Eisenhower rashly roused hopes that he could end the war—Mr Acheson must have felt a notable weakening of the United Nations position. Mr Eden, on the other hand, believes that the relationship between the Soviet Union and China invites exploitation by diplomacy. Two can play at Stalin's splitting game. China is gaining nothing by the Korean campaign; indeed, it remains in complete dependence on the Russians so long as it goes on. It may be beyond the power of western diplomacy to split the two Communist great powers in the predictable future; but it is not beyond its power to reduce the dependence of Peking on Moscow by finding ways of ending the war.

It is a subtle and attractive theory, to which some of Mr Eden's advisers are understandably attached; but it is not one which it is particularly appropriate to apply at this moment. If the Chinese had reasons to believe that General Eisenhower would do what Governor Stevenson said he himself would do if elected—keep the troops in Korea one day longer than the Communists—then they might feel it worth their while to end the ordeal by negotiation. But so long as they can hope that American opinion is moving away from Mr Stevenson's view, so long will they sacrifice six of their soldiers in order to add one more to the UN casualty list. The sooner General Eisenhower's visit to Korea is made and its results assessed, the better it will be for everyone.

The fact has to be faced that those results, after what has happened at the United Nations, may be far from reassuring. It may prove necessary to demand of the United States and its allies a greater effort for a longer time, if only to disperse any ideas in the Communist capitals that the free nations are faltering. And it is General Eisenhower's supreme asset that only he could ask for such an effort, whether of the United States or of other nations. This is a point of immense importance that may well have been missed in Moscow and Peking—the point that if General Eisenhower decides the struggle must go on or be intensified, and if the Russians and Chinese persist in demanding the forcible repatriation of all prisoners of war, then Americans will rally to him, with opinion outside the United States almost certainly following.

There is much to be said from the Communist point of view for the Indian initiative which Mr Vyshinsky frustrated. It was reasonable, conciliatory, gave the aggressors the benefit of the doubt on points of great importance, and treated the Czech and Polish governments as capable of neutral behaviour; it took the repatriation of prisoners out of the hands of the belligerents and offered them ample opportunities for delay, cheating and pressure on individuals. It was because the proposals were so open to abuse that Mr Acheson criticised them—with very good reason, given his embarrassing position as an outgoing Secretary of State. And it was, presumably, because they offered loopholes and baits to the Chinese that Mr Eden supported them, with full realisation of the risks. Yet, in spite of this—in spite of the fact that there were differences of view between Washington and London, in spite of the fact that the Western Powers were again allowing one Asian government to suggest some appeasement of another—Mr Vyshinsky said No. He may yet regret it.

The nations with troops in Korea have quite rightly decided to persist with this Indian plan. The risks it

entails are worth accepting for the prospects that it offers of breaking the Panmunjom deadlock and of mobilising the whole opinion of the free world behind the principle that there shall be no forcible repatriation of prisoners. It should be pressed ahead so that Mr Vyshinsky may be forced to seek new instructions. His masters understand and respect obstinacy and, however much they enjoy the dividends of Korea, they will not want to be manoeuvred into a position where they are clearly responsible for a failure to end the fighting. At this stage, after Mr Vyshinsky's refusal, the effort of the United Nations can be little more than a diplomatic game; but it is well worth playing, and it will be a great pity if Mr Acheson's instructions make him hold up or complicate the moves. For the game could very soon become deadly earnest; and it would then be necessary for the nations taking the leading part in Korea to show the greatest resolution and unity in seeing that the Indian plan were honestly carried out.

*

Its fate will depend largely on developments in American policy. If General Eisenhower takes and announces one decision—that there is a way to peace by negotiation and bargaining—then the Indian proposals and the UN action would cease to be useful. But if he took a decision in the opposite sense—a decision that there is no quick way of stopping the war and that the fighting must go on—then the Russians and Chinese might find the UN proposals of interest. Their constant endeavour will be to keep opinion in the United States and elsewhere divided: when appeasement is in the air they will put pressure on the front; when resolution is in the air they will want to talk peace. The virtue of the Indian proposals is that their refusal to accept forcible return of prisoners shows resolution, while their concessions to Communist views show a genuine desire for peace. Both factors are vital and there is no good reason why the American and British divergences about which was the more important should have been interpreted this week as something fundamental. They were not.

For the moment Britain's role in the matter cannot be very active. So much depends on the visit of General Eisenhower to Korea. There, it is true, he will be talking as President-elect to American officers who are responsible in the last instance to the United Nations. Yet nothing can alter the fact that this will be a highly personal mission to carry out a pledge to the American people. It is no time for unsolicited advice, whether official or unofficial. The General has sufficient experience of working loyally with allies to know how and when to ask for it. The best that can be done, for the time being, by Britain and other countries involved in the struggle is to maintain unity and pressure behind the armistice proposals.

Whatever decision General Eisenhower may reach, whether the fighting can be stopped or not, there is no reason to believe that the Korean problem can be quickly solved. Even if the peninsula could be left divided between the North and South Koreans, is it credible that the North Koreans will give up their aim of national unity under Communism, or that China and Russia will not do all in their power to weaken the American position in Formosa and Japan? Behind the Korean war lies the whole question whether the United States and Japan can establish in the Far East a counterweight to the Soviet-Chinese alliance. And it is that which really worries Mr Vyshinsky's masters.

Kilawara, Kikuyu and Kenya

[T] is rare these days for the adjournment of the House of Commons to be moved to draw attention to "a definite matter of urgent public importance." It is quite exceptional for this procedure to be used to raise a colonial issue. Yet on Tuesday of this week the important and politically controversial debate on the second reading of the Iron and Steel Bill was interrupted by the discussion of the incident at Kilawara in Kenya last weekend, when 16 Africans were killed and 17 wounded.

There was a time, even within living memory, when such an incident could cause neither concern nor interest; it would have been regarded as an inevitable accompaniment of empire-holding. Much more recently it would have been discussed in Parliament and that would have been the end of it—except perhaps for the appointment of a commission of inquiry. Today, however, discussion of an incident like that at Kilawara cannot be confined either to the colony concerned or to this country. The reactions to it may be worldwide, and by exaggeration or distortion far more harm may be done than by the incident itself.

For this reason a full statement on the Kilawara affair was essential, and if the Opposition thought that Mr Lyttelton's first statement after question-time on Tuesday was inadequate or unconvincing, they were quite justified in asking for more facts and even in pressing for an early debate. But by using an exceptional form of procedure, interrupting the normal business of the House of Commons, the Opposition ran the risk of weakening the forces of law and order in Kenya. The Labour party was right to force such a debate only if it is convinced that the measures taken by the Kenya Government to combat Mau Mau are entirely unjustified. Public opinion in this country must not be thought to be divided unless it truly is. The killing of 16 law-breaking Africans by policemen acting in self-defence, after repeated warnings and persuasion had failed, is deplorable and regrettable. But does it compare in importance with the murder of at least three times that number of law-abiding Kenya citizens—Africans and Europeans—by the agents of Mau Mau?

Mr Griffiths fortunately did not press his motion to a division, and Mr Lyttelton's full account of the incident must convince most people that the shooting was unavoidable. The gathering of Africans was unquestionably illegal, for they had clearly been collected from far and wide. They disregarded the warning of the small party of police that discovered them. They disregarded the attempts of a civilian officer—an African chief speaking their own language—to disperse them. They disregarded the warnings of the police reinforcements who arrived later and found that they had been worked into a state of frenzy by a youth who, according to Mr Lyttelton, has admitted to have

prophesied that God would arrive at Kilawara at one o'clock and that then aeroplanes would fall to the earth and the police bullets would be turned to water.

In this state of frenzy they attacked the police force consisting of 22 Africans and three European officers, who, with commendable restraint, did not open fire until the mob was seven to ten yards away. Mr Lyttelton admitted that the three officers were young—aged 20-22.

But would anyone older have acted differently or with greater restraint?

Nevertheless, even if the shooting of Africans at Kilawara was a tragic necessity, there remains the danger that the whole of the Kikuyu tribe may be provoked by it into hostility to the Kenya Government. A few weeks ago, it was still true to say that only a minority of the Kikuyu supported Mau Mau. Is this true today? And, if so, will it be true in a week or two, after a few more villages have had their cattle impounded in the infliction of communal punishment? It is this danger that the Mau Mau crimes may develop into an outright struggle, first, between all the Kikuyu and the Government and ultimately between Africans and Europeans that is far more disturbing than the Kilawara incident itself.

*

Hitherto, Mr Griffiths has supported the Government in its support of the Kenya Government's emergency measures. Certainly the reasons for doubt have increased, and some questions may justifiably be asked. Is it wise to prohibit all meetings of Africans everywhere and thereby prevent their moderate leaders from addressing them and persuading them to support the Government? Is it wise for the Government to punish innocent Africans who refuse to give information about the terrorists, when it cannot protect them from reprisals? Cannot the Government make a greater use of African leaders in resisting Mau Mau? What, once the present disturbances have been settled, are the long-term measures proposed to prevent a recurrence?

On the immediate issue—the wisdom of the emergency measures—it is hard to say whether Mr Lyttelton is right or wrong; but at least he made a strong case. Mr Odede, the acting president of the Kenya African Union, had himself told Mr Lyttelton that the holding of public meetings was inadvisable. The Colonial Secretary admitted that collective punishment was distasteful; he admitted, too, that it, and all the repressive measures, aroused the danger of alienating Africans who are now sympathetic to the Government. But he asserted that its use would be strictly confined to places where not even a small group of inhabitants help the police to find those responsible for serious crimes. With the example of Malaya before them, few people would be bold enough today to advise more moderation. But the justification of the present policy in Kenya will be a speedy end to the activities of Mau Mau. If repressive measures have to be maintained over many months, they will leave a long legacy of bitterness.

It is tempting to place the present disturbances in Kenya in a wider setting: to look upon them as the fruits of Malanism in South Africa on the one hand or of the big political advances made by West Africans on the other. But to ascribe them solely to extraneous influences would be misleading. The situation in Kenya has been inherently explosive for many years. How could it be otherwise, with a steadily growing African population, which is increasingly unable to find a means of subsistence on the land, living side by side with a small European population farming large acres?

Mr Lyttelton denies that the cause of Mau Mau's

campaign is directly economic. That may be true; but it is equally true that without far-reaching economic measures the danger of similar disturbances will remain. Some eighteen months ago, when he was Secretary of State, Mr Griffiths achieved a remarkable *tour de force* in getting all races to agree to a round table discussion on constitutional reform. Partly as a result of his efforts, and partly as a result of the increasing readiness of the Europeans to accept the participation of Africans in the colony's government, Kenya appeared to have lived down its former reputation of a land of inter-racial hostility. In spite of all that has happened in the last few months, the inter-racial conference on constitutional reform must go on, and Mr Lyttelton has given the welcome assurance that it will go on as soon as the present disturbances subside. But to give the Africans equal political rights

with the Europeans while leaving them without the means of subsistence cannot solve Kenya's problem.

The appointment of the promised Royal Commission is therefore of the utmost urgency. The delay in announcing the members is understandable, for in the colonies today a commission is judged as much by the personalities of the people composing it as by what they recommend, and an unfortunate appointment can destroy confidence in its impartiality. But time in Kenya is getting short. Mr Griffiths said this week that Kenya may be Britain's last chance in Africa of working out a democratic constitution in which all races can co-operate. It is also a test case of colonial development, a chance for Britain to show that it has the will and the means to give Africans bread—and enough of it—as well as the vote.

The Old Despotism

IT is a long time since any government in these islands nursed a sinister intention to interfere with the essential liberties of the people; but every government will behave illiberally for its own convenience—to an extent limited by little but the vigilance of public opinion. The present Cabinet is no exception. In the past ten days it has shown, in two separate matters, a shocking disregard for the principles of free, democratic government. Admittedly the offences, though great, are of a familiar kind. They are, first, the savage use of the guillotine to limit parliamentary debate on the Transport Bill; and, secondly, the maintenance of the last Government's emergency legislation—legislation that confers large and ill-defined powers on the executive. The Conservatives used to profess their wish to abolish this legislation, and the familiarity of their change of front does not excuse them.

The Labour party in recent years has shown clearly the politician's great capacity, in the pride of office, for ignoring middle opinion. There were, however, reasons to hope that Mr Churchill's ministers might in this respect have more wisdom. They came to office freshly fertilised by the liberal ideas that touched their party in opposition. They have a very narrow majority, which suffices comfortably only because of Liberal support in the division lobbies. And, above all, the Conservatives would never have gained office if they had not been accepted as the lesser evil by former Liberal supporters. In this, the experience of the general election has been confirmed, not refuted, by the High Wycombe by-election that has given the Tories their new confidence. In a straight fight, they won easily; but it is likely that a Liberal candidate could have attracted enough votes to tilt the balance against Conservatism.

These considerations ought to be strong in the minds of ministers. But power can corrupt the judgment as well as the principles of politicians. Both the use of the guillotine and the continuance of emergency regulations without reform have been pushed through against the opposition of the Liberals who are normally the Government's allies in Parliament. And in both cases, the reasons for the Government's actions cannot be put much higher than a mixture of laziness, inefficiency and concession to bureaucratic convenience.

In this Parliament there has to be government by guillotine. The Opposition, naturally enough, is bent

on delay, and the smallness of the Government's majority prevents it from committing controversial Bills to a standing committee, where its majority would be insecure. Business therefore cannot be got through at any reasonable pace without a timetable for the Bill's progress in committee of the whole House. But the necessity for this guillotining of debate does not make it any less an infringement of the minority's freedom to criticise—the freedom that is the foundation of genuine parliamentary government. The guillotine is an exceptional necessity, not a right that the majority can assert to suit its convenience. Mr Crookshank last week did treat it as such a right, and though in this week's debate he troubled to make some apology for his executioner's robes, the deed was done none the less.

There is a minor and a major criticism of this resort to the guillotine. The decision to use it was taken too soon, and should have been delayed until the first days of debate had shown beyond challenge that the Opposition was making the discussion unnecessarily and unreasonably slow. But the Government's major and entirely inexcusable affront to Parliament is its intention to limit the committee stage of the Transport Bill to 'seven days' discussion, or 49 hours of Parliamentary time. In 1947 the committee stage of Labour's Transport Bill was limited to 77 hours, and *The Economist* commented:

There has never been another such case of the brutal use of the guillotine. . . . There is no point in mincing words. The way the Government have rammed this Bill through the Commons is a scandal and an insult to the democratic process.

There is no more point in mincing words now. It is true that the present Bill is in some respects slighter than that of 1947; but the subject is the same and, as is argued on a later page, the Bill certainly cries out for improvement in committee. The Government's first and second thoughts on transport have already been radically transformed under the influence of outside criticism, and the process should go on; indeed the Minister of Transport has invited it. The only motive for extreme haste has nothing to do with transport. It is party pride. The Tories are anxious to get one of their controversial measures to the statute book now because they lost so much time in their first year—partly

from bad luck, but chiefly from their own hesitations and short-sightedness.

The fact that Labour has similarly misbehaved in the past provides no excuse whatever for the party that is supposedly most concerned to maintain the traditions of Parliament. Equally, the misdeeds of the other side are no reason why the Tories should be content to renew the Supplies and Services Act and the other emergency regulations of the war and immediate postwar years. In opposition, their views were plain. Mr Churchill said in 1947: "These powers are the negation of British freedom and our way of life in time of peace." When the war was still only two years away, that may have been a somewhat immoderate proposition. It is surely not open to challenge more than seven years after the end of the war.

No one denies that the modern state has to entrust the executive with a large and intricate volume of delegated legislation. No one denies that many of the powers exercised under emergency legislation are still needed. The whole system of rationing, the control of materials and most price controls depend on them; so does the Government's opencast coal mining. But if many of these things are still necessary, that, surely, is the reason why they should not still be allowed to rest on the vague powers that were conferred on the executive, without any effective Parliamentary supervision, in response to a long-past emergency.

The Conservatives were supposed to have a policy in this matter. A year ago the speech from the throne announced that ministers would

review the whole subject with the aim of reducing the number of these controls and regulations and, wherever possible, embodying those which must be kept in legislation requiring annual renewal by Parliament.

This was consistent with the attitude Conservatives had taken in opposition, and it was reasonable. Yet last week the Lord Chancellor calmly reported that "the Government have not yet been able to satisfy themselves that there are any powers which fall clearly into this category"—the category of regulations that can be embodied in legislation requiring annual review.

This change of view has not been explained. There are two possible explanations. Either ministers a year ago were being entirely foolish, or their enthusiasm for liberal reform evaporated as soon as they got into office. The second explanation is the less unflattering as well as the more likely. To frame legislation that would satisfactorily define the powers that the Government needs is admittedly very difficult. But it is precisely those diffi-

culties that make the definition necessary. If Parliament shuns them, they have to be faced in practice by the ministers and civil servants who decide how to use the powers. And the interpretation of vague powers is not, in peacetime, a function with which the executive should be entrusted.

The general inquiry into delegated legislation that the Government suggests has nothing to do with this problem; it will be concerned generally with Parliamentary supervision, and most of such legislation is made under statutory powers that are fairly well defined. The first stage in any real attempt to curb the inflated powers of the executive must be to put the regulations at present based on emergency legislation on to the same footing as other delegated legislation. The Government should have no powers that are not either closely defined in scope or limited in duration.

★

The Tories no doubt sincerely feel that the liberties of the British people are safe in their hands. They will not abuse these powers, so why go to all the trouble of clearing up the tangle of emergency legislation that does no practical harm as long as ministers mean no harm? They should reflect that the lowest common factor which unites their supporters in the country is dislike of what a Left-wing Labour government might be like. How much weaker will be the defence against future inroads on the country's freedom, against the further debasement of Parliament, if the Conservatives themselves have kept in being powers that are an insult to Parliament and an open invitation to bureaucratic assertion over the rights of the individual? As Mr Boyd-Carpenter fairly pointed out at the end of last week's debate, "The general criticism has been, not that we are asking for excessive powers, but that we are not asking for enough." This attitude on the Labour side is a clear enough warning. If its liberal professions mean anything, the Government should be bringing the powers of the state into definition while it has the chance.

It does not trouble to do so because such reform is outside the immediate party battle. Here, indeed, is the outstanding defect of the British political system as it now operates. It unites the massive parties of Left and Right in one thing: they are both enabled to ignore middle opinion with impunity except when an election is close at hand. But a heavy price will be paid by the Tories, and by British democracy, if they go on yielding to that temptation.

Commonwealth Consultation

COMMONWEALTH conferences have become more frequent since the war; meetings of the Prime Ministers, now virtually annual events, are supplemented by meetings of Ministers for foreign affairs, defence and finance. Yet, to the average citizen of the Commonwealth, the meetings seem to produce little result or apparently odd results. The most publicised decision of the conference of Finance Ministers last January was Australia's decision to include British goods in its sweeping restrictions on imports. Even defence presents an uncertain picture, with Britain claiming a role in the Anzus arrangements which Australia and New Zealand are unable to concede. Consultations multiply, but so apparently do the disagreements. At some point the observer begins to wonder whether, after all, the Emperor wears any clothes. It may well be that the widespread lack of genuine interest in the Commonwealth idea that is observable in Britain is due to this difficulty of seeing its practical advantages.

This mood of disappointment almost certainly springs from a misunderstanding of the basis of Commonwealth co-operation. The relationship between its members is essentially that of free associates, and no decision taken by Ministers in conference can supersede the responsibility of each separate Parliament. It is true that a specific obligation, agreed to by all the Prime Ministers, could be passed through each Dominion Parliament. Yet the acceptance of such obligations has not been popular, in part because each Dominion prefers to have its hands unfettered in times of crisis, but much more because of a feeling that to define obligations is to restrict the field and method of co-operation. Mr St Laurent, for instance, has affirmed both his dislike of specific commitments and his belief that the Commonwealth is a closer alliance than any in history. The explanation of the paradox lies in the fear that the more precisely an obligation is defined, the more likely it is to limit co-operation to the precise fulfilment of that obligation, and to exclude a wider field of common activity.

To these limitations, imposed by the spirit and history of the Commonwealth, must be added two others inherent in contemporary politics. Confronted with Soviet military might and the threat of Chinese expansion, the Commonwealth is not and cannot be a self-sufficient military power. The need to relate defence to American power in both the Atlantic and the Pacific has created superficial difficulties—Australia fearing exclusion from one region because of Nato, Britain fearing exclusion from another because of Anzus. In fact, however, only one policy could seriously disturb Commonwealth relations, and that would be some Bevanite or neutralist fantasy of facing Soviet might and spite in divorce from the American alliance. Any such policy pursued from London could, indeed, split the Commonwealth. The present differences are only surface deep and are, indeed, useful reminders that the Commonwealth cannot by any internal arrangements alter the pattern of world power. The realities of defence have, moreover, parallels in the economic field. The high degree of consumption in Britain and Australia is incompatible with any large export of capital goods to less developed dominions such as India. Any adequate scheme for mutual aid within the Commonwealth also depends upon securing capital from the United States.

The Commonwealth is thus neither self-sufficient nor naturally unanimous, and as the family grows, the divergence of ideas is likely to increase. Asian and African Dominions cannot be expected, for instance, to have the same views about colonial rule that are held in Europe. This, in turn, can create special problems in the relations between, say, London and Paris that touch New Delhi not at all. Commonwealth consultation cannot, therefore, tie individual Dominions in advance, supersede their parliamentary responsibility, alter the facts of power in the world or spring from a spontaneous tendency towards agreement. This is a formidable list of negotiations, and it may well be asked what, then, can consultation accomplish, and what is its value to the Commonwealth and to the world?

Such misgivings represent a serious underestimate of the true value of close consultation. The relations between most states are conducted within a penumbra of half-truths, ill-digested information and historic misunderstandings. Even if the objectives of policies are grasped, the reasons for them may not be. Through all diplomacy, therefore, runs a thread of suspicion which results more often from ignorance than from ill will. Even relations between such close partners as Britain and the United States illustrate these difficulties. It is, therefore, no small matter that in one community of diverse nations stretching from one end of the world to the other, the flow of information, full explanation, and the habit of consultation have reduced the factor of ignorance to the lowest level ever achieved between sovereign states. The result may not always be complete agreement, but it is almost invariably confidence and goodwill.

*

It follows that the chief way in which the Commonwealth can be strengthened and its particular contribution to peace and prosperity enhanced is by constantly improving both the quality of the information exchanged and the methods of close consultation. These improvements will of themselves make the emergence of common policies more likely; and even where disagreement persists, the atmosphere of confidence will not be disturbed. In both respects there is great room for improvement. Quantity of information, the mere passing on by London of telegrams by the batch, is no substitute for quality. An enlightened background despatch, designed to make sense of the flood of individual telegrams, may demand more work and thought, but it is the very stuff of genuine information. Nor is the geographical flow of information satisfactory. Although there are two committees in London acting as a clearing-house—Lord Bruce pointed out in 1948 that 90 per cent of the information went out from London to the Commonwealth capitals—such a concentration upon messages from the United Kingdom cannot create a genuinely informed Commonwealth. London is quite as much in need of information, and each Commonwealth capital would also gain from a greater flow of despatches, say, from Canberra direct to Ottawa, or from Ottawa to New Delhi. London does not need to be a general posting-box, and the great increase in the direct diplomatic representation of the Dominions should make possible a wider, but also more intelligent and selective, dissemination of information.

Improvements in the machinery of consultation have often been discussed, and especially the idea of a Commonwealth secretariat. This proposal would never commend itself to the Commonwealth as a whole; either it would arouse the suspicion that it was drawing to itself policy-making functions, or it would be left high and dry by the determination of national departments to lose none of their authority. But the suggestion of a joint secretariat does not exhaust the possibilities. The preparations for the meeting of Finance Ministers last January and for this week's conference of Prime Ministers have established a new and sensible pattern: a preliminary conference of officials to put the agenda in order, and to avoid time-wasting consideration of detail by the Ministers themselves. There is also great room for advance within the various Commonwealth civil services. At present, the fighting services alone are exchanging personnel on a substantial scale. This example should be adopted more fully, and officials from all departments should be seconded for service within the civil services of other Dominions. Moreover, such secondment should be treated as virtually a condition of promotion and not as a period of exile during which those who remain behind secure the most envied posts. No single factor could so quickly increase understanding within the Commonwealth as the presence in every civil service of men who know the working of other Dominions' policy from the inside.

These criticisms of information and consultation apply in all parts of the Commonwealth, but a special responsibility rests upon the United Kingdom, which it should not fear to accept. Inevitably, London will for years to come be the centre where information is fullest, and

where vision can be widest. When, therefore, as a result of the fullest knowledge and contact, it appears evident that some joint policy would command general support, it is almost certainly London that would be best placed to take the initiative. Certain inhibitions still hold British officials back. The picture of a dominant mother country, in danger of overlaying its young offspring, lingers on. In fact, however, the young Dominions are now of age and the mother country is regarded not so much as an autocrat as a problem parent whose heavy population, narrow economic resources and financial instability give grave cause for alarm. British initiative, therefore, is unlikely to be feared or resented.

It is a big step to accept the possibility of giving a lead. The initiatives themselves demand even greater resolution. The habit of mind in London is rather that of dealing with events as they arise; this, in a worldwide community, may well mean that they are already beyond control. To go ahead of events, to grasp opportunities, to create and not suffer situations is a contribution to Commonwealth development which so far has been seized only once since the war, in the Colombo Plan. But that plan does not exhaust the field of possible initiative. In the next three or four years, the relationship between the sterling and the dollar area, between developed and under-developed areas, between the strategic problems of Europe and Asia are likely to be crucial and to cut across Commonwealth relationships at every turn. Here surely are fields in which imaginative and courageous leadership from Her Majesty's Ministers in the United Kingdom could transform the Commonwealth from a passive reinforcement to an active agent in the stability of the free world.

Transport in Committee

WHEN Mr Lennox-Boyd introduced the Transport Bill nearly a fortnight ago, he used words that strongly suggested that the Government would be ready to make improvements after scrupulous and careful examination of the Bill in Committee. This attitude seemed to be fair and wise; the Bill may be an improvement on its forerunner, but it is far short of perfect. The objection to the Government's decision to allow no more than seven days to the Committee stage of the Bill, with the guillotine descending according to a fixed time-table, is not solely the grand principle—used by both sides at will—that it usurps the liberties of the House and the rights of the Opposition; it is primarily that this is a Bill that needs more time if it is to be satisfactorily reshaped.

Since the Government are wedded to the idea that privately owned road haulage alone can provide cheap and efficient service for traders, and since the disposal of the Road Haulage Executive's fleet "as quickly as is reasonably practicable" is the primary purpose of the Bill, it would be hard for them to give way on the extent or on the method of denationalisation. Yet there is a growing volume of evidence that hasty denationalisation would disrupt the trunk road haulage services on which traders now rely—and which, on the whole, they find efficient and economical. The comments of the Association of British Chambers of Commerce on this matter of disruption are entitled to respect. But perhaps there is one risk that threatens even graver harm—the risk that

British Road Services may be demoralised by the offering for sale of its vehicles for which in fact few bidders appear. The total fleet of the Road Haulage Executive amounts to roughly 40,000 vehicles, of which 30,000 are engaged in general haulage on trunk routes and tramp work, while the rest are split more or less equally between parcels, specialised traffics, and contract hire. An optimistic private estimate of the number of the Executive's vehicles that are likely to be sold is one-fifth of the total, and the presumption is that most of the 8,000 vehicles—if they were sold—would come from the trunk services, the development of which has been the outstanding achievement of British Road Services in the past five years.

There may be an argument for selling one or more of these services as a going concern, though mere change of ownership would not in itself make them capable of better service to the public. But the wisdom of taking pieces of services and offering them as "transport units" is open to serious doubt. The terms on which vehicles are to be disposed of are intended to secure that the "small man" who wants to return to the industry should be able to do so. This involves a misconception of the economics of road haulage; the small operators will have to group together, through some form of clearing house organisation, to do precisely what the Road Haulage Executive now does to obtain return loads and avoid empty running. There may be competitive sense in having publicly and privately owned trunk services

vying with each other in efficiency and cost on the same routes; there is none in taking a few vehicles from a number of routes and expecting to attract private enterprise into running them. If mileage restrictions are to go and if "A" and "B" licences are to be made more easily obtainable, the result would surely be to give British Road Services all the competition that could possibly be needed; it will also make the "small man" think twice about "coming back" into an industry that has greatly changed since he knew it.

This suggests that it would be desirable both to fix a limit to the number of the Executive's vehicles that are to be sold, and to arrange their sale in a way that does least damage to the efficient working of the road haulage industry and promises the greatest competitive spur to both publicly and privately owned services. The small man is a figment of political imagination, no longer appropriate, and almost certainly no longer anxious, to undertake road haulage business.

*

To advocate a policy of this kind is to suggest radical and unpalatable changes in the early clauses of the Bill. But the original purpose of "freeing road haulage" has now been overlaid by the reorganisation of the railways, and it is here that the restriction on the "full consideration" in Committee that Mr Lennox-Boyd promised will be most keenly felt. In his speech on the Second Reading, the Minister by no means succeeded in removing doubts about the scope of the new freedom that the railways are to be given in fixing their charges. The first impressions left by the Bill still stand—"freedom" will in practice be seriously qualified and liable to prolonged, delaying opposition. Mr Lennox-Boyd promised to listen to all that was said in Committee,

whether it comes from coal traders, who undoubtedly have views, from coastal shipping or from traders who fear that they may be subjected to unfair charges, or whether the criticism comes from those who believe that the new opportunities for the railways should be made available before the carrying out of a charges scheme, as it might be a long time before a charges scheme could be produced.

These words recognise both sides in the argument with a nice ambivalence. If the Government have any convictions about the principle of giving greater freedom to the railways in their charging powers—and it is surely the right principle—they ought to be prepared during the Committee stage to allow a greater chance for that freedom to become effective. As the Bill now stands, the greater flexibility of charges that it contemplates will be circumscribed at every turn by delays and by opposition on the part of any traders who can argue—as many undoubtedly will—that they are being hurt.

That these safeguards should still be thought to be necessary, in addition to the public obligation that the railways assume, and despite the much greater, and more effective, freedom that is promised to road hauliers, is one of the extraordinary contradictions in the Bill. But there is another matter affecting the railways' organisation on which it would be wise to take second counsels. If there is one thing that is clear in the Bill it is that the Railway Executive is to disappear; if there is one thing that is unclear in the Bill, it is the method of management that is contemplated for the future. In some respects, there is no reason to lament the disappearance of the Railway Executive—certainly not the end of an unprofitable experiment in management on functional and technical lines. Yet there have been advantages in

bringing technical matters to a central point of reference and decision, and valuable economies (by no means yet exhausted) have been won from standardisation. The work of the Railway Executive in this direction seems to have been a good deal more effective than the efforts of the general managers' conference of prewar years.

Discussion in Committee ought to concentrate on the main principles of railway organisation. First, the railways must be commercially aggressive and keyed up to meet competition. That is the argument for the devolution of commercial and operating decisions to separate regional railway organisations; presumably that is what Mr Lennox-Boyd implied in his elliptical phrase:

We have in mind . . . a substantial measure of regional railway autonomy sufficient to give genuine reality to regional railway control over matters proper to regional responsibility.

But, as he recognised, this would still leave important matters of central responsibility "for example, charges and wages" and "some standardisation of locomotives." There are two opposing pressures here. There is the pressure that comes from those who argue that power and autonomy should be given in the fullest possible degree to separate regional railway undertakings, and who minimise the importance of central management and policy making. And there are those whose inclination is towards the central concentration of direction. The British Transport Commission would, quite naturally, fall among the latter; some of those who have experience of running railway regions might be found among the former. The Railway Executive, despite all its faults, has been the only body that could attempt to apply the decisions of general management over the railway system as a whole. These decisions will still be required, and it is doubtful whether the Commission (which in any case is *parti pris*) is the right body to draft a scheme to secure them. This is a matter on which the Minister would do well to seek advice from a wider circle, and not exclusively from the Commission as the Bill provides.

If, as most observers would agree, there are to be matters reserved for central management (including, presumably, in addition to those specifically mentioned by the Minister, decisions on finance and the size and distribution of new capital works) it should not be difficult to project the form of railway organisation that is called for. At the base, there should be regional autonomy for getting traffic and moving it. In the middle, there should be central management supporting the regions by designing and securing the resources for improving the efficiency of the railway system and by accepting the responsibility for matters that can only be decided centrally. Crowning the whole, an effective policy-making body, largely part time, is required; the Bill seems to suggest (without saying so explicitly) that the Commission of the future will be of this sort. But it makes no provision at all for the taking over of the responsibility of central administration and the powers of functional direction at present exerted by the Railway Executive—which is to disappear. This leaves open a dangerous gap—dangerous because it might be filled by a functional full-time Commission, leaving entirely out of account the necessary provision of general management.

These are gritty problems, and unattractive material for debate in Committee. Yet they are matters of great importance on which experience since 1947, if objectively assessed, suggests the right conclusions. They deserve something more than snap decision in a guillotined Committee.

NOTES OF THE WEEK

Stately Shuffle

A certain pattern is discernible in the various ministerial changes that Mr Churchill has made during his year of office. Posts in the Cabinet are still reserved primarily for the Old Guard, and particularly for those whom the Prime Minister grew to trust in wartime. But outside this charmed circle, increasingly a career is being opened to the talented younger men of the Tory party, with preference for those discovered by Mr Eden and Mr Butler.

This week's reshuffle, caused by the illness of Lord Woolton, conforms to the pattern. He will not be up to the heavy tasks which fall to the Lord President of the Council in Coronation year and has therefore yielded his place to Lord Salisbury, but he remains in the Cabinet with the sinecure office of Chancellor of the Duchy of Lancaster. Lord Swinton completes this stately minuet by moving from the Duchy to take over Lord Salisbury's post at the Commonwealth Relations Office. Sir Arthur Salter becomes Minister of Materials, the job previously done in fact (though not admitted in name) by Lord Swinton. Sir Arthur's place at the Treasury is taken—now with the title of Economic Secretary—by Mr Reginald Maudling, who at the age of 35 is one of the ablest of the young men who served under Mr Butler at the Conservative Central Office, and an example of the new professional politician in the Conservative ranks.

The effect of these changes is that the Cabinet is increased in size by another lord. Mr Churchill seems determined to entrust the general brooding on affairs to men who cannot speak in the House of Commons, where the results are debated. It seems likely, however, that the "overlord" system of co-ordinating ministers is now definitely in decline. Mr Churchill appointed the overlords less as an experiment in the machinery of government than as a convenient way of making available the counsel of men like Lord Woolton and Lord Leathers without imposing on them political and departmental tasks that they did not want. The system may therefore disappear as soon as the individuals with whom it was associated move to other posts or leave the Government. It would be a pity if the result were to destroy indefinitely what could have been, if only the lords had been commoners, a valuable innovation.

There is one regrettable aspect of these changes. The Commonwealth countries will shortly find themselves dealing with a third new Commonwealth Relations Secretary within twelve months. The difficulties over the Pacific defence pact are a reminder that Commonwealth relations cannot simply be taken for granted. The post is one which should be filled for its own sake, not because it is a convenient position for a senior minister whose advice is required in the Cabinet on general policy. It is to be hoped that Lord Swinton will at least be left undisturbed to devote his considerable energies to it.

* * *

Stalemate on Steel

One thing about the debate on the second reading of the Steel Bill is certain. The Conservatives have got no political credit out of it. They fell into the extraordinary blunder of failing to keep a quorum for the major debate on one of their two major measures of the session. It is misleading to conclude that even Tory members think steel denationalisation unimportant and irrelevant. But the taunt is obvious and it will certainly be exploited effectively on Labour platforms.

The other consequence of the incident is perhaps worse. It has made feelings in the House more bitter, and the party struggle is likely to become less dignified than ever. The

immediate responsibility lies with the Leader of the House of Commons and the Government Chief Whip; they have made fools of themselves. There were, it is true, extenuating circumstances. The Speaker's acceptance of a motion to adjourn the House, in order to discuss the troubles in Kenya, was a matter for legitimate surprise. But this happened in the afternoon, and there was plenty of time to arrange that enough members should remain on the premises to keep the debate going three hours later than it would normally have done. The failure to do so produced disaster only because of a serious breach of Parliamentary etiquette. It is contrary to the conventions for the Opposition to exercise its right to have the House counted out during the inevitable quiet stage in the debate on a major bill. The counting out was an act of privateering by a handful of Labour backbenchers, and would probably have been frowned on by their own whips. But that is not an adequate excuse for the Government's failure of foresight; the counting out was precisely the sort of adventuring of which some Labour backbenchers' activities in the last session gave clear warning.

The Government's conduct of its business in Parliament would be entirely competent if the circumstances were normal. But they are not. It faces an energetic Opposition determined to make up for its lack of policy by vigorous Parliamentary attack for its own sake. Moreover, the divisions within the Labour party weaken its own whips' control over the rank and file and place a premium on aggressiveness for members on the front as well as the back benches. The Government in its response to this manoeuvring displays all the rigidity of a Spanish battle fleet. It thereby succeeds in looking dignified and even confident while Parliament is in recess—while the privateers are below the horizon—and becomes a blundering rabble under attack. The prestige of Mr Crookshank and Mr Buchan-Hepburn was battered in the last session, and the rumbling from behind them is now to reach serious proportions. Certainly the Tory leadership will have somehow to learn to think faster and farther ahead if the business of this session is not to run into the same humiliating snags as the last.

* * *

Divining Mr Dulles

The scale of the comment excited in both Europe and Asia by the choice of Mr John Foster Dulles as the new American Secretary of State is not entirely to be explained by the unprecedented importance of this post in the eyes of non-American peoples. It is also partly due to the strong personal impression that he has made abroad. In turning to the Republican party's most experienced international negotiator, General Eisenhower has necessarily picked a man who is not only a familiar figure to diplomats and politicians throughout the world, but who has become associated in many minds with particular acts and policies. Although a Republican, Mr Dulles has taken part—often a leading part—in almost every major diplomatic activity in which the United States has been involved since the war. He was among the midwives who brought the United Nations into the world, and remained to watch over its first tender years; he played a significant role in the drafting of the peace treaties with Axis satellites in Europe, and held the stage in his own right when it came to the Japanese peace treaty. It might be thought that the views of a man who had thus left his mark across the globe would be easily tagged and identified; yet the comment on his appointment has been remarkably unsure, indeed, in some respects contradictory.

To some extent, this uncertainty is due to the fact that Mr Dulles's diplomatic career has hitherto placed him in the delicate position of adviser to an administration to whose

domestic policies he was opposed. But the very fact that he was able to play such a part indicates the deeper reason for the inability of most observers to forecast his future path. Mr Dulles is a master of the art of avoiding dissension; if he does not always make new friends, at least he has a remarkable record for retaining old ones. He has not, of course, succeeded in being all things to all men; his friendship for Japan and for the Chinese Nationalists has, for instance, lost him much good will in India. Yet his successes with both France and Germany indicate the high degree of his diplomatic skill.

In the new Secretary of State the world awaits a man who has thought long and earnestly about many international issues, and who will need relatively little time to get abreast of his manifold responsibilities. But it will be wasting its effort if it tries to divine, from the many indications of his position which he has given in the past, the exact course which he will follow in the future; for Mr Dulles has always kept in reserve one of diplomacy's most valuable weapons—a touch of inconsistency.

Scrutiny at the Palais Chaillot

Few seemed to have noticed the remarkable and significant operation that is now going on in the Palais Chaillot, the headquarters of the North Atlantic Treaty Organisation. In brief it amounts to this: the defence programmes of fourteen member nations for the period 1953-54 are being submitted to close scrutiny by national officials acting in an international capacity. That is to say, Nato is expressing views and asking questions about arguments, facts and figures which have not yet been presented to national parliaments. Even when the time comes for legislatures to debate defence estimates, they will have less to bite on than Nato has; for the international operation known as the Annual Review (its method of working is described in an article on page 627) is secret and parliamentary debate is not.

This year there will be no *ad hoc* group of "wise men" to study national arguments and shortcomings and reconcile them with military requirements. To achieve reconciliation is now Nato's job; and Lord Ismay's conception of the authority that should lie with the permanent organisation of which he is Secretary-General is now undergoing its first serious test. If it survives, then the Council of Nato will have greatly increased its prestige, and cabinets will sit up and take notice when Foreign, Defence, and Finance Ministers report that Nato says this and Nato questions that.

It is futile to attempt any estimate of how much the national sovereignty of members of the Atlantic community is affected by what is happening. Formally it remains intact; actually it is being subtly modified by the influence of a common viewpoint on national policies of defence, finance and economic planning. In the exercise of this influence Nato and the Organisation for European Economic Co-operation join forces; for the OEEC is studying the economic prospects of its members—among them 12 members of Nato—at the same time as "politico-economic capability" and military strengths are being discussed in the Palais Chaillot.

Convertibility against Socialism

The tasks of the Commonwealth Conference, which opened late this week, have not been made easier by the pronouncements on economic policy that have lately come from the Labour party. At Burton on Saturday Mr Gaitskell described convertibility for sterling as a "dangerous pitfall," and hoped that the conference would "firmly reject the whole idea." How is this outright dismissal to be squared with the Labour Government's constant suggestion that convertibility and non-discrimination were the objectives dear to

its heart? The Marshall aid agreement contained no zero hour for convertibility such as led to the disaster of 1947, but a constant endeavour to restore it was certainly implicit in all the international action in which this country participated and from which it got so many dollars of American aid. To say, as Mr Gaitskell did, that convertibility "can only be considered when the dollar gap has been closed by other methods" is to suggest that he and his colleagues never thought seriously about it.

The ex-Chancellor's advice to the Commonwealth ministers seemed, in fact, to preclude any real advance on earlier conferences. He preferred to make his hearers' flesh creep with warnings of disaster if all restrictions against dollar imports are suddenly lifted. There is no question of that; there are constructive proposals on which Mr Gaitskell's opinion would be valuable. Is every Labour leader now completely committed to the sort of opposition that exaggerates government policies into bogies and offers no alternatives of its own?

Mr Douglas Jay, delivering a Fabian lecture on Tuesday, was a little more definite but hardly realistic. The sterling countries, he said, should seek to build up a gold reserve equal to five times its present size before taking steps towards convertibility. That certainly puts convertibility firmly beyond the horizon. Mr Jay made the rest of his programme sound simple. You allow no increase in imports of manufactured goods; you run a new export drive on things the world still wants—coal, steel, engineering products and chemicals; you increase home food production by 40 per cent. But what readiness is there in the Labour party to accept the consequences of such a policy: consequences such as transitional unemployment in consumer industries while the shift to capital goods industries is in progress, disinflation to shrink the demand for consumer goods to match the restricted supply, a rise in the cost of food due to producing more of it at home, and a standstill of the social services? It remains doubtful whether Labour thinking in opposition will get much beyond the prescription for Britain's recovery offered last week-end by the witchdoctor of Ebbw Vale. Mr Bevan's remedy was "the maximum injection of socialism," with the nationalisation of ICI as a particularly wonder-working drug.

The Lords on Self-Reform

Lord Simon has thought of an ingenious route through the bog that surrounds the issue of reforming the House of Lords. He is to introduce next week a Bill that would permit the Queen to create ten life peers a year—either men or women—in addition to the law lords. This is a possible way of circumventing both Government and Opposition, whose stonewalling was so evident in this week's debate in the House of Lords. Lord Samuel had then asked when the Government was going to implement its election promise to call an all-party conference to consider a reform of the House of Lords. He implied that a solution should not be difficult to find, since substantial agreement was reached at the small all-party conference in 1948. That conference broke down on the question of the Lords' power to hold up legislation, but it was able to state some principles, which Lord Samuel said were agreed, about the composition of a reformed House. Those principles are worthy of a brief restatement: (1) reform should not make the House of Lords a rival to the Commons; (2) it should not give a permanent majority to one party; (3) distinction, not heredity, should be the qualification for a seat in the House of Lords; (4) women should be eligible; (5) members should be paid; and (6) those who could not or would not perform their duties should be disqualified.

If all this were generally accepted, Lords reform would indeed be a matter that could, and should, be pushed ahead smoothly and promptly. But Lord Jowitt, for the Labour party, and Lord Salisbury, for the Government, were obviously right to say that Lord Samuel exaggerated the

measure of agreement that had been reached. The proposals were merely what the members of the conference would have referred to their respective parties if agreement on all other matters had been reached. At that stage the difficulties would have begun, mainly because of the attitude of the Labour party. Lord Jowitt, indeed, frankly confessed that the embarrassing thing about strengthening the composition of the House of Lords was that there would then seem to be a case for strengthening its powers. Even if its constitutional powers were not actually increased, the Labour party would not welcome the added prestige and influence that would follow from its reform.

Lord Salisbury firmly restated the Government's intention to call an all-party conference "as soon as matters of greater urgency have been despatched." But, as Lord Samuel complained, "the economic situation is always more urgent than a constitutional question." It will certainly be difficult for the Government to resist Lord Simon's Bill. While making an important advance towards full reform, it would be unlikely to occupy much parliamentary time. The Labour party, on the other hand, could hardly oppose a Bill that would lessen hereditary privilege. The danger is that, if the Government accepts the Bill, a complete reform of the House of Lords will be put off indefinitely. But it would be a bird in the hand.

Gold and Aluminium Coast

A White Paper published on Tuesday outlines the scheme by which the United Kingdom Government, the Gold Coast Government, and the Canadian and British aluminium companies can produce aluminium in large amounts on the Gold Coast. This is not a new-fangled project. The Volta River has long been recognised as a possible source of hydro-electric power, and aluminium production is an obvious use for it when the Gold Coast has reserves of bauxite amounting to at least 200 million tons. The scheme was first thought of some thirty years ago. Gold Coast politicians have for many years staked great hopes on it as a means of providing wealth, employment, better transport and—as a by-product of the main scheme—the development of other industries. But practical proposals for financing such a development are now put forward for the first time.

The White Paper suggests that the output of aluminium would ultimately be some 210,000 tons a year; this capacity would be attained in at most 20 years. It would be a big contribution to British supplies, four-fifths of which now cost dollars; a new sterling source of supply is the more desirable because British requirements are expected to rise from 316,000 tons in 1951 to three times that amount by 1975.

But the Volta scheme will be costly. The total capital expenditure, estimated at £144 million, would be high in relation to the output. On the other hand, the plant would have the advantage of low transport costs; most other large aluminium smelters draw their bauxite from far away. The maximum that the United Kingdom Government would spend on the scheme is estimated at £56.8 million. It would find £46 million of the total of £54 million needed for the power project, the rest being provided by the Gold Coast Government. But the bulk of the investment for the smelter—£48 million or so—would be provided by Aluminium Ltd., of Canada and the British Aluminium Company. The fact that the companies are prepared to risk so much in the scheme is certainly reason for confidence. But the Government, before undertaking its own heavy share, is to appoint a preparatory commission to examine the project and its problems in greater detail. This is wise. The lesson of the groundnuts and of the Gambia poultry schemes was certainly not that the Government should shun

large development schemes in the colonies. The lesson certainly was that it should participate only after far more thorough investigation than was then undertaken.

Riots in Iraq

Last weekend, the social and political unrest that is now always latent in Iraq bubbled to the surface. In Baghdad organised crowds took part in riots during which Iraqi, British and American premises in the town's main street were damaged, at least ten Iraqis were killed, and over one hundred injured. Events since then have followed a familiar pattern: a general took over, martial law was proclaimed, schools were closed and the city quietened at once. Watchers outside Iraq are interested to know whether developments from now on will take the shape of those in Egypt or Persia, or perhaps, in the Lebanon, where the *ancien regime* received a good shaking but where the general retired into the background and parliamentary practices have been maintained.

The ostensible cause of trouble was a demand for a direct as opposed to an indirect system of voting at the forthcoming elections. A leading article in *The Economist* of last week described how four out of five parties wanted this, and the likelihood that if their demand became vehement the caretaker government then in power would be unable to keep order. The Regent had tried to convince the dissatisfied parties that a change in the electoral law could be made only by parliament and that any attempt to make it between a dissolution and an election would be unconstitutional. But he failed. Regardless of the fact that the change they want is unlikely greatly to affect the election result, the three smaller parties were ready to brandish the weapon of crowd tactics.

Just as, in the case of the demonstrations against the Portsmouth treaty in 1947, the riots afforded other groups a chance

ADVERTISING

WISDOM . . .

Advertising pays . . . whom?

Would it pay me to advertise? Can I handle my own advertising? What does it cost to employ an agent? What do I get from an agent? Is it true that once you start advertising you have to keep it up? Can I advertise in overseas publications? How much advertising can I do for two thousand pounds? What are the pros and cons of direct mail advertising in my business?

These are only a few of the questions you are likely to want answers to before you know exactly what to do about your advertising.

Through the post it would take you about twelve months to arrive at the answers to these questions. No business with an advertising problem can afford to wait as long as that. But you could settle the thing in an hour by talking it over with somebody who knows—or can get you—all the answers. So why not come along for a chat when you are next in London?

SAMSON CLARK

SAMSON CLARK & CO. LTD., Incorporated Practitioners in Advertising
57-61 Mortimer Street, London, W.1. Telephone: MUSUM 5095

to vent dissatisfaction and make trouble for the ruling few. The slogans shouted—"Down with the Anglo-Iraqi treaty," "Up with the Partisans of Peace," "Down with the Anglo-American imperialists"—were some of them in line with party programmes but the targets attacked were mainly Communist bugbears. The fact that the crowd on the first day refused to let the civilian fire brigade put out the fire in some American embassy premises, but cheered the army fire brigade when it turned up, suggests that the Communists had told it what to do in some eventualities but not in all.

General Mahmoud's Plans

General Nureddin Mahmoud, to whom the Regent gave a mandate to organise a new caretaker government, at once arrested the leaders of all parties except the two largest—those led by Nuri Pasha and Salih Jabr—and simultaneously proclaimed that his aim was to end martial law and hold elections. He later announced that he was appointing a legal committee to prepare a new electoral law; this has helped to calm the situation because it meets one main complaint of the aggrieved parties. Having stated that his cabinet's primary task was to "maintain order and to safeguard the people's lives," the general announced "general reforms" such as free higher education, less taxation, more army equipment and training, and a new economic policy to increase the national wealth and provide the poor with foodstuffs and living quarters.

All this sounds like long-term intention; but the general, who is a rugged old soldier of Kurdish origin and Turkish type, has never before touched politics. The plan is so glib as to suggest that he stepped into the breach with the approval of the leader of the party, or the leaders of the two parties, where it is known that their fate is sealed unless Iraq remains tranquil. The outcome of the riots is therefore a defeat for Communism and eager Persian predictions of "another Abadan" can for the moment be relegated to the "misery loves company" class of comment. But the solution of the incident does not touch the core of Iraq's social trouble as described in these pages last week.

War in the Thai Country

The discovery this week for the first time of Russian lorries in Indo-China is a reminder that Moscow's interest in war in the Far East is not confined to Korea. Since the new campaigning season in Tonkin opened about a month ago, the French and Vietnamese forces have suffered several reverses at the hands of the Vietminh. These engagements in north-west Tonkin are not, however, vital to the conduct of the war in the strategic area of the Red River delta, still solidly held by the French. They do not mean that the Communist-led Vietminh will soon be in Hanoi. At the same time, they do considerably strengthen the rebel chances of removing most of the Thai country from any effective control by the central government. And it is depressing to read of the continued seeping away of both territory and prestige as the Communists press on with their attacks. It adds, moreover, to the constant danger that public opinion in France may one day refuse to bear this grim and costly burden any longer—a possibility of which the Russians are well aware.

Marshal de Lattre did no more than use his own flamboyant method of emphasis when he suggested that Saigon was the outpost of Suez. Either to underrate or to take too much for granted the importance of Indo-China is to risk doing too little about it. If the Vietminh won in Indo-China the consequences would be quite as disastrous, if not worse, than a Russo-Chinese victory in Korea. The

chain reaction of the defeat might not even be stopped at Suez. During the past few weeks, evidence on the American side of the growing understanding of these issues is shown by the start of an airlift from the United States to Indo-China—which now holds a priority in Washington second only to Korea. If the Russian lorries have played their part in forcing

the French withdrawals from the little outposts of Nghia Lo and Son-la, American supplies have made it possible to build up a much stronger base in the delta than anything which existed two years ago.

Fish in Dispute

The dispute between British and Icelandic trawler owners is still developing, and so far on an unpredictable course. Its origin was the decision of the Icelandic Government to prohibit all fishing, including its own, in certain well-fished waters off its coast; the ban was based on a government decree proclaiming these waters part of the territorial waters of Iceland. Its contention that this was necessary to end dangerous overfishing of these grounds would have carried more conviction, in this country at least, if it had been accompanied by an offer either to submit the legality of the decree to the International Court or the technical question of overfishing to an international commission.

But it is by no means clear that the subsequent actions of the trawler owners at several British ports can be justified, either on the grounds of necessity or on the grounds that they will compel the Icelandic Government to capitulate and withdraw its decree. They have decided themselves to refuse to put to sea if fish from Icelandic trawlers is landed at their ports, and they have persuaded (perhaps a stronger word would be justified) fish merchants there to decline to handle such fish. Icelandic trawler owners are now considering what countermove to make. So far, the sole beneficiary of this campaign is the German housewife, since four Icelandic trawlers due to land some 140,000 stone of fish in this country this week have been diverted to German harbours. Trade wars over food are sordid spectacles; the basic weapon is hunger. The British trawler owners say that the consumer in this country will not suffer much, for at this time of year only 10 per cent of the fish landed here is normally from Icelandic trawlers. Potentially, the position of the Icelandic consumer is weaker, since some 90 per cent of Iceland's imports are financed by the sale of fish.

Two matters of public policy are now involved. To some extent, the weapons being used in this country are those of actual or intended monopoly; if a trade approaches a position in which it can say to the consumer: "You cannot eat fish

caught by a 'foreign competitor,' it should be investigated by the Monopolies Commission, slow as that process is. Secondly, the British Government cannot let events take their course between two obstinate groups of trawler owners. It is surely for the nation of 50 million to take the initiative and suggest to a nation of 150,000 that some kind of international arbitration should be accepted by both sides.

The Taste for Sweets

It will be surprising if a government that has wisely decided to drop the allocation scheme for eggs does not soon free sweets from rationing. The difficulty, after the abortive experiment of 1949, is to make some estimate of what the free demand would be. On this, some help at least can now be obtained from the data about the demand for various consumer goods during the interwar years that has been collected by the National Institute of Economic and Social Research.

During this period, chocolate and sugar confectionery became fairly steadily cheaper by comparison with the general level of retail prices. As the accompanying chart shows, the demand steadily expanded in response. Now, however, sweets are relatively dearer again; if 1938 is taken as 100,

the confectionery price level is now 238 and the general price level is 208. This brings the relative price of confectionery—137 if 1938 is 100—back where it was in 1927. And at that time sales were 5 1/2 oz per head per week. This is no doubt less than the current demand. The National Institute has also done some research into the relation, during 1920-38, between demand and real incomes; a rough calculation suggests that the increase in real incomes since 1927 might create an additional demand equivalent to two-thirds of an ounce per head per week. On this basis, the ration is now just equal to the free demand. On the same basis, a calculation for 1949, when sweets were derationed but cheaper, suggests that the supply then fell below the demand by about 1 1/2 oz per head per week.

These figures are in no way a proof that sweets could now be freed without a shortage. The levelling of incomes since 1927 may well have increased the demand: the new rich may eat more sweets than the old rich have stopped eating. And, incomes apart, the shortage of sugar may well have stimulated the general appetite for sweets. No estimate of these influences is possible, but it seems reasonable to guess that quite a small further increase in chocolate and confectionery prices would offset them, and so bring the free demand into line with the present supply of 6 ounces.

Where There's a Will

The villagers of Gotham, it will be remembered, once built a hedge round the cuckoo and were surprised and aggrieved when the ingenious bird made a vertical exit. Administrators have learned, from rather similar experience, the difficulties of restraining that highly volatile force, business enterprise.

The process was pleasingly illustrated last week when Mr W. R. A. Hudson asked the President of the Board of Trade for figures about imports of fondant, sugar fat mixtures, and piping jelly. These distressingly expensive substances can, with sufficient ingenuity on the part of manufacturers and tolerance on the part of consumers, be used by the baking and confectionery trade as sugar substitutes. Sugar imports, to begin with, are strictly limited; but no one worries at first about licensing fondant, imports of which are microscopic. Business ingenuity, spotting the possibilities of fondant as an unrationed sweetener, promptly multiplies these imports to the point where limiting action becomes necessary. Fondant is controlled. But sweetened fat mixtures remain—and become, almost overnight, a significant threat to Britain's balance in the European Payments Union. Faint yet persevering, the administrators slap a control on to sweetened fats. Undaunted, the ingenious manufacturer boards a continental plane, negotiates an unprecedented supply of piping jelly—of which the administrator has never even heard; that peculiar, vaseline-like substance is promoted from the job of providing decorative coloured squiggles to the status of a major ingredient—and a noticeable source of foreign expenditure. By the time the administrator has caught up, the trade in piping jelly and kindred quasi-edibles has attracted enough eager foreign suppliers, complete with plant and workers, to make it difficult to put a stopper in the piping-nozzle; that would be "damaging to trading relations" (a phrase to be greeted with hollow laughter by the sugar growers whose

Evening Wear

and tails for Sale or Hire

The skis are no more than a couple of inches apart. The whole body, first crouched, inclines forward at the take-off into a straight line, rigid from the ankles. The arms sweep up like wings. The eyes are fixed on the touch-down. **It all adds up to a happy landing, seventy metres away in the valley.**

HEAD FIRST

The brains which are shaping our Nation's prosperous future are the brains in Industry's back room. The companies of AEI, integrated but independent, have long been noted for the breadth and vigour of their pooled ideas. Between them they spend a million pounds a year on research. This is a part of the price of progress. It is a measure of the stature of Associated Electrical Industries.

These are the companies of AEI
Metropolitan-Vickers Electrical Co Ltd
The British Thomson-Houston Co Ltd
The Edison Swan Electric Co Ltd
Ferguson Pailin Ltd
The Hotpoint Electric Appliance Co Ltd
International Refrigerator Co Ltd
Newton Victor Ltd
Premier Electric Heaters Ltd
Sunvic Controls Ltd

it all adds up to

Associated Electrical Industries

product, available at a fraction the price, is meanwhile piling up unsold).

The tale could be further elaborated. It does not point only the platitudinous moral that controls breed controls. It also suggests that the withdrawal of a feather-bed here and there might, no less than the provision of artificial obstacle-courses for the ingenious, elicit an unexpected capacity for enterprise. The business man, in fact, is not such a tender and vulnerable flower as he would like the public to believe, or as he sometimes believes himself.

Performance in Prague

It is just over a year since Slansky disappeared into jail and nearly two years since Clementis met the same fate. In view of the extraordinarily comprehensive list of crimes to which they and their twelve fellow defendants have been confessing in Prague, it is not surprising that it should have taken some time to make them word perfect in their allotted roles. It cannot have been easy for many of them to accustom themselves to the idea that they have been engaged in a gigantic conspiracy with the "US imperialists and their lackeys"; that for years they have been working hand in glove with such enemy agents as "the well-known war-monger" Herbert Morrison and "the British spy Gladwyn Jebb."

They have, moreover, blamed themselves for everything that has gone wrong, or has caused discontent in Czechoslovakia since the war, from food-rationing to the slow development of heavy industry, from unrest in the army to unsatisfactory foreign trade deals. These people now conveniently accept sole responsibility for actions which in fact were originally approved by the whole Czech cabinet; they beat their breasts over policies which once had the cast-iron sanction of the party; and if anyone should wonder how they have in addition got away for years with so much espionage and sabotage, the answer given is that they have corrupted the security services to their own ends.

Clearly such an orgy of confession must be highly convenient to the present rulers of Czechoslovakia, who have plenty of popular discontent to contend with. All the evidence can be turned to some useful purpose. Slansky is made to confess his disruptive activities within the party in order to show how necessary it is to strengthen party organisation and discipline through the new revised party statutes shortly to be adopted. Clementis is made to besmirch the memory of his dead friend, Dr Benes, for the benefit, presumably, of those who now compare the latter too favourably with their present rulers. One is tempted to wonder, however, whether President Gottwald will not in fact defeat his own ends. The Czechs are an intelligent western people; it will not be so easy to foist last week's performance in Prague upon them as it was to foist a comparable performance in Moscow in 1937 on the Russian people.

Moscow's Change of Tactics

The Prague trial has two features that distinguish it from similar affairs in the satellite states. Slansky is a new type of East European Communist to appear in the dock; he is the first of the top-ranking revolutionaries, uncompromisingly identified with Moscow, to be thrown to the wolves. Like Ana Pauker, he has failed; he has achieved little except popular discontent and anti-Russian feeling. His present plight serves notice on all like-minded comrades that under the new Soviet policy of emphasising the role of the Communist party as the leader of united national fronts, they must watch their step very carefully.

This is also the first of the satellite show trials in which Zionism receives more than a glancing blow, although for some time it has been growing clearer that the remaining

Jews in Eastern Europe are again to be penalised. Most of the accused are Jews, and the greatest emphasis has been laid on their origins and on the help and encouragement that they gave to the new state of Israel. It is true that Communism is traditionally anti-Zionist; but it is conveniently forgotten that four years ago this in no way prevented the Russians from making every effort to win Israel over to the Communist camp. Slansky and his friends were only furthering this opportunistic policy; now they are paying the penalty for its failure.

In the Prague trial the Zionist organisations in Czechoslovakia were alleged to be tools of the "US imperialists" who used them as channels through which to carry out their subversive and espionage activities. The virulence of these attacks suggests that the Russians have finally decided to turn their backs on Israel. They have done so largely out of chagrin that their dogmatic conviction that liberation from an "imperialist power" would pave the way for a Communist state has proved to be wrong. As a by-product of this situation they have acquired a good deal of Arab support. Anti-Zionism is not, however, officially accompanied by anti-semitism; a careful distinction is still drawn between the two. All the same it looks as if Gottwald, Gheorgiu-Dej and the rest are using the latent anti-semitism of the East Europeans as a safety valve for popular discontent.

Umbrage at Unesco

Among the ten specialist agencies set up by or linked with the United Nations, the UN Educational, Scientific and Cultural Organisation has long been conspicuous for its failure to show results commensurate with the effort and money put into it. This failure is at the bottom of Unesco's present troubles. Its Director-General, Dr Torres Bodet, declared in his speech of resignation last week that he was disillusioned at the lack of a "community of ideals" between the member nations, and some of the smaller members have accused the United States, Britain and France, which provide over half of Unesco's funds, of trying to put an end to its work. These exaggerated charges were provoked by the decision, supported by 29 members against 21, to scale down Dr Torres Bodet's proposed budget of \$20,500,000 for the next two years to \$18 million, or about the same as the 1952 level—a decision which does not affect the additional \$5 million due to Unesco next year from UN technical assistance funds. In resisting the Director-General's demands, the majority group made it clear that they had not, like him, lost faith; they were merely pressing for economy in some of the more costly and less productive fields into which Unesco has strayed. Their case was the stronger because it is obvious that, despite the attempt to concentrate its efforts made in 1950, Unesco is still dispersing its resources too widely.

Six years after its birth, many of its activities are still in the stage of experiment and preliminary study, and it is busily setting up even more specialist bodies, whose appearance necessitates further co-ordinating committees. Its interests range from the unworldly "Studies of Social Problems Likely to Create National and International Tensions" to such banal publications as "Newsreels Across the World," and its output of bibliographies, monographs and bulletins is now vast. Admittedly there are, embedded in its programme like infrequent currants in a suet pudding, a number of practical and badly needed projects; but perhaps Unesco's gravest fault is the way it relegates these encouraging items to a minor place. It seems to have no idea of the importance of presenting the peoples who support it with evidence that it can produce concrete results. Support for its ideals is still widespread; but, with its shocking proposals to build a skyscraper in the Bois de Boulogne and its decision to spend an extra \$300,000 by holding its next conference in Montevideo fresh in their memories, few people will doubt that Unesco has scope for economies.

Soft Spots for Stalin

It is highly encouraging to find an American public figure whose main concern is economics but who at the same time shows such a keen appreciation for the implications of political events as Ambassador F. L. Anderson, deputy of the Mutual Security Agency. Mr Anderson, speaking recently before an audience in Washington, not only gave a masterly analysis of Stalin's new orthodoxy but also drew from it some important morals for the West. He rejected the popular view that the recent Soviet Party Congress produced a farrago of self-delusion and misunderstanding about the West. Instead he argued that in many respects the Russian leaders showed a penetrating insight into weaknesses that the Communists intend to exploit to the full.

In all probability, said Mr Anderson, Stalin has found the Western fabric soft in at least four spots. First, by seeking to turn themselves into a self-sufficient bloc of nations the Communists have shut the free world out of important markets and sources of supply. So far the West has failed to respond to the challenge on a scale vast enough "to build at home and around the world new sources for raw materials and new markets for products." This policy, moreover, has hit western Europe far harder than the United States. Indeed, it has helped along with the shortage of capital and other factors, to retard European production. The consequent disparity between rates of industrial expansion on the two sides of the Atlantic puts a heavy strain on relations between the dollar and non-dollar worlds. Also apparent to Stalin is the tension inherent in the patron-client relationship between the United States and Western Europe. Annual grants from Congress try to temper all round, but so far no satisfactory alternative has been found. In Mr Anderson's words,

We have not yet built new economic relationships within the Atlantic community and between the Atlantic community and the rest of the free world that are self-sustaining and businesslike.

Finally, Stalin's theses show an awareness of the defects in Nato. In spite of the close military co-operation that has been established, many of the most delicate problems—largely political and economic ones—are settled bilaterally between the United States and each single ally. A pattern of this kind, in which the United States invariably appears as a disputant, tends to leave Europeans with the impression that they are being bullied by a stronger ally. The west has yet to mend its ways and transform Nato into a body that takes joint decisions in the face of what Mr Anderson calls "sly, subtle dangers."

* * *

Russia in the Reith Lectures

A capacity for being broadminded, for seeing both sides of a question and understanding the other man's point of view, is one of the great virtues of a liberal culture. It may, however, be carried beyond the optimum of impartiality to that point of unfairness to one's own case which Americans call "leaning over backward." Professor Arnold Toynbee seems to have been suffering from such an excess of magnanimity in the first of the series of Reith lectures which he is currently broadcasting under the title of "The World and the West." His theme is the clash of civilisations—a subject which he has studied in detail over the entire field of world history. In the Reith lectures, however, he is very definitely relating all this to the present international situation, and any unbalanced emphasis, which for professional historians might be merely a stimulating paradox, is liable to have a political effect which Professor Toynbee himself probably would not desire.

In the initial talk of the series Professor Toynbee urges his listeners to look back at the past:

When we look at the encounter between Russia and the West in the historian's instead of the journalist's perspective, we shall see that over a period of several centuries ending in 1945 the Russians have had the same reason for looking askance at the west that we westerners feel that we have for looking askance at Russia today.

But if the record is to be viewed "in the historian's instead of the journalist's perspective," it is important that the historian should give a fair summary of the historical facts. Professor Toynbee, however, speaks only of "this threat to Russia from the west, which has been a constant threat from the thirteenth century until 1945," and recalls invasions of Russia by Polish, Swedish, French and German armies, without making any mention of Russia's own expansion and conquests of non-Russian "western" lands—the Baltic provinces, Finland and Poland—or the southward advance which created the "Eastern Question."

From the time of Peter the Great Russia was reckoned one of the Great Powers of Europe and certainly neither the weakest nor the least ambitious. Nor does the idea of "the west" as a sort of confederacy perpetually encroaching on Russia correspond to the real course of history. When Napoleon invaded Russia he had previously crushed Austria and Prussia and was still at war with Britain; on each occasion when the Germans have invaded Russia, they have also been waging war against Britain and France. It would be indeed regrettable if the contemporary tensions of the "cold war" were to produce retrospectively a picture of Russia as the eternal villain of European history; but it is even more regrettable for the British public to be presented by a famous historian with the myth of an innocent and pacific Muscovite who has become justly embittered by six hundred years of "western" aggression.

Vive L'Empereur

The new Emperor is to be Napoleon III. He puts down all constitutions, all political rights, all political power, but his own; and he ascends the throne, with the consent of the people, a complete despot. It will be a mistake, however, to suppose that he succeeds to all the power of the first Bonaparte. . . . Napoleon had . . . the whole civil administration to form—the church to reorganise—the courts of law to establish—even the rights of property to define, distinguish, and protect. Having the army in his hand, he had all the civil and social rights of the people, unsettled by the revolution, at his mercy. What he then established, the organisation he gave to the church, to the courts of law, and the rights of property he then settled, have not since been much disturbed. They have, on the contrary, been confirmed and strengthened by their continued existence, and are now so many barriers against the completely despotic power, so many curtailments of it, which is supposed to be possessed by Louis Napoleon. No usurpation that would be tolerated could possibly place in his hands all the power of the first Napoleon. . . . He is only, therefore, in one sense a despot—a despot over the political organisation of France; and its social or civil organisation, now the steady growth of nearly half a century, he may hardly dare to meddle with. He will be as unable, therefore, as his immediate predecessors to prevent violent revolutions hereafter, by any other means than by adopting such a system of Government as will secure the prosperity of the people, and allow France to share fully in the increasing industry and increasing wealth of the world.

"They'll wrap it up for us" *

How much our Christmas shopping owes to paper!

Where should we be without the tough kraft wrapping paper from the famous Aylesford mills or that shiny sulphite paper so gaily printed? These are the papers that meet to-day's demands for bags and wrappings—and carrier bags—of the first quality. Protecting and enhancing countless products, they are examples of the many ways in which the Reed Paper Group is continually extending the field of paper's usefulness.

* There is no shortage of paper to-day.

Letters to the Editor

Living With the Dollar

Sir,—As all discussion on this subject seemed to end with what the Americans should do, perhaps you will allow me to advance my own formula, in the safe knowledge that the Americans are very unlikely to adopt it.

Briefly, they should work only in the morning. The advantages accruing, apart from the closing of the dollar gap, would be incalculable.

Almost the first gain would be that the resultant drop in their gross national product would reduce the huge proportion of their contribution to Nato, Uno and other international agencies. This would remove a main cause of the almost obsessive jealousy and resentment felt by America's allies and beneficiaries.

Secondly, she would be able to outflank her left-wing critics abroad by being the first country to bring leisure to its workers.

Finally, with the product of liberal capitalism no longer so patently superior to that of Socialism, Russia might decide it no longer necessary to encompass the destruction of the bourgeoisie throughout the world.—Yours faithfully,
London, S.W.1 W. M. G. BROWN

Sir,—There appear to be two main points at which your dollar prognoses may prove too gloomy. First, if, as seems quite likely, the continuing quest for "fair shares" and the desire to be rid of "aid" leads to the adoption of the common defence budget, with national dues assessed largely by reference to a progressive tax scale like the American, there will take place a reduction in most European partners' net defence dues, both relatively and absolutely. But since the need to strengthen the European sector of the common defence, both in arms facilities and in men, is urgent, North American acceptance of Nato's annual recommendations governing the needs of this sector could well mean additional defence expenditure on this side of the Atlantic of upwards of \$5 billion annually over and above what is now, quite wrongly, described as military and defence-support "aid."

Secondly, though for some years ahead little additional net dollar outflow can be expected from private investors, there has been increasing evidence of a strong American desire to see a large new international fund established for the development of basic capital facilities in under-developed areas. It is not so many years ago that Mr Harold Stassen, the new chief of the Mutual Security Agency, publicly urged that America devote 10 per cent of her national income to helping the rest of the world. And although President Truman's proposal that as defence expenditure declines, part of the finance thereby freed be devoted to this end is much more modest, it is not unreasonable to anticipate annual outlays of some \$10 billion, largely in

dollars, taking place within a few years. Particularly is this so if a wider interpretation is given to the concept of "under-developed areas."

There are many such areas within the Commonwealth, and provided your main premise of greater cohesion between the dollar and sterling areas holds, large additional dollar earnings should accrue to Britain and Europe. In this context it is worth recalling that most of the dollars provided by the recent International Bank loan to Southern Rhodesia are flowing to this country.—Yours faithfully,
J. L. GIBSON
Caterham

British Industry at Luxemburg

Sir,—In your issue of November 22nd, in the course of comments on the recent meeting of the High Authority of the European Coal and Steel Community and the United Kingdom delegation, at which leaders of the British coal and steel industries were present, you quote a paragraph from my speech. Perhaps you will permit me to correct this quotation which contains the word "disputes" instead of the word "issues," which was the term used and contained in the circulated copy of the speech. The sentence in question should therefore read as follows:

"In our view, the rules and regulations which will govern our relationship should be based on experience in dealing with practical issues rather than on general principles."—Yours faithfully,
CECIL M. WEBB

UK Delegation to the High Authority
Luxemburg

Bank Salaries

Sir,—The book "Professional People," reviewed in your columns last week, doubtless has great merits. May one express the hope that most of its facts are more reliable than the authors' references to banking as a career?

We are told that a bank official "may not be earning more than £600 a year by the time he is 35, and he may get less than £1,000 as a manager." At any rate in one member of the Big Five banks (and conditions do not differ fundamentally between them), none of the managers or executives receives less than £1,000 on first appointment; many branch managers are paid £2,000 or more, quite apart from the relatively large number of head office officials above that level.

An ordinary clerk on the minimum salary scale receives in London £875 at the age of 39; yet the authors quote a figure of £800 for a fully qualified actuary at 35 as evidence for their remarkable statement that "insurance employees do a little better than bank clerks."—Yours faithfully,
W. MANNING DACEY

London, E.C.3

Eggs Going to Town?

Sir,—I cannot let go unchallenged Mr King's accusation that the continuation of the controlled distribution of eggs is to the advantage of the retailer. The latter traditionally prefers to serve his customers with the quantities they want when they want them, but equally he does not want the product so expensive that the majority of his customers cannot afford to buy it. Many of us believe that a controlled distribution should only be abolished when there are sufficient supplies available to let the normal functioning of the price mechanism work without driving the product out of reach of a large section of our customers.

Anyone who has studied figures showing the steady growth of multiple food shops before the war cannot believe that restrictions and guaranteed profit margins are needed to ensure the success of this type of retail business.—Yours faithfully,
London, S.E.1 ALAN J. SAINSBURY

Books and Publications

Commonwealth Democritus

Jan Christian Smuts. By his son, J. C. Smuts. Cassell. 568 pages. 25s.

The life of a great man by his son is sure of a friendly welcome. This book contains, as it was bound to do, a wealth of interesting detail about Smuts's personal and family life, and the liberal quotations from his writings and speeches provide excellent material for forming a judgment on the range of his powers. It is interesting though not always illuminating on South African history. Those parts of it which deal with the wider world are, however, full of elementary mistakes.

Democritus, the most brilliant of the Greek physical philosophers, was born at Abdera, a city otherwise proverbial for the stupidity of its citizens.

Some such thought may float into the mind as one reads this book. Smuts was a man of extraordinary powers, and the more extraordinary in that he was born a Boer, as they used to be called. Outside the circle of his disciples and friends his own countrymen never really liked him. They regarded him much as the hearty athletes in an old-fashioned school story regard the brainy little boy who never stops working and wins all the prizes. They did not call him "a swot" but they called him "slim," which meant "much too clever for us." Although he was prime minister for fourteen years, his power was based mainly on the support of the British half of the electorate.

His career was as notable for its breadth as for its length. At Cambridge, where he read law, the great F. W. Maitland described him as the most brilliant pupil he ever taught. At 28 he became the brain of Kruger's cabinet in the last years of its existence. Ten years later he was, with expert British assistance, the principal architect of the constitution of the Union. Six years on again, he was commanding the army which conquered German East Africa. Summoned to England he was given the extraordinary position of a non-ministerial member of the War Cabinet. It is probably true to say that Lloyd George in the first war and Mr Churchill in the second both attached more weight to his counsel than to that of any other of their colleagues. At the end of the first war almost any post, any career, that he liked to choose within the gift of the British Government was open to him. Would he, for example, like to be Viceroy of India? But his roots were deep in South Africa. Democritus must back to Abdera; and after a protest against the Versailles peace-making which resounded through the world, he returned to face the flouts and jeers of his own countrymen.

Defeated in the general election of 1924 he proceeded to write in a few months a highly original contribution to philosophy entitled "Holism and Evolution." Eight years later, as President of the British Association, he addressed its centenary gathering. How valuable that address may be is for

scientists to say; but it is in any case amazing that a man whose public career had been given to law, war and politics for nearly forty years should be able to hold forth on electrons, protons, quantum theories and the like to an audience of first-class specialists in these fields.

In 1939 he brought South Africa into the war by a narrow margin of votes. But for him it would probably have gone the way of Ireland. After a life of amazing physical resilience he died at the age of eighty—killed, his son concludes, by over-indulgence in the aeroplane, which had enabled him for the previous ten years to dash to and fro across the hemispheres with an all too fatal facility.

Britain and the Sudan

Sudan Story. By John Hyslop. The Naldrett Press. 136 pages. 7s. 6d.

The Sudan: A Record of Achievement. By J. S. R. Duncan. Blackwood. 283 pages. 12s. 6d.

Of these two accounts of the present regime in the Sudan, one is written by the former editor of an English newspaper in Khartoum, and the other by an official of the Sudan Service. Mr Hyslop's observant, informative and well illustrated story makes good reading of its kind. He likes the Sudanese, as nearly all Englishmen do, and gives first-hand sketches of economic projects in the Sudan, which are usually overshadowed by the cotton scheme in the Gezira. His clue to the success of Anglo-Sudanese relations is that both laugh at the same kind of joke.

The title of Mr Duncan's book truly reflects two-thirds of its contents. The pattern is simple: the modern Egyptians are the villains; the heroes are the British and Sudanese of the old school who together established what the author calls a "Golden Age." Its decline is due to *la trahison des clercs* among the younger generation of Sudanese, and to the weakness and ineptitude of British Governments since 1919. Nevertheless the record of achievement is impressive, both during the first twenty years of pioneering and in the period of development since 1921. The devotion of the British staff to the interests of the Sudanese, which is the main theme of the book, is amply illustrated. One is left in no doubt that "the Sudan for the Sudanese" has been a cause as effectively pursued by the British in the Sudan as by the Sudanese nationalist politicians themselves.

Mr Duncan writes with the emotion of one who has lived and worked among the majority of Sudanese who are far removed from nationalist politics. Yet his last chapter, a quarter of the whole, describing the development of an indigenous political conscience and organisation, is much the best part of the book,

even though it spells the end of British responsibility in the Sudan. No better account has appeared.

Both books are retrospective and end on the same note. Mr Hyslop, the journalist, affirms British friendship for the Sudanese, founded on the tradition of Gordon, Kitchener, Wingate, and Kipling's Fuzzy-Wuzzies. Mr Duncan, the dedicated official, finds that the real achievement of the present Sudan Government is the mutual affection of the British and Sudanese leading "to the kindling of the spirit of humanity, freedom, justice, and integrity." The reader, however, may conclude that the more logical achievement has been the creation of a relatively small group of educated Sudanese who are waiting to take over the reins of government from British hands.

After the British Raj

The British Impact on India. By Sir Percival Griffiths. Macdonald. 513 pages. 45s.

It is only four years since the British gave up direct responsibility for the government of India. Moreover, by the standards of Indian history, the length of their overlordship was short—not much more than a hundred years compared with five hundred of Moslem predominance. It follows that any assessment of the British impact on India is at this stage no more than an interim report. There can still be no firm idea of what will last and what will not as a result of a century of British rule. But an interim report, presented with the judicious spirit and copious information of Sir Percival Griffiths's study, can be—and is—extremely valuable. The author himself makes no attempt at prophecy. He would agree, with that serenity of judgment that characterises the whole book, that the permanent balance sheet cannot yet be drawn up. But even the immediate evidence is enough to underline one fact. If western forms of political and social life do in fact flourish in India, the foundations will have been laid by British rule.

Before the advent of the British, there was no "Indian" nationality. The political genius of the Hindus had only twice for brief periods produced India-wide institutions. The Mauryas and the Guptas are the exceptions of Indian history. When British influence began to increase in the eighteenth century, the Moslem empire of the Moguls was also in decay. By giving the continent a central government, communications, a single administration and a single working language the British created Indian nationalism. By the mere fact of being foreign, they exacerbated it. By being on balance liberal, they gave it scope, even when, as in Bengal, it turned to terrorism.

So strong were both the centralising tendency of British rule and the revulsion against it that for a time they seemed

JOBLINGS OF SUNDERLAND

versatility in glass

Glass was first made in the Sunderland district over a thousand years ago. Today, and for some generations, the works of James A. Jobling & Co. Ltd. have been producing an ever increasing range of articles and instruments from a variety of glasses including the famous 'Pyrex' brand, the original heat resisting glass in the world

The science of plant protection

FRIEND OR FOE?

What this child becomes . . . whether he grows to think of Democracy as a term of respect or of reproach . . . depends largely on whether we in the West manage to help solve the world's food problem during the next generation. For empty bellies are no guide to rational behaviour.

At the Plant Protection Research Station at Fernhurst, scientists spend their days planning ways of beating the weeds and insect pests that rob crops of their full yield. The first selective weedkillers were tried out by them: the first insecticidal seed dressings, too. Backed by all the resources of Imperial Chemical Industries: tested and re-tested under actual field conditions, 'Plant Protection' products are helping to make life better for millions of people yet unborn.

Plant Protection Ltd

strong enough to unite Hindu and Moslem in a common "Indian" reaction. The fact that Indian nationalism included a violent revival of traditional Hinduism was, as Sir Percival Griffiths makes clear, the chief reason for the breakdown of unity and for partition. Even so, two British legacies—the rule of law and a strong incorruptible bureaucracy—were sufficient after 1947 to carry the two new nations on to a measure of stability in spite of appalling massacres.

Yet western democratic institutions have flourished so far only when coupled with the existence of a large middle class and with a pervasive belief in western standards and ideals. Here the British legacy to India is more doubtful. The desire to train Indians for self-government was no doubt perfectly sincere and was accepted as early as the 1820's as the goal of British policy, but certain aspects of British rule discouraged its development. The very centralising efficiency of British administration killed the rudimentary but effective self-government of the villages. The collector's paternal rule overlaid the earlier village councils.

Economic development also had a two-edged effect. On the one hand, the benefit to India of railway building, of immense schemes of irrigation and the introduction of whole new industries such as tea planting was incalculable—and might well be studied carefully by those now engaged in technical assistance. On the other hand, the heyday of British rule in India coincided with the general acceptance of *laissez faire*, and when the Indians—with the exception of a brilliant group of Parsee families round Bombay—showed no interest in industrial development, the Indian Government did not think it any part of its duty to promote local enterprise. Industrial development took place but under European management. The development of Indian industry dates largely from the first World War. The result has been that the nineteenth century did not bring with it a vast extension of Indian middle and technical classes. Today the narrow basis of responsibility and education is a danger to the new states.

Perhaps the safest immediate judgment is that British rule equipped India for responsibility and expansion within the framework of sane and confident nineteenth-century liberalism. Whether the equipment will survive the totalitarian irrationalities of this century is not yet proven. Sir Percival Griffiths ends his admirable work on a note of optimism, and the reader, respecting his knowledge and judgment, can be content to share the hope.

Religion and the Orient

The Mind of East Asia. By Lily Abegg. *Thames and Hudson*. 338 pages. 25s.

It is unfortunate that Miss Abegg writes so heavily, for her book is important. She is often obscure, sometimes repetitious, and always given to far too many quotations from German philosophers and psychiatrists, quota-

tions which usually do nothing for the argument except to distract from it. Nevertheless, those who persevere will be amply rewarded, for Miss Abegg's experience and qualifications are unique. She is at once a journalist, a philosopher and a psychologist. She has lived much of her life in East Asia, including Japan during the war, and she knows both the languages and the literatures. She can not only think both as an East Asian and as a European; she understands what happens when she makes the change-over from one to the other.

Her main thesis is the contrast between the East Asian emphasis on totality and the imminence of God, and the Western concern with logic and the personality of God. The West, she argues, has developed its mind out of balance with its emotions, its intuitions, and its capacity for mystic experience; whereas the East Asian has been concerned always to apprehend the universe not with one of his faculties alone, but with them all, and for him the aim is to re-live the life of the sages. He sees God in all things, and his aim is to absorb himself into this Universality by the renunciation of every desire which might distract him from contemplation.

Miss Abegg illustrates her thesis by examples drawn from every aspect of contemporary Asian life—from a comparison between Japanese and Chinese cruelty to the occasion when the Japanese Emperor could not review a particular garrison because it lay on a branch line where the rules prescribed second-class coaches, and the rules, of course, equally demanded a first-class coach for the Emperor.

Making Great Britain

England and Scotland, 1560-1707. By Douglas Nobbs. *Hutchinson's University Library*. 173 pages. 8s. 6d.

This latest addition to a well-known series finds itself in proper company, for it is an authoritative monograph and it makes pleasant reading. Mr Nobbs's theme is not, as the title might suggest, the diplomatic history of the two countries, but their internal politics—both action and theory. It shows English and Scottish history as parallel and inter-related but not, except in connection with the Solemn League and Covenant of 1643 and the Union of 1707, inter-dependent.

An introductory survey of the main trends in the political thought of the two nations covers the whole period. This is clear, terse and fair, but it is surprising to find here no notice of Filmer (whose "Patriarcha" is, however, mentioned on page 151 and appears in the bibliography), and none whatsoever of Hobbes, the spokesman of the Cromwellian regime, or of Fletcher of Saltoun, whose ideas underlay the Scottish Act of Security (1704). There follow analyses of the political, ecclesiastical and economic aspects of the "mute commonwealth" of Scotland (the phrase is adapted from Sir Thomas Craig) and of the Tudor commonwealth in England. The balance of forces in Church and

State—crown, privy council and parliament, gentry and towns, episcopalian, puritan and presbyterian—always uncertain in Scotland and becoming uneasy in the later days of Elizabethan England, was subjected after 1603 to great strains. These produced, in succession, the "Conservative Revolution" (the return in 1641 to a balanced constitution), the "Radical Revolution," when Independents, sectaries, presbyterian high-flyers and soldiers got their heads, and the "Bloodless Revolution," which, after the crown's efforts to recapture its traditional prerogative, left parliament in virtual control. The Union followed as a consequence of setting up two sovereign—or nearly sovereign—parliaments.

The canvas is large and the brushwork bold; as with every work conceived on this scale, it is easy enough to point to debatable conclusions. On two larger issues the book is open to serious objection. The economy of Elizabethan England and of contemporary Scotland—land-use, industry, commerce, finance and social organisation—is fully treated in relation to political conflict; but from 1603 this element is forgotten until, a few pages before the end, a brief and retrospective bow is made in its direction. Secondly, the Union of 1707 (which might well serve as the unifying theme as well as the *terminus ad quem*) surely deserves fuller consideration than is possible in the six pages allotted to it. The broad picture is, however, well executed; the style is agreeable; and the contribution to the appraisal of British political development is real.

AMERICAN SURVEY

The Big Change

Washington, DC

THE "change" for which the American people voted is now taking shape with a speed for which it is difficult to find a historical parallel. In the first week after the election General Eisenhower seemed more concerned to emphasise that he is at present not responsible for American policy than to prepare for the time when he will be. But last week it became daily clearer that the leisurely interregnum provided for by the Constitution is no longer feasible now that the United States is the leading world power. The General began the week with a grim but informative interview with the President and his senior advisers at the White House in which, so Mr Truman said later with more than a little relish, "he seemed rather appalled at all that the President needs to know in order to reach decisions," and departed for New York laden with a three volume brief on the world situation and the functioning of the American government. Since then he has been announcing the names of the members of his Cabinet almost daily, thus giving the new Secretaries time to digest the appalling accumulation of facts in the government files before they have to decide what use to make of them.

Although the American Cabinet is utterly dissimilar from the British in that its members are responsible only to the President and not to Congress, and there is no principle of collective responsibility, the President's choice of his "official family" is limited. Even a President who so clearly dragged his party into office as General Eisenhower must consider sectional feeling, must take account of the balance of power within his party, and must satisfy ambition where to thwart it would weaken him. General Eisenhower's appointments show that he is both broadly aware of the limitations and at the same time is determined not to be too closely bound by them.

Thus two New Yorkers, Mr Dulles and Mr Brownell, the new Secretary of State and the new Attorney General, are balanced by appointments from the industrial middle west, Mr C. E. Wilson of Michigan at the Department of Defence, Mr George Humphrey of Ohio at the Treasury, and Mr Arthur Summerfield, also from Michigan, as Postmaster-General. The farm states contribute Mr Harold Stassen of Minnesota as the Mutual Security Administrator, and the far west Governor Douglas McKay of Oregon, who goes to the Department of the Interior, and Mr Ezra Taft Benson, a Mormon from Utah with farming experience, to the Department of Agriculture. Mr Sherman Adams, now Governor of New Hampshire, who as the President's Assistant will be a civilian chief of staff, represents the rock-ribbed Republicanism of New England. The appointment of Mrs Oveta Culp Hobby as Federal Security Administrator with a place in the Cabinet is a graceful tribute both to the importance of the women's vote in the General's election and to the defection of Texas from the Democratic fold. The only area unrecognised thus far in the General's appointments, with only the Secretaryships of Labour and Commerce still to be filled, is Massachusetts and this will probably be cleared up

when the puzzle of Senator Lodge's role in the new Administration is solved.

In dealing with the balance of power within the Republican party General Eisenhower has made no major concession to Senator Taft. Mr Dulles and Mr Brownell are close associates of Governor Dewey, the Senator's arch enemy. Although Mr Dulles has of late managed to render himself unobjectionable to the Senator, Mr Stassen, by throwing Minnesota's votes to the General at the Republican convention, ensured Mr Taft's defeat on the first ballot; both Governor McKay and Governor Adams have been "Ike" supporters from the beginning. Mr Humphrey could be called a Taft man, but he was not actually on the Senator's list of suitable candidates for the Cabinet. Only Mr Benson and Mr Summerfield have been picked off that famous list, although they receive jobs which control a large share of the minor patronage. It is not impossible that in the end the Republican Old Guard has decided it is more interested in patronage than policy.

Mr John Foster Dulles needs, as the saying goes, no introduction. There is little doubt that personally the General would have preferred Mr Paul Hoffman for the State Department, but Mr Dulles's claims were formidable. Probably no Secretary of State since John Hay undertook the same office for President McKinley begins with a longer experience of international affairs or a more thorough knowledge of the mechanics of diplomacy. His relations with the next Congress should be good, an important advance compared with the past few years. He is an extremely skilful negotiator whose religious convictions do not blind him to the beauties of a hard bargain. It is no use pretending that he is not a controversial figure or that his career does not reveal great inconsistencies of view. But Mr Dulles has been cast in an impossible role ever since he came to Washington in 1944 to try to keep the drafting of the United Nations Charter out of party politics. He has had to straddle the gap between the Republican party and the State Department, representing the one to the other, advising, interpreting, but never with power or responsibility. It is only fair to expect that the inconsistencies in his behaviour will disappear with the achievement of his life's ambition and the acquisition of full responsibility for American foreign policy.

Mr Harold Stassen, like Mr Dulles, is an ambitious man whose power to harm the new Administration has been averted by taking him into it. He is no longer the boy wonder who, in 1940 at the age of thirty-three, was Governor of Minnesota; a great deal of disappointment has come his way since then, including two unsuccessful bids for the Republican nomination. Whether his prejudice against

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

giving American aid to any country with a socialist economy will survive his first contact with the highly sophisticated calculations of the Mutual Security Agency remains to be seen. But if, as some MSA officials argue, the immediate necessity is to increase the level of American aid to Asia, Mr Stassen, with his known sympathy for this idea, may be the best man to sell it to Congress and the public.

Mr Charles Erwin Wilson, the head of the General Motors Corporation (who is fatally confused in the public mind with Mr Charles Edward Wilson, the head of the General Electric Company, who was President Truman's Defence Mobiliser for two years after the Korean outbreak), is an unexpected choice for Secretary of Defence. His appointment reflects General Eisenhower's respect, and that of the US Army, for the captains of industry, but it is to be hoped that no one is under any illusion that running the enormous enterprise of the Pentagon is remotely like running an industrial undertaking, however large. The appointment of Mr Wilson, who has no political or official experience of any kind, makes it likely that the current division of power within the Pentagon, under which the civilian Secretary deals only with administrative and production matters while the Joint Chiefs of Staff have the last word on strategy, will be continued. It was probably too much to expect that the new President would appoint a Knox or a Forrestal to an office over which he clearly expects to exercise great influence himself.

The most unexpected appointment of all was that of Mr George Humphrey, the president of the M. A. Hanna company, the great Cleveland ironmasters, to the Treasury. Mr Humphrey is one of those industrialists who have worked their way up by means of the law and the position of corporation counsel. He is what bankers call a "sound" man and, although he is less likely to quarrel with the Federal Reserve Board than his recent predecessors, he is equally unlikely to restore the Treasury to the position as one of the great policy-making departments of the government which Hamilton and Gallatin intended it to have.

It is an axiom of American politics that the Department of the Interior must be headed by a westerner, for most of its business is with the public land and river projects west of the Mississippi. Governor McKay is the type of good-hearted energetic westerner who, though he disapproves of many current federal projects, will do the same kind of pragmatic and sensible job as his predecessors. Mr Brownell was clearly a candidate for the Cabinet for he, more than anyone, converted the amateurish Eisenhower movement in the weeks before the Republican convention into a professional political organisation. In his campaigns with and for Governor Dewey, Mr Brownell has acquired a kind of disinterested toughness which will stand him in good stead against Senator McCarthy when the Senator turns his witch hunt on the new Administration.

Except for the Secretaries of State and of Defence the relative importance of these appointments will depend on the way the President-elect organises his Cabinet and his relations with Congress: whether he seeks a common denominator of agreement from his Cabinet or whether he treats it as a constitutional formality like his two predecessors, weighting his reliance on the advice he receives in accordance with the capabilities of the individual adviser. One thing is certain: even with the intelligent and efficient Mr Sherman Adams to organise the sprawling executive office for him, President Eisenhower will find many problems on his desk which cannot be reduced to the famous one sheet of notepaper.

Teaching by Tape

[FROM A SPECIAL CORRESPONDENT]

It is curious that Americans should be the world's worst linguists when immigration has caused so many languages to be spoken in the United States. But it has always been rare for more than one to be spoken by the same person. The immigrants themselves often continue to speak their mother tongue until death, and acquire only a smattering of English, if any. Their sons and daughters, anxious to conform and get ahead, speak mainly English, though this one generation must speak a foreign language at home, since the parents understand nothing else. This is the end of the family's bilingualism; the immigrants' grandchildren speak only English.

Except among the wealthy, highly-educated few, knowledge of a second language is something of a social liability, reminding the hearer of recent foreign origins perhaps better forgotten. In any case, it is a generation since immigration was reduced to a comparative trickle. By and large, Americans abroad speak English—a little more loudly, if anything, than usual. Now that the United States is so deeply, if reluctantly, involved in international affairs, the handicap of a single language has become a serious diplomatic liability. The homegoing government expert, indeed even the business man, now complains that he is embarrassed by his linguistic ineptitude. Consequently, there is a demand for men and women who speak foreign languages which is out of all proportion to the available supply; fluency in a language cannot be acquired as rapidly as international responsibility. If linguists cannot be found for relatively well-paid posts, the shortage of language instructors—ill-paid except at top levels—is certainly no less acute.

Against this background of real necessity something of a major revolution is taking place in methods of teaching foreign languages. If the efficiency of a course of instruction is judged by the number of students who can attain a given level of proficiency in a fixed time and with a fixed number of instructors, then the new methods are much more than twice as effective as the traditional ones. Quantitatively, even if not qualitatively, the achievement is real.

Much simplified, the new system amounts to this: each instructor holds formal classes on the traditional pattern, and these are attended by his students for, say, six hours a week. Approximately double this time is spent by each student each week listening to recordings made by the instructor. To the instructor's recorded questions, the student records his own answers. At any moment, he may listen to the combined result, and some of the students' recordings are checked by the instructor.

So far, there is little originality in the new system. Schools have used language records for many years, and recorded correspondence courses have been available ever since the invention of the gramophone. Records can even be bought today which teach parrots to express themselves in five languages. The important difference is that the new recordings are "personalised"; they are made by the student's own instructor, who can modify them to fit the needs of his class, and the student can record his own efforts and compare them with the official version.

For this to be economically feasible, it is obvious that a recording device is needed which uses simple and cheap equipment as well as a cheap recording medium, and requires a minimum of technical knowledge to operate. On all these counts, the traditional disc recorder is ruled out and the

ubiquitous, robust, almost fool-proof tape recorder is the answer, with a beehive of cubicles, each equipped for individual private listening and recording.

The pioneer "language laboratory" of this type, which makes extensive use of electronic aids, is at the Institute of Languages and Linguistics, a part of the Foreign Service School at Georgetown University, in Washington, D.C. Here sixty courses are given in thirty-two different languages, from Arabic to Tagalog, earning every year, simple arithmetic suggests, a gross annual income of about \$500,000. The system was developed in its present form by the director of the institute, Mr Leon Dostert, who was General Eisenhower's interpreter during the last war and originated the simultaneous translation system used at the first Nuremberg trial and now used by the United Nations. Today, there are some fifty "laboratories" throughout the world (including one in Puerto Rico, one in the Pacific, and one at Shape headquarters, near Paris), largely patterned on the Dostert original. The most unexpected is the one worked out by Jesuit Georgetown for the government of Communist Yugoslavia.

A complete laboratory consists of from five to two hundred tape machines, each in a partially soundproof cell lined on three sides with acoustic tile, but open at the top, each equipped with a pair of headphones and (when necessary) a hand microphone. The degree of acoustic isolation provided is of course incomplete, but adequate for quiet speaking, while the headphones provide not only a freedom from distractions, but also a real aid to concentration. As the tape is played it may be stopped at any time, reversed, replayed as often as desired; tapes do not wear out.

The mechanics of providing students with their teacher's tapes vary, of course, from installation to installation. At the larger centres copies of the instructor's master tape are made, and stocked at a university-store. At the beginning of the academic year, a student purchases three tapes at \$3.50 each. As he finishes with one, it is traded for another; as many as seventy-five half-hour tapes may be used in a single course. On turning in the last three tapes, he receives a refund of \$2.50 a tape, thereby securing perhaps 30 hours of instruction for \$3.00, or 10 cents, the price of one large Coca-Cola, an hour. This fantastically low price is possible because a tape can be completely "erased" and used again several hundred times. The charge for classroom work is, of course, less modest, but the tape procedure does enable one instructor to handle many more students than would otherwise be the case, and thus helps to keep the total cost low.

Enthusiasts for this remarkable scheme can justly claim that their students acquire far greater fluency, and better verbal understanding, than those taught by older methods over a similar period. Indeed, one "old style" instructor recently admitted that Georgetown students, after one year, seemed conversationally the equal of his own after three. Criticism of the laboratory system is mainly directed at the fact that it does not seem to give the advanced student any comparable advantage. Since this type of language instruction is barely five years old, it is hard to know how valid this criticism may be. At present, the laboratory courses are almost confined to beginners, for it is in such elementary instruction that the need is most apparent. It may be that listening to recorded plays, recorded readings, and the like will prove a useful supplement to advanced study, though for a degree at least one year's residence abroad is usually still required. But there is no question that the mechanisation of elementary language instruction, adopted by so many universities, by the State Department and by the US Army, can give many Americans something better than the Englishman's "public school French."

American Notes

Taft at the President's Right Hand

The announcement that Senator Taft would be "available" for the role of majority leader of the Senate when Congress meets in January must have been received with mixed feelings by General Eisenhower's advisers. The majority leaders of the House and Senate are the chief connecting links between the White House and Congress; under the Democrats they paid weekly visits to the President, accompanied by the Vice-President and the Speaker of the House, to map out the legislative programme and strategy. In the last Congress Senator Bridges, who is acceptable both to the Taftites and the progressives, was the Republican leader. But he will continue in the post only if this is necessary to avoid an undignified squabble over his successor. Senator Bridges must seek re-election in two years, and the majority leadership is an exacting job which leaves little time for mending political fences, as the two last Democratic majority leaders found, to their cost, in 1950 and 1952.

General Eisenhower can count upon wide support from the conservatives and middle-of-the-roads, who make up the bulk of both parties in Congress, which Mr Truman could not. But his technical majority is the narrowest in twenty years, except for the two when Mr Truman lost control of Congress altogether. To hold his party together and present a united front, General Eisenhower will need, and apparently is planning, to work very closely with his Congressional leaders. Inevitably this means working closely with Senator Taft, the most powerful legislator Washington has seen for many years, and the undisputed leader in fact, if not in name, of the Congressional Republicans.

Mr Taft is already assuming a rather authoritative tone. The President's more liberal advisers may be nervous about too intimate an association, which might seem to put the President in the Senator's conservative pocket, until Mr Eisenhower has gained political experience. But they are not likely to be able to avoid it. Senator Taft has already rather sharply warned General Eisenhower that the Senate Republicans can make their own choice without help from the White House. And he need not insist upon becoming floor leader, with all the arduous duties that entails, in order to help shape the President's proposals to Congress. He has suggested that the President should invite to his legislative conference all three of the top Republican officers of the Senate, including the chairman of the Republican Policy Committee, a post Senator Taft has long held but which is not likely to be as important as it used to be, with a Republican President to make policy.

The Democrats, now in the minority, are not expected to need any behind-the-scenes conferences to settle who their leader should be. Senator Lyndon Johnson of Texas seems to have secured the support of most of his colleagues except those on the extreme Fair Deal wing, who do not like his friendship for the oil and natural gas interests and feel that the future of the Democratic party lies on the left of the road rather than in the middle, where Senator Johnson prefers to travel. This will be the first time since 1937 that the Democrats have had a leader from the South.

Budget in Eisenhower's Nest

General Eisenhower must by now be realising that almost his only chance of keeping his election pledge to reduce defence spending without reducing defensive power lies in a Korean settlement. Yet his Congressional leaders, Senators Taft and Bridges and Representative Martin, who have far more experience than has the General of the virtual impossibility of making substantial cuts in government expenditures under present conditions, are already warning him that if he

Fly **TWA** to the USA and back for only £146.4s.

TWA's new Thrift Season fares offer you the greatest air-travel bargains ever

By taking advantage of TWA's new thrift season Sky Tourist fares you can save £101 on the standard return to Boston, or £105 to New York.

does not bring the total of the 1954 budget down to \$70 billion, they will. That budget, for the fiscal year beginning next July, is already in the final stages of incubation and will be hatched out by Mr Truman before he leaves.

The usual inspired guesses estimate its size at about \$85 billion, with nearly \$60 billion for national security programmes and another \$15 billion for fixed charges such as interest and pensions. This is about what was asked for the current year, although Congress finally got it down to \$80 billion. Congress and the new Administration between them may reduce the 1954 budget as much or even more and it is not impossible that the 1955 budget, to be presented in just over a year's time, when rearmament is scheduled to be nearing its peak, may be kept to the \$60 billion that the Republicans are aiming at. This might enable taxes to be cut in nice time for the Congressional elections in 1954.

Meanwhile, however, General Eisenhower may be tempted to extend last year's stretch-out of the defence programme still further, putting off delivery dates on contracts already entered into, so that payment does not have to be made during the 1954 fiscal year. As the chart shows, deliveries, particularly for "hard goods" such as tanks and aircraft, lag far behind the placing of orders. Thus much of the actual military spending next year will be to pay for commitments already made with Congressional authorisation. Even if Congress were to cut the amount asked for military procurement in the coming budget, spending would be little affected until the following year. Now that foreign aid is made up so largely of military assistance, the same situation exists in that part of the budget also.

As a result both the defence and mutual security agencies always have generous spending authority in hand when they go to Congress for fresh funds and members of the new Congress are already determined to look into this practice. Congress, and particularly Senator Lyndon Johnson's Preparedness Committee, is also doubtful whether the country is getting full value for its defence dollars and has been demanding a "production czar" in the Department of Defence, a demand which seems to have been met by the appointment of an industrialist to head the department. Mr Wilson and General Eisenhower between them should know where to look for worth-while savings both in money and men. But \$15 billion is a great deal of fat to trim off even an \$85 billion budget without cutting to the bone of the country's defensive power.

Costello's Heir

The New York State Crime Commission, which has been investigating relations between political machines and the underworld outside Manhattan, has now come to the city and the dockworkers have already struck in protest at its impending inquiry into gangsterism and corruption on the waterfront. The chief revelation of the hearings held earlier in the month was the existence of an heir to Mr Frank Costello,

the underworld overlord now in prison for contempt of Congress who is due to be deported when he comes out. Testimony before the commission pointed to Mr Thomas Luchese, who is said to have been promoted to the vacant top job as ceremoniously as if he had been chairman of the board of some large corporation. To the drug peddlers he is alleged to have organised, Mr Luchese was known as "three-finger Brown." But like his predecessor, Mr Luchese ran a respectable business as a front, met federal and state judges and leaders of both political parties on friendly terms, and gave handsomely to charity—and to Tammany, the Democratic machine in New York.

In the days of its power and wealth, before the La Guardia reform administration and before it lost its federal patronage, Tammany never pretended to be pure. But it did not have to be bought and bossed by gangsters as it is today, in its decrepit old age. Further testimony before the commission showed that the sale of judgeships is common—lower court judges are elected in New York, and the district captains of the political machines can demand up to \$100,000 for a nomination and for turning out the vote. Appointment to court jobs is a political perquisite, and judicial patronage often goes to relatives or the highest bidder. One of the aims of the commission in going over ground well covered in the past by half a dozen different investigations is to discover what changes in the electoral law are needed to loosen the tight grip of corrupt political machines.

The investigation may help to guarantee the return of another reform government in the city next year. But the effectiveness of the commission, which is bi-partisan, but appointed by a Republican governor, would have been greater if it had not appeared to be dealing lightly with Republican witnesses. It was incidentally a Republican who secured from the State Parole Board the certificate of good conduct which enabled Mr Luchese to vote again, a right he lost after having been imprisoned for the theft of an automobile. Mr Carmine de Sapio, the leader of Tammany, has issued a spirited denunciation of the commission's tactics, and he is supported by less interested observers, such as Mr Spruille Braden, head of the New York City Anti-Crime Committee, who wonders why the commission gave Mr Luchese immunity from any further subpoenas. If he can be found, however, Mr Luchese may not long be available as a witness; whatever else may or may not be proved against him, he appears to have concealed four arrests in applying for his naturalisation and should soon be sent to join Mr "Lucky" Luciano in Italy.

Tobacco's Road Back

Another kind of election was held last week, one of which the results were easy to predict. Over 155,000 growers of burley tobacco voted on whether they wished to continue government control over, and price support for, their 1953 crop, which represents about 27 per cent of all tobacco grown in the United States. Although the government programme calls for a considerable reduction in the amounts they are allowed to produce—from 611 million pounds this year to 546 million next year—there is little doubt these farmers have continued their adherence to the scheme, which has governed their production without interruption since 1940. Last time 95.8 per cent of burley growers voted in favour of the plan, in which the government undertakes to support the price by loan and purchase agreements provided the growers keep within acreage quotas based on the Department of Agriculture's market forecasts. A two-thirds vote of acceptance, binding on all growers in the voting group, is required.

The bulk of American tobacco—burley, Maryland, flue-cured, fire-cured, dark air-cured and cigar—is grown with such market protection, and even those growers who have chosen the rugged road away from federal aid are now tripping over their surplus tobacco in their haste to return

to a protected market. Seven northern states that produce cigar filler and binder leaf tobacco have just reversed their decision of a year ago, after having a taste of freedom during which prices dropped sharply. And a much chastened group of Maryland farmers, who refused to continue in the scheme in 1950 when they were required to limit acreage if they wanted price support, have now voted to abandon their individualist principles for the sake of collective security.

Tobacco consumption continues to rise; Americans will spend \$5.1 billion for cigarettes this year, and perhaps it was with this in mind that Maryland farmers in 1950 and 1951 sweepingly rejected quotas in favour of expansion. But by

this spring it was apparent they were headed for trouble; production exceeded sales by 7,000,000 pounds and the price dropped to 44 cents a pound compared with the support price of 54.2 cents. With a fine disregard for their earlier vote, Maryland tobacco men called for immediate federal protection from themselves, in the form of the price supports for this year's crop which they had spurned last December. Needless to say, other tobacco areas which had played by the rules would not let the Marylanders have it both ways, so Congress failed to pass the special legislation which was necessary. Sadder, wiser, and \$5 million poorer, Maryland tobacco farmers have to struggle through another year of freedom before getting back to the safety of price supports.

Voters have their Say

In 37 of the 48 states last election day the voters, in addition to choosing between candidates for every sort of

public office, from President to city councillor, had a chance to give their opinions on a variety of local topics. Altogether about 200 of these propositions, without apparently including numerous bond issues, were on the ballots, either because they concerned matters which under state constitutions must be settled by popular referendum, or because a sufficient number of the electorate had signed petitions asking for a chance to vote on the question. In Oregon the public had its say on fourteen of these propositions, ranging from changes in the state milk laws and lorry tax regulations to approval of daylight saving time. This was rejected, as it was in the neighbouring state of Washington. There, however, housewives will in future be able to buy yellow margarine, while in Oregon alcoholic liquor can now be bought by the tot as well as the bottle. Neither Oklahomans nor South Dakotans were prepared for their children to vote at 18, and Colorado is not to have gambling machines. In Arizona and Nevada anti-trade union measures were adopted; no one advocating the violent overthrow of the government will be entitled to tax exemption in anti-Communist California, and in South Carolina preparations were made to close the public schools should the Supreme Court decide that segregation of Negro children in the state schools is unconstitutional.

New state taxes seem to have been rejected nearly everywhere that they were proposed, while changes, usually important, in state constitutions were frequently approved. But the greatest enthusiasm was shown for bond issues, and the construction industry now has a comfortable cushion of state schemes to fall back on should there be a collapse of the present building boom under federal and private auspices. Of the \$1.5 billion worth of borrowing plans proposed by state and municipal governments, nearly the whole amount was approved. School building took first place, but there were also numerous schemes for hospitals and other institutions as well as for roads and sewers. San Francisco decided it needed a new fire station but that its outworn municipal railway, which includes the historic cable cars, would do as it was; Portland, Oregon, has been denied its zoo and Seattle its new parks by voters in utilitarian moods.

Shorter Note

The death of Mr William Green, who had been president of America's original trade union organisation, the American Federation of Labour, for nearly thirty years, followed closely on that of the younger Mr Philip Murray, who headed the Congress of Industrial Organisations. Of the three grand old men of American labour, the only survivor is now Mr John L. Lewis, who led this splinter group out of the parent body and then walked out of it himself. Mr Green has been succeeded without controversy by Mr George Meany, who had been performing most of his duties for some time, but the CIO is still arguing over a successor for Mr Murray.

THE WORLD OVERSEAS

Germans and the Middle East

THE West German Government announces that, between now and Christmas it is sending special trade delegations to all the Arab states. The immediate cause of this move is anxiety to avert the boycott which the Arab states threaten to impose in protest at German reparations payments to Israel—a situation that was described in *The Economist* of November 8th. West Germany's anxiety, however, also directs attention to the very considerable recovery of its trading strength in the area.

This recovery became an obvious feature of the Middle Eastern economy from 1950 onwards. Since then, not only has the volume of trade increased but the return of the German technician as adviser has happened on such a scale as to be easily noticeable. For example there are now German experts in the Egyptian State Railways in roles which were until 1950 a British monopoly; German military experts employed in the Egyptian and Syrian armies may one day lead to Middle Eastern orders for German arms; Middle Eastern airlines are signing up ex-Luftwaffe pilots; German advice on how to keep Abadan in trim has been taken in Persia. In a word, West Germany's trade drive is benefiting from the fact that underdeveloped states which need technicians greatly prefer, for political reasons, not always to have to get these from the group of western states that they dub "imperialist."

Figures for West German trade with the main Middle Eastern countries are given in the table below.

WEST GERMAN TRADE WITH THE MIDDLE EAST
(\$ 000,000)

	German exports to:			German imports from:		
	1950	1951	1952 Jan.-June	1950	1951	1952 Jan.-June
Egypt ..	19.1	29.7	18.7	23.5	24.5	11.9
Syria	7.1	7.6	4.9	1.0	1.3	0.6
Lebanon ..	...	3.9	2.1	...	1.0	0.5
Iraq	0.3	2.3	2.0	18.2	32.9	22.2
Persia	9.3	19.9	11.1	9.3	25.4	7.2
Saudi Arabia	2.5	3.0	2.3	14.0	36.6	17.9

These reveal a balance that is, in the aggregate, unfavourable to Germany. But the breakdown shows that the balance is in fact unfavourable only in the case of the two oil-producing states, Saudi Arabia and Iraq, which between them sold to West Germany goods to the value of \$69.5 million in 1951 and \$58 million in the first nine months of 1952—virtually all crude oil. In a word, the Arabs tend to get more from Germany than they sell to it and would be severely hit economically and in terms of their development programmes if they were to turn their back on it because of its dealings with Israel.

Egypt—the biggest of the Middle Eastern states, and the biggest potential customer—would be hit the hardest because it is also a would-be heavy seller to Germany of goods that are not (as the oil is) sold through a concessionaire which might be able to maintain the supply from another quarter. Unlike its trade with other western industrial countries, Egypt's trade with Germany is nearly in balance because the

Federal Republic has been buying Egyptian cotton despite the slump this has suffered through the Wafd's price policy.

EGYPTIAN TRADE WITH GERMANY
(£ 000)

	Imports from	Exports to
1947	129	1,749
1948	336	1,753
1949	601	5,427
1950	6,149	5,507
1951	9,798	8,610
1952, 1st 9 months	8,900	8,300
1951, same period	5,600	4,500

The jump in the import figures as between 1949 and 1950 is accounted for by an agreement—which is mainly a payments agreement and which was renewed in 1951—based on a dollar rate of exchange of \$2.87 to the Egyptian pound, whereby the two countries are, within a fixed limit, buying and selling each others currencies at the agreed dollar rate. There is a fixed margin of \$15 million and when this is reached the country in deficit has to pay in an agreed third currency—sterling. No licences are needed for German imports into Egypt. At present, the trade is running so nearly in balance that the agreement does not yield Egypt any of the sterling it so badly needs but a stepping up of its cotton sales—which it is trying hard to bring about—might produce this result. A survey of the nature of the exports shows that a boycott would not only shut off a potential source of sterling but would deny Egypt latitude in commissioning capital goods for works that lie immediately ahead.

Seen through British spectacles the German export drive, particularly to Egypt, constitutes serious competition. There are few German consumer goods in the shops except pharmaceutical products; Germany is also recovering its trade in fertilisers. The main attack is along the line of investment goods; it is worth noting that in this field the Egyptians are again the beggars as they need to buy capital equipment on long term credit. So far, the Germans have not found a way of giving them the facilities that Cairo wants. Nevertheless orders for pumping plants and iron and steel constructions such as bridges are going to Germany from Egypt and big German firms are tendering for the Aswan dam and similar public works. Germany has probably in hand about £4 million worth of long-term heavy industrial contracts; this will of course lead to a market in maintenance parts. Its trade elsewhere in the Middle East is for the present much more concerned with lighter industrial products, with pharmaceuticals, electrical apparatus and agricultural machinery holding a strong place.

This rise in German trade is no unnatural development. Before the war the Middle East had strong connections with German firms and many of the trade lines that are being reformed are between old business associates. West Germany has not yet recovered the Reich's prewar position; for instance, in Egypt, in 1938, Germany enjoyed more than 10 per cent of total foreign trade, whereas West Germany's percentage was less than 4 per cent in 1951. Before the war, in Persia, Germany was second only to Russia as a supplier and in 1938 was responsible for 25 per cent of the import trade; in the first quarter of 1952, it has won its way back to third place but its share is still only 13 per cent. Although final figures are not available, the percentages have now altered to an extent that places the Soviet Union

first with nearly one-third and Germany second with approximately 20 per cent of Persia's present low volume of foreign trade. The Germans are now backpedalling somewhat because transactions under the clearing agreement which they reached with the Persians in the summer have not gone quite as they expected. The agreement allowed for an unbalance of \$8 million in either direction and the Persians are already in debt almost to this amount with little prospect of reversing the swing.

Yet the intention to narrow the gap as fast as possible is clear from the degree of agitation to which Bonn has displayed over the boycott threat. In Cairo in particular, this was made into a major diplomatic affair in which the comings and goings of the German Ambassador Herr Pawelke were more frequent and energetic than the situation seemed to warrant. Arabs are hard bargainers if they think they have their adversary on the run. This too obvious anxiety almost certainly encouraged them to take up a stiffer attitude; there were at one time distinct signs that some states were aware of the harm a boycott would do to them, and that some would have liked to escape from the propaganda position they had taken up. Instead, Saudi Arabia refused to allow a German trade delegation to enter the country, and General Neguib first asked the Germans to postpone an industrial exhibition in Cairo, and then unconstitutionally sent a direct message to Germany's industrialists pointing out the bright future that awaited them if they "settled the crisis"—i.e. settled it in the way which he hopes for.

Admittedly, Dr Adenauer's government has been in a difficult position. It has been caught between its own laudable conviction that restitution to Israel is a moral obligation and, on the one hand, pressure from the concerns which hope to expand their business in the Middle East and, on the other, pressure from those who hope to prosper out of reparation deliveries to Israel. (The first group has even been stating, according to a recent number of the *Frankfurter Allgemeine Zeitung*, that if a boycott were imposed, Germany stood to lose trade to the value of three milliard D-marks; the newspaper rightly points out that current statistics prove that the loss would not remotely approach this figure unless calculated over ten years.) As a result of this fuss and the lack of acumen about Arab technique which it displays, the delegations which Bonn now feels bound to send round the Arab capitals set out at a disadvantage.

Atlantic Assizes

[FROM OUR SPECIAL CORRESPONDENT]

JUST about this time last year the public which tries to follow the operations of the Atlantic alliance was reading about the work of Nato's "three wise men." Mr Harriman, Sir Edwin Plowden and M. Monnet were trying, on behalf of fourteen governments, to bridge the gap between the soldiers' proposals for Europe's defence and the civilian ministers' ideas of what their countries could afford. Eventually they produced a plan which was accepted, with modifications, at the Lisbon conference of Nato last February, and which has remained since then the basis of Atlantic defence planning. This year there are no "wise men," and the less said about supra-national arbitration by distinguished national personalities the better. A similar job is, it is true, being done at this moment in the Palais Chaillot; but the methods are democratic, the procedure bureaucratic, and the mood even less plutocratic than they were last year.

In the process known as the Annual Review, which is now in train, an important political precedent is being created. Nato will increase its power and prestige if it is successful in its main aim, which is to establish what forces the alliance can and should have by the end of next year, and what rough figure of forces it could afford in 1954. The process obviously involves a thorough examination of all the

economic factors affecting the common defence effort. It is just because the scope and implications of the operation are so wide that the next ministerial meeting of the Atlantic Council, on December 15th, will bring to Paris not only Foreign Ministers but also Defence and Finance Ministers. That they will settle all their business then is unlikely; too much in the future depends on American policies as yet unframed. But they will be seized of their main common problems and individual perplexities.

The process of the Annual Review began last June, when the fourteen governments received from Lord Ismay's Nato secretariat a detailed questionnaire. This inquired about the forces and production planned for the period ending December, 1953, about contributions towards bases and communications under the heading of "infrastructure," and about military budgets and the more general considerations known as "politico-economic capabilities." It amounted, in short, to asking: "What are you proposing to do, and what can you afford?" Information was also requested for more general estimates of what might be set as objectives for the year 1954. Parallel with this Nato inquiry was the more general OEEC inquiry into the economic state of member countries. At the beginning of this month most of the fourteen replies to the Nato questionnaire had reached the Palais Chaillot and work has been proceeding on them ever since.

Anyone pausing to read the semi-secret list of meetings that is shown in the main corridor of Nato's headquarters will realise that its officials and experts from national delegations are moving busily through a neatly planned maze of committees. Copies of each government's reply to the questionnaire go first to five technical teams, whose titles are: Military Considerations; Production; Infrastructure; Defence Expenditure Analysis; Politico-Economic Capabilities. Each team has as chairman an official of Lord Ismay's international staff, and he is assisted by secretariat officials and experts from three or four national delegations.

Questions and Answers

Each technical committee meets first without any representative from the country whose report is being examined. Questions are framed and the national representative and his advisers are then called in. The main purpose is to clear the ground of all technical difficulties and to get from governments all necessary elucidations. At the end of the cross-examination each technical committee will still have some questions or criticisms about each national report; but the object of what is called the "first round" has been achieved. The experts have asked their questions and the conclusions await a more general analysis and co-ordination.

At the next stage all the reports of the technical teams on a particular country are brought together before a Working Group, membership of which varies for each examination. In theory, representatives of all fourteen Nato members are entitled to attend the meetings of this group; but in practice the main work is left to four permanent experts from national delegations, assisted by the chairman of the technical teams (or their deputies) and members of the secretariat. Here again, during this "second round," the first meeting is held without the defendant country's representative being present. At the second meeting he appears to answer the questions that have been prepared. These are, of course, of a more general nature than those put by the technical teams.

The second round of question and answer having been completed, the secretariat writes a report of the working group's conclusions on each country. This goes to the Annual Review Committee, the supreme fourteen-nation body in the matter, set up by the Secretary-General and chaired by his deputy Mr van Vredenburg. This committee has to merge these country-by-country reports into one agreed report on the objectives that Nato as a whole can be set for December, 1953—that is to say figures of troops,

aircraft, equipment and so on. This will contain not only estimates but also criticism of mobilisation arrangements, reserves available and deficiencies in equipment. Throughout the process of examination, from the first round to the last, Nato officials consult with General Ridgway's headquarters outside Paris and with the representatives at the Palais Chailiot of the Standing Group in Washington.

The Annual Review Committee will therefore have done all that can be done with the national delegations to isolate those matters on which there is disagreement between soldier and civilian, between Nato and a national government or between individual governments. It is the task of the Ministers themselves meeting in December to reconcile them, or subsequently to persuade their cabinets that action must be taken to reconcile them.

As compared with the "three wise men" operation, this method of working is more democratic. It is also more cumbersome but, apparently, not less speedy. In practice the leading part in examination and discussion is taken by the larger countries. In the working group that examined the British reply to Nato the permanent representatives were supplied by Belgium, France, Norway and the United States; in the group that examined the American reply the work was done by British, Canadian, French and Italian delegates. Generally speaking, the smaller countries feel that more justice is being done this year to their complaints and difficulties. Whether the result will be a more solid backing for General Ridgway next year remains to be seen.

Foreign Investment in India

[FROM OUR CORRESPONDENT IN BOMBAY]

HISTORICALLY, foreign investment in India has fulfilled two roles, of which the second is now much the more important. First, it provided capital which could not be raised at an economic rate on the Indian market. Secondly, it acted as an *avant-garde*, bringing to India skills, technicians, and industries which the country had not hitherto had. As India has itself acquired the skills and learned to produce the technicians, the industries that foreigners have created have tended to pass into Indian hands; the scope for the foreigner has always lain in the past, and lies now more than ever, in his capacity to do something new to provide for the Indian economy modes of development which it could not generate of itself.

The straight provision of capital was important mainly in the period between the Mutiny and 1914. The railways and the telegraphs were built mostly with money borrowed in London. With the exception of steel every Indian industry—jute, cotton-textiles, coal, tea, shoes—as well as most engineering and even such services as banking and insurance, owed their origin to foreign pioneering. As late as 1914 only in cotton textiles was there a preponderance of Indian capital, though many of the managing agency houses early began to raise locally part, at least, of the capital they required for their different enterprises. After 1919, both the government and the managing agencies turned increasingly to local sources for their money; foreign investment came mainly through subsidiary companies or the branches of large outside organisations, which created such new activities as tyre manufacture and oil distribution and the modern marketing of household goods.

This was already a shift in emphasis from the capital accompanied by know-how of the days before 1914 to know-how accompanied by capital. Since the war this shift has gone even further. The total of foreign capital invested has been but a few million pounds, only about the same as the amount withdrawn as the result of the sale of existing investments. It is dwarfed by the annual release from the sterling balances, by the sum of over £30 million which it will cost the oil companies to put up the refineries they have agreed

to build (the investment of foreign capital where the capital itself is even more important than the know-how), and above all by the £300 million at which the reserve bank in 1948 estimated existing foreign investment (other than government obligations). It is, indeed, very much smaller than the £20 million a year which India remits abroad as the profits of existing foreign concerns. Obviously, the private investor is not going to provide any very large part of India's considerable requirements of capital; the primary reliance will have to be placed on such sources as World Bank loans, and aid from the United States or under the Colombo plan. Nevertheless, the private investor has a role to play out of all proportion to the amount of capital he can be expected to provide, for he brings with him an amount of knowledge and experience per million pounds infinitely greater than can be provided in any other way, even under Point IV.

PRODUCTION IN 1951

	1946 = 100
Caustic soda	507.7
Soda ash	391.6
Bicycles	265.9
Diesel engines	1,531.9
Electric motors	309.4
Coal	118.8
Cotton cloth	104.3

It must, however, be remembered that private investor, in this context, has a strictly limited meaning. It no longer includes, as it did in the early days, the pioneer starting a steamer service with one small ship, or the old lady having a flutter on a new tea share. It means almost exclusively the great corporation, with its research laboratories, its techniques of mass-production or quality control, its experience of distribution and advertising, its modern accounting, above all, its managers and foremen trained over years to work together as a team and in accordance with a tradition; such companies can greatly reduce for India the price of industrialisation, not only by their high standards of efficiency and their low costs of production, but also by their past experience of what pitfalls to avoid and by the new cadres whom they train.

Advantages for Foreign Firms

Since the war such companies have been bringing their know-how and their managers to India on an ever-increasing scale, though frequently accompanied by only a quite small or no investment of capital. The standard method has been an agreement between a foreign firm, usually English, and an Indian company, or sometimes the Indian Government, by which the foreign company provides, usually for a stipulated number of years, the advice, designs, technicians and so on, which may be necessary and sometimes a minority share of the capital, and the Indian company does the rest. Though no two agreements are ever quite the same, this basic pattern has been followed with machine tools, diesel engines, steel tubes, bicycles, textile machinery, motor cars, telephones, plate glass, locomotives and dyes, to name only the most important examples.

The benefits to India of such arrangements are obvious though in a country short of capital, the advantages are even greater where the foreign firm brings its capital with it, as the oil companies are doing. The advantages to the foreign firm are also great. It is not only that it gets paid for what it provides; it also retains for itself a customer for all those components or materials for which the Indian market is too small to justify local manufacture. For the time being at least, the market thus retained may, as with dyes, or motor cars represent a very large part of the value of the finished product. The exports of the industrial company making the arrangement may indeed go up; for one thing, once the finished product is made in India, it is normally given protection, thus reducing competition; and for another the Indian Government is becoming increasingly unwilling to agree to a series of such agreements with different foreign manufacturers covering the same product. First in, there-

"How's your Dichlorophenoxyacetic Acid* doing, George?"

Unlikely words from a farmer perhaps—but most farmers do recognize—and with very good reason, too—the important active role that agricultural chemicals play in ensuring bigger, better crops, greater beef and dairy yields. Monsanto supplies essential chemicals in ever increasing quantities to manufacturers of insecticides, fungicides, weed-killers, wood preservatives, soil sterilisers and other agricultural chemicals. By the same token, Monsanto makes important contributions to hundreds of other industries, too—helping to improve production and lower costs in hundreds of different jobs. Thus does Monsanto help industry at large—which serves mankind.

FUTURE LIABILITIES ARE MET OUT OF CURRENT PROFITS

One benefit of a pension scheme

A NORTHERN manufacturer paid gratuities to old employees on their retirement and to dependants of employees who died while in his service. Just before the war, he was embarrassed when several claims came together and coincided with a decline in trading. Warned by this experience he decided to put in a pension scheme financed by an insurance company, so that benefits could be assured in advance by premiums recognised as a normal business expense. The new arrangements have been more satisfactory both for him and the staff.

The scheme was handled by Robt. Bradford (Pensions) Ltd., who are specialists in designing pension schemes and have unrestricted choice of the entire insurance market because they are independent of all insurance companies. Their impartial advice and wide experience costs you nothing. One of the directors will be pleased to discuss cases and possibilities with you.

The first Labour of Hercules was to kill the Nemean Lion, which was laying waste the countryside and killing cattle and sheep. First Hercules clubbed it with a whole tree he had torn up, then he strangled it with his bare hands.

The Nickel organisation, too, has had its battles with rugged nature to make a good life for those who work in the mines and refineries. The ore is found in remote districts, and all community services must be provided. Near Creighton in Northern Ontario, an entire new town is being built. In the Sudbury district 1,700 homes, 7 community centres and a hospital have been provided. This is but one revealing side to the enormous task of supplying the world with the nickel it needs.

THE MOND NICKEL COMPANY LIMITED

Sunderland House · Curzon Street · London · W1

fore, very much first served. The Indian Government is, of course, aware that there are risks attached to a policy which reduces competition in this way but it considers those risks worth running. It has not the foreign exchange or the steel to spare for a series of competitive factories; and it has learnt the hard way, with the motor vehicle industry, that for many items the Indian market is so small that to have a multitude of plants is merely to ensure that they will all be uneconomic.

Provided that the investment proposed fulfils an Indian need, that it either adds to the Indian economy something new or does something old better and cheaper, the atmosphere for foreign investment is unusually favourable in India. It is not a colony like Malaya or most of Africa, so there are none of the risks of independence to come. It does not suffer from xenophobia, like so much of the Middle East. Its government is stable and democratic, unlike much of Latin America. Its policy about repatriation of capital and remittances of profits is liberal. Taxation is not, in general, discriminatory, and only recently the Finance Minister has removed from his Income Tax Amendment Bill those provisions which foreign enterprise found particularly deterrent; fiscal concessions for new enterprises are considerable. Nationalisation is not an immediate threat, and the Constitution provides for compensation for anything which may eventually be taken over. There are no compulsory percentages of Indian capital or managers laid down. Strikes are rare and judges in labour arbitration cases more reasonable than they were a few years ago.

There are, naturally, difficulties with which to contend—a low level of labour productivity, high taxes, controls, delays, and the lack of external facilities; but any concern which is prepared to make itself a part of India's life, to make its management Indian as far as it can, and to look at the problems of its Indian business from an Indian point of view, will find not only a warm welcome but, even more important, ample opportunities for making a profit.

German Liberals Veer to Nationalism

THE conference of the German Free Democratic Party last week-end did not definitely decide the question whether the Liberals will remain a centre party, or—in the words of Herr Maier, premier of Württemberg-Baden—whether they are starting on “a gallop to the right.” The rightists, however, won on points. Their leader, Dr Middelhaue, who heads the party in the industrial centre of North Rhine-Westphalia, was elected to a newly created post of second deputy-chairman, and will act as party manager to prepare for next year's elections. This more than offsets the re-election of Dr Franz Blücher as chairman. Dr Blücher is a reliable old-school German liberal democrat who is the Federal vice-chancellor and has been minister for ERP Affairs. But neither of the rival programmes—a “Liberal Manifesto” from Hamburg, and a “German Programme” from the right-wing, was adopted at the conference, and the party remains split.

The Free Democrats are the second largest party in the present Bonn coalition, and have recently been making considerable headway. They are not liberals in the British party sense, but rather conservatives with anti-socialism as their main characteristic. This has, however, not prevented the more moderate southern group from forming a coalition with the Social-Democrats in Württemberg-Baden, which is traditionally an area of small independent business enterprises and peasants; in the Ruhr, on the other hand, and in other parts of the country, this pact with socialists is frowned

upon. There the trend is to win support from the industrialists by attacking socialism and trade unionism.

The right-wing, under Dr Middelhaue, is also attempting, by drawing up a nationalist programme, to win the votes of the former Nazis, either in collaboration or in competition with the still more extreme right *Deutsche Partei*. It seems strange that the Liberals should make this bid, when it is recalled that the National-Socialists supported the very antithesis of a liberal regime, and Hitler was accustomed to denounce liberals in the same breath as bolsheviks and Jews. But the leaders are not only using vote-catching tactics; they feel that they are doing a service by offering a democratic political home to the former Nazis. There is something to be said for the idea, but everything depends on how it will be put into practice. The crucial question, on which different sides were taken at the conference, is whether the party shall distort its principles to accommodate the ex-Nazis, or whether the newcomers shall accept a conservative, democratic, pro-western programme. Dr Blücher and others felt bound to insist that the ex-Nazis must not demand that their past entitled them to leadership; on the contrary, they should admit their mistake. This warning was significant of the new self-confidence of former Nazis.

Wooing the German Soldiers

The Middelhaue group has also been trying to make the Free Democrats the party of the army. It has been particularly active in the campaign to secure an amnesty for war criminals, and, with the Evangelical Church, has made other bids for guidance of former and future soldiers. To understand this trend, it is necessary to recall that the German liberals are a Protestant party. Prussia, the backbone of the old army, was also mainly Protestant, and it used in fact to be almost impossible for an officer to become a commanding general if he was a Catholic. The links between the liberals, the Evangelical Church and the army are therefore old-established.

By adopting the Middelhaue “German programme,” the Free Democratic Party would therefore not only attract ex-Nazis, but it might well lead former and future German soldiers away from Western European collaboration, and towards a campaign for revision of Germany's eastern frontiers. At the same time, the support of industrialists would ensure financial aid for the party, and collaboration with the *Deutsche Partei* would mean the establishment of an extreme right-wing bloc. It is no wonder therefore that observers of recent developments fear that they will lead to a fresh version of the prewar *Deutsch-Nationale Partei* headed by the Krupp director, Herr Hugenberg, which joined the Nazi party in the so-called Harzburger Front, and finally succumbed to its partners.

Venezuela Votes

TOMORROW the people of Latin America's most prosperous state will go to the polls. No immediate change of government can result from these elections, which are for a constituent assembly; nor is it difficult to foretell which party will triumph. Yet the elections of 1952 will mark a significant stage in the political evolution of Venezuela, a country whose importance may be gauged by the single fact that it is the largest exporter of oil in the world.

Both politically and economically, Venezuela has moved fast and far since 1935, when the death of the dictator Gómez freed it from the chrysalis in which he had imprisoned it for a quarter of a century. For a decade after Gómez's death the country contented itself with stretching its limbs cautiously, glad of its greater freedom but

uncertain how to use it. Rich revenues from the oilfields were already pouring into the national treasury, but the military presidents who succeeded Gómez, while less opposed to innovation than him, failed to keep abreast of popular feeling. The result was the revolution of 1945, which, like the Brazilian one of the same year, succeeded because the army sided with the discontented citizens of the bigger towns.

Andean Ascendancy

The victorious revolutionaries launched out on an ambitious programme of economic and social development, based on the rapidly multiplying oil revenue, and many of their projects, if too lavish, were long overdue. For three years the entente between left-wing politicians and young army officers held firm. The first popular elections in the country's history were held, and won by *Acción Democrática*, the party led by Señor Betancourt, who had been made provisional President after the revolution. But the split was not long in coming. In 1948 the *Acción Democrática* government was overthrown by the army, and replaced by a three-man military junta, headed by Colonel Delgado Chalbaud, who had previously been Minister of Defence.

The coup of 1948 was primarily a reaction by the army against Sr Betancourt's policies of rapid social change and of favouring the organised labour groups which backed *Acción Democrática*. It was also, to some extent, a rural reaction against government by Caracas intellectuals. Its effect has been to restore the old ascendancy of the Andean

province of Táchira, in the extreme south-west; since the murder of Colonel Delgado in 1950, the strongest personality in the government junta has been Colonel Pérez Jiménez, the Minister of Defence, who, together with many of his senior officers, comes from Táchira. But the swing from left to right and from urban to rural hegemony has not meant that the clock has been put back to before 1945. On the contrary, in economic and social matters the Junta has embarked on a vigorous course which might well be described as an attempt to "dish the Whigs." Trade unions, with government backing, have secured further wage increases; schools, hospitals and social services have been multiplied; and vast sums have been poured into the development of communications, electric power, water supplies and agriculture.

Nevertheless, the junta has not achieved a feeling of security. Many Venezuelan workers have remained loyal to the proscribed *Acción Democrática* and its exiled or imprisoned leaders, and in 1951 the government was severely shaken by an unsuccessful revolt. Caracas University has been closed for months as a result of anti-government activities among both students and teachers. Only now,

four years after the coup of 1948, has the junta felt able to risk elections, and the abortive risings at the end of September suggest that its fears were not unfounded. Neither *Acción Democrática* nor the Communists have been allowed to take part in the elections, and the two main parties of the legal opposition, the Catholic COPEI and the left-centre *Unión Republicana Democrática*, have complained of the many obstacles put in the way of their election activities. These two parties have, however, been campaigning vigorously and have been allowed to put forward some strong, if indirect, criticisms of the government.

The government-sponsored *Frente Electoral Independiente* (FEI) is regarded as certain of a handsome majority in the new constituent assembly—all the more so in view of the fact that voting has now been made compulsory, and the rural population will therefore carry more weight than in 1946, when *Acción Democrática* swept to victory largely through the greater political enthusiasm of the urban worker. The FEI, moreover, has behind it not only all the power and prestige of the junta, but the equally solid fact that most Venezuelans "never had it so good." Yet, although the main issue is not in doubt, many observers will scan the election returns with interest to see how many seats are obtained by COPEI, URD and the small Socialist group, and—an even more significant point—how many of the two million voters cast blank ballots. Then, when the new assembly meets, the question will arise whether the FEI majority, which at present lacks any obvious ideological unity, can avoid falling into dissension. The answers to these questions will largely determine the speed with which Venezuela can hope to move at last into a calmer political climate.

Bad Example from Greece

[FROM A SPECIAL CORRESPONDENT]

AN official Greek delegation is now in London discussing the compensation due to the British-owned Lake Copais Company whose land was expropriated on August 22nd under Article 104 of the Greek Constitution. This expropriation is the last and greatest of the misfortunes that has fallen upon the enterprise. Ever since the attempt was first undertaken in 1886 to begin the draining of the lake, the companies have been involved in an unbroken series of difficulties. The first company, which was French, failed in its attempts to drain the lake permanently. It eventually went bankrupt and a British company took it over on behalf of the creditors.

Years of experiment followed, interrupted by the first world war and considerably harassed by the attempts of neighbouring landlords to encroach upon the land ceded to the company. These uncertainties were brought to an end in 1925 as a result of an Arbitration Award between the Greek Government and the company, the effect of which was to give the company freehold possession of about 210,000 stremmas (60,000 acres). Meanwhile experiment continued to counter the subsidence of the lake bottom which had defeated the French company; and in 1931 a successful scheme was completed. Thereafter the real work of development could go forward.

The troubles, however, did not cease. After 1933 the Greek Government severely limited any remittance of profits. In 1939 the outbreak of war put an end to all remittances. German occupation and the activities of the ELAS and EAM guerrillas during the civil war ravaged the estate. Most of the company's agricultural machinery was looted or destroyed. About 150,000 trees were cut down. Buildings were damaged and the small electricity station on the outlet tunnel was destroyed as late as 1948.

Announcement by the

NATIONAL COAL BOARD

After the 1st December you can have
as much Nutty Slack coal as you like
off the ration

20/- a ton (1/- a cwt.) cheaper than ordinary house coal

You can now buy as much Nutty Slack as you like

It's off the ration. Nutty Slack is much smaller coal than you are used to, but it burns brightly and warmly if you mix it sensibly with your ordinary house coal.

What is Nutty Slack?

Nutty Slack is just what it is called—slack with nuts in it ranging in size up to lumps about as big as two match boxes put together. Your coal merchant will show you Nutty Slack and tell you how to make the best use of it.

It is just as expensive to mine and to carry on the railways as ordinary house coal. But it is offered at 20/- a ton cheaper than ordinary (Group 4) house coal because it is not as clean and is smaller.

For open or closed fires

It is good fuel to use in an open fire or an openable heating stove, mixed with your ordinary house coal. It is perfect for banking up your fire at night or when you are going out. It is particularly useful in a modern continuous burning grate.

Order as much as you like

You can buy it from your own or any other coal merchant and you can have as much as you like all through this winter. But don't wait till all your ordinary coal

allowance is finished before you buy Nutty Slack. Order your Nutty Slack this week in time for Christmas. Use it with your ordinary house coal and make sure you get through the winter in comfort.

NOT AVAILABLE IN SOME AREAS

Nutty Slack will not be available in Scotland, South Wales, Cumberland, Durham and Northumberland, but in these areas either off-the-ration coal may be available.

Nutty Slack

will help to keep the home fires burning
however cold and long the winter

A large-scale enquiry carried out this year for the Coal Utilisation Council shows that:—

1. 98 out of every 100 families in Great Britain have a coal fire of some sort in their main living room.
2. 84 out of every 100 families have no other way of heating that room.
3. 44 out of every 100 families say they need more coal than they are allowed.

Nutty Slack will help

Look on the building site

... or in the garden

... you see **DURALUMIN**

Look where you will and you will almost certainly find one of the aluminium alloys in the comprehensive "Duralumin" range.

The increasing popularity of this versatile material is hardly surprising. It cannot rust, need not be painted, is of good appearance, and whilst only one-third the weight of steel is equally as strong and lasts longer.

"Duralumin" can be welded, machined, pressed and fabricated in much the same way as other metals. It is produced as sheet, strip, tubes, wire and sections; the latter in a limitless variety of different contours.

Have you considered the advantages light alloys can bring to your business? You may perhaps not have heard all the latest developments. A request to us to call upon you would place you under no obligation whatsoever.

Aspects of Enterprise No. 19

The first automatic flour mill

in the world was built by Henry Simon in 1881, using mechanical handling appliances instead of manual labour to transport the mill products from process to process. This was the first step in the transformation of flour milling into one of the most highly mechanised of all industries. Pneumatic handling of mill products is now replacing mechanical methods in many of the latest mills. Pneumatic mills by Henry Simon are at work or in course of installation in over a dozen countries, including the United States and Canada.

In spite of this steady visitation of disaster, the company set to work to make good all the damage, and by 1950 the estate was in full working order. Its output steadily increased and the annual production now averages 25,000 tons of cereals, 8,000 tons of seed cotton and 1,000 tons of various pulses. It also carries 70,000 head of sheep, 600 of cattle and 5,000 of horses and mules. In addition, 30,000 turkeys are grazed on the properties. The annual value of this output is in the neighbourhood of 106 billion drachmae a year (about £2,500,000). The result has been a steady increase in net profits which amounted to over £329,000 in 1950 and over £628,000 in 1951. (An equally steady increase has occurred in taxation payable to the British Government—£152,000 in 1950, £331,000 in 1951.)

A Productive Estate

It may well be the scale of these profits—and the scale of taxation—that has tempted the Greek Government to cancel the concession, and expropriate the property in spite of the specific guarantees given by the government of Mr Sofoulis in 1947 that this would not be done. No doubt, too, a nationalist case can be whipped up of foreign capitalists and foreign governments wringing extortionate gains from Greek soil. But the facts of the case are very different. In the first place, the company has entirely created the wealth it now puts to work. Lake Copais, left alone, would still produce eels and malaria. The rest is the work of the company. Again, the capital sunk in the venture has remained at various times and for years on end without remuneration of any kind. Even now, only the tax owing the British Government has been converted into sterling for remittance to Britain.

But the most striking fact is the direct gain to the Greek people which, under expropriation, threatens to disappear.

Only about a quarter of the area (about 48,000 stremmas) is cultivated directly by the company and this direct farming was undertaken only because tenants had abandoned the less fertile sectors. The rest of

the estate is farmed by some 4,450 peasant families who enjoy a very advantageous system of share-cropping. They pay about 20 per cent of their gross produce in rent and about 11 per cent for the upkeep of the company's services—drainage, irrigation, roads, threshing, transport, storage. In fact the cost of these services amounts to much more than 11 per cent of gross yields. It is in the neighbourhood of two-thirds of the company's total receipts from rents and dues and only the fact that good returns are earned on the land directly cultivated by the company enables it to finance the services at cut price.

Nor is this the only service rendered by direct cultivation. Although the land thus farmed was originally less fertile, advanced farming methods have raised its output by 45 per cent above the tenants' production of wheat and 105 per cent in the case of cotton. This daily demonstration of better farming methods encourages the tenants to improve their own methods and they are given direct help from the company in the loan of tractors and deep ploughs and the issue to them at cost price of attested seed and fertiliser. The whole enterprise is in short a form of co-operative in which the company acts as the tenants' agent and manager.

The plight of the Copais peasants after expropriation may be a serious one. Their own reaction is to believe that once the government gets its hands on the enterprise it will soon be

back producing eels. The only known government plans for land reform hardly apply to Copais. They lay it down that landless peasants shall be settled on large estates for no more than 10 per cent of the gross yield or 12 per cent where irrigation works are involved. These terms may or may not be reasonable where a landlord provides no services, no improvements and does not farm the land. There are a number of estates in Greece which fit this category and a start might well be made on them. But Lake Copais is a single, highly organised, highly capitalised and highly efficient organism. If dues are not paid, the services of irrigation, drainage and agricultural improvement cannot be maintained. If no central organisation exists, the scientific and technical substructure of the estate will collapse. In that case, it will not be a question of a peasant scratching a living on land which the landlord would not cultivate. The issue will be the disappearance of the entire estate under the peaty waters of the rising bog.

Thus the government, in a country desperately short of agricultural supplies, threatens to destroy one of the few efficient food-producing units. It threatens, moreover, to discourage private capital of any kind, domestic or foreign, from ever attempting agricultural improvement in Greece again. The real tragedy is that by a hasty and ill-judged action it is undermining what it professes to safeguard—the property and advancement of the Greek peasants themselves.

This bludgeoning decision is, after all, quite unnecessary. The Copais Company itself would no doubt be perfectly ready to negotiate a long-term settlement by which, over the years, British capital is paid off, and a trained and efficient Greek agricultural co-operative gradually takes over from the company. The present method of immediate expropriation is, in fact, calculated to harm everyone involved in it, and not least the Greek nation.

Air Subscription Rates for 1953

Owing to increased costs, some increases in air subscription rates to *The Economist* will have to be introduced from January 1st, 1953. The countries affected are:

Australia : £8 5s. (sterling)	Malaya : £6 15s.
Hongkong : £7.	New Zealand : £9.
Japan : £9.	S. America and W. Indies : £7 15s.

The substitution of an airfreight for an air mail service to Egypt makes it possible to reduce the air subscription rate to £5 5s. Rates to all other destinations remain unchanged:

Anglo-Egyptian Sudan : £5 5s.	India, Ceylon : £6.
Canada : \$21.50 or £7 14s.	Iran : £6.
East Africa : £5 5s.	Iraq : £6.
Europe (except Poland) : £4 15s.	Pakistan : £6.
Gibraltar, Malta : £3 15s.	Union of S. Africa : £5 10s.
Gold Coast & Nigeria : £5 5s.	U.S.A., \$21.50 or £7 14s.

THE BUSINESS WORLD

The Self-Service Revolution

THESE are too few self-service shops in Britain for this system of retailing to have had any marked effect yet upon the established pattern of distribution in this country. But as food shops, at least, may soon be turning over to self-service as fast as the necessary shop fittings can be supplied, the wider implications of the system deserve examination. Even at first glance, they seem to be far-reaching. The immediate result of converting a shop to self-service has, so far, almost invariably been a growth in turnover. Most of that growth in sales must be at the expense of competing shops. But once the first novelty has worn off, the customer is going to expect some return, perhaps in the form of lower prices, for doing some of the shopkeeper's work. And this has already brought the self-service retailer sharply up against the system of resale price maintenance by which the manufacturers of most nationally advertised branded goods sell only to shopkeepers who agree to retail those goods at fixed prices. Both of these consequences imply that competition in the retail trades may be intensified. The outcome of a wholesale change to self-service in this one trade might therefore amount to a revolution in the structure, as well as the technique, of retailing.

The economies that flow from self-service have been the subject of a good deal of misunderstanding. They do not, surprisingly enough, rest on any reduction in the direct costs of selling; the advantage comes entirely from a greatly increased volume of sales for a small increase in overheads. Self-service involves a return to the essentially old-fashioned principle of displaying the maximum possible amount of stock where the customer can see it, and carrying as wide a range and variety of stock as the floor-space of the shop can accommodate. The traditional counter can carry very little stock; what is worse, it constitutes a barrier between the customer and the goods on the shelves behind it. Take away the counter and the assistant, and the space previously occupied by them can be used as effective "selling space" for additional display stands. In this way, grocers are able to display their entire stock of 600 to 700 different lines at one time, a feat that is impossible in the counter-service store.

It would be a mistake to conclude that this leads to any saving in labour. If customers are to help themselves from the shelves, every item on those shelves must be separately and clearly priced, the stands must continually be re-filled, and the goods must be packed in such a way that they are easy to handle. A very wide range of modern branded groceries are suitably packed in the factory, but a good deal of wrapping has still to be done for other goods. Biscuits, fruit, vegetables, cakes, bread and many cooked meats and cheeses have to be weighed, wrapped and priced in the variety of quantities in which they are bought. The check-out points at which the goods are checked and paid for need to be properly staffed if they are not to defeat the

entire purpose of the change by creating a bottleneck through which the customer must queue to pass. One check-out point staffed by a cashier to invoice the purchases and an assistant to put them in a bag can handle three to four customers every two minutes; six to seven points seem to be necessary in a fair-sized grocery shop. At peak periods, certainly, assistants can be taken away from routine packing and pricing operations and put to work at the check-out points to accelerate the flow of customers through them, thus affording a highly desirable flexibility in the staffing arrangements. But any saving that this might bring is outweighed by the higher costs of pre-packing and pricing all stocks compared with wrapping them on the counter only as goods are bought.

The saving to be expected from changing over to self-service depends upon the increase in the volume of sales that it has so far generally produced; this in itself has reduced the total costs per unit of sale. The sales rise because more stock is on display. Any shop with sufficient floor space to display its stock in this way could probably get the same rise in turnover without introducing self-service. Indeed, the handful of luxury department stores still in business and the variety chain stores of the Woolworth type make good use of this principle. But, in general, retailers cannot provide the necessary room without doing away with the traditional counter.

The slow progress made so far by self-service in Britain must be partly due to the uncertainty of any immediate return from considerable initial outlay in a section of retail trade that from the end of the war until this year had been doing very comfortably on margins fixed by the manufacturer or the government. Conversion may cost £600-£1,600 for a small shop, without refrigerated cabinets for frozen food, cooked meats and—eventually—unrationed fats. If his turnover should not rise, the retailer has simply incurred unnecessary capital expenditure that he could ill afford; and the increase in turnover will be gained only if the stock displayed is to the liking of the customer. Stock for sale can be examined more closely on self-service stands than in other shops, and the wastage of unsold stock may be high if the goods are not properly chosen. This is especially likely with cooked meats, fish, fruit and vegetables. In all perishable commodities quality varies widely; in the case of fruit and vegetables especially, the wholesale markets are not accustomed to demand a high standard of grading and cleanliness from their suppliers.

Out of 134,000 grocery shops in the country, probably fewer than 2,000 are operating on a self-service basis. Many of these belong to groups or chains of stores that have converted them from counter service as an experiment. The Co-operatives were the first to test this new principle, and Sainsburys is among the most recent converts. The results of these trials are interesting. For

example, two food stores of the John Lewis group changed to self-service in the past year. One, in a good position on a main street, has increased its sales by more than 60 per cent in the first normal half-year's trading compared with the figure for the same period a year previously. This increase was obtained at a capital cost of £2,000 and with no change in the size of staff. It was, incidentally, gained without closing either the credit or the local delivery service, two economies that are usually introduced at the same time as self-service. Delivery services can account for as much as 5 per cent of total food selling charges, and retailers are becoming anxious to cut out this expense. Wherever this service exists at all in the United States, it is counted as an extra item on the customer's bill; a practice that is reluctantly being introduced into this country as the only means of counter-acting rising distribution costs, especially in department store trading. Last April, the John Lewis group converted to self-service the food department of one of its suburban stores in Finchley, John Barnes; this section of the shop had been consistently running at a loss. In this instance credit and delivery services were both withdrawn in an effort to get the department back to a profitable basis, and both moves lost customers. Nevertheless, the department is now being operated at a profit, and the group has converted a third shop at Manor Park. In the first two weeks sales have risen more than 40 per cent above the totals for the same weeks last year, having previously been below them. These results from widely differing districts closely parallel those of other companies.

The Express Dairy, which is gradually converting its small shops to self-service, has recorded increases of slightly under 40 per cent in the sales of a strictly limited range of foods, and this has encouraged the company to branch out from the dairy to the grocery business with a new chain of wholly self-service shops selling all produce but meat and fish. So far four have been opened; the company intends to expand at the rate of six a year. This particular development raises in a special form the question of the range of goods that self-service retailers should sell. A productivity team that recently visited the United States under the auspices of the Anglo-American Productivity Council devoted a large proportion of its report to describing the American self-service "supermarket," a mammoth self-service store where every conceivable item of food and household equipment can be bought under the one roof. Such markets combine the self-service technique of stimulating "impulse" buying by wide stock display with "one-stop" shopping, in which almost all a shopper's purchases can be made without moving from shop to shop. Like the self-service display, this is essentially a reversion to an old-fashioned principle—the village "general store" of the last century. The two ideas do not necessarily go together, but in practice the adoption of the one ensures the commercial success of the other.

In Britain, the great majority of self-service shops limit themselves to groceries (with a service counter for rationed goods) and household goods such as cleaning materials and sometimes saucepans. In most cases the converted shop stocks items that it did not sell before. Sainsbury, which sells poultry and rabbit joints by self-service in some branches, has taken the revolutionary step—for the company—of stocking soap-powders and other cleaners in one of its four self-service shops. Some

stores, such as John Barnes and the Express Dairy chain, have been bold enough to open self-service greengrocery departments. In both cases, managements have been somewhat surprised to find that profits from greengrocery are high, even though packing costs have been added to the already considerable price of the high-quality goods that are the only ones worth offering for sale in this way. The example of John Barnes is particularly encouraging, for the greengrocery department was previously operating at a loss, and there is strong local competition. The fact that there has proved to be a considerable public demand for carefully packed and trimmed produce sold at what amounts to a premium price, may have considerable bearing on future developments in the branch of the food trade where grading is most notoriously slovenly.

There are today nearly 600,000 workers in the retail food trades. If self-service shops can handle a larger number of sales of food and other packed items (including, perhaps, stationery and some articles of clothing) without a proportionate expansion in their staffs, there will clearly be a saving in labour costs. Not many figures are available yet, but experience in the self-service shops of the Express Dairy indicates that wage costs, as a proportion of total selling costs, have dropped by more than 1 per cent. The volume of total food sales throughout the economy in the past has remained steady, and it is highly improbable that the increase in sales reported by the self-service shops is due to a genuine expansion in trade as a whole. This business must have been gained from other grocers, also from ironmongers, chemists, stationers and greengrocers stocking goods that are or soon will be sold from the self-service shop's all-embracing display stands. This would suggest that the increase in turnover to be gained from conversion (for which 40-60 per cent seems to be representative) may diminish as the change becomes more general. Even so, the change would seem inevitably to point to a reduction in the number of shops required to do a given volume of business.

Most people would feel that a fall in the number of shops is desirable (without necessarily following all the implications of that opinion). There is likely to be a sharper division of opinion on the probable results of competition for trade between self-service shops. So far it would appear that all the profit from increasing turnover has accrued to the business, where it has been used to offset rising expenses in other directions, notably wages. Only in the case of the new Express chain does the management appear to have set out deliberately to quote keener prices. The field for doing so is limited at present, however, to cooked meats and greengroceries. In most other fields maximum selling prices are fixed by the government or minimum prices by the manufacturers; both give the retailer a set margin. If a manufacturer's brand prices give the ordinary retailer an adequate profit, it would follow that the self-service shop, with its rising turnover and lower unit costs, could work on a smaller margin. Should the big grocery chains convert an appreciable proportion of their shops to self-service and begin to compete with one another, complaints already being heard about the difficulties of competitive trading under resale price maintenance are likely to increase in volume. In the long run, this might lead to important changes in that practice. If so, self-service would have served the British economy well.

Freeing Non-Ferrous Metals

BY the beginning of next year tin, lead and zinc will all again be privately bought and sold on the London Metal Exchange. Copper alone, of the four metals traded on the Exchange before the war, will remain in the government's hands. Progress towards freedom, indeed, has been slow, but there are signs that the pace may now be quickening. Tin was handed back to the market more than three years ago, in November, 1949; but in spite of continued pleas from the metal trade, no other metal was given its release until private trade in lead was resumed in October of this year. The success of the lead market appears to have encouraged the Government to accelerate the release of zinc: by the end of October the authorities had announced that private trade in zinc would be resumed on January 2, 1953. Metal circles in London think that copper may be freed next June, but the government has so far given no hint of any such intention.

It is important to emphasise that the "freedom" for the markets that has been granted or contemplated so far is not freedom in the prewar sense. In particular, although the market has been reopened in tin and lead, and will soon reopen in zinc, it operates within the framework of exchange control, under systems specially devised to enable the Bank of England to maintain a detailed scrutiny. For members of the Metal Exchange the bonds of exchange control have, however, been made as light as is thought possible. Members of the Exchange hold open individual licences to buy and import the "freed" metals from any part of the world, and no limit is put upon the amount of foreign currency they may spend for these purposes in any period. The Metal Exchange itself has been made responsible for seeing that its members observe the exchange regulations, but the Bank also maintains a check through the monthly statements of transactions that have to be submitted to it by each dealer. Import of metal is not limited entirely to members of the Exchange, but other importers have to obtain prior permits from the Bank for each deal. These exchange controls are now the only restrictions upon dealings in tin and lead. Licences to "acquire, process and dispose of" the metals ceased to be needed from the day the metal reverted to the market. Government procurement of tin has ceased, and so has Government trading; in lead, the Government trading is confined to orderly disposal of the Ministry stocks. Broadly speaking, it seems that the Government's idea of freedom for metals stems from two incompatible aims. Its desire to see London re-established as a commodity centre—and thereby to increase Britain's earnings of foreign currency—and its policy of keeping the closest possible check on all transactions that might involve a loss of scarce currencies.

Tin, unlike the other metals, is primarily a sterling commodity and one of the Commonwealth's principal dollar earners. The reopening of the London market was, therefore, unlikely to increase dollar expenditure—on the contrary, it could be expected to bring added dollar receipts from commission and insurance. Moreover, by 1949 the world shortage of tin had eased, and

it could no longer be argued with any plausibility that government trading was essential to ensure adequate supplies. Admittedly, there was a possibility that the London market would provide a convenient channel for an increase in the shunting operations that were already causing the sterling area to lose large quantities of dollars. But these operations—which depend upon a supply of "cheap" sterling—temporarily ceased after devaluation of the pound in September, 1949, and the way was clear for the reopening of the tin market two months later. The story of tin since the restoration of the London market has not been a happy one—for a considerable period last year the market was subject to the vagaries of American government buying policy.

Any case for retaining lead under government purchase had weakened by the beginning of this year. Most of this country's lead normally comes from Australia and is paid for in sterling, but during 1951 the Ministry of Materials, fearing a world shortage, arranged to buy substantial quantities from the dollar area. These shipments continued to arrive in the early part of this year, but no new contracts were made, for by that time the shortage had eased—and, indeed, it had never become as acute as that of copper and zinc. Consumption of lead fell off sharply from the latter months of last year onwards, for the Ministry's selling prices were maintained much above the levels ruling in other countries. Pressure on the government to hand lead back to private trade naturally increased. For months the authorities wavered on the brink; finally, in August, they took the plunge and announced that trade in lead would be freed on October 1st.

To help the market to work freely as quickly as possible, the Ministry of Materials agreed to make spot lead available through the government broker and also to lend lead from its stocks to the producers' agents until private imports could reach this country. On the eve of the opening, the Ministry's selling price for lead—which was based on the American official quotation—

WORLD SMELTER PRODUCTION OF BASE METALS
(Metric Tons)

	1948	1949	1950	1951	First Half 1952 (Annual Rate)

stood at £131 a ton. But the American price, though treated for this purpose as the "world" price, was unrealistic, being based on a market comprising only a few consumers and producers; on the Continent lead was selling at £95 a ton. It was obvious, therefore, that prices on the reopened London market would be much below the Ministry's end-September price. In fact, they fell even further than had been expected. Although consumers' stocks were known to be small when the market reopened, demand from consumers in this country was at first limited, for as long as prices were falling they had every incentive to postpone purchases still further.

There has been remarkably little speculation, and for the first few weeks the initiative in the market seemed to rest with the producers. In the first three weeks they were willing sellers and the price dropped to £80 a ton. At that point the producers changed roles and, for a time at least supported the market. Prices began to climb and consumer buying increased. Following the Ministry's announcement that the sale of its stocks is to be spread over a long period, prices spurted upwards for a few days and reached nearly £100 a ton a fortnight ago. Since then the market has become very quiet and the price has hovered around £90 a ton. In spite of some decline in business during the last few days the volume of trading since the market reopened has been considerable: no less than 55,000 tons of lead has changed hands. Most of the contracts have been for forward delivery, and only small quantities of prompt lead have been sold by the Government broker.

Since its reopening the London market has set the pace for continental prices and American lead prices also appear to have followed the trend of London quotations—although they have not fallen to the same extent. They fell from 16 cents a lb (£128 a ton) at the beginning of the month to 13.5 cents a lb (£108 a ton) in the third week and have since recovered to 14 cents a lb. Throughout the last two months London market prices have in general been sufficiently far below the American levels to make it profitable to export lead to the United States—allowing 2 cents a lb to cover the cost of shipment and the US duty. Despite this margin, American buying in London seems to have been remarkably small, although some European lead is known to have been sold to the United States recently.

The American lead trade, indeed, seems anxious to insulate itself as far as possible from the lower price here. Lead producers in the United States, who claim that several mines may shortly have to close because the present level of prices is too low to cover costs, have called for an increase in the current duty of 1 1/16 cents a lb. If this movement gains strength it seems likely that two worlds may develop in lead. The Americans protest that most of the fall in the London market prices has been the result of the unloading of Ministry stocks. But there is little evidence to support this assertion. It is the Ministry's announced policy to allow prices to find their own level, and it has accordingly taken care not to flood the market. A considerable part of its stocks will probably pass into the permanent stockpile; the remainder, as announced recently, will be sold to Commonwealth producers over an extended period.

It seems likely that when zinc is freed its price may follow the pattern set by lead. The world shortage of zinc, like that of lead, had passed by the end of last year. Consumption in this country has been falling for some months—in spite of the removal of restrictions on "end-use" during the summer—and since the announcement of the forthcoming freeing of the market purchases from the Ministry have dropped to a bare minimum. Government stocks, at over 200,000 tons, are about twice the level at which lead stocks stood when the market was reopened. The present British official price of £110 a ton is based on the current American price of 12.5 cents a lb, but continental prices are much below this level. A few weeks ago zinc was being sold

at £76 a ton on the Continent. The price there has now risen to over £90 a ton, so that the prospective fall in the British price when the London market reopens may be less severe than was at first expected. The prospect, even so, is causing some disquiet among the producers. In the United States, where costs of production are estimated at about 14 cents a lb, there are reports that already some mines there have been forced to close—but there is some possibility that the American Government will step in to check this process, on the ground that zinc is an important metal for rearmament. Zinc producers in the Commonwealth are apparently marshalling similar pleas. They point with envy to aluminium, whose prices are not subject to the frequent fluctuations of a market. And they are disposed to minimise the virtues of a free market for zinc—on the argument that some large consumers are already understood to be making direct arrangements with the smelters to secure their future supplies. After a prolonged spell in the hot-house, the fresh air outside is bound to feel chilly—and zinc producers will not be alone in discovering that.

Although nearly half the zinc this country buys is imported from Canada and the United States, the authorities apparently do not expect the freeing of the market to cause dollar expenditure to rise. They probably assume that a fall in price may offset any increase

* Virgin metal only; earlier figures include some scrap.

in the quantity of dollar zinc imported. Canadian shipments are in any case unlikely to decline greatly, for about half the zinc imported into this country from Canada is of a specially high grade, of which supplies sufficient to supplement Britain's own production are not readily available elsewhere. But if American producers refuse to accept the lower London prices, British purchases are likely to decline. In any case, the United States is a net importer of zinc; Britain buys only marginal amounts to supplement Commonwealth supplies, which are limited by refining capacity. Moreover, larger quantities have lately been forthcoming from Rhodesia. There is, of course, the contingent risk that Britain might lose dollars through Continental purchases of dollar zinc through the reopened market. But at present this is not considered likely; the continent now has a small exportable surplus of zinc.

If this particular consideration—the degree of risk of dollar loss—were the sole criterion of the Ministry's policy, it would obviously have no excuse for not freeing copper. For Britain, at least, copper is now less of a "dollar commodity" than zinc, for almost all of Britain's copper imports originate in Northern Rhodesia; dollar costs arise only from refinery charges in the United States and from small imports of Canadian copper. Rhodesia's output of copper ore is rising steadily, and refinery capacity is also being increased. A new refinery is due to come into operation very shortly, and within a year or two it is hoped that Rhodesia will have sufficient electrolytic refinery capacity to cover the whole of Britain's requirements. But dollar considerations are seemingly not decisive at the Ministry. It is evidently concerned with the fact that there is still a world shortage of copper, that it is still allocated by the International Materials Conference, and that there are still restrictions upon its use both in this country and in the United States. In these circumstances the Government is apparently not yet prepared to permit free trade in the metal. But the need for a market has grown more obvious in recent months: copper prices have become so confused that there are now almost as many prices as there are producers. American prices are particularly unreliable, for domestic output is sold at a controlled price while imported copper sells at much higher prices on the New York market.

Until all the principal base metals are again traded in the market it will be impossible to judge how far postwar trends in consumption have affected their price relationship. Before the war the price of copper was usually twice to three times that of the other two metals, zinc being normally a little cheaper than lead. Copper prices rose less than those of lead and zinc during the postwar

shortages but the prewar ratio is now beginning to re-establish itself. As a result of the change in relative prices and also restrictions caused by shortages, there has been a considerable degree of substitution in certain uses of the three metals. Shortly after the end of the war it seemed likely that lead would be needed in large quantities for atomic piles; by 1949 the price of lead was far above that of zinc and nearly up to the level of copper. The building industry now uses much less lead than it did before the war; copper has been used in place of lead for plumbing and asphalt has been substituted for roofing and guttering. In the cables industry aluminium sheathing is now beginning to replace lead, but the decline in the use of lead has been masked by an increase in the total quantity of cables produced. High prices for virgin lead have also led to an increased recovery of lead scrap. It is impossible to estimate accurately how much this substitution may have affected the tonnage of lead consumed, but it is perhaps significant that in this country lead consumption is now at less than half its prewar rate.

In the other two metals, copper and zinc, substitution has been less important. Consumption of both has been restricted in the last year or two, although controls on zinc have recently been removed. In this country the use of zinc for galvanising fell sharply during the period of restriction, but it may now recover. Zinc has also been losing ground to aluminium in die casting, but the incentive for this change may now disappear because the price of aluminium appears to be rising while that of zinc is falling. The recent fall in lead and zinc prices may bring about a reversal in the process of substitution. But this is unlikely to occur speedily, for industrialists will need to be convinced that the lower prices will obtain for some time.

Business Notes

Commonwealth in Conference

November fogs and headwinds delayed the opening of the Commonwealth Economic Conference by a few hours. Both have a symbolical significance. The fog will continue to shroud the secrecy of the conference—as indeed it should do, since such delicate issues as floating rates of exchange are certain to be discussed. And the promise of headwinds and crosswinds is implicit in the divergent remarks that have been let slip by some of the delegates en route for the meeting. It can be assumed from these comments that on the crucial issue of convertibility there will be considerable differences of view—at least about timing. Canada, Australia and South Africa are likely to press for the maximum speed of advance. Spokesmen for the Asian dominions have shown a much more reserved attitude—perhaps because it is in the three countries concerned that least has been done during the past year towards making domestic economies tough enough to take the initial shock of convertibility. The Conference has opened with the advantage of more careful and copious preparation than has been devoted to any comparable earlier meeting. The high officials of the Commonwealth who spent three weeks on this work did far more than draw up an agenda. Their reports—written with the benefit of continuous interchange of views with their respective governments—are said to blaze a definite line of advance. The attitude of the British Government towards these reports will not be that of a neutral host at the party. The broad recommendations that emerge from them will probably be found to have behind them the collective support of the British

delegation—which comprises a massive phalanx of the British Cabinet.

The opening of the conference has been made the occasion for statements of policy by many organisations whose interests are intertwined in the issues of commercial and monetary policy that will be the main concern of the delegates. Among the latest of these statements, the most forceful is that issued by the American Chamber of Commerce in London, a highly and rightly interested party in the topics of convertibility and nondiscrimination. The Chamber's statement "Dollar-Sterling Alliance" traces some well-travelled ground in giving both the sterling and the dollar camps good advice about the kind of conditions that will have to be satisfied if the alliance is to be forged on these lines. Especially detailed and forceful is the advice addressed to the compatriots of the American Chamber of Commerce. For example, the familiar proposal to repeal the "Buy American Act" is supplemented by a suggestion that it should be made "mandatory on the US Government agencies, in the interests of the American taxpayer, to satisfy their buying requirements in the cheapest markets, whether in or outside the United States." The American Chamber of Commerce is critical, however, of one suggestion that will certainly come from the sterling side. It is "unalterably opposed to raising the dollar price of gold because in its judgment it would provide only a superficial and largely temporary alleviation in the dollar-sterling imbalance. It would not solve the fundamentals of the problem." This is by no means the beginning and end of the case for and against an increase in the price

of gold; but it should be instructive for the Commonwealth Conference to have this early and unmistakable expression of views from a fairly representative body of American opinion on a question that will certainly be debated but on which no action can take place without the co-operation of the United States.

* * *

Sterling Strengthens

The emphasis placed on convertibility in these preliminary comments on the Commonwealth Economic Conference has no doubt played a part in strengthening the tone of sterling in the foreign exchange market. The spot rate in New York has hardened this week to \$2.80½, compared with \$2.79¼ a week ago, while the London premium on three months' forward dollars has narrowed from ½c. to ⅓c. The market reports a fair volume of commercial demand for sterling both from North America and the Continent. This demand is partly seasonal; at this time of the year substantial payments are made for sterling area materials such as wool. In addition, the Continent is still bidding for sterling to pay for dollar commodities bought during the short phase of free commodity arbitrage in London between the dollar area and EPU countries. In the trends in overseas markets, moreover, the strength of the various types of "cheap sterling" has been even more impressive recently than that of the rates in London. Transferable sterling recently reached a peak at \$2.70 and has since held close to that point, at which it shows a discount of little more than 3½ per cent on the official rate—a margin that can hardly be narrowed further, so long as transferable sterling remains inconvertible. Its diminution in recent weeks has, of course, been associated with the shrinkage of the potential supplies of transferable sterling in consequence of the commodity arbitrage transactions.

Even more striking has been the strength of "switch" sterling (representing the capital proceeds of non-resident holdings of sterling securities and other assets), which this week has touched its highest level yet at \$2.63-64. This strength has been due less to investment demand for sterling securities on the part of non-residents than to the diminution in the supplies of this category of sterling. This reduction has arisen from the fact that switch sterling has been allowed to pass through certain legal and officially authorised chinks in exchange control, and this has become resident sterling. The operations in question are of considerable complexity; in general, they involve the sale, by non-residents to residents in outlying parts of the sterling area, of sterling securities bought with switch sterling. The securities in question are then sold by the residents, and the proceeds become resident sterling available for payments to any other scheduled territory or, subject to exchange control permission, to any non-resident in settlement of ordinary commercial transactions. The fact that the permission of the authorities must have been given to this diversion of switch sterling into channels of ordinary commercial sterling, seems to lend rather greater significance to the recent strength of switch sterling than the movement would otherwise command.

* * *

More Imports from Europe

The new list of quotas for imports primarily from the OEEC area, issued by the Board of Trade this week covering the first half of 1953, include several increases over the amounts allowed under the import restrictions of November, 1951, and March this year. Imports governed by the present quotas are restricted to an annual value of about £76 million; the increases to be permitted will bring this total up to about £90 million a year. Among the larger increases in particular quotas for the first half of 1953 are textile piece goods, which show a rise of nearly 35 per cent to £10 million, textile yarns

(£2,250,000 against about £970,000), and apparel (£900,000 against about £750,000). The half yearly quota of cheese imports is raised to £4 million compared with £3 million, and increased imports of nuts and apples are also permitted. Small imports of nylon stockings and decorated pottery are to be allowed for the first time since the war from these countries—the OEEC nations and other non-sterling countries outside the dollar area. On the other hand, quotas for certain imports are to be reduced, for example those for fondant and sugar-fat mixtures.

The import cuts now modified, which continue in the main to be operated by "global quotas," restricting total imports of certain commodities, were aimed particularly at reducing imports from Western Europe. The countries that suffered most from the restrictions—France and Italy—are those that benefit most from the relaxations now announced. Global quota restrictions, however, may have an exaggerated effect upon exporters of the more expensive range of any kind of goods, as importers may prefer to use their import licences to buy a large number of cheap goods rather than a few expensive ones. To cover this point, the British Government is now to permit special supplementary imports from most of the OEEC countries. The governments of those countries will have to specify the particular exports that they wish to benefit by this arrangement. The total additional value to which such imports will be allowed into Britain during the first quarter of 1953 is estimated at about £750,000, a rate of £3 million a year.

The Board of Trade states that Britain cannot yet make any general relaxation of import restrictions, despite the check to the loss of gold and the favourable balance that has recently developed with the European Payments Union. The relaxations now announced are offered as "a contribution to the development of intra-European trade." The move is welcome; and the permitted increase in some of the imports such as textiles may serve as a spur to competitive efficiency among producers in this country, who are hurrying to fulfil orders generated by a recovery in sales on the home market.

* * *

Longer Forward Exchange Facilities

The increasing volume of orders placed in Britain on behalf of the US and Canadian Governments for aircraft, parts and other defence equipment, has led to a considerable expansion of the demand for extended forward exchange cover on the part of suppliers in this country. Last July the Bank of England issued new instructions to the authorised banks regarding the provision of forward cover for orders placed by the United States authorities. These intimated that where the forward exchange operations could not be covered by the foreign exchange market, the matter should be referred to the Bank of England, where the appropriate facilities would be provided in duly authenticated cases. These additional facilities have now been extended to orders from Canada.

In the normal course, the London foreign exchange market is not allowed to deal forward for more than six months without specific authorisation from the Bank of England. A number of transactions exceeding this period have, however, taken place. Recent orders covering both military and civilian aircraft involve delivery dates running into years, not months; and, since many of the contracts have been made in terms of dollars, the manufacturing firms on this side have shown an understandable desire to cover the exchange risk. Cover for periods of up to three years has been discussed. Where such periods are concerned, there is no possibility of finding the counterpart for such operations in the market itself. In all such cases, the proposition must be put to the Bank of England; and if the operation is clearly in the national interest, the Bank of England will provide the necessary cover at rates that will be fixed for each transaction in question. These rates will have to take

into account the length of time for which cover is required and will, presumably, be calculated on the basis of the relative level of interest rates in London and the overseas centre concerned.

The Fall in Car Exports

There is no denying the severe knock that has been taken by car exports in the past few months. Up to the end of October, a total of 271,096 cars, 110,191 commercial vehicles, and 92,262 tractors had been sent abroad. Last year, the exports of tractors during the same ten months were about the same and exports of commercial vehicles were only slightly higher. By contrast, exports of cars were 30,647 higher, and the greater part of this year's fall has taken place in recent months. At the beginning of the year, exports were running at a high rate, as more ships became available. The closing of the Australian market and the growing competition in Europe has since reduced shipments to levels well below those of a year ago. The accompanying map, which gives contrasting figures for October, 1951, and October, 1952, shows how big a shift there has been in the distribution of car exports in the twelve months. A year ago, the sterling area was absorbing cars that the Canadian market refused to take. This year, the dollar markets are taking at least a small proportion of the cars that the sterling area can no longer afford to buy. It is, however, also true that

the home market is being used to mop up some of the industry's unsold exports. The industry's own figures (which measure export deliveries from the factories and therefore differ sometimes from the trade accounts recording shipments from the docks) show that in September, out of a total of 44,829 cars produced, only 22,716, or half the total, were earmarked for export. The past year's results of a number of leading manufacturers are already beginning to reflect the effects of intensified competition on profits.

The value of the industry's export trade is, however, holding up rather better than these figures might suggest. The total value of all its shipments for the ten months to the end of October was £246 million, compared with £223 million in the same period last year (in the month of October, however, their value was £4 million lower than in October, 1951). This high level of value of shipments owes much to sales in past years; the export of spares to service the large number of British built vehicles now in use abroad is very considerable. The industry's own figures show that in the first three quarters of the year spares to the value of £62.8 million, or 28 per cent of the value of the industry's total exports during that period, were despatched abroad. Without this steadily expanding trade, which is the profit-earning side

of the industry's business, the export figures would show a drop that measured more closely the fall in the actual numbers of cars sent abroad.

Ironfounders and the Bill

Controversy among the ironfounders about the inclusion of their industry in the third schedule to the Steel Bill as one to be supervised by the proposed Iron and Steel Board has arisen partly through the timing of the Government's proposal. The Joint Iron Council, which represents both the foundries and the foundry iron producers, were asked for their views about denationalisation—and hence the scope of the board—in November, 1951, and its executive had to give a broad expression of view then upon a scheme outlined to them in confidence. The executive could not ask for the views of their associations upon proposals that they were not at liberty to describe in any detail. For its own reasons, the Government then sat on its proposals for several months before publishing a white paper at the end of July. It was not until September that the Council of Ironfoundry Associations could reaffirm its policy of accepting the board's supervision while reserving the right to criticise the specific provisions of the Bill. At a convention in early October no agreement was reached; the ironfoundry associations were consulted, and at the end of October the original policy was endorsed by a substantial majority. Opposition to the inclusion of the industry among those to be supervised has been

voiced publicly during the past two months, in particular by the "tied" foundries that are departments of engineering concerns.

As has been said in these columns before, the elaborately limited powers of the board over development hardly seem to justify the anxiety many of these ironfounders feel. The Minister has further committed himself to the view that very few foundry developments would need the attention of the board, and that price control would be unlikely to be extended over more than the few standard iron castings of which prices are now controlled. It seems, too, that some safeguards on these lines may be written into the bill in the committee stage. Mr Strauss's mischievous hint that a Labour Government might follow the Conservative example and extend any renationalisation to cover the foundries need not be taken seriously.

It is, certainly, debatable whether the public interest requires that this board ought to possess these very vague powers over the 2,000 ironfoundries. But the ironfounders, in their own special interests, might be expected to find it useful. At some future date it might be valuable to them that the Iron and Steel Board's duties should include the promotion of "efficient, economic, and adequate supplies" of iron castings as well as of, for example, sheet steel, and that when the board is reviewing the provision and distribution of raw materials the ironfoundries should be treated as one of the industries mainly concerned (and have a voice) rather than as a mere outside consumer. At many points in the ironfoundry industry there is a frontier of contact, competition, and occasionally of conflict with the steel industry. In every way, the central organisation of the steel industry is stronger than that of the foundries; and it is perhaps fair to guess that those who support supervision by the board have been concerned with maintaining at least the present balance of power in any new organ of supervision. The whole issue is of limited importance to the public, one way or the other. But it should logically be dealt with as a whole, for in practice it would not be easy to make a clear distinction between the tied foundries—few of which would willingly relinquish their right to sell part of their output on the market—and the remainder of the industry.

TRADE and TRAVEL

Whether your activities entail long distance travelling or concentrated investigations, we can assist you in AUSTRALIA and NEW ZEALAND

Our TRADE INTRODUCTION SERVICE and TRAVEL DEPARTMENTS will gladly:

1. Make a SURVEY to meet your trade requirements.
2. Prepare a suitable ITINERARY.
3. Book TRANSPORT by air, rail, road or sea.
4. Secure Hotel ACCOMMODATION.
5. Arrange business INTRODUCTIONS.
6. Issue TRAVELLERS CHEQUES and TRAVELLERS LETTERS OF CREDIT.

Inquiries welcomed either through your own Bankers or direct.

THE COMMERCIAL BANK OF AUSTRALIA LIMITED

(Incorporated in Victoria) Registered Office: 335 Collins Street, Melbourne.

PRINCIPAL OFFICES:
HEAD OFFICE: 335/9 Collins Street, MELBOURNE, VICTORIA.
LONDON OFFICE: 12 Old Jewry, LONDON, E.C.2, ENGLAND.
WELLINGTON OFFICE: 328-330 Lambton Quay, WELLINGTON, N.Z.
636 OTHER OFFICES

Established in 1845.
All classes of insurance transacted including Fire, Life, Accident, Motor, Marine and Aviation. Represented throughout the world.

Head Office:
North John St. LIVERPOOL | Lombard St. LONDON

Established by the Joint-Stock Banks in 1945 to provide finance by means of loans or the subscription of loan or share capital or otherwise for industrial and commercial enterprises in Great Britain particularly in cases where the existing facilities provided by banking institutions and the Stock Exchanges are not readily or easily available.

DIRECTORS:

Chairman: THE RIGHT HON. LORD PIERCY, C.B.E.
THE RIGHT HON. LORD BLACKFORD, D.S.O.
WILLIAM HENRY FRASER, W.S.
LT.-COL. LORD DUDLEY GLADSTONE GORDON, D.S.O.
THE RIGHT HON. THE EARL OF LIMERICK, K.C.B., D.S.O.
REGINALD HUGH ROBERTS
COLIN MARSHALL SKINNER, F.C.A.

How Lancashire Chooses to Buy

Spinners and other users of raw cotton in this country have chosen whether to import the raw cotton they require next year privately or to buy it from the Raw Cotton Commission. Raw cotton users were allowed to express their choice in respect of each of the main types of cotton, and these have now all been announced. The accompanying table shows the proportion it is proposed to buy privately in 1952-53, and the quantities of the various types of cotton actually bought in the latest year for which figures are available. If it could be assumed that the buying pattern would remain stable—not only in the proportion of the total imports bought by particular purchasers but also in the types of cotton imported—this would imply that about 30 per cent of Britain's raw cotton would be imported privately and about 70 per cent left to the commission in this first year of free choice. Most of the raw cotton coming into this country is American type and about 65 per cent may continue to be bought by the Raw Cotton Commission, since users of only about 35 per cent of this type in 1951-52 have elected to import privately.

PERCENTAGE OF PRIVATE IMPORTS

Type	Total Imports by type, July, 1951, to June, 1952. Metric Tons	Percentage (by quantity) to imported privately in 1952-53*
American	283,000	35
Egyptian	100,000	15
Peruvian and Californian ..	31,000	36
West Indian Sea Island ..	1,000	64

* Options for private importation are for the period beginning September 1st, 1952, except for Peruvian and Californian type which are for the calendar year 1953.
Source: Ministry of Materials.

Users will be able to think again next year, when they are allowed a renewed option as to the method of buying they prefer. There is a tendency for the larger mills to buy privately while many of the smaller mills prefer to buy from the commission; but certain large organisations arrange for some of their mills to buy by one method and some by the other.

Meanwhile Lancashire is watching with interest the turn of events in Egypt, where the government has closed down the Alexandria cotton futures market and proposes to begin selling cotton itself in about a week's time, though leaving growers, merchants and exporters to trade privately if they wish. Despite the efforts of previous Egyptian governments, the price of Egyptian cotton has been falling during this year and before the market closed one month futures for Karnak were quoted at less than half, and for Ashmouni at about half, the prices quoted in January. Even at more realistic prices, the Neguib government has not been satisfied with the operations of the market it has taken over, according to its own statements, "in order to stabilise prices and to increase exports."

Steel from British Ore

Many British iron and steel plants were built where they still stand today because the area contained deposits of high-grade iron ore that are largely worked out by now. Such works now rely largely upon imported iron ore for their pig iron and to a greater extent than formerly upon scrap as against iron in steelmaking. Since the thirties, however, the steel industry has increased its output—though not as much as some critics would have liked—from the leaner ore to be found in Lincolnshire and Northants; by far the largest proportion of British ore consumed is now taken from these areas, though its lower ferrous content requires the use of more coke and a larger blast furnace capacity to produce a given amount of iron.

The first postwar development plan of the British steel industry, of which the production targets have now largely been attained, called for an increase in steelmaking capacity using the lower-grade home ores that are still plentiful, and notably for extra capacity at Corby; but lack of labour and housing has made it impossible to start this particular development. During the period, steelworks using imported ore have been protected, except for a period in 1950, from the growth in the cost of that ore, which was covered first by Government subsidy and later by levies upon steel output throughout the industry. This policy has now been moderated: steel producers are now charged an "estimated long-term price" for imported ore (though this is, still, less than it costs at present). For a time, too, steelworks using large proportions of scrap were able to obtain at the British prices, scrap bought expensively abroad. For much of the period since the war, therefore, the cost advantages enjoyed

by the works using home ore and paying levies to assist works using imported materials have been somewhat dulled.

Today, however, the industry's policy is to increase the use of home ores. This year it will use about 16 million tons of home ores and about 9½ million tons of foreign; because the foreign ore is almost twice as rich as the British, about half the country's iron will come from each. This is 4 million tons more home ore than was used in 1938, and the increase is to continue, according to the survey of the subject in the current statistical bulletin of the British Iron and Steel Federation:

In looking ahead over the next few years it seems likely that home ore use will expand to about 20 million tons a year.

The increased reliance upon steel made from pig iron in the industry's plans for the future is well known; the industry is participating in ore developments overseas, from which the prices of ore in the long run may tend to fall. The future balance between home and imported ore will depend upon supplies and relative prices. With the time approaching at which more and more of Britain's ore producers may have to turn from opencast to underground working, the costs of home ore are bound to rise with the years, quite apart from the additional capital and running costs of blast furnace, coke oven and sintering capacity that its use implies.

Airlines over the Pole

The pioneering flight of a Scandinavian Airlines aircraft over the North Pole last week was the probable fore-runner of a number of civil routes over this inhospitable region. The SAS aircraft, flying from Los Angeles to Alberta, continued on northwards close to the magnetic Pole with a refuelling halt at Thule in Northern Greenland, and so down into Denmark. This cut the journey between the termini by about ten hours, since the flight was almost direct from one point to the other instead of following the present circuitous route across the North Atlantic. The Scandinavian airline expects to start regular commercial polar flights to the West

coast of America next spring. The British Overseas Airways Corporation is contemplating taking a roughly similar route to reach Tokyo via Canada, in addition to flying there across Europe and Asia, as its aircraft now do.

Polar flying raises peculiar problems, the magnetic compass is useless, and the aircraft has to depend on the rather primitive method of astral navigation supplemented by a gyro compass—accepting the greater measure of human error that goes with it. Moreover, radio aids, and certainly landing facilities, are inadequate for long stretches of the route. Despite the progress being made with the American military base in the Arctic, the prospect of refuelling, and of a possible delayed take-off from such an airfield, is likely to cause civilian passengers to ponder well the compensatory advantages of shorter flying time—and the possibility of better weather, and more reliable winter flight timetables, than is found in the Atlantic. For the two companies, too, there is the possibility of some acrimonious discussion about who should bear the cost of additional Arctic radio stations if it should be decided that the safety of route demands their installation. The likelihood that BOAC will circumvent the Pole by about 1,000 miles while SAS flies within a few hundred miles of it promises to introduce additional complications.

Search for Sugar Agreement

The International Sugar Council, at its meeting in London this week, decided to ask the United Nations to convene an international sugar conference to consider the conclusion of a new sugar agreement. The 1937 Agreement has been inoperative since the outbreak of the last war. World production today is greater than demand, and more nations may be entering the export market. Stocks have accumulated in certain producing countries, notably Cuba, and the situation is aggravated by the fact that a large amount of production is by dollar countries that are dependent to a great extent on non-dollar customers.

The Sugar Council considers that a commodity agreement offers the best means of dealing with the difficulties. At previous meetings this year the Council did in fact draw up a draft agreement setting out export and import quotas, price arrangements and means of increasing world consumption of sugar. It is generally recognised that to be effective an international agreement would need the adherence of all the major producing and importing countries; the sponsors of the proposal believe this can now be achieved. In recent months it has become apparent that Russia will need to import less sugar in future because of her own increased production, and that some east European countries have now an exportable surplus. This may make other producer countries more willing to accept an agreement, especially as these new supplies will not cost dollars. The Council estimates that already there will be a world surplus of nearly 2½ million tons this year, mainly of Cuban sugar. It will be remembered that the Commonwealth Sugar Agreement, which lasts until 1959, guarantees Commonwealth producer countries a minimum yearly sale of 1,643,000 tons of sugar to other Commonwealth countries at agreed prices. Although this amount has never yet been offered, the Commonwealth producers will no doubt accept nothing less from any new international agreement.

Japan Pays Up

Almost exactly eleven years after Pearl Harbour the Japanese government has made its formal offer to resume the service of its sterling loans. As had been generally assumed, payments on the issues with a currency option clause will be made, not in dollars, but in sterling at the contractual rates. The bondholder gets the protection of

the clause, but the Treasury has been unable to tap a small but valuable source of foreign exchange. It has, however, reserved the right to reopen discussion with the Japanese government on this question if "the payments relations of Japan and the United Kingdom . . . on the present sterling basis" alter.

All the principal details of the debt settlement were made known at the end of the conference in New York two months ago, but the formal offer now clears up certain points of detail and procedure. For the British stock markets, the most important outstanding question was whether the interest arrears coupons could be dealt in separately, as they will be on Wall Street. But the tax difficulties have proved to be insurmountable, so that Japanese bonds will be quoted cum-arrears in Throgmorton Street. This may have the effect of narrowing the market as the issues quoted ex-arrears would stand under par, making them a more attractive investment to the tax-paying institutions, while the interest arrears coupons would have appealed to pension fund investors. The provisions relating to the operation of the sinking funds upon the issues have had to be adjusted to accord with the decision to quote the bonds cum-arrears. The maximum permitted prices for sinking fund purchases will be raised by the value of the coupons in arrears and the sinking funds will be increased by amounts sufficient to cover the "present values" of these coupons; the exact method of valuation will be fixed later by the Bank of Japan in consultation with the Council of Foreign Bondholders. If the bonds are drawn, the arrears coupons will be left with the bondholders. But the prices of Japanese issues have generally still a long way to go before drawings take the place of purchases—even though a sustained burst of speculative activity immediately preceding the formal announcement had forced prices up to the highest levels of the year. In the week before the announcement the price of the 1930 loan had been lifted 10 points to 165½ and the price of the Tokyo Electric stock 5 points to 186½; on the day of the announcement these stocks jumped very sharply, to 173 and 192 respectively, but they had settled down to 171 and 190 when the market closed on Thursday.

Wider Swing for the Kroner

The Swedish central bank has this week announced a considerable widening of the margin within which the sterling rate can move in the official Stockholm market. Previously, the range lay between a buying rate of Kr. 14.47 and a selling rate of Kr. 14.50. From last Monday, however, this was widened to Kr. 14.37 and Kr. 14.60. It will be noted that the new tolerance of 23 öre conforms to the spread of official dealing limits in the London market; it therefore still lies within the maximum of 2 per cent permitted under the rules of the International Monetary Fund. It would, therefore, be unwise to attribute to this change any significance beyond that of taking the maximum advantage of the elasticity provisions contained in the IMF articles of agreement. It is possible, however, that this move on the part of the Swedish authorities is connected with the rebuff they have recently sustained in their export incentives scheme. Sweden is one of the countries that has operated such a scheme in its exports with the United States, allowing exporters to retain a portion of the dollars accruing from their sales. The American customs authorities some weeks ago countered this by raising difficulties regarding the appropriate rate of exchange to apply to the valuation of the goods in question. This and other expressions of the highly critical American attitude to such schemes appear to have prepared the Swedish authorities for the inevitability of retreat on this front. In these circumstances, the Swedish authorities would naturally exploit the maximum elasticity available to them under existing IMF regulations.

Recovery in Industrial Life Assurance?

Since the postwar boom in industrial life assurance (which spent itself in 1947), new business has been comparatively sluggish. Though there were indications of some recovery in 1951, the available evidence suggests that the inclination of the British working man to save in this way has been adversely affected—perhaps by the rise of the welfare state and by the Labour party's proposals to nationalise or "mutualise" the business. The restriction of the scope of industrial life assurance for funeral benefits (by the Industrial Assurance and Friendly Societies Act, 1948) may also have been a contributory factor.

Statistics published last week by the Industrial Assurance Commissioner (covering all industrial life assurance business carried on in Great Britain by the fourteen assurance companies and 118 collecting societies operating in this field) indicate that the total number of industrial life assurance policies in force has shown a definite downward trend—from 102.5 million at the end of 1949 to 101.4 million in 1950 and 100.7 million at the end of 1951. At the same time, the number of new policies issued recovered somewhat to 6.2 million from 5.8 million in 1950 (after falling steadily from 8.5 million in 1947); and new sums assured showed a similar trend—a recovery from £232.5 million in 1950 to £254.8 million in 1951 (after a steady decline from the postwar peak of £286.8 million in 1947). The average sum assured per policy has grown from £32.0 five years ago to £41.4 in 1951. The growing popularity in industrial (as in ordinary life assurance) of endowment assurance policies as against whole life assurances (so that the former now account for three-quarters of the total new business premiums) has meant that the average premium per policy has risen more than the average sum assured. Aggregate premium income from industrial life assurance has consequently continued to rise each year—despite the fluctuations in new business. It was £133.1 million in 1951, compared with £127.6 million in 1950, and only £112.4 million in 1947 (when new business was actually 12 per cent higher than in 1951). Although industrial life assurance funds—which are now, at £892 million, about one-third of the total ordinary and industrial life funds of all British assurers—continued to increase, the rate of growth fell sharply; the increase was only £29.8 million during the year, compared with £40.8 million during the previous year, £39.8 million in 1949 and £45.1 million in 1948. Transfers to reserves—chiefly to investment reserves—during 1951 were substantially higher on the year, at some £14 million.

The costs of management—as measured by the proportion of premium income absorbed in management expenses including pension contributions—was slightly higher on the year for the assurance companies (at 30.7 per cent, compared with 29.1 per cent in 1950) and slightly lower for the collecting societies (at 36.2 per cent, compared with 36.6 per cent); though these averages conceal a widespread of ratios among different concerns.

The New Measure of Production

Full details of the workings of the new index of industrial production have now been published by the Central Statistical Office*. In essence the new index does not differ from the interim index that it replaced a few months ago, but it has undergone a complete overhaul. The weighting used to combine the individual production series is now based on the net output of industry according to the 1948 Census of Production. This has effected some major changes from the interim weights, which relied on somewhat precarious 1946 estimates using the 1935 Census as a starting point. But equally important has been an enlargement of the index. The production series have been increased in number from 400

to 1,300 and now cover 85 per cent of total industrial output, instead of the previous 65 per cent. Within manufacturing, the most important increases in coverage have been in the engineering group (from 45 to 75 per cent) and in the vehicles group (from 60 to 90 per cent). It is evident now that in neither of these sections of industry did the interim index provide a reliable measure.

As far as possible the index relies on series of physical output. But for certain products, and particularly for much of the engineering and building output, the value of deliveries or sales is the only measure. More reliable figures of changes in prices have been collected to help in deflating these series of money values, although further improvement can be expected here. (It is to be hoped that eventually these price indices will be made available for other uses.) For a few industries, such as rubber and paper, the consumption of raw materials is taken as the best indication of output. It is unfortunate that employment figures have been introduced in some series, since they assume constant productivity and hours worked, but it may be the preferable alternative to omitting these particular industries. There is still an element of doubt about these series which do not represent physical quantities, and although they are only small in number they have a comparatively heavy weighting in the index.

	Number of Series	Percentage of Weight Carried
<i>Output—</i>		
Quantities delivered or produced	1,150	55.2
Value of deliveries or sales	100	26.5
<i>Input—</i>		
Quantities of major materials received ..	37	11.7
Number of persons employed	13	6.6
	1,300	100.0

But there is no doubt that the new index is a considerable improvement on the old one and should be well worth the extra burden of work involved. Revision of index numbers is inevitable, although it is always disconcerting to their users. In a few years time this index will probably have to be revised again in the light of a later census of production. But the changes involved should be less drastic than have been necessary this time because the scope for further widening in the coverage of the index is reduced.

Trends in Commonwealth Trade

Trade figures for the sterling Commonwealth area—the Commonwealth less Canada—for the first half of this year show imports of £4,096 million and exports of £3,122 million, and thus an excess of imports over exports of £974 million. While this trading deficit shows an improvement over the deficit of £1,121 million in the previous six

of 1951. Even allowing for the higher c.i.f. valuation of imports, compared with the f.o.b. valuation of exports, the excess of imports over exports is still considerable. The second half of the year, however, should show a closer balance as the import restrictions imposed by Britain and other sterling Commonwealth countries have more effect.

The increase in foreign trade and the rise in commodity prices following the outbreak of the war in Korea has passed its peak and the fall in sterling Commonwealth exports that became apparent in the second half of last year has continued since, partly owing to the decline in the world price of those raw materials that are among the Commonwealth's principal exports. The accompanying table shows the extent of the excess of imports over exports in sterling Commonwealth trade with three important non-sterling areas. The change from a favourable to an unfavourable position towards Japan is particularly striking; and unfortunately there was also a considerable worsening in the sector that is most important, trade with the dollar area.

Shorter Notes

The Ministry of Works has raised the limits for licence-free building from £200 to £500 for private work and from £500 to £2,000 for agricultural and industrial buildings. In July the Ministry had raised the limit for private work

from the low level of £100, at which it had stood for some years, to £200. The move is intended to help the small builders, who get little or none of the benefits of the Government's expanding housing programme. But these men have been hit more by their own high costs, which have driven many households to do their own repairs, than by licence restrictions that cannot have been very strictly observed.

In a business note on November 8th, figures for the import of Brazilian cotton were expressed in pounds. This measure should have in fact been expressed in cents of 100 pounds, giving a total import of less than 10,000 cents for the first nine months of the year compared with imports of more than 1 million cents in the corresponding period of each of the previous two years.

Following the increases in the export price of raw jute in Pakistan the Ministry of Materials has increased its selling price in this country of various grades of long jute by £3 per ton from November 26.

The second series of London wool sales of the season opened in London yesterday. There will be seven sales, the last being on December 12th.

Company Notes

British Motor Corporation.—Inadvertently, perhaps, Lord Nuffield has given a sleeping dog a prod in his statement issued with the first accounts of British Motor by drawing attention to the differing trading experience of the two individual companies in the merger, Morris Motors and Austin Motor. It seems clear from his statement that Morris Motors has had a harder time in the export markets than has Austin Motor. The distinction between the trading experience of these two companies is still important, since in the first four months of the existence of British Motor very little could have been done technically to merge the two companies. Plans for co-ordination and standardisation have been drawn up and, as the first step towards a technical merger, the Morris assembly plant in Sydney is being doubled to take care of Austin requirements while the Austin assembly plant in Melbourne is being enlarged to take care of Morris requirements.

In these circumstances shareholders can do little else but compare the trading results of the two companies. In the year to December 31st last the net earnings before tax of Morris Motors fell from £7,136,038 to £6,986,778, while in the year to July 31st last the net earnings before tax of Austin Motor fell from £7,112,635 to £6,999,354. These results are at first glance remarkably similar, but it must be remembered that the financial year of Austin covered a period of far greater difficulties for the motor industry than the period covered by the accounts of Morris Motors. In 1951, the Morris group exported about 98,000 vehicles, compared with about 105,000 vehicles in 1950, while in both years the value of its export sales of all kinds remained unchanged at about £39 million. On the other hand, in 1951-52 Austin Motor exported about 98,000 vehicles, compared with about 102,000 vehicles in 1950-51, while the value of its export sales increased between the two financial years from about £45 million to over £48 million.

On this admittedly scanty evidence, it can perhaps be assumed that the Austin group had a bigger share in the export figures of the British Motor group as a whole in the four months to July 31st last than Morris Motors did; in this period 63,238 vehicles were exported by the combine and the value of its export sales of all kinds totalled just over £30 million.

The profits that the two companies earned in the four months to July 31st are now merged in the profit of £6,195,718 made by the group, of which £3,371,204 was set aside for taxation. The size of this new giant in the motor industry can be judged from the facts that the net book value of fixed assets is £17,238,601, that stocks and tools are valued at £31,632,033, and that £10,284,556 is held in cash. The contrast between such figures and the issued ordinary capital of £4,826,360 shows very clearly why the recently announced bonus issue of ordinary shares should be made. On the basis of a 52 per cent dividend, the 5s. ordinary shares at the current price of 30s. 6d. yield 8½ per cent.

Joseph Lucas (Industries).—By directing its investment policies towards the manufacture of aircraft equipment the Joseph Lucas group has recently been making itself less dependent upon the fortunes of the motor industry. This shift in investment policy has been shrewdly timed. In the year to July 31st the group's trading profits were already being "adversely influenced" by the decline of 10 per cent in the output of motor cars and motor cycles and of 5 per cent in the output of commercial vehicles and tractors. But a rapid expansion in the production of aircraft equipment, particularly in the group's new factories both at home and overseas, offset this; and the group's aggregate trading profits advanced from £7,318,931 to £7,570,360, despite an increase in costs of all kinds. A rise in taxation lopped away

the increase in gross profits so that net profits, which are shown after making certain appropriations to specific reserves, actually fell from £1,609,032 to £1,238,619. Clearly, the increase in the ordinary dividend from 7½ to 9½ per cent is more closely linked to the underlying prosperity of the group than to this movement in net earnings.

The rate at which the group has been investing in the production of aircraft com-

£1 ordinary share at 35s. yields £5 5s. per cent.

ponents can be gauged from the increase of nearly £2½ million in the value of stocks held by the group. Half of this increase is accounted for by the expansion of the group's aircraft and overseas companies; the other half is accounted for by higher labour and material costs. The new factories for aircraft equipment are operated under the Government's capital assistance schemes for defence production, but a substantial part of the group's own resources will be tied up in capital investment; at the moment orders worth more than £2½ million are outstanding for new plant and buildings. The cost of capital investment at present-day prices is illustrated by the directors' estimate that the current replacement value of the group's fixed assets, whose written down book value is

£5.4 million, is £30 million. Shareholders should bear these capital costs in mind in judging how far investment in the manufacture of aircraft equipment shortens the odds against a further increase in equity payments.

Standard Motor.—Of the companies in, or closely allied to, the motor industry that have recently published their accounts, Standard Motor appears to have received the sharpest knock of all from the contraction of overseas markets. This may perhaps be explained in part by the fact that the company's financial year ended on August 31st last, a month later than the other companies. In the financial year, the company's combined export sales of cars and tractors fell by 13 per cent to 86,097 units. To some extent this decline in export sales was offset by the release of more cars and tractors for the home market; the company's total sales fell by only 7 per cent to 125,707 units. Moreover, as a result of higher prices, the value of total sales increased from £46.9 million to £48.8 million. But higher costs more than swallowed up this increase, and the company's trading profits fell from £3,918,085 to £3,041,443.

One explanation why Standard Motor fared less well than the other manufacturers may be that its "bread and butter" product—as far as motor-car production is concerned—is the oldest of all the models that have been designed and produced since the end of the war. This would appear to be borne out by the fact that the company is now planning the production of some new models. These plans have already made their mark in the balance sheet. The book value of "dies, jigs, fixtures, patterns and press tools" has increased from £150,000 to £598,232; this suggests that new assembly and production lines are already

being laid down. The decline in the book value of stocks, from £5,073,070 to £4,835,679, suggests even more significantly that the production of the company's present models has been cut quite sharply. But it may be some time before the realignment of the company's productive capacity will have an appreciable influence upon earnings.

Rootes Motors.—Paradoxically enough, the interesting feature of the accounts of the Rootes group for the year to July 31st is that they show so little change from the 1950-51 accounts. The group has earned more from exports than ever before, but its trading profits have remained practically unchanged—at £3.2 million. Net profits have fallen—

thanks to a heavier provision for tax—but the ordinary dividend has been maintained at 32½ per cent. The group appears to have maintained its share of the market, but it is not, of course, free from the anxieties that beset the motor industry as a whole. Sir William Rootes, for example, joins Lord Nuffield in arguing that a reduction in purchase tax upon vehicles should be granted in order to stimulate sales in the home market. In common with other motor manufacturers, the Rootes group has to face not only the contraction of export markets, but also a

steady rise in costs at home. The value of stocks held by the group, for instance, has risen by just over £1 million to about £12.4 million, and part of this increase obviously represents higher labour and material costs. In order to preserve its competitive strength

4s. ordinary share at 16s. 10½d. yields £7 14s. per cent.

the group has therefore had to maintain a high rate of capital investment, and it is noteworthy that outstanding capital commitments at £1,076,000 are higher in value than those outstanding at the end of the 1950-51 financial year, when the outlook for the industry appeared brighter than it does at the moment.

Birmingham Small Arms.—The manufacture of motor cars is perhaps the least important of the many activities of the BSA group, and other engineering products have been selling more easily in recent months than vehicles. So the increase in the group's trading profits, from £2,801,731 to £3,084,837, in the year to July 31st should come as no surprise. Shareholders, however, were undoubtedly surprised by the decision to raise the ordinary dividend from 10 to 12½ per cent. The directors were certain that the time was ripe for such an increase "in view of the considerable expansion of the group's assets and activities." Presumably this expansion in capacity has been matched by a growth in sales. It has certainly been accompanied by an advance in profits, but this may be due in part to higher prices.

Increases in prices and in turnover probably account for the increase in the book value of stocks held by the group from £8,426,788 to £11,029,666. Certainly this increase in investment in working capital explains why the group had absolutely no cash resources at the end of last July. The group financed the increase in working capital investment by ploughing profits, by allowing "creditors and accrued charges" to run up from

	Years to July 31, 1951	1952

£1 ordinary share at 36s. 9½d. yields £6 16s. per cent.

£5,534,865 to £8,133,213, and by increasing its bank overdraft from £611,103 to £804,662. If the increase in investment in inventories represents something more than a temporary increase in capacity—and there are signs that it does—then a new issue of capital appears to be just around the corner. The directors have prepared the way for such a new issue of shares by taking the unusual step of raising the ordinary dividend at a time when most companies would have been content to husband their resources.

Mr Alfred Whittle, FCA, chairman of the company, who presided, said: Ladies and gentlemen, you will have observed in the directors' report that since our last meeting two members of our Board have resigned on account of ill-health, Mr A. R. Wildey, who was an executive director and in charge of our Sanderson and Sons factory at Pervale, with 54 years' service and Mr F. B. West, the company's sales director, with 50 years' service. Both these gentlemen have rendered valuable service to the company for many years and we hope their health will improve to enable them to enjoy a well-earned retirement.

Before I deal with the accounts I would like to say that the principal factor in the substantial fall in trading profits has been the exceedingly difficult trading conditions which have been experienced by our wall-paper mills during the whole of the past year, together with the high costs of pulp, paper and other materials which I referred to at our last meeting, and which have had serious effects throughout our various manufacturing units. We have not passed on to the consumers all the increased raw material costs because it is our considered policy to keep our selling prices as low as possible and at the same time at least fully maintain the qualities of our various products. You will have noted on reading the directors' report that wallpaper manufacture during the year has proved unprofitable; it therefore follows that our other interests have been the profit earners mitigating the effects of the wallpaper trade recession.

Turning now to the accounts, I will comment upon the consolidated accounts which show the position of the Group at the end of June last.

On referring to the consolidated profit and loss account it will be seen that trading profits, less losses, but including income from investments and transfer fees, amount to £2,679,000 as compared with £4,559,000 for the previous year, a drop of £1,880,000. On the other side of this account interest on debenture stock, depreciation, pension fund contributions and audit fees total approximately £531,000, leaving a net profit before taxation of £2,148,000 as against £4,008,000 last year, a fall of £1,860,000. We now come to the very heavy slice of our profits which is taken for taxation and which for the year just ended is £1,267,000, leaving only £881,082 available on the year's trading for reserves and dividends.

As just stated, the net profit of the group after charging taxation amounts to £881,082 and before bringing this amount into the parent company's accounts we are retaining £227,901 in the accounts of the subsidiary

companies; in addition, are providing £36,310 representing the proportion of profits attributable to outside shareholders. These two deductions reduce the sum remaining for the parent company to £616,871, which with the amount brought in from last year, makes the total available for allocations, reserves and dividends £1,308,588. Out of this amount your directors have allocated £50,000 to pension funds, £100,000 to investment reserve and £200,000 to stock depreciation reserve and recommend to the stockholders, as last year, final dividends of 5 per cent on the ordinary stock and 8½ per cent on the deferred stock. If you approve these recommendations and after charging the preference dividend for the year, and the interim dividends on the ordinary and deferred stock, the sum to be carried forward to next year will be £686,215 as compared with £691,717 brought in, a slight reduction of £5,502.

CONSOLIDATED BALANCE SHEET

The assets of the group at June last stand at a book value of £21,685,811. Fixed assets have been increased during the year to the extent of over £840,000 on extending and equipping some of the establishments of our subsidiary companies. Current assets at £16,491,000 stand at practically the same figure as last year, the chief changes being that stock in trade at nearly £8 million is higher by £1,925,000 and cash at bankers £527,000 is lower by £1,850,000 if we include for purposes of comparison tax reserve certificates held at June, 1951.

On the other side of the group balance sheet the major changes in revenue reserves are that investment reserve has been increased by £100,000, stock depreciation reserve by £217,000 and exchange differences by £69,950. The unappropriated profits of the group carried forward to next year, viz.: £2,282,521, have also increased by £236,193, making our total revenue reserves and unappropriated profits £6,495,742 at June, 1952, as against £5,872,693 at June, 1951, an increase of £623,049. Including under this heading the group's estimated liability to future taxation we, therefore, have a grand total of £7,867,173.

Current liabilities and provisions amount to £6,697,178. The only material change as compared with last year is the amount owing to our bankers, viz.: £1,104,000, but we have on the other hand, as previously stated, £527,000 in the bank. The actual cash position at June, 1952, as compared with June, 1951, including tax reserve certificates, shows a reduction of nearly £3 million which has been used almost wholly to finance the higher values of stocks held by the group and the expenditure on fixed assets. Of our investments, 89 per cent represents British Government and Colonial securities purchased at or below par value, all of which have fixed dates of redemption.

Current assets of the group at June, 1952, are in excess of current liabilities and provisions by almost £10 million.

WALLPAPER

The shortage of our main raw material, paper, which has restricted our production and sales of wallpaper every year since manufacture was recommenced after the war, gave way during the year to more plentiful supplies and we were thus enabled to remove all restrictions on the sale of wallpaper in the domestic market. Nevertheless, the year has proved to be one of the most difficult in our history due to the very high price of paper.

The price of paper has had a very adverse effect on our manufacturing costs. An additional and wanton burden is the purchase tax levied at the rate of 33½ per cent on prices swollen by abnormal paper costs. It is hardly surprising, therefore, that home trade sales showed some falling off but, more seriously still, it has not been possible to recover all the increased costs in our selling prices, and so for the first time for many years wallpaper manufacture has proved unprofitable.

Since the end of the financial year paper costs have shown a tendency to fall, though not so much as had been hoped. On the other hand we have reduced our prices at the lower end of the range because the public is still unwilling to pay prices which will enable us to recover costs.

Export trade was well maintained until the last few months of the year when the company began to feel the effects of the import restriction policy embarked on by the Dominions and other countries. We are now experiencing the full effect of the loss of orders from restricted markets.

During the year we have made determined efforts to reduce our operating costs to a minimum and you will be aware, on reference to the directors' report that we have ceased the manufacture of wallpaper at our Blackburn, Irlam and Derby branches, so that those we are continuing to operate will work closer to their rated capacities and so on more economical lines.

The carrying out of this policy has naturally been attended by many difficulties and hardships to the personnel employed at these plants. The directors express their sincere regret for the hardships caused and have done their utmost to minimise them.

We feel that the impact of high paper costs and purchase tax must continue to act as a brake on the expansion of sales to which must be added the depressing effect of import restrictions on export trade.

In an effort to combat these adverse effects considerable care and planning has been put into the company's publicity schemes and much success has been achieved at exhibitions throughout the country, and in raising the standards of display and presentation of

After increasing Exchequer balances by 247,641 to £3,271,386, the other operations for the week increased the National Debt by 149,243,320 to £26,278 million.

wallpaper in our own showrooms and shops and those of our customers.

SUBSIDIARIES

Last year I spoke of the main products manufactured by our subsidiary companies, viz.: straw pulp, paper, colours, paints, brushes, fabrics, powdered mica, ebonite and moulding powders for the plastics industry. These companies form a very important section of our group. I do not propose this year to deal with each company in my remarks as I did last year, but you will have seen brief references in the directors' report to the main companies producing these products. I would like to mention, however, our marketing subsidiaries—wholesale and retail—which, as you know, distribute a proportion of our output of wallpapers, paints, brushes and fabrics. These distributing companies, on the whole, have again made a valuable contribution to the trading result of the parent company and, together with the manufacturing group of subsidiaries, account for the profit shown in the accounts. At the present time, and on the information available, it is very doubtful whether our group of manufacturing subsidiaries will be able to maintain last year's profits but I am a little more hopeful about our distributing companies.

Of our Canadian companies those manufacturing and distributing wallpaper and colours have had a difficult year with lower sales and lower profits. Strenuous steps are being taken to improve the position but the outlook at the present time is far from encouraging. Our Canadian company manufacturing and distributing paints has had a successful year but so far during the current year profit margins are narrowing although sales are being maintained. Unless there is a complete change for the better between now and the year end I do not expect our Canadian group will maintain last year's profits.

STOCKS

During the latter half of the year we took steps to reduce our stocks of raw materials and finished products as it was recognised that a fall in inventory values might have a serious effect on our trading results and on our finances. Even so at the end of the financial year a certain amount of writing down of stocks was necessary, particularly of pulp and paper and materials at the fabrics section. In addition we think it prudent to set aside £200,000 out of the past year's profits to provide for further falls in stock values that may take place during the current year.

EXPORT

If the industries of our country are to maintain their positions, their competitiveness and their ability to extend the area of their operations, it is essential, as I have stressed in former years, to check inflation, to remove the distortions that have grown on our economy, and to restore financial incentive to all who are able to contribute to the greater flexibility and effectiveness of British industry. Your company has spent considerable sums in extending its export trade and it is unfortunate that when retrenchment becomes necessary in overseas markets it is consumer goods, such as wallpaper and paint, that are amongst the first victims. I can only hope that more freedom to import will be restored to our industrialists so that in turn other countries will be better placed to increase purchases from us. The vulnerability of our country's exports to these restrictions will, in my view, if long continued, result in a decline in our standard of living and bring unemployment if our imports of raw materials decline below normal working levels. The

cutting of imports has caused other countries to apply financial and economic restrictions which are reacting most unfavourably on the expansion of world trade upon which alone rests the hopes of increasing exports.

LABOUR

The past year has been difficult throughout the country because it has brought us nearer to the conflict which sooner or later is going to confront all industry—wages to be regulated by the cost of living or by the ability of the particular industry to pay them? Industries whilst enjoying a sellers' market have in their wage negotiations been forced to follow the cost of living index. As competition and consumer resistance gradually get the upper hand it will be extremely difficult for employers, however sympathetically they feel about the matter, automatically to accept the cost of living plea, without applying the realistic but doubtless unpopular test—will the public support with its purchases a higher rate of wages?

The cost of living index figure is loaded with purchase tax on many commodities, but does not reflect the benefits of taxation reliefs and other allowances.

I feel that tact and forbearance on the part of all concerned with labour problems is going to be needed during the period of adjustment that trading conditions in this country will force upon industry in the immediate future.

I do not think anyone would seriously contest the view that one of the major cures for the economic ills from which this country is suffering must lie in higher productivity. Higher productivity is intended to mean not just greater output but greater output per man hour. It means using machinery as near as possible to its rated capacity and seeing no more people than are necessary are engaged on any one job. In other words it means the most economical use of manpower, of raw materials, of time and of machinery. The gain from that would reflect itself in increased competitiveness not just on the home market but throughout those parts of the world that are still open to trade with the Western nations.

TAXATION

Over the past few years I have said much on this subject; it is a matter of great concern that this year has brought no relief. In fact since our last meeting heavier burdens have been placed on industry by the withdrawal of initial allowances and the further imposition of excess profits levy. The decrease in our trading profit means, however, that we shall not be liable for excess profits levy for the period to June last; I see no justification whatever for the imposition of a new levy at a time when British industry is struggling to maintain its strength. It is so clear that for some years the ability of British industry to expand has been seriously impaired by the amounts paid out in taxation and the unrealistic method of computing business profit; this is particularly true at the present time when many progressive companies are prevented from expanding by the lack of liquid funds and the difficulties of the capital market, where there is little inducement to investors to subscribe owing again to heavy taxation. It is not in my province to say how government expenditure may be reduced so as to lower the need for taxes, but I am glad to hear the Chancellor has promised to deal now with this urgent matter. Unless a substantial reduction is made quickly the result cannot fail to weaken seriously the country's commercial position and its ability to compete internationally. There are now unmistakable signs of a fall in the revenue the

state will obtain from taxation from British industry. To a large extent this is due to the high level of taxation and the financial policies of postwar years which have strangled industry and so prevented natural expansion. Future employment is in jeopardy, and of course with it, our standard of living.

GENERAL

It would be idle of me to pretend that the past year has been anything but difficult from a trading and financial angle. In earlier years I have stressed the need for financial retrenchment to counter the scourge of inflation; accordingly I shared the welcome given to the Chancellor of the Exchequer when a year ago he took the first steps in the direction of a return to financial stability by imposing financial restrictions, although it was realised by all those concerned with the conduct of business that those steps would for a time make trading more difficult. It is, however, disturbing to see that these restrictions which have affected industry so severely have not been applied to the same extent to government expenditure and to that of local authorities; unless there is ruthless cutting of public expenditure there is little hope of restoring financial stability and ending inflation. How futile to impose financial reticence on business and then to allow the benefits so painfully won to be dissipated through increased government spending.

For a company such as ours this mounting inflation assumes most serious importance because we are concerned not only with manufacturing costs but with the increased costs of hanging wallpapers and of applying paints. Inflation and high taxation have changed the pattern of spending through redistribution of incomes which in turn has had its effect on our trade. We have moved a very long way from the days when it was normal for householders to call in the decorator annually to decorate one or more rooms. Greatly increased application costs are having the inevitable result that an ever growing number of householders are applying our products themselves. The traditional avenue of sale through the decorator is giving way to distribution through the wallpaper retailer direct to the public. This social change is reflected in the more pleasing display of wallpapers of every quality to be seen in the retail shops. Wallpaper is almost wholly used for improving appearance whereas paints, in addition to being used for inside decorations, play an important part in the maintenance and preservation of properties. The wallpaper industry is, therefore, much more vulnerable to the vagaries of trade however caused.

FUTURE OUTLOOK

Turning now to the current year, whilst I am not unduly gloomy about present trading, I cannot say there are definite signs of improvement taking the group as a whole. We shall continue our policy of expansion and re-equipment of our establishments and of preserving the quality and service of all our products despite the uncertainties and difficulties we may have to face in the future.

CONCLUSION

I should like to conclude with a tribute to all the directors of our subsidiary companies, to our managements and staffs, and to all employees at home and overseas for their loyal and devoted services during a most difficult year. I and my board gratefully acknowledge and appreciate the assistance we have received from all.

The report and accounts were adopted.

THE NATIONAL BANK OF AUSTRALASIA

(Inc. in Victoria)

END OF INFLATIONARY PERIOD

MR H. D. GIDDY ON MEANS OF ACHIEVING ECONOMIC STABILITY

The ordinary general meeting of The National Bank of Australasia, Ltd. (with which is united The Queensland National Bank, Ltd.), was held on November 26th at Melbourne.

Mr H. D. Giddy (the chairman), in the course of his address, said: The balance sheet totals of £229,007,227 are approximately £59 million below last year. Nearly £40 million of this decrease is accounted for by repayment of Central Bank borrowings and by a decline in the item liabilities under letters of credit, etc., the latter item reflecting, in the main, reduced financing associated with the lower level of imports this year. Customers' deposits have decreased by £17 million, a moderate fall in view of general banking experience over the last twelve months. Advances also have shown only a reasonable rise of £13 million. Additionally a reasonable business and other factors have lifted gross earnings by just about £1 million to a new record of £6,340,242, but higher expenses and increased taxation provisions have absorbed practically the whole of this rise. There has been a small increase in net profit to £616,965.

TRADING CONDITIONS

At present overall business activity inside Australia is at a more restrained level than a year ago. The inflationary tempo that culminated in what is commonly termed the "wool boom" has quietened down, and, for the present, ever-mounting annual records in sales, in turnovers, and, above all, in public demand, are generally a thing of the past.

ECONOMY HAS BEEN JOLTED

It is not surprising that business and the community in general has felt a jolt in the change from the frenzied expansion in activity which is always an accompaniment, and a symptom, of active inflationary conditions. If entirely unchecked, the inflationary process would, of course, gallop on and end in a major economic collapse. Over the last twelve months that process has been checked, at least up to a point, by a great change in our overseas balance of payments brought about largely by the flood of imports with a resulting reduction in our money supplies to pay for them. Additional factors were the emergence of strong and perhaps timely buyer resistance to ever higher costs and prices, and government financial policy.

As a result of these checks entirely new conditions now confront Australian industry and commerce. A fresh breeze, in the form of competition, both individual and corporate, has swept over the economy.

THE VITAL ROLE OF INCENTIVES

Restoration of incentives is fundamental to a resurgence of real confidence. Let us adopt incentive differentials in employee remuneration wherever they would assist greater efficiency and, therefore, lower prices to the consumer. But, freedom to retain in large measure the rewards for individual economic effort is just as vital as freedom to make that effort.

Nothing is more damaging than the wear-

some repetition that it is impracticable to reduce, to any material extent, the load of taxation which the Australian people have been forced to carry. It is alarming to realise that the total amount of taxation levied last financial year was well over £1,000 million, nearly 32 per cent of the National Income. There surely is room for a substantial alleviation of this burden. Real relief here would give new zest to our free enterprise system in all its aspects.

MEETING THE CHALLENGE

Just at present the Australian economy appears to be balancing between the extremes of over-full employment and a condition of recognisable overall idle capacity. One senses, nevertheless, a tinge of the precarious in this balance. "The line of demarcation between inflation and deflation is necessarily a matter for delicate judgment," say the Executive Directors of The International Monetary Fund in their 1952 Annual Report. Yet this is the road we must tread to achieve and to maintain stable trading conditions, the foundation of all progress that is real.

How is business, and the economy generally to meet this challenge? This is, I think, a pertinent question to ask. We have got to find ways and means of achieving a steady national development, and of using for the benefit of all the new eagerness for efficiency and better productive effort.

We are not without weapons for a campaign against the waste and inefficiency of either depression or inflationary boom. Within strict limits, internal credit can be expanded in time of idle resources; taxation can be reduced to bolster public buying power; we are able to regulate our imports to meet a sudden reduction in overseas monetary reserves; we know far more than in years gone by about the effects of changes in investment expenditures, whether private or public. We are unable to influence overseas prices paid for our exports, but we ought to be able to frame policies to increase export production, and to keep its cost at competitive levels.

The wise application of such implements, and an intelligently confident attitude on the part of business and the general public, should ensure reasonable stability in general business activity and employment, without plunging into over-full employment where individual and corporate responsibility is too often weakened, leading to excesses in all directions.

But in a community which places a very high value on its freedom, success will not be achieved unless its economic implements fit a business structure that is basically free enterprise. Too often in the past their application, or their nature, has been such as to bend and at times nearly break that structure. Full appreciation of this fact by governments, and other controlling authorities, will give the nation renewed confidence that it can surmount current difficulties, and will enable the individual to regain initiative and strength of purpose in our economic life.

The report was adopted.

THE BRITISH LINEN BANK

STEADY GROWTH OF BUSINESS

The annual Court of Proprietors of The British Linen Bank was held on November 25th at the head office, Edinburgh, The Earl of Airlie, Governor, presiding.

The following is an extract from Lord Airlie's speech:

The general picture presented in the report and accounts must, I feel sure, have given you much satisfaction, for signs of steady growth of our business are not lacking, and the Bank's financial strength is again demonstrated in the testing conditions resulting from the depressed state of the gilt-edged market. That strength has become a tradition.

The net profit for the year at £225,726—although some £2,500 better than last year's figure—is still £30,000 below the 1950 result. Adding the balance of £189,411 brought forward from last year, the sum available for distribution is £415,137. Of this, £52,500 has already been applied in payment of the usual dividend for the half-year to March last at the rate of 16 per cent per annum, less income tax, and it is now proposed to devote £52,500 in payment of a dividend at a like rate for the second half of the year. Transfers of £54,000 and £75,000 respectively to staff pension fund and contingency account are not over-liberal in present conditions and on future prospects, and the balance of £181,137 left to be carried forward to next year is down by £8,274.

BALANCE SHEET

Although satisfaction with the results disclosed by our profit and loss account must be qualified, our balance sheet still exhibits under present conditions a remarkable degree of over-all strength. Deposits at the record figure of £78,202,000 are up by over £1,200,000 in comparison with last year's figure. Notes in circulation have increased by some £644,000 to £9,367,000, while acceptances and other engagements on account of customers at £3,043,000 show a rise of £209,000.

On the assets side, cash, cheques in course of collection, short money, and bills discounted (largely consisting of Treasury Bills), together amount to £30,469,000—giving a ratio of highly liquid assets to deposits and notes of 34.8 per cent, as compared with 31.3 per cent a year ago. Notwithstanding the heavy writing down of our gilt-edged investments again necessitated this year by the depreciation current at the date of the balance sheet, our portfolio of these at £41,161,000 shows a slight increase over last year's figure. As indicated in the Report, our quoted investments—all issued or guaranteed by HM Government—consist entirely of dated stocks, and as usual they stand in our balance sheet at less than their market value.

During the past year, our advances reached a peak of over £24 million in the spring, from which level they steadily declined to £18,650,000 at the date of our balance—a decrease over the year since September, 1951, of £2,139,000.

Bank premises and other property as written down stand at just over £765,000, a figure which is far below their market value on a conservative basis. Quite apart from the rise in property values which has been the concomitant of a depreciating pound, the sums written off our premises annually over a long period prior to the recent war were particularly generous.

The balance sheet total of fully £94,597,000 constitutes a fresh record.

The report was adopted.

THE INDIAN IRON AND STEEL COMPANY, LIMITED

BENEFITS OF THE MERGER

MR T. LESLIE MARTIN'S REVIEW

The thirty-fifth ordinary general meeting of The Indian Iron and Steel Company, Limited, was held on November 14th, in Calcutta.

Mr T. Leslie Martin, the chairman, presided, and in the course of his speech said:

I would draw your attention to what may be regarded as somewhat abnormally favourable features of your trading results during the year 1951-52, compared to 1950-51. We have been able to transfer from our gross earnings to a reserve Rs.5 lakhs towards the cost of the rehabilitation of the Kulti Blast Furnaces, in accordance with the requirements of Government in pursuance of the recommendations of the Tariff Board. This is not an appropriation of normal profit, since in the revised selling price of pig iron there was included a special element to provide for this reserve.

We have also paid our preference shareholders Rs.7,50,000/- for the whole year, compared with only Rs.2,28,081/- for the broken period ended March 31, 1951. In addition, we have been able to transfer a sum of Rs.10 lakhs as provision towards the development of our ore mines and collieries.

The higher profits for the year under review are, to a large extent, due to the increased production of pig iron and the improved working of the Kulti foundries as a result of the recent installation of modern mechanised equipment. Further, the upward revision of the selling price of pig iron, which came into force in August, 1951, had a bearing on our more satisfactory working results.

As the demands of the steel side of our company's operations expand, the off-take of pig iron, in the form of hot metal, will increasingly develop, but as a consequence of the merging and expansion of the company's plant and that of the Steel Corporation of Bengal, the uncertainty of the position of this company often created by the agreement with the Steel Corporation of Bengal will disappear.

The higher retention prices for steel recently announced will remain in force to the advantage of both the companies from the beginning until the end of this year, and those for pig iron until June 30, 1954. Your dividend earning capacity will not be adversely affected by any smaller sales of pig iron or as a consequence of the merger.

THE MERGER

In order to enable you to appreciate the effect of the merger on your trading prospects I can do no better than quote two short extracts from a letter of the Government of India dated October 30, 1952, and addressed to both companies:

"The Tariff Commission have made the following recommendations besides the recommendation regarding the retention prices:

(1) IISCO and SCOB may be informed that should Hirapur Iron Works be amalgamated with SCOB, the retention prices of steel produced by the amalgamated concern will be calculated on exactly the same principles as have been applied in the case of Tatas.

(2) The merger of IISCO's Hirapur works with SCOB, besides improving the economic

position of both the plants, will help the expansion of iron and steel capacity in the country... and the companies should, therefore, make determined efforts to bring about the merger as early as possible.

The Government of India have accepted these recommendations."

From the inception of the Indian Iron and Steel Company it was contemplated that as soon as a convenient moment arose it should extend its operations to the manufacture of steel. The opportunity fully to carry out this purpose did not arise, but in 1937 the Indian Iron and Steel Company became associated with the Steel Corporation of Bengal. It contributed a substantial amount of the ordinary share capital to help the establishment of the Steel Corporation of Bengal and agreed to supply to it the hot metal and all auxiliary raw materials and essential services for the manufacture of steel.

With the growing shortage of both iron and steel and the anxiety of the Government to improve the supply of both, and with the visit of the representatives of the International Bank, the question of amalgamation came to a head. It is a splendid opportunity, whether from the short or the long term point of view, upon which the shareholders of both the companies may well congratulate themselves.

DIVIDEND PROSPECTS

The effect of the acceptance by the Government of the first recommendation referred to above, namely, the calculation of the retention prices on the same principles as have been applied in the case of Tatas, will be that both the companies when merged will benefit by receiving what may be considered an economic price for the hot iron and services which had previously been reduced entirely in the interest of the consumer, who had never been at any time even in the picture when the Agreement of 1937 had been made. Full overheads and profit will be calculated on the value of the entire Hirapur block and included in the future retention prices of steel. This will make a substantial addition to the amount of depreciation and the return on investment at present allowed and will be included in the calculation of the retention prices.

The time necessary to carry out the extension schemes to bring them fully into operation and to discharge all the obligations incurred by us to finance them will require many years. For the sake of convenience I shall divide these years into three periods.

The first period during which the whole benefit of the merger will be effective will be from January 1, 1953, until the completion towards the end of 1953 of the works now in progress in connection with what is called the first stage of extensions of the two companies. This will add four to five crores of rupees to the value of the combined blocks on which full overheads and return on investment will be allowed and included in the retention prices of steel. This position will remain practically unchanged during the construction of the major extensions, which are expected to be completed and brought into operation in 1957-58. This may be regarded as the second of the three periods. Your dividend earning capacity can reasonably be expected to remain unaffected throughout the period of construction.

This brings us to the third and the last stage of the development of the amalgamated companies. It would be not only very difficult but unwise for anyone to venture on making a forecast of how the financial position and the trading results of the company will precisely stand several years hence. But this much can be said with some confidence: that your prospects may reasonably be expected to improve. It is true that we are to carry a large burden of debt, estimated at present to amount to over 31 crores of rupees, in order to carry out the extensions. But the terms offered and now being finalised between the Government of India, the International Bank for Reconstruction and Development, and the company are expected to be such that you will not only be able to meet your liabilities both as regards the principal and the interest, but there may be a certain margin left which will help you to expedite the discharge of your liabilities. You will be the owners of one of the largest integrated plants outside the United States of America with possibilities, if opportunity arises, for even further expansion.

In order to make the principles of the merger effective fresh retention prices for steel will have to be fixed, on our application, for each one of the three periods mentioned by me. The works costs will have to be calculated by a method different from that followed up to the end of 1952. The overheads and profit also will require adjustments to bring them into relation with the changing value of the combined block as and when new units are completed and brought into operation. We have the assurance of Government that this will be done. When all matters pertaining to the merger have been completed it is our intention to issue to shareholders a further short circular letter.

The report and accounts were adopted.

TRINIDAD LEASEHOLDS LIMITED

MR SIMON J. VOS'S REVIEW

The annual general meeting of Trinidad Leaseholds Limited will be held in London on December 19, 1952. The following is extracted from the chairman's circulated statement:

Once again I am pleased to be able to report that the operations of the group for the past year have shown satisfactory results.

Further deep drilling in Trinidad has not so far revealed a substantial new reservoir, but medium and shallow outstepping has resulted not only in maintaining the required level of production, but in some improvement of crude oil reserves.

Refinery throughput increased considerably and the installation in Trinidad of a fluid catalytic cracking and associated plants, recently completed, is of special significance for Regent Oil Company Limited, whose progress in the marketing of products continued satisfactorily in face of the keenest competition.

Consolidated net profit of the group for the year was £1,899,952, as against £1,470,705 last year, after allowing for all charges, including provision for depreciation, taxation and contingencies.

Before arriving at the net profit it has been necessary to provide approximately £1 million more for taxation than in the previous year.

In Canada nine wells were drilled on proven and semi-proven leases, of which seven were completed as producers. Five exploratory wells were drilled, none of which found commercial oil. Refinery operations increased as also marketing outlets.

FERRANTI, LIMITED

RECORD ORDER BOOK

The forty-seventh annual general meeting of Ferranti, Limited, was held on November 20th, in London, Sir Vincent de Ferranti, MC, MIEE (chairman and managing director), presiding.

The following is an extract from the chairman's circulated statement for the year to June 30, 1952:—

We celebrate this year, the seventieth anniversary of this business.

The accounts show continued expansion in the activities of the company and its subsidiaries and further extension of our manufacturing capacity. The consolidated profit for the year, including dividends on investments, amounts to £1,320,164, as compared with £1,227,601 for the year ended June 30, 1951. After provision for tax on all profits earned to date, the net profit is £529,208, against £540,129 a year ago.

HIGHER GROUP OUTPUT

The output of the group, which is employing 11,000 people, is more than 30 per cent above that of last year. All the departments have contributed to this increase.

There has been a steady increase in orders received during the year, and we are left with a record order book of over £15 million. Further extensions of our manufacturing facilities are in hand to deal with this and with the continuing demand for our products.

The Canadian company has substantially increased its turnover and its profits. It has started the current year with a healthy order book. The American company has increased its output. It closed its year with a profit.

The steady and continued expansion in our normal activities and our increasing commitments in respect of contracts for HM Government call for a corresponding increase in working capital in the form of stocks and work in progress and accounts in course of collection. Proposals will be laid before you at this meeting to increase the borrowing powers of the company and its subsidiaries to £5 million.

INCREASED DEMAND

The demand for power transformers continues to increase, and the output was 26 per cent higher than that for last year. As a notable contribution to the national problem of the dollar gap we recently obtained an order for nine 230 kV transformers for the Garrison Dam Power Plant, North Dakota, in the face of the most determined competition from US manufacturers.

The turnover of our insulation department in the past twelve months has exceeded all previous records. With an output of over half a million electricity meters of all types, the meter department broke all previous records.

The demand for castings continues to increase, and the output by weight of our foundry would have been even higher but for restrictions in the supply of raw materials. The demand for commercial instruments and special metering equipment continues. Our contribution towards the development of guided weapons is considerable.

The value of sales of radio and television sets shows an increase over the previous 12 months. The national demand for electric fires and water heaters continues, however, to be depressed.

The report was adopted and the resolution increasing the borrowing powers of the company was approved.

ANGLO-DUTCH PLANTATIONS OF JAVA

MR G. C. DENHAM'S STATEMENT

The forty-second general meeting of The Anglo-Dutch Plantations of Java, Limited, was held on November 25th in London, Mr G. C. Denham, CIE, CBE (chairman and managing director), presiding.

The following is an extract from his circulated statement:

Of the problems which confront us perhaps the most immediate one is security. We have suffered probably more than any other company in Java from lack of security. Not only have our staff suffered but the company has also suffered materially from this lack of security, which prevents proper supervision in the gardens with resultant loss of crop.

The Government realises only too well its difficulties and is dealing with the whole problem steadily and methodically. The task is indeed a vast one and I fear that it will take another two or three years to restore security in Indonesia to enable every man to go about his lawful business without fear.

Despite the heavy and inevitable rehabilitation expenditure, the results for 1951 show that the company was working on a profit-making basis and I am glad to say that we shall be allowed to make profit remittances. It is, however, problematic whether we shall be able to do so in the future so long as we carry an overdraft in Java. Should such action be taken by the Government then the overdraft in Java must be liquidated, and the only way by which this can be done is by making the most use of fiscal depreciation.

PROFITS MULCTED BY TAXATION

At first appearances we seem to have had a most successful year; in fact, our trading profit of £968,267 is an all-time record. This, however, is heavily mulcted by taxation and by the necessity to provide £313,283 for obsolescence and renewals ("free fiscal depreciation"), together with the normal charge of £274,571 for depreciation and writings off of the fixed assets. Indonesian tax amounts to £229,024 and the United Kingdom tax to £50,000. There is an exchange profit of £30,769 to be added, so that the final result for the year shows a net balance available of £16,036. To this figure is added £167,426 brought forward from 1950, making a total credit in the profit and loss account of £183,462. As will be seen, the net result for the year hardly justifies the payment of a dividend. I feel, however, most strongly that despite the somewhat sombre picture I have had to paint and the present difficult situation, our stockholders should get some small reward for their long-term patience. We have decided to make an interim dividend distribution of 3 per cent, less tax, in respect of the year 1952. It is unlikely that there will be any further distribution.

FUTURE PROSPECTS

I cannot pretend that future prospects are good, and it will be a hard struggle to make both ends meet. The fall in the price of rubber has very materially altered the position and blighted the whole outlook. Our present policy is to effect every possible economy, and at the same time to preserve in as good condition as possible the still fine assets which we own. It may truthfully be said that our future lies in the hands of the Government of Indonesia, and that our future prosperity will be a reflection of its successful administration.

The report was adopted.

D. & W. MURRAY (Merchants and Warehousemen)

The fifty-fifth annual general meeting of D. & W. Murray, Limited, was held on November 20th in London.

Mr A. W. G. Streatfield, who presided in the absence of the chairman, Mr C. J. Jones, read the latter's speech, in the course of which it was stated: In common with other business undertakings, the company experienced the full effect of the trade recession during the past year, the conditions contrasting greatly with those of the previous year, which proved to be a record for the company.

Needless to say, the trading results for the period are disappointing, the decline in the company's earnings being accounted for by the widespread change in economic conditions prevailing throughout Australia, occasioned mainly by the considerable falling off in income derived from the export of wool and other primary products. As the result, the profit recorded for the year shows a decrease to the comparatively low figure of £57,492, after making full provision for taxation, depreciation and all contingencies.

After adding to the profit for the year the balance brought forward from the previous year, the total profit available is £139,075. It is proposed to pay a dividend on the ordinary shares at the rate of 5 per cent for the year.

In view of all the circumstances, any forecast of future trading results would be speculative, as from present indications the prospects may be regarded as being far from reassuring, as the ensuing year promises to be more difficult and much less favourable than that through which we have passed.

The report was adopted.

KUALA MUDA RUBBER ESTATES, LIMITED

INCREASED PROFIT

The twenty-seventh annual general meeting of this company was held on November 24th in London.

Mr L. I. Simpson, ACA, the chairman, presided.

The following are extracts from his circulated statement for the year ended March 31, 1952:

The profit for the year amounted to £211,397, which compares with a figure of £195,128 for the previous year. From this profit an estimated amount of £116,780 is payable in taxation. In view of the satisfactory profit which we have made it is a considerable disappointment to us to be unable to recommend the payment of a final dividend. We have, however, out of the profit of the last two years, provided a sum of nearly £136,000 for debenture redemption and paid out £14,700 (net) in dividends.

Replanting in Malaya today is no easy matter owing to present conditions, and we have therefore joined with two other rubber-producing companies in the planting up of suitable land in Nigeria.

Our crop for the year was 2,983,662 lb, a considerable drop on that of the previous year. This is attributable to several factors, foremost of which, I think, we must place the very difficult labour conditions in Malaya. Weather too has been abnormal.

Although we are still short of liquid resources, I believe, now the debentures have gone, we can look forward to a very successful future for the company.

The report and accounts were adopted.

JOHANNESBURG CONSOLIDATED INVESTMENT

MR K. RICHARDSON'S SPEECH

The annual general meeting of this company was held on November 25, 1952, in Johannesburg.

Mr K. Richardson, who presided, in the course of his speech, said:—

The chairman, Mr H. J. Joel, has asked me to express his regret that he is unable to be present today.

Owing to very much reduced activity on the stock and share markets, few opportunities have existed during the year for dealing profitably. Dividends received have, however, been maintained and the net profit was £1,444,237, as compared with £1,628,647 for last year. A sum of £500,000 has been transferred to investment reserve, which now amounts to £1,441,992. Dividend No. 60 of 3s. 6d. per share, less United Kingdom income tax at the standard rate of 9s. 6d. in the £, absorbed £362,906, and the balance of profits carried forward amounted to £348,352, reflecting a decrease of £24,208.

Working costs have continued to rise and, in June, 1952, the average figure for the Transvaal mines, which are members of the Chamber of Mines, was 33s. 5d. per ton, compared with 32s. 3d. in June, 1951, being an increase of 3.6 per cent, as against the increase of 9.9 per cent for the corresponding figures last year. This upward trend still remains a matter of grave concern for the gold-mining industry.

Revenue from gold sold at enhanced prices during the year under review amounted to £5,043,000, which is equivalent to a premium of 8s. 8d. per ounce on all the gold produced during that period, and reflects a decrease of £419,000, or 10d. per ounce, as compared with the corresponding figures for 1951.

The Prime Minister, in opening the first uranium recovery plant at the property of West Rand Consolidated Mines Limited on October 8, 1952, stated that the annual gross revenue from uranium, when full production is reached, is likely to be in the order of £30 million per annum. The value of the gold produced by all mines, members of the Transvaal Chamber of Mines, for the twelve months ended June, 1952, was £143 million, and it will therefore be realised that the potential revenue from uranium will be of considerable importance. So far thirteen mines have been selected to produce this mineral and the first mine is already in production.

ORANGE FREE STATE

Progress in the Orange Free State gold-fields continues satisfactorily. Development is proceeding on seven mines from thirteen shafts, and at September 30, 1952, a total of 101,997 feet of development had been accomplished on basal reef; 101,225 feet had been sampled, and of this, 50,481 feet proved to be payable.

In spite of difficulties which have been encountered in the form of water, gas, and shale, it is evident that the technical mining problems are being overcome. In fact, at two mines milling has started and the total combined tonnage which they had crushed to the end of October, 1952, amounted to 1,126,000 tons.

The main problem is that of providing sufficient finance to enable the huge projects which have been planned to be brought to fruition. So far the amounts either already raised for all mines in the Free State, or in respect of which financing arrangements have been made, total some £103 million.

The report was unanimously adopted.

CONSOLIDATED AFRICAN SELECTION TRUST, LIMITED

MR C. W. BOISE'S REVIEW

The twenty-eighth annual general meeting of this company will be held on December 11th in London.

The following is an extract from the statement by the chairman, Mr C. W. Boise, for the year ended June 30, 1952:

The combined profit for the year of your company and its subsidiaries, of which Sierra Leone Selection Trust, Limited, is by far the most important, reached, before taxation, nearly £2,200,000, a decrease of some £500,000 compared with the previous financial year. This is due to a shortfall in our Sierra Leone production. The net surplus after providing £1,450,000 (66 per cent) for taxation was £740,000, a decrease of about £240,000 compared with the previous year. An interim dividend of 1s. has already been paid, and your directors recommend a final dividend of 3s. per unit of stock, subject to income tax. These dividends require a net sum of £636,953, as compared with £796,191 (4s. plus bonus of 1s.) for the previous year, when we were able to distribute a special bonus of 1s. from funds accumulated as a consequence of the observance of the voluntary limitation of dividends requested by an earlier Chancellor of the Exchequer.

GOLD COAST

Production from our mines in the Gold Coast improved both in quantity and value during the year under review. This territory provided approximately £900,000 after charging the year's production expenses. This amount was first reduced by £200,000 in respect of export and minerals duties and concession royalties. Taxation took a further £520,000, and the profit was therefore reduced to £180,000. Demands for higher pay were again presented by the Mining Workers' Union to all mining employers.

Exports of diamond by African producers increased throughout the year under review, and now considerably exceed those by the organised mining companies. Parallel with this development, illicit diamond mining continues as a serious threat to our operations. It is gratifying to note the practical and helpful approach of the new Government to the problems of our industry. Our security organisation, with the full support and co-operation of the Gold Coast Police, has had some success in reducing the depredations of the illicit miners. There is, unfortunately, no doubt, however, that substantial quantities of diamonds continue to be removed illegally from our concession areas.

MARKET PROSPECTS

The prices at which your company's production of industrial and gem material is sold to Industrial Distributors (1946), Limited, and the Diamond Corporation, Limited, have substantially improved during the year, and this has compensated to some extent for the fall in our total output. World sales for the year 1952 will show a high figure, and the whole of our available production will be absorbed under our selling contracts.

Our record for the last year has clearly shown the ever-increasing burden of taxation and of the labour and operational costs which we have to meet. These factors will continue to affect our position, and must be given their due weight in assessing your company's prospects. I consider, nevertheless, that the outlook for the current year's trading is again satisfactory.

RHOKANA CORPORATION, LIMITED

INCREASED INCOME

The thirtieth annual general meeting of this company will be held on December 10th at Nkana, Northern Rhodesia.

The following is an extract from the statement by the chairman, Sir Ernest Oppenheimer, dated October 22, 1952, which was circulated with the report and accounts for the year ended June 30, 1952:

The results for the year to June 30th last will, I am sure, be regarded as very satisfactory. The operating profit at just over £10 million, shows an increase of £1 million, but it should be remembered that this increase was to some extent caused by exceptional sales during the year. The investment income, £500,000 higher at over £2 million, again includes a substantially increased dividend on our large holding in Nchanga Consolidated Copper Mines Limited, to which we look for even more material contributions to your company's prosperity in the future.

In my statement last year I said that, as far as could be seen, the company's resources were sufficient to take care of all capital expenditure approved in principle at that time. I qualified this statement with warnings that delays and cost increases might alter the picture, and that further retentions of funds to finance stocks and stores at higher price levels, and additional capital expenditure, would almost certainly be found to be necessary. These warnings have been justified, and in order therefore to finance a part of the additional commitments which have now arisen, a further appropriation of £1,800,000 has been made to general reserve from the year's profit.

It has been decided to form a company to develop the Konkola and Kirila Bomwe special grant areas at present owned by this company. The combined area will be known as the Bancroft Mine. The mine has ore reserves which earlier and current diamond drilling programmes have already proved to total over 80 million tons. It is proposed to develop and equip the mine on the basis of a production of 4,000 short tons of copper per month.

HIGH COPPER PRICE LEVEL

The price of copper has advanced to a new high level in recent months, and this level has been maintained, with minor variations, until now. The new electrolytic cobalt plant, when commissioned early this year, ran into a number of the operational difficulties which always beset a new process, and it was not until August that production of cobalt metal began. Small tonnages of uranium-bearing ore have been proved at the south end of the Mindola section of the mine. Further exploration to delimit this occurrence is in progress.

The coal supply position during the year to June last continued to be unsatisfactory; for much of the time our smelter and power plant were restricted in output, and the smelter and other sections of the plant had to shut down on several occasions. Since the year-end there has been some improvement, July and August showing the best monthly deliveries ever received, though these were still far short of the ever-increasing requirements of the Copperbelt.

The subject of electric power supply is closely associated with the coal problem. The Copperbelt Power Interconnection Scheme is now in commission, and your company's plant is linked with those of the other three copper companies through high-voltage transmission lines. The benefits of a pooling of power resources are already being experienced, and further developments in hand will make the benefits even more apparent.

The annual report and accounts may be obtained from the Head Office, Kitwe, or from the Transfer Offices at 44 Main Street, Johannesburg, and 11 Old Jewry, E.C.2.

THOMAS PRESTON LIMITED

(Packaging Manufacturers)

IMPORTANT NEW ACQUISITIONS

The thirty-third annual general meeting of Thomas Preston Limited was held on November 21st in London, Mr George Castle, LL.B. (chairman and managing director), presiding.

The following is an extract from his circulated statement:

The trading profit for the year amounts to £285,110, against £355,033 for the previous year, but this year we have to provide a sum of £104,093 to write down our stocks of raw materials and finished goods to their market price at June 30, 1952. The profit, after charging all expenses and taxation, is £61,822 against £103,379. After bringing into account the balances brought forward from last year, providing £23,531 in respect of profits earned by the new subsidiaries before acquisition, the preference dividend, the same rate of dividend as last year, viz., 35 per cent, on the increased ordinary share capital, and making the same transfer of £2,000 to the work-people's benevolent fund, there remains to carry forward £102,059, against £114,627 brought in.

FIXED ASSETS CONSIDERABLY INCREASED

Turning to the consolidated balance sheet you will see a very considerable increase in our fixed assets, which, after depreciation, now stand at £818,597, against £434,728 last year. The increase in the ordinary share capital of £127,002 results from the rights and other issues of twelve months ago, and the satisfaction of the consideration for the acquisition of the two subsidiaries acquired during the year.

The first of these subsidiaries is Dobson and Crowther Limited, of Birmingham. This company was established in the year 1906, and has specialised throughout its existence in the production of tea and similar bags. Its products are of a high quality, and well known.

The other acquisition was Kraftcord Limited, which company produces paper yarns, cordage and fabrics. These products are in extensive use in the carpet and cable industries, and the furniture, upholstery and motor trades.

The net current assets of the group show little variation from last year's figures. Revenue reserves, however, show a reduction of some £7,000. The total assets of the group show a very substantial increase from £891,267 to £1,352,044.

During the year we have formed two subsidiaries, namely, Thomas Preston (Containers), Limited, and Thomas Preston (Cotton Bags), Limited, and since the close of the financial year we have formed Thomas Preston (Paper Bags), Limited, and have transferred to that company the trading assets of Thomas Preston, Limited. The latter company has thus become a purely holding company.

TRADING RESULTS

Turning to the trading results, the year has proved most difficult and complex for all paper converters.

During the first six months of the financial year we remained restricted in our trading by raw material shortages, and thus demands upon us remained heavy. Early in the second six months of the financial year the demand

for all packaging products fell away heavily and rapidly, due to overstocking and anticipated reductions in raw material prices. During such periods, and since, very considerable price reductions have taken place in our raw materials and finished products, and the serious extent of them will be appreciated from the provisions made as at June 30th last for stock depreciations.

Today, although there has been a buyers' strike for approximately six months, demand has not yet returned to normal proportions, but signs are evident that trading conditions should improve in the near future.

We are appreciative of the very competitive days ahead, but provided we can be assured of reasonably stable raw material and selling prices, the efforts made over the last few years should not prove unproductive.

The report was adopted.

DALGETY & COMPANY

FALL IN WOOL PRICES

The sixty-eighth annual general meeting of Dalgety and Company, Limited, will be held at the company's office on December 18th.

The following is an extract from the statement by the chairman, Mr D. Abel Smith, MC, circulated with the report and accounts:

As wool plays such an important part in the economies of Australia and New Zealand the figures of sales for 1951-52 and comparative figures for the previous season are set out:

Australia, number of bales sold 3,413,805 (3,549,998); value £A308,107,658 (£A636,156,430); average per bale £A90 5s. 1d. (£A179 4s.).

New Zealand, number of bales sold 1,231,577 (613,124); value £NZ71,107,413 (£NZ92,583,729); average per bale £NZ57 14s. 7d. (£NZ151 0s. 1d.).

The drop in the Australian wool cheque has had far-reaching effects throughout the country and following so quickly upon the prosperity of the previous year, was largely responsible for the imposition of credit and import restrictions. The increased quantity sold in New Zealand is mainly the result of the carry-over of some 300,000 bales from the previous season, due to the dock strike.

INCREASED WOOL SALES

During the year the company sold 695,441 bales in Australasia as compared with 613,200 bales in the previous season. The 1952-53 selling season opened with prices in Australia approximately on a par with the close of the previous season, and to date those values have been fully maintained. Our produce business continues to progress satisfactorily within the limits imposed by the policy of bulk trading by governments.

Our merchandise departments have made further progress and their turnover, in mixed currencies, now approaches £25 million per annum. The increased business transacted has not resulted in a similar increase in net profit owing to rising costs, price control and other factors, but the net profit still constitutes a very satisfactory contribution to the result of the company as a whole.

In both Australia and New Zealand our shipping departments have done well to return profits which were only slightly less than those of the previous year. In their anxiety to achieve a quick turn round for their vessels shipowners have tended to curtail the number of ports of call, but this has not been wholly detrimental to us in that one branch's loss has usually been another's gain.

Our travel business has again made good

progress, but the other ancillary sections of our shipping business are causing no little concern.

PROFIT AND DIVIDEND

The profit for the year, after providing for all expenses and taxation, amounts to £435,155, as compared with £667,541 for the previous year. This drop in profits was inevitable following the fall in wool prices; but, apart from 1951, this year's results are a record for the company.

We are recommending a final dividend of 6 per cent on the ordinary shares, which, with the interim dividend of 4 per cent paid in May, represents 10 per cent for the year, and we also recommend the payment of a bonus of 4 per cent on the ordinary shares, making a total distribution of 14 per cent. The ordinary shareholders' funds employed in the business amount to £5,585,670, on which figure the above distributions, after deduction of tax, only amount to 2 per cent for the year.

ALLIED BAKERIES

SUBSTANTIAL CONTRIBUTION TO NATIONAL ECONOMY

The seventeenth annual general meeting of Allied Bakeries, Limited, was held on November 21st, in London.

Mr W. Garfield Weston, the chairman, in the course of his speech, said: Total revenue at £4,516,000 is £666,000 above last year's figure, and net profit after depreciation is £623,000 up, at £3,666,000; both these increases are highly satisfactory in a period when the baking industry generally is experiencing falling profits, and speak highly of the regional directors and their teams who are responsible for this excellent showing. Our overseas companies have also contributed to these increased earnings.

We hear quite a lot today on the subject of the rising cost of living, and suggestions come from many quarters that profits are too high and contribute to the general rise in prices. So far as the baking industry generally is concerned and Allied Bakeries, Limited, in particular, nothing could be more fallacious. We are subject to rationing of most of our essential ingredients, the selling prices of many of our products are fixed or have a ceiling laid down by the Ministry of Food, our labour is well paid, and many of our major expenses are charged to us at prices available to everybody. How, then, can there be wide variations in earnings and apparently high profits in some sections of an industry? The answer is that under present-day competitive conditions (as opposed to monopolies) profits are a measure of efficiency.

Last year I touched on the subject of national taxation, and the moral obligation of industry to earn as much as possible to assist the country by its contribution to the National Exchequer. Whether we like it or not, we shall be faced for many years to come with huge budgets, and industry—directly and indirectly—is the largest contributor to the national needs. An efficient and prosperous national economy will be the payment of large sums in taxation make it possible to keep down personal taxation and help to lower the cost of living.

We of Allied Bakeries are proud of our contribution to the State needs—over £1 million this year; moreover, since the formation of the company, over 60 per cent of the group's earnings has been paid over to the Government in taxes.

It is a source of great satisfaction that we have consistently, each and every year, returned to the Government in taxes far more than we have received in subsidies.

The report was adopted.

ROOTES MOTORS, LIMITED

RECORD EXPORTS

LOWER PRICES—GREATER SALES—BETTER PRODUCTS

The annual general meeting of Rootes Motors, Limited, will be held on December 16th in London.

The products of the Rootes Group are Humber, Hillman and Sunbeam-Talbot cars and Commer, Karrier, Tilling-Stevens and Vulcan Commercial Vehicles.

The following is an extract from the statement circulated by the chairman, Sir William Rootes, KBE:

The accounts for the year ended July 31st last show the group trading profits at £3,425,697. These results show a slight fall when compared with the profits of last year at £3,473,873. Taxation absorbs £2,270,118 including £262,530 for Excess Profits Levy.

Referring to the question of taxation, Sir William Rootes said: No progressive business enterprise can reconcile itself to a state of affairs which demands that out of its earnings no less than 66 per cent has to be handed over in direct tax alone, apart from its many other burdens. Assuming the same level of profits and the continuation of the present levels of taxation, the tax appropriation next year would increase to 71 per cent. I am conscious of the necessity of providing the Exchequer with funds for major national issues such as rearmament and a sound social service, but I am not overstating the present trend when I say that, if current rates of taxation continue, industrial enterprise will lose vitality, and employment and national prosperity will decline.

Apart from the purely material side, there is also the human aspect. The country has loyally borne frustration and high taxation as the bitter fruits of war; the time has now come, however, when greater freedom and greater incentives are necessary if enterprise is to be allowed its proper scope.

GROUP'S OVERSEAS ACTIVITIES

I am glad to report that our export turnover for the last financial year was a record. This is a noteworthy achievement and, in spite of the now well-publicised restrictions in exports, I believe that the solid organisation and ground work on which our overseas business has been built will stand us in good stead in the more trying times ahead.

I feel I should refer particularly to the progress of our exports to Canada and the USA. These are relatively new markets for British vehicles. In spite of the many difficulties, we are making continuous progress and have every reason to believe we have a permanent future in that great North American Continent. Our industry holds the proud position of being the country's greatest individual exporter. There is hope of improved material supplies, and this will allow us to increase output.

The all-important problem that confronts us, our industry, and, indeed, the nation as a whole, is whether or not we can adjust ourselves to the highly competitive position that is becoming more and more evident both at home and overseas. This in short means making better and better products available at lower and lower prices to more and more people. The Government must show greater initiative in adapting itself to the new world conditions, which means that the nation cannot sell unless it buys. We have outlived the period of restrictive economy; it now undermines the foundations of our international trade.

SMITH'S STAMPING WORKS (COVENTRY), LIMITED

FULL ORDER BOOKS

The fifty-seventh annual general meeting of Smith's Stamping Works (Coventry), Limited, was held on November 24th at Birmingham, Mr J. F. Byrne (chairman) presiding.

The following is an extract from the chairman's circulated statement: It is with deep regret that I have to record the loss which the company has sustained since our last meeting in the death of Mr H. C. Aston.

The profit of the parent company of £94,817, compared with £53,698, and of the subsidiary company of £118,693, compared with £107,535. The subsidiary company has again paid a dividend of 10 per cent; including this, and after provision for taxation, the net profit of the parent company amounts to £60,966. As will be seen in the profit and loss accounts, the charge for income tax is reduced by tax on initial allowance on capital expenditure. These allowances ceased in April, 1952, and in future years the burden of the tax charge will be relatively higher. It will be noted that the balance of profits for the year has in both the parent and subsidiary company been transferred to general reserve.

DEMANDS EXCEED SUPPLY

During the year under review both your companies have had full order books, in spite of some reduction in the defence programme to which we were to have been large contributors, and at all times our customers' demands have exceeded our ability to fulfil them. This situation has been aggravated by continued shortage of steel, and the introduction of the steel authorisation scheme did little to relieve the position. In spite of the shortage of raw material, the trading results show an increase in profits at both companies; and with the national increase in steel production and the forecast of additional supplies of steel for drop forging purposes, we hope for an early return to the position of being able to supply the full requirements.

An increase in supplies of steel is vital to enable us to make full use of the steady replacement and expansion of our forging capacity at both works, which is in continuance of the policy to maintain our factories and equipment at the highest degree of efficiency. To this end, during the year £175,000 has been spent at both works in additions to fixed assets, and at the end of the year contracts placed for capital expenditure amounted to £227,000. Notwithstanding the high cost of capital equipment today, it is anticipated that further expansion of our capacity may still be necessary. We believe it is only in this way that we shall be able to assist our principal customers in meeting increasing competition.

ADDITIONS TO BOARD

During the year we were fortunate in having an addition to our board in the person of Mr H. B. T. Wilde. Mr Wilde has been associated with your company for many years and has an intimate knowledge of the financial accounts and is a most useful addition to your board.

During the year we also decided to invite Mr H. M. H. Fox, general manager of our subsidiary, to join the board of that company. Mr Fox has been responsible for many of the improvements at our Lincoln works, and his knowledge and guidance will be of great value.

The report was adopted and a dividend of 12½ per cent on the ordinary stock approved.

PETER BROTHERHOOD LIMITED

ORDER BOOK OF HIGH LEVEL

The forty-fifth ordinary general meeting of Peter Brotherhood Limited was held on November 24th, in London, Mr A. M. Neal, JP, ACGI, AMICE (chairman of the company), presiding.

The chairman, in the course of his speech, said: The total of current liabilities amounts to £434,711, against a total of current assets on the other side of £1,394,941—a surplus of current assets over current liabilities of £960,230 which, it will be agreed, reveals a very satisfactory position.

The value of our sales for the year has decreased by some 17 per cent, resulting in a reduction in net profits, before providing for taxation, from £340,942 last year to £268,022. The decrease in the sales during the period is more than offset by the increase in the value of the work in progress in our shops, amounting to the sum of £340,856.

Of this trading profit of £268,022, provision for taxation absorbs no less than £157,000, leaving us with a net profit for the year of £111,022. Provisions for taxation made previously, but now no longer required, amount to £30,000, bringing the total of available net profit to £141,022, which is within £2,270 of last year's figure.

DIVIDEND RECOMMENDATION

Your board have decided, in view of the promise made last year that the underpayment due to the limitation of dividends at that time should be redressed this year, to pay an extra 4 per cent, less tax, in respect of last year. The board also feel fully justified in recommending a final dividend of 16 per cent, less tax, making a total of 28 per cent, less tax, 4 per cent, less tax, of which is in respect of last year.

After the payment of this final dividend, a balance of £110,533 remains to be dealt with. Bearing in mind the necessity of keeping our means of production in a high state of efficiency we recommend the allocation of £78,806 to fixed asset replacement, increasing this fund to £250,000; the placing of £29,074 to general reserve which, with £15,000 transferred from contingencies reserve, increases the general reserve to £275,000 and the addition of the balance of £2,653 to carry-forward, increasing this item to £169,630.

The considerable balances under general reserve, under reserve for replacement of fixed assets and to the credit of profit and loss account, totalling £694,630, are in daily use in the business as extra capital without which it would be impossible to finance the large volume of work in hand.

The question of these reserves has received the consideration of your board who, in order to bring the issued share capital more into line with the capital employed in the business, have decided to apply to the Capital Issues Committee for permission to capitalise a portion of these reserves by the issue of existing ordinary shareholders of one new ordinary share for each existing share held.

On receipt of the necessary permission we propose to invite the shareholders to meet us again in order that we may be given the necessary authority for the increase in the authorised capital of the company.

As to the future, our order book remains at a high level which should ensure a continuity of work for a considerable time. In the absence of unforeseen difficulties, therefore, we see no reason why a continuance of prosperity should not be enjoyed.

The report and accounts were adopted.

NORTH BRITISH RAYON A DIFFICULT YEAR

The twenty-fourth ordinary general meeting of North British Rayon, Limited, was held on November 27th in London, Mr Ernest Walls (the Chairman) presiding.

The following is an extract from his circulated address:

The year under review, which ended June 30, 1952, falls into two very different portions. In the first half-year demand for rayon yarn exceeded available supply, in the latter half-year demand fell to a very low level.

The main cause of the decline in the later period was the world-wide fall in demand for textiles to which the designation "recession" has been applied but for which "slump" would be a more appropriate term. The textile slump was not only world-wide but also it affected all the fibres, whether natural or fabricated, which form the raw material of the textile industry.

STOCKS POSITION

At December 31, 1951, we had no more than a working stock of rayon with full order books, but from January onwards, even at reduced output, stocks rose steadily right up to June 30th. From that date we reduced output drastically; also more recently orders have been received at a larger rate, so that we can now look forward with some assurance to a progressive reduction in the stocks as the weeks and months go by, for it is hardly reasonable to suppose that the severe situation of the earlier months can possibly represent a permanent state of affairs in the textile industry. If it does, that industry, in the past our great pride, is doomed to near extinction.

As a result we hold a large stock of rayon yarn produced during January-June of this year at an economic cost and which, when sold at current prices should show a reasonable profit, but these profits will have to be averaged with the production after July 1st, which, owing to the low rate of output, shows a considerable loss per lb at current selling prices. When the market situation enables us to increase output rate to the economic level the loss on new output will cease, and if this improvement develops soon enough we shall have an average but reduced rate of profit for the current year. We can only hope that, as in 1951-52 an unsatisfactory second half-year followed six months of satisfactory trading, the position in 1952-53 will be reversed. The steadiness of price of artificial fibres has been one of the reasons for thinking that as the general situation improves rayon yarn will be one of the first to reap the benefit. Rayon is still the cheapest of all textile fibres, and the domestic price of British-made rayon is lower than that in any other country in the Western world.

We have, in common with other rayon producers, gone through a difficult time and are still doing so. None the less we were able to show a trading profit which I hope you will consider not unsatisfactory in all the circumstances. I may add that we made a profit in each quarter of the trading year.

Although it is early days to arrive at definite conclusions it would seem from current statistics and reports that we have recently passed the worst and, if so, our main objective must now be, by every means in our power, to get back to a reasonably normal level of production. This level can hardly be as high as the recent peak and it is not going to be reached quickly or without hard work and effort on the part of all concerned.

The report and accounts were adopted and the final dividend of 6 per cent (making 8½ per cent for the year) approved.

STAVELEY COAL AND IRON COMPANY, LIMITED

INCOME INCREASE OFFSET BY TAXATION

The eighty-ninth annual general meeting of this company was held on November 25th at Sheffield, Mr Thomas A. McKenna, chairman and managing director, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to June 30, 1952:

It is the intention of your directors to give most serious consideration, when the Act to denationalise the iron and steel industry has been passed, to the desirability of repurchasing the Iron and Chemical Company, which for 89 years has been the heart of the business, and which showed earnings in its last published accounts at a rate in excess of £900,000 a year. The timing depends upon Parliament, but it appears probable that no final decision on this matter can be made for a least a year from now. Your directors consider that until this major problem has been resolved it would be unwise to make any capital distribution to stockholders. In the meantime, therefore, the large capital sum arising from the sale of the Iron and Steel Compensation stock has been invested in short-dated Government securities. This should maintain its capital value but will of course result in a substantial reduction of income.

BOARD'S POLICY

Should your directors eventually decide that the repurchase of the Iron and Chemical Company is undesirable or impracticable, they will adhere to the policy outlined last year and will consider the question of some capital distribution to stockholders in so far as this may be practicable under the financial legislation then prevailing and having due regard to the taxation liability such a procedure may entail.

Your board also propose to use some of the capital funds to extend, where prudently and profitably possible, the holding company's interests in those fields of activity in which the Staveley organisation had acquired experience during the course of its long history and in which the knowledge could be constructively used.

The total income of the group has risen from £822,479 last year to £1,141,077 this year, but this increase is almost entirely offset by the increased charge for taxation due largely to a higher proportion of the dividend being paid out of current earnings. It will be seen that this year taxation absorbs no less than £740,954, equivalent to 65 per cent of our total group earnings.

TAXATION DANGER

If the industry of this country is to be in a position to meet the increasingly competitive days which lie ahead, it is essential that plant and equipment be continually improved and kept up to date, but with taxation at its present level this task is well nigh impossible. Indeed, it is difficult to see how any industry can continue to prosper unless there is some relief from the present penal rates of taxation which, if continued, must ultimately seriously endanger the source from which spring the profits on which tax is levied.

An 8½ per cent interim dividend was paid in March last and your directors recommend a final dividend of 14 per cent, making a gross rate for the year of 22½ per cent. The total capital invested in the group is £13,654,377. The distributions to stockholders of £399,896 therefore represents no more than a net return of 2.9 per cent on the capital invested.

The report was adopted.

SOBRANIE LIMITED

The fourteenth annual general meeting of Sobranie Limited was held on November 21st in London, Mr I. Redstone (chairman and managing director) presiding.

The following is an extract from his circulated address:

We have been confronted with a succession of circumstances which, all things considered, make the present accounts with their reduced profit a creditable achievement.

The factors which have operated to our detriment are principally two. First, the general trade recession. We have encountered a decrease in spending power which is bound to have an early reaction on the pleasures and comforts of existence in advance of any reduction in the essentials and necessities.

The second of the factors that has caused us grave damage is, of course, the closing or curtailment of many export markets. We know how large the demand is for our products and I have no doubt that once we are permitted to introduce them into the markets which are now closed to us, there will again be steady and substantial sales.

Our Sobranie Straight Cut cigarettes which were introduced last year are selling satisfactorily and will, I sincerely trust, go from strength to strength as their exceptional value is realised by the discriminating consumer. We are on the point of introducing into the market a new "cocktail" cigarette intended for special occasions and packed and boxed in a most colourful and luxurious fashion. I mention these matters as an indication of our unceasing regard for the possibilities of our trade; coupled with the traditional caution and conservatism which many years of experience have taught us is indispensable to safeguard our old-established trading name.

The report was adopted.

JOHN I. THORNYCROFT AND COMPANY, LIMITED

SATISFACTORY RESULTS

The fifty-first annual general meeting of John I. Thornycroft and Co., Ltd., was held on November 26th in London.

Sir John E. Thornycroft, KBE (governing director and chairman), said that the Tory and Socialist political parties must be told in definite terms by industry that if the iron and steel industry and the transport industry were to be the playthings of politicians, neither party could expect exports of the type of engineering products being made by their companies. The immediate necessity was long-term stability to allow of a consistent forward policy. The country's survival was at stake. That meant their standard of living and security.

During the year delays in supply of steel and other materials had caused serious hold-ups to production of ships and vehicles. In fact, the Southampton Shipyard had not delivered a single new vessel over 40 tons during the company's year to July 31, 1952, which explained the fall in trading balance for the year.

Despite all the frustrations and difficulties experienced during the year, by hard work and patience reasonably satisfactory results had been achieved, although output had not been such as he would liked to have seen. Estimated delivery dates had not been kept, which in the export market meant loss of goodwill and sales resistance to new orders. Orders in hand were sufficient to keep all sections busy for at least twelve months.

The report was adopted.

MODDERFONTEIN EAST, LIMITED

MR P. H. ANDERSON ON LABOUR SHORTAGE

At the thirty-sixth annual general meeting of shareholders held in Johannesburg on November 19th, Mr P. H. Anderson, the chairman, said the average number of non-Europeans in the service of the company over the last three financial years has been 5,451, 5,250 and 5,195, and the position has deteriorated from a peak of 5,700 in May, 1950, to 4,912 last month. This general falling off in the labour supply has been the main factor in the decrease of just under 50,000 tons per annum in the tonnage milled for the past two years.

INCREASED COSTS

As far as the increase in costs of production is concerned, these have risen steadily since devaluation, the figures for Modderfontein East over the last three financial years being 19s. 6d., 21s. 9d. and 24s. 6d. per ton milled, giving increases of 2s. 3d. and 2s. 9d. per annum. There is, however, some encouragement, in that for the first quarter of the current financial year costs have averaged 24s. 9d., or only 1s. 5d. per ton more than the average for the same quarter in the previous year. It would appear, therefore, that the rate of increase in costs is slowing down.

As I mentioned in my address about two years ago, the grade of ore mined is steadily decreasing as the workings progress away from the higher grade and more consistently payable ground in the South-western portion of the mine into areas of lower grade scattered payability. Taking into account the steady rise in pay limit due to increasing costs, there is therefore a progressive closing of the margin between the pay limit and the value of the ore mined. Apart from the diminishing latitude in grade control, mining conditions are becoming more difficult, in that as operations have advanced northwards and eastwards into these patchy areas the workings have become more scattered and the long stope faces that were one of the chief characteristics of the mine are gradually disappearing.

DEVELOPMENT OPERATIONS

In the new lease area satisfactory progress has been made in the northern portion of the old Klipfontein Corridor where some relatively small blocks of payable ore have been added to reserves in each of the last two years. Advance workings on the 11th Level are now approaching a fault which is known from boreholes drilled in the area to have displaced the reef laterally by about 1000 feet. In view of the consistently negative results of boreholes on the other side of this fault the considerable amount of cross-cutting required to pick up the reef horizon again would not be warranted. Work in this northern part of the Corridor will therefore have to be confined to probing the area up to the line of the fault in order to locate any further patches of payable ore. In the

southern portion of the new lease area adjoining the Holfontein and Welgedacht properties progress has been slow due to the fact that reef in this area lies above the East Rand sill. A relatively large amount of off reef development has therefore been necessary. Results to date have not been encouraging, but the workings have not yet reached the probable position of any continuation of the pay shoot located in the Holfontein property—if any such continuation exists.

The report and accounts were adopted.

HARMONY GOLD MINING COMPANY, LIMITED

The second annual general meeting of shareholders was held in Johannesburg on November 21, 1952.

Mr G. V. Richdale, chairman, presided and said: Gentlemen, sinking conditions at No. 3 shaft, which has now reached a depth of 4,050 feet, have become increasingly difficult since June 30th owing to faulting and the intersection of water-bearing fissures. Between July 1st and September 30th no less than 73 per cent of the total time available was absorbed in the treatment of ground by advance cementation. The estimated depth of the Basal reef in this shaft is 4,910 feet and it is now likely that it will be intersected early in the second quarter of next year. The final depth of the shaft will be approximately 5,340 feet.

The ventilation shaft intersected the Basal reef early in July at a depth of 4,364 feet and the results of sampling are contained in my statement attached to the annual report. The shaft has now been sunk to its final depth of 4,730 feet and stations and ore passes have been cut. The bottom of the shaft is at present being equipped to facilitate hoisting, and a haulage level to No. 3 shaft will be started shortly. The Basal reef should be intersected in this crosscut during February, 1953, and development on reef will then commence. It is hoped that the crosscut to No. 3 shaft will hole through early in 1954.

ENCOURAGING RESULTS

A new borehole LR8 has been drilled to determine the nature of the strata in the area where a second hoisting shaft may be sunk in due course. This borehole intersected the Basal reef at 5,044 feet, and in spite of some loss of core due to grinding, the assay results of the original intersection and three deflections averaged 1,671 inch-dwts. I think you will agree that this further confirmation of the results obtained previously is most encouraging. Your board has great faith in the future of Harmony and developments during the last year have strengthened our belief that it is going to be one of the richest mines in the new Orange Free State goldfield. Work on the surface is progressing satisfactorily, and permanent accommodation for Europeans and natives is being extended rapidly. Eighty-one additional housing units for Europeans are in process of erection in the Harmony suburb of the proposed Virginia township, while the extension of the

native hostel by 10 rooms, each to accommodate 14 natives, has been completed, and work has commenced on the construction of 10 more rooms. The excavations and foundations for the first 45,000 ton unit of the reduction plant have been started and the erection of the brown tanks is progressing. Work on the plant will be pressed forward steadily with the object of completing it during the first half of 1954 so that, given favourable conditions, milling may commence in the latter part of that year.

PROVISION OF FURTHER FINANCE

The progress of work on your company's property, and consequently the rate of expenditure, are governed to a large extent by deliveries of equipment and material and by the performance of outside contractors. It is therefore difficult to forecast with any degree of accuracy how long our present funds will last. The net cash on hand at October 31, 1952, was £2,130,697 and it is expected that this amount will be sufficient to finance operations into the second half of next year. Thereafter, as I have said in my statement, it will be necessary to make further financial arrangements to bring the mine to the production stage. These matters are now under consideration and you will be informed in due course of the proposals which your board has to make in this regard. While market conditions here and overseas are not at present favourable for raising large amounts of capital for new mining ventures in South Africa, I am nevertheless confident that we shall be able to obtain, without serious difficulty, such further sums as may be necessary to enable your mine to reach the production stage.

When the time comes to raise the third tranche of capital for Harmony, several thousand feet of development on the Basal Reef horizon should have been completed and we should have a good indication of the values and percentage payability likely to be obtained in the neighbourhood of the ventilation shaft, where mining operations will be concentrated during the early years of production. In view of the very satisfactory values so far obtained in the many boreholes which have been sunk on and around the Harmony lease area and in the ventilation shaft it is reasonable to hope that the footage to be developed on reef next year will also give encouraging results. Your board has every confidence that these hopes will be justified, in which case the problem of finding further finance for the company will resolve itself largely into a decision regarding the manner in which the necessary funds can be obtained to the best advantage of shareholders. To bring to production a large deep-level mine, such as Harmony will be, is a lengthy and very costly undertaking, calling for faith and great patience. These qualities have been shown in a marked degree by shareholders in Harmony, particularly by those of you who acquired your interest in the early days when the Sand River area of the new goldfield was only partially proved by a few boreholes. In these circumstances it is gratifying to know that your faith and patience are likely to be rewarded in a few years' time in a manner which will, I believe, be commensurate with the risk you have taken.

The report and accounts were adopted.

The Claws of the Dove

SOMETIMES history imitates art in a grotesque and terrifying manner. In that wistful city of Prague where Kafka wrote "The Trial," there ended last week a travesty of justice more bestial and absurd than any ever conjured up by a novelist. Revolutionary leaders and Czech Communists whose lives had passed between underground and barricade, men who had survived Nazi torture camps, rose before the judges of the people's courts to plead for their own death. Incredible though it may seem, wives wrote letters to the august court demanding the execution of their husbands, and sons testified against their fathers with the implacable gravity of children playing a lunatic game. One of the sons of the accused, Thomas Frejka, wrote asking that his father "a creature who no longer deserves to be called a man" should be executed. The boy's letter closes on an ultimate note of horror: "I ask that this letter be shown to my father and that, if possible, I may be given an opportunity to tell him personally what I have written in it."

The mechanics of it all had been perfected fifteen years ago during the great Moscow purge trials: the prosecutor screaming out against the accused, the defending lawyers asking the court to forgive their temerity in undertaking the case, and the condemned pouring out their confessions in toneless abjection. No moment, perhaps, was more terrible than on the last day, when the presiding judge asked whether the defendants wished to appeal. As one, the eleven doomed men rose and demanded that no appeal be allowed and that the sentence of hanging be carried out at once. Their demand was fulfilled two days ago. The Communist secret police has boasted that a man can be made to do anything after three weeks without sleep; apparently he can even be kept wakeful enough to bring down the curtain on his own life. Stress has rightly been laid on the fact that eleven out of the fourteen men on trial were Jews. The word "Jew" followed their names as the clerk of the court droned out the death sentences. Now from Czechoslovakia, in the last days, come reports of Jews and Jewish families committing suicide to forestall the anti-semitic hatred and persecution which seem to be inevitable adjuncts of modern totalitarianism. It is doubly disturbing that this should happen in Prague, where Jews have long been in the forefront of radical thought and politics, and where the Jewish population suffered so deeply under Nazism. Various motives are being assigned to the anti-semitism of this blood-trial, which may soon be followed by that of other Jewish leaders, such as Anna Pauker in Rumania.

No doubt the Communists are wooing the Arab states; moreover, the Jews in the satellite countries have kept up a measure of contact with the West. But the real motives behind this judicial farce are of a more fundamental nature. As long as revolutions are in the dynamic, fluid and creative state, gifts of the mind are prized and fearlessness of spirit is a prime weapon. But when the revolutionary state has become the monolith of totalitarianism, when the bureaucrats and the

MANAGING DIRECTOR required for old-established high-class Huddersfield worsted/woollen manufacturers. Highest qualifications required, particularly in sales. Attractive remuneration. Applications will be dealt with in strict confidence at director level and should be addressed to the Chairman, Box 123.

BUSINESS EXECUTIVE, specialised departmental co-ordination, accustomed dealing range administrative, economic, personnel problems simultaneously, seeks Assistantship to Managing Director or similar executive post. Scot. 36 years, Hons. degree Economics, knowledge Law, Accounting, 12 years' business administrative experience. Residence India, East Africa on business, practical experience international trade, Familiar Government Department, trade union negotiations.—Box 122.

EXPERIENCED Market-Research Executive, Graduate Statistician (M.A. Oxon) seeks appointment in manufacturing concern. Four-figure salary.—Box 119.

political bosses consolidate their power by exerting utter brutality and exacting unquestioning obedience, the free-ranging mind becomes a seed of peril. Revolutions devour their own children or the leaders which gave birth to them; they have to murder their Girondists, their Radeks and their Trotskys. Again and again, the Jews in Eastern Europe have maintained the heritage of rebellion out of which Communism springs; but now the Marxist paradise has been established and those that have tasted of the fruit of knowledge and freedom must perish. Slansky and Clementis are being murdered by the very party which they helped bring to power.

The story is more appalling than that of Rajk or Kostov because it took place in a cultured modern city, within short range of Western Europe and amid a population familiar with democratic processes and ways of thinking. The Moscow purges and the mass-trials and judicial murders in China profoundly disturbed the West, but the ordeal has now come closer. What can now remain of western hopes of Titoism supposedly latent in the satellite countries? Russian soldiery are not patrolling the streets of Prague, yet this trial took place without the slightest symptom of resistance and in that kind of unreal silence and acceptance which Kafka so often described. Moscow can be proud of its junior disciples.

*

At the very moment when the Communists are completing yet another stage in their assassination of the mind, a Communist-sponsored Peace Congress is being assembled in Vienna. At the very moment when any sparks of intellectual restlessness and questioning are being stamped out in the Soviet empire, the Communists are drawing to Vienna a formidable galaxy of talent and intellect. The measure of their success has been particularly noticeable in France, where men such as Sartre and Domenach, the editor of the Catholic *Esprit*, have given their adherence to the Vienna platform. That Paul Robeson should record "peace" melodies for this Congress or that Picasso's dove should be its symbol is no longer astonishing; but that non-Communist artists and intellectuals from the West should fall into the trap cannot be dismissed as a mere sign of artistic naïveté or philosophic confusion. What is happening is both monstrous and simple: the Communists, even while they are killing free minds in those countries which have already fallen under their sway, are eager to use every-

where else the capacity of free minds for criticism and doubt. What would condemn a man to the gallows in Prague or Warsaw may ensure him an honoured place on the peace platforms of the Communist united fronts in Paris or Rome. It is the supreme gesture of contempt of the commissar for the intellectual.

The Communists have nearly succeeded in pilfering the word "peace" out of the vocabulary of reason. The Vienna Congress represents their most thorough attempt to corrupt the words "intellectual" and "liberal" into the shoddy counters of propaganda. In some degree, that is the West's own fault, for the counter-attack of the free mind has been too feeble. The liberal imagination is attempting to fight conspiracy and the degradation of man with doubt and self-scrutiny. Yeats's famous words—"the best lack all conviction and the worst are full of passionate intensity"—are still true of some intellectual and artistic circles in the West. Such, moreover, is the skill and experience of Communism in its seduction of the mind, in its exploitation of any symptoms of confusion and fear, that some gratitude can be felt when the full hypocrisy and callousness of the enemy is revealed by this close juxtaposition of the Prague trial and the Vienna Congress.

No one is arguing that M. Sartre or M. Picasso should be prevented from going to Vienna, or denying that a certain measure of suspended judgment and confusion are normal adjuncts to a creative artistic mind. The fundamental question is about the use that an honest man should make of such a trip. Will any among these intellectuals and artists dare ask their Communist hosts precisely what has happened in Prague? Will any of them use their intellectual eminence to speak openly about the extent of freedom prevailing in the West? If one man were to raise a doubt and persist in it up to the point where he is thrown out of the meeting—then the Vienna Congress would have been worth holding. The spell would have been broken.

The non-Communists who are planning to attend the rally must be clearly aware of what they are doing. In lending their names to a roll of dupes, in remaining silent during what will prove to be a carnival of lies, they are hastening the day when the assassins of the mind will attempt to operate in the West, as they have already tried to do in France. As these poets and artists happily fraternise with the North Korean people's choir and the union of Uzbekistan dramatists, let them remember how near they are to Prague. The Communist dove of peace has blood on its claws.

Cortisone for Politics

CONSTITUTIONAL reform is coming back into discussion. First, the Government may be forced to shift its ideas for improving the composition of the House of Lords from the cold store to the incubator. Lord Simon is introducing a Bill that would restore the Queen's prerogative to create life peers, in addition to the law lords; and the effect should be at least that both the main parties have to redefine their views on the second chamber of Parliament.

Secondly, and potentially more important, Mr Churchill has agreed to meet a deputation from the Liberal party that will urge on him the case for some kind of reform of the electoral system. The Prime Minister has in the past shown his personal sympathy, at any rate with the motives for such proposals. He could perform no greater further service to British democracy than to force his reluctant party to reconsider them. For on any objective interpretation, government by a narrow Conservative majority has confirmed the experience of government by a narrow Labour majority. A little more of this sort of thing will bring parliamentary institutions into a disrepute that might weaken the whole foundations of democracy.

The source of the danger requires careful definition. It is not the growing bitterness of the party conflict; present-day politics are still demure by comparison with many periods when the state of democracy was healthy enough. Nor does the danger lie directly in the irresponsibility of Labour opposition, nor even in that party's preoccupation with an internal struggle for power at the expense of policy-making. The basic trouble is that the party battle is sterile. The electorate's narrow choice between the parties reflects a real uncertainty about their policies. Most of the argument between them rings unusually false.

This is most apparent in the tussles about steel and transport. There is room for argument about which side has the better, or the less bad, scheme for those industries. There can be only one opinion about the outcome of their political battle, with one side undoing the legislation of the other and the other stoutly declaring its intention of re-doing it. This must be bad, and no one except the blindest zealot can think that either party is so right in its views that it is justified, on grounds of the national interest, in refusing to budge from its present stand. Plainly the result will be a morass worse than either nationalisation or denationalisation, unless someone gives way somewhere. The extreme arguments used by both parties are wholly artificial to the public ear; they are also stale, for neither party has much to add to what it has been saying about transport and steel nationalisation for five years.

The two major measures of the session have thus been received with scepticism and indifference. Their passage through Parliament has become, both for politicians and public, less a debate than a battle about procedure. The immediate responsibility for this lies with the Opposition, whose members have little to offer in justification except a plea that, since the Government's disciplined body of supporters will not be moved by argument, delay is the only parliamentary tactic available. This is nonsense. It is a long time since party loyalties were so lax that a government might be brought down by argument. The purpose of parliamentary debate is

not, in most matters, to change immediate government policy. It is to influence public opinion for or against the government, with an eye to the next general election. Admittedly, the tactics of procedure as well as the logic of argument have always played a part in this process. But at present procedure is playing too large a part, for two reasons. Both parties are stale in argument. And, secondly, the narrowness of the Government's majority both makes procedure particularly important and exposes the skeleton of party discipline to public gaze; the fist of the party bosses can be gloved when their majority is secure, but the iron flashes when it is insecure. The gross effect is to reduce politics to a drill-ground manoeuvre. What initiative there is lies not with men who will raise principles or argue policies; it lies with privateering lawyers like Mr Bing. Such real discussion as takes place is debate not between the parties but within the parties. Inside the Labour party, it is the general debate keyed to a crude struggle for power; inside the Conservative party, it is specific debate on subjects like transport—debate in which party calculations play too large a part and suspicious prominence is given to special interests. Public opinion can have little influence on these internal debates, and as a result Parliament fails to fulfil its primary purpose.

*

This is the arthritic state of British democracy. The only cortisone that offers itself is the one that the Liberals are to urge on Mr Churchill. They, admittedly, will suggest in the first instance proportional representation, which is probably bad in principle and which certainly cannot be attractive to the two main parties. But a lesser measure of electoral reform would satisfy the Liberals and is practicable. The case for the simplest reform—the alternative vote—was stated in these columns on July 12th, and can be quickly summarised. The purpose of the alternative vote is not to convert the British political system, as it has existed in the past and with all the traditional virtues for which it is extolled, into something utterly different; the purpose is to save that system from death by ossification. In the past—with a smaller electorate and greater geographical diversity, with a government in London impinging relatively little on everyday life—the electorate, given the chance, would have been inclined to vote for a variety of policies instead of registering a clear decision for or against a government; the discipline of the single, non-transferable vote, forcing politics towards a two-party mould, was the necessary counter-force to secure effective government. Enough diversity survived: party organisation was loose and some independent members could hold a place.

Now the tide is the other way, and the institutions have to be reversed in order to exert the same balancing effect. A mass electorate, swayed by modern techniques of propaganda, and conscious of the growth of state activity to the point at which it exerts an intimate and obvious influence on the life of every individual, is now only too inclined to vote for or against a government rather than for particular policies. In these circumstances the effect of the strict two-party mould is to make the parties rigid and remote. The elector can exercise only a general choice between alternatives too vaguely defined to give

his decision real meaning. The concrete party policies come about by processes exempting him from both knowledge and influence. He does not even have such concern in party affairs as the primary elections provide in the United States. He chooses simply between Mr Attlee (not certain whether that implies Mr Bevan or not) and Mr Churchill.

The case for the alternative vote is that it would make policies more important in politics without disrupting the two-party system, as full proportional representation admittedly might do. It would provide the elector in the middle with an opportunity, which he now lacks, to show that in leaning to one side or the other he is not voting for extreme party measures. He would do this by voting Liberal as his first preference and for one of the main parties as his second preference. He would have a means of saying, for example, "I am disappointed with the Tories and now prefer Mr Attlee, but I don't want a full-blooded Bevanite policy." That is an example of a political attitude far too common to go unexpressed at the polls, as it is now. The possibility of its expression would force the two major parties to take more trouble to win moderate opinion, to attract the second preferences of Liberal voters, and so strengthen the public's influence on policy-making instead of leaving it at the mercy of the party zealots on both sides. The effect would be, in short, to restore the traditional virtues of the two-party system as it existed when party organisation was a little less rigid. The alternative vote is an electoral reform only in the sense that it is an adaptation to changed circumstances; it is in the strict sense a measure of conservation.

Why, then, do most Conservatives dislike it so much? Their case does not appear to rest on principle. The common argument is that if electoral reform is refused the Liberal party is bound to die at last, and the majority of its surviving supporters will then shift to Conservatism. That is a rash assumption. But even if it is true, does

it offer the Conservatives as much as they might gain by the survival of a party in the middle? The evidence of the last general election is that very few Liberals at present abstain from voting; where they must, they exercise their reluctant choice between the two main parties. If this is true, the alternative vote, and the consequent intervention of Liberals, will never affect which of the two main parties wins a seat. It will not give Labour a seat that under the present system the Conservatives would win, or *vice versa*. It will change the composition of the House of Commons, in addition to the policies of the parties, only to the extent that it actually increases Liberal representation. Immediately, that seems unlikely. But even if it is likely, are the Conservatives so lacking in confidence as to think that the Liberals would capture their seats rather than Labour seats?

It is true, of course, that when opinion was swinging to the Left, the Conservatives might lose more seats—to Labour and Liberal combined—than they would lose now. But Labour would also gain fewer seats; and its majority over all other parties in the House would be smaller, not greater, than it would get under the present system. With a swing to the Right, the reverse process would work. It is difficult to believe that on balance the Conservatives would lose much even of the cruder fruits of party politics. It is quite certain that the causes that the modern Conservative cherishes could not fail to benefit from the greater moderation that the alternative vote would induce in his opponents.

These are not, it must be confessed, simple issues. At this stage, Mr Churchill probably cannot do more, when he answers the Liberals, than suggest an inquiry into electoral reform. But it should not be an inquiry designed to shelve action. Each day shows more clearly that British politics is approaching a sterility from which nothing but electoral reform is likely to rescue it.

Neguib against Odds

AFTER four months of ruling Egypt, General Mohammed Neguib looks and is a tired man. The dimensions of the job that confronts him are enough to warrant weariness. When he came to power, most Egyptians seemed glad that an honest man with a sense of purpose was ready to tell them what to do. Since then he has proved intelligent as well as honest. Yet, as the months go by, time is revealing how great are the odds against which he is working—the heaviest being the dreadful economic legacy left by his predecessor the Wafd, and the eternal difficulty of meeting population pressure in a country with its cultivable land already overcrowded. The moment has come to weigh his chances of proving to Egypt that he is beneficent and deserves to be given time to carry on.

Only a man of great physical strength could work as he has worked in the last four months. He now needs a rest, if only for a few days, from the cacophony of clashing detail that obscures the main theme of his revolution. The movement which he leads was always in danger of confusion because it lacked at the outset a coherent philosophy. Its aim was national salvation. Its method was generalised and empirical. The execution of the plan was, therefore, at the mercy of minds which read the

immediate future in different ways; today, no one can be certain that all his followers are in sympathy with the dominant theme. General Neguib turns out to be a man who sees this. If his original vision was idealistic, it was qualified by his awareness that the army which was the weapon of reform was itself the nation in miniature, lifted for a moment above the people's weariness and despair by a limited purpose. Beyond the dismissal of the King and the dispersal of the old-gang politicians, there lay only an over-simplified pattern of social and political regeneration. To convert such ideas into workable decrees and laws is a test of ability, and this test comes at a time when General Neguib, and possibly some of his officers who share his realism, are wearied simply by the daily round.

There is little to show for four months of "the blessed movement." Some prices are down, but the economic situation is worse. The Anglo-Egyptian question shows signs of lapsing into a bog of detail. A fickle public is becoming tired of virtue and an influential section is yearning for the good old bad days when politics were less hazardous and more rewarding. The press, which formed a partnership with the old political regime and profited by it, is sufficiently free of control to counter-

attack. Army censors are not well-enough versed in newspaper subtleties to see, until too late, the *double-entendre* which spreads rumours. Economic difficulties, for example, are deftly underlined by assurances that they can be overcome. The reliance on civilian ministers has produced a schizophrenia in government, with some members of the Cabinet as extreme and unrealistic as any of their discredited forerunners. There are officers who support them.

These elements in combination support sections of the press which cultivate an extremism which conflicts with the original realism of the army movement. By raising such issues as republicanism and preaching a leftist economic policy which the country cannot afford, they disturb confidence; they also tend to push General Neguib into a rigid and narrow nationalism which, despite his honesty of purpose, would put him into a position as difficult as that of the old regime. Already there are signs of this. When the Egyptian Ambassador in Washington said that Egypt might join a Middle East defence plan, his statement was censored and did not reach the Egyptian papers. The negotiations on the Sudan have been made more difficult by a declaration in advance that Egypt insisted on "every word" of the agreement. Such actions smack of the old days.

Inside Egypt relief from pressure may well be too much to hope for. Inevitably the army's attack on political and other vested interests has made enemies for Neguib, and these are reinforced by disillusioned ignorance which expected miracles overnight. To take the single example of land reform, which is sometimes said to be "the only issue that unites all Neguib's supporters." Land reform has been talked about but postponed for decades on the pretext either that more study was necessary, or that it would upset production, or that there would not be enough land to go round—so best not try. Now it is to be undertaken forthwith, but on a prudent and fairly manageable scale that will be spread over five years, that will affect only 2,000 land-owners and that will re-allocate only 10 per cent of Egypt's cultivable land. In a country that is ignorant and impatient, so prudent a scheme is bound to occasion more blame than praise.

In other fields the chances of spectacular improvement are equally flimsy. The Wafd had squandered the fruits of profitable cotton seasons; the army, therefore, took over without sterling in its coffers and with a slack world demand for cotton to prevent its earning any. Lack of sterling (and other foreign currencies) compelled the Finance Minister to restrict imports, and, with fewer

imports, there is less of the customs revenue which should provide about 40 per cent of the budgetary income. Egyptians tend to cite current foreign failure to buy their cotton as the main source of their economic plight, but the figures for the first fourteen weeks of the season show that they sold 71,000 bales, as against 73,000 in the same period of 1951 and 81,000 in that of 1950. They cannot expect annually to achieve the bumper sales of 1949; India as well as the United Kingdom tends to be a variable buyer. The main difference between this year and previous years is that they have sold far less than usual to the chief buyers who pay in sterling.

Failure to produce quick change at home would be mitigated if the regime were able to show some spectacular result for its foreign policy. But here also the yield is negligible. The United States has paid public tribute to the movement's aims and has sent experts; but it had played middle-man to Egypt and Britain for both Nahas and Sirry, so that its good opinion was at a discount; and "experts" lie thick on the ground in the Middle East. Meanwhile Egypt, including the Army Committee, is convinced—no doubt wrongly—that the United States High Commissioner in Bonn ensured the Israeli reparations agreement by twisting Dr Adenauer's arm. Britain's behaviour, on the other hand, is improving but only tardily. The minor assistance with arms that it gave to the Egyptian air force and army seemed to the officers to be qualified by so many "conditions" that they felt their good intentions were on trial before a suspicious judge. Britain's release of £5 million sterling as an advance on the 1953 release from Egypt's sterling balances held in London helped the country towards the new cotton season, but did not restore its accustomed sterling position and so was thought meagre. ("After all, the money in London is ours.") At about this stage, Neguib became a realist on the Sudan issue and, after seeing some leading Sudanese, produced his proposals. But when these showed the Foreign Office and the Sudan Government that he had become a realist on Egypt's behalf, lawyers were put to work on the text, and telegrams shuffled around the Cairo-Khartoum-London triangle. Neither the principle nor the broad outline of his plan received prompt acceptance.

It is time for the western powers and Egypt to take stock. The army movement was launched against a reactionary ruling class whose misgovernment was bringing dishonour and disaster to the country. Egypt is important to the western powers; and the army move-

ment is important to Egypt. Ahead there lies the danger of reaction or of an equally inept leftism, the fires of which are diligently stoked by the Soviet Union. In Iraq there is new evidence of the use to which Communism can put the irrationality of nationalist leftism. The urban Middle East, whether conservative or radical, is essentially nihilistic. Into this vacuum of belief and thought there move organised subversive elements, not seeking power—which is, as yet, beyond their reach—but aiming at a state of chaos which will make their accession to power ultimately possible. Pseudo-Communist newspapers in Egypt increased their circulations from about 20,000 to 150,000 between the winter of 1951 and the abrogation of the Anglo-Egyptian Treaty in the following October.

If General Neguib would not express the position exactly in these terms he would probably not reject them; but the pressure of difficulties, of enemies and of unwise friends, gives him little opportunity to recapture the tactical grasp which was clearly his a few weeks ago. For the western powers, the problem of what to do is not a diplomatic one. If they want to help General Neguib, and through him Egypt, they must look less to diplomatic niceties and more to a firm, confident plan of material assistance.

No single western country could undertake such help without at once being branded with the familiar charge of imperialism. The job is one for—at the least—Britain and the United States and, if possible, also for other

countries that have long been investors in Egypt, notably the French and the Belgians. As to the form their help could take, the fashion is to give it in the form of experts. But Egypt has no need of many experts; it has many technicians of its own who know just what is needed. Its chief weakness is not on the technical but on the administrative and financial side. Its immediate needs are for capable and hardworking civil servants and for foreign exchange. The former only time can produce; but there are two ways of producing the latter. One is to give outright, as was the way with Marshall aid; the other is to restore balance to Egypt's international payments and to its budget by buying up its surplus cotton.

In Britain, the prospects of doing this by commercial means are slight: British cotton spinners are only just beginning to emerge from a recession, and are doing so only thanks to defence orders for which Egyptian cotton is less suitable than Peruvian. The Raw Cotton Commission is an agency buying in competition with private importers, is intended to balance its books, and cannot possibly be asked to make what must, for the moment, rank as a bad buy. But are governments so lacking in ingenuity that they can think of no other agency? The problem presented to them is straightforward enough. General Neguib is in deep water; either his regime is valuable to them and, therefore, worth assistance; or its disappearance would be unimportant, and it can be left to struggle on its own. What is inexcusable is to think it valuable but do nothing to help it.

“Gas and Water” Telephones

THE City of Hull, the third largest port in the United Kingdom, is unique in several respects and not least because it owns and runs its own telephone system. In Hull, the telephone call-boxes are painted green, and as recently as six months ago any of its 39,000 subscribers could call another within an area of 120 square miles for only a penny. The passionate advocates of municipal trading in the nineties, the “Gas and Water Socialists” as they were contemptuously called, would no doubt have been exasperated if they could have foreseen this vigorous offshoot of their teaching surviving for half a century to disturb the orderly pattern of a fully nationalised service; but though their socialism might have been affronted, their business sense could not have failed to be impressed by such an example of local enterprise and efficiency.

All the country's telephone services were in their early days much bedevilled by politics. In 1880 the Postmaster-General asserted his monopoly, almost casually, by a free interpretation of the eleven-year-old Telegraph Act, and was content for twenty years more to do nothing but collect a royalty from private enterprise—that is, from the National Telephone Company. Public criticism of the company, however, grew steadily more vocal—criticism based to some extent on popular ignorance of the technical complexities of this new service. Press and platform demanded “more competition,” and the blessings of competition were accordingly bestowed upon the infant industry by the licensing of municipal undertakings, while the Post Office itself developed the long-distance service. Before long, how-

ever, telephone users discovered that competition, wherever it was attempted, involved renting two telephones instead of one, and consulting two directories; long-term development was paralysed by price wars, and every fresh invention—in an era of telephone inventions—threatened catastrophe to the local rates. With the exception of Hull, all towns that had experimented with municipal telephones were glad to surrender their embarrassments after a few years.

How Hull's telephones survived and made a profit is still something of a mystery. Some Yorkshire caution prompted the town council not to declare open war on the local branch of the National Telephone Company, as other cities were doing, but to use its power of granting wayleaves, for running the company's cables under the city streets, as a bargaining counter to enforce some degree of co-operation and interchangeability between its own and the company's service. But, at first, it made the same mistake as other municipal telephone services by charging low rates and starting with outdated equipment which had to be scrapped and replaced after a few years. These were the days when “to ring up” meant literally cranking a handle to generate the necessary current for a tinkle at the other end of the line; the system was already technically obsolete when the municipalities were investing large sums in its installation.

When the telephone service was nationalised, Hull almost went with the rest of the municipal services. But some vestige of popular prejudice against coercing municipalities led the Postmaster-General to offer Hull a reprieve, on condition that it bought out the local branch

of the National Telephone Company; Hull, bursting with local pride, called his bluff and closed with the offer. The price was stiff—£192,423, as agreed for nationalisation—and the Hull Corporation was saddled with a whole department on civil service scales of pay and pension which were unheard of for local government in 1914.

But the local telephone service that resulted has been very good. Except in the slump just after the first World War, when, like the Post Office, it was obliged to increase its prices, it has shown a steady profit each year, in addition to paying the Post Office a royalty of 10 per cent on all its receipts. The pay and conditions of its 500 staff are the same as those of the Post Office, as also is its standard of service to the public—a measured rate of less than one per thousand calls which fail through faulty or busy apparatus. Yet it continues to operate at prices appreciably lower than those of the Post Office, as the following comparisons show:—

ANNUAL COST OF TELEPHONE SERVICE
(Single Line)

No. of Local Calls Per Year	BUSINESS			DOMESTIC		
	Hull	Comparable Provincial Towns	London	Hull	Comparable Provincial Towns	London
200	£ 6 s. 0	£ 10 s. 0	£ 12 s. 0	£ 6 s. 0	£ 6 s. 0	£ 8 s. 0
500	7 10	12 2 6	14 2 6	7 10	8 10 0	10 10 0
800	9 0	14 0 0	16 0 0	*9 0	10 7 6	12 7 6
2600	*18 0	25 5 0	27 5 0	9 0	21 12 6	23 12 6
Over 2600	18 0	Extra Calls at 12/6 per 100		9 0	Extra Calls at 12/6 per 100	

* Unlimited service.

“Why,” asked *The Times* in 1905, “should a municipality have a private telephone system any more than a private post office or telegraph system?” There was no simple answer to the question at that time, and there is none now. First impressions of the cheap and efficient service at Hull suggest that there must be some set of circumstances peculiar to the city which favour telephone operation. One such factor is not hard to find; the terrain is flat and the district of 350,000 inhabitants forms an isolated industrial community in a thinly populated agricultural county, and consequently a clearly defined area of inter-communication. In 1951 it had 11 telephones per 100 of population, compared with an average of 10.7 for the United Kingdom and something over 17 in Greater London. For serving a large number of subscribers with a small mileage of line, this sort of concentration seems advantageous.

But telephone economics are not so simple as that. On the contrary, from the economic point of view the telephone is probably the most complex of all the public utilities. Two simple examples illustrate this point. In the first place, unlike most commodities, which are cheaper when produced in large quantities, telephone communications within a local area are subject to certain diseconomies of scale. The economy of having a large number of subscribers to share overhead expenses is soon outweighed, in big centres of population, by the cost of providing enough exchange equipment for each to speak to each—a factor that increases in geometrical, not arithmetical, ratio to the number of subscribers. The more people the individual can ring up, or who can ring him,

the more valuable his telephone becomes, and there is therefore a sort of rough justice in the Post Office charges in the five biggest towns, which are higher than elsewhere. So if Hull corporation does not have to carry telephone cables up mountain sides and under tidal estuaries, nevertheless the fact that subscribers are fairly thick on the ground is not the pure gain that a layman would assume it to be.

Secondly, besides this spatial dimension of telephone service there is also a time dimension too. That is to say, costs are not only related in this special way with the geographical distribution of subscribers and the extent to which they are concentrated into big inter-communicating groups; costs are also affected by the amount of use these subscribers make of the telephones they have. “Peak hour” traffic, usually in the forenoon, poses a problem of supplying enough capital equipment to meet the demands of this busy period, although much of it must lie idle during the rest of the day. This is, of course, the same problem of uneven demand that is familiar in electricity supply or local transport industries. It is here that the method of pricing is of interest. In the early years of telephones flat rates were popular—that is, an annual rental with unlimited service or else a combined rental and charge-per-call with main emphasis on the rental. This sort of tariff, besides benefiting the large user rather than the small, encouraged all subscribers to be larger users than they would be if the size of the bill rose every time they lifted the receiver. Flat rates were abandoned by the Post Office as long ago as 1921; it did not disclose whether the intention was to encourage the small user and so extend the service, or to discourage the indiscriminate use of existing telephones which it was so costly to cater for. Whatever the motives of the Post Office, Hull did not follow its example, and the flat rate for unlimited service is still very popular there, while all its tariffs carry a generous allowance of free calls. Yet although they thus appear to benefit the large user at the expense of the small one, and to aggravate the peak-hour problem, it remains true that Hull's waiting list (presumably chiefly small or domestic users) is as long proportionately as that of the rest of the country, while its peak-hour traffic is still dealt with comfortably.

None of these factors offers any explanation of Hull's cheap telephone service. Various other considerations make the phenomenon all the more strange. For example, the Post Office showed a large surplus for several years during the mid-thirties, and again during the last war, as a result of utilising its margin of spare exchange equipment without making any comparable provision for the future; there is no sign, at present, that Hull is living on capital in this way. The Post Office had made great technical economies in the trunk lines which are a profitable branch of its business; Hull's benefit from this is only indirect. Furthermore, manufacturers of equipment work, necessarily, with their eyes on the great Post Office market, and Hull suffers financially from their relative lack of concern for its requirements which, for historical reasons, are technically different. But if the outsider cannot see why Hull's telephones should be cheap and profitable, the typical Hull citizen has no doubts: “Why, the thing is run on sound business lines,” he exclaims, and leaves the implication in the air.

NOTES OF THE WEEK

Opposition by Procedure

The House of Commons on Wednesday fell into more disorder than has been seen there for many years. The remark that caused the trouble—Mr Churchill's imputation of unpatriotic motives in Mr Shinwell—would certainly have been better left unsaid. But the uproar was in proportion to the state of party feeling, not to the offence. Similarly, the Opposition's complaints against the use of the closure on Tuesday night, on the committee stage of the Expiring Laws Continuance Bill, have some basis; but they certainly would not in any normal circumstances justify the extreme action taken by Mr Attlee—the tabling of a motion of no confidence in the Deputy Speaker. The backbenchers have joined in with a motion of censure on Mr Churchill.

All this was the prelude to the day's debate occupied on Thursday by Labour's earlier censure motion, which arose out of the Government's failure last week to maintain a quorum for the debate on the Steel Bill. This constant pre-occupation of Parliament with its own procedure cannot look anything but silly outside Westminster. The Opposition may be moved by some genuine resentment at the way the Government is conducting its business in Parliament, but it is undoubtedly using that emotion with deliberate intent to impose an unjustifiable delay on the proceedings of the House. Up to a point, this tactic is inevitable; pushed as far as Labour is pushing it, it may well damage the prestige of the Opposition as much as of the Government.

But whatever verdict is passed on Labour's delaying tactics, there can be no doubt about their power to upset the Government. At this early stage of the session, one day more or less on the timetable may appear to be of little consequence. In fact, however, the Government is working to a tight schedule. The intensified legislative programme carried through by the Labour Government after the war was possible only because it took over all private members' time, and was able to send even its largest Bills to standing committees; nor did it hesitate to call Parliament back on three separate occasions for meetings in September. This Government has no such extensive list of Bills but it has nevertheless no margin to speak of. Its majority, though large enough to avoid defeat, is too small to permit major Bills to be referred to standing committees, and its difficulties have been increased by the Labour whips' threat to keep a stringent control on all pairing in future. These measures have increased personal friction in the House and have strained the normally cordial relations "through the usual channels." It must be hoped that the immediate tensions will die away, but even so the problem facing Mr Crookshank, the Leader of the House, will remain acute until he not only has the denationalisation Bills safely on the Statute Book but also has the financial business of the session well in hand.

Twelfth Man Stumped?

The outcome of the second ballot for the Labour party's parliamentary committee has greatly annoyed Mr Bevan's partisans. He has been elected to the committee under the most disadvantageous circumstances—with the lowest total of votes, with no other Bevanite to support him, and with the rest of the committee composed of his most implacable opponents. Not even one middle-of-the-roader, like Mr Strachey or Mr Strauss, is there to give him comfort. This is a far less desirable result for his friends than a straight defeat would have been. That would have enabled Mr Bevan to retire to the back benches with the honours of a martyr struck down by the last-minute change in voting rules.

The actual outcome may be said not to make matters worse

within the Labour party; it certainly does little to make them better. The Right wing of the party, and particularly the trade union MPs (who seem to have voted *en bloc* in the two ballots for the committee), has shown its determination to exclude Mr Bevan's supporters and any "waverers." But in the process it has given the party a weaker and less representative committee than it merits. One or two of the older members re-elected no longer have real claim to front bench rank. The danger that the committee will in practice exasperate the party is the greater because both wings of the party remain unshaken in their pet illusions. The Right clings to the belief that Bevanism is no more than the ambitions of one man. The Bevanites hold to the view that they alone stand for a new policy in the Labour movement. In fact personal ambitions and considerations of policy are inextricably intermingled in this dispute.

Mr Bevan's return to party office imposes on him also a public test of responsibility. Can he work as a loyal member of a team of which he is not the leader? If he cannot, if he breaks from this committee as he broke from the Government in 1951, he may do himself much greater harm with the party's rank-and-file. Even his supporters' need to find the symbol for the new policy they seek might be insufficient to sustain Mr Bevan's prestige in such circumstances. Yet he will risk losing this very support if he appears to be tamed by the committee. Mr Bevan has been manoeuvred by the party leaders into a tight corner; but it would be rash to assume that he has not the resource and the ambition to break out of it.

After the Korean Debate

Now that the practical interest of the Indian proposals for a Korean armistice is over—at any rate for the time being—it is worth taking stock of what has happened. The long debate in the United Nations Political Committee was brought to an end by three remarkable votes. On Monday the Indian resolution, watered down but still recognisably akin to the original proposals for a truce without forcible repatriation of prisoners of war, was passed by 53 votes to 5, with only Nationalist China abstaining. On Tuesday the Russian alternative proposals, put forward so petulantly by Mr Vyshinsky, were rejected by 41 votes to 5, with 12 states of the Asian-Arab bloc abstaining. On Wednesday both these votes were decisively endorsed by the General Assembly. Whatever the Russians' calculations about the Korean war, such a clear expression of world opinion can hardly fail to create a new factor in the situation.

In the process of the debate the Assembly undoubtedly reassessed current strengths and weaknesses among its members, for even the great powers do not always look the same. The British moved with greater assurance and showed more old school diplomatic deftness than on some recent occasions. The Americans showed the strain of a post-election hang-over and a pre-inauguration chill. The Russians were juggling too many balls at once, and occasionally one slipped. All three felt the fluid and ambiguous strength of the Asian-Arab bloc. The position of India in this bloc gave Russia its most difficult moments. At one and the same time India must, in the Korean argument, be spanked as a tool of the West and flattered as a leader of nations able to make trouble for the West. This simultaneous double-dealing is not beyond Mr Vyshinsky's skill, though it is less impressive when done in broad daylight before an audience which has seen and heard these things before.

There is little chance now of halting or changing the actual war of attrition in Korea, at any rate until General Eisenhower returns with new plans or new proposals. But

what does emerge is that, while the Geneva Convention may need redrafting to suit the needs of the cold war, not even the Russians can fool all the people all the time. This primarily humanitarian document was twisted phrase by phrase into an apparent argument for the use of force. And this was done by a state which, beyond any other in modern history, has itself refused to repatriate its prisoners. Perhaps we shall never know how many Austrians, Germans, Frenchmen, Italians or Japanese—to name no others—still remain in Russia to-day. But even Mr Vyshinsky's infinitely skilful cynicism failed to drown their voices in the wings.

Templer Reports

General Sir Gerald Templer, the High Commissioner for Malaya, had a good record to show when he spoke in London this week. It will soon be a year since he was appointed, and throughout that period there has been a tendency for the condition of Malaya to improve. At first, the favourable trend was debatable, and men and women daily risking their lives on the estates and mines were justifiably bitter at premature rejoicing by chair-borne strategists in the safety of the towns and here in Britain. Indeed, there are still areas in Malaya, particularly in Johore, where it would be hard to point to a falling off in Communist pressure. But few could now deny that statistics for Malaya as a whole present an encouraging picture. In November the number of terrorist incidents was 41, the lowest so far, and to be compared with a monthly average of nearly 200 last year. Civilian casualties were 10, compared with 28 in October, a monthly average of 72 in the early part of this year, and 91 over the last two years.

It is, however, difficult to determine just how much of this success may be attributed to the most recent measures taken against the Communists and how much to either longer-term or external factors. General Templer deserves the highest credit for turning the tide in the battle of morale and for the determined measures by which he has done so. But of even greater significance are captured Communist documents going back over the past year which are only now becoming public.

These documents show that the Malayan Communist party has switched policies and carried out purges in true Moscow style. Instead of murdering civilians, conducting economic sabotage and cold-shouldering rival organisations, the Malayan Communists are now to work more subtly to involve the masses in revolution. They are to stop violence in unsuitable places, penetrate the trade unions and exploit bodies like the Malayan Chinese Association and the United Malay Nationalist Organisation. They have issued absurdly cynical lists of who is to be killed and who is not. This undoubtedly reflects the failure to win outright in the guerrilla struggle. But it is also in keeping with Moscow's new world-wide policy of creating common fronts against the government in power. Though the Communists may have lost a round in Malaya—and an important one—there is still a tough political battle ahead.

Division Over Kenya

There can be no doubt of the concern felt by members of Parliament over the situation in Kenya. It spilled over into the debates on the Colonial Loans Bill; it caused the interruption of last week's business; and it is likely to lead to a full-dress debate in the near future. In itself, such concern is proper, particularly when severe and repressive measures, in some instances denying individual liberties, have been taken to combat Mau Mau. But there can also be little doubt that a section of the Labour party is exploiting this concern as a stick for beating the Government and Mr Lyttelton in particular.

From the public's point of view, and in normal circumstances, a personal vendetta of this sort is unimportant. But when the Minister concerned is Secretary of State for the Colonies, and in the dangerous situation existing in Kenya today, a sustained personal attack can have most undesirable repercussions. Few Europeans in Kenya and fewer Africans can be expected to appreciate the difference between official and unofficial Labour opposition; and the campaign against Mr Lyttelton may be generally interpreted in the colony as evidence of widely held dissatisfaction with the policy being pursued there. This in its turn may embitter the Europeans, bewilder the loyal Africans and encourage the terrorists.

In the last two or three years of the Labour Government, some Conservative backbenchers became increasingly critical of the pace of constitutional change in the colonies, with the consequent danger in a time of racial tension that Conservatives as a whole would be regarded as pro-European and Labour as pro-African. In fact, Mr Lyttelton has shown himself as much in favour of the political progress of the African as his Labour predecessors, Mr Griffiths and Mr Creech Jones, were in favour of private enterprise in the colonies. There is no justification for identifying either front bench with the cause of black or white respectively, and the Labour backbenchers now attacking Mr Lyttelton should remind themselves that European settlement in Kenya after the war was encouraged under a Labour Secretary of State. At the cost of snubbing one of his own backbenchers, Mr Lyttelton last week welcomed any constructive proposals that Mr Griffiths might offer for dealing with the present situation in Kenya. For his part, Mr Griffiths, while carrying out an Opposition leader's undisputed duty to question and to criticise, should make it clear beyond doubt that he dissociates his front bench from the mischievous campaign behind him.

Saarlanders Keep Their Heads

The French Government has every reason to be satisfied with the outcome of the Saar elections. The Christian People's Party of Herr Hoffmann and the Saar (SPS) Socialists together polled 88 per cent of the valid votes cast. Both parties have opposed the reintegration of the Saar into Germany and this victory can be taken to mean approval for the policy of "Europeanisation" and a customs union with France. The French Government now finds itself in a very strong position for resuming negotiations with Germany for a long-range settlement of the Saar problem. M. Pinay and M. Schuman can face their own deputies more confidently in debate on foreign policy. In striking contrast to the period after 1925, in which France was under continuous hostile pressure to get out of the Saar, it now finds itself with something of a mandate to speak for it. Its government can now afford to be generous to Dr Adenauer, and the British should now help to find a way of keeping in being a modified form of the present regime until there exists a real West European federation into which the Saar can be fitted.

German nationalists are still wincing under the blow administered by the electors. The results could hardly have proved more clearly that the people of the territory, most of them heavy industrial workers, are little influenced as yet by the appeal of German national unity; they voted for their local economic interests. Wages, the cost of living, prospects of employment, and the always burning question of confessional schools, decided the voters' choice. But not even Herr Hoffmann, the Saar Premier, expected such an overwhelming victory for the present regime of political separation from Germany and economic union with France. The fact that 93 per cent of the electorate turned out to vote was remarkable in itself, considering that the order had come from Germany to abstain from voting, or to return blank ballot papers.

It would be wrong to deduce that the results would have

been much the same if a powerful campaign for reunion with Germany had been freely carried on. The pro-German parties suffered severely from the ban imposed by the Saar government: no subversive organisation worthy of the name was set up and there were no illegal demonstrations. The electioneering of this opposition had to be confined to whisper propaganda and leaflets. The lesson is, in fact, that Germans, whether in the Saar or the Federal Republic, are not psychologically ready for idealistic appeals of any kind after their terrible experiences in recent years. Generally speaking, they will not be moved unless a determined organisation whips them up into hysteria with demonstrations and threatens them with penalties if they fail to be good nationalists.

At present the forces working for German unity are still to a considerable extent offset by the centrifugal forces at work in a country that has been united only since 1871, and has now a federal structure. A leading and urgent motive behind the propaganda that is constantly conducted for German unity is to prevent the Saarlanders, or the refugees from the territories east of the Oder-Neisse line, or the Bavarians from slipping out of this recently acquired national cohesion. To the German nationalist, therefore, the autonomy of the Saar is not only important for itself; it sets a legal precedent for the other dismembered parts of Germany, and it affects the future of German unity in other, less precise, psychological ways. For this reason, the Saar can never be formally abandoned for all time by a German Government in favour of a meaningless "Europeanisation."

Conscription and Commitments

As a deliberate preliminary, perhaps, to the Prime Minister's general statement on defence, the Secretary of State for War has restated his answers to Mr Shinwell's campaign for a reduction of national service to 18 months. The army's resources are in any case becoming strained, for its strength is expected to fall by 15,000 by 1955; a cut of six months in national service would mean a further loss of 50,000 trained men, making altogether a loss of two divisions. That would necessitate a wholesale withdrawal from present commitments. It would also reduce the usefulness of national servicemen. The longer period of service has made it possible to send them as far as Malaya and Korea, and the cost of troop movements, already over £30 million, would be much increased if their stay in distant theatres were shortened. Moreover, the army relies on national servicemen for 1,250 officers and for about half its corporals, without whom training would be seriously disorganised. To cut the conscription period would be to lose these men in their most valuable six months of service. Finally, to make the change now would be to encourage our European allies, who have now agreed to conscription for 18 months, to fall further below the present British standard.

Mr Head is undoubtedly right. But Mr Shinwell, who continually shifts his ground, has lately made his case more plausible. He would offset some of the lost national servicemen by recruiting more regulars, whom he would attract by offering better pay. Most of the arguments for a two-year period of service clearly apply even more strongly to the three-year short service engagement, and any substitution of voluntary enlistment for compulsion is obviously to be welcomed. But this would be a costly solution if it were possible. Is it possible? Could the regulars gained balance the national servicemen lost? Numerically, they almost certainly would not. The army's intake of regulars has doubled since the short service engagement was introduced, but in the past year it was still fewer than 39,000. Mr Shinwell argues that the regular soldiers would be more efficient; but it would have to be a large gain to balance the likely loss in numbers.

His arguments are, however, what much of the public wants to hear, and they will gain force as it is generally realised how disproportionate a share of western defence is borne by Britain as compared with the Commonwealth and Western Europe. In the circumstances, the Government would probably be wise not to resist the Opposition's request that there should be some sort of inquiry into the use of manpower. Its disposition must be left to the military expert; but a committee untrammelled by military traditions might usefully consider whether the serviceman's time was being used as economically as possible.

Peace on Planning

The Government's Town and Country Planning Bill was given its second reading on Monday with a Government majority of thirty, and after a full and good-tempered debate. Mr Macmillan was at his best, and Dr Dalton, the principal Opposition speaker, at his most rotund. This Bill is the first instalment of the White Paper proposals. It is designed principally to remove the development charge and to nullify the existing liability of the Treasury to create and distribute £300 million in compensation stock before next July. What Mr Macmillan described as the main Bills are to follow next session.

It is a fair summary of the debate to say that all parties agree that the development charge, in the form in which it has existed for the last four years, is dead; but there is much less certainty that the Government's alternative proposals for the financial aspects of planning are adequate. Mr Macmillan was firm in his stand that the public should not pay again, in the form of a high price for land ready and required for development, for land values that it has helped to create. The broad principle of no compensation for values which accrue after 1947 has, he said, been generally accepted as fair. But he could do no more than hope that the private developer of land would do equally well in his bargainings with the private landowner, and that the existing armoury of powers possessed by the authorities would be sufficient to prevent extortion.

On the other hand, there was no unanimity among the Opposition about any alternative. Dr Dalton hinted, cautiously, that land nationalisation might be the only answer; at least he asked whether the time had not come when "we should bring more land . . . into public ownership," which sounded very much like Dr Dalton thinking aloud over the phrasing of a paragraph for some future Labour election manifesto. Mr Donnelly, more to his left, was obviously in favour of answering Dr Dalton's tentative question with a firm "Yes." Mr Sparks suggested that all land transactions should be conducted through the Central Land Board, surely one of the most fantastically rigid and bureaucratic proposals that Parliament has heard for some time. Mr Macmillan argued in reply that those seeking to "tax" betterment must bear two things in mind. The tax must not fall on the developer himself, for he is the pivot on which the creation of new wealth depends; secondly, while development may increase the value of fixed assets, it does not necessarily provide anyone with the cash needed to pay an immediate claim for tax. That is a challenge as well as a warning. At least the Government has been wise enough to give those interested another twelve months in which to attempt to formulate and offer their own suggestions for the future.

Autarky in the East

There is no better antidote for the nonsense so often talked about east-west trade than the periodic reports prepared by the Economic Commission for Europe, whose latest review was published this week in Geneva. As usual, the authors

probe the subject deeper and single out salient trends more skilfully than any other group of experts in the West. This is all the more remarkable in view of the handicaps under which they work. ECE must, as an agency of the United Nations, seek to look impartially at both parts of divided Europe, and it must also fashion its analysis of conditions in the East from the most fragmentary statistics.

It reports, among other things (a general summary is given on page 695), that the Communist bloc still shows very little enthusiasm for buying western consumer goods. Imports of western equipment, with a new emphasis on ships and boats, continue to receive by far the highest priority; but raw materials have begun to assume greater importance in the bloc's import schedules.

The authors of the report, using what they describe as "statistical courage," have for the first time estimated the broad dimensions of a revolutionary trend in the policy of the Soviet bloc—the enormous rise in trade between the Eastern countries themselves. They estimate that the volume of trade conducted within the Comecon group has increased tenfold since 1938. This vast reorientation of eastern foreign trade has played a very big part in the decline of trade with the west and goes far to explain why the volume of exports from the Soviet bloc to western Europe now amounts to only one-fourth of the prewar level.

Where Germans Compete

Out-of-date statistics are always misleading, and therefore the Economic Commission for Europe's latest review of conditions in free Europe paints too gloomy a picture. Its report is concerned mainly with the second quarter of this year; but recovery was already noticeable in the third quarter and it appears to be gathering momentum during the current three months. ECE might have warned its unsuspecting readers about these later developments.

The report, however, throws a new light on the rise in German exports. Ever since the end of the war some British manufacturers have waited fearfully for the day when German competitors would invade their overseas markets. A few now claim that the day has arrived, though the facts hardly support their defeatism. What has happened in recent months is that, while British exports have remained stationary in value, German exports have continued to rise. The following table shows how, during the first eight months of this year, a fall in British exports to the sterling area was offset by slightly greater exports to other overseas countries outside western Europe; exports to Europe, as compared with 1951, have remained constant.

(Millions of Current Dollars, f.o.b.)						
Year and Quarter	To Europe		To Overseas Sterling Area		To Other Overseas Countries	
	UK	W. Germany	UK	W. Germany	UK	W. Germany
1951:— Quarterly av.	536	590	822	71	438	208
1952:— First quarter.	574	670	995	73	432	203
Second "	544	686	747	61	457	231
*Third "	499	711	681	61	440	244

* Two months at quarterly rate.

Source: ECE

The German picture shows a similar decline in exports to the outer sterling area, but this was more than made good by increasing sales to the rest of the world, especially to western Europe. Among the regions where German goods have made the greatest headway are the countries of southern Europe—Jugoslavia, Italy, Spain and Turkey—and the

Scandinavian nations. France and Britain itself have increased imports of German machinery.

The explanations put forward by ECE cast no reflection on the energy or efficiency of British exporters. It points out that Western Germany is the last of the west European countries to recover, and that even now its exports have barely caught up with the postwar expansion of its neighbours. In fact, as ECE and others have repeatedly declared, the only way in which Germany can be absorbed into the economy of the West, without damage to the exports of other European nations, is to expand world trade generally.

A second reason for the comparative success of Germany is that capital goods make up a larger share of its exports than is the case with Britain. At present, capital goods are in greater demand and less subject to import cuts than the many consumer goods on which British exporters rely. Earlier delivery dates and more attractive credit terms also help to explain Germany's recent progress. These advantages, however, are due in large part to the fact that Germany as yet has no rearmament programme and its engineering industries are not, therefore, burdened with military priorities.

Lest They Forget

At a time when political and strategic exigencies make too vivid a memory of past tragedies somewhat embarrassing, the memorial service held last week at Belsen was particularly appropriate and moving. Professor Heuss, President of the Federal Republic, stated quite plainly that it would be mere insolence for any German to minimise or palliate the atrocities and crimes committed in the concentration camps. "The Germans," continued Professor Heuss, "must never forget what men and women of their own nationality did in these shameful years." Much attention is justifiably focused

on the symptoms of resurgent Nazism throughout Germany and on such incidents of violent nationalism as the murder of a French soldier at Ockfen, where the mayor refused to summon an ambulance and left a man to die in a ditch. But it is right that attention and respect should also be given to the many Germans in private and public life who have the courage to speak of the past without extenuation and of the future without arrogance. Professor Heuss has shown courage and an all too rare Christian humility in this matter.

Nothing can compensate for the 22,500 people tortured to death at Belsen; and the memory will take long to die. But those in Europe who keep it alive will look shabby both to their contemporaries and in the eyes of history if they refuse to extend their condemnation to all concentration camps, whatever the political colour of the regime that has set them up.

Gentle Push for Dockers

The decline in imports and exports has compelled the National Dock Labour Board to try to reduce the heavy cost of maintaining idle dockers. About one fifth of Britain's 80,000 dockers have been out of work for the last two months. Under the dock labour scheme their "fall-back" wages of £4 8s. a week have been paid out of a fund to which the employers of dock labour contribute a levy proportionate to their weekly wage-bills. The proportion, which is fixed from time to time by the National Dock Labour Board, was raised to 22½ per cent on November 1st. This means that the wage-bill of the port transport industry has been increased by nearly one quarter in order to keep in idleness some 16,000 dockers for whom no work can be found.

The scheme now adopted was first proposed by the port employers, who are naturally worried lest they should have to increase their charges to such an extent that entrepôt trade is diverted to the Continent. It is designed "to encourage men to seek temporary release from the industry to obtain other employment." Dockers who so wish will be allowed to take other jobs at any time between now and January 1, 1955, without losing their places on the register—although they will not, of course, draw the fall-back wages. They are liable to recall by their local dock boards at any time during 1954 and are entitled to reinstatement, with full rights, on the "Live Register" on January 1, 1955. They will be entitled to ordinary unemployment benefit after they have left the docks, either temporarily or permanently, and until they find other work.

The board's decision is based on the assumption that trade will not improve for at least a year, and perhaps for two. According to its official statement, "a careful survey of the future trend of imports and exports makes it obvious that for some time to come no great improvement in the present level of dock work is to be expected." The rise in unemployment, which has been of the order of 150 per cent in the last year, is out of all proportion to the fall in imports and exports; this is because the trades which have declined are those which deal in goods, such as motor-cars and "luxury imports" from the Continent, which need careful handling by comparatively large numbers of men.

The new scheme was decided upon after consultation with the dockers' leaders. But the dockers themselves, with their long-standing suspicions, are unlikely to be pleased, if only because they usually react automatically and instantly against any change of any kind in the workings of the dock labour scheme. Although this change is entirely voluntary and does not infringe any of their rights, they may well regard it, for the time being at any rate, as an attempt to deprive them of the benefits they won at the end of the war—of which the most important was protection against the fluctuations of the labour market. Now that a slump has arrived, for the first time since the scheme came into operation, the dockers look to it for the protection that they lacked and needed so badly in the thirties. But although the dock labour scheme

can deal with minor fluctuations it cannot deal with a prolonged slump. The merit of the new proposals is that such protection as the scheme can give is not withdrawn; the dockers are merely encouraged to seek something better. It is a sensible and humane alternative to dismissing thousands of men outright.

Punch in the Fourth Arm

The Monte Bello tests, according to the Home Secretary, show no need for "any drastic alteration to the assumption on which the nation's present civil defence is being built." The assumption may be a sound foundation, but the building makes very slow progress. A report (Cmd. 8708) published this week suggests ways to speed it up. Mr Mabane's committee had to consider how recruitment to the civil defence and allied services could be improved and what the public should be told to do in the event of war. The present report deals only with the first of these questions.

Its practical suggestions include the issue of uniforms and badges of rank, house-to-house canvassing to find recruits, and the use of films and other visual aids to preserve training courses from the tedious lecturer. Films are also recommended to stimulate recruitment; but their use is somewhat restricted since the mobile projector units of the Central Office of Information were disbanded in a moment of economy.

The committee suggests, however, that more important than any change in recruiting methods is the need for "a change in the climate of opinion." Recruitment figures show that the public is interested in civil defence only when war seems imminent. Somehow the idea must be implanted that it is the "Fourth Arm of Defence," to be kept in being permanently like the three services. The report suggests that it might be raised in public estimation by the appointment of a single head. This appointment is certainly needed, but not merely, as the committee seems to suggest, to provide a figurehead to fire public imagination. The great need of civil defence is a clear chain of command on the military model. At present it is tied up in the best civil service principles and submerged in local bumbledom. Sir David Maxwell Fyfe has accepted the Mabane committee's recommendation that local authorities should be told to appoint controllers. But where are the regional controllers whose appointment was promised long ago? With so little urgency in administration it is not surprising that the civil defence forces have reached only 46 per cent of their peacetime establishment.

Hospitals into Business?

Two reports of first importance to the hospital service were published* last week. They give the results of the experiments in hospital costing carried out by King Edward's Hospital Fund for London and the Nuffield Provincial Hospitals Trust, and their importance lies in the fact that the two bodies, pursuing their investigations independently, have come to broadly the same conclusions. If their recommendations are accepted by the Ministry of Health, they will lead to a revolution in the financial control of the hospital service and consequently in the spending of nearly £300 million annually of the taxpayer's money.

At present, the total cost of the hospital service is calculated on the basis of the cost of running each hospital group estimated under a number of headings. After the total cost has been agreed by the Government departments concerned, the amount authorised is allocated by the regional boards among their hospitals for spending under the same headings.

PROGRESS IN ELECTRONICS

IN the course of its progress the electronics industry has had a profound influence on many subsidiary industries. Twenty-five years ago, for instance, Britain's annual output of fine molybdenum and tungsten wire was about fifty million yards. Today, this figure represents little more than a month's production in Mullard's own giant plant. These enormous quantities are largely absorbed in the manufacture of Mullard radio valves, television tubes and other electronic devices.

Mullard make this vital raw material themselves in order to control the quality of their products from the earliest stage of manufacture. The factory in which it is produced is one of the most efficient in the world, and the advanced manufacturing methods and the specialised skills employed there are typical of the whole Mullard organisation.

Yet electronics itself is still in its infancy. New applications in industry, communications, medicine and defence are being devised at an ever-increasing rate. The Mullard contribution, in research and production, is one of the more significant aspects of this remarkable development.

Transfers of savings from one heading to another need prior approval, and money unspent at the end of the financial year has to be surrendered. The disadvantages of this system, and the extravagances it leads to, have often been pointed out, but it is worth quoting the comments of King Edward's Fund:

A highly centralised rigid financial control of one side only of the equation—payments—is quite inadequate and inappropriate as, under it, success comes to be measured more by the degree to which expenditure is kept within the defined limits than by the returns obtained for the expenditure.

Much more realistic budgeting could be obtained, in the opinion of both the fund and the trust, if departmental costing were substituted for the present system. Thus, instead of the hospitals' expenditure, estimated and actual, being broken down under subject headings—salaries and wages, provisions, drugs and dressings and so on—it should be based on the departments (wards, out-patients, physiotherapy, radiology) and services (catering, laundry, administration). Where possible, departmental expenditure should be broken down into unit costs to allow comparisons to be made between similar hospitals. The fund and the trust differ on the extent to which departmental costing should be carried out and on whether the expenditure of the medical departments should be expressed as prime cost or include a proportion of the cost of the service departments. But they agree that a costing system could be introduced in all but the smallest hospitals; that it would provide a much more accurate yardstick of the hospitals' financial needs than the present method of estimating; and that it would prove an efficient means of checking extravagance and calculating the cost of new developments.

People in Glass Houses

There are some pretty paradoxes in the issues raised by American charges of subversive activity on the part of members of the United Nations Secretariat in New York. The Secretariat includes, and must include, Soviet, Polish and Czech officials who are clearly Communists; what purpose, then, is served by ridding it of American Communists? It also retains the services of East Europeans and Chinese who have been denounced by their governments as traitors; why should it not continue to employ Americans who are in a similar position? On joining the Secretariat, officials must take an oath of loyalty to the United Nations, overriding their allegiance to their own governments; can an international civil service thus constituted accept governments' demands for the expulsion of its members on account of acts committed before they joined it? There is no end to these questions. They arise from the nature of the UN experiment in maintaining a bridge across a divided world, and those who wish that bridge to remain in place should not try to answer the questions too glibly.

The three jurists appointed by Mr Trygve Lie to advise him on these issues have rightly pointed out that the relationship between Uno and any nation in whose territory it maintains offices is essentially that of guest and host. (It must be remembered that there are UN offices in over a dozen countries, including Communist ones.) If this relationship is to work smoothly, both guests and hosts must act not only correctly, but also courteously, towards one another; they should avoid conduct which is merely embarrassing as well as that which is actively injurious. The advice given by the jurists appears to conform to this principle. They insist that the Secretary-General must be master in his own house; but they strongly advise him not to employ any person, regardless of nationality, whom he has reason to suspect of committing, or intending to commit, subversive acts against the government on whose territory he is employed. To carry out this principle must involve some harsh decisions, but if the good name of the United Nations is to be kept clean, the Secretariat must accept the uncom-

fortable role of Caesar's wife; neither in New York nor in Prague, Cairo, Rome or Montevideo can it afford to risk incurring the charge of harbouring subversive groups.

What Mr Lie's advisers did not say—it was beyond their mandate to do so—is that the obligation on the host countries is equally severe. There is no reason why such a country should not present its complaints against individual members of the Secretariat discreetly and politely. The tactics of Senator McCarran's committee, which have the effect of whipping up indiscriminate suspicions against the Secretariat as a whole, are in no way justified by the fact that some of its charges are well founded. The United States is, by its own wish, Uno's principal host, and the obligations of hospitality cannot be ignored.

New Men at the Vatican

In naming twenty-four new cardinals, the Pope has brought the Sacred College to its full strength. It now includes twenty-seven Italians and forty-three non-Italian members. This, in terms of a papal election, still gives the Italian bloc a concerted edge of power. Among the noteworthy aspects of the policy of Pope Pius XII have been the close interplay of ecclesiastical and political concerns and the way in which the Vatican has acted as a centre of combat intelligence in a world-wide struggle. The cardinals are its general staff and several of the new appointments are of considerable political interest.

The choice of Mgr Stepinac, Archbishop of Zurich, had been expected for some time. Together with Cardinal Mindszenty he has been a symbol of the Catholic opposition to Communism and of its renewed tradition of martyrdom under tyranny. Marshal Tito has repeatedly indicated that he will allow Mgr Stepinac to leave Yugoslavia but would not permit his return. The archbishop, however, has made it plain that he will not leave his flock, even to receive the red hat in the consistory to be held on January 12th, unless his return can be assured. This intransigence, and the amount of world attention focused on it by the elevation of Mgr Stepinac to the Sacred College, must embarrass Marshal Tito at a time when he has close relations with the West.

Of even greater interest is the Pope's choice of Mgr Wyszynski, Archbishop of Warsaw. He was largely responsible for the concordat between state and Church in Poland whereby the Catholic hierarchy and people, in return for important political concessions, have won a certain measure of safety, even of influence. It was by no means clear whether the Pope approved of this Polish solution, as he had given a specific warning against a similar arrangement undertaken in Czechoslovakia. But the vital importance of keeping Catholicism strongly alive in Poland seems to have influenced the Vatican in the direction of flexibility in East European policy.

One of the most remarkable men to be elevated to the purple at the new consistory will be Mgr Siri, Archbishop of Genoa, the youngest of the cardinals and one noted for his progressive views. His future is much discussed in Rome, where the game of predicting the next Pope has been played for so many centuries. On the whole, the political sagacity and sense of timing of Pius XII suggest that Stalin's celebrated query—"How many divisions does the Pope have?"—may admit of more than one answer.

The Irish Troubles

In the last fortnight the Irish economy has been the subject of two important reports. Our correspondent in Dublin writes that the report of the Central Bank, which covers the year ended last March, has been received more quietly than was the case a year ago. The echoes then raised by a detailed and pungent commentary on the financial situation have not yet died down; by an agreeable coincidence

Tales for Travellers

Whether you travel for business or pleasure, you will have to arrange money for the journey; but this need never be a source of worry—if you bank with the Midland. At home, more than 2,100 branches exist to serve you. Your cheques can, by prior arrangement, be cashed at any of them and wherever you call you will receive the same prompt attention and courteous service. Abroad, Midland Bank Travellers' Cheques and Letters of Credit are encashable in all countries of the world through a world-wide system of agents and correspondents.

MIDLAND BANK

the latest report appeared in the middle of a debate in which Mr MacBride invited the *Dail* to condemn its predecessor. This year, the bank's observations are pitched in a notably lower key, though they are supplemented by an omnibus clause stating that the views expressed last year have lost none of their appositeness and, indeed, "have been reinforced in urgency" by the heavy deficit in the balance of payments in 1951. This deficit, it is now noted, was caused to a significant extent by stockpiling. Imports have fallen during 1952. On the other hand, the bank views with anxiety the growth in state expenditure and the glaring disproportion between savings and investment. The bank has been charged with pessimism, and it is true that there has been an encouraging growth in exports. On the other hand, state expenditure continues to rise, and it is plain that the increased taxation imposed in the last budget has failed to secure a proportionate return. Although the state now borrows at 5 per cent, there is little sign of an adequate increase in saving, and there is much less room for manoeuvre than there was a year ago.

The second report, on the industrial potentials of Ireland, was prepared by the Ibec Technical Services Corporation of New York, under the ECA Technical Assistance programme. Our correspondent thinks it unlikely that the Central Bank was among the Irish advisers of its authors, but there is a striking agreement between the corporation and the bank in their remarks on the high level of consumption and low level of production, on the dangers of recurrent heavy deficits in the balance of payments and on the degree to which, in the absence of savings, domestic investment is financed by external disinvestment. The report also notes the astonishing degree of state control in the Irish economy, although, as it points out, this is due as much to the failure of private enterprise as to ministerial ambitions. A review of the principal groups of Irish industries allows them in general a greater degree of efficiency than they usually get credit for, though the yardstick of comparison with the United States hardly seems helpful. The corporation stresses the overriding importance of agricultural production, especially of those forms of production (such as the dead meat trade) that lend themselves to processing. In that respect at least it is at one with all the innumerable reports that have been made on the Irish economy in the last century; in the last resort, everything depends on the land.

* * *

Self-Discipline for the Press

The debate on Mr Simmons's Press Council Bill, the first private member's Bill of the session, was talked out last week; and that would be a kindly fate for the Bill itself. At best, it needs a great deal more discussion before any new Act is placed on the statute book. Admittedly, it follows the recommendations of the Royal Commission on the Press very closely, but with the important exception that the commission advocated a voluntary body set up by the press itself. The composition of Mr Simmons's Press Council—twenty members from the press itself and five, including the chairman, from outside—and the objects set before it all follow the Royal Commission's proposals. They are, on paper, unexceptionable. So, too, are the duties the Bill would impose on the council when set up, although one, defined as the censuring of "undesirable types of journalistic conduct," has a looseness of phrase inappropriate in an Act of Parliament.

But it is in clause 4 of the Bill that the woolly, and the dangerous, are really encountered. The council would have power to make rules "for making provision with respect to any matter with respect to which the council thinks that provision should be made for the purpose of carrying this Act into effect and for prescribing anything which under this Act is to be prescribed." That is only too reminiscent of the eighteenth century company floated for purposes which were to be disclosed later. But the criticism of this clause

is not based on the words used; it is based on the whole idea that any statutory body can usefully and safely be given power to make rules for securing that what are no more than a set of aspirations are followed. It is no use saying that this power is not intended to restrict the freedom of the press. In an Act of Parliament, a power to make rules implies a power to impose sanctions; otherwise words have lost their ordinary meanings.

The case against a regulatory Press Council does not mean that the journalism of this country cannot be improved. Yet the MPs who criticise its vices know that they would no more dare attempt to prohibit sex stories on Sundays than they have dared to prohibit football pools all the rest of the week. Is the Press Council, then, intended to do this dirty work for them?

There is, of course, a real and familiar dilemma. If a Press Council is imposed by law on the press it will become either a nullity, like the consumers' councils set up under the nationalisation Acts, or an instrument of dictation which will destroy the freedom of the press as it now exists. If the council is a voluntary body, its effect will depend upon its own qualities and activities; it may become something between the Royal Academy and the Fine Arts Commission—which is not to condemn it. Certainly the experiment should be tried, as an experiment.

Henry Esmond

THE History of Henry Esmond, Esq., a Colonel in the Service of Her Majesty Q. Anne. Written by Himself. Smith, Elder and Co. By Wm. Thackeray, Esq.

The story not being excellent either as a work of art or a piece of history, it might deserve much approbation from the careful delineation of the real men or the fictitious personages the author has introduced. Marlborough's base treachery, Swift's brutal rudeness, Prince Eugene's fiery resentment of the insult to the Abbé de Savoie, Steele's extreme sottishness, Addison's seclusion, the polished Atterbury's cunning, are all represented in colours of a much deeper dye than they are painted by historians. The fictitious people, too, are distasteful to us. They are all represented as creatures of impulse without principle—at one time overflowing with tenderness, at others inflamed by jealousy, or tied to a stern, unyielding pride; their religion, a submission to priests—their virtues, those prescribed at courts. They have courage, but less gallantry or generosity than envy and jealousy. . . . Fielding's novels are censured for indelicacy, and it must be admitted that the period to which the book refers requires Mr Thackeray not to be over nice; but it was hardly necessary to surpass Fielding in indelicacy and almost to equal Smollett. . . . Mr Thackeray's book would have been pleasanter reading had his own proper style been continued throughout; and it is remarkable that most of the charming passages of the book—for it is irradiated by genius—are all written in Mr Thackeray's person and manner, not in those of Col. Esmond. . . . Neither as a history nor as a novel can we say it is worthy of commendation, save and except many admirable passages that ought not, as a history, to have been in it. To speak so disparagingly of a work of a great public favourite will probably be held as a proof of heresy in us rather than of defects in it. Our respect, however, for our own deliberate convictions and for Mr Thackeray himself, whom we are sorry to see seduced from more praiseworthy pursuits to concocting improbable fictions mixed up with facts, compel us to brave the risk of expressing an unpopular opinion. There are too many very poor books not to make us regret that a gentleman endowed with the very highest talents should add to the number.

Letters to the Editor

LIVING WITH THE DOLLAR

The Meaning of Convertibility

Sir,—You criticise me for opposing "convertibility" in my speech at Burton on November 22nd on the two contradictory grounds that (a) I am going back on the policy of the Labour Government, and (b) that no one is proposing convertibility in the sense that I used it.

As to the Labour Government, at no time after 1947 did we contemplate convertibility as a means to force dollar-sterling equilibrium, which was what I was attacking. Both in and out of office I have repeatedly emphasised that we could consider convertibility only (a) when the gold reserves were several times their present level, (b) when—even without restrictions—there was a good prospect of a continuing balance in our dollar accounts. If the fulfilment of these conditions seemed remote to me, at least I am in good company. For you devoted a large amount of space in your issue of November 22nd to proving precisely this.

Convertibility is a word that can be used in many different senses. But I maintain that in present conditions it has little significance except as carrying with it non-discrimination. I have never met an American or Canadian who did not use the word in this sense. The rest of the Commonwealth also so interprets it.

This is not surprising. As far as I know, it is not suggested that free convertibility on capital account should be permitted. But most sterling earned on current account is in the narrower sense already convertible. This is true both of American and Canadian account sterling, and of sterling held by the rest of the sterling area; sterling held by the European countries is convertible into their own currencies and may be convertible through EPU, as far as we are concerned, into dollars.

We are left with sterling earned on current account by other countries. I presume it is not suggested that we should concede convertibility to the Iron Curtain group. As far as I can see, about all that remains is a few Latin American countries not already in the dollar area, with whom at present we have special monetary agreements. Quite apart from the merits, which are very doubtful, of granting convertibility to their earnings, I am afraid that if we use convertibility only in this sense we shall make ourselves ridiculous, and the Americans, Canadians and Commonwealth very angry. It is far better to come clean and admit that the real issue here is non-discrimination in trade relations—or control over dollar imports.

But was there really no reason to fear that convertibility in this sense would be considered? What, then, about the

rumour, to which you referred on page 470 of your issue of November 15th, about the attitude of the British Government? Do not many Canadians and Americans look on convertibility as a lever to force equilibrium? And why, if it is really not a live issue, did you devote so much space in the article "Is Discrimination Inevitable?"—far more than I could in a speech—to explaining, for the same reasons as I did, why it was not acceptable?

Finally, you refer somewhat mysteriously to "constructive proposals" on which my opinion would be valuable. What proposals? The British Government have certainly disclosed nothing. I have heard of nothing new from the other governments. Perhaps you meant your own proposals in "Living with the Dollar." I had not read these when I made my speech. But I have now read them, and I would say that I am broadly in agreement with the first five articles in which you seem to me to break from the pro-convertibility line to which *The Economist* was generally inclined in the past. The sixth article seems to me to fall into many of the errors against which the previous articles warned us. We are to have non-discrimination, internal disinflation for debtors—they are not to be allowed to have under 3 per cent unemployment—and there are to be no effective sanctions against creditors. If I had any doubts about the need to give warnings, they were dissipated when I read that last article, "Atlantic Payments Union."

As to constructive proposals, I made some in my Burton speech, and have done so on other occasions. I agree broadly with Mr Jay and with some of the suggestions in the other articles in "Living with the Dollar." I think we need a development plan for the sterling area and the machinery with which to carry it out. In particular, there should be far more central control of investment and dollar expenditure.

The Commonwealth Conference should try to reach agreement on these points. Failing this, I am doubtful if the sterling-dollar pool can continue in its present form, and some very drastic change, which puts more responsibility on each country for its dollar position, might have to be considered.

The conference should also work out proposals for discussion with the Americans. As far as I am concerned these would exclude convertibility and non-discrimination. Our aim should be in the first place to persuade the United States to play its part in helping to produce what you call a state of "discriminating dollar balance."—Yours faithfully,

HUGH GAITSKELL
House of Commons

Investment

Sir,—In the course of your illuminating survey you suggest that, while industrial investment in the dominions should be reduced, Britain's share in the programme "should be to take stern measures to divert resources from consumer goods industries to capital goods industries." May one take it, therefore, that when you rightly object, as you did in a leading article the week before, to trying "to freeze the existing labour force in the consumer goods industries, by off-setting at home the markets lost abroad," you have in mind the need for fiscal measures aimed directly at consumption (including, for example, the maintenance of purchase tax in the face of hostile agitation)? Obviously a general deflation brought about by restriction of investment is not a means of promoting investment. May one infer that you do not now favour dear money, except as a short-term device in an emergency, and that as labour becomes available from, and is forced out of, the consumer goods industries, it is the expansion of the capital goods industries which is called for rather than the discouragement which dear money, if it is effective, must impose?—Yours faithfully,

R. F. KAHN

King's College, Cambridge

Australian Case

Sir,—Your dollar survey says: "The delegates at the Commonwealth Conference should be squarely confronted by the fact that Britain's share of ERP dollars has been absent-mindedly poured down the drain of Australia's high cost industrial boom."

Now, in fact, in the four years ended June 30, 1952, Australia drew only net \$27 million annually from the central dollar pool, an amount less than 5 per cent of the American aid and apparently considerably less than Australia's annual drawings prewar. Moreover, in this period Australia accumulated £100 million in sterling balances. Only in the rather peculiar sense that Australia has made use of part of the capital flow the United Kingdom has seen fit to permit has the statement any shadow of resemblance to fact. If this is the sense intended, it is a rather new concept of sterling balances that not only are they never to be drawn down but also they are to grow to the full extent of any capital outflow from the United Kingdom.

Of course, it is possible to claim that Australia, along with the United States and Canada, should have been willing to provide greater assistance to the United Kingdom. But to state the case in such terms places it in a rather different light.—Yours faithfully,

R. L. GRAY

London, W.2

The Supply of Dollars

Sir,—Your analysis takes a quite pessimistic view of the feasibility of a liberal and expansionist type solution to the problem of closing the dollar gap. This view is apparently based on what seems to be a canted analysis of the ability of the rest of the world to earn enough dollars in the foreseeable future from "normal" United States expenditures overseas to purchase anything like the level of American goods and services presently consumed outside the United States. You seem to lean quite heavily on the proposition that the volume of American imports has not shown a tendency to expand greatly in the past, and that it is not likely to do so in the future, regardless of world trade and payments policies.

Perhaps your conclusions would have been different if you had taken adequate account of the following apparently slighted facts.

(1) In considering past tendencies for "normal" American expenditures to expand so as to enable the increased purchase by foreigners of American goods, you should examine past changes in the real value of the annual flow of non-governmental expenditures out of the United States. If the average of 1937 and 1938 is taken as a base, we find that an index of the real value of private American expenditures overseas (the sum of expenditures for goods and services, private unilateral transfers and net American private long-term capital movements) is 152 for 1947, 159 for 1949, 204 for 1950, and that it has levelled off since then. Thus your figure of a 30 per cent increase in American imports since prewar is certainly misleading in appraising the change in the world's annual supply of dollars from "normal" or private American expenditures.

(2) One reason, of course, why the volume of American imports has not risen more is simply that the terms of trade for the United States have deteriorated greatly since prewar, much more than is the case for Europe. Imports are relatively much more expensive for Americans than they were. As a result, a given volume of American imports in 1951 enabled the rest of the world to purchase roughly 50 per cent more (by volume) of American exports with their receipts than they could have purchased, on the average, in the period 1936-1938. The dollar gap problem has clearly been reduced and the rest of the world has gained greatly from this change. This fact appears casually in one of your graphs, but is nowhere mentioned in the text, which is generally singularly free of mention of the role of relative price factors in the problem under discussion.

(3) Another important item in the post-war dollar accounts which is frequently neglected in analyses of what to do about the dollar gap is the very large (though difficult to measure and analyse) flow of short-term capital into the United States. This flow has, of course, very important political causes, but its fluctuating behaviour suggests that it may not be

entirely unrelated to postwar trade and payments policies in the non-dollar world, however necessary the latter might have been.

(4) Finally, in considering directly the important American import item in the dollar balance of payments, there is good reason to dispute strongly your implication that the potential responsiveness of the volume (and total dollar value) of American imports to price changes is very low. The behaviour of world trade after the 1949 devaluations and before the impact of the Korean war was felt suggests large opportunities, for example, for European goods and services to displace American goods and services in both American and third markets. The most recent and thorough analysis, published by the Federal Reserve Bank of New York, "The Pattern of United States Import Trade since 1923," certainly tends to contradict your pessimistic judgment about American ability to absorb more imports if foreign goods are made more competitive.—Yours faithfully,

JOEL BERNSTEIN

Paris

Timing of a Clearing Union

Sir,—Various designs of clearing union are very much the fashion nowadays, and your model is as well tailored as any. But does it meet the occasion? Your proposal envisages a movement in two stages. First, by various measures, the non-dollar world may hope to achieve what you call a discriminatory dollar balance. Then the discriminatory import restrictions which buttress this position are to be eradicated by the introduction of an Atlantic clearing union.

This plan surely confuses two problems. On the one hand there is the problem of persistent disequilibrium between the dollar and non-dollar parts of the world. On the other there is the necessity of devising some method of mitigating fluctuations in the world supply of any major currency which may occur from year to year. In view of the predominance of the American economy and the sensitivity of its imports to small changes in its level of activity, the latter is likely as often as not to take the form of a dollar problem. But it is one which will remain even when we have lived down a persistent shortage of dollars, and is therefore distinct from it. Now your plan suggests certain measures to solve part of the first problem, namely that part of it which exists even when discriminatory import restrictions are at work, and assigns to the Atlantic clearing union the task of solving both the remainder of the first problem, namely the further persistent dollar shortage which would arise if discrimination were abandoned, and the second problem, namely that of mitigating fluctuations in the supply of dollars about an adequate average.

But it is only the second problem that a clearing union can be called upon to tackle. Certainly the various proposals canvassed before the International Monetary Fund was set up had only this in mind. If a clearing union is established before all elements of persistent disequilibrium have been eliminated, it can do no more than postpone the date at which the ultimate creditor will tire of accumulating foreign currencies. Of course, such an organisation can be given teeth to compel debtors to mend their ways. But if it is to be set up and the teeth allowed to bite at some stage before all elements of persistent disequilibrium have been removed (i.e., when the world has reached a discriminatory but not a non-discriminatory balance), what reason is there why it should not be brought into operation now and allowed to grind away not only the unbalance which would accompany the removal of discrimination, but also that which exists in spite of its presence?

Whatever may be the merits of your plan for an Atlantic clearing union in the presence of the problems proper to it, your proposal surely envisages its introduction at a premature stage. Rather there are three stages in which the solution of the dollar problem should be considered. First there is the stage in which measures (such as you suggest) must be taken to eliminate the deficit which defies even our existing discriminatory import restrictions. In the second stage these measures must be intensified and supplemented in order to make possible a gradual lifting of discrimination. It is only when both of these stages have been successfully passed that it is time to move towards the establishment of an Atlantic clearing union.—Yours faithfully,

J. R. SARGENT

Worcester College,
Oxford

Benelux

Sir,—In your article on "Lessons for Economic Federation," of November 15th, you mentioned the achievements of Benelux and pointed out that to the "observers on the sidelines" they may seem slight. Noticing that this is a fairly general impression here, I wonder if it is sufficiently realised that there is practically complete free trade within the Benelux area. The few agricultural products for which import restrictions are sometimes applied add up to less than 10 per cent of the total trade between the partners. In doing away with quantitative restrictions to the extent of more than 90 per cent of the trade and abandoning all import duties, the Benelux countries have, in the short period since the end of the war, achieved amongst themselves greater freedom of trade than exists even between the areas of the British Commonwealth.—Yours faithfully,

MARCONI

serves mankind

Marconi was a lone thinker who revolutionised communications by methods "the entire meaning of which no one before him had recognised." There is a great contrast between his crude copper-sheet aerial and the Marconi equipment which televises such programmes as the opening of the new House of Commons and the sessions of the United Nations. But there is also a great similarity—Marconi's tradition of service to mankind.

Books and Publications

Economics of Little England

The British Economy, 1945-1950. Edited by G. D. N. Worswick and P. H. Ady. Oxford University Press. 621 pages. 30s.

These essays by a group of Oxford economists, mostly from the younger generation, have to be judged by high standards. No doubt the first five years after the second German war will seem less uniquely interesting in retrospect than they were in experience. But they will certainly remain significant enough to get unusual attention from economists and from policy-makers of other kinds. An assessment that is at once contemporary and considered, as should by now be possible, can therefore claim permanent importance. And Oxford is surely the right place to produce it. The discipline that combines philosophy and politics with its economics may have defects as a training in the modern specialisations of mathematical economic theory, but its virtues should be demonstrated in essays on government policy.

If it is read with these considerations in mind, the present book is greatly disappointing. Its primary defect is in structure. Little more than a sixth of its space is given to Britain in the world. At an early stage, there is a brief essay by Mr P. D. Henderson on "Britain's International Position"; it is competent but slight. Apart from this, foreign trade and payments are reserved until the last four essays. The general one is named, significantly, "The International Aspect." The approach is that of the theorist and the elementary textbooks: this is how a self-contained economy would work; now let us introduce the complication of foreign trade. Whatever its merits for the class-room and the senior common room, this is an odd way of assessing five years predominantly concerned with how Britain was to pay its way in the postwar world. The author of the essay on the external problem is Mr Balogh, and his firmest admirer would hardly claim that it is a complete and balanced survey of the period and its ideas. It has, however, only three specialised supports—two by Mr J. R. Sargent and one by Miss Ady—treating Britain's relations with Europe, with the sterling area and with overseas development generally. All are workmanlike, but they cannot in a short space make up for the unbalance in the book's structure.

The majority of the essays, concerned with various aspects of domestic policy (in which exports have, of course, an occasional mention), are highly uneven in achievement. Among 25 essays by 19 authors this is largely inevitable, but they do not need to be so conflicting in method. The contributors vary considerably in the amount of knowledge assumed for their readers; and many seem to be uncertain whether they are writing a factual history, an analysis of events, or a critique of policies. The resulting unsureness of touch is magnified by a general dullness of style. There are conspicuous exceptions, but several

of the essayists tend to write sentences like the following:

A redistribution of disposable income from private individuals to the Government will increase the overall average propensity to spend, since the marginal propensity to spend of a government which keeps a balanced budget is unity.

Among themselves, economic theorists may be left to enjoy this pompous use of jargon, which gives a truism some cloak of profundity; but they have to stand more nakedly if they want to be read on political economy.

Among the essays that are free from these criticisms are those by Mr Chester, on the machinery of government and planning, and by Mr Kennedy, on monetary policy. Significantly, they are alike in treating their subjects historically. Too many of the other essays treat the sequence of postwar events as the means of showing where the economy was by 1950, and thereby do violence to a period that was in fact cut sharply in two by the events of 1947. This is particularly the fault of Mr Worswick's introductory essay. Until the fuel crisis, economic policy was dictated by the belief that a natural process of recovery and rehabilitation was at work; the main argument was whether to open most of the sluices and let the tide float the economy off, or to keep most of the sluices closed, in order that the economy might be pushed in particular directions. But in 1947 there came the sudden realisation that perhaps the tide was running out, not in. This change of spirit gets little reflection except in the essays by Mr Chester and Mr Kennedy, and much of the book therefore seems strangely remote. Exchange policy and devaluation, import controls, the level of social service expenditure, wage policy—these and much else of the stuff of the postwar years are inadequately treated. It may be said in the authors' defence that they have merely chosen too ambitious a title; it should have been "Some Essays on the British Economy, 1945-50." But in that case there is another book for Oxford to produce belatedly.

Russia's Ancien Régime

The Decline of Imperial Russia. By Hugh Seton-Watson. Methuen. 406 pages. 32s. 6d.

In writing of an *ancien régime*, historians are often tempted to discuss how its downfall could have been avoided. For decades writers pondered on how the Bourbons could have been saved. For some years now it has been the turn of the Romanovs. In his readable survey of the last sixty years of the Tsarist Empire, Professor Hugh Seton-Watson is greatly concerned with whether its downfall could have been averted. Indeed, the last part of his book is entitled "Lost Chances," and he turns

to the question again in the epilogue, with an indictment of the Tsar as the gravedigger of Russia.

This sustained interest is somewhat curious since the preceding narrative has already answered the question in the negative. The October Revolution was—it might be said—almost a delayed operation, since Russia was pregnant with revolution for about a century, and this was particularly noticeable in the period under review—the period, that is, following the Crimean War and the death of Nicholas I. Indeed, Mr Seton-Watson rightly devotes a large part of his book to the description of the successive revolutionary movements. An answer to a second question—why Russia could not find a middle-class alternative to autocracy—is also implicit in the economic chapters of the book. Russian industry was developing fast towards the turn of the century, but it was growing in hot-house conditions, dependent on tariffs and state-guaranteed foreign loans. The Tsar's granted concessions only under pressure. The Russian bourgeoisie was too weak to transform autocratic rule into a constitutional monarchy. Industrial development was, however, sufficient to create a large and concentrated working class, which, led by a disciplined party and supported by land hungry peasants, dealt a death blow to the Tsars.

Mr Seton-Watson gives some additional causes of their downfall. As an expert on national problems, he devotes many interesting and well-documented pages to that disruptive centrifugal force—nationalism. As an acute observer of the Balkan scene, he comes to the conclusion that a Russo-Austrian conflict was inevitable and war only was needed to precipitate the collapse of the *ancien régime*. Why, then, does he come back to the ifs and might-have-beens of history? Towards the end, particularly in the epilogue, one gets the impression that the propagandist sometimes gets the upper hand over the historian who has marshalled the facts so scrupulously. Thus, in his description of the Bolshevik-Menshevik controversy, Mr Seton-Watson gives a rather one-sided picture, leading one almost to believe that the spring of Lenin's policy was a thirst for personal power. In the brief parallel between Tsardom and Stalinism, too, the balance seems somewhat tilted against the latter, whose economic and social achievements are minimised.

It should, however, be emphasised that for most of the book Mr Seton-Watson lets the facts speak for themselves, and the amount of material he has collected, compiled and consulted may be gauged by the impressive bibliography (with, however, the curious omission of Pokrovsky, once the most prominent Soviet historian, now banned in Russia). In this interesting and valuable book he uses all along rich sources made available by his non-Russian predecessors and the Russians themselves. It is only occasionally that the historian of the late Romanovs lets himself be carried away by his dislike of their successors.

Academic Dinosaurs

The Development of Economic Thought. Edited by Henry W. Spiegel. Chapman and Hall. 811 pages. 52s.

Comparative Economic Systems. By T. Surányi-Unger. McGraw Hill. 628 pages. 47s.

One unsolved mystery of the intellectual world—Unesco might take a look at it—is the propensity of American academics to write, even on a quite elementary level, at a length three or four times as great as scholars of any other nationality seem to find necessary. They have not, it is true, endured the same discipline by paper shortage; it is also true that the American undergraduate is on an average younger both actually and mentally than his British or European counterpart and therefore—but does it inevitably follow?—happier with a comprehensive textbook which spares him the effort of parallel reading.

Even so, the sheer tonnage of American textbooks remains an unexplained phenomenon. Of the two latest examples "The Development of Economic Thought" has the better excuse for encyclopaedic format; it is an ingenious and indeed sometimes entertaining compilation of the views of economists on economists, ranging from Aristotle on Plato through Cairnes on Bastiat to Professor Samuelson on Keynes. Its subtitle—"Great Economists in Perspective"—is, however, decidedly misleading. The chosen commentators are far too often far too close to their subject—it is no doubt interesting to know Adam Smith's views on the Physiocrats, or for

that matter Marx's, but a twentieth-century appraisal would be much more to the point. The three papers on Malthus were all delivered at a centenary celebration, hardly the occasion for purely objective judgments. The assessments of Bentham by Mill and of the Webbs by Professor Tawney are hardly concerned with economics at all. And the need to match economists in pairs leads to the exclusion of the greatest and most acute of all historians of classical economic thought, Edwin Cannan. Professor Kenneth Boulding, in his introduction, compares "The Development of Economic Thought" to a stimulating collection of *hors d'œuvres*. If, however, stimulus rather than sheer bulk of nutriment, perspective rather than minutiae, are wanted, the student would do much better to re-read Keynes's "End of Laissez-Faire," at about one-twentieth the length of Professor Spiegel's compilation.

"Comparative Economic Systems" explains "the relationships among economic systems based on various interpretations of individual freedom and collective guidance." As a European intellectual from what is now an Iron Curtain country, Professor Surányi-Unger has the advantage of a wide-angled view of these systems and their underlying historical and social roots. He also has great erudition, public spirit, intellectual power and balanced judgment. But the reader must dig for evidence of these through a welter of sententiousness, prolixity, laboured analysis of the obvious, and sheer impenetrable obscurity. Boiled down to a third or so of its present length and rewritten in English (Queen's or President's) this book would be useful to students and salutary as a contribution to objective public judgment. As it stands, it is practically everything that a textbook should not be.

The Centre of the Web

Specially Employed: The Story of British Aid to French Patriots of the Resistance. By Maurice Buckmaster. Batchworth. 200 pages. 12s. 6d.

Stories of British parachutists, who went to France during the war to organise sabotage and the Maquis, continue to appear. People have seen films, heard talks, and read books about Odette, The White Rabbit, Madeleine and half a dozen others; but none of these individual narrators was able to give the whole truth about the organisation and organisers behind their secret training and clandestine activities. Maurice Buckmaster is the ideal person to give this, for he was in charge of the "French Section" from 1941 until the end of the war. From the centre of his web in London he could direct and observe all the activities of British sabotage agents in France. His must have been one of the most fascinating administrative jobs of the war. He was in close contact with men and women sent out to France on dangerous and secret work—work that demanded the attention of people high up in all three Services, of responsible politicians, and involved the chief of the section in decisions bearing upon high

strategy. The story of this job is told by Maurice Buckmaster in "Specially Employed," and he has accomplished the remarkable feat of making the telling of it into a dull book.

The first half of the book deals with the administrative organisation of the section and is larded with anecdotes and a few facts told here for the first time. The second half consists of the stories of the fantastic activities of selected agents. The genuine affection and admiration felt by the author for these people is expressed with attractive simplicity as he tells their stories, and obviously explains much of his success as head of the French Section, but his narrative style oscillates between the flat and the perky. This accounts, perhaps, for his remarkable failure to give roundness or humanity to the various characters he describes.

There are, no doubt, people who collect and read Resistance stories and these people will naturally welcome, and read with pleasure, this account by the controller of so many secret agents. Their fund of anecdotes and stories will be greatly increased by the reading of this book, but even they will doubtless regret that the spider at the centre of such a fascinating web should have spun so disappointing a yarn.

Another China

Flowering Exile: An Autobiographical Excursion. By Dymia Hsiung. Peter Davies. 288 pages. 15s.

At a time when educated Chinese are being more and more cut off from contact with the West, it is refreshing to read the autobiography of a Chinese woman who, while remaining a patriot, has become truly a citizen of the world. Dymia Hsiung is the wife of the writer, equally at home in the Chinese and English languages, whose rendering of an old Chinese play under the title of *Lady Precious Stream* was such an outstanding theatrical success in London before the war. He brought his wife and three children to England in 1937, and this book is the story, told with great sensibility and humour, of the life of a Chinese family in a European environment from the point of view of a woman responsible for making a home for a literary husband, a daughter and two sons—with an additional daughter born in England.

Mr Hsiung himself appears in these pages under the name of Lo Ken, and "Uncle Sung," the friend of the family, who dies of tuberculosis in an Oxford hospital at the end of the book, was Tsui Chi, whose excellent "Short History of Chinese Civilisation" was published by Gollancz some years ago. There are no politics in Mrs Hsiung's book, apart from incidental conversations, yet one is always aware of the background to this intensely personal history—Japanese invasion and civil war in China, the spiritual stresses of an uprooted generation in a period of profound social change, the conflict between the life of "flowering exile" and loyalties pulling the family back to China. It is a book of rare and unusual quality and a significant document of a world overlapping between East and West.

BANKING IN THE BRITISH COMMONWEALTH

Edited by R. S. SAYERS 35s. net

This book provides an account of the recent development, the present organization, and problems of banking in the countries that are, or have until recently been, included in the Commonwealth. Though intended primarily for university students it is not couched in highly academic terms, and it should be of interest to bankers and others interested in the comparative study of financial institutions. The book may be considered a companion volume to Professor Sayers' *Modern Banking* (17s. 6d. net).

ODHAMS

AMERICAN SURVEY

Economic Horizon

Washington, D.C.

WHEN, during the weekend before the election, General Eisenhower gave a "brief summary of the pledges I have made," he included the "pledge that the full resources of our new Administration will be thrown into the battle against inflation," but he did not repeat the complementary one, made earlier, that "the full power of the government" would be "instantly marshalled" if there were "any sign on the horizon of a recession or an economic collapse." All through the campaign, indeed, the Republicans were talking about high prices and the perils of inflation while the Democrats were talking about Mr Hoover and the horrors of depression. The result suggests that there are no longer enough people who remember 1932 to make a Democratic majority and that today the shrinking dollar is a more potent bogey than shrinking employment.

In spite of all this there is nothing to indicate that inflation will be the most immediate problem that faces the new Administration at the end of January, when it takes office. By then the economic tide should be ready to turn, if it has not already started to ebb. Both wholesale and retail prices have been going down since the middle of August and the gross national product has almost stopped its regular quarterly rise. It is true that the steel strike affected the gross national product and that food prices have been entirely responsible for the slight drop in the cost of living so far. But, while the retail prices of items other than food have continued to rise slightly, wholesale prices have been going down for some time. Even before the Republicans are well in the saddle the dollar will, unless there is some unforeseen international crisis, have stopped shrinking. This, by itself, would be a healthy development if unfortunately there were not also signs that the level of industrial activity may begin to fall in the spring.

In terms of the American economy alone—though not of the economies of those countries trying to earn dollars—there should be no serious recession as long as government expenditure continues at anything like its present pace. At the moment, it seems to be fairly steady at a rate of about \$78 billion a year, of which just under \$50 billion is for defence. As there were \$58 billion worth of orders placed but not delivered at the end of September and \$30 billion of funds appropriated but not committed, no cut in the defence budget this year could have any immediate effect on the economy, except perhaps psychologically. But a slight recession, of the type experienced in 1949, is possible, and

even probable, by the late spring without any cut in government expenditure. And it would have come whichever party had won the election.

Its cause will be a progressive reduction in private capital investment as the programme for increasing armament capacity begins to taper off. Neither public spending nor non-armament investment will expand to take up the slack and it is very doubtful whether private consumption expenditure will be able, or inclined, to do it. Private investment at the moment is at an annual rate of about \$50 billion, or 15 per cent of the gross national product, and is, therefore, equal to government expenditure for defence. According to some estimates, it may be running at a rate \$8 to \$10 billion lower by the summer and there may be between 4 and 5 million unemployed by that time.

In every armament programme the inflationary effects of actual defence expenditure are increased and preceded by investment in productive facilities. In the United States at the moment a guide to the progress of this investment is provided by the issue of tax amortisation certificates, which allow firms building new facilities for defence purposes to write them off at an

especially fast rate; during the last three months there has been a drop in the number of these certificates issued. Normally this fall in capital investment in armament production would be counteracted by the taking up of postponed investment for non-armament purposes, but this is unlikely at the present time. It is not only in consumption that the United States has been having guns and butter but in investment as well.

This fall in investment, even if it is as much as \$10 billion will not be as large as that in government spending at the end of the rearmament programme. Even if there is no settlement of the international situation and the level of military expenditure never again approaches the pre-Korean \$18 billion, it is reasonable to expect that it will get down to somewhere near \$30 billion when the standing forces of the West have been re-equipped and have only to be maintained. A couple of weeks ago Mr Walter Williams, who has just been designated as Under-Secretary of Commerce by General Eisenhower, suggested that "greatly expanded sales of con-

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

sumer and durable goods," encouraged by "good old American salesmanship" would have to "sustain the expanded civilian market" when armament expenditure is reduced. There are those who doubt whether this will even be able to compensate for the much smaller reduction in private capital expenditure next summer.

The problem is, as Mr Williams admitted, likely to be a psychological one. Mr Hoover may be perfectly right in pointing out that unemployment never dropped much below 10 million after Mr Roosevelt took office until the war came to the rescue, but that is not the way the story of the New Deal years is told, now that folklore has taken over. And, as is so often the case, folklore contains truths deeper than do the mere facts. The Democrats have a reputation for doing something affirmative when faced with a recession; the Republicans have a reputation for counselling patience and letting nature take its course. Even if Mr Hoover's contention that the measures that Mr Roosevelt took in 1933 delayed, rather than accelerated, economic recovery is admitted, there is still no doubt that they helped the recovery of morale. If there is any large increase in the number of unemployed over the next year, therefore, it is questionable whether it will be enough for a Republican Administration to put its trust in "good old American salesmanship." Something more positive will be needed.

There is indeed nothing to suggest that the public has been starved of either consumer or durable goods in the last two years. There was a great deal of over-stocking during the buying-spree in the autumn of 1950 by people who remembered the shortages of the war years but, although retail sales dropped off sharply in the spring of 1951, they

have maintained a consistent level ever since—and one somewhat above the level of the four previous years. Retail inventories, on the other hand, have remained perceptibly higher in proportion to sales than they normally are. The first "sign on the horizon" of the arrival of a small recession, or of an increase in unemployment, would probably produce an outbreak of clearance sales in all the large shops. Whether they would be successful in attracting customers or whether the public would prefer, at such a moment, to save against a possible slump is the question that cannot be answered at present.

Its answer will depend on the "psychological factor," mentioned by Mr Walter Williams. It will depend on how much public confidence there is, by that time, in either the will or the ability of a Republican Administration and a Republican Congress to do something to stop the recession developing into a slump. General Eisenhower has given a clear promise that something will be done and there are plenty of Republicans who realise only too well what effect another depression—or even something that could be made to look like a depression by Democratic candidates—would have on the future of their party. But it is still probably true to say that the majority of the party is by instinct and training reluctant to use the machinery of government and that the kind of measures that are popularly credited with reversing the trend in 1949 would not be used as quickly as they were then by the Truman Administration. And measures used grudgingly and too late might never catch up with the recession.

Segregation in the Schools

[FROM A CORRESPONDENT IN VIRGINIA]

It is not a coincidence that the Supreme Court put off its hearings of five cases challenging Negro segregation in the publicly-supported schools until the quadrennial emotional orgy of choosing a President should be over. This is the most emotion-charged of all racial issues. The Justices' decision to postpone discussion of it must have been welcome to the writers of the party platforms, who had trouble enough in finding satisfactory formulas to cover the related, but secondary, questions of anti-lynch law, equality in employment, and the poll tax, which restricts voting in a few southern states.

The cases to be heard next week originate in widely separated areas, South Carolina, Virginia, the District of Columbia, Delaware, and—historic anomaly—Kansas. They pose, to an unusual degree, the problem of finding enforceable law for a federal society. The local autonomy of American schools is guarded with a fierceness which no threat to their local powers arouses. More often than not, the school buildings are owned by the locality, not even by the state government. In most cases grants in aid have been acceptable only for special purposes.

The southern states' opposition to federal aid to education has been based in large part on fear that to accept it would mean, sooner or later, giving in to federal demands for an end to segregation of Negro children. But the South, like other regions, also opposes national control of what is taught in the schools. So the Court is on delicate ground, and President Jackson's warning to Chief Justice Marshall, "Mr Marshall has made his decision, now let him enforce it," undoubtedly rings loud in judicial ears.

Seventeen states and the District of Columbia maintain school systems which are segregated throughout. A very considerable number of other states north and west of the Mason-Dixon line contain districts in which there is local segregation at the elementary level—the present Kansas case concerns one of them. This segregation is required by law. In the remaining states whose school systems theoretically take no account of colour differences, there is, in fact, often segregation in practice because of the crowding of Negroes into black ghettos—something which seems a secondary matter to Southerners whose ancestors had slave quarters built near their mansions as a matter of convenience. As a result, children living in overcrowded Negro areas of New York, Chicago and other big cities fill the nearby schools to the exclusion, or near-exclusion, of others.

Segregated or unsegregated, the expansion of Negro education in the present century is amazing. In 1870, fewer than two Negroes in ten were literate at all; by 1900, more than half could read. Today, nearly 95 per cent are literate. In 1900, just over half the Negro children went to school; today, 90 per cent attend. Enrolment in Negro institutions of college level was 2,624 at the turn of the century; it was 74,526 in 1950-51. This was almost three times as rapid an increase as that for all colleges.

★

The legal basis for the expansion of Negro rights has been the Fourteenth Amendment which was passed after the Civil War and provides

No state shall . . . deprive any person of life, liberty or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws.

The constitutions adopted by the southern states after the war also provided, for the first time, for the establishment of publicly supported schools. (The New England tradition of the common school, which spread west across the northern half of the country, had no prewar southern counterpart. In the plantation society, education of the privileged was entrusted, as a rule, to Scottish and English tutors, to whose memoirs is owed much information about eighteenth and nineteenth century southern life.) Moreover, in the post-Civil War years northern money established a number of the Negro institutions in the South which are today first-rate sources of higher education.

But progress was subject to various checks. By the latter part of the nineteenth century, the "equal protection of the laws" theoretically guaranteed by the Fourteenth Amendment began to be modified by judicial interpretation. A new doctrine emerged; that Negroes might be segregated in schools, trains, and so forth, provided that the facilities for them were the equal of those for whites, the so-called "separate but equal" doctrine. The separateness was enforced, in a state like Kentucky, by the passage of the Day law in 1904 which forbade interracial student enrolment at Berea College, which had taken students of both races since before the Civil War. The provision of equally good facilities for Negroes was not taken seriously. This was also the period of many new state constitutions, and included in them were such restrictive measures as the poll tax, which limited Negro voting and hence the effectiveness of political action as a remedy.

Furthermore, during the early years of the twentieth century, the schools of the South, whether for Negroes or whites, were stunted by the grinding poverty of the area. This not only limited the available funds, but also made hard-pressed white farmers, dependent on one-crop agriculture and some-

what dubious of education even for their own children, reluctant to see their taxes used to benefit Negro children. As one Southerner puts it: "The less we have, the worse we divide it."

The really rapid change has come in the past twenty years, during which the South has been transformed from what President Roosevelt called the "Number One Economic Problem" to the country's fastest growing region. There has been more money, and better division of it. And as Negroes increased their earning power, their pressure to qualify for skilled and professional jobs, and for the community to recognise their capacities, has mounted very rapidly. The National Association for the Advancement of Coloured People has provided militant leadership.

The present effort to do away with segregation in the elementary schools follows success in securing Negro admission to the graduate and professional schools of the southern states, which was ordered in a series of individual cases appealed to the Supreme Court. The graduate level was tried first for several reasons: provision of equal but separate instruction, within time to give relief to the plaintiffs, was next to impossible, and in any case staggeringly costly; and the small number of potential applicants for such training would allow for adaptation on both sides with a minimum of friction. More than a thousand Negro students are now attending the higher educational institutions of the South, on an unsegregated basis. Their arrival went well in Arkansas, less well in North Carolina. But the change has taken place quietly.

Negroes now seek the end of segregation at all educational levels. This pressure, together with court decisions stressing that the "separate but equal" doctrine will stand up only

if Negro schools really are the equal of white schools, has caused impressive building funds to be devoted to Negro education throughout the South. The result is that in many areas the more recently erected Negro schools compare more than favorably with the older white schools. But the critics of segregation hold that the social stigma attached to separate schools means that even the best facilities cannot provide equal opportunity or enable Negroes to compete on an equal basis with whites in the colleges and universities.

This view is contested not only by some white but also by some Negro groups. Their arguments are two. One is similar to the argument for separate colleges for women; in a mixed school the top jobs in the extracurricular activities which mean much in American student life—self government, theatricals, the student newspaper, and so on—are unlikely to go to Negroes. Negro teachers and school administrators would also find it harder to get appointments. The other argument is that white resistance to mixed schools at elementary and secondary levels may jeopardise the gains recently made in the South.

In South Carolina, one of the states directly involved in the present cases, the legislature has passed a law which would permit the state to lease its schools to private groups; and in the November balloting, the provision of the constitution which requires the state to maintain a system of public schools was removed by state-wide referendum. South Carolina, at least, will be in a position to defy the Court if the decision, which it is expected will take some months to reach, goes against segregation.

American Notes

Full up in the Cabinet

If General Eisenhower wished to assert his independence of Senator Taft, or test his relative strength in the Republican party, by picking a quarrel with him, then the Secretaryship of Labour was perhaps a good bone over which to do it. Mr Taft's condemnation will strengthen the trade unions' predisposition in favour of the new Secretary, Mr Martin Durkin, a Roman Catholic who was president of the American Federation of Labour's plumbers' union. But since his first government job will be to stem the Congressional flood of anti-labour amendments to the Taft-Hartley Act, it is important that the new Secretary should have co-operation in the Senate. So far neither Mr Taft's colleagues nor the press have echoed the Senator's criticism, but it is bound to make Mr Durkin's task more difficult. If it was impossible to find a suitable Republican trade unionist, General Eisenhower might have done better to go outside the movement altogether. There is also justice in Mr Taft's contention that, if the General were going to honour a Democrat, he might at least have rewarded one of those who voted for him rather than one who worked actively for his opponent. But this would not have brought the genuinely bipartisan element which he evidently wanted in his Cabinet.

All the places in this have now been filled, with a southern Republican the only conspicuous absentee among the various groups of supporters who might have expected a place either there or somewhere equally close to the General. He is now rewarding individuals by putting them on his personal staff, among them Mr Emmett Hughes, who is supposed to have had the bright idea of the Korean visit. One group that seems to be over-represented is the automobile industry, which has provided three Cabinet members from its various branches. It is well known that this industry gave the General substantial financial assistance both before and after his nomination. Mr Winthrop Aldrich, the new Ambassador to Britain, and Mr Sinclair Weeks, the Secretary of Commerce,

also helped the General in this way, by collecting money as well as by giving it. But the extent to which such men were prepared to back their faith in the General with cash is, after all, also a measure of their sympathy for his aims. Mr Aldrich is an outstanding example of this and his experience of international economic affairs makes him a particularly suitable Ambassador for Britain at present. This is certainly a Cabinet of businessmen, which may be another reason why General Eisenhower introduced such a solid lump of labour leaven as Mr Durkin.

By the appointment of the able and experienced Mr Henry Cabot Lodge, the grandson of the man who turned America's back on the League of Nations, to be American representative at the United Nations, General Eisenhower has given striking proof of his belief in international organisation and his desire to strengthen it at a crucial time. New England's place in the Cabinet, which had been expected to go to Mr Lodge, is given instead to Mr Weeks. It is a little ominous to find the man who will be responsible for foreign trade policy saying that he is "for adequate tariffs in the case of industries that are important in the national economy and cannot compete without tariff protection"; he comes from an area full of declining industries that will apply this argument to themselves.

* * *

Wilting Controls

The election of General Eisenhower left wage and price controls with little future, for in his campaign the General made it clear that he was opposed to them and preferred to rely, for economic stabilisation, on indirect controls. But many price control officials themselves believe that the direct controls have served their purpose and that orderly dismantling is desirable. Ceilings have already been taken from items on which the consumer spends 15 per cent of his dollar and so far they have been reimposed in only one case. (The controllers reserve the right to restore ceilings if prices threaten to reach the old controlled levels.)

Congress, in extending the Defence Production Act, took away the authority to regulate a number of other prices. Only goods on which shoppers spend about a third of their incomes are firmly controlled. It is not surprising that the last legacy of Mr Philip Murray to the Congress of Industrial Organisations was a report demanding that wage controls be abolished.

Mr Tighe Woods, the third price stabiliser this year, has resigned in disgust from a job which, he complains, has come to consist merely of signing authorisations for higher prices and suspensions of price controls. He fears that, if controls are jettisoned, the prices of 200 articles will leap up. But his assistant, Mr Phelps, who has a longer experience with price

Matching zip folio cases, size 16" x 10½", available separately at £2.5.0 and £2.15.0 respectively.

Unicorn Leather Co. Ltd. (Dept. ET.10) Woodhill Works, Bury, Lancs.

More than half the income from Britain's exports is drained away in importing food from abroad. The price of foreign food is rising. Dearer food means dearer living and increased production costs. It becomes increasingly difficult, therefore, to sell goods abroad at a competitive price unless this trend can be reversed.

The quickest way to do this is to grow cheaper, more plentiful food for ourselves.

There are 17 million acres of rough grazing in this country where the fertility could be enormously increased with the proper treatment. So we have the land to grow more food.

But the £5 million in 3 years, which is all that has been allocated for this purpose, is inadequate.

What farmers need is more of the modern farming equipment that can bring to agriculture the efficiency, increased output and lower production costs that modern machinery and methods have brought to industry. Once this is understood this leak in the nation's economy can soon be plugged.

Harry Ferguson Ltd., Coventry.

GROW MORE FOOD IN BRITAIN

Ferguson tractors are manufactured for Harry Ferguson Ltd., Coventry, by The Standard Motor Company Ltd.

regulation, is not so gloomy. He believes the economic outlook is calm enough to justify doing away with both wage and consumer price controls within three months, though he would retain controls over goods going directly into defence production and thinks the new Administration would be wise to ask Congress for stand-by controls when the present authorisation expires in April.

The Democrats, who can take credit for stabilising the post-Korean economy, have no intention, however, of doing the Republicans' political dirty work for them. They feel that the ending of economic stabilisation should be left to the Republican Administration which takes power next month. The recall for consultation of Mr Michael Di Salle, who was more successful as a price stabiliser than as a candidate for the Senate, suggests that Mr Truman hopes to leave at least the framework of controls intact. But his latest move will shake them severely and casts doubt on the depth of the outgoing Administration's attachment to its own stabilisation scheme. For Mr Truman has over-ruled the various agencies concerned with the coal wage settlement, all of which agreed that, in the interests of stability, the miners should draw only \$1.50 of the \$1.90 daily rise they had won. The President has allowed them the full increase in order, so he says, to save General Eisenhower from having a coal strike on his hands. It will also make Mr John L. Lewis, the only trade union leader who delivered a satisfactory number of labour votes last month, feel that it was worth his while to come down on the Democratic side.

Fire at the United Nations?

Americans normally inclined to give the benefit of the doubt to victims of Senator McCarran's unending search for subversives have been jolted by two occurrences this week. One is the refusal of Mr Frank Coe, secretary of the International Monetary Fund and the most exalted official yet to be questioned, to tell the McCarran subcommittee, which since last spring has been examining Americans working for international organisations, whether he was now, or ever had been, a member of the Communist party, or engaged in espionage. Mr Coe pleaded that to answer might incriminate him, a reply by now all too familiar from recalcitrant Communist witnesses and one which the committee of jurists advising Mr Lie considered grounds for dismissal. Mr Coe has now resigned from the IMF, at the bidding of the director.

Hardly had Mr Coe left the stand before the grand jury covering the same ground as the McCarran committee finished its task with the conclusion that an "overwhelmingly large group of disloyal Americans," formerly employed in large group of disloyal Americans, the Far Eastern Certainly the case of Professor Lattimore, the Far Eastern expert, is not encouraging. He submitted to several days' questioning by the hostile committee many months ago. Now he is to undergo a grand jury investigation ordered by Mr McGranery, the Attorney General, who seems to have imbibed much of Senator McCarran's zeal. The charge is that he committed perjury in giving his evidence.

In the present atmosphere of hysteria, even innocent persons may prefer the damaging implication of invoking their constitutional rights to the risks of speaking frankly. Certainly the case of Professor Lattimore, the Far Eastern expert, is not encouraging. He submitted to several days' questioning by the hostile committee many months ago. Now he is to undergo a grand jury investigation ordered by Mr McGranery, the Attorney General, who seems to have imbibed much of Senator McCarran's zeal. The charge is that he committed perjury in giving his evidence.

In the interests both of the United Nations and his own Administration, it is to be hoped that General Eisenhower, once he is installed, will accept the idea of a non-partisan commission to assess the extent of Communist infiltration in the United States. The suggestion is that it should be modelled on the Canadian Royal Commission. It is hoped

that it would take the initiative away from Senator McCarran and Senator McCarthy, determine how much fire there is behind their smokescreen, and draw a clear line between dangerous subversives and the liberals whom some Congressmen consider are just as bad.

Trustbusters in Competition

The present investigation of the international operations of the oil industry provides a classic example of that need for greater co-ordination of government policies which General Eisenhower is expected to insist on. For, in spite of the protests of both the State and Defence Departments that the investigation will embitter the international relations and endanger the security of the United States, only the Supreme Court, which can hardly be guided by such non-judicial considerations, can now prevent the Department of Justice from forcing at least the American companies involved to present details of their transactions for the last 12 years to a grand jury in January. Next week, however, a District Judge will decide whether the objections of foreign governments justify keeping documents back and also whether the British government's instruction to the Anglo-Iranian Company to withhold information means that this company must be excused from the enquiry altogether.

Should this case actually come to trial, it promises to be the largest and longest anti-trust suit in history. But another competitor for that honour is already being heard in a Chicago court, where the du Pont companies and 117 members of the du Pont family (59 of them too young to appear) are accused of having exercised monopolistic control, through share holdings, over the General Motors Corporation and the United States Rubber Company. This case, the sixth anti-trust prosecution in which the du Ponts have recently been involved, goes even further into history than the oil investigation, for it begins with the French Revolution. The main charge is that the General Motors Corporation has been forced to buy its supplies from the du Pont and US Rubber companies rather than from the cheapest source available. The defence is that such a charge is unrealistic in view of the competition that exists within the corporation as well as outside it, and that the Department of Justice, not for the first time, has confused mere bigness with monopoly.

This is only one of a series of cases that the department has had in preparation for years—begun, it is said, in the hope of leaving a troublesome legacy for Governor Dewey in 1948 and now ripe to drop into General Eisenhower's lap. The Federal Trade Commission has also lately been putting a bigger thumb into the anti-trust pie in the hope of pulling out more influence for itself. But if, as is expected, the Republican member of the commission, Mr Lowell Mason, becomes chairman, he may be more inclined to advise and warn businessmen than to prosecute them. In this and other directions the winds in Washington will be more favourable for business after next January, but whether the anti-trust suits will all be blown away is less certain. Just because the du Pont case is embarrassing to his Secretary of Defence, who comes to him from General Motors, General Eisenhower may think it politically advisable to continue at least that prosecution. However, a President with such a sound grasp of international and military realities is likely to see that the oil enquiry had better be abandoned.

Foundations on the Carpet

The great philanthropic and educational foundations may not, after all, prove the last sacrifice to the passion of the Eighty-second Congress for investigating "subversive activities." Representative Cox, as he opened his hearings a fortnight ago, confessed that his suspicion of the foundations as founts of "ultra-liberal ideas" and Communism in the schools had been much tempered by a closer acquaintance

A seat facing the future . . .

No trailing sparks, not a snort or a shriek as the 6.35 pulls out from Platform 3. The steam dragon has its rivals now in the shape of the gas-turbine and the diesel. In years to come . . .

Who can say? In the future your seat may be facing an engine capable of hauling a 600-ton load from London to Plymouth, in dead silence, on an egg-cupful of fuel.

Your very small talk may be of relative thermal efficiencies . . .

And if you get there on time, in a third of the time, without hitch in your plans or smut on your collar, will you sigh for the lost romance of steam as you beckon your helicoptercab?

Or thank Progress for progressing, and TI for the very practical help which they habitually lend to the turning of dreams into reality?

with the facts. Last April Mr Cox, an arch-conservative Democrat from Georgia, secured \$75,000 from Congress to discover whether tax-free foundations were "using their resources for un-American or subversive activities or for purposes not in the interest or tradition of the United States." His investigators have found nothing to support a serious charge; to their chagrin, the Robert Marshall Foundation of Chicago, which was a particular target of the group, has had its tax-exemption withdrawn. The Un-American Activities Committee listed this fund as an open source of finance for Communist-front organisations.

Not many people beside Mr Cox can have expected to find nests of Communists in organisations bearing the names of Rockefeller, Ford and Guggenheim, the great plutocrats of the gilded age. But it is reassuring that to Mr Brooks Hays, Mr Cox's liberal and reasonable deputy, the hearings appear as an opportunity to show "what voluntary organisations are doing to promote democracy." Presumably the hearings will show that tax-free funds are used to fight diseases such as malaria, hookworm and rabies; to build schools, to study the problem of displaced persons, and to assist scientific research of all kinds. Private colleges and universities owe a great deal to the generosity of the foundations.

There are more than 30,000 tax-exempt organisations, but only just over a thousand in 1950 had assets of more than \$50,000. Their total assets were \$2.6 billion, and they spent \$133 million. It is true, of course, that tax exemption of any kind has ultimately to be paid for by the tax payer. There is, therefore, a case, as one of the first of Mr Cox's witnesses suggested, for making all tax-free foundations give an accounting to the public, as the larger ones already do. But it would be disastrous if their activities had to secure Congressional or government approval. More financial supervision, on the other hand, might discourage the use of the foundation as a means of avoiding taxes which have sprung up since 1936, when corporations were allowed to contribute five per cent of their income to charity. The investigating group, after recording the good which the legitimate foundations do with their money, could devote what time is left before January 1st, when its powers expire, to examining the possible abuses by corporations who believe that charity begins at home.

Steel Goes East

The present rate of steel output, over 2.2 million tons a week, means that the industry is running steadily at about 106 per cent of capacity. This is possible because actual capacity has increased substantially since it was calculated officially for the year on January 1st as the result of the completion of new facilities under the defence expansion programme. By the middle of next year at the latest, there should be plenty of steel available for all civilian requirements. By then, too, the most interesting of the new steel plants should be in full production—the \$400 million Fairless Steel Works on the Delaware River at Morrisville, Pennsylvania. Output of pig iron is about to begin and steel production will follow soon after. Initial capacity will be 1,800,000 tons of steel ingots a year and it is planned eventually to increase it to somewhere near 8 million, when this will become the largest, and probably the most efficient, integrated steel plant in the country. Steel products, such as tubes and wires, are also to be made by subsidiaries of the parent company, the US Steel Corporation, on the same 3,800-acre site.

No difficulty in selling the output of this particular mill is anticipated, even should the demand for steel drop, because of its favourable situation in the middle of the east coast of its favourable situation in the middle of the east coast of the country's leading industrial centre. Hitherto this eastern market has been dominated by the Bethlehem company's plant at Sparrows Point, but now steel users are said to be

queueing up to get on the books of the Fairless Works, in order to save the ever-rising expense of freight. It will cost only 20.7 cents a hundredweight to ship steel from Morrisville to New York, compared with 35.7 cents from Sparrows Point and 57.5 from Pittsburgh. It will, however, be some time before the company itself can take advantage of the new plant's chief cost-saving factor. Both coal from Norfolk, Virginia, and iron ore from Venezuela and Cuba will be brought in by water, but first the Delaware River must be dredged to enable sea-going ships to get above Philadelphia.

The construction of this huge steel mill is bringing many other problems to the local authorities of a comparatively rural district, which was already being rapidly industrialised because of its water transport and its nearness to rich

markets. Now still more factories are coming, both those which supply the steel mill—a maker of refractories, for example—and those which use its products, such as a manufacturer of kitchen sinks. It is estimated that the existing population of about 100,000 will be more than doubled before long, with 14,000 additional production workers needed in the next three years, 6,000 by the Fairless Works alone. Two low-cost housing projects, an improved version of Long Island's Levittown, to have 16,000 units all for sale, and another contractor's Fairless Hills, with 5,600 prefabricated houses, are rapidly going up. Already sewage and highway facilities are inadequate and new bridges must be built across the Delaware River, in order to bring labour from further afield.

Shorter Note

Senator Wayne Morse of Oregon, who left the Republican party in protest against General Eisenhower's election tactics, has announced that he will vote with the Republicans on the question of organising the new Senate, which meets on January 3rd. Otherwise the Democrats could have retained control of the machinery and committees until the Republican Vice-President, who has a casting vote, took office on January 20th; the two parties would be evenly divided should Senator Morse vote on the Democratic side. He may do this later, but he feels that responsibility for the Senate should be placed squarely on the Republicans from the beginning.

Correction:—The information for the chart of tobacco supply, consumption and prices, on page 625 of *The Economist* of November 29th, came from the US Department of Agriculture and not, as stated, from the Department of Commerce.

THE WORLD OVERSEAS

Berlin Outpost

(By Our Special Correspondent)

THE two-thirds of Berlin that are in Western hands still form the only gap in the iron curtain from the frontier of the Soviet world on the Elbe to its other end at Vladivostok. If a Londoner could take a twopenny tube from Hyde Park Corner and alight in the Red Square of Moscow, it would hardly be more fantastic than the situation in divided Berlin. There anyone can still take the "Metro" from the Zoo station in the British sector and alight in another world in the Soviet centre of the city; and, moreover, inhabitants of the Soviet German area can still make the trip westwards to freedom.

The contrast between the eastern and western sectors of Berlin is a measure of its importance in the cold war, in which each side is anxious to prove the superiority of its way of life to the other. In Berlin the balance has been increasingly in favour of the free world, ever since the United States decided to support the city's economy with Marshall aid, and the Soviet blockade was decisively defeated by the great air lift. In the west, Berlin is alive again. The buildings along the main thoroughfares have been extensively repaired or rebuilt; there are innumerable offices, restaurants and shops full of unrationed goods. The streets have far more traffic on them than a year ago, and the West Berliners show in their dress and bearing that they are poor but free citizens who can indulge their cockney humour as it pleases them. Statistics confirm this impression of moderate recovery. Unemployment and short-time work have been reduced, West Berlin's industries are securing many more orders than before, and again contribute a third of the output of clothing in the Federal Republic. Rather surprisingly only one per cent. of goods have in the past year been prevented from getting through to the West by Soviet controllers.

Certainly, compared with the Federal Republic, West Berlin is still poverty-stricken; and much of the centre is still barren, but it is a paradise contrasted with conditions at the eastern end of the twopenny Metro ride. The pride of the Hohenzollerns—the palaces, museums, shops, offices, restaurants, and hotels of this once rather vulgar, busy city—has gone from Unter den Linden and the neighbourhood. Now the vast desolation left by the war is broken only by a few politically significant buildings such as the Soviet Embassy, the local headquarters of the Socialist Unity Party, parts of the Humboldt university proclaiming on a banner that "to learn from the Bolsheviks is to learn how to win"; and in the former Lustgarten by wooden tribunes from which President Shvernik of the Soviet Union, side by side with President Pieck and the former *Wehrmacht* general, Vincenz Müller, watched a march past of the new Soviet German army a few weeks ago. The German Communists have one showpiece farther east—in the so-called Stalin-Ailee, and they have established large state shops at intervals; but the whole impression is of a dead, proletarian city. The Soviet Berliners are a drab, depressed community. Work, as Bishop Dibelius pointed out in his recent London address, has been raised to a religion in Soviet Germany, and it is a creed which in some

respects ideally suits the German character, but it is evident that conditions in Soviet Germany are too hard even for this hard-working race.

The difference between the economies of East and West Berlin has been reflected in the rate of exchange between the two currencies that are used in the city. Until last week, free two-way trade has been carried on in the city. East Berliners and inhabitants of the Soviet Zone came to the western sectors to buy consumer goods, such as shoes, that are particularly scarce in their area; while the West Berliners went eastwards for cheap services, and for the goods that are sold off the Soviet Zone ration in the state stores at prices that are high to the Soviet German but low to the westerner. A free rate of exchange adjusted supply and demand fairly well. Last week, however, the Soviet authorities banned the sale of goods from state shops to all except inhabitants of the eastern sector or the Soviet zone. This was done as a face-saving move to hide the real reasons for a crisis in food distribution in the East, which were panic buying and building up stocks for the Soviet German army; it has brought financial and commercial exchanges between the western and eastern sectors practically to a standstill.

This new development shows how very unwise it would be to assume that the division of Berlin is one of those temporary solutions that will last. There are good reasons for doubting that in life with the Russians *ce n'est que le provisoire qui dure*. In fact, the situation has been changing in recent months, and will undoubtedly continue

to do so. In the summer, after Dr Adenauer's signature of the new treaties with the western powers, the Soviet German authorities cut telephone lines between the city sectors, and later confiscated the few little businesses in the East that belonged to West Berliners. At the same time, the zonal frontier was cleared of all but a few politically reliable inhabitants by ruthless action that greatly embittered the Germans against their alleged protectors, the People's Police. One effect of closing the zonal border was to make West Berlin the sole remaining loophole of escape from the Soviet Zone. The trickle of refugees that has constantly flowed into the Federal Republic was concentrated on Berlin; and it grew to a stream when Herr Ulbricht announced in May that the People's Republic was to be reorganised as a Communist state and compulsory, paramilitary labour service was instituted. Although as many as possible of the refugees are flown out to the West, those who remain almost offset the number of Berliners who have found employment. They account for the fact that the drain on the Federal exchequer remains very large.

To the Communists, the number of Germans who "vote with their feet" for the capitalist camp is a matter of extreme political concern. The refugees are propagandists against the People's Republic, and the Russians must fear that they may some day be used as guerrillas against that state. Even now, it is plain that any German who plans some act of opposition to the Soviet Zone regime is encouraged by the

Epitaph on East-West Trade?

POLITICS apart, the main barrier to any expansion of east-west trade is the sheer inability of the Communist bloc to provide anything suitable in exchange for increased exports from the West. This is one of the most important conclusions to emerge from the latest study on east-west trade prepared by the Economic Commission for Europe at Geneva. For those who see the Soviet bloc either as an unplumbed source of non-dollar food and raw materials or as a profitable market, the report comes as a douche of cold water.

Needless to say, the eastern bloc lacks any export surpluses of capital goods; but far more serious from the West's viewpoint is the fact that its traditional exports of raw materials—coal, grain, timber—are static or dwindling. An analysis, showing how and why these key exports have declined as compared with prewar days, forms the kernel of the ECE report.

Exports of coal and coke from the East fell by a million tons between 1950 and 1951. Supplies of hard coal alone dropped from a record of 12.4 million tons in 1948 until in the year ending June, 1952, they amounted to only 7 million tons—a level 40 per cent below the prewar average. When in 1951 western Europe faced a severe coal shortage, it was rescued not by imports from the East but by large shipments from the United States. Put in a more precise way, the contribution of the East to the total coal imports of western Europe declined from 22 per cent in 1949 and 1950 to a mere 12 per cent in the first half of 1952.

ECE gives four reasons for the decline. The first is increased consumption in eastern Europe—no doubt part of the trend, noted elsewhere in the report, for the eastern bloc to speed-up industrialisation and to trade more and more exclusively within its own orbit. A second reason, not fully

thought that he can, if need be, escape westward through the wide open door of Berlin.

In the last few months, the Soviet German leaders have shown very plainly that they are extremely perturbed about the various organisations in West Berlin which foster resistance in the east. It is clearly against all the rules of the Soviet game to allow a centre of German-American opposition to operate in the very heart of the Pieck Republic now that it is to become a model Communist state with a politically reliable army. There are indeed many signs that the Communists find the peculiar situation in the city intolerable. From this it might be concluded that the Russians will take active measures to force the Allies from Berlin, and institute a new blockade. The building of a by-pass round the city by the Eastern Berlin authorities seemed to indicate that preparations were being made to overcome a western counter-blockade in the event of a new trade war. But to assume that Soviet action will take this line is to overlook the advantages that Moscow hopes to gain from keeping a door open into the western world.

Communist policy, it may be assumed, will be to bar the way out to the west for Soviet Zone refugees, and the way in for Germans who foster resistance in the People's Republic. It will also undoubtedly aim at punishing the Germans as far as possible if the *Bundestag* ratifies the new treaties with the western powers. For these reasons, the western governments must be prepared to find that the communications between the eastern and western sectors of Berlin are cut off for all but Communist-controlled traffic, that the terrorist restrictions on Soviet Zone Germans are tightened, and that alarming announcements will be made about the People's Army. The depressing effect of such measures on the West Berliners must be taken into account; for, in the long run, it is their morale that will be decisive.

Problem of Morale

Communist action will, however, probably be directed against the Germans rather than the Allies in Berlin, and will not go so far as another blockade. Economic and political advantages for Moscow can be seen in such a policy. The present state of interzonal trade—as of exchanges between the Federal Republic and other Soviet satellites—shows a great excess of deliveries from the west over those from the Soviet area; and it may be assumed that the Communists would like this to continue. Moreover, Moscow's political strategy presumably requires the Communists to keep Berlin as a centre where Stalin's tactics of splitting the West can be tried out. Conferences with French neutralists, such as the recent meeting of the "Congress for the Peaceful Settlement of the German Question," can be held in East Berlin, and western business men can be enveigled there to discuss deals with China. Finally, it is a place where the German "Christian-Democrat" tools of the Pieck Republic can drop informal hints into western ears about the value of accepting Moscow's treaty proposals.

The main problem for the Allies in Berlin is, therefore, to prevent German morale from breaking under the strain of prolonged resistance to Russian tactics. This can be done only by convincing the Germans, first that the Americans will not tire of supporting the Berlin economy, secondly that the Allies are united in their determination to let no chance pass of securing German unity in conditions of peace and freedom. Mr Donnelly, the American High Commissioner, has taken an admirably firm line in Berlin since he assumed office, but the Berliners are a canny people who know where the limits of his powers lie. It is on General Eisenhower that their eyes are fixed, and if their morale is not to weaken it will be for him to undo the harm that distorted reports of his intention to withdraw from Korea have had on Berlin's confidence. There is no part of the world where the repercussions of events on the distant Korean front are felt as they are in this forward position of the western camp.

The Economist Diary

A reference book for the desk

For the man who seems to have everything he could want, The Economist Diary is the ideal present. The appointments and memoranda section is designed to meet the needs of the busy man and in addition there are 72 pages of facts and figures, which together form a complete reference book.

The reference material covers a wide range of subjects, including elections, national income, banking, taxation, crime, man-power, commodities, and a special section giving the basic facts on 47 principal countries in the world.

The volume is bound in red leather and measures 10 in. by 8 in. Price (U.K. only): 42/- including postage and purchase tax. Overseas prices vary widely; a schedule will be sent on request. Full details of The Economist Diary are given in an illustrated pamphlet available from:

Diary Department, The Economist,
22 Ryder Street, St. James's, London, S.W.1

elucidated by ECE, is traced to "difficulties in the Czech coal industry." To judge from the steady flow of protests, both in the Czech press and broadcasts, about absenteeism, "failure to fulfil norms" and "sabotage," these difficulties are the result of dissatisfaction with food shortages, labour conditions and the regime in general among Czech coal miners.

A third factor is the price policy pursued by Poland, the largest coal exporter in the East. During the period in 1951 when western Europe was forced to turn to American coal supplies, Poland boosted its price to match the landed cost of American coal, thus including in its charge the inflated freights across the Atlantic. When the freight boom collapsed, Poland failed to reduce its prices accordingly, and in consequence American coal c.i.f. was for some time cheaper than Polish. Not until September of this year did the Poles reduce their prices to the level of British export coal. The fourth and final reason for declining exports is an acute shortage of manpower in the Polish coal mines.

Grain Exports Halved

The postwar facts about grain exports from the East are more discouraging. While coal exports—on the average at least—have hovered around the prewar level, grain exports from the bloc have dropped to less than half. Soviet exports, it is true, are recovering; but the other eastern countries have contributed less and less food for the West. In the words of the report:

The absence in postwar years of any substantial exportable surpluses of grain from the Danubian countries is one of the most important single factors making for a low level of postwar east-west trade.

Another recent and, so far as Europe goes, disturbing tendency is for the Soviet Union to offer its export surplus of wheat to Egypt, Brazil and Pakistan in preference to its former customers in western Europe. ECE makes no comment on this switch, but there are at least two possible explanations. One is that the Soviets are using wheat as a political blandishment; the other is that, as a rapidly growing industrial power, the Soviet Union has more need for the raw materials provided by the under-developed countries than for the products of the industrialised West. Also in line with the declining trend of grain exports is the United Kingdom's failure to obtain more than 200,000 tons of Soviet coarse grain in the harvest year 1952/53 (as compared with one million tons in the previous year).

Prices, too, may come as a surprise to people who believe eastern grain to be cheaper than dollar grain. Soviet wheat usually costs considerably more than wheat purchased from the United States and Canada under the International Wheat Agreement: Soviet maize has also, in recent months, become about 15 per cent dearer than imports from America.

Among the three commodities under review, timber exports from east to west show the most precipitate decline of all. In 1951, western Europe drew from the eastern bloc only six per cent of its total timber imports, as compared with more than one-third of a much larger import total in the years 1935-38. Indeed, until 1949, western Europe was a net exporter of timber to the east, if Finnish exports of pre-fabricated houses to the Soviet Union are regarded as of western origin. According to the report, the explanation lies partly in the failure of Polish exports to revive, owing to greater home consumption and war damage; but most of all the onus rests on the Soviet Union. With the greatest timber resources in the whole of Europe, it has failed to export on anything like the prewar scale, chiefly because of bigger demands at home and what the report describes as "difficulties in reaching the planned output."

The position today is summed up in very compact form by the following table taken from the ECE Study.

Setting aside, for the moment, the West's actual experience with eastern trade, ECE has tried to measure what the Soviet bloc could contribute, if it were so minded. The report

EASTERN BLOC EXPORTS TO WESTERN EUROPE

	Hard Coal (million tons)	Grain (million tons)	Sawn Softwood* (million cubic metres)
Prewar average . .	11.6 (1937-38)	3.9 (1934-38)	7.0 (1935-38)
Postwar maximum	12.4 (1948)	2.2 (1949-50)	1.9 (1948-50)
July, 1951, to June, 1952	7.0	2.1	0.8

* Exports to western Europe from USSR, Czechoslovakia, Poland, Rumania and Western Germany.

estimates that by even a modest expansion in its current exports of the three key commodities, the Russian sphere would enable western Europe to make a substantial saving on dollar imports—a saving of perhaps \$300 million.

Whether an increase of this kind forms part of Soviet intentions is doubtful, in spite of the hullabaloo generated by the Moscow Economic Conference, where visiting delegates were promised a magnificent burgeoning of mutual trade. The Russians declared themselves ready, together with China, to double or treble the present volume of trade with the outside world. But, as ECE points out, their plans are not likely to be of special benefit to western Europe since the bulk of the increase was envisaged for trade with areas other than western Europe. The Soviet estimate of orders that the bloc might place in west European countries over a three-year period came to \$1 billion, while the corresponding figure given for imports of food and raw materials from South-East Asia, the Far and Middle East and from Latin America was \$2-3 billion.

After analysing the implications of speeches made at the Moscow Conference, ECE concludes that in the years 1953-55 the Communist bloc, including China, aims to raise its annual trade turnover with the outside world by at least 100 per cent. In the process the share of the Soviet Union, little more than 20 per cent in 1951, will rise to about 40 per cent of the new total. These targets may or may not be reached but at least they indicate the direction of Soviet thinking. But what the speeches left unsaid is how the Russians propose to pay for an increase in imports that would be roughly fourfold.

Time and Money at Uno

[FROM OUR UN CORRESPONDENT]

GIVEN the dimensions and implications of the Korean affair, it was probably inevitable that its discussion by sixty nations should last for at least six weeks. This has, however, completely upset the Assembly's time table, and it is now obvious that its political business cannot possibly be finished by December 20th. Present planning assumes that economic, social, humanitarian, legal and financial matters can be put through by the desired date, but that the two political committees must recess then, to return in late February or early March. By that time the new American administration will be in office, Senator Lodge will head the new delegation, and decisions should be easier.

Fortunately the extension of time demanded by the political committees will cost Uno members less than did the recess at Paris. That much the completion of headquarters has accomplished: it is no longer possible to make out a reasonable case for transporting a large secretariat to another city, no matter how attractive. There are even signs that the

MOULDY ROT

"MOULDY ROT" is a fungus disease that attacks the rubber tree and restricts its yield of latex—the substance from which rubber is produced. Growing on the tree where it is cut for tapping, this fungus has caused irreparable damage on plantations in Malaya, for it spreads rapidly and the fungicides used against it in the past did not always control the disease effectively. Working on the problem in 1946, the Rubber Research Institute of Malaya invited I.C.I. to collaborate in developing certain newly discovered organic compounds with fungicidal properties. I.C.I. Dyestuffs Division accordingly produced a number of experimental samples which were tested in the Hawthorndale laboratories of the company's agricultural research station at Jealott's Hill in Berkshire, and then sent out to Malaya. In comprehensive field trials carried out by the Rubber Research Institute, one of these fungicides—subsequently named "Fylomac" 90—proved entirely effective in controlling mouldy rot disease. Easily applied by spray and containing a violet dye to mark trees that have been treated, "Fylomac" 90 is now widely used in Malaya—the largest rubber-producing and dollar earning country in the British Commonwealth.

The oldest inhabitant

Somehow, he seems always to have been part of the village. None can remember it without recalling him, for his wise advice and local knowledge have helped both young and old.

For many businessmen, it is equally hard to think of Australia and New Zealand without recalling the Bank of New South Wales. For, as the oldest public company in the South-West Pacific, its experience and knowledge of local conditions are unrivalled. And as the largest commercial bank there, with over 850 branches and agencies, it can give every assistance to its customers.

For your ventures in Australia and New Zealand, consult and use—

They work for Brookes Biscuits, Catesbys, Elastoplast, Eversharp, Gaydec brushes, Intalok hospital mattresses and luxury seat springing, Lilia and Lilain, Needle Industries, Schweppes mineral waters, Slumberland, Tokalon beauty preparations, Williams & Williams windows.

glamour factor in Uno's budget may henceforth shrink. The flags, the guards, the big glass house, the flattering attention of visitors who at times flock in such numbers as to overflow the public galleries and crowd out the press—all this is glamour built in and hence less expensive. It is also true that the prospect of a new Secretary-General brings with it an opportunity to probe into old Secretariat empires and clear out sections which were important in the days of building up, but now become less important.

Just what the new budget will look like has not yet been determined, but the Fifth Committee is working toward a figure slightly smaller than the \$4.09 million appropriated in 1952. The British are urging that on the one hand the Assembly should go slow in recommending new projects, and that on the other the Secretary-General should cut administrative costs even further than he has promised. Early in November they suggested that Mr Lie undertake an "economy exercise" to see where he could take out \$750,000 if the committee decided that this must be done. The most frequently cited sources of economies include ECOSOC activities, the Technical Assistance Programmes, and the Department of Public Information.

At the same time the Latin Americans, who tend to defend all these activities and cry for more of them, have recently asked for the addition of Spanish as a working language in Uno. This will cost an additional \$350,000, a figure which will be a focal point of bargaining if the proponents of cutting have their way. The British hope to get Uno's budget down to \$48.7 million gross, which, when about \$6 million of income is subtracted, means a net charge to governments of about \$42.5 million for 1953.

The method of assessing contributions is also in flux. Since 1948, when it was decided that no country should pay more than a third of the total budget and none less than half of one per cent, the necessary revisions have been slow and bitterly contested. Russia, which so often boasts about its power and prosperity, in the Fifth Committee cries poor. Against its vigorous protests it was decided last year to begin a three-year phase of scaling up its contribution and that of the Poles, the Ukrainians and the Byelorussians. At the same time the contributions of Britain and the United States would slide down, and minor changes would be made elsewhere. If both a budget and a 1953 contribution scale are finished by Christmas the latter will probably show the Soviet Union to be paying 12.28 per cent (up from 9.85 per cent), while Britain pays 10.30 per cent (down from 10.56 per cent), and the United States pays 35.12 per cent (down from 36.90 per cent).

The Roman Question

[FROM OUR ROME CORRESPONDENT]

FATHER LUIGI STURZO, the pioneer in Italy about fifty years ago of a modern-style Catholic political activity, which has matured into the majestic Christian Democratic Party, advocated last spring a common front of all anti-Communist forces in the Rome local elections. That proposal would have linked Christian Democracy tactically with the Royalist and Fascist factions. Save to diehard anticlericals, who expect tortuous conduct from anyone in a cassock, the sight of Mussolini's dauntless critic counselling co-operation with the illiberal right appeared startling. Some said that Signor De Gasperi must have induced Don Sturzo to sacrifice his own reputation by putting his name to the proposal and letting the Premier turn it down before some irresistible personage in the Vatican pronounced in its favour. But though Signor De Gasperi reveres Don Sturzo, he seldom draws him into his counsels. More probably Don Sturzo, now 80 years old, has sincerely come to see the political scene in a new light. His proposal foundered, but doubtless before the 1953 general

elections more will be heard in Italy and in the Vatican City of the need to close the ranks against Communism.

The conservative group inside Christian Democracy known as "the Wasps" feel far closer to the Monarchists than to the Social Democrats. But even if the Monarchists as a whole broke a tactical alliance with the Fascistic Missini, who are rather strong meat for the Wasps, the acceptance of Monarchists (let alone Fascists) into a governmental bloc would alienate the electorally stronger Social Democrats—a painful and perhaps intolerable business for Signor De Gasperi. The Roman Curia itself seems to have decided on tactical grounds to restrain Professor Luigi Gedda, dynamic organiser of Catholic bids for the favours of the extreme right, from disrupting the prospective centre bloc next year.

The Pope's advisers are not satisfied with De Gasperian Christian Democracy as the political expression of Italian Catholicism, tied up as it is with a "lay" democracy, incarnate in three small but collectively weighty parties. Neither the old nor the young guard of militant Catholicism forget that Social Democrats, Liberals, and Republicans discreetly cherish an anti-clerical tradition. Indeed these "lay" groups lack even that technician's admiration for the Holy See's managerial capacities which the Communists have some times exhibited, and which has facilitated the speculation that Stalin, like Napoleon, might one day offer the Church a provisional business deal. Between the "lay" left centre and the Catholic left centre antipathy persists.

As for the Catholic "right," if one may use this term for the strictest guardians of Papal tradition, their nineteenth century alarm at the progress of individualist and parliamentary democracy has given way to a rather sardonic twentieth century contemplation of the democrats now at grips with "left" extremists, who have come round to sharing with Papal tradition an authoritarian and corporate methodology of politics. What wonder if even a democratic Catholic sociologist like Don Sturzo may have come to feel that political Catholicism can now argue with the "lay" politicians "from strength." So much has happened since the Liberal heyday of September 20, 1870, when the temporal power of the Roman Pontiff collapsed.

Catholic Self-Confidence

A newly self-confident tone from Catholic politicians in the present decade was altogether to be expected. The hierarchy has influenced the Italian state since 1945 far more powerfully than politicians and ideologies of recent generations would have deemed possible. The men of the Risorgimento believed that the political unification of Italy would be accompanied by a wave of religious enthusiasm, but save for the rather eccentric Gioberti the major Risorgimentalists either held with Mazzini that inspired poets and prophets would arise to outclass and silence priestly cults and dogmas; or they believed, more moderately, with Cavour and Ricasoli, that liberalism's triumph in secular Italy would set the stage for a liberal revolution inside the Roman Church. When those aspirations had begun to fade, Italian statesmen of the later decades before 1914 felt themselves to be building up a secular organisation of society in which the unchanging Church would play at best a secondary, specialised, and perhaps dwindling part.

Impotently resentful against the growing State's invasion of the educational and welfare domains of society, the Church disdained to utilise the new political techniques even for its own defence, until men like Sturzo, shortly before 1914, arose to demonstrate how universal suffrage could be employed to regain for Catholicism a grip on the modern world. The Catholic Popular Party, under Sturzo, severely shook the foundations of secular Italy in 1920. Yet Mussolini's subsequent reconciliation of the Italian State with the Church was effected in a confident belief that the State, having shed its liberal softness and taken on the hard armour of tyranny,

The shares of the Co-operative Permanent earn 2½% with income tax paid by the Society. But that is not all. You enjoy the other advantages of a safe and convenient investment, security for capital, and the right to withdraw at short notice.

To many people these are as important as the rate of interest, and by investing with this Society you can secure them all. Moreover, you have the solid background of a leading national society with nearly 70 years of service to the public.

could now afford to buy off the residual pugnacity of the Church by external homage and material payments, without loosening its own grip on the soul of the citizen. Thus the abnormal situation of 1870, whereby religion waged a subdued cold war against the State, was apparently rectified.

But in 1943 the Italian totalitarian State foundered. It left, as heir to the Fascist agreements with the Church, a Republic founded afresh but uneasily on liberal professions. The Italian Republic was far outmatched by the Roman Church which, transcending national limits, had eluded any taint of defeat. It is true that Italian Communism claimed not only to be free of the taint of Fascist Italy's defeat, but actually to be a victorious force leagued with the Red and the other Allied armies, capable, if trusted, of shepherding the whole nation into the victors' club. But this Communist overture was, with rather a close shave, rejected by the nation. With a similar close shave the overture of the Italian elements closest to the undefeated super-national Church was accepted, and they have been at the centre of Italy's remarkable re-emergence out of the chaos of 1943-46 into a situation almost of international prestige. The part played in withstanding Communism by the liberal and "lay" democrats has been important, indeed indispensable; but it has tended to be overlooked.

Formally speaking, Italy in 1952 has a parliamentary regime working on the same lines as that which Mussolini claimed to have swept aside for ever. But this regime owes its existence more to external defeat than to the operation of intimate tendencies. This Italian parliamentary Republic of the mid-twentieth century is dominated not, like the liberal Kingdom of 1860, by men with a naive belief in the infinite utility of free institutions to the cause of progress, but by men who prize these, perhaps, as one of various alternative legitimate methods of exercising political power. It is not meant that men like Sturzo and De Gasperi are merely opportunistic friends of freedom. They have with obvious sincerity put their hearts into a theory of Catholic liberalism or democracy. But oncoming generations of fervently Catholic politicians will have rather less motive than these pioneers to emphasise the compatibility with Catholicism of a liberal democracy which is no longer the triumphant doctrine of a "lay" majority. The powerful non-Catholic political force today appears to be authoritarian Communism, and one may expect the Churchmen to try diplomatic as well as polemical methods in dealing with such a rival.

Realists in the Vatican

An intellectual and ethical class which sets high store upon civil liberties and upon the honest reflection of public opinion in representative government (as contrasted with those who are interested in liberty only as a method for conquering the State and dominating exclusively) will be taken rather less seriously by the realists of ecclesiastical Rome, though the support of a wealthy and buoyant America, co-operation with France in federal European institutions, and good relations with Great Britain can somewhat aid their cause.

It is possible to hope that Italy may resist fresh currents tending to carry it—in this or in that direction—as much away from the ideals of the Liberal Risorgimento as these in their day carried it away from the reactionary traditionalism of Gregory XVI. The fact of a Christian Democrat predominance in Italian politics ought, notwithstanding some dangers incidental to it, to be accepted as desirable in the present stage by those who want a stable Italy for their partner in western civilisation. The political Italy built up by the schools of Cavour and Mazzini was obviously incomplete, in that it failed to win the loyalty of such a notable class of Italians as the hierarchy and the theorists of Catholicism. It would be a narrow outlook upon the problems of Italy to deplore the reinforcement of national unity by the ending of the schism between Church and State, and this necessarily meant an influx of militant and even mildly

vindictive Catholics into politics. What would be regrettable would be the loss by political Catholicism in Italy of the tentative synthesis with the liberal and democratic tradition which Signor De Gasperi has both exalted in words and also, in a considerable degree, made the basis of his actions. For such a loss would face the most thoughtful Italians with tormenting problems of conduct.

Jerusalem Answers Prague

[FROM A CORRESPONDENT IN ISRAEL]

NOT since the struggle for independence has Israel been in such a state of tension, worry and anger. The venomous attacks on Zionism in the Prague trials have aroused great anxiety and dismay over the fate of the remaining Jews in eastern Europe; it has also thrown into sharp relief one of the great sources of domestic political tension in Israel. This is the split in the ranks of Labour Zionism. This is not new, but it has been made more bitter and dangerous by the dominance of moderate Mapai in the Government and by the concentration of the extreme left in Mapam (United Workers' Party). This cleavage has prevented a clear Socialist majority in the Knesset and has thereby forced Mapai into a most unsatisfactory alliance with the religious bloc; it has created a source of blind and ruthless opposition propaganda; and—most serious of all—it has cut off some of the finest of the country's youth from the rest of the community.

Mapam, and in particular, its central constituent group, *Hashomer Hatsair*, arose out of the ideological quandary in which certain Jews, chiefly from eastern Europe, found themselves. They were at once Marxists and Zionists; they would have accepted the dictates and discipline of the Communist party had they not simultaneously believed that the Jewish problem could not be solved by the otherwise sovereign remedy of revolutionary socialism and proletarian dictatorship. As a result they have spent the last thirty years expressing their vast contempt for all other Zionist parties; at the same time, they have tried hard to convince orthodox Communists that they are really on their side.

Today, the Israeli Communist Party proper, which is a somewhat isolated political group, is largely dependent on Arab votes and therefore has to concern itself with what interests the Arabs. Mapam has thus been put in the position of unofficial, and probably unwanted, spokesman for the satellite bloc in eastern Europe. So long as Cominform policy was only incidentally anti-Zionist, this position was just tenable. But with the Prague attacks on Zionism and on Mr Ben Gurion and others, a major political storm has arisen.

A Bitter Debate

It was probably these domestic considerations, much more than the stories of Mr Ben Gurion's plots with the Americans and such-like, that prompted the Government to raise the matter in parliament. The occasion was an official denial of the charges levelled against the Israeli Government in Prague. The bitter debate which followed turned into a judgment on both Prague and Mapam, for the Government was clearly determined to make as much political capital as it could and, if possible, to force wavering members of Mapam to change sides. The Knesset has rarely been so agitated or the atmosphere so tense. The members of Mapam contented themselves with an assertion of their belief in "popular democracy" and a denial of unswerving support for "the extreme left-wing of approval of Prague. They expressed their belief in the innocence of Mordechai Oren, the extreme left-wing Israeli journalist who, after nearly a year in a Czech prison, was produced as a witness at last week's trial and confessed

to impossible, subversive activities. At Mapam's further declaration that they sincerely wanted Oren's safe return, one deputy shouted "Are you ready to go to Prague to free him?"

The Government speakers concerned themselves chiefly with heavy attacks on Mapam: on their inconsistency; on their own contribution to the anti-Israel propaganda in eastern Europe; on their extraordinary assumption that Oren was innocent while all the others were guilty of the crimes they confessed to; on their ingratitude to Clementis, who had probably done more for the State (by facilitating the supply of arms in 1948) than Oren, and so on. The bitterness of Mr Ben Gurion and other Government speakers reflected accurately enough the unhappy party situation.

It would be rash to expect a speedy break-up of Mapam under the weight of the attack and the feeling in the country. Even if elections were held immediately, it is doubtful if they would lose more than a few of their 14 Knesset seats. Their strength is largely based upon the collective settlements, whose members are indoctrinated, passionate believers in their cause. They, and their essentially more dangerous fellow-travelling associates in the towns, are not likely to swerve quickly from their allegiance. They will only be impressed, not by one crisis but by an accumulation of incontestable evidence, of which the Prague trial is a new sample. Indeed, the process of disintegration in a section of Mapam has been going on for some time without the party being deeply damaged. Two members of the parliamentary party crossed the floor last February. Others of the leaders, particularly in the *L'Achduth Haavodah* faction, have become increasingly uncertain about policy. But there has been no real split, no party crisis, and the series of small defections has only strengthened the hand of the pro-Soviet group led by Dr Moshe Sneh. Yet even they feel the need for caution over an issue so deep and so tragic as the fate of the Jews in Soviet hands—for that, it is believed here, is what is at stake now. That is probably why they voted against the Communist-sponsored motion at the end of the debate in parliament and why they have publicly taken great pains to reassert their loyalty to Zionism. But whether Mapam will actually take the great step of declaring that the Soviets, not they, have wandered from the faith, is far from certain. The trial in Prague has brought that a little nearer; that is all.

Across the Limpopo

[FROM A CORRESPONDENT LATELY IN SOUTHERN RHODESIA.]

MOUNTAINS like crouching lions, their forepaws foothills, are scattered about a vast plain, under a vaster sky. The scene is almost Dali-esque. Across a slow-rolling river where hippos sometimes wallow, spanned by a steel bridge, the scenery changes: first to thorn-bush country, then to bald granite kopjes, lastly to softly rounded hills clothed with the shimmering jade or deep bronze of *msasa* trees. The change is not merely physical. Crossing the Limpopo, going north, one immediately enters a different atmosphere. The Rhodesians view their South African neighbour with the wary distrust of a hard-working citizen who suspects that the large and prosperous looking house across the street is really a high-class brothel. Johannesburg is regarded as a get-rich-quick town full of confidence tricksters and shady night-clubs, with no real stability. The Union as a whole is looked on as a rumbling political volcano.

Rhodesia, compared with the Union, is still a pioneering country. Since the first white settlement, only 62 years ago, life until quite recently was very hard indeed. The original pioneers of 1890 had to break their backs merely to survive. Fever and rinderpest killed off their cattle; malaria killed off their children. The colony encountered one setback after another. It began to get on its feet after the first world war,

only to be knocked flat again by two depressions. Prosperity did not really come until the late nineteen-thirties. It is still too novel an experience for most Rhodesians to take it for granted.

While it would be an exaggeration to say that South Africa and Southern Rhodesia are as different as chalk from cheese, an unmistakable difference exists. Southern Rhodesia has as yet no whiff of moral decay about it. The yellow sunlight that floods bush and *kopje* seems to have an antiseptic quality. Rhodesia appears a more wholesome, less complicated country than the Union. The racial climate is certainly healthier. Though still a servant of the white *baas*, the black man in Rhodesia seems less resentful than the black man in South Africa. The difference is almost entirely psychological, for segregation is just as rigorously practised in Southern Rhodesia—and for that matter in Northern Rhodesia—as in the Union. Nevertheless in Rhodesia there seems to be far less hostility between white and black than there is in the Union. "Segregation" is still not quite *apartheid*.

Conscious of the—rather intangible—advantages which "their" natives enjoy in comparison with natives in South Africa, the white Rhodesians are correspondingly irritated

that so many of "their" natives should want to go south. The fact remains that most South Rhodesian natives, given the opportunity, go like a shot. They are attracted in particular by Johannesburg, in the same degree as nearly all white Rhodesians are repelled by the place. The reason is tragically simple. The Rhodesian natives know that, in South Africa, wages are in general much higher, while the cost of living is at least no greater. This increases the white Rhodesians' dislike of the Union: like all whites everywhere in Africa, they are perennially short of black labour. It is not so long since Rhodesian farmers were bitterly upbraiding Transvaal farmers for luring "boys" across the border, by offering the "preposterous" cash wage of 30s. a month as against Rhodesia's 10s.

The real answer of course is greater economic development; and both the Rhodesias are expanding economically. It is claimed that in five years the national income of Southern Rhodesia has increased by over 80 per cent. But Rhodesia's income per head is still not much more than half South Africa's. Further expansion requires more transport, and more power—which means more capital. This is one of the arguments for federation. It is believed that federation would bring the required capital more quickly and in larger volume.

The white population of Southern Rhodesia has increased by 63 per cent, to 150,000, in five years; more than half is now crowded into the three towns of Salisbury, Bulawayo and Gwelo. The influx has created other problems besides an acute shortage of housing. Many immigrants came from South Africa, and a large number were Afrikaners. When it was found that they tended to bring their uneasy nationalist politics with them, Sir Godfrey Huggins's Government put a brake on this Afrikaner influx. The step did not improve Rhodesia's relations with the Union. The Rhodesians found that the immigrants pouring in from Britain also jarred. "All they want are fish-and-chip shops and cinemas," said a Rhodesian bitterly. Another said bluntly: "Some of these people come here expecting to have a soft life. They never had servants before. Now they have black ones and try to put all the work on them. If anything goes wrong, they blame the natives—or 'this damned country.'"

These are common complaints against the British immigrants. For their part, the immigrants accuse the Rhodesians of being aloof and "cliquey." Until quite recently the Rhodesians formed a small white aristocracy. As one writer has significantly put it, the original pioneers were mostly drawn from "the clubs, the shires, the professions and the army." But all this was changing even before the first rush of postwar immigration. A natural white aristocracy, with aristocratic virtues as well as vices, was already becoming merely a pigmentocracy. The immigrants have only made this obvious. The average cultural level of the enlarged white population is no longer that of Victorian gentlemen. Its sentimentality however is not extended to natives. Most Rhodesians think British preoccupation with African rights insane. This view is quickly adopted by many British immigrants within a few weeks of their arrival in the country. "In the sphere of native policy," says a cynical South African, "the only difference between Rhodesia today, and South Africa, is that the South Africans call natives 'damned Kaffirs' and the Rhodesians call them 'damned munts.' The Rhodesians are Nationalists who happen to dislike Afrikaners."

If this is not quite correct, it is because Southern Rhodesia's native policy has not so far been shaped by average white opinion. The aristocratic tradition has been maintained in politics. With a fine disregard for the views of the average white voter, native policy has been made by reasonable-minded politicians and enlightened administrators. This is now in some danger. The immigrants are by no means on the side of the angels. If they resent the older Rhodesians' "aloofness," it is only because they see no reason why they should not automatically qualify for all the privileges of the pigmentocracy, admission to whose ranks ought, they feel, to be assured merely by their possession of a white skin. Rhodesians would prefer to continue the pretence that the white community is a sort of Brook's Club with the right of admission strictly reserved. This is the real cause of friction between older settlers and new immigrants.

In Rhodesia, race relations have not yet hardened. The situation is still so to speak plastic. But this is largely due to the wise direction of the men like the Prime Minister, Sir Godfrey Huggins. Whether their school of thought will continue to guide and mould events remains to be seen. Those who do not wish to see British Central Africa following the Union into a *cul de sac* of race chaos must hope that federation will be achieved, but in a form capable of opening up new vistas of racial co-operation.

Correction: In the article on "Party and State under Stalin," published in this section on November 15th, the number of probationary members (i.e. candidates or alternates) of the Central Committee of the Communist Party of the Soviet Union was wrongly given as eleven. It should have read: **111.**

"...and this is the site for the new bay..."

The preparation for the extension of a factory may be the first step to higher, more efficient production. The second step often rests with Vickers, for the Vickers Group is one of the great world-wide organizations which can do much to ensure the success of new developments. Companies within the Group manufacture plant for a great many industries. The design of their products, often embodying the experience of many lifetimes, goes a long way towards providing the efficiency that crowns a new industrial project with success.

Products of the Vickers Group include: INDUSTRIAL TRACTORS, SCRAPERS AND DOZERS • SURVEYING AND OPTICAL MEASURING INSTRUMENTS • CONSTRUCTIONAL STEEL WORK • CEMENT MACHINERY • RUBBER AND PLASTIC PRODUCTS

We've solved some problems in our time!

TIME—1939: PROBLEM—the magnetic mine. The answer came quickly: sweep with a loop of cable carrying heavy impulses of direct current, thus generating a magnetic field to detonate the mines. But the means? Every available mine-sweeping trawler must be fitted *at once* with batteries capable of enormous output—3,000 to 4,000 amperes at 150 to 200 volts. That was Chloride's part of the problem.

¶ The trawlers got their equipment. Car batteries by thousands, with new connections hurriedly burned in to put the cells in series-parallel, provided each ship with a fearsome make-shift battery of 1,134 cells. Later, our special 400 volt mine-sweeping batteries, designed for the job and produced in very great numbers, made sweeping safer and more certain. But the magnetic mine, as a decisive weapon of war, was already beaten—by brave men and a battery that looked like an 'electrician's nightmare.'

¶ For over 50 years we have been designing & making special types of Chloride, Exide and Exide-Ironclad Batteries for every branch of industry, transport and communications. Our battery research and development organisation, the largest & best equipped in this country—if not in the world—is at industry's service always: ready at any time to tackle another problem.

THE BUSINESS WORLD

Prospects for the Gold Price

RUMOURS about a possible increase in the dollar price of gold have waxed and waned throughout the postwar years with almost monotonous regularity. At the moment they are waxing more strongly than ever before, and this has been marked on world stock exchanges by a revival of activity in gold shares. The most compelling reason for this renewed speculation has been the convening of the Commonwealth Economic Conference. No conference that is attended by a South African delegate can avoid some discussion of the gold price, and on this occasion Mr Hayenga's voice will not be crying in the wilderness. He is certain of active support from most of the other delegations at the conference. Some of the other Commonwealth countries—such as Australia, Canada and Southern Rhodesia—are themselves gold producers; while no Commonwealth Government can now disregard the advantages that would accrue from an increase in the \$500 million odd of annual current income that the sterling area derives from its gold production, and from an expansion of the wholly inadequate dollar cushion represented by existing gold reserves outside North America. It is, therefore, more than probable that some resolution in favour of a rise in the world price of gold will emerge from the conference.

The conference may propose on this subject, but it will be for the United States to dispose. What disposition is the new American Administration likely to make? At first sight, at any rate, the prospects do not look very rosy. Any hopes aroused by the disappearance from the Treasury of Mr John Snyder, who so often and so resolutely opposed any increase in the dollar price of gold, seem likely to be disillusioned as more becomes known of his successor, Mr George Humphrey, and of Mr Joseph Dodge, who has been appointed by the President-elect to be the "link-man" with the Bureau of the Budget during the interregnum and who is clearly destined to be one of the principal financial advisers to the new Administration. Mr Humphrey is a lawyer—the new Administration. Mr Humphrey is a lawyer—the new Administration. Mr Humphrey is a lawyer—the new Administration. He has recently claimed to have been "a supporter of Taft from the first time he ever ran for office," and as such he may be among those Americans who still feel it appropriate to blush with shame for what was done to the gold parity of the dollar in 1934. Mr Joseph Dodge is an austere, orthodox Detroit banker who, in his excursions into international affairs, has two severe and successful monetary deflations to his credit—that of the Deutsche Mark and of the Japanese Yen. Both these deflations were eminently sensible and necessary, and there is no logical reason why the author of them should be opposed to an inflation of the gold price. But as circumstances alter cases more frequently than they alter temperaments, there are grounds for fearing that he will be.

The rest of the Eisenhower Administration is heavily weighted with business men—and the views of the American Chamber of Commerce in London may be

representative of the views to which these business men may incline. It is worth while, therefore, to quote in full the comments made by this Chamber in its recent pamphlet on the problem of dollar-sterling imbalance.

There is one thing the USA should not do, and that is to increase the dollar price of gold. There is constant agitation, particularly by gold-mining interests and investors and speculators in gold-mining shares, to induce the United States to raise the dollar price of gold. More responsible circles are now advocating an increase in the price of gold to assist in correcting the imbalance between the dollar and the sterling areas. The Board of this Chamber is unalterably opposed to raising the dollar price of gold because in its judgment it would provide only a superficial and largely temporary alleviation in the dollar-sterling imbalance. It would not solve the fundamentals of the problem. Besides, it would damage confidence in the US dollar. Further tinkering with the parity of our currency would not only destroy its integrity but would have thoroughly bad psychological and inflationary effects on our monetary system.

Other influential American voices, it is true, have lately sung a different tune. In his recent Stamp Memorial Lecture in London, Professor John Williams recognised that the rigidity of the dollar price of gold in relation to other commodity prices was one of the prime causes of the sterling area's postwar dollar deficit. He mentioned the fear of inflation as the main American objection to an increase in the gold price, but agreed that "under conditions of modern central banking there should not be over much basis for such a fear." And he concluded by a somewhat hesitant support of the case for a higher price: "I do not say I would welcome such a change from an American standpoint, but I would not weigh my objection too heavily if there were a clear case for it as part of the American contribution to a basic solution of the dollar problem." This is very non-committal and conditional support and, even allowing for Professor Williams's high position and influence in the United States, it would be unwise to interpret his remarks as the harbinger of a real change of attitude by those who make policy in Washington.

The fact must therefore be faced that any plea for an increase in the gold price may still fall on stony ground. The new American Administration may stress, in the first place, that this is not a time at which the forces of inflation should be encouraged. It is true that the effect of the revaluation of the US Treasury gold stock on the domestic banking and credit situation could be neutralised (though some Americans believe that it would be more difficult to neutralise the psychological effect of the devaluation of the dollar). But the Americans' main objection is that what could not be offset would be the stream of increased dollar purchasing power that would be put into the hands of sellers of gold in the United States. The exercise of that purchasing power, they argue, would be bound to have some expansionist or inflationary effect on the American economy. There is, of course, some confusion of argument here. The

expansion of internal US demand arising from an increase in the gold price would be tiny, even when allowance is made for the multiplier effect; US production of gold last year was only \$59 million. The main effect of an increase in the gold price would be that foreign demand for US exports would be stimulated—or, if aid ran off to an equivalent extent, maintained. Any measure that stimulates foreign demand for American exports—whether it be classified as trade or aid—must, of course, have some inflationary consequences in America; there is really not much more in this side of the argument than that.

If, however, an increase in the price of gold is recommended to the United States merely as a veiled and more decent manner of giving assistance to the non-dollar world than the recent technique of "hand-outs," another awkward question will have to be faced. If all that is involved is assistance, the Americans may well ask, would not every interest, including that of the United States, be best served by giving the dollars to the deserving and not to those who happen to be large producers or holders of gold? It will not be forgotten in this context that Russia is a large producer and holder of gold and would, therefore, be one of the incidental beneficiaries of an increase in the dollar price of the metal. The United States may also justly argue that there are better things to do with scarce capital equipment and resources than to divert them at this moment to encouraging the production of gold. This is perhaps the strongest part of the opposition case.

There remains, too, the basic argument that gold is still a monetary metal and the standard by which values are measured. If the principal countries of the world begin to move the currency price of gold up and down with the general level of commodity prices, why, it will be asked, use gold as a standard at all? Why in these circumstances place on the Federal Reserve system, or any other monetary authority, the obligation to buy gold at stated prices and in unlimited quantities? The gold producers, it may be said, should be faced with the choice of producing either a monetary metal or a commodity that fluctuates in price as other commodities do. In these circumstances, gold producers would be very silly indeed

to choose the latter—to choose to be left to the tender mercies of a free market with no floor, with no obligation on the part of central banks to buy at fixed prices all the gold that is offered to them. Gold producers should have learned this lesson from their experience in the last year. Thirteen months ago, when gold could be sold at over \$39 an ounce on the free markets, it still seemed possible to argue that the official price of \$35 an ounce was well below the price that the world was willing to pay for the metal. But it is now clear that the high prices that ruled in the free gold markets in 1951 and earlier years were due to the artificial restrictions on the supply of gold to that market that were imposed by the International Monetary Fund. As a result of the loosening of those restrictions towards the end of last year, the price of "free" gold has recently fallen below \$37 an ounce, a figure at which there can be very little inducement to take the trouble and incur the expense involved in preparing the metal for sale in the free market.

There are, therefore, some weighty and logical objections that can be raised against any proposal to increase the dollar price of gold at this moment. But they are not overriding objections. The basic fact remains that if international trade is to be expanded, then international liquidity needs to be increased. It is easy to conceive better ways of increasing that liquidity than by raising the price of gold, and it is true that any rise in that price would not solve the whole problem; it could be only a supporting arm in the array of weapons needed to blast the way forward for a lasting advance to freer trade. In present circumstances, however, even a slender chance of deploying such a supporting arm should not be ignored. If trade had been more evenly balanced since the war—so that no one country had been left as the main residual purchaser of monetary gold in conditions of both boom and minor recession—it is likely that most governments would have agreed that an increase in the gold price, and the injection of liquidity consequent upon it, would have been to their mutual advantage. The Commonwealth Prime Ministers will, therefore, be wise if they make their expected plea for an increase in the gold price. But that does not necessarily mean that speculators would be wise to expect that any such plea will be successful.

How Thrive the Armourers?

IT is only at the worst of times that a Royal Ordnance Factory can work to full capacity; and since it supplies weapons at cost, it can never make a profit. These facts of life in the ROFs can hardly be expected to inspire the men who have to work in them, run them, and direct their activities. They also handicap any independent scrutiny of ROF operations according to ordinary business principles—for instance, by the Select Committee on Estimates of the House of Commons. Yet the factories have to be run with as little inefficiency as possible, and costing criteria have to be evolved. They employ public funds, yet are shrouded from the public gaze by an unevenly opaque veil of security. So they constitute an obvious field of expenditure to be policed by the Select Committee. And from time to time, one authority or another—their master, the Minister of Supply, or the partially informed Parliament—must make major decisions about their future. One such decision now impending concerns the oldest state

munitions establishment—Woolwich Arsenal. But the ROF organisation as a whole presents certain larger problems.

The Royal Arsenal developed from an armoury, and originally a naval dockyard, that existed at Woolwich in Tudor times, and during some lengthy periods thereafter almost the whole of the state's munitions capacity was concentrated there. In the period of disarmament after the first world war, the Arsenal was almost the only official reserve of arms potential for which successive Parliaments were prepared to find the money. Its main value as a reserve resided probably in the cadres of staff, foremen, and craftsmen—whether formally skilled or simply accustomed to the job—whom it kept employed on a trickle of output and the servicing of equipment. It was from the Arsenal's three main factories—making and filling ammunition, making guns, and making gun carriages—that the key men were drawn in the mid-thirties to plan and open up the new "green-

field" ordnance factories built in the provinces to expand and decentralise Britain's specialised munitions-making capacity. But the Arsenal's three square miles on the edge of the Thames were highly vulnerable, and with the erection of the new specialised factories there remained little that could be done effectively only at Woolwich. It was kept busy during the second world war, but since then it has been comparatively idle.

Rearmament in 1950 posed anew the question that the second world war had postponed: to what extent should the increasingly vulnerable Arsenal and its reserve of skill be employed upon the new defence programme? In practice, a certain volume of extra work appears to have been put upon the Arsenal in the first year or so of the production programme, particularly in special work to assist the expansion of arms output in other ordnance factories; but the Select Committee was told that "Certain aspects of it appear to have passed their peak," and agreed that "people do not quite know what to do with Woolwich." At the time, just over 9,000 people were employed in the factories that cover 1,312 acres there—about seven persons to the acre—while the remaining 849 acres are used for storage or occupied by "lodger units" from the armament branches of the services. In a number of workshops about half the machine tools seemed to require major overhaul, and about a quarter were fit only for scrap. The costing of this hive of under-employment is less than realistic: the Select Committee reports:

No figure for rent or interest on the capital value of the land occupied is included in the manufacturing accounts of the Royal Ordnance Factories. . . . It seems likely, therefore, that the true costs of production at Woolwich are never recorded and that the uneconomic nature of the vast site occupied is in this way concealed.

It is not altogether surprising if in the Ministry, as the Select Committee concludes, the Arsenal is regarded as "something of a white elephant." In April its activity was estimated by the Ministry at 40 per cent of its single-shift capacity; "no great expansion" was expected. The Arsenal has experience in making guns, carriages, mountings, tanks, shells, cartridges and in filling ammunition. But it would hardly seem qualified to go in for the production of specialised machine tools for munitions as a central workshop for the ordnance factories—one suggested new role that was mentioned by the Select Committee in its recent report.*

Woolwich is a special case, on a vulnerable site and no longer essential to any particular branch of armaments production. But the problem that it presents for the Ministry of Supply is partly one of maintaining reserve capacity; and to a large extent the administration of the ordnance factories as a whole is an extension of that same responsibility in the factories actually operating as well as the eight others retained on a "care and maintenance" basis. Not all of the 21 active factories, it is worth noting, are busier than Woolwich, though some of them are becoming much busier. The two factories producing tanks are being brought up to more than full single-shift capacity; and there is heavy pressure upon four others producing certain guns, 20 mm. ammunition and its filling, and the explosive picrite. Production of small arms and their ammunition remains low, because stocks are fairly adequate to meet the planned demand.

*12th Report from the Select Committee on Estimates, Session 1951-52. The Royal Ordnance Factories. Stationery Office, 9s.

As a whole, the factories today are employing about 50,000 people, against an estimated single-shift capacity of about 120,000 and a multi-shift capacity of some 200,000; during the war, when 44 ordnance factories were in operation, they employed at their peak 340,000 workers. Despite even the increased activity of the current rearmament programme—and the evidence of ordnance factory output given to the Select Committee pre-dated announcements that the programme was being curtailed to take the weight off engineering—it does not appear likely that much more than half the total single-shift capacity of the factories is likely to be required in production. Any radical developments in the design of weapons may tend, in the short run of the present programme at least to reduce the demands these factories can satisfy. Nor does it seem that these factories, specialised for the quantity production of fairly conventional weapons, could take much of the load of producing other armaments off private defence suppliers.

Other considerations that remove the ordnance factories' production of weapons from the sphere of ordinary production management arise from their special

relations with Service users. These users are responsible for inspection both of the finished products and of the manufacturing processes; and while stores for the Army and RAF are inspected by the staff of the Chief Inspector of Armaments, whose salaries are paid by the Minister of Supply, the Royal Navy has a separate inspectorate responsible not only for inspection but for the design and development of all naval ammunition. In the ammunition filling factories, these two separate inspectorates employ large staffs—amounting together to one inspector for every 4.3 workers. Even where the stores concerned are common to military and naval users, the Admiralty insists upon its separate inspections, and hence upon separate stocks of materials and components, partly upon the ground that the ordnance factories pay their filling workers by results, a practice that is not allowed in naval ammunition establishments. The Admiralty also argues, quite justly, that ammunition that will have to be stored in the confined spaces of a ship's magazine, where it might endanger men and vessels, needs more rigorous inspection than ammunition that can be stored more

safely on land. Little progress has been made with the mechanisation of inspection methods, and a prejudice has grown up against "controlled inspection," the more conventional system of giving the factories the responsibility for their own inspection, with perhaps a few Service inspectors on the spot. This system was tried at one ordnance factory during the war, and failed, setting up the prejudice against it that still lingers. But without it, or at least without a system of "uniform inspection" by which all common-user stores could be manufactured to the more exacting standards of the Admiralty and only one Service inspectorate employed generally in a factory, it is difficult to see how inspection can cease to disorganise production and to waste public money.

None of the problems that the Select Committee has emphasised are new to the Ministry of Supply, which in recent years has been altering the structure and methods of management throughout its nucleus of ordnance factories. Until the beginning of this year, the headquarters was organised under a Director-General of Ordnance Factories, who was responsible to the Controller of Supplies (Munitions) of the Ministry. Under him the factories were divided into four groups, covering explosives, ammunition, filling, and "guns, carriages and tanks," under separate directors, while specialist directors were responsible for accounts and for "engineering"—the servicing of the factories and the installation of plant. The Chief Superintendent of Woolwich Arsenal, with its three different factories, was on the same level as the production directors, and while the superintendents of all other Royal Ordnance Factories came under the director covering their particular types of production, the superintendents at Woolwich formed a separate, mixed group under their chief.

The organisation receives its orders—in ROF jargon "extracts"—from the directors-general of particular branches of munitions production in the Ministry, who have to decide how much of a given armament demand shall be placed with private manufacturers and how much with the ordnance factories. The "extracts" are passed down the chain of command to the appropriate ordnance factory; the arms production directorate at the Ministry has the formal responsibility for arranging the timely supply of materials and components, while the factory's demands for plant and machine tools are scrutinised in the ROF directorates and, if approved by the Ministry's finance branch and the Treasury, are ordered through the Contracts branch of the Ministry. For the present, tool demands have also to be sanctioned by the Controller of Machine Tools at the Ministry.

The allocation of arms orders between private industry and the ROFs depends to some extent on price, but direct competition for the same type of work is not very common, and the Ministry is hardly likely to allow the factories to stay very short of work while any of the munitions they can make are being ordered. The factories are credited annually, through appropriations in aid, with the value of the stores supplied to the Service departments at the prices fixed when the order is given; but any loss incurred through quoting low prices to obtain orders, or otherwise, is presumably recovered through the annual ROF vote. External pressure on efficiency, therefore, is largely absent; the efficiency must depend on internal

costing and financial control. A revised system of factory budgeting, introduced in 1949, is now standard throughout the organisation. Budgets covering every item of overhead and direct production costs are prepared, and eight times a year comparisons of actual with budgeted costs are sent to headquarters. This costing system, designed mainly to watch overheads, since standard production costing is not applicable to large sections of ordnance factory work, reaches right down to the shop managers and foremen. It does appear to have improved "cost-consciousness" throughout the organisation. The ordnance factories have had to replace the normal spur of profit with a team spirit and pride in efficiency; and anybody who has visited one knows that this rather "regimental" kind of loyalty does exist.

Nevertheless, a committee set up at the end of 1950 by the then Minister of Supply to investigate the organisation and control of the factories—which presumably had greater opportunities than a Select Committee for making a full investigation—recommended most radical changes. Its report has not been published; the Select Committee notes that its main theme was that

the factories should be divorced from the control of the Ministry of Supply and should be made into a self-contained corporation responsible to the Minister and run in the same way as most of the nationalised industries.

It is impossible to discuss this rather remarkable proposition without the committee's arguments; but it hardly seems surprising that the Minister did not accept it. In default of such a radical change, the committee recommended other changes; and the alterations in the ROF organisation that the Minister has since made are understood to be in accordance with some of them. These include the creation of a board of management for the factories, under the chairmanship of the Controller of Supplies (Munitions), and including not only the Director-General of Ordnance Factories, but two representatives drawn from industry outside. This board now reviews policy; a second executive board, under the chairmanship of the Director-General, including the ROF production directors, the chief superintendent of Woolwich Arsenal, and other officials of the Ministry, is concerned with more detailed direction.

The board of management, which has now been in existence just over six months, will have the main responsibility for decision upon the future of the Royal Arsenal, and such questions as inspection, the better organisation of machine tool purchases, the independent spending powers of factory superintendents, and other points that the Select Committee has raised. Following the board's advice, the Minister may soon be able to announce decisions about Woolwich and about inspection. It might be useful if he were able at the same time to say something about the special weaknesses that led his confidential committee to recommend such radical changes in ROF organisation, and about the degree to which he hopes the new boards will solve these problems.

FACTS, FIGURES, AND OPINIONS

TOBACCO: In the 17th century there were over 6,000 tobacco plantations in Devon, Somerset, Gloucester and Oxford alone, a state of affairs which led the Virginian planters to make an agreement with the English Treasury by which they paid a duty on Virginian tobacco in return for the prohibition of tobacco cultivation in England. Thus Virginia gained an outstanding position in the trade, and it was not until the early years of the 20th century that Southern Rhodesia entered the lists against her. So successful was the experiment that today Salisbury is probably the biggest tobacco market in the world.

*In the tradition
of things well done*

Down the centuries, the art of the gold and silversmith has ranked among the finest in the world and today it provides a valuable source of revenue from Overseas markets, where demand for this fine craftsmanship is heavy. Karachi, situated in the Sind Province, is famed for this kind of traditional work and, like so many centres of Eastern commerce, its industrial and domestic banking needs are served by the National Bank of India. For almost a century the National Bank of India has continued to further the interests of those concerned with Eastern trading and is, in consequence, well equipped to advise on any such matters. Your enquiries will be welcomed at the Head Office of the Bank, or at any of its branches.

carries the curve back to the 1951 level (the index for October, 1951, was 121). Detailed figures of production by industries are not yet generally available for later dates than July or August, and so do not reflect the apparent change of trend. But the component groups of the official index show that September's (mainly seasonal) advance upon August was primarily due to the manufacturing industries: the index for this wide group rose by 17 points to 115, a slightly larger percentage movement than the similar rise (to 124) twelve months earlier. In building and contracting and in mining and quarrying, the advance was less pronounced than in September, 1951, though it was appreciably larger in gas, electricity and water.

It would be unwise, perhaps, to base firm conclusions about the future trend on the evidence of the indices of these two months—September and October; comparisons, even from one year to another, that relate to periods that include or immediately follow the slack summer season may be unreliable as guides to the future. Moreover, it is noteworthy that the good showing of the provisional figure for

October, by comparison with 1951, is partly explained by the fact that the long-sustained rise in the volume of production entirely stopped in the fourth quarter of that year—and October showed no increase at all over September. Finally, it must be emphasised that the improving trend has almost certainly been mainly due to the recovery of the consumer goods and other lighter industries that formerly were most depressed. Disinflation is easing before it has done its full job.

Credit Expansion Continues

This year's rising trend of bank deposits, which slackened in October under the influence of the Government's conversion operation, grew steeper last month. During the five weeks to November 19th net deposits of the clearing banks rose by £32.9 million to £5,974 million, a movement that contrasts with a fall of £8 million in the corresponding month last year, with a rise of £24 million two years ago and a fall of £3½ million in 1949. Once again, the credit expansion proved to be wholly attributable to an increase in borrowings from the banking system by the central government, since supplies of credit to the private sector of the economy were further reduced during the period. Aggregate bank advances, which have fallen continuously since last April, dropped by a further £3.5 million (to £1,744 million, or £209 million below their peak), while portfolios of commercial bills contracted by another £4½ million (to only £57 million, in contrast with £187 million in February last). Investment portfolios, too, were slightly reduced. These figures suggest that the Government's demands upon the banking system expanded during the month by some £45 million, whereas in the corresponding month last year they declined by about £14 million.

This latest increase in governmental demands arises only partly from the growth of the Treasury's current domestic

deficit. The trend of this deficit is still showing a deterioration by comparison with last year, but the difference has been a good deal smaller than the increase in borrowings from the banks. In the five weeks to November 22nd (the period most nearly comparable to that covered by the banking figures) the Exchequer showed an "overall" deficit, including issues to sinking fund, of just over £14 million, whereas in the corresponding period last year there was an overall surplus of £9 million. At that date the cumulative deficit for the current fiscal year stood at £722 million; it has since risen to £768 million. During the past month the Treasury has had to finance not only these current requirements, but the redemption, on November 14th, of the £105 million of unconverted Serial Funding Stock, 1952; to the extent that these bonds were already held by the "departments" the repayment was in effect merely a book-keeping operation, but it is evident that a substantial sum was due to private holders and therefore involved the Treasury in additional borrowings from the banking system. The published figures of Exchequer domestic finance do not, moreover, measure the full strain that has had to be borne this year; a major cause of the Treasury's heavy dependence upon bank credit has been the big improvement in the external balance of payments. Whereas last year the huge external deficit was enabling the Government to borrow sterling from external holders and simultaneously to obtain sterling in exchange for sales of gold, this year the balance of payments has shown a moderate surplus, so that there have been large repayments of overseas sterling balances—and, quite recently, also net purchases of gold.

The outcome of these several sources of pressure, over the fiscal year to date, has been a net credit expansion of nearly £290 million, notwithstanding the steep contraction of credit in the form of bank advances and commercial bills. Hence the net total of deposits, which in the spring was as much as £200 million below the 1951 level, is now slightly above it, and the newly revised index compiled by Lloyds Bank (which is adjusted for seasonal variations) has risen during the past six months from a low point of 101.0 to 102.9 (1948=100), reversing the trend shown in the similar period of last year. Meanwhile, of course, the increase in Treasury borrowings is making good (until the season of heavy tax-gathering) part of the reduction in bank liquidity ratios that was brought about by the recent funding operation. During November, this ratio recovered from 34.4 per cent to 35.0 per cent.

Pause in the Markets

Reflections upon the further growth of the Exchequer deficit brought to a halt this week the gentle climb in gilt-edged prices that began just before the Government's conversion offer at the beginning of October. It remains to be seen whether this is a definite check or a temporary pause for breath; certainly it is the reverse side of the medal to the experience of the last two months. In this period, as the accompanying table shows, a steady accumulation of slight gains had virtually wiped out the losses that were made in September, when the market expected to receive a much stiffer dose than the Government actually administered with its conversion offer. Gilt-edged prices are thus now not very much below the levels at which they stood on the eve of the budget (and of the rise in Bank rate to 4 per cent), or for that matter at the end of last year—a point of growing significance as the accounting date of the bank's yearly balance sheets draws near. An even sturdier rally in equity prices has taken place since September. The pace of the advance quickened before the weekend and by the close on Monday the *Financial Times* ordinary share index had risen from the autumnal "low" of 112.9 to 117.8; it had fallen back to 117.2, however, by Wednesday's close.

Home ties are strongest in the month of December, especially with those who are overseas. It is kindly, it is thoughtful and it will strengthen those ties to remember them now in good time for Christmas. Greet them by Cable—it costs so little and it means so much.

If you have, give it all the support you can. If not, it is very easy to start a Savings Group of your own. Everything you require in the way of information, equipment and publicity material will be sent you free of charge on application to your Local Savings Committee, or to the National Savings Committee, 1 Princes Gate, London, S.W.7.

FOAM ON RIVERS

The following question was put in the House of Commons on Thursday, November 27th, 1952, by Sir Herbert Williams, Member of Parliament for Croydon East:—

"To ask the Minister of Housing and Local Government whether his attention has been drawn to the fact that certain detergents are now having materials added to them which have the effect of producing permanent foam with a consequential prejudice to public health and will he state what steps he is proposing to take under the Public Health Act to deal with this matter."

Mr. Marples, Parliamentary Secretary to the Ministry of Housing and Local Government, replied:—

"My Rt. Hon. Friend presumes my Hon. Friend has in mind the effect of the foaming on sewage processes and sewage effluents."

"My Rt. Hon. Friend is aware of the troubles that are being experienced and as a first step he is having the technical problems investigated in consultation with the manufacturers."

The appearance of foam on rivers and filter beds at sewage farms has become a national problem. It is possible for this foam to leave a scum on the surface of river waters which prevents oxygenation with the result that animalcula may die, the water often becomes foul and fish may either desert the rivers or die.

On sewage filter beds the foam sometimes rises four or more feet high. Portions are blown about, an occurrence which may well cause concern amongst neighbouring residents, especially those with children.

In view of the suggestion made in the House that this phenomenon is due to a lathering agent added to some domestic washing detergents, the manufacturers of Stergene wish to state that their detergent gives little or no lather, as the most modern detergents do not require foam to indicate efficiency. Stergene contains no substance which could be responsible for excessive foam on rivers or filter beds.

It is further claimed that there is ample scientific evidence for the assertion that lather is entirely unnecessary and that Stergene is the complete efficient cleanser without it.

* Issue Price.

a total amount of £2,540,000, but £540,000 of this had already been subscribed and £500,000 was reserved for Rhodesian investors. The results have also been announced this week of the first option of conversion into ordinary shares of the Distillers 5 per cent unsecured loan stock; although the equivalent conversion price of the ordinary shares, at about 17s. 3d., was slightly above the price of the existing ordinary shares, holders of no less than £1,408,350 of the loan stock have decided to exercise their first options; the company will therefore issue 1,633,686 4s. ordinary shares.

Bonus Issues and Preference Shareholders

If a recent judicial decision is upheld in the Court of Appeal many British companies will have to secure the approval of preference shareholders before making a bonus issue—or even possibly a "rights" issue—of ordinary shares. That is the implication that emerges from two recent judgments of Mr Justice Danckwerts—in *Re John Smith's Tadmester Brewery Company* on October 9th and in a friendly action brought by a director against the Bristol Aeroplane Company in the Chancery Division on November 29th. In the *Tadmester* case, the brewery were bound to call a separate meeting of the preference stockholders to vote on a proposal to create and to make a bonus issue of new ordinary shares. The company's articles of association provide—and the common form of this article gives the decision its general interest—that the rights of the holders of any one class of share may be "affected, modified, dealt with or abrogated" with the sanction (and, by implication, only with the sanction) of a separate meeting of the holders of that class of share. The point at issue was whether a bonus issue of ordinary shares "affected" the rights of preference shareholders in the company. In his decision Mr Justice Danckwerts drew attention to a passage from a judgment of Mr Justice Vaisey in a case decided in 1945...

If you have an equal number of preference and ordinary shares in a company, with equal voting rights... you would not vary the rights of the preference shareholders by issuing additional ordinary shares; in substance you would materially affect these rights, but you would not vary them.

In his elaboration of this judgment, Mr Justice Danckwerts ruled that a proposal that would have the effect of increasing the number of ordinary shares in issue and so of altering the existing balance of voting power between preference and ordinary shareholders would "affect" the rights of preference shareholders by making their votes "less telling and less important." He decided therefore that a separate meeting of the different classes of shareholders would be necessary and that the power of the preference share vote would have to be brought into play.

As a result of this decision the Aberdeen and Canadian Investment Trust has announced that it has been advised that, in accordance with its articles of association, a separate meeting of preference shareholders must be called to consider its plans to make a bonus issue of ordinary shares to its ordinary shareholders. It was in these circumstances that Mr G. S. M. White, a director of Bristol Aeroplane, arranged to bring a friendly action against his company; this case came before Mr Justice Danckwerts himself on Friday of last week and he inevitably followed his own ruling in the *Tadmester* case. Bristol Aeroplane has filed an appeal against this decision, so that comment on the merits of the arguments must be deferred. If the ruling is upheld by the Court of Appeal, the voting rights of preference shareholders will be given a legal protection that many companies have in fact already recognised—British Motor is the most recent example—by adjusting the balance of voting rights between preference and ordinary shareholders when making bonus issues.

Clinging to the Car Covenant

The shortening, announced last weekend, of the covenant period banning the re-sale of new cars from two years to one will affect only that handful of models—fourteen of them—that have not already been removed from the scheme altogether. They include all four Ford models and both Vauxhalls. It seems incongruous that a restrictive scheme of this kind is being buttressed by two American-owned manufacturers and the French Renault company, two of whose British models are still subject to covenant, while British manufacturers have withdrawn so many of their models. The only British cars still controlled are the two smallest Austin models (the baby A.30 and the A.40), the Morris Minor and Oxford, the Hillman and the small Singer.

Deliveries to the home market are bound to increase during the next two months. Shipments to Canada, which has recently been taking a substantial number of cars, always fall during the period when the ports are icebound, while import quotas to alternative markets are usually fixed on a yearly basis and most 1952 import licences have been largely exhausted already. Exports will equally certainly rise again in the New Year with the negotiation of new—and, as some believe, higher—quotas. But as that period will also see an increase in the amount of steel available for car production, the present softening state of the home market is not likely to be ended merely by the granting of new quotas to overseas importers and the thawing of the ice on the St. Lawrence.

During the next month or so, it is improbable that dealers will be left for long with excessive stocks of unsold cars on their hands—about 20,000 cars would be needed to build up their showroom stocks to the prewar level. But the rate at which their inflated order books are being run down is giving them an unpleasant taste of things to come. So far as it is possible to generalise at all, buyers are showing a strong preference for the newer models, which are not necessarily the cheapest available, and this preference affects the delivery period for different makes of cars.

Having raised the issue of purchase tax, the industry is now complaining that uncertainty about its future rates is making buyers hold back and this uncertainty will not be finally removed until the budget in April—whatever statement may be made in the meantime. But some dealers doubt whether considerations of this kind have much effect on the sale of cars for business purposes, and these transactions make up as much as 90 per cent of home sales. It is more likely that much of the impending sales resistance is the result of a greater freedom of choice among competing models, for many models have enjoyed several sheltered years on the home market while the more popular cars were being exported almost to the limit of production.

Mr Rank's Ice-Cream

Mr J. Arthur Rank made an impressive—and informative—appearance at Bow Street last week when one of his “shopwindow” cinemas in the West End of London was accused of failing to show the amount of British supporting films legally required during the “quota year” that ended in September, 1951. It was not in dispute that during the period only about 15.4 per cent of the footage of supporting films shown by the cinema were British, as against the quota of 25 per cent laid down for that year on the advice of the Cinematograph Films Council, of which Mr Rank is a member. The Circuits Managements Association, which controls the operations of the exhibition side of the Rank Organisation, was summoned. It successfully contended, however, that owing to circumstances beyond its control it was not commercially practicable to fulfil the quota at this cinema—there were not sufficient good British supporting films available during the period to this “first-run” cinema. The magistrate this week found the defence justified, and dismissed the summons. In giving judgment, he commented that “commercial practicability” was something different

from commercial advantage; the only definition that occurred to him was that the phrase was “concerned with something that must be considered sound commercial practice.” This condition is one upon which the Board of Trade, after consulting the Films Council, may allow a cinema exhibitor exemption from the quota regulations; exemption had not been allowed in this case.

In his evidence last week, Mr Rank told the court that his cinemas in the West End lost £100,000 in the year in question, and the particular cinema alone lost £17,000. He added that so far as box-office takings were concerned “there was a loss for the whole organisation” in the year in question, but that there were ancillary earnings, including a profit of £1,151,000 on sales of ice-cream.

Wool Holds Firm in London

Wool prices during this season have remained firm, in contrast to the weakening prices of a number of other raw materials. At the opening auction last week of this season's second series of London wool sales, New Zealand wools of the greasy crossbred qualities were 10 per cent higher than at the close of the first series of sales in September and as much as fifteen per cent above prevailing rates at the New Zealand markets, while Australian greasy merinos, for which there was less demand, were nevertheless 5 per cent above the September London prices and about the same as those now ruling in Australia. At the second auction of the series, held on Wednesday this week, prices were again well maintained with a further advance of about 2½ per cent for some Australian and up to 5 per cent for better New Zealand qualities. Buying throughout has come about equally from Bradford and Continental representatives, but United States buying was not apparent.

The higher prices at the present London sales were much as had been expected. Wool from the opening season's sales in New Zealand will not reach this country for some weeks and meanwhile it is known that stocks are low at the mills and orders are coming in. Australian new season wool, on the other hand, is now arriving in this country, so that the supply is relatively easier than for New Zealand qualities. But most of the clip on its way to the mills is committed to orders already booked, so it is expected that demand for Australian types also will continue fairly strong throughout the present London auctions, which last until December 12. Prices were well maintained at sales this week in Australia and New Zealand.

The world clip for the season is estimated at 2,325 million lb and consumption is believed to be at the rate of about 2,260 million lb so that current production roughly balances demand, although it must be noted that crossbred wools are more plentiful than merinos. Provided stocks held by Argentine and Uruguay, estimated at about 200 million lb, are not hurriedly liquidated—and so far they have not been—the wool market appears to be fairly stable, at least until the heavy supplies of crossbred wools come on to the market during the early months of next year.

Rayon on the Way Up

The recovery in the rayon industry is gaining momentum. In October the production of rayon staple yarn, which had almost ceased in June, was back to a figure of 15.5 million pounds, which is not far short of the industry's peak capacity. Recovery in continuous filament yarn has been slower; output increased by only 2 million pounds in October compared with an increase of 4 million in staple production. At 12.9 million pounds, it is some way below full capacity, for output has at times exceeded 20 million pounds a month. For the industry as a whole, production

in October reached 28.4 million pounds compared with 22.4 million pounds in September and 11.7 million pounds in June, when the bottom of the depression was touched.

The source of this return of confidence is best seen in the rising rate of yarn deliveries to the different classes of consumer. In August, less than 10 million pounds of continuous filament yarn were bought, compared with an average of 18 million pounds a month in 1951. Of this total, 3.7 million went to the weavers, a little under 2 million to the hosiery and other knitting industries, 2.5 million to industrial users, and 1.4 million for export. By October total deliveries had risen to 16.05 million pounds, with 7 million going into weaving, 3.2 million to the knitters, 3.4 million to industrial users (tyre production is still in the doldrums), and 1.5 million to export. Consumption is rapidly catching up on last year's figures and stocks of yarn at the factories have run down to a point where there is some delay in deliveries while plant is brought back into commission. Where stocks were held in the form of yarn, the industry has been able to clear them without too great a loss. Where, however, they were held in the form of finished cloth, they have been moved only at considerable sacrifice. And in spite of the recovery in rayon consumption, the inroads made by the cotton industry into the rayon industry's markets for certain types of dress fabrics last year seem likely to be repeated in the coming season. To meet the competition from improved cotton fabrics, the rayon industry is developing new constructions and finishes for rayon and rayon mixture cloths, some of which appear to have interesting possibilities. The slackness in the industrial demand for rayon makes the industry more dependent on the capricious market for dress fabrics than producers would like it to be.

Rubber Looks Up

The total consumption of rubber in the United States showed a further sharp increase in October, when it reached 120,000 tons, its highest monthly level since September, 1950. Moreover, American rubber manufacturers are now using a greater proportion of natural rubber as compared with synthetic. Consumption of natural rubber in October amounted to over 45,000 tons, or 38 per cent of total American rubber consumption; this compared with 37 per cent in September and 35 per cent in August. Such good news from the United States, which in spite of the high proportion of synthetic rubber it uses is still the world's largest user of natural rubber, has undoubtedly been an important factor in the recovery of world rubber markets in the last few weeks. The spot price for rubber in London has hovered around 2s. 2d. per lb during the past week. It has thus regained the level of the early days of August, and is about 5d. a lb above the low point reached in September. Political developments in the Far East—unsatisfactory news from Indo-China and the rejection of the Korean peace proposals—have also had a bullish influence on the market. Meanwhile the quantity of rubber reaching the world market continues to drift downwards. If the barter exchange of Chinese rice for Ceylon rubber goes through it will remove 50,000 tons of rubber that would otherwise have come on to the market. Output of natural rubber continues to decline in most countries, although there was some recovery in world production in October from the abnormally low figure reached in September.

World production of rubber is now expected to reach about 1,750,000 tons in 1952, some 125,000 tons less than in 1951. Indonesian production is falling particularly sharply; in Malaya the reduction in output from smallholdings appears now to be partially offset by a rise in estate production. World consumption this year may also show a fall compared with last year's level; it is expected to reach 1,425,000 tons. Most of the surplus output appears to have

been absorbed by American stockpile buying; indeed, free stocks (that is, stocks other than strategic stockpiles) at the end of September were nearly 90,000 tons lower than in January.

In spite of the cessation of new purchases for the stockpile—apart from stock rotation—the outlook for natural rubber in 1953 does not look as discouraging as it did a few months ago. Provided there is no sudden increase in price, output from smallholdings will probably continue to decline. On the other hand, consumption in the major consuming countries may increase; American consumption should continue to rise so long as the price of No. 3 grade natural rubber is not much above that of GRS synthetic. There is also the possibility that other deals on the lines of the China-Ceylon barter agreement may reduce the pressure of supplies on the market. If all these possibilities materialise, the rubber growing industry may yet solve its difficulties without recourse to an international agreement.

A Development Council Dropped

Once they had been brought into being, the statutory development councils imposed on certain industries by Mr Harold Wilson during his period at the Board of Trade, were safe for three years even though the Act under which they were set up did not specifically exclude a review before the end of this period. It was therefore only recently that the future of the Clothing Development Council, which was set up early in 1950, fell due for review, and it is not surprising that the President of the Board of Trade has taken the opportunity to dissolve it. The clothing manufacturers were the first well-organised opposition to be encountered by Mr Wilson; and although they lost a legal battle and the Development Council came into being, the effectiveness of their opposition then and since had its effect in Bradford. The rough handling they gave to the Council—most of them boycotted it though paying its levies under protest—may have had much to do with the eventual acceptance by the Board of Trade of the wool industry's alternative proposals for a voluntary body, covering roughly the same field, instead of a development council. It is a precisely similar type of organisation that is to replace the Clothing Development Council; a new voluntary body of employers and trade unionists, without the independent members the Council had. This is to receive from the Board of Trade the surplus funds accumulated by the Development Council, and similar powers to raise a levy from the industry.

There is not much doubt that industries such as these, where manufacturers are numerous and often small, can benefit from membership of an organisation with a wider range of function than the trade association. The work done by the Development Council on factory lay-out was certainly an interesting experiment that might have had considerable influence on the industry, had relations between the Council and its members been on a happier basis. But the programmes of such bodies need to be carefully scrutinised if the industry is to get value for its money, and the Council had a very considerable income of £114,000 before the accumulation of substantial balances led to a halving of the levy rate. To take one obvious example: the Development Council did extensive research on the problem of measurements, with the object of evolving new and better standard sizes. The result will shortly be published and it will no doubt be an excellent piece of work. But there already exists a highly efficient method of sizing developed in the United States and coming into general use in this country. Both manufacturers and retailers are going to considerable trouble and expense to educate their customers to understand it. The prospect of two sizing standards operating side by side is one that neither the clothing industry nor its customers is likely to relish, but this might be the logical result of the publication of a new British sizing system. The years have made it perfectly clear that

The Gateway to Security

TEMPERANCE

experiments in industrial organisation such as the development councils cannot be made to work if the industries concerned remain adamantly hostile; they can collect their money, but they cannot be sure of spending it to any useful purpose.

Barclays (D.C. & O.) on the Bright Side

In what must surely be the most colourful report ever issued by a British bank, Barclays Bank (Dominion, Colonial and Overseas) has sketched an illuminating (and illuminated) picture of its varied and widely scattered activities in the year to September 30th last. An impression of this colour and diversity can be conveyed by the names of some of the 124 new branches opened during the year (which brought the total number of branches up to 700). These new branches range from Ocho Rios (in Jamaica) through Misurata (in Libya—the most recent recruit to the sterling area) and Kericho (in the highlands of Kenya) to a branch in the cocoa-growing territory of British Togoland with the cheerful-looking name of Hohoe, but the rather admonitory pronunciation of Hoyhoy.

The substance of the report is also nicely balanced between cheerfulness and cautious admonition. The bank's net profit rose during the year from £769,581 to £879,888, but deposits fell by £2 million to some £441 million. Advances, however, rose by over £4 million to nearly £148 million—an expansion that doubtless provoked some reduction of the investment portfolio; the book value of this (which is below market value) declined by £9 million. The cash ratio was slightly strengthened. It is evident that the end of the post-Korean commodity boom, and such special factors as the devaluation of the Israel pound, went some way towards offsetting the effects of the bank's rapid physical expansion. The chairman, Mr Julian Crossley, suggested in his statement that there may be some slackening of activity in the current year. Meanwhile, the pioneer subsidiary, Barclays Development Corporation, which started operations in 1946, continues to report a modest but satisfactory expansion in business. Its total assets now amount to over £6,300,000 and its loans and other accounts to over £4,150,000. These loans—which finance a wide range of experimental projects in under-developed areas—are concentrated predominantly in the West Indies and East Africa, but the most striking increases during the past year were in Central Africa and in the Mediterranean area. As a result of this expansion its net profit (before allowing for interest on its 2 per cent unsecured notes) rose from £88,016 to £100,695 and a small maiden dividend of 3 per cent has been declared, although many of these investments are of the sort that are expected to yield a return only in the long run.

Grounds for Dearer Coffee

Consumers in Britain may soon have to pay a few pence a pound more for their coffee. A statement issued last week by the Coffee Buyers' Association explains that private importers have to pay the full world price whereas the Ministry of Food, which until recently bought the whole of this country's supplies, was able to obtain Empire coffee under long term contract at less than its current market value. Retail prices of coffee in this country, which had been fixed at a maximum of 5s. 4d. a lb, were freed in August. As a result dealers have been able to offer better blends of coffee—but the public has had to pay up to 7s. 6d. a lb for these superior blends. Now prices are to go up again—not because of further improvements in blend, but simply because a larger proportion of the supplies is being paid for at the full world price. Some of the increases have already begun; one large distributor recently increased the price of its better grade coffee by 10d. a lb partly because the blend had been improved and partly because of the rise in the cost of its supplies. The

trade as a whole now faces the alternative of allowing its prices to rise slightly or of reducing the quality of coffee.

Only a part of the coffee trade has so far been handed back to private merchants. The allocation of coffee to dealers made by the Ministry of Food in November still covered 75 per cent of this country's requirements; after the end of the year the proportion offered by the Ministry will fall to half. The Ministry is also reducing the proportion of higher grade coffee included in its allocations; in November the grade that chiefly comprises Brazilian coffee was eliminated. The Ministry had been supplying this grade at about 60-70s. a bag below world prices; thus the increase in the cost of coffee to dealers will fall mainly on the better blends. Merchants can make up for the reduction in Ministry supplies by importing under Open General Licence from the sterling area or under Open Individual Licence from other non-dollar countries (including Brazil). Imports from the dollar area are permitted only for re-export.

World coffee prices have recently eased slightly, as American buyers have been holding off the market. This will probably prove only a temporary phase. Admittedly, this season's world crop may be a little larger than last season's, although the output from Brazil—the world's largest producer—is likely to be smaller. But European consumption is still far below the prewar level and it seems that the market can easily absorb the additional supplies.

Competition in the Air

The apparent amicability with which the airlines have now reached agreement on a world-wide extension of second-class air fares is in marked contrast to the stormy meetings, with their thinly disguised threats of secession from the International Air Transport Association, that preceded the introduction of the first experimental tourist services on the North Atlantic. The agreement of IATA is necessary before any of its member airlines (which include the great majority of international operators) can alter their fares upwards or downwards; and the outcome of the conference that has recently been held at Cannes was to approve the extension of "tourist" air services to Europe next spring and to the Indian sub-continent in the autumn. Tourist services to the Far East and to South Africa should begin the following year.

Although there was no direct opposition to this extension of tourist air travel—at rates 20 to 25 per cent below the first-class fares—the proposals were coolly received by some operators. First-class passenger traffic shows no signs of falling off, despite the fall in freight and mail, and not all airlines have big enough fleets to maintain their present first-class services and operate tourist flights in addition. The enthusiasm of any one airline for new tourist services varies directly with the proportion of old to new aircraft in its fleet. When the American operators were taking delivery of new aircraft, they pressed strongly for the introduction of tourist fares and were opposed by the other airlines, including the British, that had barely sufficient numbers to operate their first-class services. Now it is apparently the two British airlines that are pressing most strongly for an extension of tourist services. Both corporations can expect delivery over a period of years of quite considerable numbers of aircraft, which will leave them with plenty of less up-to-date, but still perfectly airworthy, machines for the second-class services. From the general tone of the Cannes conference, it would appear that neither the American nor the continental airlines (with the exception of Air France) are in the same position.

Tourist services call for a high degree of administrative skill if costs are to be reduced to a point where lower fares become profitable, and not all the airlines flying on the North

A line on Effluent...

With the continued expansion of industry, the problem of the disposal of obnoxious effluents becomes more acute. Spence Aluminoferric*, however, is being used on an increasing scale for the pretreatment of industrial wastes and sewage. Aluminoferric is also used extensively in the purification of water supplies for domestic and industrial purposes.

* Aluminoferric is the Spence brand of commercial aluminium sulphate.

'Good men
don't grow
on trees!'

'We were losing a lot of good men who were leaving us for jobs where there was a pension. So I talked it over with the 'General' agent, and found that it wouldn't cost nearly as much as I'd thought to run a Pension Scheme of our own through the General Life Assurance Company. The great thing about the 'General' is that they specialise in schemes for small firms like ours. I'd certainly have a word with them if I were you.'

THE NORTHERN ASSURANCE

COMPANY LIMITED

An Announcement

Further steps in the development of the "Northern" Group are now announced.

A special Pensions Department has recently been set up to handle the ever-increasing volume of Pensions business, and the Life Assurance business of the "Northern" Group is being integrated in order to give improved service to the public.

At the end of this year the London & Scottish Assurance Corporation Limited (one of the companies in the "Northern" Group) will cease to transact new Life Assurance business, and the Actuary of the "London & Scottish", Mr. D. G. McKelvie, F.F.A., will join the Staff of the "Northern" as Associate Actuary.

From 1st January, 1953 the "London & Scottish" Organisation will issue "Northern" Life Policies. Existing "London & Scottish" Policies will continue to be administered by that Office as a closed fund. The issue of new "With Profit" Policies by the "London & Scottish" is discontinued forthwith in order to preserve bonus prospects for existing policyholders.

In further pursuance of the policy of integration within the Group, a similar reorganisation will be effected in the Marine business of the "Northern" Group. The Indemnity Marine Assurance Company Limited, under the management of Mr. E. H. N. Dowlen, will underwrite the Marine business of the "Northern" in addition to that of the "London & Scottish" as heretofore. Mr. R. Usherwood, the "Northern" Marine Manager, is to join the "Indemnity" as an Agency Manager to develop the Agency business, Home and Overseas, of all the companies for which Mr. E. H. N. Dowlen will underwrite.

CORRESPONDENTS & AGENTS at all important cities of the world.

Atlantic appear to have considered the returns sufficiently attractive to justify tourist services on those routes, even though the increase in traffic so obtained is beyond dispute. In the six summer months between May and October, BOAC carried 42 per cent more passengers than in the same period of 1951, before the services were introduced; a total of 43,785 passengers compared with 30,817. Moreover, 42 per cent of those carried this summer used the tourist services. This big increase, which is common to all tourist operators, has not escaped the notice of the Government of Eire, which some years ago had arranged with the US authorities to operate a North Atlantic service through the Government airline, Aer Linte (not to be confused with Aer Lingus in which BEA has a half-interest). A change of government in Eire led to a change in policy and the sale to BOAC of the Constellations originally bought for the service. When he came back to power again, Mr de Valera's government revived the project. Since Aer Linte has no aircraft and is unable to get any for some years, it has come to an agreement with an American operator, Seaboard and Western Airlines, to charter aircraft and crews for a North Atlantic tourist service to be operated under Aer Linte colours next spring. The American company has not been able to get a licence to carry passengers on the North Atlantic, although it already runs scheduled freight flights, while the Irish company has the licence but not the aircraft, so the proposed arrangement should satisfy both. The Irish have proved a surprisingly air-minded nation, and a service of this kind could attract quite a slice of traffic from the other Atlantic operators.

New Ways in Machine Tools

Much of the progress in machine tool design that was evident at the recent British and European exhibitions concerned the extension of automatic controls, and in particular of copying systems, to the existing range of general and specialised machines. But some of the developments that the industry is now studying concern more radical alterations of approach to the central process of cutting metals. One that has reached practical application in a power tool now being tested by industrial users is ultrasonics, which was discussed in *The Economist* of October 18th. This system uses sound waves to drill metal, by inducing vibrations in abrasives in contact with the metal surface. Other methods are new applications of electricity. One method developed in the United States (though apparently originated in Russia) is the combination of an electrolytic process with the normal method of grinding tool steels and sintered materials by diamond dust. The grinding wheel is charged negatively and the workpiece positively, and an electrolytic chemical is sprayed over the grinding surface. Small particles of metal, according to the company developing the process, are detached from the work surface and deposited on to the wheel. A second electrical method is the "spark erosion" of metal by a controlled electric discharge, which has also been developed in the United States but is now under active study in Britain. This process, which breaks down the metal surface and removes particles of metal by a controlled stream of sparks, enables drilling and machining of very hard materials without contact, as ultrasonics does. Both would appear to offer immediate service in the drilling of the new special alloys and tool materials that are most difficult to deal with by conventional cutting methods.

Another tool development for cutting hard metals that has recently been re-discovered and utilised has none of the distinguished scientific lineage of the systems mentioned above. It is, quite simply, a bandsaw without teeth; and the pleasant story of its origin, according to report, is simply that a methods analyst in a San Diego aircraft factory noticed that the back of a bandsaw appeared to cut certain materials as well as the toothed edge, and to last

longer. These materials seem to be cut by the generation of intense heat at the contact with the rapidly moving edge of the band; the plain edge operates well at high speeds and lasts longer than a toothed blade. The cost of such a band—some users have been trying out ordinary mild steel strapping—is low, and its longer work life is an important factor in maintaining production. One British manufacturer at least is bringing out a cutting machine that appears to employ a similar system, and engineering companies dealing with the particularly hard alloys used in the defence programme are studying the technique for themselves.

Pakistan and Jute

The government of Pakistan recently imposed a sharp tightening of its import controls by entirely suspending the Open General Licence system for the time being, explaining that this step had been necessitated by the country's failure to sell the greater part of its jute and cotton crops. In the circumstances the decision of the Pakistan Jute Board, announced a day or two later, to increase raw jute prices seemed at first glance rather paradoxical. In fact, however, the increase relates only to certain qualities of jute, the demand for which may tend to expand. It appears, too, that although Pakistan was left with heavy stocks of both jute and cotton at the end of last season, its drop in export proceeds has probably been more serious in cotton than in jute. Japan, which is usually Pakistan's best customer for raw cotton (normally taking some 40 per cent of the crop) has bought hardly any Pakistan cotton this year. United Kingdom purchases have amounted to slightly more than half those for the similar period last year. Even the removal of the export duty on some qualities of cotton and the halving of duty on others have so far failed to bring buyers back into the market.

The jute market has also presented a very dismal picture this year and Pakistan is known to have been left with a carryover of 1.68 million bales at the end of the season. The present crop is expected to be somewhat bigger than last year's and will probably reach 6.82 million bales. In part the size of last year's carryover must be attributed to the Pakistan government's own policy of attempting to arrest the fall in prices by fixing minimum selling prices. The world price of jute, however, has tumbled from about £160 a ton at the beginning of the year to £73 a ton (by last August). Although Dundee has recently resumed purchases of raw jute from Pakistan, business in the market has otherwise remained quiet. Nevertheless, a shortage may develop in certain grades such as Mill Firsts and above, because the quality of raw jute deliveries has been deteriorating. This is probably the reason for the Pakistan Jute Board's decision; its prices for these grades have been raised by £2 to £6 a ton: Export Firsts have risen from £73 to £76 a ton and Mill Firsts from £81 to £85 a ton. There have also been some complaints lately about the quality of Indian jute goods. India is attempting to make itself independent of Pakistan raw jute supplies, but it appears that the indifferent quality of locally grown jute is hampering sales of Indian manufactured jute. It therefore seems likely that India may soon be in the market for a considerable quantity of Pakistan raw jute.

Meat from the Commonwealth

The United Kingdom remains the world's largest importer of meat and in spite of the development of Commonwealth production since the war, roughly 60 per cent of Britain's meat imports still have to be purchased from outside the Commonwealth area. A report published this week by the Commonwealth Economic Committee shows, however, that in 1951 the Commonwealth was nearly self-sufficient in

mutton and lamb and in pork. Last year Britain obtained 92 per cent of its mutton and lamb imports from the Commonwealth compared with 81 per cent before the war. Net Commonwealth imports of mutton and lamb have fluctuated violently in the postwar period; last year's level fell to less than a quarter of that of 1950 because of a sharp fall in shipments from South America. Imports in this country from New Zealand, the world's larger exporter of mutton and lamb, also declined sharply last year as high prices for wool in the early part of the year caused farmers there to delay slaughtering.

In 1951 the Commonwealth supplied 90 per cent of Britain's pork imports or more than double its share in 1950. On the other hand only 1 per cent of the bacon and ham imported into this country last year came from the Commonwealth, compared with 16 per cent in 1950 and 22 per cent in 1938. Imports of bacon and ham, which come chiefly from Denmark and the Netherlands, form the major part of the Commonwealth's net imports of meat. Exports of pigmeat from Canada have contracted sharply in recent years, while exports from European countries have risen; as a result the Commonwealth share of world pigmeat trade last year was negligible, although as recently as 1948 it had constituted 60 per cent of the world total. Last year's Commonwealth imports of beef and veal fell sharply, reflecting the stoppage in shipments from South America to this country. Australia also sent less beef to Britain as the drought had reduced output in the dominion.

COMMONWEALTH NET IMPORTS OF MEAT
(Thousand tons)

	Beef and Veal	Mutton and Lamb	Bacon and Ham	Pork	Total
1938	415.6	79.3	299.5	25.2	819.6
1947	326.7	114.0	26.8	8.0	475.5
1948	164.3	77.4	43.0	9.8*	274.9
1949	186.3	16.7	108.6	16.7	328.3
1950	181.1	115.5	206.8	19.2	522.6
1951	46.5	27.1	214.9	13.1	301.6

* Net export balance.

Source: Commonwealth Economic Committee.

World production of meat last year was almost unchanged from the 1950 level. According to the Commonwealth Economic Committee, the postwar increase in consumption in producing countries continued last year, with the result that the quantity of meat entering international trade dropped sharply and was in fact only four-fifths of the prewar level. However, consumption of meat per head fell last year in the United Kingdom, Australia, the United States and Argentina; it rose in Canada and New Zealand.

Cotton in Egypt

After abruptly closing the Alexandria cotton futures market and announcing that it would buy and sell cotton itself, the Egyptian Government has lost little time in implementing its plans. The Egyptian Cotton Commission has now begun buying on the basis of prices fixed by the Government a fortnight ago. This Cotton Commission, according to a statement from the Ministry of Finance, will buy cotton from banks and merchants who are members of the Alexandria spot cotton exchange, but not direct from owners. It will sell to local spinners for cash, on a written guarantee that the cotton will not be exported, and it will sell for export to recognised exporting firms for cash on condition that the cotton is re-sold for export within three months. The Com-

mission's daily selling price will be fixed according to the New York Exchange spot cotton price on the preceding evening, with an addition of 30 per cent for Karnak and 10 per cent for Ashmouni. The American dollar will be reckoned as equivalent to 35 Egyptian piastres. Private spot trading in cotton is still permitted; the Alexandria spot market, where dealings came to a standstill for several days after the closing of the futures market, is again active, with prices somewhat above the Commission's buying price.

The current Egyptian cotton crop is now officially estimated at 9,213,000 cantars, compared with an estimate last month of 9,187,000, and with last season's final figure of 7,840,000 cantars. The Government has already decided to regulate acreage for next year.

Shorter Notes

The recent batch of good results from brewery companies had encouraged investors to hope that the directors of Bass, Ratcliff and Gretton, would restore the tax free bonus on the £1 ordinary stock units to 5 per cent, from which it was reduced to 2½ per cent a year ago. These hopes have been disappointed. For the year to September 30th last, the directors have declared an ordinary dividend, subject to tax, of 43 per cent—the nearest round equivalent to the tax free dividend of 22½ per cent made last year; a further increase in taxation has caused Bass's net profits to fall from £679,602 to £639,642. Following this announcement, the £1 ordinary stock units were marked down 3s. to 129s. 6d.

*

International distribution of cobalt is to end. The International Materials Conference announces that the improvement in supply makes it unnecessary to recommend distribution plans for cobalt for the first quarter of 1953, though the conference will continue to keep the situation under review. When the first allocation was made, for the fourth quarter of 1951, the quarterly production of cobalt and its compounds was at the rate of 2,100 metric tons (cobalt content), but output has steadily risen to a present rate of more than 2,800 tons quarterly and production is expected to increase further.

*

The Board of Trade have now announced the arrangements for import and export of zinc after private trade is resumed on January 2nd next year. Members of the London Metal Exchange will be granted open individual licences to import unwrought zinc (not zinc alloys) from any country. Large consumers requiring regular supplies will be able to import metal on their own account under open individual licence granted for the appropriate sources. Other traders will have to apply for licences for individual transactions. These arrangements are the same as those now in operation for lead.

*

Talks have just been concluded in London between government representatives of Britain and Portugal regarding trade arrangements between the two countries in 1953. Besides dealing with a variety of other imports and exports, understanding was reached on the supply of tungsten ore and mining timber from Portugal and coal and tinplate from this country.

Company Notes

Montague Burton.—Very few annual reports have made such depressing reading this year as the report issued by Montague Burton for the year to March 31st last. In the whole of the chairman's statement there is only one faint flicker of cheer—the news that in the first six months of the current financial year the group has made a small trading profit. But the wounds inflicted in last year's trading débâcle—discussed in a note in *The Economist* on November 22nd—will take a long time to heal; the cure will only be complete when and if a full-scale recovery in trade takes place and a reasonable stability in wool prices is attained. With the help of the banks the group has given itself first aid to staunch its wounds. About £1,600,000 has been written off stocks, so that a net loss of over £600,000 replaces a net profit of over £1 million in the profit and loss account, and a provision has been made to cover losses on future commitments by transferring £1 million from general reserves. In spite of this writing down, the book value of the group's stocks has soared from £9,267,651 to £13,716,331 as unsold garments have piled up on the shelves. The chairman admits that "contracts for cus-

tomary quantities of yarn had to be placed at unusually high prices," and it seems clear that the company's buyers burnt their fingers badly by buying too much wool at the height of the boom.

	Years to June 30	1951	1952
Consolidated earnings:—			
Trading profit.....	5,983,401	7,835,658	
Total income.....	6,076,497	8,015,582	
Depreciation.....	1,135,984	1,529,906

Fixed assets, less depreciation.....	4,276,502	6,382,798	
Trade investments.....	3,855,035	5,317,684	
Net current assets.....	4,742,916	4,503,692	
Stocks, etc.....	3,712,131	4,625,027	
"Quick" assets.....	631,342	4,489,598	
Reserves.....	7,905,300	9,905,222	
Ordinary capital.....	1,639,452	1,639,452	

to £5,317,684, is some indication of the group's stake in this particular venture. The group has ample liquid resources and should have no difficulty in covering its immediate capital commitments, but shareholders seem likely to have to be content once more with a tax-free ordinary dividend of 16½ per cent in the current year.

*

Manchester Oil Refinery.—Another unhappy chapter in the history of Manchester Oil Refinery, which produces all kinds of light oils by the vacuum distillation process, is now being written. The directors have announced that the company has shelved the new issue of capital that was foreshadowed both in the chairman's statement accompanying the 1951 accounts and by the increase in the company's authorised ordinary capital last May. This unwelcome decision has been dictated by a "considerable reduction in the current rates of profit." Among the factors that have helped to upset the company's trade, the directors list the decline in the price of lubricating oils in British and overseas markets, the tendency for customers to run down stocks, and the very sharp fall in tanker freight rates. In these circumstances it is essential to conserve liquid resources, unless capital development is to be brought to a halt. The directors have therefore decided to defer consideration of the interim ordinary dividend until the full results for 1952 are available; in 1951 an interim ordinary dividend of 10 per cent was followed by a final dividend of 10 per cent. The new construction programme, the directors add, is proceeding satisfactorily and it is hoped that it will be completed next year; but it is not clear from their statement whether capital expansion will be held up by the company's inability to raise new share capital or whether further additions to productive capacity will be financed by other means.

*

Glaxo Laboratories.—In a note in these columns on November 22nd the value of net current assets of the Glaxo group on June 30, 1952, was given as £3,875,315. This value should have been £4,875,415, compared with £4,036,937 on June 30, 1951.

Statistical Summary

EXCHEQUER RETURNS

For the week ended November 29, 1952, total ordinary revenue was £71,527,000, against ordinary expenditure of £105,415,000 and issues to sinking funds £400,000. Thus, including sinking fund allocations of £21,650,000 the deficit accrued since April 1, 1952, was £399,465,000 compared with a deficit of £88,355,000 for the corresponding period of the previous year.

COMPANY MEETINGS

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

IMPROVED RESULTS

The twenty-seventh ordinary general meeting of Barclays Bank (Dominion, Colonial and Overseas) will be held in London on December 29th.

The following are extracts from the circulated statement of the chairman, Mr J. S. Crossley, for the year ended September 30, 1952:

You may think it surprising that our figures should have shown so little change during a year which has seen marked fluctuations in commodity prices, in interest rates, as well as in economic and political conditions in many of the territories in which we operate.

Our deposits at £441 million are about the same as last year, notwithstanding the devaluation in Israel. The cash ratio stands at 23 per cent, as against 22 per cent; the advances also at £148 million show little alteration. Our investment portfolio consists entirely of "dated" stocks, nearly 60 per cent of them having to be finally redeemed within a ten-year period. Nevertheless, market values have fallen sharply during the past twelve months.

THE OUTLOOK

The results, as shown in the profit and loss account, are better than last year. We feel that they have amply justified the declaration of the old rate of dividend on the increased capital. It has been, on the whole, a year during which a high level of economic activity has been maintained throughout our territories, but I think we must expect some reduction in earnings next year. In certain directions, there have already been signs of a slackening in activity, and the lower prices now ruling for the staple export products from many regions served by this bank must have an effect on our figures.

If we cannot predict the future with any certainty, we can, nevertheless, draw conclusions from the past, and this is perhaps an opportune moment to consider the course of events during the seven years that have elapsed since the war.

Perhaps the most striking fact to be noted is that the UK gold and dollar reserves, which in 1946 stood at the equivalent of US \$2,696 million, had fallen to US \$1,685 million at the end of September this year. Moreover, in only one of these years was any material surplus recorded in our external balance of payments. That was in 1950, and was largely attributable, no doubt, to the temporary stimulus given to our exports through devaluation in the previous year, and also to American stockpiling. During this same period, liabilities had increased from approximately £4,000 million to over £6,000 million, almost entirely due to the US and Canadian dollar loans, which together account for the equivalent of £1,700 million. In more homely language, it means that in only one year since the war have we "paid our way," and during that period we have used up more than one-third of our "cash," while our debts, which were already more than heavy enough, are now roughly half as big again.

The figures themselves suggest that only in quite fortuitous circumstances, when the tide happens to be running strongly in our favour, can we succeed in bringing our accounts into balance. (If this is so, then we have not been on the road to recovery; on the contrary, we have been following a course which encroaches further each year upon our

slender reserves. Even the hardest optimist must admit that such things must come to an end. Restriction of imports and other stultifying devices can, for a time, give a brighter appearance to the picture, but the trend is unmistakable.

Most thinking people will probably admit that something is seriously amiss, though fewer are likely to be agreed on the diagnosis, and fewer still on the means of cure. For an overseas bank, or any company operating extensively overseas and having its registered office in the United Kingdom, this question is of the utmost importance.

ROOT OF TROUBLES

It is the rigidity of our present high cost structure that lies, I believe, at the root of almost all our troubles. It is not merely that our control-ridden economy is inflexible, wasteful, and quite unsuited to the more competitive conditions that are now emerging; it also induces a negative outlook.

Not only is large-scale enterprise and initiative surrounded with obstacles, but the small man who wishes to work and make progress, even if he is not actively discouraged by his union, finds a mass of controls and regulations barring his way. Under our present system it seems that the most efficient and progressive units must often be penalised. What is really required today is something to operate in exactly the opposite direction; something that would provide a bonus on enterprise and production, and end extravagance and frustration, the inevitable results of our present system.

CRUSHING TAXATION

Unfortunately, it is the case today that almost every business transaction has first of all to be looked at from the "tax angle." I do not believe that any free society can long survive under a burden of taxation, which is at once so crushing and so ill-adjusted as that which we have at present. Man is by nature an acquisitive animal—therefore, by nature, a capitalist, in whatever guise he may choose to present himself. This needs no apology for unless he can fulfil acquisitive instincts, he must live indefinitely in a state bordering on serfdom. While he must be prepared to pay his just dues to the state that protects him and provides him with amenities, a limit must be set to these demands. It is precisely in the achievement of a proper balance here that one of the arts of maintaining a healthy economy lies.

The view is widely held that a worthwhile reduction in taxation cannot be effected without encroaching upon the welfare state, and that the scale of the economies required, in order to make an effective reduction, renders any attempt hopeless. The latter argument would be a poor one, even if the facts were true. It is defeatism to shrink from a task merely because it is formidable.

As for the welfare state, this consumes in time, labour, and materials, a substantial part of our production. It follows that if we are to support it, our production must be increased, unless other things are to be sacrificed. While there may be nothing new about the concept of the welfare state, there is surely something novel in the idea that it can be free of cost to the individual. A bold spirit is needed to attack this formidable façade. Certainly we shall not be rescued

by timidity. What is needed is a change of heart and of outlook, the parents of resolute action.

Almost daily we have proof of the genius and inventive capacity of our scientists whose supremacy in so many fields is being demonstrated again and again. Let us back their leadership with a policy which offers a chance of ending that sorry tale we too often hear of inadequate production. Nothing else will suffice if we are to free the exchanges and open up that vista of transformed economic power, without which our influence in the world can never be effective. Must we wait until our whole system of government and way of life starts to disintegrate before our eyes, or shall we now challenge the negative psychology that has too long been dominant?

BANK OF MONTREAL

TRENDS IN CANADA

The annual meeting of the Bank was held at Montreal on December 1st.

Mr B. C. Gardner, MC, the president, in the course of his address, said: The results for the year are, in my opinion, satisfactory in the light of the business conditions prevailing throughout most of the period and which have naturally influenced banking operations.

In the main the situation has been marked by a rather delicate balance between inflationary and deflationary forces. Some downward readjustments which had commenced in 1951 continued into 1952, but there have also been major sustaining influences on the demand side in the form of rising outlays for defence, a high level of export trade and a vigorous trend of new capital development. While the programme of restriction of bank and consumer credit was suspended in May, there has subsequently been no very sharp upturn in the demand for bank

controls which are, in fact, becoming more and more difficult to apply effectively. It may well be, therefore, that the advent of full convertibility and elimination of exchange controls would be greatly hastened if the sterling exchange rate were first set free to find a realistic level determined by market forces.

The foregoing may be heresy from the viewpoint of the International Monetary Fund but it seems to me that the fund's concept of exchange rates alterable only arbitrarily and at long intervals has not proven applicable to postwar needs. Indeed, it would appear that the fund's philosophy in this regard is actually at variance with the broader objectives of elimination of exchange control and other restrictive devices which the fund itself is endeavouring to achieve.

The report was adopted.

ANGLO-TRANSVAAL CONSOLIDATED INVESTMENT COMPANY, LIMITED

VOLTA RIVER PROJECT—
ANGLOVAAL PIONEERS

GOLD AND URANIUM—WEALTH
YARDSTICK

Mr S. G. Menell, the chairman, in his address at the nineteenth annual general meeting reviewed the company's accounts, which disclosed that reserves were maintained at £3,850,000, and while there was a shortfall of just over £1 million in the market value of quoted investments (book value £5,400,000) the current assets showed a surplus over current liabilities of a similar amount. The acquisition of further shares in Anglo-Transvaal Industries, Ltd., had made that company a subsidiary.

GOLD MINING INTERESTS

Mr Menell stated that production at Rand Leases (Vogelstruisfontein) Gold Mining Co., Ltd., had suffered from shortages of native labour and electric power. Uranium production at Virginia Orange Free State Gold Mining Co., Ltd., was expected to commence in 1955, and the company should be the main supplier of sulphuric acid for uranium production in the Orange Free State. At the Merriespruit (Orange Free State) Gold Mining Co., Ltd., mine the No. 1 shaft had reached 3,518 feet, the final depth being 4,600 feet.

BASE METAL INTERESTS

The Associated Manganese Mines of South Africa, Ltd., due to transport restrictions, had shipped less ore in 1951 than in 1950, and the dividend was consequently reduced, but this position had recently improved. The profits of Consolidated Murchison (Transvaal) Goldfields and Development Co., Ltd., had fallen steeply with the price of antimony and the consequent restriction of production.

THE VOLTA RIVER ALUMINIUM SCHEME

This vast project, described by the London Press as the biggest colonial development of all time, was sponsored and financed by the company since its inception in 1938, in collaboration with Mr Duncan Rose and Mr C. St. John Bird.

The British Government had that week issued a White Paper on the project, and were setting up a commission to speed the £144 million plan to create one of the world's major producers of aluminium. The project aimed

at an ultimate aluminium output of 210,000 tons yearly, and would result in a saving at present-day prices of about \$150 million per annum.

The result of the 14 years of endeavour is a tribute to the pioneering spirit of Johannesburg business enterprise.

INDUSTRIAL

Industrial interests had enjoyed improved conditions, three companies paying maiden dividends and Anglo-Transvaal Industries, Ltd., had resumed payment of its ordinary dividend. Anglo-Alpa Cement, Ltd., which produced 35 per cent of the Union output, was still handicapped by the inadequate controlled price.

GOLD MINING INDUSTRY FINANCE

They were presently confronted with a very difficult financial period. Too many new gold mines had been established in too short a period. That was largely due to the post-war extensive drilling programme carried out in the Orange Free State over an area which had become attractive at the outbreak of the war, when prospecting operations became restricted. It seemed paradoxical that the very success that had crowned their efforts towards the rapid proving of a large new goldfield in the Orange Free State, which was necessary to replace the old mines, should recoil on them as an important cause of the present financial situation.

Over £100 million had been invested in recent times in the large developing mines of the Orange Free State. In the face of that heavy drain on the flow of market money, the soundness of the present position was remarkable, and more especially so bearing in mind the adverse factors at the present time.

Generally the state was in a stage of over-rapid development with all its attendant difficulties, including constantly rising costs. He believed that the courage and enterprise of investors in the mining industry would be rewarded. Gold and uranium were yardsticks of national wealth, and an increase in the world price of gold could be expected in the not too distant future.

MERLIMAU PEGOH, LIMITED

DIFFICULT CONDITIONS

The forty-third annual general meeting of Merlimau Pegoh, Limited, was held on November 27th in London, Mr J. L. Milne (the chairman) presiding.

The following is an extract from his circulated review:

The year ended March 31, 1952, produced a profit (after taxation) of £135,582 for the parent company as compared with £297,884 for the previous year. This fall is due in the main to the lower crop coupled with continued high costs and heavier expenditure in connection with security measures.

The total distribution for the year is 15 per cent. We received by way of dividends from our subsidiaries the sum of £187,616 as compared with £304,607 in the previous year. Net profit after taxation for the group is £134,717 as compared with £432,185 in 1950-51 and £99,555 in 1949-50.

The rubber crops harvested by our group of companies showed a reduction as compared with the previous year, the total being 8,083,700 lb in 1951-52 and 10,498,900 lb in 1950-51. The difficulties affecting all Malayan estates generally played their part in varying degrees in reducing our crops. A serious shortage of tappers, frequent absenteeism, intimidation of labour by bandits, lower output per tapper and reorganisation of

working arrangements following the regrouping and resettlement of labour under the Malayan Government anti-bandit measures were some of the troubles which have continued to frustrate the efforts of the various managements.

The report was adopted.

UNION FREE STATE COAL AND GOLD MINES

The fifth annual general meeting of shareholders was held in Johannesburg on November 21st. Mr T. Reekie, chairman, presided and in the course of his remarks said:

The position of Raleigh Colliery is the cause of serious concern. The operating loss incurred in the past financial year amounted to £32,067 and since production began to £63,665. Revenue was adversely affected due to despatches of coal being seriously restricted by a continual shortage of railway trucks, but the major reason for the loss has been the unduly high level of working costs.

The Board, after very careful consideration of all the factors and supported by the recommendation of the consulting engineers, has decided that the expenditure of further very substantial sums in order to finance the continuance of operations cannot be justified in the light of the small anticipated profits and the comparatively restricted reserves of saleable coal in view. It has therefore been decided that operations at the colliery will be discontinued as soon as the present reserves are exhausted, probably before December 31, 1952, and that the colliery and equipment will thereafter be disposed of.

HARMONY GOLD MINING

I wish to refer to the other main undertaking on which the funds of the company have been expended—namely, the Harmony Gold Mining Company Limited, in which, by reason of the rights taken up during the year, our holding was increased to 3,092,206 shares. The progress which is being made in opening up this property gives cause for satisfaction that this, the company's principal asset, holds good promise of being an excellent investment. Your directors have given a great deal of thought to the question of deciding the best course to be followed with regard to this asset, especially as your company has a substantial commitment to subscribe in the next Harmony issue and as its capital funds are now exhausted. It was finally decided, in view of the circumstances, that it would be preferable for the major portion of the Harmony shares to be distributed to shareholders who, in due course, could themselves exercise the rights to subscribe in the next issue. In considering whether it would be desirable to effect the distribution by means of a reduction of capital it was taken into account that, after disposing of Raleigh Colliery and making a distribution of Harmony shares, the remaining assets of the company, apart from the residual Harmony shares and two minor shareholdings, would be the coal rights. Your directors came to the conclusion that it would be more in the interests of shareholders to wind up the company at this stage and dispose of the coal rights to the best advantage with the other assets than to maintain the company in existence for a long period in the hope of eventually being able to develop one or other of these holdings. They have therefore decided that recommendations to place the company in voluntary liquidation will be submitted to a meeting of shareholders to be convened in the near future. If these recommendations are adopted, it should be possible to make an early distribution of the major portion of the Harmony shares.

The report was adopted.

THE PERAK RIVER HYDRO-ELECTRIC POWER COMPANY

ANOTHER YEAR OF PROGRESS

The twenty-sixth annual general meeting of The Perak River Hydro-Electric Power Company Limited was held on November 27th in London, Mr Hugh G. Balfour (the chairman) presiding.

The following is an extract from his circulated statement:

The directors' report and the accounts for the year ended July 31, 1952, again indicate progress, despite the unsettled conditions which continued to prevail in Malaya during that period. The gross revenue was £1,266,709, compared with £1,138,781 in the previous year.

The total operating expenses were £509,236, which was £48,500 in excess of last year's figure, for although the cost of fuel showed a net saving of £8,927, due to the greater number of units generated by the Chenderoh hydro station, the cost of labour and materials increased by £57,427, largely due to the boom conditions which prevailed in Malaya immediately following the outbreak of war in Korea.

The surplus on operations in Malaya for the year to July 31, 1952, was £757,473, compared with £678,045 in the previous year.

OUTPUT

The peak load on the system for the year was 57,000 kW, and this compared with 53,700 kW the previous year. The units generated amounted to 367 million, which was 4 per cent above last year's figure.

At the Chenderoh hydro station the river flow was very favourable through the year, and this, together with the benefit derived from the new radial gate, resulted in a record output of 227 million units, an increase of 15.3 per cent on the previous year. A new spare 3,650 kVA transformer has been installed at this station.

Malim Nawar steam station generated 98 million units, a decrease of 6.2 per cent. A considerable amount of maintenance work was done during the year and, after making allowance for the age of the major portion of the equipment, this station is now in good condition.

Batu Gajah steam station generated 42 million units, which was 18 per cent less than during the previous year. Work on the installation of the new boiler and generating sets, and the 2,000-ton oil storage tanks, is progressing as rapidly as the slow delivery of materials allows.

We have provided a sum of £250,000 for depreciation, while provision for taxation on the profits of the year requires £381,839, leaving a balance of profit of £132,777, to which must be added the amount brought forward and over-provisions from previous years of £308,126. Out of this sum we consider it prudent to augment our general reserve by an allocation of £75,000. Taking into account the results for the year and the provision for taxation now no longer required, your directors have this year decided to pay off the seven years' arrears of preference dividend to July 31, 1951, together with that due for the year under review, absorbing, less income tax, the sum of £262,500, leaving £103,403 on net revenue account to be carried forward.

Subject to no unforeseen circumstances, I see no reason why our operations for the current year should not show a comparable result to those for the year under review.

The report was adopted.

STEEL PARTS LIMITED

RECORD SALES AGAIN

The twenty-fourth annual general meeting of Steel Parts Limited was held on November 28th at Birmingham, Mr Alan Shirlaw, chairman and managing director, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to August 31, 1952. (Unless otherwise indicated the figures quoted are taken from the consolidated accounts.)

Throughout the financial year the operations of the company were handicapped by the shortage of steel; further, there was a marked falling off in exports due mainly to currency and licensing restrictions, but partly also to the developing competition of Germany and other continental countries. Nevertheless, by making the best use of such material as with difficulty could be obtained from our suppliers (whose patient consideration I respectfully and gratefully acknowledge), the sales of both this company and its subsidiary respectively constituted a record by a substantial margin.

The trading profit for the year, plus miscellaneous income and credits, amounted to £347,268 (previous year £253,869). After deducting profit and loss account charges there remains the sum of £298,749 (previous year, £210,855), subject to tax. Taxation provision, including eight months excess profits levy and tax reserve, together amount to £190,879, leaving a net sum of £107,870 (previous year £83,688) to be carried to appropriation account.

Truly, industrial taxation has long passed the heavy stage, and the penal stage, and is now at a confiscatory level.

THE DIVIDEND

Your directors feel justified in recommending that the final dividend be increased this year by 5 per cent less tax. This would make a final dividend of 30 per cent less tax, which, together with the 10 per cent interim dividend already paid, would produce a total dividend of 40 per cent less tax for the year, absorbing £27,188 net.

Relatively to the amount of the issued capital, the company is in a strong financial and liquid position—the surplus and reserves (excluding future taxation reserve, all intangible assets, and the increment value of fixed assets) now amount to 238 per cent over and above the nominal value of the one class issued capital. It is apparent that at some time further consideration will need to be given to a capitalisation of reserves.

CURRENT YEAR

Although the current year has opened up quite well in the matter of sales, which for the first two months have much exceeded the corresponding period of the previous year, and we have full order books, yet I am a little apprehensive as to how the year's trade will develop.

Your board is of opinion that if sufficient steel was forthcoming we should find that there is sufficient processing plant installed in the country to cope with any likely demand and indeed provide a surplus of the manufactures in which your company is interested.

Perhaps some opportunities for further broadening the company's interests may arise or be found. I can only say that your directors and management will face up to these difficulties and opportunities and at the end of the year present to you the best results they can in the circumstances.

The report was adopted.

SERCK RADIATORS, LIMITED

EXPANDING TURNOVER

The thirty-third annual general meeting of Serck Radiators, Limited, was held on November 28th at Birmingham, Mr W. H. Newton, MA, FCA (the chairman), presiding.

The following is an extract from his circulated statement for the year ended August 2, 1952:

The accounts which are now submitted for your consideration show a result very similar to that of the previous year. The final profit figure, however, does not do full justice to the normal trading results as a considerable amount of expense has been borne arising out of increased costs of production and incidental costs of removal consequent on the opening up of the new tube mill and the incorporation of the old tube mill premises into our engineering department.

In the new non-ferrous tube mill the transfer of existing plant and the installation of new equipment was completed early this year and full production was reached in April. From the results of the past six months it is clear that the new venture will be a valuable addition to our organisation.

Considerable progress has been made in the absorption of the premises previously occupied by the tube mill into the engineering department, but the changeover is not yet complete. However, the relief thus given to the engineering department has already borne fruit, and the additional floor space made available will go a long way towards relieving manufacturing pressure in that department and a steady increase in output is already being achieved.

PROGRESS OF BRANCHES

Our branches make continued progress. Under vigorous management both turnover and profits expand, and again I have the greatest pleasure in reporting that the aggregate result is appreciably better than the previous year. Owing to the increase in our business at the branches several of our establishments are very cramped for space, and every effort is being made either to obtain more suitable premises or to enlarge those we possess.

Serck (Eire), Limited, has had a successful year. Notwithstanding the difficulty in obtaining a regular flow of the necessary raw materials, Serck Radiators (South Africa) Pty., Limited, has made very good progress and has earned a satisfactory profit in its first complete year of trading.

CRUSHING BURDEN OF TAXATION

I cannot refrain from referring to the crushing burden of taxation to which we are subjected. Notwithstanding the very modest slice of the profits which is distributed to the stockholders, the very serious drain on our resources by taxation has a most repressive effect on all projects for healthy development.

We feel that the conditions which influenced our recommendation of the dividend last year still prevail—we therefore recommend the same payment. It is essential that we should conserve adequate resources to finance our policy of moderate expansion, and to this end, recommend the transfer of £75,000 to general reserve.

I can only repeat my comment of last year that "the business continues to progress." While from time to time we notice a temporary slackening of demand in one direction or another, with our widespread range

For six weeks now the representatives of fourteen governments and the secretariat in the Palais Chaillot have been scrutinising the defence programmes and economic capacities of members, in the hope of producing for the approval of Ministers firm figures of the resources that the Supreme Commander should have by the end of 1953 and a more general programme of his requirements for 1954. They are unlikely at next week's session to get either the approval given or the

figures fixed. Indeed, on present evidence it looks as if neither the effort to be made nor the strategy to be followed in developing Europe's defences will be decided before next spring, when it should be possible to judge in what form and amount American aid will be forthcoming. The delay is inevitable and it will continue to plague the Atlantic alliance year after year so long as fiscal years vary from country to country and so long as national budgeting habits—both in Europe and the United States—make long-term planning impossible.

★

What, then, can the Ministers in Paris do? Are they to record progress or stagnation? Are they to dilute the optimism of the Lisbon conference last February or to express their satisfaction with the general health of Nato? Are they to look at old problems, decide no solution is immediately possible, and then disperse in an atmosphere of bathos? Or are there new problems to be grappled with in a manner that will show how Nato can get things done? There is no genuine need to explain away what were called the "Lisbon targets"; General Ridgway has received very nearly all he was promised in the shape of active divisions, aircraft, and improved communications. A considerable effort has been made and the resulting economic strain has certainly been no greater than Nato's advisers last year thought tolerable. It is true that he is no nearer receiving the 12 German divisions on which so much depends; on the other hand, he is much better placed to fight a delaying action if Western Europe were attacked. It is true that he is short of certain vital supplies, but the bases and lines of communication through which his supplies must be moved are vastly better than they were a year ago. For the cold war General Ridgway is quite fairly equipped; for a real land war he is still in a position of fantastic inferiority to the mobilisable Communist forces in Europe.

This situation, therefore, presents Atlantic Ministers with at least one vital new problem. What kind of reserves is the Supreme Commander to have behind his thin deterrent coating of 25 front-line divisions? There is an infinite difference of opinion among experts about the right size for a reserve division, about the time it should need to take its place in battle, about the state of training that entitles it to be called a fighting formation. The military experts, if they believed the Ministers would face the political and economic difficulties of providing adequate reserves, could quickly overcome these differences. As the Supreme Commander's deputy, Lord Montgomery, has frequently pointed out, the reserve division of 1956 must be something quite different from the reserve division of 1939. It should be Nato's function to decide what it is to be.

Closely connected with this matter is the exasperating delay in French and German ratification of the treaty for a European Defence Community, which will frustrate more than any other single factor General Ridgway's planning for the future. The Nato Ministers have at the moment a clear choice: they can tell the French, and indirectly the Germans, that there exists no alternative plan for German rearmament—which is the truth—and that Nato wants to see the EDC treaty ratified as quickly as possible; or they can heed the numerous hostile voices to be heard in both countries and suggest that there could, after all, be an alternative. If they choose the latter course, the movement towards

a defence community will collapse and the European policy of M. Schuman and Dr Adenauer will be thrown into complete confusion. If they choose the former and more brutal course, they might yet help France and Germany to come to terms before the latter is even considered as a candidate for Nato. If such a compromise meant some modification of the defence community, some delay in executing its more drastic provisions, some departure from a text that is in places fantastically unreal—well and good. What matters is that Nato should express a firm view.

★

There remains the elusive and intractable problem of "showmanship." This unique allied organisation, with all its multifarious purposes, has to be "got across" to the peoples for whom it acts. While General Eisenhower was Supreme Commander, there was no difficulty. In those days his headquarters was prepared to discuss political integration, coal shortage, the dollar problem—indeed, anything under the Atlantic sun. General Ridgway has made it quite clear that he will give all his attention to military affairs—a very proper decision. Politics and presentation are the business of the Council itself, now in permanent session in the Palais Chaillot, meeting and talking frequently, both formally and informally. The generals, to put it baldly, have asked for and accepted political direction; now Nato has it and Lord Ismay is there to look after it, what is to be done with it? There is no short answer to the question. An organisation of this kind acquires personality only by doing and saying things; and most of what Nato has said and done so far has been of a military character. What political and economic activity is to be entrusted to the Council?

There have been small and encouraging signs. Nato governments have been consulted about American, British and French policy towards the Russians in Germany. There has been much informal discussion of common problems outside Europe. The whip is being cracked at commanders who make irresponsible political speeches. The balance is more evenly held between the almighty Standing Group Authority in Washington and the Council in Paris. But little or nothing of this reaches the public in the fourteen countries, which is generally quite unaware of the fact that all its fears and questions about the cost and quality of rearmament are weighed by Nato with an expert impartiality which is something quite new in diplomatic experience. There seems to be a clear case for encouraging the Council to make known from time to time its view on major developments in the cold war. It would be appropriate and useful, for example, that the Atlantic partners should make some joint comment on the very candid and detailed statements on Soviet foreign policy made at the recent Moscow party congress by Stalin and others. If it is the declared Soviet intention to divide the Atlantic allies by exploiting the difficulties that arise between them—some of them created by Soviet policy—that is obviously Nato's business. A firm statement next week from the assembled Ministers that they have taken note of Stalin's intention, that they intend to frustrate it, and that they know how to do so could have a most salutary effect on both sides of the iron curtain. What is more, it would draw public attention to the fact that Nato can, if it wishes, offer leadership not only to the defence forces but also to the citizens of the Atlantic community.

Defence: Enough?

THE question raised by the cuts in the defence programme is not whether rearmament has failed, or whether it has done too much economic damage, or whether it has turned out after all to be unnecessary. The question is whether it really has succeeded sooner, and at less cost, than anyone dared seriously to hope. This issue has not been clarified by the Prime Minister's statement last week, which was obscure both in purpose and in matter. In spirit it contradicted, and in hard fact it added little to, what Mr Churchill said in the debate on economic affairs last July.

The famous £4,700 million programme, designed to stretch over three years from April 1, 1951, has now been changed in three main ways. First, its physical constituents have necessarily been altered as research and new designs have made some equipment out of date. Secondly, defence production as a whole has been expanded less rapidly, in the first and second years of the programme, than was intended. Thirdly, the Government has decided to level off production for the services at the volume reached in the second year—this year—instead of raising it to a much higher peak in the second half of 1953, as was originally implied. The broad effect is that next year defence production, costing some £600 million, will be running at about two-thirds of the pace that was originally planned, or at least envisaged, for that stage of the programme.

Mr Churchill announced last July that a review of the programme, on some such lines, was being undertaken. His statement last week showed, however, some significant differences. Five months ago he emphasised the American advance in atomic power and the promised technical changes in weapons—particularly, the progress made with guided missiles and new aircraft—as reasons for shaping the defence effort to a new pattern; while immediately this adjustment was bound to hold back production, the possibility of expansion next year remained open. By contrast, Mr Churchill last week seemed to have forgotten that he had ever made the pattern of the programme an issue in itself. Instead, his emphasis fell heavily on the size of the programme, and particularly on the decision to level it off by preventing any substantial rise in production expenditure next year.

This change in emphasis is naturally accompanied by a shift in argument. In July Mr Churchill gave two distinct reasons for the Government's decision to spend less on arms than the programme for three years had provided. One reason was that the technical advances had made economies compatible with a positive gain in military power. Secondly, the need for exports could not be met without reducing the further demands imposed on the engineering industry by defence. Last week, however, Mr Churchill ignored the first of these arguments and emphasised the second. The country's financial difficulties were "not . . . a decisive, but at any rate an important factor in determining the magnitude of our defence effort." Indeed, he mentioned no other reason for the cuts. If his statement is taken at its face value, the Conservatives have done what Mr Bevan and his friends have advocated for so long, and for the reason they urged—the economic consequences of heavy rearmament.

It is as well to have this brought into the open and the case considered on its merits. No one need be ashamed of agreeing with Mr Bevan now. Nobody ever disputed that rapid rearmament would be economically harmful—though it has certainly not done anything like as much harm as the Bevanites said it would. The argument in the spring of 1951 was whether rapid rearmament was necessary in order to maintain the peace. If it was necessary—if Mr Bevan was wrong at the time he resigned from the Labour Government nearly two years ago—then by that very fact we would all, as was then argued in these columns, become Bevanites eventually.

Mr Churchill could not now be cutting defence production if the programme had failed. Production has not been increased as far and as fast as was planned; nevertheless, it is nearly three times as large as it was before the Korean war began; even more important, the production lines that have been established will make it possible to expand the output of tanks and the like much more quickly in another emergency. What has happened in the twenty months since Mr Bevan resigned is that the defence programme adopted by his colleagues has fulfilled its purpose, in part at any rate, without quite the economic disaster that he predicted. Rearmament is like the insurance taken out by a man embarking on an air liner. If he lands safely, he has wasted his money; but that does not mean that he would have been wiser to spend it on a drink, or even a new set of false teeth, before he took off.

★

The basic concept of the three-year defence programme was that of the heave followed by the long pull. The country had to make the maximum effort to put itself into a posture of effective defence as soon as possible; after that, the effort could drop back to the lower but sustained level necessary to maintain the posture. Mr Churchill is eliminating the peak that this programme implied for next year. Instead, the effort is being stabilised at the present moderately high point, apparently with the intention that it should be kept there for some years; it will not fall to a care-and-maintenance basis as early as 1954.

This timetable has obvious advantages. Immediately, it relieves the British economy from a further strain that it was ill-fitted to bear next year; Mr Butler can plan a policy for solvency with fewer tears than he would otherwise have had to impose. There is also a remoter economic advantage. Industry no longer has to fear the dislocation that would have been caused by falling back, in 1954 or 1955, from a sharply peaked rearmament programme. Thirdly, the new timetable represents a more efficient way of arranging military production. It will no longer be necessary, in order to gain the maximum strength by 1954, to build large numbers of those models of aircraft and other weapons that are ready for quantity production now but will soon be obsolete. The flatter curve of effort may well give by 1955 or 1956 the same strength as the old programme would have done, but at a considerable saving in total cost.

These advantages are important. They are plainly not decisive. The new policy is right if the chances of a

major war within the next three years are slight. It is wrong if war is, or becomes, the near danger that seemed possible in 1951. In that event the country should still face, as it was prepared to face in 1951, the economic strains of very rapid rearmament, the wastes of getting stronger quickly with weapons that are the best only for the moment. Here, Mr Churchill's statement does less than justice to his case. He is surely not the Prime Minister who would cut defence because he dare not ask for further economic sacrifices or because he ranks military efficiency in the long run above national safety in the short run. The real motive cannot be concealed.

Opposition by Obstruction

LAST week's offensive booing of Mr Churchill has proved to be, for a time at least, the climax to the rising fever of party bitterness in the House of Commons. Since then the House has twice debated its own procedure, on Labour motions attacking the competence of its Leader and the impartiality as well as the competence of its Chairman of Ways and Means. Both motions were unjustifiable, but the introspection has served some useful purpose by helping to cool tempers on both sides. The most outrageous of the censure motions, that put down by backbenchers against Mr Churchill, has been withdrawn with evident relief, and there is some hope that Parliament will get to the Christmas recess in a quieter mood.

But this does not look like more than a lull. The Parliamentary troubles of recent weeks have deep causes that will be removed, if they are removed at all, only by the pressure of public opinion. The bluntest comment on the behaviour of Her Majesty's Opposition was made on Sunday by one of its members—Mr O'Brien, who carries authority as chairman of the Trades Union Congress. He suggested that the electorate did not pay him and his colleagues £1,000 a year to boo at Prime Ministers. That is an opinion that the ordinary voter may share; and it gives the Labour leaders in Parliament reason for concern about their own future as well as about constitutional proprieties. Their party's obstructionism may discomfort the Government, but will it not damage Her Majesty's Opposition even more? Will not the "stupidity" (Mr O'Brien's word) of its method discredit the Labour party in the country even if its aim of hampering the Tories in Parliament is fulfilled beyond the wildest dreams of Mr Bing?

The constitutional issue is simple. Government by discussion rests on two acts of tolerance: the majority respects the right of the minority to criticise; the minority respects the right of the majority to decide. Those principles are expressed in the conventions of Parliamentary procedure. It is the Opposition's business to oppose, and the right to argue at length necessarily implies a power to delay—a power to be exercised right up to, but not beyond, the point at which it is compatible with the normally efficient discharge of the Government's business. Beyond that point opposition becomes obstruction of the will of the majority; it is quite as much a denial of democracy as is the suppression of minority criticism.

The point at which argument becomes obstruction cannot, of course, be defined *a priori*. It can be

Mr Churchill does not like to say so in this context, lest it should encourage complacency, but in fact he is cutting defence because he thinks that the danger of war has receded. For that reason only, the economic and technical considerations can now be given more weight than in 1951.

The danger is again that wishful thinking will allow them too much weight. This is a subject on which public debate is bound to be inadequately informed, and most people can do little but hope that Mr Churchill is right. An early discussion in Parliament would help, however, at least to define the issues for the parties and the country.

recognised simply enough according to the conventions and circumstances of particular times. A Government can get through the modern press of Parliamentary business, and an Opposition can enjoy its full rights of criticism on the matters that concern it deeply, only if a great deal of routine business is treated as non-controversial and allowed by both sides to pass almost undebated. For many years the Expiring Laws Continuance Bill has been put into this category. Last week, however, the Labour party sought to debate it, and for that purpose occupied more time than was taken by the measure in the whole of the seven previous years since 1945. When the debate was at length ended by the closure, the Labour party continued to waste time by its frivolous motion against the Chairman of Ways and Means. No reason, either of principle or of policy, was brought forward to justify this breach of convention. It was the latest and plainest in the series of acts of deliberate obstruction that the Opposition has performed this year.

There is no evidence that such tactics have hitherto impressed public opinion in Labour's favour. There is, indeed, no reason to suppose that they ever will appeal to an electorate that values its democracy. Admittedly, there are circumstances in which a conscious rejection of the democratic process can be justified as a measure of last resort. In the most famous case, the Irish Nationalists wasted the time of the Parliament at Westminster because they denied its right to responsibility for Irish affairs. If obstruction by one of the two main parties of the state can ever be justified, it must be because the democratic process has already broken down in some important respect. In theory, perhaps, one can imagine that a Government with a secure majority might introduce measures of fundamental importance that had never been discussed before the electorate; in such circumstances the Opposition might legitimately deny its right to go on governing, and might make the denial by obstruction if that were the only weapon available. Again, obstruction may conceivably be justified, as the only means of forcing an election, if there is very strong reason to think that a Government has exhausted the confidence of the public. The "harrying" tactics employed by the Conservatives early in 1951 were open to some justification—though not, in retrospect, nearly enough—on such grounds.

One fundamental point is common to every possible case of this kind. The Opposition's purpose in obstruc-

tion must be to force an election; it must wish and believe that it could gain office itself. Otherwise, the Queen's present government must be carried on and obstruction cannot be anything but illegitimate and distasteful. It requires no intimate acquaintance with the inner counsels of the Labour party to know that office is the last thing that party is at present prepared for, is capable of, or wants. It is obstructing not for the sake of office but for the sake of obstruction. And the British electorate is perfectly capable of recognising that fact about a party which is so patently lacking in policy.

The hollowness of Labour's position is, indeed, plain enough from Mr Attlee's own words. At the beginning of this Parliament, he promised: "We shall not oppose merely for the sake of opposition. . . . It would be quite wrong for anyone in the House to indulge now in the kind of tactics which were indulged in during the last Parliament." In these terms, Mr Attlee in effect recognised the right of the Conservatives to govern in spite of their narrow majority. What has happened to reverse this verdict? Certainly not any national catastrophe, either in foreign affairs or in economic affairs, such as might make Labour feel compelled to seek office to save the country. The Conservatives have in fact of late been remarkably successful in maintaining public confidence in themselves. Nor have they launched any legislation for which the country was unprepared.

What has in fact changed since November, 1951, is not the Government but the Opposition. The men behind Mr Attlee have moved to the Left, and in particular they have contrived to revive their enthusiasm for nationalising. They are perhaps sincerely indignant because the Tories have dared to lay cruel hands on the precious structures for steel and transport; and indignation is reinforced by the practical thought that renationalisation will probably be even more difficult than denationalisation has proved to be for the Tories. The Labour backbenchers have therefore made up their minds to hold off the Steel and Transport Bills by the deliberate obstruction of routine business. Their one attempt at self-justification was put in a sentence by the member who claimed last week that, "The present Government . . . are without any mandate for these major controversial items."

A New Mood in Denmark

AMONG their Scandinavian neighbours, the Danes have a certain reputation for levity. In the past, this national trait has taken observable political forms, the clearest of them being, perhaps, the slogan "What's the use?", with which the left-wing parties opposed expenditure on defence throughout the first decades of this century. But today, although Danish gaiety remains very much alive, there is growing up behind it a greater resolution and a deeper political awareness. This is not confined to questions of defence. The programme which the Government laid before the Rigsdag at the opening of its autumn session reflected the new mood of energy and determination in several respects. The unusually substantial list of proposals ranged from constitutional reforms and defence measures to an overhaul of the tax system and the elimination of many price controls and subsidies. Although the present Govern-

Some backbenchers may be sincere in this belief. For them the glories of 1945-50 are still shining; they cannot believe that the British public has turned its back on any part of the great achievement. But this, if understandable, is none the less a refusal to see facts. It cannot be shared by the leaders of the Labour party. There is, indeed, much to be said in criticism of the Steel and Transport Bills. The Tories are handling their legislation badly. They are foolish to try to make up for their own indecision in the last session by rushing both denationalisation measures through now. The Bills are capable of far more improvement in detail than will be possible in the limited time allowed, in the case of transport, for the committee stage.

But these are arguments for caution, not for a full-stop. The people who elected a Conservative majority to Parliament did so with full notice of their intention to denationalise. The mandate for these measures can be denied only if it is said that a majority of 26 (the Liberals support the Government on steel and transport) does not entitle the Government to do anything the Opposition dislikes. That is a constitutional absurdity; Mr Attlee, who in 1951 had steel taken into public ownership on a majority of six, is in no position to entertain it for a moment. The plain fact is that Labour obstruction is an attempt to use the machinery of Parliament to thwart the decision of the electorate. And that is hardly the way to electoral popularity.

It is the attempt of a group of backbenchers, including some whose respect for democracy (Western style) has always seemed to be scant. The leaders of the Labour party lend their authority to it because they are afraid of being outbid by Mr Bevan; they no longer dare to show any lack of enthusiasm for keeping the nationalisation cupboard well stocked. Yet it is on the leaders, not on the backbenchers, that the chances of getting out of the Parliamentary jam depend. As Mr O'Brien said, "The leaders of our political parties have a responsibility to impose on their followers a deep sense of respect for Parliamentary manners." And not only responsibility for manners; they have an interest in holding their followers to policies and methods that earn the respect, not the irritated contempt, of the electorate.

ment does not contain "strong men" in the usual sense of that term, it is showing itself ready to push ahead with new, controversial and, by Danish standards, surprisingly bold policies.

This quietly confident leadership is all the more striking in view of the position in which Denmark now finds itself, both externally and internally. Externally, it is perhaps the most exposed of all the Atlantic allies. It is the only one of the fourteen that fronts directly on to both Germany and the Soviet bloc. Not for a hundred and fifty years has it been successfully defended against invasion; in 1940 it fell to Hitler within a few hours. It has been the most pacifist and neutralist of all the Scandinavian states, and even today strong ties of sympathy still bind it to neutral Sweden.

Nor is its internal political situation an encouraging one for strong leadership. For many years, no one party

has commanded a parliamentary majority; and even the coalition now in power, comprising the *Venstre* party (historically "left," but today right of centre) and the Conservatives, is a minority government. The largest single party, the Social Democrats, are in opposition, and although they have loyally supported the present Government's efforts to make a reality of Denmark's undertakings to Nato—it was the Social Democratic government of 1947-50 that brought Denmark into the Atlantic Pact—they strongly oppose its economic policies. The three other opposition parties, the Radicals, the Communists, and the *Retsforbund* (which adheres to the single land-tax policy of Henry George), are all in varying degrees critical of the Atlantic alliance and its consequences. It is hard to see how any stable majority group can emerge or long endure. The present coalition, though perhaps the only possible one, has little natural unity. *Venstre* is, indeed, a much more right-wing party than its name implies; but, unlike its Conservative ally, it is based on the rural middle class, and on a whole row of issues ranging from tariffs to the Slesvig frontier there is a traditional gulf between the two partners.

*

The Danish party system may undergo changes if the Government's proposals for constitutional reform go through, but this is by no means sure. The main parties are generally agreed that the bicameral *Rigsdag* should be replaced by a single chamber, and most Danes want to see the voting age lowered—at present it is 25—but the question of whether it should be 21 or 23 is hotly disputed, the Socialists and Radicals preferring the lower figure. The new status proposed for Greenland, which would give it two seats in the *Rigsdag*, is acceptable to all parties, and there is also general support for the proposal to introduce female succession to the throne; but while the Government parties argue that a monarch's son should take precedence over an elder sister, as in the British system, the opposition holds that the crown should pass to the eldest child irrespective of sex. Constitutional reforms are, in any case, not easy to achieve in Denmark. They must be adopted by both chambers of the *Rigsdag*, endorsed by a newly elected *Rigsdag*, and approved by a plebiscite, in which the favourable majority must represent at least 45 per cent of the electorate. It is an open question whether the Government can successfully surmount these obstacles of simultaneous plebiscite and general elections.

The prospect of early elections has not led the coalition to flinch from the fairly sharp deflationary policy which it has pursued for the past two years. Although the Social Democrats can make election capital out of the present unemployment in textiles and shipbuilding, the Government can point out that it has at last stabilised retail prices; that rationing has been abolished, except for sugar, the ration of which is a generous one; that the deficit in the balance of foreign payments that loomed so large two years ago has been sharply reduced, and that in recent months there has been a most encouraging increase in dollar earnings. Moreover, the terms of trade have moved in Denmark's favour since the beginning of the year by nearly ten per cent. The economic picture is not entirely rosy—the slump in freight rates, for instance, has cut deeply into the earnings of Danish shipping—but the Government has good reason for claiming that its policies of restricting credit, reducing

non-essential imports and allowing internal prices to find more natural levels have justified themselves.

These achievements have provided the economic basis for Denmark's present effort to arm itself. In the Budget for the next financial year the Defence Ministry's estimates total Kr. 778 million, as against an estimated expenditure of Kr. 515 million for the current year, and defence costs will account for nearly 30 per cent of the new Budget. Some 3 per cent of the national income is already going into defence, and next year the figure will be 4½ per cent. Physical factors, however, slow down the rate at which the Danes can increase their strength. In particular, lack of accommodation, equipment and trained cadres have prevented the extension of conscription from twelve to eighteen months from taking full effect; sailors and airmen are already serving the longer term, but the army will not get on to an eighteen-month basis until next May. Denmark aims at an army of 100,000 men, a navy of 25,000, an air force of nine squadrons, a local defence force of 15,000 and a home guard of 50,000—all to be built up from nothing.

*

Meanwhile, however, every Dane is aware that this flat little country, whose shallow southern waters are an invitation rather than a barrier to an invader, is a vulnerable and highly desirable target on the very doorstep of the Red Army in Eastern Germany. The tangible demonstration in the recent "Mainbrace" manoeuvres that Nato has the defence of Denmark at heart was encouraging, but it brought down upon the Danes a truculent Soviet Note declaring that they alone would be responsible for the consequences if they allowed Nato forces to use bases on their soil. The Government, with the full support of the Social Democrats, rejected this charge in a restrained but firm reply, which stated that the aims of the Atlantic Pact were purely defensive. In a subsequent debate in the *Rigsdag*, a Communist motion condemning the idea that Nato forces should be stationed in Denmark was rejected by 113 votes to 8, only one *Retsforbund* member voting with the seven Communists. Most of the Social Democrats voted with the Government, after their leader, the former Prime Minister Hr Hedtoft, had scathingly condemned the Soviet Note as an attempt to intervene in Denmark's internal affairs; and although the Radicals, most of the *Retsforbund*, and one Social Democrat abstained, their spokesmen explained that they did not share the Communists' views on foreign policy. The attitude of the smaller opposition parties derives, indeed, less from contemporary neutralism than from the traditions of pacifism and isolationism that still exist in Denmark.

All the ingrained habits of many years cannot, perhaps, be quickly discarded; but, primarily as a result of the act of conscious leadership that brought Denmark into Nato, the whole tenor and temper of Danish political life are slowly changing, and the Foreign Minister, Hr Kraft, described the Radicals' attitude aptly a few weeks ago when he said that they had reverted to the past. Hr Kraft, who is now actively carrying out his duties as chairman of the Atlantic Council, has summed up the attitude of the great majority of Danes thus: "We think freedom is worth its price." These words contain the essence of the new mood that now dominates Denmark.

NOTES OF THE WEEK

More or Less War?

In spite of the calming effect of General Eisenhower's realistic statements at the end of his visit to Korea, there is plenty of ground at present for anxious conjecture about the future course of events, not only on that front but along the general frontier of the Communist and non-Communist worlds. Within a few hours of the President-elect's warning of the difficulty of finding a way to end the Korean war that did not involve the risk of enlarging it, General MacArthur proclaimed his knowledge of "a clear and definite solution" for Korea. Both the present and the future President have now asked General MacArthur to impart his secret to them without delay; but the fact that he had preferred to make his claim at a public dinner rather than to communicate directly with his Commander-in-Chief does not augur well for the validity of this "solution." Moreover, although General MacArthur claimed that his plan involved no risk of "universal" war, he does not seem to have ruled out the possibility that it might spread the conflict beyond the frontiers of Korea. Such a possibility would not appear very attractive either to Mr Truman or to General Eisenhower.

Of more interest than General MacArthur's heavy hints is the broad analysis of current Communist policy which appeared in the *New York Times* of last Sunday, and which is believed to reflect the views of Mr John Foster Dulles, the Secretary of State designate. The gist of this analysis was that the Kremlin, largely because it saw Mr Dulles himself as committed to the liberation of eastern Europe, was now basing its policies on the idea that a major war is inevitable. This implied less effort to weaken the free world, and increased attention to the consolidation of the Communist bloc. It may be argued, however, that there are two serious flaws in the reasoning. In the first place, while events such as the travesty of "trials" in Prague confirm the belief that the screws are being turned more tightly on Russia's unhappy satellites, this is no unprecedented phenomenon. Experience has shown that it is not necessarily accompanied by a lessening of Communist attacks on the unity and will of the free nations. Stalin's statements in October suggested exactly the opposite. Secondly, it is not always safe to assume that the Kremlin believes its own propaganda. However well the bogey of a "war of liberation" serves that propaganda, Stalin's intelligence services must be fully capable of telling him that the West is in no condition to prepare or launch such a war.

*

Back to Abadan

A statement of policy is seldom issued unless it signifies a new policy. Naturally, therefore, a number of interpretations have been placed upon the State Department's sybilline utterance of last Saturday about Persian oil. Decisions whether or not to buy, it said, must "be left to such individuals or firms as may be considering them"; but if purchasers were to get into legal trouble on account of Anglo-Iranian's title to the oil, they could expect no diplomatic backing from home. According to the Department, the statement is just a routine answer to commercial queries. According to a number of small American companies that are hoping to run a profitable line in cut-price oil, it is the green light to go ahead; according to the major American oil companies, it is encouragement, but shocking encouragement, to "get by the cops"; according to the British Foreign Secretary, it is a fine display of Anglo-American solidarity. It was shown to the British Foreign Office before issue.

The British are lulling themselves into false security if they imagine that the State Department approves their

legalistic attitude over Persian oil; most of the present American policy-makers think it a sure way of driving Persia into bankruptcy and the arms of the Tudeh party. Indeed, they have been discussing with major American oil companies ways out of the deadlock.

But does their argument now hold water? They admit that enough oil to save Persia from ultimate bankruptcy cannot be moved without securing sufficient tankers; one State Department official belittled the significance of last Saturday's statement because it "couldn't move enough oil to save anybody." They admit Persia cannot sell enough oil to stop the long, slow but steady headway that Tudeh is making against the Persian nationalists. They admit that to turn Dr Mossadegh's version of "nationalisation" into a successful policy would be to undermine all foreign concessions in other nationalist states. Their representatives in Persia seem also to concur in the opinion that, in view of this year's good harvest in Persia, it is not an economic collapse, but a collapse of security that is most to be feared in that country.

If in the light of all these facts, Americans wish to press London to make one last approach to Teheran, they ought to be willing to pay a price for British capitulation to their view. That price is agreement on what joint action is to be taken if the policy is fruitless, and if Tudeh, nevertheless, comes to power in Teheran.

*

Neguib Broadens his Base

The Egyptian political scene recovered some of its more recognisable features this week when General Mohamed Neguib, publicly supported by some of the members of his army committee, restored to grace the old-guard leaders. Their incarceration in the Military School last August had seemed at the time as drastic a break with the immediate past as the enforced abdication of King Farouk. Three months ago, there was no intention of restoring their political opportunities so quickly. Now it is plain that domestic and external difficulties, combined with dangerous pressure from a too radical left-wing, are the causes of the reversal of policy. General Neguib was not prepared to be a ruthless dictator; he was therefore compelled to seek reinforcement from the right.

He may well have chosen wisely. There were good men as well as bad among those shut out of political life; there are some whose honesty and intelligence are needed, and perhaps the old regime has had time to shed some of its reactionary evil during its confinement to barracks. The benefits of the change can be judged only when it is known to which of the freed politicians General Neguib will now turn for help.

His public restoration of Mustapha Nahas, the Wafdist leader whom he had thoroughly defeated, is not encouraging. The Egyptian is apt to regard British dislike of the Wafd as solely due to its futile and frenetic opposition to the British last autumn; but the British, requiring stability in Egypt, are equally worried by Wafdist misgovernment in general. The almost insuperable economic difficulties which the army has faced are in large measure due to Wafdist extravagance and corruption. The Wafd's passion for power will make the party a dangerous partner in national reconstruction. Colonel Sadat, the army spokesman, showed some awareness of this when he said that there would be no objection to Wafdist taking part in the government "as long as they did not work against the interests of the State." Such a statement implies that the army is still conscious of the power it can wield; but it will not find the old guard very willing to accept responsibility without power.

Whether the new Egypt is to be a republic or a monarchy is presumably the question that is to be referred to the nation for a straight "yes" or "no." Many believe that General Neguib might well have brought the present Regent, Prince Abdel Moneim, to the throne and restored the succession of his particular line. Abdel Moneim has the taste and character for constitutional rule and might have served Egypt's purpose well. As it is, the constitution-making process to which the political leaders of all parties are to be invited could be a source of endless dissension; for it will be surprising if the politicians will forget their personal ambitions and enmities under conditions which could restore their power. Certainly the changes this week and the plans for reforming the constitution do not alter the immediate fact of the army's power and responsibility. It will be dangerous if the army imagines that they have done so.

Labour Looks at the Future

The turmoil about procedure at Westminster has served the Labour party well in one respect. It has helped to make Mr Bevan's return to the Opposition front bench seem smooth and natural. Mr Attlee and his friends grasped the opportunity of the censure debate to allow Mr Bevan to reappear as an official spokesman of the party, and the new party committee has contrived to exude an air of geniality that is not altogether forced; both sides in the Labour party's controversy are, for the moment, relieved that the squabble has passed another climax. Some fingers may still be itching, but at least the knives are temporarily sheathed.

By the standards of the recent past, that is a good beginning to the policy discussions that the party's national executive committee is conducting this weekend. Similar meetings in the past have been held in country retreats dedicated to Labour causes. This time a West End hotel will provide an atmosphere perhaps in truth closer to that of the Morecambe conference from which the discussion grew. The more moderate party leaders then accepted, perhaps in order to head off other forms of left-wing pressure, a motion demanding that a new policy should be drafted and should include specific proposals for further nationalisation. A sub-committee's proposals on these lines are now ready for consideration.

The right wing has already let itself be forced into a position where it cannot resist some considerable measure of further nationalisation. But it perhaps retains powers of delay and selection. The present tendency seems to be to avoid a definite list of industries nominated for further nationalisation and to suggest instead a prior need to set out some general formula by which a list could be justified. It is even said that public ownership might be advocated as a method of reshaping the economy to the needs of a larger export trade in capital goods. That would be a sort of looking at the future, but through rather odd spectacles. It seems doubtful, indeed, whether anything precise can possibly emerge from the present talks. The symbolist may notice that the hotel where they take place is noteworthy for having doors at either side, each opening on to a one-way street.

No Action on Rents

The debate on rent restriction in the House of Lords on Wednesday merely underlined the fact that a solution to this urgent problem is as far away as ever. The Lord Chancellor, it is true, promised that Lord Silkin's demand for an all-party inquiry would receive "special consideration." But that is a time-honoured formula for inaction, and promises, if anything, less than the repeated assurances of the Minister of Housing that the subject is being studied in his department. The other Government spokesman, Lord Lloyd, seemed to retreat much further from the position taken up

by the Government in earlier pronouncements and in its election pledges. His speech was largely taken up with reasons for doing nothing.

Lord Lloyd argued, as Mr Macmillan has done before him, that the best thing for a great many of Britain's houses is that they should fall down as soon as possible and be replaced by new ones; he referred particularly to houses built soon after the industrial revolution, of which there were about 4 million. But at the present rate of building their replacement would take twenty years—an uncomfortable twenty years for the occupants as their homes fall about their ears. It is essential repairs that are needed, not substantial alterations to hopelessly substandard houses, and such repairs are a less expensive use of resources than replacement by new houses could be. Lord Lloyd also spoke of the difficulty of finding a workable formula for revising rents; as he rightly said, a flat increase was not the answer, and any increase that was allowed would have to be linked to the landlord's obligation to carry out repairs. But constructive proposals to meet this difficulty have been made. The Royal Institution of Chartered Surveyors has proposed that rent increases should be calculated by multiplying permitted deductions for repairs and maintenance by the percentage increase in repair costs since 1939. The institution calculates that in November repair costs had risen to 293 per cent of the 1939 figures.

It is a hopeful sign that a Labour peer should ask for an all-party inquiry, although it is doubtful whether the Opposition would, in fact, be willing to give up the electoral advantage of having nothing to do with raising rents. But neither a refusal of the Opposition to co-operate, nor any of the arguments used by Lord Lloyd, are any excuse for allowing houses to decay because landlords cannot afford to maintain them.

Kenya's Land

The emergency in Kenya appears at the moment to be dominated by the trial of Jomo Kenyatta, former president of the Kenya African Union, for Mau Mau activities. It would be wrong, however, to assume from this that much progress has been made in restoring law and order. On the credit side can be put the broadcast a fortnight ago by Mr Mathu, African member of the Executive Council, to the Kikuyu, urging them to have nothing to do with Mau Mau, and the formation of local Kikuyu resistance groups. On the other side of the account must be set the absence of any general rally among the Kikuyu to the support of the government and the police.

Against this background of sullen fear, a despatch to the Colonial Secretary from the late Governor, Sir Philip Mitchell, has now been published (Colonial No. 290). It is dated November, 1951, and is the document that has led to the appointment of the Royal Commission whose membership has still to be completed; it is, in fact, entirely concerned with the long-term problems of overpopulation, land hunger, low wages, poor health, and so on. The dispatch, indeed, anticipates much of the Labour party's motion on Kenya, which was tabled last week.

Yet the publication of this despatch may well have some reactions on the present emergency. Sir Philip argues, forcibly and convincingly, that the pressure of the Africans, and the Kikuyu in particular, on the land cannot be relieved for long by giving them more land to use up. Formally, African claims to land set aside for European occupation were settled twenty years ago by the Carter Commission. Although the Royal Commission has to consider the "opening for cultivation and settlement of land at present not fully used," it also has to take account of "existing obligations incurred . . . in relation to the security of land reserved for the different races. . . ." But does this rule out of consideration the grant to Africans of "land at present not

fully used" in the European Highlands? Economically, Sir Philip was right in urging that it is a change in the Africans' methods of agriculture that is needed to relieve the pressure of population. Psychologically, the apparent restriction on the Royal Commission's investigations may be a bad mistake. It may prejudice the commission in the eyes of the Africans as a whole, and it will certainly not help the government to gain the support of the Kikuyu against the terrorists.

Violence in North Africa

During last weekend, fifty people were killed in a riot in Casablanca and a leading Tunisian nationalist—the secretary of the local trade union movement, Ferhat Hached—was murdered in Tunisia. In French North Africa rioting is the stock way of drawing attention to grievances; wilful murder is not. The Tunisian incident is therefore likely to have the more far-reaching repercussions.

Tunis is a compact town where rumour always flourishes. Responsibility for the murder is being pinned on suspects ranging from the Communists (the Tunisian trade unions are anti-Communist) to the French Government; somewhere in between come a rival faction inside the Tunisian nationalist movement, and self-appointed French *autodéfense* units about whose retaliatory, black-and-tan aspirations certain settlers make no secret. That the French authorities feared violent action by either of the last two groups has been apparent for weeks, since police guards have been posted at the houses of all prominent men, nationalist as well as French.

Matters have not been improved by the first reactions of the interests concerned. The French authorities, by at once arresting other nationalist leaders, gave the impression that they considered their own people above suspicion, which is certainly not their honest view. French settlers foolishly attributed evidence of nationalist complicity to an eyewitness, who at once denied their story. Tunisian nationalists, in two reckless press interviews given in Tunisia and New York, openly accused the French authorities of the murder; by the obvious extravagance of their accusation they have done their cause much harm in the eyes of impartial United Nations delegations. If the French, however, are to reap the full benefit from this piece of folly they must find the assassins.

The events of the week both in Tunisia and Morocco reinforce France's thesis that debate in New York on domestic matters serves unwarrantably to increase local agitation. There can be no doubt that, on the eve of UN debates, lobbyists cable home a request for "demonstrations." The Moroccan riots, for instance, though graver than usual on account of the emotion roused by the Ferhat Hached murder, have their parallel in the incident of last April, in which five people were killed when the Tunisian case was being laid before the Security Council. The fact that the voting on Tunisia in the Assembly has so far gone less strongly against France than was expected suggests that these callous tactics are largely self-defeating.

Malice Without Forethought

The unhappiest feature of the United Nations Assembly is the opportunity it gives for the venting of malice by the ignorant and irresponsible. A classic example of this was last week's motion in the Fourth Committee, which concerns itself with dependent territories, condemning Britain's land reform policies in Tanganyika and demanding that the transfer of some 1,500 tribesmen to more suitable lands should immediately be cancelled. British spokesmen explained patiently, but in vain, that this move was only a small part of the Tanganyika land development scheme, based on the Wilson report, and that this scheme, far from

favouring the white settlers, left them on balance with less land and the Africans with more. The sponsors of the motion, who included Guatemala, El Salvador, Haiti, Indonesia, Liberia and Saudi Arabia, clamoured virtuously for "justice" for the oppressed Wameru.

Other nations, ranging from India to Denmark, acted quickly to tone down the resolution; but nobody thought to challenge the sponsors' right to pose as champions of the underdog; nobody recalled Indonesia's bloody repression of the Ambonese, or inquired how the Guatemalans (who, when at home, engage in a mutual barrage of threats and insults with the Salvadoreans, each accusing the other of savage violations of human rights) are getting on with their own land reforms, opposition to which has recently taxed the full strength of the Guatemalan army.

Some confusion was caused in these motley ranks when it came to light that several of them had never read, or even heard of, the Wilson programme. No clearer example is needed of the ludicrous situations into which Uno can be led by the notorious "salt-water fallacy": the theory that backward tribes are invariably oppressed if their governments are situated across the ocean, while the wretched life of millions of American Indians and Asian tribesmen is made tolerable by the absence of any expanse of water between them and their rulers. It is surely high time that the governments which are the chief victims of this fallacy insisted on a searching inquiry into the human rights and economic conditions enjoyed by the tribesmen of south Borneo, Central America and the Arabian deserts, and of some minorities in Asia.

Venezuela in Travail

The whole western world has cause for anxiety over the complex and unhappy events that took place last week in Venezuela. This northernmost of the South American

ADVERTISING

WISDOM . . .

Quality sells . . . slowly

There are people who say that you don't need to advertise a really good article. They say that quality sells itself; and up to a point they're right. But quality by itself can be a slow salesman; by the time the world knows what an excellent product you are offering, you may have gone out of business.

One of the basic principles of selling is that, in the long run, if a product is going to be advertised it has to be good. But another is that even if a product is good, it still has to be advertised.

In fact, before you congratulate yourself because your product is selling very nicely on its quality, wouldn't it be as well to ask how much better it would sell if you helped it with a little of the right sort of advertising?

Why not drop in and talk about it? We can show you some actual examples that will convince you.

SAMSON CLARK'S

SAMSON CLARK & CO. LTD., Incorporated Practitioners in Advertising

republics contains only five million people and inevitably carries less weight in the hemisphere than such of its larger neighbours as Brazil or Mexico; but it ranks second only to the United States as a producer of oil, its output of which is almost equal to that of the whole Middle East. Its oilfields, and the great refineries on its shores and on adjacent islands, represent the only major source of petroleum outside the United States that is not strategically exposed to Soviet threats, and their products flow to all five continents. The consequences of any serious interruption of this flow need not be stressed.

Before the elections of November 30th, it was generally hoped that Venezuela was moving slowly but smoothly towards a more constitutional form of government than it had ever known. Both the government and the opposition parties expected that the former would triumph at the polls, and that the constituent assembly which was to be formed would then be able to prepare the way for a quiet transition from the former Government Junta to a normal form of rule by a president and a congress. But only a fraction of the votes had been counted when a strict censorship was suddenly imposed; and this was lifted only for the announcement that the Junta had resigned and that one of its members, Colonel Perez Jimenez, the Minister of Defence, had been appointed provisional president by the armed forces. Colonel Perez had already been recognised as the strongest personality in the Junta, and his new appointment can hardly be described as a *coup d'état*; but this event has undoubtedly increased the tension within the country to a most dangerous point. Even now, it may not be too late for the army to recognise these dangers and come to terms somehow with the infuriated opposition; but passions have been inflamed on all sides, and such a settlement will not be easy to achieve.

The Unions and Denationalisation

The process of denationalisation affords a test of trade union statesmanship from which, hitherto, the unions have emerged well. It was never likely that they would respond either to their own extremists' pressure, or to irresponsible incitements from outside the movement, and conduct a fully fledged campaign of overtly political strikes. That would have amounted to a revolutionary syndicalist challenge; and the trade unions are neither revolutionary nor syndicalist. It was, however, quite possible that the unions might encourage a new and dangerous head of steam to build up behind normal industrial controversies, both as a protest against the very existence of a Conservative Government and as a specific warning against denationalisation.

In fact, there have so far been fewer, not more, disputes in 1952 than in the corresponding period of 1951, and the threat of industrial action, or even of industrial discontent, has supplied a surprisingly minor theme in the denationalisation debates. The unions have protested; they have not attempted, or threatened, sabotage, any more than management did when the nationalisation measures were going through.

Refraining from sabotage, however, is one thing, an important but negative virtue in statesmanship; active co-operation is another. The Minister of Transport has asked the TUC to consider nominating a trade union member to the disposals board to be set up under the Transport Bill; the TUC has agreed to consider the suggestion. Superficially, it puts the union leaders in a slightly awkward position. As Socialists and active opponents of the Bill they would feel much happier sniping from outside, having no truck with the accursed thing and no responsibility for any hitches and difficulties which the process of denationalisation may encounter. As guardians of the road haulage workers' interests, however, they obviously owe it to their constituents to seize the chance of exerting influence from the inside and ensuring that the workers' point of view is adequately con-

sidered. Active and constructive collaboration would further the whole cause of workers' control—using those words in the wide sense of participation in power and responsibility—in both public and private sectors of industry. A sulky refusal would mean a corresponding setback. Here is a positive, not merely a negative, test of statesmanship.

A Comfortable Slump

The textile slump in Lancashire was, as slumps used to go, comparatively comfortable. This is the verdict of two studies published in the last few days—one a broadsheet by Political and Economic Planning, the other an article in the *District Bank Review* by Mr W. M. Clarke.

Mr Clarke points out that prosperity in other Lancashire industries did much to offset the cotton slump. But he somewhat understates the effect of the slump when he points out that retail sales in the north-west remained higher than they had been a year before. They lagged substantially behind retail sales in the county as a whole, as the accompanying chart shows. It is curious that consumers in the north-west began to buy less, relatively to other people, before unemployment showed any increase; the reason was, presumably, the prior growth of short-time working and the general lack of confidence. The comparative recession in the shops of the north-west was greatest at the end of 1951, before unemployment reached its peak; evidently the cotton workers were forewarned. Consumer buying picked up considerably with the January sales, but remained below the

national level through the summer, in spite of falling unemployment. Perhaps the first reaction of the man or woman who got back to work in the mill was to try to restore depleted savings—which is another way of saying that the hardships of unemployment had not, generally, been acute.

The evidence collected by Mr Clarke shows, indeed, that people kept up their living standards as well as they could by drawing on their savings and cashing their insurance policies. There was hardship for those who had no such resources and who were ineligible for benefits. But even in towns where about half the workers are cotton workers—in Nelson and Padiham, in Great Harwood and Rochdale—there was no return to the want and misery of the prewar slump.

The welfare state, as Mr Clarke and the authors of the PEP pamphlet are agreed, thus cannot take all the credit for the comparative painlessness of the cotton slump. Only about half the people entitled to claim national assistance seem to have applied for it. One reason, in the opinion of the PEP investigators, was a mistaken belief that national assistance is not granted to those who own a little property; but another reason was Lancashire pride. This is reassuring.

National assistance for a worker with dependants is now so close to average wages that it might seem dangerously attractive. But in Lancashire, at any rate, people have preferred to eat into their savings; they have made economies (rarely, however, to the extent of giving up cigarettes or entertainment); and some 50,000 or 60,000, mostly young workers, have left the industry. If these other resources had not been available, if the slump had been widespread and prolonged, the strain on the facilities of the welfare state would obviously have been much greater.

Fateful Intelligence Test

Once equal opportunity in education is nominally established, minor lapses from it become almost more intolerable than were the haphazard effects of birth and income. Hence the public anxiety about the entrance examinations for secondary schools. The tests can be relied on to distinguish the best and the worst. The question is whether they can effectively select, from the mass of children on the borderline, those best fitted for a grammar school. If they cannot, the monstrous consequence is that a child may deprive himself of a university career, relegate himself to an inferior occupation and generally seal his fate—at the age of eleven.

A report published this week by the National Foundation for Educational Research* confirms earlier evidence on this subject. The whole point of the so-called "objective tests" is to reveal differences of ability as distinct from teaching and other influences. But in fact a child's performance in these tests can be affected by coaching and practice, as well as by variations in teaching. The authors recommend that coaching should cease. They are not opposed to practice, which gives a chance to the child who is easily scared by examinations without giving to some the unfair advantages of efficient coaching. Variations of practice time appear to make little difference after the first few hours. Finally, as the reliability of the tests and the children's day-to-day performance can vary so much, the report suggests that decisions about their subsequent education should be based on at least two examinations and that the objective tests should be supplemented—preferably by English composition.

The report will no doubt be carefully heeded by local authorities, who contribute to the foundation which sponsored it. But even if all the recommendations are carried out, luck and good management cannot be entirely eliminated from the selection. The 1944 Act was not intended to make the initial choice of school irrevocable; transfer from, say, a secondary modern to a grammar school should be possible. But at present differences in curriculum obscure the need for such transfer. As the sheep are so hard to distinguish from the goats, there is sense in the authors' plea that their curricular diet should not be widely different. On the other hand, it would be wrong to force all modern school children through a grammar school course because some of them are not unsuited to it. The best method of lessening unfairness is a more even provision of grammar school places; at present they vary from 60 per cent of all secondary school places in parts of Wales to as little as 8 per cent in a town in the North East.

Dr Malan Defied

Few people outside South Africa can fail to admire the courage shown this week by Mr Patrick Duncan and others in courting arrest at the hands of Dr Malan's government. The name of his father, Sir Patrick Duncan, is one to conjure with in the Union: he was the first South African to be its Governor General, and was widely and sincerely respected among all races. Now his son has associated himself as a European with the African movement of defiance against the

*Secondary School Entrance Examinations. By A. F. Watts, D. A. Pidgeon and A. Yates. 3s. 6d.

policy of *apartheid*. It is a proof of his thoughtful purpose that Mr Duncan, in order to prepare for it, resigned from the British colonial service in Basutoland and moved into a small farm in the Orange Free State. No one can pretend that this decision and the motives behind it have anything whatsoever to do with Communism.

What effect will it have? So far, the action of this small group of seven Europeans—who addressed a gathering of Africans in the forbidden township of Germiston, near Johannesburg, on Monday—has been coolly received in public, even on the United Party side. It is condemned by many as a gesture that will delude Africans into thinking that they enjoy more practical support in the white community than is really the case. It is said to be encouraging African intransigence, and so delaying the day when relaxation of racial tension will be practicable.

There is no evidence that Dr Malan is slackening his measures against the Africans. Two new Bills are to be laid before Parliament in January, one providing for detention camps and the other for further emergency powers, including that of arrest without warrant. Yet a large number of white South Africans are known to sympathise in private with the African defiance campaign; and no employers have yet penalised any Africans for taking part in it. The events in Germiston have been followed by similar ones in Cape Town. Mr Duncan and his associates have given a lead which some of their countrymen may yet follow.

Europe's Economic Conference

Some disappointment may be felt on the Continent when the Council of OEEC, with Mr Eden in the chair, meets this weekend in Paris to approve its fourth annual report. People no doubt hope that out of this meeting will come more details about the Commonwealth talks in London than can be gleaned from the official communique. As a

The Economist Diary

A reference book for the desk

For the man who seems to have everything he could want, The Economist Diary is the ideal present. The appointments and memoranda section is designed to meet the needs of the busy man and in addition there are 72 pages of facts and figures, which together form a complete reference book.

The reference material covers a wide range of subjects, including elections, national income, banking, taxation, crime, man-power, commodities, and a special section giving the basic facts on 47 principal countries in the world.

The volume is bound in red leather and measures 10 in. by 8 in. Price (U.K. only): 42/- including postage and purchase tax. Overseas prices vary widely; a schedule will be sent on request. Full details of The Economist Diary are given in an illustrated pamphlet available from:

Diary Department, The Economist,
22 Ryder Street, St. James's, London, S.W.1

"They'll wrap it up for us" *

How much our Christmas shopping owes to paper! Where should we be without the tough kraft wrapping paper from the famous Aylesford mills or that shiny sulphite paper so gaily printed? These are the papers that meet to-day's demands for bags and wrappings—and carrier bags—of the first quality. Protecting and enhancing countless products, they are examples of the many ways in which the Reed Paper Group is continually extending the field of paper's usefulness.

* There is no shortage of paper to-day.

leading member of both Commonwealth and West European groups the British Government is sooner or later bound to exchange information, but the present occasion is thought to be premature for the release of details. It follows too closely on the Commonwealth discussions for British officials to have fully digested the proposals made there and determined a course of action. It is argued also that OEEC is in no way hampered or confined because the British are obliged temporarily to hold back. For both the Commonwealth and Western Europe the goal is the same: to establish conditions for multilateral free trade and payments, looking toward convertibility. Everyone is familiar with the means: and West European countries can set about a general plan for using them without waiting for the Commonwealth.

The organisation's annual report will probably limit itself to an analysis of the dollar gap and to some general prescriptions for economic health. Little will be said about trade liberalisation beyond expressing the wistful hope that the two worst offenders in this respect, Britain and France, will shortly ease their trade restrictions. Convertibility, the most interesting topic of all, will not be discussed. This does not mean that OEEC experts have no thoughts on the subject. The managing board of the European Payments Union (EPU) has studied the question for some weeks, concentrating on the impact various forms of convertibility might have rather than on ways to achieve it. The board's study is not intended for public consumption, but will be used as a working paper when the time comes for the Commonwealth and OEEC countries to concert their policies on trade and payments.

Racial Policy for Africa

During the same long months that Central African federation has been under discussion, a private group in Southern Rhodesia, the Capricorn Society, has been formulating a statement of principles designed to be the basis of a much wider federation—the federation of the Rhodesias,

Nyasaland and the three East African dependencies. The statement was published this week under the title of "The Capricorn Declarations," together with some notes on the society's policy for race relations. The society recognises that the federation of Central Africa should precede its wider plan, and there is consequently no attempt yet to draw up a federal constitution. The chief interest in the document lies, therefore, in the means

proposed for implementing the declaration that

The successful federation of the six territories will depend essentially upon a policy of race relations which is flexible enough to meet the special requirements of each territory, and broad and liberal enough to face with confidence the scrutiny of enlightened opinion throughout the world.

Kenya and the Rhodesias, the territories where the problem of race relations is most urgent, are to be divided into two areas: native areas, where no non-African will own land, live or carry on business "except in an official capacity, or unless that business is held by the territorial government to further African interests"; and open areas, where the rights of non-Europeans to own land will be limited to urban residential and trading sites.

Superficially, the proposals appear to be *apartheid* covered up in some fine-sounding phrases. To anticipate this criticism, the society emphasises the essential differences: in the open areas, the franchise will be granted to all, irrespective of race, who have reached a certain level of civilisation, and opportunities for economic advancement will be available for Africans capable of skilled or semi-skilled labour—though here the phrasing seems somewhat hesitant. A more reasonable criticism is that undue emphasis seems to be placed on the protection of European standards, and whereas in the native areas there are loopholes for Europeans, in the open areas there are nothing but obstacle races for the Africans who want to advance. But it has to be remembered that this criticism comes easily from British armchairs—many Europeans in the territories concerned will criticise the document for placing too much emphasis on African progress. At the very least, the "declarations" can be said to be a sincere and constructive attempt to solve the racial problem from the point of view of the liberal settler. Unfortunately, the attempt is probably being made a generation too late.

True Art and False Economy

The Chancellor of the Exchequer has announced his acceptance of most of the recommendations of Lord Waverley's committee on the export of works of art. But the amount of money that he is prepared to allow will certainly not be enough for the ends he has in view. Mr Butler has apparently accepted the committee's recommendation that whenever an export permit for a work of art is refused, the owner should be offered a fair price in the home market—by a national or possibly by a municipal collection. To make such offers possible, the committee recommended that the grants to the public collections should be substantially increased. Mr Butler has accepted that also, and proposes to increase these purchase grants—now amounting to the absurdly small sum of £80,000—by 25 per cent.

This is inadequate. In the first half of 1952, permission was refused for the export of two important works of art of a total declared value of £31,000; in 1950 the value of such prohibited exports was £36,000 and in 1949 it was £73,000. An increase in the purchase grants of a mere £20,000, coupled with a ruling that there shall be no prohibition without an offer, will thus be even less effective in preventing the loss of important works of art than the present system is—and that was considered by the Waverley committee to be only partially effective. It would have been understandable if, on the grounds of economy, the Chancellor had rejected the committee's proposals altogether—though the provision made for preserving Britain's treasures is too niggardly to make economy an appropriate word. As it is, by accepting the proposals without providing adequate finance, the Chancellor will only *drop* the works of art between two stools.

Zebra Rights

Replying this week to a question in the House of Commons, the Minister of Transport declined to amend the Pedestrian Crossing Regulations. The suggestion arose out of the recent decision in the case of *Leicester versus Pearson*. The Court held that the right of the pedestrian *vis-à-vis* the motorist who arrives on a zebra crossing after the pedestrian is not absolute. The pedestrian has priority, but there may be circumstances in which a motorist whose car hits a pedestrian on a crossing may escape both criminal and civil liability. (The particular case was concerned with civil liability.)

A recent article in the *Law Quarterly Review* asked whether the regulations, as interpreted by the Court in this case, were

still a satisfactory safeguard to the public. The pedestrian injured in the street has still to prove a motorist negligent before he can recover damages and, although that may be easier where the accident happens on the crossing, it still falls well short of a certainty. The Minister apparently feels that there is not a strong enough case for extending the existing fields of absolute liability in law; it is hard to say that he is wrong. The question he was answering dealt with the civil liability of the motorist, and the penalty the motorist fears most is that imposed, or which can be imposed, by the magistrates' courts, not by the civil courts. It will not make very much difference to the total of road accidents if the punishment of the careless motorist varies chiefly according to the place where he is careless. The test should be how often he is careless, with the logical rider that the licences of drivers who are habitually careless, or for other reasons accident-prone, should be taken away more frequently than is now done.

Cold Comfort

Any coin that is much handled must lose its original brightness, and that is what has happened to the now commonplace phrase "cold war," which recently celebrated its fifth birthday. When Mr Walter Lippmann (or was it Mr Baruch?) launched this phrase on a duly impressed world, it was widely welcomed as a means of ridding the public of the illusion that because the world was outwardly at peace it was, therefore, in no danger. "Cold war" was terse and vivid, and it circled the globe at Puckish speed; but it has proved to have two serious drawbacks. Its tail was seized on by the Communists as proof of the West's aggressive instincts—although the West was only being belatedly roused to a degree of vigilance and activity which, for the Communists themselves, is the minimum permissible even in periods of "peaceful co-existence." Its head, on the other hand, introduced the confusing idea of temperature, with dire results. The impression inevitably took hold that to fight back vigorously in the "cold war" was to come perilously near a "hot" one, whereas in truth the greatest danger lay in inaction. And now, by a process of verbal attrition, "cold" is coming to imply inaction rather than action.

At this present moment, when arms are being "stretched" and other muscles perhaps unconsciously relaxed, there seems to be an urgent need for a new phrase to convey the West's need for vigilance, preparedness, and a degree of political activity that stops short of aggression but is calculated to prevent the Kremlin from always having the initiative. Danish groups organising support for Nato have devised the symbol of the hedgehog—a wholly unaggressive animal which defends itself when attacked, and makes its ability to do so plain for all to see. Hedgehogs, however, are too easily killed if caught sleeping. Alternative mottoes might be drawn from the Scout movement, or from the navies of the Atlantic allies, at least one of which uses the apt command: "Assume the second degree of readiness." But none of these can compare with Mr Lippmann's monosyllables for curtness and facility. They had better stay.

Stocktaking in Budapest

Mr Ernoe Geroe, one of Hungary's new vice-premiers, has just made an exhaustive report on the state of the nation. Like all similar exercises by satellite ministers, it contained some devastating criticisms of individual shortcomings in industry and agriculture; but the usual accompaniment of sweeping praise of the country's economic progress was conspicuously soft-pedalled.

Two points in particular are clearly worrying Mr Geroe. One is the extremely poor harvest, due to last summer's

prolonged drought; the other is the unsatisfactory state of Hungary's foreign trade. He claims that the people's food supplies have been maintained without interruption; this may be strictly true, but underground reports, as well as indirect admissions by Mr Geroe, suggest that quality, quantity and price all leave much to be desired. The bad harvest has forced the government to reduce food exports "very considerably" and, in some cases, to stop them altogether; at the same time it has had to import "considerable quantities" of coarse grains and fodder crops. As in neighbouring Yugoslavia, this has, of course, gravely upset foreign trade plans.

But Mr Geroe went on to complain of a further "fundamental reason" for the trade difficulties; he alleged that responsibility for "the lion's share" of the export arrears lay on the foundry and machine industry, a shipyard and several enterprises making railway trucks and engines. This is a surprising statement, since these have not been the sort of exports likely to make or mar Hungary's foreign trade. A possible explanation is that Hungary, after the recent Soviet Congress, was told that its heavy industry must play a bigger part in building up the Communist bloc—including China.

With increasingly importunate demands from Moscow, and with a populace made still more unco-operative by short commons, Hungary's Communist rulers can hardly view the future without foreboding. Mr Rakosi may hope that his recent appointment of five vice-premiers, as overlords under himself, will both give him a better grip on the situation and provide him with a shield in case of trouble. Mr Geroe who, as head of the recently abolished Economic Council, has been virtual economic dictator of Hungary, was plainly anxious to distribute the blame for all that has gone wrong as widely as possible among his subordinates. His new position as vice-premier is still very strong; but, of the five men promoted to Rakosi's inner cabinet, he probably has least reason to congratulate himself.

Correction.—On page 675 of last week's issue, Msgr Stepinac, Archbishop of Zagreb, was wrongly referred to as Archbishop of Zurich.

Fiscal Half-Measures

Sir,—I do hope the Liberals will be able to upset the Budget. To me the most objectionable feature in it is the frightful sacrifice of half the malt and hop duty. For what use? The consumer will not benefit by the reduction, the amount per gallon being too small to make any difference to the man who buys by retail. The whole machinery of excise must be kept up as before, and the consequent freedom of manufacture be as at present injuriously interfered with. Why not have taken off the soap duty, paper duty, or any other which interferes with manufacturing processes, and make a complete sweep. When that is done, I need not tell you the consumer benefits more than the amount of duty repealed. Witness the repeal of printed cotton duties, printed paper duties, and glass duties. In all these cases the masses of the people have benefited immensely beyond the amount of duty repealed. A maltster informed me this day, that he was of opinion that if the whole malt duty was removed, the consumer would benefit, at least, to the amount of 4s. per bushel, being 1s. 3d. more than the duty.

I beseech you, Sir, exert yourself with the true financial reformers, and do all in your power to defeat this vile affair. The alteration of the tea duty I have no objection to, and think it judicious, but the repeal of half the malt duty will be a monstrous loss of revenue, and no benefit to the consumer. I am, Sir, yours, etc.,

CIGARS FOR CHRISTMAS

choose
them wisely...

Make your choice the finest imported Jamaica. You'll get no finer cigars than these—no matter whence; and there's just a little more to it than that. Two virtues are peculiar to certain high-grade Jamaica cigars. Mildness—notable mildness—without sacrifice of character and flavour. And the very convenient attribute of being equally good to smoke in the smaller sizes. The wisest choice is still... La Tropical.

In cedar boxes of 10, 25 and 50. In cartons of 5. In all the usual sizes from 2/8d upwards. Petites 1/6d. Also singly in exclusive screw-capped aluminium tubes from 3/3d.

LA TROPICAL DE LUXE
Finest Jamaica Cigars

Sole Importers: LAMBERT & BUTLER OF DRURY LANE, BRANCH OF THE IMPERIAL TOBACCO COMPANY (OF GREAT BRITAIN & IRELAND), LIMITED

How many 5's in fashion?

There are *three*, so far as your retailer of textiles is concerned, for he must meet his customers' requirements in Size, in Style and in Shade. That he can do so successfully is largely due to the W.T.A. Wholesaler, who enables him to offer his customers a choice of the finest products from many factories all over the country.

A.C.V. advanced chassis design gives . . .

greater manoeuvrability

The advanced chassis design of the A.C.V. Mk. IV gives greater manoeuvrability due to a shorter wheelbase. This design, with its underfloor engine, brings other advantages, too: it provides greater comfort for a larger number of passengers; quieter travelling—the engine noise is much less audible;

and improved suspension—the passenger load is more evenly distributed.

Among the A.C.V. vehicles operated by GARNERS COACHES LTD., London, W.5, is this smart underfloor engine, Regal Mark IV.

Books and Publications

The Story of Industrial Controls

Civil Industry and Trade. By E. L. Hargreaves and M. M. Gowing. H.M.S.O. and Longmans. 678 pages. 37s. 6d.

This book, describing the work of the Board of Trade in the Second World War, will be of great value not only to those concerned with organising defence in the event of a future war but also to those interested, at any time and for any reason, in the control of industry. It could also be read with much interest, perhaps tinged with melancholy, by anyone with vivid recollections of the home front during the war. He will find it interesting to compare the remembered mood and emotions with the contemporary efforts to solve the more urgent problems and to further the war effort. Whatever the approach of the reader a number of speculations will emerge, some political, some philosophical. The book shows, for example, that in the early months of the war the Government was impeded by the lack of prewar planning. No doubt this caused much worry and some delay, but may not the action eventually taken to meet known situations have been more effective than any plan based on anticipation could have been? Some who seek to use this book as a guide for the future may reach this conclusion, rather than assume that instruments which have proved effective once must do so again. Reference is also made to the difficulty arising from the lack of prewar statistics, yet agitation to reduce the comprehensiveness of the Census of Production continues with some success. It is also instructive to study, seven years after the end of the war, the reasons for introducing certain measures which are still with us or have but recently lapsed, such as purchase tax or the utility scheme.

In developing their subject the authors draw a natural dividing line at the passing of the Lend-Lease Act. Dunkirk would have been another possible line. It is at times a little difficult to disentangle the change in national mood after May, 1940, from the change in the direction of the civilian war effort produced by Lend-Lease. The book might with advantage have been physically divided into two volumes. The picture is clearly drawn and effectively coloured, but the frame is heavy.

The early confidence that there would be no real shipping problem reads oddly today. It had the result that import control, along with the export drive, was originally aimed at improving the balance of payments. Both had changed their emphasis by 1941; the effort to preserve a balance of payments was found to be first hopeless and then unnecessary. The wrangling with the United States about the use of Lend-Lease supplies in British exports is described with a frankness justified by the sensible working arrangements that emerged. Today, we can be amused by the example of matchets made from Lend-

Lease steel by some 180 persons in the United Kingdom; this engaged the solemn attention of both the Combined Export Markets Committee and the Combined Production and Resources Board.

It says much for the skill of the authors that their apparently artless description of the gradual development of physical controls and rationing, of the gathering together of many channels of effort and the guiding of them to the desired ends, shows all the fateful inevitability of Greek tragedy. Almost concealed in this part of the work are two profound thoughts for present and future planners. First, the conclusion is drawn that the elaborate machinery of clothes rationing worked only because most people wanted to make it work. The book was written too early to point the moral by reference to the forthcoming derationing of eggs. Secondly, it is made clear that under consumer rationing generally the deadly sin in the eyes of the rationed was not harshness but unfairness.

The later sections of the book describe in detail the working out of the general principles of control in the chief "Board of Trade" industries. These will repay study and will doubtless be preserved for future reference in a number of libraries that would not have existed but for those very controls. Many trade organisations came into existence to deal with them. The authors point out that Export Groups were the first comprehensive trade associations to be formed in some trades. Interesting comparisons and contrasts can be drawn between the ways in which the principles of control were applied in different industries. They will probably continue to be drawn for many years to come and the emphasis may depend upon whether the study is made east or west, for example, of the Pennines.

Authorised Version

The Earlier Tudors, 1485-1558. By J. D. Mackie. Oxford University Press. 699 pages. 25s.

Recent scholarship has so drastically altered the interpretation of the periods preceding and following that of which Professor Mackie treats that the publication of this latest volume of the Oxford History of England excites particular interest. We have been taught to think of the fifteenth century in terms of "bastard feudalism" and of the Elizabethan age in terms of "clientage"; to look in both periods for vertical interests rather than for classes, for the complicated interplay of pressures from below and patronage from above rather than for the formal structure of institutions.

Can the early Tudor period, too, be best explained in this new language? Or was the scene then transformed into a Renaissance despotism by a temporary combination of economic and social forces and the dominant personalities?

It is disappointing to discover that Mr Mackie is almost wholly untroubled by such questions and doubts. He presents what was once the authorised version of this period, told with robust energy and thoroughness, and enlivened by shrewd and unsentimental judgments. But his detailed narrative is only loosely connected with his general conclusions. For him this was the decisive period of transition from the medieval to the modern world. But his medieval world is curiously unreal, and the hindsight which allows him to discern in Henry VIII's methods of government a stage in the development of constitutional government, already firmly rooted in middle class support, leaves one of the most revolutionary periods in English history blurred and hazy. His formula to explain Tudor achievements is that of common sense leadership "in general accordance with the English habit of thought." But men's thoughts were neither uniform nor the mere creatures of habit; they were disturbed and excited not only by the study of Greek, on which Mr Mackie expatiates, but also by Roman law, which seduced so many of Henry VIII's agents into entertaining ambitious projects of centralisation, control and planning.

Again, the alleged alliance of crown and middle classes is highly questionable: Empson and Dudley were scarcely the heroes of the gentry; Henry VIII himself complained of "the suits and clamours of merchants" and at one point proposed to endow the nobility as a separate caste with a privileged land law. The nature and severity of the social and political conflicts which followed Henry VIII's death suggest that he had attempted more and achieved less than Mr Mackie allows. Perhaps this concern with achievements explains why a whole chapter is devoted to the conspiracy of Perkin Warbeck while the activities of the predatory nobles under Edward VI receive only cursory treatment in the one chapter given to that reign.

So much space is given to the constitutional and diplomatic aspects of the period that little is left for the discussion of economic problems and policies, apart from the well-worn theme of agrarian changes. Here, too, Mr Mackie shows an optimism which contemporaries did not share. It is startling to learn that it was only towards the end of the fifteenth century that England began to export good cloth for export; and the description of the English export trade in the 1550s as bespeaking "a prosperity which shines in the confident pages of the chronicles" contrasts sharply with the views of Cecil, so intelligibly concerned with the dangerous dependence of the country on a single export, cloth, and

with the political consequences of unemployment in an economy so sensitive to the alternation of booms and slumps. Nevertheless we can be grateful to Professor Mackie for his own common sense and for the scale of his own achievement, which is a monument to the scholarship of a past generation. But perhaps it is to private enterprise and not to planned history that we must look for progress in historical scholarship.

Welfare Economics in French

L'Efficacité Sociale du Système Économique. By Roger Dehem. *Institut de Recherches Économiques et Sociales*, Louvain. 184 pages. 150 Belgian Francs.

This book is about welfare economics. More precisely, it is mainly an exposition of the internal conditions of production and exchange necessary to ensure that it is impossible to make anyone better off without harming others. These conditions are adequately stated in the Anglo-Saxon literature, and the book would not be justified if it were in English. There may, however, be a lack of such a clear and concise exposition of them in French as that which M. Dehem provides.

The chief interest lies in the author's treatment of the meaning to be attached to "social efficiency." M. Dehem sides with those who believe it to be tolerable to define such phrases without reference to the distribution of wealth. Any configuration of the economic system is of

maximum "social efficiency" if, and only if, it is impossible to benefit anyone without harming someone else. The principle that one should try to achieve efficiency in this sense is adopted as a fundamental ethical norm.

With this approach there ceases to be a one to one correlation between greater "social efficiency" and more "social welfare." Thus an inefficient state of the economy may, because the distribution of wealth is better, yield more welfare than an efficient one. Yet the word "efficiency" means nothing if not defined in relation to some end. And what is the end but welfare? Almost everyone would agree that an optimum state cannot be reached without considerable collective action, because the benefits of many economic activities are indivisible. Such activities must be paid for by taxation. Again, redistributive taxation plays some part in most people's Utopias. Yet taxation is freely admitted to be inefficient. So the optimum state is one of inefficiency. Is it right to torture language in this way?

M. Dehem ends his book with a brief but useful summary of neo-classical and neo-Keynesian employment theory. He justifiably pleads that welfare economics and employment theory should be considered as one. While willingly agreeing with Klein that the n equations in n unknowns of Walrasian economics may be inconsistent, and so possibly give rise to Keynesian unemployment, he appears to hope that God is an economist, and thus that pure competition, flexible prices, and perfect markets would, Keynes notwithstanding, lead to bliss. M. Dehem's exposition and analysis are excellent. One's only fear is that there may be no antidote available in French.

Moral Principles Revived

The Language of Morals. By R. M. Hare. *Oxford University Press*. 202 pages. 7s. 6d.

There are periods in history, as Mr Hare points out, when settled principles no longer seem appropriate to changing conditions; and so it comes about that sons of Victorian parents who were brought up to observe principles rather than to make the decisions on which such principles are ultimately based, find themselves with a rootless, unstable morality rather like the nice young men in Plato's Republic. This state of affairs is reflected in ethical theories which assimilate moral judgments to matters of private taste or decision. "Morality," says Mr Hare, "regains its vigour when ordinary people have learnt afresh to decide for themselves what principles to live by, and more especially what principles to teach their children." Perhaps morality is regaining some of its vigour in this country; for in philosophy, at any rate, the era of subjective theories is more or less over and much reconstructive work is being done in ethics, though most of it has so far appeared only in periodicals.

Mr Hare refers to much of this work in "The Language of Morals," which attempts to do justice to the importance

both of principles and of decisions and to explore their inter-relationship—a synthesis by the grandson of the contributions of his Victorian grandfather and his rebellious father. As the title of the book suggests, the author employs for his task the tool of linguistic analysis that was so ably used by his father to deflate some of the pretentious preaching of the grandfather; yet he constantly rejects the view, often canvassed by the father, that he is dealing mainly with verbal problems. Ethics, the author maintains, are worth studying because "the question 'What shall I do?' is one that we cannot for long evade." He frequently has cause to castigate linguistic philosophers for treating matters of substance as if they were verbal matters.

Hume and Kant and the logicians who carried on their critical tradition often pointed out that judgments about what ought to be done have a different logical status from statements about what is. They tended to assimilate such judgments to expressions of feelings or to commands and to leave it at that, passing on to the task of elucidating the logic of statements about what is. Mr Hare takes seriously the suggestion that "ought" judgments are similar to commands, but is uneasy about leaving it at that; he wants to show that "because they, like statements, are essentially intended for answering questions asked by rational agents, they are governed by logical rules just as statements are." He thus explores in a most interesting and exciting way the similarities and differences between commands and "ought" expressions in order to elucidate the logic of moral language.

Mr Hare intentionally says many very controversial things and omits to discuss in his short book many other key problems in ethics; but those who think that Kant was substantially right in regarding moral judgments as imperatives might see in Mr Hare's book one of the most important books on ethics since Kant's Groundwork. Whether the ordinary reader, for whom the book is also intended, will derive as much benefit from this book as the specialist, it is difficult to judge. But certainly, like the specialist, he will benefit from reading it more than once.

Shorter Notices

The Bechuanaland Protectorate. By A. Sillery. *Oxford University Press*. 236 pages. 30s.

It will not be long now before that central figure of British colonial administration in Africa, the district officer, disappears from the scene. Like their counterparts in every profession, most district officers are just "ordinary men"; but there has always been among them a sprinkling with a scholarly bent of mind. These are the men who, if left long enough in one area, become authorities on its people or its history. Mr Sillery is one of these, and his book is the outcome of leisure-time reading and observation. His aim is to outline in one volume the essential information—historical, anthropological, geographical and economic—that an administrative officer new to the territory might need. There is no attempt at original research. Mr Sillery relies on the very considerable amount of published material now

available and supplements this with information from official files at Mafeking.

The book is in two parts. The first, and for the general reader more interesting, part describes the penetration of Bechuanaland by Europeans and the steps by which it became a British protectorate in 1895. It is the well-known story of a reluctant British government yielding from a mixture of commercial, prudent and humane motives to the demands of the local chiefs, in this case mainly for protection against Rhodes's chartered company. Mr Sillery's dry and correct language gives no clue to his views, but the facts are eloquent enough. Bechuanaland was first opened up by Scottish missionaries, and even in this summary account one can see the clash between their efforts to protect their native charges and the activities of traders and Boer settlers. Although he does not emphasise this himself, Mr Sillery's account makes it clear that, for the Bechuana chiefs, the Boers were always aggressors, which helps to explain their attitude today about incorporation in the Union.

The second part consists of tribal histories and genealogies. It will be invaluable to the local administration but is of little interest to the general reader. An excellent bibliography and a good index conclude this useful book.

The Yearbook of the Universities of the Commonwealth, 1952. G. Bell for The Association of Universities of the British Commonwealth. 1,661 pages. £2 2s.

The new issue of this yearbook is larger than ever before, mainly because of an expansion in the general information entered for each university in addition to the lists of staff totalling some 25,000 names. A welcome addition is that the entry for each university bears the date at which the information was finally compiled—a date unfortunately usually some twelve or fifteen months prior to publication.

The inevitable delay today in publishing a work of this nature must mean that some of the information is already out of date before it appears. But although the individual university publications may need to be consulted for specific details, this volume is a valuable source of reference for general and comparative information about Commonwealth university education. One particular feature is a complete index of the names of university teachers for the whole Commonwealth.

Oasis Kingdom: The Libyan Story. By Nina Epton. *Jarrols*. 160 pages. 16s.

This cheerful traveller's tale fills a gap, for there is as yet no postwar book on Libya. Its first 110 pages are a description of Miss Epton's journey there, which is undated but seems to have taken place in 1952. The second part—another 40 pages called "Behind the Scenes"—sets out cursorily, but adequately for the common reader, the stages by which Libya reached independence and the principal features of its economic future as a state. The book's biggest drawback is that Miss Epton seems only to have visited Tripolitania, though she never says so, and this shortcoming is obvious only to a reader who carries the map in his head. Another gap is the omission, in her survey of the future, of the asset—indispensable if the budget is to be balanced at present—constituted by British, French and American military expenditure in the country. But she knows what to expect in the Arab world and is gay; and her mixture, though not filling, is palatable.

Letters to the Editor

Living With the Dollar

Sir,—I cannot believe that your proposal for an Atlantic Payments Union makes any contribution to the solution of the dollar problem.

The earlier articles in the series show very convincingly that a dollar gap is likely to persist and to amount to some \$5-8 billion (a figure which could in some circumstances be substantially increased) even if the present systems of import quotas and exchange control are maintained by the non-dollar world. You propose that this whole paraphernalia of restriction and discrimination should be dismantled in exchange for an agreement by the United States to accumulate claims on goods and services of the debtor countries to a total of some \$35 billion. Surely, however (I use your own words), "a great flood of accumulated demand will surge over into the American market as soon as import and exchange restrictions are modified," and it would not be long before the U.S.A. held its maximum of \$35 billion of (interest-bearing) claims on the non-dollar world, a claim which it would have no hope of ever collecting. How it would then be possible to make these "immutable interest bearing claims upon other people's resources... not less valuable than gold," I find it difficult to understand.

All you have done by this is to buy time during which the world will have acquired a lot more American goods which it will not be able to pay for and, in effect, there will be another loan by the United States which will have to be repudiated. By pushing the problem into the background for a few more years, this would only intensify the difficulty of solving it in the end.—Yours faithfully, J. W. HATCH
London, E.C.2

Constitutional Reform

Sir,—May I suggest that your analysis of the contemporary political malaise did not go far enough? If it had, then your favourite panacea of the alternative vote would have appeared as inept as it in fact is.

As you have said on other occasions the causes of the current sterility are three:—

1. The confined manoeuvring space which the economic plight of the country inflicts upon the parties for the selection and deployment of their domestic and foreign policies.

2. The close vote of the electorate, springing from its uncertainty at this apparent "sameness" in both political parties.

3. The encroachment by the Government upon the individual sphere of responsibility over the last half century or so, necessitating, in its turn, strong government, well-laden legislative programmes and strictly disciplined parties. Of these, the alternative vote is relevant only to the second—and if applied

would lead not to an improved situation but to one many times worse. It might, for instance, further jeopardise our chances, at the moment slim enough, of enjoying effective government.

Surely reform—that is, constitutional reform—should be directed first at alleviating the third problem? It is here that the more profitable field for innovation lies. Is it necessary, for example, that an advance vote on a matter of secondary importance be treated as implying lack of confidence in the Government, leading inevitably to its downfall? Or, on the other hand, might not House of Commons committees be established for particular fields of government to sit concurrently. Membership could be limited for the taking of votes, but not for the preceding discussion.—Yours faithfully,

C. J. STEWART

London, W.8

Bank Salaries

Sir,—In your issue of November 29th, Mr W. Manning Dacey paid our book, "Professional People," the compliment of a letter objecting to one sentence about the salaries of bank officials. There have been other indications of the banks' displeasure at what we had to say, but this particular issue was an unfortunate basis for an attack.

Our estimate of the earnings of junior bank clerks is apparently not in dispute; in fact, we may have been over-generous in our assessment. The statement about clerks at the age of 35 was literally true when we wrote it (it was, of course, physically impossible to bring every figure in the book up to date in proof). As regards the salaries of branch managers, on which Mr Dacey bases most of his case, we are advised that our statement is still true today. It was, no doubt, through inadvertence that Mr Dacey omitted to point out that the salary scale in the bank to which he is economic adviser is in general rather above those in other banks (to compensate for its pensions scheme being contributory).

We tried to write a serious book about broad and important issues; the detailed figures in the chapter "Rewards and Costs" were explicitly stated to be subject to frequent change and intended primarily to indicate the relative prosperity of the professions. Even if these particular figures were wrong (which we do not admit), is it not a little unfair to use an attack on our book as a peg on which to hang some publicity for the (very recent) improvement in the salaries of bank employees?—Yours faithfully,

ROY LEWIS
ANGUS MAUDE

Open 9-6 inc. Sats. (Thurs. 9-7)

Nearest Station: Tottenham Court Road

"All trawling and Danish seine-netting is prohibited off the Icelandic coasts inside a line which is drawn four nautical miles from the outermost points of the coasts, islands and rocks and across the opening of bays." Only trawlers and seine net vessels are excluded; other methods of fishing can be carried on, and it is understood are being carried on, by Icelandic fishermen.

It is not the trawler owners at several British ports who have decided to refuse to put to sea if fish from Icelandic trawlers is landed at their ports. This decision has been taken by the skippers and mates concerned.

During the week ending November 29th of this year, six German trawlers landed their catches, amounting to 165,200 stones, at Grimsby, whilst over the same period last year no landings were made by German trawlers. It would hardly appear, therefore, that the trawler fishing industry is approaching a position in which it can say to the consumer: "You cannot eat fish caught by a foreign competitor," especially as fish has been liberalised by the British Government under Gatt.

It should be known that the foreign producer will send fish to this country only so long as prices are attractive. The home producer, on the other hand, is left with no alternative but to land his fish here whatever the price he receives. The producer has not received as much for his fish this year as he did last year. Total imports of fish for the first nine months of this year (before the trouble over Icelandic landings arose) amounted to 2,018,960 cwt. For the corresponding period last year imports were 2,364,493 cwt. The foreign producer may have found it more profitable this year to send his fish elsewhere—perhaps to the United States.—Yours faithfully,

J. H. RAY, Secretary
British Trawlers' Federation,
Grimsby

Bad Example from Greece

Sir,—The article in your issue of November 29th creates some false impressions concerning the expropriation of the estate of the Lake Copais Company.

In the first place, it is not correct that the company holds some kind of concession. That was the position originally when the company first took over the estate, but it was changed by the arbitration award of 1925 which established the company as the absolute owner of some 190,000 stremmas of land, so that the status of the company today is exactly the same as that of any other landowner in Greece. The expropriation law of 1952, like previous expropriation laws, is a general measure which applies to all owners of land exceeding a certain area; no discrimination or exception could, therefore, be made in the case of any one particular owner in this category.

Your special correspondent also seems to suggest that the company should receive special treatment on the grounds that if the estate were taken out of its hands it would once again become a bog. This is to underrate the capacities of the Greek Government's technical services.

The Copais Estate is not by any means the only example in Greece of large-scale drainage and irrigation works. There are other large areas, especially in Macedonia, where such works have been executed and are now successfully and efficiently maintained by the competent Government services. There are also areas like the Arachthos-Louros valley where well-organised agricultural co-operatives, with the expert advice and assistance of the state, maintain the technical installations in a most efficient manner, providing the necessary capital expenditure themselves.

The Greek people like to believe that their country is not so backward that it could not maintain an agricultural estate such as the Copais property. Indeed, it would be no compliment to the company itself to suggest that, after some seventy years of managing the estate, it has not yet succeeded in teaching its employees how to run it properly.—Yours faithfully,
A GREEK

London

Insurance in the Air

Sir,—I would like to comment on the Note in your issue of November 15th. Broadly speaking, the Warsaw Convention imposes a presumption of liability upon the carrier by air which he can escape only by showing that the accident was unavoidable. The liability, however, is limited in respect of death or physical injury to a maximum sum per passenger which was intended to be the equivalent of £1,000 but has since increased to about £3,000 owing to the increase in the buying price of gold. The limit does not apply where the damage was caused by wilful misconduct. The limit of liability fixed by the contracting states in 1929 represented the consensus of international opinion as what would be a reasonable limit having regard to the wide divergence of damages in different parts of the world and, one may assume, was probably a compromise figure. Although a limit of £3,000 may appear low in American or British eyes, in many other countries it is not so considered even having regard to the probable status of the passenger by air. As it was, a number of states declined to ratify the convention, one of the main reasons being that they considered the limit of liability to be too high.

Adequate facilities for effecting personal accident insurance are provided by all the major airlines. Very many passengers make use of these facilities, whose existence is made known to intending passengers. It should not be assumed, therefore, from the mere fact that a passenger seeks to recover damages from a carrier by air that he may not, in fact, have provided himself with adequate personal accident insurance. In England, at any rate, the amount of any insurance effected by the passenger does not in any way affect the right to claim damages in addition.—Yours faithfully,

L. MURRAY STEWART

Association
London, E.C.3

Growth of Pension Schemes

Sir,—During the postwar years many employers have taken advantage of the high rate of tax relief on contributions made to properly constituted pension schemes to establish such schemes for the benefit of their employees and, indirectly, the good of their companies. One of the results has been a phenomenal expansion in the amount of new business secured by life assurance offices underwriting pension schemes, a feature of postwar insurance to which attention has been drawn from time to time in your columns. "Nothing succeeds like success"—especially advertised success—and it is to be feared that in the atmosphere created by the advertisements of life assurance offices and insurance brokers, taking advantage of the situation for their strictly legitimate business ends, sight may be lost of a fact which is never advertised—namely, that a private pension run by the employer himself can provide exactly the benefits which he needs, and at net cost.

In this connection may I draw attention to a comment made by the president of the Institute of Actuaries in the course of his presidential address which reviewed the business of life assurance over the last forty years. Mr. Gardner said "Both types of scheme are of growing importance and each has relative merits and demerits in particular cases. It is, in my opinion, in the interests of all concerned that every employer who may consider setting up a scheme should know that there are those two broad possibilities open to him and should weigh carefully their respective merits in the light of his own circumstances and preferences."—Yours faithfully,

ACTUARY

Municipal Munificence

Sir,—In your issue of November 22, 1952, you comment in detail upon the Treasury grant to the Arts Council. Surely it is time to raise a more general question? It is stated, for example, that both ballet and opera fail to pay their way. Yet if the price of seats is raised then the attendance will fall away. It would seem then that the cultured people, who enjoy and appreciate these presentations, are not prepared to pay for the cost of producing them.

It is not at all clear why this burden should be thrust upon the uncultured, whether they be taxpayers or ratepayers. There is a difference in kind between the voluntary contributions of the individual benefactor and the conscripted levies of collective patronage.

Your own heading, "Municipal Munificence," raises that very question how far a committee or council can be "munificent" when it is distributing other people's money. Doubtless it acquires a warm glow of generous feeling—without having the less agreeable accompaniment of personally footing the bill. We should not be diverted from this point by scaremongering about the survival of the arts.—Yours faithfully,

JOHN G. WALKER
Gomersal, Nr. Leeds

What is your mental age?

YOUR DAILY NEWSPAPER, for example, must give some clue to your intelligence. Why did you choose it? Is it a paper you are proud of?

Some people judge a newspaper by its circulation. But you will more often find that a high reputation and a fairly low circulation go together. The Manchester Guardian is not and never will be for the millions. It is for those who relish wit, good writing, honest reporting, clear thinking.

Many people today are so hypnotised by their present daily reading that they are seriously underestimating their mental powers. As a refreshing change, try reading the Manchester Guardian. It will talk to you as an intelligent adult.

If you have any difficulty in getting your Manchester Guardian regularly, please write to:
The Manchester Guardian, Manchester.

AMERICAN SURVEY

Korea at First Hand

Washington, DC

WHEN the flood of news dispatches, pent up behind the barricade of the army censor, came tumbling out of Tokyo and Seoul with the news that General Eisenhower had been in Korea and was on his way back, a sensitive instrument could have detected a vast sigh of satisfaction going up from the American people. Coupled with relief that the life of the President-elect was no longer in danger was a feeling that a great and rare symbolic act had been successfully performed—the keeping of an election promise. What the President-elect actually decides to do about the Korean war is now probably far less important, as far as public opinion is concerned, than it was a month ago.

A smaller but no less heartfelt cheer could have been heard from officials in Washington as they read the cautious statement that General Eisenhower made to the press. In words strikingly similar to those used by Governor Stevenson in the election campaign, the General said "we have no panaceas, no trick ways of settling any problems" and added:

How difficult it seems to be in a war of this kind to work out a plan that would bring a positive and definite victory without possibly running the grave risk of enlarging the war.

Apart from the few remaining adherents of General MacArthur—who chose the same day to announce that he had a clear solution for the Korean war, the President-elect's remarks should dispose once for all of the legend that Korea is simply "Truman's war."

What General Eisenhower actually saw during his three days in Korea is probably much less important than what he was told. With the snub which has been given at the United Nations in New York to every western and neutral effort to solve the question of prisoners of war, there seems to be little hope left—for the time being at least—that the armistice talks at Panmunjom will be worth renewing. There are some rather over-sophisticated suggestions for a negotiated solution still in circulation. One is that the prisoner issue should be solved simply by freeing all those North Korean and Chinese prisoners who do not want to go back and returning those who do, thus gaining the fruits without haggling over the principle of voluntary repatriation. But apart from the fact that this would leave the fate of the American, South Korean and Allied prisoners up in the air, it overlooks the reason why the United Nations has dug its toes in on voluntary repatriation: that in an age of ideological wars the precedent and principle of free choice for war prisoners must be established. There is another idea which suggests that the stalemate should be continued as at present on the analogy of the Roman wall, with the difference that attempts should be made to feel out the Chinese attitude by withdrawing one or two American divisions to Japan and seeing whether the Chinese make similar withdrawals.

But the commanders in the field seem reluctantly to have made up their minds that the only way to bring the Chinese back to the conference table in a negotiating mood is by destroying or fatally damaging the Chinese and North Korean armies between the present front line and the Yalu River. Whether this could be done by frontal attack now seems doubtful; whether it could be done by amphibious

landings without a reinforcement of two or more American divisions (which are not readily available) seems even more doubtful. Certainly it cannot be done by air power alone, since there are very few first-class targets in North Korea still undamaged and the inability of air attack to cripple the Communist armies in the field has been conclusively demonstrated. But even if final victory is impossible it is argued that the "waist" of Korea running from Pyongyang to Hungnam could be held with far fewer troops than the present ceasefire line.

★

These are some of the points which will have been put to the President-elect during his visit and the conferences which have succeeded it. But in fact many of these arguments will probably be wide of the mark, for they overlook the only strong conviction that General Eisenhower was known to possess before he set off to review the situation at first hand—that the American commitment in Korea should be reduced rather than increased. And in this he has the backing of the Chiefs of Staff, whose permanent nightmare is that they will find themselves at the onset of war with their forces distributed in equal halves at opposite ends of the world. It is significant that the President-elect took General Bradley, the Chairman of the Joint Chiefs of Staff, with him, for General Bradley has never been enthusiastic about any Korean solution which involved increased use of American manpower or equipment.

For this reason it is almost certain that one of the new President's first acts when he reaches office will be to order a substantial acceleration in the training of Korean troops. There is nothing very new in this. The army of the Republic of Korea has been built up from a low point of about 40,000 in 1950 to a well-trained force of 400,000 and consists of ten divisions with another two being formed and a further two soon to be formed. The furore over the General's election remarks about training "Asians to fight Asians" obscured the fact that such a process takes a long time, and that much has already been done not only in Korea but in Indo-China and Malaya as well. As it is, about 60 per cent of the present Korean line is held by non-American troops. Hitherto, the rate at which ROK divisions could be formed has been held back by shortage of equipment and shortage of officers (the Japanese did not allow Koreans to serve above the rank of sergeant). There are signs that the first shortage may be disappearing as the American rearmament programme nears the peak of production, but there is no way in which the training of all the different kinds of officers necessary in a division, including artillery and engineer commanders, let alone pilots, can be readily speeded up.

It is unlikely that the President-elect will have been advised to replace or reinforce American divisions with Chinese Nationalist troops, which has seemed to some

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Senators the quick and easy way out. In the first place, General Chiang Kai-shek, although he has not withdrawn his original offer of troops, is now extremely lukewarm to the idea. Secondly, the American military advisers on Formosa do not consider them fit for battle yet. And finally, their use in Korea, quite apart from enabling Peking to reduce the forces opposite Formosa and send them to Korea, would rekindle the civil war.

Whatever conclusions the President-elect comes to as a result of his visit to Korea—and there may be nothing very startling in them—he will find his officials in Washington, when he takes office in January, receptive to new ideas. In particular, the conviction is growing that the United States can no longer have a Korean policy, run jointly by the Pentagon and the American mother, separate and distinct from its Far Eastern policy in general. Containment of China may in fact require that greater attention be paid to Indo-China than Korea. The briefing that the President-elect will have received from Mr Dulles at Wake Island after his conversations with the State Department about the general course of Soviet and Chinese intentions cannot have been a cheerful one. If, when he returns, the President-elect is still thinking in terms of lessening the American commitment in Korea by increasing the use of South Korean troops or by fighting for a shorter line on which to confront the Communist armies, this is more likely to be for the sake of creating a strategic reserve to guard against an outbreak of trouble elsewhere in South-East Asia than for that of reducing the total size of the American armed forces.

Shopping Goes Suburban

[FROM A CORRESPONDENT IN WASHINGTON, DC]

ONE of the big motor manufacturers has lately been advertising proudly that "it was the automobile that started to change the cramped old way of life" and took people "beyond the city limits." But by doing so the automobile started a rot at the core of American towns. The 1950 Census showed that the population of the 30 largest city areas had risen by 11 per cent since 1940, while that of their suburbs had increased by 37 per cent in the same period; nearly three quarters of the urban population of cities of 50,000 and over was, by that time, living outside them. The exodus was caused by the simple desire for space and air, and originally the suburbs were only dormitories. However, the motor car, which took people out, has made it increasingly difficult for them to get back again. The number of motor vehicles registered, 32 million in 1940, is now just under 50 million, that is approximately a third of a car a head, and there is no city which is equipped to store during the day the cars of all those who come in to work every morning. The Regional Plan Association of New York has worked out that an average trainload of commuters would, if they drove into the city, take up four acres of parking space or 1½ miles of both sides of a street.

The "commuter"—which is the American word for the regular traveller who "commutes" his daily fare for a weekly or monthly lump sum—has accepted the fact that he must use public transport to and from work. In most cities this means very crowded trains or buses. Railways lose money on short journeys of this type and have done little to help the commuter, and fares are high and rising steadily. Chicago now boasts that its standard tram fare is the highest in the

country at 20 cents (about 1s. 5d.), but other big cities are not far behind at 10 to 15 cents. The metropolitan worker accepted these conditions when he moved out, but his wife and family have shown an increasing disinclination to make the tiring and expensive journey into the city.

At first only small shopping centres, to meet daily needs, were provided in the suburbs. They usually consisted of a crescent off the main street with a "Super-market" (self-service shop) for food and groceries, a drug store, an ironmongery and garden shop, a cinema and possibly a fancy bakery. But lately the large stores have found that it pays to follow their customers out to their homes. Even in the nineteen-twenties some of the big firms like Sears Roebuck, which started as mail order businesses, began to open branches away from the centres of the cities and provide free parking space for cars. They proved that a large volume of business could be done in this way, but it was some time before more specialised stores and those dealing with the higher class trade experimented with suburban branches. Logically, it was in Los Angeles, the most diffuse city, that the experiment began, but it has now spread all over the country and today twelve of New York's department stores have 38 suburban branches.

Herb Lubner in the Washington Post

Many of the early branches had to add vast new wings or extra floors within the first year of operation. One, in Washington, DC, thought it was brave when it opened, in 1947, a suburban unit of 163,000 square feet—at that time the largest in the east—hoping for a \$5 million turnover; it had one of \$7½ million the first year. The size of these units varies between 50,000 and 345,000 square feet. Experts now estimate that 150,000 square feet is the minimum for a branch carrying a full range of goods. For this they allow space for at least 1,000 cars; they also advise that no car be further than 400 feet from an entrance to the shop. The

last ten branch stores built or still under construction average 245,000 square feet.

This decentralisation of retail trade has taken several forms. Some firms chose a site on the main street of their most profitable suburb where it was unlikely that a competitor would be able to get enough space to follow. Others built on a main traffic road between the city and the growing outskirts where there was plenty of room for their competitors to join them and make that area the shopping district of several suburbs. A third method, which real estate promoters have developed, was to acquire a large area a short distance from a main traffic artery and parcel it out to complementary or competing firms, find suitable satellite shops, and add a cinema and sometimes a medical centre.

Building on a main road created new traffic problems and parking difficulties, as was shown by Long Island's "Miracle Mile" and the first experiment in Los Angeles. But it proved that straight competition pays. If a customer cannot find what she wants at one shop she can go next door, instead of risking a long journey in another direction. In the vast Skokie project outside Chicago, an example of the third method, it is proposed that the same giants that sit side by side downtown in The Loop should each have a branch, and it has even been suggested that they have them in the same relative positions as they occupy in the centre of the city. The problem of decentralisation in Chicago is, however, a simpler one than in other towns. All the rich suburbs are grouped to the north and one big shopping centre can tap all the valuable suburban markets.

★

Most firms operate their branches from the main store. Advertising and buying costs are therefore reduced while the training of personnel is kept in the family. Incidentally delivery costs are considerably lower—sometimes less than half—in these branches as with a car so close the customer takes her purchases herself. The exception to this is Bullocks of Los Angeles whose three large suburban stores are run jointly but entirely independently of the parent. The only common features are the financing and the top management. This firm's theory is that the buyers are specialists in their own districts where tastes can vary in a few miles. They have discovered, for instance, that their Westwood branch near the university and the film colony sells shorter shorts and more double beds than the one in Pasadena. But California must always be different.

It now looks as though the main pattern will be that of the enormous and complete shopping centre, planned as such, covering about 40 acres, not on a main road, with at least a million people within half an hour's journey. The American economy has grown at such a rate that it is not yet clear how this diffusion will affect the original stores in the centre of the city. Presumably they will, in most cases, hold their own for a time, while the population is rising at the present rate. But it is no coincidence that the big merchants, helped by local newspapers which see advertising disappearing, are taking a new and constructive interest in civic projects. Slum clearance, wider streets, complicated car storage arrangements and better transport facilities are all getting more attention nowadays. In a series of articles in the *Washington Post* in January of this year called "Progress or Decay" it was stated that

Washington's ten leading downtown department stores did a million dollars less business than in December, 1950—and the experts figure it was due to the big new suburban rivals which opened last fall. . . . Facts like these make it clear

downtown Washington must be developed if the central city's multimillion-dollar investments are to be protected. . . .

And Mr William Zeckendorf, a New York builder, recently wrote in the *Atlantic Monthly*:

I do not believe it is necessary to have cities die on the vine or rot at the core. I think they can be things of beauty, light and economical functionalism; but they have got to be attacked by a combination of three kinds of thinkers: the real estate economist, the designer and engineer and the city planner and civic thinker.

Certainly something will have to be done quickly. The move of the richer inhabitants to the suburbs, where they pay no taxes to the city, created a financial problem which has grown more serious with the development of suburban shopping centres. The call on the city for facilities such as roads, parking spaces and local transport services is going up while the money to provide them is dwindling. This has meant raising the rates on land to enormous figures and there are examples in most cities, particularly in New York and Chicago, where sites are left empty and tax free because it would be uneconomical to put up a building and incur a large tax liability. The next stage, which has already begun in some places, will be the wholesale move of many light industries to the outlying districts where their employees live and shop. If this happens on a large scale, as it may well do, the centre of the cities will decay and the city shops will be left with only the less profitable trade of those who cannot afford to move out and are forced to accept slum conditions.

American Notes

Labour under New Management

It is a remarkable coincidence that the old leaders of both the American Federation of Labour and the Congress of Industrial Organisations should have died within a few weeks of each other. The stage seems ideally set for the reunion of the labour movement just when it is most needed, at the start of a new Republican era. Both the new presidents, Mr Meany for the AFL and Mr Reuther for the CIO, have even offered to step aside if this would forward the cause—sacrifices which, if they are to be taken seriously, show how much importance is attached to healing the breach caused before the war when the founders of the CIO walked out of the AFL to organise the mass production industries. Mr Meany has tactfully abandoned his predecessor's tone of lofty

Air Subscription Rates for 1953

Owing to increased costs, some increases in air subscription rates to *The Economist* will have to be introduced from January 1, 1953. The countries affected are:

Australia: £8 5s. (sterling)	Malaya: £6 15s.
Hongkong: £7.	New Zealand: £9.
Japan: £9.	S. America and W. Indies: £7 15s.

The substitution of an airfreight for an air mail service to Egypt makes it possible to reduce the air subscription rate to £5 5s. Rates to all other destinations remain unchanged:

Anglo-Egyptian Sudan: £5 5s.	India, Ceylon: £6.
Canada: \$21.50 or £7 14s.	Iran: £6.
East Africa: £5 5s.	Iraq: £6.
Europe (except Poland): £4 15s.	Pakistan: £6.
Gibraltar, Malta: £3 15s.	Union of S. Africa: £5 10s.
Gold Coast & Nigeria: £5 5s.	USA: \$21.50 or £7 14s.

self-righteousness and appears ready to treat the CIO as an equal, rather than as a prodigal son.

Yet it would be unwise to assume that the unity meetings to be revived in January will bring an early reassembly of the trade unions under one roof. Apart from the jurisdictional rivalries which have always been the thorniest obstacles to a reconciliation, the new CIO president, the ambitious and able Mr Reuther, is the type of modern trade union leader regarded with suspicion by the older "bread and butter" trade unionists not only in the AFL, but in his own organisation. His victory at the CIO meeting in Atlantic City was not conceded until the bitter end, and he is not credited with the tactful touch which enabled his beloved predecessor, Mr Murray, to hold the CIO together. Mr Reuther, the head of the Automobile Workers, is young, militant, adventurous, and an intellectual. He has secured pensions for automobile workers and the five-year contracts in the motor industry which feature automatic wage increases to match those in productivity and the cost of living. But he believes that organised labour, now it has won its fight for recognition and better working conditions, has a duty to the whole community—a duty to educate its members in political activity and international problems, to participate in industrial management, and to improve social conditions.

Mr Reuther takes control at a moment when the CIO is not only sore from its own internal disagreements, but seems to have lost the inside track at the White House to the AFL. Mr Meany is credited with having persuaded General Eisenhower to extend an olive branch to labour by appointing an active trade unionist, Mr Durkin of the AFL, to be Secretary of Labour. It may be that the CIO, fearful that unity can be achieved only by its being swallowed up by its larger rival, may be willing to go no further than to authorise a revival of the United Labour Policy Committee, which functioned at the beginning of the Korean war. One of the first tasks of the trade unions will be to concert their attitude towards the shell of price and wage stabilisation which is all that is left after Mr Truman decided to override his Wage Stabilisation Board and give Mr John L. Lewis's miners all they were asking for. Mr Cox, the head of the board, has resigned; so have the industry members, contending that Mr Truman has made a mockery of stabilisation; and trade unions who have accepted sacrifices in the name of stabilisation feel hardly less aggrieved.

Republican Diet for Government

The ominous tone of Mr. John Foster Dulles's statement after discussing the handing over of the State Department with Mr Acheson may be explained by the natural caution of the legal mind, but it was hardly reassuring for the Foreign Service to be told by the incoming Secretary of State that "on the whole" it consisted, in his opinion, of competent persons, but that they would have to be checked very thoroughly. Mr Dulles admitted that they were career civil servants protected by law and said they had nothing to fear provided they were loyal and capable. He has already shown his willingness to take his own medicine by asking the Federal Bureau of Investigation to examine his record. Such confidence as was left to the Foreign Service was further undermined a few days later when Senator Wiley, with the support of Senator Connally, whom he is to succeed as chairman of the Senate Foreign Relations Committee, alleged that American staffs abroad were often far too big.

A three-pronged attack of this kind on other branches of the government, with charges of inefficiency, disloyalty and redundancy which it will not always be possible to refute, will look increasingly attractive to the Republicans as they realise how disappointingly few government jobs nowadays can be filled by political patronage. Out of a total of 2,500,000 federal workers, only about 2,500 will automatically leave with the Democratic Administration, and another 12,000 to

25,000 vacancies will occur gradually. One Democratic officeholder, Mr John Dunlap, has taken advantage of the recent reorganisation of the Internal Revenue Bureau to transfer from the political job of Commissioner to the subordinate and less well-paid, but civil service, post of head of one of the new tax districts. Another, Mr O'Dwyer, once Mayor of New York and recently a more successful Ambassador to Mexico, has resigned sooner than was strictly necessary, perhaps to save himself from being summoned back to the United States to answer for his stewardship in New York.

Certainly a change of administration offers an unrivalled opportunity for putting the government on the slimming diet which it undoubtedly needs after twenty years of unprecedented expansion. But there are signs that fatty degeneration may be a chronic disease of modern government and that the new administration may soon become as gross as the old. Pointing this out, Mr Walter Lippmann suggests that some way of ensuring that the government's weight never gets out of control might be proposed by the three-man committee which, at General Eisenhower's request, is considering how the structure of government can be simplified. This committee, headed by Mr Nelson Rockefeller, is not to duplicate the work of the Hoover Commission and other groups which have already studied governmental reorganisation, but only to co-ordinate their schemes and prepare them for presentation to Congress. If this is done quickly, the various agencies which will be shorn of their powers may not have time to mobilise as effective an opposition in the new Congress as they did in the old.

Business on its Best Behaviour

Mr Paul Hoffman, the most successful public servant drawn from the ranks of business by the Truman Administration, warned his business friends recently that the influence they will exercise in the Eisenhower government is a challenge to them to develop enlightened public policies. Certainly nothing could be more enlightened than the chorus of business support for lowering American trade restrictions which has been mounting ever since General Eisenhower's victory. The National Association of Manufacturers, with its 18,000 members, many of them small businessmen, used to be a citadel of protectionist feeling. Yet at its convention last week it listened without a murmur to a report from its international relations committee which said:

If we are to achieve the objective here recommended, that all economic aid not directly related to and necessary for our defence programme be terminated—then the way must be found to improve the access of foreign producers to American markets and foreign producers need to improve their efficiencies in designing, producing and merchandising goods and services to earn dollars.

The association itself took no position on tariff reform, but the report had been approved by two-thirds of its Board of Directors.

A month earlier, the Detroit Board of Commerce, which has 6,000 members, went further than any other substantial business organisation has gone towards advocating free trade. Pointing out that American industry has long outgrown the need for protection, and that it is illogical for a creditor nation to refuse payment in imports, it asked for elimination of all tariff barriers, the repeal of the "Buy American" Act, passage of the Customs Simplification Bill, which has languished in a Congressional pigeon-hole for two years, and greater tax incentives to encourage private investment abroad. The American branch of the International Chamber of Commerce and, of course, associations of importers, swelled the chorus demanding a realistic foreign trade policy which would permit trade to take the place of foreign aid.

It is certainly optimistic to believe that the tariff is all that prevents Europe from earning the dollars it needs and

that makes foreign economic aid—and the taxes which pay for it—necessary. Presumably American industry would not even talk about pulling down the tariff wall if it were not confident that it can hold its own without it. And some American businessmen may change their tune once they feel the cold wind of competition. But their recognition that part of the tax burden can be traced to a restrictive trade policy and that a creditor nation has its responsibilities should encourage the Eisenhower Administration to campaign for tariff reform and strengthen it for its battle with a Congress in which the advocates of protection will occupy places of power.

Post-mortem on \$50 million

After discussing the future of the Democratic party with President Truman, Governor Stevenson, with characteristic austerity, is refusing to keep himself in the public eye with television appearances as the party's leader until the Democratic National Committee has paid off the deficit on its campaign spending. This is put at \$500,000 out of a permitted total of \$3 million, half of which was spent on wireless and television time. The Republican National Committee earmarked about the same amount of its funds for this purpose, but with a good half-hour on television costing \$30,000 or more, voluntary organisations had to contribute substantially in order to keep candidates before the eyes and ears of the American electorate to the extent that was considered essential if the democratic process was to function properly. The "Volunteers for Stevenson," for example, spent \$421,000 of the \$740,000 they collected in putting the Governor on the air and the Republican telecast on election eve cost the "Citizens for Eisenhower" \$267,000.

The *New York Times*, in a survey of election spending, estimates that at least \$5 million was paid during the campaign for television time on local stations and networks combined. The station owners themselves are not universally enthusiastic about selling time for political purposes

since their well-trained audiences, wearied by uninspired political broadcasts, switch to other programmes and thus break the habits which enable a station to guarantee a regular number of listeners to an advertiser at a certain hour. But television and radio appearances certainly enable a candidate to address, even though it may be only to bore, far more people at one time than has ever been possible before and therefore provide a strong argument for shortening the traditional campaign period of two months.

Even so, however, the existing limits on campaign expenditure would still be entirely unrealistic. They are also entirely ineffective: no national committee may spend more than \$3 million on a presidential campaign, but any number of national committees may spend that amount on behalf of the same candidate and local committees may also spend within their states. The regulations which limit expenditure in a Senatorial election to \$25,000 and in an election for the House to \$5,000 can also be got round in the same way. This year at least two unsuccessful Democratic candidates for the Senate spent in the neighbourhood of \$150,000 each and a typical House candidate \$15,000. It is estimated that there were anywhere from 5,000 to 25,000 separate committees working for the various candidates in the 1952 campaign and that altogether at least \$50 million, and perhaps twice as much, was paid out, although there have been fewer allegations of corrupt practices than usual. A special committee of the House, led by Representative Boggs of Louisiana, is now holding a post-mortem on election expenditure in the hope that agreed legislation will be produced that bears some relation to the facts of political spending in a "video-era."

Beef Sky-high

Price control may go out as it came in, with an attempt to force down the price of beef, America's favourite meat. Officials are trying to discover why retail prices of at least the better grades, which rose to almost prohibitively high

**THE
NATIONAL
CITY BANK
OF
NEW YORK**

BUSINESS AROUND THE WORLD

For a hundred and forty years, The National City Bank of New York has been developing a world-wide service for businessmen.

Today the Bank has fifty-six overseas branches in the principal centres of commerce, and is in direct touch with correspondents in every commercially important city in the world.

The London branches of The National City Bank have long experience of both British and international banking. They are uniquely equipped to advise on trade with the dollar areas, and they can command the resources of a global organization.

Whatever your problem and wherever your business, The National City Bank of New York can assist you.

THE NATIONAL CITY BANK OF NEW YORK

1812—ONE HUNDRED AND FORTIETH ANNIVERSARY—1952

Incorporated with limited liability under the National Bank Act of the U.S.A.

HEAD OFFICE: 55 WALL STREET, NEW YORK

LONDON OFFICES—CITY: 117 OLD BROAD STREET, E.C.2 WEST END: 11 WATERLOO PLACE, S.W.1

levels after the Korean outbreak, have fallen little if at all in the last year, although the prices which farmers receive for their cattle have dropped steadily. Farmers put the blame on the ceiling prices set by the controllers, claiming that retailers regard these as fixed, rather than maximum, prices and are guided by them rather than by the actual cost of their meat supplies. The shopkeepers' excuse for what looks like profiteering is that they are making up for the losses which they suffered when they were squeezed against the ceiling last year. The basic fault seems to lie with prosperous housewives, with plenty of money in their purses and families clamouring for beef, who buy steaks and roasts whatever the price. They protest as they do so, but they are now refusing the cheaper pork which they were glad to have last year when beef was scarce; as a result prices of pork are well below ceiling levels.

Pork may go up a little next year since fewer hogs are likely to be available, but the rise will be limited by competition from beef. Cattle slaughter can hardly fail to mount in 1953, perhaps even faster than the demand for beef. This is because the expansion in the number of cattle on farms which began in 1949 is reaching the point where the increased stock is being sent to market. Furthermore, this year's drought has meant a serious shortage of pasture on many ranges and reserve stocks of feed for fattening are being eaten into by growing numbers of meat animals. It is therefore possible, especially if the drought continues, that there will be a serious break in livestock prices next year. This could hardly fail to be reflected on the meat counters, although it may take a real recession to bring beef prices down to what used to be regarded as reasonable levels.

Such a break in farmers' prices could also hardly fail to lead to a demand for restrictions on imports of meat and livestock. These have in fact been falling as market prices

have gone down, but cattle are now once more coming in from Mexico, after a ban which lasted for nearly six years. It has been possible to lift it at last because foot and mouth disease has been eradicated in Mexico with the help of the United States government. The similar ban on imports of meat and livestock from Canada, imposed last February for the same reason, is also to be lifted on March 1st.

Shorter Notes

Mr Alger Hiss has served one-third of his five-year sentence for perjury in denying that he handed government documents to a Communist agent, but he has been refused the freedom on parole for which he is now eligible. He will, however, be granted another hearing next year and in 1954 he will be eligible for release for good behaviour.

★

By last June almost all of America's 14,599 banks and trust companies, and 95 per cent of all bank deposits, were insured by the Federal Deposit Insurance Corporation; most of the 960 banks that remain outside are ineligible for protection because of the rules of the corporation, which is a government agency.

★

Even the traditional Christmas tree will have its loyalty checked, if Senator Wiley has his way, for he has uncovered a "diabolic conspiracy" in the importation of Christmas tree ornaments from Eastern Europe. This year 75,000,000 may come in, worth \$7 million that will "pour back into Red lands" unless patriotic Americans boycott this "Red trade conspiracy," as they are urged to do by the Senator.

How many TIME readers will be coming?

Among the thousands of visitors coming to Britain next summer, a considerable proportion will be readers of one of the international editions of TIME Magazine. For TIME is the favourite news magazine of travelled and influential men and women in every civilised country of the world. Many TIME readers will be booking their passages in British liners or aircraft; all will have money to spend on British quality goods and services. By taking space in one, or all, of the

international editions of TIME now, you can make sure that your name is known to thousands of visitors who are potential customers of yours next summer, and who will be ambassadors for British products when they return home. Write or ask your agent to consult the Advertisement Manager, Time-Life International, 4 Dean Street, W.1, to learn how economically you can win this important cosmopolitan market for your goods and services.

THE WORLD OVERSEAS

Europe's Third Chance

Dollars For Defence Industries

ALL the solutions of the dollar problem so far attempted have proved to be palliatives rather than cures. The American loans granted to Britain, France and other European countries in the immediate postwar years were inadequate to fulfil their purpose and not always wisely used by the recipients. The Marshall Plan restored European industrial and agricultural production and developed intra-European trade; but in 1952 Europe's dollar balances were in almost as sorry a plight as they were in 1947, despite the injection of \$25½ billion of American aid. More recently aid has been granted for military purposes; but nobody expected that American tanks and aircraft would overcome Europe's dollar shortage. And so the technique of off-shore procurement is being developed in order to broaden the base of European defence production.

An off-shore purchase, as its name implies, is the buying of goods from countries other than the United States with dollars supplied by the United States. It is not a new method. It was first employed under the Marshall Plan to convert the bilateral gift of American dollars into a multilateral system of dollar payments. In the first year of the European Recovery Programme American dollars were used by recipient countries to buy supplies almost anywhere. Later they were restricted to the purchase of goods within the dollar area, other than the United States—such as the purchase of Canadian wheat. Out of a total American aid of \$13½ billion from 1948 to 1952, nearly 40 per cent, or \$5½ billion was in the form of off-shore purchases.

Under the new foreign aid programme, with its pronounced emphasis on defence, off-shore procurement has assumed a different and more important role. Technically it still incorporates the use of American dollars to buy other countries' products—in this case military equipment. But its purpose is not simply to inject dollars into an otherwise dollar-hungry trading community. It is to maintain a level of domestic arms production in Europe over and above that which could be financed by the countries themselves. It has become a method of maximising defence production, while at the same time enabling countries to sell part of their armament output for dollars. Some of it may remain in the producing country and some may be sent to another Nato member.

Four Kinds of Aid

American aid is currently appropriated under the Mutual Security Act under three heads. The first is *military or "end-item" aid* (i.e., finished equipment) which may be in the form of direct shipment of American weapons or of off-shore purchases in this newer role; this aid is administered by the Defence Department. The second head is *Point IV aid* mainly for under-developed territories and administered by the State Department. The third is *defence-support aid* which is mainly in the form of commodities, machine tools, etc., and which is administered by the Mutual Security Agency; part of this aid may be in the form of the old-style off-shore purchases. The new concept of *off-shore procurement* is restricted entirely to military or "end-item" aid.

In the first year of military aid, the American Congress stipulated that at least \$1,000 million out of the total of

nearly \$6 billion should be devoted to off-shore procurement. In fact for the twelve months ending June 30, 1952, only \$684 million was spent by this method. France received the largest share (\$335½ million), Italy the next largest (\$129 million) followed by Britain (\$69 million), Belgium (\$46 million) and the Netherlands (\$38 million). The items ordered included ammunition, special transport vehicles, auxiliary combat craft, electronic and engineering equipment. But in future the actual money spent on this particular form of aid is likely to increase.

The mechanics of an off-shore purchase (which will be discussed in a subsequent article) are very complicated, for the methods are still being developed. There are at present no hard and fast rules, and since off-shore procurement is concerned with military aid, the channels of co-ordination between the various agencies tend to be military ones. The whole machinery is also very largely in American hands, a fact that is disliked as much by the Americans as by Europeans. But military aid is still a bilateral American grant. At some future stage it may have to be converted into a multilateral programme determined by Nato, for member countries should be made to feel that the defence programme is a co-operative effort and not one dictated by a powerful ally. Nato is not organised for the task although it was recently asked by the US Special Representative in Europe to draw up recommendations for the off-shore purchase in Europe of military aircraft. At least it can be said that the present method ensures that American taxpayers' money is not recklessly spent. It also enables part of the West's arms production to be co-ordinated into a single programme, though it does not help in the much more difficult problem of standardisation.

One important advantage of this method is the flexibility it gives to the military aid programme—though from the recipients' point of view it is much more rigid than the old concept under the Marshall Plan or even defence support aid—since it enables political and economic considerations to be given as great weight as strategic ones. It also conforms to some extent to the "trade, not aid" principle by enabling countries to earn dollars instead of relying on the charity of the American taxpayer. Again, even though the American Congress rightly controls the total amount of aid available (and it may even set an upper or lower limit to the amount of dollars spent on off-shore purchases) the actual division of the appropriated sum among the member countries of Nato is determined by experts outside the political arena.

The most important advantage of this method is that it enables a balance to be struck between the strategic requirements of the West and the economic and political capabilities of member countries. The French Government, for example, claimed that it could not increase its defence contribution since it could not levy more taxes. At the Nato meeting in Lisbon last February, the United States agreed to give France almost half of the total off-shore authorisations for the year in order to strengthen the French budget and to ease its dollar balance of payments in return for a French pledge to increase its defence production. The need to have a virile arms industry in Europe is only too obvious. If the level of defence production in each country were determined solely by that country's ability to finance its output, the basis would be too small to provide either adequate security for the West or a rapid expansion in output should the cold war develop

into a hot one. Off-shore purchases could ensure a sufficiently large basis for both these purposes, though they can hardly be made at the expense of reducing the basis of American domestic arms production.

But although much can be said in favour of this newly developed method of providing American aid, its limitations must be recognised. It is, for one thing, unlikely even to help cure the underlying dollar problem, despite the fact that it is "trade, not aid." The essence of this problem is simply that the pattern of world trade has greatly altered during the past thirty years, while countries have not permitted their internal production and employment structures to be adjusted to these changing conditions. Indeed, they built shelters around their economies to protect them from the changes that were taking place in international trade. Thus the growing dollar problem was effectively masked until after the Second World War.

The solutions so far adopted have done little to force any adjustment either in industrial structures or in the pattern of trade. Indeed the American loan and Marshall aid were intended to preserve the pattern of world trade, and only a relatively small amount of the funds was used to alter the industrial structures of individual countries—the oil refining programme was one such example. Likewise, off-shore procurement far from helping to solve the dollar problem, could under certain conditions exacerbate it by distorting production and employment structures still more. Countries will hardly adjust their economies to the new postwar pattern of trade by devoting an increasing proportion of their productive resources to the manufacture of defence goods, unless dollar payment for these defence goods could be counted on for the next ten years or more. Admittedly, increased arms production would tend to expand the capital goods industries and thereby help some countries to switch from consumer to capital goods production; but any help in this respect would be limited. The provision of dollars through this technique of off-shore procurement will at least help Europe indirectly by giving it a third chance to develop its overseas resources (and thereby alter the pattern of world trade later on) and to adjust its individual economies.

(To be concluded)

The Debate in Bonn

[FROM OUR SPECIAL CORRESPONDENT]

DR ADENAUER is so essential to the cause of Western Europe that the most heartening point about the *Bundestag* debate on the twin treaties was the extraordinary vigour with which he spoke. The Chancellor's voice is that of a man in his prime, not of one nearing eighty. Not many Germans were able to listen to the broadcast of the debate, but any who caught Dr Adenauer's speech will have been impressed by his personality, if not by his arguments. Germans are inclined to complain that the Chancellor is pushing through the treaties without their knowing what is in them, and his political opponents accused him during the debate (in the same terms as Soviet German propaganda) of trying to bring off a "coup d'état." But, generally speaking, his autocratic methods probably gain more support than they lose in a country which particularly likes strong leaders.

Dr Adenauer's principal speech in the debate was on a much higher level than any other. He kept to the broad issues while his supporters tended to argue about the constitution, and the opposition to put a case for Germany's narrower interests on the assumption that some alternative existed to alliance with the West, and that Germany was in a position to demand everything and give nothing. One of the Chancellor's best points was made in his conclusion:

In the Bonn Conventions, the three powers undertake on a contractual basis to bring about, in co-operation with the

Federal Republic, Germany's reunification by peaceful methods and under a democratic constitution. What tremendous progress has been achieved compared with the political situation of, say, 1947. . . . We must at long last learn from history. Ever since 1870 Germany has endeavoured to find friends and allies because it was realised that Germany, despite her power at that time, could not exist without strong friends. She has never found such friends; mostly through her own fault, through blindness to offers made to her by others, through an excessive confidence in herself, Germany's situation today is more greatly threatened than ever before; she is divided and disrupted, disarmed and defenceless, neighbour to a giant who means to enslave her. . . . Can any German in this situation accept the responsibility of rejecting the helping and saving hand proffered to us by the West?

These were necessary words to Germans, who are accustomed to blame the West for their position, just as much as the Soviet Union and far more than themselves. They did not prevent Herr Ollenhauer, the Social-Democrat leader, from declaring that nobody could have framed such a treaty who had not "turned his back to the Elbe."

The Chancellor pleaded for a complete acceptance of the treaties, because there is no alternative except disaster, in the form of an agreement between the Great Powers at Germany's expense, or war. He warned the House not to accompany acceptance of the treaties with demands for revision of individual clauses. Though he did not say so, it is obvious that, once started, there would be no end to revision by the other countries concerned, as well as Germany.

Dr Adenauer hinted that, if the contractual agreements with the occupation powers were not ratified, the occupation regime would continue. But he did not stress this point, doubtless because everyone knows that, whatever happens, the time has passed for the British, American and French to direct German internal affairs. Indeed, one of the strongest points made by the Opposition was that Dr Adenauer had quite unnecessarily "frozen" the present situation in the treaties when, left to continue along the way they were going, occupation rights would have disappeared altogether without any German *quid pro quo*.

No Alternative to "Little Europe"

On the prospects of European political federation and British association with it Dr Adenauer was his usual confident self. He refuted the Socialists' slighting references to his so-called "Little Europe" (minus Britain and Scandinavia) by recalling that, after all, this community numbered 160 million people. Herr Ollenhauer could not meet this argument. His chief weakness was in fact the absence in his speech of any alternative to "Little Europe" except a vague, unconvincing and old-fashioned system of world-wide collective security. He was on much stronger ground in his negative attacks. The Opposition leader's speech owed its inspiration to the late Dr Schumacher without his biting phrases. The only important change is that the Social-Democrats do not now declare that they will not be bound by the treaties, if ratified; but they will press for revision—which may come to much the same thing in practice.

Herr Ollenhauer declared that the treaties meant the abandonment of the eighteen million Germans in the Soviet Zone, and increased the danger of war. He also poured scorn on the strength of allied forces in Germany, and said, very truly, that even if the treaties are ratified by all the countries concerned some time next summer, the German divisions will not be ready before 1955. Moreover, as the French demand that the German army shall always be relatively weaker and is reducing its own commitments to Nato, the German divisions will not number twelve as originally intended.

German objections to paying for defence were very much to the fore in the debate. Much time was spent slinging statistics from side to side in connection with Germany's financial commitments. Government speakers declared that

they had very good reason to believe that, after next June, Germany's contribution to the cost of Allied troops in Germany would stop, and that its global commitment for all types of defence expenditure would be reduced from the current maximum of DM850 million to DM716 million a month. (British Treasury please note). At any rate, the Federal Minister of Finance, Dr Schaeffer, has estimated this amount for his budget in 1953-54 and announced just before the debate opened, that the growth of the German gross national product will allow him to reduce taxes, provided that special allowances are reduced in number.

The debate closed with a series of votes in which Dr Adenauer received an average majority of fifty, then after the coalition parties made their surprise bid for a decision on the constitutional issue, the third reading had to be postponed until January 12th; in the meantime the decision on this crucial question for Europe's future rests with a handful of lawyers in Karlsruhe. (The background to their deliberations is described in the article below.)

The Parties and the Judges

At the root of the confused and bitter dispute that is now raging over the ratification of the German treaties lies a legal question with far-reaching implications. In it the Social Democrat opposition see its best opportunity of delaying ratification until next summer, when general elections are due. If it can be shown to the satisfaction of the Constitutional Court at Karlsruhe that the treaties involve a change in the Basic Law of the Federal Republic, then that change must be approved by a two-thirds majority in parliament. This is more than Dr Adenauer's coalition can muster.

This politico-legal issue is further complicated by the organisation of the Court. It can come before the lawyers in three different forms, according to the way questions are framed. Normally, the two senates of the Court sit separately, each dealing with questions falling within its carefully-defined competence. Some causes, however, are decided by the court sitting in full session. Hence the social Democrat appeal to one senate, the Government parties' appeal to another, and the Federal President's request to a full session—each dealing with the same issue in a different form.

The Opposition framed their petition in such a way that it would come before the senate which they believed to favour them. They based it on a clause that concerns the compatibility of the proposed treaties with the Basic Law. As this clause deals only with Acts and not Bills, the senate in question ruled that it must defer examination until there was a definite act of ratification.

The Government parties likewise made their application in such a way as to ensure that it would come before the senate considered favourable to its views—the "black" as distinct from the "red" senate. They argued from a clause which concerns conflicts about the competence of various organs of the constitution, and raised questions about the functions of the upper house—the *Bundesrat*. The application was made on behalf of the majority parties in the *Bundestag* or lower house; if it had been made on behalf of the Government itself the appeal would have come before the full court.

The request for an advisory opinion from the Federal President, Professor Heuss, was framed to come before the full court. This ruled that its decision would be binding on the two senates sitting individually. As this threatened to wreck the chances of getting from the "black" senate a ruling favourable to the government parties, the Government asked for an adjournment. Discussions then followed between the Chancellor and the President, as a result of which the President has decided to withdraw his request. Having asked only for an advisory opinion he found himself liable to

be presented with a binding decision of great political consequence.

As a result of these events only one appeal is now pending—that of the coalition parties to the second or "black" senate. By postponing the third reading of the Bills offered for ratification, Dr Adenauer was able to block the Social-Democrat appeal, which would have been dealt with by the "red" senate directly it became law.

A deeply disturbing feature of the controversy aroused by these manoeuvres has been the readiness of politicians and public to assume that the Karlsruhe Court cannot be relied on for impartiality. This arises partly from the method by which the judges are elected. Half are elected by the Lower House and half by the Upper House. In the former a complicated system of proportional representation is used to ensure that all parties have a say appropriate to their voting strengths. In the latter, election is by two-thirds majority. A third of the judges are elected from a list of High Court judges eligible and willing to serve; the other two-thirds are lay judges. All are individually elected on the proposal of a party. It is therefore unavoidable that each judge should be to some extent "labelled" politically "red" or "black." How far the Court can rise above this disadvantage remains to be seen.

M. Pinay Becalmed

[FROM OUR PARIS CORRESPONDENT]

SOMEWHAT to the general surprise, M. Pinay has won by a narrow margin, a second vote of confidence on his financial policy for 1953. This policy, which is outlined in the introduction to the budget, may be described as "the mixture as before." M. Antoine Pinay's essential principles—reduction of expenditure, no new taxes, reliance on loans—inspire the new *projet de loi* as they inspired the Pinay "emergency budget" of March 25th last. The Prime Minister is able to point to the defended franc (450=£1 in March, 1952, 395=£1 in October); to a moderately successful gold-loan; to increased deposits in savings banks and subscriptions to Treasury bonds; to a fall in wholesale prices (from 152 in February to 140.5 in October) and—less brilliant—in retail prices (from 148.5 to 144.9).

DRAFT FRENCH BUDGET FOR 1953
('000 Million Francs)

Expenditure	1953	1952	Receipts	1953	1952
A. Civil budget.....	1,484	1,353	A. Direct taxes.....	945	781
B. Investments.....	992	877	B. Indirect taxes (customs: stamp duty), etc.	486	421
Of which:—					
Economic investments under the Monnet plan ...	355	...	C. Taxes on Businesses:—		
C. Military:—			Production-tax ...	...	937
Europe.....	863	835	Turnover-tax ...	...	220
Indo-China.....	376	399	Special tax on wine and meat	95	90
Overseas territories	40	36	Tax <i>à la valeur ajoutée</i>	1,100	...
			Improved collection	80	...
			Reduction of fraud	1,275	1,247
			TOTAL FROM TAXATION	2,706	2,479
D. Treasury.....	65	84	D. Other products	310	294
Less Economies....	16	...	Total resources	3,016	2,773
			American aid.....	173	195
			Loans	615	615
GRAND TOTAL	3,804	3,583	GRAND TOTAL	3,804	3,583

But, as M. Charles Barange, *rapporteur* of the finance commission of the National Assembly, demonstrates in his annual analysis of the economy, this picture is less rosy than it seems. Production has not risen in 1952 in a manner comparable to

last year. Even in April there was a tendency towards stagnation in certain sectors. Now, in December, there is a serious slump in the automobile industry with a 50 per cent drop in exports on last year and the closing down of several large factories, including Rosengart. In the home market there is a general recession which is largely due to M. Pinay's own price-cutting propaganda. People are holding off in the hope of a further fall in prices. The trouble about this shrinkage of demand is that it injures the prosperity of the important mechanical industries without obtaining from them any substantial price-cuts. The automobile industry, for instance, whose costs have a high fixed component of wages, overheads and tax, cannot—or thinks it cannot—make a big price-cut. The result is simply unemployment or underemployment (a frequent reaction is a 40-hour week instead of a 48-hour one). Meanwhile dealers and distributors of consumers' goods remain fairly rigid in face of a decreased demand, often preferring to hold on to stocks in the hope of renewed inflation.

M. Pinay's horizon is further clouded by France's predicament in EPU. It has exhausted its \$520 million quota and must pay all subsequent debts in gold or dollars. (The deficit is paid by the Exchange Equalisation Fund of which nobody, of course, knows the balance). The Government has, however, shown no sign yet of defaulting on the 1953 military programme; which fact would seem to indicate that it has no fears about its ability to secure its dollar needs in raw materials—none, at least, comparable to those expressed earlier this year. Doubtless the heavy increase in invisible exports represented by American military spending in France does a good deal to redress the payments position. But France cannot continue indefinitely to cut imports without destroying the competitive capacity of its industry.

Abortive Fiscal Reform

As will be seen from the table, the centre-piece of M. Pinay's 1953 budget was a scheme of fiscal reform. Having halted inflation, the Prime Minister had to offer the country a yet brighter prospect, if he wished to avoid being discarded in the normal manner. Fiscal reform would help to sustain the necessary "progress myth." M. Pinay's proposals were designed chiefly to make the peasants pay more taxes and to reduce fraud among *commerçants*, especially sales without invoices. The reform instituted some penetrating taxes on land and buildings, and, what was worse, the imposition of the new business-tax on agricultural co-operatives and sales-organisations, which had been immune from the old taxes on production and turn-over. When, into the bargain, it was suggested that peasant-distillers should no longer retain the privilege of distilling a large part of their alcohol tax-free, the agricultural interest stuck its toes in.

The objections to the new business-tax *à la valeur ajoutée* (TVA) were more technical and mysterious. The idea was to institute a single tax of 20 per cent on sales to replace the once-for-all production tax (15 per cent) and the (multiple) transaction taxes (1.1 per cent) which grew like barnacles on the product as it passed through the chain of distribution. Under the new system each seller, from producer to wholesaler, would be liable for 20 per cent of his selling price less—and here was the tax's anti-fraudulent beauty—certain deductions computed by the authorities on the basis of invoices supplied by the *contribuable*. The latter was entitled to claim the whole of that part of his raw-material costs which itself represented tax: the whole of the "tax-component" in his service-costs (gas, electricity) and half of the "tax-component" in the price of non-durable finished products consumed in the business. The Government also intended to whittle down tax-exonerations to a very small number of cases (producers of bread, milk, cereals and vital exports) and to lighten the tax on the first 200,000 francs of profit. The reform, it was claimed, would cheapen the installation of plant, and would encourage industrial specialisation, since *entrepreneurs* would no longer have the same interest to own

their sources of supply for the sake of un-taxed "internal deliveries."

M. Pinay's reform, which was furiously contested by theoreticians, was designed to redress the situation in which the salaried, urban, fixed-income groups bear a greater tax-burden than the business class or the peasants. Whether it would have achieved the desired effect nobody can say. In the event it was wrenched out of the budget by a most determined body of politicians, many of whom were M. Pinay's original supporters.

In its other features, the budget presents no novelties. Investments have not been cut, as was feared, but slightly increased: although it is not quite clear whether the unblocked provisional credits for 1952 figure in the budget for this year or next. Considerable allowance is made for the building of schools; the moderate housing effort continues; 100,000 new houses are to be started during 1953; work on one Rhone and one Rhine barrage will begin and the modernisation of the coal-mines will continue. The military programme shows, for the first time, a slight reduction in expenditure on the Indo-Chinese war, which is the fruit of American financial aid to the Vietnamese army. The European effort laid down in the budget is a minimum one and may be increased.

Revolution in Chinese Villages

THE Batchworth Press is publishing a book on Chinese land reform based on material from the Chinese Communist press. The accounts of what has been happening, together with various exhortations and warnings, written for domestic consumption in the People's Republic, give a rather different picture from the propaganda intended for the admiring foreigner. The Chinese Communists have recently been concerned to point out errors which have been made in the process of land reform, and their admonitions to the party cadres carrying on the work show that the policy has been running into serious difficulties.

The scheme requires division of the rural population into five classes: landlords, rich peasants, middle peasants, poor peasants and farmhands. Everyone must be formally classified in one or other of these categories. Landlords are defined as those who do not directly cultivate their land, but live on rents and interest on loans; rich peasants, equivalent to the Russian kulaks, are those who cultivate, but also hire labour and let part of their land to tenants. The idea is to stir up the lower grades against the higher, confiscate all the land of the landlords and part of the land of the rich peasants and redistribute it to the poor peasants and farmhands; this is all supposed to be done by the action of the villagers themselves, not simply by government legislation. But it is apparently found that the peasant response tends to be either less or more than the Communists want. Sometimes it is not enough. One newspaper tells the sad story of a cadre who summoned a village meeting and told the peasants they were now free to tell of all the injustices they had suffered from their landlords, but nobody had anything to say; this showed that the cadre had not adequately prepared for the meeting by preliminary incitement. On the other hand, where the peasants are really roused by agitation, they tend to go too far; rich peasants are classified as landlords and middle peasants as rich peasants, so that many hard-working farmers get expropriated and production declines. It is indeed very difficult for the cadres to work up the poorer peasants into a fury against landlords and then pull them up short at the line laid down by party directives, especially as the five categories in practice merge into one another and the classification in many cases is bound to be quite arbitrary. A further effect of the policy is that peasants now strive to avoid enrich-

Filling their lamps with everlasting oil

ILLITERACY AND CREDULITY thrive in the semi-darkness of ill-lit villages in backward lands. Where there is no progress politically nurtured unrest progresses quickest. It is more than a metaphor to say that the diesel engine is spreading the light where there has been darkness and ignorance. With the diesel engine comes the means of electrification for poverty-stricken villages, the ability to irrigate and grow crops in the desert. Foremost producers of the diesel engine are THE BRUSH ABOE GROUP. In 1951 over 70% of their production went to those parts of the earth most in need of diesel electric power. In India alone more than 20,000 diesel engines manufactured by the

Group have been installed in the last two years. Under the Group's Tube Well scheme plans are already advanced for irrigation in the Ganges valley—an undertaking which will necessitate the construction of nearly 1,000 tube wells powered by BRUSH ABOE. In conjunction with the Indian Government BRUSH ABOE are conducting experiments in the electrification of remote villages. It is anticipated that these experiments will lead to far greater productivity which will eventually raise the standard of living in the under-developed areas of this great nation. Yet these are only isolated examples of the immense contribution of BRUSH ABOE to world development.

ing themselves, hiring labour or lending money lest they be re-classified in a higher category.

The problems of classifying the peasants have certainly meant hard work for the cadres and they need to forget about it now and then, so they compel the peasants to make payments from their "class-struggle benefits" to the Peasants' Associations, and from these funds they hold "class-struggle dinners" with plenty of pork and wine. The non-cadres who do not share in these celebrations apparently regard them with disfavour, and the newspapers rebuke the cadres for abusing their position. But Communism is nothing if not a profitable business for cadres; in China they do not yet enjoy anything like the privileges of the Soviet bureaucracy, but they are already well on their way.

Pakistan Weathers the Storm

[FROM OUR CORRESPONDENT IN KARACHI]

NINE months of economic crisis have not left Pakistan unscathed, but there are indications that the worst may be over. The balance of payments forms the crux of the problem, and the October figures show that the downward curve has at last flattened out; in fact, after a series of disastrous months, the trade balance has turned slightly in Pakistan's favour.

The gravity of the crisis, and the extent of the threat to the external value of the Pakistani rupee, is clear from the figures. In the first quarter of the current financial year the balance of payments was adverse to Pakistan to the tune of Rs 28.33 crores. In the second quarter the figure was Rs 40.59 crores and it was known that the country's No. 1 sterling account was running down at an alarming rate. The Government had been far too slow to see the danger signals and to take the necessary counter action by getting exports moving at all costs. It was not till the end of June that it reduced the export duty on jute, by which time it was left with a carryover of at least 1,500,000 bales (and a bumper crop of about 7,500,000 coming into the market). It was not till the end of August that the duty on staple cotton was halved and that on desi cotton removed; it was not till September that the export duty on tea was abolished and by then the tea industry had suffered shattering losses.

On the import side, most of the critics were in full sympathy with the Government's desire to maintain its liberal policy and as far as possible to avoid the evils of import control. Unfortunately, this left the gates open for a flood of Japanese cotton manufactures which did more than anything else to upset the trade balance. When, eventually, in August, almost all categories of goods except machinery were brought under licensing control, it was a blessing in disguise as far as consumer goods were concerned, for most dealers were heavily overstocked with goods which they are even now quite unable to sell because of the progressive decline in purchasing power in the country; at the same time, the import cuts, being inevitably somewhat drastic and arbitrary, have already caused regrettable shortages to develop in supplies of various kinds of producer goods. The Government's latest move has been the cancellation of even the truncated Open General Licence; this means that all categories of goods now require import licences.

The crisis is not, however, a mere matter of difficulty in balancing payments. Import and export duties account for nearly 70 per cent of the total revenues of the central government, and the cuts in the latter combined with fewer imports have made it obvious that the year's revenue will fall woefully short of the budget estimate. Apart from the heavy burden of defence expenditure, the Government has a huge programme of development ahead. If it has yet shown no tendency to cut its coat according to its cloth it can only be because it can live on the resources accumulated during the two boom years. The various kinds of foreign aid will

no doubt help considerably; even so, a period of retrenchment and postponement of the less remunerative schemes clearly seems necessary. The price support schemes for cotton and jute have also cost the Government a good deal.

Fate—or should one say Nemesis?—chose this unhappy time to deliver a blow below the belt in the form of a severe and unforeseen shortage of foodgrains. In wheat, if not rice as well, the country had always been able to claim self-sufficiency and this was one of the most satisfactory features of its economy. The shock was, therefore, all the greater when it was realised that if famine was to be averted large quantities would have to be imported, forming another drain on foreign exchange. The prices of wheat and flour even in the Punjab, the so-called granary of the sub-continent, rose to nearly three times last year's level. The causes of the shortage were partly natural, but the inflated prices obtained by the cultivators in recent years for jute, cotton and oilseeds had a good deal to do with it. The Government has incurred a great deal of blame, on the whole rather unfairly.

Many people, particularly in India, are asking whether Pakistan's economic troubles are not all due to an over-valued rupee. To this Pakistanis might reasonably return the question: "Are Britain and India, who devalued in 1949, any better off than we are in respect of their balance of payments?" But the problem is one which deserves the most careful examination. The important thing to remember is that jute and cotton account for 90 per cent of Pakistan's exports; from this it follows that the disposal of these crops forms the crux of the matter. In neither case is the price factor, at present, a real bar to sales. Prices in the Karachi cotton market compare favourably with other soft currency cottons and even with American cotton of corresponding grades; but there is a glut of fibre in the various producing countries and buyers are taking their time. In any case, Pakistan still has plenty of export duty in hand and would prefer to sacrifice this rather than resort to devaluation to attract buyers.

The position in regard to jute is much the same. The current price is admitted to be reasonable, but the overseas demand can hardly, at its optimum, exceed 4,500,000 bales. India may take 2,500,000 (though this could easily go up to 3,500,000 if the Pakistan Government would only remove the discriminatory licence fee on jute sold to India). If the country is bound to be left with a huge carryover at the end of the season, it is simply a legacy of past policy combined with overproduction; it is doubtful whether devaluation would help very materially. In any case, from the point of view of the country's foreign exchange resources, there is little to be gained by exporting more jute and cotton but earning less from the transactions.

Arguments Against Devaluation

Why in fact, ask the advocates of non-devaluation, should we gratuitously alter the terms of trade against ourselves? The question is even more apposite when Pakistan's vast programme of development is considered. This involves very heavy imports, mostly to be paid for by the central or provincial governments or by the government-sponsored Pakistan Industrial Development Corporation. Defence requirements are also heavy. Why in such circumstances should Pakistan depreciate the external value of its rupee and thus have to pay more for its needs?

On the other side there are many points to be made. For one thing there are the interests of the cultivators, who form the backbone of the country, to be considered. Devaluation would certainly mean that they would get better prices for their produce; they would, no doubt, have to pay more for their bazaar purchases, for devaluation would mean an all-round increase in the prices of imported goods, but on balance they would gain. There are also various industries which have been hard hit by non-devaluation; for example, the manufacture of surgical instruments and sports goods—semi-

cottage industries centred at Sialkot. The trade in hides and skins also depends on exports for its survival and finds it difficult to compete with the devalued Indian rupee. Above all, the Sylhet tea industry has been brought to the verge of ruin by its high prices: although the tea export duty has now, rather tardily, been abolished, the tea companies find that, with the present cost of production, they are losing on the average five and a half annas on every pound of tea sold on the London market. This industry is an economic asset which the Pakistan Government cannot afford to destroy. If it is not to be rescued by devaluation, there are various indirect ways in which it could be helped.

The impartial observer will probably conclude that, on balance, devaluation is not immediately desirable, provided that the Government is constantly prepared to apply the necessary measures for the relief of those interests which suffer from competition with the lower valued Indian rupee. The next six months will be a critical test of the economic administration of the country.

Peace Without Goodwill

[FROM OUR VIENNA CORRESPONDENT]

OVER 1,500 delegates from all over the world have been shepherded into the unwilling folds of Vienna for the World Peace Congress which opened here yesterday. The organisers who have been busily combing every inn, hostelry and likely private house for rooms in which to accommodate the individual members of the flock have generally found that no one wants to have anything to do with them. The Congress, in fact, is so unwelcome to nearly all Viennese that the non-Communist newspapers are generally ignoring it altogether. On the other hand the capitalist transport systems serving Vienna have been rubbing their hands. British air transport companies, for example, have booked over \$13,000 worth of passages from South America alone and other air lines are doing equally good business.

Among those whose names have been publicised in advance are Emil Zatopek, Pastor Niemöller, three Hungarian Protestant bishops, and the foremost Hungarian soccer star, ex-Chancellor Wirth, Henri Matisse, Pablo Picasso, Yves Farges, Dr Kingsbury, Jean Paul Sartre, Ilya Ehrenburg and of course the Dean of Canterbury. Last, but he hopes not least, among those invited is your correspondent, who received an individual invitation in which he was told that "we would be very glad if you personally could find the opportunity to attend." The invitation was dated Prague, November 25th. This was just before the end of the Slansky treason trial in which two of the defendants had already described at great length their alleged espionage contacts with the correspondent in question. It would seem clear, therefore, that M. Paul Chareton, at any rate, who signed the letter, either does not heed or does not believe the confessions made by Dr Clementis and Dr Loebel.

M. Chareton wrote to your correspondent that

the Congress of the Peoples for Peace will be an international assembly bringing together men and women of different countries and accustomed to different ways of life, who will seek to find together, in genuine discussion, reasonable solutions to the questions today dividing the world and, thereby, to contribute to diminishing present international tension. How can the wars now going on be stopped? How can the cold war be brought to an end? How can the independence of nations be safeguarded and the security of every country guaranteed?

M. Chareton spoke of "the deep concern of bodies of all kinds—political, trade union, religious and pacifist—to find answers to these questions," but the reference to "pacifists" or even to "trade unions" and the religious bodies is perhaps unfortunate. Pacifism, said the Hungarian periodical *Szabad Ifjúság*, on April 21st, "is imperialist propaganda. It has its

agents in Hungary too. Rightist Social Democrats, clerical reaction, various religious sects, the class-enemy in villages, the kulaks." Lenin, as quoted by Moscow radio on March 25th, said that

socialists have always condemned wars as cruel and brutal. Our view, however, differs completely from that of the bourgeois pacifists, the supporters and advocates of peace, and the anarchists. . . . In all periods of history, there have been wars which are progressive wars. . . . These have advanced the development of mankind and have contributed to the destruction of particularly vicious and reactionary systems.

The East German President, Wilhelm Pieck, described Lenin's doctrine in a broadcast speech on July 10th as meaning that "there are just wars which must be supported by the proletariat and unjust wars against which there must be a determined struggle." He went on to define a just war as one which aimed "at defending a people against attack from without and against attempts to enslave people or at liberating people from the slavery of capitalism and liberating colonies and other dependent countries from the yoke of imperialism." He then gave the war in Korea as an example of "a just war of liberation" and added that the differentiation between just and unjust wars had "a certain current importance for us Germans. . . . We must fight with determination against the formation of mercenary troops in West Germany until the Adenauer Government is overthrown." There is thus a quite unbridgeable gulf fixed between the red Lazarus reclining in a bosom that certainly is not Abraham's and the pacifist and imperialist Dives suffering torments in the militarist hell stoked by Wall Street and the Vatican.

Preparation for "Just Wars"

Returning, however, to the business in Vienna, it is perhaps interesting that M. Chareton in his letter to your correspondent did not once refer to the question of disarmament or even to the limitation and control of armaments which was a central theme in the Peace Congress held here in November last year. Nor did he say a word about germ warfare. It is by no means certain that the Congress will be as discreet, but M. Chareton's caution is at least justified by what is going on behind the iron curtain where military education is now taught in all schools from the lowest classes upwards. In each of the satellite countries there is a Union for Co-operation with the Armed Forces which seeks to militarise the whole working population of the country, regardless of sex: DOSAAF in the Soviet Union, *Svazarm* in Czechoslovakia, LPZ in Poland, the 'Freedom Fighters' Association in Hungary, the GMA Rumania. Women and girls as well as boys and men are not only taught to use parachutes but also rifles. The object of the exercises, of course, is that they should be ready not only to defend their own country against an imperialist attack but also to participate in any of the wars which by definition are just wars.

In such circumstances, it is perhaps unrealistic to invite—or at any rate to expect—the delegates to the Congress to go home and tell their countrymen with any degree of conviction that war is always unjust, that it is always sinful to arm and righteous to disarm or even that Generalissimo Stalin is just aching to throw his war-weary arms round the neck of ex-Generalissimo Eisenhower and pat Mr Churchill on the back, any more than it would be to suggest that Wilhelm Pieck is ready to embrace Konrad Adenauer. It is, in fact, clear that the Congress is a weapon in the cold war; and it is clearer than ever since the so-called Slansky gang was hanged that the Communist leaders who staged the Congress can have no real part nor lot with pacifists, trade unionists and religious leaders who have a different political outlook. Indeed, if M. Chareton is sincere in his desire to bring the cold war to an end, he might start by bringing forward a resolution disbanding the World Peace Council.

"Type these fifteen letters please"

The Dictabelt has revolutionized office dictation!

FIFTEEN LETTERS or even more on a little plastic belt! That is only one of the amazing developments in office dictation made possible by the Dictabelt, the revolutionary new recording medium of the Dictaphone Time-Master.

More dictation. Fifteen minutes of solid dictation goes on to each Dictabelt; fifteen minutes of notes, letters or memoranda for your secretary to type when it is most convenient. Dictabelts fold flat for compact filing and up to ten can be posted for a 2½d. stamp.

Easier dictation. The Time-Master is extremely simple to operate—there are no time-wasting controls to set or adjustments to make. It is designed to achieve the maximum efficiency with the minimum of effort both when you dictate and when your secretary transcribes.

Better recording and reproduction. Time-Master recording on plastic Dictabelts is crystal-clear from beginning to end. The sensitive microphone catches every word you say—even a whisper: this makes transcription both easy and accurate for secretaries.

ONLY THE TIME-MASTER OFFERS ALL THIS!

1. Streamlined machine, only 4½ ins. high, slightly larger than a letterhead.
2. Uniformly clear recording and reproduction.
3. Uniform backspacing, immediate place finding.
4. Simple automatic operation.
5. Mailable, filable, expendable Dictabelts, low-cost plastic medium.
6. Nation-wide service, Dictaphone dependability.

Write for Time-Master literature to Dictaphone Co. Ltd., Dept. O, 107 Kingsway, London, W.C.2.

A sulphur famine is not the least of the many threats that confront British industry.

Much of the energy and experience of Simon-Carves is being devoted to building plants to produce sulphuric acid from pyrites. Most of them embody a pyrites "flash roasting" system which (besides many other advantages) on large plants enables enough power to be generated from waste heat recovery to run the pyrites-burning and acid-producing units, thus avoiding any demands on Britain's already overtaxed resources of coal and electricity.

These facts are published to show what British organising skill can achieve in spite of difficulties

It can be done

When United States Air Force engineers undertook the extension of an airfield in England for use by jet aircraft, a British firm was selected by the Air Ministry to be responsible for the purchase and supply of materials. The demand was immediate.

First instructions were received on April 7th 1952. Within eight days—which included the Easter holiday—materials started arriving at the site. Exactly a month later when the

last square yard of surfacing was laid, 80,000 tons of materials had been delivered. Next day the Thunderjets flew in from Iceland.

The same organisation has co-operated with American engineers in a number of similar works, besides its other contributions in building and civil engineering works both for defence and industrial development in Britain and overseas.

THE BUSINESS WORLD

Industry and Defence

"SOMETIMES it is better," said the Prime Minister, announcing the defence cuts in the House of Commons last week, "to slow down the production of weapons which are being superseded by newer and better types in order to be more ahead a little later on." A review of this kind becomes inevitable when a rearmament programme hastily put together to cover a period of three years is re-examined and stretched out over a longer time. The present rate of defence spending is probably running closer to a figure of £1,600 million than the £1,462 million budgeted for the current year. More than half the cost is taken up in paying, feeding, clothing, transporting and housing troops to prescribed standards. Economies can only come from reducing the numbers of men or from reducing defence production.

The burden of defence production on industry in 1952-53 will probably amount to £600 million. The separate service estimates show an allowance of £203 million for aircraft and stores for the RAF; £156 million for guns, ammunition, vehicles and signals equipment for the Army; and £238 million for shipbuilding, aircraft and armaments for the Navy, either built under contract (£81 million) or at Naval establishments. Clothing for the three services was expected to cost a further £66 million. These figures provide a guide to the distribution of defence production orders between the three services; these sums represent payment for actual deliveries and the resemblance between the total and the estimated load of defence production is largely coincidental.

The new programme intends to hold defence production at approximately this level of £600 million during the coming year and longer. To do this, the volume of deliveries has to be reduced, and in some cases quite sharply. But for reductions that have already been made, defence production this year would have risen to £725 million—at end-1951 prices—and would have risen further next year to £850 million. And, meanwhile, prices themselves have risen. The re-phasing of the defence programme by no means indicates any reduction in the total bill when it is eventually added up.

Since defence orders account for a significant part of the activity of industries critically important in the export trades, it is desirable to attempt some estimate of what the revised programme may mean in terms of reduced pressure on these industries and in increased potential on their part for export. The first point to emphasise is that, although big reductions have been made in the air programme, the production of military aircraft will continue to rise during the next two years. It is intended to offset this increase by compensating economies in production for the Army and Navy. The Navy has an extensive shipbuilding programme in hand, partly for frigates and minesweepers that are urgently needed, and also for cruisers and fleet carriers, the completion of which could easily be postponed. The Army—according to the estimates—is spending least among the three services on defence production, and it should

be possible to make some reduction in the rate at which reserves of such items as guns and ammunition are accumulated. This year the Ministry of Supply accelerated the placing of orders for clothing in order to relieve the depression in Lancashire, and stocks are big enough to provide scope for substantial economies in clothing purchases in the coming year. Some small cuts in orders for vehicles may be made, but the initial orders themselves were not large. Much of the Army's supplies come from the Royal Ordnance Factories, where the rate of production, always below capacity in peacetime, can be easily controlled. But the tank factories present a special case. British tank production is concentrated on the Centurion. It is being built in quantity at three centres, one operated by Vickers, one a specially designed ROF tank factory at Leeds, and a third, completely new factory should be in production in a short time. Even apart from any need for economy, it is open to argument whether the Army today could effectively use the full production that these three factories could turn out, however necessary their output may have seemed early in 1951 when the lines were commissioned. Some British-built Centurions have been ordered for Nato, others have been bought outright by the Canadian authorities for the equipment of Canadian troops in Europe. If further sales of this kind can be made British tank-producing capacity can be kept fully employed; otherwise the rate of production in the three major producing units will have to be reduced, and unfortunately this would mean a rise in production costs per unit. This rise in unit costs that follows a reduction in assembly-line output is one factor that tends partially to defeat attempts at economy in defence production.

It is presumably justifiable to slow down the rate of arms deliveries to the Army and Navy if only because the need for large reserves appears to be less pressing than it was a year or more ago. But the cuts in the aircraft orders seem to have been made with totally different objects in view. The military requirements of the RAF have altered considerably since 1950. The orders placed with the aircraft industry in the first flush of rearmament were for those few aircraft that could go into production. Of the fighters, Gloster Meteors, both the day and night versions, and de Havilland day and night Venom and Vampires were the only available designs; the Canberra was the only jet bomber. In spite of their limitations, these aircraft were ordered in quantity. Once details of the high performance of the Russian Mig fighter were known, it was clear that there was no point in continuing to equip the RAF with fighters that were known to be inferior. The cancellation of outstanding orders for Meteors, Vampires and some Venoms is therefore no surprise to the industry. Nor is it surprising that orders for the Canberra should be reduced. No fewer than four production lines were laid down for this aircraft when it was the only bomber avail-

able. But since then, the medium-range Valiant and the rather longer-range delta Vulcan are in, or going into, production, and their appearance correspondingly reduces the need for such large quantities of light bombers. The reduction in orders for piston-engined trainers follows this same principle. Recruitment into the RAF is probably not large enough to warrant the numbers of elementary trainers ordered but, meanwhile, more jet trainers have been developed; hence the cuts in piston-engined trainers are accompanied by a modification of the original order for Vampire fighters into one for two-seat Vampire jet trainers.

Simultaneously with these cuts, other newer aircraft are coming into production. The Gloster and de Havilland fighters are being replaced by the Vickers Swift and, when it comes into production, the Hawker Hunter. The Armstrong-Whitworth Meteor night fighter will be replaced by the delta-wing Gloster Javelin, and the English Electric Canberra will be complemented, rather than replaced, by the Vickers Valiant, the Avro Vulcan and eventually by a Handley Page bomber. Meanwhile, the Vickers and Boulton Paul trainers are being replaced by the Vampire trainer; and the Percival Pembroke troop transport has gone the way of other abandoned orders for troop carriers. The Rolls-Royce Derwent engine used in the Meteors, and the Ghost and Goblin engines in the de Havilland fighters, are replaced by the Rolls Royce Avon, the Bristol Olympus and the Armstrong-Siddeley Sapphire (though orders for this last engine have had to be postponed to take into account the cancellation of one projected production line for Sapphire-engined Hunters in addition to those with Avon engines). For some companies, orders for new aircraft have replaced those that have been cancelled; but this exchange of types does not apply in every case, and even where it has occurred, the change from one type to another cannot be made without some interruption to production.

★

Although the aircraft industry will need a further 10,000 men in the coming year and again in 1954 for military work alone, there will be some idle capacity in the industry. Some of these extra men are needed because aircraft production is still rising, but some are needed for the sole reason that the newer aircraft take more man-hours to produce. In many cases, also, the reduction in the number of aircraft or engines ordered from a given company is intended to fall at the end of the delivery period. At this present time, the RAF is under-equipped; aircraft such as the Canberra are now urgently needed for squadron service and every Canberra that comes off the new production lines at Avro, Shorts and Handley Page (and every Avon engine for them from the Napier, Bristol and Standard lines, as well as the Rolls-Royce factories) will be put straight into service. It is only towards the end of the programme period, when immediate RAF needs have been met, that the rate of deliveries is due to fall off. Aircraft production during the coming year will only gradually begin to fall below the rate originally planned; it will continue to rise above the levels of the past year.

Nevertheless, capital expansion in the aircraft industry, now almost complete, has been designed to provide capacity to meet military requirements to the full—that is, the original 1950-51 rearmament programme, plus orders for recently-developed aircraft such as the Javelin and Vulcan that were placed after the programme had

been drawn up. This investment has deliberately been left untouched by the latest cuts. So, in spite of a steady rise in employment, the industry will not enjoy full employment unless it can find other customers. Some of the smaller companies with cancelled orders will probably take on sub-contracting work for aircraft and engine sections from the main contractors—this may explain why Vickers-Armstrongs, which makes great use of sub-contracting, has been able to handle simultaneously such a heavy volume of civil and military work. But the employment of the expanded aircraft-making capacity will to some extent rest on the ability of the leading companies to find new markets, both civil and military. There is no doubt that the Western European countries are anxious to operate British fighters, particularly if these can be procured as off-shore purchases, paid for by American aid. But the American government does not sign orders of this kind without much deliberation, and there is always a risk that the advantage of early delivery may be lost; this delay might occur to the order for 250 Swifts—it was whittled down from 500—that is now under discussion. Whether a similar order for Canberras could be negotiated is still problematical; but it would make a considerable difference to the prospects of major sub-contractors to the Canberra programme, since some of these companies received the orders because they had considerable factory space and little immediate prospect of employment for it. The opportunities for civil exports have been exhaustively examined during the past years; the strenuous efforts that the major companies building civil aircraft have made to give early delivery dates has embarrassed their American competitors, but it would be a mistake to suppose that anything more than the preliminary shots have been fired in the Anglo-American battle for the civil airline markets.

Behind the aircraft and other armament industries, the engineering and radio industries have built up a reserve of highly specialised capacity to make components for the major military items. These range from tank-turret castings, presses for turbine blades, and specialised forging capacity, to intricate electronic equipment far removed from the mass-produced radio receiver of the domestic market. It is estimated that, for example, component and electronic production for the aircraft industry is employing as many men (more than 200,000) as are employed in the aircraft factories themselves. The employment of such capacity is immediately affected by any changes in the activity of the main government contractors. If military or civil aircraft or tanks can be sold abroad, they will need such components, but if such markets are not found, this specialised capacity cannot easily be diverted to other uses. The "burden on the engineering industries," imposed by the defence programme, represents, in fact, the bread and butter of certain sections of it, some of which have been brought into being for this sole purpose. Failing the development of new and specialised export markets, the relief of this "burden" may consist very largely of the diversion of raw materials, some of which are still scarce, from military to civil production and so, perhaps, to export. The Prime Minister was right to appeal to industry for understanding of the Government's motives and policy. In fact, the changes with which some sections of industry concerned with defence are now confronted will call for great understanding on the part of the Government.

Can Cinemas Pay?

IN the tragi-comedy of British film finance since the war, the cinema exhibitor has conventionally been cast in the role of the rich (though not necessarily wicked) uncle. The film technicians' argument that "Enough profits are made on British films, but they are made by the wrong people" was never formally accepted in Whitehall; but subsequent Government policy towards the industry seemed to show its influence. The Eady scheme, which combined an increase in seat prices with a remission of Entertainments Duty, siphoned off direct to the producer more of the resulting increase in box-office receipts than would ordinarily have reached him through film hire. Proportionately, the extra revenue it gave the producers was much more important than the extra earnings that were to be left to the exhibitors. In effect, it tended somewhat to redistribute the total revenue of the industry, at the expense of the shares taken by the Customs and Excise or retained by the supposedly "prosperous" exhibitor. Two weeks ago Mr J. Arthur Rank gave a sharp jolt to the conventional view about cinema earnings when he disclosed that about 35 per cent of the profits his group showed under "exhibition in the British Isles" in 1950-51 came, in fact, from the sale of ice-cream in cinemas; Mr Rank further declared that so far as box-office takings were concerned "there was a loss for the whole organisation" in that year. This week the Cinema Exhibitors' Association has produced for the Treasury an elaborately prepared version of the same argument—that the ostensibly rich uncle of films, in fact, stays solvent only by dint of peddling eatables and showing advertisements on the side.

The argument that the "profitable end of the business" was fast becoming much less profitable is not new, but in the past the exhibitors have often contrived to make it unconvincing. In 1950, for example, they argued that without certain minimum concessions in Entertainments Duty, many cinemas would be forced out of business. The concessions were granted only in part, but the cinemas stayed in business. The case, as overstated, collapsed.

It is only fair to admit that their arguments today are anything but ill-prepared; in fact, they now display considerable sophistication. They have been made possible by the thriving crop of statistics that the Board of Trade has grown for this industry during the last three years where none existed before. From the official figures, it is possible to see how total box-office takings are apportioned between duty, exhibitor, Eady fund, film hire and (a shade less clearly) between the distributor, foreign producer, and British producer. The exhibitors' accountants, working upon the Board of Trade figures and certain others collected within the industry, have carried the analysis much further in a report that illustrates the case for relief of duty that the exhibitors are now submitting to the authorities.

★

With considerable ingenuity, the accountants have constructed an outline profit and loss account for film exhibition in Britain as a whole for 1951-52. Their

figures for operating costs were obtained from a "quota sample" of British cinemas designed to reflect accurately the size distribution of all cinemas throughout the country. This sample covered such costs as wages, insurance, publicity, maintenance, rates, and power, among others. But it provided no useful figures for depreciation nor, in the case of leased halls, for rent, because cinemas are operated under a wide variety of letting and profit-sharing arrangements. Notional figures for both these items have, therefore, been calculated on the basis of an estimate of the total capital value of cinemas in this country. Based upon prewar costs of cinema construction, such an estimate puts the historical cost of the country's 4,600 cinemas at roughly £95 million. Depreciation has been calculated at the rate of 2 per cent of this figure, and rent at 8 per cent of these historical costs for fixed assets. Thus constructed, the estimated profit and loss account is set out in the table. Results are given from the point of view of the owner-exhibitor and of the lessee-exhibitor, but the conclusion is, in fact, identical: the accountants argue that exhibitors' net box-office takings throughout Britain as a whole, after covering all costs other than rent, amount to some 1.4 million less than could reasonably be charged

AN ESTIMATED "PROFIT AND LOSS ACCOUNT" FOR THE BRITISH CINEMA TRADE FOR THE YEAR ENDING JUNE 30, 1952

	£'000
Gross takings.....	109,639.9
Less Payments to outside interests:—	
Entertainment tax	38,126.0
Eady fund.....	2,831.7
Film hire.....	24,029.4
	64,987.1
Exhibitors' share.....	44,652.8
Less Operating costs:—	
Wages.....	18,435.8
Overheads	18,123.0
	36,558.8
	8,094.0
Less Estimated depreciation.....	1,900.0
Surplus available to owner/exhibitor to meet directors' fees, reserves, dividends, and taxation	6,194.0
Less Estimated rent (in case of lessee/exhibitor)....	7,600.6
Loss of lessee/exhibitor (to which must be added directors' fees and reserves).....	1,406.6

Source: Stoy, Hayward & Co.

for the rent of the cinemas alone. The analysis has been carried further to secure notional results for each class of cinema; broadly, these would suggest that only those with more than 1,500 seats could more than cover a reasonable rent; cinemas with between 250 and 1,500 seats could not make enough to pay rent.

How reasonable are the assumptions on which this argument is based? The sample of cinemas for which costs were obtained was small, if well-designed, and only 58 per cent of those who were asked returned usable data; the poorest response came from the smallest type of cinema and the best—almost 100 per cent—from the major circuits. The estimates of construction costs used to calculate the total historical cost of the country's cinemas accord fairly well with others made in the trade before the war, and the total value of £95 million is

probably less than most people in Wardour Street would guess. The figure of 8 per cent of this historical value for rent is made up of 6 per cent, as the rent that a landlord might expect for any commercial building, plus 2 per cent for the special "immobility" of cinema buildings. It is certainly true that most cinemas could hardly be used economically for anything else (except perhaps theatrical entertainment, which in recent years has been supplying no buyers). One of the big circuits lately sold some small "tunnel-type" cinemas for use as variety stores of the chain type, but the larger modern buildings offer little scope for commercial conversion except at very high cost. The manifold assumptions upon which this estimate of cinema unprofitability is built naturally make it highly tentative; the Treasury, for example, might be able to make surer estimates of operating costs. But it is hard to dismiss.

Why, then, do few cinemas close? Mainly because they live on ancillaries—Mr Rank's ice-cream, sweets, soft drinks, and advertising films. The argument is not that cinema exhibitors, on the whole, fail to make some sort of profit; but that the profit derives very largely from these ancillary earnings. Only Mr Rank has disclosed what one item of these amounts to for his group's 546 cinemas—£1,151,000 profit on ice-cream in a single year. Guesses in the trade have often put these earnings at 40 per cent or more of published profits for many cinemas. The Board of Trade at one time began collecting some figures but gave it up. Whether or not the full extent of ancillary earnings for all cinemas is ever recorded anywhere, it has never been published.

The importance of these earnings can be exaggerated. As has been said this week, the logical consequence of arguments that the profits of exhibition depend entirely on them might be for the cinema posters to advertise ice-cream, rather than feature films. But in a trade where duty takes 35 per cent of box-office receipts, the exhibitors may be excused for arguing:

It is surely illogical that the solvency of the trade should depend on an income which is so far removed from the main objects which prompts the initial capital investment.

If film exhibition *per se* has become chronically unprofitable, it must be borne in mind that its net receipts amount to 35 per cent less than its customers are prepared to pay for the entertainment it sells.

*

The exhibitors' accountants then proceed to estimate what they would consider "a reasonable profit" for film exhibition. Asserting that the lessee-exhibitor should expect to make as much as a shopkeeper selling highly taxed goods such as cigarettes, they argue that a fair profit would be 10 per cent on turnover (including tax)—or nearly £11 million for the trade as a whole. Adding their calculated figure for rent, this would give a "reasonable profit" of about £18.5 million for the trade from the point of view of an owner-exhibitor. They cite one of the Inland Revenue's EPL standards—8-10 per cent on assets at current values—as a check. The replacement value of a cinema today might well be 2½ times its prewar cost; applied to their £95 million estimate for original cost, the EPL standard would give standard profits of some £19-£23 million for exhibition as a whole. However their estimate of current profits is shown, it falls more than £12 million a year short of that—and EPL standards are not usually considered over generous.

No case advanced by any part of the film industry has

ever deployed professional expertise of this kind; the exhibitors, perhaps a little dazzled by such a professional display, are not asking the Treasury to concede them anything like this "reasonable level of profit." Their requests are at present much more modest; they will probably ask for not much more than the Treasury aimed at leaving them in the negotiations over the Eady plan. When the scheme was amended in 1951, its effect was expected to be that the producers of films in Britain would receive about £3.9 million more from the Eady levy and film hire than they did in 1950; but that the exhibitors too would retain nearly £3.6 million more. In fact, with the decline in admissions, the actual effects have been much smaller; although nearly £3 million has been secured for the producers, the exhibitors have gained only about £1.7 million, nearly £2 million less than was expected. The changes in Entertainments Duty that they are advocating for the next Budget might in fact, bring them an additional £3.5 million a year.

If film exhibition, as the accountants conclude "is fast relapsing into the status of a depressed industry," who should be doing something about it? First, clearly, the

exhibitors themselves; though the direct costs in cinemas may not be easy to reduce, there must be economies to be gained. Second, in conjunction with them, the remainder of the trade. Little has been done to revise methods of charging film hire or of distribution since the Plant Report demonstrated that under the present system many of the best films cannot realise their full potential earnings. Third, the Government. Nobody is as well placed as the Board of Trade and the Treasury for testing the assumptions upon which this contention that film exhibition as such is unprofitable is based. If the case seems broadly fair, it would justify some moderation of the Entertainments Duty, which almost certainly takes too much of the industry's total revenue. But the implications reach further. Is official policy towards the film industry to continue to consist of fiddling adjustments to the shares of receipts that arise from normal commercial practice? It might be. There are, after all, the renters still to be squeezed, if redistribution remains the chosen technique. But that course inescapably sets one section of the industry against another. If the object of policy is to promote a healthy British production industry, and to economise in dollars spent on films—and presumably at least not to penalise the cinema exhibitor in doing so—this is probably not the only way of doing it.

A MEMBER OF THE THREE BANKS GROUP

THE ROYAL BANK OF SCOTLAND

The Royal Bank of Scotland was incorporated by Royal Charter in 1727. Retaining its Scottish character and traditions, its influence, though deeply rooted in Scotland, now extends to every part of the commercial world. The Head Office is in Edinburgh; the Royal Bank of Scotland is a member of the Three Banks Group.

ROYAL BANK OF SCOTLAND
Founded 1727. Edinburgh, London & branches

Total resources over £350,000,000

PRIVATE TREATMENT in ILLNESS

NO FINANCIAL WORRY

In the event of serious illness or operation many people prefer private advice and treatment to the National Health Service, but are afraid of the cost. The non-profit-making B.U.P.A. offers an inexpensive solution. For a moderate annual subscription, the Association pays all or a major part of the cost of private specialist, nursing home or hospital paybed treatment, leaving members free to make their own arrangements.

B.U.P.A. has the privilege of supplying many leading Companies and Corporations with group schemes. Favourable terms arranged with Senior Executives on receipt of staff details and requirements.

Send postcard for brochure explaining how you and your dependants can become members, to:

This organisation, with correspondents throughout the world, is able to offer to those concerned with trade or travel abroad all the services a modern Bank can perform for its customers.

Hard lines about hardware!

A client of ours in the Hardware Trade was recently offered a contract from a Latin American country. "If I send the goods on a cash-against-documents basis," he asked "can I expect prompt payment?"

We were able to quote him the latest report from our Branch in the country concerned. This stated that the market showed signs of being heavily overstocked. Goods were moving slowly and delays had been experienced. Furthermore a marked (though temporary) shortage of sterling had lately complicated the situation, and some exporters had found the delays so serious that they had re-shipped their goods.

This factual information was of the utmost importance to our client and it is unlikely that he could have obtained it so quickly or in such detail from any other source.

THE ADVANTAGES OF BEING HERE AND THERE

As the only British Bank with branches throughout Latin America, we can offer you special services—either direct or through your own bank. These services are set out clearly and concisely in our booklet "The advantages of being here and there". We shall be glad to send you a copy on application to:—

The City and the Commonwealth

The City of London is making its contribution to the wider objectives of the Commonwealth Economic Conference by forming a new company which in the wider sphere of the Commonwealth will fill the role which has in the United Kingdom been played during recent years by organisations such as the Finance Corporation for Industry. The plan, which is still at an early stage of gestation, is to form, with the support of the Bank of England and in consultation with banking, insurance, investment trust, issuing houses, and other interests, a company with a moderate initial capital and borrowing powers, which can assist in the provision of finance for development projects within the Commonwealth. Projects especially favoured will be those that promise to strengthen the sterling area's balance of payments. Apart from direct financial assistance the company, when it is formed, will provide a convenient address to which proposals can be sent; if after sifting the projects are found promising they can then be sent to the appropriate institutions in the British capital market. It is also one of the aims of the sponsors that the company may act as a link between Commonwealth borrowers and lenders in overseas, and particularly in dollar, markets. This suggests eventual possibilities of useful co-operation with the International Bank for Reconstruction and Development, an institution which, it is understood, has expressed considerable interest in the project. So far, the organisation of this company has gone little further than the formation of an organising group headed by Sir Edward Peacock and comprising representatives of the Acceptance Houses Committee, the Issuing Houses Association, the Federation of British Industries, and other industrial and commercial interests.

The proposal has not been launched with flamboyant hopes of what it can achieve quantitatively for Commonwealth development in the near future. Those responsible for the project need no reminder that the total resources available for overseas development are related to savings and the balance of payments surplus; such resources cannot be conjured up by the mere setting up of a new institution. But the sponsors hope that, on the basis of what is intended to be a modest start and by dint of sound and businesslike management, the new company may come to play an important part in Commonwealth development. It will provide what many observers acknowledge to have been a missing link in the organisation of the City, namely an institution which can sift projects for Commonwealth development and help them by technical advice and, if need be, by direct financial participation. Provided that no excessive hopes are based upon it as an early and liberal provider of capital, this new company can be regarded as a valuable and worthwhile contribution to the progress of Commonwealth economic development.

Improvement in Commodities

Have prices of primary materials reached the turning point? In the first seven months of this year *The Economist* commodity indicator continued to drift downwards; in October and November the indicator remained virtually unchanged; but from the beginning of this month it has shown signs of improvement and has now reached 124 (July, 1949-June, 1950 = 100) compared with 122 in mid-October. The rise so far recorded is not spectacular, but it has one feature that may be significant: it has resulted from small increases in a large number of commodities, whereas earlier, and temporary, improvements arose from spurts in the prices of single materials or groups of materials.

The indicators for individual groups of commodities show that, with the exception of metals, the prices of most raw materials are now rising. Wool remained practically unchanged in November, but is now making headway. The index of wool prices is now 124 against 88 at the beginning of April. Jute and sisal prices have recently recovered, though cotton remains depressed by ever-increasing estimates of this year's American crop. Rubber has shown a striking improvement; the index of rubber prices has risen from 136 (July, 1949-June, 1950 = 100) in mid-October to 183 on December 10th.

These improvements in prices of the two main dollar-earning commodities have provided a cheerful backcloth to the final proceedings of the Commonwealth Conference. Their potential importance for the trend of dollar earnings of the sterling area is not to be minimised. If they continue—in other words, if the renewed recovery in American economic activity is sustained—they will make it the less easy to sell any plan for organised commodity dealings that may emerge from the conference. Information on that point, as on all others discussed at the conference, was awaited at the moment when this issue of *The Economist* was going to press.

Dealings in Japanese Bonds

The Japanese debt settlement has left a confused wake behind it in the stock markets. This turbulence has been partly caused by the fact that no definite final date has been fixed for bondholders to assent to the settlement (by presenting their bonds for enfacement at the London branch of the Bank of Tokyo). In the three-week account that began on Wednesday dealers will therefore have to take account of the difference between the bonds that have already been enfaced and those that have not. There is a further source of complication: the first interest payments under the settlement will become due half-way through the account, on December 22nd. Officially the assented bonds will not go ex-dividend until this date, but—by arrangement with the jobbers—dealings in the bonds are possible on an ex-dividend basis before they are actually marked as such in the Official List. For part of the account jobbers will therefore deal in three distinct classes of stock; non-assented bonds, assented bonds cum-dividend, and assented bonds ex the December 22nd dividend.

By postponing a formal acceptance of the settlement some bondholders, especially surtax payers, may secure certain

tax advantages. Accumulated interest tends to be reflected in the price of the bonds at a net value, after allowing for tax at the standard rate. Some surtax payers, therefore, do not intend to lodge a formal acceptance of the settlement immediately, but will allow interest to accumulate on their unassented bonds; they hope that if they sell these bonds later, they will then receive (in the market price they secure) the equivalent of their arrears of interest less approximately the standard rate of tax instead of taking the gross interest into their income which would attract a much higher effective rate. On the other side of this complicated medal, pensions fund investors, and others paying less than the standard rate of tax, may find it wise to delay extensive purchases of Japanese bonds until substantial amounts of interest arrears have accumulated on unassented bonds—for they might then, in effect, be able to buy up these interest arrears at a net rate. Market forces in themselves, however, may gradually wipe out these advantages by widening the premium at which the unassented bonds stand above the assented ones. Meanwhile, one major question mark hanging over the market concerns the attitude of the Japanese government itself: whether, at present prices, it will become an active buyer of its bonds.

Exports fall in November

Hopes that the improvement in exports in October might have marked the end of the downward trend faded with the announcement this week of the preliminary figures for overseas trade in November. The Board of Trade estimate that exports last month amounted to £207 million compared with £219 million in October and £244 million in November, 1951. The decline last month is the more disappointing because exports usually show a seasonal expansion in November. The only consolation to be drawn from the total is that since last month contained fewer working days, the daily rate of exports was 2 per cent higher than in October.

Exports to North America showed a disappointing setback, from £28.6 million in October to £24.4 million last month, though the latest figure was still £3 million above the corresponding amount for November, 1951. The reduction last month fell more heavily on exports to the United States than to Canada. Exports to the United States dropped from £14.4 million in October to £11.8 million last month, while shipments to Canada fell from £14.2 million to £12.5 million.

The decline in imports now seems to have spent most of its force. The November total of £262 million was £67 million lower than that for November, 1951. But last month's figure was only £5 million lower than that of October and only slightly below the monthly average for the third quarter of this year. Re-exports last month were £8.9 million and total exports amounted to £216 million; thus the excess of imports (cif) over total exports (fob) was £45.7 million compared with an excess of £35.7 million in October.

Fiduciary Issue at Peak Level

The expected increase of £50 million in the fiduciary issue was announced by the Chancellor of the Exchequer on December 9th. This restores the issue to the peak of £1,550 million temporarily attained during the phase of holiday currency demands last summer. During the corresponding week in December last year there was also an increase of £50 million in the fiduciary issue—an increase that was only cancelled in mid-January. During the past fortnight the note circulation has risen by £51 million (to £1,513 million), compared with increases of £52 million and £53 million during the corresponding periods of 1951 and 1950 respectively. In 1951 there was a further increase amounting to £22 million during the final two weeks before the Christmas

peak and in 1950 an increase of £18 million. There still remains a reserve of £37½ million of notes in the banking department, which seems likely to suffice to meet the further seasonal demands.

This year, however, it will be more than usually difficult to gauge the trend of Christmas spending from the behaviour of the note circulation as shown in the Bank Return—because of the possibility of unusual variations in the banks' till money. The latest figures available (those for the middle of November) show that for several months past the banks have been holding a much larger amount of till money than in the corresponding months last year. To the extent that they may have been using this reserve of notes during recent weeks, the apparent increase in the note circulation would naturally underestimate the increase in public spending. The reason for these larger holdings of till money—and, more particularly, the reason for expecting these reserves to be temporarily run down now—appears to be the desire of the Bank of England to economise by reducing its issue of new notes, and its consequent pressure upon the clearing banks to pay out old notes wherever possible. In response to these requests, the banks may have been refraining from returning some of the old notes they would otherwise have exchanged for new ones. At the same time there is some reason to believe that their efforts to co-operate in this way have been to some extent hampered by an increase in the number of firms using note-counting machines; these cannot operate with old notes.

Steel Hits the Target

Steel output this year seems likely to be in the region of 16,100,000 ingot tons. Last month it was the highest ever recorded, at an average of 345,200 tons a week; this compared with 327,800 tons a week the month before and with 316,100 tons a week in November, 1951. The highest rate of production previously recorded was during the same month in 1950, when output was at the rate of 336,000 tons a week. The average output for the first eleven months of this year has been 309,400 tons a week, or an annual rate of 16,087,000 tons a year; if the relation between November and December output is much the same as in 1951 and 1950, this month's output should be about 305,000-315,000 tons a week, much the same as the eleven-month average.

This steel output was supported by a very high rate of iron production. The country's blast furnaces turned out 206,800 tons a week, compared with 204,200 tons a week in October and with 196,800 tons a week in November, 1951. In November, 1950, the previous record steel output was matched by an output of only 193,000 tons of pig iron a week; at that time the usage of scrap in the steel furnaces was considerably higher, fed by the continued high deliveries of scrap from Germany that began to dry up in the spring of last year. This steady rise in pig iron output—by nearly 900,000 tons a week—has been perhaps the most important achievement of the industry in 1952; six new blast furnaces have been blown in during the year, and two others—including the largest blast furnace in Europe, at the John Summers works at Shotton—are being brought in at this moment. This year has seen the achievement of the main output target called for in the industry's first postwar development plan—a capacity of 17½ million tons of steel a year. The development plan did not count upon high imports of foreign scrap, though the industry was of course glad to use it in 1949 and 1950 to achieve high steel output somewhat in advance of plan. Whatever may be said in argument that the development of pig iron capacity to some extent slackened in the industry during those years, the leeway has largely been made up. Expansion henceforth from the schemes that make up the "second development plan" will raise capacity towards 21 million tons of steel a year, and allow for some closing of the older works that were originally intended to be out of production by this time.

Turn in Coal Consumption

Coal consumption in the ten weeks ending on December 1st was about 2 per cent higher than in the same period of 1951. There seems no reason to look farther than the temperature chart for the explanation of this. It certainly does not appear to have come from an industrial revival; consumption in general industry did not exceed the corresponding 1951 figure until the last of these ten weeks, and for the first 48 weeks of the year it was 2½ million tons lower. Of these industries, only the engineering and other metal trades show a slight increase in fuel consumption during the whole eleven months, along with the coke ovens (up by 2 million tons) and the gasworks. The electricity industry seems to have burned slightly less fuel to generate slightly more units; railway consumption, too, is slightly down.

The effect of the turn in inland coal consumption, combined with the increase in exports, has been that total consumption so far this year is only about half a million tons lower than during the first 48 weeks of 1951. The country has now entered the period during which it runs down its coal stocks; these fell by about 650,000 tons in the last three weeks of November, and were probably drawn upon more heavily last week. Though the industry has had an average of 17,000 more workers on colliery books during the first 49 weeks of the year, its output per manshift has remained obstinately lower. The net increase in deep-mined output this year has been less than 1½ million tons—with another million tons from higher opencast output. It is to be hoped that these production figures understate the advantage the industry has gained this year, owing to the transfer of men to training faces and to development work in the mines. If not, the industry would seem to have made poor use of its lull in 1952.

Caution in the Building Societies

One of the main reasons for the recent fall in the price of medium-sized and larger houses—those costing £3,000 or more—has been the very cautious lending policy of the building societies. For some time surveyors' valuations of larger houses have tended to be below the prices asked by vendors; and since building societies will customarily lend only up to 80 per cent of their surveyors' valuations, this has caused a definite softening in the market. In addition, some societies now adopt a sterner attitude towards mortgages against certain types of commercial buildings and "part-possession" dwelling houses (which are encumbered by sitting tenants statutorily protected from removal); mortgages that would have been merely discouraged a year ago are now frequently refused outright. This tightening of lending policy has come at a time when a few societies—most of them small societies in London—have increased the tax-free yield on their shares from the now customary rate of 2½ per cent to 2¾ per cent. This has naturally given rise to discussion whether the movement may be having some difficulty in maintaining the substantial inflow of funds that has been such a feature of the postwar years.

The suggestions to this effect seem to be wide of the mark. All reports indicate that most of the big national societies—and also the smaller societies, especially in the north, that have a devoted local following—are still getting virtually all the funds they want at the 2½ per cent rate. Certainly the efflux of surtax payers' funds out of the movement after the withdrawal of the surtax concession last April has been less than many observers had expected. The most recent report from a major building society, that by Woolwich Equitable for the year to September 30th last, showed that share and deposit capital rose by just over £6 million (to over £72 million) compared with a rise of £6.8 million in 1950-51; since September, some people in the movement suggest, the inflow of savings may have swollen rather than diminished. But the Woolwich Equitable also reported that its new

mortgage advances last year amounted to £13.1 million, compared with £15.6 million in 1950-51; when the usual crop of end-year reports by other societies comes out, more declines of this sort may be reported. The movement is clearly intent upon increasing its liquidity—not so much because it has any exaggerated hopes about an upsurge in demand for the sort of business it most likes to finance, namely the sale of new rather than second-hand houses, but because it believes that this is a time when all financial institutions would do well to ride on a shorter rein. In other words this is yet another field in which the past year's slight increase in disinflationary pressure can be seen at its useful work.

The End of Utility

The last of the utility schemes, that for the furniture industry, comes to an end on Monday. As applied to the furniture industry, it had two distinctive features. One was that nearly all the furniture produced was sold at or below the utility prices—the incidence of purchase tax weighed so heavily on any articles made outside the scheme that they were for practical purposes, unsaleable, and the total tax yield was running at no more than £4 million a year. The other was that, unlike the other utility schemes which had become with the course of time simply devices for fixing tax-free price limits, the utility furniture scheme maintained all its original rigidity, and specified in some detail the size, type and method of construction for each item, with generally unfavourable results on the inventive spirit of the industry. That it was tolerated so long is largely due to the industry's fears of the effect on its always unstable market of any increase in retail selling prices. The utility scheme did at least ensure that purchase tax did not add to the difficulties of selling. The "D" scheme that replaces it taxes a wide range of furniture on the margin of its wholesale price above a certain tax-free limit. A utility wardrobe with a wholesale price of £28 was previously tax-free, it will in future attract £1 6s. 8d. purchase tax. The non-utility wardrobe with a wholesale price of £36 used to carry £12 tax; this now comes down to £4. A wardrobe costing up to £24 still goes tax-free.

Customs and Excise have shown remarkable—some will probably call it fiendish—ingenuity in devising definitions for types of furniture for purposes of tax assessment. Tables are assessed by each square foot of surface, with a tax-free allowance of 13s. 4d. per square foot on the wholesale price. Chairs are loosely grouped into three classes according to the width of seat. Beds and headboards are classed as over or under 45 inches in width. But the assessment of "carcase" furniture, i.e., anything with open or closed storage space, is the masterpiece. The "D" limit is calculated on the cubic capacity of that space, but on a steadily decreasing "D" rate. The first three cubic feet qualify for tax exemption at the rate of £2 each, the next four feet at £1 10s., the remainder at 8s. each. When this sum is completed, it gives a "D" limit of about £24 for a 4ft. wardrobe with a volume of 37 cubic feet.

By this means, Customs have avoided what most critics expected to be the main drawback of the scheme, the multiplicity of definitions for different types of furniture. There has been considerable opposition to the scheme from the industry. Only a minority came out in favour of abolishing the utility system, but now that it is published, the scheme seems to provide the industry with few grounds for complaint other than the strain on its mathematical ability and even this has been anticipated by the thoughtful addition of a ready-reckoner. The industry is in the process of developing its new designs to be exhibited at the annual trade show late in the New Year. It should be possible then to assess the effects of the industry's new-found freedom as well as its new tax-liabilities and also the success, if any, of the new voluntary performance standards that are designed to replace the utility specifications.

Foam on Troubled Waters

At one point in its course the River Lea flows over a mill race where its normally placid waters have recently shown a startling metamorphosis into monstrous piles of foam that heap up on the river bank and blow across the countryside. This phenomenon has never been attributed officially to the increasing use of synthetic detergents, but the Ministry of Health has started talks between detergents manufacturers and sewage engineers to see what can be done to prevent future foaming.

Foam seems to occur where the flow of water carrying sewage effluent becomes disturbed. Moreover, foaming may become progressively worse in time. Despite the great increase in the use of synthetic detergents, they represent less than a quarter of the current consumption of detergents of all kinds, while the consumption of soap is running at its prewar rate of rather more than half a million tons. The scale of nuisance that appears to have resulted from the use of relatively small quantities of synthetic detergents may be a foretaste of what might happen if consumption continues to rise.

In the development of detergents chemical manufacturers have generally leaned towards those that foam. Not all detergents make foam; in the United States a non-foaming detergent is sold to industrial users who find the build-up of foam in mechanically agitated liquids a decided liability, and one British manufacturer had recently taken advantage of the present public concern to announce that its preparation gives "little or no lather." But a distinction needs to be drawn between the foam that rapidly disappears and the foam that persists. The chemical detergent itself produces a foam that soon breaks down, and does not therefore create a sewage problem. But these chemicals, although they are used unmodified in industry, are simply the raw material for the domestic detergent. In a washing powder, other compounds are usually added to hold in suspension the dirt released by the active agent. This active agent is highly efficient in loosening dirt from a surface; but of itself, it is less effective in maintaining this dirt in suspension. The chemicals that assist in holding dirt in suspension tend to have an unfortunate stabilising effect on the foam. Since some detergent manufacturers have encouraged the public in the view that foam is synonymous with cleanliness, persistent foam in the kitchen sink was not held to be a disadvantage. But if the chemical that causes foam were removed from these compounds they would in all probability lose some of their effectiveness.

Manpower Trends

Although the textile recovery continued to attract workers back into the mills throughout October and early November, the total number of workers of all kinds unemployed rose, partly through seasonal changes. On November 10th there were 406,400 people unemployed (2.0 per cent of all employed), but 36,200 of these were temporarily stopped and only 148,400 had been out of work for more than eight weeks. This compared with a total of 397,900 a month earlier. The number of textile workers registered as unemployed had fallen by 11,800 since mid-October. The employment figures for the end of October show that during the month 16,000 workers had returned to textiles. The total employed in these industries, however, was still 112,000 fewer than a year before.

The changes in numbers employed during October, outside the textile recovery, can be accounted for almost entirely on seasonal grounds. The basic industries, particularly agriculture and transport, lost some 44,000 people; the building and contracting trades lost 10,000 men, and the number in "professional financial and miscellaneous services" fell by 10,000, which was more than explained by the seasonal fall in hotel and catering

employment. Clothing and textiles gained 22,000 workers in all, and the labour force in the "other manufactures" group rose by 6,000. There has been little increase in employment in the metal-using industries since August; and the "metals, engineering and precision instru-

ments" group has lost more workers so far this year than the vehicles group has gained (mainly for the manufacture of aircraft). The accompanying table gives comparisons ranging back to the end of 1950; it shows that the growth of the whole metals and engineering group during 1951 has not continued in the first ten months of this year.

Wool Textile Workers Return

Recovery in trade has brought back many of the physical difficulties that affect output in the wool textile industry. Production is again being held back by shortages of labour and of materials. Of the two, the shortage of labour is likely to prove the most difficult to overcome, but the October figures published by the Wool Industry Bureau of Statistics show that the number of workers is gradually creeping up. In October the five main sections of the industry gained 4,431 workers but the present total is probably still some 20,000 below the peak labour force reached at the end of 1950. During the eighteen months of slack trade that followed, nearly a quarter of the workers in these sections of the industry were dismissed.

It was much easier to dismiss these employees than it is now to get them back. Those who have found other employment doubt whether textiles can offer equal security, and cannot easily be persuaded to return. Worst spinning, which lost a far greater proportion of its workpeople than did any of the other sections of the industry, is now recovering its labour more rapidly. Of the 4,431 that returned to the main sections of the industry in October, nearly 3,000 went to worst spinning; and this section of the trade has now made up about 6,000 of the 14,000 workers that it had laid off. The recession in trade took longer to affect the worst spinning side of the industry, and its losses were mild; in

*Painted 1926—
repainted 1951*

The brick and stucco of the Chadacre Agricultural Institute were painted with white lead in 1926. For a quarter of a century it was not touched. Then, last winter, the accumulated dirt was washed off before repainting—and that was all that was needed to be done: the original paint had worn thin, of course, but the film was smooth and unbroken; it formed a perfect foundation for the three coats of white lead. Although we do not pretend that 25 years between paintings usually gives the most economical maintenance, this building is a very good example of what we mean when we say white lead paint lasts.

NEWS FROM THE FISHING INDUSTRY

Bringing the gales home to you!

This map shows you the various gale-warning areas made so familiar by the B.B.C. The figures below each name indicate the average number of days a year on which a gale is blowing. When it is considered that most of these gales occur during December, January, February and March and that fishing is impossible under gale or near-gale conditions, it is not surprising that fish is sometimes scarce in winter.

There's a future in STEEL

WHEN FIRMS in the steel industry made their post-war development plans in 1946 they did not think wholly in terms of new steel works and blast furnaces. They co-operated in setting up organisations throughout the country to improve vocational training. Everyone in steel, from the most recent apprentice to the most seasoned foreman, has been encouraged to make the most of his career in this expanding industry.

By making films, filmstrips and pamphlets and by arranging lectures and visits, the companies have co-operated in helping young people at schools and in works to understand the techniques of iron and steel making, and the industry's part in producing the nation's wealth. An exchange scheme has been arranged to enable trainees to study European steel works.

Britain's future depends on the young men entering industry today.

October it gained some 250 workers—its first significant increase. Figures for combing labour are not available for the end of October, but by the middle of the month the number of workers was 350 above the mid-September level, which brought the number of workers regained up to about 40 per cent of those who had been dismissed.

This success in filling labour vacancies has had its effect on output of worsted goods, which shows a similar rapid increase. Production of tops in October reached 24.82 million lb and the rate of consumption of wool in topmaking was the highest since May, 1951, and 44 per cent above the rate for October last year. Total deliveries of worsted yarn amounted to 19.75 million lb and the rate of delivery was the highest since May, 1951. But the woollen side of the industry has a less satisfactory story to tell. Woollen spinning and weaving together lost about 9,000 workers during the 18 months' depression. Since the trough of employment in the middle of this year they have been able to regain less than 3,000 workers. The rate of consumption of wool in wool spinning and felting was 19 per cent higher than a year ago, and the rate of deliveries of blankets was 36 per cent above that of October, 1951—in fact the highest since the war.

Autumn in the Shops

For anyone involved in the buying and selling of consumer goods, October is the bell-wether of the six winter months and the rate of sales during those four weeks can usually be relied upon to set the pace for the rest of the period. This year, everything has been in the retailers' favour just as in the previous autumn everything seemed to go against them. The weather was unseasonably cold, average selling prices—and not only those of distress lines—were lower than they had been for some time and public confidence in their stability was returning. The average weekly level of sales of goods other than food (1950=100) rose from 106 to 111 between September and October. Sales were 6 points higher than in the previous October and—perhaps

a better comparison—one point higher than in October, 1950, when neither the level of retail prices nor the volume of retail sales had been bewitched by the Korean buying panic and its painful aftermath.

For the large retailers, sales were 6 per cent higher than in October of the previous year. Department stores reported increases of 6 per cent, multiple stores an increase of 8 per cent, and the co-operatives a decline of 1 per cent. But in sales of food, the co-operatives continue to expand their business, and their sales in October were 15 per cent higher than they were twelve months before compared with a 12 per cent rise for the multiples and 5 per cent for the department stores. The food trade is not, however, influenced by the same factors that affect the trade in non-food merchandise.

Sales by the wholesale textile houses to the retailers rose in sympathy with the improvement in retail sales. Home sales (1947=100) went up from 154 in September to 173 in October, 18 points higher than they were 12 months ago. The trade is satisfied that this is a "normal" seasonal

increase; but the figures for stocks, both wholesale and retail, show how greatly wholesalers and retailers still feel the need for reassurance. Stocks of wholesale textiles were down in October to a figure of 137, nearly 42 per cent lower than in the corresponding month of last year. In October, 1950, stocks stood at 152, and there is reason to believe that in spite of the fall in prices the volume of stocks held today is low.

Retail stocks present the same picture. Those of non-food goods as a group are 14 per cent lower than the year before, and stocks in the clothing categories show falls of between 20 and 30 per cent. It looks remarkably as if the process of running down stocks had been allowed to go on for too long, but while retailers remain abnormally sensitive to every slight movement in commodity prices (especially wool prices, where a recent slight decline revived memories of the price collapse of the summer and the stock losses that followed) they are going to keep stocks to the minimum even though there is increasing evidence in the textile manufacturing districts that immediate, or even early, delivery of orders can no longer be given.

Cotton and Meteors

The future of the three-cornered deal between the Brazilian government, the Gloster aircraft company and the Raw Cotton Commission rests for the moment with Brazil. The commission has had an opportunity to look at the Brazilian stocks, and there is no doubt that there is enough cotton of the type that could be sold in Lancashire to make the proposed swap of 70 Meteors for 15,000 tons of cotton a practical possibility. There is, however, a good deal of inferior cotton also in stock, and the commission wants to be assured that the bales shipped to Liverpool will be made up of cotton in the grades that it requires. This could consist of a good proportion of the cotton that the commission sells as types 5 and 6, with some classified as of lower grade. But Brazil is not anxious to sell better quality cotton and to be left with a mixed bag that will be difficult to sell at any price, and is certainly unsaleable at ruling Brazilian prices which are double those on the world markets. If Brazil agrees to let the Raw Cotton Commission pick the stocks that it wants, then the deal may still be possible. But if it insists on making up the shipments itself, then the commission will buy its cotton elsewhere, and because the time for doing this is limited, the commission has recently presented the Brazilian government with an ultimatum, to give the assurance required by a certain date. If this is not done, the commission will drop the negotiations altogether and make other arrangements for its cotton. The present impasse is a matter of some concern to Gloster, for the balance of RAF orders for Meteors has been cancelled, and unless export orders such as this can be negotiated the production line for Meteors will be dismantled.

Dearer Persian Lambskins

At the Persian lambskins auctions held in London this week prices were mostly 5 per cent to 10 per cent up on those realised at the previous sales in October. The sale consisted of about 250,000 South-West African skins and a slightly larger quantity of skins of Russian origin. On the opening day African skins sold at some 7½ per cent above the October level, but on the following day values for certain grades suitable for the European market tended to be slightly easier. The Russian skins were sold early on the second day and realised up to 10 per cent more than in October. American buying was small throughout the sale, reflecting the recent quietness in trade in that country. Nevertheless, competition

was brisk although it eased towards the end as Germany and Sweden, who were the principal buyers of African skins, appeared to have fulfilled a large part of their requirements at the opening auction. Sweden has recently lifted the restrictions on the import of furs bought for sterling and this move no doubt stimulated Swedish interest in the auction. Continental countries were the principal buyers of Russian skins and Canada also bought heavily.

With the close of this sale more than half of this season's crop of African Persian lamb—estimated at 2½ million skins—has been sold. The new season's lambs reach this country in time for the September auctions and large quantities are offered in September and October. Output of African Persian lambs has increased sharply since the war and now accounts for more than half the world total.

Life Assurance Business

The Standard Life Assurance Company, whose accounting year (unlike that of nearly all the other life offices) ends on November 15th, has announced record new life assurance business for 1951-52. Net new sums assured amounted to £34.0 million, an increase of 17½ per cent on the previous record of £28.9 million set up in the previous year. The Standard Life is one of the leading offices in staff life assurance and pension schemes; £14,288,000 of last year's new sums assured took the form of group life assurances, compared with £12,454,000 in the previous year. Deferred annuities issued last year under group pensions contracts (figures for which are not yet available) almost certainly exceeded the 1951 record total of £6.3 million per annum by a considerable margin. The Standard Life is also one of the half-dozen United Kingdom offices that transacts a substantial volume of new ordinary life assurance business overseas. Its proportion of overseas to total new business has been rising. In 1950 (the last year for which figures are available) the proportion was 24 per cent; in 1951 and in the year just ended there was probably a further increase. When the 1952 figures for most of the remaining life offices are published in the first few days of January it will probably be found that the year's new business of some at least was less buoyant than that of the Standard Life; there are indications that although new life assurance and deferred annuity business under staff schemes has continued to expand strongly, new individual life assurance policies were less easy to sell in the United Kingdom during 1952 than in previous years.

Release of French Sterling

A development that may be fraught with considerable symbolical significance for the sterling exchange market was announced last week when the Bank of England informed the market, through the Foreign Exchange Committee, that approval would be given to applications (up to an agreed limit) for the release of French-owned blocked sterling.

INDEX

The Index to *The Economist* is now published quarterly. Subscription rates are 5/- a year; single copies are priced at 2/- each. The Index to Volume CLXIV (July to September, 1952) is now available from:

The Publisher, 22 Ryder St., St. James's, London, S.W.1

Henceforth any blocked sterling in French ownership—that is, both the proceeds of capital transactions that have already taken place and the proceeds of any future sales of sterling securities by French residents—will be eligible, subject to permission from the Bank of England in each case, for transfer into a French account. After transfer, such sums will become available for normal commercial transactions. There have been certain special occasions in the past when, through the discretionary administrative action of the Bank of England, blocked sterling has been transferred into a non-resident account available for current payments. More recently, too, the Bank of England has given permission to some security operations that have caused "switch" sterling to be transferred to the account of a resident in the sterling area (who, of course, can use it as he likes). But this concession to the French is the first general ruling provision that has been made for conversion of blocked sterling into non-resident sterling accounts available for current payments. It is true that the congenial distrust of Frenchmen for their own franc means that the consequent strain upon the British economy is unlikely to be large. There may be some sales of French-held sterling securities already notified to the French authorised banks; but the greater part of the privately held French sterling securities is in the name of trustees—in bearer form or otherwise hidden from the French authorities. These are unlikely to be flushed from their hide-outs by the promise that the resultant sterling can be used by those who have French import licences to buy British goods.

The Bank of England's action is mainly intended as a neighbourly gesture. France is now as short of sterling as it is of other currencies; it has exhausted its EPU quota and any commercial sterling it can acquire will save it from paying gold to the Union. But it is doubtful if Britain's neighbourly feelings would have been translated into this action if the Exchange Control authorities had not felt it desirable, on other grounds, to make such small steps as they can in the direction of greater freedom, and towards the ultimate creation of a single and homogeneous type of external sterling.

Zinc and Exchange Control

Banks and metal exchange firms have been notified this week of the exchange control arrangements that will come into force when free dealings in zinc are resumed at the beginning of January. These follow the pattern of the arrangements already in force for free dealings in tin and lead. Participants, who must be members of the London Metal Exchange, will be allowed to make purchases of zinc in any part of the world, and will be provided by the import licensing branch of the Board of Trade with the necessary authorisation to import that zinc into the United Kingdom. They will also be entitled to hold stocks of zinc in any part of the world for their own account, or for account of another participant, but not for the account of any other resident of the scheduled territories. The usual foreign exchange control formalities will have to be observed and the necessary forms filled, but these will not hamper the freedom of dealings or the freedom with which participants will be allowed to make payments into or out of their "metals scheme account (zinc)." All payments and receipts directly connected with purchases, sales, storage and movements of zinc, will have to be centralised in these particular accounts, which will be open to inspection by the Exchange Control at the Bank of England, and the participants themselves will be required to make separate confidential monthly returns to the Bank of England showing their transactions in detail. It is understood that all books and documents relating to zinc transactions under the scheme must be available for examination by the Bank of England, if it asks to see them.

Reminder by the

NATIONAL COAL BOARD

Don't forget you can now have
as much Nutty Slack coal as you like
off the ration

20/- a ton (1/- a cwt.) cheaper than ordinary house coal

You can now buy as much Nutty Slack as you like

It's off the ration. Nutty Slack is much smaller coal than you are used to, but it burns brightly and warmly if you mix it sensibly with your ordinary house coal.

For open or closed fires

It is good fuel to use in an open fire or an openable heating stove, mixed with your ordinary house coal. It is perfect for banking up your fire at night or when you are going out. It is particularly useful in a modern continuous burning grate.

Order as much as you like

You can buy it from your own or any other coal merchant and you can have as much as you like all through this winter. But don't wait till all your ordinary coal

allowance is finished before you buy Nutty Slack. Order your Nutty Slack this week in time for Christmas. Use it with your ordinary house coal and make sure you get through the winter in comfort.

NOT AVAILABLE IN SOME AREAS

Nutty Slack will not be available in Scotland, South Wales, Cumberland, Durham and Northumberland, but in these areas other off-the-ration coal may be available.

What is Nutty Slack?

Nutty Slack is just what it is called—slack with nuts in it ranging in size up to lumps about as big as two match boxes put together. Your coal merchant will show you Nutty Slack and tell you how to make the best use of it.

It is just as expensive to mine and to carry on the railways as ordinary house coal. But it is offered at 20/- a ton cheaper than ordinary (Group 4) house coal because it is not as clean and is smaller.

Nutty Slack

will help to keep the home fires burning
however cold and long the winter

A large-scale enquiry carried out this year for the Coal Utilisation Council shows that:—

1. 98 out of every 100 families in Great Britain have a coal fire of some sort in their main living room.
2. 84 out of every 100 families have no other way of heating that room.
3. 44 out of every 100 families say they need more coal than they are allowed.

Nutty Slack will help

BARBER TEXTILE CORPORATION LIMITED.

Is your livelihood in danger?

you may be insured against fire but no insurance can replace the vital contents of your records. For many businesses, fire can mean overnight ruin.

Could this be you? Arriving at work one morning, to find only rubble and warm ashes. To find accounts, receipts, records reduced to charred indecipherable fragments. Years of hard work perished. Anxious years of recovery ahead.

There is no certain means of preventing fire.

There is a way of knowing that your vital documents are safeguarded.

Record Protection Cabinets are made by Chubb to give fire protection to all kinds of business systems. Rigorous tests prove their resistance in actual fire conditions.

Unless your records are as safe as this, send for further details of Chubb fire-resisting equipment for your particular needs.

CHUBB & SONS LOCK & SAFE CO. LTD. 40-42 OXFORD ST. LONDON W.1

Most products belong to the mass market, these days

DAILY MIRROR

THE HIGHEST DAILY NET SALE IN THE WORLD

Mine don't.

No? Then what kind of people are you after? The mass market covers all classes and all income groups.

But the vast majority are plain working class, surely?

Exactly. And, believe you me, some of them are making pretty good money and in any number of cases there are two or more wage earners in the family. Usually they have little or no fares to pay. They have canteen lunches and many of them live in subsidised houses. It's no wonder they're the people with the money to spend.

How do you get at them?

Well, I'm doing it through the Daily Mirror.

The Mirror, eh? It's hardly my favourite paper. I don't read it.

I don't read it myself. But over four million, four hundred thousand people do. If you can afford to ignore them, I can't.

What about cost of space?

On a square inch per thousand basis it's the lowest of all national dailies.

Are you certain?

Quite certain. I was doubtful myself at first but my advertising agent soon put me right.

Company Notes

Arthur Guinness.—A slight increase in beer consumption in the year to September 30th, coupled with higher prices, has produced a remarkably consistent array of trading results from the breweries. Almost without exception those that have recently published their accounts have shown increases in gross trading profits but, thanks to a bigger tax bill, little change in net profits. Most of them have, therefore, been content merely to maintain their ordinary dividends. The results of three "national" breweries—Ind Coope, Bass, and now Guinness—have conformed to this pattern. In the year to September 30th the net profits of the Arthur Guinness group increased only slightly, from £1,836,112 to £1,886,381. The increase in the net profits of the parent company—by a mere £3,555 to £1,798,569—was even

Earnings:—	Years to Sept. 30, 1951	1952
Profit, before tax	4,962,511	5,082,292
Depreciation	347,017	361,939
Taxation	2,820,480	2,921,784
Net profit	1,795,014	1,798,569
Ordinary dividends	1,102,500	1,115,625
Ordinary dividends (per cent)	28a	17b
Contingency reserve	400,000	400,000
Added to carry forward	33,709	16,992

smaller; its gross profits rose from £4,962,511 to £5,082,292, but its provision for taxation had to be increased from £2,820,480 to £2,921,784. This disappointing result has meant that the directors of Guinness, in company with directors of Bass, have not been able to restore the cut that was made a year ago in equity payments. The dividend of 17 per cent that they have now recommended is the nearest round equivalent, once account has been taken of the recent bonus issue of shares, to last year's dividend of 28 per cent; two years ago a dividend of 32 per cent was paid on the old capital.

Brewery Profits.—The trading results of six of Guinness's smaller competitors—all of them results for the traditional brewing year to September 30th—are summarised in the accompanying table. They make up a very uniform pattern. All of them report some increase in gross trading profits, mostly for the second year in succession. A year ago the advances in earnings could largely be attributed to an increase in the price of beer, but this year they mainly reflect a genuine expansion in sales. This increase in sales has been particularly marked in bottled beers, in which the "local" brewers are taking a greater interest. In this respect, the fully documented accounts of Joshua Tetley can serve as a

Profits and dividends:—	Years to Sept. 30, 1950	1951
Ansells:—

Joshua Tetley:—		
Trading profit	735,665	766,519
Net profit	192,924	193,630
Ordinary dividends (per cent)	16½	16½

typical sample for the whole industry. In the year to September 30th sales by the Tetley brewery of cask and bottled beers increased both in volume and value, so that the com-

pany received £6,284,857 from its sales, compared with £5,840,319 in 1950-51; this increase in turnover more than offset the continuing increase in costs.

The brewers' doubts about the future are put very clearly by the directors of Brickwood. They remind shareholders that "With the exception of malt, there would appear to be little reason to suppose that brewing materials . . . will become cheaper. The mounting evidence indeed points the other way. The effects of these constant price changes cannot be foreseen, nor can the level of trade for the year to September 30, 1953, be forecast." These doubts, coupled with the fact that taxation has absorbed much of the increase in gross profits, explain why the majority of the brewers have pursued a conservative dividend policy. Thus four of the six breweries shown in the table are recommending the same payments as a year ago, while a fall in net profits has forced the directors of H. and G. Simonds to cut the ordinary dividend from 24 to 22 per cent. The directors of Brickwood—one of the very few breweries to raise its ordinary dividends this year—are careful to explain that the increase in dividend should be regarded "not as an earnest of things to come, but rather as a recognition of a satisfactory result in the particular year under review."

Joshua Hoyle.—The recent accounts of Lancashire cotton spinners—like those of the breweries—have also had a consistent story to tell. But their story has been a much gloomier one—of smaller sales, smaller profits and smaller dividends. The accounts of Joshua Hoyle for the year to September 30th prove to be no exception. In that year the group's gross trading profits and its net profits were both halved—trading profits from £2,245,098 to £1,031,245 and net profits from £863,541 to £417,852—and the ordinary dividend was cut from 20 to 15 per cent. Thanks presumably to the accumulation of unsold goods on the shelves, the book value of stocks has risen from £4,318,536 to £4,686,187; this increase in stocks has been accompanied by its usual corollary, a decline in the group's cash balances (from £563,284

Consolidated earnings:—	Years to Sept. 30, 1951	1952

to £370,039). It is fair to say, however, that—despite a year of very difficult trading conditions—the group's financial resources have not been strained as severely as those of many of their competitors in the cotton trade.

The directors have submitted for shareholders' approval a scheme to reorganise the trading and manufacturing structure of the group. The directors believe that this reorganisation would give rise to certain administrative and technical economies. Perhaps a more pressing motive, however, is that it would have considerable tax advantages; in view of the reduction in profits that took place in the year to September 30th, the

Statistical Summary

EXCHEQUER RETURNS

For the week ended December 6, 1952, total ordinary revenue was £60,155,000, against ordinary expenditure of £82,739,000 and issues to sinking funds £1,660,000. Thus, including sinking fund allocations of £23,310,000 the deficit accrued since April 1, 1952, was £423,709,000 compared with a deficit of £98,710,000 for the corresponding period of the previous year.

COMPANY MEETINGS

FISONS LIMITED

STOCKPILING AND OTHER FACTORS AFFECT PROFITS

GOOD AUTUMN DEMAND FOR FERTILIZERS

MR F. G. C. FISON ON THE FAVOURABLE PROSPECTS

The fifty-ninth annual general meeting of Fisons Limited was held on December 5th at Felixstowe, Mr F. G. C. Fison, the chairman, presiding.

The following is his statement, which was circulated with the report and accounts:

As I informed you last year, Mr Walter Packard retires after the annual general meeting, having completed fifty years with the company. We wish him many happy years in his retirement.

THE ACCOUNTS

The consolidated trading profits of the group, after providing for the ordinary expenses of the business, have declined from £1,901,631 to £1,602,958. Included in these figures are the trading profits of the British Chemicals & Biologicals Group, which amounted to £157,333 compared with £221,071 in the previous year.

During the first half of the year the prices of our raw materials were still rising, but during the second half of the year, and especially during the last three months, prices began to fall. There was some profit on stocks during the first period but a very considerable loss in the second period. We have written down our stocks of raw materials and manufactured products at a cost of approximately £300,000. The value of stocks carried at the end of the year was £4,968,080, and in relation to this amount the depreciation is not excessive, particularly bearing in mind the very severe declines in freight values and prices which occurred towards the end of the year under review. I should mention also that the Board decided some time before the end of the year that manufacture of superphosphate should continue at a level higher than justified by sales, in spite of the tendency of raw material prices to decline.

This decision was taken because of the availability of sulphuric acid, which had been a limiting factor on the company's production in the previous year and at the beginning of the year under review. There was, and still is, no assurance that sufficient acid will be available to meet all the company's requirements for the current year, and in the event this decision has already proved justified by the exceptionally heavy demand for fertilizers in July and August, a demand which is still continuing at the present time.

BURDEN OF TAXATION

The profits were also affected by the stockpiling of fertilizers by our customers which took place during May and June, 1951, and to which I referred last year, and which inflated the profits for the previous year and correspondingly decreased the profits for the year ended June 30, 1952.

I should be failing in my duty if I did not emphasise the serious effect upon industry of the present burden of taxation. In all industries retained profits are essential for development, and this is especially true of the chemical industry, where improved techniques are constantly being introduced and where new products are constantly replacing the old ones.

It will be seen from the consolidated balance sheet that the Group's cash resources

at June 30, 1952, amounted to £859,000. Our cash position was greatly affected by the high value of manufactured stocks carried at that date, which was largely due to our decision to continue production at our factories in spite of a falling off in sales at the end of the year. These stocks have for a great part been sold in the first few months of the current year, and our cash position has improved accordingly.

FERTILIZERS

Comparisons of the total sales of fertilizers in the British Isles for the past three years were given by the Minister of Agriculture in the House of Commons on July 25th last, as follows:

	Tons
1949-50	4,316,000
1950-51	4,027,000
1951-52	3,182,000 (estimated)

In our view the usage of fertilizers by the farming community does not correspond to these figures, for in the first two years, while the subsidy was in process of removal, there was considerable stockpiling by farmers and the stocks were used in the last year. The actual consumption of fertilizers, therefore, may not have fallen very much.

Although the major part of our business is in superphosphate and compound fertilizers for agriculture, a substantial contribution to our profits came from our interests in Corby Basic Slag Limited, and Nitrogen Fertilizers Limited, while our horticultural trade also showed a substantially increased profit. The results of Corby Basic Slag Limited were particularly satisfactory, since sales of high-grade basic slag were not affected by the general decline of demand to the same extent as other fertilizers. The arrangements agreed with the Government consequent upon de-subsidy also placed our basic slag business on a more satisfactory footing. Under the previous arrangements producers of low grade slag had been heavily subsidised by high grade producers such as Corby Basic Slag Limited, but in the new season prices were placed on a more realistic basis, with a consequent advantage to ourselves. In the current year the only remaining Government control other than that of selling prices—namely, purchase of imported basic slag on public account—has also been removed, and the industry is now free to negotiate with foreign suppliers on a commercial basis.

RELAXATION OF CONTROLS

I refer in subsequent paragraphs to the decontrol of raw materials, but during the year under review we were also released from the very close Government control over a number of aspects of our business. In all these complex arrangements the trade was responsible for putting forward plans for taking over responsibilities previously assumed by the Government, and there was considerable anxiety in some sections of the trade as well as on the Government side as to the outcome. In fact, there were no serious difficulties.

The only major difficulties encountered during the year were due to a failure on the part of both Government and industry to appreciate the extent of the stockpiling which

had been made in previous years and the effect of steep rises in selling price consequent on the removal of the subsidy in checking the steadily rising consumption of fertilizers in previous years. It is clear also that Government agricultural policy which had tended to reduce the farmer's margin of profit had a serious effect on his willingness to purchase fertilizers. There is no doubt also that the farmer, in common with industry, experienced difficulty in finding sufficient working capital with constantly rising prices.

REINTRODUCTION OF SUBSIDY

The reintroduction of a substantial subsidy on phosphatic fertilizers by the new Government did not increase demand to the extent which, no doubt, the Government anticipated. Although the Conservative Party had announced its intention of reintroducing the fertilizer subsidy before the Election, it was, in fact, only in the latter half of the season that actual details were approved by Parliament and published. The fertilizer industry itself was by no means wholly in favour of the reintroduction of the subsidy, particularly if it had involved the same type of Government control as under the former subsidy arrangements. The present subsidy is, however, paid direct to the farmer, and not to the fertilizer manufacturer, as formerly.

The usage of fertilizers in this country is still much below the optimum, in spite of the steady increase which has been characteristic of the last 20 years, and more particularly of the war and postwar years. Anything which assists in increasing the consumption of fertilizer by the farmer is therefore to be welcomed from the national standpoint, as well as from that of our industry. At the same time, it is possible to doubt whether the application of subsidies is in the long run the best method of achieving this. The object, no doubt, is to direct the farmer's expenditure into certain channels, rather than to give them the benefit of higher produce prices, irrespective of the purpose to which the resulting income is devoted.

While the fluctuations in price due to the removal of the subsidy as well as other aspects of the previous Government policy had an unsettling effect on the farming community, there is no doubt that fertilizer consumption would have continued its upward trend if the farmers' income had been brought into the proper relationship with costs. On the whole, it could be contended that it would be sound policy to rely on propaganda by the Government and fertilizer industry to increase the sale of fertilizer rather than on marginal changes in price relationships.

MAXIMUM INITIATIVE DESIRED

I think that both the farming community and industry would probably agree that, while some direction and control by the Government is inevitable in the present national circumstances, this direction should be as broad as possible and leave the maximum initiative to the individual farmer and manufacturer. Changes of detail affecting this or that commodity make it difficult to plan for the future with any security.

Such long-term planning is particularly

necessary in the case of the fertilizer industry, in view of the large size of the installations and the consequent inevitable delay between the decision to provide further manufacturing capacity and the availability of new production to the farming community. The industry would, therefore, welcome some announcement by the Government in regard to its longer-term plans, so that the necessary supplies of fertilizers may be available to meet increased demand.

FERTILIZER FACTORIES

We have continued to maintain our factories in good working order. We have made significant technical and operational improvements as a result of investigation and research carried out within the company, and we have many other investigations in hand which we hope will prove valuable in the future. At Immingham, which has not operated at full capacity due to the shortage of sulphur, we have overcome a number of teething troubles which normally arise in a factory of this magnitude and type. We have made a number of technical improvements and are producing a product of high quality which is already being appreciated by the agricultural community, as are also our high-grade compound fertilizers based on triple superphosphate.

Our relations with the trade unions continue to be satisfactory and I would like to express my appreciation of the work of all our employees, whose welfare we have very much at heart.

Advisory Services.—Our advisory services have been fully utilised and much appreciated by merchants and farmers during the past year. The demands on this department have increased beyond its capacity, and it is intended to augment the staff so that a prompt and efficient service can be maintained.

RAW MATERIALS

I noted in my review last year that although the industry had put forward detailed schemes for the reversion of key raw materials to private purchase, the then Government had not felt able to release them in the difficult conditions obtaining at the time. The trade was notified, however, by the present Government that it was their intention to release these materials at the beginning of the season 1952-53, and detailed negotiations resulted in arrangements being agreed for the reversion to private purchase of phosphate rock and potash.

In the case of the former commodity, the rather unusual step was taken by the industry of forming a private buying agency to act on behalf of the whole of the fertilizer industry of this country. The reasons leading to the formation of the company were chiefly that in the absence of some close collaboration between purchasers, much larger stocks of rock would probably have been required, and it was doubtful whether the industry was in a position to store the necessary quantities. It was believed that collaborative purchase would provide more flexibility of supply, particularly for the smaller consumers. The industry had also to bear in mind that in the present conditions of dollar shortage all supplies would be drawn from French North Africa, where the producers are grouped into one selling agency, The Comptoir Des Phosphates de l'Afrique Du Nord.

In the case of potash, the same considerations did not apply, and the trade secured the agreement of the Government that purchases should be on an individual basis in the current year. Both arrangements have proved satisfactory in practice, and the terms on which the industry is now buying are believed to compare favourably with any which the Government would have negotiated in similar circumstances. Our company benefits

from freer trade in these commodities, as it is particularly well equipped to buy large quantities of materials and to handle them in the most economic way.

SULPHURIC ACID

In my review last year I commented on the adverse effects of the shortage of sulphuric acid on the company's business. In the year under review, due to the general recession in demand both here and in the United States, particularly in the rayon industry, the supply of sulphur and sulphuric acid was adequate over all. During the first half of the year, however, acid was in short supply and continued to be diverted from our Avonmouth plant, a particularly unfavourable feature which I commented on last year, but during the course of the year the Government relaxed their control to a considerable extent, and larger supplies of acid were made available to us.

It was unfortunate that owing to miscalculations on the part both of Government and industry, the demand for superphosphate was over-estimated and the supply of acid under-estimated. The result of this was that when substantial quantities of acid became available, foreign superphosphate purchased on contract continued to be imported and, indeed, Fisons felt obliged to honour its commitments to take up imported superphosphate, although the same material could have been manufactured in our own works.

Throughout the year the allocation of sulphur to our triple superphosphate plant at Immingham was restricted to two-thirds of capacity, but in the event this allocation was adequate to demand. Although the supply position for sulphur at the present time is much more favourable than I reported in my last review, the outlook as regards our own supplies is not entirely reassuring. In the first place, the United States Government, while relaxing domestic control considerably, is still allocating sulphur for export; and, secondly, the foreign exchange position of this country appears to require that other materials, if available, should be used in preference to sulphur from dollar sources. For these reasons the sulphur allocation for our Immingham plant is much below requirements, and this may continue to be the case, particularly if there should continue to be a surplus of acid from plants not consuming elemental sulphur.

In view of the dependence of our Immingham plant on sulphur, we have continued to follow the world supply position with the closest attention. It has become increasingly clear that while there is unlikely to be any absolute shortage of sulphur, elemental sulphur as such will not at any time in the foreseeable future revert to its former position as the cheapest available material for acid manufacture. The Government has rightly refused to allow the conversion of further plants to pyrites, in view of the undesirability of the country as a whole becoming too dependent on this material, and a proportion of the acid requirements of the country will therefore continue for some considerable time to depend on the supply of elemental sulphur. It is clear, however, that in the future anhydrite will assume an increasing importance as a raw material for the manufacture of sulphuric acid, and we have already taken a considerable interest, as I reported last year, in the United Sulphuric Acid Corporation, which will produce 150,000 tons of acid from this indigenous material. The cost of acid, however, produced from this material is relatively high by prewar standards, and the fertilizer industry is therefore turning its attention increasingly to materials other than sulphuric acid for the treatment of phosphate rock. There is increasing interest in the use of nitric acid for this purpose, and this tendency is noticeable even in the United States, where materials for sulphuric acid manufacture are

more abundant and cheaper than in this country.

With the exception of our Immingham plant, the acid supply now available to us appears adequate to our requirements, however, and, in particular, the Government has restored to us the whole of the acid which we obtained under contract at our Avonmouth plant. While there appears to be some grounds for thinking that the superphosphate industry may receive somewhat more favourable treatment than in the previous year, undue optimism in regard to the acid supply for the remainder of the current year would be premature.

NORTH-EAST YORKSHIRE POTASH

The completion of our fourth bore in North-East Yorkshire within the next month will conclude our drilling programme. Results from the latter bores have confirmed our early expectations of extensive deposits of potassium salts and, in conjunction with Imperial Chemical Industries Limited, a report describing our findings has been submitted to the Ministry of Materials.

The winning of potash from 4,000 feet below the surface presents some unique problems calling for expert advice, and we therefore commissioned Powell Duffryn Technical Services Limited to prepare a report on the mining of the Yorkshire potash. This report has been received, and is now being considered.

ASSOCIATED FERTILIZER COMPANIES

I am glad to be able to tell you that our Associated Companies in Canada, South Africa and Rhodesia have all increased their sales and profits substantially during the year. South Africa, with the exception of the Western Province in the Cape, is now suffering from the effects of a serious drought which has caused many losses in crops and livestock. In Natal the sugar crop has been seriously affected. At the time of writing this report Mr P. T. Chevallier is in South Africa, and has informed me that the Board of our South African company anticipates a satisfactory year in spite of the drought.

In Rhodesia, where weather conditions are satisfactory, we have formed a new selling company, Central African Fertilizers Limited, jointly with African Explosives and Chemical Industries (Rhodesia), Limited, which will cover the sale and distribution of fertilizers in Southern and Northern Rhodesia and Nyasaland. It is expensive to maintain separate selling organisations in these territories, and the formation of a joint company will undoubtedly lead to the cheaper distribution of fertilizers, which will be to the advantage of the agricultural community.

BRITISH CHEMICALS & BIOLOGICALS LIMITED

A proposal is being submitted at the annual general meeting to change the name of the company to Fisons Chemicals Limited. The present name is rather cumbersome and, in addition, it is thought that a direct association with Fisons will be of benefit, especially in the export market.

The decline in profits shown by the accounts arose entirely on that side of the Group's business dealing with pharmaceutical fine chemicals. In my review last year I drew attention to the fact that stockpiling, due to the Korean crisis, was responsible for a substantial part of the increased sales; this continued during the first half of the current year, but in the second half of the year there was a very steep fall in turnover, due to the running down of stocks by customers, whilst some prices were also severely affected by increased competition in the export market, particularly from German suppliers. The

market is still affected severely by foreign competition and the large stock carry-over, but there are now some indications that stocks in the hands of customers are becoming exhausted.

In other branches of the Group the year was one of continued progress, in spite of the more difficult conditions obtaining in the latter half, the sales of proprietary products, ethical medical specialities and milk products reaching new high levels. Although profits were to some extent affected by very steep rises in raw material prices in the first half of the year, the businesses concerned all showed improved results. Export sales of fine chemicals and medical specialities also showed very satisfactory increases.

The turnover of the industrial fine chemical department increased at a rapid rate in spite of the general recession in chemicals, and in particular we supplied large quantities of hydrazine, of which chemical Genatosan Limited is the only manufacturer in this country, for the manufacture both here and in the United States of America of iso-nicotinyl hydrazide, the new anti-tuberculosis drug.

RESEARCH

In the fertilizer field our company has recognised the need to carry out its own research work as well as to take advantage of the work done in Government-aided research establishments. Only on the basis of first-hand experience by its own scientific staff can a large industrial organisation keep in the forefront of progress and equip itself to shoulder the risks involved in new ventures and techniques.

A prime function of a research organisation is to establish the basic scientific facts on which plans for further development should be based. And in this period of restricted capital expenditure it is more than ever necessary that large and expensive projects should be backed by carefully scaled preliminary experiment.

It is the intention of the company further to expand its facilities for research on the fertilizer side to include both short-range and long-range objectives and to equip itself with additional laboratories, pilot plant facilities and experimental field plots sufficient to give a conclusive trial to any of the company's products.

WORLD SHORTAGE OF SULPHUR

The world shortage of sulphur has stimulated interest in all forms of phosphatic fertilizers which offer prospects of economy in the use of sulphuric acid. Among possible alternatives to superphosphate the nitrophosphates are of considerable importance, and our research laboratories have continued the study of their properties and methods of production. In collaboration with Rothamsted Experimental Station we are taking part in a comprehensive series of field trials to ascertain their agronomic value in different parts of the country.

Research continues on the recovery of sulphur from the gypsum filter cake produced at Immingham as a by-product of triple superphosphate manufacture. This important possibility is still some way from an economic solution.

THE PHARMACEUTICAL SIDE

On the pharmaceutical side of our company's business sustained research in the field of "blood plasma substitutes" has been rewarded by marked success. An eminent surgeon has said: "Narrow-fraction dextran will revolutionise supportive therapy and may be regarded as one of the major advances of the year." In the solution of the

many fundamental and technical problems associated with dextran, Benger's Research Laboratories have been pre-eminent.

In fine chemicals the research laboratories continue to do basic work on a number of new products, and in particular have given much attention to hydrazine and its derivatives. It is becoming realised that derivatives of hydrazine are likely to have important industrial applications in the future, and our company is taking steps to secure full advantage from the pioneering work which it has done in this field. Close liaison is being maintained with corresponding research work now in hand in the USA.

GROUP WELFARE ARRANGEMENTS

We are—justly, as I think—proud of the welfare arrangements provided by the company for its employees. Our first pension scheme was introduced in 1935, and provided for pensions on retirement for both staff and the weekly wage earners in our factories. In 1938 life assurance benefits were added to provide for the widows of married employees who died before retirement. In 1939 a contributory sick pay scheme was introduced, providing benefits for wage earners absent from work as the result of illness or accident. In 1945 a comprehensive pension scheme was introduced for the Group to supersede the various schemes in operation in a number of our subsidiary companies. Under this scheme the section dealing with the staff remains on a contributory basis for future service, but the company bears the whole of the cost of pensions for wage earners. The cost of all pensions in respect of service previous to the introduction of the pension schemes is borne by the company.

As you are aware, there have been substantial changes both in the value of money and in average earnings during the intervening years. The Board has recently reviewed all our welfare arrangements and has authorised extensions to existing schemes, the most important of which concerns the pensions of weekly wage earners which have been brought more into line with current wages, and from the beginning of next January all these pensions, including those being paid to former wage earners, will be increased by about 60 per cent. For the staff we are proposing to introduce next April a contributory widows pension scheme to provide a life pension to widows of those of our staff who die before retirement date.

We also propose next year to complete our welfare arrangements by the introduction of a benevolent fund for both staff and wage earners, the cost of which will be borne by the company, so that provision may be made to assist those difficult cases that occur from time to time and which are not adequately covered by any of our existing schemes.

The contribution of the company to these various funds will amount to about £119,000 per annum. The capital invested by the Trustees of the Funds has now reached £563,000 and the pensions at present being paid are at the rate of £42,000 a year.

STAFF

A little more than a year ago we set up a Personnel Department for the Group and appointed Captain John Terry, CBE, RN (Retired), to take charge of it. The number of persons employed by our company is just over 5,000 excluding those who are working in our associated companies overseas. The value of the Personnel Department has been quickly appreciated, especially so since our organisation is dispersed in so many centres throughout the country.

We are fortunate that such a splendid

spirit exists throughout the staff, and I should like to take this opportunity of thanking them all for their work during the past year.

THE FUTURE

So long as it is in the national interest to produce the maximum amount of food at home, and this state of affairs seems likely to last for a good many years, and so long as farmers are given a stable long-term policy to which to work, it seems probable that the consumption of fertilizers should continue to increase. Our company is in a good position to take advantage of this. During this autumn there has been an exceptionally good demand for fertilizers, and as far as we can judge this is likely to continue in the spring, and we are therefore planning for a considerable expansion in sales. If our forecast is correct—and, naturally, it depends upon a number of external factors over which we have no control—then we can look forward to better results during the current year.

On the chemical side of our business we are also hoping for steady improvement as we build up our organisation and begin to reap the benefits of our research. It is because we have some confidence in the future that we have decided to recommend a modest increase of 1 per cent in the dividend on our Ordinary stock.

The report and accounts were adopted.

BRITISH ASSETS TRUST, LIMITED

The fifty-fifth annual general meeting of the company was held at Edinburgh on December 11th, Mr Alaister C. Blair, chairman, presiding. In moving the adoption of the report and accounts, the chairman said:

Our income has risen each year for the past ten years with the exception of the years to January 15, 1949 and 1950, which were affected by the sale to our stockholders at a very favourable price of our holding of Second British Assets Trust, Limited, ordinary stock. This past year's income has reached a further record figure, but our tax burden has greatly increased, and in view of recent trends, both here and in America, we expect a reduction in income during the current year. We are therefore recommending the distribution of a smaller proportion of our income than usual, so as to limit the ordinary dividend to a rate we hope to be able to maintain.

The company's tax position, both as regards profits tax and double taxation relief, has become more definite during the year, and we have accordingly decided, in order to facilitate comparison for the future, to charge profits tax, which this year has become payable for the first time, against revenue account, rather than provide it from tax reserve.

During the year the ordinary capital was doubled by capitalisation of part of the general reserve. To bring this reserve up to £500,000, the directors have transferred £100,000 from tax reserve and contingent fund and £68,562 from revenue account. These changes are shown in the balance sheet.

The valuation of our investments shows a decline on the year of only 6 per cent, which may be considered satisfactory. The appreciation over book value at September 30th was slightly over 55 per cent. As usual, no credit was taken in this valuation for the premium ruling in London on dollar securities.

The report and accounts were unanimously adopted.

THE PLESSEY COMPANY

(Electrical and Mechanical Engineers)

INCREASED PRODUCTION VOLUME

TAXATION A MAJOR INDUSTRIAL PROBLEM

SATISFACTORY VOLUME OF FORWARD ORDERS

MR A. G. CLARK ON DOMESTIC RADIO

TRADING DIFFICULTIES

The twenty-eighth annual general meeting of The Plessey Company, Limited, will be held on December 30, 1952, in London.

The following is the statement by the chairman (Mr A. G. Clark) which has been circulated with the report and accounts:

The accounts to June 30, 1952, which are now submitted to you, reflect the results for a year during which the volume of production, somewhat increased over that of the year before, was free from violent change, declining volume in one or two directions being at once rather more than counter-balanced by increased volume in others. In consequence of the economies in operation which can be obtained when we are free from undue fluctuations in volume and from radical changes in the nature of the work on which we are engaged, our consolidated profit before taxation is some £247,000 higher at £344,978.

However, the incidence of taxation in these days is such that we have to provide over £600,000 for the various taxes we have to pay, so that the net profit available after taxation is about £30,000 higher than last year at £234,190.

TAXATION PROBLEM

It has been my habit over recent years to devote the greater part of my statement to reviewing the more important of the factors which have affected our business during the year, and if today comment upon this matter of taxation bulks largely in my statement on the year's progress, it is because I believe taxation has become the one problem which overshadows all others in relation to the industrial future of this country.

The growth of our own company in the past was largely financed by ploughing back into the company a large part of the profits earned, but taxation is now taking so large a share of profits that, even at the end of a successful year so little remains to be ploughed back that expansion has to be restricted.

The burden of taxation, and the necessity to formulate future plans in the light of the restricted means available to carry them into effect, tends to kill ambition and initiative and to create a sense of frustration which brings with it a general slowing-down of technical progress throughout the country.

There is, too, the ever-present problem of the replacement cost of plant and machinery being far in excess of the original values on which depreciation allowances are calculated for the purposes of taxation. When plant comes to be replaced it is therefore necessary to find considerable sums over and above those resulting from the accumulations of past depreciation, so that in these days of heavy taxation it is well nigh impossible to provide, out of profits on which the taxes have been paid, enough money to replace plant, let alone the money required to extend it.

EPL—A FURTHER ONEROUS BURDEN

And now, on top of our other burdens comes the excess profits levy. Although the

tax only applies to the six months' profit from January to June of this year it will cost us about £80,000 for the half year. It is resented the more bitterly because of the capricious way in which it falls, so that one business will escape the levy and another will incur it, and this for no reason which bears any true relation to the purpose for which the levy was said to have been devised.

The levy can, in some cases, be merely a tax on growth and development, and in these cases is bad enough. But in others it can take the form of penalising a business over some indefinite future period for the fact that in the standard years it was experiencing a difficult time and was making less profit than would normally be the case. Here the levy operates at its worst.

In our own case, throughout the last war we abandoned completely all commercial activities and devoted the whole of our energies to armament work. It was therefore necessary, when the war ended, to re-establish our commercial work from scratch, and the cost of so doing both in terms of actual cost and in terms of restricted output, meant that in the standard years our profits were far from a fair measure of our normal earning capacity from our usual work. For this, the penalty we shall pay will be taxation on a penal scale for an indefinite period.

If the present position is to continue much longer it needs no great ability as a prophet in order to foresee the ultimate consequences. Already we can see how progress is being stifled and businesses are being starved, because incentives are weakening and purses are emptying.

PURCHASE TAX

Before I leave the subject of taxation I would draw your attention to the economic consequences of the way in which purchase tax changes are linked with the Budget. Because the chances of any change in the rates of purchase tax being announced in the Chancellor's Budget Statement are many times greater than the chances of such change being announced at any other time, there has been a tendency over recent years for buyers to delay their purchases until after Budget Day in the hope that the tax will then be reduced. For two or three months before April, sales fall away and the smooth flow of production is disturbed. No serious constitutional problems would seem likely to be presented if the Chancellor would but decide, and declare, that whatever changes in purchase tax should be made from time to time, they would in no event be made in his Budget speech, but would be made at irregular intervals as and when they might be deemed advisable. If this were done, I believe that labour and production facilities could be employed to better advantage and that a considerable saving in manufacturing costs would ensue, because there would be no need for the hesitation now so noticeable as Budget Day approaches.

RAW MATERIALS AND SUPPLIES

In my statement to you over recent years I have frequently told you of the difficulties experienced in obtaining raw materials and supplies purchased from third parties. These difficulties eased very greatly during the year, so that the necessity to use substitute materials practically vanished and in general the supplies we had on order began to come through more quickly than we were able to use them. In consequence the problem of redundancy and obsolescence became very much greater than it normally would be, and for a few months stocks have tended to be at higher levels than we like them to be. We have, however, made full provision for redundancy and obsolescence in our accounts. Whatever our troubles in this direction, I can assure you that they cause us very much less difficulty and anxiety than did the task of endeavouring to maintain production when much of the material we required was obtainable, if at all, only on the basis of ordering it ten or twelve months in advance of requirements.

THE OUTLOOK

Turning to consider the prospects for the immediate future, we find that with the exception of domestic radio, the divisions into which the company is organised are busy, and are facing a satisfactory volume of forward orders. The radio industry, however, is passing through a troubled time, and inevitably that side of our business concerned with domestic radio is sharing the difficulties which the industry is experiencing. The main reasons for the lowered volume of domestic radio are the incidence of the high purchase tax and the restrictions on hire purchase facilities. So great a part of the sales of domestic radio were effected on hire purchase terms, that the present restrictions have had a most disastrous effect on retail sales, and I see little chance of real improvement until the present restrictions on hire purchase are eased.

The final dividend of 12½ per cent now recommended will make a total for the year of 25 per cent, as compared with 22½ per cent for last year.

The shareholders will, I am sure, desire to join me in an expression of our appreciation for the way in which the staff of the company has contributed, by its hard work and its loyalty, to the results which we are reviewing today.

RHODESIAN ANGLO-AMERICAN LIMITED

The annual general meeting of Rhodesian Anglo-American Limited was held at Kitwe, Northern Rhodesia, on December 10, 1952, Mr H. F. Oppenheimer presiding. He said: I should like to refer to a recent press announcement made by your company advising that a Petition had been presented to the United Kingdom Parliament for leave to introduce a Private Bill, with a view to securing the transfer of registration of your company and the others of the Group, from the United Kingdom to Northern Rhodesia.

Your company has, since the beginning of 1951, been managed and controlled in Northern Rhodesia where the whole of its business is carried on, whilst it continues to be a company incorporated in England. The present position is felt to be anomalous, and your directors therefore considered that your company should take active steps to finalise the removal to Northern Rhodesia of the companies of the group.

The Northern Rhodesia Government has been kept fully informed of the intention to introduce the Bill, which by its terms extends to Northern Rhodesia, and has accorded its full approval.

The report and accounts were adopted.

THE SCOTTISH AUSTRALIAN COMPANY

ADVERSE TRADING CONDITIONS

The annual general meeting of The Scottish Australian Company, Limited, was held on December 5th in London, Mr J. Norman Eggar (chairman and managing director) presiding.

In the course of his speech the chairman said:

We issued on July 1st an interim report on the state of affairs on our properties. From that report as well as from the warning I gave when we met last year, stockholders will not have been surprised that our earnings have been so much less than in the previous year. Nevertheless, we have been able to maintain our total distribution at 20 per cent for the second year in succession, to add £100,000 to our revenue reserve, and to increase the carry-forward to £151,000, and I think that is no mean achievement in all the adverse circumstances.

I suppose the drought in the Northern Territory and in North Queensland has been the worst within living memory, certainly it was more prolonged than any previous drought. We lost 12,900 head of cattle during the year in the Northern Territory, but that is not the worst part of the story. It has taken us years to build up a Shorthorn stud and herds, and the loss of breeders and calves will mean several more years of unremitting toil to rebuild both quality and numbers.

As regards our sheep properties, you will remember that Bowen Downs, Nive Downs and the Fernlee Group of Stations in Queensland, and Warrana in New South Wales, all suffered severely from bush fires in October last year. However, I am glad to say that most of the stations have made a good recovery and conditions are normal and healthy almost everywhere.

Our Riverina properties in New South Wales have only had a fairly successful year. The wheat harvest was nearly 5,000 bushels less, the oats harvest 1,000 bushels more.

During the last few months the wool market has certainly become more stabilised. It is almost certain that a wool terminal or "futures" market will be opened in London some time next year. It seems to me that it must make for the stability which every section of the trade wants.

THE ACCOUNTS

The first item calling for comment is the drop in the proceeds of wool and live stock accounts, the decrease in wool being £443,830 and in live stock £193,607. Our wool clip was less by 1,190 bales, and owing to adverse conditions the cut of wool per sheep was 2 to 3 lb less than normal. This was the general experience throughout Queensland. The natural increase was 30,000 lower than last year. Our stock of sheep at June 30 was 285,115, 31,000 lower. Our stock of cattle at just under 60,000 is down by 7,200. There were 15,300 deaths. We sold 16,304 head of cattle, during the year, and it is somewhat surprising, in view of the world demand for meat, that average prices at £11 11s. 2d. were 14s. 8d. less than in the previous year. Our revenue from wheat and other crops is some £5,000 up.

Taxation both in the United Kingdom and Australia is lower by reason of the reduced profit, but is still a most formidable item; in fact taxation absorbs 61 per cent of our profits.

The report was adopted.

THE ENGLISH, SCOTTISH & AUSTRALIAN BANK

LARGER PROFIT AND EXPENSES

The sixtieth annual general meeting of this company was held on December 10th, in London, the Hon David F. Brand (chairman of the company) presiding.

The following is an extract from his circulated statement for the year ended June 30, 1952:

In my report a year ago I wrote of the difficulties in Australia arising from the inflation which was caused in part from the high prices she was receiving for her exports, in particular wool. This situation had encouraged the importation in great volume of goods of all kinds, both of consumer and capital nature. The fall in the price of wool, almost as spectacular as its earlier rise, had commenced about April, 1951, and continued through the ensuing season, with the result that the overseas balances of the Commonwealth were diminishing rapidly as payments for imports were made. Finally, in early March, 1952, the Federal Government was constrained to impose severe import restrictions and to take other measures to conserve the falling overseas resources.

This action by the Government was inevitable, and although it caused some confusion and brought difficulties to distributors and exporters in the United Kingdom and elsewhere, there may be some negative comfort in the thought that without restrictions the result might well have been disastrous, equally damaging to exporters to Australia as to their customers in that country.

SIGNIFICANT FIGURES

The most significant movements in the year disclosed in the bank's balance sheet are the contraction in deposits and the rise in advances. Both are symptoms of the financial stringency existing at the date of the accounts. Deposits fell by nearly £10 million and advances rose by £12,856,000. These fluctuations were caused to a considerable extent by the need to support heavy stocks of imported goods, but since June the pendulum has started to swing back again.

It will be seen that share capital and reserves have increased by about £43,000 over the year, and now stand at £5,620,159. Cash in hand, bank balances, cheques in course of collection and money at call total £18,196,000, against £15,741,000 in 1951.

The balance-sheet indicates some relaxation of the Central Bank's control of trading bank affairs. In August last interest rates were permitted to rise slightly and, more recently, the Central Bank advance policy, which controlled bank lending, has been made less restrictive.

The gross profit at £3,580,337 is £553,407 greater than last year. This improvement, however, has been more than offset by the rise of £571,184 in the expenses of management, mainly caused by higher salary and wage rates.

After charging other expenses and taxation in Australia and London, the net profit available for distribution amounts to £237,520. The directors recommend a total distribution for the year of 10 per cent, less United Kingdom income tax.

The report was adopted.

In closing the proceedings, the chairman announced that to mark the bank's centenary year a special interim dividend of 2½ per cent, less United Kingdom tax, would be paid on January 19, 1953, to shareholders registered on December 31, 1952, as well as an appropriate bonus to all members of the staff, and to pensioners of the bank.

THE CANADIAN BANK OF COMMERCE

CONTINUED ECONOMIC DEVELOPMENT

MR JAMES STEWART ON COMPLEX PERIOD AHEAD

The annual meeting of The Canadian Bank of Commerce was held on December 9th in Toronto.

Mr James Stewart, CBE, president, said that the year might well be marked by the widespread and favourable attention from many sources that had been directed to Canada's industrial and commercial progress. Evidence of interest in Canada's economic development by people outside the country was reflected not only in the relative strength of the currency but also in the volume of foreign capital that was being invested in Canadian enterprises. Domestic confidence continued to be shown in the volume of investment in industry, in resource development and in research activities. In the aggregate the general business position continued to be favourable, yet the buoyancy was not uniformly reflected in the country.

In noting some of the vulnerable points, he wished to place due emphasis on the view that they were entering a period of increasing risk in business. Nevertheless, there was no need for pessimism provided the utmost efficiency was exercised.

While, as he had indicated, the distribution of their bounty had been uneven, the collective income had steadily increased to record heights, and the aggregate measure of productivity had surpassed the peak established a year ago. An estimate of gross national production for 1952 in the neighbourhood of \$23 billion did not seem to be unduly optimistic. That was more than a 7 per cent increase over last year, due to expanded production, price increases and very heavy agricultural harvests.

The ability of overseas markets to maintain, and expand, their purchases from the output of Canada's expanding economy continued to present difficulties. The vital interest which Canada had in foreign trade prompted them to follow closely the results of conferences now taking place. The influence of international changes could have great effect on their prosperity. He held the view, however, that the essential soundness of Canada's growth up to the present time, if reinforced by prudent management both by Government and business, could lead to further and favourable expansion.

GENERAL MANAGER'S REMARKS

Mr Neil J. McKinnon, general manager, said that a year ago stockholders were informed that for the previous nine months the banking system had been co-operating with the Government in a programme of credit restriction designed to counteract inflationary forces then prevailing. The programme as a whole exercised a moderating effect, but the influence on some lines was quite pronounced; consumer credit restraints, for example, contributed noticeably to a decline in sales of consumer durable goods. Beginning in the latter part of 1951, price-levels and the cost-of-living index showed a declining tendency, and in May of this year the credit restrictions were withdrawn.

While it was natural to expect an upward surge in consumer credit because of a hungry market created by the period of restraint, the volume in the short period of time since elapsed had increased rapidly indeed, and that had had quite a stimulating effect on retail sales. Experience in the past, however, had

indicated that under less buoyant conditions of employment or confidence the servicing of consumer credit became more burdensome, and business not only lost the stimulus of a rising credit volume, but also, during the period in which people were preoccupied with reducing debts, might well suffer a temporary lessening in current business. It was perhaps

appropriate at the present juncture to draw attention to that necessary although somewhat mercurial element in the credit structure.

Mr McKinnon dealt with the balance sheet changes and with the items in the profit and loss account.

The report was adopted.

MITCHELLS AND BUTLERS, LIMITED

SATISFACTORY YEAR'S TRADING

MR ROBERT H. BUTLER'S REVIEW

The sixty-fifth annual general meeting of the ordinary stockholders of this company was held in Birmingham on December 11, 1952.

Mr Robert H. Butler, in moving the adoption of the report and accounts, said:

Ladies and gentlemen,—In spite of our having to contend with increased prices of materials and higher wages, we have had a satisfactory year's trading, which includes a full year with Messrs Darby's Brewery. The sum of £200,000 has this year been put to reserve as it is our desire to provide the necessary finances out of our profits to cover the cost of replacement of our assets. Your directors feel this amount is barely sufficient for the purpose although it is an increase of £25,000 on the amount ploughed back last year. One would have hoped that in view of the fact that the Government is such a large participant in profits of industry (in the case of this company to the extent of over 60 per cent of the profits available for dividends) that they would be more acutely aware of the necessity for preserving assets in a profit-earning state, and to this end would revise wear and tear allowances to a basis more in keeping with present-day replacement costs.

SUCCESS OF NEW ISSUE

We are pleased to report that the issue during the year of 1,600,000 5 per cent preference shares was, in the opinion of our brokers, successful. Although a percentage was left with them the amount was considerably less than had been the case with other issues round about that time. Facilities were offered employees to subscribe, and it is a pleasing feature of the issue that 232 employees took advantage of the opportunity offered to them.

With regard to the higher cost of materials, I called the attention of stockholders to this item last year, but I am pleased to say the Brewers' Society have, since our last meeting, concluded an agreement with the National Farmers' Union under which minimum and maximum prices for barley have been fixed for 1952 and 1953, which will act as a stabilising influence on our purchases of barley and malt.

Our barrelage for the year has increased both in cask and bottle, which, I am sure you will agree, is very encouraging and is ample proof that the high standard of our products is being maintained to the satisfaction of our customers. With regard to our increased bottled beer sales, we have during the year installed two new pasteurisers with automatic packing machines, case and bottle conveyors. These modern machines have replaced our obsolescent plant, and will not only reduce the manual effort and make working conditions more attractive, but will, of course, reduce the cost of bottling.

The output of our wines and spirits department continues at a very satisfactory level, and although sales of spirits show a decline on last year's output, which was a peak year, sales of wines have shown a substantial increase.

SUBSIDIARY COMPANIES

As to our subsidiary companies:

As you know, we are very interested in improving the standard of hygiene in our licensed properties, and for several years we have been carrying out very valuable research, particularly in the question of glass washing, through the Robot Company. We have now decided to concentrate this research in our laboratory and retail management department, and have therefore decided to wind-up the Robot Company early in the New Year.

Our Highgate Walsall Brewery maintains its great popularity in Walsall and parts of Staffordshire, and we have recently renewed some of our plant to give increased output in this thriving little brewery.

I am pleased to say that in spite of increased competition in the South Wales area we have more than held our own, the draught beer sales continuing to show an upward trend.

Over the last few years we have been greatly improving our properties in South Wales and we now have some very fine licensed houses that can cater for all the needs of the public. There are some, however, that still need attention and we shall continue to carry out improvements to these as opportunities arise.

Since the end of the financial year, for reasons of economy we ceased brewing at Messrs Darby's Brewery, West Bromwich, and the whole of the brewing, bottling, wines and spirits and delivery were transferred to Cape Hill. Trading in the houses has improved and the purchase of this business is proving a valuable acquisition to your company.

In connection with our reconstruction plans at Cape Hill, I am able to report substantial progress in the construction of our new cask-washing facilities. I am satisfied from what has been demonstrated in the portion now completed, that it will be one of the finest and most up-to-date in the country, with ideal working conditions. I have already referred to new plant in the bottling stores, and to cope with the increased bottling output we are also enlarging and modernising our cold room. We have continued with further mechanisation of our maltings, and also installed equipment for the handling of sugar in bulk—a great economy. All progress we make in the direction of modernisation of plant will materially reduce our overheads, improve working conditions for our employees, and reduce labour costs.

FURTHER LICENSES GRANTED

Since our last meeting we have obtained certificates from the Licensing Planning Committee for a further five temporary premises in different parts of the city's suburbs. I would like to emphasise strongly that in consequence of the housing drive and the building of new estates, there are now a considerable number of areas in which the public have no facilities for obtaining alcoholic beverages. With the progressive drive of the housing authorities, which we are all glad to see, this problem is of increasing importance, and we are pressing our claims as strongly as we can to the Ministry of Works to enable us to meet the requirements of these new and thickly populated areas by the issue of building licences enabling temporary or a portion of the permanent licensed premises to be erected, particularly in those cases where the licensing justices have indicated, by granting justices licences, that the needs of the public require to be met.

IMPORTANCE OF DEVELOPMENT PLANS

Touching on development plans, your company owns properties in the areas of 76 local planning authorities. The development plans which these planning authorities have to submit to the Ministry of Housing and Local Government cover every aspect of the planning in these areas and may affect your sites and properties to the extent that the sites cannot be developed for the purpose for which they were bought and the properties cannot be altered or rebuilt, or they may be in areas designated for compulsory purchase. The proposals in any particular development plan may not operate for 20 years or longer, so that unless successful objection is taken immediately in all appropriate cases, the result is the placing of a "dead hand" on your properties for a long period and consequent depreciation of their capital value. What is more important in our case is the possible loss of trade through compulsory purchase and the eventual loss of the property and the outlet for the company's goods.

MISLEADING ATTACKS ON THE TRADE

I welcome the passing of the Licensed Premises in New Towns Act, which received Her Majesty's assent on October 30th last. This Act takes away from the state the licensing of new towns, and substitutes a system similar to that in force in licensing planning areas. During the debate in the Commons stockholders must have been shocked by the way the trade was attacked and misrepresented. It is a pity that people who know so little of our trade should give us figures and quote gravities in such a misleading way. Far from there being any justification for the charges made, brewers have faithfully carried out their undertakings given to the Government in 1950 to increase the gravities of their beers by 3°. In fact, the average gravity today shows an increase over the 3°.

The fact must not be overlooked that at the present time the duty is the deciding factor in the beer situation, when you consider that the Chancellor has already pocketed on an average about 8½d. for every pint of beer before any expenses whatever have been met. In the case of your own company he takes more than this figure, and I earnestly hope that he may be persuaded to reduce the taxation at present afflicting the trade.

In industry generally there are signs of some recession of trade, and in the last three months we have experienced this to some degree. We must be prepared, therefore, to face less favourable conditions in the coming year than those we have experienced in the year under review.

The report and accounts were adopted.

CROMPTON PARKINSON LIMITED TOWN TAILORS LIMITED

CHAIRMAN'S SPEECH

RECORD PRODUCTION AND SALES

NEW MANAGEMENT TRAINING SCHEMES

The thirty-ninth annual general meeting of Crompton Parkinson Limited was held in London on December 12th.

The following is an extract from the speech of Mr Albert Parkinson, MBE (the chairman), which has been circulated with the accounts:

"The year has witnessed an increase in production costs, and competition, particularly in overseas markets, has been intensified. The resulting tendency to reduced profit margins has been offset by record figures of production and sales and by maintaining our various works in a state of high production efficiency. In the latter part of the financial year there was some recession in demand for the lighter products within our manufacturing range. On the other hand the majority of our products have continued to be in strong demand and customers' requirements are still in excess of our productive capacity.

The results for the past year show an improvement on the previous year and your directors regard the increase of nearly £220,000 to £1,660,040 in the surplus from trading as satisfactory in view of the many adverse factors which have affected the year's working. Of this increase taxation absorbs an additional £130,000 and specific reserves extra £50,000. In comparison with the year the consolidated net income has increased by about £36,000 to £397,934. After deducting the interests of minority shareholders in subsidiary companies and the increases in reserves and balances carried forward in those companies the net income taken to account by the parent company is about £17,000 more than last year, viz: £321,656.

The dividends paid and recommended by your directors absorb £205,441 net—a slight increase on last year owing to the issue of £18,750 ordinary stock ranking for final dividend and special cash bonus. It is proposed to repeat the allocation of £10,000 to the central benevolent fund.

The taxation provision no longer required, £150,000, arises as a result of a settlement with the Inland Revenue Authorities of various taxation computations and the consequent release of amounts set aside in previous years. After taking this sum into account and profits relating to previous periods, there is a sum of £258,215 to be added to the unallocated revenue reserves.

FINANCE AND DIVIDEND POLICY

During the year debtors and prepayments have risen by more than £500,000 to £4,323,914 and more than £2 million has been added to the value of stock in trade and work in progress, which has reached the record figure of £7,218,486. These expansions, together with the increases in fixed assets and trade investments have been financed largely by means of bank overdrafts and acceptance credits, by a reduction in cash resources and by the retention of income through increases during the year in revenue reserves. The retention of income to finance growth of your company continues to be made more difficult by the current high level of taxation.

Your directors adhere to the view that economic conditions make it undesirable to raise additional permanent capital in this country at the present time and consider it advisable to continue a conservative dividend

policy. They recommend the same distribution as last year, namely a final dividend of 3½ per cent and a special cash bonus at the same rate.

OVERSEAS

Many difficulties have beset us during the year in our export trade from this country. Import and currency restrictions have led to the curtailment—amounting at times to a complete embargo on certain products—of valuable markets, in particular Australia and New Zealand. Nevertheless we have been able to increase the value of our direct exports by nearly 30 per cent in comparison with the preceding year, and indirect exports, i.e. equipment which we know is destined to be sent overseas by our customers, have also increased considerably. We are conscious of the policy of other countries to extend their own manufacturing resources and we have met this tendency, by an expansion of our manufacturing facilities overseas. The factory for the manufacture of A.C. electric motors which has been erected in South Africa in partnership with Lancashire Dynamo Holdings Limited is now in production.

DEVELOPMENT AND RESEARCH

During the past financial year the technical resources at our works, both as regards staff and equipment, have been further increased and the main development and research department at Chelmsford is steadily extending its services to the organisation. The design and development of all our products are constantly under close examination, and we shall continue to keep them in the forefront in this respect. We continue to train and expand our production engineering staffs, both in our various works and as a central company service, so as to ensure high and constantly improving production efficiency.

TRAINING FOR MANAGEMENT

It is now nine years since we formulated our junior board, and during that period seventy men have received the training in handling management problems which service on it brings about. Many of them now occupy senior executive positions. More recently we have set up two new schemes. One is a plan to train for particular jobs by the careful selection of a limited number of promising young men for special "on-the-job" training. The other is a more general scheme of training in the problems attached to particular products, given by the appointment of selected persons to a special committee which is encouraged to discuss and make recommendations concerning that product, its development, manufacture and sale.

These schemes of management training are additional to the apprenticeship training schemes for trade, student and graduate apprentices, the Occupational Training Scheme for youths who do not enter into apprenticeship, and the Crompton Parkins and Parkinson Empire Bursaries.

In our training schemes, our research and development programmes, our overseas arrangements and our constant search for improved technique I find solid ground for belief that our foundations for the future are well laid."

RECORD SALES DESPITE DIFFICULTIES

The twenty-second annual general meeting of Town Tailors Limited was held on December 11th, at Leeds, Mr H. M. Frazer, chairman and managing director, presiding.

The following is an extract from his speech, circulated with the report and accounts for the year to August 2, 1952:

An analogy of our last financial year is that of a commercial ocean voyage. We had plenty of rough weather, which involved accurate navigation, but there was always the hope of calmer seas and satisfactory trading. For the time being these have materialised. It has also been a year of opportunities, commencing with a severe trade recession which had to be overcome. In October, 1951, we reduced prices by drastically writing down our stocks, and the public response was satisfactory; in fact, we actually ended the financial year with record sales. We dealt with the most severe fall ever in wool prices in our stride, which is a proof of the solidity of your company.

Our group net profit is £264,382, compared with £378,472 for the previous year. The fall, which I believe to be temporary, has been caused by lower gross margins, rising costs and by further writing down of stocks. We have been helped by a cessation of the violent fluctuations of wool, our chief raw commodity. Prewar, the price for an average 64s. quality Merino Wool Top was 24 pence per lb.; in 1950 it rose to 350 pence per lb., and since December, 1951, the price has fluctuated between 152 and 120 pence per lb.; but, even 32 pence is too broad a margin.

DISTRIBUTION MAINTAINED

Your directors recommend a final dividend of 16 per cent, which, together with the interim dividend of 12 per cent, makes the total monetary distribution similar to that of the previous year. Again we have decided to recommend a bonus issue to our ordinary stockholders of one ordinary stock unit of 2s. for every five ordinary stock units held. The cost will be £50,000, which we shall take from the reserve accounts. It is proposed to carry forward a balance of £352,343 on the profit and loss account.

Our decentralised factories are all giving satisfactory output, and I am pleased to state that in the last 12 months, no labour hours have been lost by any dispute. The shops are all trading successfully. Eight new branches were opened during the year, and further shops are being opened as suitable premises can be secured. The subsidiary companies continue to be of considerable help to the parent company, with the exception of our export department, which has had a severe setback. This is due to a recession of trade overseas, restricted licences, quotas and foreign competition. Our goods were too dear, although we offered them at today's cost price. This is a serious matter.

Although our gross margins have been reduced and retail prices are much lower than hitherto, yet, I consider that we shall overcome these by increased production and turnover. With our wool stocks at or below today's prices, I do not expect we shall have to face any further drastic price reductions. Trade has been much better since the commencement of our new financial year than for the corresponding period in the year under review. In the further absence of unfavourable factors, I look forward to a continuation of satisfactory results.

The report was adopted and the proposed bonus issue approved.

THE CRITTALL MANUFACTURING COMPANY

RECORD TRADING RESULTS

LORD BRAINTREE'S REVIEW

The twenty-eighth annual general meeting of The Crittall Manufacturing Company, Limited, was held on December 10th in London.

Lord Baintree, chairman and joint managing director, presided and, in the course of his speech, said:

It gives me great pleasure to lay before you the accounts of your group of companies for the twelve months ended August 31, 1952, particularly as the trading profit is an all-time record at £818,779 before taxation, as compared with £494,535 the previous year.

Incentive bonus schemes have been continued during this last year for all staff and other employees who are not paid by results.

The increase in the group trading profits, whilst being mainly accounted for by increased profits of the parent company, reflects also a gratifying increase in the trading profits of Fenestra-Crittall, A.G., our German subsidiary, and the inclusion for the first time of the trading profits of the Crittall Manufacturing Company (Australia) Proprietary Limited, which became a subsidiary company during the financial year.

To the trading profit have to be added the dividends and income from trade and quoted investments amounting to £44,524, as compared with £54,046 for the previous year, resulting in a profit for the year, before taxation, of £863,303—an increase of £314,722.

The total group taxation at £570,050, including foreign taxes, represents 13s. 3d. in the pound as compared with £328,755 or 12s. in the pound for the previous year. I should point out that the excess profits levy was payable on eight months' trading, so that a larger amount would have to be provided in a full year. Whilst it will be appreciated that the taxation charge in this year has had to be increased on account of the recommended bonus to the ordinary stockholders, it must be realised that the problem of maintaining and expanding efficient production and, at the same time, making a reasonable return to the stockholders, becomes increasingly difficult.

FUTURE PROSPECTS

Last year I anticipated an increase in the speed of house building which, though it has been achieved still leaves a considerable gap to be bridged before reaching the annual production of houses of over 360,000 for the years 1936 to 1939 inclusive. It is a significant fact that the cost of house building is now receiving greater attention, and many schemes are being referred back to obtain lower estimates. It is, of course, of far-reaching importance that the cost of house building should come down and, indeed, with slum clearance still to be tackled, a much lower figure must be achieved. In this connection I am pleased to tell you that during the month of October the metal window industry made an all-round reduction in the price of galvanised windows, which, in our case, comprise nearly 90 per cent of the windows sold in the home market, of approximately 4 per cent.

Speaking generally of exports in terms of the value of goods despatched during the financial year, there has been an increase of 30 per cent over the previous year and, in spite of American and Canadian restrictions on house building, our sales to hard currency

and oil-bearing countries have been maintained during the period.

Since I met you last I have visited Rhodesia, where I saw the new factory of Crittall-Hope (Rhodesia) Limited ready to go into production. It is now in operation and, will, I believe, become a profitable undertaking.

With the object of establishing ourselves on a firm basis in the Canadian market, we have acquired the whole of the shares in the Canadian Metal Window and Steel Products Company of Toronto, one of the oldest and most successful manufacturers of metal windows in Canada. We intend to operate this company to manufacture certain windows which we cannot advantageously export from here, and at the same time to use it as distributor for the products of the home factories.

DARLINGTON AND SIMPSON ROLLING MILLS LIMITED

Under nationalisation the original board of directors has continued to function. When the industry is again returned to private enterprise we are hoping to retain this connection. We consider that Darlington Rolling Mills is essential to the successful development of the metal window industry both at home and overseas.

Although Crittall-Hope Metal Windows (South Africa) Limited, the financial year of which ends in February, showed an increase in profits of 90 per cent compared with the previous year, the amount distributed by way of dividend (in which your company participated) remained the same. In face of the political and economic position in the Union, I find it difficult to speak of the immediate future. No effort will be spared to maintain its efficiency during the present period of uncertainty.

The German subsidiary company, Fenestra-Crittall, AG, has continued to show a gratifying improvement in its trading results, but here again the necessity for conserving resources to finance stocks and also capital expenditure has resulted in no dividend being declared.

Crittall-McKinney Metal Window Company Limited had a successful year both as to the sale of products manufactured in Northern Ireland and those imported from this country; in particular the import of our standard products into that market continues on a satisfactory level.

LIQUID POSITION

The group liquid position, at £2,219,992, shows an improvement of £260,461, attributable to profits retained in the business.

Whilst the turnover of the group increased by more than 20 per cent compared with the previous year, stocks increased by 18 per cent and the amounts outstanding from customers by over 19 per cent. This represents quite a substantial drain on the actual cash resources of the group, which position—with particular reference to the burden of taxation and the necessity for capital expenditure—is being closely watched.

The report was adopted and the ordinary dividend of 10 per cent and bonus of 5 per cent was approved.

CONSOLIDATED GOLD FIELDS OF SOUTH AFRICA

MR ROBERT ANNAN'S SPEECH

The annual general meeting of this company was held on December 11th in London.

Mr Robert Annan, the chairman, in the course of his speech, said: The working profit of New Consolidated Gold Fields, Limited, for the year amounted to £1,996,000. Profit on realisation of investments and sundry revenue, which from the nature of our business is subject to considerable fluctuation, shows an increase of £680,000 at £1,072,000, to which the profit on the disposal of our shareholding in Southern European Metal Corporation made the principal contribution. Present conditions indicate that the increased profit from this department of our business is unlikely to be maintained in the current year.

A more stable source of revenue is the dividends on our investments and it is satisfactory that at £1,154,000 the record which we achieved last year has been slightly exceeded without this year drawing on the profits of our American subsidiary.

As the operating company has declared a dividend of 3s. per share less tax on its ordinary shares, your directors now recommend the payment of a like dividend on the ordinary shares of the parent company.

So far as the immediate prospects for our company are concerned, our results for the past year have been influenced by several favourable factors and for this reason should be regarded as above average, but when we survey our progressive and widespread interests we have, I believe, every reason to look to the future with confidence.

The report was adopted.

DICTOGRAPH TELEPHONES

The sixteenth annual general meeting was held on December 11th, in London, Mr Philip V. Summer (the chairman) presiding.

The following is an extract from his circulated statement: It is indeed with satisfaction that I am able to present to you results which I feel sure will merit your continued confidence in the company's affairs. The volume of work in hand remains constant, and our installation staff have been kept fully occupied during the year under review.

Your principal revenue-producing asset—Rental Installations—now stands at £333,978 against £326,709. The annual gross rental income has risen to more than a quarter of a million pounds, an income largely independent of the ups and downs of trade.

Current assets amount to £358,417 (including over £50,000 cash at bank) against £324,777 last year. Current liabilities total £151,617 against £201,895, thus showing net current assets of £206,800 against £122,882—a marked improvement in liquidity.

The consolidated profits of the group before taxation amount to £151,284, but no less than £92,553 is provided for taxation, i.e., 12s. 3d. in the £.

The net profit of the company, after taxation, amounts to £55,097. The board now recommends a final dividend of 10 per cent, less tax, making a total distribution for the year of 20 per cent, less tax.

With regard to the future, there have been definite signs of recovery in certain basic industries during the past few weeks which I feel sure will be reflected in our business, and enable me to make another satisfactory report to you next year.

The report was adopted.

GLAXO LABORATORIES, LIMITED

EXPANSION CONTINUES

MORE COMPETITIVE FUTURE

RESEARCH

The eighteenth annual general meeting of Glaxo Laboratories, Limited, was held, in London, on December 5th, Sir Harry Jephcott, MSc, presiding. The following are extracts from his circulated review:

To adjust the disparity between our issued capital and that actually employed in the business £796,350 of the reserves will be capitalised and one ordinary stock unit issued for each unit held. An increased ordinary dividend is considered appropriate in relation to the increased capital employed and the profit.

Our business has continued to expand, although the rate of growth was less than last year. At home turnover remained approximately the same, but price reductions—mainly of penicillin—will benefit the customer, including the Ministry of Health, by £900,000 in a full year. The history of penicillin prices during the last five years bears eloquent testimony to the benefits of research and technical improvements.

OVERSEAS TRADING PROSPECTS

I wish, however, to refer particularly to our business overseas, where more than 50 per cent of our sales are made. We have over £4 million invested outside the United Kingdom, to which greater hazards necessarily attach. In most years unfavourable circumstances in one market would be offset by more than ordinarily favourable conditions in some other market, but last year unfavourable conditions affected most markets. In part these resulted from inflationary conditions due to the Korean war, and in part from United Kingdom import restrictions reducing available sterling exchange.

Towards the end of 1950 and early in 1951 customers, in the expectation of continuing price increases, over-bought. On the 1952 recession in prices, purchases were sharply reduced. Expecting a rise in sterling purchases of their produce, many countries granted import licences far more freely than could be sustained by the subsequent availability of foreign exchange. United Kingdom import restrictions had an immediate effect, not only in reducing import licences, but in delaying payment for goods already shipped. Sometimes this delay extends far beyond the term of ordinary commercial credit, so there is the additional risk that payment may not be made in full. The directors have, therefore, considered it prudent to set aside £200,000 to an exchange reserve.

A further circumstance has developed that especially affects us. Owing to the Korean war, the United States Government stimulated, by special fiscal concessions, the spending of about £10 million on additional capacity for the manufacture of antibiotics, particularly penicillin. Whilst some of these plants are not even yet completed, world demand has not increased as rapidly as productive capacity, so that acutely competitive conditions have developed in markets where dollars are available.

All these influences fully developed only towards the end of the past financial year; they will become more obvious in the current year. We expect to offset them in some degree by further production economies and the introduction of new products, but their influence cannot yet clearly be foreseen. So far this year our export sales compare unfavourably in money value with the same period last year, the effect upon profitability being more than proportionate.

Our expenditures on research and development are now higher than ever before. I am well satisfied with the progress, but money spent on research cannot quickly reflect itself in profits.

As an instance of long-term research, we have produced after more than nine years' work a much improved whooping cough vaccine of standard and demonstrable potency. Extensive trials in collaboration with the Medical Research Council have shown that this disease can be so modified as to be of slight effect or completely prevented. A new combined whooping cough and diphtheria vaccine, also, is already widely accepted.

Among other new products, we have recently developed "Dionosil," a novel product for use in bronchography, favourably received at home and abroad. A further result of research has been to reduce the production costs of many products, enabling us to meet competition and still to trade at a profit.

There is another aspect of research. It has been said that, whilst the quality of British research is very high, the speed with which the outcome is carried through to production is not equally to the credit of this country. I do not think the British manufacturer is, in general, lacking in his desire to translate new knowledge into new products, but he is faced with considerable difficulties not of his own making. Whilst laboratory work will probably be completed with facilities already at his disposal, development involves capital expenditure. With the Government restraint on capital expenditure, unavoidable delays in securing licences to erect buildings and to obtain steel cast a shadow on the rate of progress and can seriously reduce enthusiasm.

Moreover, if development is to take place speedily, capital expenditure will probably have to begin before laboratory work is completed and when the economics of the new process are still incompletely known. It is the function of the industrialist to take the risk involved and to recoup losses on failures by profits on successes. The knowledge that the Government will take 80 per cent of any increase in profits is not encouraging and may cause those responsible to doubt the wisdom of incurring such expense.

DEXTRAN

From the dextrans, which are produced by fermentation, it was found possible to separate out material that can be given in place of blood plasma for treating the circulatory failure in shock arising from wounds, burns, etc. In 1947 manufacture on a commercial scale was begun by Dextran Limited, whose resources proved inadequate, and in July last we acquired all the issued shares. The product is sold under the trade mark "Intradex," and other products of even greater usefulness may be evolved.

Expecting that the favourable conditions of the last several years would not persist indefinitely, advantage has been taken to build up our resources. If we now have to face a difficult and highly competitive period, we do so with confidence, knowing that our finances are stronger than at any previous time, that our physical resources are much greater and more diversified, and that the organisation has been expanded and

strengthened throughout, although the immediate future may be less profitable than the past few years.

The directors again pay warm tribute to the work of the company's employees, at home and overseas, during the year. Their loyalty and enthusiasm continue unabated.

The report was adopted and the capitalisation proposals were approved.

RHOKANA CORPORATION LIMITED

THE BANCROFT MINE

MR H. F. OPPENHEIMER'S SPEECH

The annual general meeting of Rhokana Corporation Limited was held at Kitwe, Northern Rhodesia, on December 10th, Mr H. F. Oppenheimer presiding. He said: Shareholders will have noticed that the formation of a company to establish another large copper mine in the Northern Rhodesian Copperbelt was foreshadowed in the chairman's statement issued with the annual report and accounts. A few additional details are now available.

The financial structure of the new company is at present receiving the active consideration of your board. In the meanwhile, expenditure on prospecting, borehole drilling and other preliminary work has been financed by advances from your corporation, and approximately £300,000 has been spent to date. It is estimated that it will take about five years and cost about £11 million to bring the mine to production.

EXTENSIVE ORE BODIES

The mine will be located on extensive ore bodies near the Belgian Congo border about 14 miles north-west of the property of Nchanga Consolidated Copper Mines Limited. The ore bodies occur in areas comprised in special grants issued to your company by the owners of the mineral rights, The British South Africa Company.

Prospecting of the area of these special grants, totalling 56,848 acres, over a period of years proved the existence of three ore bodies. These are known as the Konkola ore body, the Kirila Bomwe North ore body and the Kirila Bomwe South ore body. The two Kirila Bomwe ore bodies are about a mile apart on the surface. The Konkola ore body is 4½ miles away. Prospecting rights are also held over a further 6,140 acres to cover possible extensions of the ore bodies in depth.

RESERVES 80 MILLION TONS

It is estimated that the reserves of copper ore exposed during the diamond drilling programme total approximately 80 million tons with an average copper content of 3.60 per cent. The Konkola ore body is estimated to contain 32,900,000 tons with an average copper content of 2.48 per cent, and the Kirila Bomwe North and South ore bodies are estimated to contain 46,700,000 tons with an average copper content of 4.39 per cent. These values are comparatively rich. The minerals are copper sulphides, with small amounts of oxide. A feature of the prospecting already completed has been that the deepest holes so far drilled show values and widths well above economic limits and there is little doubt that substantial reserves remain to be proved by further drilling. On the basis of the ore reserves so far proved, the mine would have a life of 40 years at the production rate envisaged.

Planning of the mine is in progress. A concentrator with a capacity of about 150,000 tons a month will be erected at Kirila Bomwe to treat the ore from all three ore bodies. The concentrate will be bailed to your com-

pany's smelter at Nkana, some 55 miles away. With recent improvements in technique, it is expected that the Rhokana smelter will be able to handle the new mine's production of approximately 4,000 short tons of copper a month without major additions of plant.

A NEW TOWNSHIP

The establishment of the new mine will involve the construction of a railway from Nchanga to Kirila Bomwe with a further connection to Konkola, the construction of roads and linking up with the electric power grid which serves all the mines of the Copperbelt through the Northern Rhodesia Power Corporation Limited. A new mining township will be laid out for European staff and employees, who will total approximately 500. African townships with houses for single and married African employees, who will number about 4,000, will also be established.

Preliminary work has already started at the site. An aerial survey to assist in the laying out of road, rail and power line routes has been completed.

TRANSFER OF REGISTRATION

I should now like to refer to a recent press announcement by Rhodesian Anglo-American Limited advising that a petition has been presented by that company to the United Kingdom Parliament for leave to introduce a Private Bill, with a view to securing the transfer of registration of that company and others of the group, including your company, from the United Kingdom to Northern Rhodesia.

Your company has, since the beginning of 1951, been managed and controlled in Northern Rhodesia where the whole of its business is carried on, whilst it continues to be a company incorporated in England. The present position is felt to be anomalous and your directors therefore considered that this company should be actively associated with Rhodesian Anglo-American Limited in the steps being taken to finalise the removal to Northern Rhodesia of the Rhoanglo group of companies.

The Northern Rhodesia Government has been kept fully informed of the intention to introduce the Bill, which by its terms extends to Northern Rhodesia, and has accorded its full approval.

The report and accounts were adopted.

LAKE VIEW AND STAR LIMITED

RISE IN WORKING COST

The forty-second annual general meeting of Lake View and Star, Limited, was held on December 10th, at the Chartered Insurance Institute, 20 Aldermanbury, London, E.C.

Sir Joseph Ball, KBE (chairman of the company), presided.

The chairman in the course of his speech said: The mining profit for the year ended June 30, 1952, amounted to £482,151, as compared with £563,789 last year, a decrease of £81,638. Two interim dividends, each of 6d. per share, less tax, were declared during the year, and your directors recommend the payment of a final dividend of 1s. 6d. per share, less tax, thus maintaining a total of 2s. 6d. per share for the year.

Development footage increased during the year by 1,365 ft to 23,232 ft. The ore reserves at July 1, 1952, were estimated to be 3,723,700 tons, averaging 4.82 dwt per ton—a decrease of 376,700 tons, almost entirely due to the necessity of eliminating just over 342,000 tons of marginal ore, which, owing to the further rise in production costs, can no longer be regarded as payable.

I draw special attention to the rise in working cost per ton milled, from an average of 35s. 2d. during the year ended June, 1951, to an average of 40s. 11d. throughout the year under review. This sharp rise is responsible for the heavy fall in the company's profits; but it has had what, perhaps, may be regarded as an even more serious effect, viz., the elimination from the ore reserves as unpayable of no less than 342,000 tons of marginal ore.

This follows upon a reduction during the preceding year, for similar reasons, of 112,000 tons—a total loss in the last two years of some 454,000 tons. The main cause of the steep rise in mining costs in Australia has been the constant additions to what is known as the basic wage.

The report and accounts were adopted.

HARRIS LEBUS, LIMITED

FURNITURE TRADE OUTLOOK

The fifth annual general meeting of Harris Lebus, Limited, was held, on December 9th, in London, Sir Herman Lebus, CBE, JP, chairman and managing director, presiding.

The following is an extract from his circulated review of the year ended July 11, 1952:

The trading profit after allowing for all charges including depreciation, but before charging taxation, amounts to £416,885, as against £701,107 for the preceding year, a decrease of £284,222. After providing for income tax and profits tax computed on the profit for the year, the net profit amounts to £165,680, a decrease of £80,081. The proposed ordinary dividend is 6 per cent, less tax.

We started 1951-52 with a satisfactory order book. Throughout the company's financial year there was a marked recession in trade, in the case of upholstery the most marked that many can remember. This added greatly to the difficulties and adversely affected the profit. In spite of these adverse factors we improved our share of the Utility market, and indeed overall we delivered more units of furniture than we did in the previous year.

The furniture industry has participated in the improvement which has taken place recently in retail trade in the country, and since the beginning of our current financial year there has been a marked increase in sales made by your company. Whether or not this trend will be maintained remains to be seen, but at this date we have a satisfactory order book. The company is in a position to face the uncertain conditions with confidence and to be able to take full advantage of all possibilities for future development.

The report was adopted.

BURMA ESTATES, LIMITED

THE BOARD'S OBJECTIVE

The nineteenth annual general meeting of Burma Estates, Limited, was held on December 9th in London, Sir Rupert de la Bère, MP (the chairman), presiding.

The following is an extract from his circulated statement.

The profit for the year ended June 30, 1952, is much less than that of the previous year, but it was generally recognised that the favourable factors which accounted for the exceptional results for that year could not be expected to continue. In view of the fall in the price of rubber and the lawless conditions which have been ruling in Burma during the year under review, we are not dissatisfied with the results.

The Government of the Union of Burma

has refused our request for a remittance from Burma to meet our UK tax liabilities. There is, therefore, a danger of our company being left without money in London with which to finance current operations. The Burma Government will favourably consider sanctioning the remittance to the UK of the company's money in Burma and the proceeds of its assets if the company finally discontinues operating in Burma.

Addressing the meeting, he said inter alia: The board's objective is to get its cash out of Burma and thus make it available for distribution to the shareholders. It is equal to more than half of the company's paid-up capital and it is hoped that the scheme we have in mind will enable payment to be made to members as a return of capital which will not attract United Kingdom taxation.

The report was adopted.

CENTRAL & DISTRICT PROPERTIES

EASEMENT OF GOVERNMENT CONTROL

The eighteenth annual general meeting of Central & District Properties Limited was held on December 10th in London.

Mr A. W. Bournier, who presided, in the course of his speech, said: The net profit of the group, before taxation and reserves for amortisation and deferred repairs, amounts to £71,132 which shows an increase of £4,009 over that of the previous year.

It is gratifying to see that this present Government is adopting a realistic approach to the very thorny problem of development charges and the other financial clauses of the 1947 Town and Country Planning Act. All of us engaged or in contact with the operation of this Act since its inception have realised that the provisions as originally laid down were unworkable in practice, and a definite cause of restricting all forms of property development. The abolition of the charges, subject to wise and prudent legislation on other matters which will of necessity arise in the remodelling of this Act, will, it is hoped, create a much more enterprising atmosphere, so much needed in order to deal with the shortages of all forms of property and to meet demand.

RENT RESTRICTION

I have touched in previous years upon the extremely unfair position as affecting landlords and property owners of all types by rent restriction which, it is clear by its operation, creates shortages rather than to lessen them. There are indications that the just rights of property owners and companies are at last receiving some consideration, which is now long overdue, and we can only hope that wise counsels will prevail and that steps will be taken to amend the existing legislation so as to provide owners with the requisite income out of which to maintain their properties in good order and to provide a reasonable return upon capital investment.

During the year certain further progress has been made. Your companies have acquired three additional investment properties upon terms which, in the opinion of the management, are advantageous and arising out of commercial premises in London and the Provinces.

In conclusion, I would like to take this opportunity of thanking all who have been concerned in the management, control and operation of your companies' interests for the good work which they have put in during the course of the past financial year and without which the results as shown by the accounts could not have been achieved.

The report was adopted.

Commonwealth by Thrift

THE Commonwealth Conference ended last week as successfully as anyone was entitled to expect. The official communiqué consisted, it is true, of little but vaguely worded good intentions. But those who complain on this score are crying for the moon. More definite action was, indeed, imaginable. The conference might have decided to make the sterling area a more restricted trading system; it might have denounced the General Agreement on Tariffs and Trade, declared an all-round increase in imperial preferences, and put further quantitative restrictions on dollar imports. Alternatively, it might have decided on a dash for freedom in economic policy. Sterling might last weekend have been made convertible, the exchange rate freed, the gold reserve thrown (in all probability) to the winds. If the Commonwealth had embraced either of these two sets of policies the communiqué could have announced immediate action. But it would have been bad action—the restrictionist policy wrong in principle, the all-out liberal policy ill-judged and, almost certainly, in practice short-lived.

Happily, the conference avoided both extremes. Instead it laid down the aim of creating "by progressive stages and within reasonable time . . . an effective multilateral trade and payments system covering the widest possible area." And given that decision, the conference inevitably could go no further, publicly, than a declaration of intentions. To restore multilateral trade demands action on two fronts: external and internal. In external economic policy, it is probably true to say that the Commonwealth countries have to make more changes than any others before world trade is able to flow more freely. But primary responsibility is not sole responsibility. The American postwar policy of grants in aid to Europe is plainly going into decline if not coming rapidly to an end. A substitute has to be found, and the Commonwealth cannot move in isolation from it. But the necessary consultation with the United States and with Western Europe must wait until the next Administration is settled in the American saddle. It is, indeed, essential that the Commonwealth countries should enter upon this economic consultation of the West, when it comes, with a clear set of proposals. But an attempt to sketch such proposals officially now would have been worse than pointless; it could have done little but prejudice the discussion.

External action is, however, the lesser part of the programme. It will be wasted unless the sterling countries are capable of paying their way in a world of greater freedom in trade and payments. Internal action to this end does not have to wait on General Eisenhower. It has to wait only on the cabinets and parliaments of the Commonwealth countries. The Prime Ministers and Finance Ministers assembled in London could not there publicly commit themselves to precise measures of retrenchment and disinflation. Mr Butler could not choose a Commonwealth communiqué in which to announce that he intends, say, to remove the rest of the food subsidies in his next

Budget. In internal no less than in external policy, the public concern of a Commonwealth conference is properly confined to general intentions. Even what is said in private cannot indicate how effectively these intentions will be translated into practice.

On this, the most—but also the least—that can be said is that the prospects are better now than before. For the first time, the Commonwealth countries have collectively recognised errors in their postwar ways. "Development of the basic essentials has on occasion been impeded by other development of a less sound and permanent kind, which has overtaken the countries' resources and has failed to contribute to the building of economic strength." Objectively, the weaknesses are easy to identify. They are, for example, in Australia the growth of uneconomic secondary industries; in Britain a building programme that attempts to meet a demand for houses inflated by artificially low rents and artificially cheap food. The Commonwealth communiqué does not cite such examples, and there is as yet no evidence that any government really intends to mend its ways to a significant extent. But at any rate the underlying principle they ought to follow has at last been clearly recognised. Neither the United Kingdom nor any other Commonwealth country can, by erecting a protective fence against world competition, sustain the benefits of a humane, fully-employed, gently-inflating welfare state. Survival depends on efficiency. The Commonwealth cannot shrink behind a fence of controls; it has to pay its way in an open, competitive world. The test is that "development should be concentrated on projects which directly or indirectly contribute to the improvement of the area's balance of payments with the rest of the world."

For the sterling area as a whole, it is enough to balance external payments. For this country the task is heavier. It is, as the conference clearly recognised, to help by overseas investment to develop the resources of the rest of the Commonwealth. So far since the war such British investment has been possible, in parts of the sterling area, thanks only to American aid and to borrowing from some other countries. In the future investment will have to be net investment from this country's own resources. And that has only one source. It means that Britain must earn an external surplus; it must export in total more than it imports. There is no political dispute about this aim. The Left in this country now fully recognises the necessity of an export surplus. Indeed, the pundits of the Labour party have got so far, on paper, as to discuss whether the surplus should be £350-£400 million (so says Mr Wilson) or £300 million (so says Mr Jay). Such refinements can be left to them. The only purpose of figures at this stage is to give a spuriously concrete form to ideas that ignore all the real difficulties. The point that matters is that the required surplus is substantial and the practical problem is how to create a surplus at all.

The task has two aspects. One is to make the surplus acceptable to other countries; British exports must be cheap enough for the developing countries to want to buy them rather than American or German or Japanese goods. The other is to make the surplus available; the country can export more than it imports only if it consumes less than it produces—if, that is to say, its people spend less than their incomes. Investment overseas, just

as much as investment at home, must be matched by saving somewhere in the economy.

The first of these two sides to the medal—competitiveness—gets more attention because it is more obvious. But the second is of prior importance. There are two possible sources from which Britain can find capital for investment overseas. Investment at home can be reduced, or savings must be increased. The first would be disastrous. The Organisation for European Economic Co-operation, in its unusually forthright report published last week-end, endorses the common view: at 13 per cent of the gross national product, fixed investment in Britain is, and has been for years, inadequate. If there is to be a surplus available for development in the Commonwealth, and also a healthy volume of capital creation at home, the output of the British people will have to exceed their consumption by a double margin. These fine plans, in short, depend absolutely on a large volume of savings.

This is the critical issue that any realistic economic policy must meet. How can savings be increased? The three general methods might be characterised as the magic wand, the wise uncle, and self-help. The magic wand is higher productivity; it is commonly assumed that as production increases consumption could, fairly easily, be held steady, so that most of the extra income created by the increased production would be saved. There are two difficulties about this pleasant assumption. First, it is doubtful whether productivity will, in fact, increase at all rapidly. The rise in recent years has reflected the particular conditions of postwar recovery; its automatic continuation, in the modern, inflexible British economy, was never likely, and this year's experience makes it positively unlikely—at least without a revolution in the national attitude to work. Even, however, if productivity did rise, would savings increase much? Extra production is always matched by extra real income, largely in the hands of wage-earners. And when total saving is so low, it would be miraculous if the marginal saving from extra income were high.

The magic wand, then, is probably a fiction. The wise uncle is real enough, but grown feeble with exertion. He is, of course, the state, which steps in with a budget surplus to make up for the lack of private savings. Mr Butler could increase that surplus either by taxing more without increasing expenditure or by spending less without cutting taxes. Yet higher taxation would cripple incentives and kill any chance of raising productivity. If it fell on the rich, it would be paid largely at the expense of capital or new saving, not of consumption; that is to say, the state would save only by reducing private saving still further. Extra taxes on the workers would, no doubt, bite into personal spending, but they would still damage incentives and politically they are ruled out of court on any substantial scale.

This must also be said of the alternative method of creating a bigger surplus, by cutting expenditure without cutting taxes. From the economist's point of view, this has considerable attractions. But it is highly doubtful whether any Government will take an axe to public expenditure, and it is almost certain that no Government will incur the political odium and yet eschew the political gain; if it cuts spending substantially, it will cut taxes almost as much—and the state will not save more.

On this the lesson of experience is plain. A democratic

government is a poor saver. The wise uncle might, of course, be translated into a tyrant. An authoritarian government on the Eastern model, willing to exact large forced savings and itself taking responsibility for most of the objects of investment, can save what it chooses. But in a liberal society, saving depends on self-help. It is the British people, as individuals and as shareholders in enterprises, who must save. The state, indeed, is responsible for creating conditions that make saving worthwhile; either it must leave people with more income, after tax, from which they can save, or it must make thrift—the old virtue of abstaining from consumption—a matter once again of honour and profit. There are no easy ways of accomplishing this revolution, but it is the only means by which this country can have an expanding economy, vigorously re-equipping at home

Europe Shivers on the Brink

BEHIND the bitter conflict of parties now raging in Bonn and the confusion of voices in the French Assembly there lies a question about Europe's defence that no one has yet set apart and squarely faced. It is whether there is or is not an alternative to the proposed Defence Community. If there is, then those French and German party politicians who oppose ratification of the treaties between Dr Adenauer's Government and the western nations could be acquitted of irresponsible obstruction. They could plead that they know of a better way to bring France and Germany together, to give Germans equal status with their allies in Europe and to secure the defence of free Europe against the possibility of Communist aggression. They could convincingly deny that they are appealing to national feeling against these treaties in order to get domestic political advantage; their patriotism, they could argue, is not the last refuge of scoundrels, but an enlightened view of the national and European interest. If they cannot make such a case, if their criticism is merely destructive, then the indictment to be drawn against them at this critical moment in Europe's affairs will be severe indeed.

To take first the matter of fact. In spite of the speculations of former German generals and the hints of American newspapers, there does not now exist any alternative plan for organising European defence. There is none in the Pentagon and there is none in General Ridgway's headquarters. But that, it will be argued, is only half the matter; the EDC is not only a project for German rearmament, it is also part of a project for bringing Germany first into a European and later into an Atlantic community. Could that not be done simply by inviting unarmed Germany at once to become a member of the North Atlantic Treaty Organisation? Whether it could, in fact, be done is for the Atlantic Council to decide; but it is safe to say that the Council has not formally considered the idea, for the simple reason that M. Schuman has firmly refused to do so. Indeed it has this week asked emphatically once again for the E.D.C. to be set up.

The reason for the refusal can be simply described. Membership of Nato would give to a sovereign Federal Republic a national army, with its own defence ministry and general staff, controlled as to its numbers and

and creating capital abroad. The schemes that are now being mooted on the Left, which visualise such an economy but give no place to saving, are fantasies; if the problem is ever faced at all, they will cease to be dreams of expansion and become nightmares of rigid state control and forced saving.

The Commonwealth conference has not declared actions or propounded detailed programmes, but at least it has emphasised this central issue. Conversations with the Americans, schemes for convertibility and all the rest, will lead nowhere unless the sterling countries can create the capital on which their efficiency and wealth in a competitive world depend. And there is neither magic nor manipulation that will create capital out of nothing. Saving is thrift; it is consuming less; and it has to be done by people.

strength and the purposes for which it could be used by the parliament in Bonn. The only restrictions on German defence policy would be those embodied in the conventions between the Republic on one side and Britain, France and the United States on the other. Germany, as one of the Atlantic powers, would take a full part in the planning of their strategy and political activity; for all practical purposes it would have the same voice and rights as Britain or France. Clearly, such a leap back into the first rank is more than Germany's neighbours are yet ready to accept; the necessary confidence and trust are not yet fully grown, even in Britain.

Logically, of course, Germany's return to full equality must come one day. Even in the defence community Germans would take an important part in the work of Nato and of General Ridgway's headquarters; but they would be under restrictions also accepted by France, Italy, and their smaller neighbours. The basic conception of EDC was that Dr Adenauer could give up his country's sovereignty in defence if Germany's neighbours would do the same. It is this idea of common sacrifice that is being everywhere forgotten; and with it is being forgotten the fact that the movement for integrating Western Europe will get nowhere until it has grappled with and solved the problem of joint control over defence. One way or another, if the Germans are to contribute to the defence of Western Europe, they will have to be granted equality with the French, the Italians and the Low Countries. Is it to be equality subject to the controls of a defence community or equality in full sovereignty, subject only to the much looser restrictions of Nato?

There is also a third course of action which has its advocates, notably among the Gaullists. It is that the Germans should not be rearmed, that the United States should contribute even more to the defence of Indo-China, and that the French army should bear the main burden of protecting Western Europe. This would leave the way open to further negotiations about Germany with the Russians and restore—so it is argued—France's position as an independent great power. Of this argument it is sufficient to say that France is incapable of such an effort without American assistance.

on a visionary scale, and that the German Government could not now accept—after all that has been said and done—a formal prohibition to rearm. Nor would the American and British Governments accept such a solution.

Not only, therefore, does an alternative to EDC not exist, but the objections to trying to find one are as powerful as ever they were. Certainly it is difficult to imagine that all those Frenchmen who object that EDC would both renew the German danger and weaken France can accept the Nato alternative. And there is no doubt at all that the most faithful men around Dr Adenauer would bitterly regret any solution that would lay on their stripling parliament and state the task of controlling alone a revived *Wehrmacht*. These men still see in the defence community not only the means of restoring Germany's position in Europe but also the way to maintain the democratic institutions of the Republic against the enemy within that has defied them in the past. To ignore their view would be to abandon Europe's friends in Germany.

★

To this it is sometimes replied that Nato can and should be made strong enough to control any resurgence of German militarism, that the Atlantic community should create institutions like those of the proposed European Defence Community. In the circumstances of the moment this can hardly be treated as a serious argument. It is possible that one day (some will say the sooner the better) the fourteen governments of the Atlantic alliance will set up a common defence budget, integrate their forces, abolish their national staffs and create one international staff, and put the whole complex under a group of defence commissioners responsible to an Atlantic assembly—but that day is still far off. Such a scheme is not practical politics for an American administration without long and careful preparation of public opinion; and until it is accepted in the United States it cannot be accepted in Britain.

Clearly, however, it is one thing to show that the "Nato alternative" to EDC is at present meaningless and quite another to pretend that the present treaty for a defence community in Europe is perfect. No one seriously imagines that, within eighteen months of ratification, the French, Italians, Belgians, and the rest would abolish their national defence administrations and set up an effective international substitute. No one wants integration for integration's sake, or a piece of reorganisation which would make Europe's forces ineffective until there are European army corps to accept German divisions. All kinds of technical and expert objections can be made to the treaty's clauses as they stand. But it should not be impossible for the French Assembly to ratify *en principe*, leaving it to the six governments to make what changes they wish by means of the time-honoured device of *protocoles d'application*. To create a European army might well take a generation; but foundations could be laid now without injury to German pride, without crippling France's ability to meet overseas commitments, without raising for three or four years the question of which country or group of countries will predominate. It is time that French statesmen said these things aloud and persuaded their people to grasp the possibilities of reconciliation with a weakened Germany offered by Dr Adenauer's success this week.

Of the attitude of Dr Ollenhauer, leader of the Social Democrat opposition in Germany, it is difficult to speak with moderation. He appears to believe that he can get partnership without responsibility, have his cake and eat it. He appears to argue that Germany can be reunited in some unspecified manner, provided that the western republic is not so closely tied to the West as to make re-unification unacceptable to the Russians. He wants an end to the occupation regime, equality of rights for his country and full protection from the West; but he reserves to any government of which he would be a member the freedom to make what bargain it can with the Russians, to merge democratic Western Germany with the Communist East. He shares the incurable illusion of European Socialists that they are better thought of in Moscow than their political rivals, and the incurable conviction of Germans that they can handle Russians better than anyone else. The Russian terms are, in fact, well known, and they are as unacceptable to most Germans as they are to the western allies, providing their meaning—unity without freedom—is clearly explained. This Dr Adenauer has done, fearlessly and honestly; this Herr Ollenhauer does not do. Hence the undoubted support he has won from nationalist elements in the country and his hopes of winning a general election to decide whether the treaties with the West shall be accepted or torn up. Herr Ollenhauer, it seems, would be an uncomfortable partner in Nato.

It is possible that ministers and politicians in France and Germany have been influenced in recent weeks by a feeling that an alternative to EDC would be favourably considered both in Washington and London. If so, there is a clear need for saying firmly that they are wrong. In the belief that the treaties would be ratified, the Allies have been quietly bringing the occupation regime in Western Germany to an end. Does Herr Ollenhauer think it either practicable or honourable to suggest that those treaties should now be re-negotiated in their entirety? That he should court the votes of German nationalism is understandable; but that he should threaten the whole structure of western co-operation without offering any clear alternative is just irresponsible.

★

For the American, British and French Governments the lesson is clear. The whole weight of the western partnership should be thrown behind the treaties. It is a profound mistake to think that it should not help its friends in Germany for fear that they will be embarrassed. On the contrary, in the present state of German opinion, the Allies' support for Dr Adenauer is taken for granted by his opponents; they will respect it if it is prompt and effective and ignore it if it is not. In Paris, too, there are helpful gestures to be recommended. If the ratification debates in the Assembly could be begun earlier than is now contemplated and if French statesmen would admit that they have a moral responsibility to carry through the measure they designed—then the task in Bonn could be made easier. After all, there must be some advantage to France in treaties that German nationalists attack so fiercely; just as there must be some advantage to Germany in treaties that so many French nationalists regard with mistrust. It is the task of American and British policy to see that French and German nationalists do not combine to destroy European integration and defence.

India's National Plan

WHEN, a little over a year ago, the Indian Planning Commission published in draft its first five-year plan, it was clear that a firm attempt had been made to give the country's economy a number of sane and realistic priorities. The essence of India's problem is that while 80 per cent of its 360 million inhabitants live on the land practising a static peasant agriculture, the population increases every year by about 4½ million. Indian industry, barely thirty years old, cannot absorb these millions; as it is, the feeding of the urban workers is a perpetual hazard. The first task in India must therefore be to increase food supplies, to introduce some dynamic elements into the rural economy and so to balance the inexorable dynamism of the birth-rate.

In the Draft Plan the main emphasis was, very sensibly, put upon agriculture, upon the increase in food production by irrigation and better methods of cultivation, upon the raising of rural standards by such means as better transport, better marketing, rural electricity and improved administration. The agricultural programmes, which also had to include as a matter of emergency the unfinished business of resettling some 7 million refugees from Pakistan, took up about two-thirds of the proposed expenditure of the whole Plan. The share of industry was under seven per cent.

In theory, the Plan was inaugurated with the publication of the Draft and some parts of the programme have in fact been pushed forward in the last year. But the date is rather notional. Some of the biggest schemes—for instance, the three multipurpose hydro-electric projects at Bhakra-Nangal, Damodar and Hirakud, or the fertiliser factory at Sindri—were inaugurated before 1951. The Plan simply registers their continued construction, or, in the case of Sindri, their completion. Again, the Government of India's administrative resources have been strained to the limit in the last twelve months by the successful conduct of the largest democratic election ever held. The Plan could not be fully launched at the same time. It was also decided that the Draft Plan should be exposed to the maximum amount of public criticism and discussion before it was finally adopted by the Cabinet. For the last year, it has gone the rounds of the twenty-six states and of every influential public body. Only on December 7th was the final shape of the Plan fixed by the government's formal endorsement.

In the year of public discussion, the austerity of the first Draft has, perhaps, become slightly less marked. Like any other democracy, India has shown that every region and every group has its own view of priorities and the trouble has not been to compile a list of urgently

necessary projects but to relegate anything to posteriority. Pressure on the government for more "welfare" has naturally been strong and the proposed expenditure has risen from £191 million to £255 million. Industry, too, has pleaded, not without reason, for a rather larger role. The sum allotted to it has risen by about £55 million to £130 million, and now covers 8 per cent of the Plan.

All in all, the total contemplated expenditure has risen from the £1,120 million of the Draft to about £1,550 million. Yet the modifications have not changed the essential framework. Agriculture, irrigation and transport, with an investment of £1,064 million, still command 68 per cent of the Plan's resources.

India's national income is estimated at £6,750 million. Since the annual investment under the Plan is to run at about £337½ million, it amounts to no more than 5 per cent of its national income. Moreover, the expected increase in national income as a result of the five-year effort will be only £750 million, of which two-fifths will instantly be swallowed by the consumption of millions of new mouths. It is perhaps this perspective that has led critics in India to speak of a "modest" plan and to question whether it might not have been pitched in a rather higher key.

It is certainly true that a national programme of investment of only 5 per cent a year is low compared with other countries. Most European nations have achieved a level of 20 per cent of gross national income at one time or another since the war. Soviet Russia maintained a steady 25 per cent and more in its first series of plans. Nor can there be any doubt that the level of investment is the chief determinant of expansion. But these comparisons leave out of account the facts of India's existence.

The starting point is the unutterable poverty of the great majority. In a population of over 360 million, only about 700,000 are in a position to pay any taxes. In fact, in 1951 only 14,000 people had an income of more than £3,000 a year. The national income per head is just under £19. In these conditions, to talk of a higher general rate of saving—in other words, of a further restriction of consumption—is to cut a percentage of Indians out of existence altogether. More could no doubt be done to transfer wealth from the few very wealthy families, but the aggregate result would be negligible and, in any case, there is little tradition of conscientious tax paying among the rich in India. As for the middle classes, they have already been reduced to a considerable degree of frustration by the combined effect of inflation and taxation since the war.

This economic stringency could no doubt be countered by totalitarian methods. Even a very poor country can save 25 per cent of its national income if no one cares very much who dies in the process. Communist China, whose over-populated land offers a direct analogy with conditions in India, will no doubt find that ruthlessness is a powerful instrument of saving. But the Indians are committed to the way of democracy. They cannot let the poor die. They cannot completely expropriate the rich. They cannot silence the criticism of the middle class. Politically as well as economically, a policy of caution alone is practicable.

Even given this caution, there are formidable obstacles to be overcome. It is a hard political fact that most people in India at the end of the Five-Year Plan will be little better off than they are today. The labour is to prevent them slipping back under the inexorable pressure of rising population. Yet any nation newly tasting independence expects its rewards and it cannot be said that all Congress politicians have been modest in their

PATTERN OF OUTLAY IN THE PUBLIC SECTOR

	Revised expenditure		Expenditure as in the Draft Plan	
	Outlay during 1951-56	Percentage of total outlay during 1951-56	Outlay during 1951-56	Percentage of total outlay during 1951-56
I. Agriculture and Community Development	270.3	17.4	143.8	12.8
II. Irrigation and Power	421.1	27.2	337.8	30.2
III. Transport and Communications	372.8	24.0	291.1	26.0
IV. Industry	129.8	8.4	75.7	6.8
V. Social Services	254.9	16.4	190.7	17.0
VI. Rehabilitation	63.8	4.1	59.3	5.3
VII. Miscellaneous	39.0	2.5	21.4	1.9
TOTALS	1,551.6	100.0	1,119.7	100.0

promises. India's ideal is the welfare state. Indians are not alone in expecting its descent from above and all the while Russian and Chinese propaganda reiterates the sweets of a succession of painless Communist Five-Year Plans. Happily, the average Indian is shrewd. A strain of fatalism also gives him political balance. Last year's elections eschewed extremism and gave Congress a majority at the centre and in most of the states. Yet there is a wise saying in Sanskrit that "the earliest indication to the people of a wise plan should be its achievement." In India, as elsewhere, there may be a penalty to be paid for high promises and hope deferred.

The administrative problems should not be underrated. It is true that India is unique in Asia in the strength of its administrative structure. The legacy of the Indian Civil Service is a band of devoted officials who have accomplished miracles in the last five years. The resettlement of the refugees, the negotiated incorporation of over 500 princely states in the Indian Union, last year's elections and, indeed, the scope and detail of the Five-Year Plan itself—all these are administrative achievements of the highest order. But the introduction of the welfare state must mean an enormous multiplication of responsibilities. State intervention in industry has the same consequence; and at the most vital level of all for the Plan—in the village—administration must in some areas be built almost from scratch. The structure was always slight in the princely states, and land

reform has abolished the old intermediaries—the zamindars and the jagirdars—in many districts. The peasant is the pivot of the Plan. But in many areas it may be difficult to reach him effectively.

Of this dilemma, the Indian planners are well aware. One of their main aims is to fill the vacuum in part by developing the machinery of government, in part by furthering the activities of the villagers themselves. Village councils—*panchayats*—are being created or restored, the co-operative movement, which exists to a widespread degree only in Madras and Bombay, is to be fostered. On the official side, the States are urged to assign responsibility for development to district officers and to train village workers whose sphere of action will be the villages themselves. This new approach is being tried out in a series of Community Projects covering on an average 300 villages in a number of States. It is here, incidentally, that the programme of American aid under Point Four and the Ford Foundation are making their first impact.

The most immediate problem is, however, financial. The Indian Government believes that on a reasonable forecast of present revenue, about £1,034½ million out of the proposed £1,500 million can be covered by receipts and firm saving—this figure includes £97½ million of foreign aid already given. Perhaps another £217½ million can be secured by the release of sterling balances. An uncovered balance of £247½ million remains and the government frankly admits that since further internal saving cannot be undertaken, this expenditure under the Plan depends upon the support given from abroad.

It rests with the free nations of the world to decide, whether, in the widest sense, India is a good investment. Yet their decision is, whether they like it or not, set in a framework of drama and destiny. Side by side in Asia the two most populous and ancient cultures the world has ever known are on the brink of an experiment of change and modernisation. China's transformation will take place under the star of Communism and total rule. If the Soviet analogy holds good, the people will be battered into economic growth. India, in choosing the way of liberal democracy, has renounced the weapons by which spectacular progress can be achieved. Left to its own poverty, it cannot win the race to economic strength in which, in the eyes of all Asia, it is now engaged against China.

Yet India has potentially a great asset which China very largely lacks. It is the friendship and support of wealthier lands enjoying or capable of creating an exportable surplus of capital. India's achievements since independence leave no doubt of its determination and of its ability to maintain a democratic society. Even if there were no cold war with Communism, the West would have to take a vital interest in this vast attempt to transpose into the Asian key the experiment of free society. As things are, the challenge is clear, for the totalitarians have reached India's frontiers and, willy-nilly, the contest is engaged. In such conditions it would be folly on the part of the British Commonwealth or of the United States to withhold the margin of assistance which could hold India level in the race and enable it to achieve economic advance within a tolerant and humane society.

The Vintner's Custom

IN his latest essay on how to be one up, Mr Stephen Potter includes, as an essential part of the pattern of Gracious Living, a course in winesmanship. His admirable instructions on how to talk about wine without knowing about it will be amplified by the Christmas issues of many magazines. But it does not meet the problem of how to talk to the real expert. Here Mr Potter advises shifting the ground to what he calls "Percentage-ship." "Remarks like 'the consumption of treated vermouth rose from 47.5 in 1924 to 58.9 in 1926' will impart a considerable degree of paralysis to any wine conversation." This, perhaps, is the technique in which *The Economist* can best be of service to its readers.

The popular instruction in wine gambits that now pours from the book publishers might seem to suggest that more wine is drunk in this country than before the war. Full employment and the redistribution of income have brought wine within the means of an entirely new public; a new class of tourists takes holidays in wine-drinking countries, and beer has become very expensive. But if more people are drinking wine, they are drinking less in total than they did before the war. The quantity of wine consumed is known only approximately. It is indicated by customs and excise statistics of quantities withdrawn from bond—the point at which the duty is paid. These withdrawals precede the public's purchases by weeks or months or even years, but as they are made roughly in accordance with the rate of sales, they are a fair guide to consumption. The figures, which are charted on this page, show that Britain drinks only about two-thirds of the wine it drank before the war.

As the chart shows, it is the heavy wines that have fallen on bad times. (Heavy wines have over 25 per cent proof spirit content, or 27 per cent for Commonwealth wines; they include port, sherry, marsala and madeira.) The main reason for their loss of popularity is the duty, which is now 50s. a gallon, compared with 8s. before the war, while the preferential duty is 40s., compared with 4s. before the war. The duty on heavy wines was always higher than that on table (i.e. light) wines, but whereas from the beginning of the century until three years ago it was double the lower rate, it is now nearly four times as great. In 1949 Sir Stafford Cripps reduced the duty on table wines imported in cask to 13s. a gallon and freed all wine from quota restrictions, in an effort to help the other members of the Organisation for European Economic Co-operation, especially

France. The port and sherry shippers feel that the discrimination is somewhat anomalous. They plead that, whereas the capital invested in the wine trade in France is nearly all French, much of the capital invested in the wines of Spain and Portugal is British. About half the port trade is British. Of the three largest sherry shippers, exporting all over the world, two are British, and there are three other British firms of smaller but still substantial size.

The sherry trade in Britain has less to complain of than the port trade. Consumption is down by about 25 per cent in quantity, as compared with before the war; but as more people seem to drink the better and

more expensive types of sherry the money value, even at 1938-39 prices, is probably not down at all. But sherry now has to meet severe competition from two sources. One is South African sherry, whose appellation the dealers in Spanish sherry contest in the slogan, "Real sherry comes from Spain." If the South African wine producers succeed in improving quality as much in the next ten years as they have done in the last ten, their competition will indeed be formidable. The new popularity of South African sherry has not caused a great increase in wine imports from South Africa, for it has been offset by a decline in exports of "port-style" wines. Sherry's other competitor is gin. Gin became the British *apéritif* during the war when it was all that was to be had. A habit once formed is not easily abandoned, and the reappearance of other drinks has not

interrupted the steady rise in gin drinking; withdrawals from bond in 1950-51, at 3.8 million gallons, were over twice the quantity withdrawn in 1938-39.

The rise in gin drinking has not all been at the expense of sherry. It has profited by the scarcity of whisky, and it has also contributed to the decline of port, which has suffered much more from the change in drinking habits than sherry has. Less than half the quantity of port consumed in 1938-39 was drunk in 1950-51. Between 60 and 70 per cent of the port sold in this country before the war was sold in public houses; it was the favourite drink of the ladies in the public bar—8d. for a real port and 6d. for a "port style." But today, the same measure costs 3s. 6d. The ladies find it cheaper—and, drink for drink, more stimulating—to take gin. The "port styles," now about 2s. 6d. for the prewar sixpenny measure, have fared even worse than port proper. The effect on Australia's exports of wine to Britain can be seen in the chart.

Port has also suffered from the belief that it is not *comme il faut* to like sweet wine. In actual fact people do like it, but they have persuaded themselves that they prefer a dry wine. At least two popular brands of sherry get the best of both worlds by putting the word Dry into the brand name; but the port shippers have not found such an ingenious way of appealing to fashion and taste at the same time. A greater problem for the port-shippers is, however, that it was a drink for the rich at one end of the scale and for the poor at the other. It was not on the whole a drink for the middle-classes, except on special occasions, and has suffered from the processes that have brought more and more people into that income range. Those who would once have done their drinking after meals, lingering over the port and the dessert, now drink before meals and wash up afterwards; and in restaurants people are usually pressed to drink liqueurs, which have the advantage of being more expensive. But the port trade has hopes that another change in British drinking habits is impending. Television has already caused an increase in the drinking of bottled beer; why should it not restore port to its place in the British home? With some special attraction beginning at 8 o'clock, there is no time to drink before meals, and the post-prandial drink can come into its own. The British wine producers have thought of this, too, and a poster showing the good use that can be made of a few minutes' interval in the television programme is now familiar. The port trade, assisted by money from

Portugal, is about to launch a three-year advertising campaign, mainly in the popular press and addressed to well-to-do working class families.

*

A campaign to promote wine drinking in general is also in progress, initiated by the Wine and Spirit Association, and financed by a levy on its members. It is trying to persuade restaurants and public houses to sell wine by the glass, and to get wine merchants to sell wine tokens for gifts, on the book token principle. Its publicity, however, is not struggling against the tide as the port campaign must do. The consumption of table wines has been rising fast and is nearly back to the pre-war level. It reacted to the lowering of the duty on wine imported in cask precisely as Sir Stafford Cripps had no doubt hoped. It rose so much that the duty of 13s. a gallon in 1950-51 brought in more, at £6 million, than a duty of 25s. a gallon had yielded in 1948-49.

The change in the duty also had the desired effect on French exports. The amount of French wine released for consumption in Britain rose by 50 per cent in the two years that followed. It did not bring France to the head of the list as the principal source of Britain's imports of wine, but in the first ten months of 1952 France is second only to Spain as the principal source, both in volume and value. There was also a big increase in the proportion of wine imported in bulk; the amount of French wine so imported doubled between 1948-49 and 1950-51. The phrase *mis en bouteilles au château* is a guarantee of quality; but the name of a reputable British merchant on the label is also a guarantee—so much so that the re-export of wine from this country will earn more than a million pounds in the current year.

Wine bottled in London by a good firm is, of course, appreciably cheaper than the same wine *château*-bottled. The saving is not solely due to the difference in duty; it is also due to savings in freight, insurance and bottling charges. It raises the question whether the wine trade could not do more to raise consumption by lowering costs rather than by advertising. The common question is whether costs could be cut if there were fewer middlemen. Normally the grower sells to the shipper, whose agent in London sells to the wholesaler, who sells to the retailer. Retailers and wholesalers, however, often overlap. Chain shops, breweries and some big retail stores buy direct from the shipper. The economies that they effect thereby are small; mass production and distribution cannot be introduced into the wine trade; and bad mistakes can be made by trying to dispense with the agents' wide experience of the market. A firm of chain stores, however, has hopes that, by an agreement with the Bordeaux growers, it will be able to sell wine at less than the usual prices, and so create a new wine drinking public in the British working class.

Perhaps that will have a wonderful effect on industrial relations in Britain. *The Economist* of a hundred years ago would have thought so. "Wine," it declared in the issue of October 9, 1852,

is a cordial, a restorative, a medicine. It seems peculiarly adapted, like tea, to invigorate the nervous sensibility exhausted by the sedentary avocations of civilised life. . . . The people of Britain, rich as they are, unable to procure it at its present exorbitant price, consume the cheap substitute manufactured at home.

Plus ça change. . .

NOTES OF THE WEEK

Style and Titles

The Commonwealth Prime Ministers ended their conference by agreeing on a new form for the Queen's style and titles. They made a happy choice. The entry of the Asian countries into full membership of the Commonwealth had made "British Dominions" inappropriate, and the words are dropped; but it is a typically British spirit of pragmatic compromise that inspires the new title:

In the present stage of development of the Commonwealth relationship, it would be in accord with the established constitutional position that each member country should use for its own purposes a form of title which suits its own particular circumstances but retains a substantial element which is common to all.

Flexibility and good sense could hardly go further or emphasise more fully the real unity of the Commonwealth. Everywhere the Queen will be known as Head of the Commonwealth, the phrase adopted in 1949 when India became a republic. In India, that title will be all. In Canada, Australia, New Zealand and Pakistan the title will specifically refer to the United Kingdom as well as to the Queen's "other realms and territories." In South Africa and Ceylon it will not; that has, of course, some political significance. Pakistan, again, differs slightly from the other members; from respect, perhaps, for the republic on the border, the form "Queen of Pakistan" will not be used. South Africa also differs from the other Christian members by not using the phrase "Defender of the Faith." It is all, perhaps, very subtle, but both what is common and what is different in the titles is representative of the nature and the strength of the ties that make the Commonwealth a unit.

* * *

Brown's Study

The Labour party's national executive committee emerged from its weekend of socialist planning in Brown's Hotel, Mayfair, with ranks and tempers intact. Common ground between Bevanites and non-Bevanites has been found by the use of the magic word "planning," which can mean everything from outright nationalisation in Mr Bevan's mouth to bureaucratic prodding with orders and regulations when pronounced by Mr Attlee. The executive decided that the party should draw up a new United Kingdom plan, probably for five years, which will grapple with the difficulties not only of this country but of the sterling area. The official statement described its purpose as being to assist Britain "towards greater viability and to enable it to make its contribution towards the coherence of the sterling area"—language which is surely Mr Bevan's. The proposals will be elaborated by the executive's sub-committee on policy.

In this scheme, nationalisation is apparently to be seen not as an end in itself but as a means of furthering "viability" and sterling "coherence." Both Mr Gaitskell and Mr Bevan have lately made play with the (shaky) argument that production is increasing in the nationalised coal and steel industries, but is declining in the industries in private hands. The way things are moving can be seen from the decision to set up working parties to study further fields for public ownership. Heavy engineering, shipbuilding, the aircraft industry, chemicals and textile machinery are reported to be possible candidates which fulfil the latest tests of ripeness for nationalisation: they need heavy capital investment and they contribute to the export drive.

There is a promising side to all this. One must be thankful that at least the Labour party is defining the right objective for its policy—that of grappling with the economic problems of Britain in the contemporary world. Even Mr Bevan

seems to have shifted his ground from preoccupation with the social services. The ideas of Mr Gaitskell's former colleague at the Treasury, Mr Douglas Jay, seem to be emerging as a possible bridge between the non-Bevanite and Bevanite fields of thought about economic policy. Both sides endorse his aim of controlling the economy in the interests of heavier capital investment, though their endorsement may be a little less enthusiastic when the price—in terms of the living standards of the voters and the methods of control necessary—becomes more apparent. At this stage, there is little behind the vaguely-sketched proposals except a desperate determination to find some formula that will enable the Right to square more nationalisation with its conscience and moderate the appetite of Mr Bevan's socialist soul. The people left out in the cold are the Fabians and other "intellectuals" who a few months ago had awakened to the dangers of too much centralisation.

* * *

Politics of the Conference

The Government naturally resisted the Labour party's pressure for a debate on the Commonwealth conference this week, before Parliament rose for the month-long recess. It was determined to scramble the Transport Bill through the remaining three days of the committee stage. But a debate would have served little purpose in any event. It certainly would not have put the Government in any difficulty. Those Tory backbenchers for whom all salvation lies in higher imperial preferences have so far taken their disappointment philosophically. They had been well prepared for it. Presumably Mr Butler will at some stage face an embarrassing few minutes indicating exactly what exertions for the cause of preferences the British delegation made within the conference. But that is all; the Government has dealt with its Empire backwoodsmen neatly enough.

Nor, if one judges by the weekend speeches, would the Opposition's reaction to the Commonwealth conference have amounted to a forcible or even a coherent attack. Mr Morrison mildly suggested that the conference had not been "the great success we had hoped." In the mouths of less senior spokesmen, the same thought became "total failure" or "complete failure." For Mr Wyatt, the communique contained nothing that was not agreed or known before. But perhaps that was a superficial view, for Mr Gordon-Walker detected in it "ominous hints" that the British Government intends to embark on "further policies of deflation," and he suggested darkly that this might bring the Commonwealth into direct party controversy.

Mr Gaitskell, however, went into detail without finding any sinister intentions. His complaint against the Commonwealth communique was that it was either platitudinous or obscure, though his one definite point was relief that there had been no (immediate) action about convertibility. Presumably he was here using convertibility in the sense, defined in his letter to *The Economist* a fortnight ago, of "carrying with it non-discrimination." But in the debate on the Queen's speech last month, when he referred to the rumour that the Cabinet had all but decided on convertibility, he opposed it in the limited sense of recent discussion—convertibility for people residing outside the sterling area. Mr Gaitskell seems, in short, to be against it all; in spite of the international discussions in which the Labour Government accepted multilateral trade as the aim of policy, the party is now opposed to any changes in exchange policy in the foreseeable future. It seems unduly cautious and negative for men who cheerfully profess to be working out an economic plan for the next five years.

M. Pinay on the Edge

After guiding his coalition government through crisis after crisis, M. Pinay has run into the worst storm yet. His survival after the votes of confidence due to be taken next week is doubtful. A number of factors have conspired to heighten the atmosphere of crisis that invariably surrounds debates on the budget in the French parliament. Budget questions proved fatal to M. Pinay's two predecessors, M. Plevin and M. Edgar Faure, whose cabinets were brought down in January and February, 1952. It had been expected, however, that M. Pinay's tactical brilliance would gain acceptance of a modified programme of fiscal reform. What had not been foreseen was the rather sudden decision of the Gaullists to overthrow—if they can—the present government and to take part in a new coalition. This decision, which was expressed when M. Pinay asked for a vote of confidence on December 9th, has whittled his margin of survival down to less than ten votes; and even the latter are not assured.

The decision of the Gaullist Rally to go on to the offensive has been provoked by the return from Indo-China of General Koenig, who would be De Gaulle's choice for Minister of Defence. General Koenig has bitterly criticised the way in which Indo-China is being handled, and he has once again advanced the Gaullist thesis that Germany is on the way to re-establishing its hegemony in Europe while France is involved in North Africa and the Far East. As a result, the Gaullists are determined that M. Schuman and M. Letourneau must be displaced. M. Pinay's often expressed determination not to carry on without his Foreign Minister has brought the present crisis to an acute point. The Popular Republicans, who have so far supported the government, are bent on increased social subsidies, and the splinter party representing agricultural interests will have nothing to do with fiscal reforms involving more equitable taxation of farmers and landed proprietors.

Paradoxical though it may seem, it will be owing to the shortsightedness and ambitions of French Socialists that the Gaullists may finally get to power. They have made no secret of the fact that they would join a coalition in order to master it. M. Paul Reynaud has been uttering a series of prophetic warnings against the Gaullist Trojan Horse, and these may check the levity with which numerous deputies tend to consider a change of cabinet. If M. Pinay manages to survive it will be owing to a sobering of opinion at the last minute among various sections of the Assembly who may still consider him the lesser of several evils.

Camp Guards and Communists

The periodic shooting down of riotous Communist prisoners by UN camp guards in Korea is as puzzling as it is horrible. It would be less puzzling to British opinion if the State Department had furnished any information to the British Government about the inquiries into previous incidents, such as that at Kojé which cost 78 lives and that in Cheju which cost 45. Mr Nutting surprised the House of Commons on Wednesday when he revealed Washington's reluctance to pass the facts to allies whose good name is as much damaged as that of the Americans by the latest casualty list from Pongam—82 killed and 120 wounded.

That fanatical fighting men, who link arms and march into machine-gun fire, are extremely hard to control is obvious. In any large prisoner-of-war camp the opportunities for conspiracy and violence are legion. But it appears that little has been learnt from the Kojé experiences, in which the commandant was captured by the prisoners. How do 3,600 men get together in a properly run camp? Is it impossible to check outbreaks save with the weapons of heavily outnumbered guards? If the Korean prisoners are ordered periodically to stage demonstrations of valour—they can hardly expect to escape from the islands—let them find minefields or electrified wire or other aids to suicide instead

of a firing squad. It looks as if the American and South Korean guards have an impossible task, with the result that riot and brutality flare up every two or three months.

Stalin's Birthday

When Stalin celebrates on Sunday his 73rd birthday he can look back on a recent exceptional burst of energy. He has produced a fifty-page long economic essay, delivered a speech at the All-Union Party Congress and stood for hours in the Red Square taking the salute during the parade celebrating the 35th anniversary of the revolution. It could be argued that Britain's premier, who is older than Russia's, is equally active all the year round; but the road from Blenheim to Chequers was easier than that which Joseph Vissarionovich Djughashvili had to travel from the village of Didi-Lilo in Georgia to the Kremlin. The squalor and poverty of his childhood, the privations of adolescence, the hard life of a professional revolutionary alternating between hiding and deportation, the tension of revolution and civil war, the strain of the deadly struggle for power and finally of the war with Germany—all this should have been sufficient to sap the constitution of the sturdiest Georgian.

Has Stalin then "conquered nature" and have the experiments of Soviet scientists given their leader a new lease of life? There is no doubt that Stalin would be the first to benefit from their discoveries and that much time and energy have been devoted to the study of longevity. Only last week the Soviet Academy of Medicine held a special meeting at which methods of extending life were the chief topic of discussion. Indeed, the Kremlin has its own Institute for Long Life, of which the chief spokesman and propagandist is the old Bolshevik, Olga Lepeshynskaya. She restated a few days ago in *Izvestia* her confidence in soda baths as an elixir of life. According to important physiologists, she argued, the span of human life could be extended to 200 years.

On the other hand, in photographs Stalin looks tired and aged. What if, despite soda baths, he should be no Methuselah, but an ordinary mortal? It still seems possible that the recent Congress was his swan song. If so, what is to be said about the succession to him in those estimates of Soviet intentions about which American, British and other experts seem now to be differing? It is hard to believe that Soviet foreign policy without Stalin would remain unchanged; and it is not unreasonable to suppose that it might become less cautious, especially if there were conflicts of personal ambition at the top of the Moscow hierarchy.

Houses—But in the Air?

The Minister of Housing's decision to allow the almost unlimited building of houses for sale is an excellent thing provided that it does not show literally concrete results. It is an instalment of the freedom that figured so largely in Conservative election promises. It may not—it had better not—result in many more houses, but freedom is measured by what it is possible to do, not by what is done. Some controls remain. Houses must normally not exceed 1,000 square feet in superficial area—slightly larger than the "People's House"—but by special dispensation of the local authority it will be possible to build up to 1,500 feet. The amount of softwood used will be limited; and the regional officer of the Ministry of Housing will be able to stop the automatic issue of licences on application if his area is taking more than its share of building resources. The speculative builder is resurrected by giving him an initial allowance of up to 12 licences; but the rents and selling prices of the houses will be controlled.

The success of Mr Macmillan's housing programme is always catching the Opposition bathing and Labour members were clearly nonplussed by this announcement. It is difficult

for them to muster righteous wrath about houses for the rich at the expense of those for the poor when the Government has so easily beaten their record for the building of council houses. The number of houses built to let will be about 235,000 this year, an increase of 29,000 over 1951. Mr Macmillan made it clear that the licensing procedure would be brought into operation again if the building of houses for sale proved to impede local authority programmes. But in most districts that seems unlikely. Already the number of houses built for sale is less than the permitted maximum. A year ago the Minister altered the Labour Government's ratio of one house for sale to every four built to let to a ratio of one for one. But the actual ratio during this year has been only about one licence of a house for sale for every five to let. In a few areas this has been due to the local authority's prejudice against houses for sale, but the main reason is that not many people want to build houses.

The new freedom, in fact, is made possible, not by the success of the housing programme so much as by Mr Butler's policies. While houses to let are so heavily subsidised, dearer money has proved a powerful weapon for choking the demand for unsubsidised and uncontrolled houseroom. The new policy will not reduce the burden of the capital subsidies paid on council houses; but it will do no harm provided that it produces only a few more houses without increasing that burden. Fortunately for the economy, it is unlikely to produce 300,000 houses a year; and the beauty of it, from Mr Macmillan's point of view, is that when that embarrassing target is mentioned he can say simply: "But people can build if they want to."

Rents, Rates and Costs

The London County Council is to raise the rents of its houses by an average of 2s. 6d. a week from January 26th. This decision underlines—all the more forcibly because it represents the decision of a Labour majority—the outrageously anomalous relation between rents, rates and housing costs.

It is anomalous that the minority benefiting from new housing schemes should be subsidised by the majority who do not—and who, more often than not, are no better off than the council tenant. (In 1951 the weekly rate subsidy, quite apart from the Exchequer subsidy, amounted for one type of house to 26s. 11d. per dwelling.) It is anomalous that one class of council tenant—the occupiers of houses built before 1919—should be given total protection by the Rent Restriction Acts, while those who happen to be housed in post-1919 houses must pay whatever rents the council thinks fit to charge. But the biggest anomaly of all is the placing of local authorities and private property-owners on a different legal footing in the face of economic facts which affect them precisely alike. The fact that the LCC's upkeep costs have roughly trebled since 1938-39—rising from £6 to £17 per house—is certainly a logical justification for increasing the rents out of which these costs must be met. But a still stronger justification exists for allowing higher rents to the private landlord, whose alternative is often not to draw on other resources, as the LCC draws on the rates, but to leave repairs undone and deterioration unchecked. One would suppose, moreover, that as between the local authority whose houses were built as a social service and the private landlord who, no more immorally than any other investor, has chosen houses as a source of income, it would be the former rather than the latter who should be expected to carry without recompense any losses imposed by rising costs. On the contrary; it is the local authority that is legally allowed to raise rents, the private landlord who may not do so.

The LCC's decision is not, of course, unique. But it affects more tenants, and consequently has attracted more attention, than similar moves by lesser authorities. In the public mind, it should knock the last moral and logical prop from under

the crazy structure of the Rent Restriction Acts. Their survival henceforward will be nakedly recognisable as what it has long been in fact—the product of a demagoguery and an inertia that are equally discreditable.

No Progress in Kenya

The weakness of the Opposition's case in the debate on Kenya this week was ill-concealed. Its leaders must have known that had they been in office they would have been impelled to agree to the measures that have, in fact, been taken under a Conservative Government. Labour's motion began by reaffirming its support of all lawful action to re-establish peace and order, but expressed grave concern at measures involving the punishment of innocent people—which was roughly the view of the Liberal party as well. But would Mr Griffiths, who, as Mr Lyttelton reminded the House, was Secretary of State when collective punishment was imposed in Malaya, have refused to allow similar action in Kenya?

Yet there is considerable weight in Labour's fear that collective punishment, and other severely repressive measures, "if continued may permanently embitter race relations." It was argued in these columns three weeks ago that the measures could be justified if they met with prompt success. In fact, there is little sign that fundamentally the situation in Kenya is any better, and the grave question facing the Government, both here and in Kenya, is whether it is prepared to continue these distasteful measures indefinitely—in other words, whether it regards the situation in the Kikuyu lands as one of prolonged civil war.

No one will envy Mr Lyttelton or Sir Evelyn Baring his task, for it is hard to see what alternative measures could be taken. The rest of the Labour motion dealt with the delay in setting up the Royal Commission and, pending its report,

The Economist Diary

A reference book for the desk

For the man who seems to have everything he could want, *The Economist Diary* is the ideal present. The appointments and memoranda section is designed to meet the needs of the busy man and in addition there are 72 pages of facts and figures, which together form a complete reference book.

The reference material covers a wide range of subjects, including elections, national income, banking, taxation, crime, man-power, commodities, and a special section giving the basic facts on 47 principal countries in the world.

The volume is bound in red leather and measures 10 in. by 8 in. Price (U.K. only): 42/- including postage and purchase tax. Overseas prices vary widely; a schedule will be sent on request. Full details of *The Economist Diary* are given in an illustrated pamphlet available from:

Diary Department, *The Economist*,
22 Ryder Street, St. James's, London, S.W.1

Interim measures such as the progressive elimination of the colour bar, co-operative farming, higher wages, lower cost of living, new industries and more housing: in other words, for the most part, a long-term programme of economic and social development that is indeed badly needed but cannot be produced overnight—and is therefore largely irrelevant to the question of how to restore law and order. The colour bar is, however, a different matter. Its manifestations are so varied and its roots so deeply buried that here, too, progress can be only gradual—as the Labour motion recognised. With the formation of the United Kenya Club, a start has been made, but it is only a small one. A determined effort to eliminate the colour bar would certainly be unpopular among the Europeans, but some liberal action is no more than justice at a time when thousands of innocent Africans may be punished. It would not be a concession to terrorism. It would be a concession to decency and humanity, and one that in their own interests the Europeans ought to make. No other step that can be taken immediately would be so effective in showing the Africans that the Kenya Government is as anxious to improve the lot of the mass of innocent Africans as it is to repress those guilty of terrorism.

* * *

Two Welcomes for Tito

Marshal Tito is taking no great risk when he says that he will abandon his plan of visiting Britain only if half its people make it clear that they would prefer him to cancel it. In fact, the majority of British people are curious to see the man who stood up to Stalin, who fought a good fight against the Germans, and whose country has two characteristics they admire—dour pugnacity and small size. His advisers, who have not always accurately interpreted British opinion, should try to understand this feeling for “a good little ‘un,” and talk a little less of such high falutin’ matters as Labour Party interest in the decentralisation of Yugoslav economic controls or of the intelligentsia’s interest in the liberalisation of a Communist state. The Marshal has this further claim on British attention that he is the first Communist dictator to make an official visit to London; and he is one who can—with certain reserves—be welcomed with respect, not least because he is willing to visit the West.

The reserves have been made clear to the Yugoslav people by the ferocity with which the Belgrade press periodically attacks them. There are former fighting men who remember how Mihailovitch was eliminated. There are friends of the West who still languish in Yugoslav gaols. Above all, there are Christians—not only Roman Catholics—who know with Cardinal Griffin and the Archbishop of Canterbury that the intolerance and materialism of the Communist Party still make life weary and dangerous for Catholics and members of the Serbian Orthodox Church. If the Marshal will hear privately the views of a parliamentary group representing various faiths he will do much good. The Archbishop of Canterbury put it well when he expressed the hope that wrongs would be righted “as a contribution to international comity and understanding.”

There should be some understanding, too, of the Marshal’s difficulties. Nothing will shake his ministers’ conviction that the Vatican and Italian policy work together against their regime; that is why diplomatic relations with the Vatican have been broken off. Likewise, it is not easy for Marxist-Leninists to practise or understand real tolerance, especially when Leninist-Stalinists outside their borders are doing all in their power to make life intolerable for Yugoslavia. If Marshal Tito is to savour the breezes of liberalism in London they should not blow too fiercely. Above all, it would be a pity if Roman Catholics in this country found themselves shoulder to shoulder with Communists in public demonstrations against the visit. Such a united front, however accidental, between Christians and anti-Christians would be ludicrous and ineffective.

Deviations in Vienna

The People’s Peace Congress, which has been meeting since last Friday in the Vienna State Concert Hall, has turned out to be something of a boomerang for its Communist sponsors. Instead of the expected galaxy of stars from all over the world, only a few of the old familiar faces have turned up on the rostrum. M. Joliot-Curie proclaimed at length that peace was a good thing and the Dean of Canterbury refused to be interviewed in order that he might “not miss anything of this wonderful Congress.” The Communists have, however, snared a prize bird amongst the usual doves: M. Sartre arrived in Vienna and disclosed his conversion to “social realism” and his willingness to withdraw from performance his earlier anti-Communist drama, *Les Mains Sales*.

Two issues appear to have damped the ardour of the proceedings: the horror caused throughout Western Europe by the Prague trial and the Russian rejection of the Indian plan for ending the Korean war. In a gesture unprecedented at any previous gathering of this kind, several delegates and groups of delegates have sharply challenged their Soviet friends; despite precautions against it, there has been a considerable amount of spontaneous intervention from the floor. Signora Piaggio of Italy challenged the Russians to explain why Mr Vyshinsky had rejected the Indian proposals before even consulting Peking, and she urged the “people’s democracies” to reflect on their own armaments before denouncing those in the West. Before the organisers of the Congress were able to open the necessary trap-doors and get the show rolling again according to plan, a further bomb-shell exploded. Mr Saifuddin Kitchlew, a close friend of Mr Nehru, urged the Peace Congress to endorse proposals superficially like those put forward by India in the United Nations. He was heartily applauded and the name of Mr Vyshinsky was bandied about with some irreverence.

Before matters could get even further out of line, however, Mrs Felton rose to declare that no other proposals but those put forward by Moscow deserved consideration. She repeated the charge made by Mr Kuo Mo-jo, president of the Chinese Peace Committee, that the Indian plan was mere “appeasement.” Professor Bernal also hastened into the breach and assured his listeners that the opponents of the Peace Congress were bankrupt of ideas. The spectacle of British delegates supporting the Soviet line against an Indian group is not without piquancy.

East Germans Tighten Their Belts

It is not surprising that Herr Grotewohl should have angrily discounted western reports of a serious food crisis in Eastern Germany. Such reports must help to make the West Germans feel that they are better off as they are. Yet the news is substantially correct. Herr Grotewohl, himself, has admitted as much more than once, and so have his colleagues—and not only in words. They have, for instance, banned the sale of butter in the HO shops; they have had recourse to reserve supplies of meat, fats and sugar; they have disgraced Dr Hamann, the Minister of Trade and Supply; and they have wrenched 15 hapless ministers and under-secretaries of state from their desks and sent them off at the head of “brigades” to scour the countryside for milk (to turn into butter), pigs and cattle.

As far as can be gathered, the harvest in Eastern Germany is not good, has not been catastrophically bad—not bad enough anyway to account for the present crisis. A variety of explanations have been put forward to account for it. A switch of supplies to build up stocks for the new East German army may be partly to blame, but this reason can easily be exaggerated. The vagaries of the weather and panic buying by the consumer have certainly played a part. An inefficiency in the distribution organisation, due largely to the

“...has decided on a scheme
to modernize the docks
at a cost of...”

Where Vickers
can help

With the brief news announcement that an important scheme of works is to be put in hand, there begins a period of intense activity for those who are to carry out the task. Frequently Vickers are called in, for they have been supplying equipment for docks, harbours, railways and other large-scale projects since before the memory of this generation. These are not by any means their only activities, for the engineering skill and resources of the Vickers Group also contribute to progress in many secondary industries, including soap, paint, brewing, printing, and plastics.

Among the products and services of the Vickers Group are: SHIPS
SHIP REPAIR SERVICE • MARINE ENGINES • DOCK GATES AND
MACHINERY • AIRCRAFT • RAILWAY ROLLING STOCK •
INDUSTRIAL, MINING AND POWER STATION EQUIPMENT

new administrative pattern imposed on the country last summer, has undoubtedly been responsible for many local shortages.

It may be that one of the most important reasons for the shortages lies in peasant resistance to collectivisation. Since last July there has been no room for hope that Eastern Germany would be spared this ordeal. There is, of course, no lack of lip-service to the voluntary principle; but the importance attached to building up the Machine Tractor Stations (upon which all but the richest peasants are dependent for farm machinery) is only one sign that Messrs Grotewohl and Ulbricht are not uninstructed in how to force peasants into collectives. It is true that only about 2 per cent of arable land has so far been collectivised; but these small beginnings have had a quite disproportionate effect upon the farmers' thinking. Even if the more lurid tales of sabotage and resistance are taken with a pinch of salt, the fact remains that over 2,000 well-to-do farmers fled to the West during October alone; only men moved by a very strong compulsion would abandon their land and their livelihood in this way. It is reasonable to accept the reports that many of those who stay behind are being highly unco-operative, to say the least.

Digging among the Ploughed

The universities, no less than the schools, are much exercised by the problem of selection that has been created by the postwar extension of education. At a conference in London last weekend delegates from all the British universities considered, among lesser matters, success and failure at the university and their relation to performance in entrance examinations. Sir Alexander Carr-Saunders gave some interesting figures about the London School of Economics. Of 305 students who, in 1949, were admitted to read for BSc (Econ), only 207 obtained the degree in 1952; 35 had withdrawn from the course for various reasons not accounted as failure, but the remaining 63—21 per cent—failed. Only 2 per cent failed in the final examination; the rest had failed in earlier examinations and had been "sent down." Their weakness had been undetected by the entrance examination, but it was revealed early in their university careers.

Sir Alexander suggested that the failures were often those who were "inconspicuous in the student body"; and the impression that failure in examinations goes with failure to take a full part in the life of the university was confirmed by the experience of Aberdeen University. A frequent cause of failure, it was suggested, is the student's inability, after the spoon-feeding of school work, to adapt himself to university methods of teaching. Sir Alexander was right to urge that universities should on no account take to spoon-feeding themselves; but the co-operation of the schools should be sought in making sixth form methods of work a preparation for the university, as they are in the best schools.

Most of what was said at the conference consisted of impressions and theories, and served to underline the need for an empirical study of the causes of success and failure. A ten-year research project, now half completed, has been undertaken by the Nuffield Foundation with the co-operation of Sheffield University, and should yield some valuable data. The inquiry begins in the grammar schools, where university candidates take psychological tests; those who afterwards enter the university are asked to undergo further tests and to give information about their subsequent careers. All this is related to their performance in university entrance and subsequent examinations, and to their university records as a whole. The survey would be still more valuable if it could be extended—if more students would supply information, if more universities would take part, and if the

duration of the inquiry could be prolonged to cover the subsequent careers of university graduates and not merely their first jobs. That would require more money, which the state might have to supply. But it would be worth while spending some money to avoid financing students who cannot fully benefit from a university education.

Butter, Bacon and Social Justice

In the House of Commons last Monday Major Lloyd George faced a barrage of Labour questions about certain rationed foods of which, according to his interlocutors, the poor cannot afford to buy their full entitlement. Large quantities of bacon and butter, it appeared, were being left on the retailers' hands by old age pensioners and others with small incomes and, most illegally and immorally, supplied by those retailers as off-ration supplements to their wealthier customers. The Minister's reply was a straight denial of the alleged facts. No one, however, questioned the moral basis of Labour members' indignation at the idea that those who prefer, and can afford, butter should get the benefit of any butter which others, for one reason or another, are not buying. The shabby and spiteful doctrine of "I can't, therefore you shan't" not only keeps an unchallengeable emotional hold on the Labour party; for Conservatives it apparently has enough validity, or at least enough hypnotic effect, to keep them silent when it is reasserted.

It is particularly and nakedly silly where bacon and butter are concerned. For the consumption of bacon, as the record made clear, is actually higher among the poorer than among the wealthier consumers—at the present ration level, in fact, it depends on taste; while butter, according to past Labour doctrines, is entirely indistinguishable from margarine, an article of purely symbolical superiority, to be forgone, one would think, without the slightest hardship in favour of margarine. Those deluded consumers who pretend to distinguish genuine butter from the bland, inoffensive and totally uninteresting ersatz should surely be gratefully allowed to waste their own money on backing their own nutritional fancy, leaving the less extravagant product to less picky customers. But that would not suit the Labour ethic. Since butter retains, in spite of Dr Summerskill, a reputation of especial desirability, social justice demands that no more should be available to anyone than the amount which the poorest can afford. One can only be thankful for those limitations of the administration machine which prevented, even at Labour's apogee, the rigid application of this principle to all the amenities which make it worth while to earn an income above the minimum.

Below Egypt's Standards

The unfounded charge that Britain has been deliberately squeezing Egypt and making sterling scarce by not buying its cotton has been repeated in an unexpected quarter. It appears in the normally impartial and accurate Economic Bulletin of the National Bank of Egypt's Research Department. Tables given in another section of the same journal reveal the real reason for the decline in British purchases during the period under review, namely the price charged by the Egyptian government then in office. The Bank's table of Egypt's balance of payments by areas in the first six months of 1952 shows the grave falling off in the purchases of most major buyers—notably the United Kingdom, but also India and Western Europe—with reductions (as against the first half of 1951) of £22 million, £13.5 million and £10 million respectively. The Bulletin elsewhere mentions that during the same period British army expenditures fell by over £4 million; it would have completed the picture if it had added that the British were naturally spending less sterling

inside Egypt at a time when its government had encouraged the local labour and small trading population to leave the Canal Zone.

The cotton position is, however, the biggest factor in Egypt's earnings of foreign exchange and the following British import figures for the first ten months of 1952 show how the recession in Lancashire has affected not only Egypt but all suppliers, with Brazil suffering most. It should be noted that Lancashire regards the Nile Valley as its prime supplier only for long staple cotton—that is, for fibres of 1½ inches or over; for the medium staple varieties it prefers American types, though it turns to Sudanese or Egyptian medium staple—the choice of purveyor depends on price—whenever dollars are too short to buy from America:

BRITISH IMPORTS OF RAW COTTON
000,000 lb

	Jan.-Oct. 1951	Jan.-Oct. 1952
Long staple from		
Egypt.....	66	12
Sudan.....	149	59
All other.....	2	5
	217	76
Medium staple from		
Egypt.....	65	14
Sudan.....	13	18
USA.....	113	184
Brazil.....	115	1
Other.....	323	206
	629	423

These figures do not include purchases from the 1952 crop now being sold. Sales records for the period September 1 to November 26, 1952, show that Egypt, by comparison with the same period of last year, lost slightly more custom from India and Australia than from Great Britain; there are some encouraging signs of a revival in the market for December as *The Economist* goes to press. Egypt is the victim not of deliberate boycott, but of world over-stocking two and three years ago, of a recession in the world textile trade and of its own price policy. Far from desiring or creating its present shortage of sterling, Britain is suffering from it, for it is losing contracts and customers who would have been content to go on buying British but are being forced to turn to non-sterling suppliers.

Free Trade Begins at Home

Any hopes that European countries may have had of a relaxation of British import controls were rudely dashed last week when Mr Eden, presiding at the Council of Ministers of OEEC, announced that the gold and dollar reserves of the sterling area did not permit of any major relaxations on imports from outside it. Members of the organisation had been anxiously watching Britain convert its deficit in the European Payments Union to a surplus; for it is an important market for all of them and the import cuts made twelve months ago, and again last March, wrecked many of their export plans.

No longer is it profitable for France, Belgium and Holland to send their pigs to the canning factories to provide this country with tinned ham. They have lost, too, the profitable market for sweet fat, chocolate crumb and even piping jelly, which are only a few of the devices used by British food manufacturers to get round domestic sugar rationing. These marginal industries that had grown up in Europe because of British rationing became lucrative enterprises, though they hardly helped to solve its dollar problem; if anything, they made it worse. But Europe, hearing Britain plead with the Commonwealth for freer and expanding trade, was hoping that it would set the example by restoring its liberalisation programme.

This apparent British perfidy requires explanation. It is true that the drain on the sterling area's reserves has been

stopped, and that the sterling area is again accumulating gold and dollars. But the monthly balance in Britain's overseas trade accounts is still precarious. To restore the cuts now would almost certainly perpetuate the biennial crisis and 1953, being an odd year, would show a large deficit. More important still is the simple fact that, so long as Britain's rationing is maintained, no internal fiscal measures can fully cope with keeping its payments accounts in balance. Rationing implies scarcity, which automatically gives a price premium (and generally a large one) to substitutes. European manufacturers have not been slow in recent years to show British manufacturers how the various restrictions can be evaded by dressing up food in a different form or packet. They would continue to do so, given the opportunity.

★

To free trade from restrictions is an objective worthy of more than lip service. The fourth annual report of OEEC—the best so far—shows quite clearly that it is only through freer trade that competitive forces will be allowed to work so as to develop production, increase productivity and “accelerate the process of progressive adjustment which is needed in European production if substantial progress is to be achieved towards a better utilisation of European resources and capabilities.” But if internal adjustments are not possible because of rationing and other forms of economic protection, then freedom of trade can lead only to crisis. If Mr Eden wants to prove his good faith to Europe in this matter, Mr Butler will have to speed up the process, already started, of increasing economic freedom at home.

A Bad Budget

It is not to be denied that Mr Disraeli's Budget is a maximum of disturbance to obtain a minimum of benefit. The half of the malt and hop duties prospectively repealed, the tea duties prospectively lowered, the house tax extended and the rate doubled, the income tax modified and extended to one species of property in Ireland, all the town householders inflamed with discontent, Ireland roused into anger, nobody pleased and great numbers of persons offended, long debates, and a shattered Ministry, are all effected by a Budget which leaves the revenue of the Government not much less than before, and the industry of the people with every existing shackle. We are to have many changes and no adequate improvement. In a commercial country nothing worse can be said of a Budget. That no change should be made, except there be the highest moral probability that it will effect great improvement, is a canon of political science, and particularly of the science as professed by Conservatives. To reform proved abuses was their only maxim of change. The Budget introduces changes which nobody demanded, and reforms no abuses. . . . Mr Disraeli's present changes—which are so deficient in any guiding principle that they contradict one another—may be followed by other similar changes, taking away half the soap duties and half the paper duties, and raising the rates on large incomes derived from realised property, thus exposing the community to a perpetual series of changes in our fiscal and commercial relations, unsettling all business, making all contracts uncertain, and the rewards of every exertion really precarious. There is no greater evil, we repeat, for a commercial community than to have and to be threatened by continual changes in regulations affecting daily business. Our so-called Conservative Ministers, however, are beginning a series of great changes without adequate cause, which will beget other similar changes, and cannot fail to involve our daily business in perplexity and confusion.

PLASTICS inspire new ideas

A number of British European Airways Pionair-Leopard

Class aeroplanes had to be adapted for the double duty of carrying passengers at week-ends and freight during the week. The aircraft interiors had to be fitted with surface materials

that would be pleasant to the eye for accommodating passengers, yet able to withstand the rough and tumble of freight carrying. Plastics again supplied the answer. Wall coverings of plain and patterned fabric woven from Saran yarn; window coamings, bulkhead panels, kicking plates, luggage compartment and toilet linings, roof trims and labels made of Cobex (vinyl chloride copolymer).

Plastics combine colour, attractive appearance and toughness. They supply the answer to many problems. If you're in search of a material let our Technical Service Department tell you how far BX Plastics can help. Write to Dept. E.A.1 for full range of literature.

Letters to the Editor

Living with the Dollar

Sir,—Your survey has performed an important service in pointing to the need for a vast increase in international liquidity, in the form of an Atlantic Payments Union, to supplement the present inadequate gold reserves. This should suffice to act as a buffer, not only against seasonal fluctuations, but also against those year to year fluctuations which are probably inevitable in high-employment economies. It is not clear, however, how you expect by this means to solve the chronic "dollar shortage" which you so admirably diagnose.

On the one hand you say—with perhaps undue pessimism—that the sterling area, even by adopting your recommendations as to disinflation and exchange rate adjustment, though it might eliminate the need for dollar aid, could not remove the need for discrimination against dollar goods. On the other hand, your Atlantic Payments Union has no other weapon to correct fundamental disequilibrium among its members than to compel deficit countries to adopt one or other of the same two policies whose adequacy you had previously doubted.

Perhaps your point is that only through the pressure of the APU could deficit countries be induced to pursue these policies with sufficient vigour. If you are advocating greater international control over exchange rates one would be inclined to applaud. But you are vague on this subject.

Instead you say: "The main weapon to force debtors towards solvency should be a far greater insistence on internal disinflation." Dangerous doctrine! To correct a payments deficit by curtailing aggregate demand for the country's goods and services (as distinct from preventing undue increase in such demand) inevitably involves gratuitous curtailment of production and employment, which could have been avoided by other methods of adjustment. It is no accident that the widespread use of this technique in 1951 and 1952 has coincided with a serious set-back to the expansion of European production and trade. Your figure of 3 per cent unemployment as a limit beyond which countries should not be pressed to deflate is reassuring, but many enthusiasts for "monetary discipline" might find their way on to the managing board of an Atlantic Payments Union who would regard this as pusillanimous.

What could be more dangerous to the political solidarity of the West than a situation in which it could be plausibly alleged—however unjustly—that European governments were engaged in creating unemployment at the behest of Wall Street, etc., etc.?

A sounder approach, I suggest, would be (a) to continue walking the tight-rope between inflation and deflation, at a high level of employment, (b) to use exchange rate adjustments to correct fundamental disequilibrium, as revealed by the persistence of a need for import restrictions, as and when this can be

done with advantage to export earnings, and without stimulating cost inflation at home, (c) meanwhile, to continue to apply import restriction with discrimination so as to avoid the senseless throttling of mutual trade between non-dollar countries, and (d) to refrain from international payments arrangements which would encourage a premature adoption of non-discrimination in trade.

—Yours faithfully,

MARCUS FLEMING

Columbia University,
New York, N.Y.

The Claws of the Dove

Sir,—May I comment on your leading article of December 6th, which so rightly emphasised the nightmarish features of the Prague trial. The anti-Semitic features which erupted so glaringly in the course of this trial seem to merge into a deeper and even more sinister pattern. Two main categories of Communists appear to have been liquidated lately or are still being prepared in jail for their public ordeal. They seem to be: firstly, virtually all Communists, however orthodox, whose Stalinist faith may have been adulterated by western contacts. The majority of those of Jewish origin fall into this category; but so do men like Clementis, Novomesky, the "demoralised Interbrigadists" who had taken part in the Spanish Civil War, and a number of others. Secondly, the old party apparatus—Slansky, Reicin, Frank, Svab, etc.—has been virtually demolished. This must seem odd, especially when one recalls Stalin's rise to power as well as the fact that the "anti-state conspiratorial centre" now liquidated had undoubtedly the dominant position in Czechoslovakia in the years 1948-50.

The trial appears to mark a new stage in the process of total absorption of the satellite countries in the Soviet motherland. No real "Titoist" tendencies ever appeared among the Communists now liquidated. However, the only centres of potential, even theoretically possible, future opposition have now been demolished, undoubtedly by direct Moscow intervention.—Yours faithfully,

H. J. HAJEK

Edgeware

Restless Iraq

Sir,—While well-intended, the comment on Iraq in your issue of November 22nd is based on a misapprehension. You maintain that the controversy over direct and indirect systems of election is not the real issue in dispute. You rightly attribute the prevalent "restlessness" to the discontent of a rising middle class which finds itself governed by the rural classes, that is by "a peasant population that is still in thrall to a small sheikh and landlord class." The unrest, in other words, is a phenomenon of what may be termed (for the lack of a better phrase) a "class-struggle" analogous to that before the Reform Bill of 1832. This is conceded, but the suggestion that the unrest can be solved by installing in power the two "experienced" politicians

—Saleh and Nuri—in order to carry out a radical social and economic long-term reform, is paradoxical. For such a solution would quite clearly mean the support of the representatives of what were described in your own words as "landowning and tribal interests." Do you seriously think that either man is capable of effecting the necessary reform which is, admittedly, so detrimental to his supporters' interests? Have they not both been in power, on and off, all through the eventful Regency period? And is not the present state of discontent the creation of their own clique? To accept this line of analysis one is made to believe that the rotten boroughs of eighteenth century England could not have been reformed by any statesman other than Sir Robert Walpole.

Apparently the assumption on which your analysis was based is that the Old Guard's "experience" would enable them to maintain "stability" in the country—a prerequisite for any long-term programme of reform. It is submitted here, however, that what stability the country has seemingly had was actually maintained at the expense of great instability in the future. One hardly need recall the series of abortive military coups and tribal uprisings (in the South and in the North alike) which took place in the Regency period, in support of this submission.—Yours faithfully,

F. SHEHAB

Baghdad

Bank Salaries

Sir,—I fully agree with Messrs. Angus Maude and Roy Lewis that the important issue of their book is the relative prosperity of the professions. One of my complaints, not mentioned in their letter, was precisely that the adverse comparisons made between conditions in the joint stock banks and in other financial institutions are based on misconception. What purpose could be served by comparing the earnings of an unappointed bank clerk with those of a fully qualified actuary, even if there were no dispute about the figures?

As to commencing salaries, Messrs. Maude and Lewis may rest assured that their estimates are certainly not over-generous. But are they particularly relevant to the broader issue? Whatever the proper designation of their seniors, juvenile entrants to the banks are scarcely, at that stage, "professional people"; junior clerks naturally receive junior clerks' wages.

The point at issue is the prospects that banking can offer to those who qualify for positions of responsibility, and it seems to me beyond dispute that the passage to which I referred gives a false picture. The authors may not have set out to write a vocational guide; but their stimulating book may be used as such, and it is for that reason I felt entitled to invoke the courtesy of your columns.

—Yours faithfully,
W. MANNING DACEY,
(for Banking Information Service)
London, E.C.3

Books and Publications

Twentieth Century Wellington

The Private Papers of Douglas Haig, 1914-19. Edited by Robert Blake. Eyre and Spottiswoode. 383 pages. 25s.

Haig was on the main battle-front of the First World War from beginning to end, commanding half the British army for the first sixteen months and the whole of it for the remaining three years; it was his army under his direction which finally won the war at a time when almost everyone else expected it to last another year. He was, except on paper, inarticulate; he exercised no popularity-winning arts; but his soldiers believed in him so intensely that, though Lloyd George longed to get rid of him, he never dared to do so.

Throughout the war Haig kept a detailed diary, which was sent home in instalments, typed, and ultimately bound in forty volumes, together with relevant letters to or from the writer. Only one-sixth of it is published in these closely printed pages, but the remainder is, we are told, mostly concerned with military detail which has lost interest. There has been no "expurgation," such as was very properly exercised by Mr Duff Cooper when he wrote Haig's "Life" eighteen years ago. One may wonder how Haig found time to write at such length. Perhaps the answer is that he did not play bridge, and took his necessary relaxation this way.

It was more than a mere relaxation. How satisfying, for example, after a tiresome interview with Generals Wilson and Rawlinson, to add "Both these men are humbugs." Neither the writer nor his subjects deserve to be judged primarily by such comments. Haig is anything but inarticulate in his diary. Perhaps "mordant" is the best word. Dozens of highly placed persons pass across the stage, and much more blame than praise is bestowed. Even when he likes a man he does not necessarily admire him. Joffre, for example, was a nice old thing, but "the poor man cannot argue, nor can he easily read a map." There is only one hero in these diaries, the British soldier, meaning thereby the rank and file, the N.C.O.s and the regimental officers. Corps commanders and the like, eminent individuals, may (or may not) escape the flick of disparagement but seldom win a word of praise.

Everyone knows that Haig had his own private wars with Lloyd George, Sir Henry Wilson and others. The revelation of these diaries is the very low opinion Haig entertained of the French armies from start to finish. That has caused pain, as well it might, for the French, having failed in 1940, have fashioned for themselves a legendary version of their performance in 1914-18.

The striking feature of the book is the portrait of the diarist himself that emerges. This man is not in the least like any of the modern generals, the Eisenhowers and Montgomerys; but he is very like the Duke of Wellington. There is the same natural assumption of

aristocracy; Haig's money came from whisky but, as he casually remarks, the Haigs of Bernersyde are "the oldest family in Scotland" and his marriage had placed him securely within the highest circle. Again and again in the diary, a man is, or is not, "a gentleman," and that settles it, just as it so often did for the Duke. There is the same cool, sardonic outlook on men and measures, the same curious simplicity and limitations, the same blend of pride and piety and the same utter integrity.

The editor contributes a long introduction covering Haig's previous career and the principal controversies, political and military, of the war. Each chapter has an introductory note, that on the Passchendaele controversy, for example, being a model of lucidity and impartiality.

Lessons in the Kikuyu

Mau Mau and the Kikuyu. By L. S. B. Leakey. Methuen. 115 pages. 7s. 6d.

Although this little book shows signs, in the writing, of the haste with which it was produced, it nevertheless impresses the reader by its authority and complete lack of partisanship. No one could be better qualified to write it than Dr Leakey, for he was born and bred among the Kikuyu people; speaks their language as well as he speaks English; is preparing a detailed study, written but still unpublished, of Kikuyu customs; and worked for two and a half years with Kikuyu elders and men of his own "age-group" in the tribe.

What has been described by reporters in Kenya since the Mau Mau terrorism began becomes much clearer as one reads this book: in particular, the significance of the oath and hence of the oath-cleansing ceremonies. The Kikuyu background against which the terrorism has been carried out is also much better appreciated: the breakdown of the old tribal social customs without anything equally valuable and stabilising taking their place; the formal adoption by many Kikuyu of Christianity while in reality they disown all religion (according to Dr Leakey, Mau Mau's adherents are drawn neither from the genuine Christians nor from those who still hold to the religion of the Kikuyu, but from those who profess Christianity—to obtain its material advantages—while not believing it).

Dr Leakey does not, of course, take the view that the coming of the British was a disaster, in spite of the ensuing disintegration of the old Kikuyu society. His purpose is to place Mau Mau in its true setting, and in particular to show to what extent Kikuyu land grievances are genuine. Nor is he solely expository. His concluding chapter sketches the sort of measures that should be taken to prevent a recurrence of the present situation. This book ought, indeed, to be

required reading for all members of the House of Commons who presume to speak about Kenya—not excluding the Secretary of State.

Achievement of Compression

The Shorter Cambridge Medieval History. By the late C. W. Previté-Orton. Cambridge University Press. 2 vols. 1,202 pages. £2 15s.

The title of this work is in some ways misleading. It is not, and was not intended to be, a digest of the eight volumes, written by many different scholars, of the large Cambridge Medieval History; it is a quite separate work by one author. In most ways this divorce between the two is an advantage. A great amount of the first five volumes of the large History has been rendered obsolete by subsequent research, of which Previté-Orton took full note, while he obviously relied heavily on the last three volumes, whose findings are still in most cases valid. The major item on the debit side is the absence of any form of bibliography or suggestions for further reading. This lack is especially acute since many readers of the new work would be rather lost in the detailed bibliographies of the older one. It may well be thought, however, that this loss is more than compensated by the inclusion of well over two hundred and fifty excellent illustrations, which found no place in the more austere eight-volume History.

After Previté-Orton's death Sir Maurice Powicke wrote of his "breadth of view, sensitive sagacity... [and] patient and inexorable learning." These qualities, in both their positive and their negative aspects, are well illustrated in his last work. Anyone who wishes to understand the movement of ideas behind developing medieval society or the crucial stages in that development will have to look elsewhere. But the reader who seeks a patient, careful, and on the whole readable narrative of the main events in the political, economic and religious life of the Middle Ages will find it in this work. The achievement of compression is considerable, as any specialist will realise; experts might quarrel, for instance, with one or two nuances in the description of Byzantine administration, but as a basis for understanding the working of the most complicated government machine of medieval Europe it is first-class. There are, however, times when compression reaches the point of obscurity; anyone unfamiliar with the works of Kingsley might find it hard to understand why a mob of Alexandrian male-nurses should suddenly decide to set upon Hypatia ("celebrated for her beauty, ability and charm of character"), drag her to a church "and there horribly kill her with tiles." The antecedents and results of this startling event are left obscure.

The work of the two collaborators deserves special praise. The illustrations chosen by Dr Steinberg have a

Christmas Cards

LET 'POST' ADVISE YOU
How to go one better than your friends

If sent Jolly Robins (B) show your distaste by sending scientific robin (A). If sent A, suggest with surrealist robin (C), that surely Art has its place. C, in turn can be made to feel out of date with very late Pischewepso (D). To make A, C & D feel absurdly highbrow, all you have to do is send Jolly Robins (B).

FOR THE YOUNG FOLK

ROARS OF LAUGHTER from the young and young of heart in 'Post's' new XMAS PUDDING GAME OF SPHERING THE SQUARE.

Cut out this square. Paste it on to a piece of old cardboard or preferably binding paper. Cut neatly along dotted lines, holding point of scissors towards chest and if directions are exactly followed, HEY PRESTO!! and there is your XMAS PUDDING.

Now for fun and larks. Six or eight young people, preferably of opposite sexes, pick sides. The leader holds pudding on thumb balanced at point D, and when the three girls shout BRANDY SAUCE the boys make a pyramid with their hands and the festive sphere is snatched from one corner to the other of the rectangle of players.

Post's GIFT BOX free to all

yearly subscribers who have sent cheque. ORIGINAL CHRISTMAS GIFTS For grown-ups. Are you a doctor? We will send you a novel NEW ERA two-way rustless schwepposcope.

For children. An underwater submarine which explodes at a touch. Complete with realistic imitation atomic anti-submarine gun. Or genuine WIG-WAM (above) with scalping knife and scalp.

Iceland tops Norway's GIFT

Norway's generous gift to Schweppshire of a young Christmas Tree for planting in denuded Schwepping Forest has been followed by Iceland's giant duty-free snowman, in the likeness of Disraeli, friend of Scandinavia.

freshness which adds to their interest for illuminating the text; how many professional medievalists know the complex architectural plan for the "ideal lay-out of an abbey" from St. Gall or the picture of the Hamburg Town Council in session? Of the work of the other collaborator, who revised the whole text after the author's death, it is more difficult to speak, since Mr Philip Grierson modestly keeps his contribution anonymous throughout. Those who know the work of both men will, however, know also that there are many places where Mr Grierson's work has not been confined to the addition of the useful maps and tables.

Social Money

Geld und Gesellschaft. By Wilhelm Gerloff. Klostermann. Frankfurt a/M. 288 pages. Dm. 25.

In the opening sentence of his "State Theory of Money," Knapp defines money as "the creature of law." Inspired by this formula, Dr Gerloff defines it in his opening sentence as "the creature of social relations." By this he means that money owes its origin to non-economic social requirements, and that money had served social purposes long before it came to serve economic purposes. He quotes prehistoric and ethnological evidence to show that, long before the growing complexity of barter made the use of money inevitable, it had been used to satisfy social needs. It was used for religious sacrifices; for payments as tribute, blood money, fines, and bride price; and in order to win prestige by sheer display. The author lays exaggerated stress on the last use at the expense of the others.

Although primarily concerned with the non-commercial aspects of money, Dr Gerloff emphasises the decisive importance of its adoption for commercial use on economic evolution. He points out that premonetary economies, which had been overwhelmingly static, were replaced by dynamic economies as a result of the adoption of money. This must strike a sympathetic note in the ears of students of static economic theory, who envisage the stationary state as moneyless. Oversimplified as Dr Gerloff's formula is, it is beyond doubt that the adoption of money greatly accelerated progress in both the economic and social sphere. In his "Greek Commonwealth" Sir Alfred Zimmern gives a fascinating account of the economic revolution, and its far-reaching social effects, resulting from the adoption of money in Ancient Greece.

Dr Gerloff argues that in modern society as in primitive society the possession of money confers prestige and power and the desire to achieve prestige and power through the possession of money is even today the chief economic driving force. In putting forward this argument Dr Gerloff confuses the concrete meaning of money with its symbolic meaning. When the preacher declares that "money is the root of all evil" he does not have coins and notes in mind. In his sense, as in the sense in which Dr Gerloff applies it to modern conditions, money is not the concrete means of payment

but simply a symbol of wealth, whether in the form of cash or bank deposits, investments or real property. Wealthy people owe their prestige to the large amount of wealth they hold in non-monetary form.

Dr Gerloff, apparently anticipating this criticism, takes the line that in modern conditions money is synonymous with "purchasing power." This is doubtless correct from the point of view of a theory of prices. But then, in his introductory chapter he emphatically disclaims that his social theory has any bearing on the value of money. When dealing with primitive conditions, he uses the term "money" in its concrete sense. It is on that basis that he has made an original contribution to monetary theory by analysing the social aspects of money. Having departed from this use of the term when dealing with modern conditions he lapses into vague generalities and ceases to be original. In spite of this "Geld und Gesellschaft" is a truly remarkable work and should influence economic literature within and outside Germany.

Shorter Notices

Capital and Employment. By R. G. Hawtrey. Longmans. 337 pages. 40s.

"Capital and Employment" was first published in 1937. The present edition is, however, virtually a new work, taking into account both the practical experiences and the theoretical advances of the intervening fifteen years. The central thesis, that of the superiority of Bank Rate as a stabilising influence to any fiscal, monetary or physical alternatives, remains essentially the same. The qualified student, to whom the book is exclusively addressed, will not only find it valuable as a weighty and penetrating statement of Professor Hawtrey's own views but as an illuminating survey of relevant modern economic theory; for Professor Hawtrey proceeds for choice by comparison and criticism, working his way from Professor Hayek's "Prices and Production" through Keynes's "Treatise," "General Theory," Professor Pigou's "Theory of Unemployment" and Mr Harrod's "Trade Cycle" to the United Nations' report of 1949 on national and international measures for full employment. His survey does not, however, cover the modifications and refinements which Keynesian theory has undergone since the "General Theory" was published; while this omission does not weaken his thesis, it does leave a gap in an otherwise richly comprehensive picture.

Design and Decoration in the Home. By Noel Carrington. Batsford. 232 plates. 144 pages. 30s.

This is a most attractive and useful book. Mr Carrington's approach is based on the various functions of the home and the different needs of social life. The compact modern dwelling, the old converted mansion, the bedsitter and the caravan are discussed in a practical and stimulating manner. A section is devoted to each main room of the house, to its lighting and heating, to contemporary designs in furniture, fabrics, wall-coverings, tableware and kitchen equipment. Contemporary furniture has emerged from the self-conscious modernity-at-all-costs phase of the thirties and the unavoidable severity of the "utility" period, and has found its balance in clean, graceful, simple lines and a sensitive use of beautiful materials. Woods from India and Australia, as well as oak and walnut, are used in their natural state with

great decorative effect. Designs compare favourably with the best of traditional models—and are often based upon them—and can blend harmoniously in the home with antique furniture. In textile designs and pottery British craftsmen are showing themselves to be second to none. With public interest aroused by the many recent exhibitions on furnishing the home and the efforts of the Council of Industrial Design, manufacturers and retailers have less opportunity for passing off the ugly and shoddy.

The text is but a small part of this book, for Mr Carrington wisely lets his well-selected photographs tell their own story. One could, however, do with a little more of the advice he offers so tantalisingly. The firms and designers mentioned in the text and plates are indexed, but their prices are not given. The emphasis is on products manufactured and obtainable in this country, although there are a few references to Scandinavian designs.

Kashmir: Its Cultural Heritage. By Dr. Kaumudi. Asia Publishing House, Bombay. 206 pages. Rs. 12/8.

It is pleasant at last to meet a book on Kashmir which is neither a farrago of population figures and UN declarations, nor a lyrical description of natural beauty. Dr Kaumudi's theme is Kashmir's real, though rather thin, culture. There are some temple remains, two well-defined schools of miniature, and a very considerable body of poetry, mainly either mystic or love lyrics, and all deeply imbued with feeling for the flowers, streams and mountains of the Kashmir countryside. Even the "proletarian" poetry of the last twenty years apparently keeps to this tradition with some rigidity. Dr Kaumudi has provided a fair number of translations of Kashmir poetry of every age, and it is that which makes her book worth reading for any student of Eastern culture.

BASIL BLACKWELL

AMERICAN SURVEY

New Start for Uno?

New York

TO Americans who are concerned about the United Nations and American support for its principles the combination of Mr Henry Cabot Lodge's appointment and Mr Dulles's recent speech gave new hope. Senator Lodge will bring vigour and ability to his post as head of the American mission to the United Nations, an office too long in the hands of a devoted statesman rendered unfit, by age and ill-health, for any but the lightest of honorary duties. Observers are outspoken in their hope that the appointment of other new men of the first calibre will follow, to strengthen American prestige and help find solutions for the mounting problems of the United Nations.

As for Mr Dulles's speech, this first policy statement by the incoming Secretary of State (delivered from a recording while Mr Dulles himself was with General Eisenhower) shows quite clearly that wishful rumours about the new Administration's lack of interest in Uno have no foundation. In it Mr Dulles's support of the United Nations rings clear and unequivocal. He calls for intensification of the American "determination to perfect an organisation for world peace and justice." He recognises that in these seven years of experience there have been errors as well as trials, "but the lesson is to persevere." And he proclaims that "if freedom is to seem worthwhile, free men must lead the way to a just and durable peace."

The words are brave, and they carry with them emotional overtones of a time when Americans were far more optimistic about international organisations than they are at present. Then the phrase "just and durable peace" was a battle cry. Those who have wondered whether the new Secretary of State had forgotten those days will do well to remember that he used the words in the title of a book, and that it was the church Commission for a Just and Durable Peace which gave him a platform for speeches he made before the San Francisco Conference. These played a large part in bringing him to his present stature. That commission helped prepare the American public to forsake isolationism and accept the responsibilities of international leadership.

Whether the churches could again arouse so warm and abundant a wave of idealistic support for the United Nations is doubtful; Mr Dulles himself pointed out that the novelty has worn off and unexpected difficulties have emerged. Perhaps a more important question is whether such an attempt would be wise unless the churches can at the same time create a support which is informed as well as fervent. The ebbing of that earlier tide has shown that emotion alone may be dangerous as well as inadequate. If religious bodies are again to take the lead, if their members this time are to start "making the United Nations into a more effective instrument for achieving international order and justice," they will have to educate as well as inspire.

The two tasks are not of an equal order of difficulty. In its favourite mirror the United States still sees itself as an ebullient, generous young nation, sharing its wealth and its strength with a world which somehow cannot seem to catch up. It does not see so clearly the need for time, for patience,

or for willingness to understand both the problems of other peoples and the difficulties created by American attitudes. On the one hand, the Constitution is sacred. On the other, so is the slogan: "If a thing doesn't work, throw it out."

Mr Dulles's call to a new crusade comes at a time when many Americans think the United Nations does not work, and a few of them say it should be thrown out. How completely they believe this remains to be seen. The most fevered doubts are expressed by people with whom it is hard to reason, and the loudest critics of the United Nations are found among those who know least about its workings. Even Senator Wiley, now that he is serving as a member of the American delegation, has shifted his fire so that it is directed not so much at Uno as at the State Department.

Nevertheless, in a country where public opinion is venerated even when perverted or deformed, this criticism cannot be disregarded. Given the fact that it is directed against huge and complex organisms engaged in a multitude of tasks, the virulence with which these critics personify the objects of their hatred is astonishing. They regard Unesco as a corrupter of youthful patriotism. The Secretariat of the United Nations is pictured as a refuge for Communists and Communist sympathisers, or even a Soviet plot to gain control of the United States. With hardly more reason, men who should know better claim that membership in the United Nations weakens American sovereignty and opens the way to the overriding of American laws. Representative Wood of Idaho finds American membership in Uno

a crime perpetrated against us by a coterie composed of out-and-out minions of Soviet Russia, pro-British Fabian Socialists, Rhodes scholars and just plain traitors to America.

Happily this hyper-patriot was not returned to his Congressional seat in the November election, but he can still find an audience.

Even the respectable American Bar Association has been drawn into this emotional whirlwind, and has offered an amendment to the Constitution which seeks to weaken the treaty-making powers of the United States on the plea of protecting the country against the supposed inroads of international agreements. It remains to be seen whether this action was, as some suspect, a political move against the Truman Administration which will fade away under the impact of the Dulles speech.

By the customary pattern of action and reaction which ordinarily rules in these affairs, a sturdy tide of defence of the United Nations should by this time be setting in, and there are those who see this in the cheerful crowds that throng its buildings, buy pamphlets and souvenirs in the gift shop, and sit for long hours listening to dull speeches. The

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

hunt for "subversives" in the United Nations may be at its height, but more thoughtful people realise, with Justice Burton, that "the power of governments today to destroy those whom they accuse is very great," and agree with Judge Hand that "risk for risk, I would rather take my chance that some traitors will escape detection than spread abroad a general suspicion and distrust." As the recent Supreme Court decision against the Oklahoma loyalty oath shows, the Bill of Rights still has powerful champions. But optimists will do well to note that, on the same day that Mr Dulles's speech was delivered in Denver to the Council of Churches, Senator McCarthy was given a medal by admirers in New York.

Yet there are reserves of sympathy for the United Nations beneath the surface which can be tapped. One of the extraordinary features of the San Francisco Conference was the marshalling of public opinion behind American participation in the United Nations. Many of the observers who represented voluntary organisations covering a wide range of interests at San Francisco are representing those same groups at the United Nations today. Some of them have become remarkably expert at their job of keeping a steady flow of information and guidance going back and forth between the United Nations and the American grass roots.

They include representatives of the Council of Churches, labour and trade associations and so on and can rouse the intelligent and educate the emotional. They may even be able to persuade their organisations that what the United Nations most needs is a body of informed citizens in member countries who can bring intelligent criticism to bear on its ways and its woes. Toward this end the Carnegie Endowment for International Peace is working in sixteen countries, encouraging groups such as the Royal Institute of International Affairs in London to appraise the activities of its own nationals at the United Nations. The Brookings Institution has undertaken a three-part study. Its legislative history of the Charter is almost finished; its study of United Nations activities is well under way, and it is formulating recommendations for revision of the Charter in order to have them ready when they are needed.

These are the people to whom the Dulles speech comes as a long-awaited challenge. They do not get as much publicity as the McCarran Committee and the Federal grand jury which have been investigating charges that some United Nations employees are subversive, but they may prove to carry more weight in the long run.

American Notes

Parting Shots

President Truman would have done better to repress, even if he cannot forget, his bitterness about the election campaign and the attacks on his Korean policy. He could have taken quiet satisfaction from General Eisenhower's cautious comments, which have already shown how little basis there was for the Republicans' confidence that they could pull out of a hat the honourable and safe solution which has eluded the present Administration. And the State of the Union message, which Mr Truman is to send to the new Congress before he gives way to General Eisenhower, provides an opportunity to sum up the achievements of his government and defend its decisions.

But the prospect of conferences between the new President and Mr Truman's old foe, General MacArthur, tempted him to a final volley of the plain speaking for which he is known. Mr Truman is convinced that his Korean policy has earned him an honourable place in history, and that misre-

presentation of it won many votes for the Republicans. He may well be right. But now that most Americans have decided to forget and forgive what was said in the campaign, the renewed insistence that General Eisenhower's promise to go to Korea was "demagoguery" contrasted painfully with General Eisenhower's dignified silence. It has disposed of any hope that the transition period might be eased by friendly relations between the outgoing and the incoming Presidents.

General Eisenhower's expression of interest in General MacArthur's "new solution" for the Korean hostilities, and the friendly meeting he has now had with him, were examples of the tact and magnanimity for which he is famous. No details of General MacArthur's proposals are yet available, but it seems unlikely, as Mr Truman said, that he has hit upon a plan for ending the war without incurring heavy casualties or running the risk of spreading it. If he has, Mr Truman is right to insist that General MacArthur should have informed the Department of Defence, rather than using the plan to re-establish friendly relations with General Eisenhower, whom he ostentatiously refused to support during the campaign. But General Eisenhower was committed to do nothing but listen to his party's military prima donna, whose main grievance was that he had not been consulted. Like Senator Taft, General MacArthur may have to be satisfied with this.

* * *

Pirates of New York

The current investigation of the New York waterfront by the State Crime Commission is revealing little that was not known already to the initiated about the ransoms which are exacted from shipping companies and other commercial interests in return for delivery of their cargoes by the pirates who control the city's longshoremen. But the notoriety now given to the details of this buccaneering may, through the

Located in the heart of the City, the London office of this old established bank offers its services to those interested in trade with countries in the Americas and throughout the world.

THE HANOVER BANK

(Incorporated with Limited Liability in U. S. A.)

LONDON . . . 7 Princes Street, E. C. 2

NEW YORK . . . 70 Broadway

pressure of public opinion, force the various officials concerned to abandon the complacency which has enabled this scandalous system to take hold. It is mainly responsible, as the enquiry is making clear, for the unsatisfactory and expensive conditions which are making ports other than New York increasingly attractive to foreign trading and shipping firms.

The city and port authorities have apparently been ready to let things slide as long as the shipping and stevedoring companies do not complain; it may even have been made worth the politicians' while to turn a blind eye to the waterfront. The companies have preferred to pay up rather than to walk the plank of a longshoremen's strike; they have also appreciated the close control which the present union leaders, occasionally assisted by a little extra-legal "persuasion," can exercise over the tough New York dockers. And the American Federation of Labour, to which the International Longshoremen's Union belongs, insists that it cannot interfere in the internal affairs of an independent union, even when it is, as the federation admits, being "used by gangsters."

The most infamous of these are the four Anastasia brothers, Italians who originally entered the country illegally and have since then been constantly linked with, although seldom convicted for, such organised criminal activities as bootlegging, gambling and murder syndicates. They and other leaders of union branches, who control hiring on the city's piers, have been recruiting longshoremen in the prisons. These ex-convicts are carried on the stevedoring contractors' payrolls but work only at organising thefts from incoming cargoes, ranging from passengers' luggage to a two-ton consignment which was purloined complete with its own lifting crane. A contractor who tries to get rid of these expensive employees is soon silenced by a strike. Even such an apparently spontaneous movement as the patriotic refusal in 1950 to unload two ship-loads of Russian furs could be checked by the payment of \$70,000 to the right union official.

The Crime Commission has published details of gifts amounting to over \$180,000 given by 43 shipping and stevedoring companies to 99 union officials during a recent four-year period; altogether about three times as much was probably handed over during this time. Included were substantial annual presents to the president of the longshoremen's union, Mr Joseph Ryan. These gifts certainly justify the 40,000 dockers, most of whom must be honest men, in suspecting that their union representatives at wage negotiations may have been more interested in what they could get for themselves than in what they could get for their members. If, as is possible, Mr Ryan retires before long, resentment can hardly fail to boil over into a bitter struggle for control of the union—and probably into another strike on the New York waterfront.

All Clear for Construction

Improved supplies of steel and copper have made a substantial relaxation of controls on construction possible in the New Year, months earlier than had been expected. Aluminium will be restricted at least until May, because output has recently been curtailed by electricity shortages, but this does not seriously hamper the building industry. More materials will now be available than at any time since the Korean outbreak for commercial and public buildings, such as garages, offices and hospitals, and for apartment houses and private homes. Most important, the complete ban on the building of entertainment facilities, such as cinemas and swimming pools, has been removed, although only small projects of this kind are yet permitted.

House building has in fact suffered little if at all from restrictions during the past year. The number of residential non-farm housing units started each month has been running steadily ahead of last year and the total for 1952, at about 1,160,000, will only have been exceeded in 1950 and is

unlikely to be surpassed for some time to come. For there is every indication that, with about 7 million new housing units completed since 1945, the postwar demand for houses has nearly been met, in the medium-priced class at least. Prices are not yet falling noticeably, but in many towns houses at over \$10,000 are selling slowly. The removal of government controls on mortgage credit did disappointingly little to stimulate demand. Furthermore, the low birth rate in the nineteen-thirties is now affecting the marriage rate and it may be some time before the number of new families formed each year begins to rise again.

Private expenditure for new industrial building will also be falling next year, as expansion for defence purposes is completed; this may go down by as much as 25 per cent.

Source: U.S. Department of Commerce.

Much of this decline will, however, be compensated for by the building of projects which have been deferred while materials and credit were short—both public works, such as schools and highways, and private commercial and recreational facilities. Public utilities are also likely to go on expanding and government expenditure on military construction and atomic energy installations should continue to rise, at least during the first part of 1953. So will actual spending on housing, since many of the residential units started this year will not be paid for until 1953. As a result the dollar value of building in the United States, at an estimated \$33.5 billion, is expected to break all records next year as it has done this. When allowance is made for increases in prices, the actual volume of construction will be about the same as it was this year and last—always provided that the country's economic prospects continue to look bright.

Higher Education's Deficit

Three years ago the Association of American Universities appointed a twelve-man group to locate the causes and prescribe a cure for the financial ailments of the nation's universities and colleges. One-fifth of all Americans go to college, but, despite this mass market, institutions of higher education fail to make ends meet, professors are underpaid, and building plans remain blue-prints.

The present study was financed by the Rockefeller Foundation and the Carnegie Corporation. Its diagnosis, embodied in an eleven-volume report, is that it is inflation which has sapped the purchasing power, not only of the endowment income of private institutions, but also of the appropriations granted to state colleges by the legislatures. In addition, the services demanded grow more complex and more expensive, while income from students—the major reliance of private colleges and universities—cannot be counted upon as long as the need for military manpower remains uncertain.

Some small remedies the colleges can apply themselves. They can be more economical; many try to cover too much

What are silicones, Mr. Sims, Sir?

The silicones are a most interesting group of materials based on organic compounds of silicon.

To industry the most outstanding merit of silicones is their marked resistance to the effects of intense heat and cold. They are used, for example, in jointing and insulating materials for jet engines and electric motors. They have other special applications in heat-resistant paints, car polishes, and the shower-proofing of textiles.

Midland Silicones Ltd. are the marketing organisation for the full range of silicone rubbers, resins, varnishes and fluids, some of which are already being manufactured by Albright & Wilson Ltd.

Chemicals for Industry

ALBRIGHT & WILSON

ALBRIGHT & WILSON LTD. 49 PARK LANE · LONDON · W.1

NEW 156

academic ground, and would do better to join forces with their neighbours and exchange students in certain specialties. Those with government research contracts might insist that the government pay some of the overhead, as well as the direct costs of the projects. State institutions might legitimately ask their state governments for more generous allowances. Student fees charged by the private institutions, which have gone up by 60 per cent in the last ten years, might go even higher, but this might divert students to the public universities.

However, all these suggestions are drops in the bucket of a need for operating funds which the commission estimates at \$250 million for the present year. More would be needed if professors' and instructors' salaries were to be raised, still more if the colleges, universities, and professional schools were to prepare for the peak of 2,500,000 students expected in 1960 when the crop of war babies comes of campus age. This year enrolments have started to creep up again for the first time since the record year of 1949; there are 2,150,000 students at the college or university level.

It is to business and voluntary groups that the commission looks for relief, not to the federal government. This is in accordance with the popular American view which holds that federal controls are likely to accompany federal contributions, but that business gives without strings attached. The federal government now contributes about \$500 million a year, in the form of grants to ex-servicemen and medical schools and payments for research. Corporations are reminded that they can give up to 5 per cent of their income to charity free of tax; a very small fraction of this would solve the problem. Colleges and universities are urged to speed the forming of regional begging groups which make giving as little trouble as possible. Already nearly \$3 million has been raised in this way for the nation's medical schools, whose deficit is the most intractable of all. It is permissible to wonder, however, what would happen in a depression to universities which had come to rely on annual voluntary gifts to pay their bills.

* * *

Segregation at Stake

The question of whether the constitutional rights of Negro children are infringed by the segregated schools maintained in seventeen states and the District of Columbia has at last been put squarely before the Supreme Court. For three days last week Mr Thurgood Marshall, the Negro counsel of the Association for the Advancement of Coloured People, and the driving force in its campaign to tear down the colour bar, argued that segregated schools, however excellent, constitute a denial of equal opportunity, a badge of racial inferiority, and a violation of the Fourteenth Amendment. This amendment was passed after the Civil War to prevent the southern states from abridging the rights of their newly liberated Negro citizens.

Five cases involving segregation were heard, but Mr Marshall's main opponent was Mr John W. Davis, the eminent constitutional lawyer, fresh from his victory over Mr Truman in the steel seizure case, who was briefed by the State of South Carolina. In Mr Davis's view, segregation is a legislative policy, well within the rights of the states, and no more involving constitutional issues than does classification by age, sex or mental ability. Unlike Mr Marshall, who insisted that the South "is not lawless" and would abide by the Court's decision, Mr Davis suggested that the results of striking down segregation could not be viewed with equanimity, and a spokesman for Virginia insisted that an adverse decision might destroy public support for the schools in his state. Finally, Mr Davis argued that the Constitution, which the Court for over fifty years has interpreted as permitting segregation, cannot overnight be reinterpreted to outlaw it. Since 1896 the Court has ruled

that segregation is constitutional as long as equal facilities are provided for Negroes. In recent years "equality" has been defined more and more rigorously in educational cases, often forcing the abandonment of segregation on the university level, but the basic theory has not been challenged. From their questions, however, some of the Justices appeared to feel that the Constitution, which has been stretched so far in other directions, should also be flexible where human rights and changed conditions are involved.

The District of Columbia, which is not a state and is governed directly by Congress, is not affected by the Fourteenth Amendment. It has had segregation ever since Negro education began, and Mr Davis pointed out that the same Congress which approved the Fourteenth Amendment within a month or two approved segregated schools in Washington. Could it, he asked, have meant to bar the states from doing what it authorised in the District of Columbia? Segregation may not survive in Washington, however, even if the Court decides it has no jurisdiction and that the remedy must be left to Congress. General Eisenhower, during the campaign, pledged himself to stamp out every vestige of segregation in the national capital. No one expects a decision in these momentous cases until next spring and, when it comes, it may not be as clear-cut as either Mr Marshall or Mr Davis would like.

Shorter Notes

Meeting last Monday in the capitals of the 48 states, the presidential electors, chosen by popular vote, cast their official ballots and General Eisenhower is now really President-elect. A grand total of 61,547,861 Americans, 20 per cent more than went to the polls in 1948, voted for eleven Presidential candidates last November; General Eisenhower's official poll was 33,927,549, compared with the 27,311,316 votes cast for Governor Stevenson. Nine other parties shared 308,996 votes among them; and of these groups, the Socialist party has since announced that it will no longer run candidates for national office, since it has ceased to be an effective political force. The Progressive party, which obtained over a million votes for Mr Henry Wallace in 1948, received fewer than 100,000 this time; most of its potential voters chose Mr Stevenson, particularly the Negro electorate, which in northern cities gave the Governor larger majorities than Mr Truman received from this group in 1948.

*

The SS *United States*, which cost \$78 million to build but was acquired by the United States Lines Company for \$28 million because of a construction subsidy and government allowances for special defence features, has just had its price tag marked up to \$38 million. The government, after investigating charges that it bore an excessive share of the cost, has decided to reduce it by \$10 million, which will be recovered for the Treasury by withholding future operating subsidies from the company. The company, on its side, is threatening to return the liner to the government rather than pay the increased price.

*

An indication of the size of the Ford Motor Company's empire—which is a closely kept secret, since all the voting stock is held by the Ford family—was given this week in a *Wall Street Journal* report that stated that the company's sales in 1951 were \$2,952 million and its profits, after taxes, \$87 million. Although Mr Henry Ford said these were "figure-guesses," he did not dispute the newspaper statement that the Ford Company is the second largest automotive firm in America.

THE ROYAL CHARTER COMPANY FOUNDED IN 1759

Would a better Canteen help production in your works?

Better food input unquestionably helps work output and highly efficient modern ranges built by Carron Company make better cooking easier. Further, by low fuel consumption, they reduce running costs and so make good meals a practical proposition. Carron Company have built all types of cooking apparatus for nearly two hundred years and Carron equipment may be heated by solid fuel, steam, gas, oil or electricity. The advice of Carron experts is available on the most suitable installation for your works and they will be glad to plan the complete layout for you. Regular maintenance contracts can be arranged. Write for further details to Department C.A.

the very flower of packs

Snug and shapely, the poppy-head is hard to match for inspired packing. But Bowaters, too, do nice work—they can be counted on for safe and thrifty protection for many products. Five separate companies go to form the Packaging Division of the Bowater Organisation—they handle paper in a multitude of forms. Their corrugated cases, sacks, drums, spiral-wound canisters, paper bags and protective wrappings carry British goods all over the world and offer strong evidence of a service that has solved many packaging problems.

THE WORLD OVERSEAS

The Chinese Trade Puzzle

RECENT press reports about British trade deals with China have helped to create a belief that great things are happening, or about to happen, in that direction. Rosy forecasts have been made of huge new markets for British exporters—particularly if the United Nations embargo on shipment of strategic goods to China is eased. Some interesting deals have in fact been made with China since the Moscow economic conference of last April, chemicals, fertiliser, and wool tops being the principal commodities involved. But the reality behind the rosy visions is not a comforting one. Most of the British goods sold to China this year had nothing to do with the Moscow conference. Even if they were all reckoned as its fruits, the targets for Sino-British trade set up at Moscow would still be undershot by a very big margin.

This failure has nothing to do with the UN embargo, for the Moscow "trade agreements" were drawn up after the British party had made it clear that they could not deal in embargoed goods. Nor has it been due to lack of initiative at the British end; since April, three separate organisations have been set up in London to foster trade with China and other Communist countries, and an impressive number of British businessmen have visited East Berlin to talk with the Chinese trade mission there. But there they have met with impossible offers and unrealistic prices, and the Chinese have refused to come to Britain themselves.

Nor are the prospects for the future at all hopeful. In the first place, the Chinese are still relentlessly "squeezing" such British concerns as are in their grip. Hongkong firms are not subject to "squeeze" on this scale, but their offers of goods have been spurned by the Chinese even when they eventually have to pay more elsewhere. But it is interesting to note that, despite this policy of deliberate boycott, the Communists have found it necessary to use some of these firms as export channels.

Five Depressing Clouds

This is only one of a number of pieces of evidence which suggest that Peking's original plan of ignoring the "traditional" pattern altogether and routing its external trade through Communist channels has come to grief. Earlier this year, many goods of Chinese origin, such as pig bristles, were being offered to western buyers by trading organisations in the East European satellite countries. In some cases they were priced so low as to indicate either that the Chinese had parted with them for a song, or that the satellites, having been landed with these goods as a result of transactions within the "Comecon," the Soviet bloc's international economic system, were forced to dispose of them as best they could. Recently, however, new offers of such goods have been made by the Chinese directly to British firms in the Far East. The explanation would seem to be that the Soviet bloc has not fulfilled its promises of absorbing China's export surpluses; that the Chinese are now beginning to look for purchasers who will give them a fair price; and that, receiving from the Russians little except arms for the Korean war, they are having to sup with the devil in order to obtain foreign exchange for other purposes.

But in this sorry state of affairs there is no silver lining for the British trader. The Chinese, tangled in the new intricacies of state trading on Stalinist lines, are by no means wholly disillusioned about the benefits of tying their economy

to the Soviet chariot-wheel. And even if they were, the outlook for Sino-British trade would still be darkened by five depressing clouds. The first of these is the Communist Government's policy of economic self-sufficiency. Peking has just claimed that China's output of cotton goods is now 60 per cent above its prewar peak, and still rising. There is little opening here for Lancashire; if any marginal supplies are required from abroad in the future, they will probably come from Japan, whose cheap products are more suited to a China where austerity is still *chic* than the better quality British cotton goods. It is true that some orders for cotton goods have already been placed in Britain. But the Chinese admit quite frankly that these were merely meant as an encouragement to British firms, and that there will be no steady demand. Apart from a few more similar "sweeteners," there is no prospect of any substantial market for western consumer goods.

No Export Surpluses

Meanwhile, the things which China now wants most badly from the West are machinery and heavy equipment of types which, for the most part, are not only covered by the UN strategic embargo, but are also the very things for which the whole world is crying out, and for which no new markets have to be found. To meet China's demands in this direction, British industry would have to disappoint better customers elsewhere. There would be a stronger case for meeting such demands if China were still an important source of raw materials. But the third depressing element in the picture is that China is no longer such a source. The isolation of the country, first by the Japanese war and now by its own deliberate act, has led other countries to develop alternatives for, or alternative sources of, a number of Chinese staple products.

What, then, will China be able in future to offer to the world in exchange for its needs? No great volume of trade can be built on bristles, soya beans and dried egg; and even as regards foodstuffs, no large dependable surplus seems likely to arise if all Peking's claims of rising consumption levels and falling mortality rates are true. Some Chinese Communists, admittedly, point out with disarming frankness that the People's Government can easily reduce the consumption levels of the people, and thus create an exportable surplus. But, however faithfully Stalin's example is followed in this as in other respects, the record of Soviet state trading does not suggest that China would prove a reliable trade partner. A certain amount of "surplus" rice can always be found to serve a temporary political end (as Peking found it for India last year, at a time when it had itself admitted the existence of famine conditions in several Chinese provinces) but no considerable volume of imports can be financed by such methods.

Indeed, the fifth and hardest fact of all is that even in prewar days China was not a major trading nation—except in relation to Japan. It has always been largely self-sufficient, and even Britain, most active of all western nations in this respect, never counted on its actual trade with China—as distinct from shipping and other services—for more than a small fraction of its commerce. The time is long past when western merchants were hammering on China's doors, seeking tea, silk, porcelain and other exotic goods which commanded high prices in Europe. But the Peking Government,

curiously enough, seems to have reverted to those days. Its representatives often take, or feign to take, the view that trade is a matter of indifference to them, while to the West it is a matter of life and death. In fact, the boot is on the other foot. China now has little to offer to the free world, either in supplies or in reliable markets; but it is in real need of a limited amount of specialised western products, if only for as long as it has to bear the heavy burden of its war in Korea. This need explains the Peking Government's continued use of the very "China trade" firms which it denounces, its growing impatience with the amateurishness of some of the new friends it made at the Moscow conference, and its readiness to pay for unwanted "sweeteners" in the hope that they will become a wedge with which to split the UN embargo. But in none of this is there any foundation for the belief that rich markets await the westerner who penetrates to far Cathay; and it is perhaps time that British businessmen stopped listening to the successors of Sir John Mandeville and faced the facts.

Europe's Third Chance—II

Dollars for Defence

WITH the virtual disappearance of American economic aid to Europe, offshore purchases will become the only direct means by which Washington can supplement the dollars that European nations earn through ordinary commercial channels. The latest example, announced this week, is the purchase of some 500 British tanks for Europe at a cost to the United States of \$90 million. The economic implications of this new method of aid were discussed in the previous article. The machinery used to effect these purchases is somewhat cumbersome and still in the process of development, but the basic principles are clear enough.

There are three main stages in the completion of the offshore procurement programme. The first is an assessment of the need for military equipment in each of the Nato countries. This assessment is carried out in concert between each European government and the appropriate American "Country Team." Such a team is formally headed by the Ambassador and is made up of the American Military Assistance Advisory Groups attached to each US Embassy (who carry the main burden of responsibility), representatives of the Mutual Security Agency and US Treasury, and officials of the Embassy proper.

Jointly these parties arrive at an estimate of the military requirements of each Nato country, of the prospects for unaided military production, and thus of the gap between needs and capacity. It is this gap that has to be closed by American military aid—aid which is either in the form of equipment supplied from the United States or of equipment bought for dollars in Europe, that is, offshore purchases.

Once this report (known among American officials as the "green sheet") has been completed, it is forwarded to the office of General Handy, who is deputy to General Ridgway in the latter's capacity of commander-in-chief, US Forces, Europe. In turn it is then dispatched to the Defence Department in Washington; and this procedure means that the recommendations carry the *imprimatur* of the American armed forces. In the past these country reports have not contained specific suggestions for offshore purchases; but today they tend increasingly to note those items that might best be obtained by this means.

Meanwhile, working from much the same collection of facts and figures, Mr Draper's office in Paris prepares detailed recommendations for military items to be purchased in Europe. This is the second stage. Mr Draper, the US "Special Representative in Europe" wears three hats. He is chief of the Mutual Security Agency in Europe and at the

same time US Representative on the Council of Nato; in addition he has under him a deputy for certain defence functions whose department is the one primarily concerned with offshore procurement. Defence production experts in Mr Draper's office, who are thoroughly conversant with productive capacity in Western Europe, make the initial selection of items that might be feasible for offshore procurement. In preparing their recommendations these experts call for suggestions and advice from the various "country teams," from both the political and economic specialists in Mr Draper's office, and finally from the international staff of Nato. Although this process of co-ordination is complicated and time-consuming, it does give Europeans a voice in offshore procurement, it ensures that a balance is found between economic and political factors, and it encourages the development of a unified arms programme.

When these recommendations are completed, they, too, are forwarded to General Handy's headquarters. At this point they are sent—for examination and comment only—to the procurement offices in Europe of the three American Services. Their comments are incorporated and the final recommendations for the offshore procurement programme are sent out to the Defence Department in Washington. It is here that the two sets of reports—the "green sheets" and the offshore procurements—are married and final decisions taken. All of the recommendations are examined at the Defence Department and by each of the three Services. When agreement is reached, each of the Services issues an order to buy direct to its own procurement office in Europe. Ordinarily these orders do not bear the name of any specific manufacturer, but are simply authorisations to purchase a certain piece of equipment in Europe. The procurement offices then call for bids from European manufacturers and proceed to negotiate the actual contracts.

Buying Europe's Aircraft

* This, generally speaking, is the procedure for offshore buying in Europe, but from time to time there are variations. The substantial programme for offshore procurement of European aircraft is a case in point. On this occasion Mr Draper asked Nato experts to prepare the initial recommendations for the programme; moreover, a special American evaluation team, which has just concluded its work, was sent to make on the spot tests of the individual aircraft.

While it is true that Europeans are, at several points, given a say in offshore procurement, the programme remains largely in American hands—and, specifically, in American military hands. The tendency is inevitable, since the equipment is being purchased with dollars, and it is plainly America's interest not to spend them in such a way as to narrow its own military production base. Americans naturally argue that if at any time defence production must be expanded rapidly, there should be a given minimum capacity on which to build. Therefore, the inherent conflict in the whole programme is between this American drive at home and Europe's dollar needs—political, economic and strategic.

The question now arises whether the effort to balance claims could not be performed with less friction and with greater efficiency by placing the problem entirely in the hands of Nato. This is a solution favoured not only by Europeans but also by many of those Americans responsible for offshore procurement. It would help to eliminate any suspicion among the smaller countries of coercion or neglect, and it would make for less haphazard co-ordination of defence production than now prevails among members of the alliance. At the moment Nato lacks the officials and the authority to do the job; it will require a special effort by the secretariat and the member nations to make Nato strong enough to accept the new responsibility.

(Concluded)

Two Flags for Eritrea

A UNANIMOUS vote of the United Nations is worthy of a sentence to itself. Last week, by 52 votes to nil (with only the five members of the Soviet bloc ungraciously abstaining) the Assembly congratulated itself and the United Kingdom on a happy finish to a joint job in Eritrea. Satisfaction was the greater because, at the start, disposal of this piece of Mussolini's ex-empire had seemed so difficult. First, the Big Four had disagreed over it; then the Assembly, whose decision they had bound themselves to execute failing a decision between themselves, had first rejected the Bevin-Sforza plan for part-fusion with Ethiopia and then appointed a five-power commission which emerged from its labours with two if not three different solutions, all purporting to be based on the wishes of the inhabitants.

During five years of wrangling the solutions proposed ranged from immediate independence to complete fusion with Ethiopia. In between these two extremes came various demands for a partition (based on religion and language) between Ethiopia and the Sudan, for a trusteeship and for various temporary forms of management by foreign powers. In the end none of these solutions won the day. In December, 1950, the Assembly decided upon membership of a federation—the federation with Ethiopia of an Eritrea that was to be autonomous in local affairs. It was to control its own budget, taxation and police, but to be run by a federal government in Addis Ababa in matters of defence, foreign policy, foreign trade, customs and currency.

The next stage was to execute this novel arrangement by the required date, which was September 15, 1952. By the terms of the Italian peace treaty, the authority administering each ex-colony at the end of the war was to do so until the moment of final settlement; a British administration therefore carried on. But the United Nations was responsible for drafting the terms of federation, getting them through an elected Eritrean assembly and agreeing them with the Emperor of Ethiopia. A Bolivian commissioner was appointed to do this. Meanwhile, alongside him, a British administrator ran the country, convoked the necessary Assembly, set about organising an Eritrean administration and arranged the transfer of powers, assets and liabilities. It says a good deal for the two men concerned that despite differences of upbringing and outlook they maintained a level of personal relations that enabled them to get their work dovetailed and done on time. Such situations are not easy when one staff—the UN one—is paid very much more highly than the other.

Economic Disparities

The difficulties they encountered ranged from banditry to keeping up a suitable United Nations reputation for accessibility without constantly deferring to grumblers, and from settling with the Emperor whether Eritrea was to have a flag of its own to finding Eritreans of suitable calibre for the public service. (In fact only 27 Englishmen have been kept on, although out of the 1,363 Eritrean applicants for higher government posts, only 262 passed the test in arithmetic and typing; for technical jobs, the services of a number of the 17,000 Italian residents have been retained.)

Another complication was that the population, which is half-Christian, half-Moslem, returned 34 members of each faith to the 68 seats in the Eritrean Assembly; in the end, however, all agreed to the suggested federal constitution. It is to be hoped that they will continue to do so. Powers in federal matters will be exercised by Addis Ababa, subject to consultation with an Imperial Federal Council consisting of Ethiopians and Eritreans sitting in equal numbers but with only advisory powers. In any situation in which numbers count, the Ethiopians have it by about ten to one; public

servants in Eritrea are, by contrast accustomed to much higher standards of administration.

Though the future presents difficulties, on account of the differing ways of life to which two sets of local inhabitants have been accustomed for more than a generation, the new regime started off with a flourish. The Emperor visited his new domain on the anniversary of the outbreak of the Abyssinian war; crowds acclaimed him; he sensibly allowed Eritrea its own flag and he is represented there by a suitably noble figurehead—his son-in-law. Difficulties have since arisen, however, upon ironing out certain disparities between the two economies; there is a discrepancy between the rate of the East African shilling (Eritrea's former currency) and that of the Ethiopian dollar, the result of which has been a tremendous rise in prices for the Eritrean consumer; goods ranging from petrol and firewood to textiles and telegrams have more than doubled in cost. Coupled with demands for stamp duty upon re-registration of businesses and the like, these drains on pockets have caused much discontent and several strikes. These price levels may be somewhat offset when Ethiopian grain comes into the Eritrean market, but they will not be completely so. Another potential source of discord is the division of revenue from customs. Eritrea, which possesses the ports, is entitled only to the proceeds from goods for which Eritrea is the final destination; this may be difficult to assess. Again, a falling off in administrative efficiency is bound to cause grumbling. But grumbling will not cause a breakdown of the public services and its effects will be more than offset by the satisfaction that any territory derives from running itself.

Next Stage in Poland

In a three days' session at the end of last month the newly elected Polish Diet had time to appoint a new President, a new government, to proclaim an amnesty, and then to adjourn. Apparently, it was all plain sailing. In fact, the leadership of the Polish United Workers' Party, and hence of the Polish state, is now steering its way through one of its most critical and perilous stages. The two hurdles which it has just taken in its stride—the elections and the subsequent reorganisation of the state apparatus to fit the pattern now set for eastern Europe—were but a prelude to greater obstacles, both political and economic. On the political front, after the example of the Prague trials, it is unlikely that Moscow will allow any further delays in the trial of the party's former General Secretary, Wladyslaw Gomulka. On the economic front the Polish leaders are faced with the old problem of food supplies for the towns, but in an intensified form. Last year's calamitous harvest has been followed by a rather poor one this year and the peasants are trying to take advantage of the Government's difficulties. The latter has hitherto avoided a direct showdown with the peasants. Yet it may now be forced to take stronger measures, since food shortages in the towns threaten the main objective of the regime—the rapid industrialisation of the country.

The ease with which the Government has fulfilled its electoral plan shows clearly how far Poland has travelled since the previous elections in 1947. Then, too, the Government managed to weather the storm and overcome the opposition. But M. Mikolajczyk's Peasant Party was a real opposition; it has since been smashed. Officially, it is true, Poland is not yet a single party regime. The new constitution officially proclaims this; indeed it is one of the few ways in which it differs from its Soviet model. There is still a subordinated, truncated remnant of the Peasant party, a Democratic party for the urban middle class and a Catholic group supporting the regime. The degree of independence of all these sections was shown on the eve of the elections when they all joined forces with the "non-party bloc" and the United Workers' party (an amalgamation of the Com-

munist Workers' party and the Socialist PPS) in a National Front. With no opposition the polling was a mere formality: over 95 per cent of the electors polled valid votes and 99.8 of these were for the united bloc.

The new parliament will not differ much from its predecessor which was already a rubber-stamp institution. It will only meet less often and devote still less time to discussion. There are, however, interesting changes in its composition. The United Party put forward more former Communists as candidates and many former Socialists have lost their seats. A notable disappearance is that of M. Osóbka Morawski, Poland's first postwar premier. Nor has M. Rola-Zymierski, the head of the Polish armed forces after the war, been selected as a deputy. Their departure is symbolic of the end of a period. They were prominent at a time when East European leaders still openly said that they would follow their "own way to socialism." Now all pretences have been dropped.

The office of President has been abolished and replaced by the post of chairman of the National Council, which corresponds to the Supreme Soviet of the Soviet Union. The newly appointed chairman of this council, Mr Zawadzki is no figurehead. He is an old Communist with a long apprenticeship in the jails of prewar Poland who has been a prominent member of the Politburo since the war. The council itself, however, is less important than the Government, headed by the former president—Boleslaw Bierut. Poland has thus adopted the pattern prevailing everywhere within the Soviet orbit, except in Czechoslovakia, in which the leadership of the state and the party is concentrated in the hands of the premier. Another man who has been in the limelight recently is Marshal K. Rokossowsky, the hero of the Red Army, now head of the Polish Forces; in the new cabinet he was made a vice-premier. Among the seven other vice-premiers, however the economic experts predominate.

Resistance in the Villages

In the economic field the Government is confronted with a grave dilemma: how to get food supplies for the greatly increased urban population without a major political upheaval. The rapid tempo of industrialisation would have provoked this problem anyhow. The vagaries of nature have rendered it more acute. Last year Poland suffered a terrible drought and food supplies suffered accordingly. This year the position has somewhat improved for most crops. The yield of wheat, sugar-beet and potatoes is apparently 10 per cent higher than last year's exceptionally low level. Yet, rye—Poland's basic cereal—fared no better than last year. Last year, in the face of the peasants' passive resistance, and their unwillingness to sell at controlled prices, the Government imposed a system of compulsory quotas. Now there are signs that it has again been difficult to extract surpluses from the peasants and the Government may be compelled to resort to stronger measures, because the scarcity of foodstuffs has had an adverse effect on the industrial front. High food prices have cut down the workers' real wages, and the resulting discontent has apparently expressed itself in an extraordinarily high turnover of labour.

The planners' solution is simple—collectivisation should provide new sources of manpower and facilitate the control of food supplies. With 35,000 tractors—in 15 hp units—already available and 60,000 planned for 1955, they argue that the tempo can now be speeded up. There is certainly room for progress. This year the share of socialised agriculture—the state and collective farms combined—in the total production of foodstuffs was only 16 per cent. The proportion of total arable land owned by the socialised sector is even smaller—early this year the collective farms covered only 3 per cent. Only about 300 collective farms were formed between mid-1951 and mid-1952. In the following quarter, however, some 900 new farms were set up, bringing the total to 4,215. But the size of the new farms is not

known and even at an outside estimate the socialised sector does not now account for one-sixth of the arable land and one-fifth of the total production. Hence it cannot yet dominate market conditions.

The Government is more concerned with the political consequences of a direct attack on the peasants. In this sphere at least it does not want to follow the notorious Russian precedent. It wants to feed the countryside with machinery and fertilisers and with the assistance of the poor peasants wear out the kulak by a policy of attrition. But rapid industrialisation coupled with bad harvests makes this policy very difficult. If the socialisation of agriculture goes on at the present snail's pace, the rich and medium peasants—the chief surplus producers—will remain for a long time the main suppliers. Hence they must be—and are—encouraged to raise their production. But the kulak is reckoned to be the chief political opponent, and the recent quickening of the tempo of collectivisation could possibly be the forerunner of a general offensive against him. Everything will depend on the effect food supplies have on industrial production. Compared with 1949 industrial production should be doubled this year and by 1955 it should have increased almost fourfold. This is the categorical imperative and agricultural policy will be subordinated to it.

Sniping at the Colonial Powers

[FROM OUR UNITED NATIONS CORRESPONDENT]

THE lot of the unhappy policeman is as moonshine and roses compared to the lot of a colonial power or an administrator of trust territories in Uno's Fourth Committee. Theoretically, Britain, France, Belgium, Australia, New Zealand and the United States (with Italy as a participant though not yet a Uno member) might expect to come together in this Assembly to exchange information and to profit by suggestions from interested observers. Actually, they have been driven into an appearance of unanimity which almost precludes progress. Gassed by repeated blasts of Soviet disapproval, sniped at by small countries with an inexhaustible supply of bird shot, they seemed for weeks to have no recourse but to take it on the chin and pretend to like it.

This appearance of helplessness has finally worn thin. The Australian delegate, taking a leaf from the opposition's book, laid diplomatic courtesy aside and by plain speaking produced almost as much of a shock as though one of the great glass panes had parted to let in rain and winter air. In the Assembly session called to vote on Fourth Committee resolutions Britain, France and Belgium each made it plain that though Gulliver might seem to be pinned down, he could not be made to work in that position unless he chose to, and if he did not so choose, the tasks happily laid out for him would not be done. In the end the resolutions most offensive to administering powers were tempered before being passed.

This modest victory, however, was accomplished only through great power solidarity, Scandinavian help behind the scenes, and a very firm speech from Mr Selwyn Lloyd in which he made it quite plain that the British delegation would not only vote against five out of six of the resolutions as passed by the Fourth Committee but would refuse to co-operate in carrying them out. After much debate and considerable amendment the British finally voted in favour of two, against two more, and abstained on the remaining two.

The offending resolutions are worth examining in some detail, if only because they show so clearly the continuous attempt to blur the line between Trust Territories which properly come under Uno's eye, and colonies (called Non-Self-Governing Territories in the air-conditioned patter favoured here) which are specifically treated by the charter

as not belonging to Uno's trusteeship system. The first three resolutions merely noted a report on social conditions in colonies and handed it on; protested against race discrimination in the colonies (Britain widened the scope of this resolution to include any discriminatory practices contrary to the Declaration of Human Rights); and attempted to secure the speedier adoption of Committee recommendations in the field of education, as well as of economic and social policy.

More bitterness lay in the other three resolutions, and it was on these that the colonial powers concentrated their fire. Resolution IV would have continued the life of the Committee on Information from Non-Self-Governing Territories "for as long as there exist territories whose people have not yet attained a full measure of self-government." Britain protested, and promised to co-operate with the committee for three more years, but no longer. At the end of that time the General Assembly must take up the task of revising the Charter; meanwhile, Britain "could not even by implication accept the thesis" that colonial powers were accountable to Uno for the administration of their colonies. The attempt to make the committee permanent was abandoned.

Turns on the World Stage

The colonial powers were equally firm on keeping clear the distinction between colonial administrators and the peoples whose affairs they run. The Fourth Committee had concocted a woolly and perilous resolution in three parts, designed to draw "qualified indigenous representatives" into Fourth Committee activities. This the Assembly passed, over the negative vote of the Great Powers, and after a reminder from Mr Selwyn Lloyd that Uno committees "must remain associations of sovereign and responsible governments. They cannot be converted into tribunals in which member states of the UN can be confronted with their subjects, the inhabitants of those territories."

The last resolution contained the much disputed checklist of factors which are supposed to show when the caretaker's daughter can cease being taken care of, and start being grown up. Colombia, Denmark, Iceland, Luxemburg, the Netherlands, Sweden and South Africa joined their negative votes to those of the colonial powers, but though the Asian-Arab-Soviet bloc was shaken by the defection of five small Latin-American countries, which abstained, the resolution went through.

Oral hearings of tribal troubles also showed the effect of the heady draught which combines a green-apple democracy with a yearning to thumb the nose at a great power. It will be remembered that soon after the Assembly convened petitions were presented from the Meru tribe in Tanganyika, the *Union des Populations de Cameroun*, and the All-Ewe Conference of Togoland. All three asked that they be allowed to tell their woes in person to the Fourth Committee, rather than by petition to the Trusteeship Council. Despite protests from the administering powers the committee voted to hear them. Then eight more groups of petitioners were granted permission to come in through the door thus opened. It is obviously a great thing for the representatives of indignant Wameras, to be able to tell their troubles to the representatives of sixty nations. But it is also a great thing for any one of the sixty who would like to make trouble for the other fifty-nine; it is indeed hard to sort out the democratic ideal from its abuses.

For new nations, small nations and smaller colonies the temptation to strut their little hour on Uno's stage is irresistible. Through the great glass windows they talk straight to the homeland. Warmed and comforted by civilisation's gadgets, they bask in the happy illusion that speaking their minds to the great powers adds to their own stature, and holds no danger. They have yet to learn that the game of invoking public opinion is one which can be played by both sides, and that the glass house itself may shatter if too many people throw too many stones.

The Passing of a Generation

[FROM OUR ROME CORRESPONDENT]

SIGNOR DE GASPERI wound up the national congress of the Christian Democrat party in the last days of November, after he had steered it tolerably safely past temptations to the Right (the "Wasps") and to the Left (the syndicalist wing, which, however, by adroit tactics captured a large representation on the Central Committee). After this achievement, he may have felt lying all too heavily upon him the responsibilities of an irreplaceable leader of an irreplaceably dominant party. As a politician who was active and prominent in the old pre-Fascist parliamentary life of Italy, and retains a taste for the determination of policy by debate, he may also have felt a growing sense of solitude in the country.

By deaths, illnesses, and political miscalculations, the surprisingly lively team of septuagenarians—and over—who reappeared on the post-Fascist political stage and gave lustre to its parliamentary drama, must be considered now to have passed away. When Signor De Gasperi began his long premiership at the end of 1945, the alternatives for office had been either a "Popular Front" or something known by the mysterious initials "ONB." The initials were used ironically for the trio of pre-Fascist premiers, Signori Orlando, Nitti, and Bonomi, the first of whom was already 86 years old. ("ONB" in Fascist times had stood for the children's battalions in the Black Shirt militia.) Of the trio, the youngest, Signor Ivanoe Bonomi, was the most unassuming and, in his quiet but tenacious way, as a Fabian Socialist with strong national sentiments, effected the most successful "comeback." He died in 1950 as President of the Senate. The oldest, Signor V. E. Orlando, died last week.

Both Signor Orlando and the somewhat younger Signor Francesco Nitti played a curious part in the postwar scene. Both have at times since 1944 been regarded as possible figureheads of a right wing government. But both have been insidiously flattered by the extreme left. Signor Nitti was even induced last summer to head a Popular Front list in the Rome local elections. He seemed after that experience to have decided to withdraw from active politics.

A much steadier and more constructive task in the politics of Italy after 1945 was performed by two men of the same generation, neither of them professional parliamentarians—Count Carlo Sforza, the diplomatist, and Signor Benedetto Croce, the historian philosopher. Both have in recent weeks been nationally mourned. They worked in close association with each other in the chaotic years of 1943-45, and their

Air Subscription Rates for 1953

Owing to increased costs, some increases in air subscription rates to *The Economist* will have to be introduced from January 1, 1953. The countries affected are:

Australia: £8 5s. (sterling)	Malaya: £6 15s.
Hongkong: £7.	New Zealand: £9.
Japan: £9.	S. America and W. Indies: £7 15s.

The substitution of an airfreight for an air mail service to Egypt makes it possible to reduce the air subscription rate to £5 5s. Rates to all other destinations remain unchanged:

Anglo-Egyptian Sudan: £5 5s.	India, Ceylon: £6.
Canada: \$21.50 or £7 14s.	Iran: £6.
East Africa: £5 5s.	Iraq: £6.
Europe (except Poland): £4 15s.	Pakistan: £6.
Gibraltar, Malta: £3 15s.	Union of S. Africa: £5 10s.
Gold Coast & Nigeria: £5 5s.	USA: \$21.50 or £7 14s.

presence greatly helped the bewildered parliamentary Italy which emerged from the great national disaster to recognise and assert its continuity with the honoured parliamentary Italy of the victory year 1918.

Signor Enrico de Nicola, a superb parliamentarian, was a third conspicuous elder statesman who worked with Sforza and Croce. He remains today in a physical and intellectual condition to exercise great influence, but has apparently sacrificed his powers to an abnormal personal sensitiveness. A few months ago, the last of his many impetuous resignations from the Presidency of the Senate ended by being accepted. With this, the whole elder generation of Liberal and Radical leaders has left the stage; for as President of the Republic until 1955 their distinguished contemporary Signor Luigi Einaudi stands above politics.

Unlike these eminent figures from a past Italy who nevertheless (especially the last three) found the strength to become national political figures in their old age, Signor De Gasperi has the experience—and had even begun to taste it before Mussolini—of leading a highly organised party, drawing its membership from every class and every region. He is confronted in the parliamentary opposition by a Communist party with a cynical outlook on the use of parliaments, which may well be shared by the extreme right. It is an unpromising stage for a septuagenarian who, like Signor De Gasperi, is by training and instinct a parliamentarian. His aim, however, is evidently to bring into permanent parliamentary co-operation with Christian Democracy those relics of the old Liberalism, Radicalism, and Fabian Socialism which are now grouped in the three small "lay" parties. He has been successful, this November, in bringing about a working understanding for the impending general elections. It remains to be seen whether, in course of time, the existence of one such great parliamentary force will encourage the growth in Italy of another, or others, to take the place of the present oppositions with their anti-parliamentary tendencies.

Nigeria Learns About Itself

[FROM A CORRESPONDENT]

FARMS no bigger than an eighth of an acre; 67 per cent of the land uncultivated bush and waste; another 14 per cent fallow; less than nine per cent under farm crops; five in six workers, perhaps, on the land; yields per acre less than half those obtained elsewhere from poor land in bad years. One begins to wonder whether these things are the result of Nigeria's being a peasant economy or the reason why it remains one.

This information is put forward very tentatively in a report on the agricultural output of Nigeria, based on a sample census in 1951.* In 1949 the Food and Agriculture Organisation of the United Nations asked for much detailed information about the colonial territories in West Africa, as part of their worldwide census of agriculture. Agricultural statistics were almost entirely lacking in Nigeria, and it was quite impossible to collect the details required. It was, however, agreed that an attempt should be made to present briefly some sort of picture of what grows where in Nigeria—or, in more rotund language, of the numbers of the agricultural population, of land utilisation, the area and production of principal crops, and the number of livestock in the different areas.

Even this has proved a sufficiently exacting task. In West Africa today statisticians are our twentieth century Mungo Parks and David Livingstones, and, as with them, pioneering

* Report on the Sample Census of Agriculture, 1950-51, Department of Statistics, Nigeria, printed by the Survey Department, Lagos, price 10s. Available from the Crown Agents for the Colonies, 4, Millbank, S.W.1.

often takes the form of struggling through dense tropical bush only to find more dense tropical bush. Population statistics will have to wait for the demographic survey to be undertaken shortly; this present survey adds nothing to our knowledge of this subject. For the rest, in practically the whole of the Eastern Region it proved impossible to apply the sampling methods used in the other two regions since the political atmosphere made questioning too difficult. Information for that region, therefore, is based on "opinion" surveys—that is, guesses, even if informed guesses, on the part of agricultural officers.

Yield data were collected separately and must be regarded simply as giving an indication of the possibilities; precision must not be expected. Livestock figures are unquestionably too low. The remaining information, mostly on land utilisation and the distribution of crops, was collected by sampling

YIELDS OF SOME OF THE PRINCIPAL FARM CROPS
lb per acre
Figures of highest and lowest yields according to zones

	Highest	Lowest
Rice (paddy)	2,189	513
Millet (threshed)	924	500
Guinea corn (threshed)	1,185	468
Maize (shelled)	1,407	481
Cassava (roots)	10,802	5,877
Yams (tubers)	7,784	4,652
Cotton (seeded)	563	228
Groundnuts (shelled)	732	231

methods which the writers of the report have failed to render completely intelligible. In a sentence, the country was divided up into thirteen roughly homogeneous zones or strata, which were further broken down into groups of villages, a systematic sample of villages then being selected from each group. In large villages and towns a two-stage sampling unit had to be used, and the choice of it—compound, taxpayer, or five-acre plot—had to be left to the individual officer conducting the survey.

The actual results achieved are therefore put forward with the greatest possible caution, and the officers responsible for them are less likely than anyone to attach too great significance or accuracy to them. They are at any rate "the best indication which can be obtained at present." The main value of the survey is the experience it has provided, and the lessons to be learned from it, before larger-scale or more precise attempts are made to assess agricultural output. Some points are obvious. It is clearly essential that any village surveys in the future should not be cluttered up with the sort of inquiries their methods were not designed to meet (such as population inquiries) and that they should be conducted by specially trained and appointed staff. Three more technical problems are referred to. The first is the choice of a more precise second-stage sampling unit, uniform over the whole country if possible; there is a good case for using five-acre plots. Then there is the difficulty of distinguishing fallow land or land under tree crops from uncultivated bush and waste; suggestions are made for a more exact classification which would separate the cultivatable but uncultivated from the waste. The third is the need for consistency of treatment in dealing with areas under mixed crops, for as the report points out, "crops are grown in a bewildering array of combinations and permutations, with mixed crops hopelessly intermingled with succession crops."

A final problem still remains, and one of crucial importance. Much research and study are needed to establish and perfect methods of collecting data of yield, both for farm crops and economic trees. This is all the more important because it is overwhelmingly clear that the whole future of the colonial countries depends on raising yield. Productivity is astonishingly low. Here the need for studying trends is very great—study based on information that can only be available when the collection of statistics is both systematic and continuous.

THE CASE OF THE WHOLESALER'S BUDGET

Through their branches these wholesalers were supplying many thousands of retailers with food-stuffs. Their goods went out "on time, all the time." Could the accounts section keep pace?

Canned figs or canned figures . . . which did the branches need first?

G. & W. COLLINS LIMITED, large wholesale food distributors, operate through branches in the North West. When they decided to concentrate buying and accounting operations in the Liverpool office they realized that more detailed and prompt information would be needed by their branches. Could they establish a more effective system of management-control now that the accounts were centralized?

With this problem Collins called for advice from machine accounting specialists of Burroughs Adding Machine Limited.

After investigation, Burroughs suggested the installation, in Collins' Liverpool office, of a Burroughs Typewriter Accounting machine for all Purchase and General Ledger work, with detailed posting of assets, revenues, liabilities and expenses.

Result: Apart from the great saving in time and labour in the office (one

girl, in fact, does all recording) Collins now get a *monthly analysis* of all expenditure in time for branch managers to keep within their individual budgets. Collins installed their first Burroughs machine twenty years ago, since then every accounting department of the business has been mechanized. The installation of the general-purpose accounting machine is the culminating factor in the preparation of speedy monthly accounts.

What about you? If your business could benefit from faster figuring, call in Burroughs. They can offer advice on all the latest systems, for Burroughs make the world's broadest line of modern record-keeping machines: Adding, Calculating, Accounting, Billing and Statistical Machines, and Microfilm Equipment. Remember, once you have any Burroughs machine installed in your office, Burroughs Service guarantees its continuous efficiency in operation.

ciency in operation.

The "Burroughs Man" is a trusted visitor to thousands of business houses. Call him at any time. Head Office: Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1. Sales and Service offices in principal cities.

Photographed here is Miss P. L. Langford, at work on the Purchase Ledger for G. & W. Collins Limited. She is operating the Burroughs Typewriter Accounting Machine, which helped to solve the Case of The Wholesaler's Budget.

For expert advice on business figures

CALL IN Burroughs

A Completely New Accounting Machine

READY FOR ANY JOB

AT THE TURN OF A KNOB

"COMPLETELY NEW" — those are words that can be applied, without reservation, to the Burroughs Sensimatic Accounting Machine. If you find it hard to visualize an accounting machine that is *limitlessly* adaptable, capable at the turn of a selector-knob of doing countless different jobs for a small firm, or a vast amount of one particular job for a large organization, it is time you saw the Sensimatic in action.

The key to the machine's astonishing versatility is the newly discovered principle of "Sensimatic Control" — the incorporation of a "mechanical brain" that directs the machine through every mathematical function and every carriage movement during a posting operation. Each Control Unit guides the machine through four separate operations, and, since there is *no limit* to the number of different units you can use, there is *no limit* to the number of accounting jobs the Sensimatic can do, and the Control Unit can be changed by the operator in a matter of seconds.

You owe it to your business to let Burroughs show you the Sensimatic today.

Burroughs  *Sensimatic*

COMPLETELY NEW

● **ADAPTABILITY** — A turn of a knob — that's all the effort needed to switch the Sensimatic from one posting operation to another, from Accounts Receivable (say) to Stock Records, Stores, Costs, Payroll, Purchase Ledger, General Ledger, Statistical Analysis; the Sensimatic is reset in a moment for all these procedures . . . and many, many more.

● **SPEED** — The Sensimatic's light key depression, positive form alignment, early key release, make its operation far simpler, far faster, far more easily learnt. Anyone who can operate an adding machine can get the Sensimatic into full production!

This is a Sensimatic Control Unit — which, at a flick of a switch, guides the machine automatically through every mathematical function and carriage movement. Each panel gives you any four accounting operations in any combination.

THE BUSINESS WORLD

THE COMMONWEALTH DECISIONS

Creeping to Convertibility

THE communiqué issued after the Commonwealth conference conceals a plan behind its platitudes. This "plan"—or perhaps it should be called this bundle of admirable, but provisional, aspirations—has now been taken home by the Commonwealth Ministers for final approval by their cabinets. It has three main features. First, the Commonwealth intends to utilise the breathing space gained by its present dollar balance to make a definite advance towards freer world trade and payments, provided that Western Europe agrees to certain proposals and that the United States responds favourably to certain others. Secondly, it is hoped to set afoot ambitious investment programmes in all parts of the sterling area, and to concentrate on those schemes that should do most to strengthen the area's balance of dollar payments; the main proviso here is that internal economic policies (which remain the prerogative of individual members of the Commonwealth) must be stern enough to free sufficient resources for these schemes to be carried through. Thirdly, the Commonwealth hopes that steps can be taken to secure greater stability in raw material prices; the list of provisos here must also be a long one, in fact probably rather longer than the list of steps that are envisaged.

The centrepiece of this programme—and the feature around which speculation and rumour will now revolve—is clearly the hope of securing, in the words of the communiqué, "international agreement on the adoption of policies, by creditor and debtor countries, which will restore balance in the world economy on the lines of trade not aid." And the communiqué also recognises that an "integral part" of any such agreement must be "the restoration of the convertibility of sterling," though "it can only be reached by progressive stages."

The nature of these progressive stages, and the conditions that will be attached to the achievement of each of them, are being kept secret for the moment. But the broad pattern that they may assume seems clear. The sterling area has, happily, rejected the idea of any wild dash for freedom without adequate external support; less happily, it has also rejected the idea of trying to stimulate American support for any entirely new international payments system, such as the Atlantic Payments Union that was propounded in these columns on November 22nd. Instead, the decision has been taken "to work as far as possible through existing international institutions dealing with finance and trade." The advance, both to convertibility and to the removal of import restrictions, is only to be made "as and when circumstances permit." With head tucked well into a new protective shell, the objective is now to crawl like a crustacean to freedom.

What will be the nature of this protective shell? In its full sense, at least as understood by the British Government, convertibility would mean that the forty-three foreign countries that are at present not allowed to use their sterling earnings for the purchase of dollar goods should be accorded the right to do so. As the chart on page 839 shows, thirteen of these forty-three countries are members of the European Payments Union; they earned £1,639 million from their exports to sterling countries in 1951. The other thirty—which range across the non-dollar world from Argentina through Egypt to Japan—earned £1,547 million from sales to sterling countries in 1951. The main danger arising from full convertibility of non-resident sterling would be that these two groups of countries could use as much as they wished of their sterling earnings—nearly £3,200 million in 1951, and probably not much less than £3,000 million at the current annual rate—to buy dollar goods with dollars extracted from the central reserve in London. Since the present sterling value of that central reserve is less than £680 million—and since these "convertibility-affected" countries have over £800 million of accumulated sterling balances, most of which they could still use for their necessary sterling imports—the danger would obviously be a considerable one.

It is true that the extent to which these countries would use newly-convertible sterling for the purchase of dollar rather than sterling goods would depend on the competitive power of the sterling economy; before any restoration of convertibility is possible, that competitive power must be increased, certainly by further disinflation and probably also by a freeing of the exchange rate. But Commonwealth governments would be most unwise to underestimate the size of the backlog of demand for dollar goods that has accumulated in these countries since 1939; and they should realise, too, that some countries may rush to turn their sterling into dollars as soon as the balloon goes up—in the belief that the balloon may soon be punctured and rights of convertibility withdrawn again. Some foreign merchants may even be getting down into the starting blocks for such a rush at the moment. For this reason, although full convertibility would mean that these countries could use a large proportion of their current sterling earnings for making dollar purchases if they wished, convertibility "by progressive stages" must mean that prior arrangements will be made to ensure that they do not in fact do so. Such prior arrangements might take several forms—an agreement to continue present importing arrangements under EPU would be one possible form, and an announcement that sterling could be used to purchase certain dollar commodities but not others would be a second; the latter approach

Time for Eastern trade

Ten-fifteen in Singapore and the city office of the Chartered Bank is already a hive of business activity. The Bank's New York agency has closed its books for the day and seven hours must elapse before the London, Manchester and Liverpool offices will be open for business; but wherever merchants and manufacturers are engaged in the Eastern trade the services of the Bank will be available to them at one point or another of its far flung branch system.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2.

West End (London) Branch: 28 Charles II Street, London, S.W.1. Manchester Branch: 52 Mosley Street, Manchester, 2.

Liverpool Branch: 27 Derby House, Liverpool, 2. New York Agency: 65 Broadway, New York, 6.

Branches of the Bank, under British management directed from London, are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

could in part be effected by the re-opening in London of free markets for commodities of dollar origin, a policy that the authorities are believed to favour in its own right. But these are guesses made entirely in the dark. The important point to stress here is that such safeguards will be necessary, and the Commonwealth will need to see that they are stringent.

*

At the press conference following the issue of the communiqué, Mr Eden made it plain that the Commonwealth's approach to Europe on these matters would go forward in step with an approach to the United States. The communiqué itself stated that one of the prerequisites of convertibility was "the availability of adequate financial support, through the International Monetary Fund or otherwise."

Does this indicate that the Commonwealth is going to urge that members' subscriptions to, and borrowing rights from, the IMF should be increased? There is a strong case for such an increase. One main reason why the Fund has not worked successfully since the war can be traced to the failure of its founding fathers to accept Lord Keynes's original thesis that initial quotas should be large and should vary with the value of world trade. The total of members' quotas is still only \$8,737 million, of which \$2,750 million represents the United States subscription; since America's surplus on current account, even in a world encumbered by a mass of discriminatory import restrictions, has lately averaged over \$5 billion a year, this total is obviously insufficient as a backing for the sort of world trading system that the Fund was originally supposed to make possible. An effort to increase members' quotas in the IMF—or, if this could not be arranged, to increase borrowing facilities within the restricted limit set by present quotas—would also have one of the subsidiary advantages that have been claimed in these columns for a more ambitious "clearing union approach"; it would lead to a once-for-all increase in international liquidity and would not mean that an experiment in convertibility would be dependent on the uncertain course of annual Congressional appropriations for grants-in-aid or stabilisation loans.

Doubts about Development

THE need for stern internal disinflation is reinforced by the fact that the Commonwealth, besides keeping its cost structure sufficiently under control to meet the greater weight of American competition that must be expected if sterling becomes convertible, is supposed to be committed to an ambitious development programme. Too much emphasis should not be placed on the extensive references to development in the communiqué; the various investment schemes publicised during the conference were all schemes that had already been heard of—although, admittedly, those schemes that were publicised most happen to be those that are most economic.

In short, the main work of the conference in the sphere of development was to list and sort the most important schemes already in train or in prospect, to provide a broad order of priority and to invest the whole programme with a new sense of urgency. The highest priority is to be given to development of projects that directly or indirectly contribute to the improvement

But an approach via the IMF would be characterised by one other feature, which some will regard as an advantage and others as an enticement to lethargy. That feature is that an expansion of lending by the IMF would not, by itself, alter the present pattern of incentives and financing arrangements in the world trading system. If a large increase in borrowing facilities from the IMF can be arranged, then the advance to freer trade can be large too; if not, then the advance must be limited. It is also conceivable that an approach through the IMF could be linked to the thorny problem of the dollar price of gold. Nothing was said about this problem in the Prime Ministers' communiqué, but Mr Eden admitted at the press conference that gold was clearly "of great interest to the Commonwealth." At present, \$1,584 million of the IMF's resources are held in the form of gold, and, if the gold price went up, the legalistic case for increasing the dollar value of other subscriptions to the Fund might be strengthened too.

All this, however, is airy speculation. The only definite conclusion that emerges from study of the communiqué is that the Commonwealth's "plan" for an advance to freer world trade is in a very indefinite state. Each section of that "plan," like each section of the communiqué itself, is hedged by political and economic reservations; the flanks along the line of the cautious advance are to be guarded by the strongest defences that technical ingenuity and diplomatic negotiation can erect. The grave danger, however, is that unless internal disinflation in the Commonwealth is resolutely pursued, then foreign demand for dollar goods—once even partially released—might overwhelm the strongest defences; and unless Britain can convince the Americans that disinflation here will be resolute, then it is going to be difficult to enlist their help in making those defences really strong. The decision to advance only cautiously towards convertibility does not absolve the Commonwealth from the need to advance courageously towards internal economic balance; if this fact is ignored, then the decisions reached at last week's conference will at best mean nothing at all and at worst will lead straight to disaster.

of the sterling area's balance of payments with the rest of the world. The resources developed should, therefore, either earn dollars or save dollars by replacing goods that have now to be imported from non-sterling countries. In practice, this means that there must be more emphasis on primary production—especially metal mining—in the overseas Commonwealth, and more emphasis on engineering products in the United Kingdom. The revelations in the press briefings during the conference, and to some extent in the communiqué issued after it, suggest that the Commonwealth Ministers recognise this, even if they show no haste to accept the policy implications that ought to emerge from such recognition.

If the development schemes are to be carried through and if current production of the materials and engineering products needed is to be increased, resources have to be released from other lines of activity. The activities from which resources could most easily be spared are the projects for industrialisation in the

Dominions. There was some sign of a first stirring of conscience on this subject in the communiqué, which observed that the development of basic essentials in the Commonwealth

has on occasion been impeded by other development of a less sound and permanent kind which has overtaken the countries' resources and has failed to contribute to the building of economic strength.

But this admission was immediately tempered by one of the many passages in the communiqué that are redolent of the atmosphere of the drafting committee room, where every possible interest has to be reconciled. Thus "in some countries . . . development plans have been or are being made to provide for some basic improvement in the standards of living" and "some social investment is also urgently needed in the more developed countries." Any conceivable scheme could be slipped through these loopholes. There is no need for any Minister returning home from the conference to have to admit that the conference pointed the finger of accusation at his particular development programme. And this is a great misfortune.

The only other way in which resources could be freed for these schemes would be by a sharp cut in consumption. Any attempt to finance the programme in this way would be likely to impose a disproportionate burden on the United Kingdom, but there is some pretence in the communiqué that this is the way to be adopted:

The United Kingdom Government are determined that the flow of capital from London for sound development throughout the Commonwealth shall be maintained and increased. This will only be possible if the United Kingdom can sustain the necessary level of internal savings and can achieve a surplus on overseas account additional to that required to meet its heavy existing commitments.

This passage in the communiqué deserves close scrutiny. The flow of capital from London to the Commonwealth in recent years seems to have averaged between £150 and £200 million a year. If words mean anything at all, this implies that it will henceforth be the object of British policy to budget for a persistent annual external surplus of, or rather above, £200 million—and that in a world where foreign competition will be increased by opening the floodgates of convertibility. Indeed, Mr Butler told a meeting of exporters and trade unionists this week that the aim in 1953-54 should be to attain a surplus of between £300 and £350 million, in

order to build up the reserves, as well as to meet these capital commitments. This total apparently includes some defence aid, but, even so, Mr Butler estimated that it would require an increase in exports to about 20 per cent above the 1951 level; such an increase would seem to necessitate the withdrawal of between £500 and £600 million of goods (and, therefore, presumably, of the same volume of purchasing power) from the domestic market, unless production increases sharply. This is very tough talking, and Mr Butler really should not complain when the press points out that, if words are to be turned into deeds, then the Commonwealth will have to live up to all the heartening rotundities—and forget about all the disheartening reservations—in the communiqué.

*

The main problem, therefore, is not that of providing machinery to guide savings towards Commonwealth development, but of providing the savings themselves. It is an act beyond faith and hope to busy oneself with building a ladder while there is still a danger that one end of it may dangle in empty air. That, at best, is the judgment that must be passed on the plan that emerged during the conference to launch a new Commonwealth development company, with the support of the Bank of England and in consultation with financial, commercial and industrial interests in Britain. At one time it had been hoped that this new institution would have the active support of other Commonwealth central banks, but the failure to secure this should not materially affect its role and functions. The company's main object will be to provide financial assistance for projects within the Commonwealth. Its main use, however, will be to act as a postbox for the receipt of proposals; it will sift those that it receives and direct the more promising to the institutions in the capital market best equipped to handle them. If foreign capital can be attracted for some of the proposals, so much the better; and to this end the company may co-operate with the World Bank. The company will be launched with a modest capital and borrowing powers. In a market that is already abundantly supplied with private and official institutions serving similar objects, it would be unwise to expect it to carve out for itself a place or a sufficient volume of business to alter appreciably the present financial machinery for Commonwealth development.

Three other specific proposals for improving the mechanism of investment in the sterling area—including especially foreign investment—emerge from the communiqué. The first is a concession in the exchange control regulations applied by the United Kingdom Government on the withdrawal of non-resident capital. For the past three years, residents outside the sterling area who have invested in approved projects in the United Kingdom and the Colonial Empire have been entitled to repatriate their capital up to the sterling equivalent of the initial investment. Henceforth this right will also extend to capital profits—a useful concession that may attract a little additional American capital. Secondly, all the Commonwealth governments have agreed that existing controls over the movements of capital across the exchanges within the sterling area shall be removed.

Resort to Tariffs?

THERE is some element of inconsistency between two of the main objectives discussed at the conference—that of moving towards less discrimination in world trade and of building up the Commonwealth's production of commodities and materials now bought from the dollar area. In the initial stages of development, at any rate, capital charges may make the new Commonwealth products much more expensive than similar products from dollar countries—unless sterling is heavily devalued. Will there, therefore, be a tendency to protect the infant projects by import licensing and more tariff discrimination?

As usual, the conclusion reached seems to be a compromise. Although the sterling area Governments have agreed on policies for 1953 which, they hope, should "lead to a further improvement in the reserves during that year," the communiqué is at pains to stress that "the level of the reserves is as yet too low to warrant any substantial relaxation of the restrictions on imports from outside the sterling area"; there is also a hint that restrictions on imports into one sterling area country from another may be removed first, bearing "clearly in mind the difficulties which the restrictions have raised for the export industries affected." Moreover, the communiqué adds that the representatives of some Commonwealth countries

have emphasised that they must continue to use their exchange resources in the manner which enables them to carry out their planned development programmes most effectively and that they are likely to continue to need import restrictions for this purpose.

But despite these liberal loopholes for illiberal trade policies, the broad objectives of Commonwealth trade policy are unmistakably defined as "a multi-lateral trade and payments system extended over the widest possible area." To make assurance on this point doubly sure the matter is also put in negative form. "The Commonwealth countries have no intention of seeking the creation of a discriminatory economic bloc." The issue of autarky was, however, raised when, on the initiative of the United Kingdom, "a discussion took place on a proposal that all Commonwealth countries should join in seeking release from the 'no new preference' rule in the General Agreement on Tariffs and Trade." It is difficult to escape the conclusion that this debate—in this broad form—was raised by

This will mainly affect the export of capital from Australia and New Zealand, which can by no stretch of imagination be ranged today among the large exporters of capital. Thirdly, the United Kingdom has announced its intention to discuss with the World Bank arrangements to make a part of the Bank's sterling capital available for lending for projects designed to improve the sterling area's balance of payments. All this, however, is mere machinery and should not be mistaken for the substance of the problem of development. If it attracts new dollar capital into the sterling area, it will be useful. But the main burden of Commonwealth development must fall on sterling area resources—and since those resources are fully employed at the moment, this means that each new project can start up only as some less desirable project is cut down.

the United Kingdom as something of an Aunt Sally, in the hope that it would be heavily treated by the rest of the Commonwealth. That is precisely what happened, the majority view of the conference being that any such approach would not advance the agreed objective of restoring multilateral world trade. The best argument that Ministers can use with Conservative backbenchers and others attracted by the mirage of an economically insulated Commonwealth is to tell them that the rest of the Commonwealth will have none of it. The British initiative in raising this matter in the conference will thus have served one of its purposes.

But this initiative also had another—less devious and more successful—protectionist purpose. It was to secure the co-operation of the Commonwealth Governments in an approach to the other contracting parties of Gatt, to allow the widening of certain margins of preference that would occur in the event of "increases that might from time to time become necessary in duties designed to protect domestic industry and agriculture in the United Kingdom." The particular difficulty involved is that under the Ottawa agreement the United Kingdom guarantees the duty-free entry of certain Commonwealth goods; the present provisions of Gatt can be read as precluding Britain from raising tariffs on these goods from foreign countries while continuing to abide by this obligation to the Commonwealth. The British delegation would not have raised this matter in the conference, or allowed it to appear in the communiqué, unless it had the intention of raising these tariffs and, therefore, creating the dilemma from which it is now seeking escape. It is more than probable that the tariffs in question are those on agricultural produce and that a project for their increase is part of the agricultural development and protection programme on which the Government is known to be working. The promised "co-operation" of the rest of the Commonwealth in this approach to other Gatt signatories is not a matter for surprise. This is a question of one-way traffic as far as they are concerned. They may gain somewhat by the possible widening of the margins of preference that they enjoy, and they are not proposing to respond by similarly widening the margins of preference on British goods that they import.

The measures that are to be taken to ask for amendment of the provisions of Gatt will also include "certain

special tariff problems affecting the Colonies." These concern preferences that the Dominions undertook to accord to imports from the colonies at the time of the Ottawa agreement, but that were never put into effect. These commitments are known as "accordable preferences" and it is a moot point whether they could be accorded now despite the "no new preference" rule of Gatt. The Colonies feel a certain sense of grievance that these preferences may for ever be barred, though the amount of trade involved is probably small. The Dominion Governments concerned have undertaken to look into this matter and, if necessary, to take up the matter with the other contracting parties of Gatt.

These two hints of departures from or modifications of the Gatt code amount to very little. The programme

Search for Commodity Stability

A FINAL, and unsurprising, feature of the Commonwealth's aspirations—as expressed at the conference—is that of securing greater stability in the prices of primary commodities. In their communiqué, the Prime Ministers expressed their governments' readiness "to co-operate in considering, commodity by commodity, international schemes designed to ensure stability of demand and prices at an economic level." They also recognised "the need for an agreed procedure for calling together the governments concerned to consider emergency action in the event of rapidly developing surplus or shortage of commodities entering into international trade."

This problem is likely to play a central role in international economic negotiations in the coming year; it is the sort of problem where almost everybody will agree that something ought to be done, but very few will agree on what can be done. Sharp movements in raw material prices, despite devices to hedge against them, are against the interests of manufacturers; for one thing, they make production planning impossible by causing grave uncertainties about costs. They are still more obviously against the interests of commodity producers and commodity producing countries, especially when primary products form the bulk of those countries' exports—as do tin and rubber in Malaya, cocoa in the Gold Coast and copper in Chile. In such countries a marked change in commodity prices can swiftly swing the local economy into desperate inflation or deflation, all the more difficult to counteract when the fiscal system is comparatively rudimentary. Heavy falls in prices can also hinder production even after prices recover; the fall in price puts large areas out of production or leads to closing down of mines, and it requires a considerable and sustained price recovery to make it worth while to restore productive capacity once it has been abandoned. These unstable conditions, moreover, discourage investment, and make capital unobtainable or expensive. The severe economic disturbances that raw material-producing countries suffer can also produce extreme political reactions. It should not, therefore, be difficult to secure agreement, in theory, with the Commonwealth Ministers' vague aspiration that something needs to be done.

The Commonwealth countries have also, of course, a special reason to grind this axe. Almost all the raw materials they produce and export have an important market in North America; the contraction or expan-

for agricultural expansion in Britain will have to be judged when it appears; on the face of it, however, there may be some case for "infant industry" protection here—especially if quantitative import restrictions are relaxed. The proposed approach about "accordable preferences" for the Colonies can be represented as the smoothing-out of an anomaly. Certainly the objections that can be voiced are not as strong as those that would have to be entered against any wholesale attack on Gatt's "no new preference" rule. Such an attack would have had the object of bolstering up Britain's consumer goods industries (especially against Japanese competition)—and it is the consumer goods industries that should now release resources for the production of capital equipment if long-term balance is to be secured.

sion of that market often tends to determine the course of dollar crisis or recovery. The extent to which United States demand can vary was apparent during the recession of 1949 and the subsequent recovery in 1950 and the early part of 1951. The f.o.b. value of American imports of certain raw materials in the three calendar years 1949, 1950 and 1951 was as follows: Australian wool, \$80 million in 1949, \$116 million in 1950 and \$306 million in 1951; South African wool, \$19 million in 1949, then a slight drop to \$18 million in 1950, followed by a sharp rise to \$61 million in 1951; Pakistan jute, \$17 million, \$19 million and \$30 million; Gold Coast cocoa, \$47 million, \$54 million and \$76 million; Malayan rubber, \$126 million, \$229 million and \$436 million. These increases in dollar earnings were due partly to a larger volume of sales, but also to advancing prices; since receipts in any one period largely reflect contracts placed earlier, the course of dollar earnings is not simultaneous with the course of price fluctuations. But after the spring of 1951 commodity prices turned downwards, and therein lay the seeds of the subsequent sterling area crisis; the habit of American business of liquidating stocks when prices fall tends to accentuate the decline in imports at the worst possible moment. It is for this reason that any prospects for freeing world trade are now gravely impeded by forebodings about what would happen to the best-laid plans if ever the American economy suffered a serious setback.

Unfortunately, however, all these cogent arguments for stabilising commodity prices run into a rock of disagreement when discussion focuses upon the levels at which stabilisation should be aimed. Because of its split personality, Britain may perhaps lay more claim than most to having an objective approach on the matter. As a manufacturing country and importer of primary commodities, it might like to see prices stabilised at a comparatively low level; as banker for the sterling area, it wants to see prices at a high level. This dual capacity may give Britain some opportunity to play the role of honest broker in seeking commodity agreements, but in view of the urgency of the dollar problem its claims to objectivity cannot be pressed too far. Indeed, the United States, which is the largest producer of many materials and the largest importer of many others, might have better claims to be an honest broker; the difficulty here is that—since prices depend mainly on the level of

American demand—it is a broker that has every temptation, and chance, to rig the market. Its natural tendency in a slump may be to keep up the price of the materials it produces by a series of measures that will seem to it to be issues of purely internal policy; and in the post-Korean boom it tried to keep down the prices of materials that it imported by the force of its monopoly buying power. Action of this sort is a recipe for making the world's dollar problem even worse than it need be.

Moreover, even if these differences in national outlook could be ironed out—and if arrangements could be arrived at that would seem to ensure, for the short run, the fairly constant flow of dollar spending on which all plans for world trading balance must depend—long-term problems would be bound to crop up. No arbitrarily fixed price, however ingeniously calculated and adjusted, can be right all the time for all the participants—for the producers with their altering costs and the consumers with their altering demands. The situation would almost certainly arise in which expensive and unwanted production of some materials might continue that a fall in price would have curtailed, or in which desirable production might not be evoked because of the lack of stimulus of a rise in price.

Advocates of commodity agreements, well aware of these drawbacks and dangers, now usually insist that pricing arrangements should be as flexible as possible, and responsive to long-term price trends. The International Wheat Agreement, which was founded in 1948 and is due to end next summer (its renewal will be discussed early next year in Washington), is often held up as the best model yet devised. It conforms to the new theory in two respects: it is managed by a council comprising both producers and consumers; and it makes an attempt at flexibility. Producers and consumers are free to deal in wheat outside the agreement at any price they can and they invoke the agreement only when world prices reach certain defined limits; when prices reach the minimum limit producers can call on consumers to buy

an agreed quantity of wheat at that minimum, and when prices rise above the maximum limit consumers can call on the producers to sell an agreed amount at that maximum. There is also some price flexibility, because top and bottom prices can, within an agreed range, be adjusted each year. Various proposals are now being advanced for allowing still greater flexibility in price changes from year to year. But, admirable as the wheat plan may be and still more admirable as it may become it has given rise to many complaints from producers—because the course of world inflation was underestimated when it was drawn up. Moreover, wheat is a commodity with a fairly constant demand; raw materials with much more fluctuating demand may require very different schemes, and they will also have to reckon with price competition from substitutes.

These points do not mean that the economic and social advantages of international commodity agreements at this juncture should be minimised; they merely mean that the difficulties of operating them economically will be great. No commodity agreement should be applied with a sense of finality, but each should be regarded experimentally. Any agreement that is applied must conform to three requirements: first, it must be representative of consumers as well as producers; secondly, it must avoid price rigidity by taking account of long-term price trends; and, thirdly, it must encourage expansion of those materials (especially metals) for which world demand seems most likely to increase. If the Commonwealth's "plan" contains proposals that would meet all these requirements—and that would help to maintain an even flow of dollar purchases and, with it, an increased flow of dollar investment—then it can indeed claim to propose one of the most essential foundations for a sounder system of international trade. As with so much else in that "plan," however, it is not what the Commonwealth proposes, but what the new American administration disposes, that is really going to matter. And the answer to that riddle is still anybody's guess.

Business Notes

Anglo-Iranian Debenture Terms

Anglo-Iranian has sent investors a pleasant Christmas card by arranging its long-expected debenture issue on such attractive terms. The issue is of £20 million of 5 per cent debenture stock, 1974-78, at 98½. These terms, coupled with the fact that nearly three-quarters of the subscription will not be due until the end of March, should secure a warm response from investors, particularly the institutions, who will be anxious to secure a place on the allotment list. The lists are not likely to stay open very long on January 6th. Preference and ordinary shareholders in Anglo-Iranian and stockholders in Burmah Oil will be accorded preferential treatment if they apply on pink forms. The new debenture stock, the first to be in issue by Anglo-Iranian since the former stock was repaid in 1934, will carry a first floating charge on the company's assets. The issue of a first charge debenture is becoming a common practice among those industrial giants that have important subsidiaries and a reasonably strict limit on the company's borrowing powers has become part and parcel of such an operation. Anglo-Iranian, by adopting a formula that fixes its borrowing powers at two-thirds of its paid-up capital and reserves (including income tax provisions), has assumed a limit of £83 million on the amounts that it can borrow.

The need for the new issue is plain. To some extent it is a natural response to the loss of the Abadan refinery (for although the current rate of the group's profits appears to have been maintained, its income might well have expanded but for that catastrophe) but it is also a reflection of longer-term plans to increase oil capacity throughout the world. Anglo-Iranian has a mammoth programme of capital expansion, on which it expects to spend £75 million in 1953 alone, for the completion of oil refineries in this country, in Australia and in Aden, further oil exploration, and the construction of new tankers. Retained profits will provide much of the money needed to finance these developments, but if the programme of capital expansion continues at its present pace beyond the end of 1953, they may have to be supplemented by market issues. Anglo-Iranian's needs can be matched by those of the other major groups. This week, for example, Mr Felix Guepin, a managing director of the Shell group, declared that only retained profits could provide the enormous capital that is needed for the discovery and production of petroleum. Shell's profits ("considerably less than one penny per gallon net after tax") are big; but oil profits, declared Mr Guepin, have to be big simply because the world's capital markets do not produce money on the scale that an industry of such prodigious expansion requires.

Oil in Washington and Persia

Judge Kirkland, who is hearing the grand jury investigation into the alleged international oil cartel in the District Court in Washington, held last Monday that the subpoena served on the Anglo-Iranian Company requiring it to produce documents be quashed. The judge's findings are of interest on two narrower counts. First, he declared that "this court is of the impression that the corporation, Anglo-Iranian Oil Company, is indistinguishable from the Government of Great Britain." This is the point of sovereign immunity. Secondly, the judge, in further comment, made it clear that "the Court's opinion is not that Anglo-Iranian cannot be sued" but that he was giving an opinion only on the enforcement of a subpoena against the Company.

The case would now proceed as before, with Anglo-Iranian relieved of the obligation to submit documents. But on Tuesday the judge postponed the inquiry until March 16th in order to give the new Administration a couple of months to decide whether it wants to continue the case. The decision is significant, not because the incoming Attorney General has given any indication of his views on the case, but because it becomes clearer every day that the State and Defence Departments share little of the zeal that has been shown by the Department of Justice in pursuing it. Indeed, a settlement of the Persian oil dispute by some form of co-operative enterprise of Anglo-Iranian and American companies to handle Persian oil has been mooted by the Americans. It has been suggested that President Truman is a strong supporter of this move, which would obviously put in a ridiculous light the recent efforts of the Department of Justice to bring Anglo-Iranian and the other companies to book for their alleged crimes.

The State Department's efforts to find a solution to the Persian deadlock appear to have found a cool response on the British side. They were under discussion in Paris at this week's meetings between Mr Acheson and Mr Eden and no progress has been reported. It is interesting to speculate on what might happen if a solution of this kind could be found which the Persians would accept. Some involved problems of dollar payments would be created. And what would be said by the independent oil producers in the United States if Persian oil began to flow in quantity to the Atlantic seaboard? The American oil market is already under pressure of heavy supplies—as it was a few years ago when "the cartel" was blamed for "dumping" cheap oil from the Middle East.

Hawker Siddeley Limbers Up

Rearmament has imposed a new order of battle on the capital resources of the aircraft industry. Some members of the industry have had to secure reinforcements in the capital market—the successful "rights" issue of ordinary shares by Rolls-Royce is a recent example—while others, such as the Hawker Siddeley group, have had to refurbish the old-fashioned weapons in their financial armouries. In order to do this, the directors of the Hawker Siddeley group have proposed that the old limit of £5 million on the borrowing powers of the parent company should be replaced by a limit of £16 million on the borrowing powers of the group as a whole, with a secondary limit of £10 million in respect of borrowings of a permanent nature.

The reasons for these proposals, which will allow the group to borrow "further substantial sums" to support the expansion of its business caused by rearmament, are revealed in some detail in the group's well-designed balance sheet drawn up on July 31st last. At this date the group's participation in the rearmament programme—apart from the production of Meteors, which is an important factor in explaining the advance in trading profits from £6,493,208 to £7,953,267—was just getting into its stride. Even

so, the net book value of fixed assets had risen in the year to July 31st from £7,487,937 to £8,278,592 and, far more significantly, the book value of stocks and work in progress (less progress payments, which are often only paid after a delay of some months) had risen from £16,563,984 to £24,239,193. This increase in investment has been followed by its usual corollary—a fall in cash balances (from £4,067,409 to £670,339) and a bank overdraft (of £1,728,227). These figures in themselves explain the reasons for the directors' proposals that borrowing powers should be increased. It seems probable, however, that as the deployment of the group's resources will have to accord with any shifts and jolts in the defence programme, the finance needed will be sought through further loans from the banks rather than by an appeal for new money in the capital market. The support of ploughed back profits will also be needed and this, together perhaps with certain political overtones, helps to explain why the directors have been content merely to maintain the ordinary dividend at 10 per cent.

Rights of Preference Shareholders

The Bristol Aeroplane company is after all able to go ahead with its proposed issue of new preference shares to ordinary shareholders, with the authority of a general meeting of the ordinary shareholders only; and it has announced its intention of doing so. Last week the Court of Appeal heard and allowed its appeal against the decision of Mr Justice Danckwerts, reported on page 715 of *The Economist* of December 6th. In the view of the Court of Appeal, based on the articles of the company, the board's proposal does not "affect" the rights of the preference stockholders, despite the argument that the balance of the voting power in the company will be changed as and when the new shares are issued. The preference stockholders are not, therefore, entitled to demand that the proposals shall be submitted for their approval in a separate meeting. The decision clarifies the position of the Bristol Company, but it cannot be said that it gives an unobscured green light for all comparable proposals by other companies.

Mr Justice Danckwerts's original decision in the Bristol case was based on his earlier ruling in the Tadcaster Brewery case. The Bristol and the Tadcaster companies had very similar wording in their articles authorising separate meetings of the holders of different classes of shares. Both refer to any proposal that affects, modifies, deals with or abrogates the rights of members. Mr Justice Danckwerts, on the authority of earlier decisions, held that a proposal that increased the numerical voting strength of one class of shareholders necessarily affected the rights of another. The Master of the Rolls, in the Court of Appeal, produced a refinement of this. What was being affected, he said, was the enjoyment of the preference stockholders' rights, not the rights themselves. This distinction raises a pretty problem for directors. When does a particular proposal cross the line between affecting rights and affecting the enjoyment of those rights? From a practical point of view, the Court of Appeal's decision may encourage boards to go ahead in the belief that bonus issues need only the consent of those shareholders entitled to the equity in the company. They are entitled to do so unless and until some preference shareholder succeeds in persuading the Court of Appeal that the combined effect of the company's articles is distinguishable from that of the Bristol Aeroplane company's articles.

Extending the Trustee List

The limited range of investments permitted to trustees by the Trustee Act of 1925 has been under fire for a good many years. One of the most telling shots in this battle has now been fired in the report of the Nathan Committee on

Charitable Trusts, which states baldly that "an enlargement of trustee investments is necessary and should not be delayed." The committee has based this conclusion on a familiar pattern of evidence. Broadly speaking, unless their particular trust instrument provides otherwise (as many modern trust instruments now do), trustees are personally liable for any loss in the funds for which they are responsible that may be sustained as the result of investment outside the limited range of securities permitted by the Trustee Act. In consequence, trustees governed by the Act stick closely to the securities that it permits, which are now virtually all gilt-edged, and thus fixed income, stocks. The real value of these stocks has been steadily reduced by the fall in the value of money and trustees have been forced to accept a pattern of investment which, in the words of the report, "a prudent business man would be unlikely to adopt in handling his own affairs."

The committee believes, therefore, that the range of trustee investments should be extended to stocks and shares of financial, industrial and commercial companies quoted on the London Stock Exchange, subject to the general safeguard that a limit, perhaps of 50 per cent, should be imposed on the proportion of the trustee funds that could be invested outside gilt-edged stocks. It adds that a part of the trust funds should be held in gilt-edged stocks with an early obligatory redemption date, so as to provide the fund with some cushion against a "bear market" in equity stocks. It further recommends that investments should be made only in companies that have paid an ordinary dividend of not less than 4 per cent in the past ten years and that, in order to ensure a ready market, investment should be made only in those classes of shares that have a nominal issued value of not less than £1 million. Thirdly, the committee suggests that debenture and preference shares should be authorised as trustee investments only if they carry the right to be converted into equity shares or, alternatively, if they have a fixed and "not very distant" date of redemption; only prior lien debentures should be eligible, and any authorised preference shares taken up should rank at least equally with any other preference stocks issued by the company.

Merits of the Proposals

The first merit of these proposals is that they recognise that any sensible limitation on trustee investment should be wide enough to allow sufficient—but not excessive—latitude both to the trustee whose duty it may be primarily to invest for income throughout the life of the trust and to the trustee who is anxious, as far as possible, to maintain the capital value of the trust fund. If the committee's general argument is accepted, its 50 per cent limit on investment outside gilt-edged stocks seems preferable to a specific limit on equity investment as such—and certainly no secondary limit on the proportion of equities should be imposed. But there are two specific points on which the committee's proposals seem open to comment. The first of these is the recommendation to limit the range of securities to those that are quoted on the London Stock Exchange; are there not some shares equally suitable for trustees' portfolios that are quoted only on the provincial exchanges? Secondly, the committee seems to suggest that a nominal issued capital of not less than £1 million automatically ensures the marketability of these shares; experience suggests that this is not invariably the case.

In general, however, the recommendations move a long way towards a solution of an old problem, argued down the years in these columns and elsewhere. Those, and they will be many, who support the committee's view that equity shares should be made permissible for trustee investors will accept its conclusion, but equally some will regret that it had to wait until an era when the yields obtainable on gilt-edged stocks make adventure into equities less inviting for trustees, and

when equity investment has become a favourite subject for political attack. Statutory dividend limitation or EPL, for example, would effectively prevent the trustee investor from securing some protection against inflationary pressures but they leave the trust funds that he manages exposed to the risks that are inseparable from equity investment. But reform is not to be spurned merely because times are difficult for benefiting from it.

Dollars for Centurions

The size of the order for Centurion tanks signed by Mutual Security Agency officials on Monday is big enough to ensure that British tank production remains at least at its present level for the next two years. The order is worth \$90 million, and is for about 500 tanks to be supplied to the Dutch and Danish contingents of Nato, and to be paid for by America. It is not the first dollar order for Centurions—they have already been bought by the Canadian Government for the use of the Canadian forces in Europe—but it comes at a time when the Ministry of Supply has found itself with considerably more tank-producing capacity on its hands than the War Office is prepared to employ. The Centurion was designed by Vickers-Armstrongs during the war, and came into production towards the end of the fighting. It is a medium 50-ton tank with a 20-pound gun and a 600 bhp Meteor engine, adapted from the Rolls-Royce Merlin piston aero-engine that became the standard wartime power unit for British tanks. Ever since the war the army has been supplied with Centurions by two factories, one a Royal Ordnance Factory and the other belonging to Vickers, and when the rearmament programme was drawn up at the beginning of 1951, provision was made for two new lines to be laid down. The engines have throughout been built by the Rover Motor Company and, more recently, by the Jaguar Company.

The fighting in Korea has hardly provided the full test of a tank's performance, but in certain respects it has shown that the Centurion meets some of the specifications laid down for a medium tank. It has no serious competitors in Europe, and it has what many experts consider one distinct advantage over the American Patton tank, since the engine is at the back, where it is better protected. For these and other reasons, the Centurion may become the standard tank for Western Europe—where opinion is swinging in favour of the medium tank and away from the mammoth 60-70 ton prototypes—as well as for the British and Commonwealth armies, and it is on the way to becoming an important item of export. Nevertheless, the effect of the new "off-shore" order no more than cancels the effect of the cuts made by the War Office under the revised rearmament programme announced two weeks ago. The future of a new factory laid down under the 1951 programme and shortly due to come into production remains a matter for conjecture; this affects also the engine makers and sub-contractors that have had, for example, to expand their facilities for making the 3-ton turret castings.

Tidying Up Germany's Debts

All the loose ends of the German debt settlement, with one minor exception, have now been tied up. Last week a conference between the Federal German Government and representatives of the British long-term and medium-term creditors reached agreement on the two most important residual items left over by the general debt talks earlier this year. These residual items related to the Federal Government's responsibility for the Austrian Government's debts and for payments made into the Konversionskasse by debtors in the Saar and in countries outside the Reich. The German Government has agreed to pay (in ten annual instal-

ments) three-quarters of the interest that fell due on the Austrian Government 7 per cent International Loan, 1930, between March 12, 1938, and May 8, 1945. The amortisation coupons on the Austrian Creditanstalt bonds, 1936, which fell due in the same period, will be redeemed over the next five years. Interest arrears on payments made by debtors in the Saar into the Konversionskasse will be paid up in full by the German Government, which will also pay 60 per cent of the interest arrears accruing on the payments made into the Konversionskasse by debtors in Austria, France, Luxemburg, and Belgium.

The Federal Government has also agreed in principle that municipal gold mark loans or reichsmark loans with a gold clause, which have a "specific foreign character," shall be converted into deutschmarks on the basis of one gold mark or one reichsmark equalling one D-mark; an announcement determining the nature of a "specific foreign character" is to be made as soon as possible. The date of payment of the first coupon on the 3 per cent Funding bonds, issued in respect of the interest arrears on the Young loan, has been postponed from April 15th to June 1st next year, when a full six months' interest is to be paid. The question on which agreement has not yet been reached concerns the liabilities of the Deutsche Rentenbank Creditanstalt. Apart from that, the settlement is complete on paper.

Glaxo's Bid for Cortisone

Quantity production of the drug cortisone is still, after several years' intensive research, a rich prize dangling just beyond the reach of pharmaceutical manufacturers. Only one company, Bayer, Ltd., is making cortisone on a commercial scale in Britain, and in this case only since October. In the light of the difficulties experienced, a statement made by the chairman of Glaxo, in answer to a chance question at the company's recent meeting, is of particular interest. Sir Harry Jeffcote said that Glaxo has succeeded in synthesising cortisone, but it remained to be seen whether a commercial process could be evolved. The drug is of great importance to the industry. It has become one of the accepted forms of treatment for arthritis, though not all types or all cases respond to it and it is not a cure for the disease. Relief from arthritic symptoms can only be obtained by regular "maintenance" doses on the lines of insulin treatment for diabetes. In an industry where research costs are peculiarly heavy and returns uncertain, the production of drugs in wide demand either for continuous treatment or, like penicillin, for a large number of constantly recurring conditions, provide the industry with its only steady and dependable source of income. The scale of investment in relation to output of such drugs is often so big as to give the first one or two companies in the field an effective monopoly of the market. The stakes in the race for cortisone, therefore, are perhaps the highest that the industry has known since the development of bulk methods for the production of penicillin.

Although they differ in detail, the methods of making cortisone commercially all start from the same material, ox-bile. Supplies of this commodity depend upon the number of cattle slaughtered annually and upon arrangements for collection at the slaughter-houses. British manufacturers find this a big obstacle and the Bayer company has not even attempted to collect bile in this country. The company is making cortisone from imported materials partially worked up by its American associate. All cortisone manufacturers consider that an alternative method of production is essential, for not only is this raw material relatively scarce but the cost of the drug is about £4 a gram, while a standard daily dose may be from 20 milligrams upwards.

Whether Glaxo will prove to have been more successful than the company's many competitors may not be known for some months. Much of the interest attached to the chair-

man's statement arises from the fact that this is Glaxo's first venture into the hormone field (as indeed it is for Bayer). The expansion in the knowledge and use of hormone treatment has been dramatic, and the big pharmaceutical manufacturers are apparently no longer able to leave this branch of medicine to the handful of companies that have always specialised in it. But competition from the specialists, with their long experience, is likely to be severe, and already one such company, Organon, Ltd., has established itself as the principal supplier of ACTH (adrenocorticotrophic hormone) which like cortisone, has an important place not only in the treatment of arthritis, but also of other diseases.

Decontrol of Cereals Delayed

The Minister of Food has this week reaffirmed the Government's intention to free cereals from control by next autumn. Talks between the ministries concerned, the National Farmers' Union and the trade have been going on since October, but the Minister of Food will not commit himself yet. An end to the control of wheat will have to await the outcome of the conference in Washington at the end of January to decide the fate of the International Wheat Agreement. But there is a general expectation that the rationing of feeding stuffs in this country will come to an end as early as next spring—in which case farmers will want to know about it very soon.

Two points in particular are delaying the freeing of coarse grains. First, there is the Government subsidy on feeding stuffs, at present running at the rate of about £25 million a year; if the Ministry of Food no longer buys grain and re-sells it to the farmers below cost price (which is the form that the subsidy takes), a new method will have to be found for honouring price guarantees under the Agricultural Act of 1947. The second consideration is that a large part of the feeding stuffs fed to livestock on British farms comes from the United States, so that a truly free market might create a particular dollar problem, while roughly an equal amount has recently come from Russia which is always an uncertain source. For the first nine months of this year coarse grain imports into Britain cost about £80 million, of which American supplies accounted for about £22 million and Russian grain for another £22 million; coarse grain from the Commonwealth cost only about £7 million, mostly from Australia.

The Government and the trade both believe that a way can be found round the difficulties and that any remaining risks should be taken. The trade, which for the past twelve years has operated under the umbrella of the Ministry of Food, will have to face the blasts of open competition and importers will also have to risk their own capital. Farmers voice apparently mixed views. Price apart, they want to be sure of supplies. But the farmer who grows more grain than he needs will be glad to be able to sell it, when necessary, to his neighbour down the lane instead of having to take it to an authorised dealer.

Steel according to Plan

When the steel industry's first plan for postwar development was published in May, 1946, it proposed the expenditure of £168 million. Subject to some "adjustments, eliminations, and additions," the development planned is now practically complete—and certainly almost all the levels of output envisaged in the plan for mid-1953 have already been surpassed. In capacity, indeed, the industry is hardly short of the 17½ million tons later decided upon—and it expects output to reach that record level next year. But the programme of development has in fact cost nearly twice as much as was planned—some £310 million, including spending to

the end of this year. Steel-making equipment, according to an index prepared by the British Iron and Steel Federation, now costs just over twice as much as it did in 1945.

The industry made two major changes in its plans. It abandoned the scheme for a new riverside iron and steel plant on Clydeside, partly because the locational advantages in transport costs did not seem enough to offset the high capital cost of transferring production. The "second Corby" on the Midlands orefield, too, was given up. Instead it was decided

* On a 52 week basis. Source: British Iron and Steel Federation.

to expand output at Corby; but even this development was held up for lack of labour, and has been limited by the rate of housebuilding for workmen there. Inevitably, the high cost of plant has favoured expansion at existing works and steel-making centres, where services already exist, against the building of completely new works. Initial capital expenditure such as was undertaken at Port Talbot, the industry's one great new venture in the first expansion plan, can only be justified by very considerable reductions in direct production costs. In the second development plan, outlines of which were forwarded to the Government last month, the emphasis is inevitably once more upon the expansion of plants now in operation; because of this, and because various developments under the first plan were laid out with a second stage already in view, the capital cost per ton of extra output should, at least relatively, be rather cheaper.

Foundry Safety and Efficiency

A private member's bill given a second reading in the Commons last week seeks to regulate working conditions in iron and steel foundries; in purpose, at least, it is to be welcomed. Outside the mines, there are few jobs as arduous, dirty and hazardous as foundry work. In 1950 the accident rate for the industry was three times the national average for all industries; and in 1951 the rate actually increased slightly. Large quantities of hot metal have to be constantly on the move in a foundry, and for most jobbing work the tradition is for work to be done on a soft, uneven sand floor in which some of the moulds are sunk. Even given these pre-conditions, the standard of layout, storage, and materials handling in foundries is not generally high. No other type of industrial workshop so often gives an impression of haphazard untidiness and often this apparent lack of order does in fact denote inefficiency.

Such working conditions derive in part from the fact that a large majority of the 2,000 foundries in Britain are extremely small, particularly the iron foundries; and that when most of them were laid out labour could not afford to be fastidious. Since the war the industry has been making very considerable efforts to improve conditions; washing facilities have been brought up to date in a large proportion

of foundries, and the industry—some years after coal—has now begun installing shower baths. The progress is appreciable, though there are still many firms where these amenities are primitive. Nothing has done more to tidy up the foundries of Britain than full employment; recruitment into this industry is still a bitter problem for the employers, with probably fewer young people entering it than go into the mines. The effects of full employment—plus some reports of American practice and results—have spread wider than welfare. In the past few years there has been a marked swing towards the installation of mechanical handling devices within the foundry, and towards various types of mechanised casting for repetition work. This is an industry where the drive for productivity generally brings better conditions for the workpeople in its train, and vice versa. The Government's view upon last week's bill was that attempts to specify particular penalties for particular breaches of regulations might tend to hamper the ordinary supervision of this industry under the regulations that apply to all; and the provisions of the bill probably do enter into too much detail. Even so, this Parliamentary concern may give the standing joint committee of the industry, which has been promoting improvements in foundry conditions since 1948, a little extra weight in its representations to the more old-fashioned foundry masters.

No Monopoly for the Docks Executive

The High Court has blocked the attempt by the Docks and Inland Waterways Executive to establish a monopoly in the towing facilities available within Immingham Dock. A firm of Grimsby tugowners have been granted a declaration that they too are entitled to provide towing facilities within the dock, and that, provided they pay the statutory fees, the Executive are not entitled to exclude their tugs. In a sense, the decision turned upon the construction to be placed on two statutes. One, a general statute of 1847, made harbours, docks and piers "open to all persons for the shipping and unshipping of goods and the embarking and landing of passengers"; another, local to the Humber, gave the management that the Docks Executive had replaced a right to "employ or licence" any tugs using the dock system. The plaintiffs rested their case on the first statute. The Executive claimed that, if they were entitled to licence a tug, they were also entitled not to licence it—in fact to exclude it.

But the origins of this dispute are economic. The Executive's argument was that they have a duty to carry on the docks undertaking commercially and to cover their expenses. They maintain two large and powerful tugs in the docks at Immingham. Since May, 1951, when the plaintiffs' tugs appeared, the Executive had, it was said, suffered severely from this competition. And so (if it can be called a *sequitur*) the remedy they intended to apply for that situation was to exclude the damaging competition and give themselves the protection of a monopoly. The plaintiffs' answer was that traffic using the dock was increasing and that they had secured a large part of the business because their tugs were smaller and handier. Mr Justice Sellers took the view that the plaintiffs had established the right of their tugs to enter Immingham Dock; and that nothing in any statute entitled the Executive to exclude tugs operating as the plaintiffs' tugs had been doing. The inter-departmental correspondence of the Executive, he said, had revealed less desire to make the tug services at Immingham highly efficient and adequate than to stultify competition, thus protecting their own tugs, which apparently could not hold their own in a busy port.

Excessive EPU Creditors

The Council of the Organisation for European Economic Co-operation at its recent meeting in Paris considered the

HOLD THAT TIGER

A FIRM of building contractors working on extensions to a dry-dock on the Clyde were faced with a difficult problem. They had to blast out a concrete wall—more than 1,000 tons of it—without damaging a ship in the dock only 17 feet from the nearest blasting point. It was also important that the demolition should not interfere with other work going on nearby. The contractors turned to I.C.I. Nobel Division for assistance and a team of experts from the Division's technical service department undertook to do the job. They worked on a plan of controlled blasting, using the explosive Polar Ammon Gelignite to "lift" the concrete in 8 foot sections. To prevent damage from blast and flying concrete they put up special steel screens and covered each set of shot holes with steel nets and sandbags. This technique proved entirely successful and the wall was demolished without incident.

special position of Germany and the Netherlands in the European Payments Union. Each of these countries, which not so long ago was wallowing in deficit, has now built up such a large surplus that its quota is approaching exhaustion. Although both ran deficits in the month of November the position at the end of that month was that Germany had a cumulative accounting surplus of \$405,200,000 against its quota of \$500 million, while the Netherlands had a cumulative surplus of \$291,700,000 against its quota of \$355 million. It has been decided that if the quotas should be exceeded one half of the excess should in each case be settled by payments in gold and the other half by credits granted by each of these countries to the Union. The Council rounded off these recommendations by suggesting that various creditor countries, including Germany and the Netherlands, should increase their efforts for a liberalisation of trade. The Council also recommended that Germany should take all necessary steps to speed up the liberalisation of invisible transactions and that the Netherlands should encourage stockpiling of raw materials exported from member countries and associated monetary areas. These various initiatives on the part of OEEC reveal a welcome alacrity in dealing with difficulties in anticipation of the moment at which events themselves begin to take charge. The recommendations for dealing with above-quota surpluses follow the formula applied to Belgium which to this day remains the largest excessive creditor in EPU. This episode helps once again to stress the inadequacy of EPU quotas in relation to the swings of payments which experience now shows to be part of the normal rhythm of intra-EPU transactions.

Releasing Zinc Stocks

After discussions with the trade the Government has completed its plans for the release of zinc from its stocks during the first six months of private trading which is to be resumed on January 1st. The arrangements reached between the Government and traders have benefited from the experience of a fairly smooth changeover from Government to private dealings in lead which began on October 1st. Government-held stocks of zinc are now about 135,000 tons, having increased steadily by about 100,000 tons during the past year. The Ministry of Materials will sell back to United Kingdom and other Commonwealth producers of zinc a total of 24,000 tons of the metal of their own brands; this quantity will be available as required during the first half of next year and, together with new supplies from producers, should suffice for consumers' requirements.

It is expected that Government releases will in fact be called for at the rate of about 4,000 tons monthly. A rough estimate puts next year's consumption of zinc at about 16,000 tons a month; if so, releases from the Ministry of Materials' stocks will cover about a quarter of total requirements. The Ministry, aided with advice from the zinc producers, have introduced a device into the scheme which should prevent releases of official stocks from exerting any undue bearish influences on prices. Government held zinc sold to producers' agents will be priced on the basis of the monthly average quotation of the London Metal Exchange in the following months; thus the price to producers of Government zinc sold in January will be known at the end of February. Moreover, the Government will not then price more than 4,000 tons of the previous month's sales; any zinc bought in excess of that amount will be carried over for pricing purposes to the next month. It is hoped this will have a steadying influence on the market, without unduly restricting the outflow of Government-held zinc. Should the zinc not be available for prompt delivery to consumers, the Ministry of Materials will be willing to sell prompt on the London Metal Exchange; for this purpose Mr F. C. Chisnell,

managing director of Anglo Metal, Ltd., has been appointed as Government broker.

Releases of zinc in the second half of next year will be determined by the experience gained in the first six months and by the circumstances prevailing next June. The Ministry's present price for zinc is £110 a ton; although the price is expected to fall when free dealings open next month, it seems unlikely to take a dive like that which occurred when lead was freed in October. Market conditions have changed since that time.

* * *

Slow Recovery in Freights

For the third month in succession the tramp freight index compiled by the Chamber of Shipping has shown a slight but steady improvement. From the low point of 79.2 in August, the index has risen through 87 and 94.2 to 99 for November (1948 = 100). The average for the first eleven months of 1952 now stands at about 111.6, which, if considerably lower than the average of 173.7 for 1951, is at least better than the average of about 84 for 1950. When the steep decline of freight rates occurred in the early months of the year, few shipowners would have been prepared to forecast where it would stop, and in the summer numbers of ships were withdrawn for laying up. The recovery since August has been slow, but it has been sufficient to prevent any increase in the number of ships laid up, apart from those withdrawn from service by the American authorities after their temporary release from the reserve.

The fundamental factor is that the market has returned to a more normal, competitive state, and for the time being at any rate the supply of tonnage is in fairly close accordance with demand. The markets have been irregular, and the increase in the freight index has not been achieved without marked falls in the rates paid in certain trades. In such a competitive market there is far more scope for the exercise of commercial acumen. The efficient operator of tramp ships is able to reap the advantages of his skill—and often luck; and there are many who are not dismayed by this return to a state of affairs which before the war would have been regarded as normal. On the other hand, no shipowner can pay his way if the tide of trade recedes so far as to leave his ships high and dry. Since the end of November things have been fairly quiet on the Baltic Exchange, but chartering for the early months of the new year has been going on steadily without any marked easing of rates, and shipowners expect that some fairly large orders may be circulating after the holidays.

* * *

Trends in Australian Banking

The accounts of the Australia and New Zealand Bank for its first full year of trading since the merger give a graphic indication of the severe calls that were made upon bank credit in those countries during the period of high imports and large overseas deficits during the latter part of 1951 and well into 1952. The bank's deposits fell by some £A36½ million to £A309 million in the twelve months to September 30, 1952, whilst advances rose by £A33 million to £A202 million. Since the balance sheet was drawn up the improved trade position of Australia and New Zealand has undoubtedly led to some reversal of these movements. During the phase of pressure, the stringency was relieved by the central bank's policy of granting releases from the commercial banks' "special accounts" with it; and the "A. and NZ" Bank's report shows a fall in its special accounts from £A100 million to £A39 million. Its investments—shown "at or under market value"—fell slightly, from £A15.0

million to £A14.4 million. Profits were slightly lower than in the previous year, but the dividend was maintained at 10 per cent.

The merger of the Bank of Australasia and the Union Bank of Australia into the "A and NZ"—which took place on October 1, 1951—has led to some rationalisation of services during the past year, in the shape of the merging of branches of the two banks in 39 localities where they were both represented. The record of branches opened, of agencies converted to branches, and of agencies opened—as well as of arrangements said to be in hand for the opening of further new branches—tells a tale of steady geographical expansion of services in two countries where growing and spreading trade and population clearly demand such an expansion. The bank now has 549 branches and 175 agencies. In a period when the costs of opening new branches are high and the skilled staff required is often hard to obtain, the bank is clearly in a good position to effect its geographical expansion by transfers of staff from areas where it is over-represented.

* * *

Ending Another Development Council

The development council for the jewellery industry, like the Clothing Development Council, is now to be wound up; there will be a "voluntary" body for clothing but not for jewellery. Mr Harold Wilson, who set up both these bodies, said rather plaintively in a Commons debate this week that this action would make the Industrial Organisation and Development Act of 1947 into a dead letter; but it has been clear from the start that the effectiveness of this Act must depend upon the extent to which industry would accept it. And experience of these councils has not endeared them to most of the industries concerned.

The campaign of the clothing manufacturers against the creation of a development council, and their guerilla tactics after their initial defeat, brought the industry into the lime-light; the jewellery council, though much less obtrusive, was little more successful in gaining the interest of its industry. The silverware trade associations and unions in Sheffield, the industry's most important centre, boycotted the council from its inception and sent no representatives to fill the seats allotted to them. Trade bodies in the other jewellery areas were represented, but their private members have never considered that this in any way debarred them from sniping at the council. Its work was financed by an annual levy of £25,000, not a large sum in itself, but a big one for an industry of this size to provide when trade was difficult. Part of this levy was spent on research, but a good third of it has gone on export promotion schemes that many manufacturers consider to have been of doubtful value. The development council is going to be wound up at the end of this year.

Only two development councils remain in existence: the Cotton Board and the council for the furniture industry. The Cotton Board was set up by the industry before the Industrial Organisation and Development Act had been heard of, and it became a statutory body under that Act simply to bring it into line. The furniture council was grudgingly accepted by the industry, but it has earned its reprieve by initiating research into methods of testing the durability of furniture. The outcome of this research is the tests that will form the basis of the new British Standards for furniture. However sceptical the industry may be about the efficacy of such tests, this particular aspect of the work of the furniture council has enabled an end to be made of the tiresome utility schedules without encouraging an attack on the industry for "debasement" its standards. Whether the council can continue to justify itself, and the levy that maintains it, in the eyes of the industry may depend on the extent to which British Standards for furniture succeed in attracting the public's attention.

Shorter Notes

English Electric has received a contract to supply two high-voltage transformers to the Seattle city authorities from the same city purchasing agent who two years ago rejected bids from both English Electric and Ferranti in favour of the higher tender put in by an American company. In the summer, Ferranti received a contract to supply nine power transformers to the American army on the strength of a bid that was more than £71,000 lower than the lowest American tender. The price bid by English Electric for the Seattle contract is £247,000, which is £43,000 lower than the lowest American figure. The company has also bid for the contract to supply four generators for a Federal power project near Seattle, that is being run by the United States Army Engineers; the result of this is not yet known.

*

The Council of the Stock Exchange has announced that the Treasury and the Board of Inland Revenue will not now offer any objection to the issue of option certificates to bearer, provided they have not more than two years to run. This is a happy solution to the problem that faced dealers and the investing public after the issues by Rugby Portland Cement and by Bowater Paper of loan stocks, complete with option certificates to subscribe for ordinary shares later; the Inland Revenue authorities will now treat bearer option certificates as "scrip" and not as "securities," with a useful saving of stamp duty to the market.

*

The Standard Motor Company has decided to start producing Ferguson tractors in France, in conjunction with Hotchkiss, because the level of import quotas appears to be so far below the level of potential demand. Standard has also already had the painful experience of stepping up tractor production to meet large French orders, only to have them cancelled by the sudden imposition of import restrictions. This year, British tractor exports to France may reach about 5,000 compared with last year's total of 4,000. It is expected that the French factory will have an output of 25,000 tractors a year, some of which will be exported. The factory will have to begin by assembling British-built tractors shipped "knocked-down," but eventually the complete tractor and its components will be built in France.

*

The report on the accident to a Comet aircraft that crashed during a take-off run at Rome airport in October finds that the pilot, when he lifted the nose-wheel of the aircraft off the ground, did so at a sharper angle than usual. The result of this was to give high "drag," that is, to increase the resistance of the air to the passage of the aircraft, and the engines, although they were at full throttle, could not build up the acceleration necessary to get the Comet airborne. No structural defects in either airframe or engines were responsible for the crash. The aircraft was damaged beyond repair by the forced landing. The occurrence has given dramatic proof of the safety of gas-turbine engines; although the fuel tanks were smashed by the impact, and the aircraft was enveloped in spilt kerosene, fire that might have taken place instantly with a petrol-engined aircraft did not occur.

*

Restrictions have been removed on the use of copper, brass and other copper alloys in manufactures for the home market. From January 1, 1953, licences will no longer be required for the purchase or sale of zinc; this arises from the decision to reopen the London market in zinc on January 2, 1953.

Company Notes

Turner and Newall.—A year ago the directors of Turner and Newall came in for some sharp criticism when they did no more than maintain the ordinary dividend at 20 per cent; perhaps it is not surprising, therefore, that they have now decided to pay a dividend of 25 per cent for the year to September 30th last. But they have had to do this in the face of a fall in net profits from £4,553,300 to £3,765,165; a year ago, when the directors refused to raise the ordinary dividend, net profits had risen by over £1,500,000. The fall in net profits in the latest year, however, is wholly due to the increase in the provision for taxation, from £6,560,205 to £8,001,072; presumably the group's liability for EPL explains why this increase of nearly £1,500,000 exceeds the advance in group trading profits from £13,218,345 to £14,266,076. The increase in dividend payments, coming at a time of a fall in net profits, has meant that reserve appropriations are smaller than in 1950-51; this has been borne

Consolidated earnings	Years to Sept. 30,	
	1951	1952
Trading profit	13,218,345	14,266,076
Total income	13,855,798	14,780,432
Depreciation, etc.	1,684,478	1,931,230
Taxation	6,560,205	8,001,072
Net profit	4,553,300	3,765,165

Replacement reserve	1,750,000	900,000
General reserve	500,000	600,000
Added to carry forward	417,616	197,360

£1 ordinary stock at 98s. 9d. yields 5s. 1s. per cent.

by specific reserves, for the appropriation to the general reserve is £100,000 higher. Heavy reserve appropriations in the past have widened the gap between the real capital employed in the business and the company's issued capital, and to correct this disparity the directors intend to make a 100 per cent scrip bonus issue.

The latest increase in ordinary dividends may be the last for some time. The directors point out that in "certain sections of the business a downward trend in volume became apparent in the second half of the past financial year," and that this tendency has since continued. It is therefore very unlikely that the high level of profits in the asbestos industry reported in the last two years will be maintained.

Raleigh Industries.—Now that the Government is looking with more favour and good sense on the question of bonus issues, Raleigh Industries have joined Turner and Newall—and many other companies—in the queue to have their application for such an issue rubber-stamped by the Capital Issues Committee. The Raleigh group intends to

Consolidated earnings	Years ended	
	Aug. 25, 1951	July 31, 1952
Profit, before tax	1,703,003	1,505,920
Depreciation	142,819	173,947
Taxation	885,000	777,445
Net profit	675,778	654,528
Ordinary dividends	164,063	164,063
Ordinary dividends (per cent)	25	25
Reserves	350,000	260,000
Added to group carry forward	129,613	98,965

£1 ordinary stock at 83s. 14d. yields 6s. per cent.

make a bonus issue of two £1 ordinary shares for each existing share held, by capitalising for each existing share held, by capitalising £2,500,000 from accumulated reserves. In common with many other boards, the directors of the Raleigh group take care to point out that "there is no bonus element in the proposal, nor is there any suggestion that the amounts to be distributed as dividend in the future will be varied in any way." The future will be varied in any way. The group's trading results for the 49 weeks to July 31st last reinforce this warning. For the

third financial year in succession the dividend has been maintained at 25 per cent, but this time in the face of a decline in profits before depreciation and taxation from £1,703,003 to £1,505,920. This reduction in earnings is partly accounted for by the shorter period covered by the latest financial statement, but it may also reflect a rise in costs and some contraction in the markets for the group's bicycles both at home and overseas. The fall in net profits (from £675,778 to £654,528) has not put the ordinary dividend in danger but it has inevitably led to a reduction in the amount of profits ploughed back into the business.

*

Lancashire Cotton.—The Lancashire cotton spinners have managed to weather the recession in the textile trades rather better than the woollen manufacturers on the other side of the Pennines. Both the woollen and cotton manufacturers have been faced with a slump in sales, but the Lancashire companies have not been forced to write down their stocks—a common experience in Yorkshire following the fall in wool prices. In the year to October 31st last the Lancashire Cotton Company, for example, faced the chill winds of recession without having to cover up with a cut in dividend payments. Its trading profits have fallen quite sharply, from £6,819,018 to £4,225,974, and its net profits, from £3,354,366 to £1,924,403, but the ordinary dividend has been maintained at 15 per cent. Inevitably, however, the appropriations to reserves have had to be reduced.

Earnings	Years to Oct. 31,	
	1951	1952
Trading profit	6,819,018	4,225,974
Taxation	3,435,000	2,340,000
Net profit	3,354,366	1,924,403
Ordinary dividends	318,665	318,665
Ordinary dividends (per cent)	15	15
Stock reserve	475,412	500,000
Replacement reserve	1,000,000	500,000
General reserve	1,500,000	1,000,000
Added to carry forward	36,161	80,740

£1 ordinary stock at 40s. yields 7s. 10s. per cent.

Nothing has been set aside to stock reserves (compared with the £475,412 appropriated a year ago), while the appropriation to a fixed assets replacement reserve has been cut from £1 million to £500,000, and that to a general reserve from £1,500,000 to £1 million. If the recovery in the cotton trade continues there may well be a modest expansion in profits in the current year, but shareholders cannot expect an early return to the boom-time earnings of the earlier postwar years.

*

Great Universal Stores.—Great Universal Stores appears to have caught the habit of surprising investors. The latest surprise has been occasioned by the announcement that the interim ordinary dividend for the year to March 31, 1953, had been effectively doubled. The rate of this dividend, at 12½ per cent, is the same as a year ago, but it is to be paid on an ordinary capital recently doubled by a share bonus. Another surprising feature of the announcement is the directors' report that in the eight months' trading to November 29th last the group's sales and its net trading profits before tax were higher than those reported in the same period last year. This achievement, made in the face of hire purchase restrictions at home and of import restrictions in the group's growing export markets, certainly helps to explain the latest increase in dividend payments. The yield increase in dividend payments is perhaps best calculated on the basis of a 31½ per cent dividend; on this basis the 5s. shares at the current price of 18s. 9d. yield 8½ per cent.

Statistical Summary

EXCHEQUER RETURNS

For the week ended December 13, 1952, total ordinary revenue was £54,945,000, against ordinary expenditure of £76,601,000 and issues to sinking funds £320,000. Thus, including sinking fund allocations of £23,630,000 the deficit accrued since April 1, 1952, was £445,685,000 compared with a deficit of £137,562,000 for the corresponding period of the previous year.

COMPANY MEETINGS

THE COMMERCIAL BANK OF SCOTLAND LIMITED

SATISFACTORY RESULTS

LORD ROTHERWICK'S REVIEW

The annual general meeting of The Commercial Bank of Scotland Limited was held at Edinburgh on December 18, 1952, the Right Hon. Lord Rotherwick of Tynney presiding.

The deputy governor, in the course of his speech, said:

Before commencing the business of the meeting, it is appropriate that I should refer to the loss we have sustained during the past year through the death of Mr William Shearer, who has been associated with us as an extraordinary director since 1941, although his connection with the bank extended over a much longer period. He maintained a keen interest in our affairs and his death is much regretted by all with whom he was associated.

I am sorry that the governor of the bank, the Earl of Mar and Kellie, is still not well enough to take his place here today, and I am sure you would desire me to convey to him from this meeting the good wishes of us all. In the absence of His Lordship, I have great pleasure in presiding again at the annual general meeting of the shareholders of the bank and in presenting the report by the directors which I believe you will regard as satisfactory considering the problems of the past year.

EFFECT OF DEARER MONEY POLICY

When I last addressed you a new Government had recently come into office, and the country was then facing a serious economic position without our having any clear indication as to how a crisis was to be averted and the position improved. In the interval we have seen a radical change in the monetary policy of the preceding years and a further increase in bank rate, and have returned to management of our finances on rather more traditional lines. While the dearer money policy adopted has been essentially of a remedial character, its effectiveness can best be judged by the transformation of our overseas balance of payments from an uncomfortable deficit to a modest surplus and the check upon the drain on our gold reserves which, together, have resulted in greater confidence in sterling. There are, however, no grounds for complacency, as it must be remembered that this improvement has been achieved largely through restriction of imports and that, with the running down of stocks, removal or relaxation of at least some of these restrictions must inevitably follow.

EXPORT POSITION

This leads to consideration of our present export position. Whereas a year ago our ability to fulfil overseas orders was largely governed by the rate at which we were able to produce, various factors—including import cuts by Commonwealth countries, scarcity of sterling available to other countries and increasing competition from Germany and Japan—have combined to alter the situation materially. We have encountered during the past twelve months some recession in trade and now we must intensify our efforts to compete successfully in foreign markets if our balance of payments is to remain favourable.

Our ability to effect the required improvement in exports is, of course, essentially bound up with our internal position, and I gravely doubt whether effective control of

Government expenditure has moved sufficiently in line with the dearer money policy now pursued. It is to be hoped that the Chancellor of the Exchequer's recent pronouncements will, in the event, prove to have been justified and that his budgetary estimates will be substantially realised. Moreover, I hope that his assurance that the task of keeping national and local expenditure within bounds is now a priority one, will be followed by appropriate government measures to limit public expenditure. Otherwise it is difficult to see how any lightening of the all too heavy burden of taxation, which industry has to bear, can be achieved. With costs of production and taxation at their present levels, we are in grave danger of pricing ourselves out of overseas markets. A reasonable measure of relief of taxation would assist industrial concerns to replenish the resources needed for modernisation, re-equipment and reorganisation which could increase output per man hour and enable us not only to maintain but extend our overseas trade. The report of the Royal Commission now sitting to examine the question of taxation will be eagerly awaited, and I am sure that we all hope that they will be able to make recommendations towards alleviating the crushing incidence of taxation on business profits. So far as Scotland and its special problems are concerned, we also look forward with anticipation to the report of the Royal Commission on Scottish affairs. Lastly, it is clear that co-operation and goodwill on the part of all sections of the community will be required to enable us to consolidate the gains already made in our economic position and we look for clear cut action on the part of the Government to provide the necessary incentives for increased output.

BALANCE SHEET ITEMS

Turning to the balance sheet which I have the pleasure to present, you will find that paid-up capital at £2,600,000 and the reserve funds at £4 million remain unchanged.

Notes in circulation amounting to almost £14,500,000 are higher on the year by almost £1,180,000, which increase reflects the higher costs and higher wages ruling in industry.

Deposits and other credit balances at almost £121,126,000 show a decrease on the year of £2,210,000. Having regard to the magnitude of the day-to-day fluctuations in the amount of our deposits spread over a wide branch system there is no significance in this fall.

Acceptances and engagements on account of customers at £4,503,000 are down on the year by £1,513,000. This is not, however, to be taken as an indication of any diminution of the volume of the overseas business being handled by the bank. Indeed, since the partial relaxation of certain exchange controls early in the year, our overseas business has shown considerable expansion, as will be realised from the reference made in note number four to the effect that contracts running for the sale of foreign currencies amount to £18,628,000, these being covered by purchases to a corresponding amount.

When the controls were relaxed in March the bank was in the fortunate position of having trained personnel and suitable up-to-date equipment available to enable us to take full advantage of the changed conditions. Moreover, there has been a widening of our overseas connections, principally in the

United States, Canada and the Continent of Europe, through which sound and remunerative business for the bank is being transacted.

ASSETS

On the assets side, cash, balances with other banks, money at call and short notice in London, British Government Treasury bills and other investments—which are almost entirely British Government securities—produce a total of £108,265,000, equivalent to almost 80 per cent of our liabilities to the public in respect of notes in circulation and deposits, and I am sure that in this respect you will consider that we are in a very strong position to meet the calls which in common with other banking institutions we shall have to face in the earlier months of 1953, when monetary conditions may well prove to be rather more stringent than usual, as the result of the large sums then passing into the hands of the Exchequer. As you are aware, there has been a further substantial decline in the value of British Government securities over the twelve months covered by these accounts. The situation has had the constant attention of the directors and, in view of the fact mentioned in the note in the balance sheet, that these investments are all redeemable at fixed dates and stand in the books at, or under, cost and below redemption price, the precedent set by certain of the English clearing banks in their last half-yearly statements has been followed by us and no transfers have been made from contingency account or reserve funds during the year to write down the book value of these investments.

Bills discounted and loans and advances, together at £32,136,000, show a decrease of £6,113,000. This is due to reduced demands upon us by certain public authorities who have effected funding operations during the year, to the lower costs of certain raw materials, and to the application of the Chancellor's directive to banks to control lending under present circumstances strictly within limits of the nation's prime needs and with full regard to the elimination of inflationary transactions.

As a result of the operations over the year, you will observe that profits are less by £22,665, and are lower than they have been in any one year since 1945. Our costs over these years have continued to rise, and, in particular, salaries which are substantially the largest individual item, have shown a steep upward movement. I think it is realised by the public generally that in Scotland banking services have for long been enjoyed at relatively low cost. The rising charges have compelled the banks to take stock of the situation and to determine upon measures to increase revenue. Consequently, the Scottish banks decided, not without reluctance, to introduce as from September 1st last, a new system of charge which is designed to yield a larger income, but I feel it should be emphasised that the additional revenue which is likely to accrue from this fundamental change will not by any means off-set the increased costs which we have already had to face. The immediate effect of the change was to reduce the commission income collected during the last two months of our year—no credit has been taken for accrued income under the new system, the first half-yearly instalment of which becomes payable in March next.

From the sum available the directors have

allocated £75,000 to contingency fund, and £100,000 to increasing the fund for officers' pensions.

DIVIDENDS

Interim dividends on the "A" shares of 7½ per cent, and on the "B" shares of 5 per cent, less income tax, were paid in July last, and it is now proposed that a further distribution of 7½ per cent on the "A" shares (making 15 per cent for the year), and 5 per cent on the "B" shares (making 10 per cent for the year), both subject to income tax, be approved. After payment of the dividends and allocations the carry forward to next year's account amounts to £100,993.

TRIBUTE TO THE STAFF

I cannot conclude my remarks to you without again referring to the loyal and efficient service rendered by all members of the staff, the result of whose efforts are reflected in the report presented to you today, and on behalf of the shareholders and customers alike I extend to them our very sincere thanks.

It is proposed that the Earl of Mar and Kellie be re-elected governor, and that I be re-elected deputy governor, and that the extraordinary directors whose names appear on the list be re-elected.

It is also proposed that Sir John McLean Duncanson, the ordinary director who is due to retire at this time, be re-elected an ordinary director of the bank, and a resolution will also be put before you for the re-election of Mr Douglas Mure Wood, who was seventy in January of this year and retires under the provisions of the Companies Act 1948.

You will observe from the report that Sir John Erskine has intimated his desire to retire from the general managership of the bank in December, 1953, when he will have reached the age of sixty. Sir John has been general manager since February, 1932, and the progress which the bank has made during his period of office is in itself striking evidence of the success of his management. An opportunity will, I hope, be afforded on another occasion to the shareholders to express their appreciation of his valuable services and, today, I shall confine myself to saying that while the directors have accepted his decision with very great regret, they are happy that Sir John will continue to give the benefit of his services and experience to the bank as a director.

To succeed him as general manager the board have appointed Mr Ian Wilson Macdonald, MA, CA, who is a director of the bank. Mr Macdonald is at present a partner of Messrs Kerr, MacLeod and Macfarlan, CA, Glasgow, and was from 1938 to 1950 Professor of Accountancy at Glasgow University. He has a wide knowledge of men and affairs and an intimate knowledge of the bank, gained in the first instance as one of the auditors, and for the last five years as a director. The board consider that he is fully equipped to assume the onerous duties of chief executive officer of the bank. Mr Macdonald will take up full-time duty with the bank on May 1, 1953, when he will be conjoined with Sir John in the general management until the latter retires in December next.

Mr Maurice Crichton, CA, Glasgow, and Mr Ronald J. Henderson, CA, Edinburgh, the auditors, will, under the provisions of the Companies Act 1948, continue in office, and a resolution fixing their remuneration will be proposed.

I now move that the report and accounts be adopted, and I shall call upon Mr Douglas Foulis to second the motion. After that has been done, and before I put the motion to the meeting, any shareholder who desires to make any observations will have an oppor-

THE NATIONAL BANK OF SCOTLAND LIMITED

RECORD FIGURES

LORD ROWALLAN'S SPEECH

The hundred-and-twenty-seventh annual general meeting of the Proprietors of The National Bank of Scotland Limited was held in the bank's head office on December 18th, the Right Honourable Lord Rowallan, KBE, MC, TD, DL, the Governor of the Bank, presiding.

The Governor in the course of his speech said:

The balance sheet as at November 1, 1952, has its own special features, which call for comment. Once again we are able to claim that our total of £121 million surpasses all previous totals and constitutes a fresh record in the bank's history. Deposits at £97 million are higher by about £800,000, while there has been an increase in the note circulation of £1,200,000 to £10,400,000. Advances to customers, including bills discounted, at £27,800,000, show a reduction of £2,400,000. While these figures reflect in some degree the fall in wholesale prices and in the prices of essential raw materials, the sums advanced speak for themselves as to the measure of support given to trade and commerce, not only within the bounds of Scotland but also much further afield. The cash position has been more than maintained, total cash resources of £37,600,000 representing about 35 per cent of deposits and note circulation.

INVESTMENTS

The total investments are entered at £45,800,000. This figure is less than the Stock Exchange valuations, a fact of which we may be proud in a year when there has been substantial depreciation throughout the whole list of British Government issues. That we have felt able to place £50,000 to general reserve out of our allocation of profits, as well as to increase the sum carried forward in the profit and loss account by £19,000 to £138,000, is a good indication that the bank's inner reserves have been amply sufficient to take care of what depreciation did occur in the investments.

Moreover, and it is a point worthy of notice, the greater part of the investments have final maturity dates within as short a period as ten years, and the remainder follow in fairly rapid succession thereafter. Obligations undertaken on behalf of customers in the form of acceptances, endorsements, guarantees and other like commitments show little change at slightly over £9 million, these transactions having as their foundation the free movement of goods in international trade.

PROFITS

The profits, at £286,000, are about £8,000 less than those of 1951, which can be readily explained by the increasing burden of working charges. We have, however, sufficient margin after paying our usual dividends, absorbing £102,900, to allocate £40,000 for the writing down of bank buildings and other property, and £75,000 to the trustees for the officers' pension scheme, as well as to add £50,000 to revenue reserve, as I have already mentioned.

One usual item you will find omitted from this year's profit and loss account, and that is an appropriation to the staff widows' fund. For many years the bank have been making

substantial contributions, latterly at the rate of £10,000 annually, to this fund so as to improve the annuities enjoyed by the widows of the members of the staff. In recent years that annuity was at the rate of £130, supplemented by a further payment of £20 from the bank, but a recent valuation showed the fund, standing on its own feet, to be fully adequate for the provision of an annuity of £150. This improved annuity is again being supplemented by an addition of £30, while deficiency payments of £125 are paid over to the fund on the entry of each new member to meet the difference between the rate of his personal contribution and that which would be required for the purchase of a full annuity. As these will be variable amounts they will in future, as in the present accounts, be treated as working charges and they will no longer appear in the accounts annual appropriations. Nevertheless the bank's support will be continued in the two directions I have indicated.

FINANCIAL SITUATION

In the speech delivered from this chair twelve months ago reference was made to the measures that had been adopted by the Government to deal with the national financial situation and it was suggested that the increase that had been made in the Bank of England discount rate from 2 per cent to 2½ per cent, together with the other plans that were being brought into operation, would have the effect of making for a saner outlook and a more restrained use of credit facilities.

It can now be said that at that time this country had been brought to a position where it was looking into a financial abyss, that abroad there was a widespread fear that the pound sterling would have to undergo further devaluation and that there were very real doubts as to whether Britain would be able to ride the storm. There has, as we all know, been a violent outcry from some quarters because of the further increase in the Bank of England discount rate to 4 per cent, but looking back that increase has amply justified itself, because it helped to convince the foreigner that we were in earnest about paying our way.

FAITH IN STERLING REVIVED

You may remember that a year ago we were talking in terms of an excess of one thousand millions of imports over exports in the first ten months of 1951, but now we can talk of bringing our import position into balance with our export position and of once again accumulating some reserve of foreign exchange. Perhaps the change in the situation can be best illustrated by giving the unofficial quotations in New York for transferable sterling and security sterling, which twelve months ago stood at \$2.43 and \$2.33 respectively to the pound, whereas now the rates are \$2.69 and \$2.63. This improvement is a clear indication of the recovery of faith in the pound.

THE BANKS' VIEW

It has also been represented that the increase in the bank rate has led to increased profits for banks, but that is not so, for

although a higher rate may be charged for loans, higher rates have also to be paid for deposits, and on balance the banks receive no greater net income. On the other hand the margin that existed on investment income was seriously encroached upon, and, more seriously, the higher bank rate led to an immediate and substantial fall in the value of British Government investments, which must always be the backbone of banking assets.

Whatever then our critics may assert as to the increased income flowing into our hands, which as I have endeavoured to show is really transitory, any supposed additions of that kind have been wiped out many times over by the depreciation in investment values. All banks would therefore welcome, as soon as possible, a lowering of the bank rate, with its consequent improvement in the value of their investments.

The report was adopted.

GOODE DURRANT & MURRAY, LIMITED

YEAR OF GREAT COMPLEXITY

MR LEWIS A. KEMP'S REVIEW

The fifty-fourth annual general meeting of Goode Durrant & Murray, Ltd., was held on December 17th at 197, Great Portland Street, London, W.1, Mr Lewis A. Kemp (the chairman) presiding.

The following is an extract from the statement by the chairman, which had been circulated with the report and accounts:

At our annual meeting last year I was in the happy position of informing you that your company had enjoyed the most profitable trading year in its long history. The year under review has been one of great complexity and, under the circumstances, it gives me great pleasure to announce that the result of trading, although not up to last year's standard, is second only to that year.

In my remarks last year I referred to the fall in prices of textiles. This has had a very serious effect upon trade during the current year—particularly as the retail demand fell very severely. In consequence, retailers found themselves overstocked with merchandise at high prices, and buyer resistance set in. Wholesale buyers were committed to orders for merchandise, of which there was little chance of disposal for some time to come. These factors led to cancellations and requests for deferment, resulting in some stocks being thrown on the market at prices as much as 50 per cent below cost. With markets in this condition, we were suddenly faced with Government restrictions on imports, either by licensing quotas or exchange allocations.

WORLD TRADING CONDITIONS

For our Australian branches the year has been an eventful one and trading was affected by several of the factors referred to in our report last year, wherein we stated that the effect on the Australian economy of record high prices for wool had not then been fully realised. Although prices became stabilised early in our trading year, and continued at approximately that level, the serious drop in total wool clip value is now quite obvious.

Nevertheless, in South and Western Australia, there was no evidence of any development of panic action and, consequently, the impact of the altered conditions has been adjusted, not without difficulty, but certainly without disaster.

In New Zealand there were ample stocks of most classes of merchandise and, after the

Commonwealth Finance Ministers' Conference in January, bankers there severely restricted overdrafts. Following upon this, it became apparent that New Zealand had imported far more than she was able to pay for by exports, and the Government chose to restrict imports by allocating exchange on a quota basis. This has meant that many importers have been unable to pay for goods already imported and for further quantities to which they were committed.

The effects of over-trading were felt much earlier in Africa, and surplus stocks have now been practically cleared, so that trade is gradually assuming normal proportions. This territory, however, is seriously short of capital, which is so necessary for the development of a young country. Lack of confidence seems to have restricted the amount of overseas capital becoming available.

Dealing now with the balance-sheet, I have to report that our stocks on hand have been drastically dealt with and, in our opinion, are valued so as to bring them into line with current values. Further provision has also been made for doubtful debts, although, on this occasion, no material addition is being made to the reserve for contingencies.

The profit for the year, after providing for estimated taxation, amounts to £68,925. Although this amount is sufficient to provide for the same dividends as last, the directors have decided to omit the bonus on this occasion, and are recommending the payment of 10 per cent dividend on the ordinary shares.

THE OUTLOOK

It is difficult to forecast the trend of trade for the current year, but there are signs that conditions may become more stable. Surplus stocks are being absorbed and prices have shown no further fall. With a return to healthy competition, the volume of turnover is beginning to pick up. Your directors are continuing their efforts to extend our business in existing and fresh markets throughout the world, to the advantage of the company, and the export trade of the United Kingdom.

The report and accounts were adopted.

JOHN HOLROYD & COMPANY

RECORD RESULTS IN JUBILEE YEAR

MR E. O. LIEBERT ON GROWTH OF EXPORT TRADE

The fiftieth annual general meeting of John Holroyd & Company, Limited, was held on December 18th at Perseverance Works, Milnrow, Lancashire, Mr E. O. Liebert (chairman and managing director), presiding.

The following is an extract from the statement by the chairman which had been circulated with the report and accounts:

Shareholders will no doubt have noticed that our meeting today is the fiftieth one of the company as at present constituted, but, of course, the Holroyd business was in existence many years earlier.

This fiftieth anniversary records the highest profit and the most successful year we have ever had, and at this stage I feel it right on your behalf and mine to pay tribute to the hard work and co-operation of all our work-people in the different factories, and the continued loyal services of your directors and staff. I know that you will wish me to record your thanks to all of them for what they have done.

We have again been extremely busy in all departments during the year, and have continued our policy of installing the very best equipment of all kinds and trying to improve the general working conditions.

Like so many engineering concerns we have had, and still have, certain orders for the defence programme, but these are by no means heavy, and the past year will, I think, be remembered by us largely for the growth of our export trade.

We are now reaping the reward of the efforts made to increase our export trade, which I referred to last year, and we have, during the past year, taken further steps which we hope will expand still further this side of our business, so important to us and to the country. This means that the visits made by your directors and technicians to many different countries will be continued, as personal contact with the overseas agent and buyer is essential in a business such as ours. If things are to be developed on right lines.

EPL: BRAKE ON EXPANSION

I do not propose to comment at length on the financial results of the past year as these I think are quite clearly shown in the directors' report and accounts, but I feel I must add my voice to those of so many others in condemning the new excess profits levy, which, added to a high rate of income tax, and profits tax, is a brake on natural expansion and improved efficiency—the very life-blood of any manufacturing organisation.

Once again we have placed £50,000 to plant replacement reserve, making that reserve £250,000. I explained fully last year the need for such a reserve and I would again mention that the replacement of plant at present-day prices—and at whatever cost, it must be done—is one of industry's biggest problems. We are facing it by building up this reserve, but it is one thing having this reserve and another having it represented by ready cash. Taxation makes the latter difficult, if not impossible, particularly in an expanding business when amongst other things stocks and debtors are growing in value. It would, indeed, be a bad day for this country should industry find it impossible to replace its capital equipment and keep right up to date. We have also transferred £75,000 to stocks reserve, making that reserve £100,000. This has been done as a cautionary measure, having regard to the stock growth of the past few years, bearing in mind also today's high level of prices.

THE OUTLOOK

You will wish me, I am sure, to say something about the future. The outlook is somewhat uncertain for there undoubtedly has been a falling off in demand for engineering products in many parts of the world, but whether this trend will develop into a definite recession it is too early to say. There is also the increase in foreign competition for the world markets to be taken into consideration, although as a group this has not affected us seriously up to now.

Whilst we still have a satisfactory order book in what are perhaps the most important sections of our business, there has been a change during the past few months inasmuch as orders have fallen away somewhat and are now not so high as the value of current deliveries. This means, of course, that we are eating into our orders on hand but I am not unduly concerned about this as the position so far indicates no sign of a serious recession. Whilst, therefore, in the immediate future profits may fall from the new high record of the past year, I have no reason to doubt the underlying strength of your business and its ability to progress steadily as it has done in the past.

The report and accounts were adopted.

WANKIE COLLIERY COMPANY, LIMITED

YEAR OF PROGRESS AND DISAPPOINTMENT

MR ROBERT FOOT ON NEW PRICE AGREEMENT

The twenty-ninth annual general meeting of Wankie Colliery Company, Limited, was held on December 12th, at 41, Stanley Avenue, Salisbury, Southern Rhodesia.

Mr Robert Foot, OBE, MC, the chairman, in the course of his speech, said:

This has been a year of progress in some important directions and of disappointment in others. The most important step has without doubt been the transfer of the management and control of the company to Southern Rhodesia. This transfer became effective on March 31st last, and the head office of the company was established in Salisbury on that date.

THE DIRECTORATE

I have to refer—with great regret—to the resignations from the board and from the secretaryship which inevitably had to synchronise with the transfer of the control. The directors who resigned at this time were Mr S. H. Boileau, Colonel C. F. Birney, Mr Edmund L. Hann, Mr C. D. Hely-Hutchinson, Mr P. Huffman and Mr H. M. Lewis. All of them had made important contributions to the affairs of the company during their tenure of their appointments, and their influence and interest before and during this important move were of great assistance and support. Our grateful thanks are due to them all.

It was with regret also that we had to say goodbye to our former secretary, Mr G. C. Stafford, who had given good and faithful service to the company over many years.

In Mr Stafford's place the board appointed Mr J. A. Bovey as secretary of the company, and we are well satisfied with our choice. Mr R. L. Lechmere-Oertel who, besides myself, was the only other member of the old board to make the move, is also the senior mining director of Powell Duffryn (Rhodesia) Limited.

On the establishment of the board in Salisbury Colonel Sir T. Ellis Robins and the Hon. Humphrey V. Gibbs were appointed directors. Both Sir Ellis Robins and Mr Gibbs are Rhodesian citizens of distinction. Mr Keith Hogan has also been appointed to the board on the nomination of Powell Duffryn Limited. Mr Hogan is one of the leading commercial men in the Powell Duffryn Group.

RESULT OF YEAR'S OPERATIONS

You will have seen from the accounts that our operations during the year resulted in a profit before taxation of £245,198 which, in spite of increased coal production, shows a drop of £38,198 compared with last year, which itself showed a drop of £54,473 as compared with the year before.

It has not been thought necessary to make any provision this year for Rhodesian taxation, as it is estimated that the wear and tear allowances on fixed assets and the depletion allowance will be in excess of the assessable profits. It will be seen from the profit and loss account that there is a small charge of £4,000 for United Kingdom profits tax, and that there is a credit of £31,919 representing previous taxation provisions no longer required.

The combined effect of all this is to leave a balance of profit for the year of £273,117, to which must be added the sum of £41,965 carried forward from the previous year, making together a total of £315,082 for disposal. Out of this amount the directors have

considered it prudent to transfer £95,000 to a new reserve account "contingency reserve" leaving the balance of profit unappropriated £220,082. To this new contingencies reserve the directors have decided that, as the company is no longer subject to United Kingdom taxation, to transfer the amount of £155,000 which was hitherto held in the taxation equalisation reserve account, thus making the total of the new reserve account £250,000.

As stated in the report, the company, as from February 1, 1952, increased the price of coal by 2s. 3d. per ton. This increase applied to all consumers, including the Northern Rhodesian copper companies who, notwithstanding their long-term fixed-price contracts, agreed to pay as from February 1st the same price as the Southern Rhodesian consumers. The Rhodesian railways also, as from the same date, agreed to waive the preferential rights given to them under our present price control agreement. To these important consumers I would like to express our grateful thanks for the entirely voluntary concessions which they thus made.

CONTINUALLY GROWING DEMAND

During the year under review there has been a continuing, and indeed an increasing, pressure for coal supplies throughout all the territories served by the company, which, in addition to Southern and Northern Rhodesia, include Nyasaland, Bechuanaland, the Belgian Congo and Portuguese East Africa. Notwithstanding the fact that the curve of the company's saleable output is continually rising, there is, I am sorry to say, still a serious coal shortage throughout the territories which will not be completely overtaken until the third colliery—which is now in the stage of active development—comes fully into operation, giving the company an output capacity of 5 million tons a year. The continually growing demand places great responsibilities upon the company and the railways. We have great and important tasks in front of us both which must be tackled with equal energy and determination, with full financial provision in each case for the capital required for these essential expansions.

The actual output of saleable coal during the year was 2,594,178 tons. This represented an increase of 10.8 per cent over the previous year's total of 2,342,133 tons. It is not without interest and encouragement to note the progress that has been achieved during the last five years. Our 1949 production was 14.8 per cent greater than 1948. In 1950 it was 29.2 per cent, in 1951 it was 41.2 per cent and this year 56.4 per cent greater than in 1948.

PRICE TOO LOW

The reason why, notwithstanding the very considerable additional tonnage sold, the profits for the year were nearly £40,000 less than for the previous year is, stated quite bluntly, that the price of coal has been too low in relation to the costs of production, thus leaving a totally inadequate balance of profits available for the putting aside of proper reserves for retention in the business, and for the payment of a reasonable dividend to the shareholders.

It must be obvious to every experienced business man, and indeed to every fair-minded critic of the company, that if this situation was to be allowed to continue it would before long become disastrous to the

financial stability of the company, with equally disastrous results upon the whole economy of the countries dependent upon it for their coal supplies. This would be true even if the company was not faced with the necessity of raising its output as soon as is practicable to meet the requirements of consumers throughout the territories. But this necessity, coupled as it clearly must be with the necessity to raise considerable sums of additional capital, makes it imperative in the interests of all concerned—the governments, the consumers and the shareholders—that the company should be placed as a matter of urgency upon a new foundation of financial strength and stability.

The present foundation is based upon the arrangement of price control which was established as long ago as 1923 and has now become completely out of date.

The directors, therefore, felt it to be their duty to make urgent representations to the Government for a complete overhaul and amendment of the present position. I am glad to be able to record here that the Government received our representations with understanding and sympathy, and immediately gave instructions for the whole situation to be closely and critically investigated.

NEW AGREEMENT REACHED

I am glad to be able to report, following this investigation, we have reached a new agreement which includes the following:

(a) The margin in the future will be 6s. 6d. a ton instead of 5s.

(b) The new margin will be an average margin instead of a maximum as it is at the present time.

(c) The time lag will be abolished by providing for the price to be based at the beginning of each year on an estimate which will reflect all known costs and immediately foreseeable increases or reductions when the estimate is made.

(d) The price may be revised at any time during the year to meet either upward or downward trends of costs during any period of twelve months.

(e) The railways will in future be treated on the same basis so far as price is concerned as any other large consumer.

(f) For the protection of the private commercial concerns, factories, tobacco growers, farmers and domestic consumers the new agreement will extend to all coal produced at Wankie and sold for any purpose within Southern and Northern Rhodesia and Nyasaland as well.

(g) The new agreement will deal with other matters which it is unnecessary for me to specify in detail here, but there is a special feature to which I would like to refer. There will be incorporated in the new arrangement some real and continuing incentive for the company by their own initiative and by increased efficiency either to reduce costs or to prevent them rising further. When the scheme is established it is intended that both the company and the consumers will participate in the ascertained savings in fair proportions.

FOUNDATION FOR STABILITY

The board and their advisers are satisfied that the new arrangements are both necessary and no more than are adequate to do

justice to the shareholders, and at the same time to provide a firm foundation of financial stability upon which the plans for further capital provision can be based.

The terms of the new arrangement will become effective as from January 1st next. The new price will be in the neighbourhood of 20s. per ton—a little more for some and a little less for others, the actual price to any consumer being dependent upon quantity and grade. The directors greatly regret having to announce this substantial increase, but they are at the same time completely satisfied that, for the reasons which I have given, and particularly in order to enable the company to raise on favourable terms the additional finance required, they would be falling short of their duty and responsibility both to the shareholders and to the territories served by the company, upon the financial stability of which adequate supplies of coal must primarily depend, if they were to shrink from taking now the only proper course by raising the price of coal to the figure allowed by the new arrangement, however unpopular such an increase may immediately appear to be.

THE BOARD'S AIM

Although, with the one exception of South Africa, there is no other country in the world where the pithead price of coal is as low as the new Wankie price, at the same time I would like to state here without any qualification that the directors and the chief officials of the company are taking every practicable step in the interests of greater efficiency and economy of working in the hope that they may not only avoid any further increase in the price, but even reduce it. The directors subscribe completely to the statement made by the Prime Minister of Southern Rhodesia, Sir Godfrey Huggins, when he said in his speech at the opening of the Zambesi Water Supply Scheme that coal from Wankie should be supplied at the lowest possible price compatible with decent living conditions for all employees, and with a reasonable return to the shareholders. This new arrangement can properly be regarded as a new charter for the company.

Before I leave the subject of price I want to refer specially to the position of the Northern Rhodesian Copper companies and Rhodesia-Broken Hill. It is common knowledge that, under contracts made between these companies and Wankie as long ago as 1937-38, they are legally entitled to receive their supplies of coal and coke at prices fixed in those years without provision for any increase in price to meet changing conditions. I have been very glad to have been able to report from time to time, as I have done to-day earlier in this speech, that these companies have agreed to accept increases in price to keep pace with rising costs. I am very happy now to be able to announce that the companies have agreed in principle to the cancellation of the present contracts, subject to the negotiation of new contracts which will reflect fairly both the new price structure and the large annual quantities involved.

Specific reference in the report was made to the necessity for further finance in order to provide for the expansions of the company's operations, and this necessity has been implicit in the previous part of my speech. The main categories under which this capital expenditure fall are indicated briefly but accurately in the report, and fall broadly under the headings of Coal Output, Coke Output, Housing, Hospital and Medical Services, and General Welfare arrangements and amenities. The matter is now receiving close attention, and an extraordinary general meeting of the company will be held in the New Year when the directors' recommendations will be laid before the shareholders. In view of this, there is no more which I can

usefully add on the matter on the present occasion.

EXPANSION PLANS

In view of the interest which has been shown in the question, it would be well for me to mention to the shareholders the decision of the board to expand the output capacity of the company from 3,800,000 tons to 5 million tons a year by opening a third underground colliery, instead of raising the output by opencast methods.

The two alternatives were critically examined by Powell Duffryn (Rhodesia), Limited, in close collaboration with the colliery general manager, and their recommendation was that the next expansion should take the form of a new underground colliery, instead of a large-scale opencast mine. After full consideration the board accepted this recommendation, but, in coming to this conclusion, they would like to make it clear that they are of the opinion that the time will come when large-scale opencast methods will be employed at Wankie, and that in considering plans for the next expansion that may become necessary, the alternative of an opencast mine will be brought forward again and may well be adopted.

AN OUTSTANDING EVENT

One of the outstanding events of the year was undoubtedly the visit to Wankie on August the 2nd and 3rd of the Prime Minister, Sir Godfrey Huggins, and Lady Huggins, the former to perform the formal opening of the Zambesi Water Supply Scheme bringing water to Wankie for industrial and domestic use from the Zambesi River at the rate of over 2 million gallons a day, and the latter to present the prizes at the children's annual sports.

The Rhodes Centenary Exhibition, to be held at Bulawayo next year, will be an event of great importance and significance. The board have decided that the company, its history and its present operations and progress, should be presented to the visitors in a well-planned exhibit in a manner which will be worthy both of the occasion and the subject. One of the special features of our exhibit will be a film of Wankie which will, it is believed, be full of interest to the visitors to the exhibition.

It would not be right for me to conclude without expressing to Powell Duffryn, Limited, operating through its subsidiary companies, Powell Duffryn Technical Services, Limited, and Powell Duffryn (Rhodesia), Limited, our thanks for their services to the company during the year. In many different ways, and in many different directions, they have been of great help to us, and we are grateful to them.

Finally, we owe a real debt of gratitude to the staff of the company, both in Salisbury and Wankie. It has been a year of extremely hard work for them in every way and in every department. I am glad to say that the spirit throughout the company is one of optimism for the future and the morale is high. Our thanks are due to them all.

The report and accounts were adopted.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:

JOHN BEDFORD & SONS LIMITED

RECORD SALES

The fifty-fifth annual general meeting of John Bedford & Sons Limited was held on December 19th at Sheffield, The Earl of Denbigh (the chairman) presiding.

The following is an extract from his circulated statement:

Sales are again a record in the company's history having exceeded last year's figure by a modest amount. Unfortunately, export sales show a decline on last year. This is due mainly to the import restrictions introduced by Australia last March.

As I forecast last year, production has been hampered by some shortages of raw material and by the erratic delivery of others.

Turning now to the balance sheet you will notice the large increase under the heading of materials, work in progress and finished goods. The explanation is twofold. Firstly, there is the restriction on exports to Australia and the tendency of the home trade to let the manufacturer carry the stocks. This is due, I think, to credit restrictions and to a better supply position generally. Secondly, we are now getting the benefits of the increased production and efficiency for which the management has been striving.

PROFIT AND LOSS ACCOUNT

The next item is the profit and loss account. You will see that the trading profit shows a decline of approximately £8,500, which on record sales is at first sight rather disappointing. It must be borne in mind, however, that during the year there has been a considerable wage increase and an extra week's holiday with pay. The numbers on our payroll have remained about the same whilst our wages bill has increased by about £25,000. There have also been increases in the costs of raw materials, particularly billets, and in fuel and power. It has only been possible to pass on a proportion of these increased costs to the purchaser.

On the debit side you will notice that we are liable for excess profits levy so that we have not reaped the full advantage of the reduction in the rate of profits tax. Such is the reward of progress today. You will also notice that the amount transferred to reserve is approximately the same as last year although this year it is in two parts. The object of creating a stock reserve is to provide against any sudden and unforeseen fall in raw material prices which continue to rise with monotonous regularity. Such a fall if it comes could involve us in a substantial loss in view of the large stocks of raw materials, finished and semi-finished goods which we have to carry.

The recommended final dividend remains at 10 per cent, making 15 per cent for the year, as your board consider that while the developments previously mentioned are taking place a conservative policy is essential.

The future remains uncertain. Certain sections of our employees have just received a pay increase of 7s. 4d. per week and the remainder have submitted a similar claim. This increase will naturally affect our production costs and it is doubtful if any of this can be passed on to the consumer. The home market remains difficult. With customers wishing to reduce their stocks we are expected to fulfil their orders by return. There are still many restrictions in the export market and we are meeting increasing competition.

Your board is confident that your company is obtaining and will continue to obtain its share of the available business.

The report and accounts were adopted.

THE STANDARD MOTOR COMPANY LIMITED

LARGER TURNOVER

MR C. J. BAND ON TAXATION BURDEN

The forty-ninth annual general meeting of The Standard Motor Company Limited, was held on December 17th at the registered office, Banner Lane, Coventry.

Mr C. J. Band, chairman of the company, in the course of his speech, said: Some stockholders may wonder why, with the increase of turnover as compared with the previous year, the trading profits should have been substantially less. This reduction is caused by the increased cost of production and the efforts made by the company to meet competition abroad. You can rest assured that it is in no way due to loss of efficiency in the conduct of the business.

Capital additions have increased by some £600,000 after providing no less a sum than £1,226,000 for depreciation and amortisation. The figure of £598,232 appearing in the balance sheet for dies, jigs, press tools, etc., represents the cost so far incurred on those items, for models which will shortly come into production. The costs incurred in respect of current cars and tractors have been completely written off.

DANGERS OF TAXATION SYSTEM

I have on more than one occasion felt called upon to speak about the intolerable burden imposed upon industry by the present system of taxation, and to point out that this burden is not only calculated to destroy all initiative and incentive, but also the spirit of adventure which has made this country great. I have grave fears for this country if the Chancellor of the Exchequer does not find some way of making substantial reductions in taxation.

I think stockholders will agree with me when I say that the time has arrived when the Government, and especially the Chancellor of the Exchequer, should give careful consideration to the widespread appeals for substantial relief of the burdens of taxation imposed upon industry, appeals made by so many of the heads of commercial firms throughout the country.

EXCESS PROFITS LEVY A BAD TAX

I would emphasise that whilst there is a reduction of £407,000 in the profit for the year, the amount required for taxation is reduced by £85,000 only. This arises from the introduction of the Excess Profits Levy, effective from January 1, 1952. In my opinion, this is not only a bad tax, but extremely unfair in operation, and should, in my judgment, be withdrawn.

I would remind you that the Chancellor of the Exchequer introduced the tax in order to take back to the revenue the greater part of any profits made out of the rearmament programme, and that it was imposed from January 1st last. The years for ascertaining the standard profits were the average of any two of the years 1947, 1948 and 1949. I think it correct to say that no profits were made by manufacturers out of rearmament in the year 1950.

The question one naturally asks is: Why did not the Chancellor include 1950 as one of the standard years? The only conclusion I have been able to come to is that, had 1950 been so included, the Chancellor would not have obtained the 100 millions he estimated to receive this financial year from Excess Profits Levy.

I have only to add that, although this company has not made up to date one single penny out of rearmament, it is called upon

to pay no less than £135,000 out of the profits for the last financial year in respect of Excess Profits Levy. Some people might say that this is obtaining money under false pretences. I am stating the facts, leaving you to draw your own conclusions.

Taxation in the financial year is increased to 69 per cent, as compared with 60 per cent the previous year. I know that Sir John, when seconding my proposition, intends to say something about taxation and the crippling effects it has upon our industry, and therefore I will say no more about it.

Whilst the net profits are considerably lower than the previous year, your directors have felt justified in recommending the payment of the same rate of dividend as in the past year, and also payment of £135,000, being the same as the past year, to the employees' special fund.

SIR JOHN BLACK'S REVIEW OF PRODUCTION

Sir John Black, deputy chairman and managing director, in the course of his speech, said:

The motor industry has made a very notable contribution to our country's economy since the war, and it has a right, in my opinion, to expect the Government to make adequate and prompt decisions to ensure that the industry can continue to play its full part and help to maintain employment at its highest level.

To accomplish this we feel that three things should be done at once. Firstly, some clear statement should be made by the Government on the question of purchase tax. Secondly, trade agreements should be concluded with overseas Governments, in addition to the Commonwealth, which will make currency available, and thus allow us to trade. Thirdly (a matter to which the chairman has already referred), a reduction must be made in the general level of taxation to enable us, on a long-term basis, to spend more money on more equipment in order that we may continue to be competitive in world markets.

FERGUSON TRACTORS

Reviewing our accomplishments during the past year, I will deal first with tractors, because, as I have mentioned before, they now constitute the major part of our business. The introduction of the diesel engine into the Ferguson tractor range has proved an outstanding success. Nearly 50 per cent of our tractors are now fitted with diesel engines. At the present time we are producing over 1,000 tractors a week, and we are going up to 1,250 or more in the New Year.

Plant and equipment have been ordered for the manufacture of a new and larger Ferguson tractor. This is an additional model to the present type manufactured by us and designed to operate a four-furrow plough. We and the Ferguson Company believe that it will prove to be another outstanding success, particularly in the dollar area. Since your company undertook the manufacture of Ferguson tractors for Harry Ferguson, Limited, as at 7.30 this morning 309,244 had been delivered.

It has become apparent over the last 18 months that it is necessary either to establish manufacturing facilities in France for Ferguson tractors or to lose the large business that H. Ferguson, Limited, has built up there. I am pleased, therefore, to be able to tell you today that, subject to the approval of the French Government, the Standard Motor Company is about to conclude an arrange-

ment on a partnership basis with Messrs Hotchkiss, the French motor-car and armaments firm, to form a new company to be known as Societe Standard-Hotchkiss. This company will be in operation immediately the French authorities give their approval, and we have set as a target the complete manufacture of 25,000 tractors a year. This arrangement could be extended, if it is thought desirable, to include motor-cars.

NEW CAR MODELS

Now I come to the car side of our business. You will already know that we have introduced the Triumph Sports Car. We expect this model will sell in considerable numbers in the North American market, as well as on the Continent and at home. Other new models are in an advanced stage of tooling, and production has been planned on a scale never before attained by the company. These new models consist of a new Standard Vanguard Saloon and a modified range of Standard commercial vehicles. In addition to the Vanguard range, the new 8 h.p. Standard four-door saloon will be announced during this financial year, but no substantial gain can be looked for during the present year from the production of this new model.

Together with the new sports car, the Renown and the Mayflower complete the Triumph range. I feel that when all these models are combined in a balanced production, we will have a comprehensive range to meet the demand in both the home and overseas markets. Our one-model programme introduced in 1947 has been a great success, but the changing world economic conditions have, in our judgment, made it advisable to introduce additional models to meet those conditions.

IMPORTANCE OF AUSTRALIAN MARKET

Now, with regard to export, as a result of my visit to Australia and New Zealand this year, we have amalgamated the interests of our Australian Associated Company and Standard Cars, Limited. This latter company has been our distributor in New South Wales and Victoria for more than 20 years, and we have formed a new company, "Standard Motor Products, Limited," with a nominal capital of £A5 million. I am satisfied that Australasia remains our largest potential market for exports.

The activities of our companies in India, South Africa and Canada are now gathering momentum, and they will undoubtedly prove valuable assets in the long-term development of those markets.

DEFENCE PROGRAMME

Now to the company's part in the defence programme. Last year I told you that, at the Government's request, we had undertaken the manufacture of the Rolls-Royce Avon jet engine, and that in order to do so we were building a new factory in Liverpool. This project, which is designed to release floor area in Coventry for the Avon, by transferring our spare parts organisation to the new factory, is proceeding satisfactorily. This new Liverpool factory should be in operation before the end of next year.

We, on the Board of Directors, are confident that the company will continue to grow and remain competitive, in spite of the problems that our industry will face in the immediate future.

The report was adopted.

THE BRITISH MOTOR CORPORATION LIMITED

UNIVERSAL POPULARITY OF PRODUCTS

The first annual general meeting of The British Motor Corporation Limited was held on December 17th at The Cowley Works, Oxford, The Viscount Nuffield, GBE, FRS, MA, DCL, LLD (the chairman) presiding.

The following are extracts from the chairman's statement circulated with the report and accounts for the four months ended July 31, 1952:

The consolidated balance sheet and profit and loss account cover a period of four months. In future the end of the financial year of the Corporation will be July 31st. I am sure you would like to know on this occasion how Morris Motors fared during the year ended December 31, 1951, and The Austin Motor Company during the year ended July 31, 1952.

The net earnings before taxation of Morris Motors were £6,986,778 and of The Austin Motor Company £6,999,354. Total net assets of Morris Motors at December 31, 1951, after providing for future taxation were £19,770,424, of The Austin Motor Company at July 31, 1952, £17,683,747. It will be seen that the results of both companies have been very consistent.

EXPORT

During the Morris financial year vehicles and spares were exported to a value of £39,114,273. Of this £5,376,722 was hard currency, arising mainly from deliveries to the USA and Canada. During the twelve months ended July 31st last The Austin Motor Company exported vehicles and spares to a value of £48,445,894, of which £6,063,526 was hard currency.

Exports were well maintained during 1951 and early 1952, but at least one half of the world's markets are now subject to control. It is to be hoped that Government departments engaged in trade negotiations will in future insist that our country gets terms and conditions at least as good as those of our competitors.

REPLACEMENT OF FIXED ASSETS

In the past, both Mr Lord and I have expressed our concern regarding the replacement of fixed assets. This problem calls for very serious consideration by the Chancellor. The strain on industry's resources through the continued exorbitant rate of taxation on profits is having a cumulatively harmful effect.

Our staffs have been busily engaged on the examination of methods of production and standardisation. The benefits which will arise cannot all accrue immediately.

THE OUTLOOK

Our products have never enjoyed more universal popularity. We can justly claim that they compare very favourably with any others in the world. We are backed always by the goodwill of our distributors, dealers, suppliers, staffs and customers. At the same time it would be wrong to foster any spirit of easy optimism because of the hazards and uncertainties with which we are faced, but I am confident that we shall be able to meet and surmount any difficulties which may arise.

The report and accounts were unanimously adopted.

At an extraordinary general meeting which followed, resolutions were proposed and passed which (a) increased the authorised

share capital of the company from £15 million to £35 million (b) capitalised the sum of £19,305,439 (part of the sum standing to the credit of the share premium account) by the distribution of 77,221,756 ordinary shares of 5s. each among the ordinary shareholders on the register at the close of business on November 22, 1952, on the basis of four new shares for every one ordinary share then held, and (c) multiplied by five the voting rights attached to the preference shares.

HECTOR WHALING LIMITED

INCREASED TRADING RESULTS

The twenty-fourth ordinary general meeting of Hector Whaling Limited was held on December 17th in London, Mr R. de B. Trouton (the chairman) presiding.

The following is an extract from his circulated review:

Your directors are pleased to be able to place before you accounts which, for the sixth year in succession, show an increase in trading profit.

The group earnings have enabled us, after making ample provision for depreciation and taxation, to set aside £100,000 to fleet replacement reserve, £100,000 to general reserve and £44,000 to preference redemption reserve, also to repeat the dividends which have now been paid for some years and add £20,000 to the balance of profit and loss account carried forward. Total capital expenditure of over £900,000 has left our liquid position virtually unchanged and our total capital and surplus of over £3 million has been fully maintained.

Last season "Balaena" made 160,000 barrels (about 26,900 tons) of whale oil and sperm oil. This showed a moderate improvement over the previous season and again "Balaena's" oil production was the second largest in the Antarctic.

Production of meat meal and liver meal at 3,500 tons, meat extract and Vitamin "A" liver oil followed what one may now call their normal course.

Last season our whale oil production was sold to the Ministry of Food at £110 per ton, compared with £100 for the previous season. Meat meal and liver meal, liver oil and frozen meat all earned satisfactory prices. The sperm oil market has collapsed and we have only managed to sell about 60 per cent of our production: we are still left with a carry-over of about 1,000 tons.

This year we have sold forward our entire production of whale oil at a price to be fixed in relation to the average price of palm oil, but with a minimum price of £70 and a maximum of £78. We have contracts for the sale of the great bulk of our potential production of frozen meat at substantially better prices than last year. Meat meal has been sold at a slightly better price than before, while we are arranging sales of meat extract at a substantially advanced price.

In the year under review our tankers earned exceptionally good profits. This year there has not been the usual autumnal recovery in freights, so we cannot hope for very big earnings in the summer of 1953, though so far in the current year the earnings from this source have been satisfactory.

There will be sixteen expeditions this season against nineteen last year. The prospects are that we shall have a longer season this year and, we are entitled to hope, a larger production, even if we allow for the improvement of some of our competitors from concentrating the best material and men in fewer expeditions.

The report was adopted.

THE PERUVIAN CORPORATION LIMITED

INCREASED TRAFFICS

The sixty-second annual meeting of The Peruvian Corporation Limited was held on December 11th in London, Mr W. H. White (the chairman) presiding.

The following is an extract from his circulated statement: The gross revenue from the railways and steamers for the year under review (when converted into sterling at the rates mentioned in the accounts) amounted to £3,813,146, as compared with £3,278,525 in the preceding year. Expenditure also advanced from £2,797,953 to £3,483,527, due to increases in salaries, wages, social legislation obligations and higher costs of materials. After making provision for a possible retro-active claim for a price increase in fuel oil in the year covered by the accounts, the net profit was £375,400 before charging debenture service. Since the publication of the accounts the above-mentioned claim has been withdrawn, and the provision made therefor will accordingly not be required and should therefore be added to the £375,400 before mention, which makes a total (after adjustment of exchange difference) of £494,663 compared with £514,420 in the previous year.

TAXATION

The subject of the obligations of the corporation under the social laws of Peru has been mentioned more than once at previous meetings. It will be recalled that these laws impose upon the corporation (among other obligations) the liability to pay on the retirement or death of every employee or workman in Peru a lump sum equal to one month's salary for every year of service of an employee and two weeks' wages for each year of service of a workman, and this sum is calculated on the basis of the salary or wage payable to the employee or workman at the time of his death or retirement. The English Revenue Authorities have maintained that only the actual amount paid by the corporation in each year on account of this liability may be charged against profits for the purpose of UK income tax, while the corporation, on the other hand, has throughout contended that it is entitled to charge the amount of liability which has accrued during each year, whether actually paid out or not.

The board decided to take the matter to appeal, and the hearing took place in July last before the Special Commissioners of Income Tax, when Dr Hernando de Lavalle, who was fortunately in Europe at the time, gave evidence regarding the effect of Peruvian Social Laws. The Special Commissioners decided in favour of the corporation's contention, but the Inland Revenue have since formally stated their dissatisfaction with this decision and have requested the Special Commissioners to state a case for the opinion of the High Court. As the matter is still *sub judice*, I shall not make any comments on the case.

MORATORIUM

For reasons which were given in a circular issued to the debenture holders on October 28, 1952, the board found themselves unable to formulate a permanent scheme of arrangement. Consequently, they proposed a scheme which extended the operation of the earlier ones for a further period of one year to December 31, 1953, with power to the Debenture Holders' Committee to grant an extension to a date not later than December 31, 1955. The debenture holders passed the scheme by the required majorities, namely, for 1,618 persons holding £1,495,300 debentures, and against 154 persons holding £254,700 debentures and accordingly a petition has been presented to the Court.

The report and accounts were adopted.

THE WRIGHT SADDLE COMPANY, LIMITED

A SUCCESSFUL YEAR

MR ARTHUR COLEGATE'S SPEECH

The sixteenth annual general meeting of The Wright Saddle Company, Limited, was held on December 18th, at Chamber of Commerce Buildings, 95, New Street, Birmingham, Mr Arthur Colegate, MP (chairman of the company), presiding.

After he had dealt in detail with the accounts, the chairman said:

I am glad to be able to meet you again after we have had such a successful year. It is true that the results are not quite as excellent as those of last year, which constituted a record in the history of the company, but in view of the difficulties and the increased competition the results must be regarded as remarkably good.

PROMISING NEW DEVELOPMENTS

Competition in the industry has been growing, but so far we have been able to meet it; in this connection you will see that we are continuing to spend substantial sums on capital improvements and on new developments, which should materially help us successfully to meet the altered conditions of the trade. It must be understood, of course, that these promising new developments will take time to produce the full benefit of our research and experiments. So far as our materials are concerned the position has eased considerably and it seems likely that this easier state of affairs will continue.

I have referred to our expenditure on capital improvements, and in this connection I must again draw attention to the ill-effects on the efficiency of the British industry of the way in which taxation is levied on businesses. You will see from the accounts that we have to provide for a sum this year of £65,558 for taxation, while the sum distributed by way of dividends amounts to less than £15,000. In these circumstances you can realise how difficult it is to plough back into the business as much as your directors would like in order to keep our plant up to the highest standard of efficiency. It is to be hoped that apart from income-tax, serious consideration will be given by the Chancellor of the Exchequer to the abolition of the undistributed profits tax, which exercises such a baneful influence at the present time.

THE FUTURE

With regard to the future it is more difficult than ever to make any sort of prophecy; we have opened a new financial year successfully, but the outlook is very obscure. We are endeavouring with some success to break into new markets or markets which for a variety of reasons have been closed to us for some years, and we shall continue our efforts in these directions.

I am happy to say that we continue to have the most cordial relations with our work-people and staff, with whom we work as a team, and each of our successes is due to this fact.

In conclusion, it gives me very great pleasure to tender on your behalf and on behalf of myself and the board our very sincere thanks to the managing director and his staff, both in office and factory, for the good work that they have done during the past year.

The report and accounts were adopted. Mr J. H. Gold was re-elected a director, and the meeting concluded with a hearty vote of thanks to the chairman.

WALMSLEYS (BURY) LIMITED

(Manufacturers of Pulp and Paper Making Machinery and Equipment)

MR JOHN WOLSTENHOLME'S REVIEW OF OPERATIONS

The twentieth annual general meeting of Walmsleys (Bury) Limited, was held on December 12th at Bury, Mr John Wolstenholme, the chairman, presiding.

The chairman in the course of his speech said:

The group profit for the year before charging taxation, is £459,445, compared with £480,589 for the previous year.

After charging tax and deducting the proportion of subsidiary companies' profits attributable to outside shareholders, the group profit becomes £213,826, as compared with last year's record figure of £223,555. £12,000 has been set aside for pension reserves. The recommended dividends require £34,388 and there remains the sum of £167,438 to be added to the carry-forward. This means that after providing for a final dividend of 10 per cent on the ordinary share capital, the sum carried forward becomes £821,310.

New machine tools have been supplied to every works, and existing machines have been maintained in a high state of efficiency to meet world-wide competition.

As we had anticipated, 1951-52 was not an easy year for raw materials. The position is definitely improving but none of us can yet be entirely happy about all forms of supply.

Since our last meeting important paper-making machine contracts have been completed for Britain, Australia, South Africa and Norway. Good reports have been received in all cases. Big reconstruction jobs have gone forward at home and abroad. Material has gone to new projects in New Zealand, Pakistan and Portugal and it will not be long before complete machines from the Walmsley Group are sent to good work in those countries.

FUTURE PROSPECTS

Since the war there has been a sustained demand for papermaking machinery, both at home and abroad. During the past twelve months the paper trade throughout the world has experienced a recession. We cannot expect to remain unaffected by that recession. At the best, it must slow down or postpone the process of building entirely new mills or of modernising others. Over the longer term, however, the consumption of paper and board in the world is certain to increase, and it is up to us to be ready to provide the means of ensuring that increase. Meantime, we have still a good volume of work on hand and we are committed to produce a great deal of machinery over the next twelve months.

There is a particular point to which I should like to draw attention. Export is a very important part of our business, and we have a good name in a great many countries.

Your directors have for some time been considering possible complications in the financing of orders and in the transfer of funds from abroad. You can be assured that they are being prudent in these matters. So far I don't think that we are at any disadvantage compared with our foreign competitors on general credit terms, but if the need arises, Governments must be prepared to act quickly to provide improved credit facilities.

The report was adopted.

SECOND INDUSTRIAL TRUST

The forty-first annual general meeting of Second Industrial Trust, Limited, was held on December 11th in London.

Mr Lionel A. Stride (the chairman) in the course of his speech said:

Our gross income for the year under review attained a new high level at £149,596, an increase of £3,538 over the previous year. Needless to say, our tax liability is greater, so much so that, after deduction of £58,977, which is £3,459 more than last year, we are left with a net revenue figure of £62,287, or £572 less than a year ago.

We have transferred £25,000 to general revenue reserve, against £35,000 twelve months ago, and we recommend a final dividend on the ordinary stock of 10 per cent, making 14 per cent for the year, against 12 per cent paid the previous year.

The appreciation on our investments is still considerable, although some 18 points lower than last year, from which it may be inferred that the Trust's portfolio remains sound and is well able to stand up to the violent fluctuations which are a feature of the markets today.

You will no doubt appreciate how much more difficult today is the task of your board in their conduct of your affairs than it used to be. It is more difficult than ever to decide on a policy or plan ahead. Decisions must be made quickly or reversed equally quickly in the light of constantly changing conditions at home and abroad. The record results set before you today were achieved despite these difficulties. The present indications are that the upward trend of our revenue is halting and it seems unlikely that our income will reach the same heights next year.

The report was adopted.

W. & J. LAWLEY

RECORD RESULTS

The thirteenth annual general meeting of W. & J. Lawley, Limited, was held on December 17th in Birmingham. In the absence of the chairman, Mr. H. J. Gaunt presided and, in the course of his speech, said:

The year has been one of great activity for your company, the annual value of our turnover being the highest in the company's history, the trading profits for the year being also a record at £62,674, which is £14,675 greater than the previous year.

Out of the year's profit £38,950 is absorbed by taxation, the proposed dividend takes £10,500 and the carry-forward amounts to £77,387, being an increase of £13,595 over the previous year. The taxation charge is 62 per cent of the year's profits and is a very heavy burden indeed. I can only hope that in any remission of taxation the Chancellor may be able to make in April next year, that the claims of industry will be given high priority.

Your directors again recommend the payment of a dividend of 40 per cent, less income tax, for the year.

The supply position of most metals has grown noticeably easier during the year and your company has been able to take full advantage of the easing of the position.

I am quite sure the company's products will continue to find a ready market, but I know equally well that in many directions costs are still rising steadily. As long as control and competition are fair I feel no reason to doubt the ability of the company to maintain its prosperity.

The report was adopted.

BIRMID INDUSTRIES, LIMITED

RECORD TURNOVER

The annual general meeting of Birmid Industries, Limited, was held on December 12th, at Birmingham. The Rt Hon Lord Burghley, KCMG, chairman, presiding.

The following is an extract from his address, circulated with the report and accounts for the year ended July 31, 1952:

Your directors are very pleased to report another successful year, mainly due to the increased turnover, which, with the exception of the war years, was a record in the history of the company. The very excellent results were largely due to the orders on hand at the commencement of the financial year, together with those received during the earlier part of 1952.

Unfortunately the position has changed since July, and incoming orders, together with cancellations, rather point to the fact that this year's results may not be so favourable. However, I am confident of our ability to obtain our share of all available business.

The charge for taxation, at £1,549,980, is in excess of the net profit, £961,234, by some £589,000, a very formidable figure. In this connection I would again emphasise the remarks which I made a year ago, when I stated that in the view of your directors the present method of taxing profits, especially that proportion retained for renewal and replacement of fixed assets, together with the unrealised profits on normal stocks, due to inflation, retards the development of industry in general. As compared with the previous period, the net profits for the year show an increase of £112,709.

PRODUCTION AND SALES

Group sales are up by 21½ per cent in value, as compared to last year. Increased material costs, especially metals, account for some of this, but the volume of production has also risen satisfactorily. The general rate of progress is shown by the fact that the sales value for 1951-52 is nearly double what it was five years ago in 1947-48. It is satisfactory that all the group companies shared in this increase.

Material costs have unhappily continued to rise. Adverse exchange rates, world shortages and sellers' markets have all contributed to these advances. We are almost wholly dependent on Canada for aluminium, largely for magnesium, and on other countries for iron ore, zinc and other basic materials.

This year's accounts show what a colossal burden taxes have become. I would emphasise how greatly industry needs some lightening of this load. We employ costly and massive plant to an increasing degree in our foundries and rolling mills, otherwise we cannot compete. Adequately to maintain such plant, or to replace or extend it with better, needs annual capital expenditure greater than hitherto, as such plant costs three or four times prewar rates, and in many cases is obsolete before it is worn out, so rapid is modern development.

EPL is yet another example of financial phlebotomy, and I cannot urge too strongly that action should be taken to relieve these burdens before much of British industry is seriously crippled. A note of caution: harder times are indicated in keener competition for reduced markets. We shall do our best, and that is all I ought to say.

The report and accounts were adopted and the proposed dividend of 10 per cent and a bonus of 1½ per cent, both less tax, were approved.

WALTER SPENCER & COMPANY, LIMITED

FURTHER PROGRESS

MR E. RANSOM HARRISON'S REVIEW

The sixteenth annual general meeting of Walter Spencer & Co., Limited, was held on December 18th at Sheffield, Mr E. Ransom Harrison, FSAA, the chairman, presiding.

The following are extracts from his circulated statement for the year to September 30, 1952:

I have pleasure in submitting the profit and loss account and balance-sheet, which again show an improved result on last year in spite of the many difficulties and anxieties we have experienced during the year owing to shortage of supplies. The question of future supplies is still an anxious one, but everything is being done to keep the works fully supplied.

The necessity of keeping the plant up to date is one which is constantly under review and we have a further capital expenditure, not provided for in the balance-sheet of £11,840. The purchase of further machinery is under consideration but this will be largely governed by promised relief from the present heavy taxation.

Profit and Loss Account.—You will see that the amount provided for income-tax, profit tax and excess profit levy is very heavy this year and we hope that there may be in the near future some relief from this crippling taxation, which at the present time leaves insufficient funds for replenishing our plant and machinery.

Contingency Reserve and Pension Scheme.—It is proposed to put £8,000 to the contingency reserve, making it £28,000, and also a further sum of £4,000 to the pension scheme, making this reserve £14,000.

TURNOVER AND EXPORT TRADE

The turnover for the year is considerably in excess of last year, some of which is accounted for by the increased prices, but the actual production has also been increased. The order books, while not quite so full as last year, assure us of work for some time to come, but unfortunately the export trade has fallen off considerably due mainly to lack of import licences and difficulties with currency, but we hope that these troubles will be overcome and that our overseas clients will be able to order as before.

Last year we mentioned that we might have to ask for new capital to build further premises, but in view of heavy taxation and high cost of machinery, we have decided not to proceed with this at present.

Dividend.—Your directors recommend a final dividend of 10 per cent, less income tax, making with the interim dividend 5 per cent, less income tax paid on May 29th last, a gross dividend of 15 per cent, less income tax, leaving a sum to be carried forward of £10,866.

During the year Mr Winskill, on his doctor's advice, tendered his resignation as joint managing director. Mr Brazenall, was appointed managing director.

The directors are very pleased to place on record their appreciation of the untiring services of the staff through this difficult year and the enthusiastic support of our faithful employees without which it would have been impossible to produce such results. This service has been recognised as usual by a suitable bonus to all.

The report and accounts were adopted.

THE BIRMINGHAM SMALL ARMS COMPANY

DETERRING EFFECT OF TAXATION

The ninety-first ordinary general meeting of The Birmingham Small Arms Company Limited, was held on December 17th at Small Heath, Birmingham.

Sir Bernard D. F. Docker, KBE (chairman and managing director), in the course of his speech, said: The total profit, before providing for taxation for the year, was £2,326,020 against £2,200,338.

The amount required for taxation is £1,520,309—almost exactly two-thirds of the profit. This bleeding of industry will ultimately benefit no one except the country's foreign competitors. Incentives, both to the individual, and to industry generally, are vital, and they can only happen by the lowering of direct taxation.

Having in mind the importance of our production of guns, motor cars, motor cycles and pedal cycles, I feel bound to refer to the question of purchase tax. Now that the competition for export markets renders vital a steady home market, to make possible the lowest production costs, it is imperative that the question of purchase tax should be reviewed without delay. The present uncertainty regarding the tax is restricting the placing of home orders, and affecting adversely export prices.

It is our business to go out and sell our goods; I believe in our goods, and I believe that we can sell them provided always that it is made possible for trade to exist throughout the world, and that conditions under which we have to trade are fair.

The report was adopted.

THE SOUTH WEST AFRICA COMPANY

The annual general meeting of The South West Africa Company, Limited, was held on December 12th in London.

Sir Dougal Malcolm, KCMG, the chairman, in the course of his speech, said:

The total amount provided for tax for this year is £320,683, compared with £213,444 in the previous accounts.

The profit on the year's working, after providing for taxation, is £157,778, and after adding the balance brought forward, £46,611, we have available £204,396. It is proposed to pay a final dividend of 6s. per share, which, together with the interim dividend of 2s. per share, will absorb £111,000.

Development operations at Abenab West and at our other properties have continued during the year under review.

Our sales of lead last year realised the large amount of £637,601, the average price received for our production being £151 per ton of metal. In contrast to this, the average price for lead on the London Metal Exchange was for last month £94 approximately.

With regard to our sales of zinc concentrates, the substantial figure of £141,868 realised last year was again influenced by the high prices ruling during the period under review. The average received in this instance was £152 per ton of metal, which contrasts with the present-day price of somewhat over £100 per ton. I need hardly say that the fall in the prices of these metals must of necessity have an adverse effect on our results for the financial year ending on June 30th next, though to what extent it is, of course, impossible to forecast.

The report was adopted.

HARRISONS AND CROSFIELD, LIMITED

SIR ERIC MILLER ON TAXATION

Presiding at the forty-fourth annual meeting of Harrisons and Crosfield, Limited, on December 16th, Sir Eric Miller reported total group profits for the year to June 30th of £1,822,756, an increase of £118,638, and said: The group net profit applicable to the parent company, including reserves and provisions brought back, was £886,694. The deferred ordinary dividend is maintained at 30 per cent, and dividend equalisation reserve receives £200,000, making that reserve £250,000. Total reserves now amount to £3,442,040, an increase of £775,620 over the previous year.

TAXATION DISADVANTAGES

We, in common with many other British enterprises trading overseas, suffer the following taxation disadvantages in respect of profits made abroad: (1) The combined local and UK taxes payable on such profits, even after allowing for such double taxation relief as is available, often exceed the amount which would be payable if such profits were earned wholly in the UK; (2) the taxation authorities have so far insisted on our paying UK tax on profits of overseas branches in sterling, even though it has been impossible to have such profits remitted to this country because of exchange control restrictions. Incidentally, this penal taxation affects not only trading concerns, but applies equally harshly to many of the plantation companies domiciled here for which we act as secretaries.

Weighty evidence has been submitted to the Royal Commission on the Taxation of Profits and Income, proposing to exempt overseas income from income tax and profits tax in the UK, a system which is already in force in Australia, South Africa and certain European countries. We suggest that the Chancellor should make this urgent reform law and not delay action until the report of the Royal Commission is available.

During the complete exemption proposed, UK taxation laws should be amended without delay to allow that: (a) Such profits should not be assessable to UK taxation until received in this country, thus following the practice of the USA; and (b) the principle of full double taxation relief, which at present is applicable only as between the UK and those countries which have actually entered into double taxation agreements, should be applied to all foreign income.

TEA AND RUBBER

Sir Eric said that the cessation of tea rationing brought no immediate increase in consumption, but owing to low prices and other causes world supply and absorption were rapidly approaching equilibrium. He foresaw that tea would not be available for long at prices appreciably below cost of production.

For years past, he said, the USA Government Agencies have played an almost decisive role in shaping the course of natural rubber prices by reason of their stockpile purchases on the one hand and their synthetic production policy on the other. The State Department are well aware of what a fair price for natural rubber means to the economy of South-East Asia, but they are not the Agency which dictates the policy of the USA Government in rubber matters. The natural rubber industry desires, and ought to have, a fair field in which to compete on its merits with synthetics priced on a commercial, unsubsidised basis with only minimum mandatory use. I remain a firm believer in the future of natural rubber from conviction of its merits as a tough elastic material.

The report was adopted.

LINES BROS. LIMITED

YEAR OF FURTHER PROGRESS

The thirty-fourth annual ordinary general meeting of Lines Bros. Limited was held on December 12th at the company's offices, Tri-ang Works, Morden Road, Merton, London, S.W., Mr Walter Lines, chairman and general managing director, presiding.

The following is an extract from his circulated statement: Your company has made further progress during the year. Trading has taken a big step forward towards sanity, involving a return to the buyers' market inevitable in a competitive world. Lines Bros. group accounts show the good results of a year notable for many adjustments to the old prewar conditions so well known to your board. We have no misgivings that the return of such conditions can have anything but a beneficial effect on the affairs of your company. We regard such a change as the only possible prelude to sound trading throughout the world, and to the progress of this country in the essential overseas markets.

During the year we suffered the full effects of Australian and other countries' restrictions of imports, but were able to increase the total sales of the group, thereby adding to our profits. Our investment in Cyclops and Lines Bros. (Aust.) Limited has proved profitable and this company is going ahead strongly. Lines Bros. (N.Z.) Limited is prospering and has enabled us to export parts providing fine toys which, owing to restrictions, could never reach that market as finished goods. Lines Bros. (Canada) Limited has made some further progress towards a profit-making basis.

NEW ACQUISITION

During the year we purchased a company producing a fine scale model electric railway with valuable patents and features which we are developing in many ways. This company has had a profitable first year under our group management and has excellent prospects. All the other companies in the group have earned substantial profits as a result of increased sales.

We look forward to the future with confidence, knowing that our quality goods are justifiably sought after wherever they are not subject to complete embargo. When trade throughout the world returns to freedom from interference by governments, the products of your company will be in even greater demand.

The dollar markets are receiving ever-increasing attention with good hopes of enlarging our sales. Improved selling arrangements in the USA will come into force from January 1, 1953. We have been entrusted with the development and manufacture of various items for the defence programme; at present these form only a small part of our production.

In the year under review the company made an issue of unsecured stock to take care of increased costs of carrying on business. This has been put to good use. It is sad that exorbitant taxation takes in cash so high a percentage of earnings as to prevent necessary expansion and provision of expensive modern plant unless by the issue of new capital.

Development of new ideas is going ahead strongly, and while your directors feel that the group is getting stronger, we have full understanding of the need for continual progress.

The report and accounts were adopted and the payment of the dividend on the ordinary shares of 8d. per share, less income tax, was approved.

HERRBURGER BROOKS, LIMITED

SATISFACTORY PROFIT

The thirty-second annual general meeting of this company was held on December 17th, in London, Sir Louis Sterling, chairman, presiding.

The following is an extract from his circulated statement for the year to June 30, 1952:

After providing for taxation, the net profit, although showing a reduction, has continued on a satisfactory basis. The trading profit is larger than in the previous year but increases in expenditure and taxation, together with a charge of £4,148 for employees' pension premiums result in a reduction of approximately £6,000 in the final profit.

The balance sheet continues to reveal a strong financial position. The increase of stock in hand is due mainly to our ability to purchase larger quantities of materials. Debtors, however, show a large reduction due to the heavy diminution of business owing to the restriction imposed by the Australian and other governments on piano imports which has had a very serious effect on the piano trade generally. The position has shown a slight improvement in the last few weeks, but no major recovery can be expected unless the restricted export markets are re-opened to the piano trade.

The home trade has continued to be negligible owing to the high rate of purchase tax. It is pleasing to note that the purchase tax has recently been halved and is now at the rate of 3½ per cent, but while appreciative of the gesture of the Chancellor of the Exchequer it is thought that the reduction is too small to enable any important benefit to be gained. The report was adopted.

PRICES TAILORS LIMITED

COMPLEX TRADING CONDITIONS

The twenty-fourth annual general meeting of Prices Tailors Limited was held on December 18th in London. Sir Henry Price (chairman and joint managing director) presiding.

The following is an extract from his circulated statement:

The past year proved one of the most complex in my experience.

The adverse trading conditions experienced by practically all concerns in the textile and clothing trades must by now have been made only too clear to you. We have suffered in common with others and indeed our trading to June 30, 1952, covered the period of greatest difficulty in the clothing trade.

All things considered, however, I feel that we were reasonably successful in the achievement of turnover. Throughout the year we never relaxed our efforts to ensure that the quality and price of our products were at least abreast of current competition though this has, of course, meant considerable sacrifices in normal profit margins.

During recent years I have repeatedly stressed that the aim of the board has been to provide the very best clothing that can be made at a price the average man or woman can afford, which is approximately one week's wage. I am proud of this achievement as a direct contribution to the reduction in the cost of living and I believe that this policy has given and will continue to give us at least our full share of available business.

The report was adopted.

TRONOH MINES LTD.

The fiftieth annual general meeting of Tronoh Mines Ltd. was held on December 17th in London.

Mr J. H. Rich, chairman of the company, presided.

The chairman referred to the loss to the board caused by the death of Mr Harry Rich and the retirement of Mr H. Ashworth Hope, and to the filling of the vacancies by the appointment of Mr D. W. Thomas and Mr R. J. Ward.

The following are extracts from the chairman's address which was circulated to shareholders:

In addition to the increase in the cost of fuel and material there has been a marked increase in wages due to a tin price bonus scheme. It was the original intention of the scheme that when the tin price dropped there should be a corresponding reduction in wages. When the price did drop, however, no such reduction followed because the cost of living had not decreased.

TERRORISM

Concerning conditions in Malaya, it is generally admitted that there is a marked improvement, largely due to the strong and energetic measures taken by the High Commissioner. One result has been greater co-operation between the people and the authorities in the supply of information. The fight is, however, by no means over, as is shown by the attacks which still occur.

Our staffs and their families, in common with others, continue to live in an atmosphere of acute strain. Their courage and calmness, which have largely contributed to maintaining the general morale, deserve our greatest admiration.

TAXATION

The accounts for the year ended December 31, 1951, show the heavy burden the company has to bear in the way of taxation, and now there is an additional impost in the form of an excess profits levy. Representations were made for the exemption of the Malayan tin mining industry. The claim for total exemption was not granted, but certain concessions were obtained.

MALAYAN TIN BUREAU

There has recently been set up in Washington, DC, a Malayan Tin Bureau sponsored and financed by the Malayan tin producers which will provide accurate information in the USA regarding the industry.

TIN POSITION

As regards the tin situation the immediate future is obscured by uncertainty over stockpile objectives in the USA and the control maintained on industrial consumers in that country. But the policy of the USA in keeping the price down remains unchanged, and while this policy persists there is no incentive for increased production.

In assessing the future production of tin, the nationalisation of the tin mining industry by the Bolivian Government cannot be overlooked, as it raises the question of the effect it will have on production. The general view, I think, will be that it will have a very marked adverse effect.

A well-known firm of metal brokers has estimated the probable world production of tin for 1952 to be 154,900 tons and consumption 140,000 tons. The surplus of about

15,000 tons is obviously much less than the US Government would appear to be willing to take into the strategic stockpile. The expectation that this surplus may bring opportunities for buying tin at lower prices during the next few months is not likely to materialise. There can be no doubt that the tendency will be for an increase in consumption. The increase in the population in the USA alone, which is growing at the rate of 2,750,000 a year, will inevitably have its effect on the consumption of tin, by steadily expanding the need for tinplate to make containers for processing and preserving larger quantities of food.

The tremendous increase in industrial production in the world has raised the question of the supply of the necessary raw materials. Realising the importance of this, a Commission was appointed in the USA to examine the problem. Their report, known as the Paley Report, has recently been published, and in its findings the Commission has pointed out the urgency of an increase of one-sixth in the world production of tin. One consequence of the publication of the Paley Report has been an intensive study by the US Government of the entire raw materials question and as a result there appears to be growing support for some form of stabilising price agreement. This is a complete change from the attitude formerly held. There are, however, grave doubts about the usefulness of any such schemes; there is a dislike of any interference with the freedom of the market, and there is finally the insuperable difficulty of getting producers and consumers to come to terms in any such scheme over such essentials as quotas and high and low price levels.

The report and accounts were adopted.

IND COOPE & ALLSOPP, LIMITED

INCREASED TURNOVER

The fortieth annual general meeting of Ind Coope & Allsopp, Limited, was held on December 18th in London, Col. the Rt. Hon. Lord Courthope, PC, MC (chairman), presiding.

The following is an extract from his circulated statement for the year ended August 31, 1952:

Following a period of declining output, the year provided us with a steady home trade and a substantially increased turnover. This latter arose not only from the increased price, but from the continuing swing from draught into bottled beer, and in particular a further substantial increase in the sales of Double Diamond. Notwithstanding this swing, our draught beers are receiving increasingly favourable comment.

There have been in some quarters suggestions that the industry's sales efforts are unduly concentrated on beers and wines and spirits; while it is from the sale of these articles that the greater proportion of our profit is made, it is, and has been for some years now, this company's policy to encourage both tenants and managers to provide such refreshments as may reasonably be required by the public. Where catering licences have been available, there has been a ready response to meet this demand, but it is not in all cases that any useful public purpose is served by providing catering facilities when such facilities are already amply available close by.

There is a satisfactory increase in group trading profit at £2,703,217, as against £2,582,677 last year; taxation has absorbed practically the whole of this, leaving a trading balance of £770,177, as against £765,923.

The report was adopted.

J. GLIKSTEN AND SON, LIMITED

TURNOVER WELL MAINTAINED

The forty-seventh annual general meeting of J. Gliksten and Son, Limited, was held on December 18th in London, Mr S. G. Gliksten (chairman and managing director) presiding.

The following is an extract from his circulated address: The revenue from trading of the group amounts to £718,370 as compared with £1,066,315 a year ago. The provision for taxation requires £350,183 as against £520,959 a year ago, and the net profit then remaining has been adequate to provide a substantial transfer to reserves and also to maintain the dividend on ordinary stock at 32½ per cent, less tax, the rate paid for the previous year. It should be pointed out that the maintenance of this dividend is on the capital as increased by the rights issue and capital bonus distribution in the autumn of last year.

In the consolidated balance sheet the total capital employed, including reserves and undistributed profits, amounts to £2,626,866 as against £2,080,600 a year ago. The excess of current assets over current liabilities amounts to £1,633,500 as compared with £1,192,998 a year ago. Loan capital, bank overdrafts and loan accounts are reduced by £233,353 during the year, and these features of the accounts are highly satisfactory.

The beginning of the financial year was notable for a continued rise in prices of all timber products, and in fact at one time during the year prices reached an exceptionally high level. The change in Government marked a policy of counteracting inflation by deflationary measures, and from the country's point of view these were successful and resulted in a sharp fall in prices which culminated at the end of our financial year. Since that time confidence appears to have revived and trade has improved. This has resulted in a small but satisfactory advance in the prices of our raw materials as compared with prices at the bottom of the market which did not cover the cost of production. In spite of the difficulties with which we have been faced during the past year, turnover has been well maintained, and the demand for the group's products continues to be satisfactory.

CONTROL OF IMPORTS

Changes in Government policy towards this industry are so frequent that it requires the utmost agility to adapt business policy to cover these changes—for instance, during the past year the Government have found it necessary further to control the imports of wood goods with the exception of those emanating from the sterling area. The imports of softwoods and wallboards have also been accompanied by restrictive quotas which has made the position even more difficult. It has recently been announced, however, that individual quotas will not apply to imported softwoods during the year 1953, imports to be restricted by a global limitation on the quantity permitted to arrive in this country. We shall endeavour to use our ability as distributors of softwoods to the fullest possible extent.

Export turnover has again increased during the year although in common with most other suppliers we have been severely restricted by the closure of the Australian market. Nevertheless, it is our determination to continue the development of our export departments which handle many commodities not wholly related to the timber industry.

The report was adopted.

JOSHUA TETLEY AND SON, LIMITED

RECORD YEAR

The annual general meeting of Joshua Tetley and Son, Limited, was held on December 12th at Leeds.

In the absence of Mr C. H. Tetley (the chairman) owing to indisposition, Mr F. E. Tetley presided and read the chairman's speech:

Ladies and gentlemen,—

As chairman of our company it is my privilege to submit for your approval and adoption the accounts and directors' report for the financial year ended September 30th last. You will have seen that the company has had a record year as far as sales are concerned, our gross income for the year of £6,450,124 being absorbed in the following manner:

Beer duty	%
Taxation	61.9
Materials and production costs (excluding wages) ...	5.4
Wages and salaries	11.4
General trade expenses	5.4
Depreciation and reserves ...	10.0
Interest	3.3
Dividends (net)	.8
	100.0

It should be observed that although our income has never been higher in the history of the company, yet there has only been a slight increase of some £700 in the net profit available after taxation. This is due to heavy increases in most of our costs and also the extraordinary demands of the taxation authorities. We now have each year a smaller proportion of our profits left to reinvest in the business and provide us with adequate working capital.

INCREASED COSTS

With regard to the costs, the main increase was in materials, accounted for by the high cost of malt consumed. Transport charges were another important item of expense and the cost of delivering a barrel of beer has, on an average, increased by no less than 11 per cent during the year. We have tried during the year to reduce our carriage costs by delivering a limited quantity of beer in tankers and we shall, in the future, extend this practice as far as is practicable. The cost of operating our managed houses has also risen considerably, due principally to the requirements of the Catering Wages Act.

We are transferring £50,000 of the available profit to general reserve, bringing this to £1 million, and are proposing the same to the ordinary dividend of 3s. 3d. in the £ as last year. Expressed in percentages, this dividend works out at 16½ per cent on the nominal value of the ordinary stock and represents only about 6 per cent on the equity which the ordinary stockholders have in the business. After providing for this dividend, we recommend that the unappropriated balance of £30,427 be carried forward.

THE FUTURE

As to the future, you will be glad to know that since the end of September sales have held their own and it is expected that the fall in the price of barley, which has been gradually reduced during the year, but as regards other costs we do not think that we can expect any fall

at all, and the best we can hope for is that transport and other charges do not rise much further, although we have already been notified of a 5 per cent increase in railway freights.

In conclusion, I should like to offer the thanks of the directors to all the men and women in our organisation, as it is mainly due to their efforts that we have obtained such excellent results in the past year, and I have no doubt that stockholders will wish to join the directors in expressing their appreciation of the services they have rendered.

I now beg to move that the statement of accounts of the company for the year ended September 30, 1952, as audited, together with the directors' report submitted to this meeting, be and are hereby approved and adopted, and I will ask Mr M. H. Tetley to second this motion.

The report and accounts were adopted.

S. SMITH & SONS (ENGLAND) LIMITED

INCREASED VALUE OF TOTAL SALES

MR RALPH GORDON-SMITH'S STATEMENT

The annual general meeting of S. Smith & Sons (England) Limited was held on December 17th at Cricklewood Works, London, N.W., Mr Ralph Gordon-Smith, chairman and managing director, presiding.

Referring to the more important items in the company's accounts, the chairman reported that the group profit before taxation amounted to £1,248,000, against £1,520,000 last year. After making provision for taxation, net profit was £434,000, compared with £602,000 last year. The board proposed to maintain the ordinary dividend at the same rate as last year by the payment of a final dividend of 10 per cent, making, with the interim dividend paid, 12½ per cent for the year. The transfer to reserve against possible falls in stock values of £150,000 increased that reserve to £400,000, a figure equivalent to 10 per cent of the balance sheet value of the stocks.

The chairman then referred to the commercial progress of Smiths during the last financial year. He recorded that the total sales value of the group had shown an increase over the previous year, in spite of reduced public buying and certain overseas import restrictions, which had made necessary the reduction and rearrangement of production of some consumer goods, particularly clocks. However, aircraft and industrial instrument sales had increased, and the Motor Accessory Division had maintained its turnover, due to an expansion of its range of products. The foregoing factors, together with a policy of avoiding, as far as possible, the passing on of increased costs, had resulted in some reduction in profits compared with last year.

The Motor Accessory Division had maintained its position in the very virile automobile industry, and had continued both to expand and to perfect its range of established instruments and other products, such as car heaters. It was now beginning to reap the benefit of its segregation of instrument and car heater production, its efforts to stabilise its prices of automotive products and its development of world-wide servicing facilities.

The Clock and Watch Division had maintained its position as the largest combined clock and watch manufacturing organisation in the United Kingdom. As a result of the

home trade recession, import restrictions on certain overseas markets and increased foreign competition, sales had suffered and, said the chairman, it had become more necessary than ever to increase the efficiency of the factories and organisation, and to this end Smiths were devoting their energies with increasing vigour. The alarm clock factory at Wishaw was developing into the highly efficient plant visualised and the demand for the Cheltenham jewelled lever watches had been greatly stimulated by the introduction of a new De Luxe range.

The Aviation Division had made substantial progress during the year. Aviation research and engineering facilities had been expanded and new research and development work undertaken in the field of guided weapons. Though engaged on defence and rearmament programmes, it had substantially increased its export sales, and was marketing a more comprehensive range of instruments and allied equipment than any similar organisation.

The Industrial Instrument Division with its range of instruments specially designed for industrial, traction and marine application, had continued to expand and to consolidate its position.

Kelvin & Hughes, Limited, were maintaining their leading position in the marine field with its wide range of instruments, in particular the echo sounder, marine radar and ships' compasses, as well as in the fields of aviation and industrial instrumentation.

Smiths companies in Australia and Canada were providing the users of Smiths products with an increasingly efficient service, and were building up valuable markets in these territories.

The chairman reported that the group turnover for the first four months of the current year continued to show a slight increase.

The report was adopted.

THE STRAND HOTEL LIMITED

The forty-fifth annual general meeting of The Strand Hotel Limited was held on December 18th, in London, Mr S. I. Salmon (the chairman) presiding.

Addressing the meeting, the chairman said: An event as memorable as the Coronation, which will draw for a short period an abnormally large number of people to London from all parts of the British Isles, from the Commonwealth and the Colonies, and from America—I might even say from all corners of the free world—imposes no light responsibility on large hotels to ensure an equitable disposal of their accommodation. The allotment of rooms has not been an easy task. We have given much consideration to the problem and we think we have reached a fair solution.

I would like to emphasise the fact that it is not our policy to increase our room charges for special events, and we do not propose for the Coronation to deviate from our normal scale of charges. These charges, which include breakfast, are very moderate and there is a substantial benefit in price for twin-bedded rooms. Our visitors know what they have to pay—we are One Price hotels. Our efforts are always directed to keeping prices down and the quality of our service at the highest level. On the catering side we are confident of being able to meet all demands made on us during this busy season. Our restaurants provide a variety in service and tariffs to meet most pockets, and we are sure that the many who visit them for the first time will be impressed by the marked good value they receive.

The report was adopted.

THOMPSON BROS. (BILSTON)

IMPROVED TURNOVER AND PROFITS

MR H. J. THOMPSON'S SPEECH

The forty-seventh annual general meeting of Thompson Bros. (Bilston) Limited was held on December 17th at the registered office, Bradley Engineering Works, Bilston, Mr Howard J. Thompson, MIMechE (chairman and managing director), presiding.

Mr H. Sargent (director and secretary) read the notice convening the meeting and a representative of Messrs Southern & Carter read the report of the auditors.

The chairman said: Ladies and gentlemen, I am pleased to be able to report an improvement in our trading profit for the year 1952, which has resulted in a profit of £221,180, and after deducting directors' remuneration and fees, pension scheme contributions, depreciation and taxation, totalling £145,299, there remains a balance of £75,881. To this must be added the balance brought forward last year of £51,064, leaving an amount available for appropriations of £126,945. The amount set aside for taxation this year is £99,000 against £62,000 last year, being £23,119 more than our net profit.

The increased profit this year is the result of an increased turnover, and the benefits derived from the expense incurred last year in the development of new and improved types of products. Our reserves have been further strengthened by the retention out of profits this year of no less than £53,264, and reserves and unappropriated profit have now reached the substantial total of £369,368. Your directors propose to repeat the dividend of 17½ per cent for the year by paying a final dividend of 7½ per cent and a bonus of 5 per cent (both less income tax).

PROVISION OF FURTHER FINANCE

Although the financial position is very strong, current assets exceed current liabilities by £586,680, the demands on the company's reserves to finance extensions to buildings and plant, and to secure supplies of raw materials rendered necessary in order to discharge a greatly increased turnover, have necessitated our calling upon our shareholders to provide us with increased funds.

An offer of 318,596 ordinary shares of 5s. each at 10s. 3d. each was therefore made in October last, and was largely oversubscribed. This has provided the company with a further £160,000 cash which will be a great help in dealing with the increase in output anticipated during the current year.

As stated in the documents circulated in connection with the new issue, a resolution will be submitted at the annual general meeting converting such shares into stock, and further resolutions will be proposed to convert all further ordinary shares automatically into stock as and when the same are fully

paid up and to increase the nominal capital of the company to £500,000 by the creation of a further 600,000 unissued ordinary shares of 5s. each. There is no present intention of issuing any of these shares but the directors consider that it is advisable to have a reserve of unissued ordinary capital.

CURRENT YEAR'S PROSPECTS

The first four months of the new year show an increase over the same period last year of more than 30 per cent. Orders on hand for defence and civilian works are a record for peace time, and further demands are being made. Materials although difficult to obtain, are easier than they were last year. These orders should enable us to be fully employed in the coming year.

A considerable amount of new plant has been installed during the year and new buildings are also being erected to enable us to meet the increasing demands for home and abroad of our various products.

Research and development of new projects, a policy of our company, are still being carried out.

Providing no unforeseen difficulties arise I anticipate we shall be able to report a very successful trading result next year.

My son, Mr P. H. Thompson has joined in the service of the company, being the fourth generation of the Thompson family.

In conclusion, I wish to express my sincere thanks for the valuable work and co-operation of Mr J. W. Meredith, assistant managing director, and to Mr H. Sargent, secretary and director, and to all our managers, staff and workpeople, who have overcome many difficulties to enable us to show the improvement in our year's work.

The report and accounts were adopted and the final ordinary stock dividend of 7½ per cent and bonus of 5 per cent, making 17½ per cent for the year, was approved.

The retiring director, Mr J. W. Meredith, AMIMechE, was re-elected.

The resolutions for converting the ordinary shares into stock and increasing the nominal capital of the company were approved.

MALAYALAM PLANTATIONS

RECORD YIELDS

The thirty-first annual general meeting of Malayalam Plantations Limited was held on December 11th in London, Mr J. A. Clubb, presiding.

The following is an extract from his address circulated with the report and accounts:

Our chairman, Mr H. W. Horner, is on a visit to the East.

The total tea crop and the yield per acre of tea were both records for the company. The cost of production of tea was just over

one penny per lb less than in the previous year due to our overheads being spread over a crop increased by some 2,800,000 lb. Although the yield per acre of rubber was the highest ever achieved by the company, the cost of production exceeded that of the previous year by just under one penny per lb, due to higher labour wages. The directors recommend a final dividend of 5 per cent, making 10 per cent for the year.

Given favourable climatic conditions we estimated during the current year to produce some 14 million lb of tea and 6,200,000 lb of rubber, but so far the crops of tea for the first six months of the company's current financial year, owing to less favourable weather conditions, are, 794,374 lb less than in the corresponding period of the previous year. The rubber crop for the first six months of the company's current financial year shows an increase over last year of 242,400 lb.

It would be rash to forecast what the result for the current year is likely to be in face of the present uncertainty in the tea and rubber markets.

The report was adopted.

J. W. GREEN LIMITED

The fifty-fifth annual general meeting of J. W. Green Limited was held on December 18th at Luton, Mr Bernard Dixon, chairman, presiding. The following are extracts from his statement:

I am pleased to report that, for the year under review, each of the breweries in the Group has shown an increase in trade. Comparatively rapid expansion has involved us in a great deal of abnormal expenditure. This expenditure will, in due course, bear fruit through the greater efficiency that will result from the re-organisation which is designed to meet the changed circumstances.

It will be recollected that the Group has been spending heavily in bringing the properties of newly acquired subsidiaries up to the standard of the parent company. Accordingly for the present, our expenditure on properties greatly exceeds that normally required for maintenance.

The company's development through the acquisition of various new subsidiaries has been a marked feature in its recent affairs. Your Board is pursuing a carefully planned policy which is designed to meet the situation which will inevitably develop in the future. Briefly, it is necessary that your company's products should be well known over a wide area.

The penal burden of taxation makes it difficult to obtain any material benefit from increased trade. It will be noted that the ordinary dividend of 20 per cent is covered more than one and a half times. During the year £1,205,000 debenture stock was issued and £520,000 debenture stock was redeemed. This provides the funds to undertake further development.

The report and accounts were adopted.

ORAMASTIC is an acid- and oil-resisting asphalt suitable for flooring and other coverings. Floorings made from Oramastic withstand action of oils and acids such as bleach solution used in bleaching mills, over long periods, and in temperatures up to 50 degrees Centigrade. Oramastic has stood up to tests under working conditions lasting 18 months. Enquiries are invited for exploitation of formula (provisional patent) in Great Britain.—Apply Daniel O'Rourke & Son, Solicitors, 29 Donegall Street, Belfast.

PROMINENT JUTE MANUFACTURING COMPANY requires an accountant, not older than 35, for its organisation in Calcutta. The salary offered will be commensurate with the qualifications of the successful candidate, but it will not be less than £2,000 per annum. Applications should be addressed in the first instance to Box No. 6396, c/o Charles Barker & Sons Ltd., 31 Budge Row, London, E.C.4.

AN important position as Secretary Accountant is open to suitably qualified and experienced person, aged 32 to 37, with a rapidly expanding company in the fine chemical field. Applications will be treated in strict confidence and should give full details of education and career to date.—Box 138.

STAMMER. Nervous "Stop." Facial Contortion.—It is through the mind that treatment remedies. Weekly Postal Tuition (mainly psychological) with continuous personal advice. Write for Booklet and terms.—Mr. Charles Seymour, "Liberté," 69 Grosvenor Road, Aldershot, Eng. T 1735.

STATISTICAL ASSISTANT

Young lady of good education (non-graduate) required by important commercial organisation in London (near Victoria Station) with analysis work, card index records, etc. Write for previous appointments, experience, salary required, available to Box 137.

ENGINEERING EXPORTS.—33-years-old Mechanic B.Sc., A.C.G.I., with keen intellect tempered capable and energetic, would like responsible position of concern offering worthwhile opportunity. Include fluent French, general business experience and knowledge of export trade.—Box 132

line, no two families are the same in their extravagances and their economies—and no two families want to be the same. An instalment of this boon of consumers' freedom, small but very welcome, has been provided for the British people in 1952. And they like it. Nor is the process inhumane. The prophecies of the mass unemployment, the unlimited deflation, that would follow upon any tampering with the dogma of Cheap Money have turned out to be just as silly as the economists always said they were.

This new-found willingness to give the economists' ideas a trial has not, it is true, gone very far. But it has at least and at last given them some facts to argue on and some hard ground for hoping that there will be further ventures in 1953. It may even become possible, in due course to suggest that the same logic might be applied to housing. People who give utterance to the obvious truth that the housing problem could be solved overnight if it were simply resolved to start charging a fair economic price for houses, new and old—and that any Minister who had the courage and the clarity of vision to apply this simple remedy would within six months be a popular hero—may just conceivably, before Christmas, 1953, cease to be regarded as lunatics.

Moreover, there is some reason to hope for a little progress with some other of the economists' favourite doctrines. It is beginning to dawn on all concerned that an economy which is entirely dependent for its progress upon the massive creation of new capital cannot be sustained without savings. (It is true that the curious doctrine that thrift is anti-social and unnecessary arose from the popular versions of a great economist's teaching. But it was a misunderstanding; Keynes said that saving should not exceed investment, not that it should fall short.) If saving becomes fashionable again, it may be possible to move on to a still more unpalatable truth: that competition, and all that it implies in individual displacement, is the only guarantee of adaptability and thus of survival in a rapidly changing world.

All these maxims of the economist share one unfortunate characteristic: they all prescribe something unpleasant first, as the means of securing something desirable and necessary at a later stage. Higher prices

now are the means to consumers' freedom shortly; abstinence now to abundance later; the insecurity of competition now to ultimate efficiency. That, presumably, is why the economist is something less than a mildly popular figure; he is always asking for payment in advance. But the same attitude is not taken to the surgeon who amputates now to prevent gangrene shortly, or to the vaccinator who deliberately causes cowpox in order to avoid the risk of smallpox. Nor is that school-master held to be the best whose educational principle is to give his charges whatever a majority of them think they want at the moment. But, then, in medicine and (until lately) in education, there are no politicians soliciting votes on complicated technical matters.

As some small help in clearing away the misunderstanding, let it be said with all emphasis that the only acceptable aim of all economic activity, and of all economic theorising, is to foster human welfare. Moreover, though the steady growth of material wealth is the prime constituent of welfare, there is no reputable economist today who would deny that welfare has other constituents besides mere aggregate material output. It is over a generation since the theoretical case was made for including an equitable distribution of wealth and some security against the misfortunes and mischances of life among the imperative objectives of economic policy. The economist has no right to feel aggrieved when people question his ideas about the right method for attaining these objectives; but he has a right to resent it when people assert that he puts "sound economics" above the happiness of his fellowmen.

Not even at Christmastime does the economist pose as Santa Claus. He leaves it to others to pretend to little children that the good things they get come from the North Pole, when they are really paid for out of their fathers' pockets. His benevolence is of a different order, for he sees a vision of a world so rich that it could be Christmas every day—if only men and women were willing to look a little beyond their noses. And if to accept limits in the present in order to safeguard the future is inhuman, so also is the whole long history of Man's rise from unending hunger and toil to the threshold of comfort and leisure.

Far Eastern Future

DURING the next few months the free world will be watching with the keenest interest and anxiety as General Eisenhower slips into the driver's seat and takes over the controls. Already there are rumours and speculations about the course he intends to steer in the Far East, the region about which the deepest concern is felt. Events there strongly influence relations with the whole Soviet bloc, and their course depends broadly on decisions taken in only three capitals—Moscow, Peking and Washington. It is not in London's power to play the major role of any of these three, but it has a right—especially after a conference of Commonwealth Ministers—to form and express a view of any changes in policy which may be considered by the new American Administration when it takes office. The best time to bring that view to bear would be when Mr Churchill visits Washington; but the debate in the United States is already beginning and it is taking a course which

encourages the belief that things can be said now which would not have been listened to a year ago. In the long run the key to peace and stability in the Far East lies in agreement between the United States, Britain and the Commonwealth; if they fall apart, only the Communist cause benefits, but that will not happen if courage is taken and time found for frank discussion.

There is little to be gained by going over the Korean ground again at this stage. General Eisenhower's visit to the battlefield has emphasised the fact that there is no short cut to a solution; and in no country that has troops in Korea is there any serious suggestion that if the other side will not yield, the alternative is to yield to the enemy. The last two years, however, have demonstrated that the Korean question is to some extent self-contained. There cannot be, it is true, any lasting agreement with China to live and let live without a Korean settlement; but the fact that no Korean armistice

is possible for the time being is no reason why the free world should not frame a coherent, long-term policy for the Far East as a whole.

What, then, can be the basis of such a policy? At present, although there is a much wider range of practical agreement between London and Washington over the Far East than their occasional and much publicised differences would suggest, they still approach the central problem of China from entirely opposite viewpoints. Neither has any claim to a monopoly of self-righteousness. The American Government has hardly been proved right about the best way of dealing with the Chinese Communists; and the British Government has certainly been proved wrong. Recognition has got Britain nowhere; instead, it has seriously multiplied Britain's difficulties in Malaya and has cost a great deal of American good will. Yet America's own policy has yielded no obvious dividends. Short of a general war, the gulf between Washington and Peking could not now be greater than it is. If both policies have therefore failed, it is arguable that, in the search for a new star to steer by, another look should be taken at some of the original premises on both sides. Sooner or later—the problem is largely one of timing—a way will have to be found between appeasement and unbending toughness, a path along which the United States and Britain can walk together.

It is best to start by examining present relations between Russia and China. For it is the combination of these two Communist powers which has turned the old order upside down in the Far East. If they could be separated, or at least prevented from working together as a well-drilled team, the difficulties of free Asia would be halved. As things are, both the continuation of the Korean war and any policy designed to ostracise or punish China drive Peking into a constantly more dependent alliance with Moscow. It would be, of course, naïve to expect or count on Mao Tse-tung becoming a Tito in any foreseeable future. But that is not an argument against the adoption of a policy designed to exploit the peculiar features of China's position in the Soviet constellation. Stalin now aims primarily at splitting the West; why should not the West set its sights on whatever divisions it can see in the Soviet empire?

In the matter of ideology, which is so important to all Communists, the Russians and Chinese start by being a little out of step. While the Russians claim that the victory of Communism in China is a victory for the Marxist doctrine as expounded by Lenin and Stalin, the Chinese present Mao Tse-tung as an equal, not a subordinate or pupil, of Stalin. While the Russians spare Chinese susceptibilities by not insisting on the outwardly satellite position of a popular democracy, the Chinese regard themselves as the vanguard of the revolution in Asian colonial territories; and the Russians watch their growing influence on other Asian revolutionary

movements with some suspicion. Similarly, in terms of territory, the Russians have by no means resolved their dilemma, whether to stake all on the loyalty of Mao or to reinsure by hanging on to regions important to the Soviet Union for supply or defence. Moscow's determination to stay in Port Arthur, in spite of the promises made under the Sino-Soviet Treaty of 1950, its refusal to give Peking a free hand in the central Asian territories of Sinkiang and Mongolia, and its economic grip on Manchuria—all these are symptoms of Russian distrust and possible causes of friction.

Stalin boasts of the economic unity of the Communist world, but to the Chinese the Russians have so far proved harsh and disappointing trading partners. China wants to buy capital equipment for its industrial revolution; but the few things it can export are no bait to the Russians, who may well be unwilling in the economic sphere, as in the purely military, to hasten the pace at which China can set up new industries that will make it independent of key Russian supplies. The imposing

Chinese trade mission which attended the Moscow Conference last August has long since returned to Peking, but no announcement has ever been made, even to the expectant people of China, of its success or failure in developing trade or sharing the burden of war. Even the recently reported establishment of an Asian Cominform, following the Peking "Peace" Congress, is not without its troubles. (The Chinese, incidentally, showed their independence at the Congress by inviting to it Trotskyists from Ceylon.) The Russians are glad enough to deflect the Chinese from Central to

South-East Asia, at the same time encouraging them to "co-ordinate and direct revolutionary movements" in ripe colonial-type territories like Burma and Malaya; Indo-China is already being claimed by Peking as falling entirely within the Chinese sphere. But neither Stalin nor Mao is likely to be happy about leaving the task of preparing revolution in India to the other. The fact is that the link of Communism, powerful and comprehensive though it is for the moment, has brought together two dynamic and nationally ambitious regimes whose interests do not and will not always coincide.

If this analysis is correct, the assumption that policy towards China begins and ends with denial of status and punishment of aggression is inadequate. The aim must still be to resist force with force where fundamental principles or vital interests are at stake—as in Korea and in the wars with Communism in South-East Asia—but not to turn resistance into counter-attack which will have the effect of increasing Chinese dependence on Russian support. Likewise, against the fact that weakness will always be taken advantage of in Asia must be balanced the certainty that the Chinese cannot be indefinitely denied their claims to recognition and a seat in the United Nations without dire consequences. The western powers are, admittedly, in a difficult position for

changing tactics. They are fighting an implacable foe in Korea and they are committed to rejecting any attempt to reach a wider political settlement until that war is over. There are, moreover, American voices in Korea itself which urge that only another offensive will bring the Chinese to terms. It is also difficult to think of switching to a more diplomatic approach without losing face; and it is highly doubtful whether the Chinese would react favourably to such a change. But, sooner or later, the possibilities of political negotiation will present themselves, and opportunities must be found for the free world to bring pressure to bear on the weakest links in the Sino-Soviet partnership.

There is urgent need first for agreement on the diplomatic possibilities offered by the situation in the Far East, and second for a long-term policy based on such an agreement. Much has been learnt in dealing with the Russians, all of which does not necessarily apply to the Chinese; but some of it does—the need for cool

and systematic appraisal of intelligence, for concerted manoeuvre by allies, for combining diplomacy with arms. The first need is to stop the Korean fighting on satisfactory and honourable terms; but from the moment that has been done, all the problems of the future present themselves. To examine them now with fresh minds and in an atmosphere quite different from that of three years ago has two things to be said for it: first, that the Chinese—as distinct from the Russians—might show fresh interest in a truce; secondly, that the end of the fighting would not find the United States and its allies obviously unprepared and divided about the next steps. It is, perhaps, something of this kind that is made possible by General Eisenhower's present reflections on policy in Asia. If so, British policy has the delicate task of drawing attention to the need for thinking now about diplomatic possibilities in Asia without casting any doubt of its resolution to stand firmly by the United States until they present themselves.

Government by Generals

THE precedents were set quite a long time ago. After the rigged trial and execution of their former ruler, the revolutionaries announced that power now derived from the people, and would be exercised by their elected representatives. No new elections were held, but all those representatives who had doubts about the new regime had already been purged; those who survived considered themselves legal heirs of the former assembly, and launched out on a system of government by committees. But their endless debates roused the impatience of the army, which knew that it alone had saved the revolution, and now wanted to see results. It refused to disband; it occupied the capital; and when the politicians not only rejected the idea of new elections but tried to perpetuate their hold on their seats, the General's patience was exhausted, and his troops drove them from the parliament building.

Naked military power thus showed itself for the first time. Most of the people, heartily sick of the politicians' corruption and incompetence, applauded it. But the officers were not yet ready to do without a civilian administration altogether. They tried nominating a new assembly, but its ineffectiveness soon led them to ask it to hand over its powers to the General—who was genuinely surprised, but accepted the offer. The officers now drafted a new constitution, dividing power between the General, as head of state, and a newly elected legislature. The new assembly, however, tried to reduce the size of the army, and the General promptly dismissed it.

He then experimented with direct military government, dividing the country into eleven commands and appointing eleven officers to maintain order and enforce reforms. They did this so strictly that, although their rule lasted only a year, it set up a wave of revulsion throughout the country; and when new elections were held, the results reflected this revulsion. Although the army unseated all members of this third revolutionary assembly whom it did not approve, the remainder still opposed their demands, and they, too, were dismissed by the General. For a little while he held the stage by himself, aware of the country's growing disillusionment but secure in the army's loyalty. Then his death revealed the hollowness of the whole revolutionary structure.

The successor whom he appointed as head of state lacked the confidence of the army, and was soon forced to resign. But the army itself, having lost its master, had no idea what to do with its power, and fell into bitter quarrelling. It tried two more assemblies, dismissed them both, and rapidly increased its unpopularity. Finally, the commander in the north, now the only senior officer who could rely on his troops, saw the way the wind of public opinion was blowing. He marched on the capital, brushed aside both his fellow officers and the remnant of the revolutionary politicians, and secured the holding of elections in which no candidate was barred because of his past. The restoration of the pre-revolutionary regime followed at once, amid general rejoicing.

Thus ended, in 1660, this country's first and only experience of government by generals. It left behind it a deep and lasting distaste for military rule, which remains one of the chief characteristics of British political thought. The appearance, anywhere in the world, of a government based on bayonets is traditionally regarded here as a setback for the cause of liberalism. Yet, paradoxically, from time to time British opinion gives a friendly reception to a military *coup*; the recent seizure of power in Egypt by General Neguib provided an unusually clear example. It would seem, then, that the issue is not a simple one of black and white; and it may be worth while to try to analyse the nature of military government, and to suggest when it is to be feared and when, if ever, welcomed.

The extent to which military men control, or participate in, the governments of the contemporary world is not always fully realised. The eye of the public is easily caught by such dramatic *coups* as have brought army officers to power in Egypt, Syria, and Cuba this year. It is more apt to overlook the existence of the military regimes which have maintained themselves for some time in countries ranging from Peru and Venezuela to Siam. Again, there are countries where a civilian government depends to a critical degree on the good will of the armed forces, as, for example, in Indonesia and Burma. Nor should the totalitarian nature of other states be allowed to disguise the military basis of their regimes; in this respect there is little difference between, say, Madrid and Peking, except that in the Chinese system it

is openly admitted that power resides in the "Military-Administrative Committees."

A clear distinction must, of course, be drawn between all these systems and those states where a former army officer has been elected to the highest office by due democratic process. The first essential difference between General Eisenhower and Field-Marshal Papagos on the one hand, and General Franco and Marshal Stalin on the other, is that the first two were brought to power by free and fair elections. Nor is it even necessarily true that a general who in the past has been accustomed to autocratic power cannot adapt himself to democratic ways; General Ibañez, the newly elected President of Chile, has not yet shown an intention of returning to the methods he used twenty years ago when he was virtually a dictator. If it is argued that a professional soldier must tend towards intolerance and hierarchical rule, account must also be taken of the tradition and atmosphere of his country. Wherever the military is regarded as the highest caste, the soldier in office will the more easily fall into absolutist ways; but where there is a national tradition of subordinating the military to the civilian authorities, as in most western countries, no military president or prime minister is likely to be able to exceed his constitutional powers.

★

To a certain extent, this distinction also holds good with regard to those military regimes that are established by force of arms. One of the reasons for the short duration of military rule in seventeenth-century England was the instinctive respect of the army for constitutional forms. More important, however, are the circumstances in which each military regime originates. Today, although the professional army officer is still usually portrayed as an ultra-conservative Colonel Blimp, military intervention in politics favours reform quite as often as reaction. General Neguib, in Egypt this year, has personified popular impatience with the old regime just as Generals Dutra, Goes Monteiro, and Gomes did in Brazil in 1945. In most such cases it is arguable that the democratic method has been betrayed not by the army but by the civilian politicians whose conduct has brought it into contempt. Indeed, the army sometimes intervenes not to impair free institutions but to restore them; the Brazilian instance was one of these. And even when the army, having turned out a gang of corrupt and irresponsible politicians, retains power in its own hands, it is generally a preferable alternative to the totalitarian party-state. Soldiers are seldom fanatics; they may be hardened, but they lack the deliberate cruelty associated with political extremism; and their very ignorance of political wiles makes them less capable than Fascists or Communists of fastening the full apparatus of propaganda, terror, and isolation upon a people.

There are, indeed, countries that have been saved by military intervention from falling victim to totalitarianism. Yet it is rare for this salvation to be more than temporary; for the outstanding characteristic of most military regimes is their short life. This time limit is not simply the result of a universal hatred for military government. Cromwell's major-generals made themselves objects of loathing, not because they were soldiers, but because they were rabid puritans; and modern instances are not lacking of regret being expressed when a military administration gives place to civilian rule. Nor need a

general's government be more bellicose, and so more unstable, than a politician's one; a strong man in power can often afford to be conciliatory.

It is, perhaps, lack of flexibility that is the fatal flaw in most military systems. The general-governor is usually a man accustomed to transmitting his commands down an ordered hierarchy. He has little experience of the technique of balancing opposing influences or of working for compromise. Moreover, he has no means of assessing shifts in public opinion, and he is liable to drift out of touch with the popular forces which may originally have hailed him as a saviour. True, he often enjoys the advantage of being able to put through overdue reforms more quickly than his civilian predecessors could; but this may be offset by the fact that his arrival in power has aroused unusually high and unrealistic hopes among his people. Above all, both his rule and his popularity are apt to be too personal. Although military governments are sometimes controlled by a *junta* or committee of officers, a single personality is generally dominant, and it is to this man that the public regard is turned. Death, exhaustion, or even temporary illness is thus a constant threat to the stability of the regime.

It is for these reasons that no purely military government has ever succeeded in finally solving a country's problems, even when it began with the advantage of taking the place of a wholly discredited regime. No matter how energetic and enlightened the generals may

The New Government

"England does not love coalitions." This may be so, and no doubt is so. But the coalitions which England does not love are rather those of principles and opinions than of men. The leading statesmen who compose the new Government, though many of them have never acted together in office before, have nevertheless for years past been united in their views on the most important political questions of the day. It was a hearty co-operation of Lord John Russell and his friends, when in opposition, that enabled the Government of Sir Robert Peel to repeal the Corn Laws and to carry out his great commercial and financial reforms; and it undoubtedly was by the warm and undeviating support of Sir R. Peel, as long as he was spared to us, and of his immediate friends since, that Lord John Russell's Government was able to maintain that policy against a powerful and united party of Protectionists. . . . It has not, therefore, been any great and sudden political necessity that has brought a number of statesmen together, whose views on the most important questions of the day have hitherto been antagonistic to each other. Nay, so far is it the reverse—so far has public opinion recognised the compatibility of the combination which has formed the new Government, that for the last three years at least of Lord John Russell's Government, a junction with Sir James Graham and his friends was the chief means pointed to, by Liberals of all shades of opinion, as the most desirable, if not the only, way of forming a strong and efficient Government. But what is of equal importance in the formation of a Ministry at this juncture of the affairs of this country . . . is, that we should have a Government of powerful administrative capacity—a Government that is so strong in the confidence of the country that it can afford to carry out its policy without pandering to obsolete prejudices on the one hand or popular errors on the other—that can afford to conform to the growing opinion of the day and to progress with the increasing intelligence of the age.

The Economist

December 25, 1852

be, from the very beginning of their rule they must face one supreme difficulty—that of restoring civilian institutions. Only those military regimes that have overcome it are remembered with gratitude; those that fail often lead their peoples into difficulties as great as any they have saved them from. This does not mean that the general in power must seize the first opportunity of

England's Hearty Wellwisher

IF any reader of *The Economist*, perusing his sixty or eighty pages from cover to cover week by week, has ever felt dismayed at the length of time this ritual takes, he may care to consider how fortunate by comparison was his opposite number some two and a half centuries ago, whose copy of "Collections for the Improvement of Husbandry and Trade" consisted of a mere four pages, to which he probably listened as it was read aloud in his coffee-house. Clumsily printed, on coarse paper, this obscure penny journal of King William III's reign might very well be taken as the earliest attempt to provide, as *The Economist* provides now, comment and information on trade in its widest aspects. A brief comparison yields some curious differences and some even more curious similarities.

It was written single-handed by one John Houghton, who besides this scribbling dealt in tea, coffee and cocoa in Bartholomew Lane. But while he was a merchant by profession, and an apothecary by training—having been apprenticed to the Master of the Pest House in the year of the Great Plague—he was an economist by instinct, if ever there was one. As a Fellow of the Royal Society, he launched his first number with a glowing testimonial from his associates, including Edmund Hallé, namesake of the comet, and Samuel Pepys, and as "England's Hearty Wellwisher" he wrote the weekly "Collections" with a care and sincerity which contrasted strongly with the slipshod newssheets of his day. "I'll mend all things amiss as soon as I can" he promises frequently with reference to his factual articles, and he is soon belabouring the old scapegoat, the printer: "Last week I published a paper about whales . . . the printer has greatly mistaken, making a Mouth 72 instead of 12 foot."

He opens, like *The Economist*, with a Discourse or essay. These articles run in long series, on topics which run from brewing techniques to the balance of payments, from natural history to joint stock, and in them he finds occasion to preach his gospels of freer trade, higher consumption and harder work, which were strong medicine for his time. His comments on the labour question would read strangely in a twentieth century journal:

The Weavers, 'tis common for them to be drunk on Monday, have their heads ache on Tuesday, their Tools out of order on Wednesday. . . . The style the Painters give themselves is "Honest drunken Curs" and they often work at heaving of Glass, lifting of Pewter, emptying of Sellers and such like.

He is a warm advocate of multilateral trade, and never tires of exposing the conventional view of his day that international trade should be confined to a bartering of products so as to conserve specie. Here is a fair sample of his manner, when recommending the import of cheap foreign timber:

But this will cost us some money; its likely it will; but what then? It will also get some trade for Tobacco, Stock-

coming to terms with the politicians he has displaced. But it does mean that he and his lieutenants must be consciously and sincerely working towards the restoration of civilian government from the day they assume office. The example of Kemal is perhaps the most obvious one for them to follow; and the fruits of his success are plain for all to see.

ings, Wastcoats, Course Cloths and several other things in those Parts. And I have shown that if we do not export our Money, it will do us no good. And I pray, how do we get our money? Why truly, we carry our Product and Manufacture to Spain, and there for it get Money; and this money we carry to Norway, and swap it for Wood; and what the difference is (except a little more Employment for Ships and Seamen, which we reckon Happiness) between this and carrying our Manufacture or Product directly to Norway, I profess my understanding won't direct me to.

It seems that convertibility was a plague to the wits even then.

Even the American Survey is not entirely wanting.

Our Plantations in America have not prejudiced our coasts, that were in a convenient manner planted, for they have increast the Profitable Employments not only by building of Ships, carrying out our Manufactures and Products thither, but also by returning theirs hither to supply ourselves. . . . And if it should be said that they might have consumed as much if they had staid here, yet it cannot be said we should have employed so many men in building ships and carrying and recarrying as we now do. I am apt to think it might be made out that it is a wheel to set most of our other trades a-going.

Notes of the Week are here, too, but a dozen or so lines in a footnote suffices for them. They consist of a few bald headlines from the official "Gazette"—the Emperor has beaten the Turks on the Danube, two Dutch Indianem have been taken by the French in the Channel "which is all I see useful to Posterity." But if this feature was still rudimentary, Records and Statistics was well on the way. A regular note announces "Whoever are willing from their Markets to send me Prices in good time, I'll return them in lieu one of my Collections." Whether this method of collecting fat stock prices proved more successful than we should expect, or whether occasional deficiencies were made up in less reliable ways, our understanding will not lead us to, but every week there is a table of farm prices from the principal towns in the kingdom, followed by a helpful footnote "There are some maps of England of small Value will tell where these Towns are." The rest of this section contains, besides shipping movements in the Port of London and Bills of Mortality in the City, a regular note of stock quotations. When Houghton introduced this last item, he was not without misgivings about tempting his readers to the sin of speculation.

Altho' they that live in London may every noon or night on Working Days go to Garraway's Coffee House to see what prices the Actions bear of most companies trading in Joint Stocks, yet for those whose occasions permit not there to see . . . they may be satisfied once a week how it is and have their Advantage. Only I must caution beginners to be very wary for there are many cunning artists among them.

Each week the cryptic list appears, Hudsons 185, India 140, Linen 45. He evidently received some puzzled inquiries about this item, for a month later there appears another note.

Actions signify Shares in Companies. For instance if

to men raise 10l apiece to carry on a trade, each 10l is called an action or Share. If they have hopes of great Gain they will not sell their Shares for 10l; if they fear Loss they will sell for less. So Actions rise or fall according to Hopes or Fears. . . . I find a great many understand not this affair, so I write this.

Houghton's advertisements, for which he probably charged about three-halfpence a line, are a jumble of notices on every conceivable topic, but those relating to medical cure-alls and tonics predominate, and lack the evasive language of a more squeamish age. Among the notices of books and ready written sermons is one which starts: "Complete Works of Robert Boyle, price 1s., beginning 'Medical Experiments, or a Collection of choice Remedies for the most part simple.'" It leaves the modern reader sorry that books were not reviewed. Houghton identified himself with many advertisers as a kind of agent. "I want a complete young man that will wear a livery to wate on a very valuable gentleman, but he must know how to play on a violin or flute." Or "If any have a place, belonging to the law or otherwise, that is worth 1,000l or 2,000l, I can help to a customer." Or "If any want all kinds of necessaries for Corps of funerals I can help to one who does assure me he will use them kindly; and whoever can keep their corpse till they get to London, and have a Coffin set down, may have them afterwards kept any reasonable time."

When the "Collections" came to an end in 1703, after eleven years, Daniel Defoe's famous "Review" was just beginning. That master of journalists interspersed his economics with politics and scandal.

This Age [he says in his first preface] has such a Natural Aversion to a Solemn and Tedious Affair that however Profitable it would never be Diverting and the World would never Read it. To get over this Difficulty [I have made] some sort of Entertainment and Amusement at the end of every paper . . . which Innocent Diversion would hand on the more weighty and Serious Part of the Design into the Heads and Thoughts of Those to whom it might be useful.

This no doubt throws some light on why a long-lived successor to the strictly economic "Collections" had to wait for the earnest readers of Queen Victoria's reign. But brilliant and witty as the "Review" was, and lengthy as *The Economist* is, neither, surely, can boast a tailpiece of such gentle charm as this: "I have found by experience that no Worm or mouse will eat Paper writ with ink made from a decoction of Wormwood. And a little Bay-salt in ink will keep it from moulding in Summer, and a little Brandy will keep it from Freezing in Winter. Next Friday expect more from

Yours etc.

John Houghton F.R.S."

NOTES OF THE WEEK

M. Pinay Walks Out

Once again France has been singularly ill served by its parliament. Although anything said about the present political crisis promises to be out of date two days hence, there is no doubt that M. Pinay's offer to resign early on Tuesday morning, after forty-eight hours of irritable and sterile debate, has gravely shaken confidence. M. Bidault and the MRP, without whom M. Pinay's precarious majority could not survive, decided that an increase in family allowances was more important than the stabilisation of the franc, the maintenance of a sane wage and price structure, a foreign policy leading towards European union, and the presence in power of a Prime Minister who had brought into politics a new sobriety and hope. The decision is almost incomprehensible unless it is assumed that strong personal ambitions were in play. The MRP clearly intended the fall of the present Government. In announcing its abstention at the last moment, and as the vote of confidence was about to be taken, M. Bidault's party thought it had set the stage for yet another spell of chaos. M. Pinay countered with his habitual tactical acumen and walked out before he could be formally overthrown. This leaves the door open for possible patch-work and reconciliation.

It had been hoped over the weekend that M. Pinay had weathered the worst of the storm. The Nato declaration of solidarity over Indo-China, the firmness of the French attitude towards the Bey of Tunis, and the strong current of popular opinion running in the Prime Minister's favour, had strengthened his ministry's position. He had shown himself a fearless and expert debater: when derided by a Communist deputy as the owner of a tannery, the Prime Minister riposted—"We each have our business. Mine is leather and yours is rope." Whether or not M. Pinay is given another lease of life, the present crisis shows that the best government France has enjoyed in a good while is no less at the mercy of conflicting ambitions, shortsightedness and sheer levity than any of its countless predecessors. The extreme Right and Left are given occasion to rejoice at what they interpret as yet another symptom of the senility of parliamentary institutions.

Commanders versus Ministers

The 32 ministers present last week at the Atlantic Council considered a paper which said that the military efforts made so far "do not provide sufficient forces to guarantee the security of the Nato area." They also heard General Ridgway say, in effect, that he was dissatisfied with his fifty divisions, active and in reserve. If they had presented the civilian view in the same terms they would have said that the extra productive effort called for in Europe had not been made and that they could not guarantee a safe passage through economic squalls without it. In other words, the argument of ministers has scarcely got beyond the point of saying that to win the cold war you must risk losing the hot war. General Ridgway is fully entitled to go on saying the opposite so long as his political masters leave his enormous strategic responsibilities undiminished.

To move on to a more constructive attitude it is necessary to know more about General Eisenhower's policy and the nature of future American contributions in dollars and goods. As these things cannot be surmised until later, the Council was bound to postpone its main decisions until the spring. This means that rearmament measures which would have their effect in 1954 are being slowed down, perhaps only temporarily; none the less expenditure in 1953, as compared with 1952, should rise, and General Ridgway should get another ten divisions, not counting Germans. If the members of Nato also mean business with their reserve divisions—and it was a grave omission to say nothing explicit about them—then next year's outlook is fairly satisfactory.

On the credit side were the resolution calling for early formation of Europe's defence community, the recognition that all of Nato is vitally interested in its members' Asian problems, and the general acceptance of the function of the organisation as a clearing house. The Council is not a cabinet where one gets one's way by threatening resignation: its motto is persuade or postpone. The ministers left Paris after five days' work, but the Council goes on existing in their absence—that is the important new fact. It should be encouraged to take as much responsibility as possible.

From a Former Naval Person

The British delegation seems to have suffered—as the British public have—from Mr Churchill's failure to set out the main ideas behind those points of defence policy over which his advisers and those of Mr Truman seem to have drifted apart. Having exploded an atomic bomb and having caught more than one glimpse of the technological revolution that is imminent in land and air warfare, the British are naturally sceptical about the wisdom—to say nothing of their concern about the cost—of stockpiling obsolescent weapons. And Nato itself, let it be said, never showed any clear signs of catching up the Russians in orthodox armaments. Add to this the rising cost of the existing British programme and the natural disposition of Mr Churchill—like General Eisenhower—to have his chiefs-of-staff revise their papers, and it no longer seems surprising that some ideas in London have changed.

Whether anything significant is known about Russian intentions beyond what Stalin has lately said, and whether the new British appreciation of external dangers preceded or followed the new appreciation of economic burdens is a matter for speculation; and at Nato some of the speculation has been unfavourable. No military commander welcomes an appreciation of military intentions which weakens his claim on forces he has been promised, especially when he believes—as General Ridgway must—that it has been influenced by domestic politics. These matters should be cleared up before the spring.

There are several ways in which the United States can help. One is to show evidence that its experts have worked out the implications of defence with atomic weapons in concert with allies who lack them and know little about them. Is it true, for example, that thought about such matters is the monopoly of the American Air Force? Another useful contribution would be encouragement to the American press to understand that one cannot persistently cry to Europe that this is 1938 over again. The risks of quarrels that might cause war are obvious, but there is no hard military evidence of Russian intentions to attack Europe as Hitler attacked Poland. The task of Nato—and it is one of the utmost difficulty—is to persuade Europe of the need to be able to mobilise quickly and impressively against any change in the present disposition of the Russian army and air force. It is this need that gets overlooked in arguments about balancing the certainty of cold war against the possibility of the real thing.

* * *

Out Like the Lamb

Despite all the alarms and battles of the last seven weeks, the Government has reached the Christmas recess with its legislative programme running to time. The committee stage of the Transport Bill was completed, under the guillotine, just before the House rose. And to their surprise members were presented on the last day with the Town and Country Planning Bill (which abolishes the development charge) freshly reprinted on its return from a standing committee. The rapid progress made by this Bill upstairs, in spite of Labour's opposition to it, has made many members on both sides wonder again whether much of the hullabaloo of recent weeks might have been avoided if the Government had not insisted on taking the committee stage of the Transport Bill on the floor of the House. The day has perhaps come when Bills should be sent to standing committee even with a Parliament so evenly balanced as this. It would mean, of course, that the Government would have to reserve the right to reverse on the report stage any decisions that went against it in committee. But that would be, in the circumstances, a perfectly reasonable convention, and once it was recognised Parliamentary tempers might be appreciably less strained.

As it is, the price of forcing the Transport Bill through

committee by Christmas has been not only the use of the guillotine but frequent resort to the closure. Its frequency has, indeed, been far greater than can be justified even though the Government has been under great provocation. Everyone agrees that Parliament cannot go on for long in this way, and most members on both sides recognise the need for some concessions. Indeed, in the last few days before the recess the corporate common sense of the House asserted itself. Mr Crookshank was able to announce that the two sides had agreed, by a process of compromise, to spend 8½ days on the committee stage of the Steel Bill, and the guillotine would not be invoked. The Government very sensibly made another concession by promising to extend the report stage of the Transport Bill from two to three days, and the proceedings ended on a note of amity in striking contrast to the previous bitterness. But that Parliament will come in after Christmas as it has gone out is still almost too much to hope.

* * *

Chopper on Transport

The guillotine fell on Thursday last week on the final stages of the Transport Bill in committee. Rarely was an interval for reconsideration of a Bill more desirable, for there can be few people (and probably not even the Minister himself) who are satisfied with the content of the Bill, as amended, or with the quality of last week's proceedings under a rigid timetable. There is a growing feeling that the Bill stands in need of more improvement than is possible at the report stage.

Here, perhaps, is an opportunity for the House of Lords, which could at least approach transport as a national matter in comparative freedom from narrow party attitudes that obdurately maintain that the small man is the right man to run road transport, or that the organisation of transport prescribed in the 1947 Act is inevitably and eternally right. One important matter calling for further thought emerged from last week's proceedings in committee. It is not satisfactory, as Mr Gurney Braithwaite argued, to leave the future organisation of the railways to the Transport Commission and to give them twelve months, with the prospect of extension, to reach their conclusions. This is a matter on which, as the Minister admitted, there had been friction between the Transport Commission and the Railway Executive, and on which he had come to accept the representations of the commission. It would undoubtedly help the discussion if the Government were to give a clearer idea of the lines it has in mind for the reorganisation of the railways, on which little has been divulged beyond the notion of decentralisation. If, on the other hand, its ideas are unformed, it would seem better to take counsel from a wider range of opinion than is likely to be found within the commission.

This question of organisation has little popular appeal, but it is in fact the crux of any successful scheme of reorganisation. To "abolish" the Railway Executive (an "unfortunate word" which the Minister regretted) still leaves open the main issue. It is necessary to devise and secure the right policies for all the transport undertakings that will remain with the commission. It is also necessary to secure the general management of the railways, with all that this implies in technical matters. So far there is no indication of the answer to these fundamental questions.

* * *

Slow Motion Against Monopoly

The President of the Board of Trade has at last fulfilled the simple intention that he announced in the debate on the Monopolies Commission last July. The commission has now been asked to make a general study instead of being confined to individual industries; this study will deal with some of

the practices that its particular inquiries have shown to be common to a number of industries and to be restrictive in their effects. The official reference is broadly phrased to cover any arrangements, whether legally enforceable or not, by which independent traders or manufacturers join together in discriminating against, or in favour of, any defined class of customers. The most important of such practices are, of course, exclusive dealing and the collective boycott. To prohibit them would be to take the weapons of last resort, and so much of the restrictive sting, out of many trade associations.

The decision to hold a general inquiry on these lines is, at least, an improvement on the practice followed hitherto, with the commission toiling painfully through a few industries. But it is the right decision by the Board of Trade only if it is agreed that no more radical change is possible. Are Government and Parliament so preoccupied with more important matters that there is no time to pass new legislation against monopoly practices either in this session or in the next? If that is true—as Mr Thorneycroft is obviously assuming—then the study now being started will at least do no harm. Though it will no doubt be prolonged, it should surely be finished by the end of 1954. And then, if it is not put on the shelf already occupied by the Lloyd Jacob report, it can lead to some administrative action and it might provide a basis for stronger legislation in 1955; in either event, delay will not have been worsened.

But there ought not to be such delay at all. A new Bill on monopolies would take relatively little time, if it could be sent to a standing committee; and it is at least as important as the denationalisation measures—from the political as well as the economic point of view. The Conservatives' chances in the next election will depend to a large extent on their having by then worked out an economic policy that can be honestly and enthusiastically advocated in the national interest. Conservative measures like denationalisation will fit into such a policy—and the policy will be consistent and forceful—only if strong action against private restrictions is a part of it. The new inquiry is a step in the right direction when there should be a long jump.

Pyrrhic Victory in Tunis

Events in Tunisia afford the French Cabinet a respite from anxiety but no grounds for complacency. M. Pinay, against the advice of some of his ministers, confronted the Bey last weekend with a straight choice: between signing some of the 60 decrees upon which he had been stalling for anything up to a year, or of seeing his functions transferred to a council of regency that would assume his powers of signature. The Bey compromised by signing two of the decrees.

The excitement over this minor triumph is misplaced, for the success is modified by several factors. The murderers of Ferhat Hached, whether French or Tunisian, are still at large, and there can be no lasting satisfaction on either side unless they are caught. Secondly, though the two decrees signed are those establishing an electoral system in local government, they are not the most far-reaching of the reform items that were described in *The Economist* of August 9th. Others more controversial remain to be negotiated, notably that setting up two advisory councils, one of which is to contain Frenchmen. Lastly the signature is said to have been obtained while the Palace was surrounded by troops; the Neo Destour Nationalists can say and are saying that it was secured under duress. The success of these French tactics will be measurable less by what has happened than by what happens next.

The part played by personal emotions in this struggle between the Bey and the Quai d'Orsay is enormous. The

dramatis personae are, first, the Bey himself—elderly, fond of a quiet life, reluctant to forgo the privileged life of an absolute ruler; secondly his children, who live in a series of agreeable little villas surrounding his palace. The most forceful of these are a daughter, Princess Zakia, and a son, Prince Chadley. The former is the wife of a leading Neo Destourien and the latter is an ambitious member of the same party. They are well placed for needling their parent and steadily do so. The third personality involved is the Resident-General, M. de Hautecloque, who seems to dislike the Bey nearly as much as the Bey dislikes him. M. de Hautecloque is a bad judge of the effect of his words upon his hearers; more than once he has unwisely announced that agreement is attained when in fact the Bey does not mean it to be so. The last occasion on which he committed this error was last week, when the Bey in the end refused to sign the decrees. In fact his signature, when given, was given not to M. de Hautecloque but to M. Boisseson—the plenipotentiary called the "delegate" who represents the Quai d'Orsay in Tunisia. Maybe it was given to him because the Tunisians are downcast by the lukewarm support for their case at the United Nations. More likely, the concession was intended as a snub for a much disliked Resident-General.

Arab Defence Plans

At the end of the talks held last week between General Neguib and the Syrian chief-of-staff and deputy Prime Minister, Colonel al-Shishakly, the Cairo newspaper *El Ahram* remarked that they are the only two men in power in the Middle East capable of discussing its defence "in a positive way." If "positive" also means "practical" the comment is apt; as technicians with some experience of balancing national budgets, these two men belong to the

ADVERTISING

WISDOM . . .

Buyers are human beings.

In selling a product, figures can only take you so far; after that, the business becomes personal, no amount of market research can help you if your customer—metaphorically speaking—doesn't like your tie.

We don't disparage market research—we use it ourselves—but we don't close our eyes to its shortcomings. Many a thriving business has been built on a product that according to the research figures had no future. And as many theoretically promising ventures have ended in failure. The explanation in both cases was the unpredictable personal factor.

So we never forget that the customer is human, like ourselves, and that he'll only toe the statistical line if he feels that way. It's a business philosophy we developed years ago, and it is still serving us well.

If you think that you would profit by the personal touch in your advertising, why not phone or drop us a line and we'll arrange to meet and talk it over with you?

small number of Middle-Easterners who are aware of the costs of maintaining modern defences in even a small country.

They know how much it costs to keep a tank corps or an air force up to date. They know that states such as theirs have only two choices before them to achieve this end; either they must submit to unaccustomed and heavy taxation of private fortunes, landed property and businesses, or else they must ally themselves with the forces of a Great Power.

This is not to say that they will therefore step smoothly into alliance with the West as Turkey did. Arabs and Egyptians do not feel the hostility to the Russians that burns in Turkey; they mistrust the western powers on account of the Palestine settlement; and, perhaps the most telling consideration of all, many of them think that their homes may

lie beyond the perimeter that the West is capable of defending. If this is so, they reason that to commit themselves to one side would, in the event of war, expose them to reprisals. This thought blinds them to the argument that alliance now might reduce the risk of attack.

From the standpoint of the western sponsors of the Middle East Command, these Arab fears are even harder to allay than are the antagonisms that hang around the treaties that Britain signed between the wars with Egypt and Iraq. Yet if the Middle East, whenever it comes to discuss its defence, takes refuge in procrastination, or in anti-foreign ranting, or in purely negative rallying cries of the Arab League about Palestine or French North Africa, it will leave itself sadly exposed—rich but weak, vulnerable and tempting. If *El Ahram* is right, and Neguib and Shishakly were "positive," they will have done the Middle East a service; but they cannot complete the job unless they become positive in public utterance.

Desperate Remedies in Prague

Before the conference of the Czechoslovak Communist Party last week the country was told that the delegates' efforts would be directed towards "getting things straight." This certainly seems to have been necessary. The Slansky trial was deliberately staged when it was in order to shock the Party into accepting willingly a new and more rigorous set of rules. But many members seem to have reacted incorrectly; they were greatly concerned that Slansky and his friends should have got away with so much for so long, and then admitted their guilt so fully. The Communist leaders spoke with astonishing frankness about how show trials are arranged, revealing that the Czechs are not yet inured to totalitarian brutality.

The new Party Statute, which closely follows the latest Soviet model, is designed to eradicate the "obscure and vague conceptions of a liberal character" still lingering in the old party rules. High importance is attached to "Party and State discipline" which, in President Gottwald's words, are "essentially one and the same thing—two sides of one coin." He and his associates, caught between Moscow's demands and the people's discontent, hope not only to strengthen their grip on the Party, but also to fashion a more efficient instrument to control and exploit the national economy. The "lack of State and labour discipline from top to bottom" is responsible, says Gottwald, for most of industry's failures, and the Party must remove it.

Mr Zapotocky, the Premier, struck a different note when he said that a working-class manager who was inefficient and inexperienced did more harm than good, whatever his merits as a comrade—a remark hardly helpful to the Party in the factories. He has probably put his finger on a major weakness in the Communists' position, which will hardly be improved by stronger doses of criticism and self-criticism. It must have been weakened by purges, and confused and frightened—perhaps even outraged—by the recent trials. The medicine prescribed may be too strong; but Gottwald and Zapotocky probably dare try no other.

Miners and the Board

Five weeks ago the miners quietly accepted the Porter tribunal's outright rejection of their demand for a 30s. wage increase. In contrast, they have turned down the Coal Board's offer of 6s. a week for lower-paid workers with some bitterness. Some of the delegates to the special conference last week urged that strike notices should be given; others wanted to stop Saturday working and all "co-operation" with the board. The union leaders had certainly expected more than 6s.; this is not only derisory compared with the 30s. they originally asked for, but is less than the increases gained in other industries—which have recently been of the order of 7s. 6d. Moreover, the coal board's offer was not extended, as the union had expected it to be, to all workers on day-wages, but only to those on the minimum wage. And the board had attached to it two conditions that the delegate conference would not accept: a standstill on piece rates and a further extension of the Saturday working agreement when it expires in April.

The resulting discontent has not so far led to any action; production is always at its height in the "bull-week" before a holiday, and the executive has yet to decide what its next step shall be. Presumably it will return to the board and ask for more. The union leaders clearly seemed to see the sense of the Porter tribunal's argument that it would be wrong to award a general wage increase while the whole wages structure of the industry is under review. But meanwhile it was desirable to prevent hardship at the lowest level, for the negotiations about the wages structure have been going on for a year already; they will take a long time yet, even though progress has become more rapid in recent weeks—partly as a result of the Porter tribunal's observations and partly because the descriptions of the various jobs in the mines have at last been agreed.

The board has strong reasons for resisting a substantial increase in wages. Its finances are looking shaky again, because the demand for coal has fallen and because output per manshift has fallen sharply—from 1.21 tons last year to 1.19 tons in 1952. This is more than can reasonably be accounted for by the intake of green labour, and it greatly weakens the miners' moral claim to more pay. It also suggests that the nationalised coal industry is very much further from making itself efficient than the politicians—including, nowadays, Conservative ministers—like to suppose.

Service or Authority?

The recent legal arguments about fish and sewage in the River Derwent show more clearly than ever the importance of an independent judiciary to protect the individual against what are known, by tradition if for no better reason, as public authorities. The Pride of Derby Angling Association is of no economic importance; its members merely wished to fish in the River Derwent. But, they claimed, the river was a mixture of heated, polluted water detrimental to fish. Last April Mr Justice Harman granted an injunction restraining the Derby Corporation and the British Electricity Authority from interfering with the plaintiffs' fishing rights in the course of their use of the river for sewage disposal and for cooling the towers of a power station. They were given two years to alter their installations. Both appealed, the Derby Corporation against the decision, the electricity authority in order to get the injunction modified so that it could use the river water provided the temperature was not raised to a point injurious to fish. The Court of Appeal met the second application; it dismissed the appeal of the Derby Corporation with costs, and it is this section of the Court's judgments that is important.

The contentions of the Derby Corporation were on these lines. It had installed its sewage plant under the authority of the Derby Corporation Act, 1901. When installed, the plant was quite adequate for the then population of Derby. If the population of Derby had grown since, that was not the fault of the corporation, nor did it impose on the corporation any legal duty to enlarge its plant to prevent pollution of the River Derwent. The only remedy the anglers had was to make representations to the Minister of Health. Further, for a Court to grant an injunction against the corporation brought "improper pressure" to bear on the Minister responsible for issuing building licences for the extension of public works; it was also a wrongful interference with the sovereign right of a borough council to deal with its problems as it thought fit (and, by implication at least, of its right not to deal with them if it so pleased). The Master of the Rolls said that at one stage the corporation had suggested, through its officials, that the plaintiffs' action had been brought by the plaintiffs' solicitors for the sole purpose of making a profit.

So it has been necessary for the Supreme Court of Judicature to remind a public authority that, even if it does no more than cause a private nuisance to a private individual, it is still liable to be sued in the Courts like any other subject of the Crown. If a man has a right to fish, he retains it, even though it does inconvenience the Mayor, Aldermen and Burgesses of a county borough. It is to be hoped that there are some elected members of the Derby Council who will require those concerned to justify to the public they serve the arguments, contentions and accusations they have put into the mouths of their advocates in this action; or have things gone so far that the paradox of arrogance in the public service no longer attracts comment?

Levelling in Food Budgets

Since 1940 the National Food Survey has been collecting food budgets from urban working class households, but the report for 1950 (HMSO, 4s. 6d.) introduces an important change. All types of households are included, so that some comparisons of food consumption and expenditure by social class and size of family can be made. The 4,723 households who supplied a weekly budget are divided into classes according to the income of their heads—a criterion which falls midway between the now more usual one based on occupation and a purely economic standard, which would have to include supplementary family incomes.

The accompanying chart shows how expenditure on food

for each member of the household rises with the income of its head and falls as the family gets bigger. These two effects are not entirely unrelated, since there are proportionately more small households in the top class than in the middle ones. But the number of children is evidently the more telling factor; where there were three or more, expenditure on food was less than that of old-age pensioners. In general, the upper class consumed more milk, fresh fruit and vegetables but less potatoes and bread than other classes.

According to the Crawford and Broadley budgets of 1936-37 the weekly expenditure on food then averaged 8s. 11½d., but the difference between that of the upper and lower classes was as much as 10s. 10d.—121 per cent of the average. In 1950 the comparable range was only about 28 per cent. Some of this, of course, is due to rationing, but

some also to the levelling of incomes and of family size, though the 1950 figures may underestimate the actual difference in consumption because no account is taken of raids on larder stocks or of "free" sources such as garden produce, which are largest for the higher income groups. When allowance is made for these, the weekly cost of food consumed in the home was put at 21s. 4d. per head for Class A households, 15s. for old-age pensioners and 16s. 6d. for everybody.

The survey suggests that with this expenditure very few people were inadequately fed. The standard for calories was reached by all households except those in the lowest income class, who fell just short of it. The diet of the largest families was somewhat deficient in protein and calcium content, but for other nutrients the standard was easily reached by all types of households except that old-age pensioners may have insufficient iron in their food. But in general it is only the diet of families with four or more children that can give the nutrition experts cause for real concern.

Two Views of Dr Adenauer

Two quite different but equally valid views can be taken—and are being taken in Western Germany—of Dr Adenauer's battle for the treaties that will take the Federal Republic into the Atlantic system. To the politicians and foreign observers in the artificial atmosphere of Bonn, the Chancellor seems to have gone too far in his manoeuvres to prevent the Karlsruhe Court from delaying or invalidating the treaties. All his protestations and those of President Heuss cannot undo the bad effect created in the capital when the government showed that it did not trust the constitutional

judges to make their decisions without political bias. The prestige of the Court, say the critics in Bonn, has been undermined, without justification. To them it seems that the weak West German state, based on a provisional "basic law" that was not deemed worthy of the name of "constitution," has been endangered. They ask whether the European Defence Community, if it can be pushed through only by such tricks and only at the cost of a crisis of confidence in the state, is worth the price. By declaring his firm intention to hold the federal elections not a day before they are due next September Dr Adenauer has added to his critics' doubts.

Misgiving is also caused by reports that some of his colleagues in the Cabinet are contemptuously pointing out that the "basic law" was in any case only a makeshift affair imposed by the occupation powers and must not be allowed to interfere with a political act. Such talk, though intended to help the prospects of the treaties, accords only too well with the propaganda of the anti-democrats. They would like nothing better than to increase the disrespect with which Bonn is regarded.

Seen from other German centres, however, Dr Adenauer's policy does not appear nearly so mistaken. The constitutional manoeuvres are much too complicated to interest the general public. There is no crisis of confidence in the state in Frankfurt or Bavaria, for the very reason that the Germans do not base their lives on respect for the Federal Government, the Court or, still less, for political parties. Dr Adenauer, according to this view, has not lost any ground in the country through his latest tactics; on the contrary, his Social-Democrat opponents have perhaps irritated the public by their lack of any clear-cut, positive alternative to the defence community. Dr Adenauer clings to a few simple proposals; the Socialists have only a mass of complicated objections to them. This fact may well overcome the still very general opposition among the public to the idea of rearmament. If Dr Adenauer finally succeeds in pushing the treaties through, he will have created a *fait accompli* that the Germans may accept. In that event, he will probably not be blamed for the tactics that now look so dubious.

* * *

Cheques from Uncle Joe

Neatly anticipating Santa Claus by four days, Stalin last Sunday (his birthday) awarded "peace prizes" of 100,000 roubles (£9,000) each to seven fortunate people, all stalwarts of the "world peace movement." These prizes have now been awarded for three successive years, and an analysis of their distribution shows that France leads with three out of the twenty prizes awarded; Brazil, Britain, China, Germany and the United States have each won two, and Canada, India, Italy, Japan, Mexico, North Korea one each. Qualified candidates in the Soviet Union itself seem to have been lacking; this year, for the first time, a prize went to a Russian, Mr Ilya Ehrenburg, who, oddly enough, had earlier been appointed to the adjudicating committee (Mr Kuo Mo-jo of China likewise received a prize in 1951, despite his membership of the committee).

If Russia is weak in outstanding "peace fighters," at least it does better than its satellites. In the three prize lists not a single East European appears. There may be little point in wasting roubles on countries where military training is now so important; yet surely the satellites can boast some trusty peace fighters: Mr Rakosi, for instance, who brightened the Vienna Peace Congress by announcing in Budapest, as it met, that he would flinch from no sacrifice necessary to the militarisation of Hungary. Why are they neglected, while the roubles go to an octogenarian Mexican general and an American parson (who refused them)? Does Stalin feel that it would be tactless to award prizes to men who might soon share the fate of Rajk, Kostov, Gomulka, Clementis, Slansky and Sling?

Healing Themselves

The Danckwerts award has considerably raised the financial prestige of general practice in the health service. But for some time it has been widely admitted that a monetary stimulus was not enough to raise its professional prestige in the eyes of both medical practitioners and the public. Something else is needed to attract able young doctors into general practice and to provide an incentive to keep them up to the mark once they are established. Too often, today, the newly qualified become general practitioners merely because they see no hope of ever becoming consultants or specialists.

The idea that has won most favour within the profession itself is the formation of a College of General Practice. On New Year's Day, the idea will become fact, and the functions and organisation of the new body are set out in the report of the steering committee published in the *British Medical Journal* of December 20th. Two sentences in this report stand out as illustrative of the need for some such stimulus: "if a doctor is discouraged there is no branch of medicine in which he can deteriorate more rapidly"; and "medical students (the majority of whom enter general practice) often qualify without ever having met or spoken to a general practitioner, and without having seen him at work." One of the college's functions will, therefore, be concerned with undergraduate teaching. It will not institute a qualifying examination; but in a variety of ways it will help teachers of medical students to overcome the specialist bias in their curriculum by introducing some of the techniques and experience of general practitioners. Its main function, however, will be to provide a continuing incentive for established practitioners. It will set standards of general practice; help to keep practitioners up to date; act as a clearing house of ideas and information and encourage research.

Apart from the foundation members, it has still to be decided how election to membership of the college will take place. In a materialist world, moreover, some may wonder whether the professional distinction of membership will have to be backed up by a financial reward if the incentive is not to lose its strength as the years pass. There is also the danger

Fine wire—molybdenum and tungsten—is an essential component of electronic valves. These giant wheels are used in the preliminary drawing processes.

PROGRESS IN ELECTRONICS

IN the course of its progress the electronics industry has had a profound influence on many subsidiary industries. Twenty-five years ago, for instance, Britain's annual output of fine molybdenum and tungsten wire was about fifty million yards. Today, this figure represents little more than a month's production in Mullard's own giant plant. These enormous quantities are largely absorbed in the manufacture of Mullard radio valves, television tubes and other electronic devices.

Mullard make this vital raw material themselves in order to control the quality of their products from the earliest stage of manufacture. The factory in which it is produced is one of the most efficient in the world, and the advanced manufacturing methods and the specialised skills employed there are typical of the whole Mullard organisation.

Yet electronics itself is still in its infancy. New applications in industry, communications, medicine and defence are being devised at an ever-increasing rate. The Mullard contribution, in research and production, is one of the more significant aspects of this remarkable development.

Mullard

Overflowing Prisons

The annual report of the prison commissioners [Cmd. 8692] repeats last year's depressing tale of a steadily increasing prison population. One of the few encouraging facts is that the proportion of discharged Borstal cases not reconvicted, or reconvicted once only, seems to be recovering slowly from the low level to which it fell after the war.

The overcrowding which the big prison population has led to is now well known. Attention is usually concentrated on the fact that many prisoners have to sleep three in a cell; but the commissioners also point out that the shortage of prison accommodation creates other difficulties as well. As the second diagram shows, by contrast with earlier years, the courts now tend to pass longer sentences of imprisonment. The commissioners comment that prisoners serving over three years ought to be removed as soon as possible from local prisons to central prisons, which are suitable for long sentences. Owing to the shortage of

accommodation, "ordinary" prisoners can now go to a central prison only if their sentence exceeds four years, and then only after a wait of nine months. The number of men serving sentences of preventive detention already exceeds by about 100 the places available for them, and the position is bound to get worse as more are sentenced before the first preventive detainees are discharged.

Nevertheless, the commissioners rightly criticise the courts for sometimes failing to make enough use of this form of punishment. Prison officials try to impress men sentenced to corrective training that a subsequent reconviction may mean a sentence of preventive detention. But of 36 prisoners released from corrective training, who were reconvicted while on licence and were eligible for preventive detention, only three were given this sentence. The commissioners comment that a deterrent threat which is not realised will soon lose its force. This would be particularly regrettable, since the Governor of Parkhurst, where preventive detention prisoners serve the second and third stages of their sentence, has noted that many of them have written to their relatives advising them not to risk a similar sentence. There seems little doubt that in corrective train-

ing and preventive detention the courts have two strong weapons to combat crime and the recidivist—if only they would use them.

* * *

Did You Give Him Cigarettes?

In 1951, for the first time, the number of deaths from cancer of the lung exceeded the number of deaths from respiratory tuberculosis. This fact, illustrated in one of the accompanying diagrams, is recorded in the *British Medical Journal* of December 13th. The same issue also contains the results of an inquiry—or rather an extension of an earlier inquiry—by Dr Doll and Professor Bradford Hill into the smoking habits of a series of patients with lung cancer compared with those of a matched group of patients with other diseases.

The inquiry was most carefully undertaken, and yielded a vast number of findings which cannot be given here. The most significant results are the virtually complete absence of non-smokers among the male lung cancer cases and the considerably higher proportion of heavy smokers (defined as smokers of more than 25 cigarettes a day or the equivalent in pipe tobacco). The comparisons are shown in the other diagram.

The inquiry took place in hospitals in London, Bristol, Cambridge, Leeds and Newcastle, and the differences summarised above were present consistently in each of the five areas. Dr Doll and Professor Bradford Hill estimate, on certain assumptions, that whereas among men aged 45-64 who are non-smokers the death rate from lung cancer is negligible, in those who are heavy smokers, it is 3 to 5 deaths per annum per 1,000 living. The use of a petrol lighter, often blamed for any association between smoking and the disease, was found in this inquiry to be as frequent among the smokers in the control cases as among those with lung cancer; inhaling was not a significant factor; and there was no appreciable difference between the two groups when analysed according to the Registrar-General's social classes. On the other hand, more of the control group used a cigarette holder or smoked filter-tipped cigarettes than those who had developed lung cancer. And it is evidently not so dangerous to smoke a pipe.

The authors of the inquiry are, of course, careful to point out that cigarette smoking is not the sole cause of cancer of

the lung. They do, however, conclude that it is an important factor in producing the disease, and they suggest that the increased tobacco consumption of recent years may be, in part at least, responsible for the increase in cases of lung cancer. Perhaps it should also be pointed out that women do not altogether escape scot-free from the inquiry. Most of the findings for women are in the same direction as those for men, but women are on the whole much less prone to heavy smoking.

Letters to the Editor

Commonwealth by Thrift

Sir,—In your issue of December 20th you comment on some of the suggestions for a ten-year expansion of investment and exports, which I made in a recent Fabian lecture. May I say that I welcome these comments, since my suggestions were made tentatively, so that they might benefit from discussion and criticism.

You say that the critical issue is: how can savings be increased? I agree. I said in my lecture that "we must accept squarely the inevitable corollary that consumption cannot rise rapidly," and that "we cannot have reductions in taxes on the rich and further luxuries."

To get the savings needed, we must be honest enough to make a major decision. Saving is either individual or corporate. Individual saving cannot alone cover the gap unless direct taxes are so reduced as to restore the grotesque inequalities of pre-1914. Small reductions will mean more spending and inflation, not saving.

Therefore, corporate saving must be raised. Here company saving will play a part; but if we are going to make any progress towards a more democratic ownership of property, profit taxation must be used so that expansions (at least of large companies) come partly by way of outside borrowing, and not wholly by retained profits and hence private capital appreciation. (For small companies, there is a case for a higher Profits Tax exemption level.)

There should also be a large future for corporate saving through national insurance, private insurance, and pensions schemes of all kinds. Raising of the retirement age will assist this, as well as so much else.

But experience of the last few years shows that this will not be enough. Therefore, for a far-reaching ten-year investment programme, a Budget surplus is likely to be necessary. This must mean, for a time, continued high taxation of profits, large incomes, and fortunes—perhaps adjusted so as to encourage saving. As you so rightly say, saving means "consuming less; and it has to be done by people." It also has to be done by people already consuming more than bare necessities.

So the needs of social justice happily coincide thus far with economic necessities. Is not this a programme behind which we could all unite for the sake of the country's future, and which you—with your great influence—might take the lead in propounding?—Yours faithfully,

DOUGLAS JAY

House of Commons

[We welcome the wide basis of agreement on the need for more saving that is beginning to appear. In no factious spirit, but simply out of candour and caution, we would add that a great deal depends on how "social justice" is defined. Of course, everybody would agree that no reduced consumption should be required of

people who already consume only bare necessities. But after six years of Labour rule, Mr Jay would doubtless agree that there are very, very few of these.—EDITOR.]

Cortisone for Politics

Sir,—Why does Mr C. J. Stewart assert that the alternative vote might "jeopardise our chances . . . of enjoying effective government"? In 1951 Labour obtained nine marginal seats with majorities smaller than the Liberal vote. If the alternative vote had been in operation, and if Labour had gone to the country on a policy of left-wing socialism, Liberal second preferences might have given the Conservatives a net gain of close on twenty seats.

Since the abhorrence of a politician for the wilderness approximates to that of Nature for a vacuum, your case that the alternative vote would ensure the effective rejection of extremism by Centre opinion looks strong. Moreover, if the major parties were forced to heed moderate opinion, the present unsavoury exhibition of sham fighting at Westminster might cease. Further, to dismiss the alternative vote as "inept" because it does not also solve related but separate problems arising from the overloading of Parliament is to curse a sixpence for not being a shilling.—Yours faithfully,

L. A. JACKSON

Weybridge

Sir,—You perhaps have the House of Lords out of sight a little too quickly. The arguments over steel have, you say, become stale; it is apparently unacceptable to reiterate the necessity of trying to ensure by denationalisation that in future a party shall not push through Parliament any legislation it desires in the knowledge that it will not be undone. If, then, a prospective change of government is no guarantee of the reasonableness of the party in power, then the strongest case must be made for reinstating the House of Lords as an effective instrument of delay, as the guardian of moderation in the all too immoderate politics of today. The reform of the House of Lords is very much more important than either party cares to recognise.—Yours faithfully,

PETER STEIN

Balliol College, Oxford

Comment and Defamation

Sir,—From your article of November 1st it seems that, like many others, you have misunderstood the case of *Jones v. Hulton*. Mr Artemus Jones (who later became Judge Sir Thomas Artemus Jones) did not sue the newspaper correspondent, who did not know him and had no intention to defame. (Sub-conscious memory may have accounted for the choice of name, as correspondent and plaintiff had worked for the same group of newspapers.) The action was brought against the proprietor of the newspaper,

who *did* know the plaintiff, who admitted in cross-examination that he had read the article in proof, that at first reading he thought it referred to the plaintiff and yet allowed it to be published as it stood. Clearly this was no case of publishing allegedly defamatory words, "innocently in relation to," the person who claims that he has been defamed, nor can it be called an "unintentional libel." Further, Section 4, sub-section 5, of Mr Harold Lever's Defamation Act, 1952, provides that words shall be treated as published "innocently" only if "the publisher exercised all reasonable care in relation to the publication." It would seem, therefore, that under this new Act Mr Artemus Jones could still have recovered damages.

Mr Artemus Jones's case was not a "gold-digging" action. If it had been the superior courts would almost certainly have sent the case back for a new trial, on the ground of excessive damages. Reasonable men, some of whom gave evidence at the trial, believed that the article (which purported to describe what the writer actually saw at Dieppe) referred to the plaintiff. Indeed, it was only when he found that his reputation had suffered damage that he felt himself compelled to bring the action.—Yours faithfully,

MILDRED ARTEMUS-JONES

Bangor

[We did not argue that the decision in *Jones v. Hulton* was, of itself, authority for saying that the victim of an unintentional libel could always recover some damages. It did, however, suggest that he might, and in later cases he did. Unfortunately, therefore, the name of Sir Thomas Artemus Jones has become coupled with a kind of action quite other than that which he brought.—EDITOR.]

Growth of Pension Schemes

Sir,—The letter published in your issue of December 13th seeks to draw attention to the fact that employers would save money, and provide exactly the benefits required, by running private pension schemes.

Surely over-much weight can be placed on the actual saving in cost, since the administrative work entailed in the efficient running of such schemes involves considerable clerical labour, and salary, as is only too well known by those with experience of this type of work. Furthermore, the life assurance offices transacting pension schemes provide, gratuitously, valuable actuarial guidance which, in the initiation of a private pension scheme, might well represent a further initial expense.

As many have found in other cases besides that of life assurance, "net cost" can be not only misleading but also a dangerous measure of value.—Yours faithfully,

M. G. HEPBURN

WHEN IT'S A QUESTION OF TIME . . .

closing the gap . . .

Some said, when mass production came into its own, that something vital went out of industry, that means would have to be found to close the gap between Management and Man. Means have been found. Today, through Internal Broadcasting, the voice of Management can be heard instantaneously, by every worker, in even the farthest parts of the works. Thus is encouraged that happy atmosphere in which production can thrive. T.R. Internal Broadcasting can also provide speedy staff location, music for workers and time signals, all essential to modern industrial efficiency.

Today's need for maximum output has so increased demand for T.R. Service — Internal Broadcasting, Time Control, Staff Location and Internal Telephones — that new installations can now be undertaken only in organisations engaged upon work of National Importance.

Historian's Confectionery

Rumours of Wars. By A. J. P. Taylor. *Hamish Hamilton.* 262 pages. 15s.

An historian who takes pupils is under the same compulsion as a journalist who writes leading articles; he has to form, quickly and firmly, opinions on subjects of which he has not always special knowledge. The mark of stimulating tutorials is vivid throughout this excellent collection of essays and articles; again and again one hears the chuckle of the don unmasking the clichés of the History Sixth or provoking a protest from the chaplain. Was Bismarck a wicked man? Well... "when men dislike Bismarck for his realism, what they really dislike is reality"; he lacked humbug but did not lack principles, "only they were not liberal principles." Likewise the Crimean War, "the war that would not boil": the real decision there came—not from Britain—from Austria and Prussia, the "third force" that stayed out. Their policy caused the war because the Tsar thought they were reliable satellites of his, while the western powers thought they would join their side and inflict a full-scale defeat on Russia. Austria and Prussia did not; and the result was an indecisive war, with the excellent but unpredictable result that the balance of power in Europe was strengthened.

Then there is Mr Taylor the journalist, who writes dogmatically and confidently on the issues of the day. We know next to nothing about how Soviet policy is formed—agreed. Therefore let us beware of hostile or friendly generalisations—again agreed; but then the historian sails in where leader-writers fear to tread and says that fear is at the root of Soviet policy and that the best way to overcome the fear is by trade. Similarly, the mystery of De Gaulle has made lesser pens hesitate; but there is no mystery after all. He created his legend not for his own sake, but for the sake of a France which he thought could be again illuminated with grandeur. He cheated the Communists of power in 1944 "by being like them, not by being different." As for the Gaullists they are really doctrinaires. Such epigrams whistle past the eye as the pages are turned. "The Holy Alliance was a Cominform of Kings"; one might equally say that the Cominform is the Holy Alliance of Commissars.

Between the *mille-feuilles* and the sugared almonds there is the solid fruit cake of "Prelude to Fashoda" and "British policy in Morocco, 1886-1902." This is Mr Taylor digging deep in the Record Office, bringing up day-to-day detail and spreading the footnotes. The result is impressive and nourishing, but indigestible. Yet without it we would be less wise about the real reasons for the Anglo-French entente, and less convinced that tiny mistakes, difficult little decisions and the most unfamiliar factors (in this case the difficult tribesmen of Morocco) bring about the great swings in policy. If Mr Taylor is right here, the journalist murmurs (and he

cannot possibly be sure) then he is probably generally right elsewhere.

This digging and scratching around the roots of wars and persons is most skilfully done; and by good arrangement the book has a certain dramatic shape. It begins with other historians, takes us to the present day via Napoleon III, Bismarck, "Joe at his Zenith," Northcliffe and Geoffrey Dawson, Stalin, Mr Kennan. At the end we feel that Europe is dead but the West survives; it is given a prescription for further survival:

There is a third way between Utopianism and Despair. That is to take the world as it is, and to improve it; to have faith without a creed, hope without illusions, love without God. The Western world is committed to the proposition that rational man will in the end prove stronger and more successful than irrational man. If the Western world abandons this proposition, it may conquer Communism but it will destroy itself.

One can only say, after all that has gone before, that it is a surprising peroration. Perhaps Mr Taylor has spent too much time on his specialty of foreign policy, of which he says in one essay "the great thing about foreign policy is that it is a matter of talk, of general principles." Or perhaps Mr Taylor is displaying what the publisher's blurb describes as his "gaminerie."

German Recovery

L'Economie Allemande Contemporaine. Allemagne Occidentale 1945-52. By André Piettre. *M.-Th. Genin.* Paris. 672 pages. 1500 francs.

This monumental study will be a standard work for all those interested in the German problem. Its first part, after a short introduction, deals with Germany's collapse and the Allies' attempt to reduce its excessive economic power by a form of repressive planning. A second part describes the rapid resurrection of Western Germany under the Western Allies' tutelage. The third part, "Associated Germany," covers the still incomplete integration of Western Germany in Western Europe and the North Atlantic partnership. The book is stuffed with carefully selected, judiciously tabulated facts, which are lucidly interpreted by an author who digs well below them. He is scrupulously fair, yet he cannot disguise his dislike of "German Dynamism"; he prefers Monsieur Proud'homme digging vegetables to Faust draining marshes. Though he dislikes the "Neo-Liberal" policy, which has made possible "the miracle" of Germany's rapid industrial recovery, he has to acknowledge that an austere egalitarian policy could not have done it. He rightly regrets the lack of social response which is clearly in evidence, and the failure to solve unemployment. He is fair enough to recognise that the creation of capital—especially physical capital—has had to take precedence, and

he rightly criticises the misdirection of investment that has frequently occurred.

Monsieur Piettre's analysis of the Schuman Pact turns on the assumption that Germany is obliged to let its neighbours share in its ample and cheap coal and coke supplies, even if it might prefer to turn them into finished goods. This assumption is justified when political punishment is being meted out; as a principle of international economic policies, it is hardly tenable. M. Piettre has some doubts whether Western Germany is viable, even when fully integrated in the west. M. André Siegfried, in a few brilliant introductory observations, raises the far more fateful question whether a genuine symbiosis of France and Germany is possible, however desirable it may be.

Hothouse Country

Israel. By Norman Bentwich. *Ernest Benn.* 224 pages. 21s.

Before the war, all respectable libraries on current affairs housed a shelf of plump green books called "The Modern World Series." This thin blue book is their worthy successor. In the old series, Professor Bentwich wrote a good volume on Palestine, and has properly been chosen to bring it up to date with "Israel." Among the spate of books already written on this new country, he has produced by far the most useful to the traveller and to the ordinary reader. Written by an Englishman who is also a Jew, its judgments are more balanced than those usually uttered by people who are one or other; it is also readable and fairly comprehensive.

It lives up to the succinctness of its title. There are already far too many accounts of the frustrating time of the mandate, and it relegates this subject to ten pages that are wonderfully compressed. Room is found for external but relevant topics such as the changed distribution of Jews in the world, and the relations of the state with the Diaspora. In the part that deals specifically with Israel, the best chapters are on its social standards (tribute is paid to the shelter afforded by the mandatory during their formative years), on culture, and on the machinery of government. The economic section is weaker, for it devotes too much space to plans and too little to the annual conjuring trick whereby international payments have been balanced by a country that is buying so very much more than it sells. The expedients adopted are a mystery to the layman, and would have been worth explaining.

Israel has been described—and is here described—as "a nation in a pressure cooker." The pace of development has been so hot that it must have been difficult to decide at what split-second to crystallise impressions on to paper. Professor Bentwich has stuck to essentials, and has successfully contrived to give a picture that should last for some time. But in doing so, he has needed to round off corners, and has perforce given an impression of urbanity and composure, whereas Israel's position is still the reverse of smooth or sedate.

AMERICAN SURVEY

Foreign Aid's New Year

Washington, D.C.

SO far, few hints have been dropped about the Eisenhower Administration's plans for foreign economic policy, doubtless because it has not yet developed any. In such a situation it is tempting to fill the vacuum with speculation; but the evidence varies so widely that any number of policies and attitudes on foreign aid in the future can be forecast, ranging from the most generous and forward-looking to the most pinchpenny and regressive. Some, however, of the dangers and contradictions of such speculation can be avoided by examining the legacy of a proposed aid programme for the coming fiscal year, 1953-54, which the incoming Administration will inherit from the departing one.

That programme, now being hammered out between the Director of Mutual Security and the State and Defence Departments on the one hand and the Budget Bureau and White House on the other, is bound to condition what the Eisenhower Administration does. The new government can change the amounts of the proposed authorisations and appropriations, it can doctor some of the ideas, it can throw out whole sections and, conceivably, it can insert some quite different measures. But if for no other reason than that of the Congressional time schedule, it will be sharply constricted by the proposed legislation which the old Administration will send to Capitol Hill not later than January 18th, just two days before the new government takes office.

★

As Mutual Security officials now plan it, the next fiscal year's programme will be a transition measure, retaining most of the methods and techniques of this year's and last year's legislation, but at the same time containing the seeds and, indeed, a number of shoots of a new and significantly different system of aid for future years.

As this mixture of old and new hangs suspended between the Budget Bureau and the operating agencies, the total amount of money to be requested for the programme is not yet fixed. It is clear the Administration cannot ask the Congress for a larger authorisation than the \$7.9 billion which was sought for the current year, 1953, ending on June 30th. Equally clearly, the Administration wants more than the \$6 billion Congress gave it this year. The best assumption at the moment is that between \$6.5 and \$7 billion will be requested. Between \$4 and \$5 billion of this will be earmarked for Western Europe. Every effort will be made to reduce that portion to be disbursed as "defence support," that is, as straight dollar grants. During the current year, \$1.3 billion was appropriated for that purpose, but Mutual Security officials and Congress alike are determined to wipe out this last relic of the Marshall Plan pattern as quickly and completely as possible. Some direct dollar grants of this kind will be necessary for those non-hardy perennials, Greece and Austria; but the plan is to use different devices to take care of the two other most obstinate deficits, those of France and the United Kingdom.

The bulk of the funds for Western Europe will fall, as they now do, in the category of military assistance, but it is proposed to expend a larger proportion for offshore procurement and a smaller amount for finished weapons made in the United States. For the present fiscal year, Congress appropriated \$3.1 billion for military aid to Western Europe; of this it is planned to commit \$1 billion for offshore procurement before the fiscal year ends next June. In the following year, the goal for offshore procurement is likely to be nearer \$1.5 billion.

Whether this higher ratio of funds dedicated to placing contracts for munitions production in Europe will solve, temporarily at least, the most pressing aspects of the United Kingdom's dollar problem is the subject of much debate at present. If it is concluded that it will not, the Administration will attempt to devise other means, perhaps simply direct dollar assistance in defence supporting funds or perhaps dollar grants after the manner of the old "Additional Military Production" programme, to pay for the creation of more munitions plants, equipment and payrolls.

It seems clear that special help will also be needed next year for France, whose problem is a budgetary rather than a dollar one. Various devices suggest themselves: more offshore procurement; direct grants; furnishing additional munitions for the Indo-Chinese fighting; appropriations directly out of the Far Eastern rather than the European section of the aid legislation; picking up a larger share of the bill for French military expenses either in France or in Indo-China—and one or another of these, or a combination of several, will be adopted.

In the Bill now being proposed there will be emphasis on two principal methods of building a bridge to the pattern of economic assistance that is hoped for in the future. The first is that the Point Four idea should be converted from merely supplying technical experts to a real public works development programme, and the second is a major move toward substantial American public investment abroad to increase production of industrial raw materials and even foodstuffs. In neither case, however, can the amount of funds run up to the billion or two dollars that ardent advocates of this sort of system, such as Mr Paul Hoffman, would like to see. The difficulty is that projects to absorb any such amount are not now in hand and cannot be worked up within the short space of 12 to 18 months. Accordingly, the request for funds for public works development—principally power, water and communications projects in the backward areas of the world—may not exceed \$300 million for 1954; in future years, it is to be hoped, the total will be many times larger.

There are as yet no useful estimates on how much money

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

the Administration will request Congress to appropriate for expanding production of raw materials abroad. As officials see the problem, it is to provide money on terms which the International Bank for Reconstruction and Development and the Export-Import Bank cannot offer. In effect, it means lending dollars for repayment in local currencies, when dollar earnings are not available. Appropriations for this purpose will probably be made only if Congress, the new Administration and American business become convinced, as officials of the present government are already convinced, of two things: first, that the findings of the Paley Commission report are basically accurate and that the United States requires a great increase in materials; and second, that the existing stockpile programme, aimed at meeting only American needs, is insufficient and unrealistic and that stockpiles should be adequate for the whole free world.

★

Such, then, are the broad and still very tentative outlines of the economic assistance Bill which the Truman Administration will present to Congress. But if the present Mutual Security Director, Mr Averell Harriman, proposes, his successor, Mr Harold Stassen, disposes—with the aid of Mr John Foster Dulles, the new President and the new Congress. How they will dispose can only be pure speculation, but it is perhaps worth trying to guess.

Mr Stassen in particular and the new Administration in general would seem to be obliged, for political reasons, to develop their substitute for the Marshall Plan: a new foreign economic policy that is dynamic and ambitious enough to galvanise American public opinion, just as the Marshall Plan did. It would be quite possible to dress up the proposals of the outgoing Administration and to present them, with complete justification, as a departure from the old ideas of international charity and as a basis for a new system in which each nation in the free world earns what it gets and pays according to its own ability for its own security, all within the framework of inspired international free enterprise.

As a practical matter, Mr Stassen has little choice in the area of direct military assistance to Western Europe. In the time available before next year's authorisations and appropriations must be completed, he cannot work up a plan radically different from that which the Harriman office proposes for weapons and offshore procurement help. It is doubtful, moreover, that he would want to. He is certainly predisposed in favour of the concept of letting Europe earn as much of its way as possible by producing its own munitions. Similarly, Mr Stassen is emphatically on record in favour of much heavier financial aid to develop backward areas. He has castigated the Administration for "losing China" through failure to give it that sort of assistance, and has uttered warnings that India will fall to Communist subversion unless the present aid programme there is vastly enlarged. Whether he would accept the third step, the employment of taxpayers' dollars to expand production of raw materials abroad, is not known.

By temperament (and consuming political ambition) Mr Stassen is an empire builder and budget grabber; he can be expected to ask for more, not less, money for whatever enterprise he happens to be in charge of. But by temperament—and by campaign promises—the Republican majority in Congress is the champion of economy, and there is no field so politically inviting to economy today as foreign aid. The conflict between those two forces will be as interesting to watch as its outcome will be uncertain.

American Notes

Olive Branch for the Senate

Senator Taft has announced that he will be a candidate for the Republican leadership in the Senate, something he would not do until he was sure his election would be uncontested. At one point it looked as though this important position, which carries with it responsibility for the Administration's legislative programme in the Senate, would go, for the sake of peace, to Senator Bridges, although he preferred to be chairman of the Appropriations Committee, now that he has a chance to practice the economy he has always preached. Senator Taft had angered General Eisenhower's friends by his resentment, outspoken over the Secretaryship of Labour, at the President-elect's failure to take his advice over Cabinet appointments. Mr Taft was apparently particularly incensed about not being informed that Mr George Humphrey, from his own state of Ohio, was going to the Treasury.

However, many Senators, not noticeably sympathetic to Mr Taft in other ways, shared his resentment in these matters, feeling that their traditional and jealously guarded prerogatives were being ignored. Senator Aiken, the party's farm expert, for example, was not officially informed in advance of the name of the new Secretary of Agriculture. The blame for these slights was put by the Senators on Mr Herbert Brownell, who has been advising the General about patronage, and through him on Governor Dewey, who has never treated the party's Congressional leaders with what they consider proper respect.

General Eisenhower evidently realised, or more probably was told, that his inexperience had betrayed him into tactlessness and he immediately dispatched a sheaf of olive branches to Washington. Meetings to discuss the legislative programme with the Republican Congressional leaders were arranged and Senator Carlson, after a visit to New York, announced that the President-elect had no intention of breaking custom by interfering in the organisation of the Senate. This intimation made Senator Taft a present of the party leadership he wanted; it is a constructive job for which he is well suited by legislative ability and political standing.

But his appointment means that in both Houses all the Republican leaders will come from the right-wing group who opposed General Eisenhower's nomination. It seems, however, that this is a price the new President has to pay for the co-operation which is essential, in view of the smallness of the official Republican majority in the Senate. It is now being suggested that the unofficial majority of conservative Republicans and southern Democrats should be cemented by making "sound" Democrats into vice-chairmen of committees, something the Senate has never had before, and by giving control of patronage in the South to Democrats who supported General Eisenhower, rather than to the slightly disreputable Republicans below the Mason-Dixon line.

★ ★ ★

Keeping Controls Alive

Mr Michael DiSalle has agreed to return to Washington as Economic Stabiliser to keep wage and price controls alive until the new Administration takes over next month. Mr DiSalle, the outstandingly successful price administrator who resigned early in the year to run for the Senate, is probably the only man who could. The whole stabilisation machinery, already weakened by economy and the Republican victory, was dealt an almost fatal blow when Mr Truman decided to over-rule the recommendations of his own wage board in the coal case. The resignation of Mr Cox, its chairman, was followed by a walk-out of all the members representing industry on the tripartite board, who felt that this favouritism to the miners and Mr John L. Lewis reduced all wage control to a farce. The Administration has had to admit defeat in its search for replacements; any business-

TWELVE YEARS OF US FOREIGN AID

GRANTS AND CREDITS UTILISED AND REPAID

These charts are drawn from the much more detailed statistics in *Foreign Aid by the United States Government, 1940-1951*, recently published by the Office of Business Economics of the US Department of Commerce. The figures for 1952 come from the October issue of the same department's *Survey of Current Business*.

man ready to accept so short-term and so uninviting a public service has proved unwilling to defy the boycott proclaimed by the National Association of Manufacturers and the Chamber of Commerce.

With 12,000 wage cases waiting for decisions, however, some means of carrying on the work of the board had to be found if the trade unions were not to present an equally united front of criticism. Some workers and employers have been waiting nearly two years for a verdict on the legality of their arrangements. The board's powers have, therefore, been vested in the four public members, who will work out no new policies, but devote themselves to applying the old standards to the queue of cases. The electrical workers, the largest single group concerned, have already been given a Christmas present of a 5 per cent wage rise.

Mr DiSalle, who was first called in to determine what should be done about direct controls in the few weeks left to the present Administration, argued in his report not only that they should not be dropped at once, but also that the new Administration would be wise to retain at least a framework of controls which could be made effective in an emergency. He believes that today's economic stability could be upset overnight by a new spending spree or more extensive military operations abroad. The direct controls now in effect expire on April 30th, and they could be dropped at any time by the new Republican Congress. But with the approach of responsibility, even the most conservative Republicans are showing less zest for making a clean sweep of the stabilisation machinery. Senator Capehart and Mr Wolcott, the committee chairmen of the new Congress who will determine the future of economic policy, have promised to do nothing before they hold hearings in February, and are able to discover the views of the new Administration. And Senator Lodge, General Eisenhower's representative, is apparently sympathetic to Mr DiSalle's suggestion that the Republicans should appoint someone to become familiar with the problems of wage and price control before they have to make up their minds about them.

* * *

Chinese Dragon

After nearly three years of harassment by Senator McCarran and Senator McCarthy, who called him, on different occasions "the top Soviet agent in America" and "a conscious tool of the Soviet conspiracy," Professor Lattimore, the Far Eastern expert, is to be tried, probably in March, on seven counts of perjury. It is alleged that he lied when he told the McCarran Internal Security Committee that he had not been a "sympathiser or any other kind of a promoter of Communist interests" and that he misled it on a number of specific points, by denying, for example, that he knew before 1950 that a certain Chinese was a Communist. If he is found guilty on all counts, he might be sentenced to as much as seventy years in prison.

It is said in some quarters that this will be a sensational trial, rivalling that of Mr Alger Hiss. Certainly to those intent on proving that Communist influences in the State Department were responsible for the "loss of China," it will appear as the opportunity for a grand inquest. But it must be remembered that Professor Lattimore is, and was, a private citizen, only consulted on occasion by the State Department, not a government servant; and that the perjury charge in his case is not the substitute for a more serious one. He stoutly asserts his innocence of any charge, but even if he had been a member of the Communist party, that was and is no crime. In the meantime Johns Hopkins University, which employs Mr Lattimore, and has now given him leave of absence with pay to fight the case, has refused to be intimidated and has taken a firm and courageous stand for freedom of conscience.

Mr John Carter Vincent, a career diplomat long associated with Chinese affairs, is also likely to be thrown to the Chinese-American dragon. The Federal Loyalty Board, the highest court of appeal, has concluded that there are "reasonable doubts" concerning his loyalty, and has recommended his dismissal. Mr Vincent, now Minister in Tangier, has been suspended until Mr Acheson returns. What has disturbed many thoughtful Americans is the weight given by the board to the fact that Mr Vincent, at a time when American policy was to favour General Chiang Kai-shek, indulged in "studied criticism" of the Generalissimo, and "studied praise" of the Chinese Communists. This appears to come perilously near penalising a man many years later for unpopular, and perhaps mistaken, opinions, and to run the risk of paralysing the independence of the foreign service.

The Supreme Court recently, when it threw out the Oklahoma loyalty oath law, drew a distinction which is pertinent to all loyalty investigations. State employees were required to swear that they had not, within the past five years, been members of an organisation on the Attorney-General's "subversive" list. The Court found the statute unconstitutional because it did not differentiate between innocent and knowing membership, and Justice Black wrote that

test oaths are made still more dangerous when combined with bills of attainder which, like this Oklahoma statute, impose pains and penalties for past lawful associations and utterances.

* * *

Acid Test for Chemicals

The chemical industry ends the year with one eye on its mushrooming capacity and the other on its sales charts. Its vulnerability to trade winds was shown last summer when sales slumped during the textile recession and then during the steel strike, for today chemicals play a part in almost every American factory. During the post-Korean crisis, chemicals were in short supply and long demand but, with the stretch-out of the defence programme and the increasing capacity of the chemical industry, the pendulum has begun to swing back. Queues no longer form for sulphur; industrial alcohol prices fell from 90 cents a gallon in January to a low point of 40 cents last summer; there have even been suggestions of over-production in drugs, pesticides and plastics, and of demands for tariff protection against foreign competition. All but two of the interim goals for expanded manufacturing capacity for 58 chemicals, established in the defence mobilisation programme by the National Production Authority, have been achieved. The NPA must now determine the quantities of chemicals that would be required if there were complete mobilisation; but when it does some chemical firms will be reluctant to expand to meet such purely military demands, for they fear excess capacity should the international situation improve.

The growth of the chemical industry, quite apart from the stimulus provided by the government, has been prodigious, and is still under way; it is now in the midst of a \$6 billion development programme that started in 1951 and will end in 1955. A string of superlatives is needed to write the history of this industry; it has had an annual rate of expansion three times greater than the average for other American industries, and since the war has been growing faster than even it considers normal. In the last twelve years it has doubled its plant and quadrupled its sales, so that the slight easing of the market last summer still leaves chemicals far out in front of other businesses. One of the newer chemical fields, that of petro-chemistry, the derivation of chemicals from petroleum and natural gas, has been a major factor leading to the increased industrialisation of the south and south-west.

As the huge industrial machine of the United States consumes more and more raw materials, metals, fibres and

"A cup of tea and some
Acetylsalicylic acid's the thing for you, Ma'am!"

You get it from any chemist—but perhaps you know it better by its more familiar name, aspirin.

It is only one of the many everyday products for which Monsanto makes the basic chemicals—and only one example of the many ways that Monsanto serves industry, which serves you, the public...

In every industry, from pharmaceuticals to foundries, the wide range of Monsanto chemicals and plastics is playing an active part. For full advice and information on the use of chemicals in *your* industry, write now to Sales Division.

*More commonly known as aspirin. Monsanto is the largest producer of Acetylsalicylic acid in the country.

other natural products are becoming rarer and more costly. They are therefore being replaced increasingly by synthetics, from rubber and soil conditioners to detergents and drugs. High expenditures on research and the rapidity with which these developments were put into commercial production have brought an amazing variety of products from an industry that creates its own raw materials by synthesis and then manufactures finished items from them. These modern Aladdins will undoubtedly continue to create more wonder drugs and miracle fibres which, they hope, will be wonderful enough and miraculous enough to withstand the acid test of boom or bust.

* * *

Gargantua of the Air

The House committee investigating immorality and offensiveness in radio and television programmes has advised that the industry should be trusted to regulate itself. As evidence of how effectively it was doing this, the committee reported that the "plunging necklines," to which exception had been taken on television, were creeping up since the adoption of the industry's voluntary code last March, and that makers of "hard liquor"—spirits—were refraining from advertising on the air. But beer and wines were still being presented too temptingly and the policy of always bringing the criminal to justice did not excuse the high proportion of crime programmes. The committee recognised, however, that this was due to television's rapid growth and huge appetite for material. It could consume a full year's output from Hollywood in six weeks, and the effort of keeping up with this demand leaves station owners little time for careful selection.

To the committee's pleasure educational and cultural programmes seem to be becoming more popular. The outstanding example of this is the recent commission given by the

National Broadcasting Company to Mr Robert Sherwood, who is to write nine hour-long television plays during the next three years. He will be left free to choose his own subjects and treatment and will be paid a six-figure fee and royalties, conditions which would make television attractive to any dramatist. Another cultural experiment has been the full length telecast of an actual performance of "Carmen" from the Metropolitan Opera House. This was not brought into private homes but only into thirty-one of the hundred cinemas which are equipped to show television programmes piped in by closed circuit. Business firms are beginning to take advantage of these facilities to demonstrate products and present annual reports to salesmen and customers; they need be invited only to their local cinema, instead of on a long journey, in order to see the latest designs in carpets or washing machines. At present this is an expensive process, because of the cost of the special cable, but in the new year the Federal Communications Commission is to consider reserving air channels for theatre television.

Meanwhile the commission continues to be choked with applications for permits to open new television stations. There are still over 900 of these on file but 147 have been authorised since April. When these stations are on the air, as they must be within eight months of the authorisation, the United States will have some 250 television outlets. Already no major city is without one. In the last, Portland, Oregon, telecasts began in September over the first ultra-high-frequency channel to come into use and reception is said to be better than from the old very-high-frequency stations. It is not surprising that manufacturers of television sets, who were on a starvation diet last year, are suddenly doing record business once again. But it is the spread of the television screen as much as the spread of television across the country that explains this new demand. A 21-inch screen is now standard, and owners of 12-inch screens are trading in their obsolete sets, or relegating them to the playroom.

Shorter Notes

Mr George Humphrey comes to Washington with little knowledge of government but a reputation for being a quick learner. However, his special deputy at the Treasury, Mr Randolph Burgess, and the new Under-Secretary, Mr Marion Folsom, are both men with wide banking and financial experience; both are advocates of conservative fiscal policies, and both are firm believers in the independence of the Federal Reserve System. Mr Humphrey's Assistant Secretary, Mr Chapman Rose, comes from his Cleveland steel company and Mr Charles Wilson, the new Secretary of Defence, has also brought in an assistant, Mr Roger Kyes, from his firm, the General Motors Corporation, to be Deputy Secretary of Defence. The three new service Secretaries, Mr Robert Stevens for the Army, Mr Harold Talbott for the Air Force and Mr Robert Anderson for the Navy are all business men; Mr Anderson, from Texas, was a "Democrat for Eisenhower" during the election campaign.

Winning friends and influencing people is made easier for unlucky duck shooters in Missouri by a farmer who raises mallard ducks commercially. For \$7.50 he will send a brace of birds, packed in three inches of glass fibre to prevent spoilage, to any place in the United States, accompanied by a card which suggests that the donor actually bagged the game himself.

*

With the precautions usually reserved for transferring gold bullion, the two most important documents in the United States, the Constitution and the Declaration of Independence, were recently moved from the Library of Congress to the National Archives Building. In their permanent home they will be on display every day and lowered at night to a special fire and bomb proof vault.

THE WORLD OVERSEAS

Europe's Fourth Stocktaking

THE fourth annual report of the Organisation for European Economic Cooperation is the most searching and cogent analysis of economic trends that has yet come from this body. In the past the susceptibilities of member governments have, all too often, meant the dilution of the text to the point of insipidity; but on this occasion, despite traces of similar obstructionism, the mixture remains strong, the lines of argument clear cut.

The main theme of the report is that with the end of the period of reconstruction and the disappearance of the Korean boom, the fundamental pattern of the free world economy is now exposed. This pattern is dominated by a chronic dollar shortage which affects practically all trading areas of the world. The famine arises in part from changes in the American economy and in part from changes in the rest of the world.

It is essential to bear in mind that between 1938 and the first half of 1952 the gross national product of the United States doubled and the gross national product per head increased by almost 70 per cent. One consequence of this great expansion in production is that imports of manufactured goods into the United States have substantially declined as a proportion of total American consumption expenditure. (Before the first World War the ratio was about 4.5 per cent; since 1945 it has averaged little more than 2 per cent.) This has happened in spite of greater American dependence on foreign sources for certain goods and a steady reduction in tariffs.

TABLE I

UNITED STATES BALANCE OF PAYMENTS ON CURRENT ACCOUNT
(\$ '000 million)

	1948	1949	1950	1951	1952*
Imports f.o.b.	7.82	7.07	9.08	11.18	11.03
Exports f.o.b.†	12.93	12.14	10.12	14.09	14.56
Invisibles and private remittances ...	+0.44	+0.47	+0.74	+1.58	+1.39
Total	+5.55	+5.54	+1.78	+4.49	+4.92
Local military expenditure and off-shore purchases‡	...	...	-0.61	-1.33	-1.68
Current balance	+5.55	+5.54	+1.17	+3.16	+3.24

* First half seasonally adjusted to annual rate.

† Excluding "end-item" deliveries financed by "military aid."

‡ Including common infrastructure, local purchases for armed forces and troop conversions. For 1948 and 1949, the amounts are relatively small and have not been separated from exports and invisibles.

The second big change in the American economy is a shift in the balance of various categories of invisible transactions. Income received by the United States from overseas investments rose two and a half times between 1935-38 and 1951, while the net inflow into the United States of investment income over the same period rose nearly fourfold. Again, the United States now owns 28.4 per cent of the world merchant fleet as against 13.4 per cent in 1938.

Another basic change is that the development of private American investment abroad has not kept pace with the increase in the US balance of payments surplus on current account. A further disturbing factor is that the gap between the American and European standards of living has widened, and it has therefore become increasingly difficult for European manufacturers to appreciate the sort of exports that will sell in America.

The changes that have taken place in Europe have almost invariably aggravated the difficulties created by the revolution in the American economy. In the OEEC countries, the gross national product, between 1938 and the first half of 1952,

rose by 27 per cent, while the increase per head was a mere 13 per cent. Simultaneously, and largely as a consequence of the war, the European countries lost most of their previous income from overseas investment while at the same time they undertook to pay interest to non-European countries. Before the war, European net investment was sufficient to pay for one-fifth of its total import bill; today what remains of these investments is completely offset by interest payments due to North America.

Still another blow has been the loss of former markets and sources of supply in eastern Europe and Asia, a reduction which, according to the report, is due in large part to the unwillingness or inability of eastern Europe to provide its prewar exports. Another factor tending to weaken the position of western Europe has been the virtual cessation of grain supplies from Latin America and a steep decline in shipments of meat from the same area. Finally, and perhaps most important, the terms of trade have moved sharply against the kind of manufactured goods that constitute the bulk of west European exports. Some idea of the significance of this movement is given by the report's estimate that if the terms of trade had remained constant at their 1938 ratio, then in 1951 western Europe, instead of running a trade deficit of about \$3 billion, would have had a surplus of about \$2½ billion.

All these changes reflect deep-rooted shifts in the world economy, shifts that are not confined to western Europe alone. The broad picture that emerges shows up very clearly in Table I. In every postwar year the US balance of payments on current account has registered a very large surplus. Even in 1950, when American imports jumped because of stockpiling for Korea and exports dropped, there was an American surplus of well over \$1 billion. And since the end of the Korean buying crisis the annual surplus has stood at over \$3 billion.

The details in Table II show that the American surplus was built up in trade with practically every area in the world, the only exceptions being some of the overseas territories of the OEEC countries since 1950.

TABLE II

UNITED STATES CURRENT BALANCE WITH SELECTED AREAS
Annual rates—(\$ '000 million)

United States Surplus* with	1948	1949	1950	1951	1952†
OEEC countries	8.88	2.73	0.98	1.72	1.26

TOTAL	5.55	5.54	1.17	3.16	3.24

* Excluding exports financed by military aid. † Seasonally adjusted.

Western Europe has undoubtedly made a tremendous effort to master all these adverse developments. At the expense both of consumption and investment, it was able by 1950 to increase the volume of its exports by about 60 per cent as compared with 1938. Imports over the same period remained constant. The dollar deficit shrank from \$7 billion in 1947 to barely \$3 billion in the first half of 1952. But with all this effort western Europe still finds itself facing a total deficit *vis-a-vis* the rest of the world and a dollar deficit far greater than before the war.

MEMBER FEDERAL DEPOSIT INSURANCE CORPORATION

It is the dollar deficit which is particularly intractable, since dollar imports have already been cut to the bone and those that remain, such as wheat, cotton, and oil, are essential if European production and living standards are not to fall drastically. The dollar deficit, of course, is created not only through trade with the United States but also with Canada, the oil and mineral producing countries of Central and South America and the sugar republics of Cuba and the Philippines. Similarly, the Panamanian fleet, now one of the largest in the world, has probably absorbed a large quantity of European dollars.

In considering these facts the question that immediately comes to mind is how, since the end of the war, the world has coped with this enormous deficit. The answer is far from comforting. In 1948, for example, when the deficit stood at \$5.54 billion, the gap was closed by selling \$1.53 billion of gold to the United States and receiving \$3.68 billion of American aid. In 1951 sales of gold had dwindled to \$0.05 billion while American aid was still running at \$2.97 billion. For the first half of 1952, as American aid has declined, sales of gold have once more risen sharply.

This solution is hardly a durable one. The most that can be said for the world in 1952 is that it has found out how to live with a dollar deficit of over \$3 billion. A subsequent article will describe OEEC's suggestions of how Europe and America can adjust themselves to the facts of the postwar world and establish something like a trading equilibrium.

Security in the Soviet Army

[FROM A CORRESPONDENT]

THE western student of Soviet affairs sooner or later comes up against one of the most revealing paradoxes in Soviet life, the existence of the world's most elaborate internal spy system. On the one hand Soviet propaganda maintains that the Soviet citizen is wholeheartedly devoted to the regime, and at elections votes for its candidates with majorities up to 99 per cent. On the other, no state in the world spends so much time, money and energy on spying upon, suspecting and mistrusting its citizens as does the Soviet Union. It is no exaggeration to say that its government works on the principle that every citizen is a potential enemy. And at no time in a Soviet citizen's life is this belief so strong as when he is performing his military service; for the Soviet soldier is not only a potential "anti-Soviet element," but also one with access to arms. Furthermore, his government fears that a soldier who is serving in one of the armies of occupation abroad may see and hear things that may undermine his faith in the Soviet regime. To overcome these fears, the Soviet authorities have devised and perfected three weapons: the Army Political Administration, the Army of the Ministry of the Interior, and the Ministry of State Security's Special Section. The first of these provides the political indoctrination, and the other two see that its teaching does not fall upon deaf ears.

The high command of the security services of the Soviet army is to be found in the twin Ministries of the Interior and of State Security (respectively the MVD and the MGB, the initials of their titles in Russian). The division of responsibilities between them is not easy to define; generally speaking, the Ministry of the Interior (MVD), which is the successor of the NKVD, the GPU and the CHEKA, is concerned with forced labour, political crimes and their investigation and punishment, as well as with the civil police and the normal functions of the Home Office in Britain. It has its own private army, numbering several divisions, to carry out its decisions, which include deportations, suppression of unrest or partisan activity, the staffing of prisons and forced labour camps, and the provision of manpower for public works and state projects. The Ministry of State Security (MGB) is principally concerned with checking the activities of the

population of the Soviet Union and with counter-espionage. It is clear from refugee reports that its agents pervade every branch of Soviet life, and that it sets out to convince the citizen that his neighbour is an MGB agent, reporting everything he says to the authorities. The work of the MGB is in fact a vast operation of psychological warfare waged by the Soviet Government among its own people.

"Death to Spies"

The branch of the security service working in the army was known before the war as the "special section." During the war it changed its name to "Smersh," an abbreviation standing for "death to spies," but since 1946 it has reverted to its old name. Its main responsibility is counter-espionage, to ensure that the Soviet soldier does not come into contact with any "contaminating influence," and to take drastic action against him if he does. By "contaminating influence" the special sections mean contact with any non-Soviet ideas or thought; in the case of the armies of occupation abroad this means contact with the local population and local conditions, where a comparison with life in the Soviet Union would prove disturbing. It is the special sections' duty, for example, to enforce the ban on fraternisation between Soviet troops in Germany and the German people. Their other responsibility is to increase their own reputation in the army for omniscience and ubiquity.

The special sections consist of small units of highly trained officers attached to every headquarters from the Ministry of War to regimental level. In certain circumstances there may be a special section in still smaller units; for example, if morale is notoriously poor, or if the unit is in an exposed or isolated position. In formations stationed inside the Soviet Union, the work is co-ordinated with the civil branch of the MGB or the MVD; but abroad the sections work alone. They are organised in a hierarchy entirely separate from the military command and from the political administration, neither of which has the power to appoint or dismiss their officials. The commanding officer of a unit must supply his special section with uniforms, food and accommodation, but has no control over its activities.

In order to carry out his duties, the head of a special section is provided with considerable rights and privileges. He wears the uniform of the unit to which he is attached, although sooner or later most officers and men get to know who he is. His pay is usually well above the standard for an officer of his rank—most heads of sections are majors or captains—and he can choose his staff and collaborators from the personnel of the unit without hindrance. His commanding officer must furnish him with copies of all the unit's orders and directives, and keep him informed of all training plans. The head of the special section also receives copies of all administrative arrangements, all political, restricted or secret documents, including those exchanged between the commander and his military superiors. He can demand to be present at any unit meeting, political lecture or military training exercise, and has the right to enter any unit building without warning at any time of the day or night. He can summon any officer or man for interrogation and can force him to give up any letter, paper or book in his possession. In all this, he is under no obligation to keep his commanding officer or any other officer informed of his plans.

A Network of Agents

That is, of course, only one side of his work. Even more important is the efficiency of the secret network of spying which he has to build up inside his unit. For this purpose he "recruits" officers, NCOs and men as "agents" or "antennae." Often these agents are men who already have some black mark on their personal files and can thus be coerced into spying on their fellow-soldiers. In other cases the agents are volunteers, young men anxious to prove their

devotion to the party for reasons of opportunism or personal ambition. The head of the special section orders these people to submit regular and signed reports on their colleagues, paying particular attention to those suspected of maintaining contacts with the local population. These reports must not be confined to the subject's actions: they must analyse his state of mind, his moods, and his attitude to his friends. The agents are told to watch carefully any soldier who seems to have lost touch with his family, or who is lonely or morose. It must not be thought that there is any consideration for the man's welfare in the office of the special section: it knows by experience that such an attitude may be the prelude to a decision to desert or to break with the Soviet regime. Nor is the commanding officer immune from the attentions of the section: indeed, he is one of the most closely watched in the whole unit. Sometimes the agents are instructed to start provocative conversations with their colleagues, or to spread provocative rumours, in the hope of tricking the unwary into expressing anti-Soviet opinions. These agents should, of course, make every effort to remain incognito; but in most cases the Soviet citizen is so used to spy networks that he quickly discovers the identity of the special section staff and adjusts his conversation with them accordingly.

In the higher reaches of the security hierarchy, at Army or District headquarters, the special sections have their own courts where offenders can be tried and, if necessary, punished. In wartime the sections had the right to carry out the death sentence on the spot; but nowadays the court orders return to the Soviet Union or transfer to another unit, or it might hand the man over to the civil organs of the MGB or MVD for dispatch to a forced labour camp. It is also the case that units where morale is low have been disbanded and re-formed on the special section's advice.

It is clear from all reports that the Soviet authorities attach tremendous importance to spying on their own citizens in the armed forces, and that the special sections are among the most over-worked departments of the State apparatus. The existence of this huge machine indicates that the Government, even after 35 years' indoctrination, cannot trust its people, and this appears still more striking when one remembers that the soldiers now serving in the army were born in the 1930s, and have known no other life than the Soviet. It is not unreasonable to assume that if ever the Soviet Government withdrew its forces from Germany, those responsible for security would breathe a sigh of relief.

Ethiopia and Britain

[BY A CORRESPONDENT]

THE transfer of Eritrea from British administration to membership of a federation with Ethiopia (described in *The Economist* last week) was the occasion for some warm statements by Ethiopians, and by the Emperor Haile Selassie in particular, of recognition of all that the United Kingdom has done for his country in the last decade. Yet it must be recorded that, in recent years, there has not been as much co-operation between the two countries as many Englishmen would like to see; in Addis Ababa, the interests and representation of other powers, and particularly of the United States, have increased out of all proportion to the British effort.

Historically, this is an anomaly. After the Fascist occupation of Addis Ababa, the Emperor Haile Selassie found sanctuary first in Palestine and then in the United Kingdom. He was restored to his throne by Commonwealth forces in 1941, and his government was put on its feet by a British gift of £2,500,000. British assistance played an important part in the revival of the country's administrative services, and, in 1943, military help was given in suppressing the

serious revolt against the Emperor's authority in the northern part of the country. In British estimation, these would appear to be very substantial services, but Ethiopian pride is peculiarly sensitive and it would be best to leave them to be recorded by Ethiopia's historians. In more recent years, relations between the United Kingdom and Ethiopia have been bedevilled by the problems of Eritrea and Somalia. With the successful disposal of these territories according to the wishes of the United Nations, this tedious chapter has also been ended.

One complication persists: British administered territories have long frontiers with Ethiopia. It is regrettably true that British interests in general in Ethiopia are adversely affected, from time to time, by tribesmen in the remoter parts of Kenya, the Sudan and British Somaliland. It would be preferable, from the British point of view, if the Ethiopian Government, in following up the Emperor's recent expressions of goodwill, were to distinguish between the United Kingdom as an African power and the United Kingdom as an industrial country.

The main concern of the Ethiopian Government is the modernisation and economic strengthening of the country. This "revolution," as it is regarded in Ethiopia, has now been in progress for over ten years. It began after the Emperor's

restoration, with the creation of a more comprehensive administrative system than the country had previously known, backed by a considerable army and police force. These form the essential basis for progress of any kind, and they bear the hallmark of the British instructors who helped to create them. But although administered with the maximum economy, they need considerable recurrent expenditure. The problem confronting the Ministry of Finance is one of how to find a surplus, over and above these standing charges, with which to finance the main programme of development.

The orthodox solution would be to improve the effectiveness of the fiscal regime and to attract foreign investment. But a proper balance between direct and indirect taxation is beyond the capacity of the administration in its present state, and conditions generally are not likely to attract outside investors. In consequence, a third, or perhaps more, of the revenue is derived from exceptionally high customs duties; and capital has been found in the form of loans from the International Bank. This may appear to be rather an opportunist approach, but it would not be in character for the modern Ethiopians to advance cautiously on a broad front; they prefer concentrated drives to push particular projects. First it was education, and now it is the restoration of the Italian roads,

which fell into disrepair when the bulk of the available money was being devoted to schooling.

The loans from the International Bank, agreed or under discussion, amount to \$10 million, and are intended for the improvement of roads, telecommunications, and the setting up of a Development Bank. On these and similar projects, the Ethiopian Government proposes to spend a further \$135 million in the next twenty years. If hopes for the economic expansion of the country are fulfilled, the task of repaying capital and interest on the loans may not be unduly great. But payment must be in American dollars, and for the present this fact provides one of the clues to Ethiopia's preoccupation with the earning of dollars, a preoccupation which gives the State Bank of Ethiopia a dominating position in the economy of the country. It has not only a virtual monopoly of banking, but also the control of import and export licences and foreign exchange. That the State Bank should be concerned about its dollar position is, in the circumstances, natural enough, but the lack of confidence in sterling shown by the former governor of the bank is hardly an adequate excuse for Ethiopia's sterling deficiencies. Much of the country's trade is carried on with countries in the sterling area, but, in the pursuit of dollars, licences for the export of the main produce of the country—coffee, hides and skins—have been given only for trade with the United States, irrespective of whether there is a market for them there. Since merchants are only required to surrender 80 per cent of the dollars earned to the Ethiopian Exchange Control, a large proportion of their exports are sold for sterling or other currencies, and dollars are purchased on a black market for return to the Control. The privately retained sterling is not infrequently used for the import of luxury goods because, although the policy of the government is to eschew such luxuries, there is no effective physical control on imports. Imported consumer goods are so expensive, because of the high tariffs, that the ordinary consumer cannot afford them. In spite of inflated export prices for coffee, imports of cotton piece-goods have shown only a slight increase in recent years.

Parity with the Dollar ?

On the other hand, the Ethiopians are confident about the strength of their currency. The Ethiopian dollar is linked to the American dollar, and although the minimum note coverage prescribed by law is 30 per cent in gold, silver, foreign exchange and foreign securities, it is claimed that, at the end of 1951, the coverage was 55 per cent. Certainly the Ethiopian currency is one of the few to maintain its parity with the American dollar since the devaluation of sterling in 1949. But the economic future of the country still depends on the productive use Ethiopia makes of its foreign loans and other assistance, and on its ability to establish a sounder system of tax collection and financial control.

That the writ of the central government is more effective in the provinces than hitherto is not open to doubt; but the supply of trained officials still falls far short of the number required. A great effort has been put into the expansion of education during the past decade and improvement in administrative standards may be expected. For the present, financial control is woefully inadequate for the needs of a country committed to the kind of programme Ethiopia has undertaken. There is no published budget, audit is insufficient, and waste of various kinds is obvious.

To get Ethiopians trained—in particular, as finance officers or agricultural advisers—British experience in local conditions not unlike those of Ethiopia could be used with greater effect than hitherto. If the United Kingdom would show more confidence than it has done in the development of this large and potentially wealthy country, more Ethiopians might be inclined to visit neighbouring British territories and there to learn from government-sponsored schemes for expanding production, or methods of collecting revenue. The Ethiopians, for their part, would do themselves no harm if

they developed a greater confidence in sterling, and so corrected the recent distortion of their trade towards the United States. Potentially, their country serves as a focus of interest, and of transferred hopes, for Africans throughout the continent.

China's Second Front

In his trip to Korea President-elect Eisenhower was not officially concerned with the problem of Formosa, nor did he have any direct contact with Chinese Nationalist representatives. He was, however, informed about the situation in Formosa by Brigadier Chase, who has been in charge of the American military mission training Chinese Nationalist troops there, and who came to Korea to meet Mr Eisenhower. For the United States at any rate, if not for the United Nations, Korea and Formosa are strategically linked, and the new President will be responsible for re-determining American policy with regard to both regions. There are in fact two wars actually going on. For, although hostilities between the Chinese Communists and Nationalists have been on a small scale during the last two years, they have not—as is widely believed—ceased altogether. The "neutralisation" of Formosa under protection of the American navy has stopped Nationalist air raids on the mainland from Formosa bases, but it has not stopped the war in and around several small islands held by the Nationalists just off the

South China coast. American forces do not directly participate in these operations; but, in so far as American power is shielding Formosa from invasion and American supplies are going to the Nationalists, a limited "second front" in South China may be said to be already in existence. Altogether more than thirty small islands are held by some 70,000 Nationalist troops and guerrillas, with the support of the small Nationalist fleet and a number of armed junks. The mainland is only two miles away from the nearest of these islands; others are at various distances up to forty miles from the coast. The most important are Nanpengchun off Swatow, Big and Little Quemoi outside the harbour of Amoy, Matsu and the Paichuan Islands near Fochow, and the Peishan, Tachen and Yushan groups off the coast of Chekiang province, the last-named being only about 160 miles south-east of Shanghai. Possession of these strongholds enables the Nationalists to keep a close watch on the principal ports of South China, to intercept coastal shipping, and to make frequent commando raids, in which Communist prisoners are taken and information acquired. The Communists have more than a quarter of a million troops strung out along the coast facing the Nationalist-held islands, but since the beginning of the Korean war they have been standing on the defensive in South China; lacking naval and air power there, they have made no serious effort to capture the islands. Any further development of the situation in this area is likely to depend more on decisions taken in Washington than on moves made locally by the warring Chinese parties.

Doing it pneumatically is often the best and sometimes the only way to handle bulk materials, especially when it is important to prevent contamination, dust nuisance or the escape of noxious fumes. Simon Handling Engineers have developed the pneumatic conveying system for forty years and have applied it extensively to grain, coal and dozens of other industrial materials. Pneumatic disposal of fine flue dust is increasingly used at power stations. A special pneumatic technique is being successfully applied in flour mills. Improvements, refinements and new applications of pneumatic handling are constantly studied in the Simon research and development organisation.

Look on the railway

... or on the roads

...you see **DURALUMIN**

Look where you will and you will almost certainly find one of the aluminium alloys in the comprehensive "Duralumin" range.

The increasing popularity of this versatile material is hardly surprising. It cannot rust, need not be painted, is of good appearance, and whilst only one-third the weight of steel is equally as strong and lasts longer.

"Duralumin" can be welded, machined, pressed and fabricated in much the same way as other metals. It is produced as sheet, strip, tubes, wire and sections; the latter in a limitless variety of different contours.

Have you considered the advantages light alloys can bring to your business? You may perhaps not have heard all the latest developments. A request to us to call upon you would place you under no obligation whatsoever.

THE BUSINESS WORLD

Pooh-Bah in Gilt-Edged

THERE has lately been released—by great good fortune in time for the pantomime season—some highly intriguing information about those Pooh-Bahs who are responsible for the so-called “departmental” funds, the Commissioners for the Reduction of the National Debt—the biggest investment body in the world. Do these dignitaries ever so far fall from grace as to allow the financial policy of the Government to take precedence over the specific interests of the clients whose funds they invest? The new information is seemingly designed to show that, if and when they ask themselves this elemental question, they find their consciences as immaculate as driven snow.

But the tale that points this moral is one of paradoxes far outclassing any ever known at the Court of Titipu; and it needs a new Gilbert (W. S.) to savour its exquisite oddities. The tale itself has several narrators, all of them witnesses before the latest Committee of Public Accounts; and sly chance casts another Gilbert, a sedate and unjesting one, to make the opening bow—Sir Bernard Gilbert, Second Secretary at Her Majesty's Treasury (who, if he senses the savour, does so in decorous privacy). The star performer is a more retiring official, the Secretary and Comptroller General of the National Debt Office, Mr Norman Young.

The tale relates that the National Debt Commissioners, charged with their responsibilities under Statutes dating back to 1786, are the Speaker of the House of Commons, the Chancellor of the Exchequer, the Master of the Rolls, the Lord Chief Justice, the Accountant General of the Supreme Court, and the Governor and Deputy Governor of the Bank of England. But this august body has not met since 1860; it functions instead through a quorum of three—comprising only the Chancellor of the Exchequer, the Governor and Deputy Governor of the (now nationalised) Bank. These gentlemen, one might suppose, are pretty close to the financial policy of the Government, close enough to be troubled at times about the duality of their roles. But, happily for their peace of mind (and in reassurance, perhaps, of those inquisitive purists outside the charmed circle who watch the “departments” at work in the gilt-edged market), there is another link in this curious chain of responsibility. The functions of the Commissioners since their last meeting over 90 years ago have been exercised by the Comptroller General of the National Debt Office—all their functions, that is to say, except one, the function of appointing this uniquely isolated official.

But let it not be supposed that the Commissioners are inactive: they can be “activated” when (but only when) the Comptroller puts a point to the quorum for a ruling—or (presumably) if and when he misbehaves himself. But it seems that the knotty points never arise on investment policy; only three matters, unrelated to that policy, have been put to the quorum in the past seven years. And since the quorum never volunteers advice to the Comptroller, he never needs to take the precautions usual when

dealing with Gilbertian Pooh-Bahs (“Come over here, where the Chancellor can't hear us”). Finally, to pile paradox upon paradox, there is no Minister responsible to Parliament for the National Debt Office, because it is controlled by the quorum only one of whom is a Minister. The chain of responsibility turns out to be a circle, though not, perhaps, a very vicious one.

★

The Commissioners being thus adroitly relieved from risk of embarrassment from the duality of their roles, the vital question perforce focuses upon this unique Comptroller: what steps does he take to keep his investment policy true to his trust, and above any besmirching influences from the financial policy of the Government of the day? The present Comptroller, like others before him, was formerly an official of the Treasury; he keeps himself *au fait* with Government financial policy by frequent meetings with the Treasury (but he usually “gets all he wants” at his own level—“without troubling even Sir Bernard”) and has a regular weekly meeting with the Chief Cashier of the Bank of England and with one of its executive directors. But, declares Mr Young, none of these officials ever gives him any direction as to the policy he should pursue; for is it not clear that even the Chancellor, as such, has no power to give him any direction at all? And Mr Young himself has no doubt—no possible shadow of doubt—that it would be very, very wrong of him to allow the interests of Government financial policy to clash with those of the trust funds.

He is, however, a well-meaning official and if, “consistently” with his responsibility to these funds, he can choose between two alternatives equally satisfactory to the trust funds, one of which is in consonance with general Treasury policy and the other is not, I would obviously prefer the first one.

But the primary and overriding responsibility, as defined by Mr Young, is to ensure that the gilt-edged investments he selects for trust funds are of the kinds that, in his judgment, are best suited to the requirements of the beneficiaries as notified to him by the responsible department (e.g., the Ministry of National Insurance).

At this point in the tale, no one will be surprised to find that the Treasury raconteurs see these matters in a more uncertain light than the blaze of purest white that illumines Mr Young's utterances. Thus Sir Bernard Gilbert thinks that

It would be absurd to have a body dealing with these vast funds unless you took some steps to ensure that there was harmony between the investment of these funds and the general policy of the Government. . . .

And, a few years ago, a Financial Secretary to the Treasury went even further. Mr Glenvil Hall, defending his master, Dr Dalton, against the charge of having used departmental funds to pursue his frenzied ambition for ultra-cheap money (in the particular context of the investment in “Daltons,” in 1947/48, of almost 70 per

cent of the new moneys accruing to the Unemployment Fund in that year), affirmed

It is quite obvious that the Treasury, acting for the Government, must have control of these funds and that the policy must be laid down by the Government of the day.... There is on record, too, Sir Stafford Cripps's employment of his "creature" to squeeze the bears of the gilt-edged market in 1949—but the allusion then was seemingly to the Issue Department of the Bank of England, which commands £1,500 million or so, and is no part of the responsibility of the National Debt Office.

Mr Young is, of course, much closer to the day-to-day scene than are these Treasury authorities, and he is in no doubt that the proprieties are most circumspectly observed. But in the technique of its operations, the National Debt Office quite definitely adapts itself to the Government's financial policy. The Comptroller General is most anxious not to go against the "anti-inflationary policy" pursued in recent years. But he fears that, if he does his duty by the trust funds—the duty, as he sees it, to invest them immediately they are received—he may set up inflationary influences. He therefore tries to resolve this dilemma by an ingenious dealing technique. The £4,500 million or so of moneys in his charge comprise some £3,000 million of funds that are covered by a Treasury guarantee both as to income and capital (these are principally Savings Bank funds) while the remainder are "trust funds" (chiefly the insurance funds). The Treasury has agreed that the Comptroller General may use the non-trust funds "very very liberally for the purpose of helping the trust funds," so that he does not feel any "duty" to invest the Savings Bank moneys at once. He therefore uses them, as opportunity offers, to collect securities of a kind that he expects to be required by the trust funds, and then resells to them (by inter-fund transfers) when their money comes in.

In present conditions, the relevant point seems to be that the non-trust funds, though much larger than the trust funds, rise much less rapidly. But, in any case, the National Debt Office tries to get as much as possible of the securities it needs without buying through the market. The "suitable opportunities" that it most prizes for this purpose are new issues of Government Stock, special internal issues such as the Scottish Hydro-Electricity stock (was last year's issue of 1½ per cent yearling Transport Stock precisely what the doctor ordered for Mr Young's funds?), or specially created non-marketable securities such as terminable annuities. These last securities, it will be recalled, formed a very large part of the new investments of the Savings Funds during their wartime phase of rapid growth.

Of course, to some irreverent economists the theory behind this ingenious technique looks hardly less Gilbertian than the constitutional set-up. It is certainly desirable to arrange the investment of these vast funds with the minimum dislocation of the gilt-edged market. And, in the interests of disinflation, it is even more desirable that as large a part as possible shall not be used to buy any securities at all, except from the Treasury, so that the moneys are used to redeem the Treasury's active borrowings from the banking system on floating debt, i.e. are "retained" by Mr Young in the form of "tap" Treasury bills or other forms of internal debt. But, once it is admitted that Mr Young's duty requires a given portion to be invested, he does not serve the purposes of disinflation by keeping that money off the market, because he likewise keeps off it a precisely corresponding

volume of new issues that would otherwise oppress it. The sole contribution of this technique, in fact, is to minimise the ups—and the downs—of the market. And Mr Young would apparently feel no need to do this if Government policy were to change—"if the Government were to decide that so strong an anti-inflationary policy were not necessary."

For the present, however, he apparently sees his responsibility as an unambiguous and even an uncomplicated one. His office has apparently ensured that every one of the big trust funds has ample liquid holdings to meet any conceivable demands upon them for cash (given the present actuarial assumptions upon which the responsible departments rely). This liquidity having been achieved, Mr Young's sole responsibility to the funds, he explains, is to secure for them the maximum yield. Therefore, he cheerfully buys for them long and undated securities. It is true that he must combine this maximising of yield "with perfect security"; but that is mere child's play, because fluctuations in the book values of securities that are not going to be realised are "something which is completely unimportant." Equally irrelevant are the prices at which he buys; why should he ponder the possibilities of getting a better price by waiting awhile, when his simple duty is to invest forthwith? The Comptroller General, therefore, can turn his back upon the market, and can leave all the problems of actual dealing to the Government broker (who gets a flat £2,000 a year for his trouble).

*

But is the responsibility always as clear cut as all this implies? Not always, it seems. When the Treasury is about to make a new issue, it asks Mr Young how much "would be suitable" for him to take; and, later on in the story, it transpires that the Treasury "obviously" indicates what it would like him to take—while "never for a moment" suggesting that he should answer except in accordance with his own responsibility. Finally, it appears that this curious relationship becomes even more delicate when investment of the Savings Bank Funds (two-thirds of the whole) are involved. In this matter, the Treasury has "a very great voice in any policy" (because it guarantees the funds), and if Mr Young were asked to do "something which went a little beyond" what he would have done "in the sole interests of that fund" he might... "well agree to do so."

Even after this striking dénouement of the tale, the audience may still conclude that this pantomime, unlike most of its kind, is a play without a stooge. But it will certainly agree with Sir Bernard Gilbert that there is "more than meets the eye" in these bewildering relationships between the players. One of the characters that does not meet the eye is perhaps the principal villain of the piece, the Issue Department of the Bank of England—but it was not to that separate body that Sir Gilbert's warning related. Is it possible that a sequel, and a still more revealing one, to this fascinating comedy will be staged in time for the next festive season? Unfortunately, the chances look slender. Sir Bernard Gilbert thinks that a comprehensive statement of the activities of the Commissioners "would enable people perhaps to form their own judgments as to what was going on and what was likely to happen"—and that, needless to say, would be a "rather unfortunate thing." There is no need, perhaps, for surprise that no Minister speaks for Pooh-Bah before Parliament.

Frustration for Shipbuilders

(By a Correspondent)

THE full effects of this year's steel shortage are not yet apparent in the production statistics of the shipbuilding industry; but they are readily apparent from the bare-looking berths that are now to be seen in many of the country's shipyards. In a tour round the shipbuilding districts the visitor senses an air of frustration pervading the yards; the shipwrights have a long list of export orders which their reputation for efficiency has won them in the face of growing competition from overseas but cannot fully apply that efficiency. This feeling is far removed from that in the yards in the depressed years between the wars, when the stocks were bare because there were no orders. There is no lack of orders today. On the contrary, the order book has never before been so packed with work. But the berths and the plate shops have assumed that all too familiar "hungry" look through lack of steel.

Final returns for the year are not yet available but the shape of things to come can be discerned from an examination of the latest published statistics. In the twelve months ended on September 30, 1952, for example, work was begun in United Kingdom shipyards on merchant ships amounting to 1,159,379 tons gross, according to the shipbuilding returns compiled by *Lloyd's Register of Shipping*. That tonnage compares with a total of 1,512,463 tons gross during the previous twelve months. The declining rate of production is better shown by comparing the latest available figures for successive periods of six months:—

Six months ended	Started	Launched (Tons gross)	Completed
Mar. 31, 1952.....	686,090	760,505	701,926
Sept. 30, 1952.....	473,289	600,294	671,855

In all stages of production, output was lower in the second period in question, most conspicuously in the early stages, though least of all in the final stages of production. This was to be expected: most of the steel that goes into a ship is incorporated in the hull before it reaches the launching stage.

Shipbuilding is a lengthy process, and a long time elapses between the placing of an order and the completion of the contract. It takes a long time, therefore, for marked changes in the rate of production to work their way through the statistical records. But the signs of the serious effects that this year's cuts in steel for the industry will have on next year's and subsequent years' output can be illustrated in another way, by contrasting two further sets of figures from *Lloyd's Register* shipbuilding returns:—

Date	Total under Construction and Preparing	Total under Construction (Tons gross)	Total Preparing
Sept. 30, 1951.....	4,261,346	2,271,640	1,989,706
Sept. 30, 1952.....	4,746,745	2,062,482	2,684,263

These figures show the delayed but cumulative effect of constricting the flow of vital steel to the shipyards. They show that within one year the tonnage of ships on the

stocks, or for which material is being worked on the plate and prefabricating shops, has dropped by nearly 210,000 tons gross, some 9 per cent. The tonnage for which plans have been approved and material ordered, but on which work has not yet started, has consequently increased by nearly 695,000 tons gross. It will not be long now before launching and completion returns take up the story.

When the first allocations of steel were worked out in February as a result of the decision to embark on a rationing policy, many shipbuilders were told that they would have to make do with 66 per cent of what they had asked for. When it came to actual deliveries of steel to the yards there have been a number of complaints that the allocations were not fully honoured, and that the total tonnage delivered amounted to little more than 50 per cent of their requirements. Though total deliveries of steel to shipyards this year, according to the steel industry, have been "nearer 100 per cent than 50 per cent of deliveries in 1951" persistent representations to the Admiralty have been made by industrialists and trade unions concerned with the shipyards. An increase, at first of 5 per cent, and later of 8 per cent, was promised for the last quarter of the year, and a vague promise of a further 9 per cent for the first quarter of 1953 was made later. But some shipyards have not been receiving the types and specifications of steel that they require in the right proportions; nor can they rely on an orderly or regular flow of deliveries, with the result that the normal sequence of work is continually being interrupted. The allocation system has by no means ensured that stocks of the right steel products are held at the right points. British shipbuilders are already having to tell their overseas and home customers that ships promised for delivery in 1953 cannot possibly be completed until 1954. Their German and Japanese competitors are much better placed to promise early delivery.

*

It is natural that shipbuilders should wonder if they are receiving their proper share of the steel now being produced in this country in ever increasing quantities. The circumstances early in 1952 did necessitate the control of steel distribution among user industries. But since then industrial production has declined, there has been no shortage of ore imports, and domestic and imported supplies of steel have increased. More steel has been delivered in Britain this year than ever before, though it is far from clear which of the consuming industries have received increased supplies. The question now, indeed, is how long the allocation system should be continued, particularly in view of the proposed levelling out of arms production. Such major consumers as the motor manufacturers are no longer complaining that they cannot get enough steel; their difficulty is now to sell their products overseas or even at home. Shipbuilders, on the contrary, have unfilled export orders on their books

worth £200 million or more, with the customers anxious for delivery and ready to pay, and most of the ships built for British ownership are used for earning foreign currency. But neither shipowners nor shipbuilders can get the steel to earn the foreign currency.

A very large proportion of shipbuilding steel requirements (some 70 per cent in 1951) is needed in the form of plates. This remains one of the shortages that have not been corrected this year. Demand has risen enormously from other large consumers like the manufacturers of rolling stock, electrical plant, and oil tanks. The home user of plates dislikes the export of fairly considerable quantities that is still continuing (about 260,000 tons in the first 10 months of this year against 195,000 tons in the whole of 1951), since unworked shipbuilding steel makes no use of the high conversion factor that the shipbuilding industry can add to the export value of the product. But a large proportion of these exports are "conditional"; in the case of Sweden and the Netherlands, for example, to which large quantities have been sent, they are sent in direct exchange for imports of steel-making raw materials that the steel industry's customers

depend upon. There are shipbuilders who would go so far as to allege that their short commons this year have been the result of a deliberate policy of diverting steel from the industry; others question whether the Admiralty has put its case strongly enough in the departmental allocations of steel. The result has been, in addition, some bad feeling between the shipbuilders and their steel suppliers; and much more bad feeling between the industry and Government departments. Recriminations apart, it is fairly clear that shipbuilding is an example of the kind of capital goods industry in which Britain has a firm market and a real margin of advantage over its foreign competitors. If the engineering industries are to be favoured according to their competitive strength in 1953, this one might deserve preference over some other large steel consumers—if steel distribution continues to be controlled.

Competition from shipbuilders overseas is now a major factor in the commercial situation. The privileged position that British shipbuilding enjoyed in the immediate postwar years has now disappeared, for the Continental yards destroyed and damaged by the war have been fully restored, with absolutely modern equipment, and

the former enemy countries, Germany, Italy and Japan, all keen and competent shipbuilders, are again strong competitors in the world market. Although their basic costs are still generally higher than in Great Britain, most of the foreign yards can offer much earlier delivery. In many cases they have the benefit of benevolent treatment, or even financial assistance, from their government. By contrast, British shipbuilders feel themselves hampered by government intervention. As regards competitive efficiency, this year's increase of about 15 per cent in the cost of steel and the recent rise of 7s. 6d. a week in shipbuilding wages have somewhat reduced the British price margin.

The slump in freight rates that has taken place this year forms an ominous background to the shipbuilding scene, and the swollen order book of some 7 million tons, worth about £650 million, must be viewed in conjunction with it. The shipping boom of 1951 contributed the majority of this large total of orders. During that year no less than 4 million tons gross of merchant ships, a large proportion of which are tankers, were ordered from British yards. This year's orders are unlikely to reach 1,250,000 tons by the end of December. Such a figure may at first sight be regarded as satisfactory: it is roughly as much as the current annual rate of completions, so the arrears of orders have been maintained. But it is certain that at least half of these new orders were placed in the first half of the year, before the slump in shipping set in. It can be confidently asserted, also, that the contracts placed in recent months have been comparatively few, and the rate of ordering has now been reduced to a trickle. Though it is impossible to obtain accurate figures, foreign shipbuilders seem now to be receiving a higher percentage of the orders available than for some years.

Moreover, this abundance of orders is not evenly distributed. The tonnage ordered in Britain this year has been swollen to some extent by the inclusion of many large vessels (tankers and a few passenger liners). In fact, the tonnage completed this year will probably have been provided by some 300 vessels, but the equivalent tonnage ordered this year may not amount to more than 250 vessels. This means that the yards whose berths cannot accommodate the larger ships remain slack, in spite of the huge total of orders. And it is significant, perhaps, that the ships that British owners are having built in foreign yards, few though they are at present, are mainly smaller vessels. Speed of delivery, for such vessels, is probably the determining factor.

Speed of delivery is beginning to become an increasingly important factor in the shipbuilding industry. Here the long orderbook of the British yards is in any case against them, and the consequent length of deliveries offered will remain even longer, until steel supplies return to normal. Despite the current backlog of orders, many small berths are available for early work, provided that steel can be obtained to build the ships. But owners will not place orders when they fear that delivery will be held up for lack of materials. With steel output for 1953 now estimated at 17½ million tons, and rearmament likely to take a less sharply rising share than was expected, the need for allocation of steel in general has probably passed. Even if plates remain short, the shipbuilding industry might well be able to arrange its own supplies from the steelmakers more satisfactorily without the creaking machinery of official allocation.

Business Notes

The Fall in Bank Advances

The latest of the quarterly analyses of bank advances, relating to mid-November, deserves a closer scrutiny than usual, since it completes the record of the first full year of the new monetary policy; for the first time, the effects of that policy upon the trends in advances can be examined without the distortion caused by seasonal factors. During the three months to November, total advances in Great Britain (by all members of the British Bankers' Association) dropped by £32.2 million, whereas in the similar period of 1951 they rose by £51.8 million. This contrast, moreover, becomes still more pronounced if advances to the nationalised public utilities are left out of the reckoning. The group that mainly comprises the gas and electricity industries increased its borrowings from the banks by £48.5 million during the latest quarter (or by more than twice as much as it did in the corresponding quarter last year). All other advances therefore dropped by £80.7 million during the quarter—a reduction only once exceeded in the past (by the £99.7 million reduction shown in the previous quarter), and one that contrasts with an increase of £28.2 million last year. The quarter's contraction has occurred, moreover, despite moderate additional loans to steel and engineering, those two major expanding groups, as well as to local authorities. It is attributable principally to substantial reductions in six groups—textiles (down £16 million in the aggregate), "other financial" (down £13.8 million), agriculture (£8.5 million), food, drink and tobacco (£7.6 million), "unclassifiable" industry (£11 million), and "personal and professional" (£14.7 million). During the corresponding period of 1951, these six groups increased their advances by £10 million.

The redistribution of credit during the twelve months has, indeed, been quite striking. The total has fallen from £2,016.2 million to £1,815.4 million, and only five groups now command a larger total of advances than they had twelve months ago. Engineering advances have risen by £30 million, or by nearly 25 per cent, while those to the iron and steel group have doubled (at £35 million). Together, they now account for 10.6 per cent of the total, compared with 7.2 per cent in November, 1951. Advances to utilities, transport and—surprisingly—cotton also show small

increases. The biggest decline over the year has occurred in the large personal group, which has contracted steadily after its previously continuous rise, and is now down by £58.7 million, or 13 per cent, at which it represents only 20.8 per cent of the whole—in contrast with nearly one-third in the early postwar phase. Apart from this, the really heavy declines have occurred in groups that have been strongly influenced, not only by the pressure of monetary policy, but especially by the fall in prices as well as the revival of consumer demand (thus permitting a fall in physical stocks). The textile groups and leather and rubber, for example, now

command £36 million less credit than in November, 1951, at £90 million; retail trade is down by £40 million, and food, drink and tobacco by £27 million. "Other financial" has contracted by £29 million and "unclassifiable" industry by £25 million.

* * *

Higher Rail Fares Sought

Immediately before the recess, the Minister of Transport announced that the British Transport Commission is to submit a new railway passenger fares scheme early in the New Year. It is easy to justify this move from what is known of the Commission's financial trends. The 5 per cent increase in freight rates that the Minister sanctioned in November, under the so-called provisional arrangements provided by the 1947 Act, was expected to produce about £14½ million. But the current rate of deficit was then put at between £20 million and £22 million in a full year, leaving a gap of £7½ million at the maximum.

To produce such a sum from passenger fare revisions will not be easy, nor will the process be quick. For it appears that the application will take the form of a new passenger charges scheme in substitution for the one that occupied so much time at the Transport Tribunal's enquiry in 1951 and was in part suspended by the Government last May when it was due to come into effect outside London. The reason for this procedure rests on an oddity in the Transport Act itself—to proceed by way of an alteration to an existing charges scheme would take longer than the submission of an entirely new scheme. There is scope for a more fundamental approach to railway passenger fares and it may be hoped that the scheme will admit two principles. The first is the possibility of variation in charges to conform more closely with costs. The Commission has not got very far in previous hearings in persuading the authorities to accept the implications of his principle as it would affect season tickets and workmen's fares; and it has never attempted to pursue it in relation to long distance passenger fares.

The second principle concerns the relative levels of fares in London and in the rest of the country. There is no economic argument to justify a common level of fares if, as a result, London passenger transport would remain a burden on the rest of the Commission's undertaking. If London is a special case, it should be dealt with in a special way, and not by some species of concealed subsidy from the railway system as a whole.

* * *

Agreement with Argentina

Britain seems likely to get more meat from Argentina next year, but will have to pay more for it. After the usual tiresomely protracted negotiations a treaty covering the exchange of meat and other commodities is expected to be signed with Argentina within the next few days. No details of the proposed pact have been published in London, but in Buenos Aires the Argentinian foreign minister told a press conference that 250,000 tons of meat will be shipped to Britain under the new treaty, at a so-called "pilot price" of £161 a ton; under the old protocol, which expired in April this year, Britain received 200,000 tons of meat at a so-called "basic price" of £126 a ton. It remains to be seen whether a "pilot price" means the same thing as a "basic price"; if it does, then the new price, which is roughly halfway between Britain's initial offer and the Argentina's initial demand, will represent an increase of 29 per cent over the old level.

There was no doubt room for some increase, but in the light of the trend of other commodity prices, this seems a rather poor bargain for Britain. But the meat contract cannot be judged in isolation from the other—and still unrevealed—details of this year's settlement of the annual haggle with Argentina. Hitherto virtually the only imports from Britain that Argentina has been willing to receive in exchange for its meat have been essential goods—such as coal, tinplate and petroleum—that Britain could readily sell for harder currencies; each year, for some time past, Argentina has promised to import a certain quota of consumer goods as well, but it has not lived up to its word. It is to be hoped that firmer (and enforceable) assurances have been received this time, and that something will be done too about Argentina's accumulated debts to British subjects in respect of financial remittances. Another feature of the agreement that will have to be closely scrutinised is whether the British Government has agreed to allow the Argentine central bank to run up a debit balance (the figure of £20 million has been mentioned) at the Bank of England.

It is impossible to estimate how much of the increase in meat prices will be passed on to the British consumer. The present retail price of meat is 2s. a lb. or £224 a ton. At first sight this would seem an ample margin to cover the new Argentine price of £161 and the cost of storage, freight and distribution. But Argentine meat is not considered separately in the Ministry of Food trading accounts and for meat trading as a whole there is an annual loss covered by a subsidy of ½d. a lb. Thus, the increased cost of meat will have to be passed on to the consumer unless the Ministry decides to increase the subsidy—which it certainly should not do. The effect of the agreement on the level of the ration is almost as uncertain as its effect on the retail price. Shipments of meat from Argentina under the old protocol were completed early in the summer, and since then only a small quantity has been shipped under a special contract. Nevertheless 581,300 tons of beef and 45,500 tons of mutton and lamb have been imported into this country from Argentina during the first eleven months of the year compared with 461,200 tons of beef and 15,000 tons of mutton and lamb in the same period last year. Shipments from Australia this year have fallen to a mere trickle but the decline has been more than compensated by an increase in imports of New Zealand mutton and lamb. It is largely because of this that the Ministry of Food has been able to keep the meat ration this winter at a higher level than last year, despite the now customary hold-up in supplies from Argentina.

Cars and Purchase Tax

The Chancellor of the Exchequer sprang no surprises last week when he announced that there would be no change in the rate of purchase tax on private cars before the budget, if at all. Much has been made of falling employment at the motor factories, but the industry certainly has sufficient orders at home and abroad to sustain it for several months. But the sharp reduction in the price of the Standard Vanguard suggests that mass-produced cars in the higher price ranges are becoming less easy to sell. The Vanguard has been reduced from £919 to £795 including tax; the reduction in the manufacturer's price is a good deal less at £80, but the purchase tax at the current rate adds a big bonus to every price reduction.

The Vanguard may be a special case, because the existing model is being radically restyled in the spring. But purchase tax on cars is so high that buyers would be feckless indeed if they did not discount some months before each budget a possible reduction in tax. The motor industry has also encouraged this apprehension by asking for a reduction in tax four months before the budget was due. It did not, however, plant the idea in the public's mind—the seed was sown when the government yielded to pressure to reduce the

purchase tax on textiles last spring, and later when it altered the rate on certain glass and leather goods some weeks ago. These actions have to be remembered in accepting Mr Butler's assertion that "the uncertainty (about cars) is not created by myself or by the government." The disruption of retail trading before each budget has reached dimensions that no Chancellor can ignore. As the public becomes more adept at the rules of the tax game, retailers have to act further and further ahead to avoid trouble when the public stops buying and to prevent taxed stocks from piling up. In the end, the manufacturer suffers. No one can say whether the slackness in the home market for cars is seasonal, due to tax fears, or the sign of satiated demand. But it is asking much of people "to adjust their nervous systems" while the Treasury holds its annual review of purchase tax. The answer is that they have already made their adjustment, with consequences that are plain to see.

No Par Value Inquiry

Sometimes praise is due to those who refuse to take no for an answer. Last week's announcement that the Board of Trade has set up a committee to consider no par shares is a reward for persistence on the part of those who, in the terms of the official statement, have shown "continuing interest in the matter." They had little reason for encouragement; no par value shares were not endorsed by the Cohen Committee when it studied the company law nearly ten years ago, and Sir John Barlow's private Bill, which sought to make no par value shares permissible, went virtually unsupported by the City and by the Government, and was "talked out" after some of the most bitter speeches ever heard from the Labour benches.

To set up an expert committee to inquire into no par value shares is a mark of grace on the part of the authorities that few observers had expected. The committee, under the chairmanship of Mr Montagu Gedge, QC, is composed of experts in accountancy, the law, investment, industry and trade unionism, serving in their personal and not representative capacities. Perhaps such expertise is needed less to establish the facts about n.p.v.—which after all has worked satisfactorily in America in ways that are fairly familiar—than to carry the authority of an objective (and let it be hoped unanimous) inquiry into a subject of relative technical simplicity that has seemed to become hopelessly overlaid with political animus.

The n.p.v. share is distrusted on the Left, not because it is dishonest or unsafe, or open to exploitation by unscrupulous promoters—none of these objections has any merit at all—but simply because it tells the truth about an equity share in a way that the share with a nominal or unrealistic par value never could. One of the most successful propaganda lines from the left wing in recent years has been the denunciation of "high rates" of dividend on particular shares calculated by reference to their wholly unrepresentative par values. But equally there have been deficiencies of understanding on the other side—that n.p.v. is new-fangled, unnecessary and not worthy of support from the temples of City rectitude. This attitude must be abandoned if the new committee is to do its work well and with some chance of leading to changes in this archaic section of British company law.

How Much Steel?

Last week the British Iron and Steel Federation announced its intention of producing 17½ million ingot tons of steel in 1952; at the same time, the Ministry of Supply released an estimate of 18.35 million tons for the total

supply of steel that has actually been available in Britain in 1952. This figure is presumably on a 53-week basis; it includes imports, re-usable material, and the effects of changes in producers' stocks, as well as home production. It is possible to draw from it some rough estimates of the component parts of these supplies, as in the accompanying table. This gives a figure of about 15½ million ingot tons for steel deliveries in Britain this year, nearly 9 per cent more than last year and a far higher figure than home deliveries have ever reached before in peacetime. A year ago, even amid the clamour of consumers, it was possible to doubt whether the steel shortage could be quite as bad as it sounded. Today, though all the wailing has not subsided (as an article on page 901 shows), the 1952 steel shortage seems in retrospect even less possible to take very seriously.

There are no statistics as yet to show where the extra million-and-a-quarter ingot tons of steel—perhaps 950,000 tons in finished steel products—has gone. At the beginning of this year Mr Robert Shone, director of the steel federation, put the increase in defence demand, compared with 1951, at 300,000 ingot tons more steel. Nothing in the record of rearmament this year would suggest that much more steel is likely to have been used than was planned. At that time Mr Shone also postulated a 10 per cent increase in exports of metal-using goods, which might require another 350,000

STEEL SUPPLIES IN BRITAIN, 1950, 1951, 1952
(Million Ingot Tons)

	1950	1951	1952* (estimate)
Production	16.29	15.64	16.35
Producers' stocks	+ 0.10	+ 0.43	- 0.25
Imports	16.39	16.07	16.10
Re-usable	0.58	0.56	1.80
	0.48	0.54	0.45
Total supplies	17.45	17.17	18.35
Exports	3.25	2.67	2.60
Home supplies	14.20	14.50	15.75

* 53-week year. Output in the first 52 weeks is expected to be about 16,100,000 tons.

ingot tons more steel than the year before—an increase partly to be offset by cuts in capital investment here and in supplies of metal consumer goods to the home market. In fact, exports of metal-using goods do not seem likely to be any higher in volume this year than last. Engineering output might be about 2-3 per cent higher, over the year, than in 1951; but much larger increases in engineering output in earlier years appeared to require little more than 350,000 ingot tons of extra steel each year; and employment in the engineering industries has failed to continue the increase that it showed in 1950 and 1951.

Since some consumers are still genuinely short of steel, and indeed there are still general shortages of a few products, it is hard to escape the conclusion that consumers' stocks, as well as producers', must have risen considerably since the beginning of this year. If so, maldistribution of stocks is partly responsible for individual and local shortages. That maldistribution will have come about—as some people in the industry from the beginning suggested that it would come about—from the present system of allocation. Any clear inquest on the 1952 steel shortage remains impossible until the Ministry allows consumption statistics (even in the form to which allocation has necessarily distorted them) to be published once again. But on the broad evidence available so far, steel allocation may well have done so much to aggravate the steel shortage as to relieve it. The scheme should be abolished, and quickly.

Scottish Bank Meetings

The annual meetings of two of the Scottish banks, the Commercial Bank of Scotland and the National Bank of Scotland, traditionally provide something of a curtain raiser to the meetings of their bigger London brethren in January. In the year to October 25th, the Commercial Bank showed a fall of just over £2.2 million (to £121.1 million) in its deposits, a rise of over £1.1 million (to £14.5 million) in its note circulation, a fall of over £6.1 million (to £32.1 million) in its advances and bills discounted and a decline in profits by £22,665 to £379,789. The National Bank, in the year to November 1st, showed a rise in deposits by £800,000 to £97 million and a rise in its note circulation by £1.2 million to £10.4 million; but it, too, showed a fall in its discounts and advances by £2.4 million to £27.8 million, and in its profits by some £8,000 to £286,000.

One difference between the two banks is, however, that the National Bank has adhered—and, as its Governor, Lord Rowallan, declares, is "proud" to adhere—to the old tradition of showing investments in its balance sheet at below stock exchange valuations. The Commercial Bank, however, enters its investments on the formula introduced by some of the major London banks in the middle of 1952. Its investments, which are all redeemable at fixed dates, are entered in the balance sheet "at or under cost and below redemption price"; under this formula total investments are shown at just under £50 million, which compares with a market value of £46.9 million and a book value (on the old formula) of just under £52.9 million a year ago. When account is taken of the improvement in gilt-edged prices between July and end-October, the extent of this shortfall of market value below book value (about 6 per cent) indicates that the average life of the Commercial Bank's investment portfolio must have been considerably longer than that of most of the British banks that have published balance sheets since the rise in Bank rate to 4 per cent. Another feature of the Commercial Bank's balance sheet is the vigorous expansion of its foreign business in North America and Europe, which Lord Rotherwick, the Deputy Governor, attributes to the "partial relaxation of certain exchange controls early in the year"; the Commercial Bank's contracts running for the sale of foreign currencies amount to £18.6 million, all of these being covered by purchases to a corresponding amount. Both Lord Rotherwick and Lord Rowallan pay tribute to the effectiveness of monetary policy in aiding Britain's fight for external solvency, but both, not surprisingly, draw attention to the adverse effect of recent developments on banking costs and profits. Lord Rowallan, indeed, goes so far as to say that "all banks would therefore welcome, as soon as possible, a lowering of the Bank rate, with its consequent improvement in the value of their investments."

"Mr Cube" Escapes Tax

The High Court has confirmed the decision of the General Commissioners for the City of London that the money spent by Tate and Lyle, Limited on the "Mr Cube" advertising campaign against nationalisation is an admissible deduction from profits for income tax purposes. Such expenditures must (under Rule 3 of Schedule D) be "wholly and exclusively laid out or expended for the purposes of the trade," and the key to that provision is the fact that the word "trade" is preceded by the definite article. The campaign cost £15,339; it was conducted with express authority of a general meeting of the company and designed to counter the Labour Party's threat, in April, 1949, to nationalise the sugar manufacturing and refining industry.

The Crown's contention was that the payment could not be wholly and exclusively for the purpose of the trade, that it was money spent to advance a political cause and hence connected with the ownership and not the conduct of the business; an earlier decision on which the Crown placed

great reliance was that of the Privy Council in 1923, in the case of *Wood and Co. v. the New Zealand Commissioners of Taxes*, where the Court had held that a payment made by that company, a brewery company, in a campaign against prohibition was not an allowable expense for tax purposes. Mr Justice Harman relied on two main points in his decision. First, the New Zealand case was to be distinguished because the New Zealand tax statute differed considerably from the British Income Tax Acts. In New Zealand, the expense must have been "exclusively incurred in the production of the assessable income"—a much narrower definition. The other was a sentence from a judgment of Lord Cave in 1926, that a voluntary payment made on the grounds of commercial expediency may still be wholly and exclusively spent in the purposes of the trade.

The decision conforms with common sense. The essential feature of the "Mr Cube" campaign was that it advertised Tate and Lyle, Ltd., and from an advertising point of view the fact that the campaign had a political flavour was incidental. The purpose of such a campaign is to establish the name of the advertiser in the mind of the reader in circumstances that hold the reader's interest. If the Crown's contention had been upheld, it would, logically, have meant the end of prestige advertising as such; each advertisement would have to link name and product together before the cost of it would be wholly and exclusively a trade expense. The Income Tax Acts have produced some curious results, but it would have been hard to believe that Parliament ever intended (whatever the tax authorities may have intended) that the latter should become the arbiters of advertising as of so much else.

Lower Engineering Exports

The volume of British exports in October and November was about 4 per cent above the rate current in the second quarter of the year, but, as export prices had fallen slightly, the value of sales was about the same as it had been then. The dominant feature since midsummer, however, is that while textiles and consumer goods have continued their slow recovery, shipments of engineering products (such as machinery, vehicles, cutlery and electrical goods) have not regained the level of the second quarter and are substantially below the peak levels of the first quarter. Indeed, the most striking feature of the detailed trade figures for November, which were published last week, was a sharp fall in exports of vehicles to £36.6 million, some £3 million less than in October and fully £13 million less than in November, 1951. Only 19,219 cars were shipped abroad last month, compared with 20,545 in October and 31,521 a year ago. This fall occurred although exports to the United States were well maintained; the American market took 3,532 cars in November, compared with only 964 a year ago. On the other hand, Canada is now importing fewer British cars than in the summer, while shipments to Australia amounted to only 430 last month, against 10,025 in November, 1951. Fortunately, exports of machinery in November, at £35 million, were little changed from the October rate and only fractionally below the level of the second quarter; while exports of iron and steel manufactures in October and November were higher than in the second quarter—the November total of £18.5 million was £4.4 million above that of November, 1951.

The recovery in textile exports continues to be slow. Wool exports in November were unchanged from the October total of £11 million and were still £2 million lower than in November, 1951. Cotton exports were also steady at the October figure of £11 million, but were £7.5 million below those of a year ago. This contrast between the rate of recovery in wool and in cotton is clearly shown by imports of the raw fibres; raw and waste wool imports last month cost £11.4 million, compared with £6.7 million a year ago, but raw and waste cotton imports amounted to only £9.7 million, against £24 million a year ago. Other categories

of imports continued to decline and there was a particularly striking fall in tobacco imports, from £17.7 million in November, 1951, to £4.9 million last month. Meanwhile, import and export prices are continuing to move favourably. Last month the Board of Trade's index of the terms of trade (1951=100) declined by a further point to 89; there was another slight fall in import prices but export prices were unchanged.

Rolls-Royce Goes to Sea

For some time past Rolls-Royce has been seeking to develop its interests outside the aircraft industry. The two gas turbines shortly to be installed in the Admiralty's ex-gun boat, *Grey Goose*, are the first marine engines that the company has built. They follow on the introduction of a new range of Rolls-Royce petrol engines and the appearance of the first of a similar range of diesel engines. The gas turbine units are still regarded as prototypes, but the initial shore trials have been highly successful. Most of the industrial gas turbines under development are the work of companies with long experience of the design of industrial power units; Rolls-Royce brings to the design of these big gas turbines a unique experience of jet engine design, though none of either steam turbines or high horse-power diesels.

The principal contribution of a gas turbine is the great power that it gives for small weight. The *Grey Goose* was previously powered by two 4,000 horse-power steam turbines. The two Rolls-Royce gas turbines that are now to replace them are rated at 6,000 horse power each, but the new installations save about 50 per cent in total machinery weight, as well as valuable engine-room space. Aero-engine manufacturers probably know more about weight-saving than any other engineers; whether they know as much about reducing spares and servicing time to a minimum remains to be seen. These two features, lower weight and fewer spares, explain the very active interest that the Admiralty has taken in gas turbine development for use in small craft. The United States Navy has also awakened suddenly and sharply to the possibilities, and is to purchase two Rolls-Royce gas turbines and two built by Metropolitan Vickers, the company's chief competitor in this field. Metropolitan Vickers, in whose drawing office the Armstrong-Siddeley Sapphire jet engine was first designed, has already provided the Admiralty with a gas turbine for installation in a motor gunboat, and two improved versions are now due for delivery. The Rover Motor Company has supplied the Admiralty with small gas turbines for trials in harbour launches, but it is hardly in a position to offer these bigger engines. In addition to its direct orders, the Admiralty acted as middleman for the sale of the four turbine engines to the American navy, and for the sale and licensing agreements for the British steam catapult for American aircraft carriers. These orders from the American navy should bring in about £3 million to the companies concerned and thus over \$8 million to the central dollar reserves.

Cotton Commission's Forward Contracts

Spinners who continue to buy their cotton from the Raw Cotton Commission can now undertake a greater risk in the expectation of obtaining their raw material at a better price. The commission now offers a new "direct-to-mill" contract differing in two important respects from the usual commission contract. Previously the commission sold spot, with delivery from warehouse of a definite type and quality of cotton, so that the spinner knew when he would get his cotton and that it would suit his spinning requirements. The new contract is for future delivery at an approximate, but not certain date: the spinner buys c.i.f. for delivery at the quay, and he takes a chance on when the ship will arrive. In the second

Enterprise

Whether it be the start of a new business or the extension of an old one, a banking account helps a good idea along by pointing the way to the soundest business practice. There's safety in it as well as convenience in all transactions. And, if advice be needed, it is gladly given at every branch.

It certainly pays to see the Bank about it.

The capture of Diana's Stag was the third Labour of Hercules, and the chase led him beyond Arcadia; for a whole year the animal eluded him, running all over Europe through every kind of country.

The Nickel Organisation, too, has had to follow the quest wherever it led, however inhospitable the country. The best nickel deposits exist in remote places, and the making of communications has been part of the hard task. Many miles of railway are operated, handling over two million tons of material monthly. The trains keep running in every kind of weather—and temperatures of 55 degrees below zero have been recorded at the Copper Cliff mines, in Northern Ontario. Exploration engineers, too, are constantly at work. Such is their success that proved ore bodies are now considerably greater than twenty years ago, in spite of heavy withdrawals. Yet the search for new deposits must go on, so rapidly does the demand for nickel increase.

THE MOND NICKEL COMPANY LTD.

Sunderland House · Curzon St. · London · W.1

place, the new contract is for cotton of a quality only approximately defined and the spinner has to take the risk that when it arrives the cotton may not prove precisely suitable for him.

Uncertainty of arrival means that the buyer may not get his cotton when he wants it. If it comes too soon, he has to face storage charges; if it is too late, he may have to buy his requirements elsewhere, possibly at a higher price. If the quality is not right—it may be not good enough, or it may be too good for the purpose for which it was bought—the spinner has to dispose of it and buy other cotton; the contract provisions for price adjustment for quality may cover him for the price of the cotton, but it may not help him to keep his mill working.

The attraction of the new contract is the prospect of getting raw cotton at a lower price. Small mills may prefer the certainty of buying from the Raw Cotton Commission under the old contract. But larger mills, with ampler finance, storage space and with opportunity for using a wider range of cotton, may find attractions in the new contract. All spinners who still buy from the commission will have the choice of buying spot under the old contract or forward under the new—thus enjoying the best of both worlds as the occasion suits, as some spinners who have contracted out of buying from the commission now somewhat ruefully observe.

Nuffield without Morris

The retirement of Lord Nuffield from an active role in the motor industry is like the removal of an old and familiar land mark. He has given up both his post as chairman and as director of the British Motor Corporation that he helped to form last year and retains only the title of honorary president. Lord Nuffield must be the last of that generation of motoring pioneers who could build a car with their own hands—an ability he shared with men as different as Henry Royce and Henry Ford. When technical advance in the motor industry was rapid, commercial success depended on the ability of the men at the top to assess the importance of each new development in terms of their own models; the quality of their judgment rested very largely on the possession of an intimate and intuitive knowledge of cars, how to design them and how to put them together.

By the thirties, the first spring of this technical impetus had exhausted itself, and car designing changed from an art towards an exact science in which the important element was production. The new generation of motor manufacturers are production engineers, and although William Morris was not one of them, he was more successful than most of his contemporaries in adapting himself and his companies to a new environment.

The Nuffield organisation remained as it had grown—a geographically scattered group of assembly plants, engine and body factories, radiator plants, machine tool factories and foundries, some making parts for certain cars, others making a complete model under one roof. But it was sufficiently closely integrated to be able to hold its own in terms of output and of price with the other five companies of the "big 6." At one time after the war it seemed doubtful whether Lord Nuffield could keep pace with the driving energy of men like Leonard Lord (who left the Nuffield group to go to Austin and who succeeds him as chairman of BMC) or Sir John Black at Standard, or with the efficiency of the American-inspired Ford and Vauxhall factories. He might not have done so, had the Morris Minor not been such an astoundingly successful piece of motor engineering. Many hold that the Morris Minor was the best designed of all postwar British cars, for all its modest power, and their judgment is supported by those European markets that know a good small car and have bought more Morris Minors than any other British model. The merging of the Nuffield and Austin resources should in due course bring the productive

efficiency of the group to as high a standard as can be found in the motor industry. Nuffield without William Morris can hardly be the same, but consolidation brings new opportunities of its own.

Oil Surplus without Abadan

Without Persia, oil output in the world this year seems likely to be about 5 per cent higher than it was in 1951 (during about eight months of which Abadan was still in operation). According to forecasts by the Petroleum Information Bureau, the total should be about 640 million metric tons, compared with 610 million metric tons last year; the 1952 estimate is about 60 per cent greater than in 1946.

The United States is responsible for more than half of the world output, though Canada and some of the major remaining Middle East producers are expanding their output much more quickly. In Iraq the operation of the new pipeline to the Mediterranean has been largely responsible for a growth of output to more than double the 1951 level, while Kuwait is continuing its rapid expansion of the last few years. Though it is hardly possible to do more than guess at output behind the Iron Curtain, there were signs of

OIL OUTPUT, WORLD & MAIN PRODUCING COUNTRIES, 1946 & 1952
(Million metric tons)

	1946	1951	Est. 1952
USA	248.2	324.2	331.0
Venezuela	56.7	90.9	95.0
Saudi Arabia	8.1	37.2	41.0
Kuwait	0.8	28.2	37.7
Iraq	4.7	8.7	19.0
Mexico	7.1	11.0	11.0
Canada	1.0	6.4	8.0
Persia	19.5	16.4*	...
WORLD TOTAL	390.8	610.0	640.0

* Jan.-August. 1950 output was 32.3 million metric tons.

rising output in Russia and in most of the satellite countries earlier this year, though not in Rumania; in all, output of oil in Eastern Europe may have been rising somewhat faster than in the world as a whole. Consumption in various major markets has not shown as considerable a rise as was achieved in the previous few years, and a surplus has now developed of refined products as well as of crude oil. Present conditions, therefore, would hardly offer Dr Mossadegh much profit if he were able to dispose of Persian oil on the world market. But if large quantities of Persian oil were to be offered at cut prices, there would be a sharp reaction upon the world price structure for oil.

Quality and the Merchandise Marks Act

At the time of the budget, the President of the Board of Trade promised to revise the Merchandise Marks Act. His object was to provide, together with the suggested British Standards for textiles and some household goods, better safeguards for the public than had ostensibly existed under the utility schemes. The revised bill was introduced by Lord Mancroft in the House of Lords last week, and it goes most of the way towards meeting criticisms of the old Act. It is possible at present to prosecute traders for giving false descriptions of the weight, measure, materials or method of manufacture of an article. But the evolution of new methods of treatment, particularly of textiles, has made it possible to give special properties to materials and fabrics, and descriptions specifying such properties do not fall within the scope of the present Act. The revised Act would make

prosecution possible not only when the substance of the article was wrongly described, but also when claims were made for the "quality, fitness for purpose, strength, accuracy, performance of behaviour of any goods" that could not be substantiated. Moreover, it would be possible to prosecute a trader when the description was misleading, as such descriptions sometimes are, without being technically untrue.

This revised version should provide the public with a stronger safeguard against exploitation by the unscrupulous fringe than can British Standards. These can never be more than minimum standards, if they are to be within the reach of the majority of manufacturers. Their effectiveness depends directly on the importance that the public places upon the BSI's mark on consumer goods. The tendency of some of the better quality manufacturers to ignore the mark completely, on the grounds that it signifies a standard of quality far below that of their own products, certainly does not help to strengthen public reliance upon the mark.

It has always been difficult to obtain a conviction under the Merchandise Marks Act. But the new proposals do spread the net wider, in order to take account of refinements in manufacturing (and advertising) technique; and it should protect the public more effectively—provided always that someone can be found to initiate prosecutions that become necessary. The Board of Trade has the authority to do so, but seldom appears to exercise it. Under the revised act, the British Standards Institution will be able to take action should any manufacturer use the BSI mark when he was not entitled to do so. But if neither of these bodies are concerned to "police" the new regulations, the Retail Trading Standards Association is the only body likely to take such action. This organisation is supported by the retail trade and by some manufacturers, but not by the government; it may or may not be able to afford such prosecutions. The new act provides for rather stiffer fines than in the past, but says nothing about costs. Such cases are not cheaply prepared or cheaply fought.

"Hard" Capital for the Sterling Area

Since the plans for Commonwealth development sketched out at the recent Prime Ministers' conference must depend, in part at least, on the flow of capital from hard currency areas to sterling countries, any news of loan operations of this kind is doubly welcome at the present time. Two such operations have been announced in the past week. The first of these is a Swiss credit for Sw. Frs. 30 million to the South African Government. This does not represent fresh money; it is a partial renewal of a banking credit of some Sw. Frs. 36 million made nearly three years ago to the South African government by a syndicate of Swiss banks. This credit was for two years, with an option to renew for a third year; as this option was exercised, the credit will fall due in the early part of next year. While Mr Havenga was in London recently he entered into negotiations for its renewal. He found that three large Swiss deposit banks were prepared to renew their respective tranches of Sw. Frs. 10 million each, but that the smaller banks that took part in the original transaction wanted repayment of their quotas (amounting in all to some Sw. Frs. 6 million). The Sw. Frs. 30 million that has been renewed will be for two years with the option of a third year renewal, as in the case of the original credit. This credit is without strings, and is not specifically attributed to any commercial operation or capital development.

The second and more substantial operation is a \$31.5 million loan from the World Bank to the Indian Iron and Steel Company Limited. The loan will help the company to carry out a five-year project that is so designed to more than double its present blast furnace capacity of 640,000 tons a year and to increase its finished steel capacity from 350,000 to 700,000 tons annually. This loan covers one of the pro-

jects studied by the World Bank mission that visited India earlier this year and is the bank's fourth loan in India; it follows upon previous loans of \$31.2 million for railway development, \$18.5 million for power and irrigation, and \$7.5 million for land clearance in Central India. This fourth venture blazes a new and interesting trail since it is the first made by the bank directly to a manufacturer. When the bank has lent funds for private manufacturing enterprise in the past, it has done so by making loans to intermediary borrowers, such as central or development banks that have re-lent the proceeds to these enterprises; this latest loan, which has a term of fifteen years, will be made direct to the Iron and Steel Company, although—as is necessary under the bank's articles of agreement—it will have the guarantee of the Indian Government.

Stronger Tea

Tea prices, which signally failed to revive following the end of rationing in this country in September, now seem to be making a slight recovery. At the London auctions this week prices were 2d. to 6d. a lb dearer than during the previous week. Demand had been particularly weak in recent months, for when rationing ended housewives and trade alike had tended to consume their stocks. As a result tea was being sold in London at prices well below the cost of production and freight. Now the period of adjustment seems to be passing—wholesalers report increased business and are therefore buying slightly larger quantities.

This improvement in demand has coincided with an improvement in the quality of tea offered at the sales. Prices for lower grade teas have been particularly poor this season; some months ago, when it seemed that the Indian crop this year might be some 40 million lb higher than last year's, the Indian growers decided to pluck the bushes more finely. As a result the quality of the output has improved but the quantity has decreased sharply; it now seems that when the crop year ends in April the world crop will in fact be smaller than last year. Nevertheless, the North and South Indian producers have decided on a voluntary restriction scheme to reduce next year's crop by 8 per cent, from 620 million lb to 570 million lb. In addition about 80 tea gardens have already notified their intention to close down as prices are insufficient to cover their costs. The government of India is deeply concerned at the plight of the tea industry. An official team that had been investigating conditions issued its report last month and recommended various measures of financial relief for tea growers. The report has not yet been adopted by the government, but in the meantime the government has granted a postponement in the time at which the tea excise duty is due to be paid. In Pakistan the government has suspended the tea duty for a further three months.

The Ceylon tea growers have not been so badly hit. This year's Ceylon crop is likely to be smaller than the record levels of the last few years. Ceylon tea tends to be of better quality and it has sold well in London this year. Yet Ceylon apparently intends to restrict the quantity of better quality tea that it will send to London in the future—a proposal that the trade in London considers to be a mistake.

Increasing Nickel Production

World production of nickel is still insufficient to meet the current requirements of defence, stockpiling and civilian needs, and the metal is one of the remaining half-dozen still allocated by the International Materials Conference. It is not surprising therefore that producers are pressing ahead eagerly with exploration for new nickel deposits in various parts of the world and with the development of existing mines. The giant in this field is the

International Nickel Company of Canada, which produces 90 per cent of Canada's, and over 80 per cent of the free world's, annual output. This company's \$150 million expansion programme at its underground mines in Northern Ontario is due for completion next year; the programme, which is entirely financed out of the company's own resources, should provide International Nickel with an annual capacity of 13 million tons of ore from underground operations and thus should ensure that it will be able to maintain its present annual output of about 250 million lb. of refined nickel for some years to come. Canada's second largest nickel producer, Falconbridge Nickel Mines, also has a development programme in hand in Northern Ontario and hopes to reach an annual nickel output of 35 million lb by 1954; while Sherritt Gordon Mines are developing nickel-copper deposits in Manitoba and expect to complete a new refinery (with an annual capacity of 17 million lb) next year. Outside Canada, a United States aided project in Cuba is expected to produce 30 million lb of nickel next year and the French firm of S. A. Le Nickel (operating in New Caledonia) has brought its production up to 14 million lb yearly and is modernising its plant. New projects elsewhere are at a preliminary stage.

Despite this actual and pending increase in production, nickel producers do not seem to fear any serious drop in demand when rearmament production tails off. Government stockpiling may continue for some considerable time, and, as restrictions on the use of nickel and nickel alloys are removed, the metal should find a ready market for its traditional uses in the steel industry for hardening and resistance to rust. Recently many of the metal-using industries have been obliged to use substitutes, but in his year-end review Dr John F. Thompson, chairman of the International Nickel Company, expresses his confidence that most of them will be glad to return to nickel when they can.

Atomic By-Products

There is a widespread feeling among scientists that greater use could be made in industry of materials made radio-active by exposure in an atomic pile. Understandably enough, the principal use of these materials is for "tracer" work. Being chemically identical with the normal atoms of the same element, radio-isotopes will behave in precisely the same fashion. But since they give off radiation, their course can be traced by ordinary Geiger counters, whether they are undergoing a chemical reaction, being absorbed into human tissues, or simply travelling down a pipe. This gives the research worker a laboratory tool of immense value, but there is no reason why the same property of giving off easily recognised and measurable radiations should not be exploited in routine industrial operations. A number of papers on the use of these isotopes presented at a conference at Oxford in the summer of 1951 have just been published.* Their subjects range from measuring techniques to process control, the elimination of static electricity and radiography. With the exception of radiography, which is simply a convenient method of non-destructive inspection of objects that it is either impossible or inconvenient to bring to a high-powered X-ray, the applications described were for the use of radio-isotopes in production processes in a wide range of industries, including chemicals, textiles and steel, where they would appear to be of immediate practical value.

The accompanying table shows the number of packages despatched from Harwell, where the radio-active materials are taken straight from the atomic pile, and from Amersham where, when necessary, these isotopes are incorporated into a specified chemical compound. By comparison with other users, mostly laboratories, the number sent to industry is small. Some, at least must find their way into industrial research laboratories while the greater part are known to be

* Radioisotope Techniques. HMSO. 25s.

used for radiography. The comparison suggests, at the very least, a remarkable lack of appreciation in industry of the potentialities of this new and inexpensive tool (consignments from Harwell cost an average of £20, those from Amersham,

	DELIVERIES OF RADIO-ACTIVE MATERIALS JANUARY-SEPTEMBER				
	Total	Export	Hospitals	Government and Universities	Industry
From Harwell...	7,247	2,433	2,392	790	396
From Amersham (March-Sept.)...	310	151	23	88	33

£100 to £150 and equipment costs are small) that may in part be explained by the absence of qualified physicists in all but a handful of organisations or, perhaps by the exclusion of industry from any spheres where it might have an opportunity for becoming more familiar with the practices and techniques of nuclear physics. Many of the isotopes used in laboratory and clinical work have a short working life sometimes measured only in hours. But many that can be used in industry have an effective life of 4 years, and sometimes of 5,000 years, except where a rapid disappearance of radiation is essential, as in surface coatings. This may affect the volume of demand, but it does not wholly excuse its low level.

* * *

Loans Save Little Fuel

This has not been the easiest of years in which to promote schemes for fuel economy in industry. Many industries have been producing somewhat less and therefore requiring less fuel. During the mild 1951-52 winter, distributed stocks of coal did not decline by nearly as much as would normally be expected. By the late spring, too, it was obvious that coal was no longer scarce; temporarily or not, there was fuel to spare. As a result, industrial customers did not hasten to replenish their stocks until the cold spell began. And it would have taken more than the careful conclusions of the Ridley report to galvanise them into any anxiety to go out and buy new boilers.

Even given these unpromising circumstances, it is difficult to believe that the Minister of Fuel's one daring blow for fuel efficiency—offering £1 million a year in loans at commercial rates for industrialists prepared to invest this borrowed money in "approved fuel-saving appliances"—would ever have had much effect. Up to the middle of this month, less than £26,000 had in fact been lent—to only three industrialists. There were a few more borrowers in the offing, and negotiations were in progress on loans amounting to about another £103,000. Most industrialists can find more remunerative purposes than this for funds that they borrow at commercial rates; it is only in a very few industries that fuel costs are a significant item, and most of these already pay attention to fuel saving. If this scheme is to be effective, it needs amendment. And there are some signs that the other ideas accepted by the Minister—such as an advisory service run by industry itself—are not arousing much enthusiasm among industrialists.

Shorter Note

The International Materials Conference has announced its allocations of copper, molybdenum and sulphur for the first quarter of 1953:

	Copper (metric tons)	Molybdenum (metric tons)	Sulphur (lengths)
4th quarter, 1952.....	747,655	5,680	1,650,130*
1st " 1953.....	723,080	6,134	1,675,100

* Quarterly rates. Allocation was 3,300,260 tons in the 2nd half 1952.

Britain will be allocated 1,800 tons less copper, 90 tons more molybdenum and (at a quarterly rate) 14,000 tons less sulphur than in the current quarter. The fall in copper allocations is due partly to lower requirements and partly to more realistic supply estimates.

COMPANY MEETINGS

BERKELEY PROPERTY AND INVESTMENT COMPANY

ANOTHER SUCCESSFUL YEAR

PURCHASE OF SUBSTANTIAL CANADIAN INVESTMENT

MR PHILIP B. FRERE'S SPEECH

The twenty-eighth annual general meeting of the Berkeley Property and Investment Company, Limited, was held on December 19, 1952, at 16 Berkeley Street, London, W.

Mr Philip B. Frere, MC, the chairman, presiding, said: Ladies and gentlemen,—When we last met, just under a year ago, our former chairman, General Dawnay, was gravely ill and I conveyed to him on your behalf a message of sympathy. Most of you will be aware that he died during January of this year—and, in formally reporting to you today this sad outcome of his illness, I would like, and I feel sure also that you would wish me, to pay a tribute to his memory.

General Dawnay occupied a distinguished position in the City of London, where he was widely known and highly respected for those rare qualities, of wisdom, knowledge and understanding; these gifts, his wise counsel and his wide experience were nowhere more valued than by his colleagues in this company, to which over a long period of years he rendered outstanding service.

A YEAR OF SUSTAINED PROGRESS

Turning now to the accounts which you have before you, I think I may fairly say that we have had another successful year. The profit before taxation has risen to just under £201,000, the precise increase over last year's figures being £15,876. Bearing in mind that last year's profit was itself a record and some £43,000 more than the year before, you will see that the new administrative policy adopted some three years ago, and since then energetically put into effect, continues to bear fruit. This sustained progress is particularly noteworthy in a year such as that under review, when conditions in the property world have been markedly difficult. Taxation inevitably takes the lion's share of our profit—£116,157 this year—and I fear we must recognise that the possibility of any reduction in the foreseeable future is remote.

You will see that we make a small transfer of £1,995 to our general reserve to bring the figure in the holding company to a round sum, and that after writing off small balances of preliminary expenses in some of our subsidiaries we are left with a net surplus of £82,088, to which must be added the amount brought forward from last year of £44,140, making a total of £126,228. From this must be deducted the cost of the preference dividend amounting to £21,656, leaving available a balance of £104,572. Out of this balance we propose to repeat last year's dividend of 8 per cent on the ordinary stock, leaving us to start our new year with a carry forward of £75,130, which is practically £31,000 more than the corresponding amount last year.

BALANCE SHEET CHANGES

Turning to the balance sheet, you will see here substantial changes, which reflect the disposal of certain of our United Kingdom properties in order to finance the acquisition of our important Canadian subsidiary, the North of Scotland Canadian Investment Corporation, and of other investments of lesser significance in this country. The Canadian acquisition was announced in the press at the time, but you will, I feel sure, wish me to give you some further details, and this is the appropriate time to do so.

I said just now that the past year has been a difficult one for the property world. It has: and there seems little chance of things getting any less difficult for some time to come. The conditions favourable to property investment are, essentially, freedom to borrow, and a low and, if possible, a falling rate of interest. The conditions we in fact have to endure, and are likely to have to endure for a long while, are precisely the opposite—the most stringent restrictions on borrowing and a high and maybe rising rate of interest. These factors led your directors to the view that the time had come when we should realise a substantial part of our United Kingdom holdings and reinvest the proceeds where they could be employed in conditions more favourable to our type of business, and at the same time provide a desirable spread both in the character and the location of our capital security.

CANADIAN PURCHASE

Our Canadian purchase provides the means: we consider ourselves more than fortunate to have found this company and to have been able to negotiate the purchase, and I personally wish to pay a very warm tribute to our managing director, Mr Bloomfield, and our deputy chairman and finance director, Mr Frew, to whom the credit for this achievement must be given, and upon whose shoulders the main burden of the exacting work necessarily fell. Their services to the company, both over here in the earlier stages and subsequently in Canada, deserve our warmest thanks.

You now own through the Canadian subsidiary a large fund in Canadian dollars, securely invested in land and Government bonds available for our participation in the immense possibilities of that great country. The Dominion of Canada as the whole world knows is possessed of natural resources of quite exceptional richness, the development and exploitation of which has only just begun: a great and a prosperous future undoubtedly lies before her.

CANADA'S POTENTIAL WEALTH

But I would stress to you here, today, that it is upon the future in Canada rather than the immediate present that we should found our anticipation of profitable return—that this investment is of a long-term rather than a short-term character. Canada needs very large sums indeed of capital to develop her vast potential wealth: she is in equal need of men—of population. Only with the building up of these two essential elements can she attain to that high degree of commercial prosperity to which she is destined by virtue of her mineral and other wealth. Such a building up is not accomplished within one year or in two—it is a much more lengthy process; and in the meantime caution must be the watchword where investment is concerned. But given this element of caution and careful judgment, given the ability to take the longer-term view, we, your directors, are confident that your Canadian subsidiary will in the years to come prove itself to be a valuable and rewarding investment.

For practical reasons of management and direction, no less than for fiscal reasons, it is desirable that the board of our Canadian

subsidiary should be autonomous and distinct from the board of the parent company—that it should have the status of an independent body directed and controlled by Canadian nationals of standing and experience. I am glad to tell you that leading members of the Canadian legal and accountancy professions have accepted office as directors and that in our view these gentlemen will bring to the board of our Canadian subsidiary precisely those qualities which we consider to be essential to its success, together with a close knowledge of local affairs and conditions.

EFFECT ON INCOME POSITION

One word about the probable effect of this substantial change of investment upon our income position in the current year and in the immediate future. It is likely that our income from this particular source—our Canadian subsidiary—will temporarily be less than the income from the investments which it replaces; so that during the current year our purely investment income may show a reduction. Against this, we are confident that our other sources of income—in particular income from trading operations of our subsidiaries—will more than compensate for any reduction under the former heading; so that the final result in our profit and loss account will be not less favourable than it is at present.

To return to the balance sheet—you will notice a substantial increase in current liabilities and a corresponding increase in current assets: the reason for this is that, at the date of the balance sheet much of the purchase price for the Canadian company was unpaid, much of the purchase price of the properties disposed of had not been received. The large balances arising in this connection, debit and credit, have since the date of the balance sheet been very largely eliminated and will have been completely liquidated within the next few days.

SUBSTANTIAL CAPITAL SURPLUS

There is nothing further in the balance sheet to which I need draw your attention—the comprehensive notes, which form part of the accounts, will be found to provide explanations where the figures themselves need amplification.

There is, however, one matter to which I would like to refer before closing, namely, the substantial capital surplus arising from the sale of our United Kingdom properties to finance the purchase of the Canadian subsidiary; you will remember that some two years ago we had a revaluation of all our properties which showed a figure considerably in excess of book values. I would like shareholders to know that the properties sold realised a figure substantially in excess of the valuation made two years ago, which is more than satisfactory when it is remembered that during the last twelve months the property market generally has suffered a sharp recession.

I have already expressed our special indebtedness to two of our directors: but I cannot conclude these remarks without a tribute to our administrative staff, whose loyal and devoted work during the year has materially contributed to the satisfactory

results which it has been my privilege to place before you.

The report and accounts were unanimously adopted.

NEW ZEALAND LOAN AND MERCANTILE AGENCY COMPANY, LIMITED

MR MICHAEL G. H. BROWN'S
SPEECH

The fifty-eighth annual general meeting of New Zealand Loan and Mercantile Agency Company, Limited, was held, on December 19th, in London.

Mr Michael G. H. Brown, the chairman, who presided, in the course of his speech, said: You will have seen from the press that the price of wool is holding up well. If present prices are maintained and the whole of the expected clips in Australia and New Zealand are disposed of, these two countries should receive a very satisfactory income from their exports. In the four months from July to October, 1952, Australia had a favourable trade balance of £62½ million in Australian currency, against a deficit of nearly £177 million in the same four months of 1951. Similar figures for New Zealand are not yet available for this period, but with higher prices for meat and dairy produce they should be showing the same trend.

The Australian figures show a very remarkable improvement and leave one to hope that the severe import restrictions in both countries may soon be further relaxed. If they are, then we should benefit, particularly in our merchandise departments.

SEASONAL CONDITIONS

In Victoria and New South Wales seasonal conditions are favourable. There is a good body of feed almost throughout these areas, and stock is in good condition. With certain exceptions, the south and central districts of Queensland have also had good weather, but the north-west is still suffering from a most severe drought. In New Zealand there have been heavy rains for the last five weeks which have delayed shearing and retarded the fattening of lambs. There is, however, an abundance of feed, and if the sunshine, which is expected, comes the prospects will be good. Dairy production to date is running at record figures.

As we know to our cost in this country, the weather can change rapidly. Australia has, on the whole, had good weather conditions now for some six or seven years. It would be unwise, however, to assume that the era in which that part of the world was liable to spells of bad weather has passed. Against this, there is no doubt that these countries have greatly improved their ability to withstand bad weather conditions, by improving their lands, by increased water facilities, and by continually improving technical knowledge.

We tend in this country only to hear the surprising items of news from the other side of the world and not to hear about the regular day-to-day affairs. In the past year, the main items of news were of credit restriction, severe import controls, bush fires, floods and droughts. Although these have hit many individuals very hard indeed, both countries, as a whole, have carried on a regular and even prosperous economy. Provided they will really face up to their high cost structures, particularly in Australia, I know of no reason why they should not continue, with some ups and downs, to expand their economies.

The report and accounts were adopted.

COMBINED EGYPTIAN MILLS LIMITED

(Cotton Spinners, Manchester)

YEAR OF TRADE FLUCTUATIONS

SIR JOHN REYNOLDS ON THE OUTLOOK

The twenty-third ordinary annual general meeting of Combined Egyptian Mills Limited, spinners of cotton and synthetic fibres, was held on December 22nd in Manchester, Lt.-Col. Sir John Reynolds, Bart., MBE, JP (the chairman), presiding.

The following is an extract from his circulated statement:

The gross trading profit for the year is £1,703,384 compared with £2,507,964 in 1951. Provision for taxation at £861,000 (against £1,315,000) does not include anything for excess profits levy, since the board is advised that the year's profits will not attract liability to this tax. The board believe that despite their fall, the profits of the year justify them in recommending payment of the same dividends as last year, namely, 8 per cent on the ordinary stock and 7½ per cent on the preference stock, but this should not be taken as an indication that these rates can necessarily be maintained for the current year. In addition a further £200,000 has been placed to the general reserve, thus raising this reserve to £1 million. The remaining balance of £141,543 has been added to the carry-forward, raising it to £411,322.

For many years your board have been following a carefully planned policy of re-equipment and modernisation and it is their intention to continue. The extent must, however, be tempered by the net means available to us. During the year, £108,421 has been spent on capital additions and, moreover, our plant has been kept in first-class condition by the expenditure of £443,000 on repairs and maintenance. Future commitments on capital account as at September 30, 1952, are £219,000. The high cost of new machinery is retarding our plans for renewals in the progressive way which we feel our business demands. I hope that there will be some early adjustment in values which would encourage us to accelerate our programme of modernisation. The frequent introduction of new fibres has led us to develop a research unit which will allow us to participate in such developments at an early experimental level. The spinning of synthetic fibres may well feature ever-increasingly in our affairs.

SATISFACTORY LIQUID POSITION

The level of stocks of cotton, yarn and sundry stores at £1,772,901, compared with £2,155,765 a year ago, gives some indication of the strong line your board took against spinning yarn for stock. It has not been necessary to use any part of the stock contingencies reserve and the company has been successful in accomplishing the transition from higher prices to the present more moderate levels without suffering any appreciable losses on stock. We have thus been able to end the year with a satisfactory liquid position—£1,575,193 cash and £2 million tax reserve certificates. The tax reserve certificates cover our tax liability to September 30, 1952 (payable January, 1953, and January, 1954), and we are, therefore, in a position to finance out of our own free resources a return to full trade.

HISTORY OF RAPID FLUCTUATIONS

The history of the year's trading is a history of such rapid fluctuations in trade as can seldom have been seen before.

At one time during this year, trade was worse than ever experienced in the history of your company.

Lancashire's exports of yarns which, unfortunately, have shown a decline since the peak postwar year 1949, were very severely hit by this general world depression. While it may be too early to record a definite turn in trade, domestic textile industries in many countries are now showing increased activity, in common with our own. This is already reflected by the recent improvement in our yarn sales overseas. Your company continues to foster its valuable export trade, and to guard the good name of its high-quality yarns which are known the world over.

Our order book, in common with other spinners in our section of the industry, is not on as high a level as we would wish, and our weekly return of spindles actively working is still well below normal, and much further recovery must be made in the coming year if the figures of 1952 are to be equalled.

GOVERNMENT'S TASK

Cure for our ills is not simple, and the greatest enterprise and skill will need to be used if the known retraction in international world textile movements is not to force Lancashire to eventual reduction of spindleage.

The only useful long-term policy which any government can pursue is first to reduce the burden of taxation, and secondly, to protect markets, not so much against competition as against unfair competition.

Further improvement in the trade's efficiency requires two things: (1) availability of money to modernise machinery and (2) re-deployment of labour to make full use of the new machinery thus installed.

Availability of money is the major target which the government should have in mind. This may be achieved either by direct subsidy, as was done by Sir Stafford Cripps under the Cotton Spinning Re-equipment Subsidy Act, or by a common-sense readjustment of the basis of company taxation.

THE CURRENT YEAR

Of the coming year I speak with great hesitation. October opened with earnings showing but a very modest measure of profit. Since then an improvement in trade has been experienced and more spindles, I am glad to say, are now at work although on a much lower profit margin than a year ago.

It is my personal belief that the steady improvement from the worst is likely to continue, that home-trade (in retail circles) is not grossly over-stocked, and that the home-market will before long become once again a substantial buyer in Lancashire. Further, our position has clearly improved with the decline in the price of high quality cotton to a more sensible level. If I am right in anticipating a recovery in the home market, a reasonable year's trading may be expected, but in this I am in the realms of prophecy and trends of trade cannot easily be foreseen, even by the wisest and best informed of planners.

The report and accounts were adopted.

BROWN BAYLEY'S STEEL WORKS LIMITED

REVIEW OF A DIFFICULT YEAR

MR J. W. GARTON'S STATEMENT

The thirty-fourth annual general meeting of Brown Bayley's Steel Works Limited, was held on December 19th in Sheffield, Mr J. W. Garton (chairman) presided, and made the following statement:

"In regard to the repayment of the preference share capital, I said in the second paragraph of my statement which was circulated with the report and accounts, that the scheme for such repayment would be in your hands before the end of the year. An essential part of the scheme is the liquidation of The Farnley Iron Company Limited, but it was not considered advisable to put this company into liquidation until your company had purchased the outside shares in Farnley. This purchase was completed on December 8th, so that we are now in a position to proceed to finalise the scheme. It is, of course, necessary on a repayment of capital to obtain an Order of the Court to convene the necessary meetings of the classes of shareholders, but it has not proved possible to finalise the scheme in time to obtain the necessary Court Order before the Court sittings end today. However, the necessary applications to the Court will be made as soon as possible after the Court sittings commence on January 12th, and unless any unforeseen difficulties arise, I can assure you that the proposals will be sent out by the end of January."

The following is an extract from his circulated statement:

The year under review covers the first complete twelve months' period of this company since its steel making subsidiary Brown Bayley Steels Limited was transferred to national ownership.

As is our custom, the consolidated accounts of The Hoffmann Manufacturing Company Limited for the year ending December 31, 1951, are circulated with this statement, and also I have received permission from The Iron and Steel Corporation of Great Britain to circulate the accounts of Brown Bayley Steels Limited for their first period to September 29, 1951. You will see from these accounts that the companies are still very profitably employed and there would seem to be no reason why for some time this should not still be the case.

The directors have, during the year, appointed to the board Mr E. Lawrence N. Tuck; LL.B., a partner in the firm of Godden, Holme and Co., solicitors, London. I have known Mr Tuck for many years and he has had considerable experience in the affairs of The Hoffmann Manufacturing Company Limited, which is your company's principal subsidiary. His great knowledge will be of assistance to us during the next few years. Mr Tuck's appointment will come before the meeting for confirmation in the usual way.

Mr Fred Atkinson has been a director of your company for many years in a technical and commercial capacity and having now attained the age of 70, retires in accordance with Section 185 of the Companies Act, 1948. I should like to put on record our appreciation of the valuable services Mr Atkinson has rendered to your company over many years.

FINANCIAL FIGURES

The balance sheet of the parent company shows further additions to our holding in The Hoffmann Manufacturing Company

Limited, which has been achieved by utilising surplus cash and certain investments of the Farnley group. This has, of course, resulted in an increased amount due to subsidiary companies. During the year there has been a fall in the value of gilt edged securities and this is reflected in the lower market value of the company's holding of £1,128,750 British Iron and Steel 3½ per cent guaranteed stock, 1979-81; this is the total original stock issued to the company by way of compensation for its steel interest, the income from which has been used for the payment of dividends.

The consolidated balance sheet again excludes The Hoffmann Manufacturing Company Limited group whose consolidated accounts for the year to December 31, 1951, are separately produced as part of this report. The purchase of further shares in The Hoffmann Manufacturing Company Limited referred to in my previous statements is clearly reflected in the accounts.

In the consolidated profit and loss account, last year's figures have been adjusted so as to eliminate all items referring to the assets sold to Brown Bayley Steels Limited on January 8, 1951, except that the £33,090 retained for dividends to February 14, 1951, has been added to the net profit after taxation. The fall in the trading profits from £126,528 to £90,363 refers almost entirely to subsidiary companies and will be the subject of later comment. A full year's interest on iron and steel stock as compared with 5½ months in the previous year is chiefly responsible for the large increase in investment income. The additional holding in The Hoffmann Manufacturing Company Limited together with an increased dividend accounts for the extra income from this subsidiary.

Our taxation advisers are of the opinion that there will be no liability to excess profits levy for the seven months' period from January 1, 1952.

SUBSIDIARY COMPANIES

The Hoffmann Manufacturing Company Limited, as you will see from their accounts, have had another successful year and the demand for their products remains at a very high level.

The South African company's trading profit fell by £13,537. This company is a selling organisation and the fall in profit is entirely due to difficulties experienced by its main supplier, Brown Bayley Steels Limited, in obtaining licences to export steel from the United Kingdom. With regard to The Taylor Rustless Fittings Company Limited, which is the stainless steel fabrication works in Leeds, shortage of supplies of suitable sheet steel has limited the turnover and has, therefore, resulted in a smaller profit. However, the position of both these companies continues to give satisfaction.

BROWN BAYLEY STEELS LIMITED

The accounts of this former subsidiary company, circulated with this statement, represent the steelmaking assets of the group vested in the Iron and Steel Corporation of Great Britain on February 14, 1951. They show highly satisfactory results with a trading profit on an annual basis of £821,816 compared with £774,932 for the year to July 31, 1950. It is interesting to note that out of the net profit after taxation of £264,374 there was retained in the business £245,856.

GENERAL

Once again I must say that it is very difficult to forecast the future of your group and I can only assure you, as I have done before, that during the time of this uncertainty, any dividends received by this company from the trading companies of the group will be handed to the shareholders and that the company will continue to operate at the smallest possible expense.

You will appreciate that it is impossible to take any definite decision as to the future until it is decided whether the steelworks can be repurchased or not, but when this is known, your directors will submit proposals for the future of the company as quickly as possible.

The report and accounts were adopted and Mr J. S. Ridges and Mr E. L. N. Tuck, the retiring directors, were re-elected.

HEENAN & FROUDE, LIMITED

ANOTHER SATISFACTORY YEAR

The fiftieth annual general meeting of Heenan & Froude, Limited, was held on December 22nd at Worcester. In the unavoidable absence of Mr Alah P. Good (chairman), Sir Richard A. Pease, Bt, presided.

The following is an extract from the chairman's circulated statement for the year ended August 30, 1952:

Your group of companies has again had a satisfactory year of trading and all the works have been engaged to capacity. Group net profits before taxation stand at £394,003, compared with £370,851 last year, and after providing for taxation, which takes over 63 per cent of net profits, there is left £144,515, against £140,943.

The balance of orders on the books at the close of the year was well in excess of £5 million, representing yet another record, a gratifying achievement in a year when the sellers' markets which have dominated world trade for a long period have in many cases turned in favour of buyers. Of total orders about one-half is on the books of the parent company and, with the growing competition from other industrial nations making itself felt in engineering, it will be difficult to maintain these peak figures, which are due in some measure to the rearmament programme. The resistance of overseas buyers to price increases is hardening and with foreign manufacturers ready to step in with quick delivery and often lower prices and long-term credits, a continuance of the upward trend in costs at home will soon be reflected in smaller order books.

Your company celebrated its fiftieth anniversary as an incorporated company on March 2, 1952, and the occasion was marked by the distribution of a Jubilee bonus of 2½ per cent on the ordinary shares.

ALL SECTIONS FULLY EMPLOYED

All sections of the company's business have been very fully employed and, notwithstanding the demands made on the design and technical staffs by the inflow of orders, time has been found to maintain the development programme by adding to the range of machines and experimenting in new designs.

The demand for the company's engine test plant was at a high level from both home and overseas markets, and a major advance has been made in the design of a new type of Froude dynamometer capable of absorbing very high powers at extreme speeds. The Heenan Eddy-current Couplings continue to expand into new industrial fields.

In the industrial cooler section orders have increased regularly each year since the war. The automatic machine section has successfully put many new designs into service and offers a very wide range of machines.

The steel scarcity has delayed all contracts in the municipal engineering division, in some cases for more than a year, but it is hoped that steel authorisations will be granted as supplies improve.

Turning to the subsidiary companies, Fielding and Platt Limited have during the year concentrated on the development of improvements to their very wide range of hydraulic presses. The output of malleable and grey iron castings of Court Works Limited reached a new peak. The new building work and re-equipment of W. G. Bagnall Limited at the Stafford Works continued during the year.

Industrial Waste Eliminators Limited effected a substantial increase in deliveries of its abattoir equipment and this increase in turnover has earned a best-ever profit for the year. Further progress has been made during the year on the adjustment of the production lines at the Wishaw Works of Morton Machine Company Limited. Associated Locomotive Equipment Limited have had a satisfactory year and the two remaining subsidiaries, The New Destructor Company Limited and Hyganic Developments, Limited, are not trading.

The report was adopted.

THE INDUSTRIAL CREDIT COMPANY, LIMITED

DR J. P. BEDDY'S REVIEW

The nineteenth ordinary general meeting of The Industrial Credit Company, Limited, was held on December 17th, at the offices of the company, 9, Leinster Street, Dublin.

The chairman, Dr J. P. Beddy, in moving the adoption of the report and accounts, said, *inter alia*:

The total assets of the company appear at £2,844,087. This total is being financed on the basis of a paid-up share capital of £1.5 million. To a very substantial extent the company relies on temporary borrowings. Your directors consider that the company's present borrowings are at too high a level. In contemplating any increase in paid-up capital, however, due regard will be given by them first to the dividend-earning potential of the company and, secondly, to the undesirability of financing temporary and quasi-temporary obligations by permanent capital.

The gross profit for the year at £91,775 shows a reduction of £41,304 from that of the previous year, due principally to a decline of over £90,000 in profits on sales of investments, which decline was partly offset by other items (mainly increased underwriting profits). There was an increase of £36,650 in administrative and general expenses, due almost wholly to the payment of additional interest on borrowings. Were it not for bank and loan interest, the net profit (£32,058) would have exceeded £78,000.

As to the current year, your company is committed to a number of capital issues involving in all over £1.1 million. Already since October 31st your company has sponsored one public issue of cumulative preference shares and ordinary shares, and it is a welcome sign that the ordinary shares were over-subscribed. In the issue of preference shares, however, there are difficulties. While present conditions continue, it is likely that there will be greater resort to issues of participating preference shares.

The report and accounts were adopted.

COVENT GARDEN PROPERTIES COMPANY

YEAR OF RE-INVESTMENT

The twenty-eighth ordinary general meeting of Covent Garden Properties Company, Limited, was held on December 18th, in London, Sir Brian Mountain, Bart. (the chairman), presiding.

The following is an extract from his circulated statement:

The revenue of the company and its subsidiaries for the year, after deducting cost of administration, management and repairs amounted to £443,767 an increase of £20,475 over the previous year. Dividends from subsidiary companies, which are included in the figure of net revenue, show an increase arising from the acquisition of the balance of the ordinary shares of Clarendon Property Company, Limited.

I mentioned last year that your company was in process of acquiring a number of shop and office properties of an aggregate value of £1,500,000. The transaction took the form of the purchase of shares in ten companies owning the properties. The shop properties, which occupy good trading positions, are almost all situate in London and the suburbs and are let to multiple and other established traders. The group also own a number of office properties in the West End of London let to substantial tenants. All these properties were acquired as from December last and from the results to date your directors are satisfied that this investment will prove a satisfactory one.

Your directors decided in March last to sell the property known as Princess House, Oxford Street, for which an attractive offer had been received. Completion of the sale took place on June 24th last. The surplus arising on the sale of the property has been transferred to capital reserve. Certain properties have already been purchased with part of the proceeds of this sale and your board has under consideration at the moment various further proposals for the re-investment of the balance.

THE ACCOUNTS

You will have seen that the properties owned by the group appear in the consolidated balance sheet at almost £9 million. Quoted investments show a reduction of £141,305. This represented the book value of the shares of Clarendon Property Company, Limited, owned prior to the acquisition of the balance of the ordinary shares of that company. The item unquoted investments represented the security realised during the year.

From the gross revenue of the year has been deducted debenture stock interest, amortisation, directors' and trustees' fees and also profits tax and income tax. The figure of taxation amounts to £118,000 for income tax and a further £60,000 for profits tax, an increase in the aggregate of £13,626 over last year. The net profit for the year is £97,114 and there is a balance available of £181,486.

It is proposed to pay a final dividend of 2½ per cent on the ordinary shares, making a total of 5 per cent for the year, leaving an amount to be carried forward of £94,337, an increase of £18,607 over the previous year.

Shareholders will appreciate that the year under review has been one of re-investment and that this will apply also to the current year. Your directors are however satisfied that this redeployment of the company's resources will provide an improved portfolio giving a wider spread of risk and in due course a greater return to the shareholders.

The report was adopted.

REGIS PROPERTY

FURTHER PROGRESS

The fourteenth annual general meeting of the Regis Property Company, Limited, was held on December 18th in London. The Rt. Hon. Lord Kennet of the Dene, PC, GBE, DSO (the chairman), presiding.

The following is an extract from his circulated statement:

The construction and partitioning of the new section of Plantation House was finally completed in 1951. The effect of the completion of this project can be seen in a substantial expansion of income in the profit and loss account. An increase of revenue from offices has outweighed a further rise in outgoings in respect of flats including additional expenditure of £12,341 on their current repairs and maintenance. Against this expansion there is a heavier charge for interest on increased mortgage liabilities, but the result has been a growth during the year of £7,759 in profits subject to taxation, which now stand at £167,112 for the year.

INCREASED NET PROFIT

The net profit of the group has risen by £2,471 to £76,361. The surplus of the year's net profit after deducting the amount provided for deferred repairs has increased from £48,788 to £66,476. This gives clear evidence of very satisfactory progress in the earning power of the company. The progress is not yet ended: office leases entered into prior to 1939 will be falling in during the coming years with further increase in revenue. In view of the strong position the directors recommend a final dividend on the ordinary shares of 11½ per cent, making 16 per cent for the year, as compared with 12½ per cent for the previous year.

Reserves and surplus now amount to £793,362. These reserves, together with the ordinary capital of £400,000, constitute the equity of the company. In view of this position the directors have considered that the issued capital should be brought more into line with the actual capital employed in the business, and they have therefore obtained Treasury consent to capitalise £400,000 of reserves and to make an issue free of charge to ordinary shareholders of fully paid shares on a one-for-one basis. Shareholders should not assume that amounts distributed as ordinary dividends will be increased as a consequence of this.

FINANCIAL RESOURCES

There is a substantial excess of current assets over current liabilities, and of these assets more than £500,000 is held in the form of deposits. £550,000 or more of these resources has been set aside for a further property investment.

The greater part of the company's revenue now comes from office properties. But the company owns 19 blocks of flats, and by far the greater number of these flats are controlled at statutory rents. Each year the cost of upkeep of these properties and the expense of providing services for tenants become more burdensome. It is our policy to maintain these services to the fullest extent practicable in the light of existing circumstances, but I am certain that the majority of our tenants are not under the illusion that expenditure on upkeep and services is adequately covered by the rents of their flats. In fact it is, I think, now recognised that untold harm is being done to the interests of both landlords and tenants by the anomalies of the Rent Restrictions Acts.

The report was adopted and the proposed bonus issue was approved.

NAHUMS HOLDINGS LIMITED

EFFECT OF TEXTILE RECESSION

The third annual general meeting of Nahums Holdings Limited was held on December 23rd in Manchester, Mr Daniel R. Nahum (chairman and managing director) presiding.

The following is an extract from his circulated statement:

Following so closely on the record group trading profit of £207,987 achieved in 1951, it is with regret that I have to report this year that the group has suffered a small trading loss.

The world-wide textile recession is well known to you, and although we have incurred considerable stock losses in common with most other textile businesses, I consider that we have passed through the recent crisis with marked resilience.

The group accounts show a trading loss of £16,063 which is arrived at after making full provision for reducing the stock to market value at June 30, 1952. Furthermore, this loss also takes into account amounts paid to suppliers in respect of the difference between contract price and replacement cost of forward cloth purchases.

I informed you last year that it was the intention of your board to continue to diminish old long-term commitments and to avoid new ones and also to reduce progressively the amount of bank finance employed in the business. I am glad to be able to state that our policy has, in fact, achieved a considerable measure of success in both directions.

IMPROVED LIQUID POSITION

A noteworthy feature of the consolidated balance sheet is the reduction in the value of the stock from £924,192 in 1951 to £571,735 this year—that is a decrease of £352,457. Although this decrease reflects, to a certain extent, the severe fall in textile prices that occurred in the year under review, it can also be satisfactorily recorded that the volume of stock carried was considerably lower than in the previous year. This achievement is mainly the result of successful sales drive campaigns carried out during the second half of the company's financial year.

The improvement in the group's liquid position is also demonstrated by the reduction of £147,835 in our indebtedness to bankers and by the decrease of £86,051 in trade creditors, accompanied by the maintenance of the level of trade debtors.

I hesitate to make any forecast concerning our prospects for the current financial year. The value and volume of the sales orders booked by our cloth companies during the first four months of the year are in excess of the comparative figures for the previous year. The activity of our yarn business has also improved compared with the position six months ago. Nevertheless it is impossible to foresee the pattern of trade that will prevail in our industry several months hence. I can only repeat my statement last year that your group is well placed to take full advantage of any further improvement in trading conditions.

The versatility of your group; the ever increasing sales coverage and sales impetus at home and in the many ramifications overseas; the accent on more original cloth production, as to both design and finish, commensurate with economic price levels—these are the factors upon which we are concentrating as the basis of your group's future.

The report and accounts were adopted.

DENNIS BROTHERS LIMITED

ANOTHER SATISFACTORY YEAR

GRIEVOUS BURDEN OF TAXATION

SIR GEOFFREY BURTON ON INCREASING COMPETITION

The annual general meeting of Dennis Brothers Limited was held on December 19th at the Café Royal, Regent Street, London, W.1, Sir Geoffrey Burton (the chairman) presiding.

The secretary (Mr H. E. Johnson, FCIS) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended September 30, 1952:

I am glad to be able to report that we have again had a satisfactory year, and the net profit is only slightly less at £172,521, as against £176,506 for 1951. Although the turnover is greater, our expenses, in spite of all efforts to effect economies, are still increasing. We have had to face during the past year increases in wages both to the manual and clerical workers, which cannot automatically be passed on to the consumer. In fact, it has been our endeavour, wherever possible, to avoid doing this, and to create fresh savings by increased output per man-hour, and by reducing non-productive expenses in all directions possible.

Stock is down by £40,000, but our debtors have increased by £42,000, tax reserve certificates by £11,000, and the liquid cash position is better by £29,000. It will also be noted that our current liabilities have decreased considerably, our creditors being down by £13,000, and provision for current taxation down £61,000.

TAXATION

At the same time there is no need for me to emphasise that taxation is a most grievous burden on an expanding company, and, in fact, takes 60 per cent of the profits, and prevents all those engaged in our undertaking from enjoying the full fruits of their efforts. In addition, we have to collect from our customers at home large sums in purchase tax—another severe burden. We trust that the Chancellor of the Exchequer will see his way to reduce public expenditure and so enable him to remove the purchase tax now levied on commercial vehicles at the rate of 33½ per cent. Much publicity has been recently given in the press to the necessity of reducing purchase tax on pleasure cars, but little is said about load-carrying vehicles. These are essential to the public, and there is, therefore, a very strong case for removing this burden. I sincerely hope that the Chancellor will take an early opportunity to declare his policy, and so remove the uncertainty which at present exists to the detriment of our order book. The slowing down that has already taken place due to this cause is bound to affect our prospects for the coming year. I have read this morning in the press that the Chancellor only yesterday indicated that he did not intend to consider any change in purchase tax on commercial vehicles before the Budget. This is extremely disappointing. Our immediate difficulties are further increased by the change of policy in regard to nationalised transport, which for the time being has resulted in an almost total cessation of buying on the part of operators.

Depreciation, although calculated on the same basis as in previous years, is lower. This is due to the fact that we have kept our

capital expenditure during the year down to a minimum.

APPROPRIATIONS

Turning now to the appropriation account, the balance brought forward from 1951 is £258,529. To this must be added the profit for the year of £172,521, making a total of £431,050. We have paid an interim dividend of sixpence per share, less income-tax, amounting to £19,720, and we now recommend a final dividend of two shillings, less income-tax, which will absorb £78,880, and this will leave a balance of £332,450. Owing to unforeseeable possibilities in connection with stock, plant replacement and overseas commitments, we have thought it best to carry this sum forward rather than appropriate it for some specific purpose.

A Commercial Vehicle Exhibition was held this year at Earls Court, and it was agreed on every hand that the stand of your company was one of the most attractive in the show. We displayed, among other models, an entirely new goods-carrying and passenger vehicle, and from the interest shown and the inquiries received we are hoping for good results once we get into production which, with the still restricted supply of materials, is, unfortunately, a slower process than we like. The material position is not at all happy, both in the matter of supply and in some directions increased prices. Certain controls have gone, but there are others that have still to be dealt with.

The doctrine that, because the demand for a certain raw material appears to some extent to exceed the immediate supply, it is necessary rigidly to control the whole distribution, is in my opinion quite unsound. I am confident that the advantages that would accrue to industry by freeing the material from this rigid control would far exceed the temporary difficulties that might be met. This applies particularly to steel.

EXPORT TRADE

The Government is continually pressing for increased exports, and rightly so, but to accomplish this we must reduce our costs. The competition we now have to meet from other countries is much more severe, coupled with the fact that currency and the restriction of import licences is closing markets against us. In point of fact the outlook for export business is not at all bright, although I am pleased to say we have maintained our standard during the past year. During the period our executive directors have visited Spain, Portugal, Holland, Irak and Yugoslavia, and we are continually seeking new markets.

The fire engine and municipal vehicle departments of your business have both had successful trading results, though competition is steadily increasing. The municipal vehicle section especially is meeting strong competition both at home and abroad. We are not afraid of this competition—in fact we welcome it. It is a challenge, and we readily accept the challenge. Competition acts as a stimulant to better products, improved design, methods of production and marketing, and last but not least to lower costs and prices. These are among the great benefits which private enterprise can confer. Such an urge quickly disappears when an

industry is nationalised, and no longer has such competition to face.

THANKS TO EXECUTIVE AND STAFF

I have the honour to be chairman of your board, which as you know includes the top executives of the company. These men are responsible for the daily administration of your company and its various departments. They are doing a great job, and you can be sure that your interests could not be in better hands. To the remaining staff and work-people who comprise your company, I would like to offer our thanks for their loyal, unselfish and successful efforts during the year.

The report and accounts were adopted and the final dividend of 2s. per share, making 2s. 6d. per share, less tax, for the year, was approved.

The retiring directors, Sir Geoffrey Burton, Mr N. P. Andrew and Mr R. E. Dennis, were re-elected and the remuneration of the auditors, Messrs Gane, Jackson, Jefferys & Freeman, having been fixed, the proceedings terminated.

THE ROVER COMPANY

TURNOVER AGAIN INCREASED

The fifty-seventh annual general meeting of The Rover Company, Limited, was held on December 19th in Birmingham.

Owing to the indisposition of the chairman, Mr E. Ransom Harrison, FSAA, Mr H. Howe Graham, FCA, presided.

The following is an extract from the chairman's circulated statement:

I am pleased to report that during the year under review we have again increased our turnover both in value and in the number of vehicles sold. Our export sales for the year also reached a new record despite the fact that several of the principal overseas markets have during the year severely curtailed their purchases of motor vehicles.

During the greater part of the year costs continued to rise, but in the main these increases have not been passed on to our customers, and we have, therefore, had to work to lower profit margins. Although increased competition and restrictions abroad necessitate working to smaller profit margins, the Government take an increasingly large proportion of our trading profits in the form of taxation.

To take care of the expansion in our output referred to above and to allow for further expansion as and when this can be achieved we have purchased during the year additional factory space. We have also been fortunate in acquiring the premises adjoining our London repair department which will enable us to provide increased service facilities for our customers in the London area.

Development of the gas turbine car has continued during the year, and last June we established a speed record of over 150 miles per hour in Belgium which has been officially recognised as the first world record for cars driven by this type of engine.

It is still not possible to forecast when gas turbine cars will be sold in quantity commercially, but we are finding that there is likely to be a market for small gas turbine engines for industrial and service purposes.

The surplus on trading and management fees for the year of £1,401,889 is approximately £100,000 less than the figure last year despite the increased turnover, and reflects the smaller margin of profit on which we have had to work. The net profit amounts to £313,300 as compared with the figure last year of £258,030. After bringing in the balance from last year's account, there is a total available for disposal of £401,562 out of which the directors recommend a final dividend of 1s. per share less tax, making a total distribution for the year of 2s. per share less tax. There is a balance carried forward to next year's account of £101,186. The report was adopted.

BRITISH OVERSEAS MINING ASSOCIATION

MR R. L. PRAIN'S SPEECH

The seventh annual general meeting of British Overseas Mining Association was held on December 17th, at Selection Trust Building, London, EC.

Mr R. L. Prain, OBE, president, was in the chair.

The president, in the course of his speech, said:

TAXATION

The industry's greatest handicap remains the inequitable and overburdensome taxation imposed in this country. It has been intensified during the year by the introduction of the excess profits levy. As you will know from the Council's annual report, this association played its full part in obtaining substantial modifications to the original proposals, but the levy remains ill-conceived in principle and exceptionally onerous in practice.

Various provisions affecting mines, such as those of the Income Tax Act, 1945, have been introduced into the United Kingdom tax legislation during recent years, but, valuable as they are within their limited scope, they remain quite inadequate to ensure the survival of the industry in competition with its rivals in other countries.

Our fiscal code lags far behind those of the other countries with important mining interests in its recognition of the special problems of the mining industry. For example, in the United States of America, Canada, Australia and Southern Rhodesia, there are systems of percentage depletion allowance. This is one of the most valuable forms of relief and of encouragement which can be given to a mining industry. In South Africa and South-West Africa there are important provisions enabling new mines to amortise the whole of their capital expenditure before paying any tax, while in Northern Rhodesia substantially the same legislation has recently been introduced.

In the light of the increased cost of equipping new mines to which I have referred, these allowances have a special value. In South Africa, Southern Rhodesia and Northern Rhodesia the equitable principle has been adopted that only those profits derived from or accrued in those countries are taxable there, so that no additional taxation is levied on profits brought in from overseas.

OVERSEAS OPINION

We have none of these things in the United Kingdom. This is resented abroad, where the countries whose mines are owned by British companies see the financial strength of their mining industries continuously sapped to meet tax liabilities in the United Kingdom.

A striking example of this can be seen in the recent introduction of percentage depletion in Southern Rhodesia. The Minister of Finance, in announcing that allowance, made it clear that it was to be restricted to Southern Rhodesian companies or to overseas companies whose own governments gave similar reliefs. Thus a Canadian or United States company would obtain a depletion allowance in Southern Rhodesia which is denied to United Kingdom companies. For companies in this country to be under such a competitive handicap cannot be consistent with an enlightened policy of colonial development.

The development of new overseas mines from this country is now virtually prohibited by our tax system. The long-term effect on our national economy of this strangling of one of our most important industries can only be most damaging.

CHANGE OF DOMICILE

The burden which our tax code places on British companies operating overseas is so severe that it led a previous Chancellor to introduce the much criticised provisions which have now been embodied in Section 468 of the Income Tax Act, 1952.

These provisions seek to retain for the United Kingdom a relatively small fraction of revenue, which in my view is likely to be more than offset by the losses rendered by the repressive effects of the section. They can only result in a diminution of this country's influence over both existing and new sources of raw materials. It is difficult to overstate the harm which the provisions are doing to our relations with overseas territories both within and outside the Commonwealth.

NEED FOR URGENT LEGISLATION

The association has referred to all these tax difficulties in its memorandum to the Royal Commission on Taxation and we hope soon to give oral evidence before that body. The Royal Commission, however, have to sift an enormous volume of evidence on all aspects of our appallingly complicated tax laws, and it will be a very long time before their report is published. It will be still longer before any of their recommendations can be implemented.

This delay occurs at a crucial time in our economy and its dangers to the overseas mining industry are evident. It is our responsibility and our duty to do all we can to convince our financial authorities of the urgent need to change the laws governing the taxation of this industry.

The report for the year ended September 30, 1952, was unanimously adopted.

Mr Robert Walker, MBE, re-elected president and Mr A. M. Baer vice-president for the ensuing year and the proceedings terminated with a vote of thanks to the retiring president.
