet with an incredulity which may extend to the whole anti-Bevanite case. The charges will merely seem to substantiate Mr Bevan's claim that he is victim of a smear campaign. This danger is the greater because Mr Bevan completely dissociates himself from the Communists: they are, he says, the death watch beetles of democracy.

Mr Gaitskill's attack would have been more effective if he had contented himself with showing how Bevanism, with its hatred of America and its half-heartedness about rearmament, serves Communist ends. Mr Bevan himself is aware of this weakness in his position and warns his following not to let the Communists kill a good cause by making it their own. Fortunately the majority of the rank and file can still see that a Communist cause is unlikely to be a good one. They showed that on the last day at Morecambe, when they endorsed the rearmament programme that the Labour Government initiated, and would have nothing to do with motions to withdraw troops from Korea and Britain from the Atlantic alliance.

* * *

Pardon Without Forgiveness

It is not generally understood that the recent release from imprisonment of General von Mackensen, and the medical paroles extended to Field Marshal von Manstein and Field Marshal Kesselring, are acts of clemency by the Crown. They are based entirely on a study of the merits of each individual case; no motive for them has to be made public and any number of considerations may be involved in the treatment of these aged and ailing commanders. An act of royal clemency, although carried out at the recommendation of the Foreign Secretary, in no way signifies a new policy; nor can it be taken, even by inference, to cover all other similar instances which might arise. Above all, nothing in the decision taken with regard to these war criminals is intended to reflect on the justice of their condemnation or on the process of law by which they were tried. There is no question of judicial review.

The difficulty is that these acts of clemency towards individuals have taken place in a heated political atmosphere. German nationalism and its fierce sensitivity about war criminals have constantly embarrassed Dr Adenauer. In many quarters, in fact, it is being said that the Chancellor obtained British clemency by pressure bargaining and in return for promises of German co-operation in defence. This, however, is untrue. The tact with which the issue of clemency for war criminals was handled in the Bundestag shows there was no question of blackmailing the Foreign Office. The Germans are well aware that any such attempt would have boomeranged. Nevertheless, it would be unrealistic to deny that Britain is anxious to increase the basis of confidence and mutual trust in Anglo-German relations. Even if the Chancellor did not press for action in specific cases, this action by the British will undoubtedly strengthen his position with his own supporters and may facilitate the ratification of EDC.

Those who will feel profound moral indignation at the release of these military executioners are perfectly entitled to do so, and the reactions in France and Belgium promise to be vivid. Those who feel uneasy on political grounds can also argue effectively that such acts of clemency play straight into the hands of resurgent German nationalism and that Germans are prone to interpret generosity as weakness. Few have noticed that many smaller fry have been released or have had their sentences reduced; but many Germans are soothing their consciences by saying—as if there were some ministry of propaganda at work—"now the Americans have been doing similar things in Korea." No one need have any illusions about the way in which this release of a few officers

(at most some 15 cases will be considered) will be received by most Germans. The more moderate elements will accept it as a gesture of good will. The Neo-Nazis and army elements, however, will be neither grateful nor impressed. What they hoped for is a complete exoneration, a quashing of Nuremberg and all subsequent indictments of war criminals. There is no prospect of their obtaining such a monstrous reverse of justice.

* * *

General Chuikov's Complaints

At last Tuesday's celebrations in East Berlin of the third anniversary of the Pieck Republic, the theme of German unity was not entirely abandoned; but the presence of the Soviet President, Mr Shvernik, and the marching columns of "people's police" in their new Russian-type uniforms underlined the recent swing in Soviet policy—away from German unity towards the policy of sealing off Eastern Germany and integrating it with the other Soviet satellites. The more the Russians concentrate on this policy, the more they will be disturbed by the "nests of spies, diversionists and terrorists" in West Berlin, whose "criminal activities" against Soviet Germany were denounced by General Chuikov in a letter to the western High Commissioners in Berlin last week. He was probably stung into sending it because he has been so pressed by Mr Donnelly, the US High Commissioner, about the kidnapping of Dr Linse, the economic adviser to the Committee of Free Jurists. But in any case the Russians obviously find the Berlin rent in the iron curtain not only exasperating but gravely disquieting.

It is not at all easy to decide what attitude the western powers should adopt towards the clandestine anti-Communist activities carried on by various groups of west Germans in Berlin. If these Germans are prepared—as they are—to risk life and freedom in order to foster the spirit of resistance displayed by their fellow-countrymen under Communist rule, then, in principle, it is wrong to deprive them of allied support and sympathy. It is, indeed, widely assumed that many are supported by American funds and assisted by RIAS, the American radio in Berlin. The Russians are in no position to make a fuss; for the record of Communist intrigue in the Federal Republic is certainly long and impressive; and it is only a few months since Herr Ulbricht was inciting the West Germans to overthrow Dr Adenauer by force.

That is not to say that every type of anti-Communist activity is expedient. None of it is free from danger; for instance, one of the officials of the Committee of Free Jurists absconded to the Russians with its card index of men and women who had come to it for help. But enterprises which involve heavy risks for a dubious prize are not worthwhile; above all, nothing should be done to give the east Germans false hopes of speedy deliverance. The Free Lawyers have hit on the ingenuous expedient of exposing East German officials who break a Communist law or regulation. This breeds disquiet and confusion among the regime's supporters; the Russians, as enthusiastic advocates of "criticism from below," should be the first to appreciate it.

Setback in the Saar

A chill wind has sprung up in the grim ruins of the Saar, which threatens to blow away many of those blueprints for a new Europe so painstakingly outlined during the past few months. In Paris the latest German proposals, put forward by the Federal Chancellor on October 1st, have been received with glum coldness. Not quite all these proposals have been published, but their nature is sufficient to show that the long drawn out conversations, held this summer

PROGRESS in ELECTRONICS

THE HEART of every electronic device is the electron tube. Without it there would be no radio, no television, no telecommunications, no nucleonics, no radar.

The development of electron tubes is a major activity of the Mullard organisation. In extensive research laboratories, Mullard scientists are continuously at work increasing the efficiency of existing techniques and designing new ones to meet the ever-changing needs of industry, communications and medicine.

Bringing the benefits of this research to industry and the community is the other function of the Mullard organisation. Every year, in great factories in Lancashire and Surrey, millions of valves, electron tubes and components are produced for Britain's electronics industry. Behind the name Mullard, therefore, is a store of experience in electronics that may well prove of immense importance to your own organisation.

Mullard

Mullard Ltd., Century House, Shaftesbury Avenue, London, W.C.2

(MP3671)

between M. Schuman, Dr Adenauer and Professor Hallstein, the German Secretary for Foreign Affairs, have failed. This is a bitter blow, indeed, to hopes of a genuine Franco-German rapprochement.

The German Chancellor's proposals were in effect to Europeanise the Saar for five years—that is, to give it home rule under the supervision of the Council of Ministers of the Coal and Steel Community—to postpone the forthcoming elections, to give the opposition parties in the territory immediate freedom of operation. In addition, there were economic clauses, full details of which are not yet available, amounting to a weakening of the present French position. In view of the unfavourable French reaction, the Germans have since suggested that the five year period represents only a first stage, to be followed up later when it can be seen how far the wider integration of Europe becomes a reality. This is far from enough to dispel the mood of cynicism in Paris.

The recent stage of the Saar dispute opened in July when M. Schuman and Signor de Gasperi proposed Saarbrücken as the seat of the High Authority of the Coal and Steel Community. During the negotiations which followed in August, M. Schuman and Dr Adenauer put out the view that they hoped the question of the Saar would very soon be settled once and for all. This optimism was always suspect, since few understood how any German Chancellor, whatever his goodwill, could give up any territorial claims until after a settlement with the Russians.

Perhaps the only possible compromise was a Europeanisation formula for fifty years—temporary in theory yet permanent in practice. To the French, five years merely suggests German ill faith. Unfortunately, without agreement on the Saar, French ratification of the Bonn treaties is unlikely, and such a failure must strike at the roots of nearly all that has so far been done to bring Germany into the European Defence Community.

By-election Barometers

The reaction of the electorate to recent political developments will shortly be tested in several by-elections. The deaths of three Labour members—Mr Longden, Mr Tomlinson and Mr Willey—have caused by-elections in Birmingham (Small Heath), Farnworth and Cleveland. The Labour member for Hayes and Harlington, Mr Ayles, is retiring because of ill-health. Two Ulster Unionists, Sir Hugh O'Neill and Mr Gage, are also said to be applying for the Chiltern Hundreds, causing by-elections in Antrim North and Belfast South. Finally, there will be a by-election at Wycombe, where the member was Mr W. W. Astor, who has now succeeded his father as Lord Astor.

Of these Wycombe is the only constituency that is at all likely to change sides. In the 1951 election the Conservatives held it by a majority equal to 3.3 per cent of the total poll. A "swing" of only 1.7 per cent would therefore be enough to give the victory to Labour. After Wycombe the nearest

VOTES IN 1951 GENERAL ELECTION

Constituency	Conservative	Labour	Liberal
Antrim, North	unopposed	11,815	...
Belfast, South	37,046	31,079	2,779
Birmingham, Small Heath	15,156	25,756	...
Cleveland	18,112	26,297	...
Farnworth	12,949	23,823	...
Hayes and Harlington	27,084	25,331	...
Wycombe	...	...	...

thing to a close fight will be at Cleveland, where a swing to the Conservatives of 4.82 per cent would bring them victory. The swing in by-elections, however, is rarely in favour of the party in power. It is true that in the first of the four by-elections that have taken place since the 1951 general election—at Bournemouth—the Conservatives

slightly strengthened their hold. But in the other three the swing has been to Labour, culminating at Dundee in a swing of 6.5 per cent. A changed allegiance, of such proportions would give Labour a fairly easy victory at Wycombe.

The Ban Postponed

The representatives of the engineering employers' federation did well on Wednesday to recommend that wage negotiations should continue "untrammelled" by the instruction that no offer should be made to the unions. They will meet the union leaders on October 21st and the threatened ban on overtime and piece-work, which was to have started on October 20th, has been postponed indefinitely. Now that the federated employers are to declare themselves free to bargain there is a good chance that the crisis can be avoided.

The union leaders had been quick to abandon the £2 claim to which they stood committed, but the employers made their first big concession at the Ministry of Labour on Wednesday afternoon. It is true that they had offered to submit the whole dispute to arbitration, but that offer had been refused before it was made by the assembled executives of the 38 unions concerned, and it would not have been easy for the union leaders to go back on the decision of their York conference. In claiming that their hands were tied, the union leaders were but adopting the employers' tactics. Until Wednesday morning the employers' representatives in the talks at the Ministry of Labour argued flatly that they were not empowered by their constituent associations to offer any increase. A war of attrition developed until Sir Alexander Ramsay suddenly gave way.

Was that decision the result of a change of heart, or were the employers merely holding on as long as possible? Some of them were certainly in favour of no surrender and were thinking in terms of a lock-out, which, it was argued, might in the end cost them less than the enforcement of the ban on overtime and piecework. On the other hand, the employers may have been playing for time in order to save themselves money.

The engineering employers, though they represent more profitable concerns, may have found some moral support in the Railway Executive's outright refusal of the railwaymen's claim for a cost of living increase of 10 per cent. The claim was this week heard by the Railway Staff National Tribunal, but a decision has yet to be announced. The years of inflation have given the unions very big ideas about the wage increases they should have. But the new pattern may prove to be one of firm and prolonged refusals by employers, ending ultimately in wage increases that make the first claims look very silly.

More Violence in Kenya

When Parliament reassembles next week, the Secretary of State for the Colonies should take an early opportunity of stating how serious the Government considers the present outbreak of crime in Kenya to be. After consultation with him the Kenya Government recently passed a series of emergency measures, including the control of newspapers, the registration of societies with a membership of more than ten, restrictions on the movements of members of Mau Mau, and the admission of sworn statements as evidence against persons suspected of belonging to the society.

Is there justification for this legislation, together with the repressive administrative measures which have accompanied it—the banning of public meetings and the curfew? In this country it has been attacked as a symptom of hysteria among the Europeans, some of whom are accused of deliberately and fantastically exaggerating the activities of Mau Mau in an attempt to preserve European dominance. In the Kenya Legislative Council, too, a nominated unofficial

member criticised the legislation on the grounds that it went too far and might be used unjustifiably. On the other hand, the toll of murders and violence to persons and property continues to mount—though not all of them have necessarily been committed by Mau Mau members. A serious feature is the murder of African witnesses against the terrorists; most disturbing of all, perhaps, is the murder this week, by fellow Africans, of a respected African chief, who had served the Government for over thirty years and who had recently denounced Mau Mau at a mass meeting of the Kikuyu tribe, from whom the society draws the bulk of its membership.

This particular murder must surely shake the self-confidence of those who believe that the chief danger comes from European hysteria. But it is high time that the list of crimes—cited in Kenya's Legislative Council by the very member who recently said that the activities of Mau Mau had been exaggerated—should be seen in their proper perspective. Why has the Kenya Government, or for that matter the Colonial Office, been so dilatory, or so reluctant, in giving the essential facts?

Royal Memorial

The response to the launching of the King George VI National Memorial Fund was immediate, and over £200,000 had been subscribed in the first four days. No indication has been given of how much more it is hoped to raise. King George V's Silver Jubilee Trust raised about £1 million as a permanent fund, and the national memorial fund opened after his death about £600,000; but in these days appeals cannot count on being successful, however warmly people may feel towards their cause. Part of the fund will meet the cost of the traditional statue; the rest, and the greater part, will, in Mr Churchill's words, be used to form "a permanent foundation . . . for the spiritual, mental and physical needs both of the young and of the old."

This all sounds rather vague, though it is true that there are good reasons for some caution in announcing specific objects for the appeal. The welfare state, in theory, takes care of most of the needs of its citizens which formerly might have been the object of a national appeal. People cannot be asked to make voluntary contributions to supplement expenditure they have already met as taxpayers. Voluntary spending today has to be confined to fields which the state has so far not found fit to till or to fill gaps caused by lack of co-ordination in provision made by the state. But even here the organisers of a new fund have to walk carefully lest they overlap with other, established, voluntary effort.

The Silver Jubilee Trust, like the new fund, has as its object the welfare of the younger generation, and it furthers this mainly by making grants from its income to the voluntary youth organisations. It also tries to co-ordinate the activities and research work of other bodies and individuals in this sphere. At the other end of life, the National Corporation for the Care of Old People fulfils similar grant-making and co-ordinating functions. Perhaps, the King George VI fund would find its best outlet by working through these two established organisations. Whether it does so or not, some clearer indication of how it will be spent might do much towards ensuring the success of the appeal.

Economics at Strasbourg

The Consultative Assembly of the Council of Europe has been trying to come to grips with economic problems. At its last session it recognised the need to develop production of raw materials and foodstuffs in overseas territories that have "constitutional links" with member countries, and to this end it made three recommendations. The first was that a European investment bank should be set up so that funds from all member countries could be used for development projects. The second suggested long-term contracts and international agreements to give producers the security that might encourage an expansion of output. The third proposed the introduction of a preferential tariff system between Western Europe and Commonwealth countries, in which the tariffs would be higher than the existing imperial preference, but lower than the standard tariff.

The idea of a European investment bank is straightforward; the question is whether this would be the most suitable organisation for the purpose. Long-term contracts and international agreements are more contentious. Although they provide security to the producers they do not necessarily encourage increased output, as Britain well knows from its postwar experience; but since they have become fashionable in current economic discussion, the Assembly might be excused for giving them uncritical acceptance. The preferential tariff is an entirely different matter. It is a highly complicated subject that requires to be worked out in detail before any sensible discussion can take place—much less recommendation. It is true that a special working party had submitted a report to the Assembly, which is summarised on page 102. But a number of speakers distorted the original proposal. Some apparently regarded this recommendation as a means of maintaining discrimination against dollar goods. Others saw in it a chance to erect a high tariff wall.

In fact, as Lord Layton stated with great clarity, the report said neither of these things. The working party stressed the fact that it was unable to undertake a detailed study, but it suggested that "the preferences should be brought about through a lowering of duties between the countries concerned" and that "any country offering commensurate concessions should have the right to be admitted within the preferential group." These distinctions are important, for they imply that the proposed preferential system does not aim at excluding America and that it could take the place of the now out-dated most-favoured-nation clause in promoting a wider area of freer trade. The Strasbourg Assembly has not improved its reputation by giving the proposal unanimous support after only a day's debate.

Statistics and Inflation

If a rising cost of living is any guide to the progress of inflation, Britain is in a bad way. According to the latest statistics of the Organisation for European Economic Co-operation, retail prices have risen in the first half of this year more sharply in Britain than in any other member country. In three countries the cost of living was not only

The Balance of Payments

These diagrams depict the salient features of the White Paper on the Balance of Payments, which is reviewed in an article on Page 113. The upper set of diagrams analyse the figures for the United Kingdom, on the left by categories of trade, on the right by geographical areas. (All figures are in £ millions.) The bottom left-hand diagram shows, above the line, the gold and dollar reserves held by the United Kingdom and, below the line, its sterling liabilities. The bottom right-hand diagram shows the credit and debit balances (in £ millions at the annual rate) of the three main divisions of the sterling area in their trade with dollar countries.

by three per cent in the first quarter of this year, and by almost another three per cent in the second quarter. On the other hand the cost of living in France rose by six per cent in the first quarter, and then fell by nearly four per cent in the second quarter. Yet Britain is nearer to controlling its internal inflation than France. The main cause of the rise in the British cost of living was the reduction of food subsidies, a disinflationary move—provided incomes were not allowed to rise more sharply—as surplus income was being mopped up by the higher prices. In France, prices were reduced by M. Pinay's personal campaign and later by government decree; but the surplus income has not been mopped up by either voluntary or forced savings; nor have wages fallen. The accompanying table might suggest that France is making more headway than Britain in its battle against inflation; but the truth is the other way round.

Icelandic Fisheries

When the International Court of Justice earlier this year gave its decision in the Norwegian fisheries dispute, many feared that the decision would open the door to parallel, and far less justified, action by other countries. Those fears came true in the case of Iceland. In May, Iceland re-drew the outer limits of what it claimed were its territorial waters, from point to point instead of parallel to the shore, and prohibited foreign fishing activities on the landward side of the new lines. Relations between the fishing industries of Iceland and Britain are now thoroughly embittered; when a strict rule of law is abandoned for one based on "reasonableness," reasonableness itself tends to fly out of the window.

The British argument in the dispute with Norway was that, in international law, territorial waters are defined by a line drawn by reference to the low water mark on the mainland. Before the Court Britain conceded that a country might also treat as territorial waters waters which on "historic" grounds were part of that country's realm, provided the historic title was clear. It challenged Norway's claim to control over the waters within the outer islands

of the coast on both grounds; but the Court, by a majority, found against both British contentions. From the point of view of British deep-sea fishing interests, the most damaging section of the judgment is that which allows a country to adjust its territorial limits over coastal waters to its own fishing needs. This section must have been uppermost in the mind of the Icelandic Government when it made its new fishing regulations last May. And with reason, for the produce of the fishing fleets provides Iceland with some 70 per cent of its exports.

But a good deal of the trouble since May has been caused by the method Iceland adopted in making these new claims. British notes of protest have brought only negative replies; the regulations came into full effect at once; and last July a Grimsby trawler skipper was fined £1,970 at Reykjavik for breaking them. Iceland's argument has been that it has prohibited all fishing in these waters, including that of its own trawlers, to give them a chance to restock themselves naturally. British trawler owners regard the regulations as an arbitrary and one-sided decision intended to drive them out of fishing grounds that, last year, yielded some 2½ million hundredweight of fish, and their federation has banned the landing of all fish from Icelandic trawlers at Hull and Grimsby. If restocking is the main objective, the two Governments concerned could, if they wished, negotiate something less drastic than the total ban of last May; could not the areas be limited progressively, starting with the most over-fished, or by some method of rotation? One thing seems certain: no reasonable result is likely to come from talks between the fishery interests themselves while they are in their present mood, and this country has still to eat a lot of fish.

Variation on a Theme by Petrillo

Music, it has been said, is the most international of the arts, a universal language. As an economic activity it is not, however, exempt from frontier trouble. Until this week, most observers would have agreed that the record for obstructive, restrictive and generally dog-in-the-manger practices in the field of musical economics was unchallengably held—under the able leadership of Mr Petrillo—in the United States. The championship, however, has now unmistakably passed to Britain. The refusal of the Musicians' Union to allow the famous Negro folk opera, "Porgy and Bess," to be conducted for more than three performances by Mr Smallens, its own musical director—even with a British conductor "standing in" idly on full pay for the length of the run—is a real connoisseur's specimen, of a ripeness hardly to be matched by the most assiduous search through the repellent jungle of trade union or business restrictionism.

Given the initial surrender to the principle that no British conductor's income should suffer (or rather that a free gift should be made to a conductor who would, had "Porgy" never come to London, have had neither fee nor grievance), it is hard to discover a positive motive for the ban; and a powerful motive against it, one would have thought, is provided by the fact that its enforcement would put thirty-four members of the Stoll orchestra, all union men, out of their jobs. The membership of the Musicians' Union, so unmistakably the losers, may be expected to ask whether either personal feud or personal log-rolling is involved in this remarkable proposal to cut off their noses in order to spite Mr Smallens's face. One cannot, unfortunately, expect with equal confidence that their American counterparts will reconsider their support for a policy which provides so many powerful, if not exact, precedents for national exclusiveness pushed *ad absurdum*. A long time seems likely to elapse before musicians of all nationalities, confronted with the proposition that higher and more reliably art-proof fences are the most precious product of collective negotiation, begin to murmur, in the words of the banned opera's catchiest song, "It ain't necessarily so."

Farming and Food Production

To secure the increase in food production which the country urgently needs, still more concerted and more vigorous measures are necessary. For the individual farmer, landowner, and student of agriculture, this implies above all else the provision of reliable information on progress in farming methods and in agricultural research.

The Times Agriculture Review provides such information and brings together news and opinion about the problems and prospects of British agriculture which are not normally found in the daily Press or in the technical farming Press. Its first issue as a regular quarterly publication appeared last June, on the occasion of the Royal Show, and was widely welcomed. Now, on the occasion of the London Dairy Show, comes the second issue.

In this issue, which is fully illustrated, the Duke of Beaufort, President of the British Dairy Farmers' Association, writes on the Dairy Show, and Professor H. D. Kay, Director of the National Institute for Research in Dairying, discusses the factors that influence the quality of milk. Mr. Clyde Higgs contributes his regular article on new machines on the farm, and among other regular features are the records of the chief pedigree stock sales and notes on

estate maintenance. There are articles also on the progress of the attested herds scheme; the choice of improved varieties of seed that will respond fully to high farming methods; grain drying on the farm and the establishment of lucerne leys of high production.

Oversea farming is represented by an account of the experience of New Zealand dairy farmers in controlling the grazing of pastures to secure the maximum output of milk.

Greece Tries Again

Once more the Greeks are to go to the polls in search of the political stability that so persistently eludes them. It is only just over a year since elections were held on the basis of "reinforced proportional representation"; this brought about a wholesale massacre of most of the minor parties but it did not provide a stable government. A coalition of General Plastiras's EPEK and Mr Venizelos's Liberals has since then limped uneasily along; it has been gravely handicapped by its tiny parliamentary majority, its own internal quarrels and the rigid opposition of Field-Marshal Papagos's Greek Rally, which forms the largest single party in the chamber.

Now the Greeks are to jettison proportional representation and try their luck with a simple majority system of voting. Although Field-Marshal Papagos has been persistently asking for fresh elections on a majority basis, the new electoral law has had a rough parliamentary passage. The Greek Rally complained, possibly with some justification, that the government had been guilty of gerrymandering in defining the new constituencies. It also objected to the decision to deprive the armed forces of their vote so that, in the words of Papagos, "those called on to defend the country are thereby denied a right enjoyed by those who plot against the nation." The government's excuse is that delay in counting the service votes holds up the final results by many weeks and that the rank and file vote under pressure from above. Both sides no doubt remember that a majority of the army vote went to Field-Marshal Papagos at the last election.

None the less, the Greek Rally maintains just as much as the other parties, and probably with more justification, that it stands to gain by the new method. Whether or not this optimism is justified, the Rally certainly has over its rivals the advantage of greater internal cohesion. It is to be hoped that fears of dissension will deter the Rally neither from adopting a strong and effective electoral programme, nor from carrying it out if it should be returned to power. In the past its aims have not been conspicuous for their lucidity; and strong government without strong policies to restore the country's economic stability will not help the Greeks.

Dollars from the Caribbean

When it was announced last month that Lord Reading was to pay a series of good will visits to Latin American countries during November, some doubts were expressed about the decision to limit his itinerary to the more southerly of the twenty republics. The Foreign Under-Secretary's tour will cover Brazil, Uruguay, Argentina, Chile and Peru, but he will not be able to visit any of the dollar-account countries bordering the Caribbean. His mission will undoubtedly be useful—no British Minister has made such a tour since the war—but it is certainly a pity that it cannot be extended to cover areas in which British commerce is relatively less well established than it is in Brazil and the River Plate countries, but which hold out the possibility of dollar sales of British goods that find no market in the United States. In the first seven months of 1952 the value of British exports to the Caribbean dollar area was about £23 million, of which exports to Venezuela represented nearly £10 million; and there is ample evidence that this trade could be expanded if British firms that concentrate their efforts on southern and eastern Latin America could be induced to look further north.

A warm welcome must therefore be given to this week's announcement that a British trade mission will leave in November for a six-week visit to Mexico, Cuba, the Dominican Republic, Venezuela and Colombia. This mission comprises several businessmen with personal experience of the area, and its discussions and findings should contribute substantially to the expansion of trade with these rapidly evolving countries. It is not inappropriate that the first year

of the new Elizabethan age should see a reawakening of British interest in the Spanish Main.

Pilgrims to Peking

The thunder of tanks, guns and bomber aircraft that marked the celebration of Communist China's revolutionary anniversary in Peking had barely died away before the scene-shifters appeared to lay out the red carpets for the latest Communist "peace congress," which opened in the same city on the following day. No discrepancy between the two occasions seems to have been remarked either by Mao Tse-tung's docile subjects or by the foreign delegates to the congress, some of whom stood at the saluting base while the armed might of the new China paraded by. But one would like to hear Mr Ivor Montagu, who has been representing the "World Peace Council" at the congress, construe the Chinese poem specially composed and circulated for the anniversary, and which contains the interesting line: "We love peace, and smash all our enemies into pieces."

It would seem, indeed, that the Chinese, scorning the reticent tactics of their comrades in the West, have made a point of emphasising to their visitors that "peace," in their view, is essentially a bellicose affair. On the eve of the conference Kuo Mo-jo, chairman of the Chinese Peace Committee, issued a long statement on the committee's activities in which he proudly pointed out that, while it had taken full part in the Stockholm peace appeal, its chief task had been "the movement to aid Korea," and that it had been outstandingly successful in collecting funds for the purchase of fighter aircraft and munitions. Later, in a speech to the conference, Kuo declared that peace could only be brought about through the liberation of "enslaved" peoples. This theme was repeated by many of the speakers, with particular emphasis on the need to secure national independence for Japan by ridding it of foreign troops; there was, of course, no reference to China's acceptance last month of the indefinite presence of Russian forces on its soil.

The Peking gathering bears the official title of the "Asia and Pacific Peace Congress." Although dominated by the Chinese, it has drawn visitors from many South American countries as well as from Australia, Canada and the United States. If no new themes have emerged from it as yet, it has at least provided a new network for the dissemination of such established Communist theses as unrestricted trade, anti-imperialism and hatred of the United States. It is not insignificant that the proposals before the congress include the exchange of cultural missions, students, scientists, sports teams and farmers between the countries represented. Clearly, much fellow-travelling is contemplated.

THE ECONOMIST,
22 RYDER STREET, LONDON, S.W.1

Letters to the Editor

Strasbourg and Luxembourg

Sir,—The article in your issue of September 20th sought to make two points: first that Britain should welcome the decision of the Ministers of the six countries to go ahead and establish, if they can, a federal policy for "Little Europe"; secondly, that the Council of Europe might as well be dismantled, because the interests of the non-federating member-states are best served by an appropriate development of the institutions of the North Atlantic community—which you admit are incomplete.

Few will quarrel with the first point. But I venture to dissent strongly from the view represented in the second. The British Government surely do not share that view. The short answer is that "there'll always be a Europe," not so much a geographical as a spiritual fact to be set alongside the mercantile society of the United States and other parts of the New World, and this Europe must include Britain. Mr Churchill, in his first pleas for united Europe, no doubt had in mind primarily the provision of cement for Franco-German relations, but since the Congress at The Hague he has shown a full appreciation of the need for the European myth, if there is to be any effective resistance on this side of the Atlantic to the challenge from the East. Nato, if only because of the disproportionate weight of the United States, is not enough. For this reason alone the existence of the Council of Europe, as a forum where the nations' problems can be placed in their European setting, is a moral and political necessity, even though it might seem to contribute nothing to the sum total of actual achievement.

All honour to M. Schuman for his initiative. But he would be the first to admit that the establishment of the coal and steel community would never have been possible unless the climate had been prepared by the meeting of minds at Strasbourg. Equally, most would agree that the work of that community may yet be facilitated through the association with other European countries which the Council of Europe provides.

When people decry the Strasbourg assembly as a mere "talking shop" I am tempted to retort that that is precisely what it is meant to be, what, indeed, any Parliament is. There will be plenty to talk about if and when the new restricted communities take shape, and it is through the Strasbourg forum, with representatives of all free Europe exercising the necessary control, that the limitations of technocracy, on the one hand, or the dominance of partial interests, on the other, can be surmounted.

Since your article was written, the Consultative Assembly has taken three steps of major importance: its endorsement on September 30th (by 102 votes out of 103) of Mr Eden's proposals for associating the Council of Europe with the work of the restricted communities;

its recommendations to develop European and Commonwealth trade through long term contracts, planned investment, and preferential agreements, and to call a world monetary conference to review Bretton Woods; and its request for an annual report from Nato.

All this shows that the assembly has an important role to play as the voice of Europe, influencing opinion in a way that no intergovernmental association, whether it be OEEC, Nato, or the United Nations, can do. In fact, pending that distant day when there is enough Atlantic consciousness to make possible the establishment of an Atlantic Assembly, the matrix of Europe at Strasbourg performs, I submit, an indispensable function.—Yours faithfully,

Strasbourg

W. H. C.

A Leak in the Wellington

Sir,—In the Business Note in your issue of October 4th it is suggested that rubber boots imported from Hong Kong "may well have originated in China and Japan."

I can say with certainty that all rubber footwear shipped from Hong Kong to this country is of Hong Kong manufacture. This footwear enters the United Kingdom under claim to relief from duty in accordance with the imperial preference regulations. It is supported by certificates of origin, countersigned by fully qualified accountants who are authorised by the Hong Kong Government and accepted by H.M. Customs here. Costings (and full stock records of raw materials and production) are submitted to H.M. Customs by the accountants for each factory at regular intervals in addition to a complete chain of evidence confirming the source of all raw materials used in manufacture. The accountants are required to carry out frequent "spot checks." They are all highly respected members of the profession (some are British firms of world-wide reputation) and take great care to ensure that their endorsements on certificates of origin are fully in accordance with the facts.

To those who know the background to these footwear imports, statements that they really originate in China or Japan are revealed as nonsense—or perhaps as old wives' tales which gain in currency according to the degree of competition.

As a footnote I would like to mention that in 1951 all Hong Kong manufactured products shipped to the United Kingdom were valued at £3 million; in the same year British goods valued at £38 million were bought, used and distributed by the colony.—Yours faithfully,

E. G. A. GRIMWOOD

Hong Kong Government,
London, W.C.2

European Export Subsidies

Sir,—May I draw your attention to some points arising from your article in your issue of September 27th?

1. It is true and considered abnormal

here that the Government takes 90 per cent and the exporter 10 per cent of dollar proceeds of exports. We shall have no rest until the 10 per cent is 100 per cent again.

2. It is correct that the Dutch exporter (mostly not the merchant but the manufacturer and the agriculturist) makes a premium of about 5 per cent of his dollar turnover on these 10 per cent of retained proceeds. The premium of 7 per cent, as stated by you, was made during a period as long as that in which 3 per cent and less was obtained.

3. These export dollars are not on a free market, but the exporter has to use them for advertising, travelling expenses and/or imports.

4. The sound conclusion from these facts is that, allowing the exporter 100 per cent instead of 10 per cent, the premium would disappear or would be reduced to a fraction of the official rate of exchange.

5. Shunting of goods is certainly not possible with these export bonus dollars, because the latter are too expensive.—Yours faithfully,

J. H. SEIJLHOUWER

Bloemendaal

Sir,—Your article in your issue of September 27th touches an important and delicate problem.

May I first correct some of the mistakes mentioned in the article and the summary?

Dutch exporters retain 10 per cent of their dollar earnings emanating from the export of Dutch goods. These dollars are not transferable and can only be used either for travelling expenses or for the import into Holland of goods for which otherwise no licences are given. It is only by selling these goods at a higher price that a "premium" can be obtained. Recently this premium has worked out at Fls. 5.60 to the dollar, or about 5 per cent on the dollar exports as a whole. At times this rate has been as low as Fls. 4.60 or less than 2½ per cent on the dollar exports as a whole.

As these 10 per cent retained dollars are only allowed on exports of Dutch goods your allegation that this premium "induced Dutch exporters also to search diligently to find foreign goods they can shunt in the North American markets" is not correct. What you call "shunting operations" is in reality based on the Dutch system of allowing a Dutch transit dealer, who purchases foreign goods in some EPU countries (and weaker currencies), to use 90 per cent of the dollar proceeds of the sales of these goods in the United States, for transactions in the opposite direction. This means that this transit dealer—or as these 90 per cent are freely transferable—one of his Dutch colleagues is allowed to purchase goods in US dollars selling them to EPU countries.

As there is still a demand in these countries for dollar goods a premium is always obtained. Once a premium is obtainable it is obvious that the first transaction (the dollar creating one) can be executed at a loss, thus enabling Dutch merchants to sell certain Euro-

pean commodities in the United States cheaper than the producing country itself could do.

The medal has two sides, however; as an example, it is certainly disagreeable for a Swedish wood-pulp exporter to find that Dutch transit dealers are offering his commodities at a lower price than he himself, but against this the Swedish importers are able to purchase via Holland much desired nylon stockings and American cars. As the Swedish importer must have a licence from his government to pay Holland in guilders for these so obviously non-Dutch commodities, they can never deny being aware of the proceedings.—Yours faithfully,

TRANSITDEALER

Correspondence Colleges

Sir,—I hope you will allow your readers to be informed that "Chartered" accountancy was earlier in its origin in Scotland than in England. All references, therefore, in your article on "Correspondence Colleges" to the Institute of Chartered Accountants should have been to the Institute of Chartered Accountants in England and Wales. The Scottish body remains distinct and, as I say, received its first charter much earlier.—Yours faithfully,

A. G. MCBAIN

Glasgow

[*Nemo me impune lacessit.*—EDITOR.]

The Microbe Hunters

Sir,—As a regular reader of your paper I feel I must protest strongly against the sentiments expressed in your Notes in your issue of September 27th.

First you do a grave injustice to the United Nations' cause in attempting to smear the scientific commission—a type of tactics which is more suitable to Communists than the responsible leaders of a democracy.

Secondly you appear to have little regard for the traditions of Western law and science if you are prepared to reject evidence—or even the offer of evidence—on grounds not connected with the nature of that evidence.

Thirdly the cynical view that British business men may take profit out of Chinese trade while British soldiers are killed in Korea, but that no delegations should be permitted to attempt to establish friendly relations with China, seems to me to reflect a degree of moral insensitivity which I for one should not like to advertise as blatantly as you have.—Yours faithfully,

JOHN CHILD

St. Catherine's Society, Oxford

[It is not a "smear" to point out the previous political affiliations of people who claim to be making an impartial investigation any more than it would be to object to the trial of a lawsuit by a judge who was a large shareholder in the company bringing the action. With regard to the reproach of "moral insensitivity," the point is that trade with China in non-strategic goods does no harm to British soldiers fighting in Korea, whereas political propaganda against their cause concerted with the Chinese Communists under cover of "friendly relations with China" does them a great deal of harm.—EDITOR.]

Books and Publications

The War of Bricks and Mortar

History of the Second World War: Works and Buildings. By C. M. KOHAN.
HM Stationery Office. 540 pages. 32s. 6d.

This is not specifically a history of the Ministry of Works, that Ministry which in its five wartime years had three titles and four ministers. But since its theme is the carrying out of the vast rearmament and wartime building programme, the backbone of the story is the Ministry of Works, the circumstances that led to its creation in the second year of the war and to its achievement by the end of 1942 of the central planning, direction and control of the wartime building programme. This was a part of the war effort that had no, or few, dramatic moments, on which the limelight never fell. But the successful prosecution of the war depended on the construction of the camps and the hospitals, the airfields, factories, radar stations, docks, pipelines and all the rest that made the war on sea and land and in the air possible. It was a programme amounting to a thousand million pounds or more.

Mr Bevin was primarily responsible for the creation of the Ministry of Works, against which the old Office of Works fought fiercely. It was Mr Bevin's intention that a new Ministry of Works and Buildings should take over all Government building whatsoever; and when created it was given a wide charter in this respect, far wider than in fact it ever enjoyed. But even in peacetime it would almost take a revolution to force the various ministries of Whitehall to give up their building departments. In war, with the ministers like medieval barons, marshalling their private armies, defending their frontiers or raiding their neighbours, it was an impossibility. In actual fact the original opposition of the Office of Works to the swapping of horses in mid-stream was sound; it would have been an unjustifiable gamble to have tried to build up a single building department to take over the whole construction programme in the stress of war.

But Mr Bevin's objective of central control was, as Mr Kohan shows, ultimately attained. The trouble that over and over again threatened the Government's building programme was that no way had been found of securing any order or balance in it, in spite of many attempts at co-operation by the various Government departments. Each department considered that in the end it must be the sole judge of its own requirements and of the extent and timing of its activities. Effort after effort was made, first by an Interdepartmental Works Committee, then by a Works and Building Priority Committee (under the chairmanship of the Parliamentary Secretary of the Ministry of Labour) to bring order into the mounting programmes of the departments. And yet in the late autumn of 1940 it was calculated that the total of all the programmes of all the departments was double the capacity of the whole building labour force, even if any-

thing like the whole labour force could have been spared for new construction, or could have been made available.

It was an impossible situation. The struggle then became one for centralised control, and incidentally against the system of priorities by committee. The Ministry of Works was established in October, 1940, with a compromise charter and little accepted authority. Nevertheless, at a very early stage of his Ministry Lord Reith invited the Production Council to scrap priorities and agree to an assessment by the Ministry of Works of the capacity of the building industry and the demands of the departments' building programmes; on the basis of this the available building capacity was to be divided among the departments broadly in accordance with the strategic priorities of functions as laid down by the Production Council, the departments themselves applying their own internal priorities. It took two years of struggle finally to overcome the suspicions of departments and the idiosyncracies of ministers and to arrive at a workable arrangement. In spite of a great effort by the Minister of Labour to go back to priorities controlled by a committee of ministers, at last in December, 1942, as Mr Kohan says, "The wheel had gone full circle . . . the impartial administration of the building programme by the Ministry of Works had been accepted by the departments." As time went on the system came to be run increasingly on scientific, statistical lines and obviously with great smoothness since even the interdepartmental committee ceased to meet.

But it was not only the co-operation of the departments that was necessary. The harnessing of the building and civil engineering industries was achieved without recourse to any statutory order and with remarkably little friction and an abundance of good will. The long, hotly opposed and finally Government-imposed, scheme of payment by results, once it was in force, was ably administered by a joint committee of the industry itself. The whole industry was geographically organised for the repair of air raid damage and to meet the threat of invasion; apprenticeship was dealt with on national lines; great advances were made in welfare conditions on the building sites—all in striking contrast with the chaotic conditions that obtained in the 1914-18 war.

Mr Kohan's book is, however, so full of meat that much more space would be required to deal with it adequately. It provides material for study both by those optimists who still hanker after a more efficient building industry and those realists, or pessimists, who have to think and plan in case such crises should again arise. It also tells a good story. One cannot but admire the

enacity and patience of the author in weaving the tangled tale of those five years into what is a clear and documented account. It is inherent in the self-denying ordinances, to which the editor of this series of war histories refers in his preface, that so much of the colour is lost. Impersonal history is only half the truth. The limitation of subject too, however inevitable, means that much well worth remembering will go for ever unchronicled—Lord Reith's brave fight for postwar planning, Lord Portal's imaginative contribution of the prefab to the postwar housing problem. The first received no encouragement from the top and was perhaps the main reason for Lord Reith's ruthless dismissal in February, 1942. The second was so bitterly and unfairly assailed on all sides that even its author lost courage and resigned a disappointed man. So Ministers come and go, but the Ministry goes on and its work during the war will have had its permanent impact on the building industry and on building in this country whether in war or peace.

Brazil in a Pint Pot

Brazil: An Interim Assessment. By J. A. Camacho. Royal Institute of International Affairs. 116 pages. 11s. 6d.

To put not a quart, but a gallon, into a pint pot is always a feat, and Mr Camacho is to be congratulated on his bold effort to do so. Brazil is a rapidly developing country of 53 million people, larger than the United States, diverse in terrain, economy and society, and bedevilled by political complexities. To summarise in such a small volume its physical and human geography, its history as colony, empire and republic, its successive economic revolutions, its social problems, and its contribution to literature and the arts would be impossible without some degree of simplification, and the pundits will no doubt take Mr Camacho to task for an occasional omission or lack of balance.

He need not fear them. This book, the third (and the best to date) in the Chatham House series on Latin American countries, deserves a warm welcome. It is more than just a short handbook, although in that capacity it is badly needed. It is also a lively analysis of Brazil's most important characteristics. As the author points out, Brazil is a colonising nation whose experiences are no less significant because the colonising has happened to take place within its own frontiers. It is a country with an unusually good record of peaceful international relations. Despite strong provincial rivalries, it has successfully maintained the unity which its Spanish-speaking neighbours were so quick to lose. Even more important, perhaps, is its experience of racial relations. European, Indian and Negro stocks have blended to produce a genuinely Brazilian nation in which racial prejudices, if not entirely absent, are less of a problem than in any other country of multiple origins. Mr Camacho has extracted these, and other, significant themes from the bewildering variety of the Brazilian background with great skill, and he deserves to be widely read.

A Feast of Churches

English Parish Churches. By Graham Hutton and Edwin Smith. Thames and Hudson. 64 pages and 226 photographs. 42s.

About two-thirds of this beautiful book consists of photographs. These are technically excellent; only people who have attempted this sort of photography will know how much skill and patience must have gone into their making. Mr Hutton says that he and Mr Smith sometimes had to wait "not merely for hours but for days and months—in some cases years." The English climate is indeed seldom kind to photographers who want to capture the glow of sunlight on crumbling stone or the detail of a tomb in a dark corner. But there is much less excuse for the flat, grey expanses that pass for skies in most picture postcards and photographs in railway carriages; Mr Smith shows how vastly these would be improved if care were taken to obtain a painter's sky.

Many people will be content to possess this book—and once seen it has to be possessed—for the photographs alone. They would, however, be well advised to read Mr Hutton's introduction before studying the photographs in detail. With a masterly display of selection and compression, he surveys the history of church architecture in this country over a thousand years, and the photographs have been taken and grouped to illustrate the changes in style. There is a glossary of architectural terms; but it is hardly necessary, for Mr Hutton has achieved the feat of being learned and authoritative in this specialist field while remaining intelligible to the layman. It is a slight drawback to have the notes on each church separated from the plates, but doubtless this was done for good reasons.

Last week, the formation of the Historic Churches Preservation Trust was announced. The trustees, whose main task is to raise £4 million to aid parishes to repair their churches, will find this book a valuable ally. Not only does it show how rich a store of beauty English churches contain; but some of the photographs show only too clear evidence of decay. Mr Hutton reminds us that the church interiors have long since lost the warmth and colour they possessed in the Middle Ages—"they are but pale, sad shadows of their pristine selves." Now, however, their very fabric and structure are in danger, not, as were the screens, paintings, and statuary in earlier centuries, from reforming and puritanical zeal, but from poverty and neglect.

Celtic Trio

Three Great Irishmen—Shaw, Yeats, Joyce. By Arland Ussher. Gollancz. 160 pages. 12s. 6d.

On finishing this book one would welcome an epilogue in the St. Joan manner, in which the shades of Shaw, Yeats and Joyce provide a ghostly "Any

questions" programme, with the author as question master; for his study abounds in incentives to argument, and is presented with a shrewd vigour. His penetrating and genial investigation apportions blame without presumption and praise without adulation, and if the resulting survey, from an Irish standpoint, shows a different and surprising perspective, it is none the less stimulating and refreshing.

Mr Ussher suggests that Shaw's characters do not live independently—"the navel-string connecting them with their author is uncut"; that he was not artist enough to admire what he could not justify with his reason, but was philosopher enough to want to admire everything that energetically lived; that his work is therefore not quite art or philosophy, but "the best conversation the world has to give"; and that in the course of his whole long, active, argumentative life he never forgot his manners but was "in an innate and mystical sense well-bred." This last point is crucial, since Mr Ussher believes that with the decline of aristocracy our choice is between Mob and Man—between "blackguardocracy" and the free spirit; unless man becomes gentleman in the Shavian sense, his doom is sealed, for "in his present state he is as out of date as a horse-drawn omnibus."

Certain parallels are found between Shaw and Yeats, who is placed chronologically between the rationalism of the former and the surrealism of Joyce. Both were protestant in temperament, influenced early by Blake and late by Goethe, shy and retiring men who yet undertook the drudgery of public affairs. Both ended by idealising mob leaders while scorning the mob; both were anarchical in thought and carefully law-abiding in practice; both were dramatists, self-dramatists, skilled public speakers, failed novelists, comedians, and possessed "the high single-mindedness which is the best meaning of nobility." But in Yeats, art and thought were perfectly integrated while in Shaw there is a discord between emotion and mind. Yeats lifted the aestheticism of the nineties into a great art, and carried it over into a world which has cast away religion and is beginning to despair of science; but his symbolism is here criticised as verging on emblematisation and as resulting in a remoteness from even the cultivated general reader. Mr Ussher sees Yeats as the last of the Homeric poets of mood and idea, and Joyce as the first avatar of the less personal, less natural poetry of the unconscious. All three protagonists are regarded as being, in a sense, displaced persons. Shaw's creative evolution was out of date, Yeats came too late in the history of homogeneous nations to realise his dream of being the flower and crown of Ireland in its greatest century, while Joyce was a Chaucer in a modern world, faced with the task of expressing his own age and also of bridging the hiatus in Irish literary experience since before the Middle Ages—"forging the uncreated conscience of his race."

Mr Ussher calls "Ulysses" a strange,

Ships Ahoy!

A gas-turbine vessel has crossed the Atlantic. An atomic submarine can travel up to 2,400 miles without surfacing. We look back to the man in the crow's-nest and forward to... what? Ships without funnels, flat as the horizon? Ships without screws? Ships without crews? Naval architects and marine engineers have interests nearer to hand which sound more prosaic—the future of aluminium construction, for example. So has TI. But as new principles of propulsion, new speeds and new capacities spring their demands upon engineering ability, TI will be ready, as now, with many of the new component parts.

TI'S FIFTY-ONE FACTORIES SERVE THE WORLD*

THE MANCHESTER GUARDIAN now carries news on the front page

FROM NOW ON, there will be news on the front page of the Manchester Guardian. And it will be *news*—not hysterical headlines.

You may wonder why the Manchester Guardian is changing thus; or, perhaps, why it did not happen before. The reason for the change is that the Manchester Guardian is more and more becoming a national newspaper. Less than a third of its readers now live in Greater Manchester. And so a front page consisting of classified advertisements of local interest will no longer do.

Let us assure those who abhor change that the character and 'flavour' of the Manchester Guardian will not in any way alter. The Manchester Guardian will remain as witty and as wise as ever.

Those who are not familiar with the Manchester Guardian should get to know it. It is one of the few great newspapers which it is a real pleasure to read.

If you have any difficulty in getting your Manchester Guardian regularly, please write to: The Manchester Guardian, Manchester.

STORY & CO. LTD.

Designers of Interiors

KENSINGTON · LONDON

EXPERIENCE gained over many decades in the design of interiors and the actual production of fine furniture together with suitable floor coverings and textiles, enables Story's Contracts section to give competitive estimates on a high level of quality and design, both in English Traditional styles and in the Contemporary manner.

Since 1945, Board Rooms, Directors' and other offices, reception halls, showrooms, restaurants, canteens, residential staff quarters, etc., have been successfully executed (many in collaboration with the clients' architects) for over 30 notable organisations, including Martins Bank Ltd., I.C.I. Ltd., Tube Investments Ltd., Kuwait Oil Co. Ltd., Kodak Ltd., Cyanamid Products Ltd., Dunlop Rubber Co. Ltd., Patons & Baldwins Ltd., Lever Bros. & Unilever Ltd., Ind Coope & Allsopp Ltd.

droll, uncomfortable masterpiece about a dull day in the lives of an irritating prig, a prosy philistine, and a trollop, and thinks it a comic creation worthy to rank with Gargantua, Gulliver, or Tristram Shandy. He deplores the anticlimax of "Finnegan's Wake" as "the weirdest folly in the history of verbal architecture." He concedes Joyce's Irish bravura, over-sly, jeering insinuations, and oppressive lack of elation and delight—"a slightly loutish Blake, Joyce sees Infinity with a long nose and Eternity in a belch." But his overriding merit is a broad humanity with aesthetic detachment. Shaw longs to remould the world, Yeats to escape from it, but Joyce accepts it in all its beauty and squalor. If the art of criticism is to send the reader back to the original with renewed zest, this book should be an outstanding success.

Lawyers on Current Problems

Current Legal Problems, 1952. Edited by G. W. Keeton and G. Schwarzenberger. Stevens and Sons. 339 pages. 37s. 6d.

This is the fifth volume of the series and it contains fourteen of the weekly lectures given in the Faculty of Laws at University College, London, during the session 1951-52, together with Lord Justice Denning's presidential address to the Benthams Club. The title is deceptive; fortunately so, for a discussion of matters which are problems only to lawyers would have the same limited interest as a selection of difficult hands at contract bridge. The contents are in fact lawyers' comments on some of the social, political and economic problems of the day, shaped by the relevant law, but concerned with the impact of these laws on society and on individuals. The subjects include the liability of company directors, the compulsory purchase of land, the control of domestic and administrative tribunals, the Schuman plan, abortion, the protection of British property abroad and "Officialdom and Infancy." Lord Justice Denning's address is concerned with his belief that there is a need for a new "equity," or a willingness on the part of judges to change the non-statute law to meet new injustices.

To see social and political problems through a lawyer's eyes has the fascination of a familiar view seen through a camera obscura. It is valuable to see the limitations which the strictly legal approach must accept, for both the legislator and the public should know what those limitations are. It is encouraging to encounter the personalities of some of the writers; the most provocative are Professor Glanville Williams writing on abortion and Mr Richard O'Sullivan, QC, on the state and family and children. Most of all, perhaps, it is a relief to escape from a world of political and economic theories into a more precise and limited world, where words are expected to have a single and consistent meaning whoever uses them and where

principles are taken as proper guides for the regulation of both conduct and its consequences. There is a very great deal of knowledge in this book, some evidence of blinkers, much humanity and much of what, in the west, we know to be our true contribution to civilisation.

Geographical Pioneer

Human Geography. By Jean Brunhes. Translated by Ernest F. Row. Harrap. 256 pages. 25s.

Jean Brunhes's "La Géographie Humaine," first published in 1910, has hitherto been available to the English-speaking world only in an American translation of 1920, which was not without blemishes. The appearance of a new English edition is, therefore, to be welcomed. The translation is made from the latest French edition of 1947, itself an abridgment of the three volumes of "La Géographie Humaine," with the addition of material from other publications of the author. The work has also been revised to take account of changes in world conditions; yet in spite of this complex history it manages to maintain a welcome and surprising clarity and uniformity.

Brunhes's work has, of course, paid the penalty of success, and much that was fresh and stimulating when first written has passed into the general body of accepted geographical ideas. It is no longer new, although perhaps still necessary, to insist on a classification of towns by function and morphology rather than by mere size, or to draw attention to the weaknesses of watersheds as political boundaries, to quote two examples at random. In addition, certain of Brunhes's ideas in human geography may appear naive in the light of more recent investigations in the social sciences. But if some of the first impact has inevitably been lost, a surprising number of valuable lessons remain. Especially is this so in the field of methodology, in, for example, Brunhes's use of "sampling" and in his avoidance of hasty generalisations and crude physical determinism. Above all, the book is made to live by detailed examples and illustrations drawn from Brunhes's own field investigations.

The translation is good; the illustrations and maps are of outstanding interest; the price is reasonable for these days. This edition will certainly be welcomed by teachers and students of geography.

Government and Geology

Geological Survey of Great Britain. By Sir Edward Bailey. Allen and Unwin. 278 pages. 22s. 6d.

In this book, the former director of the Geological Survey records its progress from its beginning in 1835 until his retirement in 1945. The detailed history of the survey and of those involved in it

will inevitably be of greater interest to the geologist than to the general reader, to whom the scientific controversies in which geologists engaged will probably be incomprehensible. But there is much of wider interest. The survey was initially not only an organisation for investigating and mapping the rocks of Britain but also a kind of embryo Imperial College, with professors of chemistry, mechanical science, natural history and other subjects. Geology in fact must be added to the list of those sciences which have claimed to co-ordinate all others, a claim which, in the days when Huxley, Stokes, Murchison and others were associated with the survey, had some justification. This episode in the history of science ended with the death of Murchison in 1871.

Of equal interest is the way in which the apparently straightforward process of geological exploration has been involved in controversies of wider importance. How much freedom of publication should be given to the government scientist? Should the survey charge for answering the floods of enquiries that descend upon it? Should the private firm be forced to disclose to the state the results of its shaft or boring? On all these problems Sir Edward Bailey writes forcefully. This is certainly a book to be read by those interested in the history of science in this country, or in the relation of the scientist-civil servant to the state on the one hand and to private enterprise on the other.

Collected Works of J. V. STALIN

The English publication is announced of Stalin's works, complete in about sixteen volumes. The volumes will appear at approximately monthly intervals commencing in October, 1952

LAWRENCE & WISHART

AMERICAN SURVEY

Candidates Abroad

Washington, D.C.

ALTHOUGH there has been much beating of the tom-toms about foreign policy during the election campaign, neither General Eisenhower nor Mr Adlai Stevenson has shown any great desire to get involved in a serious debate about the future. The fate of the one attempt to offer a novelty—Mr Dulles's "liberation" idea—suggested that there was no political advantage to be gained at the moment by proposing bold new programmes. Both candidates, of course, have had plenty to say about past history, for which blame has been apportioned and reapportioned, but what is to come has been discussed only in general terms. The Governor has warned of blood, sweat and tears without being very specific about the quantities required; while the General has talked forcefully about ending the Korean war, preventing future Koreans, increasing the military might of the country and reducing taxes. Understandably enough, he has been vague about how he is going to accomplish these conflicting miracles.

Even the argument about the glory or the shame of American achievement in the foreign field over the last seven years should have been muted, by comparison with the circus the country would have seen if Senator Taft had been nominated. It should have been muted for two reasons. Mr Stevenson, whose job it must be to defend the record of the present Administration, had almost no part in its compilation. On the other hand, General Eisenhower, who must attack everything this government has done (except those measures passed during the Republican Eightieth Congress, for which his party is prepared to take credit) has been deeply involved in many of the Administration's most important decisions. The advantage in this kind of situation obviously rested with the Governor.

It was this, perhaps, as much as any pressure from those within his chosen party, that persuaded General Eisenhower to embark on the task of rewriting his own role in the history of the last seven years to his own advantage. He must have felt that he could rely on Governor Stevenson keeping the campaign on a high level, no matter what the Republicans did. In this he was right. However, the General seems to have forgotten President Truman and his ability to hit hard when aroused. And there is no doubt that the President has been aroused, not to synthetic indignation for campaign purposes, but to genuine wrath. When Mr Truman says "The General whose words I read, whose speeches I hear, isn't the General I once knew" there is genuine sadness in his voice and bewilderment in his manner.

It is not easy to understand why the General should have laid himself open to charges of dishonesty over Berlin and Korea. But the absurdity of his position had been demonstrated earlier when he spoke in Flint, Michigan, about bipartisanship in foreign policy and the virtues of the late Senator Vandenberg. The editorial comment during the next two days in the larger eastern newspapers which have been supporting the General could only be described as a display of open relief at the discovery that their candidate had not become an isolationist. Probably not even the *St. Louis Post-Dispatch* and the *Louisville Courier-Journal*—the two

important papers which have recently described their disenchantment at length and given their support to Mr Stevenson—would have thought of accusing General Eisenhower of forsaking his old ideals to that extent; but it was quite clear that some of the independent newspapers which plunged for the General in the early days were beginning to wonder how much further he would go to accommodate Senator Taft and minimise the "differences of degree" between their two positions.

The next day in Illinois he made an incautious remark about letting "Asians fight Asians if there has to be a war in the Orient," which was quoted out of context in many newspapers and given thereby a meaning the opposite of what was intended. The previous sentence—"we do not want Asia to feel that the white man of the West is his enemy"—explained what General Eisenhower was driving at, however inept his driving may have been and however disappointing his remarks must have been to those who believe in collective security. But the anxious way in which this remark was received showed again that those who were "for Eisenhower before Chicago" had had their convictions so rudely shaken in the last few weeks that they were waiting with bowed head—ready to receive the next blow. Perhaps it was the imminence of the General's visit to Senator McCarthy's Wisconsin that made them so jumpy.

The truth probably is that General Eisenhower and his speech-writers are doing no more than try to encourage the Taft Republicans to flock to the polls without disillusioning the General's original backers too much. And so far they seem to have succeeded. The formula they have found is an effective one. It includes extended references to the enormous importance of Asia, but no statement that Asia is more important than Europe. There are complaints that the Administration has not been stern enough with Europe, followed by criticism of the government's failure "to achieve a real unity of spirit with our allies." There are little stories to show that many years of living overseas have not made the General admire foreign ways—one demonstrating that he has not swallowed British socialism and another that he has not been attracted by the system of multiple political parties on the Continent. And, at Cincinnati, he showed, in Mr Taft's home town, that he is as adept as the Senator at quoting Mr Acheson out of context to prove that he encouraged the invasion of South Korea. Until recently, General Eisenhower has always called Mr Acheson a great Secretary of State.

This performance has been disappointing to those who hoped that a debate on foreign affairs during the campaign would serve some constructive purpose. There are optimists who hope this regularly every four years, just as there are optimists who predict regularly that the candidates chosen by

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

the two parties will ensure that the campaign is kept on a high level, but they are always disappointed. This year, in particular, the kind of criticism of Administration policy that the optimists hoped to hear would have carried the General further from, not nearer to, Senator Taft and was, therefore, presumably unthinkable. No Republican candidate, even if he had been able to subsist without the money which the party's old guard can produce, would have been able to criticise the Democrats for being too kind to Chiang Kai-shek or too slow to recognise the Chinese Communists.

Mr Stevenson complained a week ago, with some justice, that he had not "been able to develop any useful debate on the real problems and specific issues that confront this country." It may be for this reason that neither of his major speeches on foreign policy, in San Francisco and Louisville, was entirely successful. It is one thing to argue the merits and demerits of a policy for achieving certain ends; it is quite another thing to have to combat the assertion that these ends will be achieved automatically if one's opponent is elected. And, on the all-important subject of how the war in Korea is to be brought to a satisfactory end, General Eisenhower has offered nothing but the equivalent of Mr Baldwin's "Trust me." This may be enough. It should not be too hard to persuade a large number of voters that an expert at fighting wars is also an expert at finding a way to stop them. And so long as the greater part of the American press goes on industriously pretending that the President, and not the General, is responsible for the present undignified brawl, most of the people may remain in ignorance of the fact that, as the President said, General Eisenhower has "betrayed his principles."

But Governor Stevenson, less confident that there is an easy way out of the role that history has thrust on this generation of Americans, seems now to have abandoned the pointless task of refuting criticism point by point. In his "fireside chat" last week from Chicago, he decided to explain what leadership means to a nation which is unable to escape it. The response he got was heartening to him. He told the country that

you may seek comfort at the feet of false leaders, who, like medicine doctors, beat drums to ward off evil spirits. You may listen to false leaders who tell you there is an easy way, that all you have to do is to elect them and thereafter relax in a tax-free paradise. . . . You may fail to face the facts squarely in this great controversy of our time and you may be so deluded that you run the risk of being beguiled to destruction, for there is no easy way.

This was something that no political candidate has ever done before in the United States. It is, in fact, exactly what his admirers had expected General Eisenhower to do.

How Sudden a Change?

[FROM A CORRESPONDENT IN WASHINGTON, D.C.]

GENERAL EISENHOWER promises, if he is elected, to make "top to bottom" changes in Washington's governmental machine. Governor Stevenson, while trying not to cast any serious reflections on his own party, hints that he, too, has changes in mind. But it is doubtful whether either of the presidential candidates or the people who must choose between them yet realise the magnitude of the task involved in turning the federal government over to a new administration. Nothing like it has happened before. No government serving so many people, employing so many people, spending so much money, so endowed with a momentum of its own, and possessing such a large and relatively invulner-

able base of civil service workers has ever passed from one pair of hands to another.

The change will take place no matter which candidate wins. At first glance, it might seem that the change would be deeper and broader if there is a Republican victory, but that is not certain. Although Governor Stevenson might go about it more gradually, in the long run he probably would be quite as anxious as General Eisenhower to make the new administration his own. On the other hand, the governmental machine is so big, and its course has to be planned so far in advance, that whoever wins will, for a long time, feel that Mr Truman is looking over his shoulder and, in important ways, guiding his hand. Changes are easier to promise than to carry out.

★

There are no precedents for the shift of power that is to take place on January 20, 1953. What occurred on April 12, 1945, when President Roosevelt died and Mr Truman stepped into his place is no guide. Then the budget had already been submitted to Congress and the fact that Mr Truman was a Democrat of the Roosevelt persuasion made the transition relatively easy. There were decisions to be reached, things to be learned, and some Cabinet changes to be approved, but there were no new policies to be inaugurated, no budget to be recast at once, no clean sweep to be made of high government personnel. All that was necessary was that the name "Truman" appear where the name "Roosevelt" had appeared before.

Going back even further, to March 4, 1933 when Franklin Roosevelt took over from Mr Hoover, the last Republican President, is no more helpful. Just before he left office, Mr Hoover had submitted a budget, for the year beginning

on the following July 1st, of a little over \$3 billion. The budget for the year beginning next July will be about \$80 billion. In Mr Hoover's time, the federal government employed between 500,000 and 600,000 civil servants. Today the number is 2,570,000. The depression, the second world war, the Korean outbreak and the New and Fair Deals have caused a proliferation of government agencies in which Mr Hoover himself and a corps of experts in administration from inside and outside the government very nearly got lost four years ago. That was during the life of the Hoover Commission on the Reorganisation of the Executive Departments. Finally, it was only home affairs which suffered through the failure of Mr Roosevelt and Mr Hoover to co-operate during the much longer interregnum which prevailed then between the election and the inauguration of a new President. Now, continuity in foreign policy is even more vital.

To a very large extent, a budget makes a government, and the bigger the budget, the truer that is. It is therefore an extremely important fact, however little it is noticed, that the budget with which General Eisenhower or Governor Stevenson will be presented next January began to be drawn up before either one was nominated by his party for the Presidency. It will be nearly complete by the time one or the other is elected, and will be casting a forward influence upon government policy by January 20th, Inauguration Day. The construction of an \$80 billion budget requires about nine months, and is in full swing six months before the January deadline for its presentation to Congress. The budget for the year beginning next July began to be fought out in the departments and agencies of the government last July. During the late summer and early fall the Bureau of the Budget, an agent of the President, examined the requests of the departments and agencies and conducted further battles over dollars and cents. Then the Budget Bureau had to submit the result to the President, and, if he ordered, impose new changes upon the departments. By election day the President will have had to make many firm decisions.

The process takes no account of changes of administration. The President is required to submit his new budget within fifteen days after the new Congress convenes on January 3rd, which means that Mr Truman, not his successor, will submit the spending programme for the year beginning the following July. Twelve years ago an effort was made in Congress to clean up this untidy situation by providing for the budget to be submitted in February in inauguration years, but perhaps because in those days changes of administration were not part of the usual American experience, nothing came of the attempt.

The ten weeks between Election Day and Inauguration Day simply is not long enough to permit an incoming President to make a searching examination, let alone a deep-reaching revision, of such a massive document as the budget, even if he devoted himself to nothing else. The work of seven months cannot be undone in two, even assuming that a President-elect could assemble, as soon as the votes were counted, a staff of fiscal analysts matching that of the Budget Bureau. A White House spokesman has said that Mr Truman will offer the fullest co-operation in budget matters to the new President whatever his party. This attitude is in keeping with Mr Truman's respect for orderliness and continuity in government and his understanding of the problems of the Presidency. But all of Mr Truman's co-operation cannot create the time required. Inevitably, therefore, Mr Truman's budget will be imposed upon his successor, and along with the budget there will go, unavoidably, large parts of the Truman programme. In the months between January and

July, as Congress debates the appropriations requested, the new President will have opportunities to modify the proposals in the budget. But the appropriating process in Congress is quite as formidable and ponderous as the budget-making process in the Executive Branch, and does not lend itself to sharp alteration of programmes which have hardened in the departments months earlier.

The new problems inherent in the coming change-over have occupied a few minds in Washington. The Secretary of Defence, Mr Lovett, has made the interesting proposal, which has been approved by Mr Truman, that the President-elect at once name his new Secretary of Defence, and send him or his deputy to the Defence Department for briefings on the department's budget and the organisation and policies it reflects. Inasmuch as the department spends about five-eighths of the whole federal budget, this would be an obviously useful step. Mr Lovett suggests that the same might be done at the State Department and the Treasury so that in the vital fields of defence, foreign policy and finance the smoothest possible transition from one administration to another might be achieved.

Changes in personnel will, because of the size and complexity of government today, present the new President with other problems. He will, of course, change his Cabinet completely, although conceivably Governor Stevenson might not do this all at once. Below the Cabinet level, there will be a multitude of changes to make. It is impossible to estimate the number, because many such officials are appointed for fixed terms, and how many would choose to submit their resignations no one knows. Changes are possible in such important places in the government as the President's Council of Economic Advisers, the Bureau of the Budget, the National Security Resources Board, the Central Intelligence Agency (now headed by General Bedell Smith, once General Eisenhower's chief of staff), the Atomic Energy Commission, the Civil Aeronautics Board, the Mutual Security Administration, the Federal Reserve Board, and almost countless lesser agencies. In absolute numbers, the changes may not seem very great. One informed estimate recently put them at under two thousand. But these changes would take place in the top layer of government personnel, and finding even a thousand replacements would be task enough to occupy the President-elect during all the time he has before his inauguration.

American Notes

No Quarter for the General

General Eisenhower claims that he is far too old a soldier to be rattled by the "harmless blanks" being fired at him from the back of President Truman's campaign train. But his advisers, who remember that they laughed in 1948 when Mr Truman made a similar tour of the whistle-stops in his own behalf, treat the attack more seriously. A Republican "truth squad," armed with bulging briefcases, has been dispatched to give first aid to the General's reputation after each Presidential fusillade.

The official Republican view, and that of most of the press, is that this is a degrading and sickening performance, an exhibition of "gutter politics" which cheapens the Presidency and can only damage Governor Stevenson. Unquestionably, for better or worse, it links the Stevenson candidacy with the record of Mr Truman's achievements and weaknesses. The President is ardently defending his own administration and twenty years of Democratic rule, almost as though he viewed the election as a public verdict upon himself.

What Century did they build for?

From the early development of our railways to the latest requirements of air travel Cubitts have combined modern methods with enduring quality to retain their leadership in the constructional field. The solid portals of Euston and the

giant spans of the British European Airways Hangars at London Airport bear joint witness to over a century of progressive achievement.

Where Vickers
can help

The preparation for the extension of a factory may be the first step to higher, more efficient production. The second step often rests with Vickers, for the Vickers Group is one of the great world-wide organizations which can do much to ensure the success of new developments. Companies within the Group manufacture plant for a great many industries. The design of their products, often embodying the experience of many lifetimes, goes a long way towards providing the efficiency that crowns a new industrial project with success.

Products of the Vickers Group include: INDUSTRIAL TRACTORS, SCRAPERS AND DOZERS • SURVEYING AND OPTICAL MEASURING INSTRUMENTS • CONSTRUCTIONAL STEEL WORK • CEMENT MACHINERY • RUBBER AND PLASTIC PRODUCTS

"The most interesting event in English history since the war has been the successful launching of HISTORY TODAY."

Thus, on August 29th 1952, *The Times Literary Supplement*, described the new historical magazine that, less than two years ago, set out to bring history to life, in terms of present-day knowledge and present-day problems, for the benefit of the general reader. Every article is authoritative, ably written and fully illustrated. The October issue, now on sale, includes contributions on *Russia in 1839*; *Founding of Pennsylvania*; *Carlyle: Herrings and History*; *The Younger Pitt*, etc. etc.

* Formerly Larra

This may hurt the Democrats a little in the south, where Mr Truman is unpopular. But they can afford it there. The effect may not be the same in the much more evenly balanced states of the west and middle-west. Mr Truman, unlike Governor Stevenson, has no scruples about re-fighting the campaign of 1936. His slogan is "Look out, neighbour"—a variation of General Eisenhower's "Look ahead, neighbour." His theme is that the politically inexperienced General has been captured by the Republican right wing and turned into a "front for the special interests"—the oil lobby, the medical lobby, the private electricity lobby, the landlord lobby, and all the other private pressure groups. Vote Republican, he has been saying, and there will be no more Hungry Horse dams to provide cheap electricity for farms and new industries, no more great reclamation schemes. Vote Republican, and say goodbye to farm prosperity, full employment, high wages and social security. The "truth squad," encumbered by its own conservatism and the Republican record in Congress compiled during the party's long sterile years of opposition is at a disadvantage in answering such charges. The General's failure to rebuke Senator McCarthy for his slanders on General Marshall, which Mr Truman feels deeply, may be even harder to defend.

When the President concentrates on the conflict between liberal and reactionary domestic policies, he has been more enthusiastically received than when he accuses General Eisenhower of being partly responsible for the Administration's mistakes in Berlin and Korea. But professional help of any kind is at a premium in the Stevenson camp, which, in proclaiming its independence of the machine, to seem, in dissociating itself from the professional politicians. Senator Fulbright of Arkansas has now been called in to bridge this gap. The Gallup poll results are causing anxiety in Springfield; they show that the Governor, instead of catching up as the campaign goes on, is still well behind the General. The Roper poll, on the other hand, suggests that half the voters are still undecided; and that there is still room for a Democratic rally.

Justice was Incompetent

The Republicans have been anxious that the Chelf subcommittee of the House, which has been investigating the Department of Justice since last February, should release at least some of its findings before the election. The group's report on Mr McGrath, the former Attorney General whom Mr Truman appointed to clean up the Administration, does not make any allegations of corruption. But Republicans will be able to quote Mr Chelf, who is a Democrat, on the "inglorious failure" of the Executive to clean its own house, on Mr McGrath's "deplorable lack of knowledge of his own department," on his appointment of unqualified and unsuitable men, and on his lack of enthusiasm for purging even his own department of wrong-doers and incompetents.

Mr McGrath, it will be remembered, chose Mr Newbold Morris as his special investigator of corruption. The report insists that the Attorney General was told, in time, that Mr Morris was himself under investigation in a case involving the sale of surplus tankers. In view of this, the report concludes that the appointment was certainly hasty and improper, and that there are good grounds for believing that Mr McGrath saw advantages in appointing a man who might be susceptible to pressure to go easy on the dirty linen. Nor did Mr McGrath make any effort to co-operate with Mr Morris during the latter's brief term of office.

Mr McGrath has been out of the Administration for six months and his successor is at least making a show of energy. Mr McGrath has relieved the Department of two of the men whom the subcommittee hold responsible for the "shameful" slowness of the Department in handling war contract cases, though the third is now head of the Claims Division. He is ostentatiously busying himself with the

deportation of criminal and Communist aliens, and proceeding against others who secured American citizenship by fraud. It may be that Mr McGrath, as a political figure, is too stale to arouse much interest. But the committee's post-mortem will strengthen the general impression that it has long been time for a change at the Department of Justice.

* * *

Autos in Abundance

During the steel strike consumers turned a deaf ear to warnings that there might be a shortage of motor cars, and this indifference has reinforced the industry's belief that the long-heralded buyers' market is here at last. Output in 1952 has been held down to a yearly rate of about 4.5 million cars by the allocation of metals—fortunately, it appears, since sales have been slightly below production all year long, but next year it is expected that controls will be relaxed or withdrawn, and manufacturing will depend on market forecasts. These forecasts are hardly encouraging to an industry that has sold almost 30 million automobiles since the war, 6,600,000 in 1950 alone, for they indicate that from now on purchases will be made mainly for replacement, at the rate of four to five million a year.

All is not gloomy in Detroit, however; there are still 12 million prewar cars in use, and since most of the postwar designs have not been altered radically for several years, the industry hopes to turn major style changes to its advantage in 1953 by making earlier models look obsolete. It is an indication of intensified competition that the new models will be unveiled in November and December, earlier than is customary. In preparation for this, second shifts and overtime are being worked and the factories are once more going beyond the Michigan borders to recruit workers.

Although the industry is as coy as a Parisian couturier about revealing any details of its new look, hints have been given of what the bedazzled motorist may expect. The most important changes will be in engine performance; the trend toward higher horsepower has relegated six-cylinder motors to the "smaller" cars. More striking to the eye will be the body designs which will present a longer, lower car that stresses visibility in curved, one-piece windscreens and rear windows, tapered hoods and raised front fenders. There will also be more "optional" accessories on expensive cars such as power brakes, power steering and air conditioning.

Competition is to be, that is, by the addition of more and more costly equipment, in contrast to the competing methods of a pioneer in the field, Henry Ford, who reduced prices by stripping motor cars to their bare essentials. Certainly price is becoming a major factor, with over half the sales now being financed by hire-purchase, and will become even more of an issue when prices rise, as they are expected to do in 1953, by from 5 to 7 per cent. The popularity of small foreign cars has forced Detroit to recognise the need for cheaper models, but the prestige element is still felt to be so weighty that rather than frankly advertise a small car for a small budget, it is reported that shades of 1929 will be invoked and Americans urged to buy the minor models "as your second car."

* * *

"Murderers' Row"

Governor Stevenson last week turned to baseball, not, as might be thought, to the gangster kingdom, for a vivid phrase to describe the chairmen of committees in a Republican Senate who, he argued, would frustrate every international and progressive proposal of a Republican President. "Murderers' Row" was the name given to the New York Yankees' team in the nineteen twenties which included such mighty hitters as Babe Ruth and Lou Gehrig; they were more than a match for any pitcher. President Wilson once described the American government as a govern-

ment by the chairmen of the Standing Committees of Congress, and this remains largely true, though the powers of the Executive have grown, and the President can take his case to the people on radio and television over the head of the legislators.

Even if General Eisenhower is elected President, his party's chances of carrying the Senate are not bright. The Democrats held a majority of four when Congress adjourned. Only fifteen of the thirty-five Senate seats at stake this year are held by Democrats, and of these, nine are considered reasonably safe. The Democrats need win only five of nineteen doubtful contests to retain the majority which enables them to organise the Senate and name the committee chairmen. The Republicans would have to win sixteen to win control.

Should the Republicans bring it off, there are unquestionably some disasters in store. If Senator McCarthy is re-elected in Wisconsin, and unfortunately there seems no likelihood that he will be defeated, he would become head of the Committee on Government Operations, with the power almost of life and death over government departments and their servants. Senator Capehart, author of the amendment to the Defence Production Act which built inflation into the Act designed to restrain it, and implacable enemy of price and rent controls and public housing, would succeed at the Banking Committee which handles such legislation. Senator Milliken, at Finance, is, like Senator George, the present chairman, an advocate of lower taxes, but he is also opposed to tariff cuts. Senator Cain, the spokesman for private property interests, would be a calamity at Public Works. Senator Hickenlooper would be a deplorable successor to Senator McMahon as chairman of the Joint Committee on Atomic Energy.

Governor Stevenson very naturally did not go out of his way to draw attention to the beams in the Democrats' eyes. The chief eyesore is Senator McCarran, the powerful advocate of racial prejudice and enemy of human rights entrenched in the Judiciary Committee. Senator Langer, the ranking Republican, whose views on immigration are progressive, could not but be an improvement. For the sake of the farm vote in the middle west, Governor Stevenson has opposed the sliding scale of farm supports, and he therefore unfairly hung Senator Aiken of Vermont in his gallery of criminal portraits. He also overlooked the likelihood that Senator Saltonstall would make a worthy successor to Senator Russell at Armed Services; that Senator Wiley, who is in line for the chairmanship of the Armed Services Committee, has in recent months most courageously defied his party's isolationists, and that Senator Lodge, if he is re-elected, would be an ornament to the Rules Committee. Senator Taft, as chairman of the Labour and Education Committee, would be unpopular with the trade unions, but he is more open-minded on these subjects than they are willing to admit and a legislator of great experience and knowledge.

Construction Ahead

In the three months July, August and September, more new construction was put in place, despite the steel strike, than in any previous quarter. It was \$9.3 billion worth compared with \$8.7 billion in the third quarter of 1951, though the rise in labour costs means that physical volume was only slightly greater. The most rapid expansion since the end of 1950 has been in public spending, chiefly on defence installations and atomic energy plants. But the relaxation of credit controls last month may widen the boom. The main benefit will be felt, not by housing, but by commercial construction, which has been held back by the requirement of a down payment of 50 per cent instead of the traditional 33 per cent, and by a ban on the use of second mortgages. The Federal Reserve Board, under an amendment to the Defence Production Act, had no choice but to exempt housing credit from control, and it was not considered worth

while to continue controls on commercial construction, which amount to only one-sixth of housing's volume.

Moreover, one aim of the restraint on commercial building was to release scarce materials for the defence programme, and that need is disappearing. The steel strike has made it necessary to postpone until next May the bigger rations of steel, copper, and aluminium which the building industry might otherwise have had this autumn. But by next spring, even builders of bowling alleys, penny arcades, country clubs and theatres will be entitled to certain amounts of scarce materials. There will be more structural steel for blocks of flats. Builders of shops and office buildings will be given the same allowances as those given for industrial projects. There will be more generous amounts of metals for new schools.

Business activity in September, according to Federal Reserve estimates, reached 223 per cent of the 1935-39

average, equal to the postwar peak of April, 1951. Saving is dropping back to a more normal rate, to the relief of retailers. Few observers look for any recession in the next six months. But Mr Fowler, the new Defence Mobiliser, has once more called attention to the great expansion of capacity to produce basic materials. Those who look beyond the peak of the defence programme, which is scheduled to be reached in the middle of 1953, rely on the postponed demand for schools, roads, hospitals, office buildings—and swimming pools and skating rinks—to take up some of the slack which may appear.

Shorter Notes

Economy-minded housewives who put their woollens and furs in their deep-freeze units for protection against moths during the summer have been penny-wise and pound-foolish, the Department of Agriculture says. This kills the moths, but may also ruin the furs. The Department advises the use of freezers for food only, since other forms of moth prevention are easier and more suitable.

America's sweet tooth meant \$1.6 billion in sales of chocolates and sweets by confectioners last year, it is reported, an average of \$10.72 for every person.

Those who distrust the public opinion surveys of voter preference have a new guide to election trends, the sales of special cigarettes branded either "Stevenson for President" or "I Like Ike." The new cigarettes have not been on the market long enough for conclusions to be drawn, but they might prove as accurate as the chicken feed poll of 1948, when farmers in the midwest who were offered feed sacks with either Mr Truman's or Mr Dewey's name on them defied all predictions by choosing Mr Truman both on the sacks and in the voting booths.

Perpetuum mobile

FROM THE VAIN SEARCH for a machine that would continually rewind itself emerged the most important of all generalizations of physical science—the principle of the conservation of energy. With the development of the diesel engine science has come close to an approximation of this principle. And today the diesel engine is being applied to the services for mankind to which the search for perpetual motion was dedicated—the raising of water, the fertilising of deserts, the grinding of corn.

BRUSH ABOE is a group of companies concerned mainly

with the production of diesel engines—from the small 3 h.p. engines, more than 20,000 of which are working in India, to powerful 3,000 h.p. engines for heavy diesel-electric generating plants. In 1951 over 70% of the production of THE BRUSH ABOE GROUP was exported—to make the earth more fruitful by irrigation, to bring light and power to the under-developed areas of the East, to modernise locomotion everywhere. Every day and every hour the diesel engines exported by BRUSH ABOE are somewhere in the world improving living conditions—thus ensuring a "perpetual motion" of service to mankind.

VOL. MCIII, No. 252

Schweppshire Post, 1952

A new-found holograph of Schschwov, dancing master to the Princess Imperial, reveals the long-lost step "point-mains", proving that "sur les pointes" originally implied the tip of the index finger.

Small wonder that the *première danseuse* of to-day, with the long pointed fingernails of 1952, finds this position difficult to maintain.

An Interesting Find

EXCAVATIONS AT SUSSCHWEPPESS

Here, with measuring rod in cms. to show relative size, is a string of early corks proving that a palaeoschweppeic era did exist; though whether the corks were ever actually made of flint has never actually been proved. Some of these early corks are so rough that it is doubtful whether they were made by the hand of

man or nature or what their function, or whence.

During the cress tea which followed the recent outing of the Wescht Schweppshire Archaeological Society, Mr. Geoffrey Coad-Sanderson, secretary, said: "No cork without a bottle".

Is there a link between the civilisations in this fascinating Susschweppeian treasure and the recently excavated mug handles of the Persian Gulf?

The Susschweppe
Cork-Necklace.

CINEMA

MASTERPIECE AT THE 'FORWARD'

Motorbicycleto (English sound-effects) is the simple story of a simple motor bicycle engine and the part which it plays in an ordinary simple community, set amidst the intangible beauties of the Via Latina. I, for one, was deeply moved by this plotless and featureless film of overtones and undertones.

Moses (at the Schweppza Cinema). This film cost twelve million dollars. Verdict: Hi-ya, Mese.

A book of COBELES

Architectural Notes

Our photographer, in this glimpse of a "book" or "sette" of cobbles in the road by the tramlines outside Schwapping Station has caught the natural beauty of intuitive design and instinctively unfettered composition of the untutored roadmaker. We have chosen this picture, taken with an ordinary box camera, because it illustrates also the intuitive beauty of natural design, and the instinctively unfettered roadmaker's untutored composition.

Malenkov Reports to the Party

WHEN Georgi M. Malenkov ended his seven-hour report to the All-Union Congress on behalf of the Central Committee, the 1,200 delegates assembled in the Kremlin greeted him with an enthusiastic ovation for Comrade Stalin. This salute to the master for the pupil's performance was symptomatic. In fact Stalin partly stole Malenkov's show. The Congress really started three days before its opening meeting when Stalin's lengthy economic essay was published in *Bolshevik*. Then, when the Congress actually began, it was officially opened by Stalin's "comrade in arms"—Vyacheslav Molotov—who had performed the same ceremony at the previous Congress in 1939. This time Molotov was also elected acting chairman of the meeting, thus making it quite clear that the question of the succession is far from settled and that the leader's mantle is not at all certain to fall on Malenkov's shoulders. Malenkov's subservience to Stalin was discernible even in the construction of his speech, which was closely modelled on Stalin's past reports. But the copy was much duller than the original. After the early Bolshevik orators Stalin himself used to sound rather dreary and pedestrian; but one longed even for Stalin's crude jokes to break the monotony of his bureaucratic successor's speech.

Still, when all these reservations have been made, the fact remains that Malenkov was entrusted with the *pièce de résistance* of the meeting—the report of the Central Committee. It was left to him to expand and embroider the hints on foreign policy contained in Stalin's article and to outline the economic situation and the state of the party—subjects which will be further elaborated in the later reports of M. Saburov and Nikita Khrushchev. Malenkov's comments on foreign policy are dealt with elsewhere. Here it is proposed to stress the highlights of that part of his speech which dealt with economic and party affairs.

Economic Situation

EXPANDING BASIC PRODUCTION

The main stress is still laid on heavy industry. Judging from Malenkov's estimates of this year's output, the production of

		SOVIET INDUSTRIAL PRODUCTION

* Malenkov's estimates.

basic industries should exceed its long-term targets and the Plan may well be fulfilled ahead of time, in the now customary four years and three months instead of five years. This looks

especially true for the iron and steel industry—the key to industrial expansion—whose original objectives for 1955 seemed comparatively modest (see *The Economist*, August 30, 1952). Only coal output lags somewhat behind, since efforts to raise the productivity of miners have hitherto proved fruitless in spite of substantial investment in capital equipment. In fact, all Malenkov's complaints about shortcomings may be taken as part of a general campaign for cost cutting and increasing the productivity of labour. The fulfilment of promises made to consumers may well depend on the outcome of this campaign; for in the past the output of industrial consumer goods has not been rising as fast as scheduled, and the Soviet planners certainly do not intend to divert resources from heavy to light industry.

EASTWARD SHIFT OF INDUSTRY

The magnitude of the shift of industry from the traditional centres in the Donbas, Moscow and Leningrad to east of the Volga can be gathered from the figures quoted by Malenkov. Industrial production in the east has risen threefold since 1940 and last year already accounted for about one-third of the total. Approximately one-half of the total Soviet output of coal and oil, and more than half the crude and rolled steel now comes from these regions. The eastward expansion speeded up by the war has been continued ever since. It has obvious strategic advantages: many regions are becoming self-sufficient, bombing targets are spread out and industrial centres are shifted from the vulnerable western frontier to more sheltered inland regions.

TRANSFORMING THE COUNTRYSIDE

Agricultural production is apparently moving forward at last. This year's output of grain—it is claimed—should reach 130 million tons, despite the bad harvest in Siberia. This, however, is only 3 million tons more than was planned, but not fulfilled for 1950, and is still far away from the minimum target of 175 million tons for 1955. Why was so little headway made in this field in the postwar period despite the restoration and expansion of agricultural equipment? (The total horse-power of tractors and combines is now nearly 60 per cent higher than before the war.) Malenkov offers a partial explanation in the disorders caused by the great social transformation of the Soviet countryside involved in the amalgamation of collective farms. The process has now been ended and the average farm is nearly 3 times as large as before, the total number having been reduced from 254,000 to 97,000.

Malenkov has certainly nothing against this change, but considers that it was at first carried out too recklessly and thus was accompanied by undue disturbances. The plans for agro-towns and for rural industries are senseless at a time when the countryside should be fully occupied with increasing agricultural output. Thus, without mentioning him by name, Malenkov snubbed Nikita Khrushchev who was the architect of this policy. Yet, he also indirectly attacked Andreyev—its opponent. Moreover, Stalin himself has just asserted that bridging the gap between town and country is indispensable for the establishment of Communism. The Communist millenium, however, still looms far on the horizon, while it is inopportune now to run the risk of peasant resistance.

The report discussed first the changing pattern of world trade and showed how the United States has increased its share of world trade since the war from 11½ per cent to 16½ per cent, while Western Europe's share declined from 47½ per cent to 36½ per cent. And to make matters worse,

the United States now provides a larger proportion of the world's exports than it takes of the world's imports. For Europe the opposite is true.

The working party assumed that the dollar problem would persist for some time and argued that Europe must develop resources within its metropolitan and overseas territories not only to reduce its dependence on the dollar area but also to provide exports to that area as the United States increases its demand for foreign supplies of raw materials. A first essential is to promote trade within Europe so as to achieve the benefits of a better division of labour. This means that the various measures to liberalise intra-European trade should be restored and that these measures should be extended to countries with constitutional links with member countries—as indeed the sterling area has already done.

The working party referred to the possibility of introducing a secondary preference system between Europe and its overseas territories which would leave existing standard tariffs and preferences untouched. It emphasised that it was unable to undertake a technical study of this problem, but suggested that the preferences should be brought about through a lowering of duties between the countries concerned and that any country offering commensurate concessions should be allowed to join. But before any such system could be put into operation, it would be necessary to secure the sanction of the signatory countries to the General Agreement on Tariffs and Trade. Long-term contracts and international commodity agreements, it was thought, could encourage an increase in output while at the same time preventing abnormal price fluctuations. But their purpose should be to reduce fluctuations about the long-term trend and not to attempt to make the average price over a period of years higher or lower than it would otherwise have been. The working party realised that such an objective would be very difficult to attain.

Before discussing the problems of economic development, the report reviewed quite cursorily some of the main staple commodities such as grain, sugar, tobacco, rubber, etc., to bring-out some of the peculiar problems. It stressed the fact that development must be studied commodity by commodity and area by area and not as a grandiose all-embracing policy. But if international trade is to be extended, currencies must be interchangeable with one another and, as the experience of the EPU has shown, this means that member countries must aim at achieving internal stability. This stricture applies to all countries, both debtors and creditors; each has adjustments to make to keep the world economy in equilibrium. The report concluded that

only by a joint effort and a readiness to accept a strict financial discipline in order to achieve a substantial rate of savings and a surplus in their balance of payments, can the member states of the Council of Europe ensure without inflationary pressures at home, the continuous flow of investments necessary to overseas development.

The prime need of development is an adequate supply of capital. The working party made no attempt to assess the annual quantity required, but it realised that the demand for capital would be larger than any single country (other than the United States) could afford to supply. It realised, too, that private investment by the United States was likely to be small. It therefore argued that the capital requirements for development could be met only if all countries of Western Europe contributed, and to facilitate this it suggested the setting up of a European investment bank that would enable those countries without dependent territories to join in the development of other countries. In the international sphere, it thought that the World Bank, supplemented if necessary

BURY FELT

On his tour, the General revealed that he possessed the common touch to a high degree. His speeches, which have a staccato colloquial manner still reminiscent of the barrack

Then, finally, came the fiat that Nahas must retire. His last years must be spent in untroubled—and untroublesome—peace. It was another enforced abdication. The aged leader saw himself, like the King, launched out upon an idle future, with destination not Capri but the Styx. The fate of Nahas was not, however, as firmly sealed. The new law was being interpreted to mean that the Wafd could only exist without Nahas, but there was nothing to prevent his choosing instead Nahas without the Wafd. And this is what he did. The first refusal to fulfil the conditions imposed on parties by the

new law meant that the Wafd would cease to exist as a party. In choosing this course, Nahas, and the people who identify their future with his, counted upon the turn of fortune's wheel. They calculated that "the leader of the people" would hold court at his Garden City villa, and that by so doing the press and public would continue to consider the Wafd a reality even though it was debarred from political activity by the law. Wafd intransigence was immediately countered by a statement from Fathy Radwan, the Minister of State, intended to discredit the Wafd Party, and by Mohamed Neguib who launched out upon his successful tour.

The Wafd leader was unfortunate in that when the Army took over Egypt there emerged at its head a man who shows all the signs of being able to lead the people. He leads, furthermore, without appealing to nationalistic extremism. He preaches a kind of commonplace social morality. His three-point slogan is "unity, discipline and work." Liberty, he says, must have its limitations—the other fellow has his rights too. He confined his references to the national aspirations to about two hundred words at Tanta in which he condemned that "son of a dog," Mr Head, for his reference to the Canal Zone, and even then he said the people would have to work and stand united if they were to achieve their aspirations. The tenor of his words was altogether different from the sound and the fury of Nahas's declamations against the British enemy.

European Steel Output Expands

THOSE who see a slump around the corner will find little support from the latest figures of steel production just issued by the Economic Commission for Europe. With very few exceptions steel production throughout Europe has been expanding steadily ever since the end of the war, and in most countries it has surpassed the output of even the most prosperous prewar years.

EUROPEAN CRUDE STEEL PRODUCTION.
('000 tons). Annual rate.

	Best prewar year	1936-38 average	1947	1951	1952 1st half	1952 July
U.K.	1939 13,434	11,974	12,929	15,889	16,302	14,468
W. Germany ..	1938 17,007	16,181	3,060	13,506	15,013	16,538
France	1929 9,711	6,216	5,733	9,832	10,798	10,368
Saar	1933 2,557	2,404	708	2,603	2,749	2,892
Belgium	1929 4,140	2,120	2,892	5,088	5,286	4,248
Luxembourg ..	1929 2,705	1,976	1,714	3,077	3,024	2,892
Italy	1938 2,323	2,145	1,691	3,063	3,460	3,552
Holland	...	44	187	553	578	...

After Britain, Western Germany has the most impressive record. Its achievement in steel production demonstrates once more the remarkable resilience of the postwar economy. Although the west Germans were late starters, owing first to physical destruction and then to the limitation on heavy industry imposed by the Allies, they have made a swift recovery. In July of this year production had reached an annual rate of 16.5 million tons—a rate equal to Britain's for the first half of this year. While this figure is still well below the peak attained during Hitler's rearmament boom—some 18 million tons in 1938—the signs are that the Ruhr will rapidly make up the difference. Investment plans for the German steel industry envisage an increase to 18½ million

tons by 1956, but many observers believe that by the end of 1954 the Germans will already be producing at an annual rate of 19 million tons.

The other countries of the coal-steel community can point to substantial, if less spectacular progress. Dutch steel production is small but growing. Belgian output remains above the prewar peak, in spite of some grumbling among customers about the high price of Belgian steel. French steel production is 73 per cent above the depressed year of 1938 and 11 per cent higher than the 1929 record. But the French, even when the Saar's production is added to their own total, are outdistanced by the west Germans. France will have to expand steel production much faster if it is to achieve that "industrial parity" with Germany which its politicians and industrialists regard as the surest guarantee against German domination of the six-nation community.

New Zealand and the Commonwealth Conference

[FROM OUR WELLINGTON CORRESPONDENT]

THE conference of Commonwealth Prime Ministers in London in November has not so far aroused any marked interest in New Zealand. This is possibly because the House of Representatives is still in session and preoccupied with domestic affairs; more probably it is because the agenda for the conference has not been published or discussed publicly by the Prime Minister, Mr Holland, or any of his Ministers. But behind the scenes there is a great deal of activity, and the various government departments concerned with trade, finance and production are marshalling a very detailed brief for the Prime Minister. This will include a survey of New Zealand's capital development requirements during the next five years. It will not be a complete survey because there is not time to make one, but by taking representative firms in all branches of industry as examples, it will provide a very useful guide.

A survey of this type is badly needed in New Zealand. The country is well served by a very competent statistics department, but no detailed survey of its capital development requirements has ever been made. The Department of Industries and Commerce, which is assuming more and more of the responsibility for planning the country's economic future, has pointed out that New Zealand fell seriously behind in its capital development during the depression of the thirties and that it had not recovered from this when the second world war set it still further back. The struggle for postwar recovery has tended to place the emphasis upon immediate requirements and to thrust the needs of the future into the background.

Cutting Down on Dollars

Mr Holland can be expected to stress New Zealand's development possibilities for British capital, but he will also emphasise that New Zealand must have reasonable liberty to look elsewhere for the equipment and materials that cannot be obtained within the Commonwealth. The ambitious Murupara paper and pulp project, for instance, which is designed to exploit the vast timber resources of the state forests inland from the Bay of Plenty in the North Island, has now been reorganised so that it will need much less hard currency than was at first envisaged. Nevertheless it will still need some dollars to pay for the necessary equipment. British paper interests were offered a chance of co-operating in the scheme directly, but the negotiations broke down because they wanted to take complete control. The Government has laid it down as a matter of policy that the control must remain in New Zealand, and this may be taken as a significant indication of the probable line of policy in other major developments.

New Zealand's interest in the strengthening of the sterling area is unequivocal. Britain is still buying between 60 and 70 per cent of all New Zealand's exports, and the Commonwealth including Britain about 73 per cent. Quite apart from the bonds of tradition and sentiment, which are stronger in New Zealand today, probably, than in any other part of the Commonwealth, the Dominion's self-interest binds it irrevocably to Britain as its chief market. Recent criticism of the price the United Kingdom is paying to New Zealand for its meat should not be allowed to convey the impression that the importance of the British market is not recognised in New Zealand and deeply valued. It is, however, a warning that a large section of New Zealanders, notably among the farmers, is becoming increasingly critical of the disparities in the prices Britain pays to its various overseas food suppliers. The feeling is growing that New Zealand's sympathy and feeling for the mother country is being exploited—not by the British people, but by those who do their bargaining.

Opportunity for British Firms

New Zealand has now irrevocably tied its development to hydro-electric power, and with consumption constantly overhauling power output, the rapid development of the various major power schemes in both islands is of paramount importance. The Government has now recognised that the resources of its own Works Department are inadequate to keep up with the demand and is inviting overseas contracting firms to its aid. There is plainly a great opportunity here for British firms if they can use it; but if they cannot, New Zealand will inevitably be forced to turn elsewhere.

The country is also planning an extensive development of its artificial fertiliser production. This is based chiefly upon phosphatic manures and envisages at least the doubling of present superphosphate production. Schemes for establishing large plants to manufacture superphosphate by new processes which will not require the direct importation of raw sulphur are now under consideration and will need heavy capital development. If New Zealand is to be Britain's major overseas source of food supplies it is clearly in the interests of British capital and British industry to help this programme as much as possible.

At the forthcoming conference New Zealand will, however, be bound to emphasise that its situation as a Pacific country, its new defence alignment with the United States, and its trade with North America make it highly desirable and its trade with the United States make it highly desirable and its trade with North America make it highly desirable. It for it to develop rather than reduce these associations. It can be relied upon to support very strongly any united Commonwealth moves to encourage a more reciprocal attitude by the United States. The continued exclusion of New Zealand butter from the American market and the tags that are at present imposed upon New Zealand's meat trading in the same area are felt to be out of keeping with the spirit of Gatt. It is also recognised that the present system of American wool buying has a disturbing effect upon the New Zealand market. It was largely the effect of American stock-piling that induced last year's wool boom, and it is recognised that marked reductions in American buying could have equally disturbing effects in the opposite direction.

Cost of Welfare State

New Zealand has so far escaped the worst effects of the current wave of inflation, but the Government is not finding it easy to reconcile other classes in the community to the large postwar increase in farming incomes. Its most immediate problem is to put more value into the New Zealand pound, and here it finds itself handicapped, in the field of state expenditure, by its commitment to the policy of a welfare state. The Government has made no attempt to attack this problem. Its reluctance is understandable, since any general curtailment of welfare activities would be extremely dangerous politically. It is not yet recognised, outside some

official and some economic circles, that the general stringencies of the sterling area may force the country to make some such unpalatable decision. New Zealand has already run down its sterling reserves very severely and it is doubtful whether it will be able to achieve the balance with the non-sterling area promised by Mr Holland last January. As the restrictions upon imports and currency tighten, Mr Holland is facing increasing criticism among sections of the population which are traditionally favourable to his party. He will therefore be anxious to explore any methods that may be discussed in London of bringing down the cost of British exports and of putting greater value into sterling.

As a prosperous and well fed country, New Zealand can perhaps be excused, at the moment, if it does not realise as keenly as does the United Kingdom the crisis in the affairs of the Commonwealth which the London conference is to attempt to solve. Its good will towards Britain and its dominating interest in strengthening sterling are, however, beyond doubt.

Socialist Gains in Japanese Elections

JAPAN has now voted in the first parliamentary general election since the signing of the peace treaty and the end of the Allied occupation regime. The result, though involving no drastic change in the balance of political forces which existed in the last House of Representatives, is very significant of contemporary trends. The Liberals, who have provided the present government led by Mr Yoshida, remain the strongest single party; they still have an absolute majority in the House, but with a representation reduced from 285 to 240 seats in a total of 466. The largest non-socialist opposition party, the Progressives, has increased its strength from 67 to 85. But the most striking gains have been made by the Socialists, who have increased from 46 to 111, and have wiped out the parliamentary representation of the Communists; the latter won 36 seats in the last general election, but none at all in this one, though they put up 107 candidates.

The Socialists, however, are not a united family; they are divided into two bitterly hostile factions which function as distinct parties. Of these, the Right Socialists, led by Mr Kawakami, have increased from 30 to 57, while the Left Socialists, led by Mr Suzuki, have risen from 16 to 54. It

ECONOMIC CONDITIONS ABROAD

The Economist Intelligence Unit provides quarterly reports on economic and business conditions in

Argentina, Australia, Belgium, Borneo, Brazil, Burma, Canada, Chile, China, Colombia, Cuba, Denmark, Egypt, Finland, France, India, Indonesia, Indo-China, Israel, Italy, Japan, Yugoslavia, Kenya, Malaya, Mexico, Netherlands, New Zealand, Norway, Pakistan, Persia, Philippines, Portugal, Siam, Southern Rhodesia, Spain, Sweden, Switzerland, Turkey, Union of South Africa, Uruguay, USA, Venezuela, Western Germany.

These reports give a concise analysis of matters of concern to exporters and investors. Particulars may be obtained from The Economist Intelligence Unit, 22 Ryder Street, St. James's, London, S.W.1.

is the latter, therefore, who have made the biggest gains, and they have undoubtedly done so largely by absorbing the former Communist vote. On the face of it, the switch of votes from the Communists to the Left Socialists is a very encouraging sign; it certainly reflects a general anti-Russian sentiment in Japan, which was fed by the Soviet Government's failure to return a large proportion of the prisoners of war captured in 1945, and exacerbated just before the elections by Moscow's veto on Japan's application for admission to the United Nations. On the other hand, the Left Socialist policy is to oppose both rearmament and the stationing of American troops in Japan; it advocates the absolute neutrality of a completely unarmed country between the Soviet Union and America. This mixture of pacifism and nationalism avoids the unpopularity of being openly pro-Russian, but as a force of opposition to all efforts to make Japan defensible against a Communist coup it certainly plays the Communist game.

The absolute majority in the House held by the Liberals approximates Japanese parliamentary politics to the British idea of party government rather than to the type in which cabinets can be based only on unstable coalitions of minority parties. It is not certain, however, that the Liberals will be able to maintain their unity. The party has been deeply divided by the personal feud between Mr Yoshida and the former leader, Mr Hatoyama, who was "purged" by General MacArthur in 1946 for having sung the praises of Hitler at a time when it was fashionable in Japan to do so; Mr Hatoyama claims that Mr Yoshida made a verbal promise to return the leadership of the party to him if he were "depurged"—as he now has been. The bulk of the Liberal deputies apparently support Mr Yoshida, but if Mr Hatoyama's followers break with the party they can deprive it of its majority in the House, and there would then presumably be manoeuvres for a coalition between the two Liberal factions and the Progressives.

Conservative Revival in Sweden

[FROM OUR SCANDINAVIAN CORRESPONDENT]

THE dullest election campaign within the memory of most Swedes has produced the most surprising results of the past twenty years. On the first count the non-socialist parties seemed to have obtained a clear, if tiny, majority in the Second Chamber of the *Riksdag*, with 116 seats out of 230. When the postal votes had been counted they were found to have only 115, but this does not affect the fact that the Social Democrats have met with a wholly unexpected setback. Their vote, after falling to 46 per cent of the total ballot in the 1948 general elections, had risen to 48.6 per cent in the county council (*Landsting*) elections of 1950, which were on the same electoral roll. The behaviour of the Communists and of the Soviet Union since 1950 seemed to promise the Social Democrats a considerable accession of votes from the left. Accordingly the party optimists spoke of winning 120 seats, and most people expected them to get about 115, or half of the whole Chamber. Instead, they got 150,000 votes less than in 1950, their share of the total ballot was only 46.4 per cent, and two of their 112 seats were lost. Meanwhile, the Conservatives have increased their seats from 23 to 31, and the Liberals from 57 to 59. The Communists have, indeed, lost three of their eight seats, but it is the opposition rather than the Social Democrats who have benefited.

The changed balance of power is of future rather than immediate interest for two reasons. First, 25 of the non-socialist votes belong to the Farmers' Union, still the allies, though restive ones, of the Social Democrats. Second, on

some important measures the First and Second Chambers vote as one, and in the two together the left-wing parties still have an absolute majority.

In these circumstances, the position of the Farmers is crucial. Without them the Social Democrats would be hard put to it to govern and still less to continue on a Socialist path without relying to a probably unacceptable extent on the Communists. The future of the coalition is still in doubt. The Socialist Prime Minister, Hr Erlander, on hearing the election results, immediately stated that, since a majority of the voters was still behind the coalition, its future was not affected by the election. Tearing himself away from his wireless about the same time, however, the Farmers' leader, Hr Hedlund, expressed his opinion that the coalition had been too much for many of his former supporters, who could not get accustomed to it in the relatively short time it had existed, and they had transferred their votes to the Conservatives. Hr Hedlund added that he saw no reason to depart from the present arrangements. But it is reasonably certain that, as long as the coalition does continue, the Farmers will demand a stiffer price for their support. Their most important newspaper has already come out for a revision of policy.

The Communist Vote

For the foreign observer two other aspects are of especial interest—the persistence of a surprisingly large Communist vote, and the Conservative revival. The former is a remarkable and most disquieting phenomenon. In spite of the recent spy trials and the loss of two Swedish aircraft over the Baltic, the Communist vote has fallen only by 23,000 since the 1950 county elections. The only conclusion can be that there are many more convinced Communists in Sweden than was generally supposed.

On the other side, the Conservatives' success has been equally surprising, as their leader Hr Hjalmarsson, who undoubtedly had much to do with it, was prompt to admit. It would be tempting to conclude that, because the latest public opinion poll, published in election week, shows that the largest support for Swedish participation in Nato comes from the Conservatives, their success might presage a change in thinking on foreign as well as home policy. But it would be quite wrong. Foreign policy as such was not an issue in the elections. Moreover, much of Hr Hjalmarsson's unexpected support is undoubtedly due to dissident Farmers, few of whom favour Swedish membership of Nato. It would be stretching belief too far to assume that the Farmers who voted Conservative were also in favour of a different foreign policy. In any case, the alleged percentage support for Nato in the various parties—44 per cent among Conservatives, 38 per cent among Liberals, 17 per cent among Social Democrats and 13 per cent in the Farmers' Union—represents only about a quarter of the whole electorate.

Internal policies, however, will certainly be under strong attack. Dissatisfaction with the high rate of taxation, and with the Government's obstinate and sometimes slippery refusal materially to modify its attitude—to make, for example, significant inroads into its enormous budget surplus in order to lighten the burden of rising living costs a little—has contributed much to its setback at the polls. Tax relief is therefore likely to be on the agenda. Similarly there should now be a general easing of controls and a loosening-up of the economy. But, as British experience in a situation much more favourable to new measures has shown, strict limits are set to the hopes of a jubilant opposition by the high level of fixed costs inherent in a welfare state and the claims of foreign trade. All the same, the spectacle of a retreat from socialism in the country that for many years has been hailed as a model of socialist successes should prove an interesting political phenomenon. But then Sweden is neither as socialist nor, having regard to its favourable position these last twenty years, as successful as is generally maintained.

We've solved some problems in our time!

WANTED—an unspillable aircraft battery. That was 1916. On the western front, British artillery observation pilots, harried by enemy fighters, were learning new evasive manoeuvres in a very hard school. With them, right way up or upside down, went the batteries used for W/T communication with the gunners below. Every so often, inverted batteries lost their acid and put the wireless transmitters out of action.

Chloride Batteries solved that problem quickly—and finally. A battery with each of its necessary gas vents constructed in the form of compartments within compartments, so as to make an acid trap, was soon in action: the first truly non-spillable battery, and the forerunner of every such battery made since.

For more than half a century, each year has brought its quota of problems to this company. In industry, transport and communications here and abroad, we

can point to tens of thousands of our Chloride, Exide and Exide-Ironclad Batteries each giving satisfactory service in the special job for which we were asked to design and produce it. Those are answers which time has proved to be right.

Our battery research and development organisation is the largest and best equipped in the country—if not in the world. It is at industry's service always—ready at any time to tackle another problem.

THE BUSINESS WORLD

Unexpected Surplus

AGAINST all expectation, Britain earned a surplus of £24 million on its balance of payments in the first half of this year, compared with a deficit of £394 million in the second half of last. The deficit with non-sterling countries fell between these two periods from £576 million to £244 million, thanks mainly to a reduction in imports of £232 million (or nearly 19 per cent); other reasons for the narrowing of this gap were the increase of £35 million (or between 4 and 5 per cent) in British exports to these non-sterling countries and an improvement of £65 million in net invisible payments to them (chiefly because no interest payment falls due in the first half of the year on the North American loans). Simultaneously, Britain's surplus with the sterling area rose from £182 million in the second half of 1951 to £268 million in the first half of 1952. The main factor here was an increase of £76 million in British exports to this area; a small fall of £16 million in Britain's imports from Commonwealth countries was partly offset by a £6 million decline in its net invisible receipts from them.

This, in broad outline, is the story of Britain's recovery—and all these figures are struck before taking credit for the £58 million of American defence aid, which new-fangled and misleading official practice now seeks to add to the overall surplus (making it £82 million instead of £24 million in the last half-year). The recovery has certainly been more rapid than any fore-caster in the dark months of last winter thought that Britain could achieve; and it has also been greater than Mr Butler, speaking in the House of Commons in late July, thought that Britain had achieved. Even Mr Butler, it now transpires, was misled by the insufficiently cheerful picture presented by the monthly trade and navigation accounts.

The factors that have made recent trade and navigation figures misleading deserve close analysis, for they contain at once the explanation of this week's happy surprise (which the gilt-edged market was not slow to register) and the first of several bluebottles in this apparently soothing ointment for shattered nerves. Hitherto, it has been possible to make some guess at the course of this country's visible trade balance by deducting between one-tenth and one-eighth from the value of imports as recorded in the trade and navigation figures (to allow for freight and insurance charges) and then subtracting the resulting net figure from the f.o.b. value of exports. This simple arithmetic gives a reasonably accurate result only if three conditions are fulfilled: First, that the composition of imports (and thus the proportion of freight and insurance charges) is not in course of major change; secondly, that exports not included in the trade returns (chiefly diamonds, silver and second-hand ships) remain approximately stable; and thirdly, and most important, that no distortion is introduced by the fact that the trade and navigation figures record the values of exports and imports as they pass

through the ports, while the balance of payments figures seek to record them when changes in ownership take place.

In recent months all these three factors, and especially the last, have given an odd twist to the picture presented by the monthly trade and navigation accounts. The basic reason for this twist lies in the fact that Britain tends to pay for its imports more promptly than it receives payment for its exports; both imports and exports, of course, are carried on credit across the high seas—but the credit that carries each of them is often extended by British banks. The result is that when imports are declining, the balance of payments benefits more quickly than is apparent from the trade and navigation accounts; and when exports are falling, the adverse effect upon the

balance of payments is delayed. This means—and it is here that the first fly appears in the ointment—that the heavy fall in exports that occurred in May and June, which most people had assumed would burden the balance of payments figures for the first half of the year, will in fact have to be borne in the current half-year's accounts; while the heavy fall in imports, which most people had supposed would benefit Britain's balance of payments in the current half-year, has in fact lent its helping hand to the figures published this week. In other words, the two main reasons for this week's pleasant surprise were reasons that have been borrowed from the improvement that had been expected for the second half of this year.

Does this mean that Britain will relapse into deficit for the second half of 1952? The Government seems to be quietly confident that it does not. The Treasury still expects to achieve overall balance, though within a changed geographical pattern. In particular, it believes that Britain's deficit with the non-sterling world should be brought down from £244 million to £115 million in the current half-year, and that at that level it will be covered by receipts of defence aid. As an offset to this improvement, the recent Commonwealth import restrictions mean that Britain's surplus with the sterling area

will inevitably fall from the peak level of £268 million achieved between last January and June, but it should not fall below the £115 million needed to secure overall balance.

This geographical pattern—a smaller surplus with the overseas sterling area and a smaller deficit with non-sterling countries—is, of course, highly desirable on general grounds, but there must inevitably be some concern about the way in which it is apparently being achieved. So far, exports to non-sterling countries (as shown in the trade and navigation accounts) are obstinately refusing to expand in the current half-year, and it must be assumed that any improvement in oil companies' profits which have still not recovered fully from Abadan and other invisible receipts will not greatly out-

TABLE II—THE STERLING BALANCES
(£ million)

	Dec. 31, 1948	Dec. 31, 1949	Dec. 31, 1950	June 30, 1951	Dec. 31, 1951	June 30, 1952
HELD BY NON-STERLING AREA COUNTRIES:—

weigh the payments due at the end of December on the North American loans (amounting to £41 million in interest and £29 million in capital). It follows, therefore, that if the non-sterling deficit is to be brought down by nearly £130 million to £115 million in the current half-year, the main factor must be another drop in non-sterling imports—perhaps of the order of 10 to 15 per cent. The decline in non-sterling imports between the second half of 1951 and the first half of 1952 already amounted to £232 million (or approximately 19 per cent); of this no less than £192 million fell on imports of raw materials, food and tobacco. Mr Butler declared at the Mansion House on Tuesday that this cut was achieved "without any depletion of our stocks as a whole; indeed, there was some increase." It seems clear, however, that in certain imported raw materials—as distinct from in the broad aggregate—stocks must have been depleted, and that they are going to run down still further in the second half of the year. Some time before the end of 1953 they will have to be built up again—and it is this fact, together with the difficulty of expanding non-sterling exports, that makes it impossible to view last week's pleasant surprise as anything more, in Mr Butler's words, than an "invaluable breathing space."

★

Unfortunately, too, the overseas dominions have been much slower than the mother country even in drawing breath. Figures that can be deduced from the balance of payments White Paper, set down in Table III below, suggest that the total strain imposed on the United Kingdom by the overseas sterling area's external deficit

fell from £376 million to £269 million between the second half of 1951 and the first half of 1952. Within these totals, however, the overseas dominions' imports from the dollar area showed no change, and their deficit with the dollar area actually increased by £4 million (in a period when Britain's deficit with that area fell by £129 million). Moreover, the fact that the dominions' sterling balances fell by £309 million between end-December and end-June, despite the probable continuance of some net capital outflow to them, shows what a heavy gap they have to make up by the import restrictions now in effect.

While the dominions continued to pre-empt the United Kingdom's productive resources and to borrow from it, the colonies continued to lend to London on a mounting scale. Besides increasing their surplus with the dollar area in the half-year by £25 million to £68 million, and getting back to balance with EPU, the colonies increased their sterling balances by £75 million to £1,042 million. These balances have now more than doubled since the end of 1947; in fact, West Africa and Malaya seem to have been second only to the United States as capital exporters in the last few years. Many Australians would no doubt be surprised to know how far their uneconomic industrialisation programme has been financed by Mr Nkrumah's Point Five aid.

Obviously this cannot go on for long. One of the most significant series of figures in the balance of payments White Paper is, in fact, the table of sterling balances, reproduced as Table II in this article. That table shows

that not only the independent dominions but also non-sterling countries ran down their balances sharply in the first half of this year. In many cases—and particularly in southern South America—these balances are now virtually at vanishing point. Clearly, exporting to these countries—profitable to the industries concerned, but often unrequited as far as the national economy is concerned—is going to be much more difficult in the years ahead. The urgent need now is that this increasing difficulty, and the much needed stimulus to a diversion of British resources that it will accord, should not be circumvented by a large outflow of British credit to them. Lasting solvency, like lasting sculpture, can come only from stone that is hard to cut.

New Frontiers for Electricity

ALL the nationalised fuel industries are acutely conscious of the slackening in demand that began late last year, but the British Electricity Authority is the first to record its effects on a year's trading. So great is the momentum of expansion in electricity that the effect was felt only in a falling off in the rate of increase in consumption, though it became a marked falling off as the year wore on. In the first half of BEA's financial year to March, 1952, output from power stations was 11 per cent more than in the same period of 1950-51, but in the second half output was only 3 per cent higher, and it fell below the previous year in December and March. Maximum demands each month, which from April to August, 1951 were well over those of a year earlier, fell below the previous year's figures in the next three months, and again in March. One welcome consequence was that BEA was able to increase its generating capacity by much more than maximum demand rose, and with more effective load-spreading in industry only six power cuts had to be made during the winter, compared with 86 in the winter before.

In its annual report this week BEA attributes the slackening partly to milder weather between September and March, but largely to the parallel slackening in industrial output, which was 4.4 per cent up on the previous year in the first half of 1951-52, but only 1.3 per cent up in the second six months. Even so, it managed to sell 8 per cent more electricity during the whole year than in 1950-51 (when the corresponding increase was 12 per cent), and nearly 10 per cent more to industrial consumers. BEA also raised its prices from an average of 1.181d. a unit to 1.220d. Revenue from 50,400 million units of electricity sold to some 13½ million consumers thus rose, by nearly 12 per cent, to £256.4 million. Nevertheless, because some of the area boards were engaged in designing new standard forms of tariffs, the increases in prices required to meet increases in costs were in some cases delayed, and total revenue did not rise sufficiently to cover the increase in costs.

The total revenue of the industry rose by £26.9 million in 1951-52 to £263.9 million, but its total expenditure—which includes £22.8 million of interest paid on its capital—rose by £30.3 million to £261 million. The combined surplus was thus reduced from £6.3 million to £2.9 million—the smallest margin in any of the four years since nationalisation. Within that total, the balance shifted. The central authority, which generates electricity and sells it to area boards, made £4.3 million on the year, while the fourteen area boards, in the aggregate, showed a deficit of £1.3 million. This change resulted largely from an increase in the central authority's bulk tariff for power. It increased the demand charge in this two-part wholesale tariff and refined its definition of "maximum demand," changing the wholesale price of electricity to conform more nearly with costs at peak hours—a principle that the industry regards as impracticable to apply to retail prices.

The generation system's load factor based on the maximum demand supplied, fell to 50.9 per cent in 1951-52, from 52.6 per cent the year before. Works costs of generation increased by about 8 per cent to just over a

halfpenny a unit: the heat consumed per unit sent out fell by 2 per cent, owing to more efficient generation, but rose in cost by 9 per cent, owing to the rise in cost of fuels. The authority is the largest consumer of coal in Britain; in 1951-52 it took 34.3 million tons, paying on the average for this and other fuels about 11 per cent more in price than a year before. With railway and road haulage rate increases, higher fuel prices cost the industry some £9½ million more than in the previous year; increases in salaries and wages added £4½ million.

Nobody would suggest that the current faltering in the upsurge of maximum demand in itself calls for a drastic recasting of the existing programmes for expanding generating, transmission, and distribution capacity (though the extent to which maximum demand may be inflated by peak hour prices that are too cheap remains as relevant as it ever was). BEA spent £137.4 million last year—more than ever before—and this year it hopes to spend more than £160 million. It brought 1,192,000 kW of new generating capacity into service and shut down 119,000 kW, its biggest net increase in capacity. It spent rather less on mains transmission than the Government had belatedly approved, and rather more, owing to higher prices, on distribution. As a whole, spending was kept within BEA's allotted share of the Government's investment programme. Lord Citrine remains deeply concerned about the effect on the planning of future construction programmes that a possible Government limitation to 1,500,000 kW in any year might impose; but it still seems true that shortage of equipment and difficulties in construction, rather than permission from Whitehall, are limiting factors in the industry's vast programme of investment.

But the industry has much better grounds for its worry over the growing costs of this investment programme. A power station of 120,000 kW begun in 1948, when capital costs were already between two and three times their prewar level, might have cost £6 million. By the time it was completed, it would have cost the authority £500,000-£750,000 more. The same station started today would probably cost £7½-£8 million, in spite of the technical economies that have been effected. BEA cannot escape the effect of rising interest rates, though it is privileged over other industrial borrowers; its last issue of capital, in April this year, cost 4½ per cent, against 3 per cent in 1948. Its current rate of capital expenditure—about £150 million a year—would represent, say, about £115 million at 1948 prices, and this increase in prices and interest rates means about £2½ million extra in charges on each year's capital outlay.

★

These hard facts have not persuaded the authority to alter the provision it makes for depreciation to correspond to current costs of new equipment. BEA justifies its adherence to depreciation based on historical costs with some closely reasoned arguments that might form a model defence, had not the newest recruit to nationalisation, the steel industry, already sold the pass by setting aside a special reserve from taxed profits to bring its normal provision for depreciation up to replacement cost levels.

The British Electricity Authority remains steadfast in its adherence to accounting convention, and finds new aspects of social purpose to justify its decision:

The main ground on which the replacement cost basis has been advocated appears to be that it is the duty of an industrial organisation to maintain its productive capacity intact out of current revenue. . . . Its application to an industry operated by public corporations financed by loan capital would imply that it is the duty of the consumer to provide, through higher tariffs, the additional money estimated to be necessary. . . . The authority do not agree that this is an obligation which should be placed on the present consumers.

Depreciation at historical costs, it says, has always been the practice of the electricity supply industry; and it comments, with justification, that until the Inland Revenue accepts the replacement cost principle consumers would have to pay roughly double the extra amount needed for more realistic provisions. Moreover, "it is quite conceivable" that technical improvements might so reduce future replacement costs—even apart from the uncertainty of future price levels—as "to offset substantially" the increase in equipment prices to their present level; it follows, therefore, that depreciation based on current costs might put "an unnecessary burden" on consumers.

Although it is quite impossible to accept such arguments, it is only fair to record that BEA added £2.3 million to its central reserve fund; this fund, with area reserve funds, now amounts to some £10 million. It has also put aside £2.3 million to bring the taxation reserve up to £5.8 million; in spite of the withdrawal of initial allowances this year, it is still estimated that no profits tax liability will arise until 1953-54 and that any liability for income tax will be deferred for several years after that date. But the fact that it is now spending on capital investment some £150 million each year and setting

aside less than £40 million means that it must remain a constant borrower of new loan capital at the privileged interest rates that it enjoys. Its statutory borrowing powers are restricted to £700 million. By the end of March this year it had raised £371 million, and its outstanding contractual commitments amounted to some £274 million; thus its unexercised borrowing powers had been largely hypothecated. In due course Parliamentary approval will be required for further borrowing. At the present moment, despite the issue of £150 million worth of stock in April, bank loans stand at about £35 million and they are increasing at the rate of some £9 million a month. The time is rapidly approaching for an independent assessment of the extent to which BEA ought to finance the replacement of its capital, as distinct from its extensions, out of its own net revenues.

There are some signs that this stubborn defence of depreciation at historical costs, coupled with the refusal to ask the electricity consumer to pay for maintaining intact the equipment that supplies his power, are now reinforced by some anxiety over what the traffic will bear. For many years the industry has accepted its "7 per cent per year" increase in consumption (which held good even last year) as a law of nature. But some doubt seems to be dawning whether demand—at any rate from certain consumers for certain loads—will remain so triumphantly inelastic if prices are pushed much further. If BEA had to increase all its prices by the proportion that realistic depreciation would require, would it price itself out of some of the attractive off-peak business which it is still trying to promote, with every reason, in its quest of a better-balanced load?

Spokesmen for the British Electricity Authority had no comment this week on the Ridley report, and little to say about tariff policy. But it is perhaps still fair to question

its difficulties in seeking useful off-peak-loads—even if depreciation provision were made realistic—would not arise rather from the form of its own tariffs than from the actual amount of the price. So long as the authority holds that there is no practicable method of charging more for electricity when it costs more at peak hours, it is logically bound to overcharge the off-peak consumer whose custom it is entitled to attract. For example, if it sells at peak hours for 1½d. electricity that costs it nearly 4½d. (to take the estimates of the Ridley report), it must recoup itself from the off-peak consumer—and also resign itself to spreading and shedding peak loads for years to come, and in the long run perhaps to excessive capacity used at an unnecessarily low load factor.

But it would perhaps be expecting too much of the

Agenda for GATT

NO meeting of the contracting parties to the General Agreement on Tariffs and Trade has ever been held in an atmosphere so full of uncertainty as the session that is now taking place at Geneva. One question mark hovers over these proceedings like the sword of Damocles: what is to be the future relation of the United Kingdom and other countries of the Commonwealth to Gatt? That issue may acquire greater precision in the course of the Commonwealth Prime Ministers' conference, which opens at the end of next month. Meanwhile, an uncomfortable interval has to be filled, in which respects have to be paid but major decisions avoided. Courtesy without commitments is the keynote. By sending relatively junior delegations to the Gatt meeting, most of the Commonwealth countries have followed the lead given by the United Kingdom when it sent its ministerial "second eleven" to the Mexico City meetings of the International Bank and the International Monetary Fund. The United States delegation at Geneva may be more high powered but it is not in reality powerful, for the whole issue of American trade policy, including the Reciprocal Trade Agreements Act and the relations of the United States to Gatt, are in the lap of the next President and Congress.

Apart from these questions of representation by second teams and the doubts and reservations that may lie behind the proceedings, the current meeting of Gatt has to work through an important agenda. The meeting will not be enlivened as others have been by concurrent tariff negotiations. To have started another round of bargaining now would have been too great an act of faith in the face of the prevailing uncertainties; it would in any case have ignored the clear symptoms of tariff indigestion that were evident at the Torquay meeting, when the last round of multilateral tariff negotiations was conducted. None the less, delegates of 34 countries now assembled in closed session at Geneva will have to settle issues of considerable importance during the coming five or six weeks.

The items on the agenda fall into four broad categories. First, there are consultations with countries that have imposed import restrictions on the ground of weakness in their balance of payments. Secondly, complaints of alleged violations of the provisions of Gatt have to be heard. Thirdly, there is the vexed issue of the admission of Japan. And fourthly a reconciliation must

current lull in fuel demand to count on much change of heart in the industry about tariffs that might transfer demand from peak to off-peak hours. The authority has taken the opportunity of a mild winter, the Ridley Committee's discussions, and the setting up of a small departmental committee on load control, to put into abeyance the practical tests of load control that it undertook to make last year. Although demand seems to have fallen off more this summer—in the first five months of BEA's current financial year demand was probably below that of the same months in 1951-52, though it jerked upwards in September—there is not much real anxiety about pricing electricity out of the market. The holly berries, after all, are early on the bough. Perhaps it will be a hard winter—with BEA once again crying confusion to all its critics.

be attempted between the Schuman Plan and Gatt.

In the first category, consultations will concern not merely import restrictions of long standing but also the recent accentuation of discriminatory import cuts by Britain and France. These exchanges are unlikely to give rise to explosions of the kind that occurred at Torquay on the first consultations. The accepted definition of consultations among the subscribers to Gatt has changed considerably during the past eighteen months and has come to accord closely with that held all along by Great Britain. The chairman of the present session of Gatt, Hr Johan Melander, of Norway, put the point plainly in his opening speech:

We should eliminate any suggestion or feeling that the countries with whom consultations are taking place are defendants in a cause, and the other contracting parties are plaintiffs. A consultation under the General Agreement is a discussion of mutual problems undertaken in the common interest.

To put his meaning beyond doubt, Hr Melander emphasised that the special role of Gatt was to deal with practical questions of international trade, not with the financial aspects of trade restrictions. He hoped, therefore, that the Geneva meeting could avoid the "excess of legalism" which had tended in the past to plague consultations of this kind. Given such a liberal and sympathetic definition, the consultations on import restrictions should not give cause for friction or complaint at Geneva.

The complaints about particular violations of the general agreement that lie before the present session are a truly representative selection. To enumerate them is to demonstrate the important service that Gatt renders by providing a platform from which alleged wrongs can be ventilated by the smallest countries against the biggest. There is, for instance, a goodly tally of complaints against the United States. Some are of old standing, such as the criticisms of United States' restrictions on imports of dairy products. Others are of more recent origin, such as the recent increase in the United States tariff on dried figs and the export subsidy on sultanas. Gatt has no power to apply sanctions or even to pass judgment in such matters; but it provides a means of bringing moral pressure to bear on delinquents in commercial policy and there is ample evidence that dislike of being required to answer for breaches of the code acts as a considerable deterrent to would-be transgressors.

The wide range of complaints before this session may be gauged from the following selection. Germany is being accused by Norway of putting higher duties on Norwegian than on Portuguese sardines—to which the Germans answer that the Norwegian “sardines” are quite another kind of fish—namely, brislings. This is not merely an argument in marine biology; it involves an important commercial principle, that of tariff nomenclature, on which the Germans have been ready to trample in the past—it was not so long ago that the Germans defined “cheese” as the product of milk obtained from cows grazing at 1,000 metres and over, so as to withhold from the Netherlands concessions they wished to give to Switzerland. A more explosive complaint may be that tabled by India concerning the discriminatory export tax on jute levied by Pakistan, for this issue is inflamed by the present political relations between the two countries. Its dangerous potential underlines the service which Gatt provides by establishing an open forum where such a dispute can be discussed. Belgium will be reproached by the United States and Canada for the restrictions on dollar imports that Belgium has imposed, though that country does not suffer from balance of payments difficulties. The Belgians will presumably reply that in OEEC and EPU Belgium is being criticised for running an excessive dollar deficit balanced by an EPU surplus and thus acting as a funnel for the entry of inessential dollar goods into Europe. Which of these two voices, in each of which the United States has a part, is to prevail? On this issue, Gatt will be performing a good service in reminding the world once again of the occasional contradictions of United States policy.

Japan's application to join Gatt is probably the most important single item on the agenda of the meeting. The battle on this issue has probably been won before it has been fought. On a simple majority of members' votes, Japan can proceed with arrangements for multilateral tariff negotiations with a view to later accession to Gatt; that majority seems to be assured among the 34 countries represented at Geneva. Among that majority will be found the Asian members of the Commonwealth. In spite of this, there are indications that the United Kingdom, supported by Australia, will fight a delaying action. In doing so, it is likely to accumulate discredit, for the cause it is fighting is poor and defeat is inevitable. Efforts are therefore being made to evolve a formula which will please all parties—to postpone effective action until well into 1953, but to do so with sufficient courtesy to Japan to make postponement a positive compliment. An initiative of this kind will deceive no one, but it may be a useful attempt to deprive the “get-out-of-Gatt” school in Britain of the one argument they might wield with success in the coming debate on imperial preference and “unfair competition.”

The harmonising of the Schuman Plan with the Gatt code creates an exceptionally complicated set of problems. The simplest of them is the fact that within the European Coal and Steel Community there will be free trade in coal and steel and, therefore, tariff concessions which will not be extended to countries outside the Plan. In order to create this selective free trade area a waiver must be obtained from the relevant provisions of the Gatt code. But in discussion on this matter, other decidedly relevant issues may have to be considered. One of them is the level of the common tariff in coal and steel that the Schuman countries will apply versus

the non-Schuman countries—which may affect Britain and Sweden. Another is the range of commodities to which free trade within the community will apply. Some of the Schuman countries would like to see it stretched a long way along the line of semi-manufactured goods. Provision may also have to be made for the possibility of one of the countries in the coal and steel community applying import restrictions on steel for balance of payments reasons. Would the whole of the community have to follow suit—as would logically be required of every constituent of a truly free trade area? Such incidental questions reveal the complications of this issue, but the necessary reconciliation will no doubt be found. The chairman's references to the Schuman Plan as “one of the most ambitious and courageous international experiments which has yet been attempted” reflects the prevailing will to find solutions of this complex of problems.

When the work of the session is rounded off by a number of technical questions, included at the behest of the International Chamber of Commerce, on such subjects as the valuation of goods for customs purposes, the problem of nationality of manufactured goods, documentary requirements and consular formalities, its utilitarian character becomes clearly apparent. Gatt at Geneva will not excite those critics in this country who would like to throw it overboard and live in a lotus land of preferences and protection. It will do nothing to inspire those who may be wavering in their support of the ideas of expanding competitive trade and are being tempted into rosy views of the supposed expansion and prosperity that could be secured in a preferential commonwealth kraal. The debate on these matters will begin in earnest late next month. Meanwhile, Gatt will show, in a sober fashion, some of the advantages that come from nations talking together about their mutual trade. They are too important to be thrown aside in exchange for a commercial mirage.

Recorded and Indexed

To record, summarise, and index economic documents and events, this is one of the many functions of the *Records & Statistics* supplement to *The Economist*. For example, issues published during the last three months have contained information on subjects as varied as the latest Soviet Five Year Plan, the Annual Reports of the Iron and Steel Corporation and of the Transport Commission, the OEEC Report on the financial situation in Western Europe and North America, the results of the 1% sample of the 1951 census, and the American report on the Materials Policy Commission.

A monthly cumulative index, published in the first issue of alternate months, enables each item to be found quickly and easily.

Subscription rates: £2 10s. a year, or, together with *The Economist*, £5 a year.

Records & Statistics Department, The Economist, 22 Ryder Street, London, S.W.1.

Business Notes

Funding by Persuasion

The newcomers to the gilt-edged market have not improved upon acquaintance. The Treasury's latest issues are now seen to bear a much closer family resemblance to the ill-favoured debutantes of last November than was at first suspected outside the limited circle to whom the preliminary introductions were made. Last year it was evident from the outset that the authorities were gate-crashing their Serial Funding Stocks into the banking system and were determined upon their acceptance. This time the approach was more diplomatic, and the hard features of the protégés were veiled so graciously as to suggest that they were expected to win through by their own charms alone. Admittedly, they are better favoured than last year's trio, but it is now clear that something more than natural appeal was needed to secure for them the reception accorded this week.

The Treasury announced after the close of business on Monday (and the simultaneous closing of the lists) that cash subscriptions amounting to £135 million had been received for the new 1953 1½ per cent Funding Stock, £67 million for the 1954 1½ per cent Stock and £115 million for the 1955 3 per cent Stock, making a total of £317 million. There is no doubt that the greater part of these applications came from the banks; those from other unofficial quarters, including the discount market, are unlikely to have surpassed a few tens of millions. The turn offered by the 1953 stock by comparison with the existing 1953 issue on the eve of the announcement was about ½ per cent, both on the issue price and on the redemption yield (£2 15s. 9d. per cent), but on the 1954 stock it was much narrower (and the redemption yield only a penny or two more); moreover, the margin between the redemption yield on these one- and two-year bonds and that currently obtainable from Treasury bills was much less than that offered last November.

The change of trend in bank advances (not to mention the pressure of bank salaries) has doubtless made the banks more than ever anxious to improve their earnings from other assets if their position permits; but it is hard to believe that they would readily have sacrificed liquidity for so small a turn had they been left entirely without official guidance. After all, the recent steep rise in liquidity ratios had not tempted them to add perceptibly to gilt-edged portfolios by purchases in the market. One of a number of reasons for this caution may have been the knowledge that any attempt at the genuine funding operation that was needed would have depressed prices (though not necessarily in the short bond section); and to that extent the very timidity of the tactics actually chosen has been a reassuring influence—for the short run. But the real key to the banks' response lies in a more positive guidance than this. It is now generally known that the authorities indicated that liquidity ratios ought to be reduced, and that the cash offer of these bonds should be the occasion and the means of the reduction.

Cutting Liquidity Ratios

Since the ratios of the individual banks vary widely—the range among the clearing banks at the September make-up was from 36.4 per cent to 41.6 per cent—a suggestion of this kind is sharply distinguishable, in a technical sense, from the suggestions made last November, when the banks were expected to take up funding stocks in proportion to their deposits, and for a given total amount. None the less, a rough estimate of the sum the authorities hoped to secure seems to have been deducible from other indications—notably from a hint that the appropriate ratio might be in the region

of 34 per cent—given the reduction that will occur during the tax-gathering season early next year. Since the ratio shown in September was 38 per cent and gross bank deposits then stood at just over £6,000 million, the conclusion was drawn that clearing bank applications would total about £250 million. In fact, they may have fallen somewhat short of that figure; and, after allowing for subscriptions by the Scottish banks, discount houses and other financial institutions, it seems likely that a moderate sum was taken by the authorities themselves.

The authorities would certainly emphasise one other important difference between these issues and those of last November. The offer then was made exclusively to holders of Treasury bills to exchange into bonds, and no cash subscriptions were invited. This time it was emphasised that the offer was exclusively for cash, and that subscriptions in bills would not be accepted. Thus the issue was given the guise of an entirely normal market operation—and it may even have been intended to be more normal than it in fact proved to be. In a formal sense, the distinction between cash and bills was of course maintained; but in a practical sense it was an impossible distinction, because cash had to be found for the subscriptions in the interval before the Treasury used the moneys for formal repayment of bills—and the only way of providing it was for the “special buyer” to buy bills, for account of either the Bank, or the “departments,” or the Treasury itself. After some indecision at the end of last week, this was of course duly arranged, and wholesale purchases of bills were made on Monday to the extent necessary to keep the discount market “out of the Bank.”

In these various ways, the technical appearances of these issues are therefore an improvement upon the bludgeoning method of last year; but the principle involved is not so very different, and there are some who would even prefer to see it starkly displayed instead of coyly hiding behind these trappings. It may be that a comment such as that does less than justice to the intentions of the authorities, who may even believe that the suasion they have exerted has not been considerable. But if they do indeed cherish such an illusion, they greatly underestimate the power of a hint as distinct from a formal “request.” They have for so long schooled the banks to regard requests as commands that they must not complain if fine gradations in the expression of official desires have ceased to be distinguishable. For the rest, the full verdict on this operation must await the results of the conversion, the lists for which close next Monday. Only then will it be possible to guess whether any net funding of bank liquid assets is likely to be achieved—to guess how much of this week's sharp reduction in those assets will be restored when the unconverted margins of the bond maturities are repaid next month and next March.

* * *

Chancellor and the Deficit

Meanwhile, the behaviour of the gilt-edged market in this past week reflects very clearly the general judgment that the intention of these new loans is merely to maintain the *status quo*. The market's initial pause for appraisal of the operation scarcely did more than halt the recovery that had set in a few days before. The declines on Thursday of last week did not exceed ¼; and these minor losses have since been made good in a generally firm market—except that the rises in short bonds that had been adjusted to the terms of the new issues still leave them with small net losses. The long-term market has now regained a large part of the ground so suddenly lost a fortnight or so ago; prices are within

one and two points of last month's peak. But the firmness in the past few days has probably been due as much to the impression given by the balance of payments White Paper and by the Chancellor's speech at the Bankers' Dinner on Tuesday as to the reprieve granted by the softness of the tactics of the conversion loans. The former influences have certainly been the dominant ones in industrials, which have gained ground daily, raising the index of *The Financial Times* by 1.9 from its low point of 112.9 reached in the middle of last week.

Mr Butler's speech surveyed a year of achievement, quite impressive achievement; but it has been a year well documented with economic data, so that he added little to what was already known. He likewise gave no new pointers to economic policy. In the sphere of domestic monetary policy, the only deduction that can usefully be drawn is that the Chancellor prefers at present to wait until the revenue quarter of this fiscal year before taking any new decisions. For reasons that were already familiar, he believes that the current Exchequer deficit is "to an abnormal extent due to special or temporary factors, and that any shortfall on the estimates I made last March will not be so serious as to defeat the ends I had in mind." It is to be hoped that he is right; and it is equally to be hoped that he will be forthright, now that the season for review of departmental estimates is approaching, in his determination "that the improvement in our external finances shall not be prejudiced by any slipping away on the home front."

The problem here is one of degree; for there is wide scope for action between the extremes of "panic slashing" that nobody would advocate and the very modest economies that have been achieved so far, despite the Chancellor's bold words. It is very evident, for example, that the Governor of the Bank of England has a much sharper sense of the need for economy in public expenditure than has the Chancellor—perhaps because, while the Governor is spared the responsibility for imposing it, he is better placed to observe the dangers of its insufficiency. The potency of monetary policy, Mr Cobbold said on Tuesday, has been demonstrated afresh in this past year; but "it cannot work miracles," and its efficacy in restraining the private sector of the economy is in danger of being neutralised by heavy public spending: "it is generally held in the City that this is the most important question of the day for our further progress in strengthening the currency." It is, indeed; and the same point was made in different form by Mr John Braithwaite, speaking for the Stock Exchange. He pleaded for a more realistic basis for taxation of companies—and would even prefer a higher rate of tax on true profits to the present rate on "phony profits," distorted by the system of depreciation allowances. But, this vital point apart, he believes that the country cannot "much longer stand the present level of taxation." Certainly it cannot much longer stand the wastage of productive capital and dearth of risk savings that are the inevitable fruits of the present fiscal system.

Raising the Sights in Steel

Pig iron output last month reached 208,600 tons a week, equivalent to an annual rate of 10,845,000 tons. It scored a record, 7,000 tons a week higher than in August and 19,100 tons a week, or nearly a million tons a year, higher than in September, 1951. This massive increase has come about partly from the six new blast furnaces that have been brought into operation at British steelworks since the beginning of the year; and it provides the solid base upon which Mr Sandys was this week able to express his hopes that steel production next year may surpass the 1950 record of 16½ million tons "by a substantial margin." Two more blast furnaces, at John Summers and at Sheepbridge, are expected to be blown in by December; the year's big increase in blast furnace capacity provides a more lasting foundation for record steel output than was implicit in the increase in output in 1949

and 1950. That increase, valuable as it was, could not be more than temporary, for it was founded upon huge imports of scrap from Germany that were expected to dwindle and did so drastically last year. The last twelve months has seen a steady shift from scrap to pig iron in steel-making, and the industry's plans for development in the future call for the continuation of this increase until in several years time the proportion of steel made from pig iron reaches nearly 75 per cent.

At the opening of the new Trostre tinplate mill this week, Mr Sandys was able also to endorse the forecast of 16 million tons this year, accidents barred, that the industry has been making for months. But he had nothing to say about steel allocation. Few large consumers seem to be complaining of a serious shortage of steel in general today, though certain types are still tight, and alloy steel, even of "economy" specification, is hard to obtain. There have even been hints of a growth—and considerable unbalance—in consumers' stocks of steel. It is probably still too early to expect the Government to consider relinquishing this one major physical lever of production planning that remains to hand. But prospective steel supplies after the next few months do not suggest that allocation will long remain necessary or very effective.

Happier Motoring

The four catalytic cracking units that should be producing premier-grade motor spirit by the time that it begins to be sold again in February will have a capacity of less than 2 million tons of this higher-grade spirit a year; the planned total capacity, with the two units due to come into operation next year, may be some 2½ million tons. Last year's total consumption of motor spirit was just under 5½ million tons, and about 2½ million tons of that was used in goods and public service vehicles, most of which will presumably use the branded commercial-grade spirit, of pool quality, that the oil companies are also to sell. Rather more than half the eventual "cat cracking" capacity will be owned by Shell and Anglo-Iranian, which market their petroleum products jointly. Of the American-associated companies, Esso has the Fawley cracker, the largest single unit in the country, and the Coryton cracker, which may not come on stream for some months, is owned jointly by Socony-Vacuum and Powell Duffryn. Regent Oil, controlled by Trinidad Leaseholds and Caltex, has no catalytic cracking unit in this country.

The output of premier-grade petrol immediately available, therefore, may amount to about three-fifths of the spirit used by private cars and motor-cycles; since some of the modern light delivery vans have the same engines as cars, the companies hope to sell the better petrol to some of these also. Competition for the motorist's extra three pence a gallon, therefore, will not necessarily be too hectic early next year, unless disinflation and the present level of motor fuel tax have made him rather less willing to purchase extra efficiency in motoring than the companies hope. But the advertising campaigns are already launched; and the companies' plans for exclusive dealing by garages are being given final touches.

A year's output of premier-grade petrol may take about 45,000 tons more crude oil than it did to make 1,500,000 tons of pool. This extra import, costing about £225,000, is now revealed as the hidden point at which the Minister of Fuel baulked for so many months: for about 8 per cent of its cost may be in dollars. Mr Lloyd seems now to have accepted the companies' contention that this \$50,000-odd may well be offset by the economy in use that better petrol will offer. The import of tetra-ethyl-lead for pool-grade petrol, to replace ingredients now to be used in the premier grades, will cost about \$700,000 next year. But the industry plans to have a new plant operating within a year capable of producing all of this ingredient that will be needed for British pool grades.

To some *this is just a Vase!*

But anyone familiar with ceramics would know that it is a piece of world-famed Delhi blue pottery.

Through years of specialized study, the ceramics expert has attained a high degree of skill and discernment in his particular sphere and this is also true of the National Bank of India and its unrivalled knowledge of eastern trading. As a result of many years of continuous experience the National Bank of India can now provide much information vital to the success of modern trading ventures. Your enquiries will be welcome at the Head Office or at any of the Bank's branches.

COFFEE: The earliest

witness to the tonic effect of coffee was possibly an Arabian goatherd who noticed that whenever his flocks fed on a certain shrub the effect on their behaviour was immediate and remarkable. Greatly daring, he ate a handful of the berries and found the effect so exhilarating that he ran non-stop to his village to break the news of his discovery.

Although the popularity of coffee was well established by the middle of the nineteenth century, it was only at the beginning of the twentieth that Kenya Colony began to grow it. To-day Kenya specialises in the *arabica* variety which is the finest quality grown.

Full and up-to-date information from our branches in Kenya on the coffee industry and on general market conditions in the Colony is readily obtainable from our Intelligence Department.

"Terylene" on the Market

Imperial Chemical Industries has announced this week that small quantities of goods made from "Terylene" yarn are coming on the British market. There has been a certain impatience in the textile industry with the progress that ICI has made in putting this new synthetic fibre into production. It is the first yarn of its kind that can properly be called a wholly British development. ICI began experimenting in conjunction with the Calico Printers' Association in 1944, and is now in the stage of pilot plant production with an annual output of 600,000 odd pounds of yarn a year. The first full-scale unit, intended to produce 11 million pounds of yarn annually, will not be ready until 1954. Meanwhile the one other company that has rights for "Terylene," du Pont, has succeeded in putting the fibre into production on an appreciable scale in the United States and distributing what appear to be considerable quantities of yarn; some American-made garments have in fact appeared on sale in London this summer.

Progress in the new ICI plant at Wilton has been governed by plant deliveries, which took a year to 18 months compared with 8 to 9 months in the United States. But there are other reasons which may account in part for delay. ICI is committed to a heavy capital expansion scheme of which the "Terylene" venture represents only a small part. The two raw materials used to make the fibre, terephthalic acid and ethylene glycol, are both to be produced at Wilton and it is reasonable that the sections of the plant producing them and also their raw materials are working smoothly before proceeding with manufacturing commitments based on them.

The marketing of a textile fibre opens a new field for ICI. "Terylene" fabrics have to sell on performance. The fibre presents a valuable combination of properties, for it is remarkably strong, not very elastic, highly resistant to water, light, and acids. It is also expensive; in full production the price of the yarn is not likely to be any lower than that of nylon (11s. 3d. for staple nylon and 20s. 10d. for 30 denier continuous filament) and will thus be considerably dearer than natural fibres, with the possible exception of silk. It is not difficult to envisage a considerable industrial market for "Terylene" and the domestic market is expected to take considerable quantities. Being relatively inelastic, it does not have the potential use for stockings that has been the mainstay of nylon; on the other hand, it has a rather warmer texture, and greater resistance to creasing. ICI claims that none of the fabrics, knitted or woven, needs to be ironed after washing. Certain technical difficulties connected with the low moisture absorption of the fibre have somewhat limited the range of dyes that can be used, and these technicalities also explain why no mixtures of "Terylene" with other fibres have yet been demonstrated in this country. The first tentative experiments already suggest that the market will absorb considerably more than 11 million pounds of yarn a year, and a three or four-fold increase in capacity is under discussion.

The Yield on Japanese Bonds

This week, with the initial burst of enthusiasm over, Japanese bonds have settled down to a more humdrum existence, while investors have attempted to sort out—by guess work or slide rule—the individual merits of each loan. Price movements in the market have not been excessively violent, but, as the accompanying table shows, investors have tended to favour the 1907 loan, the Tokyo Electric stock, and the 1924 loan more than the other government stocks. One new factor had to be taken into the market's calculations on Tuesday when the original somewhat vague statement on sinking funds—that "where there are already sinking funds these will be renewed in accordance with the original contracts as from 1953"—was amplified by the publication of

the actual amounts of the sinking funds to be applied. The Tokyo Electric stock now has a fixed annual sinking fund of £117,000, payable annually. Half yearly sinking funds are to be applied to the 1924 loan (amounting to £179,000), to the 1930 loan (£131,500), and to the 1926 Tokyo loan (£60,000); and a quarterly sinking fund of £11,795 is to be applied to the 1912 Tokyo loan. The sinking funds on these four loans are cumulative, so that the amounts given relate to the first instalments only.

This information induced some switching from those loans not supported by a sinking fund to those that are; by the close on Tuesday the 1910 loan had recorded a net loss on the day of $\frac{1}{2}$ to $73\frac{1}{2}$, while the 1924 loan showed a net gain of $\frac{1}{2}$ to 102. The operation of these sinking funds cannot, of course, be taken into account in calculating the yields offered by the loans—and, in any case, such calculations can only be very rough approximations. In view of the substantial tax deductions that will be made from all interest payments (including interest arrears) net redemption yields

	Remaining Life in years	Price on Sept. 29, 1952	Price on Oct. 8, 1952	Approx. net redemption yield %	Net yield basis suggested in the market %	Suggested equivalent value

* Adjusted to give effect to the dollar clause at \$4.03 to the £. † Adjusted to give effect to the dollar clause at \$4.87 to the £. ‡ Adjusted to give effect to the Swiss franc clause at Fr. 17.35 to the £.

are perhaps more meaningful in this context than gross yields; the accompanying table therefore shows approximate net redemption yields on the basis of prices at the close on Wednesday. This calculation immediately reveals one curious anomaly: the net redemption yields on the shorter dated stocks are higher than the yields offered by the longer dated loans. A circular issued by a well-known London firm of stockbrokers this week has drawn attention to this curiosity; it suggests a more reasonable, if arbitrary, gradation of net redemption yields and the equivalent price of the loans that would offer these yields. These calculations, which are shown in the last two columns of the table, may take too "bullish" a view of the general yield basis on which Japanese bonds will eventually settle. But it is hard to resist the conclusion that the shorter dated stocks have been somewhat neglected.

"As Much Tea as You Like"

So far as the trade is concerned the ending of tea rationing in this country has proved a damp squib. Although free to do so since Monday, housewives have not rushed out to replenish their store cupboards, nor have wholesalers received any sudden demands for supplies. Admittedly, prices at the London tea sales have risen slightly in the last few days, but this seems mainly to have reflected a seasonal improvement in the quality of tea offered. This is the time of the year when the main part of the Ceylon supplies reach London and the quality has been exceptionally good this season. Moreover, the fact that less tea than usual has been offered in Colombo during the last few months has stimulated interest in the London sales.

Derationing of tea has been a slow but painless process. Importing was handed back to private trade in April, 1951, but before the domestic rationing system could be abolished British prices had first to be brought into line with world

levels. The Minister announced in March this year that he had decided to remove the subsidy of 8d. per lb, and when this was carried out some three months later the trade was allowed to increase retail prices by up to 10d. a lb, on the understanding that reasonable quantities would be available at 3s. 8d. a lb (compared with the minimum subsidised price of 3s. 4d.). In July the ration was increased to 2½ oz a week, and at the beginning of September it was further increased to 3 oz. By making this gradual increase, rather than removing rationing in a single step, the Ministry was able to gain in advance some idea of the possible size of unrationed demand. And although the increase in the weekly ration to 3 oz at the beginning of September seemed unduly cautious—it is unlikely that average weekly consumption of tea will reach this level—it did give distributors a breathing space in which to build up stocks in the shops. The housewife has enjoyed a gradual increase in supplies during the last few months, and has also been able to buy cheaper tea. The trade has done better than merely keep its promise to provide tea at 3s. 8d.; many popular brands have since been reduced to 3s. 4d. and some are now selling at 3s. a lb.

The ending of tea rationing in this country has undoubtedly been made easier by more plentiful world supplies. In the first seven months of this year, production in all countries excluding China totalled 551 million lb compared with 512 million lb in the same period last year. The whole of this increase has come from larger output in northern India, where it seems that freer picking has led to a sharp rise in the proportion of poor quality tea. Prices of all grades of tea have been much lower this year than in 1951, but the market for poorer grades has been exceptionally weak. Thus while prices at Colombo have shown some improvement in the last two or three months, those at Calcutta, which is the main outlet for northern Indian supplies, have continued to fall.

New Agreement for Sugar?

Prospects for a new international agreement on sugar seem to be improving. Last week the special committee which had been studying the problem reported to the International Sugar Council that the time had come to negotiate a new agreement; the existing agreement was set up in 1937, but the quotas fixed under it have not been enforced since the war. There will be a month in which governments can study the committee's report before the council meets in November to decide whether to ask the United Nations to call an international Sugar Conference next spring. It will not be easy to negotiate a new agreement, but the need for a revised treaty is now widely accepted. The Council estimate that there will be a surplus of 2,385,000 metric tons of sugar this year: the whole of the non-dollar supplies will be absorbed, and the surplus will consist entirely of sugar coming from the dollar area and principally from Cuba. The economies of many of the sugar producing countries in the dollar area are based on sugar, and to cut production would mean reduced revenue and large scale unemployment. These countries are therefore favourably disposed towards any scheme that offers a chance of minimising the cuts that might fall on them. At first sight, non-dollar producing countries seem to have less to gain from an agreement, but the sugar markets cannot be completely insulated from each other by \$ and £ signs. Sooner or later any weakness in dollar sugar would affect production throughout the rest of the world.

Cuba supplies the bulk of the sugar for the free market and holds most of the current surplus. This year's record crop amounted to some 7 million metric tons compared with an average level of 5½ million tons. Threatened with an enormous surplus, Cuba set aside about 1½ million tons in a stabilisation reserve to be released over a period of five years, and was left with some 2,400,000 tons to be sold outside

the United States and Cuba, of which only 50,000 tons remains to be sold. But as most countries have now bought all the sugar they want for this season and since the European countries will have ample supplies of their own beet sugar, Cuba is unlikely to sell much from the stabilisation reserve. The Cuban Government has recommended that next year's crop be limited to 5 million tons but it is anxious not to have to accept the whole burden of cuts leaving other countries free to increase their production.

Since the international agreement of 1937 world sugar conditions have changed radically. During the thirties the world market had been shrinking, for more and more consuming countries were covering their basic requirements from subsidised domestic production, or from preferential imports. The quotas established by the agreement were far bigger than the free market and were never effective. Increased populations and higher rates of consumption in certain areas such as Eastern Europe and Africa may have enlarged the potential market. But if serious cuts in production in Cuba and other dollar areas are to be avoided, some way will have to be found to enable the United Kingdom and other consuming countries short of dollars to pay for the extra sugar.

Manpower and Mobility

During this year, as Mr Butler noted this week, the mobility of labour in Britain has improved considerably. Is the labour moving in the right direction? From the August employment figures released this week, the answer must once again be yes—with qualifications. In August, young people who have left school and enter employment contribute to a large increase in the total working population: this year the total rose by 82,000 to 23,401,000. Of this increase, 66,000 entered civil employment; those who took longer to find jobs swelled the "wholly unemployed" category by 16,000, bringing the number of workers completely idle to 326,000. But the number of workers "temporarily stopped" fell by 20,000; so the total of registered unemployed fell by 4,000 to 396,000 at the end of August. By September 15th this total had fallen further to 389,600; most of the additional workers finding employment in this fortnight, too, were workers who had been temporarily laid off.

Of the basic industries, only agriculture gained a particularly large share, amounting to some 15,000 of the extra people entering industry in August; the increase in coal-mining had slackened seasonally and transport was losing workers. Manufacturing industries took more than half the extra workers. Textiles and clothing showed proportionately large increases totalling 12,000; these do not wholly account for the fall of 16,600 in textile unemployment, but many employers usually fail to take workers temporarily stopped off their employment returns. The vehicle group gained 7,000, with 2,600 of them going into aircraft; and metal manufacture increased its labour force by 2,000. But employment in the "engineering, metal goods, and precision instruments" group, which is five times that in metal manufacture, rose by only 5,000; though even this was welcome after a few months with no net increase whatever.

The only other group to record a large increase was the distributive trades—which suggests that the shop round the corner has not wholly lost its attraction as a gateway into employment. True, the distributive labour force at the end of August was only 1,000 larger than at the end of last year. But the engineering group had 26,000 fewer workers than at that time; and only 19,000 of them have gone into vehicles and metal manufacture. So the official emphasis on the metal-using industries—which followed a considerable growth in their employment last year—has still fully to exert its desired influence on the mobile manpower of 1952.

SHRINK FIT

At an engineering works in the Midlands, a 2,000 ton hydraulic forging press had to be overhauled because of wear. The firm decided that a good way of effecting repairs would be to "shrink fit" new parts in place of worn ones. A metal part to be fitted by this process is deliberately made a precise amount too large. When extreme cold is applied the part shrinks and can be fitted into another. The metal expands as the temperature rises to normal and a very tight fit is thus ensured.

The firm therefore consulted I.C.I. Billingham Division who make "Drikold"—a solid refrigerant which, with a temperature of minus 110°F., is a convenient means of producing extreme cold. The main part of the problem was to shrink a hollow steel cylinder weighing 7 tons and fit it into the body of the press. The firm made the necessary preparations and provided lifting tackle, whilst an I.C.I. man supervised the shrinking. This was done by closing the cylinder at one end and filling it with 80 gallons of methylated spirit and 1,400 lb. of "Drikold." Five and a half hours later, at a temperature of minus 95°F., the cylinder had contracted by 30 thousandths of an inch. It was then hoisted into position. This completed one of the biggest shrink fitting jobs ever undertaken.

Retail Trade Returning to Normal?

Month by month changes in the level of retail trade have assumed a new importance since sales first began to fall. The improvement that has been taking place during the summer has not been so sharply defined as to give traders firm assurance that a steady recovery was in train. The sharper-than-average fall in sales between July and August has, however, been interpreted as something of a set-back. The index of retail sales (1950=100) fell from 117 to 109 compared with a drop from 106 to 100 between July and August last year. Non-food merchandise sales fell from 110 to 94 compared with a fall of from 102 to 90 in the same classes of goods a year ago.

These general figures, however, conceal a marked variation in the trading experience of different types of retailers. Multiple stores have gained ground throughout the year; their sales index of 117 in August showed a drop of only four points compared with July, and their weekly sales were 8 per cent higher than a year ago. By contrast the sales of co-operative stores were 4 per cent lower for all goods except food; sales of food rose by 14 per cent and counteracted a disconcerting drop in the business done by other departments.

The big department stores are barely holding their ground. Sales of all merchandise were 2 per cent higher than a year ago, even with the help of a substantial tourist trade. Since the second half of the year the John Lewis group has been recording regularly weekly sales figures below those for the

same period in each of the past two years. Other big department groups, having gone through an exceptionally slack time early in the year, are only now beginning to feel a renewed flow of trade though it is not sufficient even to show much improvement on the level of business in the second half of last year, when the rush to buy had already exhausted itself.

There are several explanations why the multiple stores should have gained so much ground. They were the most severely hit by shortages that persisted from the beginning of the war until early this year, and greater range of supplies has given them the opportunity to show a big improvement on their previous years' trade. These stores, too, freely bought up the job lots that have been offered by manufacturers and wholesalers since the textile slump began, an advantage of which neither the department stores nor the co-operatives availed themselves on any scale.

These are special circumstances. Between July and August, wholesalers' stocks of textiles were reduced from 163 to 156 (1947=100) and there is not likely to be any more "distress" selling. It is the lowest August figure for some years. It is an encouraging indication that trade may return to normal this autumn. If the multiple stores continue next year to show the same rate of improvement, there may be more conclusive evidence of a swing away from the type of retailer that carries a large and varied stock, to one relying on the rapid turnover of a limited range of mass-produced articles.

The Nash-Austin Deal

The Nash Kelvinator Corporation—one of the four principal independent motor manufacturers in the United States—has long been interested in producing in Europe a small sports car specially designed for the American market. Over a period of years discussions have been held with a number of manufacturers, among them the Standard Motor Company and Fiat in Italy. An agreement has now been reached whereby the Austin Motor Company will provide the engine and chassis components (the standard A.40 engine) and Fisher and Ludlow the body, of a small car to be assembled for Nash at the Austin works. The intended volume has not been made public. At a rate of production of, say, 2,000 units a week it would not be possible to get the cost-weight ratio common in the United States; but it is likely that the delivered cost would not be higher than production there at a similar rate.

American manufacturers have speculated for some years about the potential American market for a car much smaller than the standard American car of about 3,300 pounds weight but produced at the same price-weight ratio. General Motors' postwar plans included the production of a 2,200-pound car; but increasing capital costs caused this project to be abandoned after negotiations for the site and much of the equipment had reached an advanced stage. Nash already markets a Rambler saloon of 2,350 pounds and has been exhibiting a 2,000-pound prototype of the car likely to be built by Austin, in order to test public reaction. By this new agreement, Nash will be able to test the American market for a small sports car—not, perhaps, at as low a price as production on the accepted American scale might give, but certainly as cheap as any small-volume output in that country, and without any of the risks attached to tooling up for such an intrinsically speculative project. Last year Britain shipped 27,000 cars to Canada and another 20,000 to the United States, most of them of about the same weight as the projected Nash-Austin car. But the two British sports cars that have made a market for themselves in North America are the MG and the Jaguar, both produced and marketed on a limited scale. Nash has some experience of sub-contracting designs abroad. The Healey company has recently been building a sports car body fitted with a Nash engine. But the outcome of the new link with Austin, which involves introducing the principle of integral chassis-less construction into the passenger car section of the motor industry, will be watched with intense interest. The British company, in its turn, appear to have been exploring means of increasing its production runs. Final confirmation that the 800 c.c. engine of the Austin 7 is being fitted in the Morris Minor means that production of both this and the A.40 engine will be on a much bigger scale than the output of the two Austin cars in which they are used. As the integration of the Austin and Nuffield groups proceeds this principle is likely to be extended—it is one important way of offsetting the short production runs and the diversity of models that characterise the British car industry.

Zinc Falls, but Lead Tumbles

Lead and zinc have both fallen this week. During the first eight days of free dealings, lead slumped to £87 10s. a ton spot, as much as £44 a ton below the Ministry of Materials' recent selling price, but it recovered some £6 to £8 a ton on Thursday. On Wednesday the Government selling price of zinc was reduced by £4 a ton to £118 a ton following a fall in the American price. Some American smelters had been quoting zinc at 14 cents a lb, although one large smelter was offering the metal at 13½ cents a lb; this week all the smelters adopted the lower price.

Lead had fallen steadily for a week; on Wednesday it took a sudden tumble, falling by £7 a ton to £87 10s. a ton. It was reported on Thursday that the producers began to

support the market. The volume of lead traded during the first eight days was heavy—no less than 12,000 tons changed hands. This is a figure of total turnover, and some lead may have changed hands more than once. Much of the business has been for future delivery, and sales of Government-owned lead have been small. It is too early to judge whether much lead is being re-exported and whether the London market is earning foreign currency. Although London prices are considerably lower than those ruling in the United States, the fall in prices, if it continues, will not encourage American buying. American prices have also been reduced this week, on Tuesday the smelter price was reduced from 16 cents a lb to 15 cents a lb—apparently moving in sympathy with the London market. This is the precise opposite of recent experience, when British prices have followed American movements. Allowing some 2 cents a lb to cover the cost of shipment to and import duty in the United States, the British price is still well below current American levels.

Bigger Metal Allocations

Further evidence of increasing production of metals has come from the International Materials Conference this week in its recommendations of larger allocations of copper, nickel and cobalt in the fourth quarter. Total allocations of copper amount to 747,655 metric tons for the current quarter, compared with 744,290 last quarter with the prospect of some additional supplies of Chilean copper outside the distribution plan. The nickel allocation is 37,049.6 metric tons, against 36,580 metric tons last quarter and that for cobalt is 2,884

IMC DISTRIBUTIONS, OCT. TO DEC., 1952
(Metric tons)

	Copper		Nickel		Cobalt	
	3rd Qtr.	4th Qtr.	3rd Qtr.	4th Qtr.	3rd Qtr.	4th Qtr.
United States	368,100	362,000	24,826.5	24,938.6	1,583.9	1,987.8
United Kingdom	100,300	101,800	5,424.3	5,472.6	360.0	360.0
Germany	50,100	52,900	1,378.9	1,394.7	147.0	147.0
France	36,900	38,000	1,764.3	1,777.5	111.0	111.0
Canada	32,200	34,200	989.0	991.5	33.0	33.0
Others	156,690	158,755	2,383.0	2,482.7	240.5	245.2
TOTAL	744,290	747,655	36,580.0	37,049.6	2,475.4	2,884.0

tons, against 2,475.4 tons. Detailed allocations for the principal consuming countries are shown in the accompanying table. Supplies of nickel, even after the increase in production, are still insufficient for the civil and defence needs of the free world. On the other hand, cobalt supplies may increase sufficiently by the early part of next year to justify the ending of international distribution of cobalt and its compounds.

Port Operation Improves

Since the Ports Efficiency Committee was set up in March to investigate the slowness of operations in British ports, particularly London and Liverpool, there has been a general improvement in the turnround of ships, and congestion in the ports has been greatly eased. But this improvement has obviously been largely a consequence of the decline in shipping traffic and the absence of any major labour disputes. So far as London is concerned, an improved lighterage system, the coming into operation of two new grain elevators, and the handling of sugar in bulk have helped to accelerate the rate of operation. But the committee, in the second of its reports to Lord Leathers, is certainly right in stressing that complacency over the present improvement would be dangerous, and in adding "it is safe to predict that certain of the causes of the difficulties and delays that were giving so much anxiety some months ago will recur, probably next winter."

The basic trouble is that the United Kingdom ports, which suffered so much war damage, have no cushion of reserve capacity to meet sudden or seasonal increases in traffic. Even seven years after the end of the war, much of the damage done by the war has not been repaired. To take Liverpool as an example, the report states that in 1951 this port was attempting to handle a tonnage of cargo 14 per cent greater than before the war with 24 per cent less fully-effective berth capacity, and the increased tonnage was accounted for wholly by export cargoes, which require more accommodation in sheds and require more handling than import cargoes. Replacement and repair work has been delayed by Government restrictions on capital expenditure and in particular by the shortage of steel. In both its reports, therefore, the committee has stressed the importance of releasing sufficient steel to enable these port facilities to be provided. It specifically recommends the allocation of some 10,300 tons of steel, spread over 18 months, to enable 23 extra berths to be brought into operation in Liverpool and London; about 8,000 tons of steel, spread over three years, to provide additional storage accommodation at London, Liverpool, Manchester and Bristol; and about 2,900 tons to increase milling capacity in London, Manchester, Hull and Leith.

New Money for Stilfontein

In the next eight years production from the new OFS and West Transvaal mines should increase the value of South Africa's combined gold and uranium output by £100 million to £250 million. It is against this background, briefly outlined in a broadcast from London by the Union's Finance Minister, Mr Havenga, last week, that one of these developing mines, Stilfontein Gold, is making a new issue of ordinary shares. The Stilfontein gold mine is coming into production several years earlier than originally planned, and the directors have decided that its milling capacity should be increased to 80,000 tons a month by the end of 1953. To finance this and other developments the company has to raise about £1 million immediately and another £600,000 by the end of 1953. Shareholders are therefore being offered one new 5s. ordinary share at 18s. each for every ten shares held; with each two shares taken up subscribers are given the option to purchase a further share at 22s. 6d. each in 1953. After this announcement, the existing 5s. shares rose from 23s. 9d. to 24s., but by Wednesday's close they had fallen back to 23s. 4½d.

The circular giving details of the offer also reveals that the directors expect that the company will shortly be invited by the Union Government to extend its uranium plant beyond its originally planned size. The cost of the expected extension is provisionally estimated at £1,500,000, and shareholders are therefore being asked to agree to an increase of £2,000,000 in the amount that the company is authorised to borrow for the purposes of uranium production. By all accounts the development of uranium production should be a profitable investment. After setting in motion the production machinery of the Union's first uranium plant at West Rand Consolidated Mines on Wednesday, Dr Malan revealed that the capital cost of the Union's whole uranium production programme was likely to exceed £40 million, and estimated that when these plants come into full production gross revenue will probably exceed £30 million a year.

As the directors of Stilfontein consider that the borrowing powers of the company for general purposes should also be increased, shareholders are being asked to agree to an increase in the total amount that the company can borrow (by means other than the issue of a loan stock) from £5,500,000 to £8,000,000. In order to compensate loan stockholders for this proposed increase in borrowing powers, the conversion rights on the existing loan stock will be amended, so that stockholders will be able to convert £25 of every £100 of stock into 22 ordinary shares, instead of into 18 shares as at present.

This new issue by Stiffontein will be one of many that will be made as the development of the new South African gold and uranium fields gathers speed, but unless Britain expands its hard-won export surplus the London market is not going to be in any very good shape to finance them.

Simplifying Steel Capital

The rearrangement of capital structure and directorships carried out last week by three nationalised steel companies, Richard Thomas and Baldwins, the Steel Company of Wales, and Guest Keen Baldwins, was the first operation of its kind since the Minister of Supply instructed the Iron and Steel Corporation to "hold the position" last November. This rearrangement, which is formally "with the concurrence" of the nationalised corporation and has been approved by Mr Sandys, removes the cross-holdings held by Richard Thomas and Baldwins in Guest Keen Baldwins and by both companies in the Steel Company of Wales. Instead of being owned jointly by the two other companies and the nationalised corporation, the Steel Company of Wales thus comes into the direct ownership of the corporation.

The change, from the point of view of the Iron and Steel corporation, is an administrative convenience with no necessary significance for denationalisation. Nevertheless, it has made three subsidiary companies into self-contained properties—a change that may commend itself to possible purchasers, and in particular to Guest Keen Nettlefolds when that company has to decide whether to buy its associate back.

Tanker Freights Decline

Spot rates in the tanker freight market fluctuate even more than dry cargo rates, and today the general level of tanker voyage rates is lower than at any time since the outbreak of war in Korea. Last winter spot rates soared to more than three times the old Ministry of Transport scheduled rate (which is still used as a base line for measuring tanker rates). Within three months they dropped to about MOT plus 160 per cent, and by July they were in the region of MOT plus 50 per cent. Now they are even lower. As winter approaches, the demand for tankers usually increases, but there have been no signs of any improvement in recent weeks. The major oil companies, far from chartering vessels, have even been offering some of their own tankers for charter.

from the awards made by the London Tanker Brokers Panel, which form an index of the time charter rates for tankers; in the accompanying chart this is compared with the monthly course of dry cargo freights as indicated by the Chamber of Shipping Index of sterling tramp

rates. The general downward trend is reflected in the latest tanker award made by the panel, which is 42s. 3d. per ton deadweight, compared with the rate of 52s. set in April. The award is calculated on the basis of a tanker of 12,000 tons d.w. on two years time charter, and it is used by the oil companies as a basis for computing the value of inter-company transactions, as well as for determining the freight element in the selling prices of petroleum products. It comes up for review every six months. The first award, in April, 1949, was 18s. 6d. and it remained fairly steady until October, 1950, when it rose to 30s. Subsequent rises brought the figure to 52s., but now it has started to go back. Increases in the prices of various oil products have followed earlier rises in the tanker brokers' award, but it does not necessarily follow that decreases will follow the latest decline.

Stable Prices?

A general stability of commodity prices with only a very slight downward movement continues to be the trend shown by *The Economist* Commodity Price Indicator; and the recent, long delayed, fall in the price of lead, although producing a corresponding fall in the indicator figure, does not alter this general impression. The indicator for all items was fairly constant week by week from middle August to end of September; for August 20th it was 124.7 and for September it was 124.2. For October 1st the indicator remained at 124 and the latest figure, for October 8th, is 123, but this last fall is almost entirely accounted for by the sharp fall in

the price of lead on the recently reopened London market. The indicator continues to reflect steadiness in the prices of other commodities.

The more detailed indicators show the following movements between October 1st and October 8th: food a slight fall from 118.8 to 118.7, fibres unchanged at 101.6 and metals showing the only marked fall—from 154.9 to 151.6, a movement due, in the period, almost entirely to the lower lead prices. While the future of prices must still remain uncertain, the indicator nevertheless prompts the question—have free prices in the commodity markets, as against Government supported prices, almost reached bottom?

Report on Oilseeds

Prices of vegetable oils have fallen sharply since the middle of 1951 and are now generally below the levels prevailing at the beginning of the Korean war. The decline in values during the past year has marked the transition from scarcity to plenty in world supplies. According to "Vegetable Oils and Oilseeds 1952" published last week by the Commonwealth Economic Committee, world production declined

There's your key to the mass market

What, the Daily Mirror?

That's right.

But it's such a

All right, so you don't read it. Nor do I, usually. But more than four million, four hundred thousand other people do — every day.

What kind of people?

Good honest working class, most of them. But they are the people with the money to spend these days. Take a glance at the average council estate. See the television masts. Believe me, for products such as ours, there's only one market worth bothering with — the mass market.

When you come to think of it, that's probably true of most products.

Yes, it probably is. Incidentally, the Daily Mirror is a very good proposition where cost is concerned, too. It has the lowest inch per thousand rate of all national daily papers.

The highest sale and the lowest cost, eh?

That's right.

DAILY MIRROR

THE HIGHEST DAILY NET SALE IN THE WORLD

Statistical Summary

EXCHEQUER RETURNS

For the four days ended October 4, 1952, total ordinary revenue was £53,280,000, against ordinary expenditure of £64,315,000 and issues to sinking funds £140,000. Thus, including sinking fund allocations of £16,883,000 the deficit accrued since April 1, 1952, was £304,387,000 compared with a deficit of £37,393,000 for the corresponding period of the previous year.

JAMES HOWDEN & COMPANY, LIMITED

(Boiler Auxiliary and General Engineers)

OUTPUT LIMITED BY STEEL SUPPLIES

OVERSEAS BUSINESS WELL MAINTAINED

MR CRAWFORD W. HUME ON RECENT DEVELOPMENTS

The forty-sixth annual general meeting of James Howden & Co., Limited, was held on October 9th, at 195, Scotland Street, Glasgow, Mr Crawford W. Hume, MINA (the chairman), presiding.

The Secretary (Mr John D. Young, CA) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman (dated September 10, 1952) which had been circulated with the report and accounts:

Since the last meeting we have suffered a sad and severe loss through the death of Mr James Struthers Niven. Mr Niven joined the staff as a young man after his discharge from the army in 1918 and in 1927 he was appointed secretary of our subsidiary, James Howden and Company (Land) Limited. In 1937 he became secretary of James Howden and Company, Limited, after having served for some years as assistant secretary. He became a director in 1947. In his business career he was unwavering in his loyalty to the highest principles and he rendered faithful, diligent and valuable service to the company. His keen discernment and common sense were recognised and highly respected in business matters while his cheerful personality, sense of humour and kindly disposition endeared him to all who knew him.

Mr J. D. Young, CA, who for many years worked closely with Mr Niven, has been appointed secretary, and the board has every confidence in his ability to carry on the traditions established by the late Mr Niven.

A GRATIFYING POSITION

The accounts for the year ended April 30, 1952, are in the usual form, and it is satisfactory to note that the trend in the results which has been evident over the last few years has continued and has led this year to a gratifying position. The improved facilities mentioned last year and the policy of the board in keeping the factories and plant in first-class condition have again resulted in an increase in output which is reflected in a profit after taxation of £474,445, compared with £257,458 in the previous year.

Provisions have been made for profits tax and excess profits levy for the year ended April 30th last and a reserve for income tax on profits for the same year due in 1953-4. These together amount to £635,057. The excess profits levy included in that sum is £73,500, which applies to the four months of 1952 up to April 30th.

£350,000 has been transferred to the general reserve account, bringing this to £750,000. £30,000 has been transferred to a reserve for employees' pensions and benefits. In comparing this and the other figures with the corresponding amounts for 1951, it should be noted that for convenience of comparison effect has been given to the increase of capital made in August, 1951.

After making the appropriations shown in the directors' report and providing for the dividend the balance carried forward amounts

to £56,711, as against £48,259 in the previous year.

REVIEW OF PAST HISTORY

It is perhaps of interest to review some aspects in the company's history since May 1, 1938, the beginning of the last fiscal year before the war, until the present time. During that period of fourteen years almost £1 million out of the profits has been retained and wholly used in strengthening the company. In the same period the company has paid taxation of £2,500,000. All the money which has been ploughed back into the business has been utilised for its expansion and improvement, to the advantage of the company's customers, shareholders and employees alike. The main factory has been greatly extended and the plant and equipment much improved. Two new factories have been equipped and set to work, and are now established and progressive units. The new research building has been erected and put to use. During this period of greatly increasing activity we have necessarily had to conserve some of our resources in cash. As compared with past years the figures in the present balance sheet in respect of cash and tax reserve certificates may appear substantial, but in fact they are no more than are necessary to cover our month to month fluctuations and our tax commitments during the present year. Both shareholders and employees can, I think, be justifiably proud of the business and organisation which has been built up during these years. We have all taken our share in the development work and we should all have our share in the results of that development.

Much has been said elsewhere on the subject of taxation and I propose here to say only a few words. To my mind excess profits levy is a bad tax as it handicaps progressive companies and takes no account of the results of long-term policies of development such as this board has endeavoured to support.

PROBLEM OF SUPPLIES

OVERTIME AND PIECE-WORK BAN

Just as these remarks are about to be published news has come through that the Confederation of Shipbuilding and Engineering Unions has decided to instruct its members to ban overtime and restrict piece-work at a date to be fixed later. The effect of this decision is at present unpredictable but it might well have more serious consequences than a restriction due to material shortages from which we have been suffering. The engineering industry is of ever-increasing importance to this country. It is the mainstay of rearmament and exports. At least two-fifths of Britain's exports are engineering products and the remainder of the exports all depends on modern machines made and maintained by engineers for its competitive strength in world markets. At the same time an ever-increasing proportion of our internal activity and amenities depends of engineering productivity. It is to be hoped, therefore, that wiser counsels will prevail and that a storm disastrous to the country's economy will be averted.

The company has continued to enjoy the loyal co-operation of the administrative and executive staff and the workpeople and I should like on your behalf to thank every employee for his faithful and friendly service during the year under review.

The report and accounts were unanimously adopted and the final dividend of 22½ per cent, making 30 per cent for the year, was approved.

The retiring directors, Mr Crawford W. Hume and Mr P. H. N. Ulander, were re-elected, and the remuneration of the auditors, Messrs William Hart, Junior, and Wilson, CA, having been duly fixed, the proceedings terminated.

WATNEY COMBE REID & COMPANY

DISAPPOINTING LONDON TRADE

The ordinary general meeting of Watney Combe Reid & Company, Limited, was held on October 3rd in London, Mr S. H. Combe, MC, the chairman, presiding.

The following is an extract from his circulated statement:—

As was the case last year, this year's trading has again proved exceedingly difficult and in the case of the London trade disappointing, although your company's trade as a whole showed an increase on the previous year. Costs have continued to rise, and any benefit derived from the increase in the price of beer to the public last year has long since disappeared. Competition has become more and more pronounced, but in spite of this our products have found new markets covering the whole of England and many parts of Wales and Scotland. Bottled beer sales have again shown a sharp upward movement.

EXPORT TRADE DIFFICULTIES

Export has improved satisfactorily, but far better results could be obtained if the authorities could be prevailed upon to grant us some much needed building licences. In order to advance the cause in this respect, your company purchased a large factory in the north-east of London, which at comparatively low cost can be adapted for our purpose, but even now it would seem impossible to get the necessary licence. Until such time as we are successful in our application we are largely precluded from taking advantage of the foreign market.

The cost today of licensed property maintenance is a burden which few individual

traders could possibly carry. This is a factor often apparently overlooked by those who would like to see the end of the tied house system. One of the charges most frequently levelled against the system is that it restricts freedom of choice for the customer. When one reads that in one comparatively small area of England alone—it happens to be South Lancashire and East Cheshire—you can today take your choice of no fewer than 175 bottled beers and 139 draught beers, the charge surely falls to the ground.

THE YEAR'S RESULTS

Trading profit at £1,542,879 compares with £1,434,852 after charging the provisions made in past years for deferred repairs with £240,000 (£290,000). By reason of the terminal date of our financial year we have suffered fully six months of the vastly increased barley prices ruling for last year's crop, and, although trading profit is up, this has been more than offset by increases in taxation, debenture charges and depreciation.

After providing for taxation and all other necessary provisions and expenses, the net profit for the year at £601,751 is £138,365 lower. It is proposed to appropriate £200,000 to the reserve for properties, plant and contingencies, and to pay a final dividend on the deferred ordinary stock of 10 per cent and a bonus dividend of 2 per cent, making with the interim dividend already distributed 17 per cent for the year.

So far as the beer trade in the South of England is concerned, I cannot foresee in the near future an upward trend taking place. It is doubtful whether we have even reached a point where no further decline is likely. This applies more especially to the London area, where our trade is particularly subject to large numbers of the population being moved outwards to the new housing estates.

The report and accounts were adopted.

ELECTION day in America is now barely more than a fortnight away. The campaign is reaching a tense and strenuous phase, but it has already been full of drama. One might have to go back to 1912 to find another that has aroused as much interest. When it began three months ago, after the nominating conventions, the dominant feeling among American allies was one of relief that the fundamental principles of American foreign policy were now, after all, to be in debate. "Those of us who have no votes," said our own leading article,

but whose lives and liberties yet depend upon the policies of the United States, can settle back to watch the show with the comfortable knowledge that we shall be able to cheer the winner in all sincerity, whoever he may be. . . . May the best man win.

No one who knows European—and particularly British—opinion, however, was in any doubt that coupled with this sigh of relief was a very widespread hope that General Eisenhower would be the next President. It was not only that people on this side of the Atlantic knew and liked the General and approved his known views. America's allies had also been much more shaken than many Americans realise by the volume of support that General MacArthur received last year for his (as it seems in Europe) very dangerous views and by the lengths to which malice and misrepresentation could be carried in attacking Mr Acheson, who from three thousand miles away seems to have deserved very well of his countrymen. General Eisenhower seemed to be the man of destiny to end these bitter schisms in American public life and lead the Republican party back to responsibility. Western Europe, in July, was solid Eisenhower territory.

Since then, however, there has been a subtle change in atmosphere. Governor Stevenson, three months ago, was an unknown. But the speeches he has made since have made a great impression, not simply for their grace and eloquence (though those qualities count) but also for the evidence they have given of a man who has thought things through, who has built up his principles and will not allow himself to be pushed off them. On the other hand, General Eisenhower's friends are at a loss to understand what has happened to him. The first doubts came when he seemed to swallow whole the crude formulation of the "liberation" doctrine that Mr John Foster Dulles put before him, which sent shivers down every European spine and seemed to confirm the insidious propaganda that paints the clumsy Americans as the chief threat to peace. The General put the matter right in his next speech; but, with his experience, he should not have got it wrong in the first place. Then there was the celebrated breakfast with Senator Taft. Whether or not the General capitulated to the Senator, nobody has suggested that the Senator capitulated to the General—and yet the great merit of General Eisenhower in European eyes was that he stood for something different in principle from Senator Taft's purely self-regarding brand of Americanism. Then the General started attacking the foreign policy pursued by the Democratic

AUTHORIZED CAPITAL £23,000,000
ISSUED CAPITAL (24,000,000 Shares of 2/6 each) £23,000,000

Extracted from the Annual Report for the Year ended 30th June, 1952.

Tonnage milled, 1,998,000		Per ton milled	
Total Working Revenue	£10,587,604	£5 3 2	
Total Working Expenditure	2,898,285	2 4 7	
Working Profit	£7,689,319	£5 18 7	
Total Profit for the year	£7,734,028		
Balance unappropriated at 30th June, 1951	948,899		
Forfeited Dividends	151		
	£8,678,078		
This amount has been dealt with as follows:—			
Taxation	£3,240,953		
Mineral Lease Consideration	784,337		
	4,025,290		
Dividends declared during the year—No. 12 of 1s. 4d. per share and No. 13 of 1s. 6d. per share	4,658,788		
	3,400,000		
Leaving a balance unappropriated of	£1,252,788		

The Ore Reserve was re-estimated as at 30th June, 1952, as follows:—

Reef.	Available			Shaft and Safety Pillars			Total	
	Tons	Value, Dwt.	Width, Inches.	Tons	Value, Dwt.	Width, Inches.	Tons	Value, Dwt.
Carbon Leader	5,927,000	12.5	46.4	1,250,000	12.6	45.6	6,777,000	12.5

Compared with the previous year the available reserve increased by 10,000 tons, the value was 0.5 dwt. per ton lower and the slope width 0.2 inch greater. The unavailability tonnage increased by 118,000 tons, the value was unchanged and the slope width 0.2 inch less.

Satisfactory progress has been made in the sinking of A1, A2 and A3 Sub-incline Shafts and in the preparatory work in connection with A4 Sub-incline Shaft. Operations have commenced on the haulages south from Nos. 1 and 2 Shafts to the proposed sites of the Sub-vertical Shafts.

Tonnage Milled 2,283,000

Total Working Revenue		Per ton milled	
	£4,006,255	£1 18 4	
Total Working Expenditure	2,299,093	1 9 9	
Working Profit	£1,707,162	£0 5 5	
Net Profit for the year	£1,619,148		
Balance unappropriated at 30th June, 1951	461,949		
Transfer from Shareholders' Contingency Reserve	5,100		
	£1,077,197		
This amount has been dealt with as follows:—			
Funds Transferred for Capital Expenditure	£10,108		
Taxation	179,890		
Forfeited Dividends Account	3,096		
	192,194		
Dividends declared during the year: No. 34 of 3s. 6d. per share and No. 35 of 2s. 9d. per share	389,676		
Leaving a balance unappropriated of	£488,126		
The estimated Ore Reserve as at 30th June, 1952, was as follows:—			

Reef	AVAILABLE			SHAFT AND SAFETY PILLARS			TOTAL	
	Tons	Value, Dwt.	Width, Inches.	Tons	Value, Dwt.	Width, Inches.	Tons	Value, Dwt.
Kimberley Reef	542,000	2.7	62.7	70,000	3.8	65.1	612,000	2.8
Bird Reef	1,175,000	2.8	60.6	238,000	3.0	68.8	1,413,000	2.8
South Reef	748,000	3.6	46.9	132,000	4.0	48.0	874,000	3.7
Main Reef	1,055,000	4.0	48.1	801,000	4.5	49.2	1,856,000	4.2
Leader	823,000	3.7	54.4	81,000	3.4	63.6	904,000	3.7
Total A.	4,337,000	3.4	53.6	1,322,000	4.1	63.2	5,659,000	3.5

Compared with the previous year's estimate, the available reserve decreased by 757,000 tons, the value and slope width increasing by 0.1 dwt. and 0.1 inch respectively. Rising costs and the consequent increase in the pay limit accounted for £14,000 tons of the decrease in the available reserve.

The full Report and Accounts may be obtained from the London Secretaries, A. MOIR & CO., No. 4, London Wall Buildings, London, E.C.2.

Administration since the end of the war in terms which not only shed a curious light on his own part in the events he described but cast some doubt on the course that he would follow if he were elected.

If these were merely instances of campaign oratory, they could be dismissed as having no necessary bearing at all on future policy—after all, Franklin Roosevelt first got elected on promises of economy in government expenditure; and anyone can understand the practical necessity of conciliating the Republican right wing at least to the extent necessary to get its vote. But what has set people wondering is the emerging signs that Mr Eisenhower the politician is a different man from General Eisenhower the architect of united victory. Part of his appeal was that he would be a President, perhaps lacking in expert knowledge of the facts in many departments of public policy, but solid as a rock on all matters of principle. How does that square with the Wisconsin incident, when he endorsed Senator McCarthy and removed from his speech the intended words of tribute to General Marshall, the Senator's victim? The great virtue of having a General was supposed to be that he

was trained to take awkward decisions and stick to them. How does that square with the Nixon affair, when he hesitated for days and finally accepted the verdict of mass emotion? No doubt he does these things because his entourage use what to a soldier is the powerful argument that he must not let his side down. But would he be any less susceptible to the same appeal in the White House?

These are no more than questions, without answers suggested—but they are the questions that are being asked among European observers of the American scene. The public opinion polls show that the General started with a great lead and that he has not yet lost it—and that is probably an accurate description of opinion here as well as in America. Certainly America's allies have not turned partisans in America's election; but they have largely lost their initial partiality for one side. Nothing has happened seriously to shake their belief that the foundations of the Atlantic alliance are safe whoever wins. They can still say in all sincerity "may the best man win." But when they say "the best man," the mental image is no longer as clear a reflection as it was of one familiar physiognomy.

Axe or Pruning Knife

THE sweetness and light that made the Conservative conference at Scarborough such a contrast to Morecambe, did not entirely mask a division of opinion on economic policy, and particularly on the related subjects of taxation and government expenditure. The Tories—who, for all their fourteen million votes, are largely a middle-class party—feel deeply about taxation. They represent the sections of the people who, in a richer country, find themselves poorer and do not like it. It is not therefore surprising that the policy of wielding an axe on expenditure has its many adherents in a Conservative conference, or that a resolution calling for its "drastic diminution" should be passed with acclamation. But Mr Butler knows the concrete realities into which these abstractions resolve themselves. "If you are going to have big economic changes," he said, "you can only get them by big changes of policy." Acceptance of the welfare state means, in fact, acceptance of a budget and a tax burden to match. He promised to use the pruning knife, but not the axe.

Pruning knives are of differing sizes and cutting powers, and many, even of those who accept Mr Butler's general argument, will continue to hold that he is using a blunt one so long as he continues to reject the proposal of an external investigating committee on the Geddes or May model. The departments, of course, detest the idea, particularly the Treasury, upon whose own methods of control the mere appointment of such a committee casts a slur. But the opposition of the departments is really the chief argument for an outside body. There is an inevitable and natural tendency in Whitehall for departments to respect each other's preserves, and even the Treasury, which has an effective veto on new ways of spending money, is much more tender with the established. It is an illusion to suppose that any internal economy campaign will treat harshly the things that the departments cherish. It looks as if Mr Butler has swallowed the departmental brief a bit too easily.

But though there is money to be saved in this way, it is not big money, as big money goes these days. The main point the Chancellor was making is undoubtedly

right, all too right. Anyone who wants to reduce expenditure by more than, say, seven or eight per cent can do so only by changing policies that have been deliberately decided and will be hotly defended. It is perhaps worth calling the roll once again. There is very little room for large economies outside the two main categories of defence and the social services. Defence must go up again next year; after that, however, it is still possible to hope for a reduction. Maintenance of a level of preparedness must cost less than building up to that level; indeed, if the service departments' estimates do not conform to that principle, they will have to be told to do their sums again. But beyond this obvious point of common sense, the cost of defence can be quickly and radically reduced only by a major act of policy—a decision by Her Majesty's Government that Britain is no longer, and should no longer try to be, a major power. Whoever else might be willing to take such a decision, the Conservatives patently are not.

For the social services, a similar blanket answer cannot be given. Some expenditure in this general category is obviously sacrosanct. There can be no cut in social insurance payments or pensions. The major premise of the welfare state is the need for a floor, a minimum income below which no citizen may fall. Inflation has already lowered and undermined that floor to an extent which forbids any further tampering. The imposition of charges in some parts of the health service had immediate results in limiting expenditure, and the principle might well be pushed a little further. But its major effect will be to arrest the rise of expenditure on the service rather than to reduce it. Education has been under pressure for two years already between the upper millstone of official directives and the nether of rising costs and growing school population. Over the field of the social services properly so called, then, there is little possibility of achieving economies without making changes in major principles of policy which the majority of the Conservative party genuinely would not wish to abandon, even if they dared.

There remain the subsidies. The food subsidies amount in the current year to about £300 million, the housing subsidy to about £85 million. But of the food total, £47 million is accounted for by the "welfare" subsidies for children's milk, orange juice, cod-liver oil and so forth. To sacrifice these, with their proven value to national health, would be penny-wise retrogression indeed. Another £57 million goes in direct producer's subsidies such as fertiliser subsidy and ploughing grants and could hardly be abandoned without throwing over the whole policy of agricultural expansion, of which they are, indeed, the most logical and least wasteful part. The consumers' subsidies proper, totalling £200 million, are another matter. As another article in this issue demonstrates, a clean sweep could be made of all subsidies except those on bread and milk at a cost of no more than a few pence per head weekly and at a direct annual saving to the Exchequer of £100 million. Nor should the bread and milk subsidies be immune, though their removal might have to be more gradual. As for the housing subsidies, the case for their abolition rests much more on the wider benefits that would follow from getting rents on to a realistic basis than on any saving of actual expenditure. The saving might, indeed, be small, since most of the present expenditure arises from bargains made years ago.

What does all this add up to? By doing everything that has been mentioned here, and pruning right up to the edge of changes in major policy, it ought to be possible to reduce civil expenditure by £150 million, possibly by £200 million, and just conceivably by £250 million—to which should be added well over £100 million secured in Mr Butler's first budget. These are not close estimates based on detailed examination, they are orders of magnitude; and the only reason for mentioning them is to prove the point that the most that even a very courageous Conservative government could knock off the total of civil expenditure that the Socialists left behind is about £400 million or even less. Anything more would involve things for which there is certainly no mandate in public opinion—even in the Tory party. Three or four hundred millions would certainly be worth having, and every effort should be bent towards achieving it. But it is still less than one-tenth of the total expenditure. It would permit a reduction in the burden of taxation only from rather over 40 per cent of the national income to rather under 40 per cent. And it allows nothing for defence expenditure which, even when the effort to overtake lost time is ended, will be on a higher plateau than in the late forties. The conclusion is inescapable that a drastic reduction in expenditure will never be possible without a revolution in public thinking that only a major catastrophe could bring about.

Does this mean, then, that the burden of taxation can never fall below the crushing load of today? If so, then it is a sentence of lingering death for the British economy. Indeed, no one who retains faith in this community's power to survive can possibly allow himself to accept any such conclusion, however logical it may seem. But the only avenue of escape from it lies along the road of a very rapid increase in the national income and hence in taxable capacity. If income per head in Britain were only as much as two-thirds of what it is in the United States, then a tax burden of only 20 per cent would cover the present level of expenditure.

The argument therefore comes out at the familiar point: Salvation for this country depends absolutely on

stimulating a rapid rise in the national income—in real terms, not in funny money. A progressive Conservative party, which, by reason of its sincere attachment to the welfare state, cannot advocate reductions in expenditure, can escape from its dilemma only by a raging, tearing campaign for higher production, higher efficiency, higher income. Yet the puzzling thing is that it makes no move in this direction. There is no great mystery about the ways—the non-Socialist ways, that is—in which a country sets about increasing its output. The United States is a standing example, and a special group of articles in this issue analyses another example in Western Germany. The recipe consists in equal parts of freedom for enterprise—which involves freedom for prices to move in response to competitive supply and demand—and mobile massive investment in productive capital. Heavy taxation makes it more difficult, but by no means impossible if every other policy is re-shaped to serve this end.

This, one would have supposed, is pure Conservative doctrine. Yet why is it not preached and practised? Why is it that men who hold themselves out as the alternative to socialism seem yet to be quite content with the socialist defeatism of a permanent siege economy? That the Conservatives agree with the Socialists on some things—on the desirability of the welfare state, for example—is neither so surprising nor so depressing as the discovery that, in practice, they do not differ from them on anything of importance. If they do not know how to liberate the spirit of enterprise, or to reawaken the desire to build for the future, it is difficult to see what justification there is for their existence.

ADVERTISING

WISDOM . . .

Advertising pays . . . whom?

Would it pay me to advertise? Can I handle my own advertising? What does it cost to employ an agent? What do I get from an agent? Is it true that once you start advertising you have to keep it up? Can I advertise in overseas publications? How much advertising can I do for two thousand pounds? What are the pros and cons of direct mail advertising in my business?

These are only a few of the questions you are likely to want answers to before you know exactly what to do about your advertising.

Through the post it would take you about twelve months to arrive at the answers to these questions. No business with an advertising problem can afford to wait as long as that. But you could settle the thing in an hour by talking it over with somebody who knows—or can get you—all the answers. So why not come along for a chat when you are next in London?

Five Years of the Monnet Plan

FRANCE'S first plan for modernisation and re-equipment is drawing to a close. The Commissariat Général, appointed in 1946 to formulate and oversee the plan, has chosen this moment to describe what French industry has accomplished under its guidance. The occasion marks not only the end of the first five-year period but also the departure of M. Monnet, who has presided over the Commissariat and given the plan his name. He goes now, as chairman of the High Authority of the Coal-Steel Community, to preside over a far wider sphere and to spread among the six nations the doctrine he has dinned into French ears: invest more, produce more, cut costs, and thereby lay the foundation both for a sound economy and a higher standard of living. The fact that for many Europeans this is still a revolutionary thesis should not daunt a man whose career has been so largely devoted to converting innovations into accepted platitudes.

The Schuman plan is an experiment that could hardly have been undertaken without the prior restoration of French heavy industry. If this task had not been tackled energetically in the years after the liberation, France would have lacked the courage and self-confidence to enter into even a limited union with Western Germany. The truth was that France, even before the war, was turning rapidly into the most backward of western industrial nations. For over a generation industry had been allowed to decline and decay, a trend that was vividly described by the first report of the Commissariat in 1946. On the eve of the Second World War, nearly one-third of French industrial productive capacity was not employed. The spirit of enterprise had been weakened to such a point that investment of capital barely covered the needs of replacement. Both in agriculture and in industry, the productivity of labour was below that of countries with modern equipment. In addition, the war destroyed part of French physical capital and forced the

liquidation of a substantial portion of external assets.

These were the conditions that brought the Monnet plan into being. Its broad objectives were to reach, by the middle of 1948, the level of output of 1929—which exceeded that of 1938 by a quarter—and to reach by 1950 a level of 25 per cent above 1929. It proposed also that the effort to modernise and expand should be concentrated on six key sectors: coal, electricity, steel, cement, agricultural machinery and transport (oil refining later joined these as an important dollar saver). For each of the six "key resources" the plan set goals to be achieved by 1950. These were later somewhat scaled down and stretched out so that the target date became 1952-53.

So far as the execution was concerned, the plan aimed at an *économie concertée*, rather than a bureaucratic *économie dirigée*, and that, in fact, is the way it has worked. There has been no shower of white papers, memoranda and files, no elaborate detailing of administration and no army of bureaucrats—nothing that most Socialists would recognise as planning. Instead the Commissariat has simply kept before the government and public a general outline of broad paths to be taken and, with whatever weapons have come to hand, has prodded industry along these paths. At no time was it intended that the planning process should blanket the whole of the French economy. Rather was it hoped that concentration on the key sectors would lead to the creation of a general drive towards expansion.

It will be seen from the accompanying charts that, apart from oil refining and the production of cement, even the modified targets set by the Commissariat have not been reached, although in most cases the deficit is not serious. The only real failure is in tractor production, which has attained only 62.5 per cent of the goal.

The Six Key Factors of the Monnet Plan

For coal the ratio of achievement is 96.5 per cent, for electricity 93 per cent, for oil refining 107 per cent, for steel 84 per cent, and for cement 106 per cent. The failures to measure up to expectations are undoubtedly disappointing until one remembers the past and the fact that targets were set in an economy that for years had seemingly resigned itself to stagnation and what the Commissariat calls *décadence*. Only by looking closely at what has been done within a few leading industries and by viewing this progress against the past twenty years can any real assessment be made.

Production in the French coal industry had slumped from a peak of 55 million metric tons in 1929 to 47.6 million in 1938, and there was a corresponding fall in productivity. Immediately after the liberation, coal was nationalised, and of all the basic industries included in the Monnet plan it received the second largest share of funds for new investment. By this year France was the only west European country, apart from Britain, to have restored productivity to at least the prewar level; at 1.39 metric tons per manshift, productivity in the mines is now even higher than during the boom year of 1929. Production, too, is well ahead of the prewar level; it is now running at an annual rate of almost 58 million tons, which is some three million tons above the 1929 crest and ten million higher than in 1938. With the exception of Belgium, no other West European coal producer is within sight of its prewar rate of production. The one respect in which French progress compares unfavourably with other European nations is miners' housing. Western Germany, with a production two and half times that of France, has built miners' houses at a rate more than seven times the French.

The development of electric power stimulated by the plan is perhaps a more typical example of the effort needed to overcome prewar lethargy. Before the war France grossly neglected its power resources: the production of electricity increased between 1929 and 1946 by a meagre 60 per cent, as compared with a fourfold rise, for example, in Great Britain. For this reason the single largest share of the planners' funds was devoted to expanding electrical power capacity—particularly hydro-electric. This meant that for the first time the major emphasis was placed not on the extravagant use of scarce coal but on the exploitation of France's abundant resources of waterpower. But in spite of this preferential treatment, the French electricity industry is still comparatively undeveloped. In Britain, Sweden, Denmark and Austria, for instance, output has nearly trebled since 1938, while in France it has risen by 81 per cent.

★

In monetary terms the achievement of the Monnet plan is impressive. During the five years of its existence (1947-51), total investments in the industries covered by the plan amounted to 3,800,000 million francs (at end-1951 prices). Of this sum—equivalent to approximately £4,000 million—slightly over one-half came from self-financing and ordinary credit facilities. Some 1,560,000 million francs, or 41 per cent, were provided by the special modernisation and equipment funds. And in turn, half of these special funds represented the franc counterpart of American aid. It might be expected that the nationalised industries would have received the bulk of new investment, but in fact less than 40 per cent of the total investment went to them. Of the remaining

60 per cent that was applied to private and "mixed" concerns, over a third was furnished by the government's special modernisation funds. Government aid to private enterprise was especially important in the steel industry, where American counterpart funds have been used to provide France with four of its largest new rolling mills—two hot strip and two continuous cold strip.

The plan has certainly not lacked its critics. The more cynical of them say that even without the Monnet plan, much of the investment would have taken place. Other detractors complain that it is partially responsible for France's inflationary difficulties. Again, there are those who feel that too large a proportion of the investment has been in the form of durable goods and they point to the fact that during six postwar years only 250,000 dwelling units have been built in the whole of France.

There may be some substance in these complaints, but only on the assumption that no special stimulus to the productivity of the French economy was required. More houses are certainly needed, but, though houses add to human welfare, they do not usually contribute to productive capacity. Inflation would have been easier to avoid if there had been less investment and if the counterpart funds had been used to pay off debt—but the real national income today would be smaller. If M. Monnet's original diagnosis was correct—and the facts hardly permit of any doubt that it was—then his plan has been sound.

Whether any durable structure will rise from the foundations he has laid is still not altogether certain. The French will have to show greater readiness to overcome their past reluctance to create real capital rather than to hoard and consume. Indeed, the underlying weakness of the plan has sprung from precisely this source. Year after year M. Monnet has been compelled to battle for the necessary funds and to stiffen government officials against the temptation to balance budgets by cutting appropriations for new investment. The abiding recovery of France must wait upon the appearance of a French government that both recognises the importance of new investment and is prepared to take the necessary fiscal steps to ensure a healthy balance between consumption and investment. This is all the more essential now that the French economy must adjust itself to a greater armament burden and to a decline in American economic aid.

The German Economy A Special Survey

Page 205 of this issue

Coming Demise of a Ministry?

A GOVERNMENT department without a policy is like a ship without a rudder—and such (not entirely, or even mainly, by its own fault) has been the Ministry of Food in recent years. During the war the object of food policy was simple and its methods effective. Supplies of food were restricted by the lack of shipping space, while cost—once the principle of subsidies had been accepted—was a secondary consideration; the nutritional experts took control in order to ensure that the maximum balanced food value was obtained from domestic production and the Ministry's permitted tonnage of imports. This policy was continued until 1948-49, but when the annual subsidy bill approached £500 million it became impossible to ignore costs any longer. From that time on, to the familiar objectives of keeping the cost of living down and the rations large, a third was added: that of keeping the cost of the subsidies down.

The difficulties of the Ministry of Food in recent years have arisen from the fact that these objectives are mutually incompatible, and its policy has fluctuated according as one objective or the other was considered from time to time to be the more imperative. The total cost of subsidies depends on three factors: the prices paid by the Ministry for its purchases from producers at home and abroad; the prices at which it sells out for consumption the food it has bought; and the size of rations (which is, of course, to some extent dependent on prices). There have been times since 1948 when, in order to keep both retail prices and subsidies within limits, the size of the rations has been below what it might have been. This has happened in two separate ways: either the Ministry has refused to pay the world price for a particular food and has been unable to buy as much as it might have done; or else it has been forced to pay higher prices and has cut down the quantity

bought so that a higher subsidy per unit consumed would still not cost it more in total. To such lengths is policy reduced when categorical political imperatives are injected into economic relationships. Release from these ridiculous dilemmas did not come until 1951, when even the pretence that the cost of living was being kept down was tacitly abandoned. As a result, the size of rations could, in general, rise, even though the world supply of foodstuffs was scarcer than it had been in 1948-49.

A committee set up by the Labour Government to consider the future of the Ministry of Food came to the conclusion that, once rationing was abolished, the

Ministry could become a very small department dealing only with nutrition and the welfare foods. But at the time the conclusion was academic, for until prices were set reasonably free and the problem of the subsidies was tackled, there was no chance of abolishing rationing. The first attack on the subsidies was made by the late Sir Stafford Cripps in 1949-50, when the annual cost was reduced by £60 million to £425 million. But the real assault did not come until this year, when Mr Butler announced his intention of reducing them to an annual rate of £250 million. Food subsidies in 1951-52 amounted to £415 million, and if it had been desired to keep food prices stable, the subsidy bill would have been £460 million in the current year, so that the new figure represents an effective cut of over £200 million. But the cuts in the subsidies, and the consequential rises in prices, were postponed until half way through the year—most of them came into operation at the beginning of October—so that the actual expenditure in 1952-53 will be £309 million. Once the subsidies were no longer sacrosanct, the Ministry of Food was given room to manoeuvre both in its buying policy (because any increases in purchase prices demanded by producers could be passed on to the consumer and not absorbed by the Government in its subsidy bill) and in its longer-term policy of moving towards freedom.

There are three different kinds of food subsidies. First, the various welfare schemes (vitamin foods, milk-in-schools, etc.) which are at present costing a little under £50 million a year; arguments for and against these must be based more on social than economic considerations. Secondly, there are the direct agricultural subsidies (fertilisers, feeding-stuffs, ploughing-up grants, etc.) which now amount to over £50 million a year. Here technical considerations are important, such as the need to reclaim submarginal land, to maintain soil fertility, or even to ensure a given domestic agricultural output for strategic reasons. The third group consists of the price subsidies proper; their purpose is to protect the British consumer from the high cost of producing food both in Britain and overseas. This article is concerned wholly with this third category. They are sometimes called the consumer subsidies, but that may be misleading. It is, indeed, an exercise in metaphysics to determine whether any particular subsidy benefits producers or consumers most. Nearly a third of the total is paid to home producers, and if the Ministry of Food were to abolish the subsidy in the sense of charging for what it sells as much as it pays, other and more direct subsidies to the British farmer might become necessary, so that any initial saving might have some offset.

No official figures have been published showing how the new annual rate of £250 million will be spread among the different foods. But a rough calculation from the current amount of subsidy on the various foods and from the level of consumption during the past twelve months would seem to show that £110 million is being spent on the welfare and agricultural subsidies and £140 million on the consumer subsidies. Of these, bread and flour still heads the list with £40 million, followed by milk (£25 million), bacon (£17 million), butter (£15 million) and meat, margarine and eggs (each £10 million).

The subsidies have at last been brought down to a level where many of them could be taken off without imposing

much additional hardship. The subsidy on meat is now an average of only 3d. a lb. This could be removed without great trouble and private importation permitted even if rationing were continued for the time being. The subsidy on cheddar-type cheese is also only 3d. a lb, while the sugar subsidy is 1d. a lb, milk 1d. a quart, eggs 3d. a dozen and flour 6d. per 7 lb. The foods with the largest unit subsidies are butter (6d. a lb) and bacon (4½d. per lb); the margarine subsidy is 2½d. a lb and that on cooking fat 2½d. a lb. On the face of it the subsidies on meat, sugar, eggs and cheese could be taken off without making any material difference to the retail prices. Indeed such a move would cause an additional rise in the index of retail prices of one point, and an increase in weekly expenditure of 1½d. Even if the subsidies on butter, margarine, cooking fat and milk were removed the index would rise by only 1.05 points and weekly expenditure by 3½d., whereas the removal of the bacon and the flour subsidies adds a further 1.54 points to the index and 5½d. to weekly expenditure. The total abolition of the consumer subsidies would increase the cost of living index by 3½ points and weekly expenditure by 11d. The Chancellor's new policy has already raised the index by 4½ points and weekly expenditure by 1s. 6d.

It is possible, in fact, to compile a programme of de-subsidisation by stages, proceeding from those subsidies that could be removed without causing any disturbance to those that would be more difficult:—

	Retail prices index, points. Cumulative	Consequential rise in— Weekly expenditure per head. Cumulative
Stage 1.—Butler proposals of March, 1952, now in force.....	4.5	1s. 6d.
Stage 2.—Meat, sugar, eggs, cheese.....	1.0	5.5
Stage 3.—Butter, margarine, cooking fat, milk...	1.05	6.55
Stage 4.—Bacon, flour...	1.54	8.09
		11d.
		2s. 5d.

In view of what has already been accomplished this does not look too formidable a task.

The removal of subsidies and the abolition of rationing are closely related matters, but not identical. The Government has set itself two criteria in judging whether rationing could be abolished: first, the relationship of demand and supply must be such that they would balance without any—or at least any substantial—rise in the price above the present unsubsidised price; and secondly, that no additional expenditure in hard currencies shall be required.

What foods meet these two conditions? Something depends on what is meant by the requirement of no increase in prices. Thus it seems as if the public (taking the country as a whole) is disinclined, at present prices, to buy more than 2s. 2d. worth of meat a week. The freeing of the meat trade would undoubtedly lead to rises in the prices asked for the better-quality cuts, but the lower grades would fall, and the average of grades—and of seasons—would probably be no more than the present. Again with eggs, if the present allocation system were abolished, together with the subsidies, and imports allowed in freely at cost during the so-called "flush" season, there would certainly be a greater seasonal range in the price of eggs—say from 3s. to 6s. or 7s. a dozen—

but the average would probably not be very different from the present controlled price plus the subsidy. And neither meat nor eggs are dollar foods to any large extent. Sugar, in the world at large, is both plentiful and cheap, but additional supplies would have to be bought for dollars. As soon as the Chancellor can afford to spend another \$50 million on sugar imports both the sugar and the sweet rations could be abolished without risk. Wheat also is a dollar food and here again world supplies are plentiful; but to abolish the subsidy at one go would

mean a significant rise both in the cost of living index (1½ points) and in weekly expenditure (4½d.). Bacon is mainly a sterling import. At current retail prices some people are not taking up their ration; but there is a substantial unsatisfied demand from others that is being held back by the rationing scheme. Nevertheless if the subsidy were abolished and the price rose by 4½d. to 4s. 7½d. a pound, it would probably be found that demand and supply were in tolerable balance. With cheese, the weekly ration of one ounce is so small that it hardly seems worth while continuing it, especially as unrationed non-cheddar types are available. Vegetable oils are both plentiful and cheap and can be bought for sterling. But margarine could hardly be de-rationed without considering the effect on butter. The present unsubsidised price of butter is 3s. 6d. a lb; but if it were unrationed the price might well rise to 4s. 6d. a lb or even 5s. Butter is scarce in the world and the supplies available in world commerce have failed to expand—partly because the Ministry of Food has been unwilling to pay sufficiently high prices. If the Government took courage and freed the butter market—and such a move would need considerable political courage—margarine and cooking fat could also be unrationed.

The stage is certainly being set for the return of freedom to the food trades. But there are two preliminary conditions. The first is that Britain's overseas accounts should be put on such a firm basis that the need to make sudden quantitative cuts in imports will not recur. The second is that some adjustment may have to be made to the Agriculture Act of 1947—not, indeed, to take away any of the British farmers' basic security, but to maintain his income in ways other than by guaranteeing prices which, in some cases, are higher than the consumer is willing to pay for what the farmer produces.

Freedom for the food trades will not necessarily mean cheap food—at least not at first. But it will enable the British people to regain their right to decide for themselves how they will spend their incomes and what prices they are willing to pay.

NOTES OF THE WEEK

Socialist Struggles

The lull in the internecine struggles of the Labour party is more apparent than real. With the reassembly of Parliament this week, the fight has immediately been transferred from the platforms of the country to the corridors of Westminster. Last weekend Mr Attlee broke his silence with a demand for an end to the "party within a party, with separate leadership, separate meetings and supported by its own press." This, coming on top of the intensive counter-offensive from Mr Gaitskell and the union leaders, persuaded Mr Bevan and his colleagues that the time had come to give at least the appearance of beating a retreat. In an article in this week's *Tribune*, Mr Bevan announces that he and those who resigned with him from the Labour Cabinet will stand for the parliamentary committee of the party in the next session, and that they will open up their group meetings to any Labour member of Parliament who cares to attend.

Although this is covered with a great deal of bluster about no party within a party ever having been formed, it represents at least a partial withdrawal. Everything now depends on whether Mr Attlee will accept these terms. He is under strong pressure from two sides. Mr Gaitskell and his colleagues in the anti-Bevanite movement regard Mr Bevan's offer as derisory, designed only to lull the Parliamentary party into a false truce. But many members in the centre of the party, who have been meeting in a so-called "Keep Calm" group, are prepared to grasp at the chance of appeasement. Distracted by the electoral dangers of a split, and—horror of horrors—by the thought that they might have to make up their minds between one side or the other, these middle-of-the-roads may have a considerable influence at this stage. Several ex-Ministers have taken refuge amongst them, including Mr John Strachey, who had spent a harrowing weekend leaping on and off the Bevanite band wagon.

Yet even if Mr Bevan's terms are considered adequate, time alone will show if anything more than a temporary settlement has been reached. It will for instance be very difficult to tell whether the Bevanites have dispersed or merely gone underground. They can still decide their policy in private meetings at each other's houses. Mr Attlee and Mr Morrison can hardly be much happier with Mr Bevan again sitting with them on the front bench than they were when he was attacking them from the rear. At Morecambe, where he was supposed to be a spokesman for the National Executive, he made a speech filled with class malice and anti-American utterances that in no way reflected the view of the majority of the Executive. That was an ugly portent of what may lie ahead if he rises again as a spokesman for his party in the House of Commons.

Conservative Confidence

The Tory leaders came away from Scarborough well satisfied with the outcome of their party conference. They had made good use of the occasion to demonstrate the party's sense of unity, to parade their ablest administrators and leaders, and to stimulate the morale of their rank-and-file for the year ahead. By its nature and size, the Tory conference is an occasion for showing what the party is feeling rather than what it is thinking, and this year the constituency representatives soon allowed their worries about the dangers ahead to be overcome by their thankfulness for success. Most of the controversial policy issues were either dropped or pressed with restraint. Hardly a word, for instance, was mentioned about the road levy, and the most outspoken criticism of the Transport Bill came, not from the conference

itself, but from the Mayor of Scarborough in his address of welcome. Lord Swinton turned aside the criticisms of party publicity with that suavity achieved only by those who served an apprenticeship under the late Lord Baldwin. Only in the debates on Gatt—when the veteran Mr Amery led a real attack—and in the demands for further cuts in Government expenditure, did dissatisfaction with the Government's policy find vigorous, if brief, expression.

These criticisms were more than balanced by enthusiasm for the party leaders. Mr Churchill got his usual warm welcome. Mr Eden was given the ovation due to an heir apparent. But even this was surpassed in volume, if not in significance, by the applause accorded Mr Butler after his speech. The audience thumped and roared their approval even though the Chancellor had stood firm and refused to give away a single sixpence, and even though the same audience, five minutes later, eagerly voted for the resolution demanding the concessions and cuts that Mr Butler had spurned. The answer to this paradox lies in their delight at Mr Butler's demonstration of strength—not only at the conference but also in his speech at the Mansion House dinner. Not everyone wants to go where Mr Butler is leading, but all are delighted that he can lead so strongly.

The political importance of Scarborough lies chiefly in the added confidence given to the Tory leaders in the Commons—already apparent in their bearing this week—and in its evidence of the broadening basis of the party in the country. At Westminster the Conservatives may still be largely a party of Old Etonians and Guardsmen, leavened with the new type of professional politician trained by the Tory Central Office; but in the constituencies the income groups—if not the social classes—from which they draw their support are not so far removed from those that vote Labour. This fact will present growing problems not only to the Labour party, but also to the more rigid elements in the Tory leadership.

No Decision on Rents

The Minister of Housing scored a big success at the Scarborough conference. The delegates were delighted with his progress towards the target of 300,000 houses a year which their predecessors set two years ago; and although Mr Macmillan admitted to being reminded by the Chancellor that money is short, he said that the target still stood.

He could not, however, give any promise of the measure that would make so large a housing target unnecessary—a raising of rents to a more economic level. He merely said that he could not announce a decision, and that parliamentary time was hard to come by. It has been confidently reported that the Government has decided against a general increase in rents and is searching for ways that will discriminate between properties. The truth is that nothing has yet been settled: and the whole subject is still being studied at the Ministry of Housing. The argument that controlled rents are causing houses to fall out of use has lately been much taken up by the press, and it seems unlikely that the Minister will be able to face next year's party conference without having done anything to implement its resolution that the Rent Restriction Acts should be reviewed.

A minor step towards straightening out some of the distortions of housing policy was recently recommended by the working party on requisitioned houses, and the Minister has now instructed the local authorities to act upon its recommendations. The main proposal was that the local councils should set about rehousing the 132,000 families now occupy-

ing requisitioned homes, thereby saving the Exchequer some £6 million a year. The suggested timetable requires authorities with one such family or less per thousand inhabitants to release those homes by the end of next year, while authorities with proportionately more requisitioned properties are allowed longer time. Properties which their owners want to occupy themselves have a priority for release second only to that of expensive property that is a heavy charge on the Exchequer. As two of the possible means of "release" of other property, it is suggested that owners might be induced to accept the present occupants as tenants, or that the authorities might acquire the properties concerned. The Requisitioned Property Owners' Association sees a sinister connection here. It would, indeed, be hard if the local authority were to use the threat of compulsory purchase to force them to accept tenants that they do not want. On the other hand, even in that event, they would be no worse off than thousands of landlords who, owing to the Rent Restriction Acts, are unable to get possession of their property; and often, perhaps, their hardship has been less, for their property has at least been maintained for them.

Reserves for Ridgway

General Ridgway made his case soberly and firmly at the Pilgrims' dinner on Tuesday. The Supreme Headquarters for the defence of free Europe has not been given its "minimum military requirements"; its information indicates that the Soviet strength "has definitely grown and continues to grow"; its need for properly trained reserves remains urgent; and it does not feel that time is on its side. In other words, unless the statesmen decide that danger is not imminent, and unless governments maintain that the economic limits of what is possible have already been reached, General Ridgway has a fair claim to more tools with which to do his difficult job.

Mr Churchill's speech was hardly a helpful prologue to such a businesslike statement. He seems now more concerned to show how wrong it was during the last election to call him a warmonger than to explain to the public how he sees the military problem of Britain and its allies. Every time he says in so many words that the danger of world war has receded, the statement has a relaxing effect far beyond what is justified. If it is the political and military effort of the Atlantic alliance that has moved Stalin towards his present tactics, then that is an argument for continuing it. Mr Churchill, it is true, said "we shall do our utmost, short of going bankrupt, to increase these deterrents," but the public still does not know what his strategy for the cold war is.

Sound Man of Europe

Lord Montgomery has been saying in London that "infirmity of purpose" is one of the chief dangers against which the Atlantic alliance must guard. He would doubtless agree, after his visit to Turkey, that this is as well understood in Ankara as in any other capital of the free world. Standing guard as they do along a most vulnerable sector of the Soviet Union's southern frontier, the Turks have shown no lack of courage and consistency over the last six years. It was in 1946 that they last felt the full weight of a diplomatic offensive from Moscow, which denounced a long-standing treaty of friendship between the two countries and demanded as the price of its renewal the cession of parts of Eastern Turkey, Soviet bases in the Black Sea Straits and a revision of the Montreux Convention governing the use of the waterway to the Mediterranean. With American and British support—this was before the cold war officially started—they made a spirited stand against bullying. Since then they have been equally game in their replies to Soviet protests against the construction of air-bases with American assistance, and

against participation in Nato and in the planning of a Middle Eastern Command.

These things are being recalled during the visit to London of the Turkish Prime Minister, Mr Adnan Menderes, his Foreign Minister, Mr Fuat Köprülü, and six prominent journalists. It follows closely Mr Eden's successful visit to Yugoslavia and is further evidence of the Foreign Secretary's interest in Britain's position in the Eastern Mediterranean, and the links that are being formed between Belgrade, Athens and Ankara. The Turks share with this country the responsibility of being simultaneously interested in Europe and the Middle East. They pressed hard to join Nato both because they regarded themselves as the hinge between the two theatres, and because they felt that American military help against an aggressor—their real target—might not be forthcoming if they were linked merely to the shakier framework of an Anglo-Middle Eastern organisation. Subsequent events in the Middle East have proved them right.

The domestic odds against which they have established this position are described in an article on page 169. Prominent among them is the expense of maintaining under arms military forces that cost over 31 per cent of the national budget. Naturally, very substantial American aid has helped them to bear this burden. Such drawbacks as there are to it, they carry off with distinction; for, unlike most peoples who have recently experienced social revolution and are still in the first stages of industrial revolution, they feel no false pride about accepting foreign aid and advice. The balance of their judgment is of service not only to themselves but to the whole free world.

Retort to Persia

There were two choices open to the British Government in answering Dr Mossadeq's "ultimata" of recent weeks. One was to continue politely to counter his intemperate accusations and unacceptable demands with repetitions of the Truman-Churchill offer of August 30th. This course had the merit that it was an agreed Anglo-American policy and left no room for Persian doubt on this score. It had, however, two substantial demerits. First it had produced no results, and offered no promise of them. Secondly, by keeping silence about Persian distortions of British policy, it allowed a substantial British case to go by default. The second alternative, therefore, was to state the British case, and to take the consequences.

After consultation with the American Government the second course was adopted. In a British Note delivered to Persia on Wednesday and a simultaneous statement issued by the Foreign Office, Mr Eden again says that he cannot budge beyond the Churchill-Truman proposals (a point on which the Americans agree) and goes on to rebut the whole series of Persia's "inaccurate statements," "misrepresentations" and discourtesies. He does so, however, in language far removed from the dulcet tones of policy statements concerned with the State Department—which may give the Americans a chance to quit the role of joint negotiator and return to that of honest broker between two rivals. He has offered the Persians the chance to hit the trail that they are only too ready to follow—that of trying to play America off against Britain.

To rebut Persian lies was right; to expect that Persians would listen to rebuttal was futile; the British case therefore needed stating less for their ears than for those of other countries, and in language that Washington would not have felt obliged to soften. Yet the Americans can take heart on one point. Their great fear is that Dr Mossadeq will collapse and, by collapsing, give place to a Tudeh successor. The British reply will, temporarily, restore his fortunes in that it affords him fresh battlecries in his "struggle against foreigners."

Ardent and Hopeful

The air exercises held over this country during the past two week-ends provided the first real opportunity for testing the country's air defences under realistic conditions; that is, it was the first exercise in which jet bombers have been used. The results were not unsatisfactory. The radar defences, which have been steadily extended during the past three years, proved fully capable of picking up incoming attackers at a sufficient distance beyond the coast. The Meteor and Venom day and night fighters, which are the backbone of fighter command, do possess, whatever their other limitations, the rapid rate of climb that is the first essential requirement of an interceptor fighter, and it was Venoms that broke up an attack on Birmingham made early in the exercise by fast, high-flying Canberras.

But what a motley collection of attackers the defenders had to meet. The raids were carried out by vintage piston-engined bombers, British and American, by American Thunderjet fighter-bombers which are in the same partially obsolete category as the Meteor, and by a bare handful of Canberras. There is no ground for complacency in the evidence that a gratifyingly high proportion of these were intercepted before they reached anywhere approaching their targets; there is even less reason for congratulation if this in fact represents the best that the combined British and American bombing teams can do in terms of attack. The slow rate of delivery of the Canberras is a major disappointment. Where these bombers were used against London, they proved more than a match for the southern defences. A small raiding force of about ten Canberras (and an atom raid may not include a large number) reached London last week-end without, in the official phrase "any interception being reported." It seems highly probable that the radar defences had picked up and kept track of these bombers, but that the locally-based fighters were less than a match for them. There were, significantly, no Venoms in that area at the time; had there been the outcome might have been different. Until the delivery of the delta-wing Gloster Javelin night fighter in two to three years' time, the Venom is likely to be the best night interceptor in service. A Russian Canberra-type jet bomber has been reported in action in Korea, long before the United Nations have such aircraft to spare for operations there.

Exercise Ardent suggests, in fact, that the British defences are adequate to meet the threat that such a bomber constitutes, but it also showed that the margin of safety is a narrow one, likely to be whittled away by further inevitable and imminent improvements in bomber design. The exercise suggests that the risk that has been taken in refraining from ordering an intermediate night fighter between the Venom and the Javelin is an unwise one that deserves review.

Later Closing

The Union of Shop, Distributive and Allied Workers is much upset because the shops can now stay open until 8 o'clock—or 9 o'clock on late night. A defence regulation, for obvious reasons of blackout, prescribed a closing time of 6 o'clock during the winter months; and the regulation was kept on afterwards for the sake of saving fuel. But when it was lifted last week the prewar closing time laid down in the Shops Act automatically came into force again.

The union's opposition seems unnecessary. There is no longer reason to fear that shopworkers will be forced to work very long hours. Employers are deterred from asking them to do so by the fact that overtime has to be paid for anything over the 46-hour week prescribed by the wages councils; and if they should nevertheless insist on overtime work, they would not long keep their staff while employment remains full. A fact which suggests that the change in the law will make little or no difference to the hours worked is that few shopkeepers have exercised their right to stay open until

even 6 o'clock in the winter—still less until the 8 o'clock in summer time that has remained unchanged since before the war.

The only practical effect of lifting the defence regulation is that the shops will be able to rearrange their hours so as to attract more custom. By special authority from the local councils some rearrangements have already taken place. In central London many of the shops have stayed open until 7 o'clock on Thursdays; and they are then filled with office workers and others, who would either have added to the congestion on Saturday morning or else would not have shopped at all. In opposing a measure that makes such adjustments easier, the union is acting against the interests of its members' pockets (for many are paid on commission) as well as of the level of employment in the trade. They are also adding point to the charge that is so often made against British shops—that the convenience of the customer counts for very little.

Compensation from the Japanese

There are some big discrepancies between one allied country and another in the amounts distributed to ex-prisoners of war and civilian internees in Japanese hands. At the end of last week, it was announced that Canadian servicemen and civilians will get 7s. 5d. a day, which means for a Canadian captured at Hongkong and held for three years eight months about £500. This compares with 17s. 11d. a day paid to Americans, which would work out for most of them at over £1,000; a probable total distribution of £50 a head to Australians; and a first share, announced on October 6th, of £15 a head for British servicemen and civilians.

These distributions are made from Japanese assets seized in the allied countries and made available under Article 14 of the peace treaty with Japan. (Article 16 provided for the transfer of Japanese assets in neutral countries or ex-enemy countries to the International Red Cross for distribution to benevolent organisations on behalf of former prisoners of war of all nationalities. These assets totalled about £5 million.) The sum available from Japanese assets seized in this country is only about £1,250,000; of this, £850,000 is being distributed initially to give £15 a head, and the balance later. Inevitably, it will be asked why, since the sum available is so small, is it not concentrated on giving larger sums to those in real need or who have suffered especial hardship? This was, in fact, the Labour Government's intention; but the prisoners of war themselves, through their organisation, the Far Eastern Prisoners of War Association, have always insisted that the sum should be shared equally among all prisoners. Those of them who are, in fact, still suffering from maltreatment at Japanese hands are, it is to be presumed, receiving disablement pensions from the Ministry of Pensions with special allowances if their disablement is particularly severe.

Shades of the Comintern

On the last day of the 19th All-Union Congress Stalin took the rostrum. He had provided a curtain raiser with his article in *Bolshevik*; he now delivered as epilogue a short address to the Communist parties of the world. Thus, he has again dominated the Congress occasion, this time not so much as the Party's active leader, but rather as the master theoretician of the Soviet Union and master strategist of world communism. The address explained why so many Communist leaders had flocked to Moscow. The heads of almost all parties—but not Mao Tse Tung or Togliatti—were there in person. The presence in the Kremlin of such a galaxy of seasoned leaders and the prominence given to their

Good packing is an investment

Proud of your product? Then be critical of the way it is packed! Wise manufacturers use "FIBERITE" packing cases, for "FIBERITE" quality is complementary to good goods. But "FIBERITE" cases are not a luxury, they are as good as good packing can be—yet they are economic in cost and bring packing room savings that are a distinct advantage these days—savings in space, time and trouble.

—so advertisers get more circulation than they buy

In 1949, The Reader's Digest had a 300,000 circulation. This year—it has a guaranteed 700,000 average net sale. And sales are still piling up.

Advertisers gain handsomely from this rapid rise. This autumn, for instance, they are getting about 100,000 circulation per month free.

They've had a bonus, in fact, each year since The Reader's Digest accepted advertising—for the page rate is based on a conservative guaranteed sale which has always been exceeded.

READ IN THE HOME

Research shows that The Reader's Digest is read at home by 90 per cent of its readers. They're people of above-average purchasing power, too. The Reader's Digest is skilfully edited to carry your message to both men and women, and page rates for advertising space compare very favourably indeed with rates for other magazines.

COLOUR VALUES

Full colour pages in The Reader's Digest are extra good value, for the colour rates are less than 30% above black-and-white. For consumer goods from cars to clothes, groceries to gas cookers, colour has proved its power to sell.

The proportion of advertising space in the magazine is strictly limited, so space should be reserved without delay.

The Reader's Digest

speeches evoked memories of the early revolutionary days of the Comintern. Stalin, however, made it plain that the parties' tactics are to be those of the Comintern of the late thirties, and outlined clearly a policy of united front to be followed. If the Communist parties in capitalist countries, he argued, wish "to be patriots of their land, if they wish to lead the forces of their countries . . . they will pick up the banner of freedom that the bourgeoisie has thrown overboard. . . ."

Even his reference to direct action was connected with the defence of the Soviet Union. Stalin recalled the campaign of "Hands Off Russia" organised by British workers after the first World War and compared it with the recent assurances of Thorez and Togliatti that the workers of their countries would not fight against the Soviet Union.

Yet if analogies with the thirties are many, the war has changed the situation radically. Stalin himself stressed this difference. He, the prophet of Socialism in one country, spoke in glowing terms of the change, of the end of Soviet isolation and the establishment of similar régimes "from Korea and China to Czechoslovakia and Hungary." The Communist parties of capitalist states are requested to subordinate their interests no longer to the land of the Soviets, but to Soviet lands. That Stalin appeals to them directly, over the heads of their governments, shows that he has little hope of coming to an understanding with the West. On the other hand, with the Soviet régime extending now over one third of the world, he can await the collapse of capitalism in greater comfort. Or to use his own words: "The struggle is now lighter and work going more gaily."

Less Grain from the Russians

This week Mr Averell Harriman reported to the United States Congress that the controls on supplies of strategic materials to communist countries have effectively slowed down the Russian military build-up. Unfortunately the report coincided with the news of Soviet retaliation that will effectively slow down the British agricultural build-up. Instead of supplying Britain with a million tons of grain—as they did last year and as Britain wanted it to do again this year—the Russians have restricted their sales to 200,000 tons, of which 150,000 tons will be oats, 30,000 tons barley and 20,000 tons maize. The Russians suggested that their harvests were not so good as they expected; yet only recently Mr Malenkov announced that this year's grain harvest totalled 130 million tons, which is nearly 10 million tons more than in 1951.

As a result, Britain's imports of grain will be some 800,000 tons less during the coming twelve months. Fortunately its barley crop has been good and is estimated to be some 250,000 tons larger than last year. Also, additional grain supplies may be obtained from North Africa and the Middle East, though the quantities are likely to be small. On balance Britain looks like getting some 500,000 tons less than last season and the most serious deficiency will be in maize, for last year the Russians supplied 300,000 tons and the chance of getting more from Argentina appears to be remote. The only possible alternative source is the dollar area.

The Russian manoeuvre is obvious. If Britain and British agriculture are not to suffer, the United States will have to choose between supplying extra dollars to enable Britain to buy grain from the dollar area or to give it permission to supply electrical equipment and other capital goods, as well as certain raw materials to Russia, in return for a supplementary contract. Some may, of course, feel that the British pig is a worthy sacrifice on the altar of economic cold warfare, though Mr Bevan would undoubtedly raise vociferous objections. The wisest course would be to

encourage Jugoslavia—and even France—to develop their grain production, so as to reduce Britain and Europe's dependence on both Russia and the dollar area.

Werewolves Uncovered

Anger and dismay have been aroused in Germany by the discovery that Americans have been training, arming and financing a German "underground" for use in the event of war. When the Socialist Premier of Hesse, Herr Zinn, revealed the facts, he stated that there exists a black list of unreliable Germans to be assassinated if war came; it includes Social Democrats—some of them officials—as well as Communists. The Federal Supreme Court confirmed that the police had arrested some of the men involved on a charge of conspiracy but had released them when the Americans intervened. Faced with this embarrassing evidence of his countrymen's secret service activity the US High Commissioner, Mr Donnelly, has ordered a joint American-German investigation. This is a right and courageous decision; but the fat is already in the fire and Communist propagandists are warming their hands at its heat.

What is particularly alarming is the apparently carefree manner in which American officials recruited irregular forces from the League of German Youth, one of those vaguely nationalist bodies which have cropped up in postwar Germany. It must surely be well understood that the kind of youngster who was happiest in the Hitler Youth would not much mind whether he was employed against Russians, German democrats or the Americans themselves. Werewolves make bad police dogs.

The gravity of the affair is out of all proportion to the number of young men involved in it. It touches the Germans on a number of very sore spots. They have been growing increasingly restive about their lack of control over American-sponsored agencies that conduct propaganda and intelligence activities, or support subversive action in Soviet-held territory. Moreover, they are determined that the Federal Government alone shall decide whether Germans shall be armed—and which. It is in the Allied interest to support the government and parliament in their insistence that rearmament shall be undertaken, when the Bonn treaties are ratified, only under the closest political control. Nothing would be easier than to bring together sinister elements in German public life behind the screen of cloak-and-dagger activities. It is to be hoped that Mr Donnelly will fight hard for the supremacy of the civil over the military authority; for public opinion both outside and inside Germany will be watching closely.

Schoolchildren's Teeth

When Mr Bevan, as Minister of Health, was rebuked for allowing the drift of dentists from the local authority service he replied to the effect that schoolchildren's teeth were not necessarily being neglected; many of them were being treated in ordinary dental practice. The Ministry of Health's own report shows how false his assumption was. In 1950-51, out of every thousand children of school age only about 110 received treatment—other than for an emergency—under the general dental service.

Since then, the charge for dentures imposed by the Labour Government and this year's charge for dental treatment must between them have reduced the amount of general dental practice—though no precise figures are yet available. As a result, dentists have begun to return to the local authority services, encouraged also by the increase in pay for this work, together with the cuts in the fees for treatment under the

general dental service. The fact remains, however, that there are not nearly enough dentists to go round, to provide, that is, an adequate service for children and adults. If there were, the main reason for a school dental service—to provide a priority service for children—would disappear. But such a service is also a means of overcoming parental apathy. If the initiative in taking children to the dentist is left with their parents many of them will go untreated, however adequate the facilities for treating them in general dental practice.

It is against this background that the British Dental Association's offer to set aside 10,000 hours weekly for the treatment of schoolchildren should be considered. The dentists concerned would treat the children in their own surgeries, not in the local authority clinics. Understandably, the Ministry of Education appears reluctant to accept this offer; it would prefer to re-establish and expand the school dental service by using the dentists' time on a sessional basis in local authority clinics. The Ministry of Health has not yet declared itself; but it would be understandable if it disliked the idea of part of the cost of the school service falling on the health service. Understandably, again, the dentists prefer the higher fees for piecework under the health service to the sessional fees paid by local education authorities. So, as a result of the administrative division of the health services, and until all these conflicting interests are reconciled, it looks as if schoolchildren's teeth will continue to suffer.

Remembrance of Things Past

There are signs that the nation is becoming increasingly concerned with the fate of its historic buildings, and from as far away as New Zealand voices are being raised on their behalf. Last week it was announced that £70,000 had been given to the National Trust by an anonymous woman donor. This was a very large and generous gift, but there should be no illusions about the extent of the help it can give. Today, £70,000 can hardly do more than save perhaps one house from decay and destruction.

In contrast to the reviving interest in historic buildings it is sad to record that the Shaw Memorial Appeal, which Mr Butler launched last November, is to be wound up after raising less than £1,000. This failure illustrates the fact that only causes that have an obvious emotional appeal—such as relief funds after a disaster—are likely to succeed today. The fund raised after the Exmoor floods totalled over £1 million—a thousand times the amount subscribed in memory of Bernard Shaw. This particular cause was not helped by Shaw's will, which left the bulk of his large estate for what was generally regarded as the silly purpose of instituting a simplified alphabet. Not even his house at Ayot St. Lawrence is likely to serve for long as a memorial to its owner; for he left it to the National Trust without any funds

to maintain it. Last year the admission fees charged to visitors were enough to cover the outgoings, but this year receipts have fallen by half and the National Trust, faced with a loss, is considering letting the house.

It would be wrong to conclude that public apathy about the Shaw Memorial and about the house he left to the nation is a sign that his memory has fallen on barren days. His credit as the author of so many of the ideas that are now the staple of daily social and political life may have been temporarily somewhat masked by the provocative garrulosity of his old age, and not all his plays command the admiration of former days. But the best of them still draw large audiences, and their performance is in itself the best memorial to their author.

Europe's Own Harwell

The European Council for Nuclear Research, which was set up under the auspices of Unesco in December, 1951, has decided to build a giant atomic research centre just outside Geneva. The laboratories will house the world's largest cyclotron and synchrotron and will have electromagnetic installations capable of generating upwards of thirty billion electron volts. The enormous magnet required by the synchrotron will embody "new principles of design and construction," and it is expected that five or six years will elapse before the Geneva centre is completed. This entire project will cost more than 100 million Swiss francs and is to be financed in seven annual instalments by the ten participating countries (Belgium, Denmark, France, Italy, Yugoslavia, Norway, Holland, Sweden, Switzerland and Western Germany). The share to be borne by each country will be determined by Unesco. It is emphasised that the research to be undertaken at Geneva will be of an entirely theoretical nature and will bear essentially on mesons and the light they throw on the structure of matter. The nature of the equipment to be used effectively precludes any study of atomic energy in the practical sense.

This whole project and the fact that Switzerland should have been selected as its site, raises a number of interesting questions. However detached the interests of the participants, and however remote from atomic warfare research into the nature of matter may be, it is difficult to draw a hard and fast line between military and non-military aspects of nuclear fission. In the light of this, Switzerland's role may be a new departure, however slight, in that country's attitude towards European integration and defence. The attitude of the British Government shows that the Council for Nuclear Research is taken to represent a further step towards a more or less united Europe. Why should Britain have withdrawn from membership unless the Geneva plan had certain political overtones to which this country is not altogether reconciled?

There are other rather interesting features in this Geneva

enterprise. It has long been an open secret that America has been anxious to bring German brains and knowledge back into the atomic picture. The Council counts Western Germany among its members and this may prove to be the least awkward way of utilising German research. There is much to fire the imagination in the creation of a European research centre whose brilliant team will include Professors Bohr and Amaldi. It should prove a stimulating counterweight to America's near-monopoly in nuclear study and should mark a further stage in European integration.

A Record Liquidation

A representative of the Chinese People's Government, commending to Tibetan leaders a couple of years ago the tolerant and moderate spirit of the new regime in Peking, is said to have been asked about Communism and to have replied somewhat incautiously "Communism comes later." The phrase might be taken to sum up the technique of Communism in Asian countries, which consists in winning power through broad coalitions and then making control absolute when an effective secret police system has been organised. Communism comes later—but not very much later. A Minister of the Chinese People's Government has now openly boasted that more than two million "bandits" have been liquidated in the recent repressions, and it has also been officially disclosed that about half of those arrested last year were "directly transferred to the surveillance of the masses for reform through labour"—which means that they were sent to forced-labour camps without the formality of trial. Even on the partial and piecemeal figures given by the Chinese Communists themselves, the scale of killing and enslavement has been very large indeed; the mask of moderation, which gained the golden opinions of so many foreign observers as well as of Chinese liberals at the time of the first entry of the Communist armies into Peking and Shanghai has now been finally discarded.

This revelation of the regime's ferocity is in striking contrast to the Asian-Pacific "Peace Conference." This is the latest device for influencing popular sentiment throughout Asia (and also in Latin America) by means of an international gathering under Peking's guidance. An Indian delegate, Mr Gopalan, declared that "we hail the people of China who have created a new world and who are a beacon of light to all peoples of Asia and the Pacific region." Britain was "represented" by Mrs Monica Felton and Mr Ivor Montagu; the former told the conference how she had interviewed British and American prisoners of war in Chinese hands and how they had all come to realise that the war in Korea was "unjust," while the latter is reported to have called Mr Lyttelton and General Templer "war criminals, morally every whit as guilty as those who were hanged at Nuremberg." Doves of peace, both live and pictorial, were prominent, and all the proceedings were marked by fervent rhetoric and pseudo-pacifist humbug.

The Nine Lives of M. Pinay

Despite dire predictions to the contrary and a menacing parliamentary horoscope, M. Pinay finds himself at present in a stronger position than heretofore. He has succeeded in checkmating his political adversaries without sacrificing a major piece—M. Schuman—on whom the brunt of the attack was to bear. The ominous debate on foreign affairs has been postponed and the National Assembly has been peacefully disbanded so that its members might attend various party and departmental rallies. M. Pinay stuck his head in the lion's mouth from the very first moment and has emerged unscathed.

On the very day on which the Assembly reconvened,

M. Pinay obtained the necessary unity within his own cabinet with regard to the Tunisian problem. He persuaded M. Schuman to discard idealistic scruples and to take a strong negative stand towards the inclusion of Tunisia on the agenda of the United Nations. By putting himself and his government in the van of French nationalist feelings on this point, M. Pinay avoided being trampled by the rear. The Radical Socialists had to admit themselves entirely satisfied with M. Pinay's intransigent position concerning the entire question of French North Africa. The MRP, on the other hand, saw the ground for mutiny cut from under it by the Premier's vigorous programme for fiscal reform and by the successes he has so far obtained in the battle against rising prices. The Socialists felt themselves committed to supporting M. Pinay as they see in his government a strengthening element in the Council of Europe. M. Pinay further assured their co-operation by suggesting that two prominent Socialists—M. Jules Moch and M. Léon Jouhaux—be included in France's delegation to the United Nations.

On one outstanding issue, however, M. Pinay stood in a dangerous line of fire. Both the Gaullistes and the Communists kept hammering at the fact that France was becoming a small power, a mere dependency of the United States. Last week's diplomatic contretemps, in which Ambassador Dunn left in writing certain remarks about French rearmament which were intended for oral discussion, gave M. Pinay a golden opportunity to play the strong man. By rejecting the American note as "inadmissible" and by denouncing any American attempts at directing internal French affairs, M. Pinay has left the Communists and General De Gaulle's RPF very much in the cold. Although he may still fall a victim to inflation or to a break-up in the centre coalition, it seems likely that M. Pinay will be able to carry on for some time with renewed prestige.

Napoleon III

The goal to which Louis Napoleon has been steadily directing his steps is all but reached. If the empire be not yet proclaimed, only the form is wanted: in substance it is complete, and it will immediately receive the form. He has been saluted with cries of "Vive l'Empereur!" throughout his triumphant journey, and returns to Paris with all the splendour of a conqueror. He satisfies the French. So far as is allowed to transpire . . . he has not found a single opponent in his journey. He has exhibited himself without fear to all classes of the people, whom, if he mean to beguile, he appears, in favourable contrast to most of his late predecessors, willing to trust. His popularity, though officially exaggerated, cannot be doubted, and he is borne to the imperial throne to all appearances by a zealous and joyful people. His present position is truly astonishing. No man ever excited more mistrust, or more deceived expectations. His name was his only recommendation. He was little better than a derided outcast when he was chosen President. Gradually, but successively, in a very short time he has built up for himself a high reputation. If some of the means he has employed are justly viewed with indignation and horror—if as a man he has utterly discarded all respect for very solemn obligations—as a politician his prudence, his sagacity, his great skill, are demonstrated by his success. Not one false move has he made. He seems never to have uttered a word or moved a finger but to promote his objects. He has conquered obstacles that appeared insuperable, overcome enemies who had the reputation of being all-powerful, and, from being despised, has won, with the general approbation of the French, an imperial crown.

Letters to the Editor

Britain and the Dominions

Sir,—No doubt British foreign policy has improved in Europe since the election, but there is little evidence that any improvement has spread very far beyond Europe. As you pointed out in your issue of September 16th, whatever lies behind the Chancellor's neglect of Mexico City, it cannot but appear maladroit to an observer abroad. However, what might prove to be more serious, despite the much heralded November conference, is the unreal approach to problems which concern the Dominions, and for that matter some of the colonies. The extraordinarily clumsy outburst following the omission of Britain from ANZUS cannot have made a very good impression anywhere. The published reason for complaint—only the most uncharitable would regard it as a real reason—that Britain could be committed to war by some Dominions leaves an unpleasant taste with any who recall that in the past all the Dominions have unhesitatingly accepted their commitments on this score towards Britain itself.

It is in commercial relations that some of the worst gaucheries are to be observed. It was these in all probability (and they have been occurring through successive British governments) that moved Mr Colin Clark recently in Melbourne to draw the analogy of the Commonwealth as a family, two elder sons about to leave home, and two loyal and very virtuous sons, Canada and New Zealand, anxiously trying to disguise the facts that father has taken to the drink and another brother, Australia, is a hopeless dipsomaniac.

Canada is probably the worst sufferer. In addition to the points raised by your Ottawa correspondent in your issue of September 13th there is an unhappy record of breach of faith with Canadian primary producers. Canada's efforts to extend the terms of reference of the Commonwealth Conference are readily understandable. Realism, not a series of shopworn platitudes, is desperately needed if the Commonwealth is to do more than subsidise experiments in socialism in Great Britain.

Irritation is apparent in New Zealand, too, where low prices for exports and cascades of imports into the last major overseas market to remain open after the crisis of 1951-52 have caused that bastion of unquestioning loyalty to London to express resentment at ill-informed criticism. New Zealanders are gentle people not given to an impetuous display of feelings, but papers both here and in London have been vehicles for this unusual reaction.

All this adds up merely to a need for more careful consideration of the facts by responsible elements in London Whitehall and Westminster will have to acquire something of the tolerance that the Dominions themselves display, and a little more of the outlook and understanding so much in evidence in the

City and elsewhere in Britain. Officialdom's present careless disregard for all forms of tradition can only add yet another "achievement"—save the mark—to a remarkable postwar succession of debacles.—Yours faithfully,

M. H. PATTERSON
East Bentleigh, Victoria, Australia

European Export Subsidies

Sir,—Do not your strictures on currency retention schemes and on your old bugbear, commodity shunting, ignore the fundamental trouble of which these practices are mere symptoms? Under the present rules of the International Monetary Fund rates of exchange are fixed, but most countries are no longer willing or able, as they were under the gold standard, to adjust their internal to their external finances. Hence these rates do not equate free demand and free supply in the exchange markets and do not indicate the relative scarcity of the goods that can be bought with various currencies. In other words, real and nominal rates of exchange no longer coincide, and this shows up in possibilities for arbitrage in commodities. If left free, this arbitrage will tend to eliminate the disparities. This is a somewhat roundabout way of attaining international equilibrium, but effectively the only one consistent both with Bretton Woods and with the inflationary policies pursued by the leading nations.

Currency retention schemes facilitate and encourage this useful trade, which, under present conditions, should have the blessing of every supporter of the international division of labour. Whether such schemes stimulate only direct exports or commodity shunting as well is immaterial, since these exports will contain imported inputs. It is all to the good if commodity shunting promotes the spread of retention schemes, for this increases the volume of arbitrage and hence makes it more effective. Rather than as "selective and competitive devaluation of the worst kind," I would describe this as a competitive reversion to economic realism, in which the forerunners are duly rewarded for their perspicacity. It is no coincidence that among the countries with currency retention schemes are conspicuous those few (notably Holland and Germany) which have made serious efforts to balance their external accounts by suitable domestic measures, and thereby have contributed more to the establishment of orderly cross-rates than have the fixed exchange rate fetishists.

You suggest that the IMF, after its inauspicious failure to ban free gold sales, might now apply itself to the prevention of commodity arbitrage. This second crusade, like the first one, would display a fittingly medieval attitude; as regards economic insight, both are on a par with the canonical denunciation of interest. Would it not be better to recognise that a drastic revision of the Bretton Woods agreement, transforming the fund from a burden into a help for international trade, is long overdue?—Yours faithfully,

Chicago H. S. HOUTHAKKER

Correspondence Colleges

Sir,—Surely the remedy for the unsatisfactory state of affairs in commercial professional education revealed in your articles lies in a reform of the technical colleges so that they can provide the type of training for the commercial professions that the universities provide for the learned professions. This can only be done by securing that teaching is done by able staff who are also engaged in research, and by giving students time for attending classes.

The first requirement involves a fundamental reform of conditions in technical colleges. This could be achieved by reducing teaching hours drastically. This would make possible the appointment of a specialist staff, each with a specialist's interest in a particular subject, who would have time for research. Secondly, salaries paid in technical colleges should compare with those paid in business. Most teachers are paid no more than they would receive in secondary modern schools.

Reform is also needed for the conditions under which articled clerks study. During their period of training they should be regarded as pupils rather than clerks and should have at least one day a week in which to attend classes.

You rightly point out that a generation of accountants has now grown up who have been trained by correspondence colleges and who therefore have more confidence in them than in local technical colleges. In view of the existing state of many of these colleges this is not surprising, and even if the changes suggested above were made these colleges would still have to build up a reputation for efficiency. In the interim period, therefore, they would have to be prepared to organise classes for very small numbers of students. But the benefits of such teaching to the professions concerned would be enormous.—Yours faithfully,

R. J. BARNES

Coventry

Periodicals for Refugees

Sir,—Many refugees in Europe have now spent seven years in their "temporary" camps. Perhaps your readers may be glad to know of a simple and economical way of helping them.

There is a constant demand among these refugees for English periodicals, especially illustrated magazines. "Periodicals for Refugees" sends supplies to them, and boys from this school have already packed and despatched some 27,000 magazines. But to keep pace with the requests we receive, we need both further gifts of second-hand magazines, and also some help towards the very heavy postage costs. We can send 30 oz. of periodicals for 8d.

I shall be glad to send further details of the scheme on request.—Yours faithfully,

MARK GIBBS
Audenshaw Grammar School,
Audenshaw, Manchester

THE MANCHESTER GUARDIAN

now carries news on the front page

FROM NOW ON, there will be news on the front page of the Manchester Guardian. And it will be news—not hysterical headlines.

You may wonder why the Manchester Guardian is changing thus; or, perhaps, why it did not happen before. The reason for the change is that the Manchester Guardian is more and more becoming a national newspaper. Less than a third of its readers now live in Greater Manchester. And so a front page consisting of classified advertisements of local interest will no longer do.

Let us assure those who abhor change that the character and 'flavour' of the Manchester Guardian will not in any way alter. The Manchester Guardian will remain as witty and as wise as ever.

Those who are not familiar with the Manchester Guardian should get to know it. It is one of the few great newspapers which it is a real pleasure to read.

If you have any difficulty in getting your Manchester Guardian regularly, please write to: The Manchester Guardian, Manchester.

Nice going to the NEAR EAST

Athens, Beirut, Damascus, Istanbul, Teheran . . . any of the principal cities of the Near East . . . only one night away by luxury KLM airliners.

Schedules are convenient: KLM service is superb. During your journey on board, food and drink are 'on the house', and you will be wonderfully well looked after. Yes, with KLM it's comfort first and fast all the way!

Reservations from all Air Travel Agents or KLM Royal Dutch Airlines 202/4 Sloane Street, London, SW1 (Tel.: SLO 3488) and at Birmingham, Manchester, Glasgow and Dublin.

Why this badge means even more today

DID YOU KNOW . . . ?

- 1 The TA was in the past the second line of our Army. It is now a vital part of the first line.
- 2 The TA includes some of the oldest, most famous regiments of the British Army. It uses the most modern equipment, as issued to the Regular Army.
- 3 The British Army could not mobilise today without the TA.

Already thousands of men and women are giving up a slice of their spare time to the TA—because they know that, as able-bodied citizens, they couldn't offer their country a more useful service. They find companionship, skill in working with first-class men and equipment, a

true sense of responsibility for their families and countryside. But they'll tell you themselves that they need more willing help—and quickly. Their enthusiasm for the Territorial Army is matched by pride in their unit and in the job they are doing for their country.

Spare time for Britain in the TERRITORIAL ARMY

The Story of Arms

British War Production. Second World War: United Kingdom Civil Series.
By M. M. Postan. HMSO and Longmans. 512 pages. 32s. 6d.

This is a synoptic volume introductory to more detailed studies of the administrative machine of the Supply Departments, the common factors of raw materials, labour, finance, machine tools and oversea supplies. For the general reader it should prove the most interesting of the series. Professor Postan describes with great clarity and sufficient completeness the complex rise and fall of the munition production organised by the three Supply Ministries.

It is difficult to treat the stories of these three departments as a single subject, for the closest link of each was always with its associated service. Indeed, the military significance of the various munitions and their relation to service formations could perhaps have been more fully explained. For the first two to three years of the war the Supply Ministries worked separately, and their inter-relationship was largely a competitive claim for priorities (which tended to reside where Lord Beaverbrook did). But, at the end of 1942, the shortage of manpower in general had become (to use Mr Postan's concise phrase) "the one limiting factor to which all others were rapidly reduced." From that time until the end of the war the munitions programmes had to be assessed and were effectively limited by this one measurement.

Before that time, there was no central department charged with the general direction of the whole of munition production. There had been pressure for a Ministry of Munitions or Production, ranging in size from a small "private office" to a single Ministry swallowing the whole field of the existing three. As Mr Postan suggests, the real objection to such a proposal was that the Prime Minister with his statistical advisers and through the medium of the Defence Committee (Supply) was fulfilling a limited function of overall control with knowledge and authority. But, early in 1942, another problem arose. American production, which there had been a tendency in the early years to discount in London, became dominant in almost every field, and after Pearl Harbour it became imperative to make a combined British approach to Washington both on production plans and on the proportion of American output that should be allocated to British forces.

It was the pressure of these needs—the need to allocate labour (and, in minor degree, materials) and the need to provide co-ordinated British representation in Washington—that called the Ministry of Production into existence, and it was these tasks that the Ministry in the end performed, after the more ambitious ideas, of general oversight and super-

vision which surrounded its cradle were gradually abandoned.

Mr Postan has divided his history by time—Munich, Dunkirk, Pearl Harbour, "VE" Day are the dividing dates. This, no doubt, was inevitable; but it has the consequence that it is difficult to trace the full story of the growth in armament output (slow at first, rising rapidly to 1943 and then slowly falling). Charts covering the whole period might have knitted the story together and would have clarified the somewhat confusing picture of successive requirements, programmes and deliveries. At the end of the war the Secretariat of the Chiefs of Staff produced a volume showing graphically the position as it was seen at succeeding dates; it is a pity the general reader cannot share its dramatic effect.

This history was not begun until the end of the war; all depends on official files and memory. Mr Postan has been triumphantly successful in spinning a narrative out of his tangled raw material. Those who were involved will be unlikely to disagree with him on more than minor points of fact; but there may be differences of opinion about why a certain thing happened and who was the moving spirit. Some of those around whom much seemed then to revolve appear here perhaps once by name and once by titular initials. Others of equal or less importance appear commonly by name, which has the merit of bringing the history to life, but sometimes with what will seem to those who remember the events as an odd twist.

For the most part, Mr Postan withholds the views that he must have formed in the course of his examination of vast official records. Occasionally, however, he permits himself a judgment, and the present reviewer is tempted to comment on two points that are made in the final chapter. The author describes the limitations of the programming and planning work done at the centre, in the Ministry of Production. But he misses the point, which was admitted at the time, that the imitation by the three operating departments (initially in self-defence) of the same techniques made the work at the centre less necessary. In another section he deals with the importance of efficient management in industry—a story which should be more fully told and with less anonymity. Experience showed, in direct contradiction to earlier views, that the quality of management of a firm was often far more important than previous experience of a particular type of production.

This is an impressive volume and is of much greater current interest than could have been expected when it was first planned.

The Asquith Age

The Rule of Democracy, Vol. VI: History of the English People, 1905-1914. By Elie Halévy. Two Vols. Ernest Benn. 686 pages. 42s.

The reissue of the English translation of this great work, written during the interwar period, is a service for which all students will be thankful. Halévy's first volume, entitled "1815," was a masterly survey of every aspect of English life in the year of Waterloo. There followed volumes on 1815-30 and 1830-41. Then, feeling that he would probably not live to complete his scheme, the historian transferred his labours to what he called his epilogue and gave us two large volumes on 1895-1905 and 1905-14. It is this last which is now reissued, with a new title, and divided into two volumes. Halévy died in 1937. After his death a volume in the earlier series on 1841-52 was published. In the reissue this volume contains an essay by R. B. McCallum, bridging the gap between 1852 and 1895.

This reviewer has read the volume now published twice over in past years in its French original and felt that he might be excused from reading it again; but really if you start it, and if you like history, the lure is irresistible: French elegance of narrative, French urbanity, detachment, impartiality, by no means lost in the skilful translation of E. I. Watkin. One of the recent essays on the Asquith centenary remarked that the decade before the 1914 war seemed to have become a blank in the national memory, a gap between the Victorian period piece and the "present discontents" of 1914 onwards. If this be so, here is the filling of the blank, the Asquith Age. It is also the first decade of Mr Churchill's ministerial career, the only part of his life, so far as can be recalled, which he has not subjected to autobiographical treatment.

Analysis of Constitutions

British Colonial Constitutions, 1947. By Martin Wight. Oxford University Press. 571 pages. 42s.

Mr Wight has printed a selection of constitutions from nine countries, prefixed by an introduction in which he has attempted to show, in cross section, the 70 or 80 "political units" of the dependent empire (it is hard to be more precise about number or name) at the point of development which they had reached in January, 1947. The student will find here a useful classification of territories in terms of their institutions. But constitutions reach only a little way; and there is an invigorating freshness in Mr Wight's approach to the problems of plural societies by way of their electorates, even when one cannot agree with all his conclusions. "Responsible Government," he says, "is the point at which, in general, an electorate is sufficiently mature for communal representation to be discarded." This generalisa-

tion goes too far; it is questionable as history, and too tidy as a description of present trends. The emphasis on "maturity" (a subjective term in politics) glosses over the struggle for power, particularly in the settler colonies where

the critical character of the relationship [between white and black] lies in the irreversibility of the numerical balance coupled with the potential reversibility of the balance of culture and power.

Deeper problems lie in Asia, where a facility, even an eagerness, in importing Western political machinery is combined with a spiritual resistance—the legacy of an overlaid civilisation—to Western ideas. Mr Wight has some stimulating suggestions to offer: corporate representation, obnoxious to current Western political theory, may have a prosperous life in the East. One could wish that he had extended his view of electorates to include the political party. He has, indeed, touched on the manner in which the constitution in Barbados (with its homogeneous society) is being transformed through the convention of party government, much as it was transformed in Canada a century ago. But what of party in the plural society? What social conditions are necessary for the working of a multi-party system? Will the idea of the single party state form a bridge between ancient and modern autocracy? Here, in a field too often ignored by the constitutional lawyer, there is a place for the *enr'aide des disciplines* by which the anthropologist and the sociologist may assist the political engineer.

But it would be unfair to press too far these objections to an admirably concise analysis. Mr Wight's limits of study are narrow, but deliberately drawn. He never pretends that he knows the answers; he has contributed a valuable restatement of the problem.

Friend of Churchill

Godolphin. By Sir Tresham Lever. John Murray. 334 pages. 25s.

Sarah, Duchess of Marlborough, wrote of Sidney Godolphin that "he was the best man that ever lived." This was high praise, even from an old friend, but it did not prevent him from sinking into comparative obscurity when the history of his time came to be written. His political career has been overshadowed by the larger fame of his friend and colleague, John Churchill, the victor of Blenheim. Otherwise he is merely remembered as the husband of the virtuous but ill-fated Margaret Blagge, who maintained such a curious friendship with the diarist, John Evelyn—and as one of the founders of British horse breeding.

Now things have changed, for in this lively and interesting book Sir Tresham Lever has written the first reasonably full account of Godolphin's life, based upon a commendably thorough study of much unprinted material and particularly on the voluminous correspondence he maintained with Sarah and John Churchill. The first part deals with

Godolphin's career to the accession of Anne, and makes, by itself, a remarkable story. He appeared as a royal page just after the Restoration, but by 1684 he was head of the Treasury, and regarded as an astute man, who thrived in difficult times. Although he lost his office he kept his influence under James II, and remained one of the king's principal advisers until the Revolution. He weathered that storm with such consummate skill that in November, 1690, he was back at the Treasury. There he made a deserved reputation as a shrewd financier, maintained a prudent connection with the exiled James, and joined the Churchills in seeking favour of Princess Anne.

Finally there is a long description of Godolphin's service under Anne until 1710, when Harley secured his ignominious dismissal. As Anne's chief minister Godolphin, though now ageing and ill, scraped up the money for Marlborough's wars, and, what was no small achievement, kept a shaky administration together. The book does not reveal Godolphin as a statesman. He appears as a supple politician, with, as befitted one who found his recreation at Newmarket, a flair for choosing the winning side. That John Churchill owed much to him is clear; that Godolphin himself would often have cut a sorry figure without his friend is even more obvious.

In one respect Sir Tresham has not made the most of his opportunity nor done full justice to his hero, for, particularly in the latter part of the book, he has got too close to his subject. His narrative is chiefly constructed out of material carefully gathered from day to day correspondence. Yet such evidence, important though it is, loses much of its significance unless it is interpreted by a far more thorough and acute commentary on the politics of the time than is here provided.

Shipping Out of Perspective

The Shipping Industry: Its Constitution and Practice. By Victor Dover. Macdonald and Evans. 440 pages. 130s.

It is not easy to understand the object of this book. In his preface the author disclaims any attempt "to displace the many excellent textbooks which treat of shipping in its specialised aspects," but hopes that it will fill what in thirty years' experience as lecturer to adult students of shipping appeared to him to be "lacunae in the subject as generally presented to students" and "to remove some of the difficulties commonly experienced by them in the early stages of their professional work." The main body of the book is devoted to considering in some detail such matters as the contract of affreightment, charter parties, bills of lading, ships' papers, the shipment of goods, general average and marine insurance; and although these chapters are liberally illustrated with specimen forms (an example which other authors of shipping textbooks would do well to follow), it is difficult to see that Mr Dover has improved on his pre-

decessors. It is not a common gift to be able to present a complicated subject in a simplified and easily understandable form. Mr Dover has made a bold attempt at it, but his method of simplification too often consists of abbreviation, leading to the omission of essential explanation. At other times, on the other hand, he overwhelms the reader with too much detail.

Another of the author's intentions has been, it must be presumed, to extend the book's scope beyond the limits of the shipping clerk's office routine; to give him some idea of the "constitution" of the industry; to acquaint him with some of the details of ship construction, and to enable him to appreciate some of the economic factors that govern the operation of shipping. The idea is most commendable, but the way it has been carried out in this book leaves much to be desired. The author has obviously attempted to get too much on to his canvas, and the picture he presents is inevitably incomplete; it is even more unfortunate, therefore, that so much valuable space has been wasted on unnecessary, out-of-date and uninformative definitions. His references to ship construction are often meaningless and sometimes totally inaccurate. When he deals with shipping institutions, his definitions are sometimes no less than remarkable.

Part of the trouble may be that the author has specialised so long in certain subjects that he has not succeeded in keeping in touch with modern developments outside his immediate experience. It is surprising, for example, that there is no reference either to diesel or turbine propulsion for ships, let alone to the important economic and commercial implications of these prime movers. The uninformed reader might, in fact, reasonably assume that the majority of ships are still coal-burning reciprocators, for in his introduction the author advances as one reason for Britain's maritime position the fact that "her coal-seams are extensive, and, amongst other sorts, yield an abundant supply of the kind of coal best suited to the firing of ship's furnaces."

To attempt to contain in one book the whole ocean of shipping practice is an ambitious task for an author and lecturer who has sailed for a long time in one corner of it; and when Mr Dover is dealing with the subjects with which he is most familiar, his work is least open to criticism. When he ventures into what must be unfamiliar waters, shallow though they may be, he begins to flounder.

The Machine Age

Creating an Industrial Civilization. A Report on the Corning Conference. Edited by Eugene Staley. Harper and Bros., New York. 368 pages. \$4.00.

Economic aid programmes for Western Europe and underdeveloped Eastern countries and the investigations of Anglo-American productivity teams have implicit in them the desire to make American industrial and technical know-how available to other communities for

A new, dominant advertisement position in THE FINANCIAL TIMES

beginning January 1, 1953

FRONT PAGE SOLUS 8 in. d.c. £144

From January 1, 1953 THE FINANCIAL TIMES will carry an 8" d.c. solus position on the front page at the special price of £144 per insertion. Thus will be created undeniably the best advertisement position in daily journalism for advertisers seeking business with the men who mean business. For all Trade Advertisement positions on other pages the present run-of-paper rate will be charged.

No apology is needed for talking shop in THE FINANCIAL TIMES. There is no intrusion on other interests because this newspaper is read

for business reasons only—and how big these reasons are for men about their lawful business occasions!

the advancement of their material standard of living. But modern industry not only creates goods; it creates living conditions for human beings. Can the United States export one aspect of its way of life without the other changes in community structure, social values, and group relations which the machine age has brought to the American people in the last century? This question makes the problems surveyed at the Corning Conference as urgent for ourselves as for them.

Under the joint auspices of the Corning Glass Works and the American Council of Learned Societies, a group of prominent men and women drawn predominantly from management, labour and the universities discussed, during a weekend conference in May, 1951, industrial civilisation from the standpoint of human values and sought to isolate the major human problems demanding solution in the next century. In the balance sheet of gains and losses it was generally accepted that the very success of industrialisation in satisfying minimum physical needs had evoked the search for the satisfactions of being alive and made leisure, to quote one example, a problem for the masses.

Running through all the four study groups—on work, leisure, the community and personal morale—into which the conference was sub-divided was the assumption that industrial civilisation had substituted for the closely knit communities of more primitive societies

specialised groups pursuing their own interests, and in the process the individual had lost his wholeness, sense of participation and mastery of his own circumstances. To restore the sense of participation to working life, faith was pinned on changes in the patterns of work organisation with emphasis on smaller more compact units and on sensitising managements to the problems of human relations and industry's community responsibilities. The decision-making authority of management, which is invaded today in West Europe by *Comités d'Entreprises* and *Mitbestimmungsrecht*, passed unchallenged.

The background papers present the reader with surveys of current American thought on their society and the discussion reporters convey to him some of the stimulus and excitement which the participants obviously enjoyed. His appetite will be whetted, not satisfied by the abundance of problems which emerge as material for research.

Shorter Notices

International Monetary Co-operation, 1945-52. By Brian Tew. Hutchinson. 180 pages. 8s. 6d.

In the first part of this workmanlike textbook Professor Tew sets out, concisely if somewhat stiffly, the basic problems of international finance in the postwar world. In the second part he describes, in much the same style, the working of IMF, EPU and the sterling area. In the third part he

sets off at a breathless gallop—with liberal acknowledgments to *The Economist* and to various bank and United Nations reviews—over the course of monetary events since the war. He has managed to take in a commendable amount of detail, but has necessarily had to run the risk that all but the most initiated of his readers will miss the wood for the trees.

The British Party System. Edited by Sydney D. Bailey. The Hansard Society. 211 pages. 10s. 6d.

This symposium manages to cover a great deal of ground in comparatively few pages. It is divided into an historical section on the evolution of the party system, a section on the history and philosophy of the three main parties (with a note on the position of minor parties and independents), and a final section on some problems of the party system. Its approach is discursive and informative rather than critical, and it strikes no notes of alarm. Mr Sydney D. Bailey, in a brief introduction, points out that "the party system is often praised, occasionally denounced, but rarely described or explained," and offers the wise observation that "The secret of making the system work is to know when to put it into cold storage." This is a useful and interesting book, whose many authors have done their task well.

Correction

In the review of "Alexander of Tunis," by Norman Hillson, which appeared in our issue of September 27th, a statement was attributed to Lord Altrincham (formerly Sir Edward Grigg) which had, in fact, been made by Sir James Grigg. We regret any confusion which may have been caused.

FROM HARRAP

AMERICAN SURVEY

Presidential Body-Line

(From a Correspondent on Mr Truman's Train)

MR TRUMAN ended his campaign tour and returned to Washington last weekend; and nobody can have been happier to see him back home in the White House than General Eisenhower and the Republican party's high command. The President's 8,500-mile romp across the United States and back has been a harrowing experience for them. There were bitter complaints, in effect, that what Mr Truman was doing was not cricket. Certainly it was not the sort of game the Republicans had expected to play.

The Republicans were in the position of a team which had buckled on its pads and gone to the wicket with a clear idea, arrived at after much consultation and discussion, of how to deal with the bowling. They had seen the other side nominate a bowler, a player with a classic style, whose speciality was the slow, gracefully delivered leg-break. The measure of this bowling had been taken and the batting strategy had been mapped. And what happened then?

What happened then was that the Democrats put on at the other end an exponent of the most extreme body-line bowling—a demon if ever there was one. He had no style at all, but he sent them down with such speed, and they bumped and rose at such angles, that the batsmen were hopping and the air was a-quiver with appeals to the umpire. Meanwhile the leisurely, tricky leg-breaks were still coming from the other end. It was a batsman's nightmare.

A. E. Stevenson, the slow bowler, would take a long run from Madison, Wisconsin, and he would say: "My opponent has been worrying about my funny-bone. I am worrying about his backbone." Neat, perfect in pitch and pace, and summing up all the arguments about whether the Stevensonian technique places too high a priority on humour and whether General Eisenhower has shown sufficient moral and intellectual courage in his dealings with Senator Taft and the party professionals.

But then Truman (H. S.), the fast bowler, with a short and furious run from Erie, Pennsylvania, would deliver this one:

Everything shows that the Republican candidate is another Old Guard Republican. He is not a liberal. He fooled me, and he fooled all the liberal Republicans. . . . I thought he had some firm principles about our foreign policy, and that he was opposed to the Taft isolationist policy of too little aid too late. . . . He has publicly embraced and endorsed [Senators] Jenner and McCarthy. . . . I never thought he

would speak to, let alone endorse, those two birds Jenner and McCarthy. That act made it perfectly clear to me that I had made a mistake in ever thinking that he was qualified to be President. You can't trust a man who switches around that way, both deserting his principles and his former friends.

That was a ball less calculated to curve in and dislodge the bails than to knock the batsman's head off.

In Wisconsin A. E. Stevenson was noting wryly a tendency, centuries old, to decry the younger generation, and was observing that perhaps the solution to this aberration is to be found in the flashing epigram of La Rochefoucauld that "the old begin to complain of the conduct of the young when they themselves can no longer set a bad example."

In Ohio Truman (H. S.), was saying, not wryly but starkly:

The Democratic party has always had a heart for the people. With us the people come first. With the Republican party, property comes first. The Republican party is controlled by the big banks, big industry and big lobbies who pay the party's bills and run the party to suit themselves.

Governor Stevenson, in discussing the dangers to what he called the community of freedom itself which are presented by those who would suspend justice and destroy freedom in the name of anti-Communism, said:

In case you have not been reading all the philosophers, I remind you that Aristotle said "History shows that almost all tyrants have been demagogues who gained favour with the people by their accusations of the notables."

President Truman, discussing precisely the same subject, said:

There's a group of hotheads—mostly Republicans, but with a few Democrats—who want to do away with the Bill of Rights whenever a man is accused of Communism. Beware of a party that tries to make votes out of false charges about Communism. The hysteria, the irrational fear

that they are manipulating in one direction today may turn against other groups tomorrow. Once these deep forces of prejudice and unreason are set loose no man can tell where they will go. They could tear our nation apart, setting group against group, creed against creed, the older immigrant against the newer.

It was noticeable during the fortnight or so when the two Democratic leaders were campaigning, each at the top of his particular form, that the Republican attack upon Mr Stevenson diminished. The main fury was turned upon Mr Truman. He was declared to have brought American political behaviour to an all-time low, to be engaging

in "gutter politics," to have perfected, in Senator Taft's phrase, "a technique of lying." For a while the Republicans dispatched a Senatorial "Truth Squad" to the places where Mr Truman had spoken so that the impressions left upon the citizens along his route might be corrected. The exercise was less than a rousing success. That may have been because, as Senator Taft fretfully said, "He brings forward such a succession of misrepresentations that when you're answering one, three others have been made." Or it may have been that the attempt to rebut Mr Truman's charges simply gave more publicity to them.

*

The President was by far the most interesting personal study during the two weeks of the Democrats' double bill. When he said that he had not had as good a time since 1948 there was much reason to believe him. He gave himself and the Democratic party the benefit of all doubts on all scores. His way with a slightly blurred fact was to touch it up and sharpen it; the pictures he so briskly drew were sometimes quite startling. The attacks upon him by Republican speakers and by the "hatchet commentators" of the "one-party press" seemed to give him genuine satisfaction. In a cheerful aside at Indianapolis he said, "I don't mind the mud—I've thrown back too much of it and I know how to handle it."

The prime object of the tour was to help to win the election for Governor Stevenson, whom Mr Truman calls the finest new leader to come along since Franklin Roosevelt. But it was almost as clear that the President had something else on his mind. Tough politician that he is, he seems to have sustained a personal hurt from the criticism General Eisenhower has directed at his foreign policy, and most particularly at the decision to stand and fight in Korea. For Mr Truman appears to believe that his place in history will be secured by that decision. It is a belief which is shared by some very good judges of history, one of whom, as he indicated during his visit to Washington last January, is Mr Winston Churchill.

That the General should have espoused the view that the Korean war was a "blunder"—even though so far he has stopped short of calling it "Truman's war," as Senator Taft does—has been too much for the President. He once promised to help General Eisenhower to become President: once he virtually offered him the Democratic nomination. But now Mr Truman has no more faith in the man he once fully and warmly trusted.

He has been disenchanted, he says; and the disenchantment is complete enough to convince him that a "military man" will not do. The President was warned before he began what may well be his last big campaign tour that there were certain dangers about the assault on General Eisenhower. It might have been resented by the people at the whistle-stops, and they might have taken ill his revival of the old question of whether a soldier might safely be made President. Mr Truman took these risks, rather cautiously at first, but in the end with full confidence. Perhaps his political instinct told him that he was on safe ground. Or perhaps he had come to feel so strongly that he was prepared to take the risks whether there was danger or not.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Bellwether State?

[FROM A CORRESPONDENT IN OHIO]

As the presidential campaign moves into its last weeks, the pivotal state of Ohio is leaning toward the Republicans. It is not too late, however, for some Republican blunder to make it lean the other way. Ohio is not safe for either party. In the thirteen presidential elections of this century it has gone Republican seven times and Democratic six. In 1948 Mr Truman carried the state by only 7,107 votes out of a total vote of nearly 3 million.

There is nothing doubtful, however, about the state's political importance. Ohio might well be substituted for discredited Maine as an electoral barometer, if only accurate advance readings could be assured. Since 1900, with only one exception (1944), the candidate who carried Ohio has entered the White House. It is one of the key states of the middle west, and its 25 electoral votes might provide the margin of victory this year. Four years ago, it was a last-minute change in farm sentiment that gave Mr Truman his surprising victory. But Ohio is not mainly a farm state. It has industry, big cities, a number of Negro and foreign-born voters, and an independent tradition fostered by its numerous colleges. It provides a fair sample of the whole electorate.

In Senator Taft's home state, General Eisenhower started out under a severe handicap. Disappointed and embittered by the outcome of the Chicago convention, the Taft supporters at first ignored all appeals from their party leaders, who were beginning to fear that even the party's candidates for state office would suffer. In early September, when the campaign should have begun to get under way, a political sit-down strike was threatened. The "harmony breakfast" of Senator Taft and General Eisenhower on September 12th changed all that. Their agreement on principles was accepted by Ohio Republicans as a clear-cut victory for the Senator. The faithful took it as a signal from their leader to stop dragging their feet. Since then the more conservative tone of the General's speeches, his hammering on the themes of corruption, Communism and Korea, and the missionary work of Senator Taft have put many in a mood to march. Unlike Governor Dewey in 1948, General Eisenhower is not taking Ohio for granted. In his midwestern speeches he has stated the ideas of midwestern Republicans in language they like to hear. Speaking from the same platform as Senator Taft, in the Republican stronghold of Cincinnati, he delivered his sharpest attack on the Administration's foreign policy, and even implied that he now believed Asia to be the area of supreme concern for Americans. This trend toward the right may have lowered the General's standing along the eastern seaboard, but not in Ohio. During his whistle-stop tour of the state his seventy rear-platform talks were enthusiastically received, and the crowds in the cities were reminiscent of the welcome given Franklin Roosevelt in 1936.

Governor Stevenson's managers believe, or at least say, that this turn-out has no political significance; it merely reflects public eagerness to see a military hero in the flesh. They may, of course, be right. Analysis of the big voting blocs fails to indicate anything like an Eisenhower sweep in Ohio. Only two groups are firmly in his corner: the white-collar workers, who have been hardest hit by inflation, and the farmers, who now appear to be more satisfied with the Republicans' agricultural policy than they were in 1948. On the other hand, the warm endorsement of Governor Stevenson by the American Federation of Labor and the Congress of Industrial Organisations may be an important

Herblock in the Washington Post

factor. While it is yet to be proved that labour leaders can deliver the labour vote, their endorsement can hardly be discounted in a state with a big industrial population. Democratic speakers emphasise the "contentment" of this group, as Republicans appeal to the "resentment" of white-collar workers and the business community. The Negroes, who vote more as a bloc than any other large group, and who remained loyal to the Democrats even when Senator Taft scored his triumph in 1950, favour Mr Stevenson because of his more forthright views on racial equality in employment.

Nevertheless, the Gallup Poll shows that General Eisenhower holds a better lead over his opponent than Governor Dewey, the Republican candidate in 1948, enjoyed at the same stage of his campaign. The issues which seem to interest audiences most are the Republican favourites—"the mess in Washington," the Korean stalemate, high taxes, inflation and the need for a change. President Truman's frontal assault on General Eisenhower's prestige has made a bad impression. Here, as elsewhere, the General enjoys an immense personal popularity, while his opponent remains an unfamiliar figure. Barring some resounding blunder, General Eisenhower should carry the state, though his margin may be small.

*

In congressional elections Ohio, one of the most conservative of the industrial states, usually votes Republican. The lively possibility that this year may produce a Republican President and a Democratic Senate adds importance, though it has not attracted much attention, to the contest for the junior senatorial seat. Compared to the race two years ago, which gave Senator Taft a majority of nearly half a million votes, there is little public interest—a condition that usually favours the incumbent. He is the conservative, one-time isolationist Republican Senator Bricker, who has been in the Senate for six years, and before that served six years as Governor of Ohio. In 1944 he was chosen to run as Governor Dewey's vice-presidential candidate to hold the isolationist vote. This year, he is attacking the Administration's foreign policy, especially in the Far East, and capitalising on the mingled anxiety and resentment with which many parents view the Korean war. Only the strongly internationalist press supports his opponent, Mr Michael Di Salle, former federal Price Administrator and one-time Mayor of Toledo, Ohio. Mr Di Salle is a genial, quick-witted public servant, with mild Fair Deal views, a genuine enthusiasm for the foreign policy of President Truman and Mr Acheson and an addiction to the new campaign technique of the "talkathon," a marathon question-and-answer session on television. He has an appealing personality, but in Ohio personalities are less important in senatorial than in presidential elections. The Bricker-Di Salle contest is a straight party affair, in which the Republican has the advantage, owing to his impressive reputation as a vote-getter and his superior party organisation. The Republicans take Mr Bricker's re-election for granted, and well-informed Democrats privately admit that their candidate has only an outside chance.

Senator Bricker is a greater favourite than General Eisenhower with Ohio Republicans. The reverse is true of Mr Charles Taft, the Senator's younger brother and the Republican candidate for Governor of Ohio. The present Governor, Mr Lausche, a Democrat, is now trying to win a fourth term, something unprecedented in Ohio's 150-year history. He is an able administrator and a politician of unusual gifts, who holds the Democratic state organisation in the palm of his hand. Thanks to his appeal to independent voters and to Republican businessmen, in the past

he has run 100,000 votes or more ahead of the national Democratic candidates.

The Republican nominee also has an impressive following among independents, especially those with strong religious and reformist views. He served the State Department well during the last war, has a reputation for fairness to labour, and is one of the country's leading Protestant laymen. Far less orthodox in his Republicanism than his more famous brother, he has won the support of the American Federation of Labor. But the younger Taft's reputation as a liberal Republican is his worst handicap this year, especially in his native Cincinnati, where his long service as a non-partisan member of the City Council earned him the enmity of the local Republican organisation. There is a saying current in Ohio that the governorship will be won by the candidate who suffers the fewest stabs in the back.

Governor Lausche makes a point of emphasising his independence of "labour domination." His ability to keep taxes down and to balance the budget—sometimes at the expense of the state's welfare institutions and the condition of its roads—has won him the gratitude of many Republican businessmen and industrialists. Mr Lausche supports Governor Stevenson, but is careful not to involve himself too deeply in national politics, realising that in state affairs party lines are relatively fluid. He is confident that his Democratic critics are outnumbered by Republicans who find Mr Charles Taft too much of a New Dealer.

Mr Taft realises that he has an uphill task, though he has the personal support of his brother. His name, a great one in Ohio, may help him more than an Eisenhower victory in the state. This is because, for the first time in a presidential year, voters will mark their choices for President and Vice-President on one ballot, and those for state officials on another. This "separate office" ballot was adopted in 1950 to benefit Senator Taft. This year, it will help the Republicans in the presidential contest, where Mr Lausche's popularity will be of no help to Governor Stevenson. And conversely it will help the Democrats in the state election, as Mr Charles Taft will get no help from the Eisenhower voters.

American Notes

After Mobilisation

The seventh quarterly report on the defence programme raises once more the problem which is bothering both businessmen and government experts: what will happen to the economy when defence spending reaches its peak next year? Mr Fowler, the new Director of Mobilisation, who plans to retire in December and therefore cannot afford to waste time getting to the point, has reported officially what he has long been saying, that industrial expansion has gone so well that materials will soon be available either to speed up the arms programme or to swell civilian production—if the demand for the latter exists, which some economists doubt.

The aim has always been to concentrate first on expanding the industrial base, and nearly half of the tax-aided expansion of plants and facilities will be complete this year. The actual production of arms is less advanced. In the third quarter, despite the steel strike, deliveries to the forces reached a total of \$8 billion, compared with \$7.7 billion in the second quarter. But of the \$129 billion appropriated for defence since the Korean shock in 1950, only \$41 billion of goods has been delivered and paid for. Another \$60 billion is already on order. Clearly, although defence spending may reach its peak in the middle of next year, the prospect is not for a sharp cut-off—a precipice down which business would fall—but for a plateau extending well into 1954.

For the moment the business barometer is set more than fair. As the chart shows, there has been an amazingly quick recovery from the steel strike and a slower one from the "slump within the boom" which took place earlier this

year. Textiles, television sets, and chemicals are finding ready buyers. Unemployment, at 1,438,000, is at its postwar low. The period of heavy liquidation of inventories is over. Production as a whole has never been higher in peacetime. But Mr Turner, the new member of the Council of Economic Advisers who made the flesh of business creep last month by announcing that defence spending had virtually reached its peak, unquestionably is right in insisting that the slower rate of increase in defence spending to be expected from now on will deprive business of a powerful stimulus. Nor

can it rely on the pent-up civilian demand which sustained prosperity after the war. There are no consumer shortages today.

Mr Fowler, who is more concerned with the physical opportunities, would like to see the arms goals for 1955 met, as far as possible, in 1954; he would like to fill out the mobilisation base to be completely ready for a full-scale war; and to divert some materials to building schools, hospitals, and roads. If the economy is to be kept going full tilt, he considers controls will still be necessary—materials priorities for the defence and atomic energy programmes, and standby wage and price controls. The question whether arms production should be speeded up is first of all one for the services; and it would mean asking for more money. But in the end the answer will depend on the new President, on General Eisenhower, who in office may not be quite so scornful of "today's artificial war prosperity" or on Governor Stevenson, who has indignantly rejected the idea that arms spending is anything but a painful necessity.

* * *

Candidates on the Wing

The presidential candidates, whose voices were momentarily drowned out by President Truman's blasts at the whistle-stops, are now darting about the country, shoring up their own weak spots and feeling for each other's vulnerable states. Their progress is made all the more hectic by the suspicion that a larger number of voters than usual have not made up their minds yet. Inevitably the nominees turn up in the same places. General Eisenhower and Governor Stevenson have both renewed their wooing of doubtful and powerful California; by the end of the week the Governor will have followed the General into Texas, which the Republicans hope to detach from the Democratic South by promis-

World-wide banking

Businessmen with international interests rely on a bank whose services are world wide. The National City Bank of New York provides a global network of 56 branches, as well as banking correspondents in every important centre of the world.

The staff of the London branches are experienced not only in British banking, but also in the financing of overseas trade, and are uniquely equipped to advise on trade with the dollar countries.

Wherever your interests lie, a world-wide organization stands at your service.

ing to favour state control of oil under the water along the coasts.

Governor Stevenson's strategy in Louisiana and Florida, two other shaky columns of the solid South, has been to take a firm stand on tidelands oil and Negro rights. He can be relied on to do the same in Texas, and then to go on, as he has before, to argue that the South has particular reason for echoing the Democratic slogan "Don't let them take it away." For the South has benefited more than any other region from Democratic prosperity. One of the ironies of the campaign is that it is just this prosperity which has created a southern middle class that is beginning to feel it is respectable to vote Republican. But it is probably too soon for the Republicans to make many inroads in the South. Indeed, is is a question whether both candidates are not spending time in the South which might more profitably be invested in the larger and more doubtful states in the north and west. There is no question that in the campaign's last weeks both candidates are driven more and more to repeating themselves, though at Salt Lake City this week Governor Stevenson enlarged effectively upon a theme he has only touched on before: the Republicans' extraordinary attempt to convince the voters that America, at the height of its prosperity, power, and opportunities, is isolated, half defeated and half bankrupt, and wholly miserable.

The latest Gallup poll suggests that Governor Stevenson is catching up, with 45 per cent instead of 43 per cent of the voters favouring him, 49 per cent instead of 51 per cent favouring the General, and 6 per cent still undecided. The puzzle is whether, as he becomes better known, he can draw even in the fortnight or so which remains. One factor in the General's slipping popularity may well have been the humiliating lengths to which he has felt he had to go to persuade members of his own party in the middle west to vote for him. General Eisenhower will breathe more freely in the purer air of the two coasts, where he can devote himself to the task of winning back the thoughtful voters who have been alienated by this performance.

Mr Carey's Boomerang

Mr James Carey, president of the International Union of Electrical Workers, has resigned from three government advisory boards as a protest against the award of defence contracts to the General Electric Company. Mr Carey's complaint is that this is a danger to national security, since the company recognises a rival union, the United Electrical Workers, which was expelled from the Congress of Industrial Organisations on the ground that it was Communist-controlled. The grievance against General Electric is an old one. What has brought it to a head is that the Electrical Workers have just concluded a new contract and the company refuses to give Mr Carey's men any better terms.

The advantages to General Electric of dealing with two rival unions, one of which is too weak and isolated to put up much of a fight, are obvious. Mr Carey's exasperation is natural. The company is in a strong enough position to declare that it will make no further concessions, strike or no strike. Mr Carey's backing is much more doubtful. The two biggest locals in his union have voted to accept the company's terms, and there is some criticism inside the union of Mr Carey's emotional leadership. He, and his fellow officers say they will resign their union posts rather than accept General Electric's offer.

Four years ago the General Electric Company was forced by the Atomic Energy Commission to withdraw recognition from the Electrical Workers in plants where work was being done for the commission. This could be defended, on the ground of security, though it was no substitute for careful screening of individual workers who might stumble on a

secret. But Mr Carey is asking government departments to assume the power of life and death over trade unions working in a plant where any sort of government work is done. Even the Taft-Hartley Act merely made it impossible for trade unions with Communist officers to use the government labour services. Who would have the task of deciding whether a union was Communist-controlled? The possible abuses of such power are so great that one wonders if Mr Carey has really stopped to consider them. After all, the Communist-controlled trade unions lost nearly all their influence and importance when they were expelled from the Congress of Industrial Organisations several years ago.

Cooler Inside

Most of Texas sweltered during the long heat wave this summer, when thermometers rose to 100° for weeks on end. But residents of Dallas had a brief respite as well as a glimpse of future comfort when they inspected the nation's first group of low-cost houses completely equipped for air-conditioning. Built to sell at \$12,500 (which is still "low-cost" in America, although the official equivalent is £4,500), these three-bedroom houses have a combined heating and cooling system, using gas and electricity, which costs about \$140 a year to operate and will enable families to maintain whatever indoor temperature they fancy even though outside temperatures range from 105° in the summer to 30° in the winter. Housing contractors from all over the country braved the Texas heat to visit the project and some declared that in a few years no house in the price range above \$15,000 will be constructed without central air conditioning.

Postwar incomes and advertising methods have made air conditioning seem more like a necessity than a luxury, a feat that makers of other major appliances look upon with wonder when they recall that it took eighteen years before the millionth refrigerator was sold. Only in 1947 did the electrical trade journal begin to list sales of one-room cooling units, but by the end of this year it is estimated that 500,000 homes will have them. These units, the smallest air conditioning equipment available ($\frac{1}{4}$ to 1 horsepower) are still the cheapest and most popular coolers, selling for from \$200 to \$400. While the long-term trend may be, as the builders believe, towards larger units which control temperatures throughout the house, there is also a big market for the small units, especially in older houses that do not have the special wiring or air ducts needed for centralised systems.

The principal firms making the room coolers, who were caught short by unexpected demand this summer, are in some cases doubling their output for next year's season. Even so, such production will occupy only a fraction of the capacity of an industry that has just climbed into the billion-dollar-a-year class. The bulk of its sales are to industrial and commercial users: cinemas, shops, restaurants and office buildings. The largest commercial installation in the world (the biggest general unit is at the Department of Defence in Washington) was recently made in some Pittsburgh office buildings where there is a control box in each of 6,013 rooms to permit individual selection of temperature. Motor cars have been the newest addition to the air conditioners' market; 1953 models of the Cadillac, Oldsmobile, and perhaps the Chrysler and Packard cars will have air conditioners as optional equipment (\$400 to \$700 extra). However, the air conditioning industry is not spending all its time counting potential customers, agreeable as that may be, but is devoting energy and attention to bettering its products; home air conditioning of the future will not only control temperature and humidity but, we are told, will also deal out death to bacteria with one device and waft the fragrance of flowers through the air with another. One must hope that the wires will never get crossed.

AMERICAN INVESTMENT ABROAD — 1946-1951

President Truman's Point Four Programme is now in its second stage; the groundwork of technical assistance for under-developed areas has been laid and the time has come for an intensified effort to encourage private American investment in these countries. Such investment will not only benefit the under-developed areas, but help to fill the dollar gap left by the United States export surplus. As the first chart shows, since the war new private investment abroad, although it has been gradually rising, has been most inadequate in this respect. An annual outflow of about \$4 billion would be more in keeping with what is needed, but it seems doubtful that private investment can be increased to this extent in the foreseeable future, even though the outflow of capital this year is running at about double last year's rate.

Much of the new investment abroad since the war has been in petroleum development, but in 1951 a larger proportion of capital began to go into other industries. Most of this new investment, however, was in the Western Hemisphere rather than in the European countries that have a greater need for dollars. The yield on these foreign investments is very substantial and receipts from them have been growing rapidly since the war, because of the increasing American interest in productive facilities abroad, the expansion in output from them and the rise in the general price level. The charts are based on articles in the August and September issues of the *Survey of Current Business*, published by the United States Department of Commerce.

Health in Politics

This summer the Brookings Institution published a survey of American health resources which found that the average death rate has been very greatly reduced in the past fifty years and that most people enjoy increasingly good health. There are still wide differences between the health of whites and non-whites, and between poorer and richer states, but these are narrowing. Yet the problem of making adequate medical care available to all and enabling people to meet its cost remains serious. General Eisenhower recognised this in his speech at Los Angeles; instead of merely denouncing "socialised medicine" as he has done before, he suggested that reliance should be placed on the system of voluntary non-profit insurance plans which have expanded so rapidly in the last decade. Federal loans to these plans, he thought, might help them to insure against the serious illness which is a catastrophe to a whole family.

Governor Stevenson's position is not vastly different. He too is against "socialised medicine," though he would not call the six-year-old Act for federal aid for hospital construction socialism. But he showed a willingness to consider any solution—and in particular the report of the President's Commission on Health Needs which is to be submitted in December. The American Medical Association evidently trusts General Eisenhower not to, if he is elected. The association has just wound up a successful campaign against compulsory health insurance and the leaders of it are now devoting their very great propaganda talents to securing General Eisenhower's success. The leadership of the AMA has no confidence in the President's commission, though it is headed by an eminent doctor and he has been given a free hand. Last June the association's House of Delegates was asked to condemn Dr Magnuson's report sight unseen; indeed, hearings were only completed this month.

A great variety of opinions has been heard, ranging from that of the US Chamber of Commerce, which urges that if only people would give up alcohol and tobacco they could pay their medical bills, to those of the trade unions, who want a complete compulsory system of insurance. Representatives of the voluntary insurance schemes were heard with respect. A survey last year showed that 86 million Americans had protection against hospital expenses, 65 million against surgical expenses, and 28 million against medical expenses. At the end of the war only 22 million people had any form of health insurance. There is, of course, much overlapping. Spokesmen for the schemes do not pretend they are perfect, though they have kept the hospitals afloat. They concede that coverage is limited; and argue that better service could be given if the hospitals did not lose money treating the poor. Some of them suggested that it would be preferable to provide medical care, rather than insure against doctors' charges. But the practice of group medicine is something that the more short-sighted doctors hotly oppose.

Pay As You Leave

The F. W. Woolworth and S. S. Kresge companies, perhaps the most famous chains of "variety stores"—the name "five and ten" (cents) is vanishing beneath the flood of inflation—are joining the postwar rush into self-service. The Woolworth shop in New York, where an experimental beginning has been made with help-yourself and pay-as-you-leave, claims to have made the change because nowadays customers like to choose for themselves and not to have to wait until they can attract the attention of an assistant. But much of the attraction of self-service, to managers and shoppers alike, arises out of the difficulty of finding and keeping trained labour in retail trade. And the high cost of that labour at a time of growing competition is in most cases an even more important factor.

The complete self-service system worked out by the super-

markets, where customers collect all their groceries and food-stuffs in a wheeled basket from under one roof and pay as they leave through a turnstile, was one of the reasons why they could undersell other types of food stores in the depression years. Their postwar growth—with under five per cent of the retail units, supermarkets are now responsible for one-third of the food business—seems to be due, however, as much to their success in cashing in on the modern way of life as to their lower prices. People can now afford to buy food in quantity, they have cars to take it home in and refrigerators to keep it in and they like to make their choice at leisure from a large stock in an airy modern building. Competition within the supermarket field has become severe and as a result these markets, in order to increase their turnover, are stocking goods other than food; profit margins are also higher on such things as cigarettes and toilet articles. The supermarket is in fact taking on the character of a general shop, another reason why variety chains and drug stores are going into self-service.

One result of the rush into self-service is that manufacturers of more and more goods are developing their own brands; it has been found, for example, that socks and stockings can only be sold satisfactorily by self-service under a well-known label and independent makers of inexpensive hosiery are co-operating to overcome this difficulty. Stockings also bring up another self-service problem, that of packaging; a new "Stocking Stik," a tube nearly two feet long, has the advantage that a shopper cannot put it in his pocket; it thus reduces pilferage, always a serious question where small articles are concerned. Clear plastic wrappings have done much to make the spread of self-service possible, for fragile goods can be seen and even handled without being soiled. And these wrappings are attractive enough to have satisfactory "impulse appeal"; tempted by the display of goods on the open shelves, customers find themselves paying as they leave for more than they had planned to buy.

Shorter Notes

Tourist air fares on trans-Atlantic routes this summer have been an outstanding success, with a fifty per cent increase in passengers compared with the same three months of 1951. On the two major American airlines providing this service, 39,000 of the total of 73,000 travellers between May 1st and August 15th paid the new fares, which are \$486 for the New York-London return flight compared with the first class fare of \$711. Next summer's tourists will find that the scheme will operate in intra-European travel as well.

Chippewa Indians of the Turtle Mountain reservation in North Dakota will be enrolled in defence production when they start training soon for the manufacture of the tiny jewel bearings needed in timing devices. At present the United States imports 100 million of these bearings a year from Switzerland, but the desire to have a domestic source of supply outweighs the price factor; the domestic bearings will cost at least 20 cents, while the Swiss ones average 8 cents. The Indian Affairs Commission of North Dakota, which maintains that the Chippewas have the necessary precision skill for the work, has persuaded the government to set up a small factory there which will turn out 9 million bearings a year when in full production. Already an attempt is being made to protect this infant industry by putting a tariff on imported jewel bearings.

The Census Bureau reports that the high marriage rate, prosperity, and the large volume of new houses are reducing the size of the average American household. It was made up of 3.33 persons last April, 3.59 in 1947, and 3.67 in 1940.

"After you with the Alkylaryl Sulphonate, dearie!"*

Frankly, we'd be as surprised as you to overhear a remark like that.

Nevertheless, the addition of a little of this chemical to a lot of water makes it take on increased cleaning power and speed. It spreads more rapidly, penetrates more deeply, wets more thoroughly. Things *really* get clean — more easily and at less cost. Supplying this chemical to manufacturers of cleaning compounds and solutions for industrial and domestic use is another example of how Monsanto serves industry — which serves mankind. You'll find Monsanto making equally important contributions to hundreds of other industries where chemistry plays an active role.

* Chemical synonym for a group of detergents, of which Monsanto's SANTOMERSE — Registered Trade Mark — is an important member.

THE WORLD OVERSEAS

Growing Pains in Turkey

TURKEY'S staunch determination to defend its independence is the subject of a Note on page 145. The domestic political and economic basis of this effort have received less notice, since the Turks do not make a fuss about their internal affairs. Yet the growing pains of a democratic state and the setbacks and successes of building up an under-developed economy form an essential part of the picture.

Although the Turks present a serene front to the world the political scene in Ankara is far from dull. The Democratic Party is not as united as it was; there have been discontented grumblings at the Prime Minister's tendency to take too much upon his own shoulders. Mr Menderes, however, is a man of considerable stature whose failure to observe some of the niceties of democratic procedure may be due to the extent to which he towers above his colleagues. In any case his assertion of the office of Prime Minister over and above that of the President may mark an important stage in Turkey's democratic constitutional development. In some ways, however, the Democrats have found it easier to fall into some of their predecessors' faults than to carry out the programme they set themselves in the spring of 1950. Presented with a novel phenomenon in Turkish life—a constitutional opposition—they have very naturally not always realised that to try to stifle criticism, particularly in the press, is not the best way of dealing with it.

Since its dramatic defeat at the polls in May, 1950, Ataturk's People's Republican Party has manfully carried out the dictum that the chief duty of an opposition is to oppose. It attacks the government on the widest possible front, from its alleged inability to maintain public order to its failure to close the growing gap in the balance of payments. But it seems unlikely that it can shake the stability of the Democratic regime with its massive parliamentary majority. The PRP's opposition tends to suffer from its very diversity, which betrays the conflicting tendencies within its ranks and prevents it from presenting the country with a strong coherent policy as an alternative to what the Democrats have to offer.

In the economic field the Democrats, like their predecessors, have benefited enormously from American aid. Up to the end of last June over \$144 million of Marshal Aid alone had been poured into the economy. The Government has avoided the fatal mistake of treating agriculture as a poor relation whose interests could be safely thrust to one side in the pursuit of industrial glory. In fact, of course, the greater part of Turkey's national wealth lies in and under the soil. Agriculture provides a livelihood for about 75 per cent of the population, and in 1948 accounted for about 47 per cent of the national income. Its expansion is vitally necessary both to help close the gap in the country's balance of payments and—even more important—to feed the rapidly increasing number of mouths.

At the opening of the Izmir International Fair last August the Minister of Economy and Commerce said that Turkey's main economic problem was to improve the productivity of the nation's villagers, to raise their standard of living and to increase their purchasing power. The solution of this problem must largely depend on the extent to which the Government can bring the villages into closer contact with each other and with the towns. In its plan to develop communications, it has sharply stepped up the amount invested

in roads—from £T60 million in 1950 to £T134 million in the present year—and has continued the sensible policy of constructing as wide a network as possible of rough but adequate roads instead of concentrating on a few impressive first-class ones.

Increasing agricultural production is bound to be a lengthy business, if only because the Turkish villager is set in his ways and does not always immediately see the point of growing much more than he and his family need for themselves. All the same, the determined efforts of the Government to increase the area under cultivation and its policy of rapid mechanisation are already bearing fruit: this year's cotton yield is 160,000 tons compared with 155,000 tons last year, and the bumper cereal harvest of over 11,500,000 tons was not entirely due to the kindness of the weather. The area under cereal cultivation, which before the war averaged about 17 million acres, rose to nearly 22 million acres in 1951 and to nearly 25 million in 1952. The number of tractors in the country rose from about 2,000 in 1948 to about 24,000 at the present time.

Tractors Without Mechanics

Rapid mechanisation, however, has not been without its drawbacks. There is a danger that it may lead to a growth of economic and social inequality in the villages; the poorer peasants do not find it easy to buy tractors and other machinery, even on the easy credit terms allowed by the Agricultural Bank, and they are sometimes forced to hire on stiff terms from their richer neighbours. Again, fears have been voiced that so long as the rate of industrial expansion remains comparatively slow, the rapid mechanisation of agriculture may increase the serious underemployment already existing in the villages. There is also inevitably the Turkish farmers' lack of mechanical skill, which leads to an unduly high casualty rate amongst the farm machinery. The Ministries of Agriculture and Education are now making a joint effort to overcome this difficulty through a three-year £20 million plan to build seventeen centres for the training of agricultural technicians.

The exploitation of Turkey's great mineral wealth has been going ahead steadily in recent years. Last year increases in production over the 1948 level amounted to 12 per cent for coal, 43 per cent for iron ore, 80 per cent for pig iron, 17 per cent for steel, 57 per cent for chrome and 118 per cent for copper. Coal production, which in 1938 was about 2,500,000 tons, rose to over 4,700,000 tons in 1951; iron rose from about 77,000 tons to nearly 220,000 tons; and crude steel production which was negligible in 1938, amounted to over 135,000 tons last year.

Turkish industry, however, is still crying out for capital investment. The transfer to private hands of some of the huge state-owned enterprises, which formed an important plank in the Democrat's election programme, has proceeded only at a snail's pace because the supply of private capital is limited; in any case no one wants to put his money into enterprises many of which have not been run at a profit. But a beginning has been made in the abolition of state monopolies.

The Government is doing its best to persuade the Turk to overcome his reluctance to invest his savings in industry, and it is in fact probable that the amount of private invest-

ment is not now as small as it is sometimes thought to be. In a speech last June, President Bayar urged private enterprise to "take the initiative in the industrialisation of Turkey" and promised wholehearted technical and financial backing by the state. In 1950 the Industrial Development Bank was founded to provide private individuals with the long-term capital that the ordinary banks could not supply. It began operations in March, 1951, with funds provided by private Turkish capital, by the World Bank and by ERP counterpart funds. By the end of last July it had received 915 requests for loans and had approved 103, amounting to T£52.2 million, principally for textiles, cement and the building materials industry.

It is significant of present trends that private investors, in theory at any rate, will play a part, together with the Government and the World Bank, in financing the ambitious plans for the development of the rich Adana plain by means of flood control, irrigation and hydro-electric power; and that the power plant, when completed, will be turned over to a private company. The flow of private foreign investment, however, is only moderate so far. Since the law of August, 1951, which was designed to attract foreign investment to Turkey, less than ten of the 70 applications received have been granted; in any case, foreign investment is only allowed to supply 50 per cent of the capital required by any undertaking.

The Government's extensive plans for the development of the Turkish economy have produced one formidable snag—the growing deficit in the balance of payments caused chiefly by large imports of the capital goods which Turkey cannot itself supply. The adverse balance for the first seven months of this year was T£299.5 million, compared with T£95.5 million in the comparable period of 1951. The position will probably pick up somewhat now that Turkey's normal exporting season has started again, particularly as with the good harvest and the increased production of such minerals as coal, chrome and copper there will be no dearth of Turkey's main exports—provided markets can be found for them. The Government has so far refused to abandon the liberalisation of trade introduced two years ago. It takes the line that in the long run Turkey stands to gain from a liberal import policy which makes possible the modernisation and mechanisation of industry and a consequent rise in the standard of living. But it seems unlikely that it will be able to stick to its guns unless Turkey can achieve some notable successes on the world markets.

Ten Days' Council in the Kremlin

THE culminating point of the 19th All-Union Congress, after ten days packed with speeches, greetings and resolutions, was a short speech by Stalin which is commented on elsewhere. To an outsider the debates may have seemed somewhat dreary, with controversy conspicuously absent. Yet, this was the first opportunity since 1939 to hear so many important Soviet personalities making official pronouncements; and these daily meetings have provided some insight into Soviet life and plans, into the economic and political problems facing the Party.

If there was no controversy there were, on the other hand, apparent contradictions, a semblance of discord. Stalin, in his article published on the eve of the Congress, drew a picture of the western world threatened by internal conflicts and minimised the danger to the Soviet Union. Yet many speakers insisted on the threat of aggressive western imperialism. Some delegates stressed the might of the Soviet economy, others its shortcomings. Some spoke of the proximity of Communism, others of the reckless dreamers, "dizzy with success," who hope to storm their way to a Communist

society. This picture of discord is, however, deceptive. The main purpose of the Congress was simultaneously to reassure Soviet citizens and yet prevent them from resting on their laurels, to arouse pride in their achievement and yet spur them on to further work. It was necessary to show both the successes and the shortcomings, the might and the threat, the distant goal and the path to be travelled. There was no real contradiction in all these statements. They were only different facets of the same tableau and various actors were given different parts to perform.

THE VOICE OF THE GENERALS: The task of extolling the striking power of the Soviet army was given to Marshal Bulganin the political chief of the forces, and to Marshal Vassilevsky, its military head and minister of war. The latter emphasised the high quality of the officer corps and claimed that about nine out of ten officers on active service and six out of ten in the reserve took part in the last war. Some 86 per cent of the officers on active service are party members. In another passage Vassilevsky disclosed that the last five-year plan has made it possible to supply the Soviet forces with arms much superior to those they had during the war and that the new plan will allow even more striking progress. Bulganin repeated that the switch-over to war production was carried out partly in three to four months and completely in about a year.

VOICE OF THE PLANNERS: During the economic debate Bulganin declared openly that, "while the plan is another proof that the Soviet people are giving all their strength to peaceful construction . . . we make no secret of the fact that our economy can in the shortest possible time be switched over to a war footing." He also said that the technological improvement and training of cadres envisaged in the plan will further strengthen the defensive capacity of the country. Herein lies the crux of the matter: the Marshal and the head of the State Planning Commission, Saburov, look at the same problem from two different angles. Rearmament must be a heavy drain on the Soviet economy, but otherwise it is a means of allotting a big slice of the national income to investment.

In the current period emphasis again is laid on heavy industry, and this would have been so—though to a lesser extent—without the arms race. The ambitious plans for agriculture and consumer industries will be fulfilled only if productivity increases according to schedule. Yet, even if they are, total consumption will be raised by less than one third. Investment, on the other hand—including defence investment—should be doubled during the quinquennium. Thus, the planners can praise Soviet economic progress while the marshals claim great strides in military preparedness.

Delegates from the Frontiers

ALLIES AND NATIONALITIES: The strengthening of the ties within the Soviet bloc was emphasised. When referring to military preparedness they talked of the united forces from the Pacific to the Elbe. There was also much talk of closer economic co-operation. The delegates of Communist parties of the Soviet bloc and those of other foreign countries—there were 43 delegations altogether—were applauded copiously and kept all the time in the lime-light.

Prominent among the speakers were also the representatives of the various Soviet nationalities. Regional meetings preceding this Congress have shown that nationalism still raises its head in many republics. A special effort seems to have been made, therefore, to show the cohesion of the whole country, particularly the allegiance of the border states. A disproportionately great amount of time was devoted to the Baltic republics, while vice-premier Beria drew special attention to the economic progress of the Soviet republics of Central Asia compared with Middle East states.

POST-REVOLUTIONARY GENERATION: Some light on the puzzling changes in the Party statute is thrown by the

Stick to it!

Although advertising is nowadays scientifically organised, it can never be entirely an exact science. The creative inspiration of the artist and writer plays so big a part.

Yet there are certain simple principles governing the use of creative work which, though often ignored, are vital to its maximum effect.

One is that the same characteristic theme or "personality" in your press advertising should be repeated in your posters, showcards, packaging—indeed, in every facet of your advertising front.

Another is that when you have settled on a creative advertising theme—you should stick to it. Not for months. But

for years. Variations, yes—but on one theme.

For advertising is not an escalator to success. It is a form of education—gradually shaping an attitude of mind which leads in due course to a settled preference and habit of buying.

Consider some of the advertised names which spring first to your mind—and you will notice that most of them have been consistent in their "idea" for many years. That's why you remember them now!

Crawfords have proved in countless successful campaigns that the only way to get the utmost effect from your advertising is to ensure that its theme is both cohesive and continuous.

"Type these fifteen letters please"

The Dictabelt has revolutionized office dictation!

FIFTEEN LETTERS or even more on a little plastic belt! That is only one of the amazing developments in office dictation made possible by the Dictabelt, the revolutionary new recording medium of the Dictaphone Time-Master.

More dictation. Fifteen minutes of solid dictation goes on to each Dictabelt; fifteen minutes of notes, letters or memoranda for your secretary to type when it is most convenient. Dictabelts fold flat for compact filing and up to ten can be posted for a 2½d. stamp.

Easier dictation. The Time-Master is extremely simple to operate—there are no time-wasting controls to set or adjustments to make. It is designed to achieve the maximum efficiency with the minimum of effort both when you dictate and when your secretary transcribes.

Better recording and reproduction. Time-Master recording on plastic Dictabelts is crystal-clear from beginning to end. The sensitive microphone catches every word you say—even a whisper: this makes transcription both easy and accurate for secretaries.

ONLY THE TIME-MASTER OFFERS ALL THIS!

1. Streamlined machine, only 4½ ins. high, slightly larger than a letterhead.
2. Uniformly clear recording and reproduction.
3. Uniform backspacing, immediate place finding.
4. Simple automatic operation.
5. Mailable, filable, expendable Dictabelts, low-cost plastic medium.
6. Nation-wide service, Dictaphone dependability.

Write for Time-Master literature to Dictaphone Co. Ltd., Dept. O, 107 Kingsway, London, W.C.2.

report of the Credentials Commission, which has analysed the age structure and the length of Party service of the delegates. It shows that out of nearly 1,200 delegates with voting power only a handful, less than 20, had joined the Party before 1917. Since the representatives are usually chosen among the elder, more seasoned members holding important posts, it can be safely assumed that there are very few old Bolsheviks left in the ranks of the Party and not very many who have joined in the pre-Stalinist era. In fact, about three-quarters of the total membership is accounted for by newcomers, who have joined since 1939. They entered the ranks during the war when screening was very superficial, and one of the urgent tasks now is to educate and discipline them so as to recover for the Party the character of a devoted élite.

NEW STATUTE AND PROGRAMME: On the dropping of the fifty year old title "Bolshevik" and on other proposed changes in the statute M. Khrushchev added no new information. Despite the apparent encouragement of criticism, it was accepted without alteration by the Congress. The main purpose of the changes, which strengthen still further the control of the Party by its higher organs, seems to be to close every possible loophole for deviations and divisions. The Congress appointed a special commission to prepare a new Party programme. A similar commission was elected in 1939 but it produced no tangible result. Thus the Party is still, in theory, bound by its old programme drawn up in 1919, which has certainly been made out of date by the vast and rapid changes which have transformed Soviet society. Stalin himself is again the chairman of the Commission and his new pamphlet is to serve as a guide for the draftsmen.

NEW CENTRAL COMMITTEE: Finally, the Congress elected its standing body, the Central Committee of the Party. Since the election is really settled from above, it is interesting to see what changes have been brought about. The committee's membership has nearly doubled, increasing from 71 to 125. It will tend to be unwieldy and probably become even more subservient to the Presidium—the heir of the Politburo—or the Secretariat. What these changes signify will be considered in a later article.

Indonesia's Deceptive Stability

[FROM A CORRESPONDENT]

THE comparative quiet of the last few months in Indonesia presents a deceptively stable picture. No great strikes, no violent armed upheavals, no startling threats to the currency—all this is true and to the good. It deceptively suggests, however, that a firm and purposeful policy has at last been pursued; in reality there has been a downward trend in the nation's economy and a drift to the left in political affairs.

Of Indonesia's two leading parties—the *Masyumi* (the Moslem party) and the PNI (*Partai Nasional Indonesia*)—the PNI seems to have adopted an anti-foreigner, and particularly an anti-American, attitude during the past few months. On many of the unofficial committees, for instance, which set themselves up to organise the celebrations for Independence Day on August 17th, members of the PNI made great play of their brotherhood with the Communists, a fact which fitted neatly into the Party's present tactic of a united popular front. Great interest has also been shown by the press in the so-called Asian Peace Conference at Peking. These left-wing enthusiasms, however, have left the Government cold and it has done what it could to keep them in check. Mr. Mukarto, the Foreign Minister, has warned against a

hasty approach to Moscow and the delegates to the Peking Conference have been denied any official status.

Unfortunately the *Masyumi* is at this moment split into two factions, one led by Dr. Mohammed Natsir, the former prime minister, the other a religious rather than political movement calling itself the *Nahdlatul Ulama*. It is to be hoped that the factions will come together or, at least, not oppose one another, in the general elections which are expected about next April. In the villages, the various parties are already active with "political instruction" and propaganda, and this activity is certain to increase month by month; one of the most active bodies is SOBSI, the Communist dominated trade union organisation. A disruptive element will be provided by the numerous illegal armed organisations, especially the *Darul Islam* in West Java who strongly disapprove of the elections and can be relied on to endanger the security of the voter as much as possible. It is probable, however, that if the *Masyumi* sticks together it will emerge at the head of the poll largely because of the established prestige of its leaders and the innate conservatism of the people in the rural districts. These personal factors count for even more than the influence of religion.

Theft and Low Productivity

The economic situation is the old tale of low productivity and high pilferage, non-competitive prices and the closing of estates. The sugar companies, for instance, have announced that the yield is not more than 80 per cent of the expected figure, and that about a further 30 per cent has been stolen. The loss to the industry through theft and low productivity is estimated at Rp.62 million, with the result that many estate-owning companies are now financially on their last legs. Moreover, all commerce has been subjected to a severe strain by the new import regulations, which stipulate that when an application is made for a licence to import, 40 per cent of the value must first be deposited with the Government. Then, when the licence is granted, the usual credit is opened through a bank to the full value of the goods, and the 40 per cent already paid has to be reclaimed from the Government. But since the banks have been forbidden to grant overdrafts to meet this new outlay, or to increase existing overdrafts, any business which relies on such imported consumer goods as materials and machinery requires a good deal of extra ready cash to finance its current trading. Such ready cash is scarce.

The capital, Djakarta, has lately been in a constant buzz of rumours and counter-rumours about devaluation. The Government is, indeed, deeply concerned about the stability of the currency. The Foreign Minister has proposed to the cabinet that Indonesia should join the Colombo Plan and its reaction, not finally known as yet, should be of great interest. In the past the Indonesians have avoided the Colombo Plan, first, because they felt it imposed conditions which do not accord with the country's "neutral policy," and, secondly, because they would therefore presumably expect some sort of special treatment to relieve their qualms.

But it is the lack of security in West Java which now causes the most public alarm. Sumatra is quiet; East Java, once a major centre of gang warfare, has been cleared and the city of Surabaya is no longer under a curfew. West Java alone remains unsettled. The main areas of disturbance are in the hills around Bandung, long the centre of the *Darul Islam* insurgents, and on the northern coastal plain near Tjirebon (formerly Cheribon). The gangs are short of funds, and kidnappings, which include Europeans, have taken place around the local sugar factories, even within a few miles of Tjirebon itself. The main coast road from Djakarta has been closed for some miles and traffic diverted because of gang activities. The army, the TNI, is doing its best, but the country is ideal for the professional guerrilla and the casual bandit. However, limited trouble in certain areas of Java is far preferable to the ubiquitous gangsterism which prevailed at certain periods in the past.

Free Europe in Munich

[FROM A SPECIAL CORRESPONDENT]

BROADCASTING to the lands beyond the Iron Curtain is an uncomfortable profession. Those who practise it are exposed not only to the invective of the Stalinists and of their allies on this side of the curtain, but also to a volume of friendly and unfriendly advice, well- and ill-formed, from the numerous political, national, sectional or technical groups who think they could do the job better. The organisers of Radio Free Europe in Munich suffer from two further disadvantages: the impact of the American presidential campaign and the environment of present-day Germany.

Radio Free Europe is more than an organisation for the diffusion of news and political propaganda to enslaved Eastern Europe. A determined and surprisingly successful attempt has been made to create complete, free broadcasting stations for several of the East European nations. These stations, of course, devote a great deal of their time to news bulletins, polemical commentary on events in Eastern Europe, and talks on various aspects of political and social life in the free world. But they also have their cultural programmes, with music, songs and plays performed by nationals in their own languages. Polish, Czechoslovak and Hungarian stations have already been established. The emigrations from these countries include talented writers, artists, economists and political journalists. In Radio Free Europe some of these have been given an opportunity to exercise their talents in a manner that they can hope will be of some service to their compatriots behind the curtain.

Episodes such as the controversy provoked in the American and European press by the statements of Mr Eisenhower and Mr Dulles on the liberation of Eastern Europe immensely complicate the task. All East European exiles, except those who are willing to forget their nationality and become citizens of the United States or of some American or European country, fervently desire the liberation of their homelands. This is especially the case of those employed in Radio Free Europe, who are only there because they wish to make their small personal contributions to that end. They are understandably depressed by evidence that a large section of West European public opinion is indifferent to the fate of Eastern Europe, and correspondingly pleased by evidence of the strength of contrary opinions. But this does not mean that they are happy to see the future of their countries made a subject of electoral demagoguery.

The fear has sometimes been expressed that Radio Free Europe, by taking a militant and crusading attitude, would arouse false hopes beyond the curtain, would encourage premature and hopeless adventures, in which patriots would perish and reprisals would fall on whole nations. This fear is hardly supported by the facts. Both the leading personalities in the national stations, and their American advisers, are well aware of the harm that such an attitude could cause, and are on their guard against it. On the other hand, they are aware of the danger that if hope of liberation is withheld, moral resistance weakens. They must somehow steer between the Scylla of enthusiasm and the Charybdis of despair, with no magic political compass to guide them. But if they cannot offer a time-table of deliverance, there is yet much that they can do. They can give their audience evidence that the free world has not forgotten them. They can tell them that there is a free world, and tell them how its inmates live. Above all, they can maintain the cultural, moral and national traditions of their nations.

It is in the cultural field that the Stalinist onslaught is most deadly, and it is here that defence and counter-attack are most important. For example, the Stalinists attach great

importance to the falsification of history. To rob the nation of the memory of its heroes and statesmen is no less important than to rob the peasant of his crop or the worker of the product of his labour. Cultural Stalinisation can be fought only by representatives of the culture that is under attack. The chief merit of Radio Free Europe is that its Polish listeners hear programmes that are not only conducted in the Polish language, but planned by Poles for Poles. Czechs and Hungarians can be told the facts about their past which their present rulers conceal or distort. But to denounce the lies of the Communists does not mean falling back into the chauvinist spirit in which historical and cultural problems were so often handled between the world wars. The common sufferings of the East European peoples make them more receptive than in the past to the idea that they should think of their Baltic and Danubian neighbours as friends. Daily contact between the Polish, Czech, Slovak and Hungarian writers and technicians in Radio Free Europe seems to be helping mutual understanding. But all these are long-term trends. No broadcast propaganda will produce quick results. This the American organisers of Radio Free Europe understand.

Fanatics of the Sidelines

The choice of Munich as the site of Radio Free Europe can be defended on various grounds, but the environment has its disadvantages. One in every nine inhabitants of Bavaria has been expelled from Czechoslovakia: in the city itself the proportion of *Sudetendeutsche* is still higher. These people have good reason to hate not only the Czech Communists but also other Czech political groups which shared with the Communists the responsibility for their expulsion. It is true that many of the expelled have found a decent place within the West German economy. It is true also that many understand that, whatever the future of Central Europe, the German and Czech nations must live side by side in peace, and that the bleak succession of atrocity and counter-atrocity must be ended. Unfortunately, however, among the politically active *Sudetendeutsche* the spirit of chauvinism is alive and vigorous. It is personified in the leader of the *Sudetendeutsche Landmannschaft*, Lodgman von Auen, a pre-1914 pan-German who has learned nothing and forgotten nothing, a man more civilised than Hitler, but an heir to the Bohemian German demagogues who were Hitler's teachers in Vienna fifty years ago.

The Sudeten politicians keep a lynx-eyed watch on the Czechoslovak station of Radio Free Europe; the Silesian and Pomeranian expellee politicians do the same for the Polish station. The Hungarian station has less to fear from German groups. But in Bavaria are some thousands of Hungarian ex-soldiers of the army of the 1944 fascist government of Szalasi. The leaders of these men are at best narrow-minded and reactionary generals, at the worst fanatical Nazis. There are also miscellaneous small groups of Slovak separatists and Rumanian and Bulgarian former fellow-travellers with the Nazis. None of these extremist groups, nor even the expelled *Landmannschaften*, enjoy the official support of the Bavarian or Federal government, though they would appear to have their friends in the "Kaiser Ministry." The truth is rather that the absence of any policy in Bonn towards East European problems—other than that of the Soviet zone of Germany—gives rise to fears for the future. If Bonn's eastern policy is a room swept and garnished, there is certainly no lack of devils waiting to make their entrance.

Radio Free Europe is, of course, an imperfect institution. It cannot escape the frustration and demoralisation inherent in the unhappy estate of emigration. But against these can be set the efforts of intelligent men from three enslaved lands, striving to think out anew the problems of their own countries, and to understand neighbour nations in a European spirit.

Franco-American Quarrel

WHAT are the facts behind the most recent misunderstanding between France and the United States? At Lisbon the Americans said that they would try to contribute \$500 million to the French military budget for 1953. M. Létourneau, when in Washington, obtained a further promise of \$150 million intended to lighten the burden created by the war in Indo-China. M. Pinay therefore conceived his budget around an estimated \$650 million of aid. In a note handed to him last week, however, the State Department informed M. Pinay that he would get only \$525 million. It was hinted, moreover, that even this allocation depended in part on whether or not M. Pinay would increase his military budget. In addition, there is the fact that the arms industry is seriously dependent on American off-shore purchases. France had hoped that another \$625 million would be allocated by the Department of Defence, but it now appears that only a third of this sum will be available; so M. Pinay faces not only a gap in his budget but a critical situation in a vital industry.

The French argue, most convincingly, that it is impossible to pursue a sound budgetary policy or to contribute effectively towards European defence so long as America refuses to make long-term financial engagements. In a memorandum submitted to Nato on September 22nd they pointed out that bilateral dealings between individual governments and Washington were wholly inadequate to meet the needs of a multilateral defence organisation. Despite the existence of permanent Nato machinery for that purpose, individual members were forced to deal directly with the Pentagon. Instead, the French proposed a common budget in which all Nato members would agree about the gap between what the military asks for and what national economies can do. This deficit would then be met by multilateral action. By pooling financial resources it would be possible to make long-range plans, and financial and material reserves could be shifted whenever a critical situation developed in a member country.

The Americans, too, have a strong case. Whichever way one looks at it, their aid to France is enormous (most estimates even overlook the \$100 million which accrue annually through military spending, base-rentals, etc.). The French tend to forget the existence of Congress and of the American taxpayer who has not, as yet, been stunned into total acquiescence by years of enforced generosity. The timing of various French appeals and fits of temper is also not above suspicion: the poor relation seems to appear outside the window every time there is a party on, and M. Pinay must have been aware of the embarrassment he was causing to an administration engaged in a Presidential election. Indeed, the speed with which the diplomatic blaze-up has been snuffed out shows that M. Pinay spoke at a most delicate juncture. Finally, it is being said plainly that the French armament industry is not yet a model of economy or efficiency. There are serious doubts abroad about whether a large American investment in French arms production is the most fruitful way of strengthening European defence.

The airing of these differences should stimulate fresh thinking about Nato's role in the use of American aid. Recent statements by General Bradley, by Lord Ismay and by Field Marshal Montgomery, all support the views implicit in the French memorandum. Nato will have to be given greater power if it is to carry out its task, and a multilateral budgeting system could contribute towards this end. The Mutual Security Agency in Washington has prepared a "green book" on the whole problem of assistance to Europe. It contains proposals which should meet French objections more than half-way and suggests a dollar bloc in which various national

defence budgets could be co-ordinated. The new President will find it on his desk, and this French-American family quarrel may help to make it "priority reading."

Mao Tse-tung's Road to Power

FROM time to time during the past two decades writings by the leaders of Chinese Communism intended for domestic rather than foreign consumption have been studied by Western specialists in Chinese affairs. But there has been a dearth of documentation on the history of the movement and it has remained far more obscure than has Russian Communism. A *Documentary History of Chinese Communism** which has now appeared as a result of study organised by the Russian Research Centre at Harvard University goes far to fill the gap. The editors have to admit that it has been found impossible to obtain texts of certain documents which would be desirable for the completion of the story; thus no documents can be traced from the first Chinese Communist party Congress, which was held in 1921, and the earliest material in the book dates from the summer of 1922. But for the subsequent development of the party and its official political line there is a useful selection of material culminating in the Organic Law of the Central People's Government of September, 1949.

A collection of documents full of allusions to the Chinese politics of the moment as well as to Marxist dogmas is hardly to be appreciated without a commentary. This has been provided, so that the documents are, as it were, imbedded in a historical survey of Chinese Communism by three American writers. They have discreetly kept off the most controversial issues of this history—notably the effects of Russian and American policies on the course of the civil war in China. They have confined their theme to the evolution of the party line, and within these limits their account is fair-minded and thorough.

The question best illuminated by this collection is that of the relation of Chinese Communist doctrine (and particu-

ECONOMIC CONDITIONS ABROAD

The Economist Intelligence Unit provides quarterly reports on economic and business conditions in

Argentina, Australia, Belgium, Borneo, Brazil, Burma, Canada, Chile, China, Colombia, Cuba, Denmark, Egypt, Finland, France, India, Indonesia, Indo-China, Israel, Italy, Japan, Yugoslavia, Kenya, Malaya, Mexico, Netherlands, New Zealand, Norway, Pakistan, Persia, Philippines, Portugal, Siam, Southern Rhodesia, Spain, Sweden, Switzerland, Turkey, Union of South Africa, Uruguay, USA, Venezuela, Western Germany.

These reports give a concise analysis of matters of concern to exporters and investors. Particulars may be obtained from The Economist Intelligence Unit, 22 Ryder Street, St. James's, London, S.W.1.

larly the "thought of Mao") to the Marxist-Leninist creed as transmitted to China from Russia. From the beginning it was recognised that social conditions in China were different from those in Russia and that the principles of Communism would have to be adapted to the Chinese environment. The inference first drawn from the backwardness of the Chinese economy and the weakness of the urban proletariat was that the Chinese Communists could only be effective in combination with the Kuomintang as the party trying to carry out a bourgeois-democratic revolution; this was the line pressed on the Chinese Communists by the Comintern. The result was that in 1926-27 the Chinese Communist party, in order to maintain the alliance with the Kuomintang, tried to curb the mass movement of the peasant associations which had been stimulated by Communist propaganda and became extremely powerful immediately after the collapse of the "war-lord" regime in South China.

Stalin's Miscalculation

Mao Tse-tung, who was not at that time the supreme leader of the Chinese Communists, but was already one of their most influential figures, protested vigorously against the policy of restraining the peasant *jacquerie*, and the fact that his report on the agrarian situation in Hunan (written in February, 1927 and reproduced in the present collection) was not suppressed indicates that there was considerable sympathy in the party for his point of view. As Trotsky was at that time likewise attacking the policy (endorsed by Stalin) of curbing the revolutionary mass movement in order to preserve the alliance with the Kuomintang, Mao's line was parallel to Trotsky's; but Mao never seems to have been reckoned a Trotskyite and was indeed indifferent to Soviet internal politics. In Moscow the affairs of China were so much ammunition in the bitter polemics between Stalin and Trotsky, but for the Chinese it was naturally their own revolution, and not the faction fight in Moscow, that was of absorbing interest. Mao himself always avoided any renunciation of the Comintern.

After the Kuomintang had turned on the Communists and thus discredited the policy of sacrificing the mass movement for the sake of conciliating the nationalist bourgeoisie, Stalin extricated himself from his embarrassment by putting all the blame for failure on the Chinese Communist leadership of Chen Tu-hsiu and switched the Comintern line abruptly to one of extreme "adventurism." This, however, was initially not in favour of Mao, but of another rival for leadership, Li Li-san, who promised victory through risings of the proletariat in the cities. The policy of reliance on the urban workers, however, also resulted in failure, and only the peasant guerrilla forces were left, holding their own in various parts of the countryside. This situation naturally brought Mao to the top, as peasant revolt was his speciality, and the Comintern gave him definite, if somewhat grudging recognition.

Peasant Basis of Power

Mao and his followers have never admitted that their policy of building revolutionary power on a peasant basis was in any way incompatible with Marxist-Leninist theory; it was, in their view, simply a tactical adaptation to actual conditions in China. The Chinese industrial proletariat was too weak to make a revolution, but the agrarian situation was such that the poorer peasantry could be made the instrument for a great social upheaval, which would serve Communist ends provided that the direction of it could be kept in Communist hands. Mao, in 1927, expressed his view of the relative importance of the various revolutionary forces in China at that time by a statistical estimate that of a total value of ten points "the urban dwellers and the military units rate only three points, while the remaining seven points should go to the peasants in their rural revolution."

Mao's stand may be compared to Lenin's "discovery" of the peasants, contrary to the traditional Marxist attitude, in 1905. But Lenin still conceived the agrarian *jacquerie* as auxiliary to the action of the proletariat in the cities, whereas Mao believed that peasant insurrection could be decisive without success in the cities. Moreover, Lenin approached the peasant question from the outside, whereas Mao was himself of rustic origin though not of poor peasant, but of "kulak" stock. His understanding of peasant needs and sentiments has undoubtedly been a major factor in his success. On the other hand, the destiny which he has determined for the Chinese peasant is the one which Communism is bound sooner or later to impose on all peasants—that is to say, collectivisation. Communism always tricks the peasant by first promising him a redivision of the land in private ownership and only revealing the ultimate goal of collectivisation after power has been won and consolidated. Hints of collectivisation in the not so distant future are now becoming more and more frequent in China, and the news is gradually being broken to the peasant that he has been given the land of the landlords only in order that it may be taken away again.

A misunderstanding of the tactical nature of the concentration of the Chinese Communists on peasant insurrection was the origin of the idea, which became so prevalent in Britain and America, that they were not really Communists at all but merely "agrarian reformers" who had adopted the Communist label. This impression was strengthened by the apparent moderation of the Communists during the period of the renewed Kuomintang-Communist united front against Japan, and even later before the civil war had been won. The selected documents show that throughout these phases of superficial concession and conciliation, the indoctrination of party members continued to be on the most uncompromising lines; indeed, as the editors put it, "the Party chose to re-emphasise its basic principles during this period, in an evident determination to maintain its Leninist foundations in the midst of all the changes brought about by the war-time shift to the united front."

Tactical Hocus-Pocus

The contrast between the unvarying rigidity of the basic doctrine and the extreme flexibility of the tactical programmes is perhaps the most striking feature of this collection taken as a whole. Recent Chinese history shows this dualism in its most extreme form, though it is characteristic of Communism everywhere. The essential thing in Communism is that the party members—and especially those in the inner ring of the leadership—should understand what the objective is and should never be led astray by the tactical *hocus-pocus* devised for the uninitiated. The goal is always the same—absolute power for the party, total possession of the means of production by the party state, the destruction of all domestic forces of resistance; and permanent warfare "cold" or otherwise, against the principal powers of the non-Communist world. Everything else is essentially humbug—the politics of a transitional tactical phase by which the Party for the time being gains support outside its own ranks. It is true that there may be fierce disagreements about what is tactically expedient at any given moment; such conflicts may be the form taken by personal rivalries for leadership or they may arise through individuals who by conviction or temperament become so attached to one phase of policy that they cannot adjust themselves to a reversal of the party line. In 1937 the Chinese Communist party had its Martyrs and Tillons who could not swallow the new united front with the Kuomintang and it took all Mao Tse-tung's prestige backed by the full authority of the Comintern to bring the uncompromising militants into line. But the militants need not have worried about Mao's moderation or feared that he might become soft towards opponents of the party; since he came to power he has shown no deficiency in "Bolshevik firmness."

It often happens that several companies or divisions of the Simon Engineering Group bring their widely differing services to bear upon a single contract. A large new phosphorus factory near Bristol for Albright & Wilson Ltd. is a case in point. One division of Simon-Carves acted as consultant on siting and layout and is responsible for building and civil work; a second is dealing with materials handling and processing equipment, and a third with electrostatic dust precipitation; Simon Handling Engineers are supplying pneumatic discharging plants for unloading rock phosphate from ships.

These facts are published to show what British workers can achieve in spite of difficulties, with British organising skill behind them.

It can be done

The job was an oil refinery in Britain—and this vital industry demands speed. Every stage of construction was scheduled in advance; and, for good reasons, the day and the hour were fixed for completion of one essential section. This involved complex construction by unconventional methods, requiring 4,000 tons of concrete and steel.

A programme was drawn up showing each day's work for the six months allotted. Everyone responsible had a

copy and everyone worked to it. Whatever the weather—and this was midwinter—progress never departed substantially from schedule; and the work was finished a few hours ahead of time. That programme, though backed by knowledge and experience, relied on the spirit of the men on the job, and it was they who proved it correct.

Plans for DEVELOPMENT

Business men who have plans for development in overseas and colonial territories which call for medium or long term finance should write for our new booklet. It explains what the Corporation can do for you and gives details of the countries in which we operate. Please write to the Manager at the address given below.

BARCLAYS OVERSEAS DEVELOPMENT CORPORATION LIMITED

54, Lombard Street, London, E.C.3

A Completely New Accounting Machine

READY FOR ANY JOB

AT THE TURN OF A KNOB

"COMPLETELY NEW"—those are words that can be applied, without reservation, to the Burroughs Sensimatic Accounting Machine. If you find it hard to visualize an accounting machine that is *limitlessly* adaptable, capable at the turn of a selector-knob of doing countless different jobs for a small firm, or a vast amount of one particular job for a large organization, it is time you saw the Sensimatic in action.

The key to the machine's astonishing versatility is the newly discovered principle of "Sensimatic Control"—the incorporation of a "mechanical brain" that directs the machine through every mathematical function and every carriage movement during a posting operation. Each Control Unit guides the machine through four separate operations, and, since there is *no limit* to the number of different units you can use, there is *no limit* to the number of accounting jobs the Sensimatic can do, and the Control Unit can be changed by the operator in a matter of seconds.

You owe it to your business to let Burroughs show you the Sensimatic today.

Burroughs  *Sensimatic*

COMPLETELY NEW

● **ADAPTABILITY** — A turn of a knob—that's all the effort needed to switch the Sensimatic from one posting operation to another, from Accounts Receivable (say) to Stock Records, Stores, Costs, Payroll, Purchase Ledger, General Ledger, Statistical Analysis; the Sensimatic is reset in a moment for all these procedures . . . and many, many more.

● **SPEED** — The Sensimatic's light key depression, positive form alignment, early key release, make its operation far simpler, far faster, far more easily learnt. Anyone who can operate an adding machine can get the Sensimatic into full production!

This is a Sensimatic Control Unit — which, at a flick of a switch, guides the machine automatically through every mathematical function and carriage movement. Each panel gives you any four accounting operations in any combination.

MAKES ACCOUNTING MOVE

BURROUGHS ADDING MACHINE LIMITED, AVON HOUSE, 356-366 OXFORD ST., LONDON W.1

THE CASE OF THE EXTRA AUSTINS

A new assembly line enabled Austin's to turn out over 3,000 cars a week. . . . How many machines did they need to turn out nearly 20,000 pay-packets?

More cars for export, more figure-work — faster

AT LONGBRIDGE, the great Austin Motor Company is now turning out well over 3,000 cars every week — the greater proportion for export.

This phenomenal production rate owes much to the output from the new Car Assembly Building, which houses the most modern assembly lines in the world.

Austin's full production programme, however, has thrown new burdens on office departments, where the pay-packets for nearly 20,000 workers — and all that additional information on P.A.Y.E. operation, needed by Government and Tax Authorities — have to be prepared every week.

Could office production be stepped up and streamlined, too? Austin's thought so, and called in Burroughs to help. After investigation, Burroughs suggested the installation of their Class 30 machines to handle all Payroll problems, and, just about the time the new Austin assembly plant was ready, these machines went into operation.

Result: The Austin Payroll can now be prepared, and payslips issued, as fast and as smoothly as car-assembly in the shops. The workers are paid from one unit of

14 machines — less than half the number of machines previously employed.

Every worker gets a concise, fully-informative payslip which tells him exactly where he stands, and how his pay is made up. These machines also produce prompt figure facts, which include the main Cost Analysis, and up-to-date Tax and Earnings Records that provide immediate answers to tax queries.

What about you? If your business could benefit from faster figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs make the world's broadest line of record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Microfilm Equipment.

Call Burroughs today. Sales and Service offices in principal cities round the world. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1.

Photographed here is Miss Madge Tomlinson, of the Burroughs Installation staff, who instructed the Austin operators in the use of the Burroughs Class 30 machines on Payroll work, and helped to solve the Case of the Extra Austins.

THE BUSINESS WORLD

Development Areas Revisited—I

Policy and Costs

TO all appearance there has been little change since the war in government policy for the control of industrial location. The Distribution of Industry Act, 1945, created the development areas out of the prewar depressed areas, changing the title as a first step towards rescuing them from depression, but without any pretence that they were specially fitted for development. The 1945 Act has been amended once only and the amendments were slight. No official review of the workings of the Act has appeared since 1948, and its principle has rarely been challenged.

In spite of appearances, however, important changes of policy have in fact occurred. In the early years, almost any candidate for a factory in the development areas was considered eligible, whether he made toys for the home market or knitwear for North America; later, applicants were screened more carefully. The building of "advance" factories was discontinued some years ago; since then, the defence programme has put a damper on civil building and altered the geographical spread of the new factories now going up; sometimes, also, pressure has been put on manufacturers to think of sites in districts right outside the development areas. All these changes have meant that the favours originally offered to the development areas have been steadily whittled down.

In part, this has reflected a diminished preoccupation with the risk of severe unemployment in these areas. In part, it has been due to a greater emphasis on broader national objectives such as the export drive, control of capital investment, or the munitions programme. There has also been a more realistic assessment by the government of its powers to control industrial location. It would seem, however, that the general public has moved in the opposite direction and formed an increasingly exaggerated impression of the efficacy of the government's powers. The development areas have been visibly far more prosperous and have had a far larger share of new industry than at any time between the wars. What is more natural than to attribute the change to the Distribution of Industry Act? It is commonly overlooked that the circumstances in which the Act came into operation were peculiarly favourable to the developments that it sought to promote. With booming markets both at home and abroad, there was an extraordinary expansion in manufacturing employment in all parts of the country, and new factories were put up at a rate much higher than before the war. At the same time there was a complete transformation in the basic industries of coal, steel and shipbuilding, in which prewar unemployment was concentrated and in which over one worker in four in the development areas was engaged in 1939. The shortage of labour in other parts of the country, the greater purchasing power of the home market and the new opportunities in export markets combined to dispose many

firms to open branch factories in the development areas without the added incentive of government assistance.

In view of the length of time for which government control of location has continued, it is surprising how little has been published about the experience of firms that have gone to the development areas. It is highly desirable that this experience should be examined dispassionately in the present comparative calm, while the development area policy is largely in abeyance. A study of the effect on costs of production of setting up a branch in one of the development areas would be useful both to other firms faced with this choice and to anyone trying to weigh up what is involved in taking work to the worker.

A study of this kind has been in progress over the past few years, under the auspices of the National Institute of Social and Economic Research, with the assistance of the Board of Trade; and the first two reports have now appeared. The first of these, by Mr W. F. Luttrell, on "The Cost of Industrial Movement" * relates mainly to shoe production and analyses the experience of firms setting up branches at a new location; the other, by Mr D. C. Hague and Mr P. K. Newman on "Costs in Alternative Locations: the Clothing Industry" † is a study of the extra costs that were incurred by London clothing firms setting up branches in South Wales (or the North-East Coast in one case) rather than within the London area.

The first report provides an interesting demonstration that almost any branch factory starts off with higher costs than the parent factory—sometimes more than twice as high—and that the settling-in period may be prolonged. For three shoe firms that set up branches after the war, total costs averaged 110 per cent more than at the parent factory in the first year of operation and even in the third year 12 per cent more. The excess of direct wage costs showed a fall between the first and third year from 94 per cent to 24 per cent. Even more important were excess overheads, although few firms carefully compared overheads at the branch and at the main works. One large firm, where nearly all the excess costs came under the heading of overheads, did not even keep a separate account of the branch's overheads but lumped them in with those of the parent works.

Excess costs at the branch arising from the distance of the site from the main works cannot be measured. Branches that were opened within 30 miles had lower costs than those farther away, particularly those more than 60 miles away. But this was mainly due to the nucleus of skilled workers that was available within the

* Cambridge University Press, 18s. † Cambridge University Press, 12s. 6d.

traditional area of boot and shoe manufacture and not available further away. Cost of transport was a relatively trivial factor. The success of a branch factory seems to depend heavily on circumstances that have more to do with management and supervision—the method of training workers, for example—than with location.

Management and supervision, however, are themselves affected by choice of location. Both reports show that there is a limit to the amount of travelling that managers will or can undertake without prejudice to their real job of managing. They cannot be for ever superintending the manufacturing, marketing and development problems of a branch a day's journey away; nor can their harassed subordinates easily afford to spend time in recruiting key workers (to whom the policy of bringing work to the worker does not apply), finding houses for them, and developing skills that are completely lacking in the neighbourhood. The cost in managerial efficiency of opening a branch in a distant part of the country is not easily measurable, but it is certainly significant.

The second report suggests that these drawbacks have been successfully overcome in the clothing industry. There is no reference to significantly higher unit costs at branch factories, and when all items of cost likely to be affected by a move to South Wales have been examined, the differences compared with a hypothetical new branch in London are very small. Transport costs, for example, varied from 0.3 per cent of turnover below, to 0.8 per cent of turnover above, costs at a London location. Administrative services and other costs, so far as they could be measured financially, differed by an equally narrow margin. Labour costs were generally comparable, but there was a wider range of variation. In one factory, labour costs were little more than half those in London; in another, they were 20-25 per cent lower than London; in a third, earnings were between half and two-thirds the average in the main London factory, but wage-costs were less wide apart because of differences in skill; in two others, the difference in wage-costs was relatively slight. Wage-cost generally amounted to about 15 per cent of turnover; thus an average difference of, say, 10 per cent would represent 1.5 per cent of turnover and against this saving might have to be set the higher cost of training and supervision in South Wales and a rather higher rate of absenteeism.

Clothing is an important case: probably as many firms on the new industrial estates are in this industry as in any other. But it is also a peculiarly favourable one. Even before 1939 there was a marked tendency for the industry to expand in the development areas and contract elsewhere. Since 1939 the movement has been accelerated by the need to find new sources of cheap labour at the same time as conditions have favoured the use of less skilled workers, longer runs, and line production methods. For these reasons, to go to South Wales has presented positive advantages for some clothing firms quite apart from the attraction of a modern factory at favourable rent. "In traditional clothing centres," as one firm wrote, "it is very hard to break with traditional methods." Clothing firms that moved to South Wales and the North-East Coast escaped most of these difficulties and could start afresh with mass production techniques in a well-equipped factory, in which scheduling and management control were a great deal easier.

Pressure on clothing manufacturers to move to the development areas, therefore, has followed an established trend, and may well have happy results. Over the past year unemployment has no doubt risen steeply in the new clothing factories, but not nearly so steeply as in the traditional centres of the industry. Between June, 1951, and June, 1952, for example, unemployment in clothing nearly doubled in the development areas but more than quadrupled elsewhere. In hosiery, where unemployment at June, 1951, was negligible outside the development areas and a little over 1 per cent within them, it had risen by June, 1952, to about 5 per cent both in the development areas and in the rest of the country.

In other industries there have been enough factory closures over the past year to give some substance to the constant fear of the development areas that branch factories opened there would be the first to shut when demand slumped. But the casualties have been perhaps no higher than one must reckon in a sample of new factories wherever located. It may be true that, even when the branch factories have lower costs than the main works, they are more vulnerable because the main works have less hope of re-engaging any workers who are discharged. There is as yet no evidence that this has dominated the reactions of managements to adversity. The branch factory is often supplying a quite different market from the parent factory or even making a quite different product, so that the immediate reaction is rarely so drastic as outright closure.

Many of the firms that have gone to the development areas have plainly had no reason to regret their choice. All the branch factories that Mr Luttrell examined had more than paid their way since they were set up, even although unit costs were higher. The erection of a branch factory was a decidedly better proposition than outworking in shoe-manufacturing or sub-contracting in engineering. But the establishment of a branch was no light undertaking; if the same output could have been produced at the main works, extended if necessary, costs would have been much lower and the strain on management greatly relaxed. It was only the impossibility of recruiting additional labour or finding room for a factory extension that made firms undertake a branch.

The most obvious condition governing the success of the new branch factories has thus been the wide margin between prices and costs that allowed them time to gain a footing. It has generally been necessary for the branch factory to content itself with longer runs of the simpler products, leaving the main works to take on batch manufacture of the latest or most complicated models. Where this division of labour has not been possible, firms have been less willing to disperse their activities or less successful if they did. Where a large range of auxiliary services has been necessary, as in many branches of the metal and engineering trades, firms have been reluctant to go outside the traditional centres of their industry. They have found it easier to move when the branch could be run as a separate unit by a management with wide discretion, and when the branch could be given the advantage of an adequate nucleus of key workers from the parent factory. Even in the most favourable conditions, however, it has taken some years to bring direct costs at the branch into line with costs at the main works; and overhead costs have often proved a more severe, more lasting and more neglected handicap.

(To be continued)

Ultrasonics in Industry

SOLID practical achievement is concealed beneath the scientific trappings of ultrasonics. This formidable word concerns the use of acoustic energy at frequencies pitched above the range of human hearing. As a science, ultrasonics will always be a closed book except to a handful of initiates, but in its practical application it promises to lead to some interesting changes in industrial techniques. Industry is apt to be frightened of new discoveries that can be understood only by highly qualified scientists, and to forget that a piece of apparatus as familiar as a domestic television receiver is a minor masterpiece of electronic engineering. The new techniques call for practical application and this, in the first instance at least, frequently has to be pioneered by the scientists themselves. Thus it happens companies whose experience is essentially scientific are beginning to find themselves involved in the design, production and marketing of industrial apparatus far removed from their chosen field of activity. Ultrasonics provide a typical example of the awkward problems that this can create for the scientific innovator who brings the fruits of research to the stage of practical application.

The bare principles of ultrasonics are not difficult to describe. Sound travels in waves, and if there is enough power in the waves, they can strike a surface with considerable force. Because this force is in the form of waves, a surface to which it is applied is struck at regular intervals and not subjected to continuous pressure. The successful application of this force of sound waves depends, however, on developing a sufficient degree of power, and this has proved no easy matter.

This is the basis of the new techniques of ultrasonics. They depend on making use of the curious behaviour of certain materials when they are subjected to an electric current or magnetic field. Some crystals change their dimensions when current is applied in certain directions; some metals behave in the same way when they are placed in a magnetic field. If power is applied to them intermittently, these materials can be made to expand and contract; if they do so at sufficient speed, they set up vibrations which take the form of sound waves so high in frequency as to be inaudible.

The industrial application of ultrasonics has proceeded along two parallel lines, determined by the type of apparatus (called a "transducer") used for production of the waves. Crystals may be used, but they will not withstand a very high input of energy, being limited to a power of about 500 watts. They produce waves of high frequency up to 500 megacycles—that is 500 million cycles or vibrations per second.

The other form of transducer uses metal placed in a magnetic field, and gives a wave of lower frequency (up to 100 kilocycles or 100,000 vibrations a second) with more sharply defined peaks and troughs, and can handle a much higher power input. The present maximum input for the metal transducer is 4 kW, and it transmits about 45 per cent of the input, but there seems no reason why input should not go up to 20 kW for those applications that require higher power. The distinction between the low-energy, high-frequency wave produced by the crystal method, and the high-energy, low-frequency wave of the metal transducer is important

because it determines the practical applications of the two types of apparatus. The high-frequency method is being used for measuring and testing and it may have some applications to sterilising. Among the leading British companies in this type of work are Kelvin Hughes, the General Electric Company and the Mullard Company, which has done some work in the application of ultrasonics to sterilising. Kelvin Hughes has built up a considerable market for marine echo-sounding equipment incorporating a crystal source of ultrasonic waves. By transmitting these to the sea bed from the ship's bottom, and measuring the time that they take to bounce back, a clear picture is obtained of the sea bed, or of the size of any shoals of fish that they may strike. Trawlers are making considerable use of this equipment; some fishermen maintain that they can identify the type of fish from the echo they receive, though the makers are probably more modest in their claims.

Kelvin Hughes have recently adapted these echo-sounding principles to the detection of flaws in castings, while GEC has developed similar equipment for the Dunlop Rubber Company to test tyre solidity. As specifications become more exacting, so industry becomes increasingly dependent on non-destructive testing, and ultrasonic flaw detection is sometimes more accurate, and less dangerous, than radiography. It will, for instance, reveal hairline faults and air pockets that X-ray tests could miss. But important though it is, this is not the main, nor the most exciting, of the possibilities of industrial ultrasonics.

The alternative type of high-powered, low-frequency transducer is the product of Mullard Ltd.—the only company, it claims, marketing apparatus that will produce sound waves of this power. Several of the applications at present being groomed for their commercial debut rely on the effect of high-powered sound waves on liquids. The intermittent pulse of the wave builds up a wall of pressure before it, followed by a sudden drop in pressure in its wake. This produces in liquids a phenomenon known as "cavitation," as a result of which the structure of liquids appears to be changed by the rapid pressure impulses. It is worth noting that this phenomenon of cavitation is produced only when the waves are passing through a liquid where they meet some resistance. It does not take place in air, which is easily displaced; hence the waves are quite harmless to anyone who might get in their path.

The first practical outcome of the company's research, once the high-powered ultrasonic generator was perfected, was a small soldering iron for aluminium. In this case, cavitation is produced in the liquid solder itself, and used to erode the oxide film that prevents the satisfactory tinning of aluminium by any other known method. As the film is eroded, so the solder instantly coats the metal and leaves a tinned surface that can be soldered to any other surface by conventional and reliable methods. If this process becomes widely accepted, it may remove one important restriction on the use of

aluminium. It could, to take one example, open a wide field for the substitution of aluminium for copper electrical wiring with a big saving in cost and in weight.

Soldering irons and a tinning bath using these new methods are already on the market. The company is now sufficiently confident of the drilling capability of ultrasonics to attempt a series of field trials by offering a different type of unit to certain owners of soldering irons which would, in effect, convert them into portable hand drills. Here the sound waves are used to bounce abrasives against the material to be drilled; they do so with surprising efficiency and tools have been developed that cut through materials ranging from diamonds and glass to tungsten carbide with speed, accuracy, and a clean surface. If acoustic energy can be used in this way to cut exceptionally hard materials without any effective wear on the tool face—usually tool wear is exceptionally heavy because the head is cutting materials as hard as itself—it would greatly reduce the time and cost of machining. At present, experimental ultrasonic tools can cut to an accuracy of two thousandths of an inch; this figure may be improved but some limits to cutting accuracy are likely to be imposed by the faint scattering effect of the abrasive.

It is expected that ultrasonics can be developed for mixing liquids. Pigments can be broken down at the same time that they are being mixed into the paint, thus cutting down—and perhaps cutting out—the long process of ball milling. Emulsions of antipathetic liquids can be prepared in the same way. Both processes make use of cavitation. Even more important, if cavitation is set up in molten metal, and ultrasonic waves continue to pass through as it sets into an ingot, the formation of large crystals in the centre of the ingot seems to be inhibited and the crystal structure remains uniform throughout the ingot. If this principle can be applied industrially the outcome will be an ingot with uniform physical properties, making the process of rolling into sheet a far simpler job than it is today, when varying crystal structure leads to variations in the properties of the sheet.

The scientists who have brought the application of ultrasonics to its present point have considerable faith in the future of these developments. There are other uses of equally intriguing potentiality. Ultrasonic waves can be used to promote chemical reactions by breaking down tightly-knit compounds like carbon tetrachloride. They can also be used to de-polymerise—that is to break down long chains of molecules into short ones; artificial blood plasma is being produced commercially by such means. Some mills are experimenting with ultrasonic waves to clean wool and rayon waste, literally shaking the dirt off the fibres. The same process can be applied to raw wool, but its value depends entirely on the value that the processor puts on the recovered fibre. Ultrasonic waves will also clear smoke, but unless it is necessary to trap exceptionally small particles, or an exceptional fire hazard is present, existing plant does the job better and cheaper. Recovery of carbon black might be one such special case.

Ultrasonic ageing of whisky has been attempted, and the results are claimed to be good. The subtle chemical process that takes place during years of ageing can, it is said, be cut down to a matter of hours—though distillers and vintners may need a lot of persuasion before they abandon their time-honoured methods and their heavy

investment in ageing cellars. One German distillery and two Rhenish wine companies are, however, installing high-frequency ultrasonic plants for ageing. It is an open question whether ultrasonic waves can be used to sterilise food and other perishables. Milk has been pasturised efficiently, but cavitation caused chemical change that affected its taste. Further work may, however, lead to more promising results. Some medical uses have been suggested, but no treatment of this kind is attempted in this country, and in the United States it has been banned.

★

Ultrasonics research has reached the stage where much of the work is now passing out of the laboratory into the hands of the production engineers; it is here that the difficulties arise. For example, the Mullard company is primarily engaged in producing valves; but as electronics develop, the valve makers may have to decide whether to take on increasing responsibility for the design of much of the equipment in which their valves now form the major component and which no other manufacturer is at present ready to undertake. Mullard has gradually begun to build large pieces of electronic equipment such as linear accelerators for Harwell and it would not be stepping outside the company's self-imposed boundaries to supply, as it is doing, the generators (essentially inaudible "loud" speaker systems) and the small transducer heads needed to produce ultrasonic waves of useful power.

These new applications have developed with such speed that the company finds itself already marketing soldering equipment (of which three sets are sold at £85 each to the United States for one in this country), a tinning bath (at £500) and would appear to be about to put a small power tool, with its own jigs and fixtures, into production. This has come about because the transducer, the contortions of which give rise to the waves, has to be built into the working head of the machine, but it involves taking a big step outside the confines of electronic engineering as it is generally understood. Such are the responsibilities and the problems of modern innovation. Research leads to new principles; the application of those principles involves manufacture in new fields. Any company can be forgiven for a certain hesitation whether to develop along new and strange paths. Yet, from the progress that is being made in all aspects of electronics, it may be only a matter of time before the industry is led by its own technical resourcefulness into fields far outside the immediate limits of electronics themselves.

The Motor Industry

Some startling changes, technical and economic, now confront the British motor industry. After several years of unexampled demand, the industry is facing a period of intense competition abroad and at home. A special section in next week's issue of *The Economist* will discuss what kind of cars the industry should produce and where it may expect to sell them.

In the Seaports of the East...

from the Arabian Sea to the Pacific Ocean the branches of the Chartered Bank perform a wide range of banking services connected with overseas trade and local industry. Merchants and manufacturers in the United Kingdom who trade into the East are invited to consult the Bank's managers in London, Manchester and Liverpool.

Where every house is different

A STRANGER might wonder why no one in these neat streets of dark green doors has thought to challenge the neighbours by a bolder colour scheme. He might even make the mistake of supposing that the houses in Elm Row were all alike. But if he lived here he would quickly realise that it is not the colour of its front door that lends a house its character, but the people who live behind it.

★ ★ ★

OF ALL WHO DO business hereabouts it is perhaps the insurance man who understands best of all how diverse are the personalities and interests, and how varied the needs and circumstances of these 'average' households. For his job has to do with the most intimate of family financial affairs; to carry it out faithfully he has to bring a very personal service to bear upon problems that are never quite the same in any two homes.

★ ★ ★

AN INDISPENSABLE feature of this service is the regular collection of life assurance premiums when these can most readily be paid—usually at intervals that match the frequency of the pay-packet. But for this there would be many families in this typical street who would almost certainly make no voluntary provision for the future. Among the hundred or so homes there is hardly one where no industrial assurance policies are held. For most of them regular personal saving depends essentially upon the service the insurance man brings to the door.

IN ELM ROW this saving fulfils more often than not a twofold purpose. First and foremost it provides life assurance. There are few whose Home Service Insurance budget does not include provision for financial aid in the event of the breadwinner's death.

THE SECOND and increasingly popular role of Home Service Insurance is to build up a modest reserve of capital for future use. Twenty or thirty

years ago the majority of industrial assurance policies taken out were 'whole life' contracts. To-day most new policies are effected with the expectation of enjoying their benefits during life time.

IN THE ELM ROW households, as in most other homes throughout the country, it is the insurance agent to whom the family looks for help and guidance in choosing, from among the wide range of policies, the scheme best suited to domestic needs and means. The very regularity of his visits and the understanding of family problems and aspirations that he inevitably acquires gives him an authority as friend and confidant that is accepted as a matter of course in the homes at which he calls.

IN THIS RESPECT, the agent's responsibilities as family adviser have widened appreciably over the past few decades. The average citizen has set his sights on new standards of life for himself and his family. He looks to his insurance policies as a means of helping to provide future amenities that enable him to look forward to retirement with pleasure rather than anxiety. Endowment assurances maturing at the critical time when careers have to be chosen may spell all the difference between blind alleys and worthwhile jobs for his children. These family plans depend for their fruition upon the services of the insurance man which transform thrift from a conscious effort into a habit.

THIS IS WHERE the domestic economies practised in Elm Row touch upon the wider economy of the nation as a whole. For Home Service Insurance is long-term thrift with a purpose—a purpose which can be fulfilled adequately only if the saving is steady and continuous. This stability, a characteristic of insurance contracts, earns the industry the important place it occupies in our economic life.

HOME SERVICE INSURANCE adds £50 million to the nation's net savings every year. Much of this depends upon the thrift of the 'average' families who live in Elm Row and elsewhere. But it is the personal painstaking service of the insurance man—who knows Elm Row not by the numbers on the front doors but by the people who live behind them—that makes this thrift effort possible.

Issued by the Industrial Life Offices

Business Notes

Technical Success

Measured against the limited objective assigned to it, the Treasury's cash-and-conversion operation has been successful, and indeed has probably surpassed the best expectations. When the conversion lists closed last Monday, £345 million of 1½ per cent Serial Funding Stock 1952 and £374 million of 2½ per cent National War Bonds 1951-53 had been converted out of total holdings of £450 million and £522 million respectively—a somewhat smaller proportion than had been expected for the former issue but a bigger one for the latter. The £253 million of stock that remains to be repaid in cash—comprising £105 million of Funding stock due on November 14th and £148 million of War Bonds due on March 1st—is, therefore, covered by the cash subscriptions of £317 million with £64 million to spare. When the operation was first announced just over a fortnight ago, most people were guessing that the balance was likely to fall on the other side of the account—leaving the Treasury with the need to borrow a marginal sum on floating debt in order to finance its commitments.

Judged by technical standards, the authorities are entitled to congratulate themselves on a tidy and workmanlike achievement. Without disturbing the market, and without giving away any perceptible "turn" to subscribers, they have cleared out of the way—or, rather, pushed a little further on—nearly £1,000 million of impending maturities that could have been embarrassing. Had the operation been less effectively managed, they might have been faced with such substantial borrowings on floating debt as would have seriously aggravated the rising trend of bank deposits and the marked excess of bank liquidity. But, when due credit has been given for the technical achievement, it has still to be reiterated that this operation falls far short of the objectives that should inspire monetary policy in present circumstances. There was and is a clear need for genuine funding of debt—for striving continuously to lighten the weight of short-term Government debt held by the banking system by selling medium or longer term debt to the wider public, thereby moderating or stopping the rise in bank deposits and mitigating the evil effects of the excess of Government spending. Secondly, if this primary objective is set aside or deferred because the authorities fear to disturb the market, there still is need to pursue the secondary objective of mopping up the excess of bank liquidity—if only as an earnest of continued adherence to the principles of the monetary policy introduced last November.

This latest operation is in no sense a genuine funding; and even to the second of these objectives it makes only a tiny contribution. Many people, realising that the banks' preponderance in the cash applications was inspired by the official desire to see a reduction in liquidity ratios—possibly from last month's level of 38 per cent to about 34 per cent—had wrongly assumed that the net result of the operation would be a reduction of roughly this order. But in fact the £253 million of stock that must be repaid in cash by March 1st next (involving an increase in Treasury borrowings from, or a reduction in its repayments to, the banking system) is roughly equivalent to the amount of floating debt that the banks have just sold in order to finance their cash subscriptions. (A peculiar feature, incidentally, is that these bills were treated as surrenders for cancellation by the authorities, and not as "departmental" purchases.) In other words, although the immediate reduction in liquidity ratios has been sharp, the net effect of the loan operations, when they are completed next March, will have been very small. The £64 million of surplus cash that the Treasury has secured represents little more than 1 per cent of last month's total of bank deposits.

Problems Postponed

Thus, the operation has really done no more than to hold the line in the face of impending maturities. Moreover, even the technical success has depended overwhelmingly upon the co-operation of the banks. Before the operation was mooted, it was being argued by believers in the virtues of orthodox policy that if the authorities were really seized of the principles they professed earlier in the year, they ought not to rely upon suasion even for the purpose of ensuring a renewal of the stocks with which the banks were saddled in the special funding operation of last November. But, in fact, it is now clear that full conversion of bank holdings of the 1952 Serial Funding Stock was taken for granted; the suasion, regarded as superfluous for achieving that result, was reserved for the task of procuring cash subscriptions from the banks. Bank subscriptions, taking cash and conversion applications, probably accounted for not much less than two-thirds of the total applications from the public as distinct from the "departments" (which must have contributed substantially to the conversion).

Although the operation was thus strongly buttressed, it has enabled the Treasury to gain only a little time. Obviously, it would have been utterly unreasonable to have tried to foist stocks on to the banks any longer; but, since their help was being enlisted in dealing with the technical problem in the short-term market, it might have been expected that the authorities would have made a simultaneous offering to the general public of a medium or longer stock. As it is, the broad effect has been to replace 1952 debt by 1955 debt, and to push roughly one-quarter of the original total of 1953 maturities into 1954. This is illustrated by the following table, which shows the effects of the operation on the stocks concerned after the unconverted portions have been redeemed:

	ORIGINAL ISSUES	For cash	By conversion	TOTAL
1952 1½% Funding Stock..	450	135	242	577
1953 1½% Funding Stock..	200	135	242	577
2½% War Bonds ...	522	67	68	485
1954 1½% Funding Stock..	350	115	409	524
1955 3% Funding Stock..	...	115	409	524
	1,522	317	719	1,586
Less Treasury Bills redeemed				64
				1,522

In other words, the immediate problem has been solved at the cost of ensuring that it will recur, in substantially the same form, at the same season in each of the next three years—for, in addition to the above maturities, £810 million of bonds finally mature early in 1954, £735 million early in 1955 and £426 million in 1956. But the fact that the Treasury has treated the market gently on this occasion, and has relied instead upon co-operation from the banks, suggests that it is not unduly perturbed by the burdens of re-financing that loom ahead. In the circumstances, it is perhaps a little surprising that the market has not saluted its reprieve—a short-term reprieve—more noticeably than it did in the first half of last week.

★ ★ ★

Trade Gap Still Narrowing

So far as it is possible to judge from the provisional trade figures it seems that there was a further improvement in the overseas trade balance in September. The value of imports declined by £25 million on the month, but exports

rose by £6 million and since re-exports were virtually unchanged, the surplus of imports (cif) over exports (fob) was reduced between August and September by no less than £30 million to £44 million. This is the lowest import surplus for any month since November, 1950. Too much stress should not be put on the sudden fall in imports to £238½ million last month; in September, 1951, and September, 1950, imports also showed a reduction of at least £20 million below the corresponding August levels. Last month's improvement in exports to £186 million arises from the fact that there was one more working day in September than in the previous month. As a result, the daily rate of exports was again reduced, but only by 1 per cent compared with 6 per cent between July and August. Shipments to North America seem to be maintaining the improvement achieved earlier in the year. Exports to the United States at £12 million were

BRITAIN'S OVERSEAS TRADE

a little above the monthly average of £11½ million in the third quarter. Exports to Canada last month amounted to £11 million and the monthly average for the third quarter of some £12 million was 28 per cent higher than the rate in the first half of the year.

Because of variations in the number of working days in each month, a comparison of the trade figures month by month does not always show longer term trends in imports and exports with clarity. An attempt is made to avoid this difficulty by adopting three monthly moving averages in the accompanying chart. It shows that exports, after reaching record heights in the first quarter of the year, dropped sharply in the next few months but now seem to be declining more slowly. Imports have fallen far more steeply than exports, and the momentum of their fall is increasing. Balance achieved by a reduction of total trade has its obvious dangers for a country whose future depends upon greater trade. But, for the time being, the improvement in the terms of trade is softening the harmful effects of a continued reduction in the value of imports.

Larger Stocks

The Chancellor of the Exchequer has lately emphasised that the improvement in the British trade balance has not been secured at the expense of stocks. Raw material stocks at the end of September were on the whole higher, and in some cases considerably higher, than a year earlier. This favourable comparison may owe something to the decline in industrial demand earlier in the year and to a steady flow of imports on completion of contracts made before there was any thought of imposing restrictions. Stocks of selected raw materials up to the end of July, the last date for which official figures are available, are given in the accompanying table. For eight out of the nine commodities listed, stocks were higher than in July, 1951, the single exception being copper. The trend shown in these figures has been maintained into

September. During the first six months of this year, compared with the last six months of last year, the consumption of copper increased by 16 per cent, whereas consumption of lead fell by 36 per cent, of zinc by 4 per cent, of softwood by 9 per cent, of cotton by 30 per cent, of rubber by 6 per cent, of sulphur by 12 per cent, and of wood pulp by 8 per cent.

UNITED KINGDOM STOCKS OF RAW MATERIALS

Unit	Copper	Lead	Zinc	Soft-wood	Cotton	Wool*	Rubber	Sulphur	Wood-pulp
	'000 tons	'000 tons	'000 tons	'000 stds.	'000 tons	mn. lb.	'000 tons	'000 tons	'000 tons
End of: 1951

Apart from commodities such as copper, of which there is still a world shortage, United Kingdom stocks should remain satisfactory for at least some months. There is no immediate prospect of any reversal of the more favourable terms of trade that have been of such signal assistance to the balance of payments this year. Production of many materials that were thought critically scarce only a short time ago is now beginning to match demand. But a sharp rise in industrial demand in the United States or in Europe could quickly alter the present appearance of greater ease.

Towards Realism in Steel Costs

The increase in the price of pig iron that was ordered by the Minister of Supply this week marks a first step—if a timid one—towards charging steel producers in this country the actual costs of the steel-making materials they use. It arises primarily from a slight modification of the price charged for imported iron ore by the British Iron and Steel Corporation (Ore) Ltd., which with another company acts under the control of the British Iron and Steel Federation as a bulk buying agency for all the iron, steel, and steel-making materials that the industry brings in from overseas.

Since the war, BISC (Ore) has sold foreign ore at less than the price, including freight, that it has had to pay on the world market; until 1950 the resulting loss was borne by the Government, but since 1950 it has been financed by a general levy throughout the industry on ingot output. Last year's sharp rises in the price of foreign ore and the cost of freight brought the loss resulting from this sales policy to a very high figure, and the levy on steel ingot output had to be raised accordingly. This year, world ore prices have remained high, and since the steel industry obtains most of its shipping on time charter it will probably have reaped little advantage as yet from the slump in freight rates. The bargaining over next year's supplies of ore is already going on. It is not easy to foresee much decline in ore prices; the Americans are out of the European steelmakers' market for ore, but German demand is growing. On the other hand, BISC (Ore) can at least expect to pay less for shipping tonnage.

The postwar policy has naturally meant an artificially low domestic price for imported iron ore. The federation, the nationalised corporation, and the Minister have now agreed

that the pig iron makers should "be charged prices for imported ore more nearly approaching the true cost of purchase and transportation." It cannot be said, however, that this particular approach is likely to bring the prices and costs very close to each other unless next year's ore costs come down remarkably. The increases in the price of pig iron vary from about 10s. to £2 10s. a ton, and appear in the main to pass on the whole increase in the price of ore direct to the iron consumer. Taking into account the ferrous content of these imported ores, the average increase per ton of ore would obviously be considerably less than the average increase in pig iron prices. But the home price charged for imported ore has not been changed since 1950, according to a Ministry statement, though the landed cost, to judge by the Trade and Navigation Accounts, has gone up during the last two years from just under £3 to nearly £6 a ton. And even in 1950, the price that BISC (Ore) charged pig iron makers for this ore may have been somewhat less than the actual price it had to pay. All sides of the industry's tripartite government, therefore, deserve encouragement for this modest concession to realism in iron and steel prices. But there is still a long way to go.

Who Pays?

No increase in the price of steel will follow upon this week's increase in the price of pig iron. The cost to steel-makers is to be entirely offset by a decrease in the ingot levy that they pay on each ton of steel output. It has not been announced whether this change has been accompanied by any adjustment in the levy on scrap, and the rebate for pig iron, used in making steel. Whether this has happened or not, it seems obvious that within the industry the change will be to the advantage of works that make pig iron—and later steel—from home ores. If these works sell their pig iron, they gain an increase in price while their cost of home ore (which is far cheaper than imported, though it requires more coke and higher capital charges per ton of output) remains unchanged. If they use their pig iron to make steel, they benefit from the cut in the ingot levy on steel output, thus cutting their steel production costs. This would appear to be confirmed by the fact that the only change in steel prices consequent upon the change in the price of iron is a slight reduction in the price of hot finished steel tubes. Stewart and Lloyds, the industry's most important home ore producer, is at the same time a very important producer of these hot finished tubes. How the change will affect the works that use imported ore, or a very large proportion of scrap, is less easy to judge. But it makes Stewart and Lloyds look an even better favourite, in present circumstances, among the steelworks that the private investor would most like to denationalise.

The German Economy

A Special Survey

Page 205 of this issue

Outside the steel industry, the effect of the price changes will fall mainly upon the ironfounding industry. About 60 per cent of the foundry pig iron used by this industry is made from home ore and will therefore not be affected; other types of iron will cost from 2½ per cent to 18 per cent more. These increases will presumably be passed on to their customers, among which the motor industry, in particular, may feel the effect. These customers for iron, however, have no solid ground for complaint over the change; they have been, and to a smaller extent are still, incidental beneficiaries of the steel industry's complex pattern of holding down its material prices by means of levies. It has never been found practicable to apply to these ironfoundry customers the levies that the British Iron and Steel Federation has been able to raise from its own steelmakers and from steel founders. They have enjoyed the benefit of artificially low prices since the war, and this week's change does no more than bring their costs, too, slightly nearer to reality.

The Specialloid Case

The prosecution at the Old Bailey of two former directors of Specialloid Ltd. under the Prevention of Fraud (Investments) Act, 1939, ended on Monday with their conviction on two of the counts in the indictment. Section 12 of this Act (which did not come into force until August, 1944) created three new offences in connection with the offering of securities for sale, subscription or underwriting. These are: knowingly making a misleading, false or deceptive statement, or forecast; dishonestly concealing material facts; or "recklessly" making a misleading, false or deceptive statement or forecast. Uncertainty has existed over what this last offence involved. Last month, when the Crown asked that the prosecution should be heard by a High Court judge, counsel stated that the Common Serjeant had ruled that fraud was an essential ingredient in it, while Mr Justice Humphreys had held that it was not; the question for the jury was whether the degree of negligence became "reckless" conduct. It cannot be said that this prosecution has cleared up this uncertainty. The jury found the two defendants guilty of dishonest concealment of material facts and of making a forecast which they knew to be misleading, false and deceptive. They were not called upon to give any verdict on the third count in the indictment, which involved "recklessness."

Nevertheless, the case is important, for it reaffirms the need for the greatest care on the part of directors (and, by inference, on the part of their professional advisers and accountants) when making statements intended to attract new capital. Specialloid Ltd. was fully employed during the war making pistons and piston rings for internal combustion engines, and it prospered accordingly. Its profit for the year to March, 1945, was £55,574. As the war neared its end the situation changed. The internal accounts of the company showed, so the prosecution alleged, a trading loss of £23,000 in the quarter ended June, 1945, and one of £77,000 for the six months to September, 1945. The trading loss for the full year to March, 1946, was £150,000. Against that the company had the benefit of an EPT refund, put at £193,000. The case against the two defendants was that, between March and November, 1945, during their negotiations for a capital placing, they failed to inform the issuing house of the trading loss and left it with the impression that the company was still earning a profit. It might be argued that an EPT refund can be regarded as a portion of an earlier year's profit coming back into the company's hands; but the relevant point is the failure to disclose the fact of the refund. The crux of the case, from the public point of view, was that, in this difficult trading year, an incomplete set of figures was used to induce strangers to the company to invest £100,000 of their money in it. Mr Justice Donovan, in his summing up, said that directors

ought to be strictly honest in all their representations about how the business was going. There is no new doctrine in this dictum—just a reminder of the weight to be attached to the word "strictly."

Dollars in the Air

An announcement from the American ambassador's office in Paris this week has caused something of a stir in the British aircraft industry by suggesting that the United States Defence Department was prepared to spend a sum amounting to \$225 million on the purchase of aircraft in Europe. In the last budget, the Defence Department was voted a considerable sum to cover the supply of arms for Western Europe, some of which was to be spent as defence support on equipment built in the Nato countries. The placing of those contracts is in the hands of the Defence Department's officers in Europe, who asked the Nato secretariat some months ago for proposals of the numbers and types of aircraft it would recommend for "off-shore" purchase in this way.

It is an outline of a report on those proposals that has been published in Paris; before the orders are actually placed the Defence Department has to be satisfied that the aircraft recommended comply with the terms laid down when Congress voted the money for their purchase some months back. It seems fairly certain that the performance of the aircraft, and their delivery dates, will meet these conditions; but American military procurement procedure is fraught with pitfalls and it is too early to rule out possible difficulties over prices. But since a large number of aircraft—originally put at 1,700—is involved, and there is clearly no way of providing them from the United States, the "evaluation tests" now going on may not be unnecessarily protracted. In any case, there is no risk of a postponement of the orders while the matter is referred back to Washington for approval. The Defence Department already has the money, and complete authority to spend it for this purpose.

There are some grounds for hoping, therefore, that the Nato proposals will be agreed to, although it is now admitted that rising costs will mean that the numbers of aircraft that can now be obtained for the \$225 million appropriated will be smaller than was first hoped. When the scheme was drawn up, it was expected that Britain would provide 500 Vickers-Armstrong's Swifts at an estimated cost of \$69 million and Holland and Belgium would build a further 500 under licence at a cost of \$42 million. A sum of \$86 million was allocated for the purchase of Mystère IVs in France and \$26 million for Venom night fighters to be built in Italy under licence from the de Havilland company.

* * *

Comets on the Counter

Since the British aircraft industry has been under fire in recent weeks for its reputed inability to deliver new aircraft within a reasonable period, it may seem surprising that Vickers are able to assure delivery of as many as 500 Swifts to Europe as well as meeting considerable RAF commitments. In few cases do the facts appear to justify such hasty accusations. The de Havilland company, which has been the principal, but not the only, target of the critics, has given an account of recent negotiations with airline operators that puts matters in a rather different light. The company appears to have undertaken not only to meet individual operators' requirements for 50 Comet IIs in 1955, but also to begin delivery of the Comet III, carrying between 60 and 80 passengers over effective stage lengths of more than 3,000 miles, by late 1956. This is quite as early as the most optimistic American forecasts of jet transport deliveries, and since the Comet III's doubled payload involves a major feat of re-designing, such a date hardly seems unreasonable. The rate of Comet production is "actually in excess of orders in

hand" and the company suggests that it would be even higher if operators were ready to put their signature to firm orders.

Much the same arguments seem to apply to the Vickers Viscount. The company has firm orders for 58 of these aircraft, and negotiations are well advanced for roughly another 60, for which it is offering delivery late in 1954. No case has yet arisen of a Viscount sale being lost because of unsatisfactory delivery dates. Such facts seem to put the ball back in the airline operators' court. No airline wishes to give an appearance of lack of enterprise in an industry where enterprise is the foundation of success; yet, when it comes to the point, some operators seem to experience a certain psychological difficulty in committing themselves to gas turbine aircraft to replace piston-engined transports.

A considerable feat of organisation within the aircraft industry has made possible the simultaneous undertaking of the rearmament and civil aviation programmes. The recasting of the defence programme, from rapid rearmament to continuous re-equipment with new types, has eased the pressure on the factories, and extensive resort to sub-contracting of components and of complete designs to other manufacturers less fully occupied should be bearing fruit by 1954, the critical date for deliveries. Rolls Royce, which supplies engines for the Comet II, the Viscount and the Swift, has extended its own lines and has built a new factory, and three additional companies have also been called in to manufacture its engines. Both Vickers and de Havilland have made extensive use of sub-contracting companies for the building of complete wing or fuselage assemblies; in addition, Vickers has obtained increased factory space at Hurn and de Havilland has sub-contracted the building of complete Comets to Short Brothers and Harland at Belfast. The Bristol Aeroplane Company is likely to come to a similar arrangement with Canadair, Ltd., in Canada, in order to double existing capacity for the turbo-prop Britannia. This can hardly be called unenterprise. Steps have been taken to expand output of eminently saleable aircraft and to turn the industry's technical lead to good advantage. The industry cannot fill large orders for immediate delivery off its existing production lines, and no serious prospective buyer would expect it to be able to do so.

Cotton in Egypt

General Neguib will soon have to make up his mind what to do about Egyptian cotton. Successive Egyptian governments have attempted to hold cotton prices at artificially high levels in complete disregard of world demand. This policy resulted last season in a series of crises in the Alexandria market which led to reductions in the fixed minimum prices. But buyers not unnaturally continued to hold back, and stocks accumulated. The Egyptian Government's stocks last May were put at about a million kantars of cotton—mostly Ashmouni—and at the end of that month the government suspended the export taxes for the remainder of the season in another vain attempt to get the trade moving. Further extensive purchases by the government amounting probably to another million kantars—mostly Karnak—have since been made at its guaranteed prices. Prices have fallen sharply and heavy book losses have been incurred on these stocks.

At first sight, it might appear that the easiest course for the Egyptian authorities is to cut their losses, to sell their stocks for what they will realise and end the price support scheme. Such a policy would have the merit of providing Egypt with urgently needed exchange, and the cotton industry throughout the world would welcome the freeing of the Alexandria market. But it would also be most unpopular, for cotton is Egypt's major source of wealth; a collapse of prices would bring ruin to large sections of the population. The difficulties are increased by the planting of a large

"We don't have to be colossal"

persisted the chief accountant.

"Powers-Samas make units exactly the size

for a business like our own—small,

but if I may say so, perfectly formed".

"Compact and progressive" agreed the chair-

man "And how crippling might the cost be?"

"The annual cost of Powers-One would be

no more than the salary of one ordinary

clerk", replied the accountant.

"We can buy the unit or rent it."

"Now that sounds like efficiency we can

acreage of Karnak from which both yield and quality are exceptionally good. As a result, Karnak prices now stand at a very small premium over Ashmouni. Moreover, while stocks of Ashmouni can generally be disposed of to the Egyptian mills—if necessary by offering a concealed subsidy—no such ready outlet awaits the longer-stapled Karnak. In the past the only method of disposing of Karnak without placing it on the market has been by barter deals with Russia and there is no sign that Russia is willing to take any additional quantities at present. Perhaps Egypt might look at the possibilities of an arrangement with the main consuming countries to dispose of agreed quantities of cotton as was done in the case of wool through the Joint Organisation.

Freight Market Recovery

Although there is as yet no sign of a repetition of last year's pressure of demand for tramp tonnage, the freight market is at any rate moving out of the summer doldrums, and rates are beginning to improve for chartering ahead into the winter months as well as for spot tonnage. The Chamber of Shipping tramp freight index, which takes only sterling fixtures into account, moved from 79.2 in August to 87 in September (1948 = 100), thus reversing, if only slightly, a downward trend that has been consistent since the figure of 190.5 in October last, apart from a slight hesitation in May. The index for August, 1951, 149.3, happened to be the lowest reached during that year, and it is likely that the figure of 79.2 for last August will prove to be the low point of the freight index in 1952. Since the end of September the modest rise in freight rates has been continued, and charterers are generally beginning to show more interest in covering their requirements fairly well ahead.

During August and September a shortage of tonnage developed on the North Pacific coast of America and in Australian waters, although there was a surplus in the North Atlantic. The rate for heavy grain from the North Pacific to the United Kingdom accordingly increased during September from about 73s. 9d. to about 85s., and since then 92s. 6d. has been paid. Meanwhile, American coal chartering for Europe began to revive a little, with the result that after a low level of about 26s. per ton rates began to advance to as much as 34s. 6d. for Rotterdam. The rate for sugar from Cuba to the United Kingdom also advanced slightly, from 52s. 6d. to 53s. 9d. per ton during September. Inquiries are renewed for grain from Western Australia, and the ruling rate has moved from about 80s. in August to about 92s. 6d. Moreover, there is a considerable movement of grain from North America to India, and the resumption of chartering for Black Sea grain has also helped to increase the demand for tonnage. Exceptional movements of cargoes, such as grain to the Argentine and coal to Pakistan, both from the United States, are also contributing to employment, and the fact that the St. Lawrence season is nearing its end has brought rates for U.K. shipments up to 10s. per quarter, an improvement of nearly 2s. on earlier fixtures.

Commonwealth Trade in 1951

In recent years the Commonwealth share of total world trade has hovered steadily around 30 per cent. In 1951, when the volume of total world trade was slightly higher, Commonwealth exports accounted for 29.1 per cent of world exports, compared with 30.5 per cent in 1950. Commonwealth imports accounted for 32.6 per cent of the world total compared with 30.2 per cent in the previous year. Among the five largest trading countries of the world the United Kingdom continued second and Canada fourth ; USA was first, France third and Germany fifth.

But although the fall in total Commonwealth exports and

the rise in total imports were only slight, they were sufficient to produce the serious balance of payments difficulties of 1951 and convert a surplus into a deficit. The countries largely affected by the drop in exports in 1951 were the United Kingdom and to a smaller extent Canada and Australia; nearly all Commonwealth countries increased their imports.

The United Kingdom is still by far the largest trading country of the Commonwealth, and accounts for roughly one third of the exports and 40 per cent of the imports. The Colonial territories taken together recorded in 1951 imports

Country	Exports*			Imports		
	1949	1950	1951	1949	1950	1951
United Kingdom.....	1,844	2,256	2,707	2,275	2,608	3,914

* Including re-exports.

of £1,477 million and exports of £1,695 million, a larger volume of trade than any individual Commonwealth country apart from the United Kingdom. The trade of the Commonwealth countries is shown in the accompanying table taken from the recently published survey of the Commonwealth Economic Committee.* Except for Canada, which carries on a large part of its business with the USA, almost half the trade of the members of the Commonwealth consists of trade with one another. Between 70 and 80 per cent of the trade of New Zealand and Southern Rhodesia in 1951 was with other parts of the Commonwealth.

Strong Ale and Froth

The only safe conclusion about the monthly figures of beer output is that as a guide to the trend in beer production or consumption they are anything but safe. Weather varies in any given month in different years; Easter jumps about between March and April, and Whitsun between May and June; there may be 4 or 5 week-ends—the trading peaks—

in a month; and as the proportion of bottled beer, which keeps longer than draught, increases, it becomes more difficult to relate production to consumption. Any comparison of single months in successive years seems inevitably to lead to premature pessimism or optimism.

* Commonwealth Trade in 1951. Stationery Office. 1s.

Even a cumulative monthly comparison may be erratic. In the first month of 1952 beer output was 10 per cent higher than a year before; in the first two months it was only 1.4 per cent higher; after six months it was only 0.7 per cent higher. The July output was the highest since 1947. But those who hailed it as signalling a new trend are now faced with an August figure of 2.22 million bulk barrels—the lowest since 1936. The July figure raised 1952 output to date to 2.5 per cent more than 1951, the August figure now cuts this lead back to 0.6 per cent. There has been too much short-term judgment in recent times about output in this particular industry. It might be a good thing if comparisons were confined to groups of months in which some of the disturbing influences cancelled themselves out; the quarterly figures may be less misleading, provided that Easter did not jump from the first to the second quarter.

Two questions remain unanswered. What is the general trend? And how representative is it? Some leaders of the brewing industry fear that demand may decline further, particularly in the South of England. Yet, although it may be too soon to speak of a revival, the postwar decline does seem to have ended. The moving annual total, which eliminates seasonal fluctuations, shows a change in general direction in the summer of 1951, and the low August figure this year makes little difference. But whether the gradual upswing since then is temporary or permanent depends on varied and possibly conflicting factors: wages, prices, the beer duty, taxation in general and the whole economic climate.

The swing of public taste from draught towards bottled beer makes the national trend an even less useful guide to the experience of individual firms. The postwar fall in consumption has been borne wholly by draught beer; bottled beer now forms one-third of the total output, compared with a quarter in 1938. The shift varies between areas, and its effects vary between different brewing companies. In the short run the effect turns on bottling capacity, which small as well as large brewers are installing fast, but in the long run it may partly depend also on the readiness to develop "free" sales.

Last Testament for Havana Railways?

United Railways of Havana will be sold, if at all, at a knockdown price—thanks to the policies adopted by the only possible buyer, the Cuban Government. The chances of such a sale now seem to be brighter—a possibility not unconnected, perhaps, with the recent change of government in Cuba and with the fact that Cuba has a good deal of sugar for sale. To facilitate a prompt sale, if and when the Cuban Government makes an offer, the directors of United Railways have submitted a scheme to simplify the company's capital structure and to give the directors power to sell without first consulting the holders of any stock or the trustees for any of the debenture holders. The capital reorganisation scheme will provide for a more equitable distribution of the proceeds of any sale than if the old Laocöon-like structure were left standing.

This involves drastic steps—the wiping out of all interest arrears, the conversion of preference and ordinary capital into a single class consolidated stock, and the replacement of a conglomeration of debenture stocks (with one or two exceptions) by a mixture of income loan stocks and consolidated stock. These income loan stocks are to be divided into two classes, so that a three-tier capital structure will result. At the top of this pyramid will stand the debenture stocks of the Havana Terminal Railroad, the servicing of which is the responsibility of United Railways. Holders of these debentures are in effect guaranteed the repayment in full of their original investment of £850,000 and will also receive a slice of the consolidated stock issue; a dollar clause attached to the first income loan stock will protect the capital

One benefit of a pension scheme

A NORTHERN manufacturer paid gratuities to old employees on their retirement and to dependants of employees who died while in his service. Just before the war, he was embarrassed when several claims came together and coincided with a decline in trading. Warned by this experience he decided to put in a pension scheme financed by an insurance company, so that benefits could be assured in advance by premiums recognised as a normal business expense. The new arrangements have been more satisfactory both for him and the staff.

The scheme was handled by Robt. Bradford (Pensions) Ltd., who are specialists in designing pension schemes and have unrestricted choice of the entire insurance market because they are independent of all insurance companies. Their impartial advice and wide experience costs you nothing. One of the directors will be pleased to discuss cases and possibilities with you.

Robt. Bradford
(PENSIONS) LIMITED

18b COPTHALL COURT • LONDON • E.C.2

value of their holdings—and their holdings alone—against any further depreciation of the pound against the dollar.

From the proceeds of a sale the first income loan stock, of which £2,318,000 will be issued, would be repaid in full. Unsecured creditors outside Britain would be paid off next, and limited compensation would be paid to the staff and directors of the railway. After these payments, two-thirds of any balance left over would be distributed to the holders of the second income loan stock (subject to the limit set by the par value of the stock of £3,429,500) and the remaining third to the owners of the consolidated stock. A price of about £5 million, over and above a sum sufficient to pay off unsecured creditors in Cuba, might be acceptable if it were offered; if so, stockholders would all get some slice from the cake. This prospect, together with the endorsement of the scheme by the institutions and by the trustees for the holders of the existing debentures, should make the proposals acceptable to the holders of all classes of stock.

British Glues' New Process

The glue industry is not normally found in the vanguard of technical progress; but a new and radical advance in the method of extracting fat from bones used in glue-making seems likely to have repercussions throughout the oil and fats industry. British Glues and Chemicals, Ltd., the biggest manufacturer of animal glues in the country, has evolved a new technique of breaking down the cell structure of animal matter in order to remove the fat contained within those cells from the gelatinous material required for glue. The accepted method of extracting these fats is by heat, with or without the additional use of solvents, but it now seems highly probable that an alternative method of cold rendering can replace it. British Glues has installed equipment in its factories, designed by the company's technical director, that breaks down the animal matter under water pressure which, in effect, bombards the cellular tissue like breakers on a sea wall; under this intermittent pressure the cell walls give way, and the fat is washed out.

This process has two advantages over the accepted method of heat-rendering: the quality of the fat extracted does not suffer deterioration, which is always difficult and often impossible to avoid when heat is used; hence the quality of this by-product appears to be improved and is certainly easier to control and to specify. The soap-making tallow is at present commanding a price of £95 a ton compared with £42 a ton for tallow extracted by the conventional heat-solvent method. The second advantage is in the speed of the process. "Impulse rendering," as it has been called, is a continuous process, while rendering by heat is a batch process. The former removes the fat from the bone (British Glues' raw material) in "rather less than a second"; fat and bone are then separated by gravity and the fat is led off for storage less than three minutes after the bone was first loaded on to the plant. Heat rendering formerly used takes 20 or more hours and the difference between the extraction rate is negligible. The saving in fuel, space and capital cost is self-evident, but against it must be set the industry's existing heavy investment in the older type of equipment. This may stand against the early introduction of impulse-rendering into other fat-extracting industries where fat is extracted from animal materials as a major product, not a by-product. Pilot tests suggest that the technique is just as applicable to the extraction of oils from edible fish, animal and vegetable matter as it is to extraction from bone; but those industries too have considerable sums tied up in heat-rendering plant. British Glues, which is solely responsible for the new process, has entered into an agreement with an American engineering company, the Sharples Corporation, in order to develop it in North America. The company is prepared to license the process in other territories and is in some cases providing the equipment.

More Money for BIM?

No single observer could hope to assess with justice the value of the work done by an organisation such as the British Institute of Management. To be fairly equipped, he would need to have sat through scores of papers at a dozen conferences, and to possess a mind that miraculously sifted out the cogent points without accumulating irritation at the inevitable overlap of repetitive abstraction. He would need to have attended many committees, to have read a mass of publications, and to have taken to the institute a wide range of specific problems requiring assistance. He would need, if he were to judge this deluge of information, argument and advice properly, a large number of entirely different lifetimes of experience. In fact, he would have to be several hundred different managers.

Judgment set aside, the observer can record not only the BIM's account of its first five years but the degree of support it has won in British industry. Up to the end of March, it had gained 1,248 corporate subscribers, and its council includes a fair sprinkling of leaders in a number of British industries. It completed last year a merger with the Institute of Industrial Administration, which now becomes its "professional wing," and it is sponsoring a service within industry for the confidential exchange of information on executives' salaries. It is publishing a journal, a review, and a service of "Management Abstracts," in addition to occasional pamphlets on different aspects of management; and it has now become a British centre for distributing reports comparing productivity and performance in American factories and industries. It is conducting research into business statistics, office management, and the structure of organisation in business enterprises. It has built up an elaborate library and information service upon its subject, handling a large volume of queries upon such subjects as incentive payments and training for management.

The Institute has not, however, yet persuaded British industry that it is worth supporting in full; so far, its income of £63,000 a year from business subscriptions, research grants, and publications covers only just over half of its expenditure. The remainder, last year, was covered by a Government grant of £58,000. This Government support was promised in the first instance only for five years, and the Committee therefore approached the Board of Trade to ask for continuing assistance. This year it has been granted £50,000; it comments that

while this practical evidence of support is encouraging, the sum mentioned . . . is inadequate, notwithstanding the continuing growth of our subscription income, if the Institute is to carry out the full functions of a central institute of management.

It is still negotiating, therefore, for "an appropriate long-term arrangement" with the Government. Hesitation in Whitehall is perhaps easy to understand, for it is inevitably hard to assess the full efficacy of such an institution. In the long run, certainly, BIM must become self-supporting, for the only real evidence of its value to industry is the value that industry is prepared to pay for it. Nevertheless, if British industry were fully alive to its enlightened self-interest, management might not need improvement. In the short run, money spent on improving it is almost certainly worth while; and in this case a fairly small increase in support from public funds might pay a big dividend in helping BIM do its highly necessary job.

More Cocoa Round the Corner

Present estimates, which may be somewhat conservative, put the prospective world output of cocoa in 1952-53 at 744,000 tons, or some 75,000 tons more than last year. The weather during the next few months will decide. Last year's crop, which at first promised to be a record, turned out exceptionally small because heavy rains during the autumn

severely damaged the crop in the Gold Coast and Ivory Coast, while across the Atlantic drought reduced output in Brazil. Until the crop is gathered, no estimate can really be safe. Yet the most recent estimate—which is based on official forecasts for the main countries—seems unduly modest since it gives a total which is about 20,000 tons lower than the average for the three years 1949-51. For instance, trade sources put the estimate for the Gold Coast at 250-260,000 tons. Output throughout West Africa this year is expected to show an increase, particularly from new trees planted during the last five years. Conditions seem generally favourable in most growing areas; heavy rain has fallen in Nigeria but does not seem to have caused much harm so far.

The cocoa markets are at present marking time. Buyers are cautious because of uncertainty about the probable level of demand, and for their part the West African Marketing Boards are not pressing supplies on the market. Prices declined during the early part of September but have since

recovered slightly. The trend should become clearer in a few months' time when supplies will be larger and when American buying normally begins on a large scale. Latest reports from the United States, however, are not encouraging; stocks are not low and consumption of confectionery so far this year has been below last year's level. Some improvement may take place when—and if—this year's fall in cocoa prices is reflected in cheaper confectionery.

Shorter Notes

Some confusion about prospective softwood imports has now been cleared up. The Ministry of Materials informed the Timber Federation that permitted imports of softwood into the United Kingdom during 1953 will be not less than 1 million standards. Last month, the Ministry announced that import licences for 500,000 standards during 1953 would be made available at once. This statement led to the mistaken belief that this figure would constitute the total for the year, and an immediate scramble for licences resulted. This week's statement should satisfy the trade; a million standards should meet requirements at about the same rate as this year without any heavy drawing on stocks, which at the end of July amounted to 676,900 standards.

The decision of the Rank Organisation to concentrate its film production at Pinewood and to sell the Denham film studios is now being followed by preparations for a sale by auction of the studio's technical equipment, furniture and fittings. This sale is expected to take place early next year; no details have yet been released of any negotiations for the sale of the studio property itself, though earlier this year there was a suggestion that the EMJ group might be interested in acquiring it for television purposes.

A guide to the Excess Profits Levy has been prepared by the Federation of British Industries. Copies of the guide, which has been written as simply as possible to explain the major provisions of this complicated levy, can be obtained from the FBI, 21, Tothill Street, S.W.1, at 1s.

Holders of the unsecured loan stocks in Cable and Wireless (Holding), now one of the biggest investment trusts in this country, are being offered the right to convert their holdings into a longer-dated first charge 5 per cent debenture stock (1972-77) at par. Two issues are affected, comprising £3,632,662 of 3 per cent stock and £4 million of a longer dated 4 per cent stock. Of the 3 per cent stock, £2,257,683 is due for redemption at the end of next December and the balance at the end of 1953. Owners of this stock are being given the right to convert the whole of their holdings into the new 5 per cent debenture. Owners of the 4 per cent unsecured loan stock, which is due for final repayment at the end of 1960, are being given the option to convert half of their holdings into the new debenture stock.

The Ministry of Food has bought the whole 1952-3 output of the British and South African whaling companies at a price "to be determined by a formula" which will be between £70 and £78 a ton for No. 1 oil. A similar offer made last year at a price of about £110 a ton was rejected by all but two companies; but later in the year the Ministry was able to buy the output of the other companies at lower prices.

The latest estimate by the United States Department of Agriculture puts the prospective cotton crop at 14,413,000 bales. This is higher than last month's estimate of 13,889,000 bales—presumably the damage caused by drought is not now thought to be as serious as was originally feared. Cotton prices in New York weakened following the announcement.

BURMA MINES LIMITED

An Interim Report of Burma Corporation (1951) Limited, dated 25th September, 1952, has been received from Rangoon on some of the more important features of the Corporation's activities pending finalisation of the Accounts to 30th June, 1952, which is subject to some delay.

During the twelve months to 30th June, 1952, sales of products obtained from processing surface stocks amounted to:—

Refined Piglead	4,798 tons.
Refined Silver	231,670 ozs.

and 3,251 tons of other products,

all of which realised satisfactory prices. Surface stocks remaining are estimated to yield ultimately 1,400 tons refined lead; 180,000 ounces silver; plus some quantity of other products.

Available labour at the Mine has been utilised solely on repairs and maintenance in preparation for the resumption of mining, the initial target being 8,000 tons per month. For this target a trained labour force of 1,600 is required. The force has been increased from 497 on 1st February to 1,058, and recruiting still continues; but it is too early to say whether the recruits mostly drawn from indigenous sources will be adequate to requirements.

Rehabilitation of the Mansam Falls Hydro-electric Power Station now in progress will bring available hydro-electric power to 4,000 kW., the minimum required for extraction and treatment of 8,000 tons of ore a month.

Despite continued, though much reduced, sabotage by insurgents, Burma Railways have been able to restore traffic on the main line sufficiently to meet current requirements.

Company Notes

British Celanese.—Since the end of the British Celanese financial year in June there has been an improvement in trade, but it is not as yet certain whether the recovery has progressed sufficiently to transform the trading loss which the group suffered in the last quarter of the financial year into a profit. Indeed the chairman, Mr. G. H. Whigham, points out that it is impossible at the moment to forecast the future level of profits or dividends, though he hopes to be able to give shareholders more up-to-date information on the state of trade at the annual general meeting at the beginning of November.

There are some signs of improvement, particularly in sales at home and in export sales of yarn; accumulated stocks are being liquidated and idle machinery is gradually being brought back into commission. But as yet the recovery in trade has not spread to every side of the business, and Mr. Whigham warns shareholders that "it will be some considerable time before the effects of the recession on production and on profits are fully overcome."

The period of convalescence is likely to be prolonged. Even if the group's markets regain their former buoyancy, part of the skilled labour force that was lost during the recession will have to be replaced, while the technical difficulties of bringing rayon plant into production again are more serious than for other textile manufacturers. Again, a considerable accumulation of stocks has still to be liquidated. At the end of June stocks held by the British Celanese group stood at nearly £7.4 million after £900,000 had been written off; the increase of about £1.3 million

(a) After a special stock write-down of about £900,000.
(b) Including special dividend of 7 per cent, absorbing £81,267, paid last December, but relating to the financial year 1950-51.

in the book value of stocks was due almost entirely to the accumulation of unused raw materials and unsold finished products. The fact that stocks of finished products are being reduced more rapidly than stocks of raw materials suggests in itself that the recovery in trade has not yet become rapid.

In company with the chairman of Courtaulds, Mr. Whigham believes that the long run prospects for the rayon industry are still good. The group, again like Courtaulds, is backing its belief by pushing ahead with its programme of expansion and development. In the last financial year the gross book value of the group's fixed assets increased by £1.6 million to £18.3 million and at the end of June outstanding capital commitments were put at nearly £2.5 million. The slump in the textile trades has not severely disrupted the group's long term plans but its effects will probably make their mark on the full accounts that will cover nine months' trading to the new accounting date at the end of next March.

Calico Printers.—The preliminary statement issued by Calico Printers shows as clearly as the full accounts of British Celanese how the sudden switch from boom to slump has affected every corner of the British textile

industry. In the year to June 30th trading profits earned by the Calico Printers group fell sharply from £4,397,000 to £1,709,000. Before striking the past year's figure for profits full provision had been made for stock depreciation, though the amount written off is not disclosed in the statement. But it must have been substantial and may account for a large part of the precipitate decline in earnings.

An equally sharp reduction in the charge for taxation, from £2,321,000 to £346,000, provides a welcome cushion to the effects of the recession upon net profits, but as the group has again had to provide over £1 million for maintenance and depreciation, the group's net profits have fallen from £1,021,318 to £296,737. This latter figure has been struck after writing back £246,000 from an EPT provision no longer required. This non-recurring credit of £246,000 has enabled the directors to set aside £250,000 (against £700,000) to a general reserve and to maintain the ordinary dividend at 12½ per cent. Presumably the strength of the group's reserves encouraged the directors to maintain the ordinary dividend; in this connection shareholders will note that the reserve against stocks and debtors has been left intact and that profits have borne the full brunt of stock depreciation. At the current price of 33s. the £1 ordinary stock units yield £7 11s. per cent.

Fisher and Ludlow.—The decline in vehicle production in this country suggests that the Fisher and Ludlow group will earn smaller profits in the current financial year, already six months old, than in the year to March 31st last. In that year a modest advance in profits, from £1,148,995 to £1,222,726, was achieved, but it may be that the fall in profits this year will be almost as moderate. The group has probably already felt the pinch of falling sales of motor vehicle bodies and of Bendix domestic appliances. To some extent, however, the effect upon profits of this reduction in sales may be counteracted by an increase in earnings from defence contracts and from the production of mechanical handling equipment.

But if shareholders should expect some reduction in profits, any increase over and above the 22½ per cent ordinary dividend paid for the year to March 31st would be improbable; the question would rather be whether a dividend of 22½ per cent may be maintained. Here the strength of

	Years to Mar. 31, 1951	1952
Consolidated earnings:—		
Trading profit	1,148,995	1,222,726
Total income	1,152,551	1,234,311
Depreciation	245,432	257,350
Taxation	515,857	584,857
Net profit	328,167	342,169
Ordinary dividends	75,470	75,470
Ordinary dividends (per cent)	22½	22½
Retained by subsidiaries	93,804	119,455
Added to carry forward	129,518	118,431
Cons. balance sheet analysis:—		
Fixed assets, less depreciation	1,212,217	1,194,726
Net current assets	3,299,156	3,584,824
Stocks	1,587,459	1,733,201
Cash	1,129,549	1,594,625
Reserves	2,107,678	2,347,314
Ordinary capital	638,904	638,904

10s. ordinary stock at 36s. 3d. yields £6 1s. per cent.

the group's balance sheet rather than any fall in profits appears to be the principal arbiter. Last March the balance sheet was undeniably strong. A further increase in the group's productive capacity had been achieved without imposing any strain upon liquid resources. Indeed, the group's cash balances had actually risen, from £1,129,549 to £1,594,625, amply covering the group's outstanding contracts for capital equipment of £200,000. Such a high degree of liquidity may encourage shareholders to feel that the ordinary dividend will be maintained at 22½ per cent.

EXCHEQUER RETURNS

For the week ended October 11, 1952, total ordinary revenue was £53,001,000, against ordinary expenditure of £78,729,000, and issues to sinking funds £560,000. Thus, including sinking fund allocations of £1,443,000 the deficit accrued since April 1, 1952, was £330,675,000 compared with a deficit of £56,556,000 for the corresponding period of the previous year.

ODEON THEATRES AND SUBSIDIARY COMPANIES

PROGRESS FULLY MAINTAINED

GROUP RESULTS AN ALL-TIME RECORD

EADY SCHEME: CONTINUATION VITAL TO BRITISH FILM PRODUCTION

The fifteenth annual general meeting of Odeon Theatres Limited, and the annual meeting of its subsidiary companies, British and Dominions Film Corporation Limited, Gaumont-British Picture Corporation Limited, Odeon Associated Theatres Limited, and Odeon Properties Limited, were held on October 10th at the Dorchester Hotel, London, W., Mr J. Arthur Rank, DL, JP, the chairman, presiding.

The following are extracts from his statement which was circulated with the report and accounts:

In my last statement dealing with the group accounts for the 52 weeks ended June 23, 1951, I was able to report good progress in the financial rehabilitation of the group.

I am very happy to present to you this year accounts which show that this progress has been fully maintained. From these accounts you will see that our financial position and profit-earning ability have been markedly improved.

You will recall that at June, 1949, our financial position was severely strained as a result of the reverses suffered in the large-scale production of British films.

The two following years were fully occupied in dealing with the many problems which arose from this cause.

During this period, under the guidance of the managing director, Mr John Davis, the organisation of the group was closely examined with a view to reducing administrative expenses, improving the efficiency of our operation and raising the enthusiasm and morale of the personnel.

The results for the year under review, namely, for the 53 weeks ended June 28, 1952, demonstrate the beneficial effects of this policy.

The trading results for the period showed a marked improvement over the previous one and in fact are an all-time record in the history of the group as now constituted. At the same time, we have been successful in effecting further substantial reductions in the funded and unfunded indebtedness of the group.

ODEON THEATRES LIMITED

CONSOLIDATED BALANCE SHEET.—Revenue reserves show a substantial increase of £1,045,954 and now amount to £1,421,645.

Loan capital, including mortgages, debentures and secured notes at £16,733,443 shows an aggregate reduction of £1,911,275 when compared with £18,644,718 last year.

I am also glad to record that the first and second secured notes of British Optical and Precision Engineers, Limited, amounting to £1,750,000, which fell due for repayment either at December 31, 1952, or 1954, were the subject of a funding operation which was completed in 1952.

BANK LOANS AND OVERDRAFTS.—Between June 23, 1951, and June 28, 1952, the bank indebtedness of the group has been reduced by a further £2,437,008 and now amounts to £6,776,738. Thus compared with the position at June 25, 1949, a total reduction of approximately £9,500,000 has been made.

FILM PRODUCTIONS.—The stock value of film productions including the substandard

film library at June 28, 1952, amounted to £2,996,779.

A year ago it was necessary to make provision for losses on unreleased films. I am happy to say that at June 28, 1952, we have not considered such a provision necessary.

The contingency provision shown as a deduction from the value of film productions on the consolidated balance sheet amounts to £437,155. This provision is designed to cover the uncertainties which must always exist in the distribution of films, particularly overseas.

CONSOLIDATED TRADING PROFITS, less losses, subject to depreciation, interest, etc., amounted to £6,397,278 for the year, as compared with £5,125,230 for 1950-51. This marked improvement is principally due to the fact that net losses on film production and distribution (before depreciation) amounted only to £25,094 in the year under review, as against £1,182,099 in 1950-51.

After deducting £925,359 (1951, £921,876) for outside shareholders' interest, the profit attributable to Odeon Theatres Limited, is £834,620, as compared with £138,227 in the previous year.

GAUMONT-BRITISH PICTURE CORPORATION LIMITED

The financial position of this group shows a substantial improvement.

Revenue reserves at £4,958,236 are £374,972 greater than last year, due to the addition of retained profits.

The trading profit for the year, subject to depreciation, interest, etc., is £2,895,094, and compares with £2,852,264 in the previous year. Depreciation absorbs £549,016 (£542,522 in 1950-51) and after crediting interest and commission receivable and deducting interest payable, audit fees, etc., the Group profit before taxation amounts to £2,126,963 as compared with £1,994,999 last year.

After allowing for £355,885 for outside shareholders' interests, the net profit applicable to the Corporation is £331,079 (1950-51 £426,920).

BRITISH AND DOMINIONS FILM CORPORATION LIMITED

Revenue reserves have been increased by £98,608 to £867,088, as compared with £768,480 last year.

NATIONAL PROVINCIAL BANK

I have referred in previous years to the support which our bankers have given during our difficult years and the happy relationship which we have had with them. It has given me considerable satisfaction to see the amount by which we have reduced our bank indebtedness during the last three years—thus proving that the confidence which the bank placed in your company and its management was justified.

FILM PRODUCTION

It has been said in some quarters that owing to the financial problems with which the country is faced the importation of foreign

films should be reduced and the output of British films increased and that if necessary this position should be achieved by legislation. I do not subscribe to this view, and am surprised that it should be put forward as a practical proposition in view of the unfortunate experience which the industry suffered as a result of such a policy in 1948-49.

I believe that the British production industry will expand slowly, surely and economically if it is allowed to develop its creative talent without political interference.

I am convinced that the basic factor which must always control the volume of British film production is the availability of creative talent.

THE EADY FUND

I referred last year to the extension of the Eady fund for a period of three years to August 5, 1954, and expressed the view that such an extension would assist in solving the immediate film production problems. I believe that, by and large, it has done this.

The Eady scheme is a voluntary scheme adopted by all sides of the industry. It is obviously desirable that it should be a voluntary scheme, but it is vital that the future continuance of the scheme after August, 1954, is considered and settled now.

The existing arrangements expire in August, 1954. Experienced and prudent producers know that they will have to make decisions long before that date as to their future production policy if arrangements have not been made to extend the existing scheme.

I think that all those who understand the problems of the industry are now satisfied that while entertainment tax is maintained at its present level the British production industry cannot persist on a sound and economic basis without some financial support similar to the Eady scheme.

I envisage that unless arrangements have been completed by the spring of 1953 for an extension of the Eady scheme, the present level of production will commence to fall, and by August, 1953, will be coming to a standstill.

Producers realise that unless their forthcoming productions can be released early in 1954 they will not secure the benefit of the existing Eady fund and based on past experience a programme of films cannot recover its cost in these circumstances.

I know that serious and far-seeing members on all sides of the industry realise the necessity for an extension to the existing scheme and are beginning to appreciate the importance of dealing with the problem now. It must always be remembered that a firm production programme is not one which can be altered quickly, and that policy decisions once made normally do not become effective from a commercial point of view until many months later.

It would be a tragedy if, owing to delay in dealing with the extension of the Eady scheme, all the work which producers as a whole have done to put their house in order should be disrupted and lost.

In so far as this group is concerned, we shall materially curtail film production in

August, 1953, unless we know that the production side of the industry will be receiving support under a proper scheme after August, 1954. This policy is essential in the shareholders' interests.

I was pleased to note from the debate in the House of Lords on July 21st last, and from the reply to a question in the House of Commons on July 29th by the President of the Board of Trade, that HM Government have intimated that they are in favour of a continuation of the Eady scheme, but wish this to be arranged on a voluntary basis by the industry itself at an early date.

This expression of policy by HM Government is most encouraging, and you may rest assured that as far as this organisation is concerned, we shall do everything possible to further this policy.

QUOTA

First feature British quota for the year ending October 1, 1951, was set at 30 per cent. I am happy to inform you that all our theatres satisfied their legal obligation. The quota for the year ending September 30, 1952, has been fixed at the same percentage. I anticipate that our theatres will also satisfy this quota.

While I believe that a British quota is necessary and desirable, I must admit that it has been no easy matter to fulfil this obligation and this has necessitated playing a number of programmes which did not necessarily appeal to the general cinema-going public. I am certain that it is essential to give British producers encouragement to make further efforts to produce films of high entertainment value.

ENTERTAINMENT TAX

During the year the industry has again had to spend a great deal of time in wrestling with the problem created by the unfair discrimination in the rate of entertainment tax which it has to pay as compared with other forms of entertainment.

Unfortunately, these efforts have produced little by way of results.

In the 546 theatres operated by this group the public paid during the year under review £30,018,278 by way of admission prices, and of this total no less than £11,808,831 was drained off as entertainment tax representing 7s. 10d. of every £1 taken at the box-office, or 39 per cent of total paid admissions. We suffered a decrease of 3.16 per cent in the number of admissions as compared with 1951, but, despite this, paid in entertainment tax an increase of 10.52 per cent, or over £1 million, an absurd and unhealthy position. I consider that the industry is entitled to tax relief, and that if this were granted the Treasury as well as the industry would gain by the maintenance or increase in box-office attendances.

THE UNIONS

In my speech 12 months ago I referred to our relationship with the trade unions, and made special reference to the difficulties being experienced by the production side of the industry as a whole in its relationship with the Association of Cine and Allied Technicians. Since then the Joint Industrial Council for Film Production has carried out some effective work which could not have been achieved if agreement had not been reached between the three trade unions.

I, therefore, feel justified in expressing the hope that the representation of ACT with the National Association of Theatrical and Kine Employees and the Electrical Trades Union to form the employees' side of this Joint Industrial Council, although the association is not without difficulties and problems, may nevertheless tend to improve the

relationship between the employer and employed in our film studios.

EXHIBITION

DOMESTIC.—In my view this group as the proprietors of two important chains of cinema theatres which are British controlled, carries a definite responsibility to support British production.

During the year we have played 34 British first features, in 17 of which we had no financial interest, and 16 British supporting features in which we were financially interested in only two.

OVERSEAS.—Our theatres, both those directly operated by us and those which are in association with partners, have made further material progress during the year. Their efficiency of operation has been further improved. Attendances have been maintained and, what has been most gratifying, the demand from the public for British films in the countries concerned has increased.

DISTRIBUTION

DOMESTIC.—The extensive reorganisation of our domestic distribution to which I referred last year has been completed with gratifying results. The appointment of Mr K. N. Hargreaves as managing director of General Film Distributors Limited, has proved a wise one and our relationship with independent exhibitors is better today than it has ever been before.

EASTERN HEMISPHERE.—The hard work which has been put in in recent years is bearing fruit. I am happy to say that we have an efficient and enthusiastic distribution operation in all territories.

CANADA.—The remittances to this country from the distribution of British films by our Canadian organisation were, during the year under review, the highest which we have ever achieved. I am hopeful this revenue will continue to expand.

UNITED STATES.—Some of our films have had outstanding successes in the large centres. We have also made some progress in the smaller ones, but even so the territory still remains a difficult one.

STUDIOS

Pinewood has been in steady production during the whole year, the tempo increasing as the year progressed.

Nine films have been produced in which we have participated financially: "Hunted," "The Card," "The Importance of Being Earnest," "Penny Princess," "Something Money Can't Buy," "The Planter's Wife," "Venetian Bird," "Meet Me To-night," "It Started in Paradise." We anticipate that in the current year we shall produce at least 15 films in these studios.

Apart from the productions which I have already mentioned, we have participated financially in the Ealing production programme for the year, which comprised "I Believe In You," "His Excellency," "Where No Vultures Fly," "Secret People," "Mandy."

MANUFACTURING COMPANIES

I have referred to the refinancing of British Optical and Precision Engineers Limited, a most important financial operation and one which has done much to stabilise the affairs of this company and its manufacturing subsidiaries.

The results for the year ended December 29, 1951, showed a profit before tax of £515,641 being an improvement of £321,760 as compared with the previous year.

One-third of the turnover for the year ended December 29, 1951, was secured in the export markets.

CINEMA-TELEVISION LIMITED.—This company has made steady progress during the year under the able guidance of its managing director, Mr Darnley-Smith, and has been extending its interests and activities. Particular progress has been made in the development of specialised cathode ray tubes and photo-electric cells.

The company has, as you know, for many years been actively interested in the development of a large screen television system for use in the motion picture cinema.

We believe that in the coming years large screen television will play an important part in public entertainment.

The problem of the right to use the air by the cinema industry has not yet been solved. We hold the view that the development of large screen television is a development of modern science and that we should have made available to this industry channels which can be used as a matter of right and not as a matter of bargaining with the other vested interests.

BUSH RADIO LIMITED.—A record turnover has been achieved by this company during the year although the market for the sale of radio and television receivers has been disturbed by fiscal measures.

DIRECTORATE

In my last statement I referred to the outstanding service rendered to the group by Mr John Davis, the deputy-chairman and managing director of Odeon Theatres Limited. I must again place on record the board's appreciation of his brilliant administrative powers and sound judgment which have contributed so largely to the satisfactory trading results and the improved financial position which I have been able to report to you.

CONSULTANT ACCOUNTANTS

I have referred in previous years to the invaluable advice which we have received from Messrs Peat, Marwick, Mitchell and Company, and particularly from their partner, Mr R. G. Leach. The year under review has been one of consolidation and, on behalf of myself, Mr John Davis, my colleagues and the shareholders, I again wish to thank Mr R. G. Leach for the generous help and advice which he has given to us continually throughout the year.

PERSONNEL

The policy to which I referred last year of the development of young and enthusiastic manpower has been continued, and is being of material assistance to us. I believe that we have today the best pool of potential executive manpower of any company in this industry. I wish to thank them sincerely for their services during the year.

THE FUTURE

Our major financial difficulties have now been overcome. The personnel and organisation of the group are in first-class order. We face the future with a measure of confidence in the knowledge that if the cinema industry is given reasonable conditions in which to operate we shall maintain our important position in it, and I hope to be able to present satisfactory trading results to our shareholders.

At the meeting of Odeon Theatres Limited the report and accounts were adopted.

At the meetings of each of the other companies the report and accounts were also adopted.

A vote of thanks warmly congratulating the Chairman, Deputy Chairman, and their colleagues on the remarkable recovery shown in the accounts was proposed by a shareholder and carried unanimously.

THE GREAT UNIVERSAL STORES, LIMITED

A YEAR OF SUBSTANTIAL PROGRESS

MR ISAAC WOLFSON'S STATEMENT

The thirty-fourth ordinary general meeting of The Great Universal Stores, Limited, was held on October 15th in London, Mr Isaac Wolfson (chairman and managing director) presiding. The following is an extract from his circulated statement with the report and accounts for the year ended March 31, 1952:

The year under review has again been a record one, despite more difficult conditions experienced during the last six months' trading.

PROFIT AND LOSS ACCOUNT

The consolidated trading profit is £10,007,555 as compared with £8,161,150 last year. To the above-mentioned trading profit must be added dividends from trade and other investments, etc., of £58,999, making a total revenue of £10,066,554. From this has been deducted depreciation of fixed assets £740,654, remuneration of auditors £52,579, interest paid £635,274, dividends and profits attributable to outside shareholders of subsidiary companies £279,006, leaving a net distributable revenue before taxation of £8,359,041. Taxation takes the substantial sum of £5,365,365, leaving a net distributable revenue after taxation of £2,993,676, as compared with £2,318,595 last year. The consolidated trading profits as compared with last year show an increase of £1,846,405.

INCREASED DIVIDEND

For the year ended March 31, 1951, a total dividend of 40 per cent, less tax, amounting to £284,631 was declared on the ordinary stock of the parent company.

In view of the continued large net earnings cover, your directors feel justified in recommending an increased dividend payment for the year. It is, therefore, proposed that a final dividend of 18½ per cent, less tax, be declared upon the company's ordinary stock as doubled by the capital bonus issued subsequent to the date of these accounts as referred to in the directors' report and later in this statement.

This is equivalent to a payment of 50 per cent for the year on the original ordinary capital, excluding the share bonus, and compares with 40 per cent per annum paid for the previous year. The above total dividend for the year amounts to £353,853, as compared with £284,631 for the previous year, and is covered eight times by net distributable earnings. The above dividend represents only 3 per cent, less tax, in relation to the net assets employed in the group.

GROUP ASSETS

The assets of the group, which are of a fixed nature (mainly properties), form 20 per cent of the total assets of the group. The balance of 80 per cent represents current assets, which enjoy a high degree of liquidity in so far as very large sums of cash are continually revolving in respect thereof in the normal course of trade of the group.

Total current assets at £51,474,232 represent an increase of £4,410,708 in relation to last year, whereas total current liabilities have increased by £844,625. Thus the surplus of current assets over current liabilities is now £21,542,261, as compared with £17,976,178 last year.

CAPITAL AND RESERVES

The issued ordinary capital of the parent company has increased by £12,500 to £1,348,013 as at the date of the accounts.

Capital reserves now stand at £6,263,397, being an increase of £476,423 over last year.

Revenue reserves, including undistributed profits and the amount set aside for future income tax, total £11,733,838, being an increase of £3,080,844 over last year.

The above total capital and revenue reserves of the group now amount to £17,997,235, which is five times the total issued capital or over thirteen times the amount of the issued ordinary capital of the parent company as at March 31, 1952.

From the above it was, therefore, apparent that the issued ordinary capital of the parent company of £1,348,013 was out of all relation to the real capital employed in the group.

The consent of Her Majesty's Treasury was, therefore, obtained to the capitalisation of £1,348,013 of reserves of the company to be applied in paying up in full 5,392,052 A ordinary shares of 5s. each (non-voting) to be allotted by way of a bonus to existing holders of ordinary stock units registered on May 8, 1952, in the proportion of one new share of 5s. each for every 5s. stock unit then held, that is one for one. Thus the ordinary share capital of the parent company is now doubled at £2,696,026.

These new ordinary shares rank for the final dividend to be declared in respect of the year under review, that is, to March 31, 1952.

TRADING CONDITIONS DURING YEAR

I am gratified to be able to report that, through the medium of our 702 channels of retail distribution at home we again served a larger number of customers than ever before and that our sales increased by 15 per cent over the previous year.

PAST AND PRESENT PROFITS

In my supplementary remarks on the accounts for the year ended March 31, 1948, I stated that we were budgeting over a four-year period to earn annual trading profits in the group of not less than those shown for the above-mentioned year which amounted to £2,928,448. Those four years have now elapsed and I am pleased to record how conservative our estimates were when I state that the actual trading profits for those four years were:

Year ended March 31, 1949	£ 4,576,290
" " " " 1950	5,896,913
" " " " 1951	8,161,150
" " " " 1952	10,007,555

This makes an aggregate trading profit for the four years of £28,641,908, out of which there has been provided during that period £14,965,907 for taxation.

In conclusion, difficult conditions may continue for some time, and it would be unwise to make any forecast as to future results. Retail sales for the group for the current year to date are in excess of last year, and I am hopeful that results will continue to be satisfactory.

The report and accounts were unanimously adopted.

BURBERRYS LIMITED

COTTON AND WOOL PRICE VARIATIONS

OUTLOOK IMPROVING

The thirty-third annual general meeting of Burberrys Limited was held on October 9th in London.

Mr Geoffrey Bostock, FCA, the chairman, in the course of his speech, said:

Ladies and gentlemen: My statement on the accounts for the year ended March 31, 1952, which is printed with the report and accounts, was written some five weeks ago and since that date there have been variations in the prices of cotton and wool, the former having gone down and the latter having gone up in that period. What affects us is, of course, the difference between prices at March 31, 1952, and today, as our accounts are based on prices ruling at March 31st.

The prices of both these commodities are of great importance to us as not only are we manufacturers of raincoats, which have a world wide reputation, but we are equally well known as merchants of high-grade cloth, which we supply to countries in many parts of the world.

In my statement I said that there were no very definite signs of an improvement in demand, but I am now able to say that in the last eight weeks there has been an improvement in our retail sales and in wholesale orders booked.

DIFFICULTY OF FORECASTING

Whilst the directors very much regret the setback the company has suffered, they always had in mind that the sellers' market had to end some time. Their difficulty was that having to buy twelve months in advance they had to forecast twelve months ahead what supplies would be required to maintain an adequate stock with a sufficient range of new styles to satisfy our customers at home and abroad. I think any of us would find it difficult to forecast now what we shall want in twelve months hence.

I venture to say that all companies in the woollen and cotton trades, whose accounts ended at March 31, 1952, had to write off large amounts to bring their stocks down to the values ruling at that date, and in our particular case, this was unavoidable.

Many companies had substantial reserves and were thus enabled to continue dividends, though often at reduced rates. In our case, as I have pointed out on several occasions, no profits were ploughed back during the 16-year period when the preference dividend was in arrear and so we have not reserves which we would be justified in using for dividends in view of the insufficiency of our liquid capital in this period of inflation.

The board are carefully reviewing the company's organisation to see what improvements are possible and, in particular, the costing system is under examination. We are fully aware of the changed conditions throughout the world and that we are up against competition. We have a very good list of agents situated throughout the world—except behind the Iron Curtain—and we have our own branches in New York and Paris, and, unless prices fall necessitating further amounts to be written off stocks, and provided the indications of the improvement in sales in the last eight weeks continue, I shall expect a moderate profit in the current year.

The report and accounts were adopted after the chairman had replied to questions and comments by stockholders.

RANSOME & MARLES BEARING COMPANY

SHORTAGES AFFECT OUTPUT

The thirty-sixth annual general meeting of Ransome & Marles Bearing Company, Limited, was held on October 10th at Newark, Mr F. W. Baker (the chairman) presiding.

The following is an extract from his circulated statement:

Output during the year under review has been affected through material shortages, particularly in the first six months of the year, nevertheless the turnover has been an all time record. This has applied to both volume and value; in the latter case increased prices have contributed but these increased prices have not reflected the full extent of the considerable rise in the cost of raw material and wages. Benefits arising from continuing development and increasing productivity of our factories have been passed to our customers by absorbing a substantial portion of these increased costs.

The balance from trading account of £994,103 shows an increase of £181,446 over the previous year.

PURCHASE OF NEW PLANT

During the year £420,770 was expended on the purchase of new plant. In addition, delivery was made of some of the plant in respect of which payments on account were included in the 1951 plant additions. Since the payments relating to these machines amounted to £126,000 the effective increase to our plant was £546,770.

Taxation absorbs an additional £104,000 at £430,000, so that the net profit, £357,755, shows an increase of only £12,299. This indicates the drain which penal taxation makes on cash resources, a drain which the abolition of initial allowances and the imposition of Excess Profits Levy has accentuated. It must also be remembered that depreciation allowances are totally inadequate and bear no relation to present day replacement costs.

The directors recommend that the amount available for appropriations should be dealt with by making the same final distribution as last year, viz., a dividend of 12½ per cent and a bonus of 5 per cent, absorbing £91,875, and by carrying £100,000 to general reserve, £10,000 to special pension fund trustees and increasing the carry forward by £58,354 to £208,533.

Referring to the balance sheet the liquid position is one of considerable strength showing a surplus of liquid assets of £2,535,811.

NEW FACTORY AT ANNFIELD-PLAIN

The cash and tax reserve certificates show a total of £704,967. There are, however, capital commitments of £666,430, a large proportion of which is in connection with the new factory at Annfield Plain as was a portion of the expenditure on plant during the current year.

Construction of this factory has been delayed through material shortages, but good progress is now being made and it is hoped that production will start in the early part of 1953. The resulting increase in output will be of material assistance in dealing with our order book, which is at present of record size.

Your company continues to enjoy a full order book and, with expanding facilities and the widespread demand for its products over many fields of engineering, there is every prospect of another satisfactory year.

The report was adopted.

INDUSTRIAL FINANCE AND INVESTMENT CORPORATION

A YEAR OF CONSIDERABLE DIFFICULTY

MR J. N. BUCHANAN'S STATEMENT

The annual general meeting of the Industrial Finance and Investment Corporation, Limited, will be held on November 7th at Winchester House, Old Broad Street, London, E.C.

The following is the statement by the chairman, Mr J. N. Buchanan, DSO, MC, which has been circulated with the report and accounts for the year ended June 30, 1952:

The year under review has been one of considerable difficulty. Proposals published in July, 1951, for the control of dividends put a temporary stop to a number of propositions we were dealing with. The smooth working of the company was further impeded by the general uncertainty created by the crisis last autumn in the country's balance of payments, followed by new and increased taxation of companies' profits, dearer money and additional restrictions on investment.

FALL IN INVESTMENT VALUES

It was inevitable that these events should be reflected in our accounts. There has been a substantial fall in the value of our investments and a drop from the previous year's high figure of profit from finance business and on realisation of investments. On the other hand, investment income has shown a further increase, and shareholders will, I hope, find the final result satisfactory.

For some time the investment income has been sufficient to cover our fixed charges and the dividend paid. As the revenue from this source has increased, the board see no reason for not recommending the same dividend. Since the whole of the depreciation of investments could not then be met out of the balance of the year's profit, we decided to draw on the investment fluctuation reserve which was set up for this purpose.

As is shown in the accounts, this depreciation has resulted in a substantial reduction in the income tax we have to pay. The amount of the reduction has been transferred to the investment fluctuation reserve as a set-off against the depreciation.

TAXATION CHARGE

In comparing the charge for taxation this year with the previous year, it should be borne in mind that in the previous year we received considerable relief from income tax because of the change made in 1950 in the basis on which our investments are valued. A very small balance of this relief has fallen into this year. For the same reason and because a large part of our revenue consists of franked investment income, no liability to profits tax has arisen on these accounts.

In the result, the total of the investment fluctuation reserve and the carry-forward on profit and loss account has fallen by £12,000. During the company's year the *Financial Times* index of industrial Ordinary shares fell from 135.8 to 105.5, which were nearly the highest and the lowest points reached since the war, and it is very satisfactory that, despite our investments being valued individually on the most conservative basis, the year's profits have been sufficient to maintain the dividend and meet the depre-

ciation with a draft of only £12,000 on reserves.

CURRENT YEAR'S OUTLOOK

The outlook for the current year is still uncertain. Since June 30th there has been a rise in Stock Exchange prices, which has benefited the company. In view of the uncertainty, however, an unusually high proportion of our funds is in cash or short-dated investments. This, and the more difficult conditions in trade and industry generally, may affect our investment income temporarily but not, it is hoped, to a material extent.

From my earlier remarks you will appreciate that our managing director and his staff have had a trying year. The results show how efficiently the difficulties have been dealt with. On your behalf as well as that of the board, I wish to congratulate and thank them all.

FOY, MORGAN & COMPANY

The seventeenth annual general meeting of Foy, Morgan & Company, Limited, was held on October 10th at the offices of the company, 16 Eastcheap, London, E.C.3, Sir Gerald Lenanton (the chairman) presiding.

The following is his circulated statement:

The forecast in my statement last year of better trading prospects during 1951 was, owing to exceptional circumstances, greatly exceeded. It cannot be expected that such a result will recur in the near future.

After payment of dividends on the company's preference and ordinary capital and transfers to the preference share redemption fund and pensions account, there remains a carry forward of £267,113 on profit and loss account. Your directors propose, as will be seen from the resolutions set out in the notice convening the annual general meeting, that of this sum £184,779, together with £15,221 of reserves, making a total of £200,000, be capitalised and applied in paying up 200,000 7 per cent cumulative preference shares of £1 each.

The total paid-up capital of the company would thereby be increased to £557,610. The net carry forward will be approximately £82,000.

The report and accounts were adopted and the resolutions increasing the capital of the company were approved.

Economic Intelligence

The Economist Intelligence Unit provides a means whereby the specialist knowledge of *The Economist*, its research facilities and its sources of information, both at home and overseas, can be directed to the particular requirements of business firms and other organisations. The Unit can supply information and prepare reports on a wide range of subjects. In suitable cases, it can provide authoritative opinions on specific problems.

The Economist Intelligence Unit

22 Ryder Street, St. James's,
London, S.W.1

TAP AND DIE CORPORATION, LIMITED

INCREASED TURNOVER

The second annual general meeting of this company was held on October 16th in London.

Mr D. G. N. Lloyd-Lowles, the chairman, in the course of his speech, said: Our trading profit has increased from £379,230 last year to £596,099 this year. It would have been the wish of your directors to pass on as much of this increase as possible to the shareholders but the incidence of heavy taxation, coupled with the more difficult trading conditions now being encountered, have led them to propose the maintenance of the dividend at last year's level of 36 per cent with the addition of a bonus of 1½ per cent.

Trading conditions in the year under review were good and the group turnover exceeded that for the previous year by 35 per cent in value. Overseas trade in over 40 different countries accounted for more than one-third of our turnover and showed an increase of 25 per cent over the previous year.

Our turnover this year has so far been maintained but the volume of orders is not so large and it would be unwise to forecast that our profits will be at the same level.

The report was adopted and at a subsequent extraordinary general meeting resolutions were passed approving the board's proposals to increase the capital of the company to £1 million by the creation of 3,500,000 ordinary shares of 3s. each and 500,000 ordinary shares of 5s. each; to capitalise part of the share premium account and distribute it among the shareholders as a bonus issue of shares, and to consolidate all the ordinary shares into shares of 5s. each.

E. W. TARRY & CO.

INCREASED TURNOVER

The annual general meeting of E. W. Tarry & Company, Limited, was held on October 15th in London.

Sir Harold Fortescue Flannery, Bt. (the chairman), in the course of his speech, said: The turnover for the year exceeded by a substantial amount that of the previous year. The trading profit was £199,370, compared with £162,469 in 1951, and the net profit for the year was £64,886.

In the Union of South Africa, the permits granted to us being favourable, we were able to maintain a steady flow of supplies to our branches. In Southern Rhodesia, our branches reported steady trade conditions, while in Northern Rhodesia there has been much activity and development.

The turnover for the five months of the current year exceeded that of the corresponding period a year ago. Whether or not the sales will be maintained at a high level for the remainder of the current year is difficult to estimate.

The capital reserves include the share premium account of £100,000, and your directors consider that this sum should be capitalised so as to bring the capital account more into line with the assets employed in the business. The consent of the Treasury Capital Issues Committee has been received.

In view of the satisfactory results, the board feel justified in recommending an increased dividend to the ordinary shareholders by way of a bonus of 5 per cent, in addition to the dividend of 15 per cent.

The report was adopted, and at a subsequent extraordinary general meeting the proposed increase of capital and bonus issue were approved.

BEAUTILITY FURNITURE LIMITED

STEADY PROGRESS

The twenty-first annual general meeting of Beauty Furniture Limited was held on October 10th in London, Mr Herbert E. Down, FCA, the chairman, presiding.

The following is an extract from his circulated review on the accounts:

It is with some pride that I present the twenty-first annual accounts of your company. Growth throughout the years has been steady and constructive and your company has again made progress in a year which has been one of the most difficult for industry.

Turnover has again increased considerably, while net profit at £296,204 is advanced by £61,706, compared with an increase of £69,855 in the preceding year. Taxation absorbs £170,674, an increase of £37,499.

Reserves.—£10,750 has been added to the reserve in respect of Initial Allowances on plant and machinery, bringing the total up to £30,750. General reserve receives £30,000 as in the previous year and now amounts to £205,000. A special reserve of £40,000 has been made for stock contingencies. Total capital and reserves employed in the business amount to £824,412, compared with £710,382.

It is proposed to pay a final dividend of 25 per cent, making 40 per cent for the year, which is the same as last year.

I have referred on previous occasions to the constant improvement in design and value which characterises your company's productions. This policy is yielding satisfactory results up to date in that turnover has been maintained compared with last year.

The report was adopted.

THE GERMAN ECONOMY

Divided It Stands

UNTIL quite recently, Western Germany's rise from the ashes of total defeat was treated almost as if it was one of the miracles of history. Now, however, various questions are being asked about it, as politicians, economists, strategists and businessmen try to reach conclusions about the future of a country whose fate is so closely linked with their own. It is asked whether the early reunion of Germany is the only solution to the problems caused by partition; whether the social system has become dangerously unstable; whether Germany's economic success is built on such flimsy foundations that it would collapse without further American aid; whether German competition in export markets is a serious threat to British industry; and what part the German economy will play in European defence. The object of this survey is to give some help in answering these questions.

All surveys of postwar Germany must start with the brutal fact of the dismembering of the country along the Oder-Neisse line and again at the Elbe. In area, the present Federal Republic comprises only 52 per cent of the Reich of 1937. Before the war this area contained 57 per cent of the population of the Reich; now it holds 75 per cent of the German nation. (The density of population is, however, still lower than that of Britain or the Low Countries.) The partition left the greatest concentration of industry in Western Germany, while the areas with the biggest surplus of grain, sugar and potatoes were lost to Poland and the Soviet Union. Innumerable industrial concerns in the west had properties in the east which fell into Communist hands; the textile industry was particularly hard hit, as spinning and weaving had been separated, in west and east. In the first postwar years, indeed, the difficulties created by partition were indescribable. The chaos caused by millions who had fled westward for their lives, or had been expelled

from their homes in the lost eastern territories, was superimposed on the vast movement of refugees from bombed areas.

But the effects of division have now been overcome to a remarkable extent. Trade agreements have partially offset the results of splitting an integrated economy. True, a gap still remains in the Federal Republic's supplies of home-grown food, and this affects the balance of payments. In general, however, the problem caused by partition has changed; it is no longer one of supplies but of lost markets. The Ruhr, which used to sell two million tons of steel a year to Eastern Germany, now watches with anxiety the erection of the *Huettenkombinat Ost* and other giant steelworks that will make the Soviet zone self-sufficient in a few years' time. And the day can be foreseen when the "little Ruhr" that is being developed in Upper Silesia and Teschen under joint Czech, Polish and Soviet auspices will compete with German coal. These are prospects that must be faced in the event of continued division at the Elbe, and they make it all the more imperative for Western Germany to develop markets at home, in the area of the Schuman coal and steel pool, and in the backward countries overseas.

The two parts of Germany have now grown so far apart that the remaining economic difficulties caused by their separation are small compared with those of 1945; indeed, any abrupt reunion now would cause an economic crisis. But partition has left at least one lasting mark on Western Germany. The nine million people who came to the west without capital have not all been absorbed, and they still represent a heavy burden on the economy. The number that find work is practically offset by the stream that still flows in from the Soviet zone.

Matters of Fact

Ever since its earliest days, over a century ago, *The Economist* has taken as its task, not merely to comment on the passing scene of events, but also to provide a permanent record of facts, both statistical and documentary.

This task is now performed in the *Records & Statistics Supplement to The Economist*. Week by week this supplement contains, in condensed form, the record of world events—industrial, commercial and financial. And the facts can be found quickly and easily by means of the cumulative index that appears in the first issue of alternate months.

Records & Statistics is obtainable by postal subscription only, at £2.10.0 a year: a combined subscription to it and *The Economist* costs £5.0.0 a year.

For a specimen copy please apply to:
Records & Statistics Department,
The Economist, 22 Ryder Street,
London, S.W.1.

Binding Cases

Binding Cases for THE ECONOMIST and RECORDS & STATISTICS can now be supplied. These cases, made by Messrs. EASIBIND LTD., are in stiff, dark blue cloth covers, and are gilt-lettered on the spine; they provide an extremely effective and firm binding. The case for THE ECONOMIST will hold 13 issues and the quarterly Index; that for RECORDS & STATISTICS will hold 26 issues. The year can be stamped on the spine. The cost per case, post free throughout the world, is 11/-.

Orders, stating requirements clearly and enclosing a remittance, should be sent, not to THE ECONOMIST, but to—

EASIBIND Ltd.

(Dept. E), 84 Newman St., London, W.1. •
A binding case can be sent on approval, if required.

The Statistical Picture

IN 1939 there were 39.3 million people in the area that is now the Federal Republic. In 1950 the census showed 47.7 million, of whom 25.3 million were women and 7.8 million were Germans expelled from other territories; and by the middle of 1952 there were 48½ million.

The high figure of unemployment is the outstanding fact in the social structure of the Federal Republic. At various times it has been taken to indicate that social and political conditions were extremely unstable, that a dose of controlled inflation was needed, and—in American calculations—that Germany could provide a

large reserve of manpower for an army and for defence production. And German employers have quietly indicated from time to time that they could not have made such demands on their men if the labour exchanges had not had long waiting lists. All these deductions are accurate, except the need for controlled inflation; but several reservations must be made. In the first place, the latest statistics show a big drop in unemployment. Indeed, in September the German press surprisingly announced that, on the basis of calculations used by the United Nations, there was full employment in Western Germany. As the figures at that time showed 6.25 per cent of the labour force to be out of work, the statement seemed exaggerated—at least by postwar definitions of full employment. But it corresponds to the actual experience of employers in the towns. The explanation lies in the fact that some of the people who register at the labour exchanges are practically unemployable, some do not seriously mean to take jobs, and others are doing part-time jobs without notifying them. Probably not more than 600,000 are actually unemployed and potentially employable, and they include tens of thousands of young people who have not been trained, partly because the Germans insist on maintaining the old standards of training for apprentices. But there is clearly a substantial reserve of labour, and, if prejudices could be overcome, a further reserve could be found among women.

National Income

The Federal Republic's financial contribution to defence (which has hitherto mainly taken the form of paying the costs of the occupation) is now based, like that of members of the North Atlantic Treaty Organisation,

on estimates of its gross national product. Computations of the national income have thus become particularly important and controversial, and international comparisons are sometimes based on differing definitions. Figures based on gross national product at market prices—that is, net national product at factor cost plus indirect taxes, minus subsidies and plus depreciation allowances—show that the percentage increase every half year since the beginning of 1951 up to the end of June, 1952, has been 9 per cent; 12.7 per cent; and 0.2 per cent.

When they fixed the German defence contribution for 1952-53, the Three Wise Men appointed by Nato said that the Germans were underestimating the likely rate of increase in the gross national product. But the Germans are now pointing out that in the first half of 1952 there was almost no increase at current prices, and that even the five per cent rise for the current Nato year that the Wise Men considered too low an estimate will probably not be reached. The Germans may still be proved wrong if the second half of 1952 shows as big an increase as that of 1951, or if defence orders are placed by the Allies on a larger scale. But the present levelling off of production and the delay in forming a German army suggest that the spectacular increases of the past year will not be repeated for some time.

The Wise Men agreed that, as Germany had exceptionally heavy burdens and a relatively low national product, the percentage of the latter to be allocated to defence should be less than in Britain, France or the United States. Accordingly, the percentages of gross national product allocated were 14.4 per cent in 1951-52 and 17.6 per cent in 1952-53 for the United States; 10.9 per cent and 12.8 per cent for Britain; 10.6 per cent and 11.0 per cent for France; and 10.5 per cent for the year 1952-53 for Germany.

It is enlightening to compare the German distribution of national income with the British. In the first half of this year, only 55.7 per cent of Western Germany's gross national product went into private consumption, while in Britain, in 1951, the figure was 70.4 per cent. In Germany, the state took 16.8 per cent, in Britain 17.3; and while in Britain gross domestic investment represented only 16 per cent, German investment accounted for 25 per cent. Moreover, 2.5 per cent of the German national product went into net foreign investment, whereas the British accounts showed a net disinvestment overseas of 3.7 per cent.

In the last year, savings have resumed their place in German private budgets, and the total of savings is now DM4 billion (£330 million)—a remarkable sign of

confidence in a people who have twice in a generation lost everything through inflation, and who now live on the borders of Soviet-occupied Europe.

The gross inequality of wealth characteristic of the first postwar years still exists. There are still said to be 18 million people living below the level of subsistence; but this is probably an exaggerated figure, as few Germans will have filled in the relevant questionnaires accurately. Great numbers are, however, undoubtedly living in extreme poverty, and not all of them are of the working class; some are dispossessed landowners, former officers and civil servants. But the extremes are being reduced. After the outbreak of the Korean war, prices rose less in Germany than in most other European countries. Real wages have risen, more jobs are constantly found, shares are increasing in value and dividends are now being paid. The Germans are, however, still working longer hours for lower wages than the British. Excluding miners, the average wage of a male worker in industry in May of this year was DM1.60 (2s. 11d.) an hour, or DM82.23 (£7) a week, and the average working week for men in industry was 48.2 hours.

Better Wages, Bad Houses

The German worker is far better off in terms of real wages than he was a few years ago. If 1938 levels are taken as 100, industrial wages per hour are now about 192 as against only 93 in 1949, while the cost of living index was 168 last July against 160 in 1949. But for the appalling housing conditions, the worker would even be better off than before the war. He has an unlimited choice of things to buy, and no trade union restrictions prevent him from working overtime to buy them. A great deal is now being spent on holidays. As for housing, 400,000 dwelling units a year are going up, but although the credits provided for private building have led to an astonishing number of new offices, shops, restaurants and better-class flats, relatively few homes have been built for workers. The need is so vast that it can never be fully met unless Germany is reunited and millions of refugees return to their old homes.

The federal finances are in better shape this year than at any time since the war. Hitherto the Minister of Finance has never known at the beginning of the fiscal year what sum he would have to raise for occupation year costs. Now he has the assurance that the Allies will keep their demands down to DM600 million a month; and it has also been agreed that, from the date of ratifi-

Arms or Exports?

THE upward surge of German industrial production since the currency reform of 1948 has been impressive. But it has levelled off this year, and it has not been unbroken in the past. The "little slump" which alarmed business circles in 1949 showed how deflationary symptoms can suddenly appear even in a country where potential demand is still almost unlimited. This year again, there was some depression in the textile trade, and gloomy talk was heard; but there was in fact no cause for general alarm, and when some prices had been reduced, production and sales of consumer goods rose again, while savings continued to go up even in the holiday season. Never since the collapse has there been such general confidence both in the currency and in

cation of the European Defence Community treaty until June 30th, 1953, Germany's total defence expenditure is not to exceed DM850 million a month. After that, the amount of Germany's contribution is a matter to be thrashed out between Bonn, the EDC and Nato.

Meanwhile, some other features of the federal finances deserve to be noted. Occupation costs or defence absorb 39.5 per cent of expenditure in the federal Budget of DM23.3 billion for the year ending on March 31st next, and financial aid to Berlin (which Bonn reckons as defence expenditure) takes another 2.7 per cent. The cost of social welfare, pensions, building and other subsidies, which together account for 41.2 per cent, is substantially equal to that of defence. The war has thrust a heavy burden of social relief on to Germany. Although the unemployment fund itself shows a surplus, relief and pensions have to be paid not only to refugees, disabled persons and war widows, but also to the retired civil servants of Hitler's swollen Third Reich, and to the former regulars of the *Wehrmacht*. Some of the budgetary strain is, however, relieved by the fact that little need be allocated to servicing internal debt.

Taxation, which together with Customs duties is to provide over 89 per cent of the revenue during the current year, is less easy to analyse, since the system is extraordinarily complicated. There is no doubt that German taxes are extremely high, and the company tax is, theoretically, higher than in Britain. But allowances are manifold and generous, and the scale of income tax is not so progressive as in either Britain or America. Moreover, tax evasion is widespread; German civic ethics have deteriorated greatly during the years of rule by party bosses and the bitter struggles of the postwar years under an occupation regime.

peace, and that, in a country which is extremely sensitive to fear of inflation and war, is vital.

Last November a peak of industrial production was reached, when the index figure (1936=100) rose above 150. It has been below 140 this year, but the signs are that the trend is slightly upwards again. The fact that the drop in unemployment has not been reflected in still higher figures of output is simply due to the fact that less overtime is being worked.

Output in the coal and steel industries, however, has not risen to anything like the same extent as output in industry as a whole. In June this year, the index for coalmining was only 110 and for iron and steel only 106

(1936=100). In the coalfields, daily output is still not much more than 400,000 tons a day, a figure which should have been reached several years ago. Why so little progress should have been made latterly under German control after a good beginning under very efficient British direction is a puzzle. According to the German experts, it is due to lack of capital. Some DM3 billion (£250 million) is needed for expansion and modernisation if the 25 per cent increase requested by OEEC is to be achieved, and it is hoped that this will now be provided through the Schuman pool. In the meantime, a small increase in output has been achieved through incentive wages and improvement in the lamentable housing conditions of the Ruhr.

There are, however, grounds for believing that there is another reason for the comparatively low coal output. The Allied action in breaking up the steel-coal combines of the Ruhr has been partly responsible. For years now, coal managements have not known in whose hands ownership of the mines would eventually lie, and the regrouping of the concerns is still not completed. Moreover, nobody can yet tell what the effect of the Schuman pool will be on competition in export markets for coal. Uncertainty about the future has, it is thought, led mine managers to pursue a cautious policy. Some day, there may be a rapid and big increase in cheaply produced Ruhr coal; but meanwhile the Ruhr's steelworks have had to depend for much of their output on imported

American coking coal, paid for at first in steel products and latterly in free dollars.

Crude steel output is now running at the rate of 16½ million tons a year. That is to say, the Ruhr is rapidly overtaking Britain. German plans for expansion have multiplied since it became evident that restrictions would be lifted and the new concerns took final shape out of the old steel-coal combines. In the next few years, output should rise to at least 19 million tons; indeed, plans for greater production of flat products call for a crude steel supply of some 21 million tons.

The Ruhr is not impressed by arguments to the effect that there will be too much steel or that the modern strip mills of France can supply German shortages within the Schuman community's single market. The Germans note that their output is still no higher than it was in the Reich of 1913, while that of all the other producers has multiplied. They see no reason why the Schuman pool should not, as its founders intend, open up a mass market in Europe, and give the Germans access to French North Africa. Moreover, German steel industrialists believe that, if the Soviet Zone were reunited with the Federal Republic, the Ruhr (if it were financed by some new form of Marshall aid) would be so occupied with raising the

standard of living in Eastern Germany that it would be immune from any world slump. German heavy industrialists are inclined to look beyond the present period of rearmament, on the assumption that there will either be a war, in which case the Ruhr will be finally destroyed, or that there will be a *détente* and disarmament. For this reason, it is American, rather than British or French competition that is most feared in the future.

Reluctance for Rearmament

Clearly, the great question that faces German industry is whether arms will again be produced. The obstacles in the way of a new armaments industry are considerable. Destruction and dismantlement have effectively smashed the big munitions works in the west, and many of the main assembly plants were in areas now in Soviet hands. The Krupps works at Essen will not be rebuilt for arms production as long as Herr Alfred Krupp is alive. The industrialists who were imprisoned by the occupation powers can hardly be expected to follow the turn of 180 degrees that has taken place in the victors' attitude towards German rearmament. Moreover, the German industrialists do not have happy memories of Hitler's rearmament drive. At the outset, they welcomed his programme because it rescued their works from the depression, but they quickly found themselves subject to a rigid system of state controls that was galling in the extreme.

Hardly any of the old "Ruhr barons" are now left, but those industrial leaders who still have the outlook of the old entrepreneur rather than the manager will avoid anything that leads to state control; and arms contracts inevitably mean controls. For that reason, among others, industrialists who manufactured for the *Wehrmacht* are today concentrating their plans on building steelworks and similar projects for India, Egypt or Latin America. For the same reason, the entrepreneurs of the Ruhr are turning away from crude steel or coal, and are devoting their energies to the manufacturing ends of the reorganised heavy industrial combines, for they see the basic industries now passing under the Schuman High Authority; they know that they will be socialised if the Social-Democrat party comes to power; and they dislike the fact that in steel and coal concerns labour representatives already have the right to a joint share in management. The Bonn Government is also very chary about arms production. The policy of the government, as well as of industry, is in the first place to continue Germany's export drive. It is realised that to convert factories to armaments would mean the investment of about a billion dollars—and the same sum might be needed in a few years' time for reconverting to civilian production. American offshore orders for such semi-civilian goods as optical instruments are wanted, but there will undoubtedly be difficulty about inducing Germany to turn its hand to munitions.

Nevertheless, there are several factors that modify this picture of flat opposition. In the first place, if Germany has armed forces of its own as part of the European Defence Community it will be obliged to contribute towards their equipment. The Americans have promised to provide all the initial heavy arms and much of the light equipment. But this situation will change if the central "Ministry of Supply" of the EDC operates as intended, for it will place contracts for the whole community with Germany, among other countries. More-

over, the EDC treaty requires the bulk of each member's contribution to defence be spent internally.

It is also certain that when the time comes the new German forces will demand German weapons. Already a strong body of opinion is claiming that the *Wehrmacht's* light machine gun was superior to anything the Americans have and there will be general readiness to supply basic materials, machine tools, and parts for armaments. Special alloy steels, for example, will be produced again. British and French industries are already using German machine tools to ease the strain on their resources.

It is, therefore, almost assured that Germany will, in one form or another, take part in Western armament production. But, according to German intentions, arms will have to be additional to an increase in civilian production and exports. The government will press for an

Foreign Trade and Balance of Payments

THE rate of increase in Germany's foreign trade has been spectacular. It has doubled since 1949, reaching a total of \$7 billion in 1951, and exports alone rose by 75 per cent last year. By far the greatest proportion of trade is with the countries of the European Payments Union. In the first half of this year no less than 77 per cent of exports went in this direction. The result has been the extraordinary change in Germany's position in the Union; from being the biggest debtor, it has become the largest creditor, with a cumulative credit of \$443 million at the end of September, 1952. There has, admittedly, been a decrease recently in the rate of Germany's monthly surplus with the Union, owing to increased imports into the Federal Republic. There was actually a German deficit in trade with the United Kingdom in July and August, and in August the same held good for trade with the Dominions as well. However, Germany continues to run a surplus in trade with every other one of the EPU countries.

Both the earlier deficit and the present surplus have been partly due to non-recurrent causes—but the deficit much more so than the surplus. The main cause of the rush to buy after the Korean war was the general belief that sterling would be revalued. A second reason was the German importers' swift action in piling up stocks of raw materials before prices had risen to the post-Korean peak. German exporters were then placed in a good competitive position by the post-Korean import-boom. Thus, the drastic change for the better in Germany's balance with the Union is partly the natural consequence of the earlier buying spree. It was also the result of the restrictions on imports imposed by the German authorities at the time. Now that the position

American loan to be used for expanding industry in general as well as for the conversion of works to defence needs. If this general expansion is made possible by American aid, Germany will probably be able to finance its defence contribution and to maintain, or even slightly increase, its present standard of living. Otherwise it is difficult to see where the finance is to come from. The Ministry of Finance will not increase taxation, and the Ministry of Economics will not impose restrictions on consumption; the market for state loans is very limited, and there is a general determination that defence shall not be financed by inflation, either open or concealed in the Schachtian manner. Defence, in short, is not to halt Germany's struggle to gain its due place in the world, but to aid it. This is the intention of the German nation; and the chief lesson of occupation has been that nothing lasting can be done in Germany against its will.

is reversed, Germany has taken measures to foster imports, but with only limited success. Stocks are now depleted, but importers will only buy when they consider raw material prices have reached their lowest current level. The Government will not liberalise imports further, because that would open the German market to a flood of vegetables and similar produce.

In the short run, therefore, Germany's surplus in EPU will be brought down by the need to build up stocks. In the long run, it will also be decreased by the amount of sterling which is to be transferred by Germany to Israel, as part of the recent settlement; and by the transfer that has to begin next year under the London settlement of the Reich's prewar debts.

With the dollar area, Germany's visible trade continues to show a surplus of imports, and this is inevitable as long as wheat and coal have to be imported. American coal imports into Germany are now falling, but the Federal Republic's dependence on imported grain is not likely to be reduced much further. This year 1.6 million tons of wheat will come from the countries in the international pool, much of it from the dollar area. Unless this situation can be changed, Federal Germany's abnormal dependence on dollar imports will continue.

Nevertheless, Germany's dollar deficit is not by any means as alarming as the export-import statistics would indicate. Dollar-earning invisible exports are considerable, notably the services rendered to and the dollar expenditure by Americans in Germany. This latter item has risen rapidly as more GI's and their families have moved into the country; nearly \$120 million were received in exchange for marks from American agencies

in Germany in the year ending last June. As a result, the balance of payments with dollar areas at the end of the first seven months of this year showed a small credit for Germany of \$1.2 million.

This again understates the position as regards the *Bank deutscher Laender's* gold and dollar reserves. During the same seven months, these rose by \$139 million, chiefly owing to payments from EPU. The Bank's total gold and dollar reserves reached over \$500 million at the end of July. This is by all counts an extraordinary record for a country whose currency notes were issued in

1948 without any backing at all. With American blessing, Germany's economic leaders are now seeking a way in which the Deutschemmark can be made convertible.

In forecasting the future, it is as well to note that Germany's reserves will not be drawn upon for transfers under the London debt agreement. The German financial authorities stress that the creditors agreed that transfer shall only be made out of current trade surpluses; and they agreed that trade agreements should be framed in such a way as to leave Germany with a surplus. This simplifies Germany's task of payment except to the dollar creditors. The chances of building up a dollar surplus on trade account depend in the main on the amount of offshore defence orders that the Mutual Security Agency places in Germany. So far very few such contracts have gone to German firms, partly because there is a general reluctance to tender for very large orders that require retooling to carry out. The German Government is, however, pressing both for more offshore orders and for an American loan for industry. If both are granted, the outlook for German production and the dollar balance is good.

Trade with *Latin America* has proved disappointing. High hopes of this market were raised at the outset of the German export drive, and seemed justified by the way in which sales expanded and long-term contracts for capital equipment were secured. But payments difficulties have intervened. It is now realised that Germany must find some way of selling to countries that cannot afford to pay. German exporters feel that business must go on, but not at their expense. They look to the state to find some way of expanding markets in underdeveloped lands. Various proposals are put forward, including the formation of a credit institution such as the US Export-Import Bank that would finance backward countries, particularly those whose products are too dear to compete in the world market. It is also proposed that transit trade, such as the sale of Brazilian coffee to Eastern Europe, should be built up, and more individual German firms should transfer capital to set up branch enterprises overseas.

All such ideas reflect the determination of the Germans to shun restrictions as a means of curing economic

troubles. At the same time, industry is insistent that the risks involved shall be borne by the state. Collaboration with other nations is desired. It is realised that Germany cannot provide much capital for developing the backward lands; but that if the International Bank, for example, were to do so, the German export trade would benefit. Germany, in short, claims a part in schemes such as Point Four and the Colombo Plan.

Loss of Eastern Trade Resented

The state of trade with the *Soviet bloc* points to the need for some such opening for German enterprise. Since 1936, exports to the Soviet bloc (including China and Eastern Germany) have declined from 15 per cent of total exports to 3 per cent, and imports from 16 per cent to 3.9 per cent. And the latest indications are that the trade agreements with the satellites are not working well, partly because satellite goods are not competitively priced.

This drastic proportionate decline in trade with the Soviet area is serious for several reasons. Before June, 1941, Germany imported grain from the Balkans and the Soviet Union. Now it must buy from the dollar area. China was a large source of soya bean, which made up a deficiency in protein that exists today. (The average consumption per head of meat is lower than it was before the war, and lower than in Britain.) And the Soviet Union provided a market for German capital equipment during the great slump. The need for such an outlet may arise again.

The German authorities are conscientiously operating the system of export licensing to which all countries receiving American aid adhere, but there is general resentment at the loss of eastern trade. It is galling that exchanges with fellow-Germans in the Soviet Zone should be subject to the restrictions of the American Battle Act, and that trade agreements could not be concluded directly with Moscow. Further, there is a general belief that Germany has been forced to reject Communist contracts that have then been taken by less closely controlled nations. Finally, the Germans resent having to

buy goods from China through Hongkong or some other more indirect channel and pay hard currency for them. One of the first actions to be taken when the new contractual agreements with the Western powers are ratified will be to try to conclude trade pacts and exchange trade missions with Moscow and Peking. However, the present evidence suggests that Moscow will continue to try, for political as well as economic reasons, to channel all trade with the Soviet bloc, including China, through Eastern Berlin. Thus it will still remain to be seen how Germany can be given an alternative outlet in the underdeveloped countries of the Western world.

How the "Miracle" Came About

THERE is nothing miraculous about the recovery of Western Germany. On the contrary, it has been a plain example of natural cause and effect. Stripped to essentials, it has shown how human beings behave when they are in desperate need and the instinct of self-preservation is suddenly given not only the stimulus of hope but free play. To adapt the well-known metaphor, Germany at the time of the currency reform of 1948 was not like a fat and hard-worked donkey that needed a stick as well as a carrot to push it on; rather, it was like a starved beast tethered in a desert that suddenly had the tether removed and a large carrot placed in front of its nose. Even an idle beast would respond to this stimulus, and the Germans are the very opposite of idle.

How was the tether removed, and of what was the carrot composed? First, there was the currency reform, and the accompanying restoration of freedom to the price system. Together, these actions put money back in its rightful place as the hair-spring of the whole economy. Secondly, American aid primed the pumps by providing a flow of raw materials and food. Thirdly, a skilful financial policy has shown how both taxation and credit can be manipulated so as to favour investment and to restrain consumption. These three factors were interdependent. The currency reform could not have succeeded without the food and raw materials that American aid supplied, and the currency would have collapsed again if it had not been for the new monetary policy; while, on the other hand, until the decision was made to cut away over ninety per cent of outstanding money, all other measures were useless.

The Currency Reform

The day after the currency reform, the whole situation changed. Not only were the shops suddenly full of goods, but rationing and nearly all price controls were swiftly abolished. For some time, admittedly, it was feared that the quota of currency issued to the public to meet their immediate needs had been too big; but the rush to produce saved the situation. Few of the sceptics of 1948 would now deny that Dr Erhard's bold experiment, the abolition of state controls on all but a few basic commodities, has justified itself. The prices that established themselves in 1948 were certainly higher than those they replaced, but since the latter were the wholly theoretical "stop prices" of 1936 the comparison was meaningless. There was a strange reluctance among both Allied officials and German Socialists to admit that before 1948 Germany had been on the Lucky Strike standard, with American PX stores and displaced persons' camps as the central banks of issue. The illusion was long maintained that the mark had been a valid currency, and that prices and wages had really been at the level at which they were frozen in 1936. The new prices were high in relation to wages, and they still are, but a man knows that by working harder he can buy the goods; and this is of particular importance to the Germans, who have lost so much of their property and are determined to buy it all back. Above all, the absence of labour unrest has shown

the popularity of Dr Erhard's policy. Today, any attempt to reintroduce rationing would cause something like panic, and goods would vanish again from the shops. This fact must be borne in mind in any discussion of methods of financing defence.

American Aid

Yet, if the reforms of 1948 freed the wheels of the German economy from the rust of years, it was aid from the United States that got the wheels turning over. In this connection, there was a sting of truth in the late Dr Schumacher's words when, demanding that the Allies should send Germany more food in the hungry postwar years, he declared that "total victory means total responsibility." If the Allies had not occupied Germany, they would not have done so much to rescue it. (It is worth recalling that the British have

not confined themselves to dismantling war plant; they were, for instance, the first to start the feeding of school-children.) Above all, if American troops had not been among the occupying forces, Congress would not have granted the relief funds that preceded Marshall Aid in Germany. The part that the Americans have played in putting the country on its feet cannot be overestimated. Expressed in money alone, the total of United States assistance is formidable; relief funds and Marshall Aid together have amounted to \$3.4 billion, and a small amount of aid from the Mutual Security Agency is now being received. But the help Germany has received from the Americans is more than a matter of dollars granted; they have undertaken the most varied beneficent activities, the sum of which defies computation.

Monetary Policy and the Rebirth of Capital

If currency reform was a bold leap taken in semi-darkness, and American aid a blend of enlightened self-interest and natural generosity, the third element in German recovery was of a different nature. The federal *Bank deutscher Laender* and the other financial authorities have had to navigate a long and tricky course to reach their objective, the restoration of the country's ability to produce. It was not easy, especially in the early stages, to avoid both inflation and deflation. On the one hand, the destruction of capital meant that production had to

be restarted on credits; on the other, public purchasing power had to be strictly limited. To achieve the first of these aims, the banks have issued lavish short-term credits at very high interest. Many firms, desperate for capital, used these short-term advances for the long-term purpose of buying new plant. It was a risky business, but it has paid. The banks, as well as the manufacturers, have made big profits. Bankruptcies are now fewer than before the war; indeed, they are probably too few. Counterpart funds from American aid have provided a valuable source of medium and long-term credit. The expansion of note and coin circulation has been kept in a healthy relation to the expansion of production and other factors in the national economy. And, while production was thus stimulated, the purchasing power of the public was restricted by low wages and salaries and high prices. It was not until production was well up that the trade unions pressed and secured their claims for higher wages; meanwhile, the worker had to fill his pay packet by overtime.

In these conditions, capital investment has been extremely high, and is now proceeding at the rate of DM23 billion (£1.9 billion) a year. Self-financing has played an extraordinarily large part. The entrepreneurs have been able to recreate capital by charging whatever prices they liked (except for coal and, until recently, for iron and steel); there is no true free market economy in Germany—there is only freedom from state controls. Although in theory price rings do not exist, there is little evidence of free competition. However, the special conditions of postwar Germany offer some justification for cartels; a manufacturer who had to rebuild his shattered factory on credits needed some form of protection against a rival whose property was intact, and the system of price-fixing by trade associations has helped to prevent inflation and to recreate capital.

So has another German custom, the practice of building up huge company reserves by writing down plant to a nominal value and paying low dividends. Astonishing facts came to light when the issue of new Deutschmark balance-sheets after the currency reform enabled firms to revalue their assets without incurring tax penalties. In spite of the loss of over 90 per cent of liquid assets through currency reform and the losses due to destruction, partition and dismantling, many companies have been able to revalue their Deutschmark capital at a higher figure than the former Reichsmark total, and many more have revalued at the same figure.

The coal and steel companies, admittedly, have not been able to invest out of profits to the same extent as

other concerns, for the prices of their products were controlled. They have received credits from counterpart funds, and are supposed to benefit from an investment fund that is to be levied on the profits of other enterprises, but the latter project is too complex to be effective. The iron and steel industry will therefore need several billion marks to modernise itself on the scale of the British and French industries.

Finally, it remains to be added that the recreation of capital through self-financing by industry has been generously aided by the manifold tax allowances that have been granted by the State. These are no longer as large as they were, but they are still very extensive. Company reports repeatedly record that investments have all been covered by depreciation allowances. A move is now being made to abolish taxes on profits distributed as dividends, in order to promote a new market for capital issues.

To sum up, many things have limited the expansion of German industry, but lack of finance-capital has not been among them; and it is fairly safe to predict that German capital will in future be forthcoming to a surprising extent for any project that the Government and the public consider necessary to promote German national strength.

Old and True

What does this analysis add up to? As the pieces of the jigsaw are fitted together, a familiar, indeed a classic, picture emerges. If the special circumstances attendant on Germany's postwar experience are set aside, and certain qualifications are admitted with regard to German national habits, it becomes clear that the country's record of recovery between 1948 and 1952 contains a lesson of universal value. Germany has been able to accelerate its rate of production and to restore its international balance of payments because it has given both individual and corporate enterprise the fullest incentives. It has done that by wielding the monetary weapon skilfully and without inhibitions. By freeing the price system, it checked consumption and simultaneously goaded the wage earner into frenetic activity. By offering industry lavish but costly credits, it applied a similar goad to the entrepreneur; and by so manipulating the taxation of industry—which in principle is very high—as to encourage the ploughing back of profits, it enabled him to rebuild his capital at an astonishing pace.

The price, of course, has been a temporarily low standard of living for most Germans. But the rising indices of real wages and consumption and the drop in unemployment indicate that the German people are not having to wait very long for its reward. A policy whose essence was to stimulate the formation of capital at the expense of consumption has shown that it need not involve an indefinite postponement of all increase in consumption.

The German economy has demonstrated the unchanging truth of the often forgotten axiom that, apart from windfalls, the only way a country can increase its national income, and thus improve its individual standards of living, is by working and saving. The "miracle" of German recovery proves to be no more than a well-worn platitude; but, to the clear sighted, it should for that reason be all the more impressive.

Refugees from Reality

YESTERDAY was United Nations Day, the anniversary of the coming into force of the San Francisco Charter, and in many countries statesmen were recalling the aims of that charter and pointing to the need for further sustained efforts to safeguard peace. Indeed, with the General Assembly in session in New York but apparently trying to mark time until the Americans are safely past polling day, this is a most appropriate moment to reassess the general problem of peace-keeping in the harsh light of present reality. For it is clear that that light is altogether too harsh for many people, not only in the new United Nations building but in this country and elsewhere, who find it pleasanter to don either blinkers or tinted glasses and to look away from the central problem in search of some easier path to peace. This is no new phenomenon. A hundred years ago, *The Economist* was commenting with gentle acidity on the departure of a number of English ladies and gentlemen for a "peace congress" on the continent, at which pious sentiments were expressed and equally pious resolutions adopted in a vein familiar to our own generation. The Briand-Kellogg "pact of perpetual peace," that abiding monument to the futility of pacification by paper, is now almost a quarter of a century behind us. But, if escapism in international affairs has at times been even more prevalent than it is today, it has never been so dangerous. Nor, indeed, has it ever taken so many different shapes.

Its simplest form is that of which rose-tinted spectacles are the symbol: the attempt to pretend that things are not as bad as they seem. Although two disastrous wars have made it less easy for a statesman to find a receptive audience for this attitude, the fact that it has not lost all its appeal is obvious, not only from Mr. Bevan's present efforts to assume what at one time was Mr. Baldwin's mantle, but, more disturbingly, from such speeches as that delivered by the Prime Minister at the Pilgrims' dinner last week. For the most part, however, the mere use of rosy tints no longer suffices. Public opinion is sufficiently alive to the dangers of our time to demand that a political leader should offer some positive proposal to lessen the threat of war; and, for this reason, the pink glass is seldom plain. More often, its reassuring glow is merely the basis for a more elaborate optical device.

Such devices may be classified under three heads: the microscopic, the telescopic, and the common blinker. The Briand-Kellogg pact may be taken as the prototype of current microscopic escapism, the essence of which is to concentrate the eye on the fine type of a well-drafted text. Under the lens is displayed a five-power peace pact, a convention on human rights, or some similarly impressive document, containing enough resounding phrases to satisfy the emotions, and a mass of detail whose analysis, clause by clause and comma by comma, effectively distracts attention from the thinness of the paper. Whether the motive of those who prepare such texts is instinctively escapist or deliberately diversionist, they serve the same purpose: the untidy, unmanageable world of reality is excluded, and discussion is restricted

to the finer shades of meaning in a document whose implementation depends on factors outside the tiny field visible through the lens.

★

Much of the above applies also to the telescopic devices, but these do not purport to offer any immediate solution to the world's problems. Their devotees prefer the longer view. Taking their stance on an eminence from which it is easy to overlook the difficulties in the nearer foreground, they peer at the far horizon and there descry the outlines of the ordered world that is to be. This technique makes it possible to plan in the most minute detail the layout of the new Jerusalem, without having to grapple with the bothersome business of getting there. Moreover, since one's fellow men are much less trouble at a distance than they are at close quarters, assumptions can be made about the good behaviour of mankind in the far-off federal future that would be hard to maintain in the light of contemporary events.

Yet, despite the attractions of the two techniques already described, the most common escapist device remains the traditional blinker. It is popular, presumably, because it leaves a greater impression of reality. He who dons blinkers does not find himself looking at a piece of paper or at a misty horizon; he is allowed to look at something perfectly real and immediate, the only limitation being that he cannot see the much more important thing alongside it. His self-appointed leaders can usually argue not only that their projects are admirable in themselves, but also that they are sanctioned by high authorities ranging from the Sermon on the Mount to the San Francisco Charter. And indeed such projects are almost always both admirable and authenticated, but none the less capable of dangerously distracting attention, and enthusiasm, from more vital objectives.

Thus, poverty in Asia, Africa and Latin America is real enough, and its eradication is a noble and useful aim. The exclusion from membership of the United Nations of a dozen or more sovereign states is an unjustifiable anomaly which cannot continue indefinitely. The fact that, while common criminals are brought to trial, the world lacks machinery for punishing the men who launch aggressive wars in which millions die, is an ironic paradox, and there is much to be said for the idea that an international criminal court should be created to sentence such offenders against peace. But it must be asked whether those who canvass these and other causes, both in the halls of the United Nations and in their own countries, are not diverting into them an enthusiasm that is so badly needed for a more vital purpose. And, without questioning the integrity of all who pursue such causes, it must also be asked whether some of their champions have not deliberately turned aside from the straight but steep path that leads to peace, in order to make apparent progress, and political capital, on easier by-ways.

★

What is this straight path? It is well enough defined in the preamble to the United Nations Charter, which sets out, as the first two definite lines of action required of the member nations, "to practise tolerance and live together in peace," and "to unite our strength to main-

tain international peace and security." For most peoples, though not all, the practice of tolerance is not difficult. But the second obligation is a harder one. As the General Assembly was told on the first day of its general debate by the External Affairs Minister of New Zealand,

the military and economic burdens of collective action must be borne by the majority of states supporting the action, rather than by a willing minority. . . . Mere verbal or voting support is not enough.

This principle, as Mr Webb pointed out in the same speech, applies not merely to the present struggle in Korea but to the whole task of organising joint resistance to aggression. And it is a difficult principle. "To unite our strength" means to pay a price in effort, in money, and in lives. It means having to accept all the frictions and frustrations of teamwork between unequal partners. It means a long and patient struggle, without heroics, without interim dividends, without even a glimpse of the Delectable Mountains. No politician on an election platform can hope to get stormy applause for a speech in this vein. No writer of letters to the newspapers can exhibit his personal talents to effect if he confines himself to such realism. No voluntary organisation can sweep the country off its feet by restating the obvious so bluntly. It is obviously far more attractive to dally among grandiose projects for financing the development of backward countries, for outlawing genocide, or for re-writing the UN Charter, especially if one can create the impression that these are much more advanced ideas than the pedestrian one of merely deterring aggression by resisting it. Yet there was never a time when it was more important for the nations that want peace to hold fast to that pedestrian idea. In Korea, Mr Acheson told the Assembly last week,

the aggressor, having defied the United Nations and lost, having found himself pushed back behind his initial line of attack, now counts for victory upon those of faint heart who would grow weary of the struggle. . . . It is in Korea that our whole structure of collective security is meeting its supreme test. It will stand or fall upon what we do there.

International escapism was, perhaps, understandable in the days when, even to the far-sighted, no practicable means of deterring an aggressor was visible. Today, when such means are steadily developing before the eyes of every man, it is inexcusable. Worthy though some of its incidental objectives may be, they must remain subsidiary to the central cause of defending peace; and those who elevate them to a higher position must face the charge either of refusing to face facts, or of deliberately and cynically manipulating the idealism of their more simple fellows.

The Motor Industry

A survey of the technical and economic problems facing the British Motor Industry in the period of intense competition ahead

PAGE 265

Between Devil and EDC

IT was to be expected that France and Germany would pause, sooner or later, to think and argue before contracting the marriage that M. Schuman and Dr Adenauer have arranged for them in the European Defence Community. It has always been possible—indeed, it is still possible—that either party might prefer a long engagement to a sudden and successful courtship. There is much to be said for patience and caution in pressing on with this match; for both countries the surrender of national sovereignty in defence is a momentous step, even for the Germans, who have not yet regained it. But the circumstances that make it possible at all are transient; the Soviet attitude may become less frankly hostile, the Germans may become too confident of their growing strength to accept the limitations of the community of six, the ardour for European unity might flag for lack of achievement. Both the French Foreign Minister and the German Chancellor therefore feel that speed and boldness—even the *fait accompli*—are needed if their Parliaments are to take the first step towards federation and final reconciliation.

In everybody's mind, moreover, is the knowledge that this whole complex story began with the American insistence—over two years ago—that Germans must take part in the defence of Western Europe. The defence community and the European Army are in origin French conceptions, designed to make the best of a bad job—that is, to allow the creation of German divisions without danger to France. That they have also become objectives of German policy designed to give it equal status in Europe is a later development—a development which explains why the *Bundestag* seems disposed to ratify the necessary treaties before the year is out, whereas the Assembly is quite likely to refuse or delay ratification. For better or for worse, the strategic planning of the Atlantic partners is based on the assumption that there will soon be a Defence Community and that German divisions will begin to make their appearance under Nato command sometime between 1954 and 1955. Not so long ago it was the Germans who seemed most reluctant to play their part; feeling against rearmament was strong and it was widely said that Nato was not strong enough to protect the Federal Republic from any measures the Russians might take to prevent the reappearance of German forces. Now the demand is heard from political leaders that Germany should have forces in one form or another to give it a voice in the world's affairs. As the demand grows, so the fear increases in France that M. Schuman is following a path that can lead only to humiliation, and possibly disaster.

These fears have lately exploded before the public in speeches made by M. Herriot, the third highest citizen of the Republic, and by M. Daladier, who has for some time been interested in finding out what price Moscow would pay to avert German rearmament. It looked for a day or two as if M. Pinay's coalition cabinet might be deeply affected by the impact; but it has now rallied and the EDC treaty is to be put before the Assembly on November 15th for detailed examination in committee. Whatever happens, the damage has been done. Things have been said and done which arouse indignation and

misgivings in Germany. There is a crisis of confidence which, if it persists, might become a crisis of western policy.

The treaty that is being called in question is the result of many months of hard and detailed negotiation and, in fact, anticipates with its system of checks and balances many of the criticisms which are now being made and are discussed by our Paris correspondent on page 238. The French are particularly worried by those clauses which define the relative voting strength of governments in the Ministers' Council of the community, and by the regulations controlling the withdrawal of troops by member governments for domestic or colonial uses. They feel, too, that the treaty would allow the Germans to build up a large militia and police force outside the community's control. But these specific objections are only symptoms of deeper objections. First is the fact that an attempt to maintain simultaneously parity with Germany in EDC and resistance to Viet-minh would strain French resources to breaking point and further increase Germany's economic preponderance. Second is the hesitation, sympathetically understood in this country, to be left *tête-à-tête* with the Germans but without the British to hold the balance. Although the security of France against aggression is covered several times over by Nato, American and British guarantees, it is the day-to-day political and psychological dealing with Germans that the French fear—without the British chaperon. They feel, therefore, that a real Franco-German reconciliation must take place—notably over the question of the Saar—and every possible political safeguard must be secured before national sovereignty in defence is given up. A European political system first, if humanly possible with the British in it, and the defence community afterwards—that is the demand of those who want to delay ratification of the treaty in the hope that an alternative policy may somehow present itself.

What, in fact, are the possible alternatives? If in six months there is still no EDC the pressure for German rearmament (by 1955) without its safeguards will be very strong. The Americans will not accept indefinitely—and neither will the British, once they come to count the cost—a state of affairs in which Germans play no part in the defence of Germany. American and British troops stationed between France and the Soviet Union there certainly will be so long as relations with Moscow do not improve; so much is implied by the solemn guarantees that have been given. But the forces will not be increased beyond their present numbers, which are obviously too small for their task. If, therefore, German rearmament begins in spite of everything, it can be controlled only in two ways: either by making the Federal Republic a full member of Nato—which the French still refuse to contemplate—or by agreement between the Germans on one side and the Americans on the other; for it is the United States which would have to order and pay for much of Germany's equipment. That Washington would take this course with reluctance is virtually certain; but, failing an agreement with the Soviet Union on Germany, what other possibility is there?

There are Frenchmen who privately hope that the Russians will see an opportunity in the present situation to offer better terms for a four-power meeting on Germany. But there is no public sign of this. Published Soviet terms hold out a prospect which no Frenchman can safely accept: a united and unoccupied Germany, under constant political and economic pressure from the Communist East, controlling its own army and forbidden to belong to any western defence organisation. Nor is this a prospect that sensible and democratic Germans can accept. Likewise, the time for talking about a neutralised and disarmed Germany has passed. To bring unarmed, free western Germany into unity with armed, police-controlled eastern Germany would be for allied policy—and for any French government—an act of suicide. It would bring Soviet power to the Rhine within a decade.

Within the present limits of western policy and strategy, which are largely dictated by the manners of Moscow and the size of the forces it keeps at the edge of the Iron Curtain, it is not possible to see any practical or desirable alternative to the Schuman-Adenauer policy which produced the coal-steel pool, offers the defence community, and is drafting a federal constitution for Western Europe. Some Frenchmen will urge that Britain could save the whole situation by becoming a full member of the European Defence Community. The only realistic reply to this suggestion is that which has been made *ad nauseam* in these columns. Any European organisation which this country could join as a full member would have to be sufficiently loose to allow freedom of military, financial and political action in the world outside Europe. An organisation which had the power—as a federal body would have—to exercise a veto on the number of British troops and aircraft available for

the Middle East and Asia, on the allocation of defence expenditure and on other vital policy decisions is entirely unacceptable to any British Government. Yet a looser organisation, such as Britain might join, would not provide those legal safeguards against German military resurgence and economic domination that France demands. Nor would it produce a federal community. Europeans have to choose between a tight and genuinely federal organisation with the British outside, or a less rigid and effective body with the British inside.

It should surely be clear by now that this country's interest in the integrity of France and its good relations with Germany is so strong that Britain outside, but closely linked to, a defence community would pursue precisely the same aims and exercise just the same influence as it would inside. All that can now be given to France—and to Germany, for it, too, is a partner—is more assurances on paper; but they will add nothing real to the safeguards of the European community. Its security lies ultimately in the Anglo-American co-operation which is the backbone of the Atlantic Community. It is persistently overlooked in France and elsewhere in Europe that the defence community is bound in practice and by treaty to be subordinate to the powerful 14-nation group of Nato. If all that was required were to be a German contribution to defence it would be best secured by making Germany a member of Nato; but what is also required is that France, Germany and others should unite politically through the crucial act of surrendering sovereignty in defence. The EDC offers the possibility of both. If the French Assembly refuses ratification it will check—perhaps wreck—the movement towards a united Europe without checking German rearmament; and months of delay will cause great mischief.

Expediency and Copyright

LIPSERVICE and legislation notwithstanding, few forms of monopoly arouse much anxiety in Britain: and copyright, understandably, least of all. For the essence of copyright is private monopoly—in the mechanical reproduction of literary, dramatic, musical, and artistic works. But this monopoly is consciously granted, for a limited time, as one element of an implied bargain. Such works are of special benefit to the community. So the community grants a special privilege as an incentive to the intellectual endeavour required to bring them forth. It forgoes, for a time, its power to obtain these works in the way that it obtains the works of any other man's hand and brain, by paying the price they would fetch in a freely competitive market; and allows the creative artist—or his publisher—to charge during this meantime what the traffic will bear.

But copyright can only subsist in the material record of these works, not in the ideas that form them. And it seems to have originated at the instance of the publisher, who desired an exclusive right that could be assigned to him, at least for long enough to recoup his original investment in producing the material record. This widens the bargain; and ever since it was first codified in 1709, the protection given by copyright in Britain has been widening, and its term lengthening. The technical developments of the last half-century, in particular, have created—or may seem to imply—a wide variety of ancil-

lary privileges, loosely labelled "copyright," for the owners of reproducing "contrivances." The latest development of such apparatus, and the question whether it justified even further extension of such rights, was partly responsible for the setting up of the Board of Trade committee that has just published a lengthy report on copyright.

But this committee had more important duties than finding a formula by which the Cup Final might be televised. It was directed to examine the existing law of copyright and report whether changes were required, particularly because of technical changes or to accord with international practice, but also for any other reasons. And it has indeed explored many ramifications of the subject: for example, the relation between artistic copyright and the registration of industrial designs (during which it decided, among other things, that no copyright should subsist in a toy soldier); the right of "fair dealing" with copyright works, by quoting them in a review or micro-filming parts of them in a reference library; and the right of the "libraries of deposit" to receive a free copy of every publication (which it upheld, but would not extend to bodies desiring similar rights over films and gramophone records). Some of its recommendations for alteration of the Copyright Act of 1911, or the preparation of a new, comprehensive, and better-arranged act, bear witness to its meticulous study of such

detailed problems. Unfortunately, its two main recommendations—designed to reconcile British with international copyright law, and to codify such "performing and performer's rights" as broadcasting—are not convincing and suggest undue regard for expediency.

Almost by accident, it would seem, continued adherence by this country to the international copyright convention first signed at Berne in 1886 may now require a reversal of a public safeguard introduced into British copyright law in the Act of 1911. The total period of copyright in Britain, as in the other countries adhering to the Berne convention, is the life of the author plus 50 years after his death. This is an indefinite period, affording widely differing periods of protection, for example, to the early works of Bernard Shaw and Rupert Brooke. But the United States—where monopoly of any kind is a sore point—is almost alone in setting a definite period running from the date of publication (the period is 28 years, with an option to the author, but not the publisher, to extend it for another 28).

In 1911, however, Britain modified the total period of copyright by "compulsory licence" and "licence of right" provisions similar to those inserted (and recently extended) in its patents legislation. For the last 25 years of the copyright period these allow any publisher to bring out the work, provided he gives written notice and pays royalties of 10 per cent on all copies sold to the owner of the copyright. The other Berne signatories make no such proviso; but the revised convention signed at Rome in 1928 bound signatories to conform with the international period of copyright only so far as was consistent with their domestic laws. The revised convention drafted at Brussels in 1948, which Britain has not yet ratified, omitted this reservation; and the committee holds that if Britain does sign the draft revised at Brussels, it must repeal the licensing provisions inserted in 1911.

Upon this interpretation, the committee has little hesitation about throwing these provisions overboard. Their advantages, it holds, in no way compare with the benefits of Berne. It doubts whether the provisions have in practice served their original purpose—to secure earlier republication of works that remain of interest to the public. It points out that at present copyright does not prevent the early production of cheap editions of books long before the period of full protection has expired. This is incontrovertible; but at present the "licence of right" provisions are in force. Would publishers continue to bring these cheap editions out so soon if these provisions were removed and the period of unchallenged monopoly were again extended?

How long ought copyright to last? Inevitably, the answer must in practice be arbitrary. In theory, perhaps, long enough to recoup the author for his pains and the publisher for his first investment in reproducing the work; plus, more dubiously, a further period in which to recoup also, from a successful work, part of the investment in putting out other new and untried works. But this monopoly right already lasts far longer than the great bulk of publications remain saleable or the author can be attracted to continue his endeavours, and probably longer than the publisher would need to cover this and several other investments. The American system, which allows the author of the exceptional work—but not the publisher—to renew his right to its rewards, is more practical

and more equitable than those of Britain or Berne. Indeed, the lack of a common copyright policy for the English-speaking world is the most important gap in international copyright arrangements; and any change in British policy that would facilitate closer agreement with America would be more valuable to this country than the present convention if the choice had to be made. But to extend the period of complete monopoly—which is what the committee suggests—is to move in precisely the opposite direction. Moreover, it may not even be required for continued adherence to the revised Berne convention. Is it certain that the other signatories would prefer Britain to remain outside the convention rather than accept a renewed reservation on the term of copyright?

*

Rights over public performance carry the extension of "copyright" much wider than any the book publisher enjoys. These rights, which cover what the purchaser of a reproduced work does with it after he has paid for it, apply to sheet music and gramophone records already; and the committee, after a most instructive discussion of the subject, recommends that they should be extended to television broadcasts. Such performing rights are exercised at present by central bodies set up to administer them, the Performing Right Society and Phonographic Performance, Ltd. Both bodies issue licences on payment of fees to owners of sheet music or gramophone records who wish to give public performances of the works, or may prohibit performance. This performing right over records, incidentally, appears to have arisen from the drafting of the 1911 Act rather than from any intention of the gramophone companies. At that time they asked for protection only against the "pirating" of direct copies of their records; and indeed specifically added that the purchaser of a record should be assured the right to play it however he wished. But a judicial decision in 1933 established that a right over public performance did, notwithstanding, belong to the gramophone companies; and since then they have guarded it jealously, under pressure from the Musicians' Union.

The latest "performing right" at issue concerns the broadcasting of public spectacles such as sporting events. Sporting promoters have no copyright in such events, though they can refuse access to their property. They feel, with justice, that the broadcasting of television, and to a lesser extent of sound versions of such events—and particularly the reproduction of these broadcasts in public—may diminish their patronage from spectators prepared to pay for admission. A television broadcast of football, for example, might diminish admissions not only at the match concerned but at other matches taking place at the same time. The promoters sought a "copyright" in order to charge the broadcasting authorities for such broadcasts, and in some cases to restrict their performance in public.

The committee, however, has chosen another way. It proposes that a performing right shall be created not in these events, but in the television (though not the radio) versions of them, to be owned by the broadcasting authorities, not the promoters of the spectacles. This, the committee holds, will enable the BBC to charge a fee for public performance; and from these fees it can raise enough money to pay the high fees demanded by the sports promoters for admission to the events.

This is an ingenious proposal, though it might prove

more difficult than it sounds. But it is not easy to see what it has to do with copyright. The committee shows very clearly that it recognises that these performing rights for contrivances such as gramophone records have little to do with "fundamental copyright," the protection of a creative artist's work; it admits, indeed, that they deserve some other name. It knows that these rights may be abused, and may require independent review of their exercise and the fees charged; but it makes no recommendations, partly because it feels that changes might raise the possibility of a musicians' strike "which we are not qualified to judge." The Musicians' Union, which a fortnight ago was suffering heavy criticism for its ban on a foreign conductor, may congratulate itself on having recorded this quiet victory last week.

It must still be asked whether this unsought pseudo-copyright in public performance, arising from no more than a judicial interpretation, should not be repealed. It is hard to believe that the committee would have recommended its continuance for gramophone records, Musicians' Union or not, if it had not been concerned to create a similar right for the broadcasting authorities.

Inflation in Australia

THE Federal Arbitration Court of Australia has before it an appeal from the Australian employers that the working week should be extended from 40 to 44 hours and that the basic wage—now over £11 a week—should be reduced by nearly £3 a week. The trade unions have, not surprisingly, rejected the proposal, but the last word, according to Australian law, lies with the court. Its powers to fix wages are supplemented by the provision that the minimum wage must be adjusted at quarterly intervals to the cost of living as computed by the Commonwealth Statistician, and in times of normal stability, this mechanism and the court's control have had a steadying effect. But clearly it could never have been intended to apply this provision to abnormal periods. During the war, price, wage and profit controls were imposed and maintained until 1947 when, in a referendum, the Australian people rejected the continuance of price fixing by the Commonwealth and the power to fix prices reverted to the States.

Since that time the Arbitration Court has found itself manoeuvred into the position of deciding crucial economic issues in an atmosphere of violent inflationary pressure and strong party disagreement. The automatic quarterly linking of the wage rate with the cost of living gave an automatic spin to the inflationary spiral four times a year. But the suspension of the process would have been tantamount to a wage freeze at a time when prices and profits were said to be "finding their own level." In the event, the spiral has continued and in October, 1950, even received an extra spin, as the result of the court's decision, in view of the immensely prosperous wool sales, that the economy could carry an increase of £11 in the basic wage, in addition to the routine quarterly increase. The court has felt compelled to reject the employers' request that the automatic quarterly readjustment should be put in abeyance pending its judgment on the claims of the employers. Another rise of 11s. occurred at the beginning of August, bringing the wage to an Australian average of £11 7s. a week. Two years ago it was £7 6s.

This anxiety for a quick and convenient formula has involved the committee in somewhat embarrassed manoeuvres to protect "social service organisations" against arbitrary exercise of such rights—they advocate that a supervisory tribunal should be set up, but remain "unable to express a firm opinion" on the exact powers it should have. Without some convenient formula, the sports promoters would remain able to charge the BBC for access, and other film or television organisations could bid up the fees; but that does not justify giving the BBC yet another monopoly right. In its absence, admittedly, the BBC would be left with the problem of persuading its viewers to pay higher licence fees if it wanted to raise the money to finance a bigger and better television service. But that, properly, is the BBC's business, not the business of a committee charged with the examination and improvement of copyright law in Britain. Even the rights that the existing law was designed to offer have been widened and extended to a degree that may be prejudicial to the public interest. No case has been made out for making accidental extensions permanent, and inventing others.

The inflationary pressure represented by this startling leap is a fundamental threat to the stability of the Australian economy. It would be dangerous enough if it represented no more than the effect of postwar dislocation. In fact, it reflects something deeper and more dangerous—a fundamental maladjustment in the use of Australian resources. Before the war, capital and labour were already withdrawing from primary production and the land. Before the war, the urban conglomerations of Sydney and Melbourne had grown up. Before the war, bitterness in industrial relations in key industries was an obstacle to high output and productivity. The war simply reinforced much that was already potentially out of balance and the postwar inflation has done the rest.

After the fall of Singapore, Australia was compelled to improvise a large industrial effort to back up its armies and to make good its isolation from other sources of supply. At the end of the war, the Labour Government in Australia, in common with many other governments, expected a slump in the high prices for food and raw materials. In its determination to see full employment maintained it sought to establish in peacetime activity all the industrial capacity that had been created for the war effort. Before the war, the number of men working in agriculture and mining on the one hand and industry on the other was about equal. In 1950, the proportion was of the order of 500,000 in primary production to 800,000 in industry.

This booming full employment coming after the suppressed demand of the war created the normal postwar inflation and, after the removal of Federal price control in 1947, the upward surge set in. It was accentuated by the scale of migration—a little less than 200,000 a year—and by the record height of the export prices for primary products (which make up 80 per cent of Australia's exports). It was also assisted by political developments. In 1949 the election brought into power a conservative government, pledged to oppose controls. In 1950, the budget, framed on the eve of a political campaign to make effective legislation banning the Communist party,

was the opposite of severe. It was only in 1951 that some attempt began to be made to deal with inflation at its real source—the gross excess of demand over national supply.

The Budget introduced higher income tax and purchase tax on some luxury articles. It also allowed for a surplus. At the same time, some curb began to be placed on fresh private investment by the application of capital issues control and the development plans of the States were checked. Yet this relatively mild dose of deflation was quite insufficient to check demand. The pressure upon Australia's foreign reserves became so great—its international balance fell from £A843 million in June, 1951, to £A362 million in June, 1952—that, after the meeting of the Commonwealth Finance Ministers in January this year, the Australian Government took the step of introducing drastic import cuts which in some categories were as much as 60 per cent of the 1950-51 level. At the same time, alarmed no doubt by the unpopularity to which even the mildest deflation had given rise, it retreated from some of its deflationary measures. Only in one sphere—in the development plans of the States and in the cutting of migration—has deflationary pressure been fully maintained.

Unhappily for Australia and the Commonwealth, this is the sphere in which contraction conceals the worst dangers for the future of the economy. The investment of the States covers transport, power, forestry and above all water—water which is Australia's fundamental limiting factor and the key to its advance. Since the war, the basic sectors of the economy have been relatively neglected. Investment in them has increased, but not in proportion to the money and manpower that have gone to manufacturing on the fringe of the cities—including the majority of British migrants and a high proportion of British capital. Primary production has declined and only high prices have concealed the fact that wool production is stationary while wheat, meat and dairy farming are all shrinking.

But the worst relative decline of all is in roads and railways, in electricity and in water. In fact, in many areas, increased agricultural output would be useless since transport does not exist to move increased supplies. Moreover, the dislocations in the transport system and the continuous shortages of power undermine the efficiency of the new industries. In the short run, since they are protected by tariffs—and by import cuts—their relatively high cost may not appear to enter into the national balance sheet. Nor can anyone fail to be amazed at the patience with which town dwellers accept power cuts, temporary shortages of food and uncomfortable transport. But in the long run, the maladjustment of the whole economy must be of concern not only to Australia but to its partners in the free world.

In the first place, the fall in primary production and the stagnation in basic development mean that the Australian economy itself must abandon hopes of rapid expansion. The logic of the present situation is the cut in migration that has recently taken place. Without expanding food, expanding water and expanding power, the economy will be stunted. The pyramid cannot rise high if the base is too small. Australia can, in theory at least, afford this development. Provided the population expands only slightly, about 12 million people could feed themselves and develop an autarkic industrial system fairly comfortably in a continent of Australia's size. In the short run, the communities which would suffer most directly

from such a development would be Australia's neighbours.

All those nations which need food, Britain first among them, stand to suffer when in the next decade Australia ceases to be an exporter of food—which it must do if present trends continue. The hope that Australia, with a vast potentially rich hinterland for minerals, will play an important part in expanding world production of raw materials would have to be laid aside. Last but not least, an Australia that no longer produced a food surplus, whose transport was in disrepair and whose electricity supplies were woefully inadequate might be a liability and not an asset in time of war.

These risks and dangers do not go unrecognised. Unhappily, while government and people may be at one in wishing to avoid the consequences of unbalance they are deeply divided when it comes to willing the difficult means of doing so. The Government coalition is hampered by the fact that the manufacturing interests which should be curtailed are among its most influential supporters. Joint action between the Commonwealth and the six States is rendered difficult by the different political composition of their governments—three out of the six States have Labour majorities. The public may dislike inflation but it is generally believed to dislike even more fervently the deflationary measures needed for a cure. Many Australian observers have come to believe that only a severe economic crisis can convince the Australian people of the need for more workers on the land, for more pioneering in the "outback" and for harder and longer effort at the work bench in the cities.

Ireland's Prosperity

Every post from Ireland now brings us intelligence of its rapid improvement. Never before was so large a quantity of cattle purchased at the Scotch fairs for Ireland as this year; and if some of the people continue to pour out of it to the West, from the East there is pouring in a stream of wealth and a new race of men. An activity and spirit—says a local journalist—for a long time unknown, animate all classes. A new vitality is imparted to the effete frame. Markets are brisk and good, rents never better paid, poor-houses are empty, and the only trade stagnant is that of political agitation. The people who are left and the new comers are so busy providing for their own welfare, that they have neither time nor inclination to join in any effort to pull down the Church or upset property. Belfast, of which the wealth is increasing week by week, promises, we are told, to rival Liverpool; and "throughout Ulster the traveller is gladdened at every step by proofs that the effects of trading and manufacturing prosperity extend very far beyond the vicinity of its chief emporium." The healing hand of Nature is fast closing the wounds she made, and with her wonted benevolence she seems not to have removed a terribly diseased limb till it was necessary to save the body, and she is now restoring it to health and vigour unknown for ages. . . . It is not our present duty to refer to the causes of the permanently degraded condition of the bulk of the Irish. . . . We are more willing to record with satisfaction an improved sense of duty in all, which, combined with the great improvement already made, encourages the hope that improvement will be permanent, and that Ireland, blessed with unbounded fertility, will never again relapse into its former degradation, to be chastised again by similar sufferings.

The Economist

October 23, 1852

NOTES OF THE WEEK

Mr Attlee as Disciplinarian

Mr Attlee may have come late into the field in the Bevanite struggle, but now that he is there he is displaying a characteristic stubbornness. On his recommendation the Labour Shadow Cabinet rejected Mr Bevan's compromise proposal that his group should not be wound up but should throw open its doors to all members of the party. It then took the drastic step of proposing to the parliamentary party a motion calling for an end to all parties within the party unless specially authorised, and to an end to the slanging match. Since these requirements apply to both sides in the dispute, they commanded the support of those sitting on the fence and were duly endorsed at the meeting of the parliamentary party on Thursday by 188 votes to 51; 53 members were either absent or abstained. The open meeting staged by the Bevanites on Tuesday was thus the first and last of its kind.

Though this is by no means the end of the Bevanite bid for power, it is an important victory for Mr Attlee and the orthodox leaders. They have publicly asserted their authority over Mr Bevan at Westminster, and have made it clear that the parliamentary party is not going to have its affairs run by management committees in the constituencies, many of them in areas which have never returned a Labour candidate and are never likely to return one. Moreover, this vote means that the parliamentary party has agreed with Mr Attlee that the Bevanites were a "party within a party"—a charge which has been at the heart of all the counter-attacks on the Bevanites—whether from union leaders or others ever since Mr Richard Stokes first used the phrase in a speech early in August. Mr Attlee has indeed focused the controversy on the issue of loyalty, on the need for all members of the party, however senior and however wide their support in the constituencies, to abide loyally by majority decisions. It is by this test, as well as by whether they cease to act as an organised group within the party, that Mr Bevan and his colleagues will now be judged.

This places on the party leaders an equal responsibility to allow the Bevanites freedom to express their views while policy is being formulated. Even so, the Labour party has thus imposed a much stricter discipline than exists in either the Conservative or Liberal parties, which have never threatened to expel a member for having his own views on policy within the general framework of the party's aims. The Labour party, with its memories of 1931 and its tradition of solidarity against the boss class, has a much greater fear of deviation. And its leaders are understandably anxious to prevent such incidents as Mr Bevan's Bermondsey speech in April, 1951, when he tried, while still a member of the Labour Government, to force the Cabinet's hand on the shape of the Budget by publicly announcing that he would never agree to the imposition of charges in the health service—at the very time that those charges were being discussed in the Cabinet.

Emergency in Kenya

Mr Lyttelton's two statements on Kenya, and events themselves, have left no doubt about how serious the terrorist activities of Mau Mau have become. On Monday night a state of emergency was proclaimed in the colony; a battalion of the Lancashire Fusiliers arrived from the Middle East; and a big round-up of suspected leaders of the secret society was begun. These include Mr Jomo Kenyatta, the leader of the Kenya African Union, a political organisation. It should still be emphasised that the violence is confined to a small part of the colony and is undertaken by a small minority of the Kikuyu tribe. But, according to Mr Lyttelton,

Mau Mau terrorism is carefully planned, centrally directed and its object is to destroy all authority other than Mau Mau. Its leaders are establishing their own courts in their attempt to usurp the functions of government.

This is a complete answer to those who have described the emergency legislation passed by the Kenya Government to deal with Mau Mau as unjustifiable and as a symptom of hysteria among the European population. It is significant that so far no member of the Opposition has criticised the emergency measures, though there have been questions on detail. In particular, Mr Griffiths asked for reassurance, and received it, that Mr Kenyatta's detention did not mean that the Kenya African Union itself would be proscribed. As he pointed out, it should be made clear beyond doubt that Mr Kenyatta is being detained for Mau Mau activities, and that his association with the Kenya African Union is irrelevant, lest the whole of that body turn against the Government.

The prompt suppression of Mau Mau cannot, of course, be the end of the matter, and the Opposition welcomed Mr Lyttelton's announcement that he is visiting Kenya next week

"to consider, with the Governor, plans for the future development of the colony." The membership of the Royal Commission, which is to investigate social and economic problems in the three East African dependencies, has still to be announced, and presumably it will be many months before it can make its recommendations. If promise of action has to wait till then, the danger of sporadic acts of violence will remain, and relations between Africans and Europeans, on which visitors to Kenya have spoken so favourably in recent months, may become thoroughly embittered.

The Engineers Consider

The engineering wages dispute is reaching a new climax. The employers' offer of an extra 2d. an hour amounts to 7s. 4d. for a 44-hour week (the shipbuilders offered 7s. 6d.), which is about as much as the arbitration tribunals have given to other unions whose members want compensation for the rise in the cost of living. The provincial bus workers were recently awarded 7s., electricity supply workers were given 2d. an hour, and on Tuesday the Railway Staff National Tribunal awarded adult railway men an extra 7s. a week. Increases of this order seem now to be considered reasonable and usual.

But there are many in the unions who are not interested in what is reasonable and usual. There are even some who would rather that rearmament and exports were disrupted by the ban on piecework and overtime than that a satisfactory wage increase should be negotiated. The general unions

the confederation will no doubt be prepared to accept the employers' offer; but the craft unions, having set their original demand too high, may easily be persuaded to regard 7s. 4d. as "an insult." Since Tuesday, three important district branches of the Amalgamated Engineering Union have declared in favour of imposing the ban on overtime and piecework which was postponed when wage negotiations were resumed. The decision will be made when the executives of the confederation meet in London next Wednesday.

The employers justified their original refusal of a wage increase by pointing to increased competition in their export markets and the danger of being priced out of them. The publication of the latest export returns may make the unions less inclined to dismiss these arguments as mere excuses for meanness: between the second and third quarters of this year engineering exports fell by 15 per cent and exports of metals and metal products by 19 per cent. The shadow of unemployment cast by these figures may have a sobering effect on the unions. On the other hand, they have been encouraged, by the employers' last minute offer, to think that when it comes to a trial of strength a ban on overtime cannot be allowed to come into force; and they still feel that they have been treated unfairly by an industry which will make profits out of arms, if not out of exports, for a long time to come.

Mr Vyshinsky's Flying Wedge

Visitors to successive United Nations Assemblies have long been accustomed to the sight of Mr Vyshinsky advancing briskly through the lobbies in the centre of a formation of the kind known on American football fields as a "flying wedge." Apart from protecting the Soviet Foreign Minister's flanks and rear, this purposeful phalanx of advisers is also a remarkably apt symbol. Not for nothing have the Russians sent to this year's Assembly the strongest delegation they have ever mustered. The ink was barely dry on Mr Stalin's prophetic utterances about inevitable conflict between the non-Communist powers before Mr Vyshinsky and his impressive entourage were hastening across the Atlantic to ensure, to the best of their considerable ability, that the prophecies should be fulfilled.

In the non-Communist front there are plenty of promising crevices into which they can now insert their wedges. Apathy over the Korean war, instinctive revulsion at the mere suggestion that germ warfare has been launched, and anxiety for a share in the offers of trade with the Communist world so temptingly held out during the summer, are all elements on which propaganda can play. Moreover, the Russians probably hope that the delicate hints of lessened tension dropped in Moscow earlier this month may lead one or more of the United States' partners to feel that it might steal a diplomatic march on its allies by encouraging an individual approach by the Soviet government.

But the Communist press has made it clear that the biggest wedge of all is to be driven into the crack between the western powers and the Asians. The Assembly is to be made a platform where "the wrongs of imperialism" may be exposed, where the western governments can be manoeuvred into "voting against the colonial peoples," while the Soviet Union comes nobly to their defence. In the past Mr Vyshinsky's efforts in this direction have had some noteworthy successes; but it may be questioned whether it was wise to preface his new offensive by such a frank revelation that rifts in the free world are essential to Soviet policy. Even the sincerest anti-westerner among the Asian delegates at the Assembly may pause for a moment before accepting the direct patronage of Moscow.

Hot War in the Cold

On Wednesday the United States Defence Department announced the biggest number of American casualties in Korea in any week since June. Nearly a thousand Americans

were killed, wounded or captured last week, and casualties were also heavy among South Korean troops, who have played a major role in resisting the present Communist offensive. Although the Chinese have undoubtedly suffered even more heavily, their losses have not yet deterred them from pressing their attacks, which have now continued for three weeks, during which time several of the key hilltops have changed hands a dozen times. If this is not a major enemy offensive on last year's scale, it is nevertheless far from insignificant.

It is easier to tell what the Communist onslaughts do not mean than to find their real meaning. They have not been launched for the sake of their stimulating effect on the home front; on the contrary, the Chinese and North Korean peoples have hardly been told anything about them. Nor were they a reprisal for the suspension of the truce talks, for they began before that happened. Their original objective might have been a swift advance on Seoul, which lies only fifty miles south of the sector where the main attack was launched; but that objective must by now have been abandoned in view of the staunch allied resistance. If the Communists' intention was to improve their tactical positions before the winter closed in, it has been largely frustrated. If it was to demonstrate their superior strength on the eve of the United Nations Assembly's debates, that, too, has not been successful.

But it remains possible that the Chinese offensive was undertaken in order to sharpen controversy, both in Uno and between the American political parties, as to the value and the means of maintaining the Korean front. To the Communist leaders, it is a matter of indifference how many casualties are suffered by their own troops for the sake of such a purely political objective. There is not the slightest sign of this campaign being brought to an end on terms that the United Nations commander can honourably accept.

New Season in Vietnam

The seventh campaigning season in Indo-China has opened with sharp fighting and a reverse for the French and the Vietnamese in the fall of garrisoned posts in north-west Tonkin beginning with Nghia Lo. It would be wrong, however, to deduce that this in itself is a vital setback or a direct threat to the French hold on the Red River delta. The outlying and isolated garrison of Nghia Lo, with a strength of less than five hundred men and temporarily deprived of air support owing to the weather, was outnumbered by about seven to one in a specially mounted Vietminh attack. Although the defeat has a local significance which should not be minimised, the operations have not so far affected the main French position in the delta area.

For the larger scale fighting that is to be expected during the next four months both sides have been preparing hard during the summer. Unless there is a sudden drop in morale on the government side, these preparations are likely to have benefited the French and Vietnamese quite as much as the Communist-led Vietminh. With the mountain routes under French air attack, the Chinese are thought to have been able to deliver to the Vietminh about 3,000 tons of stores per month. Unless Peking decides to send China's own armies over the border in force, this is hardly enough to outweigh the now massive support reaching the government from the American arsenals.

Although the topical importance of the war in Indo-China varies both in French internal politics and in French-American relations—always great, it again looks like being specially prominent in the immediate future—the struggle plays a constant role in Far Eastern strategy. The outcome of the new campaigning season is therefore being closely watched in the rest of South East Asia; but there is less sign than there was a year ago of possible Chinese preparations for invasion. If the war can still be confined to Indo-China,

■ full-scale Communist victory seems unlikely, even in Tonkin. During the next few months this should add to the significance of the gradual hand-over of real political power by the French to the Vietnamese which is now going on.

* * *

Copper Strike

The strike of the African miners on the Northern Rhodesian copper belt raises more important issues than whether or not their demand for a higher wage is justified. Their union, which is notable among African trade unions for its solidarity and sense of responsibility, is asking for an increase of 2s. 8d. a shift. This would about double the money wage—African miners are also paid by free board and lodging—of the lowest-paid workers, and the union has rejected the smaller offers made by the companies. If profits were the sole criterion, the companies could afford the full 2s. 8d., but they assert that the Africans are already being paid all that is justified by the work they do.

It would be truer to say the work they are allowed to do, and it is taken for granted that the Africans are really striking for the right to do more skilled work which would justify higher wages. The companies would be willing to train the Africans for semi-skilled jobs, but they are faced with the colour bar maintained indirectly by the European Mineworkers' Union. By an agreement made between this union and the African union at an early stage of its formation, no African can take over a job performed by a European except at the same rate of pay and with the same living conditions.

Obviously, nothing can be done to implement the recommendations of the Dalglish Commission, which early in 1948 proposed that certain types of work exclusively performed by Europeans should progressively be made open to Africans, so long as this obstacle to African advancement exists. But the issue has political implications as well. It is probably true to say that if the European mineworkers agreed to accept the Dalglish recommendations, they would be taking the biggest possible step towards securing the Africans' support for Central African federation—or at least towards weakening their opposition. Otherwise, whatever happens to the federation plan—which the Europeans wish to see adopted—they will lay up for themselves a store of trouble for the future. Since the Africans are not being given free rations while the strike lasts, the present dispute may be over quickly—and the Africans left more embittered than before. But the Europeans should be aware that, in the present mood of Africans, the barrier to their advancement cannot be maintained indefinitely, and they would surely prefer to remove it by agreement rather than under duress.

* * *

Fiddling With Foreign Exchange

It is a pity that Mr Butler refuses to raise the travel allowance above £25 for the twelve months beginning on November 1st. This breaks the agreement of the Organisation for European Economic Co-operation, which binds all member countries to allow at least £35 for tourists. Of the other members, Austria allows no foreign exchange to tourists except on special application, and Norway allows £25; but the other countries all allow £35 or more.

It is not only international agreements that are brought into disrepute by the British travel allowance. More serious is the effect it has on respect for the law in this country. Now that holidays abroad are a mass movement of about a million people each year, there are many who do not want to spend much more than £25. Last year, when the allowance was £100, the average British tourist abroad spent

between £40 and £45 including his fare—which means that in the country he visited he spent just about £25. But many people who want to spend more can still do so without very much difficulty. Probably the majority of tourists change the five pounds that they are supposed to keep for travel in Britain and for paying customs dues; and anyone who has a friend abroad may get more. Public opinion may be somewhat disgusted by accounts of lavish spending abroad, but few people feel that it is gravely unethical to scrape up a little extra currency, so that they do not spend the entire holiday counting their sous.

A raising of the allowance to £35 would cost little in foreign exchange. It would be better to rely on the general policy of disinflation to keep tourist expenditure within reasonable bounds, and to raise the allowance to a level at which the inducement to break the law would be less strong.

* * *

Persia Loses its Whipping Boy

From the moment last week when Dr Mossadegh proclaimed to the Persian nation, in a broadcast 85 minutes long, that diplomatic relations with Britain had become "pointless," he had played himself into a position from which it was difficult to retreat, unless he could announce some huge compensating success. Why, then, did his cabinet wait a week before delivering the Note that broke off relations? Possibly it needed time to arrange representation in Britain by the Swedish Government. Possibly it hoped that the American Embassy, which was doing its best to dissuade Dr Mossadegh from a decision so negative and unfruitful, would offer a bigger dollar gift than the \$10 million down which it had suggested in the Truman-Churchill offer. He did not directly ask for this, but there was common talk of it in Teheran.

Economic and psychological relations between the two countries had reached such a point that the breach will not have a profound effect. Trading will not cease, but it is usually impaired when business men can get no advice from a consul or commercial attaché on the spot. The accompanying table shows that any falling off is likely to hurt Persia more than it hurts Britain:

ANGLO-PERSIAN TRADE							
Persian Trade (\$ million)				British Trade (£ million)			
	1950*	1951*	Jan. to April, 1952		1950	1951	Jan. to Aug., 1952
IMPORTS				IMPORTS

From UK	54.4	49.1	6.9	From Persia	47.8†	33.1†	2.4
Percentage ..	26.4	19.8	12.2	Percentage ..	1.8	0.8	0.1
EXPORTS				EXPORTS			
Total	648.7	590.0	43.4	Total	2,256.1	2,706.6	1,841.8
To UK	133.7	92.5	4.1	To Persia	30.3	19.5	3.8
Percentage ..	20.6	15.7	9.4	Percentage ..	1.3	0.7	0.2

* Includes imports by oil companies and exports of oil. † Includes imports of oil.

Psychologically, too, the Persian Government stands to lose. Many will get a moment of uplift at seeing the Union Jack being furled and the turbaned Sikh and arms of Queen Elizabeth II disappearing from the imposing gate in the Piccadilly of Teheran, but nationalist leaders will lose a long-standing asset. Hitherto, one of Dr Mossadegh's chief rallying cries has been the need for unity and alertness in face of the "sabotage and intrigues" of the British embassy staff, who were blamed for ills that had nothing whatsoever to do with foreign relations. Who will be whipping boy when the grievances continue, even though the British are gone?

Europe Eyes the Commonwealth

Europe is showing some anxiety about the way in which officials of Commonwealth governments have been discussing in London for over a month such matters as imperial preference, convertibility, trade policy and even the price of gold—all of which closely affect its governments. Yet not a single informed account of what has passed in the conference rooms has been allowed to emerge. Whitehall's curtain of secrecy has been so effective that ill-founded rumours are rife. It is imagined that Britain and the Commonwealth are planning a new "imperial isolationism," a Schachtian autarky to overcome the dollar problem. It is true that Britain and the Commonwealth are determined to do something this time about the recurrent dollar crises. For this reason alone some concrete proposals must be expected to emerge when there have been two Commonwealth meetings within a year. Canada, for one, will not be content with polite platitudes.

Until Ministers have concluded their talks late in November or early December, no official pronouncement will be made; but two things can be said now to dispel the worst of Europe's fears. First, that there is no likelihood of any increase in the margin of Commonwealth preference. Since many Commonwealth goods (particularly food and raw materials) enter this country duty free, Britain could increase the margin of preference accorded only by raising its tariffs on foreign goods; but this would cause a further rise in its cost of living. If Commonwealth countries reduced their tariffs against British manufactures, they would merely intensify British competition with their own growing domestic industries.

The second point is that the Ministers will do nothing that is likely to antagonise the United States, or even Europe. The dollar problem is international, and not peculiar to the Commonwealth. The Dominions recognise that development and solvency go together and that they can be achieved only by expanding the volume of international trade. Mr Butler's explicit undertaking last July, that any policy decided at the conference would have to be co-ordinated with both Western Europe and the United States, was seriously meant. The Commonwealth is, it is true, a family of nations, but like most families it is not a self-contained economic unit.

* * *

South Africa is Warned

Last Saturday, for the second time this year, Europeans were killed and mutilated by a crowd in Africa. The events in Port Elizabeth were on a much smaller scale than those in Cairo last January; but the spirit which has just led to the brutal death of four white South Africans was the same as the flame which swept through the Egyptian capital nine months ago. At both ends of the continent race hatred ran riot. Although on Saturday, it is true, seven Africans also died under the bullets of the police, the murder of the Europeans was the result of deliberate incitement to arson and violence by a group of men playing on an anti-white feeling which was already there.

In spite of the extreme *apartheid* policies of the Malan Government, this is new in South Africa. Such acute tension between the races has not hitherto been a feature of the national life, however illiberal the prevailing white attitude, and it certainly serves as an ugly warning which the Nationalists would do well to heed. By all accounts the reports of the riots have indeed been received with a sense of shock in the Transvaal.

It will, however, take far more than this to check the South African Government in its present course. Nor is it easy to see just how Dr Malan and his colleagues could now do enough to relieve the tension without reversing engines completely. That might mean not only dropping the severity of *apartheid* but materially modifying the general policy of racial segregation to which nearly all white South Africans, in the

United Party as well as on the Nationalist side, subscribe. It is not practicable simply to switch overnight to the kind of liberal magnanimity which outsiders are too prone to recommend. The problems of such a large and racially conscious white community, living among Africans at a very much earlier stage of development, are too complex and deep-seated. But the lesson of Port Elizabeth is that the initiative is passing from white hands. Unless something is done to arrest this trend of events, the Nationalists will defeat their own ends, at an immense and tragic cost in blood and hatred to all South Africa.

* * *

Flogging or Prison

The last time the House of Lords debated flogging for crimes of violence, there was a Labour Government, and the advocates of flogging had a poor chance of a sympathetic reply. But the Conservative party is, on the whole, as strongly in favour of corporal punishment as the Labour party is in opposing it, and the Conservative peers and the judges who this week demanded the restoration of flogging may have hoped for better success.

Fortunately, the Lord Chancellor was able to resist the demand for what he and Lord Templewood, the chief opponent of flogging among the Tories, called panic action—rightly so, for this time Lord Goddard, the Lord Chief Justice, and others demanded the reimposition of flogging not only for those crimes for which it was abolished in 1948 but for "all forms of felonious violence." As the Lord Chancellor said, the clock would be put back a hundred and thirty years—and this in spite of the fact that the number of crimes for which corporal punishment could be imposed before 1948 has actually fallen since then. This may not prove very much; but the one thing it does not prove is that the abolition of flogging has led to an increase in this class of crime.

Those who oppose flogging are not sentimentalists. They are just as horrified at the general increase in crimes of violence as the Lord Chief Justice. They are only concerned to find the most effective deterrent, and they are convinced that longer sentences of imprisonment are more effective than flogging. Lord Goddard finds it distasteful to pass long sentences of imprisonment on young men, and until the implications of the Criminal Justice Act are fully faced, no one should pretend that prison is likely to reform peculiarly vicious offenders. But the public will be better protected from them if they are shut up for a long period than if they are flogged, sentenced to short terms of imprisonment and then set loose again. The public's best protection, however, remains the police. If people directed as much emotion and energy towards strengthening the police force as towards demanding the restoration of flogging, they would be taking the most practical step they could towards protecting their persons and property.

Probation Studies

Two years ago the social affairs section of the United Nations Secretariat issued a book tracing the spread of probation from the United States and this country to the Commonwealth and the development of similar measures in some

Autumn Book Supplement

will appear in next week's issue of *The Economist*

European countries. Recognising probation as a constructive method of dealing with offenders, the United Nations suggested the formation of study groups in order to consider the legal and practical difficulties which prevent other countries from adopting it. As a result, a European Seminar on Probation is being held this week, and it is fitting that the United Kingdom should act as host to the representatives of the 17 nations taking part.

Probation in this country is a flexible method of dealing with offenders because almost any kind of condition may be attached to it, and because it is applicable to almost any crime except murder and treason. It is more than just an alternative to institutional treatment, for it introduces the principle that an investigation of the social background of the offender should be allowed to influence the court in determining how it should deal with him. In continental legal systems sentencing is comparatively inflexible because there is no common law and a specific punishment normally follows a specific crime. Moreover, the finding of guilt and the passing of sentence is one indivisible process. Social investigations, therefore, if they are to affect the sentence, have to be carried out before the finding of guilt. The disclosure of their results, sometimes in open court, may do great harm to the accused person, whether he is innocent or guilty. In this country, on the other hand, guilt must be established before the court may ask for information, including reports by the probation officer, about the person charged with an offence.

In many continental countries, however, there have been developments in the direction of probation, usually in the form of suspended punishment. Sometimes sentence is pronounced but not carried out if the accused remains of good behaviour during a certain period; sometimes the imposition of punishment is suspended and the sentence itself is not pronounced. These suspensions are often accompanied by some sort of supervision. But no continental country has as yet a trained and professional probation service of the kind

that has proved so valuable in Britain. If they can be applied within the framework of different legal systems, there are useful lessons to be learnt from British practice.

* * *

German Trade Unions Remain Moderate

The Congress of Federal Germany's trade unions was held last week-end in Berlin, where the atmosphere is conducive to political realism. Perhaps for that reason, the delegates showed more moderation than had been expected in some quarters. It is true they elected as chairman Herr Walter Freitag, head of the metalworkers' union, who is more uncompromising than his predecessor, Herr Fette; but he has declared against extra-parliamentary action by the unions to enforce their demands for joint direction of industry and the public services. It was not their business, he said, to "put things right that the electorate messed up." This probably means that under Herr Freitag the unions will not repeat the strikes of last spring against the works council law. Herr Freitag, who is a stalwart Social-Democrat, will doubtless concentrate upon securing his party's backing for the unions' demands: a legitimate policy for which nobody can reproach him.

The congress also showed political judgment by rejecting the invitation to joint talks that had come, inevitably, from the Soviet German trade union federation. The West German unions' executive will have nothing to do with men who exploit German workers on the orders of Moscow. Like other champions of national unity, they draw a sharp distinction between Russians, with whom it might be a good thing to negotiate, and German satellites, who are disliked and despised.

On most issues of foreign policy, the congress avoided specific decisions, because the unions are split—particularly

on rearmament—and did not wish to stress the fact. Even on home affairs the congress showed little ability to frame a concrete programme. The demand for a forty-hour week was adopted, but it is difficult to believe that the German workers will be ready to press it. The main struggle will certainly be, as hitherto, over the unions' claim to parity in the direction of private and public enterprises. So far labour representatives have gained a minority vote on the boards of private firms; but employers will fight with all means to prevent any further encroachment on their powers.

Already, the conservatives are blaming Dr Adenauer and his Christian-Democrats for giving away too much to the unions, and are trying to form a solid bloc of the right. The tendency is therefore towards greater extremism on right and left. But this development, deplorable though it is, is not yet dangerous.

* * *

The Marshal and the Caudillo

Marshal Juin's indiscretions are becoming too frequent for comment to keep pace with them; but his latest excursion into politics is of considerable interest. In an interview given to the monarchist review, *Destino*, he declared that Spain must play a part in European defence and implied that Spanish units should be incorporated into a European or Nato army. Marshal Juin founded his argument on the truism that there is no sense in allowing various countries to be defeated separately, and on the more controversial assertion that no European unit could be complete without Spanish participation. He urged closer collaboration with Spanish interests in North Africa and evoked sentimentally the days of 1925 when French and Spanish troops together quelled the revolt in the Riff.

This interview coincided with General Franco's speech to the civil war veterans on the battlefield of Alto de los Leones. The Caudillo exalted his old comrades in arms for having been the first to wage the European fight against Communism. He spoke of the danger of war and argued that traditional liberalism—for which he shares Stalin's contempt—was not a sufficient force against the red peril. In a deft reference not only to his own position but to that of France, General Franco urged that weaker partners in common defence should be given economic aid without being exposed to "interference in internal affairs."

These pronouncements by the Marshal and the Caudillo put the whole question of Spanish participation in European defence back into the picture. In their protracted negotiations with Spain, the Americans have discovered the truth of the old proverb, "love is like a Spanish inn where you only find whatever you have brought along yourself." The Spaniards are demanding a formidable price for the use of naval and air bases and there is little prospect of agreement until well after the American elections. General Franco's collaboration is really quite unimportant, and something more is needed to justify it than a blend of Catholic solidarity, military calculation and sentimental memories.

* * *

Production or Financial Stability?

The declining trend in Europe's production is causing grave concern to member countries of the Organisation for European Economic Co-operation. It was, indeed, one of the main topics discussed by the Council of Ministers at their meeting in Paris this week, when they examined the draft fourth annual report. Industrial output is not only failing to rise at the average annual rate of five per cent agreed by the Council twelve months ago; it has declined quite noticeably in both the first and second quarters of this year. All countries, even Germany, have now an output that is measurably lower than the peak reached in the fourth quarter of last year.

The question really is whether production should be boosted at the expense of inflation. The Council was unable to give a clear-cut decision, for at the same meeting it adopted the report of the special working party on internal financial stability. This suggested that inflation had still to be overcome; indeed, the stubborn deficit in Western Europe's total and dollar balance of payments suggests that domestic consumption and investment are still too high. But, it is asked, will a further cut cause increasing unemployment?

If, in the final analysis, the choice lay between increasing the value of money and maintaining current high levels of employment, most countries would choose the latter. But unless those countries can increase their productivity at a rate greater than their overseas competitors, such a policy must in the end lead to some form of devaluation, whether it be by means of export subsidies, floating exchange rates or a straight reduction in the dollar exchange rate. The OEEC's fourth annual survey, which will be published in December, should shed some light on these vital matters, even though the light might be heavily shaded by careful wording and significant omissions.

Tied Cottages in Scotland

No debate on rural housing, in Parliament or elsewhere, can avoid the essentially insoluble problem of the tied cottage. It is a problem which varies in importance and urgency according to place and circumstance. Where farming is intensive and settlement correspondingly dense, there may, in these days of buses and bicycles, be no reason why the farm worker should not live in his village and go daily to his place of employment like anyone else, thus escaping the uncomfortable pressure, and risk of dislocation to his private life, which even in the best conditions are inseparable from a service tenancy. Quite apart from uncertainty of tenure, it is much more comfortable for his family to live as part of the village community, with its school, shops and transport, than in the isolation of an outlying farm cottage. The argument against the tied cottage as a feudal anachronism is reinforced by more positive arguments in favour of good country planning.

Both arguments were well to the fore, powered with all the emotional force generated by memories of oppression, in Labour speeches last week on Clause 3 of the Scotland (Housing) Bill, which provides that subsidies may be granted for the private building or repair of tied cottages and that local authorities may be required to submit schemes to that effect. Their traditional and well-founded distaste, however, could not do away with the fact that Scotland provides what is practically a limiting case in the tied-cottage controversy, the tied cottage providing, over large areas, the only practicable means of housing the farm worker. It is the isolated farm with a cluster of cottages, not the substantial village with a constellation of farms, which has always been typical of agriculture in these areas and must, for reasons of sheer topography, remain typical in the future. The smooth running of such farms, with all its implications for the national food supply, depends on their adjacent cottages being as exclusively available to their own working staff as a stationmaster's house is exclusively available to the stationmaster.

Some Labour members, recognising that the tied cottage is a necessary evil, still maintained that no such evil thing, however necessary, should be subsidised by public money; an attitude which, however natural, does little credit to their common sense. Nothing will ever make service tenancies, whether on farms or elsewhere, really satisfactory. But since the grant of public money can be, and under the Scotland (Housing) Bill will be, used as a lever to enforce the employer-landlord's conformity with a decent code of conduct, the recognition of the tied cottage's permanency which such a grant implies should bring a net diminution of its disadvantages to the tenant.

How much horse power in a raincloud?

There is more energy in a raincloud than in an atomic bomb—and one day we may know how to tap it: there is inexhaustible power in the tides, and people have envisaged a time when we may use so much of it as to alter the orbit of the moon. . . . Perhaps the windmill will stage a comeback, lifted on an aluminium tower to a height of a thousand feet or more. And what of solar radiation? . . . Or will cheap power from atomic fuels outdistance all the rest? Who knows? . . . But one thing is certain—whether the power station of tomorrow be a forest of steel masts or an atomic reactor buried in a concrete hill, it will owe something to T.I. Not in components alone, but in the practical devices that take shape when T.I. specialists are called in.

T.I.'s FIFTY-ONE FACTORIES SERVE THE WORLD*

Letters to the Editor

Icelandic Fisheries

Sir,—In your issue of October 11th your Note about the Icelandic fisheries says that "In May, Iceland redrew the outer limits of what it claimed were its territorial waters, from point to point instead of parallel to the shore, and prohibited foreign fishing activities on the landward side of the new lines." I would like to call your attention to the fact that this ban also includes Icelandic trawling, so that Icelandic vessels are entirely subject to the same rules as foreign vessels.

I think that when you say that "Relations between the fishing industries of Iceland and Britain are now thoroughly embittered," you are making an overstatement and I, at least, have the feeling that responsible people from both sides will soon be continuing the friendly relations which fortunately have existed between them for a long time.

Later you say that

From the point of view of British deep-sea fishing interests, the most damaging section of the judgment is that which allows a country to adjust its territorial limits over coastal waters to its own fishing needs.

In connection with this I would like to draw your attention to the fact that although the fishing needs in Iceland play a very important role in this matter, the conservation of the fishing grounds, which are about the most important breeding grounds for cod and other white fish, has just as much influenced the Icelandic Government in the action taken, and the rules promulgated in the spring were based on an Act of 1948, which primarily deals with the preservation of breeding grounds for the purpose of fish conservation. Ninety-five per cent of Icelandic exports consists of fish and fish products, not 70 per cent as you state.

The regulations did not come into full effect at once. They were published on March 19th, but came into force on May 15th, and this was done so that Icelandic as well as foreign fishing vessels could have sufficient time to adjust themselves to the new rules.

Lastly, I would like to mention that the Grimsby trawler skipper who was fined for breaking the rules was proved to be 1.1 mile within the new limit or, in other words, 0.1 mile within the old 3-mile limit.—Yours faithfully,

AGNAR KL. JÓNSSONS,
Icelandic Minister.

Aid and Anglophobia

Sir,—Out of respectful consideration of Lady Astor, Mrs Braddock, Dr Summerskill and Mme Anna Pauker I have always liked to give the pre-eminent place among the Sublime Futilities to the proposition that we must look to a great increase in the direct participation of women in public affairs to bring toleration, gentleness and the rule of sweet reason to a quarrelsome world. I am a little distressed at the threatened sup-

planting of my old favourite by the current solemn doctrine that great sacrifices must be made to invest in backward countries for the purpose of (1) gaining their friendship, (2) turning their minds from Communism.

We have been investing abroad for a couple of centuries and, to round off our experience, we have been able since the war to learn through America what it is like to be at the receiving end. The results of this international economic intimacy are thus not a matter of conjecture. Two of them at least can be foretold with a certainty that is unique in the field of politics. The first is that the giver or lender will be heartily detested. The second is that it will create the nucleus to form, and the conditions to nourish, whatever variant of communal hatred the next generation may find most satisfying.

One can only speculate on the shape and colour which fashion and circumstance may give to future anglophobia, but it is interesting to note, in passing, that so shrewd a judge as our own Mr Bevan considers that the well-tried "Capitalist Exploiter" and "Imperialist Warmonger," even after such a long and brilliant innings, are still good for years of useful work.—Yours faithfully,

JOHN F. CALDWELL
Cheadle, Cheshire

Five Years of Monnet Plan

Sir,—In the article published in your issue of October 18th, it is said that "with the exception of Belgium, no other West European coal producer is within sight of its prewar rate of production."

I should like to inform you of the facts relating to the production of coal in Spain. Compared with a yearly total of 7,339,971 tons, including bituminous coal, anthracite and lignite, in 1935 (the last year before the civil war), the rhythm of production in 1952 is more than one million a month, which makes a yearly total of from 12 to 13 million tons. This figure, which has been the annual average in the last years, nearly doubles the figures for the period before the civil war. The maximum pre-1936 figure was 7,655,883 tons in 1932.—Yours faithfully,

J. M. RUIZ-MORALES,
Economic Counsellor
Spanish Embassy,
London, S.W.1

Britain Puzzles Canada

Sir,—Your issue of September 20th contained a letter of mine in response to an article which appeared the previous week and which mentioned the Canadian's perplexity at the United Kingdom's attitude to their Government orders.

My letter contained one inaccuracy which needs correcting. I stated that lack of progress payments was one of the

reasons handicapping new firms. The Canadian Government has rightly pointed out that on defence contracts they give progress payments up to 90 per cent. In other departments, progress payments are not usually offered, and I am sure it will be realised that new firms are understandably reluctant to press for progress payments when they know that competitive tenderers have no need to do so.

Your article of September 13th also referred to a United Kingdom circular actively discouraging overseas governments from ordering British armaments. I have made enquiries and am informed by the Board of Trade that this circular was a legacy from

a time when supplies were severely limited. It is now under review as part of a general review of the procedure for obtaining defence orders which is being carried out following the decision, announced by the Prime Minister in the House on July 30, to increase exports of armaments.

We are all mindful of the immense help which the Canadian Government has given this country, and it is good to learn that every difficulty is being investigated to help trade and good will to flow in both directions.—Yours faithfully,
C. I. ORR-EWING
House of Commons

The Lebanon Follows the Fashion

Sir,—It would be very difficult to understand what happened in Lebanon last month without taking into account a certain rigid rule in public life and political behaviour that we call confessionalism. The aim of confessionalism is to create and keep a certain equilibrium of prestige in public administration between the various religious groups. Parliament is elected on this basis, and it is practically agreed among all religious communities that the President of the Republic should be a Maronite, the Prime Minister a Sunnite and the President of Parliament a Chiite. Posts in public administration are also distributed on that basis.

The actual state of public administration under the presidency of El-Khoury was well described in your article, but two main facts that obliged the former President to resign were not mentioned:

1. The big majority of the Lebanese people and the majority of Lebanese cities and villages joined in a general strike asking for El-Khoury's resignation and the end of his presidency.

2. All Sunnis in Parliament took the decision to abstain from forming any government until El-Khoury's should resign. This was the direct cause that brought matters to a head and not "refusal by Parliament to co-operate with any cabinet proposed by the President." In fact, 52 Members of Parliament out of 77 supported the former President to the last moment, and presented to Parliament a petition in that sense.—Yours faithfully,
Beirut

THE LONDON EXPORT CORPORATION LIMITED announces that it is empowered to negotiate contracts on behalf of the China National Import Export Corporation, Peking, for a wide variety of equipment and machinery for the Chinese civil industries.

The quantities required are large, and both immediate and long term contracts will be placed with those suppliers whose specifications, prices, and delivery dates conform to requirements.

Interested companies or persons should communicate with Division A of the London Export Corporation Limited, Correspondents in the United Kingdom for the China National Import Export Corporation, at 295 Regent Street, London, W.1., submitting full details of their product.

As manufacturers will be aware, contracts will be subject to Board of Trade export regulations. The types of machinery required are as follows:—

REQUIRED CATEGORIES OF GOODS.

- | | |
|---|---|
| 1 Textile machinery and parts. | 6 Office equipment such as typewriters & calculators. |
| 2 Small and large engines, pumps and compressors. | 7 Paper including newsprint and bank, and magazine paper. |
| 3 Building and mining equipment. | 8 Foundry tools and equipment. |
| 4 Electrical equipment. | 9 Chemical equipment. |
| 5 Refrigeration, heating and hospital equipment. | 10 Mechanical equipment. |

THIS EXAMPLE of one of Honoré Daumier's famous caricatures of bourgeois society first appeared in the French comic journal *Charivari*. The title of the picture is a pun on the name of the subject, Baron Joseph de Podenas.

Daumier, who was born at Marseilles in 1808, often modelled his subjects in clay before drawing them on lithographic stone. His satirical drawing of King Louis Philippe as "Gargantua", which was published in *La Caricature* led to his imprisonment for six months.

That Daumier's work continued to appear even after his imprisonment epitomises the traditional freedom of the Press in a free world. In contemporary times the caricaturist continues to satirise public figures with no hindrance except the censorship of good taste exercised by the Press itself.

Today the newspapers and journals of the free world, with their immense facilities for obtaining news and information, bring the searchlight of knowledge and comment to bear on world-wide affairs which otherwise might be conducted (and in countries where news is censored are so conducted) behind a curtain of secrecy. With a free press at his disposal no literate person need today be ill-informed.

Many hundreds of newspapers published in many countries throughout the world are supplied with paper by the Newsprint Division of the Bowater Organisation.

Books and Publications

Brown Studies in South Africa

The Peoples and Policies of South Africa. By Leo Marquard. Oxford University Press. 258 pages. 16s.

South Africa is in the news and on the publishers' book lists. In the last few months Miss Jean van der Poel has given new historical interpretations in "The Jameson Raid"; Mr Vladimir Halperin's study of Milner and the empire has dealt with the aspects of South African history that form a chapter in British imperialism; we have had an impressive personal statement from a South African labour leader, Mr Solly Sachs; the journalist's seeing eye has produced "Report on South Africa"; the extra mural tutor has done his very competent best in Mr John Hatch's "Dilemma of South Africa"; the South African Institute of International Affairs has made a partially successful attempt to assess the economic resources of Africa south of the Sahara; those who like the cosy anecdote might try Mr Francis Gérard's "Springbok Rampant."

And still they come. But the latest of the current reports, from Mr Leo Marquard, far from being redundant, is the only one of plain facts plainly stated, and none the worse for that. It is not the background for all the others, but the corrective, or, better, the touchstone; and if the book shows a large measure of agreement with Mr Sachs's rather clanging stridency, or the occasionally golden-syrupy, determinedly sympathetic enthusiasm of Mr Davidson, the agreement is an indication of its value and of theirs.

Mr Marquard writes carefully without "angle"; but his standpoint is that of the true liberal, summed up in his own sentence "Western civilisation cannot be maintained by denying rights but only by extending them." With that as an axiom, he introduces the many peoples of South Africa, describes their government and administration, analyses their politics, policies and parties (the best part of the book) and discusses their religion, education, and their "colonies"—the last a section in which just enough is said to prove that the subject is beyond the scope of the book. Unfortunately, there is nothing about economic structure, little about industrialisation, agriculture, or the trade unions, and only slight but thoughtful comment on the disastrous economic implications of Dr Malan's policy of apartheid. This is doubly a pity because the divorce of politics from economics is the fundamental mistake of much South African thinking today. Concentration on the economic problems of the country, including the tragic progress of Africans "from barbarism to pauperism," would render the political problems much more capable of solution, and is in fact the only fruitful approach.

A suggestive point Mr Marquard makes in passing is that while by its policy South Africa may win the

adherence of illiberal white communities elsewhere, it will lose any chance of leadership in the continent as a whole, south of the Sahara. The weight of population, though not of economic strength, is already in West Africa, and the political initiative may ultimately pass there. The politicians of the Union are forfeiting its predominance in Africa and its reputation in the world.

Economic Liberalism

Aperçu d'Histoire Economique Contemporaine. 2 Vols. By Louis Pommery. Librairie de Médecis. Paris. 722 pages.

This ambitious survey of economic history from 1890 to 1952 is, in fact, the history of an idea and of the successive attempts to prove it false. M. Pommery's two volumes tell, with impeccable lucidity, the story of the decline of economic liberalism in its nineteenth-century guise. The work is divided into distinct parts by the course of events itself, but M. Pommery begins by assessing the forces militating against classical liberalism and examines whether or not the very momentum of liberalism bore within itself essential flaws. M. Pommery defends the thesis that the disruption of political equilibrium caused by the 1914-18 war had a series of consequences which made the 1929 crisis inevitable. The premature return to the gold standard in England, the collapse of German currency and the uncritical American boom originated directly in the postwar situation. M. Pommery's patriotism betrays him, however, into minimising the role of France in the general debacle. The deliberate undervaluation of the franc as a trade weapon should be taken into account.

Up to that point, and in his account of the 1929 crisis, M. Pommery covers familiar ground, although he tends to illuminate events from the refreshing point of view of a convinced liberal, for whom the natural sanity of economic processes has again and again been sacrificed to political intervention. It is in its survey of the "great experiments" (1933-38) that this book asserts its value. M. Pommery discusses in turn the New Deal, the economics of Nazism, the second Soviet Gosplan, statism and syndicalism in Italy, and the economics of Japanese expansion. Where his discussion is less satisfactory is in its account of the incoherence and lack of initiative displayed in France after the 1936 devaluation. Deliberately, perhaps, M. Pommery avoids going beneath the surface of the Blum and Reynaud experiments.

The second volume deals with the

period after 1939 and offers an important comparative analysis of war economy as practised in the first and second world wars. This whole subject of total mobilisation may become increasingly important in the near future and the brevity of M. Pommery's observations on the subject is disappointing. The same applies to the question of economics under occupation, although M. Baudin's "Esquisse de l'Economie française" does something to fill the gap. The entire second volume is somewhat weaker as it is based on a rather indiscriminate mass of recently published material and lacks the advantage of perspective. The brief sections on postwar Japan, EPU or industrial development in the Soviet Union read like summaries of press-cuttings. But M. Pommery's mastery reasserts itself in the concluding survey of the economic world picture on the threshold of a new half-century. The pages on European unity, nationalisation of industries, and the phenomenon of perennial inflation, form a declaration of economic liberalism in the wake of alternative experiments which M. Pommery has tested and found wanting. Nothing could be plainer than his conclusion: "Il faut choisir entre la liberté individuelle et la dictature policière." For the author, only one choice is possible.

Land and Poverty

The Land System in Palestine: History and Structure. By A. Granott. Eyre and Spottiswoode. 359 pages. 21s.

The conclusion which the reader seems intended to draw from this survey is that the stagnation in agrarian matters that marked Ottoman rule continued, in large measure, under the mandate, which failed to undertake "any planned or well-thought-out action for the improvement of the condition of the fellah." The book is marred by statements such as the following:

The Palestine legislator and administrator... made it their primary object to limit the reconstruction and the development of the country. At first they used indirect means and concealed their intentions, but in the end they came out into the open and tried to put the Jewish activity, the mother of progress, on a bed of Procrustes.

This may arouse the suspicion that the writer is concerned to justify the thesis that more land must be found for Jewish immigrants "not only through the acquisition of new and additional areas but also through the development of those the Jews already possess."

The historical background is briefly sketched. The statements that the *iqta* system corresponded to the system of feudal fiefs in the West and that the Arabs "left in full force the administrative and legal systems" of the Byzantine and Persian empires are somewhat

sweeping. The changes in landownership in more recent times are shown, but the author's argument is not always easy to follow. For example he states that profound changes in agrarian matters took place under the Ottomans, but on the next page we are told that

since in the course of centuries only slight changes took place in the economic structure of the country only slight alterations are to be found in the forms of land tenure. Only from about 1870 did development commence to become more rapid.

The book is, however, a valuable contribution to its subject. The conditions of insecurity which prevailed under the Ottomans are clearly shown; the emergence of large landed estates is traced and in this system the writer sees the main reason for agricultural stagnation and the miserable condition of the *fellaheen*. He shows that there has been an increase in small ownership in the past seventy years, and that this, under the mandate, was accompanied by an increase in cultivation. The origins of *waqf* land are discussed, and the tendency of private owners to convert their property into *waqf* to safeguard them from confiscation is noted. In this institution the author sees a great hindrance to the spread of prosperity.

The social structure of the Arab family group (the *hamula*), the reasons for the impoverishment of the *fellaheen*, their indebtedness, and their tendency to be transformed into landless agricultural labourers are described. Such problems as the fragmentation of holdings are discussed in detail, and the main lines of Jewish rural development are sketched. In a final chapter on tenancy and leasehold the evils of the old system of tenancy are emphasised. It would appear from this survey that while the main lines along which the *mesha'a* village and the tenancy system of Palestine have developed are common to most Near and Middle Eastern countries, there are considerable differences in detail.

Pests and Weeds

Untaken Harvest. By George Ordish. Constable. 170 pages. 15s.

In the folklore of agricultural economics there are no two more respected dogmas than that of a growing world population inexorably starving to death, and of the fantastic crop losses caused by pests and diseases. To which farmers properly retort that humanity can have all the food it wants if it is prepared to pay the price of more intensive farming, of land reclamation and, above all, of pest control. A totally misleading impression of the crop losses caused by pests and weeds has been created by expressing them in terms of the market value of the crop in a year when prices were inflated by scarcity. Mr Ordish uses a different yardstick; he expresses losses in terms of the land and labour spent in cultivating crops that yielded no harvest.

Had it not been necessary to offset the low yield of infected crops by growing

a bigger acreage, that land and labour could have been put to other use. But the author is equally aware that protection can prove more costly than the marginal value of the crop, and one of the most interesting sections of this book is devoted to evolving a formula of what he calls the cost/benefit ratio, to calculate the profitability of applying partial or complete preventive measures against attacks of varying intensity. From the examples given, it would appear that partial pest control yields better returns than complete control. It is also evident that pest control pays best on the semi-luxury crops and sometimes not at all on those that the nutritionist considers to be socially the more important.

If the wasted acres under cultivation of low-price infested crops are to yield a harvest, it rests with the chemists and machinery makers to reduce still further the costs of protecting them; failing which the market value of the crop must rise until it equals the marginal cost of control. But this raises other difficulties not touched in this book. More powerful and persistent chemicals can reduce the cost of protection, but they do so at the price of introducing new dangers to both sprayer and purchaser of the crop, simply because they are more toxic and more persistent than the weaker, safer sprays they replace. The cause of food production has been done a disservice in the past by the sentimental confusion of social with economic factors. Mr Ordish is typical of the new generation that has sworn to eschew this muddled thinking, but the question of the toxicity of pest control technique may be the one case where social needs have to be taken into account.

The Defeat of the U-Boat

U-Boat, 977. By Heinz Schaeffer. William Kimber. 207 pages. 15s.

This book is the first from Germany to give some idea of the physical and tactical conditions under which U-boats operated in the Battle of the Atlantic. The author served eighteen months during the most critical period of that battle as watch-keeping officer in a U-boat, and was then put in command of a smaller boat for training new crews in the Baltic training ground. At the age of twenty-four, just as the war was ending, he was sent out on his first operational voyage in command of U-977. When off the Norwegian coast he learned by radio of Germany's impending surrender, but, in doubt as to the authenticity of the order to cease operations, he placed before his crew the alternatives of returning to Norway or escaping with their boat to Argentina. Sixteen of the older men, mostly petty officers with families in Germany, elected to be put ashore at night on a lonely stretch of the Norwegian coast. With a remaining crew of thirty-two men, mostly inexperienced, and with his periscope unusable, the captain headed for the Azores, and then on to Argentina. For sixty-six days, in order to escape the attentions of the Allied patrols, he

kept his boat submerged, running on the Diesel engines and using the Snort. His description of this voyage, the eventual safe arrival at Buenos Aires and the interrogation by suspicious authorities who were convinced that he had brought Hitler with him—these are the most readable parts of an otherwise patchy story.

The author suggests that Radar, as used by the Allies, was the main cause of the defeat of the U-boat, and that if only Dr Walther's hydrogen peroxide propulsion and the Snort had been used earlier, Germany might have achieved its object. He also gives us glimpses of Radar and Asdic decoys, and other devices that enabled U-boats to evade destruction. But one should not be taken in by all this. The fact is that the German submarine campaign was defeated not just because the Allies had a new weapon in Radar, not even because the German counter-measures came too late, but because the various and costly British and American resources on the sea and in the air were all vigorously applied against this menace to our very survival. It is unfortunate that the public should have to learn of this vital aspect of the war from the random memoirs of its late enemies.

A Problem for Management

Industrial Leadership and Joint Consultation. By W. H. Scott. The University Press of Liverpool. 207 pages. 12s. 6d.

Dr Scott has presented, in this excellent work, the findings of investigations conducted in three Merseyside firms to try to deduce the effectiveness of joint consultation. He has selected three companies which by virtue of their different history, degrees of prosperity, and size, etc., form a composite sounding board from which to take readings of the various reactions which must exist in dissimilar industrial atmospheres.

Early on, Dr Scott strikes at the root of the problem—"the conception of industrial democracy as being primarily a matter of creating the 'right machinery' has undoubtedly for the moment prevailed."

As the evidence is produced, it becomes increasingly apparent that apathy and lethargy (surely by now almost national characteristics) are prevalent. The majority of employees when interviewed about their works' councils or committees were either just not interested, or frankly sceptical of managements' intentions, or else they just condemned it as a waste of time. Joint consultation, by bringing together management and workpeople in formal discussion, was to have contributed much to industrial Utopia; but, in fact, it has failed, Dr Scott suggests that much of the blame for this failure may lie with management. He claims, and he produces plenty of evidence, that management has been content to pay lip-service to an idea. If joint consulta-

The north wind doth blow...

and we should have snow, but it's odds-on that rain or fog is what we'll get. So, I'll entrain for a happier clime where snow falls to good purpose and the winter sports season is about to start. Better dust off my skis, for pretty soon I'll be swishing down the snow slopes filling my lungs with the dry, sparkling Alpine air and renewing my summer tan. How will I go? By train, to be sure. French Railways are laying on special services for winter sporters.

SNCF-points to better travel

- ★ The through winter sports service from Calais to the Upper Savoy Alps with 1st and 2nd class seats and couchette berths will connect with the afternoon service from London cutting the journey by 3½ hours.
- ★ The Paris—Lyons electrification, now complete, clips from twenty-five minutes to nearly two hours off journeys from Paris to the French Alps.
- ★ Tourist tickets offer reductions of 30% for return and circular journeys of at least 2,000 km.
- ★ Of special interest to gourmets—meal vouchers for use on French Rail journeys may be purchased in England and paid for in sterling!

tion is going to succeed it must become, as it were, a state of mind; working groups at all levels in the industrial hierarchy must get together and discuss their problems. The desire for an interchange of ideas and opinions must permeate the whole structure from top management to the factory floor. As Dr Scott says:

The first requirement of joint consultation, so far as the worker is concerned, is the development of consultative relations in the primary working group, between foremen, charge-hands and operatives.

In a world which is becoming increasingly conscious of the need for greater productivity, there are many who mention, perhaps tentatively, but certainly hopefully, that inviting phrase "human relations in industry." It is a subject in danger of suffering from an excess of jargon and woolly-minded thinking. Dr Scott's admirable study does much to present this problem in its true perspective. His conclusions, and some of his cures, are supported in an appendix written by an executive of one of the firms co-operating in the inquiry. It is a book full of invaluable material.

Creative Interpretation

Utility and All That: And Other Essays. By D. H. Robertson. *Allen and Unwin.* 206 pages. 18s.

Professor Robertson's only too rare ventures into print shine like a good deed in the naughty world of economic controversy. This Laureat of learning pursues Truth with a glee and disregard of dignity suggestive of a puppy halfway down a rabbit hole; he manœuvres intractable and nebulous concepts with a virtuosity which never degenerates into verbal juggling; he suffers fools, if not gladly, at least with dismissive tolerance; he grinds no axes; and he demonstrates that the most abstruse and stratospheric themes of the learned journal's *avant garde* can be fit subjects not only for the intelligent layman's attention but also for his keen enjoyment.

For some of the essays and reprinted lectures collected here, this last would be too comprehensive a claim. They are addressed to audiences not indeed, of high academic specialists, but nevertheless to a public having some considerable expertise in economic theory or practice. "The non-academic reader is warned," says Professor Robertson, characteristically, in his Preface, "that Nos. 4, 6, and 13, while not highbrow by modern standards, are probably of a different order of stodginess from the rest." No. 13 is, as it happens, a brief "background paper," written for a discussion group of the International Economic Association and dealing with the international terms of trade—as illustrated by Lewis Carroll's *Agé Agé Man*. The desire to quote, amounting almost to a frenzy, must be repressed; but readers of Professor James Meade's "Balance of Payments" are urgently referred to pages 176-177 of "Utility

and All That." Similarly those economists—some of them of quite respectable attainments—who have been more or less completely baffled by the developments of modern welfare theory as expounded by Mr I. M. D. Little, Professor Hicks and Professor Samuelson, may find a refreshing enlightenment in the title essay, disarmingly but deceptively described by the author as "an interim report by an idiot to his fellow idiots."

But if it is as an interpreter of the *avant garde* to the main body of economists—or to *avant gardistes* in other economic specialties—that Professor Robertson performs his most characteristic function, that does not imply in him any aversion from the parallel job of sorting out, for a much wider public, the economic implications of current events. The essays on the "Problem of Exports," 1945, on "Western European Economic Union" (broadcast in 1948), "Britain and European Recovery" (1949) and "British National Investment Policy" (January, 1952) are well within the layman's grasp, and reveal at once their author's consistency and his shrewdly realistic sense of political possibilities. If this book stimulates one regret, it is that only one essay—"Some Notes on the Theory of Interest"—displays Professor Robertson the powerfully original thinker rather than Professor Robertson the interpreter. But the regret is really ill-founded. Interpretation, as it is exemplified here, is in itself a high creative activity.

Australia's Economic Crisis

Australian Production at the Crossroads. *Angus and Robertson.* 154 pages. 12s. 6d.

This book consists of six papers read at the Australian Institute of Political Science at the end of January, 1952. The authors, mainly economists distinguished in the Australian scene, all agree that there should be greater production in Australia; the majority also argue that the pattern of the economy should be changed, although there is less agreement on what the pattern should be. In general, the papers insist that agricultural production must be greatly increased and there is a recognition that the importance of agricultural production in Australia has never been properly appreciated by the various Governments. As a result, there has been little real incentive in the past for the farmer to increase his production. But the contrary condition has existed for almost two decades in secondary and tertiary industry. Successive Governments have offered real incentives to firms in this sector of the economy to expand—and they have done so, as many believe, at the expense of the all-important primary industries and of the development of the base of the economy.

The authors reveal clearly the resulting weakness of the Australian economy—the lack of balance in investment, the distorted pattern of the economy, and the failure to arrest the spiral of inflation. They are less clear in suggesting

remedies. Special emphasis is placed on achieving higher levels of production as a means of combating this inflation. The problem of greater productivity is also quite generally recognised. Here, however, the papers become more interesting for what they fail to say than for what they record. Little reference is made to the responsibility of management in this field, and indeed one speaker (the Minister for Labour) endeavoured to place the responsibility for the failure of the two sides of industry to co-operate on the subservience of the Labour party to the trade unions. This view was strongly opposed by a moderate trade union leader, who showed more understanding of the basic problems of productivity than any of the speakers.

Naturally, since the papers were delivered to an Australian audience, the scale of Australia's great resources and its potential scope for development are taken for granted. Nor does the book give any real impression of the political scene, which so completely controls the present crisis in the Australian economy. Without such information the reader will find it difficult to obtain a real idea of the true forces which influence the problems discussed here in their purely economic sense.

Text and Reference Books

"Investment Companies." Twelfth Annual Edition, 1952. By Arthur Wiesenberger. (New York) A. Wiesenberger & Company. 384 pages. \$15.00.

The American investment trust movement, with the exception of a very few small companies, is barely yet a quarter of a century old. But it already shows enormous variety in its manifestations. The most striking difference with English and Scottish investment trust practice is the wealth of information available, and Mr Wiesenberger's annual compilation has become the standard source. Here will be found every figure that the interested investor could reasonably require—calculations of "leverage factors" and "price volatility" as well as the complete portfolios of 84 trusts.

Chambers's Encyclopædia World Survey. *George Newnes.* 368 pages. £3.

The editor of this Survey describes its main object as being to "provide a self-contained review of contemporary topics." It covers the period since the latest publication of Chambers's Encyclopædia: 1950 until February, 1952.

The book starts with a calendar of events, followed by articles dealing with international affairs and with the main branches of national life; arts, sciences, industry, etc. The chief emphasis, perhaps only to be expected, is on the United Kingdom. The second part of the book deals with foreign countries, region by region.

The emphasis throughout seems to be on the general reader, for although there is a great deal of information in this survey, it is not arranged in such a way that it can be used as a work of reference for obtaining facts quickly.

AMERICAN SURVEY

Making Capital Out of Communism

Washington, D.C.

HAD an American been among those men of varied nationality who sat down to write an essay on elephants—with the Pole writing on "The Elephant and the Polish Question," the Englishman on "How to Shoot an Elephant" and the Frenchman on "L'Eléphant et L'Amour"—he would undoubtedly have chosen the title of "The Elephant and Communism." For the elephant is the Republican symbol, and there is no topic about which members of the Republican party talk so much as they do about Communism, and few about which they know so little. Long years of opposition have spared them the responsibility for assessing Soviet motives, for deciding when or where to oppose Soviet expansion and for preventing, or correcting, the infiltration of government departments by Soviet agents. They have been free to search for Communists where they wanted to find them—among government officials appointed by the Democratic Administration.

Considering the fervour for the Popular Front in the nineteen-thirties and the motley crew taken into wartime agencies and later, when those agencies were hastily disbanded, dumped in the State Department for sorting, it is remarkable that so few examples of espionage were found and that nothing more serious than the Hiss case developed. But used with skill by the McCarthys, large and small, these few cases have succeeded in scaring a people who have less experience of spying and being spied on than European nations. Americans seem to expect foreign spies to label themselves as such, or, at least, to have the good manners to join a few Communist organisations. It was seriously suggested, early in the campaign, that Mr Stevenson could not be trusted as a President because, having worked in the State Department with Mr Hiss for a few months, he had not instantly recognised him as an enemy agent. If Mr Churchill were running for office in the United States, he might just as well be called "soft on Communism," because he was Prime Minister at the time that Dr Karl Fuchs was first employed by the Government.

Many of those who were General Eisenhower's most enthusiastic supporters early in the year believed that he was the only man with any chance of winning the Republican nomination who would be willing and able to keep the most important problem of the time—how to deal with the Communists at home and abroad—out of politics. It is his failure to do this, indeed his willingness to use the methods of the extremists, even if not in their most extreme form, that has driven people who never voted for either Mr Roosevelt or Mr Truman into vocal opposition to him. It has also, if the polls are any guide, persuaded many more, particularly among the less educated classes, who always voted for Mr Roosevelt and Mr Truman, to rush for protection from the devil under the wing of a military hero.

When the General told an audience at Green Bay, Wisconsin, that the purposes that he and Senator McCarthy had "of ridding the government of the . . . subversive and the disloyal are one and the same" and when he later said in Montana that he intended to rout "the pinks" as well as

"the Communists" out of the government, he was implicitly asserting that, to his knowledge, the government contained "pinks," Communists, the subversive and the disloyal. Coming from an ordinary politician trying by every means in his power to get back into office this kind of statement could be assessed at its real value; coming from a man supposed to be above partisan politics, who has been in the inner councils of the Administration for most of the last ten years, it is likely to be taken by the innocent at its face value. General Eisenhower knows, as well as the President and every other responsible official, that, as General Bedell Smith said in such an unfortunate way, the head of every government department must always act on the assumption that his organisation has been infiltrated by enemy agents. And that, no doubt, would be General Eisenhower's explanation of the meaning of what he has been saying. It is not, however, what it has meant—nor, in the opinion of most people, what it was meant to convey—to the more ignorant members of his audiences.

Mr Stevenson was justified in asking a few questions of the General. "Would he fire J. Edgar Hoover?" Mr Hoover, the head of the Federal Bureau of Investigation, has never been criticised, even by Republican members of Congress. "Would he fire General Bedell Smith?" General Smith was the Republican candidate's own former Chief of Staff; his bald statement, given in quite another connection, that he took it for granted that there were enemy agents in the Central Intelligence Agency, which he heads, recently created a sensation. He has since made amends by saying that he would think himself lucky if he got as much co-operation from the next President as he had done from Mr Truman. Finally the governor asked

Would he discharge General Smith's deputy, Allen Dulles, the brother of his own chief adviser on foreign affairs? . . . Is the Republican candidate seriously interested in trying to root Communists out of the government or is he only interested in scaring the American people to get votes?

But answer came there none.

Perhaps it was too much to expect a party which has been out of power so long to refrain from exploiting an issue which could be represented as purely domestic. What did come as an unpleasant shock, however, even to those who had no great hopes of keeping the campaign on the level where the Governor started it, was the willingness of General Eisenhower to make political capital out of the world's fight against the Communists in Korea. He must have been remarkably ignorant if he did not know that the South Koreans had suffered more casualties and had more troops in the front line than the United States and that new troops were being trained and armed as fast as possible. Yet he

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

preferred to pretend that there was "no sense" in American troops being there and that we must "make certain that those South Koreans . . . defend their own lines."

In speech after speech and at whistle-stop after whistle-stop, there has been the suggestion that the presence of a soldier in the White House will ensure an end—a quick and successful end—to the Korean war. Mr Stevenson's answer at Spokane, Washington, was to say:

I will not play politics with war and peace. Our men are fighting in Korea so they will not have to fight in Alaska, Spokane or Omaha. They will come home from Korea just as soon as our national safety permits. And, for my part, I deplore the suggestion that they can come any sooner. There is no trick that can end the Korean War—as I am sure the General knows full well.

Not only does the General know it, but his advisers are careful to point out that when he promises to find "an intelligent and honourable way to end the tragic toll of American casualties in Korea" he makes no specific promise about when he will be able to do it. That, however, is something that the audiences seeing the great hero and listening to him for a few minutes fail to notice.

It is this aspect of his campaign which, Mr Joseph Alsop said a week or two ago, is responsible for the remarkable fact that the reporters who have been travelling with the General, who were warmly sympathetic to him at first and some of whom even went to Paris to urge him to be a candidate, are now "almost solid for Adlai Stevenson." This is not the way political correspondents normally react during a campaign. Mr Ernest Lindley, discussing the same phenomenon in the magazine *Newsweek*, recalls that 50 Washington correspondents were almost equally divided between Mr Willkie and Mr Roosevelt in 1940 and between Mr Roosevelt and Mr Dewey in 1944. In 1948 they were 37 favoured Mr Dewey to 7 for Mr Truman. Mr Alsop's explanation is that the reporters have had to watch audiences taking at their face value the General's

intimations, which are not exactly promises but sound perilously like promises . . . that he will "bring the boys back home" and fill their places in the battleline with South Korean troops. . . . His hearers fail, so to speak, to read the fine print on the back of the contract. And the newspapermen are more or less forced to read the fine print simply because the contract is offered to them so often.

The opinion of reporters may be no guide to the feelings of the electorate. But to anyone who knows that a reference to the "fine print on the back of a contract" is an American euphemism for a legal way of getting out of an awkward commitment, this is a damaging indictment of the men who have led the General through his "crusade." Their battle-cry now seems to have been borrowed from General MacArthur—"There is no substitute for victory."

Farmers, in Two Minds
